CONTRIBUTORS

Editor of First Edition

Willie F. Page is professor emeritus (retired) of Africana studies at Brooklyn College, in Brooklyn, New York. He is the author of numerous reviews and journal articles. His published works include *The Dutch Triangle: The Netherlands and the Atlantic Slave Trade 1621–1664.*

General Editor of Revised Edition

R. Hunt Davis, Jr., Ph.D., is professor emeritus of history and African studies at the University of Florida. He received a Ph.D. in African studies from the University of Wisconsin, Madison. Dr. Davis is an expert on the history of South Africa, African agricultural history, and the history of education in Africa. His published works include *Mandela, Tambo, and the African National Congress* (1991) and *Apartheid Unravels* (1991), along with numerous articles and book chapters. He served as director at the University of Florida Center for African Studies and is also a past editor of the *African Studies Review.*

CONTENTS

LIST OF ENTRIES

PREFACE

In three initial volumes, the first edition of this encyclopedia covered African history and culture from earliest times to 1850. This new edition adds two volumes to carry the coverage to the present. Also, we have revised the original three volumes to include a number of needed articles, while consolidating some entries and updating others. One particularly necessary revision involved including entries for all of Africa's present-day countries in each of the three initial volumes. In addition to new country articles, Volume I now includes a number of new geographical entries. African languages, which had been spread among the three volumes, are now consolidated in this volume, as well. The present Volume I thus contains entries that are not necessarily tied to any specific chronological period as well as articles that deal with African history and culture prior to 500 CE. The articles in the remaining four volumes are more solidly anchored to the time periods of each particular volume.

Examining Africa's past represents, in many ways, a supreme challenge to scholarly endeavor. Some of it is known, but much of it still awaits further research. It is possible to lay out a broad outline of the past, but fundamental questions remain. For example, what sparked the massive expansion of Bantu-speaking peoples, a population movement that lasted centuries and that transformed the cultural and political landscape of the continent? How did Africans learn to make iron, and how did iron-making technology spread from region to region? Exactly who were the Egyptians? Were they, as many Afrocentric scholars have argued, black Africans who migrated into the Nile River Valley from elsewhere? Or, as many traditional Egyptologists have maintained, were they indigenous to Egypt? Or were they a mixture of peoples? How were empires such as Mali, Ghana, and Songhai governed, and what was the relationship between rulers and ruled? How extensive was the impact of the transatlantic slave trade on Africa? What is the legacy of colonialism, and how do we measure its impact today? Why is Africa today the world's poorest and most disadvantaged continent? What will it take to change this situation?

Fundamental questions like these serve to spur further research on both the African past and present. There is a desire—indeed a pressing need—to discover more about Africa's past and to better understand its present. For millions of people around the world, in Africa and elsewhere, it is part of a discovery of their own traditions and heritage as well as those of their neighbors and their ancestors. For others, it is a wish for knowledge. Who can let languish the exploration of so vast a part of human life and history?

When using this encyclopedia, readers should keep in mind the vastness and diversity of Africa itself. It is the world's second-largest continent, occupying one-fifth of the earth's land surface. It contains the world's longest river, the Nile, and its largest desert, the Sahara. The continent's climate and topography exhibit tremendous variation. Thus it is not surprising that Africa is equally vast and rich in the diversity of its peoples and cultures. Simply put, this great diversity makes it impossible to offer a comprehensive treatment of African history and culture for any of the encyclopedia's chronological periods. As a result, choices had to be made about what to include and what to leave out. On the whole this has been done following several simple criteria. Among the most important of these are, first: What are the most significant historical developments and cultural features of Africa, past and present? Second: What are the best-established facts and interpretations? Third: What will be most useful and interesting for the reader? And fourth: What information will be most helpful in bringing Africa's past and present to life for the reader? It is the hope of everyone associated with this project—the writer, the editors, and others—that these criteria have resulted in an array of articles that illuminate the richness and variety of African life and culture over time. It also is our hope that this work will stimulate those who read and use it to continue to learn more about how, in the words of the Greek philosopher Aristotle (384–322 BCE), there is always something new coming out of Africa.

R. Hunt Davis, Jr.

HOW TO USE THIS ENCYCLOPEDIA

This encyclopedia is organized chronologically, dividing the African past into five major eras. This division serves to make it easier to study the vastness and complexity of African history and culture. It also allows students and general readers to go directly to the volume or volumes they wish to consult.

Volume I, *Ancient Africa,* deals with Africa up to approximately 500 CE (roughly, in terms of classical European history, to the Fall of the Roman Empire and the dissolution of the Ancient World on the eve of the emergence of Islam). The volume also includes articles on the continent's key geographical features and major language families. In addition you will find articles that deal with certain basic aspects of African life that, in essential ways, remain relatively constant throughout time. For example, rites of passage, funeral customs, the payment of bride-wealth, and rituals related to spirit possession are features common to many African societies. Although these features can evolve in different cultures in radically different ways, their basic purpose remains constant. Accordingly, rather than try to cover the evolution of these cultural features in each volume, we offer a more general explanation in Volume I, with the understanding that the details of these cultural touchstones can vary widely from people to people and change over time.

On the other hand there are entries related to key cultural and social dimensions whose changes are easier to observe over time. Such entries appear in each of the volumes and include architecture, art, clothing and dress, economics, family, music, religion, warfare, and the role of women.

Volume II, *African Kingdoms,* focuses on what may be loosely termed "medieval Africa," from the sixth century to the beginning of the 16th century. This is the period that witnessed the rise and spread of Islam and, to a lesser degree, Arab expansion throughout much of the northern and eastern regions of the continent. It also saw the flowering of some of Africa's greatest indigenous kingdoms and empires. Other Africans, such as the Maasai and Kikuyu living in and around present-day Kenya, did not live in powerful states during this time yet developed their own dynamic cultures.

Volume III, *From Conquest to Colonization,* continues Africa's story from roughly 1500 to 1850. During this era Africa became increasingly involved with the Atlantic world due to European maritime exploration and subsequent interaction through trade and cultural exchanges. This period also included the rise of the transatlantic slave trade, which in turn created the African Diaspora, and the beginnings of European colonization. As a result, it marks a period when the dynamics shaping African culture and society began to shift.

Volume IV, *The Colonial Era,* covers Africa during the years 1850–1960. This historical period begins with Europe's conquest of the continent, leading to the era of colonial rule. Political control enabled Europe to extend its economic control as well, turning Africa into a vast supply depot of raw materials. Volume IV also covers the rise of nationalist movements and the great struggle Africans undertook to regain their independence.

Volume V, *Independent Africa,* deals with the continent since 1960, when Africans began regaining their independence and started to once again live in sovereign states. (This process, of course, took longer in the southern portion of the continent than in other parts.) In common with the rest of the world's people, however, Africans have faced a host of new and challenging problems, some of which are specific to Africa, while others are of a more global nature.

In addition to the aforementioned cultural entries that appear in all five volumes, there are entries for each of the present-day countries of the continent as identified on the Political Map found at the front of each volume. Readers can thus learn about the key developments in a given country within a given time period or across the entire span of African history. There are also articles on individual ethnic groups of Africa in each of the volumes. Since there are more than a thousand identifiable groups, it has been necessary to limit coverage to the major or key groups within a given period. Thus, a group that might be historically important in one period may not be

sufficiently important, or may not even have existed, in a period covered by one or more other volumes. Likewise, there are entries on the major cities of the continent for given time periods, including, in Volume V, all the present national capitals. Another key set of entries common to all volumes concerns historically important persons. In general, historians are more readily able to identify these individuals for recent periods than for earlier times. As a result the latter volumes contain more individual biographical entries. An exception here is the case of Ancient Egypt, where historical records have enabled us to learn about the roles of prominent individuals.

In preparing these volumes, every attempt has been made to make this encyclopedia as accessible and easy to use as possible. At the front of each volume, readers will find an introduction and a timeline specific to the historical era covered in the volume. There are also three full-page maps, two of which appear in all five volumes (the current political map and a physical map), and one that is specific to the volume's time period. In addition the front of each volume contains a volume-specific list of the photographs, illustrations, and maps found therein. The List of Entries at the front of each volume is the same in all volumes and enables the reader to quickly get an overview of the entries within the individual volumes, as well as for the five-volume set. Entries are arranged alphabetically, letter-by-letter within each volume.

Entry headwords use the most commonly found spelling or representation of that spelling, with other frequently used spellings in parentheses. The question of spelling, of course, is always a major issue when dealing with languages utilizing an alphabet or a script different than that used for English. Changes in orthography and the challenges of transliteration can produce several variants of a word. Where there are important variants in spelling, this encyclopedia presents as many as possible, but only within the entries themselves. For easy access to variant and alternate spelling, readers should consult the index at the end of each volume, which lists and cross-references the alternate spellings that appear in the text.

Each volume contains an index that has references to subjects in the specific volume, and the cumulative index at the end of Volume V provides easy access across the volumes. A cumulative glossary appears in each volume and provides additional assistance.

The entries serve to provide the reader with basic rather than exhaustive information regarding the subject at hand. To help those who wish to read further, each entry is linked with other entries in that volume via cross-references indicated by SMALL CAPITALS. In addition the majority of entries are followed by a **See also** section, which provides cross-references to relevant entries in the other four volumes. The reader may find it useful to begin with one of the general articles—such as the ones dealing with archaeology, dance, oral traditions, or women—or to start with an entry on a specific country or an historically important state and follow the cross-references to discover more detailed information. Readers should be aware that cross-references, both those embedded in the text and those in the **See also** section, use only entry headword spellings and not variant spellings. For those readers who wish to research a topic beyond the material provided in individual and cross-referenced entries, there is also a **Further reading** section at the end of many entries. Bibliographical references listed here guide readers to more in-depth resources in a particular area.

Finally, readers can consult the **Suggested Readings** in the back of each volume. These volume-specific bibliographies contain general studies—such as atlases, histories of the continent, and broad works on culture, society, and people—as well as specialized studies that typically cover specific topics or regions. For the most part, these two bibliographic aids contain those recently published works that are most likely to be available in libraries, especially well-stocked city and college libraries. Readers should also be aware that a growing number of sources are available online in the form of e-books and other formats. The World Wide Web is also a good place to look for current events and developments that have occurred since the publication of this encyclopedia.

Photographs and Illustrations

Maps

INTRODUCTION TO THIS VOLUME

In Volume I, *Ancient Africa,* readers will find everything from information about the earth's earliest hominids to the history and culture of the Egyptians and Nubians to the events that led to the establishment of Roman Africa. These, of course, are the subject areas for which we have the most historical information. As a consequence Volume I is somewhat skewed in the direction of these subjects. Some of this information, especially dealing with human origins, has a "late-breaking" quality to it, due to the extensive ongoing research and important new archaeological findings that occur almost every year. Information about ancient Egypt, on the other hand, is more constant, although here, too, ongoing research continues to provide important new results.

Readers also will find entries about a wealth of other peoples, places, and events. Particularly important are the beginnings of some of the world's earliest agricultural and pastoral societies, for the transformation from hunting-and-gathering to planned food production is essentially the point at which history begins. Nevertheless, even to this day some Africans continue to live in hunting-and-gathering societies. For this reason, readers will find articles on such peoples as the San and Mbuti and their way of life. Splendid and sophisticated cities such as Memphis, in ancient Egypt; Napata and Meroë, in the kingdom of Kush; Carthage, in what is today Tunisia; and Jenne-Jeno, on the inland Niger River delta, point to the early importance of urban life and culture in African history.

This volume provides the principal coverage of geography for the encyclopedia as a whole, with entries on the major rivers, lakes, and other important geographical features of the continent. Languages also receive extended coverage in Volume I, with articles on each of the major language families as well as on important language sub-families and some individual languages. As with the geographical entries, this basic information is relevant for the subsequent periods in African history but does not necessarily need to be repeated in the other four volumes. However, if a certain language has particular relevance to a later historical era, that language may be listed in volumes other than this one, as well.

Religion and spirituality constitute prominent aspects of a people's culture and hence receive extended coverage in this volume. Some of the religion-related articles, such as those regarding life in ancient Egypt, are specific to the time period of this volume. Other religion entries, however, such as those on ancestor worship and funeral customs, are written in what is sometimes called the "anthropological present," which underscores both the timelessness and the continuity of the subject. Because we are using this historical writing technique, certain religious and spiritual subjects are covered here but not in later volumes, where they may be equally relevant. There are further entries on many other topics, such as animals, that were important to ancient African life and remain significant far beyond the early era of African history. Thus some of these articles serve not only to introduce ancient Africa but also to point to some of the traditions that continue to characterize Africa since that time.

When it comes to the study of ancient African history, it is important to realize several points. First, traditional historical and archaeological methods have provided extensive information on the major African civilizations of the ancient world, including Egypt, Kush, Aksum, and Carthage. These civilizations also left written records and documents, and we can use these to supplement the ample archaeological evidence to piece together some semblance of their histories. In contrast, archaeology has always been more difficult to pursue in sub-Saharan Africa. Part of the reason is environmental, since the humid tropical climates are more destructive of material remains than are arid and semi-arid climates. Moreover, archaeologists tend to focuse more on monumental sites than on those of an everyday nature, and sub-Saharan Africa has far fewer monumental sites than the northern and northeastern portions of the continent. Beyond this there is the whole question of the availability of written sources. The vast majority of sub-Saharan societies did not utilize writing until much later in their history. Instead they relied almost exclusively on oral history for maintaining links with their own cultural tra-

ditions and with the past. Many societies had oral history specialists (or griots, as they are known through much of West Africa), who were responsible for passing down significant historical events and cultural practices from one generation to the next, events and practices that continued to possess relevance for the living generation. Thus, this volume's article on oral traditions is also relevant for later eras of African history and culture.

Oral traditions, however, often involve the inclusion of information—legends, myths, folklore—that is difficult to verify factually and thus is incompatible with conventional historical methodology. As a result many more traditionally minded historians have viewed with skepticism the use of oral traditions for reconstructing the past. It always must be remembered, though, that quite frequently these oral histories are all we have to go on in our efforts to understand the pasts of many of Africa's peoples. Similarly, it is also important to remember that these histories and traditions, even when they seem to encompass magical, mythical, or otherwise improbable events, often manage to give us an impressive portrait of the minds and spirits of the people who listened to them

and passed them on from one generation to the next. Because of this, when discussing the origins of a particular culture or the beginnings of a particular society, we often include not just the known empirical evidence but also information from the legends and myths that are told about these events.

A final point to remember is that, quite often, when it comes to the history of peoples and cultures, modern scholars are forced to operate by a kind of logic of extension. For example, we may not have much hard data about the entire ancient history of a particular people, but we might have fairly reliable accounts of their lives and ways dating back a thousand years or more. If the study of their languages, genealogy, or culture supports the assumption that these people have lived in that same area relatively unchanged, we can project what their lives may have been like 500 or even 1,000 years earlier. Such logic cannot be pushed to extremes, however, and for this reason certain groups and peoples have either not been included in this volume or else treated less extensively than some might desire. In other words, even in today's "Information Age" we simply do not have enough information.

TIME LINE (PREHISTORY–541 CE)

Prehistoric Africa	
5,000,000 BCE	Period of early hominids
4,400,000 BCE	*Australopithecus ramidus* exists in Ethiopia.
4,200,000 BCE	*Australopithecus anamensis* exists in Kenya.
3,000,000 BCE	*Australopithecus afarensis* ("Lucy") exists in Ethiopia.
	Australopithecines ("Taung Child") exist in South Africa.
2,500,000 BCE	Early Stone Age; Oldowan Toolkit
2,000,000 BCE	Middle Stone Age
	Homo habilis emerges.
	Australopithecus robustus exists in South Africa.
1,750,000 BCE	*Australopithecus boisei* exists in Tanzania.
	Homo erectus ("Turkana Boy") emerges.
1,500,000– 40,000 BCE	Acheulean Age
200,000 BCE	*Homo sapiens* emerges in tropical Africa.
60,000 BCE	*Homo sapiens* in Ethiopia.

40,000 BCE	Mining appears in present-day Swaziland.
40,000– 7000 BCE	Late Stone Age
20,000 BCE	San people living in southern Africa.
15,000 BCE	Qada culture flourishes in Nubia.
20,000– 10,000 BCE	Pleistocene epoch; last ice age comes to an end.
9000–6500 BCE	Early calendar used in Congo area.
8000 BCE	Cattle are domesticated.
	Copper discovered and used by Neolithic peoples.
	Sahara begins to dry and become a desert.
7000–4800 BCE	Neolithic Age
6000–5000 BCE	Sorghum domesticated in the Sudan.
Ancient Africa	
5000 BCE	Irrigation used in Egypt.
4800 BCE	Badarian culture begins in Egypt; Predynastic Period begins in Egypt.

4200 BCE	Naqadah I culture in Egypt.
4000 BCE	Egyptians grow food along Nile.
	Badarian culture flourishes in Upper Egypt.
3700 BCE	Naqadah II culture in Egypt.
3500 BCE	Bronze used for weapons and tools.
	Hierakonpolis constructed.
3400 BCE	Nubian A-Group flourishes.
3200 BCE	Naqadah III culture in Egypt.
3050 BCE	Upper and Lower Egypt are unified under Menes.
3000 BCE	Beginning of Archaic Period (Dynasties 1–2) in Egypt
3000 BCE	Berbers arrive in North Africa.
2780 BCE	Nubian B-Group flourishes.
2705 BCE	Egyptian Old Kingdom (Dynasties 3–8) begins.
2550 BCE	Egypt's King Khufu builds Great Pyramid.
2430 BCE	Egypt's King Sahure reaches Punt by boat
2400 BCE	Kingdom of Kerma begins in Nubia.
2300 BCE	Nubian C-Group flourishes.
2213 BCE	Egyptian Old Kingdom ends and First Intermediate Period begins (Dynasties 9–10).
2040 BCE	Egyptian Middle Kingdom begins (Dynasties 11–12).
1880 BCE	Egyptian Middle Kingdom ends and Second Intermediate Period begins (Dynasties 13–17).

1570 BCE	Egyptian New Kingdom begins (Dynasties 18–20).
1550–1070 BCE	Horses introduced into Egypt.
1525–1417 BCE	Thuthmose I–IV rule Egypt.
1400 BCE	Amarna period begins in Egypt.
	Iron/steel smelted in Tanzania.
1304–1237 BCE	Ramesses the Great
1200 BCE	Sea Peoples attack Egypt.
1070 BCE	Egyptian New Kingdom ends and Third Intermediate Period begins (Dynasties 21–26).
1000 BCE	Bantu expansion begins.
	Immigrants from Saba, in Yemen, arrive in Ethiopia.
	Pre-Aksumite period starts in Ethiopia.
900 BCE	Napata kingdom flourishes in Nubia.
900–600 BCE	Nok culture flourishes.
800 BCE	Phoenicians found Carthage.
780–664 BCE	Kushite dynasty controls Egypt.
663 BCE	Assyrian invasion ends Kushite rule of Egypt.
600 BCE	Camels introduced to Egypt and Sahara.
590 BCE	Meroitic period in Kush.
500 BCE	Aksum emerges as a power.
	Carthage dominates North Africa.
	Hanno explores Africa's Atlantic coast.

The Greco-Roman Period and Beyond

332 BCE	Alexander the Great conquers Egypt; Ptolemaic Dynasty begins.

264–146 BCE	Period of Punic Wars; Carthage is destroyed.
200 BCE	Meroë civilization begins.
30 BCE	Roman conquest of Egypt.
24 CE	Roman conquest of Nubia.
100 CE	Iron technology spreads throughout Africa.
200 CE	Christian monasticism in north-eastern Africa.
	Akan groups migrate into what is now Ghana.
250 CE	Nubian X-Group rises.
400 CE	Bantu expansion slows down.
350 CE	Decline and fall of Meroë.
335 CE	King Ezana rules in Aksum.
395 CE	End of Roman rule in Egypt.
400 CE	Ancient Ghana Empire begins.
	Town of Jenne-Jeno established.
429 CE	Vandals arrive in North Africa.
451 CE	Coptic Christians split from Roman Church.
541 CE	Christian Nubia becomes independent.

A

Abu Hamed Area located on the upper NILE RIVER between the fourth and fifth cataracts, within present-day Republic of the SUDAN. In ancient times Abu Hamed was fought over by EGYPT and NUBIA.

Abu Hamed, which is dominated by an S-shaped Bend of the Nile, is found in what was once Upper Nubia. This stretch of the river runs in a southwestward direction for about 150 miles (about 241 km) before returning to a northerly direction at the end of the bend. Here the river is rocky and fast, and it was often dangerous to ancient navigators.

More than 2,500 years ago, the highly sophisticated Nubian culture flourished in this region. As part of the long struggle between Egypt and Nubia for control of the area, the armies of the Egyptian pharaoh (king) THUTMOSE I (r. c. 1525–c. 1512 BCE) advanced through Sudan before stopping just south of Abu Hamed. The region was invaded once again around 671 BCE, when ASSYRIANS defeated the armies of the Egyptian KUSH empire that stretched from Abu Hamed to the NILE DELTA.

Between the sixth and eighth centuries CE, the people of Nubia converted to COPTIC CHRISTIANITY and resisted invasions from Egypt, which had been under Muslim rule since the seventh century. Between the 13th and 15th centuries, however, Abu Hamed finally became Muslim-controlled. The area of the fourth cataract between Abu Hamed and GEBEL BARKAL has proved fruitful to modern archaeologists, who have discovered there many signs of ancient human life, including rock inscriptions, cemeteries, and churches.

Further reading: Derek A. Welsby, *The Kingdom of Kush: The Napatan and Meroitic Empires* (Princeton, N.J.: Markus Wiener, 1998).

Abusir, pyramids of Mortuary complex of Fifth Dynasty kings in ancient EGYPT, built in the 25th century BCE, once a site of pyramids, sun temples, and funerary temples. The ancient burial grounds of the OLD KINGDOM at Abusir were located in northern Egypt about 10 miles (16 km) from the Giza plateau. Located between the cities of Giza and SAQQARA, the site held 14 pyramids, several sun temples, and tombs of royalty and government officials. Only four of the pyramids remain.

Perhaps the most notable distinction at Abusir is the construction and decoration of the sun temples. In addition to the more common pyramids, mortuary temples, and tombs, several of the Fifth Dynasty kings, including Niuserre and USERKAF, built temples with great stone pillar obelisks in honor of the sun god RA.

The mortuary temples built with the pyramids at Abusir were unusually decorated; walls and columns were intricately sculpted in relief, with palm, lotus, and papyrus plants standing out from the surface. Columns with lotuses at the head, or the capital, are the oldest known examples of this type of relief sculpture.

Although they were built after the great pyramids of Giza, the Abusir pyramids are much smaller, with the tallest rising to 223 feet (68 m). The pyramids at Abusir have the typical north entrances to their chambers.

Still standing today are the unfinished pyramid of Neferefre, the unfinished pyramid of Neferkare, the pyramid of Niuserre, and the pyramid of Sahure. Some parts of the Abusir complex have not yet been excavated.

Abydos Considered the home of the ancient Egyptian god OSIRIS and an important royal site during Egypt's early

Dynastic Period. Archaeological excavations of the tombs at Abydos began in 1895. These suggest that each ruler built large, rectangular, brick enclosures intended as funerary palaces. However, no human remains have yet been found in these structures.

Of all the royal monuments found at Abydos, the temple of the Nineteenth Dynasty pharaoh SETI I (r. c. 1318–c. 1304 BCE) is the largest and most notable. Among its features are impressive representations of the god Osiris, as well as of Seti I and his successor, RAMESSES II (r. c. 1304–c. 1237 BCE). The temple of Seti I includes a "Royal List," also called a "King's List," that gives the names of many of Egypt's rulers. Located in a gallery known as the Hall of Ancestors, this list is part of a wall relief that depicts Seti I and Ramesses II paying homage to the rulers who came before them.

Several ancient Egyptian Royal, or King's, Lists have been discovered, including the papyrus Turin Canon, the Abydos and Karnak Lists, which were found in temples, and the Saqqara List, which was found in a tomb. Although these lists tend to arrange the names of Egyptian rulers in chronological order, none of them is complete by any means. Instead, they seem to include those names that their authors determined to be important or valuable for one reason or another.

Abydos enjoyed royal favor throughout its history. However, its actual role in royal burials is unclear. With the exception of Queen Merneith, there is little indication that other rulers were buried at Abydos.

Abyssinia Ancient name for the area including the present-day country of ETHIOPIA. Scholars differ over the origin of the word. According to some, the name appeared during the rise of AKSUM in the first century CE. Others speculate that the word originally referred to an ETHNIC GROUP that lived in old Ethiopia. Still others suggest that the word derives from the ARABIC word for "mixed" in reference to the fact that the area is comprised of many ethnic groups.

acacia gum Also known as gum arabic, one of the oldest and most widely used of the natural gums harvested from species of the acacia tree. Dating back 5,000 years,

to the time of the ancient Egyptians, gum arabic has been used as a binder in inks and cosmetics and as an agent in the process of mummification. Ancient Egyptian inscriptions refer to *kami*, a type of gum arabic used in painting as a pigment binder and adhesive.

Today, acacia gum is widely cultivated in tropical Africa from MOZAMBIQUE to SOMALIA, the Republic of the SUDAN, ETHIOPIA, KENYA, and TANZANIA. In Sudan, there are special "gum gardens" in which the trees are propagated from seeds. Elsewhere, the gum is collected from wild trees. Oddly, the best yield of gum arabic comes from trees that are in an unhealthy condition. Hot weather, poor soil, and lack of moisture are all factors that improve gum production.

Commercial gum arabic is still widely used today in pharmaceutical preparations, in inks and other art supplies, and in practically all categories of processed foods.

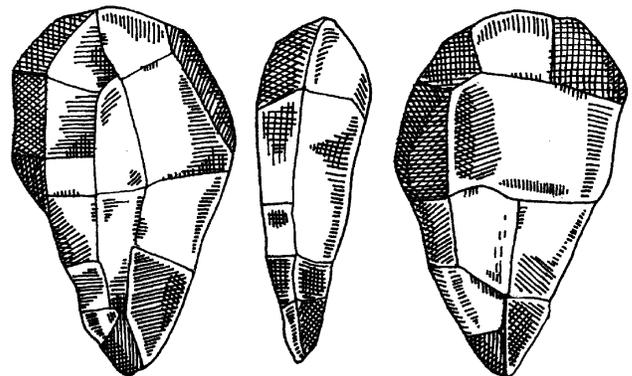
Acheulean Age One of two major phases of the early STONE AGE in Africa. The Acheulean Age began approximately 1.5 million years ago and lasted for more than 1 million years. Its hallmark was the evolution of sophisticated toolmaking, specifically the development of hand axes, cleavers, and picks. (The name *Acheulean* is derived from the place in southern France where the hand ax was first discovered.) The era is often associated with the corresponding biological development of *Homo erectus*, a large-brained, bipedal toolmaker whose remains have been found in many parts of Africa.

Acheulean technology also included the development of the use of fire, which further contributed to the


The left, top, and right-side views of an Acheulean hand ax found in Kamoa, Democratic Republic of the Congo, show the heavier, flaked construction characteristic of this hand tool.

modification and refinement of existing tools. Tools specifically designed for hunting were another important achievement during this age.

See also: ARCHAEOLOGY (Vol. I).

Acheulean toolkit Prehistoric set of axes and scrapers that were named for the valley in France in which early discoveries of the tools took place. Although tools of this type were first unearthed in southern France, the vast majority have been found in Africa. In general, they are sharper and heavier than the older OLDOWAN TOOLS, with chipped flakes and sharpened points. Most were used, in one way or another, in the preparation of food.

Adulis Port on the RED SEA that flourished during the height of the kingdom of AKSUM. Beginning as a fair-sized village, within a few centuries Adulis expanded into a center of world trade. Merchants arrived there from Arabia, GREECE, India, and Ceylon and then traveled for several days by caravan to the Aksumite kingdom, climbing nearly 7,000 feet (2,134 m) above sea level in the process. Adulis also served as a link to the ports that stretched to the central coast of East Africa. This enabled Aksum to continually diversify and replenish its stock of trade goods.

Afar People who have long lived on the arid coast and hinterland of ERITREA and in the eastern Danakil province of ETHIOPIA; also, the language spoken by the Afar people. Sedentary pastoralists, the Afar apparently migrated to the Danakil area from the Ethiopian Highlands, perhaps as long ago as the prehistoric era. Living in the DANAKIL DESERT, even in ancient times the Afar settled as close as possible to whatever sources of water they could find. Over time, as their numbers increased and they became divided into chiefdoms, diminishing water supplies led to frequent clashes with SOMALI peoples.

Afar Depression Low-lying area along the northeastern coast of ETHIOPIA. The Afar Depression is part of the great RIFT VALLEY, which runs from southwestern Asia to southeastern Africa. At approximately 300 feet (91 m) below sea level, the Afar Depression is Ethiopia's lowest

point. The depression has long been occupied by the AFAR people, who also live on the nearby DANAKIL DESERT and in parts of DJIBOUTI.

Africa Name of the second largest continent of the world, covering an estimated 11,687,187 square miles (30,269,814 sq km), and situated south of Europe between the Atlantic and Indian oceans. Over the centuries, Africa has been identified by many names. Among Greek and other ancient travelers it was known as Aetheiopia, Corphye, Ortegia, and Libya. The Moors, Nubians, and Numidians, on the other hand, frequently called the continent Alkebulan, meaning "mother of humankind."

The name *Africa,* however, may be a corruption of a Carthaginian name originally used by the BERBERS. The Carthaginians, who traced their origins to Phoenician seafarers, had come to the northern coast of Africa as early as 1000 BCE.

By 800 BCE the Phoenician trading stations had become full-fledged colonies. Their capital was at CARTHAGE, the site of modern-day TUNISIA. There Phoenicians and indigenous Berber agriculturalists coexisted, creating a distinct Carthaginian culture that lasted until its conquest by Rome in 146 BCE. At that time Rome assumed control of the trading colonies, identifying the northernmost region of the continent as Africa.

Afro-Asiatic languages Family of languages once spoken primarily in North Africa and western Asia that includes the Semitic, Berber, Cushitic, Chadic, and ancient Egyptian branches. The SEMITIC LANGUAGES from both Africa and Asia include ARABIC, the major spoken, religious, and commercial language of North Africa today, and the language that was spoken by the Harari. The languages in the Berber branch of the Afro-Asiatic family were spoken throughout North Africa by various nomadic peoples, including the TUAREGS, in the regions of MOROCCO, TUNISIA, and ALGERIA. The Cushitic languages were spoken in parts of ETHIOPIA, SOMALIA, and regions of East Africa. The languages of the Cushitic branch were BEJA, Agaw, Burgi-Sidamo, Oromo, and Omotic. The most important of the CHADIC LANGUAGES was HAUSA, spoken in the kingdoms of Hausaland.

Other languages that fell into the Afro-Asiatic family were AMHARIC, spoken in Ethiopia and the language of the Solomonic Dynasty; GE'EZ, the literary language of the Ethiopian church after the fourth century CE; and TIGRINYA, spoken in northern Ethiopia, ERITREA, and TIGRAY. These all belong to the Semitic branch.

afterlife Concept or belief that life continues after death. Many African societies express their belief in the afterlife through specific rituals and shared social experiences. One of the strongest beliefs is that the afterlife is an ordered world in which individuals reside after death. This world may exist in caves, in forests, or, as the Abaluyia and others believe, in a place beyond earth.

Although beliefs about the afterlife differ among societies, one common theme is that those who have passed on still have at least some role in the living community, which is why specific acts, or rituals, are performed for the dead. These rituals range from simple burial rites to elaborate ceremonies that might require creating a shrine or making offerings of FOOD, drink, or money.

The choice of which ritual to perform generally is determined by economic circumstances, living arrangements, or long-standing traditions. Groups like the Lodagaa of BURKINA FASO, for example, believe the land of the dead lies to the west, separated from this world by the River of Death. At funerals, friends and relatives provide the symbolic fee of twenty cowries, which is needed by the deceased in order to cross the river. In contrast, groups like the MBUTI place personal belongings in the grave, while other groups bury household items for the deceased to use in the afterlife.

In most societies the funeral plays a critical role following the death of a loved one, allowing people to share their grief and reinforce the ideals they hold about life after death. The Hadza of present-day TANZANIA provide an interesting example. They bury their dead in a relatively simple ceremony. They return sometime later, however, always at night, to perform the Epeme dance. This dance is done to ensure the wellbeing of the living by honoring the dead. Another group, the Yombe, who live in present-day northern ZAMBIA, inform the community of a death by playing a special rhythm on a drum. After wrapping the deceased in a shroud, the Yombe create a grave, called a "house," that has several rooms. The Yombe then turn the deceased to face the place of his or her birth in order to find the way home. Some societies, such as the AKAN, from GHANA, hold a second burial ceremony to mark the end of a mourning period. For them this second ceremony is a final recognition that the dead have successfully achieved their place in the spiritual realm.

Agaw (Agau, Agew) Ethiopian ETHNIC GROUP situated in the central and northern highlands. Through the study of regional speech patterns, linguists have traced the continuous presence of the Agaw as far back as 7000 BCE.

Mainly farmers, the Agaw were overshadowed by the neighboring kingdom of AKSUM during its rise to political statehood. Like the BEJA and NUBA, Agaw speakers were subject to Aksum's demands for tribute, as well as its repeated attempts at religious conversion. In the eighth cen-tury, Islamic expansion limited Aksum's sea trade and weakened the power of the Aksumite state. As a result the Aksumite kingdom was relocated deeper within Agaw territory. There Aksumite military colonies created a feudal society, while Aksumite priests continued to spread Christian religious teachings. Though the Agaw continued to rebel, frequent intermarriages between Agaw women and Aksumite soldiers led to the beginnings of an intermingling of the two groups.

Agbor Ancient IGBO settlement located in western Igboland, in present-day NIGERIA. Little is known about the history of Agbor, although Igbo people probably occupied the region in ancient times. Evidence from surrounding areas indicates that the earliest Igbo settlers in Agbor may have been the Ado na Idu, Nri, or Isuama. These inhabitants probably lived in a manner similar to their Igbo neighbors, subsisting primarily through agriculture. Loose village structures were centered on a council of elders who provided leadership and authority. The recognition of ancestors was central to the traditional Agbor RELIGION, although it included a belief in a supreme god.

age grades Ancient system designed to instill cultural identity through the social interaction of men from different generations. In Africa, age grades typically involve the youngest and oldest male members of a society. Grouping these individuals by age allows a useful exchange of human interaction; youthful ideals and enthusiasm are tempered by the wisdom and experience of elders. In most groups age grades operate on an independent basis, free from family influence, and, unlike AGE SETS, they are organized within a local residential area.

In Africa various types of age grades have developed over the centuries, perhaps in response to changing societal needs. The earliest groups may have functioned as decision-making bodies for their communities. Over time, age grades became known for both defending their communities in times of war and participating in public work projects. In MANDE society, for instance, seven age grades, each with a specific group name, are maintained at all times, while new ones are created every seven years.

Age of Metals Period during which several ancient African cultures developed the technology for smelting brass and iron for use as tools and ornamentation. The exact time period, chronology, extent, and role of the Age of Metals in ancient Africa has been a subject of contro-

versy among historians, archaeologists, and other scholars. Much is known about the BRONZE AGE and IRON AGE in ancient EGYPT. Elsewhere, however, far less is known. Indeed, for many years the vast majority of authorities maintained that most of Africa witnessed no Bronze Age at all, progressing, instead, directly from the late STONE AGE to the Iron Age. More recently, however, evidence has been found of Bronze Age items in NUBIA and southern Republic of the SUDAN, as well as in present-day MAURITANIA. Whether these items and the technology behind them were local in origin or whether the objects or their technology were imported from a place such as CARTHAGE is not known.

According to those who have witnessed recreations of the process, the ancestors of the Haya people of present-day TANZANIA made steel using a small furnace. The bowl of the furnace was approximately 18 inches (45.7 cm) deep and lined with mud obtained from a termite mound. (Composed of grains of silica and alumina, the termite mud does not absorb much water.) The top of the furnace was shaped like an inverted cone. Made of iron slag, it stood about 5 feet (1.5 m) high. At its base, eight blowpipes were inserted at various depths.

A fire was lit with swamp grass and fed with charcoal produced outside the furnace. Goatskin bellows were then used to force air through these pipes and into the furnace in order to produce a fire with an extremely high temperature. After the smelting process, according to the witnesses, the Haya dismantled the furnace and recovered lumps of steel from the bed of swamp grass charcoal.

More, however, is known about the development of iron-making technology. In particular, investigations dating back to the 1970s suggest that advanced and highly complex iron making was known among the Haya people of present-day Tanzania at least 2,000 years ago. Handed down through generations of oral history, this iron-making technology apparently was sophisticated enough to create good-quality steel.

age sets Widespread system that assigns specific tasks to adult males from various clans and communities. Over the centuries age sets have played an important role in reinforcing traditions and creating stability in African societies. For example, age sets have been widely used in Africa for military defense. They also have been used to initiate young men into secret practices or in the knowledge of underlying systems of belief. In this way young men learn to respect and value the knowledge of those elders who have guarded and maintained those practices throughout their lives.

Elder members of the age sets have certain rights as well, and these rights form the basis for strict social controls. For example, at a certain age young men are taught to assume responsibilities in marital and community affairs. Often, however, some elders within the system continue to exert their influence. They might do this by determining the age at which younger men are allowed to acquire adult status. Other areas in which elders continue to have influence are testing young men's suitability for marriage and helping to choose suitable brides for eligible young men.

Age sets play an interesting role among the MAASAI, whose young boys compete to enter age sets known as *moran.* Once they enter the age set the boys often spend an extended period preparing to become adults. This preparation sometimes goes on until the men are well into their twenties. After entering a *moran,* their loyalties become focused on their families and herds.

agricultural revolution Process by which humans began to cultivate their food; sometimes called the Neolithic revolution. In the eastern region of the SAHARA DESERT in northern Africa, which was then well-watered grasslands, the agricultural revolution took place between 9,500 and 8,000 years ago and significantly changed the way FOOD was produced. No longer simply hunting and gathering their food, the inhabitants of the region now began to cultivate their crops with the aid of tools designed specifically for that purpose. It was once believed that this change in food production methods was introduced into Africa from the Middle East. However, the evidence now suggests that AGRICULTURE developed on its own in three widely separated areas of the world: the Middle East, Southeast Asia, and the eastern Sahara. Three additional centers of agricultural innovation—two in the HORN OF AFRICA and one in the West African wooded savanna—emerged before 5500 BCE. The major crops produced in Africa during this period included YAMS and rice, as well as various types of MILLET, SORGHUM, and palm oil. Other plants, such as wheat and barley, were probably imported from western Asia at a later date.

About 4000 BCE the NILE VALLEY began to play an important part in the agricultural revolution. The banks of the NILE RIVER produced a variety of crops, and the Nile

Valley became one of the earliest centers of food production in the region. With the increase in agriculture, grain exports and other commerce began to develop. These activities helped establish a solid and prosperous economy, and the society that emerged laid the foundations for pharaonic Egypt.

agriculture Of all the innovations of early humans, crop cultivation and animal husbandry, in other words, agriculture, are widely considered to be the two most important. Neither of these activities, however, could have occurred until the glaciers retreated and previously waterlogged landmasses dried out. Only then could people establish year-round, farm-like settlements in those areas. These settlements, in turn, led to large, dense populations and, ultimately, to stratified urban societies. These politically organized societies eventually evolved into fully developed civilizations.

> **Cattle may have been domesticated in Africa even earlier than 9000 BCE. A team of researchers, led by University of Massachusetts anthropologist Dr. Charles M. Nelson, recently reported on findings made at three sites in the Kenya highlands, approximately 25 miles (40 m) from Nairobi, KENYA. There the researchers found the remains of cattle. After testing their findings using radiocarbon dating techniques, the group reported that the remains apparently were 15,000 years old. The researchers' further investigations suggested that these cattle were domestic, rather than wild, animals.**

The two key elements of agriculture—planting crops and domesticating animals—appear to have developed independently in at least eight areas of the world, including three in Africa: the eastern SAHARA DESERT, the HORN OF AFRICA, and the wooded savanna belt of West Africa. These developments occurred between 9,000 and 7,000 years ago.

The Development of Agriculture in Africa The first signs of African agriculture are evident in the period between 10,000 and 9000 BCE, when the Sudanian population of the eastern Saharan region began collecting tropical grasses that were the predecessors to such domesticated crops as sorghum, fonio, and pearl millet.

They also began to switch from hunting to raising wild cattle, which they had domesticated. This preceded the domestication of the wild grains they had been gathering by at least 1,000 years. By about 7000 BCE, however, they were cultivating some of the grains, including SORGHUM. They also began to grow COTTON around this time, with baked clay spindle whorls for weaving cloth existing in the middle NILE RIVER valley as early as 5000 BCE. As the climate became drier after 6500 BCE, this Sudanic agricultural tradition spread westward to the upper bend of the NIGER RIVER.

A later independent development of agriculture took place slightly later in the RED SEA Hills region of the Horn of Africa, where the full domestication of cattle had occurred by around 7000 BCE. Sheep and GOATS then spread into the region from southwest Asia. Yet another independent invention of agriculture took place further south in the highlands of ETHIOPIA, where *enset,* sometimes called the false banana, began to be cultivated. The stem and the bulb of the plant are edible when cooked. The other major region of independent agricultural invention appeared among the peoples speaking NIGER-CONGO LANGUAGES in the forested savannas of West Africa. Here a "planting agriculture" emerged by about 8000 BCE, with YAMS as the major crop. Rather than sowing seeds, as with grain crops, part of the yam was planted back into the ground, where it later took root. Subsequently, the oil palm was tended for its cooking oil, nuts, and palm wine. The raffia palm, too, was tended, and its fiber was used to make cloth. By the fifth millennium BCE the first signs of agriculture were evident in EGYPT, where grain crops had come from southwest Asia. Thus, by 3500 BCE, agriculture was well established throughout the northern half of the continent. It subsequently spread southward over the next several millennia until the peoples of southern Africa were practicing agriculture and raising livestock by the first few centuries CE.

> **Researchers representing Southern Methodist University, the Geological Survey of Egypt, and the Polish Academy of Science recently reported on discover6ies they had made in the area of Wadi Kubbaniya, a now-desolate region in Egypt's Western Desert. Their report indicates that between 17,000 and 18,500 years ago—when much of Europe was still covered with ice—Africans in that area were growing barley, capers, chickpeas, dates, lentils, and wheat.**

African agriculture is based on either vegetation or cultivation. Vegetative agriculture is garden-style growing

in which tubers or shoots are placed in the ground to yield a plant. Yams were probably the first crops used for garden-style growing. Cultivation-based agriculture depends on the use of seeds for larger crop yields and is more labor-intensive. Since crop rotation is a relatively new technology in Africa, land was traditionally overcultivated and abandoned when exhausted.

The tools found most readily in traditional agrarian societies in Africa are the digging stick, hoe, and spade. Plows were not traditionally used other than in the Ethiopian highlands. Low soil fertility meant that soil could only be cultivated for a short period of time and production was relatively low. Once the plot of land was chosen, existing plants were burned to produce a vitamin-rich ash fertilizer. After the seeds were planted and sown, the fields had to be periodically pruned of weeds during crop growth. Wild animals and insects were always a threat to the harvest, as was drought. After the crops were harvested, the land was replanted and the process began again. Without a plow, the land could only be used for two to three years, or until the nutrients had been completely leached from the soil. It was then abandoned for up to 20 years so that native plants would have time to refortify the soil. The farmer then migrated to a new plot of land to start the process over. As populations grew, finding enough land to maintain this shifting cultivation method was difficult. Nonetheless, it continued for centuries in much of Africa, particularly the central and eastern regions. In equatorial Africa, little soil preparation was done other than stripping the land, which often resulted in extremely poor crop yields. In the semi-arid regions, the planting season was shortened to only a few months due to the long dry season.

The social implications of agrarian societies varied in different parts of Africa. Among many peoples, the men typically prepared the fields by burning and clearing them. The women usually did all the labor-intensive planting, sowing, and harvesting. Other than this common male-female labor division, agricultural customs among peoples differed greatly. Division of land might have been based on age, gender, democratic allocations, or other traditional systems.

To many African people, working the soil was as much a ritualistic process as it was a way to grow food. In places like Dahomey, for example, the people appealed to a higher god whom they believed created the world by furrowing the earth. Most peoples performed elaborate ceremonies to bless the planting, sowing, and harvesting of the crops. Seeds were often passed among family members as sacred objects. Priests were called upon to ask the gods for a successful harvest. This close association between traditional cultivation techniques and RELIGION has resulted in conservative agricultural advances throughout much of Africa.

Yams have long been a staple in many of the tropical forested regions. Native to Africa, these wild tubers have been domesticated into the modern variety over the centuries. They were relatively easy to grow because they required simple garden-style cultivation. Although they have low nutritional value, these dense carbohydrates store well in both dry and humid climates. Combined with a variety of fruits and vegetables, they have provided a good base to the African diet for centuries.

An equally important native plant is the oil palm. It was originally found only in the forest, but with domestication, it has become one of the most important sources of oil in Africa. Plantains, a member of the banana family, were also important to much of the African population, particularly in the rain forests. Native to southeast Asia, the plantain was probably introduced to eastern coastal Africa by the Malagasy people of MADAGASCAR, who arrived as early as the first century BCE. Over a period of several hundred years a variety of other crops were introduced to Africa through foreign contact. Some crops, like cassava, corn, and groundnuts (peanuts), which originated in the Americas, became important staples in parts of western, central, and eastern Africa after the 15th century.

Seed plants are more labor intensive than tubers or plantains to cultivate. In Africa the most common traditional seed plants were the millet variety of cereals. Found in temperate savanna regions, seed plants required properly prepared fields. The field was first cleared, usually with a hoe. After the seeds were sown, the fields required constant care to keep weeds at bay and to prevent animals from pillaging the ripening plants. Once harvested, the millet was fermented or ground into flour.

One of the most important domesticated plants grown in Africa was sorghum. Native to Africa, sorghum has been grown in the eastern Sahara for more than 7,000 years. Beginning in the first millennium sorghum cultivation began to rapidly spread as iron tools were introduced to different parts of Africa. Other important millets included digitaria, bulrush (pearl) millet, and finger millet. Today, many of the traditional millet crops have been replaced by corn.

One of the few crops in Africa that requires wet cultivation is rice. Native Guinea rice has been cultivated around the GUINEA coast and Niger basin for more than two thousand years. Indian Ocean traders brought a common variety from Southeast Asia between the ninth and 10th centuries. Because rice was easy to store and did not need to be ground before eating, it became popular among the upper classes along the coast during the following centuries.

Ahmose I (Amosis)

Ahmose I (Amosis) (r. c. 1570–1546 BCE) *First king of the period historians call Egypt's New Kingdom*

Ahmose was the son of the pharoah Seqenenre Tao II (r. c. 1591–1576 BCE) and Queen Ahhotep II (d. c. 1515 BCE). Ahmose became pharaoh at a young age, succeeding both his father and his older brother, WADJKHEPERRE (r. c. 1555–1550 BCE), the last king of the Seventeenth Dynasty. Because of his youth Ahmose's mother, Queen Ahhotep, probably served as co-regent during the early years of his reign. As pharaoh, Ahmose continued Egypt's war with its Asian enemy, the HYKSOS. Ahmose triumphed, driving the Hyksos out of EGYPT. Next, he reconquered NUBIA, returning it to Egyptian control. With his borders secure, Ahmose then set about consolidating his power at home.

The last years of Ahmose's reign were devoted to reorganizing Egypt's system of government. Ahmose also built many religious and funerary monuments, although few have survived to modern times. He was particularly devoted to AMUN, the god who was to assume even greater importance during the reigns of his successors.

Ahmose ruled for about 25 years, and examination of his well-preserved mummy suggests that he was close to 35 years old when he died. He and his queen, Ahmose

The face of Egyptian pharaoh Ahmose I (r. c. 1570–c. 1546 BCE) is painted on this Eighteenth Dynasty mummy case. Egyptian Museum, Cairo, Egypt © *Gianni Dagli Orti/Corbis*

Nefertari (c. 1570–1505 BCE), produced one son, AMENHOTEP I (r. c. 1546–c. 1525 BCE), who succeeded his father as pharaoh.

Akan

Akan Peoples of the forest region of present-day GHANA, TOGO, and IVORY COAST. There is continuing debate about the origin of the Akan peoples, who eventually spread throughout the Volta Basin. One theory is that the Akan came south from present-day northwestern Ghana. Other theories say they came from the northeast, perhaps from as far away as EGYPT, passing through ancient Ghana on the way. The association with ancient Ghana is supported by the fact that certain names are shared by the Akan and the Mandinka, who have strong links to ancient Ghana. The matrilineal tradition of ancient Ghana was also found in some of the Akan states, including Ashanti.

Regardless of the precise origin of the Akan, it is widely believed that these people began migrating into

the forest region 2,000 years ago. In time, distinct king-doms began to emerge. The Fante people, for example, settled in the southwest, the Akwamu and the Akyem in the northeast, and the Ashanti in the northwest. Ashanti warriors were fierce fighters, and they forged alliances with neighboring states to conquer their adversaries and become one of the most powerful nations in West Africa, especially in the 17th century.

Akan gold weights Small, brass objects, some in the shape of plants, animals, and figures. Others are engraved with markings and designs. These weights are generally believed to be relics of the ancient AKAN people of IVORY COAST.

The Portuguese called these objects "gold weights" because they saw them being used for the purpose of weighing GOLD. Historians believe, however, that only a few of the objects, which also have been called "Ashanti gold weights," were actually used as gold weights. Opinions differ about what the true purpose of these objects might have been.

Some historians maintain that the Akan gold weights were a means of artistic expression. Others believe that the objects represented a classification system used by the ancient Akan people. For these scholars, the weights were a kind of ancient encyclopedia cataloging such entities as creatures of the land, air, and sea, as well as various other material and nonmaterial things. Still another view is that the weights were intended to aid the memories of those citing proverbs. (A particular symbol, for example, might have been nothing more than a design in itself, but when considered with its metal base, it might have represented the message of a proverb. In this way a particular weight, with its many complex symbols, could have represented a very detailed text.)

Regardless of their exact purpose, the gold weights are thought by some scholars to be examples of ancient African writing. The symbols on the objects have been matched with symbols used in ancient Libyan writing, suggesting that the Akan ancestors may have contributed to the development of writing in northeastern Africa. The symbols are arranged together on single metal pieces, which may mean that they stand for particular words or phrases.

Akhenaten (Amenhotep IV) (r. c. 1379–c. 1364 BCE) *Ninth king of the Eighteenth Dynasty*

Known as the "heretic pharaoh" because of changes he instituted in Egyptian religion, Akhenaten, the son of AMENHOTEP III (r. c. 1417–c. 1379) and Queen Tiye (c. 1415–1340 BCE), began his reign as Amenhotep IV. He

married NEFERTITI (c. 1403–1367 BCE), and the couple produced six daughters. The early years of his reign reflected his traditional upbringing, in particular, the long-standing dedication to the god AMUN.

In the fifth year of his reign Amenhotep IV began to promote a form of monotheism that radically altered Egyptian religious and political structures. He replaced worship of Amun with devotion to a new god, ATEN, and changed his royal name to Akhenaten to indicate his allegiance to the new deity. He then moved the religious capital from its traditional site, Thebes, to a newly constructed capital at AKHETATEN (also known as el-Amarna).

Akhenaten sought to impose the new religion on his subjects by suppressing the cults of other Egyptian deities. He destroyed the old temples, building new ones devoted to Aten. Religious services at the new capital were frequently led by the king and queen themselves, with Akhenaten serving as the one and only high priest of the new cult. This brought him into direct conflict with Egypt's established priesthood, which was devoted to the cult of Amun.

Akhenaten's new cult was never really accepted or even understood by his subjects, and most people continued to practice the old religion. Later generations came to regard the religious changes he made as heretical. After his death, Akhenaten's successor, TUTANKHAMUN (r. c. 1361–c. 1352), moved to restore Egypt's traditional religion, making Thebes once again the religious capital. Although Akhenaten's monotheistic cult ultimately proved unsuccessful, during its brief existence, it produced significant changes in Egyptian ART. These are evident not only in the temple decorations at el-Amarna but also in the literature of the period.

Akhetaten (el-Amarna) Religious capital of EGYPT during the reign of AKHENATEN (r. c. 1379–c. 1364 BCE) and consecrated for the worship of the god ATEN. Also known by its modern ARABIC name, el-Amarna, the city of Akhetaten was founded by the "heretic pharaoh," Akhenaten. Situated midway between Egypt's old religious capital at MEMPHIS and the royal city of Thebes, the city was dedicated exclusively to the worship of Aten. There Akhenaten led services devoted to this new, monotheistic deity whom he hoped would supplant Egypt's traditional gods. The most important buildings in the city were the temples and palaces devoted to Aten, but there also were administrative offices as well as houses for nobles and artists. In addition, outside the city, there were tombs intended for the nobility and the royal family.

Akhetaten served as Egypt's capital only during the reign of Akhenaten. After his death the city was abandoned and its monuments dismantled or destroyed.

Aksum (Axum)   Capital city and major kingdom of ancient ETHIOPIA from about 500 BCE to 1000 CE; noted for its trade networks, ARCHITECTURE, and traditions of Christian faith. According to many anthropologists it is quite likely that humankind first emerged in the Great RIFT VALLEY that cuts across Ethiopia from the RED SEA to Lake Turkana. In this valley, archaeologists have found fossil skeletons dating back 3.5 million years. By the time of the late STONE AGE several prehistoric populations inhabited present-day Ethiopia, most notably the Omotic and Cushitic-language speakers. Initially HUNTER-GATHERERS, these peoples eventually learned to cultivate various grains and other crops and to domesticate sheep, CATTLE, DONKEYS, and GOATS. They established patterns of life that have continued among their descendants down to the present time.

During those thousands of years the indigenous peoples also interacted with the immigrants who came to the region, especially from across the Red Sea. One of the first groups of immigrants, Semitic-speaking traders from Saba, or Yemen, in southwestern Arabia, began arriving about 1000 BCE, or even earlier. Actively involved in the Red Sea trade along the Arabian Peninsula, they sought to expand trade along the Ethiopian coastline. Settling in the mountainous regions of TIGRAY, AMHARA, and Shoa to the south, these Sabaean settlers produced the culture generally known as pre-Aksumite. The ancient city of ADULIS, near modern-day Massawa, was the most important pre-Aksumite trading center, maintaining important links both along and across the Red Sea. At the same time, the immigrants added their knowledge of irrigation and hillside terracing to the plow and hoe cultivation of the indigenous Kushites. The result was a network of farms that developed in the region's valleys and foothills.

Sabaean settlement continued for 1,000 years, with frequent contacts and intermarriages between the Kushites and Sabaean settlers. The result of all these interchanges was a distinctive culture from which the BETA ISRAEL, or Falasha, trace their origins and Judaic faith.

By about 500 BCE a number of descendant colonies united to form a powerful city-state whose capital, Aksum, was situated on a northeastern plateau overlooking the Red Sea. This geographical vantage point strengthened the

Stone monuments (called *stelae*) at Aksum, in Ethiopia, dating from the fifth century BCE are thought to mark royal burial sites. © *Davis Bartruff/Corbis*

kingdom's trading networks with EGYPT, Arabia, and other trading ports along the East African coast. Spreading out from its primary port at Adulis to secondary ports on the Gulf of Aden, Aksum's trading networks eventually extended as far as the eastern MEDITERRANEAN SEA and the Middle East, India, and even present-day Sri Lanka.

As time passed Aksum became a strong trading competitor with MEROË, in the KUSH kingdom. *The Periplus of the Erythraean Sea,* a shipping guide recorded in the first century BCE, describes Aksum as the primary market for ivory in the northeast. The kingdom also supplied elephants for military conquests waged by the PTOLEMIES, in Egypt, as well as rhinoceros horn, animal hides, GOLD dust, spices, tortoise shell, frankincense, and myrrh.

By the fourth century Aksum's trading ties had grown to encompass the eastern Roman Empire, which ensured the kingdom even greater prosperity and international recognition. Indeed, at the height of Aksum's power, its rulers dominated an area extending from present-day Republic of the SUDAN to SOMALIA and from the coast of the Red Sea to the Nile Valley. At times Aksumite power even stretched across the Red Sea to the Arabian peninsula.

During this period Aksum grew in wealth, as well as in political and military influence. Archaeological excavations have recovered everything from gold and silver (which initially may have been imported from outside the kingdom) to silk and muslin. Glassware from royal tombs has also been discovered, as have metal tools from Egypt and spices originating from locations as distant as the Far East. There also is evidence that Aksumite manufacturing was sufficiently developed for the kingdom to make— and even export—glassware and crystal, as well as brass and COPPER items.

Aksum has a number of monuments, known as stelae, that are significant for their size and purpose. Aksum's tallest stelae measures 108 feet (33 m) high and weighs between 550 to 700 tons, making it the world's largest monument of this type. These structures are believed to have served as markers for the subterranean tombs of Aksum's kings. Carved to look like multistory buildings, the stelae have doors, windows, and baseplates for offerings.

Aksum was one of the first African kingdoms to mint its own coins, and archaeologists have recovered Aksumite coins in sites as far away as Yemen. Although from the third to the seventh centuries, gold, bronze, and silver were all used to make the kingdom's coins, its gold coins were carefully matched, in their weights and inscriptions, to the coins of ROME. Over the years archaeologists have been able to use these coins to undertake detailed studies of the kings and rulers of Aksum.

Aksum's most successful ruler was King Ezana (r. c. 320–c. 350 CE), whose authority extended from southern Arabia to the western edge of the ETHIOPIAN HIGHLANDS. Known by the traditional title of *negusa negast* (king of

kings), Ezana held dominion over numerous chiefs and princes who paid him allegiance and monetary tribute.

How does a building remain standing for thousands of years? Among those who apparently knew the answer were the ancient Sabaean settlers of Aksum, who were one of many ancient populations who knew the secret of building with dry stone. This form of architecture uses no mortar to bind the stones together, and archaeologists have traced surviving remnants as far back as 300 CE. These remains include castles that stood several stories high and were built with stepped walls, battlements, and corner towers. Other notable examples of Aksum's dry stone architecture include St. Mary of Zion, one of the earliest churches built in the kingdom.

The conversion of this king to CHRISTIANITY marked a significant chapter in Aksum's history and had a profound impact on the region. The Christian religion had apparently come to Aksum many years before, brought to the kingdom by merchants from Byzantium. However, the religion had made few inroads in the kingdom until Ezana embraced the faith near the end of his reign.

The precise reasons for Ezana's conversion are unknown, although there is speculation that it might have been due to either influence of the Roman emperor Constantine (272–337 CE) or Aksum's close trading ties with GREECE. Another influence may have been Frumentius, a Syrian missionary who served as Ezana's tutor. Whatever the ultimate reason for Ezana's decision, its significance to him and his is made clear by the way in which Aksumite coins began to bear images of the Cross of Christ rather than symbols from Aksum's traditional, polytheistic religions or images of Ezana himself. A more lasting effect of this conversion, however, was the way in which it allied Aksum with now-Christian ROME and isolated Aksum from the people within the region who continued to follow traditional polytheistic religions.

Inscriptions left behind by King Ezana provide details about a number of wars. Some of these stemmed from religious conflicts; many others were caused by Ezana's monetary demands on the region's independent chiefdoms. (When the Tsarane, for example, refused to pay tribute, Ezana led a military expedition against them.) Other conflicts may have been resolved by enslaving and selling captives to Rome, as in the case of the BEJA nomads from the Red Sea hills.

About 350 CE, at the height of Aksum's power, King Ezana ordered an invasion of the island of MEROË. Towns and villages were razed and crops were destroyed. Prisoners and livestock were seized and many Kushites fled, set-

tling, perhaps, in Kanem-Bornu (in what is now central Republic of the SUDAN). An inscription left by King Ezana states: "Twice or thrice they had broken their solemn oaths and had killed their neighbors without mercy, and they had stripped our deputies and messengers whom I sent to inquire into their raids. . . . And as I had warned them, and they would not listen but refused to cease from their evil deeds. I made war on them, they fled without making a stand, and I pursued them for 23 days, killing some and capturing others."

Renewed Christian fervor came to Aksum in the wake of the Councils of Nicea (c. 325 CE) and Chalcedon (c. 451 CE). The decisions made by these councils effectively made heretics of the MONOPHYSITES—Christians who had previously maintained the purely divine nature of Christ. When the councils rejected this interpretation, the Monophysites became subject to persecution and, eventually, to violence. In the wake of this, many Monophysites took refuge in Aksum. There they found asylum and ignited a period of religious enthusiasm that became known as "the second conversion." Among the more notable figures during this period were the Syrian monks known as the Nine Saints. Establishing a strong monastic tradition in the region, they ultimately helped found what became known as the Aksumite Christian or Ethiopian Orthodox Church.

After Muslim conquests during the seventh century, the trade routes that had made Aksum so rich were blocked or even changed. As a result the Aksumite kingdom lost its economic preeminence. Forced to resume an agricultural focus, the kingdom faced dwindling natural resources caused by soil erosion and overexploitation of trees. The Aksumites became enmeshed in serious religious conflicts when they decided to resettle in the interior central highlands. There they faced serious revolts from groups such as the Beja and the AGAW, Semites who rebelled against the proselytizing of the Aksumites. The final blow to Aksum came in the 10th century, when the Banu al-Hamwiyya, an Agaw group led by a woman known as Gudit (Judith) or Isato, sacked the Aksumite kingdom.

Alexander the Great (356–323 BCE) *King of Macedonia, and ruler of a vast empire*

Alexander was the son of Philip of MACEDONIA (382–336 BCE), and Olympias, a princess of Epirus (present-day Albania). As a child he studied literature, SCIENCE, and MEDICINE under the Greek philosopher Aristotle (384–322 BCE). By his late teens he was taking an active part in the affairs of state, ruling as regent in his father's absence, serving as an ambassador in Athens, and commanding part of his father's army at the battle of Chaeronea, in 338 BCE.

Crowned at the age of 20, Alexander quickly established his authority by executing his Macedonian enemies. He then set out to restore Macedonian rule over the Greek cities of Thessaly, Athens, and Thebes. He then turned eastward in search of new lands to conquer.

In 334 BCE Alexander attacked Persia and, with a force of only 42,000 soldiers, defeated the larger army of the Persian king Darius (r. 336–330 BCE). Forging southward, Alexander's army arrived in EGYPT in 332 BCE. The Egyptians, who loathed the Persians, welcomed Alexander and named him pharaoh. While in Egypt, Alexander established the city of ALEXANDRIA, which became a seat of learning and economic power for 900 years.

Alexander then led his armies back to Persia, defeating King Darius once again, and marching eastward to the Indus and Ganges rivers. Everywhere his armies went, Alexander spread Greek ideas, reformed unjust laws, and established himself as the supreme ruler. Just 33 years old when he died, Alexander had created an empire that stretched from southern Europe to India, encompassing virtually all of the world then known to Europeans.

Alexandria   Second-largest city in EGYPT, located on the MEDITERRANEAN SEA on the western edge of the NILE DELTA. Alexandria served as one of the world's leading cultural center for hundreds of years. Alexandria was founded in 331 BCE by the Macedonian king ALEXANDER THE GREAT (356–323 BCE), at the site of a fishing village named Rhakotis. Finding the place an ideal crossroads between the rest of Egypt and GREECE, Alexander commissioned the Greek architect Dinocrates to design a city to serve as a regional capital. Although his capital was founded in 331 BCE, Alexander himself did not return there during his lifetime. He was, however, buried there following his death in 323 BCE.

Ptolemy I, one of Alexander's commanders, succeeded him, thus beginning the dynasty of the PTOLEMIES. Although Ptolemy I was, like Alexander, Macedonian, he saw the potential for Alexandria to be the intellectual, cultural, and commercial capital of the Mediterranean world. Under his guidance the city flourished, becoming famous throughout the ancient world for its remarkable library and for the Lighthouse of Alexandria, which by the second century CE was considered one of the Seven Wonders of the Ancient World.

Throughout the Ptolemaic dynasty, the city continued to serve as a great center of trade and learning. However, by the end of the reign of CLEOPATRA (r. c. 51–c. 30 BCE), Octavian CAESAR (63 BCE–14 CE) had seized Egypt for ROME. By this time Alexandria's population had grown, attracting people from all around the Mediterranean. In addition to the original Egyptian population, Greek and Jewish communities developed within their own districts. Alexandria became even more diverse as CHRISTIANITY spread throughout the Roman Empire in the following centuries. After many years of being subject to persecution, in 312 CE Alexandria's Christians gained influence when Christianity was made the official religion of the Roman Empire.

In 642 Muslim forces under the command of Amr Ibn el Aas (d. 663 CE) arrived from Arabia and peacefully captured Alexandria. As the ruler of Egypt, Amr made the crucial decision to move his capital to the eastern bank of the Nile River to establish the city of al-Fostat. This would later become the center of present-day CAIRO.

While the Arabs respected the history of Alexandria, they were more interested in developing their new capital, and over the next thousand years or so the city gradually reverted to a small fishing village. The port of Alexandria would not regain its importance until the mid-19th century.

Algeria   Country located in North Africa measuring approximately 919,600 square miles (2,381,800 sq km) that borders the MEDITERRANEAN SEA in the north, TUNISIA and LIBYA in the east, NIGER and MALI in the south, MAURITANIA and WESTERN SAHARA to the southwest, and MOROCCO in the northwest. Over the course of its long history Algeria has belonged to many great empires, from the PHOENICIANS to the Romans. Algiers is its largest city and capital.

Algeria's first inhabitants were the BERBERS. According to cave paintings dating from 8000 to 2000 BCE, the Berbers were CATTLE herders and hunters. Around the ninth century BCE the Phoenician civilization in present-day Tunisia established trading posts, including Algiers and Annaba, along the Algerian coast. Between the third and second centuries BCE coastal Algeria was known as NUMIDIA and was ruled by Berber kings. From around the first century BCE to the fifth century CE, Algeria was controlled by the Roman Empire.

alphabets and scripts   Alphabets were largely unknown among the vast majority of ancient African languages, which remained, until fairly recently, primarily spoken languages. Despite this, however, ancient Africa did see the development of three major early alphabetic writing systems: COPTIC, GE'EZ, and Meroitic. In modern times, N'ko and Vai emerged in West Africa.

Coptic   The Egyptians, of course, were one of the first peoples to develop an organized system of writing, and their HIEROGLYPHICS date back to the fourth millennium BCE. Coptic script emerged more than 3,000 years later and represented the last stage of Egyptian writing. It also represented what would turn out to be the only native African writing system based on what could properly be called an alphabet, with characters clearly representing phonetic sounds.

Based largely on the Greek alphabet, COPTIC script contained an additional seven letters, borrowed from the Egyptian demotic script, to denote sounds not used in the Greek language. Coptic, however, did not immediately gain acceptance in EGYPT. In fact, although it was developed as early as the second century BCE, Coptic did not gain widespread use in Egypt until the third century CE. It was at this time that Christian missionaries, wanting to make their religious scriptures accessible to Egyptians, used Greek characters to translate these writings into Egyptian.

Coptic script replaced both the DEMOTIC script, which used more than 400 symbols, and the even older system of hieroglyphics—which included an unwieldy 130 characters used to convey sound and an additional 4,000 hieroglyphs used to represent ideas of enhanced meaning. The Coptic system gradually dropped some of its borrowed demotic characters and became highly standardized.

In 451, when the Coptic Church broke away from the Orthodox Church, it adopted Coptic as its liturgical language. It remained the script of the church until at least the 14th century.

Ge'ez   An Ethiopian script, Ge'ez was used in writing the AMHARIC language and dates to c. 300 CE. In the Ge'ez script each character stands for a syllable rather than a phonetic sound. Ge'ez became the primary written language of ETHIOPIA, used not only to record the lives of the saints and to compose religious poetry, but also to write stone inscriptions, philosophical tracts, and chronicles of royalty. The Bible was translated into Ge'ez between 400 and 600 CE. Ge'ez remained in use as the literary language of Ethiopia until the modern era, and it is still the liturgical language of the Ethiopian Orthodox Church today. Unlike other Semitic languages, Ge'ez is written and read from left to right.

Meroitic   Throughout its history, the Nubian kingdom of KUSH utilized writing. Because of Egypt's strong cultural influence, Kush had long based its writing system on hieroglyphics, but when the center of the kingdom moved south to MEROË (c. 500 BCE), a new Meroitic script began to emerge. This system combined hiero-

glyphic signs and written letters and drew from Egyptian writing. While there are numerous extant texts and inscriptions written in Meroitic script, and the connections with Egyptian hieroglyphs has allowed some individual words to be translated, scholars are still unable to decipher the Meroitic script as a whole. This is largely because they have not been able to relate it to known, or cognate languages. This suggests that the Meroitic language came from outside the region of the Nilotic Sudan, which is in keeping with the evolving understanding of the diverse sources of Meroitic civilization.

Other Languages and Alphabets Much later, in the 19th century, the Vai, a West African people who speak a language of the MANDE branch of the NIGER-CONGO family of languages, also developed a written script. Like Ge'ez, Vai is a syllabic, rather than a phonetic, writing system. It is still used in LIBERIA and SIERRA LEONE.

In the mid-20th century the GUINEA intellectual Souleymane Kanté (1922–1987) created the N'ko alphabet that captured the tonality that was an essential feature of Mande languages. He had experimented with ARABIC script and the Roman alphabet for reducing his own Mande language, Maninka, to writing, but neither proved satisfactory. So he created a completely independent alphabet. N'ko subsequently inspired a grassroots literacy movement among Mande speakers across West Africa.

Several other native African languages, including HAUSA and Swahili, adopted writing systems that borrowed Arabic script, which Arab conquerors had brought to North Africa in the seventh century CE. Arabic, however, lacks the "e" and "o" vowel sounds, as well as consonants that represent the sounds "ch," "g," "p," and "v," all of which are used in many African languages. For this reason, the Roman alphabet, which arrived with Christian missionaries and European colonists, replaced Arabic script in written African languages in the 19th century.

Amanitare (r. c. 12 BCE–c. 12 CE) *Queen of the ancient Kush kingdom*

Queen Amanitare and her husband, King Netekamani, were the co-rulers of Musawarat es Safra, located just 20 miles (32 km) from MEROË, in the kingdom of KUSH. Established near the beginning of the Common Era, Musawarat became a trading center linking southern and western Africa, Asia, and the Mediterranean region. Among Amanitare's achievements was the construction of several temples at NAGA, some 20 miles (32 km) from Musawarat. Archaeological excavations at Naga have unearthed a Lion Temple that is distinguished by an en-

graved image of a four-armed, three-headed lion god. Also of interest is a nearby smaller temple whose mix of architectural influences reflects Musawarat's complex trading ties. The walls of this smaller temple contain a remarkable relief of Amanitare's son, the celebrated military hero Sherkarer.

Amarna period Era of religious and political turmoil in EGYPT during the reign of AKHENATEN, c. 1379–c. 64 BCE. After Amenhotep IV changed his name to Akhenaten to reflect his devotion to the god ATEN, the young pharaoh set out to establish a new capital dedicated solely to the worship of that deity. He named this new city AKHETATEN, meaning "the Horizon of Aten." Decorations created for the religious monuments in the new city resulted in a new and unique art form. Instead of the rigid depictions of royalty that were traditional in Egyptian art, Akhenaten and his family were shown in a more human manner, engaged in everyday activities. The literature of the period, particularly its poetry, also underwent radical changes, which found expression in hymns and devotional pieces created in praise of Aten.

The Amarna period, which sometimes is called the Amarna Revolution, lasted barely three decades, coming to an abrupt end with the death of Akhenaten. Despite its relatively short duration, however, it proved to be an important phase in Egyptian religious and political history.

Amenhotep I (Amenophis) (r. c. 1546–c. 1525 BCE) *Second king of Egypt's Eighteenth Dynasty; son of Ahmose I and Queen Ahmose Nefertari*

Amenhotep I was very young when he came to the throne, and, as was often the case during the NEW KINGDOM, his mother was co-regent during the early years of his reign. Amenhotep enjoyed a relatively peaceful and popular reign. He focused his attention on securing and consolidating the empire created by his father's successful military campaigns against the HYKSOS and NUBIA. Under Amenhotep's rule, EGYPT enjoyed both economic prosperity and great artistic expression, which were manifested in the many monuments he built and restored.

Amenhotep was the first pharaoh to separate his mortuary temple from the tomb in which he was actually to be buried, a practice that continued by his successors. He died without a direct heir.

Amenhotep II (Amenophis II) (c. 1450–c. 1425 BCE) *Sixth king of the Eighteenth Dynasty; son of Thutmosis III and his second wife, Hatshepsut-Merytre*

Amenhotep II is best remembered as a man of considerable physical strength, an avid sportsman, and a great military leader. As a ruler, Amenhotep II had to preserve and protect the immense empire he had inherited from his father, THUTMOSE III (r. c. 1504–c. 1450 BCE). Amenhotep II quickly proved his strength as a military leader, when Asian city-states revolted against Egyptian rule. Displaying incredible fierceness in battle, he rapidly conquered his enemies. Later in his reign he conducted equally brutal wars in Syria and NUBIA. During these campaigns he was reputed to have publicly displayed the bodies of captives both on the prow of his ship and on the walls of the royal capital at Thebes.

Upon his death Amenhotep II was succeeded by Thutmose IV (r. c. 1412–c. 1402 BCE), his son by his marriage to his sister, Tio. Buried in the VALLEY OF THE KINGS, Amenhotep's tomb was unearthed in 1898. At that time it was found to contain not only his mummy, but also those of several other pharaohs.

Amenhotep III (Amenophis II) (r. c. 1417–c. 1379 BCE) *Eighth king of Egypt's Eighteenth Dynasty*

The son of THUTMOSE IV (r. c. 1425–c. 1417 BCE) and Queen Mutemwiya, Amenhotep III enjoyed a long and peaceful reign, during which Egypt enjoyed a period of economic prosperity. He was particularly noted for the luxury and splendor of his royal court. He also was a patron of the arts, building and restoring monuments throughout his kingdom.

Like many pharaohs, Amenhotep III maintained a large harem. However, his chief wife, Tiye, was a strong, capable woman who played an important role in the governing of EGYPT. The royal couple had four daughters and two sons. When he died at the age of 50, Amenhotep III was succeeded by his younger son, who would later change his name from Amenhotep IV to AKHENATEN.

Amenhotep IV See AKHENATEN.

Amenirdis I (r. c. 760–c. 747 BCE) *The sister of King Piankhy, founder of Egypt's Twenty-fifth Dynasty (c. 780–c. 644 BCE)*

Amenirdis is notable as the first woman of the ancient kingdom of KUSH to hold the title of "Divine Wife of AMUN." Initially controlled by the powerful male priesthood of Amun, young women of ruling families were first appointed as priestesses during the eighth century BCE. Their appointment allowed kings to assert greater control over the city of Thebes as well as land and wealth consecrated to the god Amun. After he established the Twenty-fifth Dynasty of EGYPT, PIANKHY continued this tradition. Some historians have argued his decision gave greater legitimacy to the Kushite conquest.

For a brief period, Kushite priestesses formed their own dynasty, adopting the daughters of reigning kings upon whom they conferred title and responsibility. Amenirdis I (r. c. 745 BCE) passed the title on to Shepenupet II (r. c. 700 BCE), Piankhy's daughter. Surviving records indicate this practice continued under the reign of Taharqa (690–664 BCE), whose daughter Amenirdis II inherited the title but died before her formal installation.

In keeping with the traditions of the gods, priestesses of Amun lived a celibate life, attended by servants and administrators. However, the recognition granted to them was in many ways equal only to that of the reigning Kushite kings. Priestesses were given a formal coronation, royal temples, and extravagant burials that immortalized their deeds. Although they were restricted to the city of Thebes, it appears that they held a high degree of political power and amassed great wealth. The restoration and construction of public buildings, monuments, and statues reflect the good works of these ancient women. Temples built to honor Amenirdis I still stand at MEDINET HABU. Their numerous wall reliefs show the priestesses making ritual offerings to Amun on behalf of the king.

Amhara Ethiopian ETHNIC GROUP; also the name for the region they occupy. The primary language of ETHIOPIA has long been AMHARIC, the Semitic language of the Amhara. The Ethiopian Orthodox Church, which largely shapes religious life in Ethiopia, is closely allied with the Amhara. One of the main reasons for the success of the Amhara is the closeness of their family relationships, since for them kinship and land ownership are linked.

There are at least two major accounts of the origins of the Amhara. One story declares them to be descendants of Sabaean settlers, or Himyarites, who crossed the RED SEA from present-day Yemen. According to archaeologists,

these Sabaean immigrants, who may have arrived in Ethiopia as long ago as 500 BCE, developed both the hybrid language known as GE'EZ and an original form of Ethiopic script. These settlers also brought with them their advanced knowledge of irrigation and terracing systems, which greatly aided in establishing durable methods of farming in the arid lands of Ethiopia. Throughout their history, the Amhara have earned their livelihood from the soil, raising teff (a type of cereal), as well as corn, wheat, legumes, and vegetables.

Another account of the Amhara's origins, taken from the *Kebra Nagast,* Ethiopia's national epic, asserts that the Amhara are descendants of King Solomon and Queen MAKEDA (queen of Sheba). On the basis of this, the Solomonic dynasty of Ethiopian rulers, who were primarily of Amharic descent, carried the title "Lions of Judah."

Amharic A language of the Semitic branch of the Afro-Asiatic family of languages. Amharic has served as the primary language of ETHIOPIA for many centuries and, for almost a millennium, has been both the official language of Ethiopia, used in court and government documents, and the language spoken by the dominant population group of Ethiopia.

Like other Ethiopian SEMITIC LANGUAGES, Amharic is descended from GE'EZ, the ancient ecclesiastic and literary language of Ethiopia. The grammatical forms used in Amharic clearly place it in the Semitic branch of AFRO-ASIATIC LANGUAGES, which were introduced into Ethiopia by traders from southern Arabia during the first millennium BCE. Although it strongly resembles other Semitic languages in its use of grammatical forms, Amharic employs a syntax much more similar to that of the Ethiopian Cushitic languages, especially OROMO.

Amharic is one of the few African languages that produced an ancient written literature. Amharic derived its written script from the alphabet of ancient south Arabia. Though originally written from right to left (as ARABIC is), Amharic script—probably as a result of Greek influence—later changed direction from left to right. Amharic did retain the practice, common in many Semitic written languages, of separating words by placing two dots between them.

amulets Objects, ornaments, or symbols imbued with ritual power that are worn, carried, or placed in graves; also known as charms. Based on a number of archaeologi-

The ankh, right, and other ancient Egyptian amulets were thought to possess ritual power. Museo Egizio di Torino, Turin, Italy © *Gianni Dagli Orti/Corbis*

cal excavations, amulets appear to have been in use in Africa from an early period. In ancient times, they were made from materials of the natural environment, including animal bone, shells, and rock. One of the earliest known charms was recovered in the western sudanic belt and dates back to the NEOLITHIC AGE (c. 5000–c. 3000 BCE). There is speculation among ethnologists that this particular relic resembles a type of fertility charm comparable with ones still used by the Fulani.

In southern EGYPT the population of el-Badari (c. 4300–c. 3800 BCE) was associated with recovered amulets that resembled HIPPOPOTAMUSES and gazelles. These items may have functioned within BADARIAN CULTURE as magic charms used for protection during the hunt. They also might have been used to prevent the spirits of dead animals from causing harm. Hunting charms were important to many African societies and, in later periods, were sewn onto hats or shirts. This practice continued in regions of SOUTH AFRICA and NIGERIA until well into the modern era.

During the period in Egyptian history known as the MIDDLE KINGDOM (c. 2040–c. 1840 BCE), amulets were used in a wider context. Egyptian mothers tied charms on a string and placed them around the necks of their children for their protection. This also was done as a cure for illness. High child-mortality rates were not unusual in Egypt, and many such charms contained spells and prayers written on papyrus.

Charms used to protect Egyptian pharaohs in death were made of GOLD, lapis lazuli, and obsidian. These objects were placed between the bandages of the pharaoh's mummified remains, while large scarab amulets, contain-

ing spells and prayers, were placed on the heart to protect it. A considerable number of COWRIE SHELLS were also used in Egyptian burials as a powerful symbol of rebirth and regeneration.

The use of charms and amulets continued in many parts of Africa in ancient times, playing an important role in major RITES OF PASSAGE. Among the Pende of ANGOLA and Democratic Republic of the CONGO, for example, elders continue a custom even today in which they carve small ivory masks known as *minyaki*. Initiates wear these MASKS as amulets as they undergo rituals that prepare them for adulthood.

Amun (Amun-Ra)   The sun god of ancient EGYPT, whose name means "concealed one." Egyptian worship of Amun dates back to the earliest times, but Amun did not become the preeminent, all-powerful deity until the pharaohs of the Eighteenth Dynasty attributed their military successes to him. At that time, Amun was merged with the northern sun god, RA, becoming Amun-Ra, "King of the Gods." Worship of Amun became widespread, and the priests who served the deity were rich and powerful. As a result those priests exercised great influence over the pharaohs.

Amun usually was depicted in the form of a strong young man, often with the head and curled horns of a ram. According to Egyptian mythology, Amun was married to the goddess Mut. Their son was the god Khonsu.

The cult of Amun-Ra flourished at the Egyptian capital of Thebes until the reign of the pharaoh AKHENATEN (r. c. 1379–c. 1364 BCE). At that time, worship of Amun-Ra and the other gods of the Egyptian pantheon was abandoned and replaced by devotion to a single new deity, ATEN. Akhenaten's attempt at a monotheistic revolution, however, did not last long. After his death, Akhenaten's successors restored Amun to the supreme place in the ranks of the gods.

Amyrtaeus   (r. 404–399 BCE) *Egyptian pharaoh, believed to be from Libya, who was the only king of Egypt's Twenty-Eighth Dynasty*

Amyrtaeus is believed to be a relative of another Amyrtaeus, who years earlier had tried to oust the Persians from the NILE DELTA region. After succeeding Darius II to the throne in 404 BCE, Amyrtaeus fought a successful military campaign against the Persians, who occupied LOWER EGYPT.

By 400 BCE Amyrtaeus had gained control of UPPER EGYPT. Beyond this, little is known about Amyrtaeus's reign other than that, according to Egyptian tradition, he broke an Egyptian law that led to his son being forbidden to succeed him.

Anansi (Ananse, Kwaku Anansi)   Mythological spider trickster of the Ashanti people of present-day GHANA. According to Ashanti myth Anansi is the son and intermediary of the sky god Nyame, on whose behalf Anansi brings rain and floods. Traditionally, Anansi is a cunning figure, living by his wits. He is credited by some with creating the first human; in some legends he is also responsible for creating the separation between day and night. Anansi was also seen as having taught people how to sow grain and to use a shovel in the fields, thus introducing AGRICULTURE. Although in Ashanti legends Anansi is rarely bested by any human, in at least one myth he is beaten after an encounter with a girl made out of wax. When the girl refuses to speak to him, Anansi hits her with his legs. Anansi is then stuck to her, allowing people to approach and attack him.

ancestor worship   Somewhat misleading term used to describe the practice, prevalent among West African peoples, of honoring ancestors. So-called ancestor worship centers on the belief that the deceased can intercede in the lives of their living relatives. Although supported by no universal set of beliefs, the practice is similar in most African societies. Believers hope that ancestors who are properly honored will bring good fortune to their relatives on earth. On the other hand, some ancestors may become evil spirits who haunt the living, cursing them with disease or natural disaster. In this case, the family must provide the appropriate sacrifices to appease the evil spirit. If the spirit continues to plague the living, his or her bones may be dug up and burned.

Ancestors are usually recognized individually rather than collectively. A family or clan typically honor their relative in group ceremonies, calling upon that individual to bless them with a good harvest or protect them from a village plague. The living usually communicate with the deceased through prayer or sacrifice. While the deceased are believed to have the power to influence the living, they do not have unlimited powers and can only influence those who recognize them.

In order to enter the ancestral realm properly, the deceased must be buried according to custom. When the head of a family dies, his eldest son often takes over his position of family authority. In most cases this first heir to the deceased must perform the burial ceremony for his father. With some peoples, a man who dies without a direct heir cannot be honored. Instead his soul is left to wander aimlessly as a ghost. Funeral rites may continue for years until the deceased has properly passed into the ancestral realm. Ceremonies, prayers, and ritual sacrifices

may aid in the process. Not until funeral rites for the deceased are complete can the son officially lead the services for his departed father.

Many peoples who honor their ancestors believe that the ancestral realm is organized hierarchically, parallel to the living world. Thus, the rank of the deceased increases only as the rank of his counterpart on earth increases. For instance, if the living son is heir to family authority, his father's rank in the ancestral world will increase as his son's rank rises in the family or among his people.

ancestry   Founding members of families, groups, or nations identified through myths, shrines, and specific sites. In Africa one of the most important roles that ancestry plays is in defining life's purpose and traditional values. For thousands of years, oral history has helped to accomplish this through myths. In some societies, myths detail heroic deeds or hardship that give meaningful personal or national histories to future generations. It should be kept in mind, however, that not all African societies share this view. Among the Pokot of western KENYA, for example, ancestral spirits traditionally are viewed as evil and are held responsible for great misfortune. In fact, it is believed that even speaking of the dead opens the way for bad luck.

Special symbols or shrines commemorated family ancestry in many ancient African societies. In the kingdom of Benin, in what is now NIGERIA, some royal families used a special altar under which founding male ancestors were buried. Carved wooden roosters were placed on the altars of female ancestors. Commemorative figures that honor the ancestors were also used by the Baoule of IVORY COAST.

One of the most ancient symbols of ancestry in Africa, the ARK OF THE COVENANT was used to commemorate the national ancestry of ETHIOPIA, beginning with King Solomon and Queen MAKEDA (queen of Sheba). Similarly, among the Ashanti of GHANA, a unified national ancestry was achieved through the centuries-old tradition that maintained symbolic royal stools and a royal umbrella that "covers the nation."

Ancestry may also be linked to particular sites. For NUER groups in the present-day Republic of the SUDAN, a special tamarind tree in their homeland west of Bahr el-Jebel traditionally represented the place from which many claim to have originated. Similarly, the KIKUYU treated Mount Kenya as the House of Mumbi, the spiritual dwelling place from which they originated and to which they would return as ancestors.

Traditional RELIGION continues to make a place for ancestor reverence and worship. For example, in the annual EGUNGUN festival of the YORUBA people, the roots of which lie thousands of years in the past, it is believed that the spirits of deceased and sometimes divinized ancestors are summoned to bring comfort and relief to the living.

Angola   Present-day country on the southwestern coast of Africa measuring approximately 476,200 square miles (1,233,400 sq km) that is bordered on the north by the Republic of the CONGO, on the west by ZAMBIA, and on the south by NAMIBIA.

Angola has been inhabited since prehistoric times, as evidenced by early human remains found at archaeological sites in Luanda. However, many thousands of years passed before more developed societies arrived in the area. The first settlers were HUNTER-GATHERERS who spoke KHOISAN LANGUAGES. At the beginning of the sixth century Bantu-speaking people, who had mastered METALLURGY, flocked to the region, probably originating to the north, near present-day NIGERIA or CAMEROON. When they reached Angola, these newly arrived agriculturalists were able to use their knowledge of AGRICULTURE, metalworking, and ceramics to dominate the indigenous inhabitants. After several centuries various BANTU LANGUAGES had been established throughout the region. The result was the genesis of a number of different ethnic groups who took on different characteristics and spoke languages with Bantu roots.

Ankaratra range   Volcanic mountain range in the central highlands of the island of MADAGASCAR. Covering nearly 2,000 square miles (5,180 sq km), the Ankaratra mountains lie to the southwest of Antananarivo, the present-day capital city of Madagascar. Mount Tsiafajavona, the island's second highest peak, lies within the Ankaratra range.

Anlamani   (r. c. 623–c. 593 BCE) *Kushite king of Egypt*
Anlamani and ASPELTA (r. c. 593–c. 568 BCE), his brother, were royal descendants of the prominent Kushite rulers that included Taharqa (r. c. 690–c. 664 BCE) and PIANKHY (r. c. 751–c. 716 BCE). Like his predecessors Anlamani apparently erected one of the stone pillars, known as stelae, that have provided historians and archaeologists with important insights into the inner workings of the Kushite kingdom. Among other things, Anlamani's stelae record his progress among the various Nomes, or provinces, of EGYPT. Although, as these and other records show, Anlamani kept a watchful eye over the vast territory that was controlled by KUSH, he was unable to prevent warfare with the nomadic Blemmyes who inhabited the western desert.

Anlamani's reign was also noteworthy for the role played by the female members of his family. On his stelae, he describes how his mother, the KANDAKE, or queen mother, Nasalsa, attended his royal coronation at Kawa and played a prominent role in royal proceedings. He also describes the importance of his sisters, consecrated priestesses of AMUN. According to Anlamani's records, one of the chief responsibilities of these women was to play the sistrum in the holy temples that his predecessors erected at GEBEL BARKAL in honor of the god AMUN.

ants There are more than 8,000 species of ants, which vary in length from .08 inch to 1 inch (.2 cm to 2.5 cm). Some African ant species, like the driver ants found in the tropics, do not live in permanent colonies. They are nomadic and carnivorous and move in long columns, devouring animals unfortunate enough to cross their path. Large armies of driver ants can even consume large mammals. Also found in the African tropics are tailor, or weaver, ants. These ants build nests out of leaf fragments that are held together by a kind of silk secreted by their larvae.

In ancient Africa there were many interesting beliefs about and uses for ants. In EGYPT, for example, ant eggs were crushed and used as cosmetic eyeliners. Elsewhere in Africa, the industriousness of ants associated them with fertility. The Pangwa of TANZANIA believed that the world was created from ant excrement. According to the Dogon people of MALI the anthill was a symbol of female fertility.

Apedemak God worshiped by kings of the ancient kingdom of KUSH. Elevated to the status of a national deity, Apedemak was a highly symbolic figure. He usually was depicted as having a man's body with four arms and a lion's head. The head, according to some reports, represented the Twenty-fifth Dynasty king Taharqa of EGYPT.

Worship of Apedemak may have been temporarily suspended in the eighth century BCE when Kushite kings conquered Egypt about 740 BCE. Initially the Kushites' adaptation of Egyptian religious rites included the worship of the god AMUN. By 200 CE, however, Kushite kings returned to many of their own ancient religious practices, including the worship of Apedemak.

Aqaba, Gulf of Northeastern arm of the RED SEA, which separates the Arabian and Sinai Peninsulas. The Gulf of Aqaba borders modern-day Israel, EGYPT, Jordan, and Saudia Arabia and has had a long history as a commercial port and strategic area. In ancient times, Aqaba was on the spice caravan route to Egypt, GREECE, and

other parts of Europe. Religious scholars have linked the area with the biblical port city of Ezion-Gerber, where King Solomon was said to have built a fleet of ships.

Arab coastal trade Commerce between Arabia and coastal Africans took place as early as the first century BCE. Early immigrants from Arabia and Yemen left their politically unstable homelands in search of new territory along the eastern coast and HORN OF AFRICA. They crossed the RED SEA and established trading ports along the coasts of present-day ETHIOPIA, SOMALIA, and the Republic of the SUDAN. These trading centers connected Africa to the riches of Arabia, Asia, Persia, GREECE, and ROME for the first time. Early Arabian traders exchanged weapons for African GOLD, ivory, honey, tortoise shells, and slaves. As the Arab immigrants intermarried with local people, new cultures emerged. In Ethiopia, around 100 CE, the powerful trading kingdom of AKSUM was founded by people who centuries earlier had emigrated from Saba, in Yemen, and intermarried with the indigenous Cushitic-speaking peoples. Although Arab coastal trade flourished over the next 200 years, it sharply declined from the third to seventh centuries with the fall of Rome, warfare with Ethiopia, and internal conflict among African peoples.

Around the same time, as the first Arabs reached the Horn of Africa and eastern coast in the first century BCE, other Arabs crossed the Red Sea further south at the Strait of Bab el-Mandeb. They too established trading kingdoms. A rich culture developed as the local people integrated the Arabian Semitic language and Sabaean religion (from Saba) into their culture. The Arabs introduced basic WRITING technology and stone-building techniques, allowing for rapid advances in these early African kingdoms.

Sub-Saharan Africa, known as *bilad al-sudan*, or "land of the blacks," to the Arabs, also had early contact with Arabian traders. Southern coastal Africa along the present-day Swahili Coast was connected to the African interior via extensive trade routes.

Arabic Semitic language of the Afro-Asiatic language family originating in the Arabian Peninsula. The influx of Arabs into Africa, especially during the seventh century, had considerable impact, so much, in fact, that Arabic became the primary language not only of the Middle East, where it originated, but of North Africa as well.

Arabic constructs most words on the basis of three consonant sounds, with vowel sounds inserted either before, between, or after consonants. Depending upon where they come in relation to these consonants, the vowel sounds indicate associated meanings as well as number (i.e., singular or plural). The use of prefixes and suffixes attached to the root words provide further shades of meaning or indicate grammatical case (e.g., subject or

object). The three consonant sounds "s," "l," and "m," for example, provide the basis for such related words as *Islam*, *Muslim*, *salaam* (peace), and *salama* (safety). Arabic sentences normally follow the pattern of verb-subject-object.

The Arabic language remained largely confined to the Arabian Peninsula until the seventh century CE, when Islamic Arabs initiated a campaign to conquer and colonize various regions of Africa (and Asia) and convert its peoples to Islam. The military—and missionary—success of these efforts had a powerful impact on many African tongues and cultures. Later settlement by Arab traders, beginning in East Africa in the 14th century, also served to heighten the influence of Arabic on African languages.

Even in areas in which Arabic did not replace—or at least diminish the importance of—indigenous languages, Arab conquest and trade often had a significant impact on local cultures and tongues. Arabic influence can clearly be seen in the large Muslim population of eastern and Central Africa, for example.

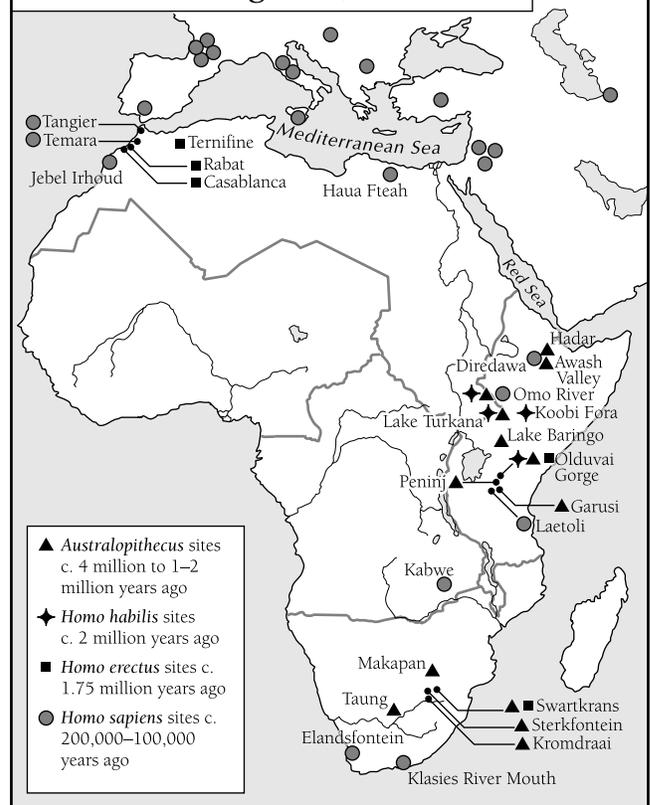
The Arabic influence on African language and culture can be seen most readily among the Swahili and HAUSA tongues, where Arabic vocabulary has influenced the formation of words in both languages. Although most Swahili vocabulary is drawn from BANTU LANGUAGES, a great number of Swahili words have been derived from the Arabic vocabulary, including the word *Swahili* itself, which means "the coast" in Arabic. In addition, both Hausa and Swahili (unlike almost all other African languages) developed a written alphabet, something which is most likely a direct result of the influence of Muslim Arabs, upon whose alphabet these indigenous Africans based their own.

The AMHARIC language of ETHIOPIA, affected by the migration of Arab traders in the first millennium BCE, also demonstrates a strong Arabic influence.

Indigenous African languages and dialects have influenced spoken Arabic in these regions as much as Arabic has had an impact on them. Although many North Africans now use the Arabic language almost exclusively (unlike most regions of Africa, where multilingualism is the norm), this spoken Arabic varies widely from country to country. Written Arabic, however, is largely consistent throughout North Africa. It has become the dominant language in MAURITANIA, MALI, MOROCCO, ALGERIA, TUNISIA, LIBYA, EGYPT, and the Republic of the SUDAN, and is commonly spoken in SOMALIA, CHAD, Ethiopia, and DJIBOUTI.

See also: LANGUAGE FAMILIES (Vol. I).

archaeology   From the Greek words *archaios,* meaning "ancient things," and *logos*, meaning "study of," archaeology is a relatively young science, but it has already unlocked many mysteries associated with the study of Africa, which scientists consider the cradle of humanity. In just the last few decades, many ancient, fossilized remains have been recovered as a result of archaeological

Sites of Hominid Remains, c. 3.18 Million Years Ago–40,000 BCE


excavations, including the TAUNG CHILD in SOUTH AFRICA; *ZINJANTHROPUS* and *HOMO HABILIS* in OLDUVAI GORGE in TANZANIA; *HOMO SAPIENS* in Kabwe, ZAMBIA; Nario-kotome boy in Lake Turkana, KENYA, and one of the oldest fossilized recoveries to date, Dinkenesh (or "Lucy"), recovered in Hadar, a region of the Awash River valley in ETHIOPIA.

For these finds to provide useful information, archaeologists must interpret, classify, and analyze the data that results from them and explain their significance within the correct environmental, cultural, and historical contexts. Archaeologists are often aided in their investigations by written records, ORAL TRADITIONS, and artifacts from the time period. They may also draw on the work of such specialists as geologists, botanists, linguists, and chemists, among others.

Many archaeological discoveries, in the form of human and animal remains, provide a glimpse into the day-to-day activities of prehistoric human beings—those peoples who lived before the invention of WRITING, approximately 5,500 years ago. The time period in which these prehistoric peoples lived is generally divided into the Early, Middle, and Late Stone Ages. Excavations of STONE AGE sites have yielded a great deal of information concerning hominids, the biological term derived from

the Latin word *homo* (human being) which describes the various branches of the homininidae family from which modern humans descend. Hominids were primates that had the ability to think, stand, and walk on two feet as early as 2.5 million years ago.

Archaeologists have also been trained to identify and retrieve artifacts or objects that are made or changed by human hands. These artifacts might include pottery, ROCK ART, cloth, or stone tools such as the ACHEULEAN AGE hand ax found in Tanzania and Kenya and dating from between 700,000 years and 1.5 million years ago. Such primitive tools, for example, are easily distinguished from the more refined cutting tools produced during the Late Stone Age by more evolved humans, known as *Homo sapiens,* or modern human beings, who began to appear 100,000 years ago.

Recovered graves represent another source of artifacts and have provided archaeologists with some idea of prehistoric religion in Africa, particularly in regions where burial patterns consistently reveal some form of belief system. Such graves have been identified in Zambia, ZIMBABWE, and MALAWI. In both northern and southern Africa a number of graves have also been recovered that held the remains of *Homo sapiens* along with stone tools.

Some archaeologists specialize in certain periods and regions, such as ancient EGYPT and NUBIA, that offer an abundant degree of material culture. For example, in the Eastern Desert of Egypt, archaeologists found an ancient building that they believe was once occupied by a pharaoh. They were able to confirm that the building was a multiroom dwelling that dated back to the MIDDLE KINGDOM. These rooms contained basin rims and the remnants of pottery. In addition, a dried-up well connected with the building had many hieroglyphic inscriptions.

Archaeologists can use data from more extensive excavations to reconstruct an entire ancient civilization. For example, the ruins of Great Zimbabwe and its surrounding smaller villages, which lie in Masvingo in modern Zimbabwe, have offered archaeologists important information concerning the development of early city-states in Africa. Archaeologists who have conducted excavations at the ruins have been able to reconstruct the events that influenced Great Zimbabwe's rise and that contributed to its downfall. This was done by using special tools such as trowels and small brushes to scrape away dirt and sand. This allows the archaeologists to study the strata, or levels, of rock and determine the age of artifacts while causing the least amount of damage.

One of the cardinal rules in archaeology is maintaining the contextual integrity of the site. This means that items found in one soil strata cannot be lumped with others from another strata. To prevent this from occurring, all information discovered in the field is recorded on special forms known as *provenance sheets* for later analysis in laboratories. Special computer software is also used to recreate the original stratigraphic layers of ancient sites.

To gain some idea of the age of their findings, archaeologists have increasingly relied on sophisticated dating methods such as radiocarbon dating and potassium-argon dating. These methods evolved from atomic physics and involve measuring the breakdown of chemical elements in formerly living objects. Recently, archaeologists have collaborated with scientists in testing the DNA found in human and animal tissue to provide an even more complete picture of the past.

architecture   In ancient Africa, as in other parts of the ancient world, architecture was determined by the climatic conditions, natural resources, and sedentary habits of its peoples. African buildings vary from mud houses in tropical habitats to elaborate tombs and palaces in others. From EGYPT to Great Zimbabwe, however, none of these buildings "just happened." In fact, each of them, from the simplest mud house to a great pyramid, had to be planned and constructed with great skill.

Houses   In sub-Saharan Africa, houses are among the most common architectural constructions, and their basic configurations and designs often date back thousands of years. Traditionally, most of the houses of sub-Saharan Africa are circular, a shape that offers a number of advantages to the people of this area. To begin with, the area of a circle provides more than 25 percent more floor space than a square with the same perimeter and more than 43 percent more space than any rectangle with that perimeter.

Beyond this, circular houses require significantly fewer materials than square or rectangular ones. Circular houses also have greater resistance to the forces of changing winds. In addition, they generally are easier to make. This was an important factor for nomadic peoples who had to abandon their homes every few months or for agricultural peoples who moved frequently because of land rotation.

A notable circular house design is that of the traditional MBUTI home, which dates back hundreds and even

thousands of years. To build their homes, these people of the northeast Congo region first drive saplings into the ground. Next they bend the tops together overhead, securing them with smaller twining saplings. This forms a dome-shaped structure that is covered with large heart-shaped leaves that overlap to form a waterproof enclosure. Dead branches are placed on top to hold the leaves flat. Once the leaves settle into place, even the hardest rains generally cannot penetrate a Mbuti house.

The Chagga of TANZANIA, who long inhabited the fertile slopes of Mount Kilimanjaro, traditionally construct beehive-shaped houses. Interestingly, the critical dimension used in the construction of these homes is the height of the tallest man known by the builder. The diameter of the house always is two to three times the length of that man's arm span, from the fingertips of one hand to the fingertips of the other. The circumference of the house is marked off by tying a hoe to the end of a rope and attaching the other end to a peg located at the center of the planned dwelling; as the builder walks around the peg, he draws a circle with the hoe.

A number of agricultural peoples used cylindrical walls for their homes, topping them with cone-shaped thatched roofs. The walls intersect the roof to form a circle. The major distinction between this cylinder-cone design

and the dome and beehive designs of the Mbuti is the material used to construct the walls. In the dome and beehive houses, the walls are made of the same material as the roof, usually saplings covered with leaves or grasses. In contrast, the walls of the cylinder-cone dwelling are usually made with mud, clay, or some other material that is plentiful in the area.

Exactly how each group or people creates these cylindrical walls—and what they do to decorate them—varies. The KIKUYU of present-day KENYA, for example, traditionally form the walls with a network of wattling that is fastened to posts and then daubed with clay. Mud is used whenever clay is not abundant. In contrast, the Hehe people of Tanzania construct a large, oblong structure with many large rooms. The walls are 10 inches (25 cm) thick and have a flat thatched roof daubed with earth. This type of construction keeps the structures remarkably cool in even the hottest weather.

Another approach is taken by the MAASAI, who since ancient times have constructed houses resembling covered wagons. The structure traditionally is covered with a mixture of mud and cow dung. Once the sun has thoroughly dried the walls, the house is clean and sanitary. Fishermen in the Lake Kyoga area also use local materials for their homes, which they construct with a thatch made

This reconstruction at Botshabelo Village, South Africa, shows a Ndebele hut of the earliest style, made only of thatch. The wooden door is decorated in a traditional motif. © Lindsay Hebberd/Corbis

of papyrus stems. The finished homes resemble inverted baskets and can be moved from place to place by canoe.

The walls of many of these houses traditionally are whitewashed and then decorated with elaborate designs. Some houses have murals painted on the inner or outer walls. Other types of ornamentation are placed around doorways or on roofs. In southern NIGERIA and along the GUINEA coast, murals, decorated relief patterns, and carved wooden doors and posts are found at the homes of the privileged. The outer walls of the traditional red-earth houses of the IGBO, in present-day Nigeria, are often painted in red, black, green, and white geometric patterns. Murals and mats woven with intricate designs are found in many areas of the Zambezi region of the Congo.

Larger Structures   African architecture, of course, has not been limited to houses, even in ancient times. The Egyptians were among the most famous architects and builders in human history, and their works remain marvels.

The GREAT PYRAMID at Giza, for example, was the very first of the Seven Wonders of the Ancient World to be constructed. Built as a tomb for the great king KHUFU, the pyramid is awe-inspiring in size. The length of each of the four sides exceeds 755 feet (230 m), and the corners are almost perfect right angles, astonishingly accurate to within 0.007 of a degree. The height is 481.4 feet (146.7 m) and the base covers an area of 13.1 acres (5.3 hectares). The ratio of one-half the perimeter divided by the height yields a number equal to 3.1408392 (compared with the true value of pi, which equals 3.1415927), a remarkable fact the significance of which is not yet understood.

The Great Pyramid of Giza also is one of the largest structures ever built. In its original form, it was large enough to simultaneously hold within its walls St. Paul's Cathedral, St. Peter's in ROME, the cathedrals of Milan and Florence, and Westminster Abbey. And, if they were broken into 1-foot (30.48-cm) cubes and laid end to end, its stones would stretch two-thirds of the way around the equator.

Among other monumental architectural achievements are the famous ruins at Great Zimbabwe, which give a vivid impression of the splendor of Mwene Mutapa, one of the wealthiest kingdoms of southern Central Africa. Built more than a thousand years ago, it, too, represents a major triumph of African architecture and construction.

Ark of the Covenant (Ark of the Law, Ark of the Testimony)   Highly revered chest or cupboard, reputed to contain the scrolls or tablets of Jewish law. It is of special importance to Ethiopian Christians. Considered the "holiest of all holies" for the Jewish people, the Ark of the Covenant has been described as a rectangular box made of hardwood and covered with gold plate. It is said to be 4 feet long; 2 feet, 6 inches wide, and 2 feet, 6 inches deep. According to various traditions, the cover of the Ark is decorated with cherubim, or angelic figures. Biblical references indicate that Moses made a case shaped like the "belly of a ship," into which he placed two stone tablets of the law.

The legends of the ark have an important role for many Ethiopians, who trace their Judeo-Christian heritage to the reported union of Solomon and and Ethiopian queen. According to the *Kebra Nagast,* Ethiopia's holy book of ancient secrets and traditions, the Ark of the Covenant was handed down for safekeeping from one generation to the next, from Moses to Israel's great king Solomon. In the 10th century BCE Solomon met Queen MAKEDA, known in the Bible as the queen of Sheba. Queen Makeda, who acquired the Ethiopian throne at a young age, had traveled from her country to Jerusalem in hope that Solomon would teach her how to govern.

The *Kebra Nagast* goes on to explain that Solomon used trickery to seduce the visiting queen, who eventually bore him a son. Solomon, however, later dreamed that this son, named Menelik, would someday be responsible for transferring responsibility of the holy laws from Israel to Ethiopia. At the age of 13 Menelik, who had been residing in Ethiopia with Queen Makeda, came to Jerusalem to visit his father. After being taught Jewish history and law, Menelik was anointed king of Ethiopia. (He thus became MENELIK I.) At the same time, several nobles from Solomon's royal court were assigned to assist the youth in his development (see BETA ISRAEL). In spite of this, however, Menelik stole the Ark and returned with it to Ethiopia, thus fulfilling Solomon's dream.

The Ark, say many traditional legends, remained hidden away through centuries of wars and political upheaval. A number of these tales insist that the Ark was kept in a cave that had been sealed when an earthquake caused a landslide.

Obviously, the mysteries of the Ark are not likely to be solved any time soon. But many Ethiopians insist that the Ark ultimately was kept in the kingdom of AKSUM, thus forming the basis for their claim to be the Chosen People of God.

Arsinoe I   (r. c. 282 BCE) *Queen of Egypt and the first wife of King Ptolemy II Philadelphus*

Arsinoe's father, Lysimachus (c. 361–c. 281 BCE), the king of Thrace, arranged her marriage to symbolize the union of Thrace and EGYPT against Seleucus I Nicator of Syria. She married about 282 BCE and had three children. Although the length of their marriage is unknown, Arsinoe I did not remain queen of Egypt for long. When

Egypt and Thrace defeated Syria in 279 BCE, Ptolemy's recently widowed sister, ARSINOE II (316–270 BCE), arrived in Egypt. Arsinoe I was sent into exile sometime around the arrival of Arsinoe II. Some scholars believe that Arsinoe I was exiled immediately following Lysimachus's death, when Egypt's political tie to Thrace ended. Others speculate that Arsinoe II convinced her brother that Arsinoe I was conspiring to assassinate him. Whatever his motivation, Ptolemy sent Arsinoe I to Coptos in UPPER EGYPT and married Arsinoe II.

Further reading: Sarah B. Pomeroy, *Women in Hellenistic Egypt: From Alexander to Cleopatra* (New York: Schocken Books, 1984).

Arsinoe II (316–270 BCE) *Queen of Thrace, who later married King Ptolemy II Philadelphus of Egypt*

Ptolemy I Soter, the father of Arsinoe II, was the founder of Egypt's Ptolemaic dynasty. He arranged for Arsinoe II to marry King Lysimachus of Thrace (c. 361–c. 281 BCE) in 300 BCE to secure the family's power within the Thracian kingdom. Arsinoe II accused the heir to the throne, her stepson Agathocles, of conspiring to kill his father. When the trusting Lysimachus ordered the execution of his son, Seleucus I Nicator of Syria declared war on Thrace. During the war, Thrace allied itself with EGYPT through the marriage of ARSINOE I (r. c. 282 BCE), Lysimachus's daughter by a previous marriage, to Ptolemy II Philadelphus of Egypt, the brother of Arsinoe II. Lysimachus died from battle wounds in 281 BCE, and Arsinoe II was forced to flee Thrace. She temporarily settled in Cassandrea.

When Thrace defeated Syria in 279, Arsinoe II's half-brother Ptolemy Ceraunus tricked her into marrying him. His interest extended no further than the Thracian throne. When he arrived in Cassandrea to claim his new wife, he immediately killed Arsinoe II's two youngest sons. She fled to ALEXANDRIA, where her brother King Ptolemy II Philadelphus and his wife Arsinoe I ruled Egypt.

Shortly after the arrival of Arsinoe II in Egypt, Arsinoe I was sent into exile at Coptos in UPPER EGYPT. Although Arsinoe I could have been exiled immediately following Lysimachus's death, most scholars speculate that she was exiled when Arsinoe II convinced her brother that Arsinoe I was conspiring to assassinate him. Arsinoe II then married her brother, a practice customary among the Egyptians but puzzling to the Greeks. From that point on, the name *Philadelphus,* which means "brother-loving," was attached to the names of Ptolemy II and Arsinoe II.

Arsinoe II Philadelphus became a powerful force in the Egyptian monarchy. She appeared on Egyptian coins, and several towns were named in her honor. In keeping with custom, she was deified during her lifetime. A cult was established in her honor when she died, and a massive shrine, the Arsinoeion, was dedicated in her honor.

Further reading: Sarah B. Pomeroy, *Women in Hellenistic Egypt: From Alexander to Cleopatra* (New York: Schocken Books, 1984).

Arsinoe III (245–204 BCE) *Wife of King Ptolemy IV Philopator and queen of Egypt*

Arsinoe III was the sister and husband of King Ptolemy IV Philopator of Egypt. Their father, Ptolemy III Euergetes of EGYPT, married Arsinoe III in 217 BCE to her brother after Egypt defeated the Seleucid kingdom in Southwest Asia. During her reign, Arsinoe III had little political influence. The Ptolemaic dynasty fell into a state of decline as her husband succumbed to the influence of his corrupt court ministers. When Arsinoe III gave birth to the heir to the throne, her husband forbade her to appear in public. When Ptolemy IV died in 205 BCE, his court officials had Arsinoe III assassinated to ensure that they would retain power. Her son Ptolemy V Epiphanes was then crowned King of Egypt. At only six years of age, Ptolemy V became another puppet for the royal court.

art Contemporary people around the world make clear distinctions between useful objects and objects whose sole purpose is to be beautiful. However, prehistoric African cultures typically incorporated beautiful images, designs, and objects into their everyday lives, tending not to categorize their crafted objects as what we call art.

Aspelta (Aspelto) (r. c. 593–c. 568 BCE) *Ruler of both Egypt and the Kush kingdom*

During Aspelta's reign Egyptian religious beliefs and rituals were retained, as were HIEROGLYPHICS, Egyptian architectural styles, and the practice of mummification. Aspelta's greatest accomplishment of record was shifting the capital of the kingdom of KUSH to MEROË, which became a center of political, cultural, and social power in 590 BCE.

Assyrian Of or relating to the ancient empire of western Asia situated in the upper valley of the Tigris River; the Assyrian empire began its ascension around 2000

BCE, and rapidly declined after about 612 BCE. Ancient texts credit the Assyrian king Esarhaddon with the invasion of EGYPT and the capture of the capital city of MEMPHIS about 660 BCE. His son Ashurbanipal (c. 681–c. 669 BCE) continued the conquest of Egypt, sending armies as far as Thebes. Weapons made of tempered iron reportedly gave the Assyrians a decisive advantage over the Egyptians, whose weaponry was made of bronze and stone. The process of smelting iron to make tools and weapons is believed to have been mastered by the Assyrians as early as 1300 BCE.

astronomy The practice of the science of astronomy has been widespread in Africa since ancient times, and instances of ancient astronomical practices have been discovered in virtually every part of the continent. In EGYPT, for example, astronomical studies led to perhaps the world's first solar CALENDAR. In KENYA stand huge, megalithic monuments that modern scientists have determined to be carefully aligned with stars and other heavenly bodies. Ancient Africans also learned that numerous earthly cycles—seasonal, planting, animal migration, animal mating, and so on—are closely related to the cycles of the Moon and Sun. From their long-term observations, they created calendars with which they scheduled planting and harvest times as well as important festivals and rituals.

Accuracy and precision were important to these ancient Africans. In part, this was a matter of survival, since the success or failure of everything from crops and hunts to annual migrations often depended upon the accurate prediction of weather and seasonal events. These predictions were also politically important because the astronomer-priests with the most accurate predictions enjoyed the most power and prestige.

Another example of ancient, African astronomy has been found in northwestern Kenya. There anthropologists have studied the recently discovered Namoratunga I and Namoratunga II sites, which date from the fourth century BCE. The first of these is a large rock-art cemetery in which the graves are surrounded by megalithic stones. These huge standing stones are marked with symbols resembling cattle brands.

According to some scholars, Namoratunga II may have been used to create a calendar system as early as 300 BCE. However, it contains only a single grave that is surrounded by several huge standing stones. Namoratunga II also contains nineteen large stone columns arranged in rows that seem to have no relationship to the graves. The columns of Namoratunga II do, however, follow obvious patterns and seem to be related to astronomical events that are part of a complex calendar system developed long ago by eastern Kushites. This calendar links the rising of seven stars or constellations—Triangulum, the Pleiades,

Aldebaran, Bellatrix, Central Orion, Saiph, and Sirius—with a 12-month, 364-day year.

Aswan (Assuan, Assouan, Syene) City and state in southern EGYPT. Located on the east bank of the NILE RIVER, Aswan has a long history of foreign rule. The city is situated near what is now known as Lake Nasser, across from the island of ELEPHANTINE. In ancient times, Aswan was known as Swen (meaning "the mart" in Egyptian) and was the site of an important quarry that supplied granite for Egyptian monuments. (These quarries are still used today.) Under Macedonian and Greek occupation during the last few centuries BCE, the city was named Syene. It time it successively became a garrison post for the Romans, Turks, and British.

Atbara River Tributary of the NILE RIVER. The Atbara River, also known as the Black Nile, is approximately 500 miles (805 km) long. It flows over Nubian sandstone northward from the Ethiopian Highlands to the Angareb and Satit Rivers in present-day Republic of the SUDAN. From there it flows into the Nile at Atbara. The banks of the Atbara River are mainly semiarid badlands. During the dry season from November to May, the Atbara virtually evaporates to the extent that only a handful of pools remain. In the rainy season, it swells to provide more than 20 percent of the Nile's total water volume and carries more than 11 million tons of silt down river into the valley, which is now blocked by the Aswan High Dam, and becomes Lake Nasser.

Aten Deity promoted by the Egyptian pharaoh Amenhotep IV (r. c. 1379–c. 1364 BCE). After coming to power, Amenhotep IV declared his allegiance to a new deity called Aten. Changing his name to AKHENATEN as a sign of his devotion, the pharaoh then made the worship of Aten the kingdom's official religion and set out to eliminate devotion to all other gods, especially AMUN-RA.

Under Akhenaten's direction, a new city was constructed midway between Thebes and MEMPHIS. Named AKHETATEN, meaning "Horizon of Aten," it became the center of the new RELIGION, replacing Thebes as Egypt's religious capital, and Akhenaten the pharaoh officiated as the one and only high priest of Aten.

Akhenaten's new religion represented a radical break with traditional Egyptian theology. The supreme god of Egypt's old pantheon was AMUN, usually depicted as the

sun after it had set and become hidden from view. In contrast, Aten was pictured as a bright-red sun disc with extended rays. The new religion also replaced dozens of other deities (each with its own powers and personality) with Aten, a singular god who was worshiped as the one and only true source of created life.

Worship of Aten did not survive beyond the reign of Akhenaten. After his death, Akhenaten's successors treated the new religion as heresy. Dismantling and destroying the monuments devoted to Aten, they reestablished the previous Egyptian belief system and moved the religious capital back to Thebes.

Atlas Mountains

Atlas Mountains Mountain chain located in Northwest Africa. Stretching more than 1,200 miles (1,931 km), the Atlas Mountains extend from the port of Agadir, in southwestern MOROCCO, through northern ALGERIA to the Tunisian capital of Tunis in the northeast. The highest point in the range is Jebel Toubkal (Mount Toubkal) in southwestern Morocco. Formed of sedimentary rock during the late Jurassic period, the Atlas Mountains are rich in minerals, especially phosphates, coal, iron, and oil. The most rugged areas of the Atlas range are in Morocco, where the tallest peaks can be found. In Algeria, the system becomes a series of plateaus, with the Tell Atlas and the Saharan Atlas regions surrounding the Plateau of the Chotts.

The Atlas Mountains function as a weather barrier between the MEDITERRANEAN SEA and the SAHARA DESERT, to the south. The slopes facing north get enough rain to support forests and farms. Streams that flow down this side of the range are diverted to irrigate fields of crops essential to the people of North Africa.The south-facing slopes are much drier than those facing north. This southern section, called the Saharan Atlas, is covered with shrub and grasses and dotted with salt lakes and SALT flats. Although too dry to farm, the Saharan Atlas can support grazing sheep.

Australopithecus

Australopithecus Type of hominids that are considered ancestors of the modern human species, HOMO SAPI-ENS. All evidence of the earliest known hominids, which belong to the genus *Australopithecus,* has been found on the African continent.

The genus *Australopithecus* included several species, the best known being *anamensis, afarensis, africanus, boisei,* and *robustus*. These species originated during the Pliocene epoch (1.6 to 5.3 million years ago) and had become extinct by the end of the early Pleistocene epoch (900,000 to 1.6 million years ago).

The oldest of these species is the *Australopithecus* (or *Ardipithicus,* as it is called by some) *ramidus,* discovered in the Afar Triangle of ETHIOPIA and dating back 4.4 million years. The 4.2-million-year-old fossil of *Australopithecus anamensis,* the second oldest hominid specimen, was found in KENYA. The third hominid species, *afarensis,* probably was an ancestor of the australopithecines that followed it. Like *ramidus*, it was discovered in the Afar Triangle of ETHIOPIA. The most famous *afarensis* specimen, Lucy, dates back 3.2 million years.

Evidence of both *Australopithecus africanus,* who lived 2 to 3 million years ago, and *Australopithecus robustus,* who lived 1 to 2 million years ago, has been found in SOUTH AFRICA. Fossils of the *boisei,* originally called ZINJANTHROPUS, were found in Tanzania and date back 2.3 to 2.5 million years.

Fossils belonging to the genus *Homo,* which refers to more "human" species, have also been discovered in Ethiopia, Kenya, and ZAMBIA. Although *Homo* specimens also have been found in the Middle East, Asia, and Europe, most paleontologists believe that the first hominids in Eurasia were derived from an African source anywhere from 1 to 1.8 million years ago.

The biological term *hominid,* from the Latin word *Homo,* or person, is used to describe the various branches of the Hominidae family. These Hominidae were closely related primates with the ability to think, stand, and walk on two feet in ways similar to modern human beings. As early as 2.5 million years ago, these hominids began to make the first tools.

Archaeologists have determined that the australopithecines, one of the broad categories of hominids, had a brain capacity of 26 to 33 cubic inches (440 to 550 cc). Perhaps the most notable example of this species ever discovered is the TAUNG CHILD, the name given to a fossilized skeleton found in South Africa in 1925. The Taung Child lived between 2 and 3 million years ago and lived to an age of three to six years. The child's brain capacity was 25 cubic inches (410 cc), a figure that probably would have expanded to 26 cubic inches (440 cc) had the child lived to maturity.

During the 1960s, archaeologists recovered another branch of the Hominidae family at OLDUVAI GORGE and Lake Turkana. Classified as HOMO HABILIS (meaning "handy"), HOMO ERECTUS (meaning "upright"), and HOMO SAPIENS (meaning "wise"), these species are the closest to modern humans, with brain capacities measuring up to 78 cubic inches (1,280 cc). The reconstructions of recovered remains in Africa indicate a broad similarity to human features and a range of body size from slender to robust.

See also: HUMAN ORIGINS (Vol. I).

aware Traditional game played in many regions of Africa; also known as *awele* and *oware*. *Aware* is considered one of the oldest games in the world, having its origins in ancient EGYPT, where it was reportedly used as an early bookkeeping method.

Aware may have been symbolic of early AGRICULTURE and CATTLE raising, since terms such as "seeds and land" and "cattle and fields" became synonymous with a player's side of the board and the small objects used to navigate it. The widespread variations of the game within Africa attest to its longevity and popularity. It is called *ayo* among the YORUBA, *giuthi* by the KIKUYU of KENYA, and *adi* in southern GHANA. In UGANDA it is known as *omweso*, while the IGBO call it *azig*. Among Arabs, it was known as *mancala,* which reportedly meant "to move" or "to transfer." Stone boards have been identified at ancient temples at Thebes, KARNAK, and LUXOR. Ancient forms of the game board have also been found embedded in stone ruins in ZIMBABWE, as well as in the megaliths of ETHIOPIA.

The game's popularity within the royal courts was captured in many works of sculptured art, and elegant game boards were carved from ivory and GOLD. Yet much has been written about the game's simplicity and spontaneity, since *aware* could be played on the ground or any other flat service on which two parallel rows of six holes or cups could be arranged. Three-row versions were played in ETHIOPIA, and four-row versions have been noted in the Swahili regions of East Africa. The number of holes varied as well, ranging from six to 50. In a two-row game, 48 seeds would be divided between two players. A four-row game would require the use of 64 seeds divided between two players.

Moving counterclockwise around the entire board, each player tried to capture the majority of his or her opponent's seeds. On the surface, *aware*'s rules appear simple, but for new generations of players its many variations and complexities have been compared to chess.

Ay (c. 1352–c. 1348 BCE) *King of Egypt's Eighteenth Dynasty who became pharaoh after the death of Tutankhamun*

A prominent court official at the royal city of AKHETATEN, Ay came to the throne at an advanced age and ruled only four years. His brief reign was devoted to restoring the traditional Egyptian religion that AKHENATEN (r. c. 1379–c. 1364 BCE) had attempted to overturn. Some scholars suggest that Ay married Ankhesenamun, the widow of Tutankhamun (r. c. 1361–c. 1352 BCE), in order to become pharaoh. Ankhesenamun, however, seems to have disappeared from sight soon after the death of Tutankhamun, and it is a queen named Tiy who is depicted at Ay's side in all the decorations of the period. To further deepen the mystery, a wall painting in Tutankhamun's tomb shows Ay presiding at the dead pharaoh's funeral rites, a duty he would perform only if he already were an heir to the throne.

B

ba In ancient Egyptian RELIGION, the part of the spirit of the deceased that could leave the tomb and travel the earth during the day. Not simply a composite of a person's body and soul, the *ba* represented all the attributes of a deceased individual. According to traditional Egyptian religion, the *ba* came into being at the moment of death and needed a mummy or a tomb statue in which to exist. The latter, generally made of wood, was believed to become magically alive in the tomb of the deceased.

The *ba* was often represented as either a falcon or a bird with a human head. The closest translation of the word *ba* is "animated manifestation," the part of the spirit of the deceased that had the power to leave the body, change its shape, and journey back to earth. At night, however, the *ba* had to return to the body of the deceased.

Many Egyptians considered animals to be the *bau* (plural of *ba*) of deities. There also were *bau* that were thought to represent the various powers of kings and queens. *Bau* often were painted on coffins or sarcophagi. They also were seen in reliefs and architectural features.

See also: *KA* (Vol. I).

baboons Baboons live mostly on the plains and rocky savannas south of the SAHARA DESERT. Male baboons, which can weigh up to 90 pounds (40.9 kg) and stand up to 4 feet (1.2 m) tall, are usually much larger than females, which often weigh as little as 30 pounds (13.6 kg). Both males and females, however, have coats of harsh fur of varying colors and long, curving tails. Adult males often have capes of long hair over their shoulders.

Baboons are considered highly intelligent and sociable animals. Living in structured societies known as troops and led by a dominant male, they communicate by doglike barks and by changing their posture and the shape of their tails. They generally live between 30 and 40 years on a diet consisting of plants, insects, bird eggs, and small mammals.

In ancient EGYPT one type of baboon, the Hamadryas, was trained to perform many household tasks. Considered sacred, the mummified remains of Hamadryas baboons have been found in tombs, and their images frequently adorned both temples and tombs. The Hamadryas were thought to be representatives of THOTH, the god of writing, who, according to the ancient Egyptians, recorded the verdicts of the dead at the last judgment.

Badarian Predynastic Egyptian culture that flourished about 4500 BCE. The earliest prehistoric culture of UPPER EGYPT, Badarian culture represents the height of achievement of the African Chalcolithic (or primitive predynastic) period. It was named for al-Badari, the site at which, in 1925, British archaeologists first excavated evidence of this ancient culture.

Apparently a sparsely populated agrarian community, the Badarians grew wheat and barley and herded CATTLE, sheep, and GOATS. The Badarians distinguished themselves through their finely made black-topped POTTERY, which included both pots and vases. These featured thin walls and ripples, both of which are signs of a level of artistic skill rarely found in so-called primitive cultures. Painted and decorated, Badarian pottery employed a variety of polished finishes.

Unlike many other early cultures, the Badarians, while still focusing on the functionality of objects, apparently

developed an aesthetic of beauty. Jewelry has been found—shells, stone and COPPER beads, and bracelets—that dates back to this period both in Badarian regions and in EGYPT. In addition the Badarians manufactured and utilized cosmetics, fashioning them by grinding down metal and mineral ores.

The Badarians used flint tools such as stone axes, sickle blades, saw-edged knives, and arrowheads. They wore clothing of linen as well as leather. Statuettes indicate that they probably worshiped a fertility goddess or earth mother as their main deity.

The Badarians buried their dead, along with food and goods for the AFTERLIFE, in shallow oval pits. Bodies were usually laid on the left side, as if sleeping, with the head to the south and the face pointed toward the west. Women had the largest graves.

Bahriya Oasis One of approximately five oases situated at the edge of Egypt's Western Desert near LIBYA. Ancient trade caravans relied heavily on the numerous tree-lined oases in Africa's northern desert regions. Sometimes known as *foggara,* the wells of these oases tapped into underground rivers, which may have originated as far away as the ATLAS MOUNTAINS. Some of these oases, including Bahriya, Farafra, Dakhla, and el-Kharga, may also have supported small permanent settlements. A fifth such OASIS, Dunqul, was located near ELEPHANTINE in UPPER EGYPT.

See also: DAKHLA OASIS (Vol. I); KHARGA OASIS (Vol. I).

Ballana culture See NUBIAN X-GROUP.

Bamana (Bambara) MANDE-related language spoken by a group, also called Bamana, that lived in the grasslands near the upper NIGER RIVER. After the arrival of Islam in the region about the 13th century, the Bamana were also known as Bambara, meaning "unbelievers." Bamana speakers were identified primarily as Mande until the early 17th century.

The origin of the Bamana speakers is uncertain, but it is widely believed that their ancestors migrated into the area from the SAHARA DESERT, bringing with them the agricultural skills and tools that they had used there when that region could still sustain crops. Rice, as well as several varieties of MILLET, seem to have been their main crops. Although both iron and COPPER are believed to have been known in nearby regions around c. 500 to c. 1000 BCE, the extent of the metalworking knowledge of the ancestors of the Bamana is not known.

See also: BAMBARA (Vols. II, III).

bands and segmentary societies Two contrasting groups that can trace family lines to a common ancestor. Anthropologists usually refer to bands as stateless societies without rulers because bands often consisted of small groups of people who lived in camps. Traditionally these groups had few institutions and based their economy on an equal exchange of goods. Typical of these among the ancient peoples of Africa were the !KUNG of SOUTH AFRICA, whose members were dependent on each other to hunt and forage for FOOD.

Sometimes groups formed larger family clans when they united in times of war, epidemics, or starvation. Among the Ngombe peoples, who occupied the forests of the northwest Congo region, any size group that claimed descent from the same ancestor was known as a *libota.* Through polygamous marriages involving several wives and numerous children, some *libotas* may have had as many as 5,000 descendants, all of whom traced their family line to Gonji, the oldest man of the oldest generation.

When family members decided to break away from the larger group, a segmentary process occurred as they migrated to other regions of the same territory. The Tiv of NIGERIA were typical of this process and were organized into many small segmentary groups. Under the segment system, such groups received protection from larger groups that established institutions to settle disputes and administer justice. Some groups imposed fines, imprisoned individuals, or banished them in order to restore order, but disputes among the Tiv were settled by a singing duel.

In present-day Africa the system of segmented societies has been greatly affected by modernization, but members of the same band often live near each other and follow ancient customs, even in urban areas.

Further reading: William R. Bascomb & Melville J. Herskovits, *Continuity and Change in African Cultures* (Chicago: The University of Chicago Press, 1975); Daniel G. Bates, *Cultural Anthropology* (New York: Simon & Schuster, 1996).

Bantu expansion Process through which people speaking the BANTU LANGUAGES spread throughout the southern half of the African continent. The expansion was carried out over a couple of millennia, with Bantu speakers eventually making up the vast majority of the population in the region.

The Bantu languages originated with an ancestral Proto-Bantu language that was spoken in the BENUE RIVER region of the western Cameroonian grasslands and neighboring eastern NIGERIA. The nature and the timing of the Bantu expansion is a matter of scholarly debate, but it was clearly linked to the development of AGRICULTURE in the Benue region, perhaps as early as 3000 BCE. The in-

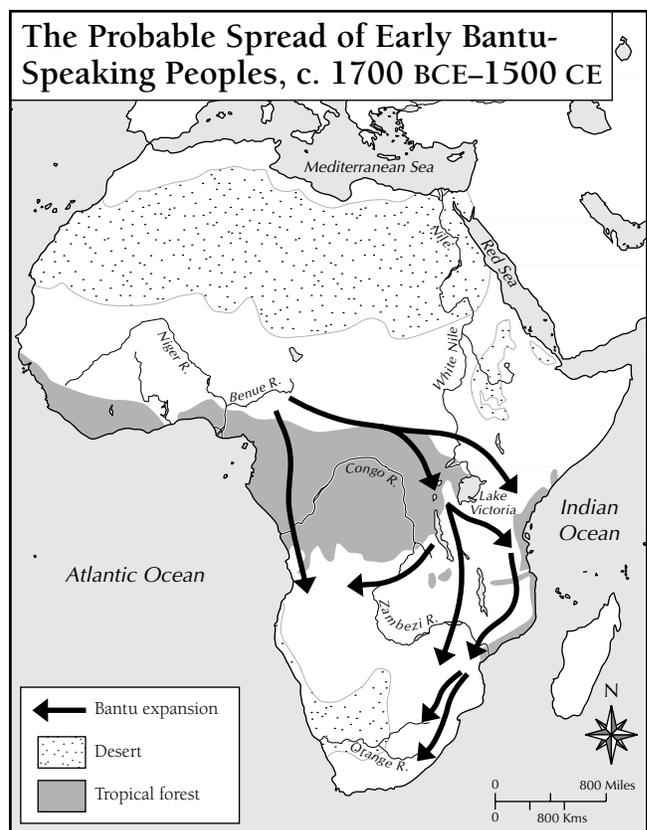
habitants began farming both cereal and root crops and raising livestock. Access to agriculture provided the Proto-Bantu with a technological and economic base that was superior to that of the largely nomadic groups of HUNTER-GATHERERS, who at this time inhabited the vast regions of southern, Central, and East Africa into which the Bantu-speaking peoples expanded.

The probable cause for the expansion was an increasing population that required more land for FOOD production. Because hunter-gatherer populations were not as densely settled, Bantu-speaking farmers were able to establish themselves on fertile areas in their midst. These new settlers did not pose a challenge to the established patterns of life because their villages and fields did not at first take up much land. In time, however, the villages became cultural and economic centers, attracting indigenous peoples from the surrounding regions. While there certainly was conflict over land and resources, the more common state of affairs was coexistence and gradual assimilation. The archaeological site at Kalambo Falls, near the southern end of Lake TANGANYIKA, provides evidence of such coexistence. Bantu-speaking farmers established themselves in the region as early as the fourth century CE, but the older STONE AGE way of life continued alongside the agriculturalists for many centuries.

One plausible explanation of the timing and direction of the Bantu expansion is that the first phase was made up of a gradual eastward movement from the Proto-Bantu core area in CAMEROON toward the Great Lakes region of western UGANDA. Taking place mainly to the north of the rain forests and along the UBANGI RIVER watershed, this phase began in the latter part of the second millennium BCE. As the Proto-Bantu speakers spread out, the original language began to diverge. A North Bantu branch of the language emerged that included both a Proto-West Bantu and a Proto-East Bantu. Beginning about 1000 BCE these two languages then began to expand from their core regions.

The West Bantu speakers expanded south into the rain forests of the CONGO BASIN and then into the southern savanna. Soon they moved still farther south into the drier woodlands of what is now southern ANGOLA and ultimately into the arid regions of today's northern NAMIBIA. Much of the initial movement occurred along the rivers of the Congo basin, which allowed for movement through a region whose heavy RAIN FOREST made it inhospitable for farmers and herders. The Proto-East Bantu expansion moved into the forest and savanna border regions of the upper CONGO RIVER and upper ZAMBEZI RIVER and then into East Africa and southeastern Africa. This process was far advanced by the early first millennium BCE.

In the East African savannas and uplands, the Bantu agriculturalists encountered Cushitic and Nilo-Saharan

The Probable Spread of Early Bantu-Speaking Peoples, c. 1700 BCE–1500 CE


peoples who farmed grains and raised CATTLE. Duting this time the Bantu learned the technology of iron smelting. The earliest evidence of iron smelting in East Africa dates from about 800 BCE in the western Great Lakes region. It seems that the Bantu speakers rapidly embraced this new technology, not only because it provided for superior weaponry but, more importantly, it allowed them to make superior agricultural implements such as hoes and scythes. Archaeological evidence points to a rapid expansion throughout central, eastern, and southern Africa by grain farmers who also herded cattle and utilized iron tools. This expansion took place from the second century BCE to the sixth century CE. Some non-Bantu peoples, such as the Khoikhoi of southern Africa, also adopted cattle herding but remained distinct from the Bantu peoples who had migrated into the region.

The expansion of the Bantu speakers came to a halt after they populated the areas that were suitable for rain-fed agriculture and had obtained sufficient grazing lands for their herds. Thus they did not expand into the more arid regions of southern Africa such as the Karoo and the Namib Desert. They reached the natural limits of their expansion by about 1500 CE.

Bantu languages   Strictly speaking, Bantu is a term of linguistic classification, although it is also used to refer to those who speak one or another of the approximately 500 closely related Bantu languages. The term Bantu means "people," with its root, *ntu*, meaning "human being" and its prefix, *ba-*, indicating the plural form. It describes the large number of languages belonging to the Benue-Congo branch of the family of NIGER-CONGO LANGUAGES. These languages share much in the way of a common vocabulary, especially for basic terms such as numbers, colors, and so forth. Like other languages in the Niger-Congo family, Bantu languages employ different vocal tones to indicate different meanings. In addition, such southern Bantu languages as Sotho, Xhosa, and Zulu have incorporated some of the unique click sounds that characterize the KHOISAN LANGUAGES of southern Africa.

Just as most Indo-European languages classify nouns according to gender, Bantu languages place every noun in a particular class. These are marked by prefixes (e.g., the *ba-* in Bantu) and sometimes suffixes. The noun class determines the prefixes that link subject, verb, and object in a sentence. Verbs in the Bantu languages are made up of the root, or stem, which indicates meaning. As with the nouns, prefixes and suffixes are then added to this stem to indicate tense, voice, mood, negation, person, and number.

Today the Bantu languages are the dominant languages of the southern half of Africa from southern CAMEROON in the west to KENYA in the east. They are spoken in 27 African countries. All of the present Bantu languages stem from a single ancestral language: Proto-Bantu. This ancestral language was part of a cluster of several languages spoken in the BENUE RIVER region of the western Cameroonian grasslands and neighboring eastern NIGERIA. This was a region where the population began to practice AGRICULTURE, perhaps as early as 3000 BCE. They began by farming both cereal and root crops and raising livestock. Words related to these crops and DOMESTICATED ANIMALS, such as GOATS, have been passed along from Proto-Bantu into the subsequent Bantu languages. Access to agriculture provided the Proto-Bantu speakers with a technological and economic base that was superior to that of the largely nomadic groups of HUNTER-GATHERERS inhabiting the vast regions of central, eastern, and southern Africa into which the Bantu-speaking peoples were expanding.

The spread of people speaking one of the Bantu languages was part of the historical process of BANTU EXPANSION. Although the nature and timing of the Bantu expansion is a matter of scholarly debate, it led to several branches of the Bantu languages. The initial branch was North Bantu, which was spoken in the area stretching eastward from Cameroon to western UGANDA and which was limited mainly to areas north of the rain forests and along the UBANGI RIVER watershed. The North Bantu branch gave rise to both the West and East Bantu branches, for it contained the proto languages of both groupings. The West

Bantu languages are spoken extensively in the CONGO BASIN, while those of the East Bantu branch are found throughout eastern and southeastern Africa. Yet another branch, Central Bantu, is the result of a later fusion. Speakers of the Central Bantu languages reside in the southern savanna and arid woodlands of ANGOLA and ZAMBIA.

The best known of the modern Bantu languages is Kiswahili, which in addition to being the mother tongue of some 5 million people of the Swahili Coast is a lingua franca for another 30 million people living in East Africa. Another important Bantu lingua franca is Lingala, which is used by some 7 million people living mostly in the Democratic Republic of the CONGO. Other Bantu languages with more than 5 million speakers include Rundi in BURUNDI, Rwanda in neighboring RWANDA, KIKUYU in Kenya, Xhosa and Zulu in SOUTH AFRICA, Shona in ZIMBABWE, Mbundu in Angola, and Luba in the Congo area.

baobab tree   One of the world's oldest and largest trees, indigenous to Africa, India, and Australia; also known as the *kuka*. Although there are different types of baobabs, those found in the dry savanna regions of Africa are scientifically classified as *Adansonia digitata*. Because its leaves only bloom for a brief period during the year, some view the baobab as an enormous upside-down bottle whose branches resemble twisted roots.

Ethnic groups in regions where the trees grow, such as Republic of the SUDAN, KENYA, TANZANIA, NIGERIA, SENEGAL, the Limpopo Valley, and ZIMBABWE, have known for centuries that the baobab is a major sustainer of life. Some groups, in fact, refer to the baobab as "mother" because its pulp is used for healing a wide range of ailments. It has been used for treating scurvy, malaria, and rickets, as well as infections of the eye, skin, gums, and urinary tract. Beyond this, the baobab's bark has been used to make rope, fabric, and even FISHING nets. The leaves, when in bloom, have been used to flavor drinks and stews and to produce a fruit, about a foot in length, called "monkey bread."

Baobabs measuring more than 20 feet (6 m) wide are estimated to be about 1,000 years old. Generally the older the tree, the more water its hollow trunk and interior roots can reserve. This is particularly critical in the more arid regions where humans and animals such as elephants seek water during long droughts and have inadvertently destroyed the trees as a result.

In ancient times these baobab trunks served as burial tombs for kings, chieftains, or founding members of family clans. This tradition was strongest among the Wolof and Serer of Senegal and the Tonga people of Zimbabwe, who laid their dead to rest with jewelry and surrounded

Baobab trees line a road near present-day Morindava, Madagascar. *© Chris Heller/Corbis*

by other valuable items. These groups referred to the living tree as an "ancestor," paying homage through special rites and ceremonies.

Barbary Coast North African coastal region bordered by the SAHARA DESERT to the south, EGYPT to the east, the Atlantic Ocean on the west, and the Mediterranean to the north. The name *Barbary* comes from the Latin word *barbari*, "barbarians," the term given to the people who lived on the periphery of the Roman Empire. Those people, who came to be known as the BERBERS, were the region's original inhabitants.

basket making Ancient craft in which grasses or other natural fibers are woven, braided, coiled, or sewn into practical and decorative objects. Baskets have played an important role for much of Africa's history and are generally associated with FOOD production. Evidence of the earliest forms of basketry date back to the Neolithic Period (c. 5200 BCE) when inhabitants of the Faiyum of EGYPT, an area between the NILE VALLEY and the Gebel el-Qatrani escarpment, produced reed baskets to store cultivated grains. When made as an open-type netting or box-like trap, baskets were also used by these people to catch fish. Archaeologists have also recovered a number of basket granaries lined with straw matting. Attached to homes or hung from trees, these basket granaries indicate how these people stored their food in the semi-arid environment that existed at that time. This basket-making tradition remained prevalent among later populations, including TUAREGS and the HAUSA, who lived along the ancient trade routes of the SAHARA DESERT.

Along with environmental factors, societal traditions often determined the need for particular types of baskets. Although basket weaving is traditionally the work of women and their daughters, in slack periods men and boys also participated in basketry. Baskets functioned as bowls, grain and flour sifters, and seating mats, and some baskets were so tightly woven that they could hold milk or other liquids. Basketry techniques were also used to make MASKS, masquerade costumes, and musical instruments.

The uses and variations involved in basket making were largely based on the availability of natural fibers in a particular region. Unique patterns were created by alternating complementary colors. These were achieved by means of dyes or by using contrasting natural fibers, such as long grasses, straw, willow reeds, rush, rattan, raffia bamboo, or palm leaves. These natural fibers were some-

times dried or soaked for pliability. Animal hides, COWRIE SHELLS, and other decorative items were also at times sewn to finished baskets.

Batn el-Hajjar   Barren rocky area between the second and third cataracts of the NILE RIVER; also known as the "Belly of Stones." The Batn el-Hajjar's narrow gorges are flanked by rocky terrain. During ancient Egypt's MIDDLE KINGDOM (C. 2040–c. 1668), the country's southernmost border, which divided EGYPT from NUBIA, was located just south of the Batn el-Hajjar. By the start of the NEW KINGDOM (c. 1570–c. 1070 BCE), Egypt's border extended as far as the fourth cataract of the Nile.

beads   Worn for social status, ritual purpose, or personal adornment, beads were integral in the traditional African culture and ECONOMY. Archaeological evidence has confirmed the use of beads dating back to the prehistoric period. The wearing of waist beads, a common form of BODY ADORNMENT for both men and women, is an ancient practice in Africa, and it generally has represented a sign of ethnic affiliation and social status. Waist beads also were seen as a distinctive sign of beauty. Ancient waist beads were probably made of such natural objects as feathers, flowers, or stones. Later, beads that had been obtained by either trade or early forms of a craft industry were used.

Some of the earliest examples of waist beads have been found within BADARIAN CULTURE of southern EGYPT (c. 5000–c. 3800 BCE), where men apparently were the primary wearers of beaded girdles. Excavations have led to the recovery of the remains of at least one individual wearing strands of beads around his waist, some of which were made of steatite, a precious stone. These stones were also glazed with malachite, a green carbonate mineral.

Although it is not certain whether women wore waist beads in the Badarian period, by ancient Egypt's MIDDLE KINGDOM (c. 2040–c. 1668 BCE), Egyptian women were wearing waist beads as a status symbol. Archaeological excavations have recovered a beaded girdle worn by Princess Set-Hathor, the daughter of the pharaoh Sesostris II (r. c. 1950–c. 1920 BCE). The princess's girdle was made of GOLD, lapis lazuli, and green feldspar and was also decorated with COWRIE SHELLS. The addition of cowrie shells on the beaded strand apparently represented a safeguard against the evil eye. Elsewhere, in a tradition that continued up until modern times, waist beads often were used to signal the marital status of women.

Beads were also worn in Maadi, near el-Omari in southern Egypt, where carnelian beads, perhaps dating from 4000 BCE, were recovered from storage pits originally thought to hold grain. Elsewhere in ancient Africa, 2,000- to 3,500-year-old rock drawings of the SAN people, in what is now BOTSWANA and the KALAHARI DESERT, rou-

tinely depicted people wearing beaded jewelry that archaeologists believe was made of eggshells of OSTRICHES. Eggshell beads worn as flattened disks have also been documented among the Turkana of northern KENYA. In other societies plant seeds, straw, reed fibers, seashells, fossilized bone, and animal horns were used as well.

To make such beads, a sharpened tool probably would have been positioned over the bead and either hammered or worked until each side was pierced. Some powdery substance, possibly chalk, was probably added to make the bead easier to string. Fibers used for the strings probably included palm leaves, sisal, and vines. The rough grainy surface of other rocks was used for polishing the finished bead, which ultimately might be round, flat, square, hexagonal, or even barrel shaped.

The analysis of some beads recovered from ancient Egypt's Predynastic Period, circa 4000 BCE, indicates that they were made of steatite, also called soapstone, which was considered a precious stone. A glaze was used to give beads a glass-like appearance. By the Fifth Dynasty (c. 1465–c. 2350 BCE), early forms of glass beads were being made. Blue faience, green feldspar, lapis lazuli, carnelian, turquoise, hematite, and amethyst also came into popular use in Egypt, undoubtedly carried by merchants associated with the Mediterranean and RED SEA trade.

In later eras these beads spread from Egypt to regions south of the SAHARA DESERT, probably carried by Arab merchants along camel routes to IVORY COAST, GHANA, and NIGERIA. Various populations along the East African coast wore carnelian beads, which possibly reflects early trade in that region. In fact, beads represented an important form of currency in early regional economies. The monetary value assigned to a specific number of beads on a string might have an equivalent value to locally made items or food and in many cases served as an important form of BRIDE-WEALTH.

The origins of certain types of beads have yet to be identified. In West Africa, two types of Akori beads are among the oldest recovered in the region. The oldest type dates back to 439 CE. Other beads in the region include the Aggri. Made of glass or porcelain material, Aggri beads have generally been found embedded in the earth and may have been associated with important rituals.

From the earliest times, beaded MASKS, crowns, and other royal objects have been associated with reigning kings in GHANA, MALI, CAMEROON, KwaZulu-Natal, and Nigeria. In AKAN society, kings and priests traditionally have worn special bead bracelets to convey their royal status. However, beads may have held a particular appeal for women since they offered a creative outlet and an important source of income. Among the Ndebele of SOUTH AFRICA, for example, beads were used to announce an impending engagement. Elsewhere, Pokomo and Akamba women have long performed certain important ceremonies wearing beaded "dance necklaces" or collars. The

best-known of this form of beadwork has traditionally been worn by MAASAI women.

Along with traditional uses, beads transmit the history and culture of a particular region, creating an outward expression of unity between generations. In South Africa, the Xhosa use ornate beadwork to designate various AGE SETS. Unique designs serve as symbolic code words relating to history, proverbs, and sometimes poetry. Similarly, countless generations of Zulu women have used beads as a form of education, transmitting social ideals to young girls in vibrant patterns that accent clothing, bags, and accessories.

As Africa's economy continued to evolve, beads and the way they were worn became more ornate, eventually coming to include a greater variety of glass, coral, bronze, ivory, amber, and silver.

bees Bees have been domesticated for thousands of years. The first mention of beekeeping in ancient Egypt occurs as early as 2400 BCE. The ancient Egyptians made good use of bee products: They used honey as a food sweetener and as a cosmetic for softening the skin and treating open wounds. Bee venom was sometimes used as MEDICINE. Beeswax was used to prepare mummies and build ships, and it was combined with pulverized stone to make glue. Egyptians traded honey with other countries and wore JEWELRY decorated in the shape of bees.

Ancient Egyptian marriage contracts required husbands to provide wives with honey throughout the marriage.

Behdet (Edfu) Ancient city of UPPER EGYPT, also known as Edfu, whose patron god was HORUS. With increasing governing instability during the First Intermediate Period (c. 2213–c. 2040 BCE), Upper Egypt and LOWER EGYPT divided into warring kingdoms. The inhabitants of Lower Egypt worshiped SETH of Ombos, while those of Upper Egypt recognized the reigning god as Horus of Behdet. After Egypt's reunification during the MIDDLE KINGDOM (c. 2040 BCE–c. 1820 BCE), Horus became the national god of the Egyptian state. Subsequently reigning kings were known as "the living Horus." Behdet was also the site of a metal foundry, where blacksmiths, known as *mesnitu,* created religious icons using a forge located within the city's great temple.

Dover Publications, 1969); Barbara Watterson, *The Egyptians* (Oxford, U.K.: Blackwell Publishers, 1998).

Beja Ethiopian Cushitic-speakers, also known as Hedareb NOMADS, who share an ethnic and linguistic affiliation with a number of groups that inhabit the RED SEA hills along the border between present-day Republic of the SUDAN and ETHIOPIA. Speakers of one of the oldest dialects in Ethiopia, also called Beja, the Beja people tend to be scattered, undoubtedly the result of their traditional way of life as nomadic pastoralists. A patrilineal society composed of a number of small, related clans, the Beja were loosely organized under a chieftan's rule. The Beja contributed to the decline of MEROË by raiding caravans and crippling trade. The Aksumite king Ezana described them as constantly engaging in warfare with their regional neighbors.

Benin, Republic of Country in coastal West Africa measuring approximately 43,500 square miles (112,700 sq km) that shares borders with NIGER and BURKINA FASO to the north, TOGO to the east, the Atlantic Ocean to the south, and NIGERIA to the west. By about 4000 BCE Benin's population was fully engaged in AGRICULTURE. Those living in the drier northern regions grew grain crops such as MILLET and SORGHUM and had DOMESTICATED ANIMALS such as GOATS and CATTLE. Neither the crops nor the livestock were suitable for the tropical RAIN FOREST zone of southern Benin. There, in common with others in the broader West African tropical forests, they developed a planting agriculture, sometimes termed "vegeculture," with YAMS as the major crop. The oil palm, which provided both cooking oil and palm wine, and the raffia palm, which provided the fiber for weaving raffia cloth, were important tree crops in the south. FISHING, hunting, and gathering wild foods were important as well.

The early agricultural developments led to a growing population. Commercial development began to take place over the first millennium BCE, especially with the trading of iron products from those regions that did and didn't have workable iron ore deposits. This trade tended to be at the local level, though in northern Benin the population became linked to the growing commercial network of the savanna and desert.

Benue-Congo Branch of the Niger-Congo language family. Benue-Congo languages are spoken from the

Cape of Good Hope northward to NIGERIA and include the BANTU LANGUAGES.

See also: LANGUAGE FAMILIES (Vol. I).

Benue River West African river that is the longest tributary of the NIGER RIVER. Flowing for approximately 673 miles (1,083 km), the Benue is an important water highway for the transportation of COTTON, groundnuts (peanuts), and other trade goods. Originating in northern CAMEROON, it flows through falls and rapids across central NIGERIA. Along its course, the Benue River marks the border of Cameroon and the Nigerian state of Benue. It varies in width from 1,600 to 3,200 feet (488 to 976 m) and is joined by the Mayo-Kebbi tributary and the Gongola River before converging with the Niger about 30 miles (48 km) from the Nigerian coast.

Berbers Pre-Arab peoples of North Africa, including the well-known TUAREGS, who for thousands of years have inhabited the areas from the coast of MOROCCO to the Siwa Oasis in EGYPT and from the Mediterranean to the SAHARA DESERT. Their language constitutes one of the five branches of the AFRO-ASIATIC LANGUAGES.

Based on archaeological findings, the Berbers are known to have occupied parts of Morocco as early as 1600 BCE. Their history goes well beyond this, however, and although the exact origin of the Berbers is unknown, historical evidence dates them to at least 3000 BCE. Indeed, most scholars consider them to be the original population of North Africa. Over the centuries, however, the Berbers have mixed with so many ethnic groups that they have lost much of their independent racial identity.

Throughout time two primary groups of Berbers inhabited the lands of North Africa. One group consisted of farmers and CATTLE raisers living in the northern plains and mountain regions. The second group was made up of of semi-pastoral nomadic peoples living in the deserts and pasturelands.

The livestock and agricultural products of the Berbers have played an integral role. In the 12th century BCE, the PHOENICIANS established a large trading empire on the North African coast. Phoenicians relied on the Berbers to supply them with crucial foodstuffs for their settlements and for export. Not only were the Berbers exposed to the manufactured goods of the Mediterranean world, but they also fell under the influence of the Semitic culture of the Phoenicians. This helped pave the way to the Berbers' later acceptance of the three major monotheistic religions: JUDAISM, CHRISTIANITY, and Islam.

Ancient Berber society was essentially feudal in structure, with distinct classes that included nobles (primarily NOMADS and pastoralists), the clergy (called *inislemen*), vassals, artisans (*inadan*), and laborers (called *iklan*). Berber society also tended to maintain a social and class distinction between AGRICULTURE and trade, with farming falling to the lower classes and trade to the upper classes.

ROME overtook the Carthaginian empire in the second century BCE because Roman leaders wanted to control its wealth and trade. During this time, however, a wealthy and powerful Berber state existed in NUMIDIA. The Numidian Berbers possessed large numbers of CAMELS, an animal perfectly suited to the desert conditions. This provided them with great military strength and the ability to control trans-Saharan trade routes. The Romans viewed this Berber state as a threat and eventually conquered the Berbers, making Numidia a part of the Roman Empire. Rome continued to rule this area for more than 600 years, giving rise to a Romano-Berber population that still exists to this day.

Beta Israel (Falasha) Agriculturalists from the highlands north of Lake Tana and the outskirts of GONDAR, in ETHIOPIA. Also known as Falasha, they have maintained their faith in the Jewish RELIGION over several millennia; small numbers of Beta Israel live in Ethiopia to this day.

There are many conflicting stories concerning the origins of the Beta Israel (or "House of Israel"). One common story involves their descent from the noblemen who accompanied King MENELIK I from Jerusalem when he reportedly brought the ARK OF THE COVENANT to Ethiopia. Menelik, the supposed first king of the Solomonic Dynasty, is traditionally identified as the son of King Solomon and Queen MAKEDA (queen of Sheba). Another legend, however, identifies the Beta Israel as one of the lost tribes of Israel who established their kingdom in Ethiopia following the Hebrew exodus from EGYPT.

Whatever their origin, the roots of the Beta Israel stretch back well before the arrival of Semitic farmers from southern Arabia around 600 BCE. Many of their religious texts are ancient, attesting to the longevity of their faith. Beta Israel are strict observers of the Jewish Sabbath, and their holy book, translated into GE'EZ, is the cornerstone of their religion. Traditional priests, or *kohanim,* are elected by the Beta Israel to serve as spiritual leaders of the community. Outsiders have commented that their ceremonies reflect a fusion of traditional African practices, along with rites of the Christian faith; yet observance of the Jewish calendar's holy days and festivals, rites of purity, consumption of ritually slaughtered animals, and male circumcision are also strictly observed.

JUDAISM apparently was widespread in the region of Ethiopia before the adoption of CHRISTIANITY by the Aksumite king Ezana, during the fourth century. At that

time, those who refused to convert were persecuted and forced to live in the mountainous highlands. Subsequently, as outsiders within a predominantly Christian society, the Beta Israel lived as a segregated caste, surviving by weaving, making POTTERY, and working as BLACKSMITHS or goldsmiths. Although the region's ruling elite held these crafts in low regard, this expertise allowed the Beta Israel to maintain a sense of independence and identity. They were able to form their own social guidelines, elect leaders, and retain their religion and culture.

Further reading: Miguel F. Brooks, *Kebra Nagast (The Glory of Kings): The True Ark of the Covenant* (Lawrenceville, N.J.: Red Sea Press, 1998); Donald N. Levine, *Wax and Gold: Tradition and Innovation in Ethiopian Culture* (Chicago: University of Chicago, 1965).

Betsileo   A Malagasy people who make up the second largest ETHNIC GROUP in MADAGASCAR. The Betsileo are a mix of Bantu-speaking and Bayo-Indonesian peoples who settled on the island during the first millennium. They practice a form of ANCESTOR WORSHIP influenced by traditional Christian beliefs.

blacksmiths   Since ancient times the blacksmith has held a revered position in some African societies. Indeed, it is widely believed that there were two types of kings found in ancient Africa. One was a warrior who ruled over a closed, stratified society, and the other was an artisan who reigned over a hard-working, open society.

Early societies in the SAHEL were nearly evenly divided between pro- and anti-blacksmith stratification. Although EGYPT was a caste-based society, the people of Ta-Seti, who according to legend invaded EGYPT and began the dynastic period, were known as *mesniu* (blacksmiths) and supposedly did metal work with COPPER.

Egyptian legend has it that these people, who were identified with UPPER EGYPT, were followers of the god HORUS, while those in southern Egypt were followers of the god SETH. According to Egyptian mythology, after Horus killed Seth, the blacksmiths settled on land given to them by Horus. This land was located on both sides of the NILE RIVER, in what is called Middle Egypt. However, in one of several battles between the North and South that took place at Anu, the South was victorious.

The status of the blacksmith in African society has always been steeped in mystery, spirituality, admiration, and awe. The blacksmith is glorified and shunned, admired and despised. In many areas he is believed to have magical powers and, as a result, is afforded special privileges and bounded by special social mores. Some are humble and tactful; others are bold and arrogant.

In most African societies, because the blacksmith is considered a craftsperson, and therefore a person of respect, the products of blacksmiths are believed to have particular value; they are even said to have important powers. For this reason works created by blacksmiths—which may be made of terra-cotta, stone, or wood as well as metal—are used to adorn and declare social status. These objects also may help establish the presence of a spirit, since a well-crafted object is believed by many peoples to be able to call forth both divine and human spirits. For this reason, these crafted objects are important in nearly every aspect of African culture.

Among many groups RITES OF PASSAGE are a significant focus of ART objects. Beyond the rituals associated with such familiar passages as birth, puberty, marriage, and death, many groups hold special induction ceremonies for healers, diviners, blacksmiths, and other skilled craftspeople; in some societies, the blacksmith performs some or all of these functions.

Blue Nile   River located in northwest ETHIOPIA, approximately 850 miles (1,360 km) long. In ancient times the Blue Nile sustained agricultural crops such as COTTON, wheat, SORGHUM, dates, sugar cane, and legumes. Its waters provided fish for inhabitants of the region and transported merchants to and from EGYPT.

From its source at Lake Tana in the ETHIOPIAN HIGHLANDS, the Blue Nile descends thousands of feet through a deep gorge. It then journeys south and west through present-day Republic of the SUDAN. At the Sudanese capital city of KHARTOUM the Blue and WHITE NILE meet above the Shabluka Gorge, forming the main stream of the NILE RIVER, the world's longest river. Two-thirds of the Nile's waters come from the Blue Nile.

boats   See GALLEY (Vol. I); SHIPBUILDING (Vol. I).

body adornment   Personal adornment in Africa has always conveyed multiple meanings. Societal values, for example, associated with status, marriage, or initiation were often communicated through specific items of adornment. Early evidence for this has been found in cave paintings of the Tassili Plateau in the SAHARA DESERT that date from c. 8000 to c. 6000 BCE. In one of several scenes, the painted figure archaeologists refer to as the Horned Goddess performs a ritual dance. She bears the ancient markings of SCARIFICATION along with an elaborate headdress. Her image may have been meant to convey her place in society or to impart the importance of fertility; it may also have held other meanings. Other prehistoric images of this nature have been found in SOUTH AFRICA, where women in vulture headdresses performed similar ritualized dances.

In Africa, hair, too, has always served as an important statement about the individual. The Tassilli cave provides one of the earliest images of the traditional hairstyle popularly known today as cornrows. In many parts of Africa, hair braiding evolved into what became an elaborate form of cultural identity that included family affiliations, lineage, and marital status. Married women in EGYPT, for example, reportedly wore shoulder-length hairstyles that appear to have been a series of twisted strands. By the time of the Eighteenth Dynasty in the NEW KINGDOM (c. 1550–c. 1070 BCE), wigs made of animal wool and plant fibers were far more popular, particularly among the upper classes.

Recovery and analysis of ancient makeup palettes indicate that body adornment was also associated with the need to protect and enhance the skin. Groups like the SAN used animal fats colored by plant dyes. The Kuba used a mixture of camwood and palm oil that was applied to the face and body. Palettes containing cosmetics also indicated that both men and women in the Sudan wore makeup or facial paint. These palettes, sometimes containing alabaster or slate, have been linked to the Tasian, BADARIAN, and NAQADAH I cultures that existed as long ago as 4000 BCE.

Another form of makeup began when Egyptians started to protect their eyes against the glare of the sun with powders made of pulverized lead, COPPER, antimony, or malachite. These powders were applied to the eye with wooden, stone, or metal sticks. Over time this form of application became highly stylized among women. Questions also have been raised about whether or not Egyptian women painted their lips. In answer, there are Egyptologists who point to the Egyptian word *seshet* as a word to describe a cosmetician, since it reportedly means "painter of her mouth."

Body adornment extended to the natural plant dyes and minerals used to create intricate patterns on the hands and feet. The application of henna leaf extract, widely used for this purpose, was practiced by women in Egypt, NUBIA, and ETHIOPIA. Like other forms of adornment, this practice may have spread through interaction associated with regional trade or migration. It has also been associated with the IGBO, whose patterns and methods were known as *uli*.

In Africa, men have always held strong ideals concerning adornment as well. The widely touted prenuptial contest associated with the Geerewol festival in NIGER, NIGERIA, and CAMEROON is a case in point. For many centuries, among the Fulani-related Wodaabe people, it has been traditional for the men who are eligible for marriage to enter a contest in which women judge them on the basis of their artful use of makeup.

Eligibility for marriage has also generated other forms of body adornment in Africa. In various regions, the traditional fatting houses or fattening ceremony was usually reserved for young women between the ages of 15 and 18 years old. The goal of this ceremony was to add sufficient body weight to achieve a desired image of a large-sized, ro-

bust woman. Seen as adding to a woman's poise, elegance, and attractiveness, this practice was associated with wealth. The process was known to take months or as much as a year to complete. Along with an amplified diet, during this time, young women were taught social etiquette and given instructions about the proper role of a wife.

Book of the Dead In ancient EGYPT, a series of funerary texts containing magical spells and prayers. The Book of the Dead was written on PAPYRUS scrolls and illustrated with colorful images. The texts that make up the Book of the Dead were intended as instruction manuals for the souls of the deceased, a way to help them overcome the obstacles they would encounter while passing through the underworld. The most important of these texts are the Book of Going Forth by Day, The Book of What Is in the Underworld, and The Book of Gates.

The images in the texts originated as decorations on the walls of tombs of Egyptian royalty and nobles in the OLD KINGDOM (c. 2705–c. 2213 BCE). Later, in the MIDDLE KINGDOM (c. 2040–c. 1668 BCE), they were used to decorate the coffins of commoners, nobles, and royals alike. The texts themselves were not written down on papyrus scrolls until the NEW KINGDOM (c. 1570–c. 1070 BCE). Although these scrolls were costly to produce, they became popular among those who could afford them and continued to be widely used until the end of pharaonic rule in Egypt.

The Book of Going Forth by Day was the text most frequently used by the ancient Egyptians. It is a loose collection of about 200 sections, or chapters, containing the magic spells and passwords to be recited by the deceased in the AFTERLIFE. According to Egyptian belief, these words would help ensure that the deceased would pass safely through the underworld to enjoy the blessings of paradise.

Another text, The Book of What Is in the Underworld, also known as Amduat, was first found on the walls of the tomb of the pharaoh THUTMOSE I (r. c. 1525–c. 1512 BCE). This collection of royal funerary texts was intended as a guidebook to the underworld. According to common Egyptian belief, the book would help the deceased successfully reach the appropriate destination in the afterlife.

The Book of Gates stands apart from the other funerary writings because of the emphasis it places on the importance of the sun god RA. In The Book of Gates, Ra is portrayed as the creator and preserver of life, as well as the one who resurrects the dead. The work contains spells

to make the sun rise and to show the paths the deceased must travel in their voyage in the boat of Ra.

Boran Oromo (Borana, Borena)

Sub-group of the OROMO nation. Described as pastoralists, the Boran have occupied northwest Borena and the southern region of ETHIOPIA for thousands of years. Considered the guardians of culture and tradition, their most important institution was the *gada* system, which has exerted a strong influence on its members and, like AGE GRADES, traditionally has been exclusively for men. This age system emphasized cultural identity, exerted societal control, and organized social, political, and religious activities.

Boran government was made up of the eldest men of the *gada* system. These men, known as *jarsa biyya*, presided over moral and customary law, ceremonies, and religious life. From 47 to 55 years of age, men were chosen to act as priests, or *quallu*. As such, they were authorized to represent Waqa, considered the creator of life. Through different activities Boran men gained critical insights into how their society functioned. This knowledge was reflected in their outward appearance, and especially in their wooden walking staffs.

From a very young age, Boran Oromo boys and men traditionally learned to carve staffs, or forked sticks, that signify work activities, entry into adolescence, and even marriage. Married Boran Oromo women carried a *siqqe,* a staff with a point that has three tiers.

Creating a wooden staff required a critical set of circumstances. For example, only specially designated trees could be cut, and only on certain days of the week. The wood of the *Haroreessa hiddo* tree was the first choice among carvers since its moist wood was considered a symbol of life. After being carved, the sticks were dyed and then oiled with butterfat to maintain the life force of the tree. Considered a living object, the wooden staff of a Boran man was broken and left on his grave when he died.

Border Cave

Multilevel cave situated in the region between KwaZulu-Natal in SOUTH AFRICA and SWAZILAND. Excavations at Border Cave have unearthed many significant findings from the STONE AGE period.

Using radiocarbon and other dating methods, archaeologists have been able to trace recovered skeletal remains to a period ranging from several thousand to millions of years. The recovered skull and mandible fragments found in Border Cave 1 and 2, for example, are between 100,000 and 150,000 years old, a period that corresponds to what is generally considered to be the Middle Stone Age in Africa. This, in turn, has helped archaeologists identify the remains as belonging to the species known as HOMO SAPIENS, which is generally considered the ancestor of modern human beings.

Additional excavations at Border Cave 3 have unearthed the skeletal remains of an infant as well as remnants of a shell that may have come from ostrich or emu eggs. The cave was also a source of hematite, which, according to some evidence, ancient populations mined more than 28,000 years ago. (Hematite is a mineral that ranges in color from black to red and represents the chemical component of iron ore.) It is possible that this hematite was used as either a paint for BODY ADORNMENT or to create cave ART. However, the presence of this material may also indicate the possibility that iron-making activities occurred in the region at a later date.

Botswana

Landlocked country measuring approximately 231,800 square miles (600,400 sq km) in southern Africa. It is bordered by present-day SOUTH AFRICA, ANGOLA, NAMIBIA, ZAMBIA, and ZIMBABWE. Nearly equal in size to the state of Texas in the United States, present-day Botswana is noted for its arid, subtropical temperatures and vast, sandy plains. One of its major rivers is the Okavango that feeds into a number of inland northern deltas. The Makgadikgadi Salt Pans support diverse wildlife species, including wildebeest, antelope, and zebra. In contrast to the KALAHARI DESERT, or "thirstlands," in the southwest, Botswana's eastern region consists of rocky hills and shallow sand.

Botswana may be one of the oldest regions of the world, with underlying bedrock estimated at 2.5 billion years old. Based on a number of archaeological studies, the region also appears to have been populated from an early period. Historians generally agree that Botswana was first occupied by SAN hunter-gatherers between 20,000 and 30,000 years ago, if not longer. They appear to have occupied the Kalahari as well as the northern deltas. Some sources indicate that the Khoikhoi (meaning "men of men"), PASTORALISTS who occupied various regions in South Africa, arrived slightly later and coexisted with the San in Botswana.

At the eastern site known as Depression Shelter in Tsodilo Hills, archaeologists have found evidence of con-

Rock paintings, some possibly 20,000 years old, created by the San peoples have been discovered in the Tsodilo Hills, Botswana. © *Galen Rowell/Corbis*

tinuous land use from 17,000 BCE to 1550 CE. It is believed that the highly fertile soil in this area supported large settlements of clay and thatch homes. These are believed to have been arranged in a circle around a central court or gathering place. However, it is not yet clear which of the groups occupied these settlements since the activities of San HUNTER-GATHERERS and Khoikhoi pastoralists were sometimes interchangeable, depending on the scarcity of FOOD resources.

It is generally believed that Bantu-speaking farmers migrated into Botswana approximately 1,500 to 2,000 years ago. Their methods of crop cultivation relied on a method known as swidden AGRICULTURE, which involves the cutting and burning of forestland to promote fertility. This method stood in contrast to the smaller environmental impact made by the San and Khoikhoi. The Bantu were also associated with iron-making in Botswana. Remnants of an iron-smelting furnace dating to at least 190 CE have been recovered at a site in TSWAPONG HILLS near Palapye. Its use undoubtedly placed further demands on natural resources for fuel.

The Tswapong Hills have been a particularly rich source of archaeological discoveries. Located in the eastern part of the country, near the city of Serowe, the hills contain numerous caves and gorges that have yielded some of the most extensive information about early Bantu-speaking peoples yet found in southern Africa. These peoples, who were the ancestors of the TSWANA, migrated into the region beginning about the first century CE and overcame the indigenous !KUNG, who had inhabited the region for up to 30,000 years before this.

The extraordinary number of rock paintings preserved in Botswana's arid environment has greatly expanded present-day knowledge of social exchange among these groups. Most of the paintings have been attributed to the San since they depict traditional healing rites, rain-making ceremonies, animal sacrifice, and a range of other activities associated with hunting and gathering culture. A number of archaeologists, however, admit that it is possible that others were responsible for making these paintings, since some images depict relationships between the San and the Khoikhoi. Other paintings show battles between the San and Bantu and are suggestive of group conflicts.

One painting, found in the area of Gaborone, modern Botswana's capital city, is an engraving that shows animal tracks and human feet. It is traditionally attributed to Matsieng, a creation myth figure who generally is considered to be an early Tswana ancestor.

According to some historians, the central issue of such conflict involved farms that had been established by Bantu speakers in the San or Khoikhoi settlements of Tsodilo Hills. Eventually the San and Khoikhoi were marginalized to outlying areas of Botswana, and the Bantu speakers, known today as Tswana, emerged as the region's dominant ETHNIC GROUP.

bride-wealth   Symbolic gifts in the form of money, goods, services, or livestock made by prospective grooms to the FAMILY of the bride. Often these contracts also represented a political alliance, a theme repeated in many other African societies in which marriages were arranged through a council of elders or reigning chiefs. Luxury items such as cloth, COPPER bracelets, BEADS, hoes, CATTLE, and various forms of livestock solidified the marriage, with the expense for these items borne by the entire family of the groom. This expense sometimes was so great that it was paid over several years.

In rural African societies, bride-wealth was shaped by different traditions and needs. In ancient times, communities such as the IGBO of southern NIGERIA and the NUBA of the present-day Republic of the SUDAN required that a groom spend months or even years cultivating land that belonged to the bride's family. In these regions the agricultural labor of a woman, as well as that of her future children, was associated with potential land ownership. As a result these societies required that a woman's birth family

be compensated for the loss of this labor. By the time of the IRON AGE, in regions that included present-day CENTRAL AFRICAN REPUBLIC, Republic of the CONGO, and CAMEROON, where YAMS, groundnuts (peanuts), and cassavas were widely cultivated, groups such as the Banda presented iron farming implements as bride-wealth. In contrast, the Serer of western SENEGAL placed a high value on livestock and used GOATS, CATTLE, and sheep as a bride-price. Cattle were used by Khoikhoi and TSWANA in the eastern region of BOTSWANA and in various regions of SOUTH AFRICA.

Bride-wealth is an ancient, widespread tradition practiced in city-states as well as in outlying rural societies of Africa. One of the earliest references to bride-wealth appears in Egyptian texts dating back to the seventh century BCE. Marriage contracts, known as *shep en sehemet,* detailed property and monetary items that listed the bride-wealth the groom presented to the father of the bride. Although restricted primarily to the upper class, such a list provides some idea of the potential value women held as future queens, priestesses, or landowners.

Overall the concept of bride-wealth allowed a man to obtain full conjugal benefits and full rights to any offspring produced within his marriage, along with an awareness of a woman's value to her family. It also served as a way to effectively control the number of wives a man might attain. Inversely, the custom served to discourage the likelihood of divorce, since custom demanded that, in the event of a divorce, the woman's family return the gifts that had come to them as bride-wealth.

Bronze Age Prehistoric period following the STONE AGE and preceding the IRON AGE during which weapons and other implements were crafted from bronze, an alloy made of COPPER and tin. Copper was the first metal that people used to their advantage in large quantities. Though scarcer than iron ore, copper ore can be found in places relatively easy to access. Furthermore, because it is soft and has a low melting temperature, copper is easy to work. As a result, to this day metal workers generally need only wooden mallets and other rudimentary implements in order to shape copper into JEWELRY and ornaments. However, this softness also limits copper's usefulness, making it relatively weak when used for weapons and tools.

Tin, however, also is abundant and, when added to copper, has a hardening effect. This led to the production of bronze, which was used in many of the great civilizations of the ancient world. While much is known about the use of bronze in EGYPT, the Middle East, and the Mediterranean, little is known about the extent of its use in sub-Saharan Africa. Evidence shows that bronze objects were used in NUBIA and in the southern region of present-day Republic of the SUDAN. In addition, tools, arrowheads, and other weapons—all made of bronze and dating to the fifth century BCE—have been found near Akjoujt, in MAURITANIA. The origin of the technology needed to make this metal is unknown, but archaeologists and historians have posed the theory that knowledge of the process came to other parts of Africa from CARTHAGE.

Iron has often been called the "king of metals," and it has traditionally brought increased military power and advanced AGRICULTURE, as well as domination of trade and control of rich natural resources, to societies with the technology to use it. If iron smelting developed as early as the Haya people appear to have accomplished it, then the need for a Bronze Age technology might have been bypassed. It is conceivable that, in most of western and southern Africa, many cultures went straight from the Stone Age to the Iron Age. This is further borne out by the fact that iron smelting was practiced as early as the first millennium BCE in most areas of the middle Senegal valley and the inner NIGER DELTA. As a result the need for bronze may primarily have been for the making of symbolic and ornamental objects. If this indeed was the case, then those people who already had iron technology had the riches to import any bronze items they wanted.

Burkina Faso Landlocked country in the West African interior measuring approximately 105,900 square miles (274,300 sq km). It is bounded to the north and east by MALI, to the south by IVORY COAST, GHANA, TOGO, and the Republic of BENIN, and to the west by NIGER. Burkina Faso lies within the West African savanna, sometimes referred to as the SAHEL, and is mostly plateau country with grasslands and scattered woodlands.

Burkina Faso's early population spoke NIGER-CONGO LANGUAGES. By the fourth millennium BCE, the region's people were growing grain crops such as MILLET and SORGHUM and had DOMESTICATED ANIMALS such as GOATS and CATTLE. The development of AGRICULTURE led to population growth and more complex social structures. In the north of the country, archaeologists have found some STONE AGE axes, which belonged to the Neolithic culture out of which the early farmers emerged.

A major technological advancement was the smelting and forging of iron, which took place in the first half of the first millennium BCE. The mining and working of COPPER was also important. The growing use of metals helped promote commerce because not all regions were equally fortunate in terms of the local availability of metals. Another item of commerce was the COTTON cloth that by 1000 BCE was produced in the sudanic belt. The growth of trade led to the specialization of labor for BLACKSMITHS, weavers, and traders.

Burundi   Landlocked country in eastern Central Africa covering approximately 10,700 square miles (27,700 sq km) and bordered by RWANDA, TANZANIA, and the Democratic Republic of the CONGO. Some scholars believe that Burundi's first inhabitants were the HUNTER-GATHERERS known as the Twa, a small-statured ETHNIC GROUP that apparently was present when the first Bantu-speaking people arrived. By the fifth century the HUTU, who were agriculturalists, began migrating into the area. This migration lasted until the 11th century, by which time the Hutu had come to dominate the Twa and other groups in the area.

Bushmen   Term sometimes used, especially in the past, to refer to the SAN people of the KALAHARI DESERT region. The term is believed to derive from the word *bosea* (small), which was used by the early Dutch settlers in SOUTH AFRICA. Though the word *Bushmen* has been widely used, many now find the term derogatory, preferring *San* or, in the TSWANA language, *Basarwa*.

Buto   Chief goddess and protector of ancient LOWER EGYPT; also called Uto, Edjo, and Per Wadjit. Buto was often depicted as either a deadly cobra wrapped around a PAPYRUS stem or a woman wearing the RED CROWN of Lower Egypt. When portrayed as a rearing cobra with a spread hood, ready to spit poison on the pharaoh's enemies or incinerate them with her fiery glare, the image of Buto is called the *uraeus*.

Buto, the personification of the sun's burning heat, was the queen of all the gods. She was regarded also as a goddess of the night and was honored with one of the six great FESTIVALS of the ancient Egyptians. According to Egyptian mythology, Buto, whose name literally means "she who is green," was nurse to the infant god HORUS. In this role, she protected the child from his treacherous uncle, SETH, by hiding him in the delta marshes.

Along with NEKHBET, the vulture goddess of UPPER EGYPT, Buto was believed to defend and protect the royalty of united EGYPT. Depicted together on the royal diadem and other works of ART, the two goddesses symbolized the sovereign's reign over Egypt. In addition to her role as the protector of the pharaohs, Buto was believed to bite and kill Egypt's rulers at their appointed times of death.

The goddess's name was given to the city of Buto, which was the capital of the sixth nome, or province, of Lower Egypt and a major center for the cult that worshiped the goddess.

Byzantine Africa   Area of Africa, including North Africa, EGYPT, and part of LIBYA, that belonged to the Byzantine Empire from the third century CE until the coming of Islam in the seventh century. The eastern portion of the Roman Empire continued to be an important political, social, economic, and religious force after the breakup of the Western Roman Empire at the end of the fifth century CE. Historians call the Eastern Roman Empire the Byzantine Empire, after Byzantium, the ancient name of its capital city, Constantinople (now Istanbul, Turkey), but to its people and rulers it was simply the Roman Empire. Its official language was Greek, although its inhabitants spoke a variety of languages and dialects that ranged from Latin to COPTIC. It was made up of lands in northeastern Africa, southeastern Europe, and southwestern Asia. Although parts of the empire were lost to Islam and other threats, the Byzantine Empire remained significant until 1453, when the Turks captured Constantinople and founded the Ottoman Empire.

The history of Byzantine Africa begins when Octavian CAESAR (63 BCE–14 CE), by then the emperor Augustus, made Egypt a province of ROME in 30 BCE, which was a year after the death of CLEOPATRA. Roman colonization, coupled with Augustus's successful quieting of hostile peoples in the area, created conditions that led to four centuries of prosperity.

The Founding of Constantinople   By the third century CE the Roman Empire began to decline as a result of internal strife, famine, and war. In 306 DIOCLETIAN (245–316 CE) named Constantine (c. 288–337 CE), later known as Constantine the Great, his successor in the west. By 312 Constantine had defeated his rivals for the throne and became emperor of the west, ruling as a co-emperor with Licinius in the east until 324. That year he defeated Licinius in battle, converted to CHRISTIANITY, and moved his capital to the site of the ancient city of Byzantium, located on the Bosporus, the strait of water that separates European Turkey from Asian Turkey on today's map. Constantine dedicated his new capital as a "new Rome" in 330, renaming it Constantinople after himself. The move placed the new administrative capital of the empire in a place of strategic and commercial advantage between Europe and Asia. Constantine died in 337. His sons and nephews fought for control of the em-

pire and even wanted to restore traditional Roman RELI-GION. The empire permanently split into its eastern and western parts after Emperor Theodosius I died in 395. The fall of the Western Roman Empire is often dated to 476, when Germanic invaders forced the last emperor, Romulus Augustulus, from the throne.

North Africa in the Byzantine Period North Africa thrived under Roman rule. The numerous and spectacular ruins at various sites in TUNISIA and Libya attest to the prosperity of the region. Between the first and third centuries, private estates of considerable size became common, many public buildings were erected, and an export industry flourished. Many North Africans received Roman citizenship. In 193, a North African, Septi-

mus Severus, even became emperor. Following Constantine the Great's declaration of religious freedom for all in the empire in 313, Christianity in North Africa grew strong. The fourth and fifth century church fathers Tertullian, Cyprian, and Saint Augustine, the bishop of Hippo, were important leaders whose writings had an effect throughout the early Christian world.

By the end of the fourth century, however, Roman civilization in North Africa was entering a period of decline. The Germanic Vandals invaded Africa and soon made CARTHAGE their capital.

C

Cacheu River River that runs approximately 125 miles (201 km) through central West Africa in the territory of present-day GUINEA-BISSAU. The river flows to the west, where it ultimately reaches the Atlantic Ocean near the town of Cacheu (formerly spelled Cacheo). The surrounding coastal lowlands produce crops of SORGHUM, cassava, corn, and MILLET and are also used for grazing CATTLE, sheep, and GOATS.

See also: CACHEU (Vol. III).

Caesar, Gaius Julius (c. 100–44 BCE) *Roman general, statesman, and dictator*

A brilliant military strategist, Caesar joined with Pompey the Great and Marcus Licinius Crassus in an alliance called the First Triumvirate, which ruled ROME from 53 to 50 BCE. At the time, Rome dominated the Mediterranean region, ruling lands on both the African and European seacoasts. Operating from a Roman post in Syria, Crassus prompted a war with the Parthians. Crassus' defeat and death at the hands of the Parthians at Carrhae in 53 BCE destroyed the fragile alliance that ruled Rome. Pompey attempted to seize all power for himself, but Caesar amassed his armies and drove Pompey from Rome. Pompey fled southward, ultimately to EGYPT, where Ptolemy XIII had him killed in 48 BCE.

At that time, Ptolemy XIII was fighting a civil war for the Egyptian throne with his sister, CLEOPATRA, who, following the tradition among Egyptian royalty of sibling marriage, was also his wife. To settle the matter, Caesar, who had followed Pompey to ALEXANDRIA, ordered both Ptolemy and Cleopatra to submit to his judgment. Beguiled by Cleopatra's charms, Caesar had her installed as queen of Egypt. Refusing to accept the ruling, Ptolemy escalated the Egyptian civil war, and Caesar almost died in the battles that raged through the streets of Alexandria. But by March of 47 BCE, Caesar had overcome Ptolemy and secured Cleopatra's seat on the throne. Caesar remained in Egypt with Cleopatra for several months. The queen later gave birth to a son, Ptolemy Caesarion, whom Caesar acknowledged as his own.

After leading Roman armies in Asia Minor (present-day Turkey) and quieting a rebellion in Rome, Caesar returned to Africa in 46 BCE. This time, he went to NUMIDIA, where King JUBA I had allied himself with three mutinous Roman military leaders. Caesar swiftly and soundly defeated this alliance and declared Numidia a province of Rome.

A victorious Caesar returned home, where he declared himself dictator of all Rome. Cleopatra reunited with him in Rome later that year. Secure in his rule, Caesar drew up plans to rebuild the once-great African coastal city of CARTHAGE. Before he could see his plans come to fruition, however, he was assassinated by a group of Roman senators on March 15, 44 BCE.

Caesar, Octavian (Augustus) (63 BCE–14 CE) *First emperor of Rome*

Born Gaius Octavius, Octavian was the grandnephew and a favorite of Julius CAESAR, who adopted him as his intended successor as ruler of ROME. Upon his great-uncle's assassination in 44 BCE Octavian took the name Gaius Julius Caesar. By making peace with his rivals, Mark Antony and Marcus Aemilius Lepidus, Octavian ended the civil war that had followed Caesar's death.

Beginning in 43 BCE the three ruled the empire as a triumvirate, with Lepidus ruling over Rome's extensive dominions in North Africa, which included both NUMIDIA and MAURITANIA. Within several years, however, Octavian had forced Lepidus from power and wrested control of Africa for himself.

In 37 BCE Antony abandoned his wife Octavia (Octavian's sister) and married CLEOPATRA. Octavian felt his position as Caesar's only recognized heir to be even further threatened when Antony accepted Caesarion, Cleopatra's son by Julius Caesar, as her co-ruler. Five years later, claiming that Cleopatra exercised undue power over Antony, Octavian declared war on the queen of EGYPT. By 31 BCE Octavian's forces had overwhelmingly defeated those of Antony and Cleopatra. Within a few months, Octavian had captured and annexed Egypt, Antony and Cleopatra had killed themselves, and Caesarion was executed. Ultimately, Octavian also seized Cleopatra's treasure, using it to pay off the pensions of his military veterans. As the sole ruler of the Roman Empire, Octavian gave himself the title of *augustus*. He ruled the Roman Empire for more than forty years (27 BCE–14 CE), restoring the empire to peace and prosperity.

Cairo Capital of EGYPT and largest city in Africa. Located on the east bank of the NILE RIVER, Cairo was officially founded in 969 CE. Prior to this, the city had been known by a variety of names, including MEMPHIS, Heliopolis, and Babylon. During its ancient history, it was governed by a long list of rulers, from the ancient Egyptians, Greeks, and Romans to the Arabs and Turks.

About 5,000 years ago, MENES (r. c. 3050–2890 BCE), the legendary pharaoh who united UPPER EGYPT and LOWER EGYPT, founded the city of Memphis approximately 15 miles (24 km) south of modern-day Cairo. In 525 BCE invading Persians established a fort, named Babylon, north of Memphis, from which they controlled Egypt until the arrival of ALEXANDER THE GREAT (356–323 BCE) in 332 BCE. The region later fell under the rule of the Romans.

calabash Hard-shelled gourds produced by a tropical vine or tree; common varieties include the white-flowered gourd (*Lagenariasic eraria*) and the bottle gourd (*Cucurbitaceae*), both of which come from vines. Bottle gourds bear fruit that is edible when young but, when grown from seed, they require a great deal of time to produce. This is, perhaps, the basis for Dahomean folk tales that relate that the calabash symbolizes the earth—its two halves representing the land and the sky.

Used since ancient times as a decorative item in the tropical regions of Africa, the hard-shelled gourd was also prized as a handy storage container. Traditionally, because of the great variation in gourd shape, the finished vessel often resembled a club, dipper, kettle, or trough, measuring anywhere from a few inches to several feet in height. In order to make containers, the gourd and its ripened fruit were soaked in water. The fruit disintegrated and was discarded, and the hard outer peel became more pliable. After being dried in the sun, it was easier to carve into shapes or to add incised decorations and symbols. Colors of calabash gourds ranged from ochre to golden brown and were often accented by the dark oil of shea nuts. Among the most elaborately decorated calabashes, which featured BEADS, leather, or reed coverings, were those produced by the Fulani of Adamawa, in CAMEROON.

Finished calabash containers were most often used to store grains, water, milk, MEDICINE, and tobacco. They were utilized as digging tools or as spoons for serving or eating. For centuries calabash played an important part in making MASKS. Calabash has also been used in the creation of musical instruments.

One traditional calabash instrument of ancient origin had seeds or pebbles woven into a net or macramé covering. When shaken, the beads produced a rhythmic amplified sound against the hollow gourd. Smaller hand versions had beads sealed within the calabash. In northern GHANA, the Frafras made a *duuliga*, or violin, from the calabash gourds. Generally it was covered with snakeskin and leather. The instrument's playing strings were made from horsetails with inverted twigs used as a bridge. Other instruments made from the calabash gourd include the African thumb piano, noted for its resonating sound created by a hollow cavity and metal or bamboo "keys." The *balafon*, similar in design and sound to a XYLOPHONE, was also made from the calabash.

The hard shell is capable of withstanding various manufacturing and decorative techniques. Most common were resist dye techniques, which entailed creating designs from candle wax or the paste of cassavas. Stamps made from calabash shells have also been used to decorate fabric with ornate designs, symbols, and proverbs.

Because of their durability, versatility, and beauty, calabash containers have always been highly regarded. The technique of making calabash vessels was passed down from one generation to the next, making them an important source of material culture.

calendar As many recent archaeological discoveries demonstrate, calendars have been important to the peoples of Africa since ancient and even prehistoric times.

Calendars may have been used in Africa for far longer than scientists once believed. One of the most interesting recent archaeological discoveries is a piece of bone found in the present-day Republic of the CONGO. Dating back to between 9000 and 6500 BCE, the bone has 39 notches carved on its surface. At first, the artifact was believed to be linked to some kind of numerical notation. Further study, however, led scholars to suggest that the notches are part of a system noting the phases of the Moon. If so, this notched bone might be one of the earliest calendars yet discovered.

Ancient societies probably first began to note time in relation to natural events or work routines that were regularly repeated. As a result these people probably divided the year into periods of planting or harvest or into times of rain or drought. Later they began to incorporate into their thinking patterns involving the progressions of the sun, moon, or stars.

The lunar calendar was one of the earliest attempts to organize these observations. Lunar calendars are based on the phases of the moon, with generally a month assigned to each lunar cycle. Since each of these cycles is only about 29 days long, lunar calendars inevitably were "short" almost 11 days when compared with the 365¼ day solar year. As a result, over the years, lunar calendars inevitably became out of step with the seasons. To rectify this, some societies developed calendars based on a different number of months; others periodically instituted various kinds of corrections to their calendars.

Ancient Egyptian Calendar The ancient Egyptians are generally recognized as the first to develop a calendar based on the movement of the sun. Although it had several inaccuracies, the Egyptian calendar represented a major step forward in the measurement and recording of time. It is uncertain exactly when the ancient Egyptians created the first versions of this calendar, but some scholars believe that its use dates back as much as 6,000 years.

The Egyptians based their calendar on their observations of the sun, stars, and NILE RIVER. Noting that SIRIUS,

which is one of the brightest stars in the heavens, was invisible for a period of several months, they discovered that it reappeared in the eastern sky just prior to the beginning of the Nile's annual flood. This fact became the cornerstone of their calendar, which divided the year into a system of 12 30-day months. They then brought the total number of days in a year to 365 by adding five festival days, each in tribute to a different major deity.

The Egyptian calendar also divided the year into three seasons, each of which was four months long. These seasons reflected shifts in the climate as well as other changes in the natural environment. The season of *akhet*, for example, roughly corresponded to the modern season of autumn and marked the time of the Nile's flood, which lasted from mid-July to mid-November. *Peret*, the next season, lasted from mid-November to mid-March and represented the Egyptian winter. *Shomu*, the Egyptian equivalent of summer, began in the middle of March and lasted until mid-July.

The solar year's extra one-quarter day was not taken into account by the ancient Egyptians. But Egyptian civilization lasted so long that this seemingly minor error eventually became a major problem. In fact, it got to the point that the Egyptian calendar and the progression of seasons were so mismatched that the Egyptians were having winter during a time that, according to the calendar was actually summer. The Egyptians eventually rectified the situation by creating a new calendar.

Calendars in Other Parts of Africa Elsewhere in ancient Africa, other types of calendars were used. For thousands of years, for example, astronomer-priests in West Africa based their calendars on the rising and setting of certain stars. This allowed them to link the planting and harvesting of certain crops, as well as the celebration of key religious FESTIVALS, with the predictable arrival of nature's seasons.

In other parts of Africa variations of a lunar calendar were used. Some peoples reconciled discrepancies between the lunar cycle and solar year by allowing for special "days of waiting," often a period in which people waited for the annual rainy season to begin. The individual months of the year were often named for activities typical of that time; months also were simply assigned numbers.

Other peoples dealt with the discrepancy between the lunar and solar cycles by creating twelve different months that were, in turn, divided into four unequal weeks. Thus, a month would begin with the disappearance of the moon and then progress through weeks last-

ing for 10 days, 10 days, four days, and five days. Each of these days often had a particular spiritual significance and was believed to bring either good or bad fortune to humans, domesticated animals, and wild creatures alike.

Some peoples developed particularly accurate systems for predicting the seasons. The Kamba of present-day KENYA, for example, traditionally calculated the arrival of rainy and dry seasons with the aid of the sun. By drawing lines through certain points in their fields, they were able to measure the position of the sun and make surprisingly accurate predictions about the arrival of the seasons.

Cambyses II (r. c. 525–521 BCE) *King of the Persian Achmeunid dynasty, who ruled ancient Egypt in the sixth century BCE*

Cambyses II is believed to have solidified his power by killing his brother Smerdes, in 529 BCE. In 525 Cambyses completed the conquest begun by his father, Cyrus the Great, who had invaded Babylon in 539. After the conquest, Cambyses II became the first ruler of Egypt's Twenty-seventh Dynasty. According to the ancient historian HERODOTUS (484–425 BCE), Cambyses II was a harsh king who treated his Egyptian subjects poorly. Herodotus also claimed that Cambyses II lost his sanity and committed suicide, but there is little evidence to support these claims.

camels Mammals that stand about 7 feet (2.1 m) tall and weigh approximately 1,500 pounds (680 kg). They have long necks, small ears, thick eyelashes, and powerful, sharp teeth for fighting. Their coats vary in color from dusty white to golden brown. Camels with one hump are known as dromedaries and are bred for riding. Flat, thick-soled, cloven hoofs that do not sink into the sand, double rows of protective eyelashes, and nostrils lined with hairs to protect against flying sand are all physical traits that make camels suitable to the desert environment. Camels are able to survive on coarse VEGETATION and can drink as much as 25 gallons (95 l) of water in a matter of minutes. Their famous humps serve as storage areas for fat and allow them to go for days without water. Capable of carrying loads of 500 to 600 pounds (227 to 272 kg), camels can travel at speeds up to 8 to 10 miles (13 to 16 km) per hour for as long as 18 hours at a time.

For centuries camels have been used by the people of North Africa and the SAHARA DESERT as means of carrying loads across sandy areas. It is believed that camels originated in North America 40 million years ago and then spread to South America and Asia.

Modern camels had a relatively late start in Africa, having been introduced to the ancient Egyptians by the PHOENICIANS some time in the fifth century BCE. Soon after their arrival in Africa, however, camels became prized for their ability to carry trade goods across the Sahara. They were also valued for wool, meat, and milk.

Cameroon Country covering about 183,600 square miles (475,500 sq km) of west-central Africa. Cameroon is an ethnically diverse land, featuring over 200 distinct ethnic groups, including both the Fulani and various MBUTI groups.

Cameroon borders the Gulf of Guinea to the southwest, NIGERIA to the west, CHAD to the northeast, the CENTRAL AFRICAN REPUBLIC to the east, and the Republic of the CONGO, GABON, and EQUATORIAL GUINEA to the south. Geographically, the country is divided into four regions. The coastal region of the southwest, which is dominated by dense rain forests and swamps, has one of the wettest climates in the world, receiving, on average, more than 150 inches (381 cm) of rain a year. Just past the coast there are a number of volcanic mountains whose slopes hold much of the country's most fertile soil. Of these mountains, Mount Cameroon is the tallest, with an elevation of 13,350 feet (4,069 m). Beyond these mountains is a dense forest in an area that is about 1,000 feet (305 m) above sea level. In Cameroon's interior is the Adamawa Massif. Rising to a height of 4,500 feet (1,372 m), it is dominated by savanna. Further north, the savanna becomes the marshy land surrounding Lake CHAD. Here, the climate is drier than in the rest of the country.

In the south, the Sanaga, Wouri, Nyong, and Ntem Rivers run west into the Atlantic Ocean. The CHARI and Logone rivers move north from the Adamawa Massif and drain into Lake Chad. A river system in the Chad Basin, which includes the BENUE RIVER, flows into the NIGER RIVER basin of Nigeria. The Ngoko River and Sangha River join together and flow into the CONGO BASIN.

Archaeological evidence suggests that Cameroon has been occupied for about 50,000 years. The first people to live in the area were MBUTI groups, known in Cameroon as the Yele and Binga. For thousands of years these people have inhabited Cameroon's southern forests, hunting antelope, wild pigs, and other animals, and gathering foods like wild fruit, nuts, tubers, and caterpillars. Living in clans of 10 to one 100 members, they are NOMADS, moving as needed to places where FOOD is more readily available. As a result they live in huts that can be fully constructed in a matter of hours.

The BANTU LANGUAGES originated with the proto-Bantu languages spoken along the Cameroon-Nigeria

border, with BANTU EXPANSION beginning as early as 1000 BCE. About 2,000 years ago different ethnic groups began migrating to the Cameroon region. The most important of these were the Sudanic-speaking Sao people, who settled around Lake Chad sometime in the first century CE.

Cameroon grassfields Region bordered by present-day NIGERIA to the west; noted for its extensive iron industries. The early widespread use of iron in the grassfields appears to have been linked to the wealth gained from early food production and trade. Among the region's earliest population groups were HUNTER-GATHERERS known as the Baka, said to have occupied the region approximately 50,000 years ago. Early forms of food production occurred about 4000 BCE and included the cultivation of YAMS and bananas.

Migrating Bantu speakers, as part of the BANTU EXPANSION into equatorial Africa, later settled in the southern forests of CAMEROON and the western grassfields. These groups appear to have been related by common languages and cultural practices and formed a number of diverse patrilineal societies, including the Chamba, We, and Isu. They were also among the groups credited by some historians with bringing traditions of iron making to the region.

Radiocarbon dating has confirmed that smelting techniques were used in the region thousands of years ago. Nearly 100 sites at which smelting occurred have been identified; they are believed to have been used to produce a wide range of items associated with AGRICULTURE, hunting, and household use. Iron may also have been used to create symbols and various other items related to royalty. At least one group, the Mbum people, made iron tokens of uniform shape. These tokens, made in varying denominations, could only be used in very specific ways, including the purchase of trade or prestige items, or as a form of BRIDE-WEALTH.

It is known that later kingdoms developed as a result of trade. One of the most powerful and longest lasting dynasties in Cameroon was associated with the Tikar. Other significant kingdoms were organized by the Mileke, the Menda, and the Mum. In examining many of these ancient smelting sites and speaking with the modern-day descendants of the ancient inhabitants, archaeologists have been able to reconstruct early METALLURGY processes. On a physical level, the process consisted of placing iron ore and charcoal into a heated foundry. The recovery of glazed material indicates that high temperatures were used for long periods at a time, which sug-

gests that foundry workers may have processed the iron over several days.

Other aspects of iron making included such rituals as specific prayers, songs, or dances. As a result the physical act of creating iron and the traditions that surrounded it were compared to the act of procreation. Potent herbs were traditionally buried beneath the furnace to strengthen the "birth" of a malleable form of iron.

Throughout the grasslands, there apparently were many taboos associated with iron production as well. Arguments or any acts of bloodshed—accidental or deliberate—were not allowed at iron-making sites. Menstruating women were barred as well. Married men were therefore the main keepers of the grassfield furnaces and were instructed to refrain from sexual relations prior to and during the process of smelting.

The formation of such ritual activity appears to have been based on the belief that iron could absorb the positive or negative practices associated with adult life. This was particularly true for weaponry such as spears, daggers, knives, or machetes, all of which were considered significant targets of negative influences. Masters of the forge were those men who best understood the various facets of iron production. They were among the earliest kings and were considered some of the most powerful members of early grassland societies, often credited with the power to heal or destroy.

Canary Islands Group of mountainous islands in the Atlantic Ocean that lie about 50 miles (80 km) off the coast of northwest Africa. They include Gran Canaria, Tenerife, Lanzarote, La Palma, Fuerteventura, Hierro, and Gomera, among others.

The origins of the people of the Canary Islands are uncertain. Juba II, who ruled MAURITANIA from 29 BCE to about 20 CE, sent an expedition to the islands, and they were found to be unpopulated. However, the expedition did find the remains of some ancient buildings on Gran Canaria. It is believed that Roman ships visited the Canaries in the third century, as Roman *amphoras* (narrow-necked jars) of that era have been found offshore.

cape buffalo Large mammal belonging to the same family as WATER BUFFALO and CATTLE. Unlike the water buffalo, which originally came from Asia, the cape buffalo is native to the African continent and has not been domesticated. The cape buffalo is black or dark brown, and adult males can grow to nearly 6 feet (1.8 m) tall at the shoulder and can weigh up to 2,000 pounds (908 kg); fe-

males are smaller. Cape buffalo are highly social animals that live in large grazing herds of up to 2,000 members. In ancient Africa, cape buffalo could be found throughout the sub-Saharan continent on open savannas and grassland, as well as in swamps and lowland rain forests.

Cape Verde, Republic of

Cape Verde, Republic of Island country approximately 1,560 square miles (4,040 sq km) in size located in the Atlantic Ocean, some 400 miles (670 km) west of SENEGAL. The country's 10 islands and five islets are clustered in two groups. The northern, or windward, group is known as the Barlavento Islands and includes Santo Antao, São Vincente, São Nicolaue, Santa Luzia, Sal, and Boa Vista. The southern, or leeward, group is known as the Sotavento Islands and includes Brava, Fogo, Maio, and São Tiago, where the capital city of Praia is located.

Despite the fact that the country's name means Green Cape, drought is a serious problem for these rugged volcanic islands. As a result there is a shortage of both tree cover and arable land. The islands were uninhabited at the time that the Portuguese came across them in 1460. The first Portuguese settlers arrived in 1462, settling on São Tiago. It is possible that people from the Moroccan mainland had sailed to the island of Sal to collect salt from its extensive deposits.

Capsian culture Ancient African civilization that settled in the southern region of what is now TUNISIA as long ago as c. 6000 BCE. They are generally believed to be the direct ancestors of modern-day Libyans. *Capsian peoples* and *Capsian culture* are phrases that are used to describe the large number of prehistoric tools produced during what some archaeologists call the Late Paleolithic period and that others refer to as the Late STONE AGE. The name was borrowed from the inland regions that include the great salt lakes of el-Meka located near Qafsah (Capsa). Capsian peoples were largely sedentary, and the fact that plant FOOD products have been established as a formative part of their diet may account for an expanding population. And, although they domesticated plants, evidence suggests that the Capsians also hunted.

There have been various reports that the tools and products of this culture were in place approximately 10,000 to 6,000 years ago. Recovered tools include a type of drill created to bore holes in ostrich eggshell fragments, which were then strung and worn as necklaces. Many stone microliths or blades have been recovered along with POTTERY. Overall these finds provide a picture of a sedentary society.

The influence of the early peoples of this region is believed to have spread to the northern and eastern regions between 9000 and 5000 BCE. Evidence from the later NEOLITHIC AGE after the sixth millennium indicates that CATTLE became an essential source of trade at this time, perhaps through the influences of EGYPT or various groups from the Sudan. In addition, a significant shift in certain traditions or tool-making capabilities took place during the same era. Archaeologists speculate that because the climate and environment were well suited for hunting, the techniques for making appropriate tools developed during this period prior to the first millennium BCE. This led to a period that was characterized by the use of iron tools and weapons.

Analysis of several rock carvings found in the Atlas, Ahaggar, and Tibesti Mountain ranges have linked them to Capsian culture. These carvings are of great significance since they depict animals, some long extinct, that once roamed the region. Identifiable figures include the giant buffalo, ELEPHANTS, RHINOCEROS, and HIPPOPOTAMUS. Findings of large middens, or refuse heaps, indicate that the region was inhabited by land mollusks as well. The areas of their former habitation are now largely desert terrain.

One of the most unique aspects of the region involves thousands of large, stone tombs or megalithic stone structures. Estimated to have been built around the first millennium BCE, the megaliths of Mzora in ALGERIA stand nearly 200 feet high and have been credited to Capsian peoples.

caravan routes Network of trade routes that extended from the sub-Saharan kingdoms of West Africa, including ancient GHANA and ancient MALI, across the SAHARA DESERT to North Africa, where, on the coast, goods were then exchanged with European merchants. For almost 1,000 years trade moved over these routes from the NIGER RIVER to the city of Sijilmasa in North Africa. Beginning about the fourth century CE this trade was controlled by the Soninke Empire of Ghana. At the height of Ghana's power, which lasted for more than 700 years, these caravan routes were the lifeblood of the empire, carrying SALT, slaves, ivory, civet, gum arabic, foodstuffs, COTTON cloth, metal ornaments, leather goods, and, above all, GOLD.

Carthage Ancient city located on North Africa's coast near present-day TUNISIA. Carthage was the principal city of the PHOENICIAN civilization. Later, it battled with ROME in the PUNIC WARS, during which it was burnt and destroyed. Carthage was rebuilt before being destroyed for good in the seventh century CE.

Phoenician Carthage Carthage was founded by the Phoenicians in the ninth century BCE. The Phoenicians called Carthage *Kart-hadasht,* meaning "new town." Ac-

cording to tradition, the city was founded by the Tyrean queen Dido, who was fleeing her brother King Pygmalion. Built on a peninsula projecting into the Gulf of Tunis, Carthage had two harbors connected by a canal. Beyond the harbors was the Byrsa, a walled fortress built on a hill.

Carthage's Phoenician settlers were sailors and merchants. and the city became a commercial center, with wharves, markets, and factories built by slave labor. The Phoenicians grew wealthy trading POTTERY, textiles, ivory, lumber, slaves, fruits, and metal. (The latter included deposits of silver, which, beginning as early as 800 BCE, were brought from mines in Spain and North Africa.) Although the evidence is limited, Carthage no doubt benefited from trade across the desert to the south via the trans-Saharan trade routes.

The Phoenicians reaped great profits taking cheap manufactured goods, like pottery or JEWELRY, and trading them for valuable metals. In Roman times Punic goods, such as beds, cushions, and mattresses, were both prized and imitated. Still, because Carthage produced few pieces of ART and literature, there is very little information regarding the government, language, and daily life of the city. Carthaginian religious rituals involved human sacrifice to Baal, a fertility god, and Tanit, the Carthaginian version of the Phoenician goddess Astarte. The Greek gods Demeter and Persephone and the Roman goddess Juno were also absorbed into Carthaginian RELIGION.

Carthage's Empire By the sixth century BCE Carthage dominated the entire North African coast, from the Atlantic Ocean to the western border of EGYPT. Carthage's empire expanded to include nearby Libyan peoples and older Phoenician colonies. It also controlled Sardinia, Malta, the Balearic Islands, and part of Sicily. One Carthaginian admiral, HANNO (c. 530–470 BCE), traveled along the coast of North Africa about 430 BCE. Another expedition, led by Himlico, traveled up the Atlantic coast of Europe as far as Britain.

Between the fifth and third centuries BCE, Carthage engaged in a series of wars with GREECE and ROME. Carthage battled with the Greeks for control of Sicily, which was only 100 miles (160 km) from Carthage and was a perfect stepping-stone between North Africa and Italy. Carthage was defeated in Sicily in 480 BCE, when the forces of Carthaginian general Hamilcar were repelled by the ruler of Syracuse, Gelon. In spite of this defeat Carthage still held territory in the western part of Sicily. In the fourth century BCE Syracuse's rulers made repeated attempts to rid Sicily of the Carthaginians. In 310 BCE the forces of Syracuse's ruler Agathocles attacked and inflicted great damage on parts of eastern Tunisia. Agathocles' forces, however, ultimately were defeated.

Ruins of the ancient city of Carthage have been preserved in present-day Tunisia. *© Nick Wheeler /Corbis*

Roman Carthage Carthage's three wars with the Romans are known as the PUNIC WARS. In the First Punic War, fought from 264 to 241 BCE, the Carthaginians were defeated and lost their hold on Sicily. The Second Punic War lasted from 218 to 201 BCE and featured the famous Carthaginian general HANNIBAL (c. 247–c. 183 BCE). Hannibal and his war ELEPHANTS marched through Spain and France and crossed the Alps into Italy. Though he was victorious at Cannae, Hannibal ultimately lost to the Romans. As a result the Carthaginians ceded to Rome control of Spain and a number of islands. During the Third Punic War, which lasted from 149 to 146 BCE, the Romans destroyed Carthage, spreading SALT over the ruins as a symbolic gesture of contempt.

In 122 BCE, after a period of 25 years during which Carthage lay in ruins, a new city was built, called Colonia Junonia. This city survived only 30 years. Later, in 29 BCE, the Roman emperor Octavian CAESAR (63 BCE–14 CE) rebuilt the city, fulfilling a wish made by his predecessor, Gaius Julius CAESAR (c. 100–44 BCE). This new city was known as Colonia Julia Carthago.

Roman Carthage thrived, ranking behind only Rome in wealth and importance, and the city was a favorite of Roman emperors, although none lived there. Under the Romans, Carthage was also a center of CHRISTIANITY. Important Christian Carthaginians included St. Cyprian, who was Carthage's bishop in 248 CE, and Tertullian, a Christian ecclesiastical writer who lived there in the third century CE. The famous philosopher St. Augustine was bishop of nearby Hippo in the fifth century.

Carthage declined after the third century CE. In 439 the Vandal king Gaiseric captured the city, which then became the Vandal capital for almost a century. In 533 the Byzantine general Belisarius captured the city and renamed it Colonia Justiniana Carthago in honor of the Byzantine emperor Justinian I.

Between 697 and 705 CE the city was conquered by the Arabs. Among Carthage's ruins are the remains of fortresses, temples, and an aqueduct that date from the Roman era.

Carthaginian Religion Similar to other ancient societies of Africa, Carthaginians created a framework for religious worship that centered around a supreme god known in Africa as Baal Hammon. The word *Hammon* was associated with the sun, an attribute that the Phoenicians apparently found strong and protective. A number of lesser deities coexisted with the high god, many of whom reflected the influence of EGYPT. For instance, in Carthage the deity Eshmoun was equivalent to ASCLEPIUS, considered a sacred healer in Egypt. Even from a personal perspective, Carthaginians generally had first names that reflected religious faith.

Over the centuries historians and archaeologists who have studied this era and region have commented on the Carthaginian traditions involving human sacrifice. Based on the recovery of skeletal remains, archaeologists have determined that the practice of human sacrifice to Baal flourished well into the third century BCE. Generally, small children were sacrificed in a religious ceremony that occurred once each year. Their burned bones make it uncertain as to whether this was the sole cause of death. There have been some reports that the children were the first-born males of wealthy families. Thousands of urns containing their ashes have been found in Hadrumetum, Motya, and Cirta, which became the capital city of the ruler known as MASSINISSA (240 BCE–148 CE). The urns at earlier sites were buried under large stone markers called stelae, but it is generally believed that this practice declined in the fourth century BCE. The urns were associated with the shrine of Tanit, a goddess who was widely worshiped after the fifth century and who may also have received sacrificial victims.

Since the burials of adults have generally been described as modest, with few burial goods, questions still persist among historians and archaeologists as to why such practices were so prevalent.

caste systems Social classes separated from one another by royal status, specialized skills, or wealth. In many West African kingdoms, the society's castes were made up of free people with special crafts, such as weaving, making POTTERY, or doing leather work. There also were castes of musicians and praise singers. In exchange for their services, caste groups like these often enjoyed the special protection of a kingdom's ruling class. This relationship generally lasted until the ruling class lost power, at which time caste members were forced to sell their wares or services to anyone who would buy them.

One of the most complex and significant castes in Africa was composed of BLACKSMITHS. These artisans, who made weapons as well as essential agricultural and household items, were consistently associated with both divine kingship and spirituality. Indeed, not only did many ancient kings use the blacksmith's anvil as a symbol of royalty, but the ORISHA, or deity, of war and iron was OGUN, a legendary figure who dwelled in the blacksmith's forge.

As in other parts of the world, the castes of ancient Africa faced limitations as well as enjoyed privileges. In areas such as RWANDA, for example, only members of the ETHNIC GROUP known as HUTU were allowed to be blacksmiths. Elsewhere, in ETHIOPIA and the western Sudan, there were religious taboos as well as negative assumptions about various craftworkers. These beliefs prevented craftworkers from marrying outside their caste.

The cattle depicted in this rock painting from Algeria, created 4000–1500 BCE, are being washed in a river in the *lotori* festival, a Fulani initiation rite. *© Pierre Colombel/Corbis*

caterpillar The larvae of a butterfly or moth. The caterpillar has long fascinated the MBUTI of the ITURI FOREST of central Africa. These people use caterpillars to make poison for their arrowheads and, before their hunts, they will pray to N'go, the caterpillar deity, to make their poison strong. In Mbuti mythology, the caterpillar is believed to have divine qualities. Along with another insect, the PRAYING MANTIS, the caterpillar is associated with Kaang, the creator god.

cattle Grazing mammals raised for their milk, meat, and other products. In Africa, the domestication of cattle began between 5,000 and 10,000 years ago, following the domestication of sheep, GOATS, pigs, and DOGS. Long-horned, humpless cattle were well-established in the NILE VALLEY of EGYPT by 4000 BCE. These cattle, known as the Egyptian, or Hamitic, longhorn, appear in pictographs on the walls of Egyptian pyramids. Over the next 2,000 years these animals migrated from the Nile to ETHIOPIA and into the southern reaches of the continent. Eventually, HORSES replaced cattle as sources of labor, leaving the primary value of cattle to be meat, milk, and leather.

Africa, like other continents, has known many breeds of cattle. Most are indigenous, having existed on the continent for thousands of years. Other breeds have evolved more recently through cross-breeding with either African or imported cattle. Regardless of their origins, however, cattle have been of profound importance to several peoples of Africa.

The MAASAI are one such example. For hundreds and even possibly thousands of years, Maasai life has revolved around cattle. Besides providing the Maasai with their

basic food staple—milk—ownership of cattle determines virtually every social role as well as the social status of each individual person.

The breeds of cattle kept by the Maasai vary considerably, mostly because of the Maasai's age-old practice of clandestinely acquiring cattle from their neighbors. The Maasai traditionally have justified this tradition with a legend stating that their deity, Ngai, gave them the sole right to keep cattle. As a result, the Maasai maintain, their cattle tend to be larger and healthier than other peoples'. The truth is, however, that the Maasai have so many cattle that the offspring of both the Maasai and their cattle have more than enough milk to drink, and, as a result, are indeed healthy and sizable.

The Fulani are another people for whom cattle have been of prime importance for hundreds of years. Mainly herders and traders, the Fulani established trade routes that fostered economic and political ties with otherwise isolated ethnic groups. As they traveled these routes, the Fulani traded with the sedentary farmers they passed, exchanging dairy products for agricultural products and luxury items. The Fulani then exchanged the latter for other goods as they continued on along their nomadic routes.

The Watusi, or Tutsi, developed a breed of cattle, known as the Ankole-Watusi, that became a favorite of breeders around the world. Medium-sized cattle with large-diameter horns, their ancestry can be traced back more than 6,000 years. Later, between the 13th and 15th centuries, these cattle were brought into northern UGANDA by Nilotic- and Cushitic-speaking peoples, leading to the eventual spread of Ankole-Watusi cattle from Lake Mobutu to Lake TANGANYIKA.

Among other important African breeds are the Bonswara and the Mashona, which also is known as the Makalanga (or Makaranga). Another breed, the Nguni, is a subtype of the Sanga, which is associated with the pastoralist tradition of the Bantu-speaking peoples. Other important breeds include the Tswana and the Tuli.

Central African Republic   Landlocked country measuring approximately 240,300 square miles (622,400 sq km) and bordered by present-day CHAD, Republic of the SUDAN, BURUNDI, both the Democratic Republic of the CONGO and the Republic of the CONGO, and GABON. Origins of human life in the area date back a million years or more. Some historians even maintain that civilized societies were in place in this region well before the better-known civilizations associated with ancient EGYPT.

The region was initially populated by HUNTER-GATH-ERERS such as the Aka, groups whose ways of life were altered when the northern region was impacted approximately 100,000 years ago by climatic changes known as pluvials, or prolonged periods of rain. As a result many of these nomadic communities became sedentary; the people settled around the rivers, where they cultivated grain and fished. A number of these settlements bordered the CONGO RIVER in the southwest and undoubtedly contributed to the river's later importance as a prominent trade route. Unfortunately, the Congo River has also played host to deadly diseases that decimated many of these populations.

About 1000 BCE settlers associated with the BANTU EXPANSION began to dominate the region, bringing with them a clan-based social structure. Modern excavations in the region have unearthed many significant finds, which have provided telling information about the existence of these early groups and the events that shaped the region's history.

The earliest recovered stone tools were crude and worn. They have been described as "pebble tools" because of their small flakes or edges. In contrast, at a site known as Batalimo, near the Ngoere River in Upper Sangha, an advanced type of Acheulean hand-ax that was recovered demonstrates how the tools used in this region evolved over time. Other finds include microlithic tools made of hard flint and quartz; these date back approximately 8,000 years. POTTERY associated with the NEOLITHIC AGE (between 3000 and 1000 BCE), with distinctive designs and a flat bottom, indicates that the inhabitants were early FOOD producers. Overall, these findings are characteristic of a sedentary, well-developed society.

Stone megaliths erected in the Bouar region have been less easy to interpret. Megaliths like these, which generally are free-standing stones with distinctive shapes and which often weigh several tons, are usually erected by organized societies and are used as a type of burial site. (They also are known as *tumuli* or *cairns*.) Unfortunately, the absence of skeletal remains—a factor that archaeologists have attributed to high soil acidity—makes it difficult to confirm that the societies that built these stone pillars were indeed organized ones; only items made of iron have been recovered from the megalith sites during excavations.

Radiocarbon dating indicates that the megaliths of the Central African Republic range in age. The oldest megalith pillars were placed there about 5500 BCE; the most recent pillars date back from 450 BCE.

ROCK ART in the region also confirms the antiquity of early populations. Although paintings and engravings have been found in the northern and eastern regions of the Central African Republic, the northern cave sites are where archaeologists have discovered highly stylized yet identifiable human forms. They also have found numerous symbols drawn with red ochre.

The Central African Republic has been associated with early methods of FOOD production, such as systematic planting, cultivation, and harvesting that called for specialized tools. Simple digging sticks were replaced with early forms of hoes, knives, and picks that were used to cultivate cereal grains and wild seeds such as MILLET and SORGHUM. The region has also been noted for its oil palm (*Elaeis guineensis*), a highly nutritional food product used for cooking and for making palm wine. The production of palm oil and wine became the basis of a significant industry in Africa. Food imports into the region included YAMS and bananas, which was another important food import that was cooked in numerous ways and also brewed for beer.

Other notable aspects of the region are its handicrafts, including BASKET MAKING, carved stools and MASKS, and a unique musical instrument known as the *balafon.* Made of animal horns, wood, and CALABASH gourds, the *balafon* was the forerunner of the modern-day XYLOPHONE. Equally notable are the diamonds found throughout the region, which have attracted prospectors from around the world.

Chad Landlocked country in central Africa, approximately 496,000 square miles (1,284,760 sq km) in size, that shares borders with LIBYA to the north, the Republic of the SUDAN to the east, the CENTRAL AFRICAN REPUBLIC to the southeast, CAMEROON to the southwest, and NIGER to the west. It also shares Lake CHAD, which in ancient times was much larger than it is today, with NIGERIA to the west. Chad's northern reaches stretch into the SAHARA DESERT, while the southern portion of the country, in the region of the CHARI RIVER, contained well-watered savanna grasslands suitable for AGRICULTURE.

Chad is associated with the earliest evidence of human origins. In 2002 scientists announced the discovery of a skull near an ancient lake bed that now lies in the desert. Nicknamed Toumaï, or "hope of life" in the Goran language, it dates back between 6 and 7 million years. In addition to pushing back the age at which the human lineage separated from that of chimpanzees, the discovery also shifts the focus of human origins

from the HORN OF AFRICA westward to central Africa. Much more recent archaeological evidence from the ENNEDI region in northeastern Chad, from perhaps the eighth millennium BCE, provides some of the earliest insights into the NEOLITHIC AGE. The evidence is older than that found in the NILE VALLEY. Although the archaeological sites now lie well into the Sahara Desert, during the Neolithic era the region was much wetter. Rock paintings from that time show large game animals that could not live there today. This area of Chad is also part of the narrow belt between Lake Chad and the Nile Valley that according to linguists is the likely core area from where the Afro-Asiatic, Niger-Congo, and Nilo-Saharan LANGUAGE FAMILIES emerged. They were in one way or another associated with the early agriculture and the domestication of animals in this region.

By 5000 BCE, and probably much earlier, the economic basis for Chad's population was formed by grain crops such as MILLET and SORGHUM, along with a variety of domestic livestock including CATTLE, GOATS, and sheep. After about 3500 BCE the Sahara expanded, and the locus of agriculture shifted to the south. This was to be the area where the great states of the African medieval era emerged, linked as they were to the central TRANS-SAHARAN TRADE ROUTES.

Chad, Lake Large lake located in west-central Africa. The fourth-largest lake in Africa, Lake Chad is what remains of a much larger and more ancient inland sea. A shallow lake with two basins, one at the north and one at the south, its main tributaries are the CHARI and LOGONE rivers.

Chadic languages Major subgroup of the family of AFRO-ASIATIC LANGUAGES. The Chadic group comprises many languages, the most important of which is HAUSA. During the 13th century some of the Chadic languages changed substantially as Muslim traders from North Africa integrated with the native Chadic-speaking groups, introducing many of their ARABIC words to the language.

See also: LANGUAGE FAMILIES (Vol. I).

Chari River River located in the Chad region of north-central Africa. The Chari, or Shari, is 600 miles (966 km) long and drains a 250,000 square mile (647,497 sq km)

region before it flows into Lake CHAD. It is the largest river system in the Lake Chad Basin.

The Chari River serves as the divider between the two contrasting regions of Chad: the SAHEL and mountain regions to the north and the Lake Chad floodplains to the south and west. The Chari River has historically offered an abundant supply of fish for the local population, and the sediments of the river create fertile soil for FOOD crops as well as for COTTON.

cheetahs   With their powerful legs, cheetahs are well known as the fastest animals in the world, capable of reaching speeds up to 60 miles (97 km) per hour. Averaging 55 inches (140 cm) long, with 25-inch (64-cm) tails, cheetahs stand about 30 inches (76 cm) tall and weigh up to 130 pounds (60 kg). The coarse fur of an adult cheetah is colored a sandy yellow and is marked by small black spots. Two black streaks run down its face from the corners of its eyes.

Cheetahs usually live about 12 years. Male cheetahs live in groups of three or four; female cheetahs, except when they are raising cubs, usually live alone. Cheetahs hunt alone or in small groups, generally during the afternoon. They prey on GAZELLES, impala, and waterbuck. Cheetahs, in turn, are preyed upon by LIONS and LEOPARDS. Unlike most cats, a cheetah's claws only partially retract, which allows the animal greater traction when it runs.

In ancient times Sumerian and Egyptian nobles trained cheetahs to aid them in their hunting expeditions. In ancient EGYPT, where cats were revered, the goddess Mafdet was often depicted as a cheetah, and, according to legend, she killed a serpent with her claws. Images of cheetahs also adorn the tomb of King TUTANKHAMUN.

child rearing   In Africa, the raising of children involves not only a child's immediate FAMILY but also the community at large and the child's ancestors. Child rearing also involves a reinforcement of the cultural values and traditions most cherished by each particular society. In most African societies, community rites surrounding child rearing start at birth. The most ancient traditions of the KIKUYU, for example, call for them to bury the placenta of a recently born child in an uncultivated field. This is done because, to these pastoral people, open pastures symbolize all that is new, fertile, and strong. The Yansi, on the other hand, traditionally throw the physical remnants of birth into the river as a way of showing that the child belongs to the community. Both practices were meant to ensure that healthy children were born in the future.

Other rites were specifically designed to strengthen the bonds between fathers and newborns. Since the earliest times, AKAN fathers, for example, traditionally were called upon to pour the child's first libation, or tribute, to the ancestors. Akan fathers also were required to provide the child's first pillow, which was a clean old cloth believed to carry the father's spirit.

African mothers, meanwhile, have been required since ancient times to perform special rites of purification. These rites usually begin during the earliest stages of pregnancy and might include carrying special charms and observing special taboos against the consumption of certain foods. Among the MBUTI, who have inhabited sub-Saharan Africa since the STONE AGE, women were long required to perform ritual offerings in the forest to ensure the safe delivery of their children.

One of the most significant rites associated with child rearing is the assignment of a name. Traditionally, important ceremonies accompanied the various naming practices. Among the Wolof of West Africa, for example, a social event was organized in the mother's home. Taking place a week after childbirth, the child was seated on the lap of an elder. Its name (and the meaning of that name) was then whispered into the child's ear, along with a prayer, making the child the first to hear its own name. Only after this was the child's name formally announced to the jubilant attendees.

Among many African peoples, names were traditionally a sign of a strong belief in reincarnation, and children received the names of those ancestors they most resembled in physical features or behavior. A child might also have received the names of grandparents or significant community leaders. Descriptive names that might have been related to a special incident associated with the birth or the period of pregnancy might also have been given. In this way the child could acquire several names during his or her lifetime, each of which described, in some way, who he or she was.

Breast-feeding, for many peoples, represented the most critical time for young children, and it generally lasted anywhere from 12 to 24 months. Although this long period of nursing offered a built-in immunity for most children, once they were weaned such dangers as malnutrition and disease claimed many lives. Those children who did survive beyond this period, however, eventually came to flourish under the watchful eyes of older siblings, members of the household, and the community at large. In this way children absorbed the social and cultural values of the society, as well as the community's codes of acceptable social behavior. Part of this process also involved identity or marks. For some societies, this sometimes meant physical markings, sometimes known as SCARIFICATION, on the face or body. In other societies, the piercing of ears or the wearing of particular kinds of JEWELRY or charms indicated that children had become full members of society.

Work tasks traditionally offered other learning experiences for young children. In some societies, especially

in ancient times, children between two and four years old were expected to help with hunting and gathering, household tasks, herding sheep and GOATS, and feeding DOMESTICATED ANIMALS. Rock paintings dating back to the prehistoric era tend to bear this out, showing women and children collecting fruits and nuts, as well as leaves and roots. As the children reached their middle years, more responsibilities were placed upon them, including obtaining water for the household, herding livestock, cultivating FOOD, cooking, and running errands. By assisting adults, children expanded the food reserves of the family, providing for greater economic opportunities through trade or sale.

Puberty in ancient African societies traditionally meant greater involvement in the community. Initiation into adulthood was linked to sacred rites and SECRET SOCIETIES. Already familiar with domestic and agricultural work patterns, the teenage girls of many societies were considered ready for marriage as soon as they were formally initiated into adult membership in the community. In some societies, particularly when BRIDE-WEALTH was required, boys married anytime between 18 and 30 years of age.

After a marriage took place a young couple often lived within a parental household or compound (which family the couple went to live with was dependent upon whether they were part of a matrilineal or patrilineal society). In this way, couples were able to assist aging members of the extended family, who in turn passed on their wisdom to the couple's offspring.

Chiwara Mythical hero of the BAMANA-speaking people of central MALI. According to tradition Chiwara taught the Bamana how to farm. In his honor the Bamana hold a festival in which dancers wear MASKS representing antelopes, the animal associated with Chiwara.

In the Bamana language, *chiwara* literally means "farming animal." According to legend the mythical Chiwara was the offspring of the first woman, Mousso Koroni, and a snake. Chiwara was a hard-working animal who tilled the soil using his claws and a magical hoe that had been given to him by his mother. In this way Chiwara taught the Bamana people both the skill of farming and the value of hard work. The forgetful Bamana, however, became lazy when crops grew plentiful. Chiwara

was disheartened and buried himself in the ground, never to be seen again. (The word *chiwara* was also understood to mean "excellent farmer," the highest praise one could receive in Bamana culture.)

In their festival in honor of Chiwara, Bamana males represented the sun, while the females were associated with the earth. Together, they symbolized the perfect balance that is necessary for a successful harvest. Wearing antelope masks, the dancers imitated the movements of the graceful animals by standing hunched over and carrying two short sticks as forelegs. They moved to the beat of songs sung by women in praise of the farmers.

Christianity Along with Islam and JUDAISM, one of the world's three great monotheistic religions. Each believes in a single, all-powerful God, and each believes that its sacred scriptures represent the divine word of God as revealed to humanity. Christianity professes its belief in Jesus Christ as the son of God and the savior-redeemer of the world.

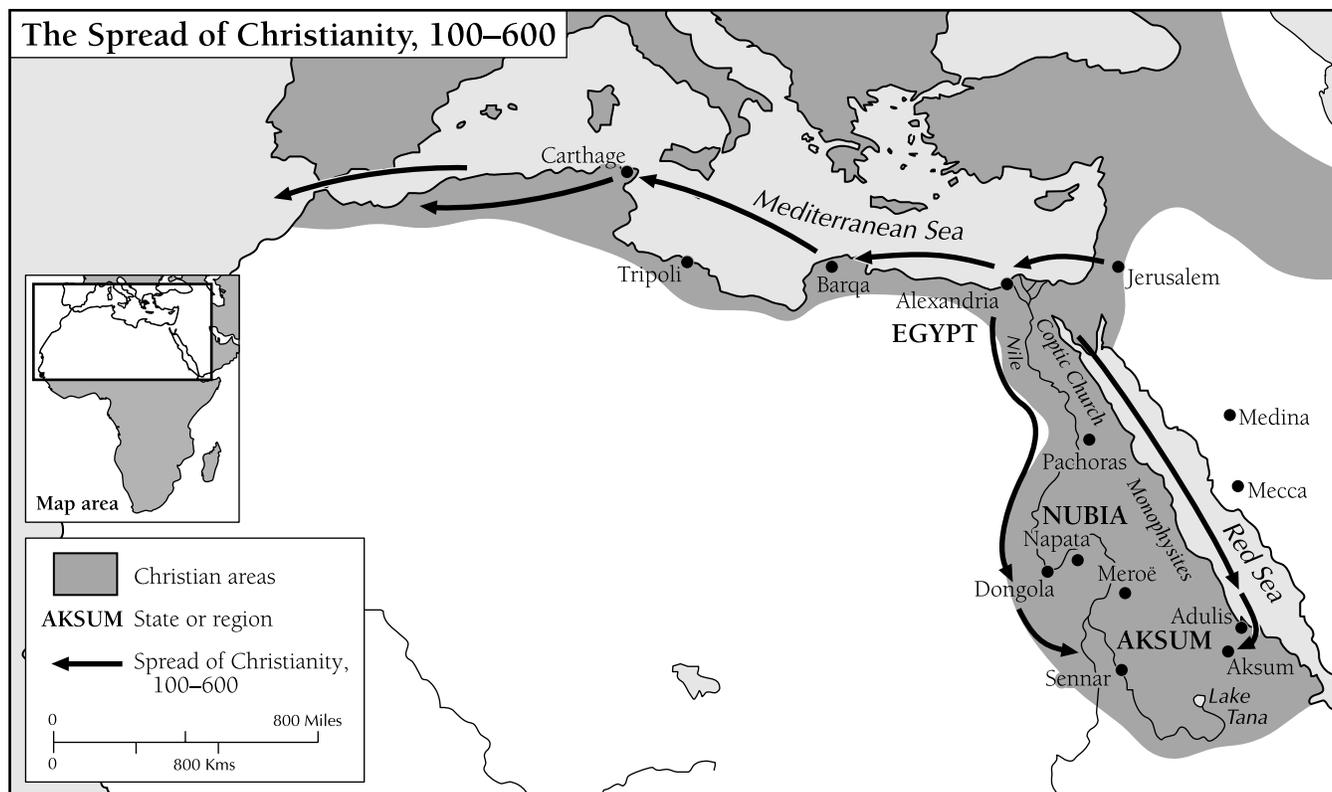
The Early Church in Africa According to Christian tradition the RELIGION was first brought to Africa when Jesus, Joseph, and Mary traveled to EGYPT after Jesus' birth. The religion later flourished in parts of North Africa under Roman rule. The early African church had a strong presence in communities like CARTHAGE and Tangier between the first and third centuries.

The tradition says that one of the first people to spread Christianity after Jesus's death was St. Mark, who preached in Egypt around the years 40 to 60 CE and who founded a church in ALEXANDRIA. In Christianity's first two centuries the religion spread quickly, with each region led by a bishop. By the year 220 Christianity had grown to the point that the province of NUMIDIA had 13 bishops.

For many years, however, the Roman Empire continued to persecute early Christians. As late as 258, in fact, St. Cyprian (d. 258), a theologian and the bishop of Carthage, was martyred for refusing to offer sacrifice to the Roman gods. By 313, however, the Edict of Milan was passed throughout the Roman Empire, allowing Christians to worship freely.

In its early days the African church also underwent a number of controversies that resulted in breaks from the official church based in ROME. In the early fourth century, for example, the Donatist movement arose after a group of Numidian bishops objected to the appointment of the new bishop of Carthage. Instead of accepting the new bishop, they appointed their own, declaring themselves to be the true church. As a result the Donatists, who at one time included one-half of the Christians in Africa, were persecuted and their churches confiscated.

In the fifth century an argument involving the Monophysites also caused a schism, or split, in the church. It

The Spread of Christianity, 100–600


was at that time that the COPTS of Egypt and Syria, who believed only in the divine—rather than the dual—nature of Jesus, broke with Rome.

Early African Christians were among the first important contributors to Latin Christian literature. One of the most influential thinkers in the early history of the Christian Church, St. Augustine (354–430), was born in Numidia. He became the bishop of Hippo, near Carthage, in 396; his writings include the *Confessions* and *City of God.* Other notable thinkers from Christian Africa include Tertullian (c. 160–225).

The Catholic and Christian presence in Africa was diminished with the introduction of Islam between the seventh and 10th centuries. Still, the Christian Church in ETHIOPIA today stands as a descendent of the long tradition of Christianity in Africa.

Christianity and Traditional African Religions
Ever since Christianity spread to Africa, especially in Roman North Africa, Africans have observed both Christian and traditional rituals and beliefs. At times they have even taken elements from both forms of worship.

Although there certainly is not one single traditional African religion, general similarities and differences can be sketched out between Christianity and the traditional beliefs of Africans.

Like Christians, many African peoples believe in the existence of one supreme being or creator god. However,

early European visitors to the continent did not think this to be the case, partially because there seemed to be few shrines devoted to a supreme being. Since the creator was a remote being that stayed out of human affairs, few Africans offered worship to one god. Mulungu, for example, is the supreme, omnipresent god of many East African peoples. But this deity is prayed to only as a last resort, not as a matter of course or daily ritual.

Traditional African religions and Christianity also share a belief in an AFTERLIFE. Many African peoples, from the ancient Egyptians to the MBUTI of southern Africa, have buried the dead with their possessions so that they can use their belongings in the next world. Unlike Christians, however, many African peoples revere their ancestors, whom they believe have supernatural powers. The Bantu-speaking Fang people, for example, have long believed that the bones of ancestors can affect the fortunes of people.

A major difference between Christianity and the traditional religions involves the acceptance of other DEITIES. Unlike most African religions, Christianity does not allow its believers to worship any deity besides God. In contrast, followers of traditional African religions pray to various secondary deities as well as to their ancestors. These secondary gods serve as intermediaries between humans and the creator. The YORUBA people of NIGERIA, for example, believe in a creator, OLORUN, who watches

over a group of divinities called ORISHA, to whom worshipers appeal for guidance and support.

Another important difference is seen in the attitude toward nature and fertility. Christianity does not include rituals that celebrate nature or fertility. Traditional African religions, however, have long seen these principles as worthy of worship. The people of CARTHAGE worshiped a fertility god named Baal, who was represented as a calf and who was offered human sacrifices. The BAMANA people of central Africa hold an annual festival in honor of CHIWARA, the deity that was thought to have taught people to farm.

Missionaries have brought Christianity to many areas of Africa. Nevertheless, African traditional religions continue to survive. In part, this is because, unlike Christianity, African religions do not observe a strict doctrine and constantly evolve to include beliefs of other religions. As a result some African people observe a religion that combines traditional practices with Christian beliefs.

circumcision Surgical modification of male or female genitalia, or sexual organs. Although the controversy surrounding the practice of circumcision in Africa is recent, there is sizable evidence indicating that it is a cultural form dating back to antiquity. Archaeologists have documented the earliest instances of circumcision in Egyptian mummies, dating from at least 4000 BCE, that show evidence of the procedure. Additional evidence is provided by early travelers and writers about the region, including HERODOTUS (484–425 BCE), who noted that "the Egyptians and Ethiopians have practiced circumcision since time immemorial." From the NILE VALLEY the practice appears to have spread through resettlement and migration patterns, reaching many parts of Africa, including ETHIOPIA, the Sahara, and the SAHEL, as well as areas populated by the Fulani, IGBO, and HAUSA. Although less documentation has been found for its existence in the central and southern regions of Africa, the practice of circumcision has occurred there as well.

For those in Western society, understanding the prevalence and longevity of circumcision has meant looking beyond the dangers of blood loss, trauma, and potential death experienced by women, young boys, and girls. Its proponents have argued that one must take into account the social, cultural, and economic factors of practicing societies; it is these that reportedly account for the longevity of the practice among traditional societies, Muslims, Christians, and Jews in Africa.

Circumcision's many variations reflect conformity to specific social beliefs and values, but it appears to be most predominant in patrilineal societies in which potential bridegrooms and members of their families exercised

a strong influence. For example, in those parts of Egypt, SOMALIA, and neighboring regions in the HORN OF AFRICA where female circumcision is rigidly enforced, the prevailing belief is that it keeps women chaste and pure for marriage. Although there is little fanfare for women who undergo the procedure, it carries significant economic considerations because, unless a young woman is circumcised, she is not "marketable" as a wife. The ramifications for uncircumcised women and their families generally include social isolation and condemnation. Proponents have also cited the presentation of traditional family values as a critical factor in preserving the custom.

Moreover, within traditional societies in which young males and females simultaneously experienced circumcision as a rite of passage, the practice has been viewed by many as a powerful expression of social identity and acceptance. In KENYA, accompanied by a great communal celebration, Akamba children are initiated between the ages of four to seven years. Circumcision is traditionally seen among them as a commitment to the adult world of work and social responsibilities. Similarly, MAASAI males and females had to undergo circumcision before they were even considered adults deemed suitable for marriage or assignment to roles in society. After circumcision these males and females remained symbolically bound together for life within established AGE GROUPS. Those who were uncircumcised remained outside of society, considered neither male or female.

The simplest and most widely practiced form of male circumcision entails the cutting of the foreskin. Among the most extreme variations are two forms of castration. Populations such as the BEJA of Nubia and ETHIOPIA, the Sidamo of Ethiopia, and the SAN and Khoikhoi of SOUTH AFRICA have traditionally practiced unilateral castration. Bilateral castration, practiced by Muslim enslavers, produced a caste of men known as eunuchs who were deemed suitable attendants for female harems.

Female circumcision in its most simple form involves clitoridectomy, or the surgical removal of the clitoris. In some societies, the labia minora and labia majora may also be removed. The most extreme form of female circumcision, practiced in regions such as Somalia, is known as the pharaonic tradition. In Western society it is known as infibulation and entails the removal of the clitoris and both labia. The remaining sides of the vulva are sutured together and remain intact until the young woman's wedding night.

civets Although often referred to as a civet cat, the civet is not really a feline but belongs to a related family that includes the mongoose. Civets are about 30 inches (76.2 cm) long, not including a 20-inch (50.8-cm) tail. They weigh up to 25 pounds (11.3 kg) and have coats of gray or black fur, which may be marked in different patterns of stripes and spots. Their faces resemble those of weasels.

Civets are solitary animals, usually living alone in trees and rocky hillsides and going out at night for food. Some civets, such as the African civet and the Congo water civet, are semiaquatic. Although most civets live on the ground, palm civets are found in trees and eat fruit. Civets usually give birth to litters of two or three.

Civets are noted for glands, located near their genitals, that give off a musky odor. Although, in nature, these glands are used for marking territory, humans have long used them to manufacture perfume, removing the musk from captive civets every two or three weeks. As a result civets were among the many trade items that caravans, controlled by the empires of GHANA, carried from the NIGER VALLEY to North Africa.

clan Group of related FAMILY members who trace descent from a common ancestor. A clan may be limited to a small geographical area or dispersed across a wide territory, but, invariably, the members of a clan share a strong bond of identity and common origin. Often, that identity is represented by a special emblem or sacred object.

A clan's sense of identity is further determined by observing the rule of exogamy, wherein men and women of the same clan are not allowed to marry. Identity also is reinforced by sharing a common name. Clans may be broken down into LINEAGE groups or into sub-clans, which refer to segments of a clan that have been dispersed throughout a region. The mutual support and unity created by a clan is one of its most important functions. Clans can expand through marriage and thereby strengthen their alliances with other clans.

Clans are formed when family groups become large and members spread to different areas of the same territory. Although larger in size than bands and segmentary societies, family clans may still need to unite for economic or other reasons. Among the Pokot (or Suk, as they sometimes are called) of western KENYA, for example, the clan traditionally regulated marriage and maintained other forms of social control. Clan members who trace their family line to a female ancestor are considered a matriclan. Patriclans are represented by a single male

ancestor. Over centuries, the loyalties of family clans eventually broadened and were replaced by AGE GRADES or SECRET SOCIETIES.

Cleopatra (r. 51–30 BCE) *Queen of Egypt and last ruler of the Ptolemaic dynasty*

Celebrated in literature and legend for her extraordinary beauty, Cleopatra was equally celebrated in history for her intelligence, commanding presence, and political skills. Like the other rulers of the Ptolemaic dynasty, she was descended from Ptolemy I, one of the favored generals of Alexander the Great (356–323 BCE) and the dynasty's founder. Born about 69 BCE, Cleopatra was the daughter of Ptolemy XII Auletes; the identity and ethnic background of her mother are uncertain. Although some historians have suggested that, because of the fairly common mixing of Greek-Macedonian, Middle Eastern, and African bloodlines, Cleopatra probably had a dark-skinned complexion, she, like other Ptolemaic rulers, undoubtedly would have considered herself to be Greek. In spite of this, Cleopatra took an active interest in Egyptian culture and customs, and she was, in fact, the only member of her royal line to actually be fluent in the Egyptian language.

Cleopatra came to the throne at the age of 17 or 18, reigning jointly with her father. Upon his death she first ruled in conjunction with her brother, Ptolemy XIII. Then after his death she ruled with her other brother, Ptolemy XIV, whom she had married according to the Egyptian royal custom of sibling marriages.

During this time EGYPT became embroiled in the political turmoil and civil strife of ROME. Misjudging the situation, Cleopatra, along with factions of the Egyptian court, at first sided with the Roman consul Pompey rather than Pompey's adversary, Gaius Julius CAESAR (c. 100–44 BCE). This misstep led her brother, Ptolemy XIV, to exile her for a period. By the time Caesar visited Egypt, however, Cleopatra had regained her position and was allowed to meet the victorious Roman leader. The resulting affair between the two rulers led to the birth of Cleopatra's son, who eventually bore the name Ptolemy XV Caesarion. In time Cleopatra ruled over Egypt as co-regent with Caesarion, enjoying the security of Caesar's protection until his assassination in 44 BCE.

Determined to keep Egypt from falling under complete foreign domination, upon Caesar's death Cleopatra quickly turned for protection to one of Caesar's protégés, the Roman consul Marc Antony. Their romantic and po-

litical liaison at first proved highly beneficial to both of them. On the one hand, it gave Antony access to Egypt's wealth and resources, which were valuable to him while he was consolidating his power and pursuing his ambitions in Rome. On the other hand, it gave Cleopatra support in her campaign to extend Egypt's borders and to maintain its independence.

Marc Antony, following Roman custom, killed himself by falling on his sword. The cause of Cleopatra's death, however, is less certain. According to popular legend, she died of a snake bite, having clasped to her breast a highly poisonous snake known as an asp. Some historians argue, though, that the actual cause of her death may have simply been some form of poison. Regardless of exactly how the two met their ends, the victorious Octavian had the lovers buried together in a single mausoleum in the city of ALEXANDRIA.

The grand designs of both Antony and Cleopatra, however, came to an end at the battle of Actium, where, in 31 BCE, Antony was decisively defeated by the forces of Octavian, later known as Augustus CAESAR (63 BCE–14 CE). Eventually, both Antony and Cleopatra committed suicide rather than face the humiliation of defeat.

climate Africa's various climactic regions reflect its location in the tropical zone. Still, within Africa's relatively uniform climate are deserts, grasslands, and rich tropical forests. These changes in terrain and climate have long affected the lives of Africans. In ancient times climate determined where Africans chose to live, their way of life, their language, and even their religious beliefs.

Climatic Zones Generally, a symmetric pattern of climatic zones extends both north and south from the equator. The equatorial tropical RAIN FOREST regions in central Africa are bordered to the north and south by savanna grassland, which is bounded by the desert. In the extreme northwest and southwest of Africa is a region of mild, Mediterranean-type climate. There are also a few mountainous regions.

The rain forest climate can be found in the central part of the continent and the eastern coast of MADAGASCAR. The average temperature in this area is about 80° F (26.7° C), and the average annual rainfall is about 70 inches (1,78 cm).

North and south of the rain forest are belts of tropical savanna climate. Here, the temperatures remain high year-round. Rain falls during the summer season. These areas consist of open grasslands dotted occasionally with trees like acacias and BAOBABS.

Past the savanna lands are arid, desert climates. Less than 10 inches (25 cm) of rain fall annually in the SAHARA DESERT in the north, in the HORN OF AFRICA in the east, and the KALAHARI DESERT and Namib Desert in the southwest. In the Sahara temperatures vary depending on the time of day and season. The highest temperatures are in July, when the average temperature is over 90° F (32.2° C). During the Saharan winter, the temperature can fall below freezing at night.

In the north and northwest—MOROCCO, ALGERIA, and TUNISIA—and in the far southwest of Africa, the climate is typically mild and wet during the winter and warm and dry during the summer.

A mountain climatic region is found in parts of ETHIOPIA, East Africa, and the ATLAS MOUNTAINS in Morocco. The weather is warm and temperate. On the highest peaks, like Mount KILIMANJARO, snow can be found.

Impact on People Climate had a tremendous influence on the migration of ancient peoples. Areas of present-day TUNISIA were populated by HUNTER-GATHERERS known as the Capsian people around 10,000 BCE. The dry, open country of North Africa was ideal for hunting, and it led them to migrate north to influence the Ibero-Maurusian group of present-day Algeria and east to the Gulf of Sidra.

The proximity of desert, Mediterranean, and mountain climates in North Africa has led to a concentration of people leading different ways of life. While Roman North Africans led sedentary, agricultural lives, the BERBERS in the Atlas Mountains lived as NOMADS, tending sheep and CATTLE. In the deserts, Arabs soon began trading along CARAVAN ROUTES. Their proximity to one another allowed for trade and the exchange of ideas and cultures.

In contrast, the densely forested regions of the interior of Guinea led to less migration and a later development of trade than in the sudanic belt south of the Sahara. Due to the relative isolation the boundaries of the forest promoted many distinct cultures and languages, although the languages all belonged to the family of NIGER-CONGO LANGUAGES. Also, rather than the grain-based AGRICULTURE of the savanna, the people of the forest relied on root and tree crop agriculture. Perhaps as early as 8000 BCE the people along the savanna fringe of the forest began planting YAMS, which were to become the principal FOOD crop. They also utilized palm trees for producing palm oil and raffia cloth. They lacked DOMESTICATED ANIMALS except for the guineafowl. As they began to use the polished stone axes of the NEOLITHIC AGE, agriculturalists moved deeper into the forests, for they were able to clear land for their yams and palm trees, which required sunlight. Also, by early in the first millennium CE the arrival of Asian crops that could grow in the shade, like the plantain

and COCOYAM, led to the further expansion of farming in the forests. Hunting and gathering also continued to be important.

The climate has also affected the religious beliefs of Africans. For example, once the necessary tools were available to farm the tropical forests of West Africa, these areas became quite heavily populated and supported fairly urban civilizations. Consequently, the religious beliefs found there were based on their states and their rulers. Kings of city-states were associated with gods, good luck, and fertility. In East Africa, however, the temperate grasslands supported cattle herding and a more rural way of life. As a result East African religious beliefs centered around the worship of sky divinities who were associated with their ancestors.

cloth and textiles

Cloth and textiles used for clothing, blankets, bandages, burial shrouds, and tents have been produced since the beginning of civilization. One of the earliest known fabrics of human manufacture was linen, which was made from flax, a long-stemmed plant that grew along the NILE RIVER. Ancient Egyptians made linen as early as 5000 BCE. First, the flax was pulled from the ground and retted, or soaked, in water. The fibers were then separated from the stems and beaten until they were soft. These fibers were next twisted into thread that was woven into linen on a loom. The ancient Egyptians used linen for everything from the robes and loincloths they wore to the bandages in which they wrapped their mummies.

Elsewhere in Africa nomadic Bedouins used the hair of domesticated GOATS and sheep to weave the tents in which they lived. Strips of coarse cloth known as *fala'if* made from this animal hair were then sewn together into a long rectangular shape and supported by tent poles. These tents were lightweight and easily taken down.

The BERBERS of North Africa also used animal hair and wool to weave tents and carpets. These textiles were often dyed with roots and herbs and featured intricately woven symbols that were meant to scare away evil spirits.

The ASHANTI people of GHANA and the Kuba people of the CONGO BASIN were also renowned for their intricate textiles woven from palm fibers. The best-known Ashanti cloth is called *kente* and is worn at various ceremonies.

See also: CLOTH AND TEXTILES (Vols. II, III, IV, V).

clothing and dress

As elsewhere, humans in Africa developed clothing in response to the environment and the availability of resources. For HUNTER-GATHERERS like the forest-dwelling MBUTI of central Africa, tree bark offered an ample supply of materials for clothing. Similarly, the raffia palm tree, which is indigenous to central and West Africa, supplied an early source of clothing for people living in those areas. Men were the primary weavers. Other early forms of natural fibers used for clothing were jute, wild silk plants, and flax. Silk cultivators and users included the HAUSA, ASHANTI, YORUBA, and Nupe.

Pastoralist societies tended to wear animal skins supplied by their herds. These skins were scraped and cut into forms after being dried and treated. One of the earliest known prehistoric cave paintings, found in Bechar in ALGERIA, for example, depicts men wearing animal skins and coats made of feathers. The BORAN OROMO of ETHIOPIA and the MAASAI of KENYA also utilized their herds to make leather garments.

In the colder, mountain climates of North Africa, pastoralist groups such as the BERBERS coupled the use of animal skins with fur to create clothing that provided warmth. The fur was woven into a variety of woolen-like items ranging from clothing to tents, blankets, and rugs. It has long been the custom of women in this region to wear shawls known as *mouchitya* as a sign of their marital status. Similarly, in the ETHIOPIAN HIGHLANDS, men and women have long worn *awollos,* or shawls, made of woven grass to protect them from the cold.

The earliest known cultivation of plant fibers used to weave cloth in Africa has been traced to EGYPT between 4000 and 3000 BCE. Along with animal skins, sedentary societies such as the Tasian culture, BADARIAN CULTURE, and NAQADA I cultivated flax. Although it is not certain what type of device was used to weave or spin the material, archaeologists have recovered bone needles that clearly were used for sewing. Looms were certainly present by Egypt's dynastic period, from which there are wall reliefs depicting looms in use. Needles, in use as early as the OLD KINGDOM (c. 2705–c. 2213 BCE), were made of COPPER. These and other findings, such as the linen burial cloths found in ancient tombs, indicate that production of cloth was firmly entrenched during this period. However, stylized dress was reserved for the upper classes.

There is some debate as to whether the tight-fitting sheaths depicted in Egyptian art were worn by all women or only by goddesses and religious figures. More generally it is believed that by 1550 BCE, during the NEW KINGDOM (c. 1590–1070 BCE), clothing for both males and females had evolved to fuller garments known as a *kalasiris.* Women wore this garment supported by shoulder straps or bodices with sleeves, while men wore this form of clothing from the waist down. During an earlier period, men were known to wear kilt-like garments that fell to the knee and sometimes to the calf. In contrast, Egyptian laborers apparently wore a form of apron, while children and servants appear to have worn little if any

clothing. Forms of dress in the neighboring kingdom of MEROË were comparable to those of Egyptians.

Stylized cloth was associated with the rise of early kingdoms that also pushed new forms of expression. Embroidery, appliqué, and other forms of embellishment with BEADS, COWRIE SHELLS, and GOLD threads made specialized forms of cloth a coveted luxury reserved for ruling kings. Specialized cloth, such as the raffia cloth made by the Kuba people, was also used to make specific statements about regional culture and FAMILY LINEAGE by using proverbs and designs of animals and plants. Cloth of this type became an essential component in royal ceremonies, FESTIVALS, masquerades, and ritual work.

Many ancient forms of cloth production served significant functions in modern African society, although with limited use. Bark cloth made by the Mbuti, for example, traditionally was only worn at such sacred events as funerals, ceremonial dances, and INITIATION RITES. Beyond this, male TUAREGS have long worn indigo veils and robes to announce their status as adults.

cobras African cobras include ringhals, which inhabit the southern part of the continent, and tree cobras, which are found along the equator. The Egyptian cobra, which is native to EGYPT, is identifiable by its small, flat face and rounded snout. It can grow up to 8 feet (2.4 m) long. In ancient Egypt, cobras were associated with the snake goddess BUTO, who was often depicted as a snake coiled around a PAPYRUS roll. According to Egyptian legend, Buto helped nurse the god HORUS when he was born. She also protected him from his treacherous uncle SETH, who killed Horus's father, OSIRIS. Buto was believed to be the protector of Egyptian royalty. As a result Egyptian kings wore a depiction of the cobra on their crowns.

cocoyam (taro) Tuberous root plants generally grown in the forest regions of Africa. Known as the "Asian yam" or taro, cocoyams were first imported from Asia sometime during the first century CE. They entered Africa by way of southeastern trade routes, transported by Malaysian or Polynesian sailors from the South Pacific. These seafarers subsequently settled on the island of Madagascar by the second century, and some historians believe the crop spread from this point. Others hold that the cocoyam was present in Africa at an earlier period, pointing to many myths that relate to its existence. It also was carried overland from South Asia into North Africa, having been noted in EGYPT as early as 500 BCE.

Among the many African myths dealing with YAMS and cocoyams is one that has long been told among the IGBO. In it the Igbo's founding king sacrifices his children, a boy and a girl, whose burial results in the first yam and cocoyam.

The assignment of female qualities to cocoyams, which are a prominent FOOD staple, carried over to the role of gender in their cultivation. For centuries, the cocoyam has provided a notable source of income for women farmers in Africa. Successful harvests not only provided subsistence for the woman's FAMILY but also promoted cooperative marketing strategies.

coelacanth Ancient lobe-finned fish known to inhabit the waters off the southern coast of Africa. Based on fossilized remains, scientists have determined that the coelacanth was a likely ancestor of some early forms of land vertebrates hundreds of millions of years ago. This assumption is based on the coelacanth's unique physical characteristics. Its body, which may range in color from blue to brown, is notable for its lobes. (Lobes are the rounded, fleshy projections attached to fins and tail, which give this species the appearance of "walking" on limbs or feet.) Coelacanths have been measured at a mere 6 inches (15 cm) and up to 5 feet (150 cm) in length. They may weigh as much as 150 pounds (67.5 kg) or more.

For many years fossilized remains served as the only record of the coelacanth's existence. Scientists assumed that the coelacanth had become extinct approximately 60 million years ago. These beliefs were revised after in 1938, when it was discovered that the species was flourishing in the southeast region of the Indian Ocean, near SOUTH AFRICA, MADAGASCAR, and COMOROS. In fact, for centuries it has been part of the regional diet. (It is generally dried and salted before consumption.)

Comoros (Comoro Islands) Archipelago situated in the western Indian Ocean between the northern tip of the island of MADAGASCAR and the coast of East Africa. Its four major islands are Njazidja, Mwali, Nzwani (Anjouan), and Maore, which is also known as Mayotte. The islands are noted for unusual wildlife, including Livingstone's flying fox, a giant fruit bat found nowhere else in the world, and the COELACANTH, a fish once thought to have been extinct for millions of years.

Congo basin Area in tropical western Central Africa that is drained by the CONGO RIVER. The basin covers 1,600,000 square miles (4,100,000 sq km) and occupies most of the present-day countries of Democratic Republic of the CONGO and the Republic of the CONGO, as well as parts of ANGOLA, northeastern ZAMBIA, and southern CENTRAL AFRICAN REPUBLIC. The basin is made up of an intricate system of tributaries and channels surrounded by dense tropical RAIN FOREST. In ancient times, the area was inhabited by the forebears of the small-statured MBUTI people and, later, by Bantu-speaking peoples.

The Congo basin extends over 1,200 miles (1,931 km) from north to south, about the same distance it also covers running from the Atlantic in the west to the Nile-Congo watershed and Lake TANGANYIKA in the east. This basin is made up of a system of tributaries flowing downward along concentric slopes. These slopes surround a depression known as a cuvette, a sunken area containing alluvial deposits lying on sand and sandstone.

Due to its location straddling the equator, the climate of the Congo basin is hot and humid, with an average temperature of about 76° F (24° C) in northern parts of the basin. In this region it rains throughout the year, with an average of about 67 inches (175 cm) of rainfall annually. The savanna territory of the southern region is dryer. This area has distinct dry and wet seasons and averages 49 inches (125 cm) of rainfall a year.

The earliest known reference to the Congo basin occurs in ancient Egyptian records. Around 2000 BCE the Egyptian commander HARKHUF visited this region, known to Egyptians as the Land of Trees, and wrote of a "mysterious place with forests so dense they were as dark as night in the middle of the day." Harkhuf also claimed to have discovered a race of small-statured men who sang and danced to their god. These tiny men, who apparently were the region's first inhabitants, became known to outsiders as the PYGMIES. Growing to an average height of about 4.5 feet (1.5 m), they survived by hunting, FISHING, and gathering wild fruits and edible plants. They lived in shelters made of brush deep in the jungle.

Between 500 and 150 BCE, iron was introduced to this area. A trade route was established from Koro Toro in the north to the Likouala region, located between the Sangha River and the UBANGI RIVER. About the same time, the region began to be inhabited by various Bantu-speaking peoples, who fished and farmed near the river. In medieval times, the Congo region was dominated by various empires that often traded such goods as COPPER and ivory.

See also: CONGO (Vol. III); CONGO BASIN (Vol. II).

Congo, Democratic Republic of the (Congo-Kinshasa; formerly Zaire) Western Central African country, approximately 905,400 square miles (2,345,000 sq km) in size and occupying the larger portion of the CONGO BASIN. To the north lie the CENTRAL AFRICAN REPUBLIC and the Republic of the SUDAN, to the east lie UGANDA, RWANDA, BURUNDI, TANZANIA, and ZAMBIA, which, along with ANGOLA, also runs along the southern border. The Congo has a narrow outlet to the Atlantic at the mouth of the CONGO RIVER, which along with the UBANGI RIVER constitutes its western border with the Republic of the CONGO. The extensive river system has facilitated transportation and the movement of peoples and goods for several millennia. Approximately half of Africa's tropical forests are in the Congo, and these are its principal ecological feature. Transitional woodlands lie to the north and south of the RAIN FOREST, while the southernmost area consists of savanna grasslands and light woodlands. The Mitumba Mountain Range runs along the country's eastern edge, bordering the RIFT VALLEY.

The earliest clear evidence of human habitation in the area dates from the middle phase of the STONE AGE, which lasted from c. 1.5 million to 40,000 BCE. Archaeological discoveries of ACHEULEAN TOOLKIT sites in the southern savanna regions provide concrete evidence of the Middle Stone Age populations. This population evolved into the Late Stone Age, which emerged somewhat after 40,000 BCE. This way of life continued to remain viable until the first phase of the BANTU EXPANSION led to the spread of agriculturalists along the northern edge of the rain forest in the latter part of the second millennium BCE.

Following this expansion of the North branch of the Bantu peoples the West Bantu expansion took place southward into the rain forests of the Congo Basin and then into the light woodlands of the southern savanna. Here the YAMS and palm trees that the West Bantu brought with them could readily grow. Much of the initial movement was along the rivers of the Congo basin, which allowed for movement through what because of its heavy cover of rain forest, would have been an inhospitable region for farmers and herders. It was only with the arrival of the banana as a major FOOD crop, perhaps around 500 CE, that the Bantu-speaking farmers could establish themselves in the deep forest. Until that time, Late Stone Age HUNTER-GATHERERS, such as the ancestors of the MBUTI (sometimes referred to as PYGMIES) continued as the dominant population of the rain forests.

The Bantu occupation of the open southern savanna grasslands was facilitated when people belonging to the East Bantu group moved westward, bringing with them the grain crops and CATTLE of East Africa and merging with people of the West Bantu group. They also brought new technology for iron working. By about 500 CE the migration of the Bantu into the southern savanna had come to an end. The nuclei of farming villages began to grow as their inhabitants developed agricultural techniques adapted to their surroundings. Along with population growth came the beginnings of incipient state structures.

Because of the wide variability in soil and rainfall patterns, however, the population remained unevenly distributed, affecting the rate of social and cultural change.

See also: CONGO, DEMOCRATIC REPUBLIC OF THE (Vols. II, III, IV, V); ZAÏRE (Vol. V).

Congo River   Africa's second longest river, after the NILE RIVER, and one of the longest in the world; located in west-central Africa, primarily between the present-day countries of Republic of the CONGO and the Democratic Republic of the CONGO (formerly ZAÏRE). The Congo extends about 2,900 miles (4,640 km), ranging in width from 0.5 to 10 miles (.8 to 16 km). It rises in the highlands of northeastern ZAMBIA between Lake TANGANYIKA and Lake Nyasa (Malawi), where it is known as the Chambeshi River, at an elevation of 5,760 feet (9,216 m) above sea level and at a distance of about 430 miles (688 km) from the Indian Ocean. Formed by the junction of the Lualaba and Luvua rivers in the southern part of the Democratic Republic of the Congo, the Congo River flows generally north to a point just south of the equator, where the Lualaba becomes the Congo River proper. From this point the course of the river resembles a huge irregular arc, looping northeast, northwest, and southwest to an outlet between Banana in Congo and Sharks in ANGOLA, on the coast of the South Atlantic Ocean.

Like South America's Amazon River, the Congo flows out of an equatorial zone in which heavy rainfall occurs almost all year. Upstream from Malebo Pool, the Congo basin receives an average of about 60 inches (15.25 m) of rain a year, of which more than one-fourth is discharged into the Atlantic. The drainage basin of the Congo, however, is only about half the size of that of the Amazon, and its rate of flow is considerably less than that of the Amazon.

More than 4,000 islands, including about 50 that are more than 10 miles (16 km) in length, are situated in the Congo River. With its numerous tributaries, which also include the Aruwimi, Kasai, and Lomami Rivers, the Congo is the main artery of TRANSPORTATION in central Africa and drains the central African equatorial basin, an area of more than 1.6 million square miles (4.16 million sq km). This drainage basin includes most of Republic of the Congo and the Democratic Republic of Congo, as well as northern Angola, western Zambia and Tanzania, and the southern part of CENTRAL AFRICAN REPUBLIC. It is the most clearly distinguished of the various geographic depressions situated between the Sahara, the Atlantic Ocean, and the lakes of East Africa.

The Three Sections of the River   From its sources to its mouth, the Congo River system has three contrasting sections. The first, the upper Congo, is characterized by confluences of lakes and rapids. At first, several streams unite to form the river. Then, after about 60 miles

(96 km), the upper Lualaba, Luvua, and Lukuga rivers merge. Each stream undergoes some type of expansion, even when it does not form a lake. Rapids occur not only along the head streams but also several times along the course of the main stream. Navigation is possible along some sections of the upper Congo, but only for vessels of low tonnage.

The second section, the middle Congo, flows steadily for more than 1,000 miles (1,600 km) to within 22 miles (35 km) of Kinshasa. Its course is narrow at first, but it soon grows wider, after which islands occur in midstream. This change in the character of the river corresponds to its entry into its alluvial plain. From that point onward, with the exception of a few rare narrow sections, the Congo divides into several arms, separated by strings of islands. It increases from a width of 3.5 miles (6 km) downstream from Isangi to widths of up to 8 miles (13 km). Beyond the natural silt levees occurring on either bank, some areas are subjected to extensive flooding that increases the river's bounds still further. The middle course of the Congo ends in a narrow section called the Chenal.

The Congo's third section begins upon leaving the Chenal. There the Congo divides into two branches, forming Malebo Pool, a vast area about 15 miles (24 km) by 17 miles (27 km). Immediately downstream are the first waterfalls of the of the river's final section. Cataracts and rapids are grouped into two series, separated by a fairly calm central reach, in which the altitude drops from a little less than 900 feet (270 m) to a few yards above sea level. The Congo's estuary begins at Matadi, downstream from the rapids that close off the interior Congo. With a length of 83 miles (133 km), it forms the border between present-day Angola and Republic of the Congo (Kinshasa). At first the estuary is narrow, with a central channel 65 to 80 feet (104 to 128 m) deep, widening again downstream of Boma. There the river, obstructed by islands, divides into several arms. In some places the depth does not exceed 20 to 25 feet (30 to 40 m), which makes dredging necessary to allow oceangoing vessels to reach Matadi. Beyond the estuary's mouth, the course of the Congo continues offshore as a deep underwater canyon that extends for a distance of about 125 miles (200 km).

Navigability on the Congo is limited by a series of 32 cataracts over the river's lower course, including the famous Inga Falls. These cataracts make it impossible to navigate the Congo between the seaport of Matadi, at the head of the Congo estuary, and Malebo Pool, a distance of about 250 miles (400 km). Below Matadi, however, where the Congo estuary begins, the river is navigable to the sea, a distance of approximately 83 miles (133 km). The only obstacle to navigation on the upper Congo are the cataracts near Kisangani. Between Kisangani and Kinshasa, at the northern terminus of the cataracts, the

river is navigable to all river craft. Many vessels have regular schedules on this route, as well as on most Congo tributaries. This helps the Congo form the continent's largest network of navigable waterways, amounting to 9,000 miles (14,400 km).

Climate and Animal Life The equatorial climate that prevails over a significant part of the Congo basin is coextensive with a dense evergreen forest that spreads out over the central depression. The forest region is bordered on either side by savanna, and the forest and savanna often meet.

Animal life in the Congo basin is close to that of the equatorial forest, which is sharply distinct from the wildlife of the savannas. Numerous species of fish live in the waters of the Congo, with more than 230 identified in the waters of Malebo Pool and its tributaries alone. The swamps often dry up at low water and are inhabited by lungfish, which survive the dry periods buried and encysted in cocoons of mucus. The waters of the Congo itself also contain various kinds of reptiles, with crocodiles being the most striking species. Semi-aquatic tortoises are to be found as well, as are several species of water snakes.

More than 265 species of birds typical of the equatorial forest have been recorded in the Congo region. Occasionally or seasonally, however, atypical birds may be seen, including such seabirds as the sea swallow, which fly upstream from the ocean. Migratory birds from Europe, including the blongios heron and the *Ixobrychus minutus* (little bittern), pass through the region, too. Species with a wide distribution within Africa, such as the Egyptian duck, also have been noted.

Aquatic mammals such as HIPPOPOTAMUSES, otters, and manatees are present but are rare. The manatee has been officially identified only on the Sangha tributary, but it appears to have given rise to legends of a siren-like creature called Mami Wata.

copper Reddish, extremely ductile metal that is an unusually good conductor of electricity. Copper is found in a free metallic state, and, in Africa, this is how it was discovered and first used by neolithic peoples around 8000 BCE. The source of much of this copper was—and still is—the rich veins of ore found in present-day ZAMBIA. This belt extends about 280 miles (448 km) northwest from present-day city of Luanshya, in Zambia, into what is now the Katanga region of Democratic Republic of the CONGO. Up to 160 miles (256 km) wide, this area contains more than one-tenth of the world's copper deposits.

Using copper as a substitute for stone, ancient peoples fashioned crude hammers, knives, and other utensils.

The malleability of the material made it relatively simple to shape by beating. Pounding hardened the copper so that more durable edges resulted. Copper's bright reddish color and its durability made it highly prized.

The search for copper during this early period led to the discovery and working of native copper deposits. Sometime after 6000 BCE people discovered that copper could be melted in a campfire and cast into a desired shape. After this came the discovery of copper-bearing rock and the process of using fire to reduce the ore to metal. This was the dawn of the age of METALS and the birth of METALLURGY.

In EGYPT, where graves have been found containing copper weapons and other implements, this metallic age began sometime between 5000 and 4000 BCE. At Gerza, just south of the modern site of CAIRO, the inhabitants learned basic copper metallurgy from immigrants from MESOPOTAMIA. By about 3500 BCE the Gerzeans had developed an entire civilization based on copper metallurgy. During this same period Nubians also were fabricating instruments made of copper.

Around 3500 BCE, copper was intentionally alloyed with tin to produce bronze, which was both harder and tougher than either copper or tin. For this reason it was widely employed for both weapons and objects of ART. From Egypt, the use of bronze rapidly spread across the Mediterranean to Europe, and the period of the metal's extensive and characteristic use has been designated the BRONZE AGE.

As copper became more important to them, the ancient Egyptians sought copper, as well as GOLD and antimony, in the land of PUNT. Although the exact location of Punt is unknown, it probably was along the mouth of the ZAMBEZI RIVER, where the gold obtained, even today, has a distinctive greenish tint, probably due to impurities of copper and antimony.

Unlike northern Africa, central Africa had no specific Bronze Age. Instead, in the last millennium BCE, central African peoples discovered the value of copper during what was, for them, the IRON AGE. These peoples prized copper for its luster and color, using it extensively for personal JEWELRY—bangles, chains, necklaces, hair ornaments, and rings. These objects were given to loved ones as well as to important personages, and were made with great craftsmanship. Copper also was used to beautify personal belongings, and copper-inlaid decorations appeared on knife handles. Fine copper wire was used to bind spearheads to shafts, and burnished copper nails were used as embellishments on shields. Copper was also used in works of art used to furnish the graves of important people.

The demand for fresh copper grew with each succeeding generation, particularly as the development of new political authorities led to the need for court regalia for kings and chiefs. Copper was also used for the musical instruments that accompanied kings and their nobles

on their sojourns around their domains. Not surprisingly, during this period copper frequently became more valuable than gold.

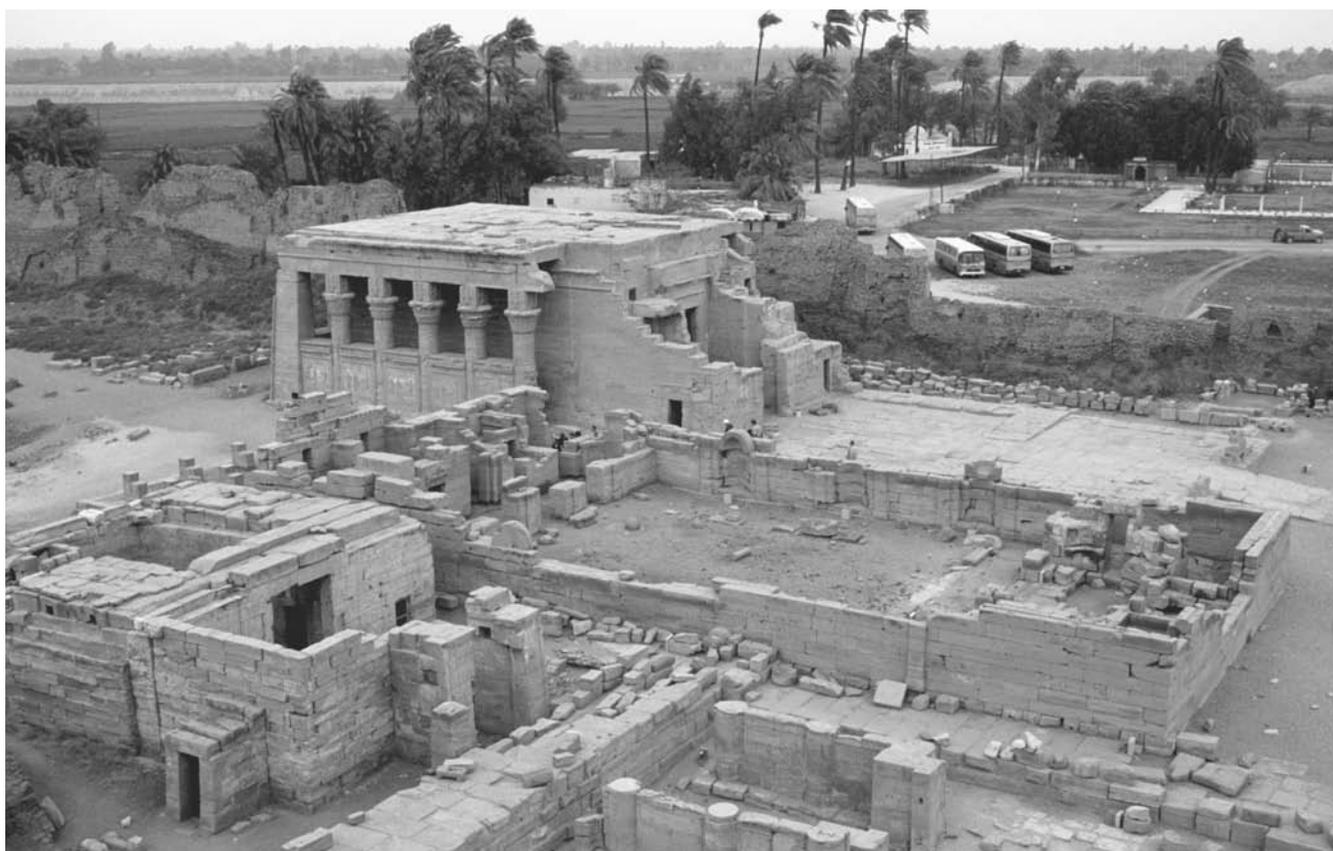
Coptic The last form of the language of the ancient Egyptians, which evolved when EGYPT was converted to CHRISTIANITY. After the conquest of Egypt by ALEXANDER THE GREAT (356–323 BCE) in 332 BCE, Greek replaced ancient Egyptian as the official language of the country. While the Egyptian population continued to write and speak the ancient dialects, the advent of Christianity created the necessity of translating the Hebrew scriptures and Christian gospels into a language the common people could easily understand. This was resolved by creating a script for ancient Egyptian utilizing a combination of the Greek alphabet and a few letters from DEMOTIC script. As a result Coptic played an important role in the development of Christianity in Egypt, remaining the liturgical language of Egyptian Christians for centuries.

Copts Name by which the Christians of EGYPT are known. The word *Copt* is derived from an Arabic distortion of the Greek word *Aigyptos,* which itself is a corruption of the ancient Egyptian name for the city of MEMPHIS, *Ha-Ka-Ptah.*

According to the Coptic tradition, Christianity was brought to Egypt in 61 by St. Mark the Evangelist, a disciple of Jesus. During the next two centuries, the new RELIGION rapidly gained acceptance throughout the country. The center of Coptic Christianity was ALEXANDRIA, the city founded by ALEXANDER THE GREAT (356–323 BCE) after his conquest of Egypt in 332 BCE.

The Coptic Church contributed considerably to early Christian thought, producing such well-known theologians as St. Athanasius (c. 293–373) and St. Cyril the Great, who was head, or patriarch, of the Egyptian Church from 412 to 444 CE. St. Anthony (c. 251–356), the founder of Christian monasticism in the East, was another major figure of the church in Egypt during that time. Later, dur-


The shrine celebrating the divine birth of Thirtieth Dynasty pharaoh Nectanebo I (r. c. 380–362 BCE) or Nectanebo II (r. 360–c. 343 BCE) at Dendara, north of Luxor, was reconsecrated as an Egyptian Coptic church by the fifth century CE. *© Vanni Archive/Corbis*

ing the fourth century, it was Coptic missionaries who were responsible for introducing Christianity to ETHIOPIA.

The Coptic Church still exists today in modern Egypt. Though a minority within a Muslim country, the Copts continue to practice their Christian faith, viewing themselves as direct descendants of the ancient Egyptians. Dr. Boutros Boutros Ghali, secretary-general of the United Nations from 1992 to 1997, is but one of many Copts to figure prominently in the modern world.

In 451 the Coptic Church separated from the rest of Christendom following a theological dispute concerning the divinity of Christ. Known as the MONOPHYSITE Controversy, or Monophysite Heresy, this resulted in an independent national church. Although it was isolated from most of the Christian world, the Coptic Church continued to flourish on its own until Egypt was conquered by the Arabs in the seventh century.

cotton Soft, white, fibrous substance taken from the tropical plants of the *Gossypium* genus. Cotton was one of the first textile fibers manufactured by humans. Production seems to have been developed by the ancient Indus civilization between 5000 and 3000 BCE. By around 2500 BCE, the craft had developed enough that ancient Egyptians were wearing cotton clothing.

Although cotton originated outside of Africa, it ultimately bore a strong connection to the continent. Woven cloth cotton appeared by about 3000 BCE at Mohenjo-Daro, in the ancient Indus civilization. How-ever, scholars have determined that the plant used to make the cotton of Mohenjo-Daro originated in the KALAHARI DESERT of southern Africa, where it still grows today. Botanists are unsure how this plant appeared thousands of miles away in another civilization, but they suspect that the cotton plant was cultivated in Africa before its arrival in the Indus Valley. There is also archaeological evidence of cotton textiles in the middle NILE VALLEY by 5000 BCE.

Traditionally cotton has been woven by African craftspeople using elaborate looms, including the vertical cotton loom and the horizontal fixed-heddle loom, a device that is still used in MADAGASCAR today.

cowrie shells Brightly colored shells that served as one of the earliest forms of money in ancient Africa. Cowrie shells are the oldest and most widely used currency in human history, having been used before the introduction of coins (c. 600 BCE). Before cowrie shells, the barter system and CATTLE were used in business transactions.

Cowrie shells were valued for their beauty and the difficulty in obtaining them. The Kuba people of Central Africa built vast trade networks that allowed them to obtain cowrie shells from distant places. The Ghana Empire, which controlled many of the trade routes in West Africa, also traded cowrie shells. Cowrie shells were not just used for trade and currency, however; they also were used as ornaments. The Nupe, for example, used them to decorate cloth MASKS, and some of the peoples of ETHIOPIA used cowrie shells to decorate their baskets.

Cowrie shells belong to the marine snails of the Cypraeidae family that flourish in the tropical waters of the Pacific and Indian Oceans. Thick and humped, the shells are often glossy and speckled. The variety of shell most commonly used as currency was a small yellow and white type known as the money cowrie.

Crete Island in the MEDITERRANEAN SEA, located southeast of mainland GREECE. Crete is long and narrow, with an area of 3,190 square miles (8,262 sq km). The island developed one of the earliest civilizations in human history. By 3000 BCE Crete was part of the early Minoan civilization that produced exquisite POTTERY, SCULPTURE, painting, and metalwork. During this time Crete established trading links with northern Africa. Ancient records show that traders from EGYPT imported both Cretan cedar and oil (products that were used in the preparation of mummies), while Cretan baskets, pottery, and JEWELRY were traded for goods from areas in northwestern Africa.

By the IRON AGE (c. 1200 BCE) Crete was controlled by the mainland Greeks known as the Mycenaeans. In 67 BCE the Roman Empire conquered Crete. Under Roman rule the island was linked with the Greek civilization of Cyrenaica in North Africa. It later became part of the Byzantine and Ottoman empires.

crocodiles One of the largest living reptiles, generally recognized by its long triangular snout. Widely found in Africa, from EGYPT to SOUTH AFRICA and from MAURITANIA to ETHIOPIA, the Nile crocodile (*Crocodylus niloticus*) is divided into several subspecies: the East African crocodile

(*C.n. africanus),* the West African crocodile (*C.n. chamses*), the South African crocodile (*C.n. corviei*), the Ethiopian Nile crocodile (*C.n. niloticus*), the Kenyan Nile crocodile (*C.n. pauciscutatus*), and the Central African crocodile (*C.n. suchus*).

Some humans eat crocodile eggs and prize their skins. In certain regions of Africa humans also eat crocodile meat. In ancient Egypt the crocodile was revered by certain sects and was represented by Sobek, the crocodile god of fertility. Worship of this crocodile deity was particularly prevalent in the province of Fayoum. Mummies of crocodiles have been found in excavations of Egyptian tombs.

crows Black birds belonging to the same family of animals as the raven and the magpie. The pied crow, which is found in tropical Africa, is distinguished by its white nape and breast. According to the FOLKLORE of the SAN, the bird's white patch comes from a lump of fat. It seems that when San did not return promptly from a long day of hunting, their wives would tie a piece of fat onto the birds and then send them out in search of the men. Although the fat is mentioned in many versions of the tale, its exact purpose is debated. Some versions state that the fat was intended for the bird to eat as it conducted its search; others declare that it was meant to feed the hungry hunters.

Cyrene Greek city in North Africa. Cyrene was the capital of the ancient kingdom of Cyrenaica (c. seventh to fourth century BCE), located in a fertile region rich in natural resources. The city was established in an eroded river valley at 2,000 feet (610 m) above sea level and named after a nearby spring, Kyre.

Located in present-day LIBYA, Cyrene was founded in 631 BCE by a group of settlers from the island of Thera in the Aegean Sea. The settlers were led by Battus, whose descendants ruled Cyrenaica for eight generations. During the reign of the Battiads, Cyrene thrived economically, as it often traded with other Greek cities. The Battiad dynasty expanded their kingdom to include the port city of Apolliana and the towns of Barje and Euhesperides.

Sobek, the Egyptian crocodile god, is sometimes depicted as a crocodile and sometimes as a human with the head of a crocodile, as in this bas-relief from the Temple of Sobek and Horus (C. 205–180 BCE) in Kom Ombo, Egypt. © *Gian Berto Vanni/Corbis*

About 440 BCE the city became a democracy. Then, in the fourth century BCE, Cyrene surrendered to ALEXANDER THE GREAT (356–323 BCE) and fell under the rule of Egypt's Ptolemaic Dynasty. Under Ptolemaic rule Cyrene became a center of learning, featuring great scholars and a medical school. In 96 BCE Cyrene became part of the Roman Empire. The city continued to flourish as the capital of a Roman province that also included CRETE. Cyrene declined in the first half of the first millennium before ceasing to exist after its conquest by Muslims around 64 CE.

D

Danakil Depression   Basin area in the DANAKIL DESERT, between northern ETHIOPIA and southeastern ERITREA; like the Danakil Desert, it has long been populated by the nomadic AFAR people, who migrated there from the ETHIOPIAN HIGHLANDS. The Danakil Depression is one of the lowest places on earth not covered by water, lying about 400 feet (116 m) below sea level at some points. It is part of the Great RIFT VALLEY, a geological fault system extending from the Jordan Valley in southwest Asia to MOZAMBIQUE in southeast Africa.

Like the rest of the Danakil Desert, the Danakil Depression was formed after the evaporation of an inland sea. The depression is a triangular basin made up of SALT pans and active volcanoes, which separate the Danakil Desert from the RED SEA. The CLIMATE of the Danakil Depression is hot and arid: Temperatures reach 120° F (49° C) and the depression receives less than 7 inches (18 cm) of rain fall annually. The landscape is rocky, with little VEGETATION or wildlife.

Danakil Desert   Desert lowland area lying between northern ETHIOPIA and southeastern ERITREA, bordering DJIBOUTI. Also known as the Afar Plain or Danakil Plain, the Danakil Desert is part of the Great RIFT VALLEY, a geological fault system extending from the Jordan Valley, in southwest Asia, to MOZAMBIQUE, in southeast Africa.

A rocky desert area, the Danakil has little VEGETATION or wildlife. It reaches temperatures of 120° F (49° C) and receives less than 7 inches (18 cm) of rain per year. The desert runs 350 miles (570 km) from north to south, while widening from 50 to 250 miles (80 to 400 km). Active volcanoes, often called the Danakil Alps, separate

the desert from the RED SEA to the north and east. The ETHIOPIAN HIGHLANDS border the desert to the west.

The Danakil Desert was once a sea that has now evaporated. As a result 450 square miles (1,200 sq km) of the desert are covered by more than 1 million tons (1.12 metric tons) of SALT. In the northern part of the desert, the DANAKIL DEPRESSION is 400 feet (116 m) below sea level. The area is populated by the AFAR, a nomadic people who migrated there long ago from Ethiopia's highlands.

dance   Over many centuries a wealth of dance forms have emerged in Africa that incorporate the history, RELIGION, and traditional values of countless societies. Dance also has served as an important aspect in RITES OF PASSAGE ceremonies and is a long-standing form of social recreation. An extensive and complex activity, dance in Africa has been described as earth-centered and as the lifeblood and expression of community solidarity. It is almost always performed in league with MUSIC such as drumming, song, and sustained audience interaction.

While no one society can be said to represent a standard dance style, the dance forms of many African peoples share several common elements and purposes. Mass dance movements are prevalent in many public ceremonies. The music might begin with an underlying rhythm created by drum, shells, rattles, or hand clapping. All areas of the body are used to punctuate the music, with quick movements of the torso and the arms or with uniform steps ranging from the very simple to the complex series of leaps and movements made by such groups as the

MAASAI. The Ewe people of TOGO recreate their origin stories in dance forms that imitate the movement of birds. These steps have a larger meaning that is symbolic of migration patterns.

Another form of dance common to many African societies is the ring dance, in which dancers face the middle and move in a counterclockwise circle. It is interesting to note that after the European slave trade began, this form of dance survived in the American South as the ring-shout. The ring, a vital symbol of community solidarity, also symbolizes regeneration. Processional or line dancing is often an essential part of FUNERAL CUSTOMS, and other forms include "free-flow" dance formations or formations that complement a solo dancer.

In the ancient world, dance evolved in many different ways and forms. Cave paintings attributed to the SAN of BOTSWANA depict dancers in religious trances, which some sources believe may have been invoked through repetitive dance steps in ways similar to other societies that invoke SPIRIT POSSESSION. Likewise, the ancestor's of the SHONA women of present-day ZIMBABWE believed themselves to be possessed by *mhondoro* spirits who imparted counsel after being invoked through dance. Similar healing rites were later performed by HAUSA women in West Africa and the Kalabari women of the NIGER DELTA.

Early forms of dance also evolved from the daily routines of work life. Various peoples might typically display the elements involved in FOOD production, such as using a hoe or pounding grain. The *ziglibit* dance of IVORY COAST imitates the pounding of corn. These familiar and communal settings are also emphasized in yearly harvest dance FESTIVALS. In Nigeria the Irigwe people imitate the growth of crops in their leaping dance steps. Nupe fishermen of Nigeria portray their skilled throwing of FISHING nets in dance. Pastoral groups in the Republic of the SUDAN and KENYA incorporate the movements of CATTLE in their dances, while groups such as hunters or BLACKSMITHS have secret dances only known within their castes.

Scenes depicted in various wall reliefs lead to the conclusion that dance was commonplace in ancient EGYPT. Some scenes show dancers (primarily women prior to the MIDDLE KINGDOM) singing, dancing, and clapping. Women dancers often performed as part of religious rites and were associated with specific temples. They were also linked to the royal kingdom and were reportedly always accompanied by a female leader. The practice of having a leader of the dance line, a master of the DRUMS, and an initiator of song are also common features in many African societies.

The indictment of "savagery" leveled against African dance by such European writers as Joseph Conrad often failed to take into account the dance's larger context. Many dances are in fact erotic, created as a central part of fertility rites, or as a part of INITIATION RITES. Dance is thus used to reinforce certain ideas concerning communal identity and the social role of young adults. In north-central Igboland a special mask known as *Agbogho Mmuo* was held in the air and "danced" by young male initiates to acknowledge the beauty of young women. In ancient GHANA it was common for girls in Ga society to display their beauty. It should also be noted that in many other societies, dancers are traditionally segregated by gender or age. The YORUBA of Nigeria held dances in which the entire community participated, including the ruling king, and danced according to status and age.

The strength, skill, self-discipline, and endurance of dancers were also tested by traditional war dances in societies that raised armies for battle. In both the Zulu and Ndebele societies of southern Africa, men performed dances that honor the history of warrior kings. The need to exhibit great skill while dancing also extended to reigning kings. The Ashanti kings were judged by their dance skills performed at their coronation ceremony.

While the role of dance in African societies remains constant, styles changed and spread over the centuries as a result of migration, trade, and the development of city-states. With the advent of new religions and ideas, many traditional dances were abolished or forgotten.

Abrams, 1996); Kariamu Welsh-Asante, ed., *African Dance: An Artistic, Historical, and Philosophical Inquiry* (Trenton, N.J.: Africa World Press, 1994).

Darius I (r. c. 521–486 BCE) *King of the Persian Achmeunid dynasty of the sixth and fifth centuries* BCE

Darius succeeded CAMBYSES I (r. c. 525–c. 521 BCE) to the throne and spent the first years of his reign crushing revolts in Persia, Media, Babylonia, and the East. A powerful leader, he expanded his kingdom to include parts of India. According to tradition, he was a good king to the Egyptians. His projects included a canal that ran from the Nile to the RED SEA, as well as a large temple to AMUN at el-Kharga. Upon his death, in 486 BCE, Darius was succeeded by his son Xerxes II.

death and dying   Attitudes and practices concerning death vary greatly among African societies. GEOGRAPHY, economy, and local customs play an important role in determining each people's view of death. Typically, groups that are sedentary tend to give more importance to death and the surrounding ceremonies than nomadic people. A plausible explanation is that NOMADS must quickly

bury the dead and abandon the body in order to move on to new territories in search of FOOD. For precisely this reason, the Mbeere of KENYA left their deceased in the bush to decompose naturally. More sedentary peoples, such as the Lugbara of UGANDA, created permanent burial grounds that could be attended to for years. Groups like these these developed elaborate funeral rites that sometimes spanned decades. They believed that a proper burial was essential to send the deceased's spirit into the realm of the ancestors, where it would be worshiped by surviving relatives.

Variations on ANCESTOR WORSHIP, a common practice among many traditional African societies, is evident in the customs of the Dogon of present-day MALI. The Dogon believe a person has at least eight souls that are separated from the body at death. Once separated, the soul journeys back to the Creator of all humanity. This journey can take several years, and it requires many expensive sacrificial ceremonies on the part of the deceased's family.

FUNERAL CUSTOMS among groups and peoples are just as varied as views about death. In general, however, most peoples consider sudden death from disease or accident bad luck, so the body is not treated with the same respect as when an elder dies. Those peoples who bury their dead often prepare the body by simply washing it; sometimes they also clean out the stomach or intestines. Some peoples remove the fetus from women who die in childbirth and bury it because they believe the buried fetus prevents others from becoming infertile. After a body is prepared for burial, a ceremony or mourning period usually follows. Funeral rites may last as long as the burial, or they may continue for years.

Deir el-Bahri, Temple of Modern Arabic name for the site of an ancient Egyptian mortuary complex built by King MENTUHOTEP II (r. c. 2040–1989 BCE). Located in the cliffs to the north of Thebes, Mentuhotep's structure consisted of three levels topped by a pyramid. This design was unique for its time, differing significantly from the burial monuments of earlier rulers by combining the king's mortuary temple and tomb in one building.

Queen Hatshepsut (r. c. 1504–1482 BCE), who ruled EGYPT during the Eighteenth Dynasty, also erected a temple at el-Bahri. Modeled after Mentuhotep's nearby temple, it has long been famous for its elegant and graceful design. The decorated reliefs on its exterior reflect the glories of Hatshepsut's rule, as well as her great devotion to the god AMUN. Of particular interest are the temple's depictions of a trading expedition to the land of PUNT, which took place during her reign. Although Mentuhotep's temple complex has not survived, Hatshepsut's monument still remains much as it was when first constructed.

deities Deities in ancient African societies were part of complex belief systems and took many different names and forms. Many societies were monotheistic, having a belief in a central, all-powerful deity that could be contacted through prayer or offerings. Other societies combined this belief with a faith in the existence of lesser deities that served as intermediaries between the all-powerful god and the living. The rationale was that the central deity, as the powerful Creator of all things, was removed from the daily affairs of humans. Therefore, the responsibilities for daily concerns were assigned to deities that had the ability to produce fertile crops, to ensure economic growth, or to generate prosperous trading. Among the Anang of NIGERIA, for example, Abassi was considered a powerful, invisible giant who ruled over the universe from his compound in the sky. Lesser deities in Anang society were known as Nnem, and they served as helpers or messengers to God. Among the Mossi of Yatenga, in BURKINA FASO, Wennam was the principal deity who assigned earth custodians—Tenga Wende and Tido Wende—to provide earthly abundance through farm crops. Prayers and offerings were given to the earth custodians through specially built shrines. The YORUBA of Nigeria recognized OLORUN as their supreme deity but depended upon the ORISHA for resolving dilemmas or meeting day-to-day needs.

Many such deities were portrayed in artwork or appeared as carved figures throughout the ages. In some societies these figures represented the power of the deity or served as a means of transferring spiritual power. Some figures were placed on shrines within the living compound or family homes. Other figures were carried by dancers during rituals honoring specific deities.

demotic Flowing, cursive script that served as the final stage of hieroglyphic WRITING in ancient EGYPT. Although probably developed expressly for use in government documents, demotic script became the most common everyday script in Egypt from around 660 BCE until the early fifth century CE. (Its name is derived from the Greek word *demotikos,* which means "for the people.") In addition to being utilized for government documents, demotic script became common in correspondence, business, literary texts, wood carvings, and stone inscriptions. Only priests, who continued to use the older HIERATIC script in writing religious texts, avoided using the more prevalent demotic script.

Like modern cursive handwriting, demotic script joined the letters of words, employing quick strokes of a

reed brush to create a flowing handwriting. Although harder to read than hieratic script, the demotic script allowed more standardization—that is, everyone wrote its characters in essentially the same way. The last dated example of demotic text is a stone inscription from 425.

The ROSETTA STONE (discovered in 1799 and translated in 1822) is inscribed in demotic script, hieroglyphs, and a Greek translation. The presence of all of these written languages provided the key to deciphering ancient Egyptian hieroglyphics.

Dendara Village in EGYPT; site of a well-preserved ancient Egyptian temple. Dendara, on the west bank of the NILE RIVER in central Egypt, was the principal site of the cult of HATHOR. The ancient Egyptian goddess of the sky, fertility, women, and childbirth, Hathor was represented either as a cow or as a woman whose crown consisted of a sun disk held between the horns of a cow. The Hathor temple at Dendara is one of the best-preserved buildings of ancient Egypt. Built primarily during the Ptolemaic Period (c. 323–c. 30 BCE), it was completed by the Roman emperor Tiberius early in the first century. The influence of both classical Roman and Greek styles can be seen in the relief carving. This is especially true of the human figures, which feature the heroic, voluptuous, larger-than-life proportions characteristic of the Greek style.

deshret Arid, reddish-yellow land of the SAHARA DESERT that covers approximately 95 percent of EGYPT; from the Egyptian word meaning "red earth" or "desert." Ancient Egyptians distinguished the dry, sandy, infertile *deshret* from the land they called *KEMET* (black earth), the extremely fertile soil of the NILE RIVER valley. This silt-layered, fertile soil washed over the fields of ancient Egypt every year when the Nile flooded. Its richness allowed the Egyptians to carve out from the desert a band of green fields bordering each side of the river. The distinction between *deshret* and *kemet* is characteristic of the Egyptian adherence to dualism, the notion that any totality consists of two elements joined in harmonious opposition. Capitalized, the terms refer to UPPER and LOWER EGYPT; *Deshret* was also the name of the RED CROWN, the symbol that represented the Delta region of Lower Egypt.

Dida Galgalla Lava desert, found in KENYA, consisting of gray sand and brown and gray boulders. The Dida Galgalla lies north of Marsabit and west of Lake TURKANA. It is part of the Great RIFT VALLEY, a geological fault system that runs about 3,000 miles (4,827 km) from the Jordan Valley in southwestern Asia to MOZAMBIQUE in southeastern Africa. Although Dida Galgalla is a harsh environment, it is home to many rare birds.

Diocletian (245–316 CE) *Roman emperor who strengthened the empire's position in northern Africa*

Gaius Aurelius Valerius Diocletianus, an officer in the Roman army, was proclaimed emperor by his troops upon the death of Emperor Marcus Aurelius Numerianus (Numerian) in 284. Carinus, Numerian's brother and co-emperor, challenged Diocletian's claim to the title of *emperor,* but was assassinated by his own troops during the battle for the throne.

Diocletian recognized the difficulty of one man ruling the vast Roman Empire. So in 286 he chose to share the throne—and the title of augustus—with Marcus Aurelius Valerius Maximianus (Maximian). Seven years later Diocletian named two younger men, Gaius Galerius Valerius Maximianus (Galerius) and Constantius I Chlorus (Constantius I), as subordinate rulers with the title *caesar.* Each of the four rulers had administrative control over a portion of the Roman Empire, with jurisdiction over Africa being divided between Diocletian, who ruled over EGYPT, and Maximian, who ruled over the rest of Roman Africa.

Through a combination of warfare and administrative reorganization, Diocletian restored the strength of the Roman Empire, which had deteriorated under several prior rulers, and extended its boundaries in Persia and Africa. In 296 Diocletian's armies recaptured Egypt, which had declared its independence from the Roman Empire. As part of his reorganization of the empire, Diocletian divided Cyrenaica, a region of North Africa, into two provinces: Libya Superior (Pentapolis) and Libya Inferior (Sicca). He then assigned a permanent military force to the region—the first such contingent placed in Africa by an emperor.

In 305 Diocletian abdicated and forced Maximian to do the same, leaving rule to his handpicked successors, Galerius and Constantius I.

disease in ancient Africa Disease has plagued the African continent for thousands of years. The African people have long coped with disease-causing organisms by adapting to their environment. Threatening diseases were kept at bay with simple changes in diet, water sources, or migration patterns. Subtle genetic mutations over the centuries have allowed Africans to effectively deal with many diseases.

However, new diseases emerged in response to the changing African environment. Parasites and microbes that cause diseases are directly affected by GEOGRAPHY. Some thrive in the savanna grasslands or semiarid deserts,

while others prefer the rain forests of the western coastal regions. Parasitic diseases like malaria depend upon mosquitoes for transmittal; thus, the disease survives only in areas with pools of water. Temperature and altitude also play an important role in determining where microbes are viable. Extreme CLIMATE changes can affect the susceptibility of the population to otherwise nonthreatening diseases.

The Role of the Seasons The seasons affect diseases both directly and indirectly. The wet season allows mosquitoes and other parasitic hosts to breed, while the dry season can contribute to heat exhaustion, which can negatively affect human immune systems. Dry seasons have always been a time of travel for the African people; they abandon their crop fields to visit neighboring villages for trade. However, diseases travel along with their human hosts, often with devastating effects.

Particularly before the time of European involvement, the seasons determined the state of health of Africa's agriculturalists. Barring periodic catastrophes like drought, the wet season supplied a bounty of FOOD for Africa's inhabitants. The nourishment this food provided enabled people to increase their body weight, thus strengthening their immune systems against disease. The dry season brought drought and hunger, which increased the susceptibility of the immune system. On the other hand, the dry season prevented parasitic larvae from hatching.

Parasites Parasites are some of the most common disease vectors in Africa. Like all parasites, those found in Africa rely on a secondary organism to transport them to the host. Common parasites include filarial worms like the *Loa loa* and the *Calicoides*, which are both transmitted by flies. Intestinal worms are passed to humans from MONKEYS, although they are not life threatening.

Echinococcus granulosus is a tapeworm common in sheep, CATTLE, CAMELS, DOGS, and many other mammals in Africa. Ingesting their larvae can lead to hydatid, or echinococcal disease, which causes severe cysts throughout the body, particularly in the liver. In the Turkana region of KENYA, where dogs are important to society, hyatid disease is spread predominately through the feces of dogs. Children are particularly susceptible to the disease because mothers use dogs to guard their children while they work.

Another native African parasite is *Leishmania.* It is transmitted by tropical sand FLIES that bite humans and animals. Some strains of *Leishmania* cause minor disfigurement by producing open sores on the body and face, while others have more serious side affects. One form of *Leishmania* has long been evident in the regions surrounding present-day ETHIOPIA, where inhabitants often sought shelter in nearby caves. The parasite was contracted from sand flies that feed on cave-dwelling rodents.

Schistosomes are parasites that are passed through the feces of snails. The origins of this parasite can be traced to the lakes of central and eastern Africa, where many species still exist that infect both humans and baboons. Humans are infected by coming into contact with infected water. The disease can cause serious liver, bladder, and kidney problems.

Viruses Viral diseases are abundant in Africa. Many have never left the continent, but some have caused substantial problems abroad. Most are harbored in animals and then passed to humans via tick or insect bites, although the bites rarely result in disease. More often the virus is destroyed by the immune system or protects its host from a more dangerous virus.

Malaria Malaria has long been a serious health threat in Africa. Mosquitoes transmit all four strains of the disease. One of the more lethal strains has been largely controlled after thousands of years of genetic selection. The sickle-cell trait common to Africans developed as a direct response to the malaria parasite. Sickle cells limit the parasite's ability to grow once inside red blood cells, thus largely protecting the host. In tropical regions outside of Africa where sickle cells are not common, this same malaria strain is a serious life-threatening disease.

Disease in Ancient Egypt Evidence gathered from ancient Egyptian papyri and the medical examination of mummified remains suggest that the people of ancient EGYPT suffered from many of the same diseases that afflict people today. These included malaria, poliomyelitis, smallpox, trichinosis, bubonic plague, arthritis, gout, tooth decay, and gall stones. Among the most common diseases in ancient Egypt were parasitic infections. Malaria, characterized by recurrent chills and fever, as well as anemia and enlargement of the spleen, may have been the disease that claimed the life of ALEXANDER THE GREAT, in 323 BCE. Another parasitic infection, schistosomiasis, also was common in ancient Egypt.

divination Widespread throughout Africa, divination has long served as a central component in African RELIGION. It has also played a prominent role in political and cultural areas, as well as in the succession of kings, and, as such, offered practitioners the ability to gain the confidence of rulers. For example, divination was prominent in the enthronement or installation ceremonies of ancient kings in EGYPT. It also serves as an important means of reinforcement of FAMILY and community identity.

Over the centuries a vast number of divination systems have developed in Africa. The ritual skill required to master these systems included a thorough grounding in names, signs, and figures, along with their interpretative counterparts, such as proverbs, parables, or symbolic riddles. For centuries, these systems have appeared deceptively simple to outsiders. For instance, the Dogon traditionally read the tracks left by animals from an ancient period, while the Mum of West Africa interpreted the movements of spiders. More frequently, divining involved the casting down and "reading" of various objects, such as COWRIE SHELLS, divination stones, or gourds. Other diviners interpreted vital information from numbers, from reading palms, or from images in water. Many divination experts were linked to spiritual DEITIES either through an ORACLE or some other form of medium.

Other types of divination reflect a very complex SCIENCE, such as the system of IFA. Administered by a *babalawo* (father of mysteries), divination has been a dominant tool and feature of the religions shared by the YORUBA and Fon peoples of NIGERIA, Republic of BENIN, TOGO, and GHANA. It has long been associated with the deity Orunmila, who was considered the god of divination, and involved the use of 16 palm nuts cast on a divining tray. Each throw of the palm nuts gave a numerical formula whose meaning was revealed to the *babalawo,* and the procedure was repeated every five days.

A common thread among various forms of divination is that ritual specialists often created them to explain the unexplainable, including droughts, storms, depleted soil, or ruined crops. On a personal level, divination can almost be compared to a form of "preventive medicine," foretelling impending illnesses and diagnosing their underlying causes. Whenever misfortune stemmed from neglect of family or ancestral spirits, diviners were able to offer the appropriate actions to repair the results of this neglect. Overall, divination served as an important means of keeping society in harmonious balance.

There has been considerable debate as to whether the practitioners or specialists who were able to perform divination were customarily men or women. This may have depended on the particular society. The skills involved probably were passed down as an inherited body of information from family members. Diviners also served as apprentices to master teachers for a fixed number of years. It is also possible that the ability to divine may have occurred more quickly as a result of SPIRIT POSSESSION. The diviner's function has been described as multidimensional and may have included healing skills as well. Among the Zulu of KwaZulu-Natal, SOUTH AFRICA, for instance, Izangoma was the title used for females who traditionally served as a diviner-healer for one of several goddesses, such as Nomkhubulwane. Similarly, Nganga was a variation of the same title used by the Kongo people of western central Africa. The primary tools of the Nganga diviner generally included herbs and special medicines whose contents remained a secret. For societies in the Congo region, Nkisi figures were also employed by Ngangas. The chief responsibility of identifying WITCHCRAFT, and the application of appropriate remedies for the harm caused, were often accomplished through divination.

divine rule Belief among some ancient African societies that kings obtained the right to rule from the society's deity or DEITIES. Exempt from ordinary laws and customs, many ancient kings served dual functions as rulers and intermediaries for the deity.

In Africa the concept of divine rule can be traced back to ancient EGYPT, where from even the earliest dynasties pharaohs claimed to be descended from various deities. Elsewhere in Africa royal claims to divine rule entitled kings to wear special royal garments and crowns. They might also carry scepters or other objects to signify their power and status. Among some peoples, kings even lived in special areas removed from the general popoulation.

Some societies simply replaced kings who became ill, wounded, or disabled. Others believed that, even if a king's power was divinely based, kings could be overthrown or replaced if their actions became cruel or unjust. In SENEGAL, for example, a king who had been wounded in battle would be replaced by a paternal brother. Other societies legitimized regicide, the actual or symbolic killing of the king, in situations that called for the king's removal. This practice, too, dates back to the ancient Egyptians, among whom aged pharaohs faced death. In Egypt this practice was eventually transformed into a symbolic ritual known as the SED FESTIVAL, which represented the periodic rejuvenation of the pharaoh.

Dja River Also called the Ngoko River, the Dja forms part of the border between CAMEROON and Republic of the CONGO. The river stretches nearly 450 miles (724

km) before it feeds into the Sangha River, a tributary of the Congo. Much of the river is navigable by small craft.

Djeme   Site of the mortuary temple of RAMESSES III (r. c. 1198–1166 BCE); later known by the Arabic name Medinet Habu. During a reign of more than 30 years Ramesses III was revered as a military hero who not only defeated invading forces from the west but also successfully expanded the territorial boundaries of EGYPT. Ramesses' victories ushered in a period of great prosperity for Egypt, which in turn generated the construction of many buildings and temples. One of the outstanding works of the period known as the NEW KINGDOM (1570–1070 BCE), Ramesses' memorial temple housed a library and contained numerous inscriptions and wall reliefs related to his victories.

Djerid   Largest SALT lake in Africa, also known as Chott Djerid and Shatt al-Jarid. Located in southwestern TUNISIA near the SAHARA DESERT, Djerid occupies an enormous salt-flat basin of about 1,900 square miles (4,921 sq km). Except after heavy rains, only the lowest parts of the lake are covered with water.

Djibouti   Present-day country covering about 9,000 square miles (23,300 sq km) on the northeastern coast of the HORN OF AFRICA. Djibouti is bordered by ERITREA to the north, the RED SEA to the east, to the southeast, and ETHIOPIA to the south and west. Inhabited since the STONE AGE, Djibouti was inhabited by Somali PASTORAL-ISTS and the AFAR.

   See also: DJIBOUTI (Vols. II, III, IV, V).

dogs   Dogs held a special place in ancient Egyptian society. Only people of royal blood were allowed to own pure-bred dogs, which were treated lavishly during their lives. When their masters died, these dogs would be placed in tombs with them to provide protection in the AFTERLIFE. One of the earliest known breeds of domestic dogs in EGYPT is the Basenji, a short-haired, medium-sized dog that whimpers rather than barks. Basenjis were raised in the courts of Egypt's pharaohs.

   Africa is also home to a wild dog known as the African hunting dog, a long-limbed animal with large, pointy ears. African hunting dogs prey on antelopes south and east of the Sahara.

domesticated animals   Africa witnessed the early domestication of animals along with the emergence of AGRICULTURE. Africans were responsible for domesticat-

ing four animals: CATTLE, cats, DONKEYS, and guinea fowl. By about 8000 BCE inhabitants of the RED SEA hills area who had been hunting wild cattle began to domesticate them so that they could have a more reliable supply of meat. This far-eastern area of the SAHARA DESERT thus became one of the three areas of the world, the other two being the Middle East and India, where domesticated cattle independently emerged. Wild cats were domesticated in ancient EGYPT and elsewhere on the continent. A wild counterpart to the domesticated donkey lived throughout North Africa. It was probably domesticated by about 3000 BCE, becoming a beast of burden throughout North Africa and the Middle East. In the West African forest zone the people domesticated the guinea fowl, probably before 5000 BCE.

Dongola Bend   Region encompassing the lands situated between the third and fourth cataracts of the NILE RIVER; also known as Dongola Reach and The Land of Yam. Originally populated by farming and FISHING communities, Dongola is a fertile river valley described as the garden of the Upper Nile. It spans more than 200 miles (322 km) of unbroken terrain and produces abundant crops of MILLET and COTTON, as well as CATTLE and other DOMESTICATED ANIMALS.

   At the beginning of ancient Egypt's Twelfth Dynasty (c. 1990–c. 1780 BCE) a trading post was established in Dongola, which was by then considered a province of the Egyptian Empire. The ruling dynasty's plans to push further south into Nubia were interrupted by the HYKSOS occupation of EGYPT, in the 17th century BCE. Ultimately, after the Hyksos invaders were expelled, the rulers of the Eighteenth Dynasty (c. 1570–c. 1320 BCE) resumed the expeditions to the area.

   During his reign the third pharaoh of the Eighteenth Dynasty, THUTMOSE I (r. c. 1525–c. 1512 BCE), led an army to Dongola, venturing beyond the fourth cataract to Kurgus. There, in the region that became the capital city of MEROË, Thutmose left an inscribed marker noting his conquest. Although a number of Kushite revolts occurred in Dongola following the death of Thutmose I, they were suppressed by a succession of Egyptian overlords.

donkeys   The introduction of the domestic donkey to the African continent was an important factor in the improvement of TRANSPORTATION and LABOR productivity for many peoples. Wild asses have inhabited the continent of Africa for thousands of years. Two varieties still thrive in northeastern Africa, the Nubian and the Somali asses. Rock paintings indicate that ancient Egyptians hunted

Nubian asses, so their range must have extended from the Nile to the RED SEA. Small numbers of wild Nubian asses still inhabit parts of The Republic of the SUDAN. Their Somali relatives are much larger and live in the desert region between the Red Sea and the plateaus of present-day SOMALIA.

The ass was one of the first animals domesticated in Africa. Bred by the Egyptians from its wild counterpart, which was native to North Africa and Arabia, the donkey became one of the most important domestic animals in Africa. Donkeys were used in early EGYPT as the principal means of transportation and as labor animals. As populations spread from North Africa to the Sahara and the eastern coast, indigenous peoples began using the donkey for labor and transport. It was particularly important to early Afro-Asiatic peoples.

drums Oldest known musical instrument in the world, the drum dates back to around 4000 BCE in ancient EGYPT. The MUSIC produced by the drum—and the drum itself—varied from group to group in ancient Africa. A drum is a percussive instrument that is constructed by stretching a skin over a vessel or frame; the sound comes from the vibration of the stretched skin as it is struck. The earliest drums were probably made from hollowed-out tree trunks with a reptile or fish skin stretched across it. These drums were struck with the hands. When animal skins took the place of fish or reptile skin as the stretched membrane, sticks were then used to beat the drum. Eventually a double-headed drum was produced by attaching tension cords through holes in the skins in order to hold the two ends together. Perhaps the best-known double-headed African drum is the Ethiopian *kebero,* which was used to accompany the music of important religious ceremonies.

Drums were also important throughout sub-Saharan Africa. In religious FESTIVALS and rituals, dancers often performed intricate movements to the syncopated rhythms of drums, which were played primarily by males. Drums were played by one person, in pairs, or in a larger group known as an *ensemble*.

Dyula (Dioula, Diula, and Jula) People of western Africa who speak a MANDE language of the Nilo-Congo family. They are chiefly Muslims and have long been noted as commercial traders. Most of the Dyula inhabit the trade routes of IVORY COAST, but Dyula clans have also settled in lands that became present-day BURKINA FASO, MALI, GHANA, and GUINEA-BISSAU. The word *dyula* means "itinerant trader," and the Dyula are respected for their abilities in commercial dealings. The Dyula were active GOLD traders as long ago as the third century CE, flourishing during the periods of ancient GHANA and the empire of Mali.

See also: DYULA (Vols. II, III, IV).

E

eagles Because of their powerful build and majestic bearing, eagles have long been associated with power and warfare. According to the traditions of the ancient Egyptians, for example, the king was granted the authority to rule over the earth by Holse, the god of the eagle. In EGYPT, eagles also were associated with the phoenix, a bird that was part of Egyptian mythology from early times.

ebony Valuable timber tree (*D. dendo*), native to various parts of Africa as well as to parts of Asia, the Americas, and the Pacific; also known as black ebony, billetwood, as well as GABON, Lagos, Calabar, and NIGER ebony. The best ebony is from the heartwood of the tree. Heavy and almost black in color, this hard, dense wood can be polished to a beautiful sheen, which makes it one of the world's most exquisite, as well as most durable, woods.

Ebony was highly prized in ancient times. The Greek historian HERODOTUS (484–425 BCE), for example, wrote that the Ethiopians sent a tribute of 200 logs of ebony to Persia every three years. Ebony from NUBIA was used to make some of the famed treasures of the Egyptian kings and contributed significantly to Egypt's material wealth.

See also: EBONY (Vol. III).

ecological zones Ecological zones, or ecosystems, of Africa fall roughly into the following categories: coastal zones, deserts and semi-deserts, mountainous zones, savanna grasslands and woodlands, and tropical RAIN FORESTS. Africa's ecological zones are affected by elevation and CLIMATE. Most of southern and eastern Africa lie above an altitude of 3,280 feet (1,000 m) above sea level, as are much of the MAGHRIB, the central and eastern SAHARA DESERT, and the HORN OF AFRICA. Rainfall patterns, shaped by the INTERTROPICAL CONVERGENCE ZONE, the monsoon seasons of the Indian Ocean, and ocean currents have been major factors in shaping the ecological zones. Temperature also plays an important role, as does latitude. Also, long-term climatic shifts affect the ecological zones. One such example can be seen near the end of the long Holecene wet phase that occurred in the Sahara regions during the third millennium BCE. This climatic change created much of the desert region that we know today. More recently, human activity has affected the ecological zones. For example, over the centuries, humans have been felling forests for heat, cooking fuel, and for the smelting of iron. At the same time, overgrazing has led to desertification in drier grasslands regions.

A low coastal plain is present in much of the continent, though it varies in its vegetation. Along much of the West and East African coasts, mangroves dominate, though the southwestern coast, with its drier climate, is arid to semiarid. The far north and the far south have a Mediterranean-type climate with winter rainfall patterns and a vegetation of forest and scrub. Moving inland from both extremes of the continent, the landscape becomes increasingly arid. To the north is the large expanse of the Sahara, and to the south lie the smaller expanses of the KALAHARI and the Namib deserts. The deserts gradually give way to dry grassland and thornveld steppe regions, which south of the Sahara are called the SAHEL. These regions change into better-watered, tropical, grassland savanna and then wooded savanna. In the CONGO BASIN and behind much of the West African coast lies rain forest.

On the western side of the continent, the ATLAS MOUNTAINS sit between the Mediterranean coastal zone of the western Maghrib and the desert interior. On the eastern side of the continent, the Northern Desert stretches much farther south along the coast than it does in the west. The Sahelian ecology inland also encroaches farther south. The Congo Basin rain forest does not extend beyond the RIFT VALLEY and its string of lakes. However, the tropical, wooded savanna and tropical grasslands stretch across the interior of the southern part of the continent. A relatively narrow belt of the eastern coast, stretching southward from KENYA into SOUTH AFRICA and broadening out somewhat in MOZAMBIQUE, is made up of tropical and sub-tropical coastal forest.

See also: ECOLOGY AND ECOLOGICAL CHANGE (Vol. V).

economy As with most ancient peoples, economic issues were major considerations in many African cultures. Not surprisingly, dynamics such as CLIMATE, terrain, subsistence, shelter, natural resources, technology, trade, and even ART were all related in one way or another to economics.

Subsistence Once people moved from the hunter-gatherer stage of subsistence and began to develop tools and settle into village life, most economic decisions resulted from a combination of experience and the availability of resources. In hunting as well as FISHING societies, for example, status often was determined by continued success in the hunt or catch or by the size and number of fishing vessels an individual owned. With the AGRICULTURAL REVOLUTION, the availability of water sources and grazing land determined whether an ETHNIC GROUP survived through PASTORALISM, farming, or a mixture of the two. Whatever the option, by well before 500 CE, AGRICULTURE emerged as the basis of the economy throughout most of the continent.

Shelter In many parts of Africa, housing was not as problematic as it was in colder, harsher environments. Thatched-roof homes were erected in wet, heavily forested areas, while mud and clay structures were built in more arid climates. However, wealth and status often were linked to the number and size of the dwellings owned by a person. Thus, economic considerations were linked to the availability of the materials needed to erect dwelling places. In some parts of the continent, including ancient EGYPT, KUSH, and AKSUM, building activities moved far beyond the basic provision of shelter. Elaborate houses were built for those in the upper social levels, as were public buildings, temples, monuments, and, in MEROË and Egypt, PYRAMIDS. Building construction in these societies thus became an important component of the economy.

Natural Resources Throughout Africa settling in close proximity to fertile fields and mineral deposits often was the means to acquire immense power. For example, the rich soils of the NILE VALLEY provided the economic underpinnings of the complex civilization of ancient Egypt.

Indeed, fertile soils constituted the principal natural resource for all pre-industrial societies, since ultimately even a highly sophisticated society such as Egypt's rested on an agricultural base. A solid agricultural foundation, however, could not be obtained through anything other than the natural resources at hand. Other important natural resources, including COPPER and GOLD, were obtainable through trade.

Trade Early HUNTER-GATHERERS did not engage in much trade or barter, but as soon as Africans adopted the more settled mode of existence associated with agriculture, trade became necessary to the economic livelihood of communities. Farmers, for example, bartered with neighboring hunter-gatherers, exchanging grain for wild game. Gradually trade activities led to the development of the markets that became a key aspect of African village life. Trade also became vital to the well-being of major states. As noted, Egypt depended on trade to obtain resources that it lacked, and Aksum emerged as a powerful state in large part because of its strategic location in relation to the trade routes of the HORN OF AFRICA.

Art and Crafts Artists and BLACKSMITHS were revered in ancient Africa, in part because their products were considered functional rather than merely decorative. In many societies birth, death, and natural events such as weather favorable to the growth of crops, were believed to depend on appeasing various ancestors and DEITIES. This required creating effective icons and fetishes for use in ceremonies. Those who fashioned these objects were thought to possess magical powers. Since the well-being of entire communities often depended on adequate yields from the hunt or harvest, these objects—and the people who made them—were very closely associated with the economy of the community. In the more sophisticated societies, such as those of the Nile Valley, producing art became a major economic activity and supported large numbers of skilled individuals.

Edfu (Idfu) Town in central EGYPT; location of the Temple of HORUS. Located on the west bank of the NILE RIVER, about 65 miles (105 km) from ASWAN, Edfu houses the best-preserved cult temple in Egypt, the Temple of Horus. The town itself has been known by many names, having been called *Tbot* by the early Egyptians, *Apollinopolis Magna* by the Greeks, and *Atbo* during COPTIC times. About 3400 BCE it was the capital of a predynastic Upper Egyptian kingdom that worshiped the god Horus.

The large sandstone temple is second in size only to the great Temple of KARNAK, and it bears an abundance of inscriptions and HIEROGLYPHICS. These tell of religious ceremonies and recount tales of the pharoahs' wisdom and might. The temple, which was discovered in 1860,

was well preserved by its long submersion under desert sands. Excavations on the site have yielded a magnificent black marble statue of Horus and a Roman necropolis, as well as Coptic and Byzantine remains.

Edo   Kwa-speaking group that has long inhabited the southern forest region west of the NIGER RIVER. These peoples have inhabited this area, in what is now the Benin province of present-day NIGERIA, for upwards of 3,000 years. Originally single-family settlements dominated the region. In about the fifth century, however, village communities began to form in order to improve safety. These communities also facilitated more efficient use of natural resources.

Egungun   A masking cult in YORUBA society that represents the return of the dead from the spirit world. According to traditional Yoruba belief, an Egungun, a supernatural being after whom the cult is named, is the embodiment of the spirit of a male ancestor who returns from the spirit world to visit his FAMILY. Not every ancestor is invoked as an Egungun, only those who lived a good life on earth and who, because they are in favor with OLORUN, the Creator, are permitted to enter heaven and return to the world of the living. Such ancestors are seen as worthy of true worship, not just veneration, and may be used by the living to appeal to the creator. The Egungun can either intercede with angry divinities to protect the living from harm or simply bless the living and receive their offerings.

The living person who puts on the family's Egungun attire also puts on the ancestor's spiritual power. He wears a special outfit made from cloths of different colors that cover him from head to foot. His feet are obscured, and he wears a veil that allows speech but conceals the wearer's identity. Many Egungun also wear special MASKS and charms. The person wearing the Egungun attire is accorded the respect due an honored visitor from heaven; women and the uninitiated may not touch the Egungun on penalty of death.

Egungun are sometimes summoned by an individual to bring spiritual benefits and comfort to his descendants. They are also summoned by entire villages to go from dwelling to dwelling and bless the living at the start of the yam season or the planting season and at other FESTIVALS. Egungun are also called on at times of calamity to carry a propitiatory offering to an offended divinity.

Egypt   Country covering about 386,700 square miles (1,001,600 sq km) situated in northeast Africa. Egypt is mostly desert, with the NILE RIVER running, south to north, for 600 to 700 miles (960–1120 km) through the center. On either side of the river lies a narrow strip of land known as the NILE VALLEY. The northern part of Egypt, known as the NILE DELTA, is where that river empties into the MEDITERRANEAN SEA. Modern Egypt is bordered by the RED SEA to the east, the Republic of the SUDAN to the south, and LIBYA to the west.

The name *Egypt* is derived from the Greek word *Aigyptos,* but the ancient Egyptians called their country *KEMET,* or "black land," for the dark, richly fertile soil that results each year as the Nile overflows its banks and floods the river valley. In sharp contrast to this is the "red land," or desert (*DESHRET*), which makes up much of the rest of the country. Until the country was unified (c. 3050 BCE), the ancient Egyptians divided their land into two kingdoms, UPPER EGYPT and LOWER EGYPT. Because the Nile flows northward, Lower Egypt was the northern part of the country, and Upper Egypt was the part to the south.

Egyptologists divide the long history of ancient Egypt into kingdoms and intermediate periods. These are in turn subdivided into dynasties of rulers.

Predynastic Period	
Badarian Culture	c. 4800–c. 4200 BCE
Naqadah I, II, III	c. 4200–c. 3050 BCE
Early, or Archaic, Period

the introduction of WRITING, the advancement of medical SCIENCE, the development of sophisticated agricultural programs, and the creation of lasting architectural monuments.

Although a majority of Egyptologists interpret the ancient Egyptian word *kemet* to mean "black land," some Egyptologists and other scholars dispute this interpretation. *Kemet*, according to them, means "Land of the Blacks," a reference to the black-skinned Africans they believe were the actual inhabitants of the ancient kingdom.

Since the latter half of the 20th century the racial makeup of the ancient Egyptians has been a subject of considerable controversy. The traditional view of Western scholars is that the ancient Egyptians were a light-skinned but sun-tanned people. According to these scholars, truly black-skinned people began to be seen in Egypt only after the Eighteenth Dynasty. Other scholars believe that, from predynastic times onward, the ancient Egyptians were in fact black Africans. The most prominent of these scholars is the Senegalese historian Cheikh Anta Diop. Diop points to the writings of the fifth-century BCE Greek historian HERODOTUS (484–425 BCE), who described the Egyptians of his time as black and as having a culture that was African in orientation.

elephants The African elephant is the largest living animal on land, weighing 8 tons (7 metric tons) and standing 10 to 13 feet (3 to 4 m) at the shoulder. Elephants are usually gray or brown in color and have little body hair. They breathe through their powerful trunks, which are also used to suck up water and to pick up FOOD. On either side of an elephant's trunk are tusks. Ivory is made from elephant tusks.

Elephants are found in sub-Saharan Africa and live in jungles and savanna, moving in small groups led by older cows (female elephants). Adult members of the groups can each eat more than 500 pounds (225 kg) of grasses and other VEGETATION a day, and can live up to 60 years.

Elephants have played an important part in Africa's history and culture. In the mythology of many African peoples, elephants symbolize strength, leadership, and greatness. The Baule people of GHANA and the IGBO people of NIGERIA, for example, traditionally have carved MASKS in the form of elephants. The Samburu people of present-day KENYA have, for hundreds of years, worn ivory charms made from the tusks of elephants that had died in the wild. These charms were put on babies to protect them from harm. Another Samburu custom has been to burn elephant dung on the floor of the house of a newly married couple to bless them with a long, happy marriage.

Elephantine Former name of the site known today as ASWAN, situated along the NILE RIVER. Ancient accounts of Elephantine emphasize its importance as a route to the lands south of EGYPT. Some of the most important of these accounts were those of HARKHUF, an Egyptian governor who took part in four expeditions to the area during the Sixth Dynasty (c. 2350–c. 2250 BCE).

Harkhuf's journeys took him as far as KERMA, in the kingdom of KUSH, near the third cataract of the Nile, where he sought to discover trade routes and establish economic relations with the rulers he met. Harkhuf's travels along what he called the "40-day road" ultimately brought him praise from his royal masters. As he wrote in approximately 2300 BCE: "The majesty of Mernere, my lord, sent me, together with my father, the sole companion, and ritual priest Iri to Yam in order to explore a road to this country (south). I did it in only seven months and I brought all gifts from it. . . . I was very greatly praised for it."

Elgon, Mount Extinct volcano found within the Great RIFT VALLEY along the border of present-day KENYA and UGANDA. Mount Elgon consists of a crater up to 5 miles (8 km) wide with several peaks rising from it. The highest of these peaks is Wagagi, which has an elevation of 14,178 feet (4,321 m).

On its eastern and southeastern slopes, Mount Elgon blends gently with the Uasin Gishu Plateau, which stands at 6,200 feet (1,890 m). But on its western and northwestern slopes, high cliffs separate Mount Elgon from the plains of eastern Uganda. Within the volcano's crater are forests and swamps, which are drained by the Suam and Turkwel rivers. The area has long been occupied by the Gishu, a Bantu-speaking people.

Ennedi Region in the northeastern part of present-day CHAD, known for its ancient ROCK ART. Stone, cave, and cliff paintings dating back to as early as 6000 BCE have been found on the massif of the Ennedi region. The types of rock art have changed considerably over time, with different colors and styles in their representation of the animal species, dress, and weaponry, but they are generally classified into three periods: Archaic, Bovine, and Dromedary (or Equine).

The Bovine Period, extending from around 2000 BCE to 1000 CE, represents a significant change in the rock art of Ennedi. To a great extent this is due to the domestication of CATTLE and sheep as well as to the emergence of DOGS as companions. Since these animals are consistently depicted as being healthy-looking and plentiful in number, it has been suggested by some scholars that the appearance of these domestic animals during this period is linked to climatic changes that brought about a general increase in the prosperity of the area.

Human figures from the Bovine Period are shown wearing more elaborate JEWELRY than the figures from the earlier Archaic Period. This ornamentation includes adornments for the ears and head as well as more extensive garments, such as headdresses, robes, and long, full skirts. Their weaponry also was more sophisticated, with spears, shields, and curved clubs all being depicted. The life scenes increased in scope as well, with depictions of containers filled from grain harvests, women in conversation or dancing, and musicians playing instruments.

It is estimated that, over the centuries, there have been 15 or more styles of rock art in the Ennedi region, each differing in its depictions

See also: ENNEDI (Vol. II).

Equatorial Guinea Country in tropical western Central Africa, some 10,800 square miles (28,000 sq km) in size that is made up of Río Muni, a mainland coastal enclave, and five volcanic islands in the Atlantic Ocean. Río Muni, which features coastal plains and interior hills, shares borders with CAMEROON to the north and GABON to the east and south. The largest island is Fernando Pó (now called *Bioko*), which is about 780 square miles (2030 sq km) in size. The small islands of Corisco and Great and Little Elobey lie in the Gulf of Guinea about 100 miles (161 km) northwest of the mainland portion of the country. The present-day capital city of Malabo is on Bioko. The fifth island of Annobón is also small and is located 350 miles (563 km) southwest of mainland Equatorial Guinea.

The earliest humans of the mainland portion were HUNTER-GATHERERS. Today's Yele people are descendents of this original population. The BANTU EXPANSION brought the first farmers into the area more than 2,000 years ago. YAMS were their principal crop. The arrival of bananas by about 500 CE provided local farmers with an important new crop that greatly enhanced their food-producing capacity. During this period some Bantu speakers from the mainland also settled on Fernando Pó.

See also: EQUATORIAL GUINEA (Vols. II, III, IV, V).

Eritrea Former province of ETHIOPIA, approximately 36,000 square miles (93,600 sq km) in area, including regions in the HORN OF AFRICA and the mountainous plateaus bordered by the RED SEA. Much of Eritrea's ancient history has been overshadowed by the kingdom of AKSUM, which reached its heighht about 350 CE. However, numerous cave paintings recovered in the region attest to a regional history dating back to at least 6000 BCE. During these ancient times the area was primarily populated with indigenous AGAW, Nilotic-speakers from the forests of southern Sudan, and Kushite pastoralists who originated in the desert to the north. During the pre-Aksumite era (c. 800–300 BCE) these peoples were joined by Semitic speakers originating in southern Arabia (Yemen). As the recovered temple at Ilmuquah reveals, the region's religious traditions have also been diverse, reflecting elements of JUDAISM, CHRISTIANITY, and Islam.

See also: ERITREA (Vols. II, III, IV, V).

Eshu (Esu, Eshu-Elegba) One of the principal divinities in traditional YORUBA religion. In Yoruba belief, Eshu is the divinity that must be appeased before all other divinities or ancestors. Eshu delivers sacrifices and offerings from humans to the gods and from one divinity to other divinities, thus maintaining the relationship between the human and the supernatural worlds. Eshu must be taken seriously because he is the god who tempts and tests, rewarding and punishing humans regardless of rank and influence, to determine their true character. He prompts human beings to offend the gods, whose anger they must then mollify with sacrifices. It is said that without Eshu, the gods would go hungry.

Eshu is comparable to neither the Christian Satan or the Muslim Shaitan; traditional Yoruba belief does not look upon the world as a contest between absolute good and absolute evil. Still, Eshu can create hatred between brother and brother, and he can reconcile them after years of dispute. He can kill a firstborn child and provide offspring to the childless. He punishes those who do not offer the required sacrifices and rewards those who do. In Yoruba religion, Eshu personifies the coexistence of good and evil in the world.

Esna Site of the important cult of Khnum, the ancient Egyptian god of fertility, water, and procreation; located

The temple of Khnum at Esna, Egypt, built during the reigns of Ptolemy VI (C. 180–C. 145 BCE) to Decius (249–251 CE), lay buried under Nile mud until the 19th century, when this hall was excavated. The town of Esna still covers the rest of the temple. © *Richard T. Nowitz/Corbis*

south of the city of Thebes. According to Egyptian myth, Khnum used a potter's wheel to create humankind from clay. The temple at Esna shows Roman influence in its reliefs and columns.

Ethiopia East African country, some 435,000 square miles (1,126,900 sq km) in size, bordered by present-day ERITREA, DJIBOUTI, KENYA, SOMALIA, and Republic of the SUDAN. Based on the unearthing of skeletal remains of humans who lived millions of years ago in HADAR, the Omo Valley region, and in Aramis in the Awash Valley, Ethiopia is considered one of the cradles of humanity. Called ABYSSINIA into the 20th century, the region was the site of AGRICULTURE and domestic herding dating back to the STONE AGE. Within its diverse population are eastern Cushitic speakers including the OROMO, SOMALI, AFAR and Saho, who were primarily nomadic herders. Other groups, such as the AMHARA and TIGRAY, reflect a mix of Arabic influence, carried by immigrants from the Arabian Peninsula in the centuries before Christ.

Royalty in Ethiopia includes the Solomonic dynasty, initiated, according to Ethiopian tradition, by Queen MAKEDA (queen of Sheba). Ethiopia's tradition of literacy dates back more than 2,000 years and includes a popular form of script known as *lessana ge'ez,* or simply GE'EZ, meaning "the language of the free." However, Ethiopia's embracing of CHRISTIANITY, initiated during the rule of King Ezana (r. 320–350 CE) of AKSUM, generated some of the most unique forms of religious devotion and architecture in the world.

Marcus, *A History of Ethiopia* (Berkeley, Calif.: University of California Press, 1994); Richard Pankhurst, *The Ethiopian Borderlands* (Lawrenceville, N.J.: The Red Sea Press, Inc, 1997); David W. Phillipson, *Ancient Ethiopia: Aksum, Its Antecedents and Successors* (London: British Museum Press, 1998).

Ethiopian Highlands The Ethiopian Highlands, which cover almost two-thirds of ETHIOPIA and much of central ERITREA, were produced by the lava flow of long-extinct volcanoes. The average elevation of the region is about 5,500 feet (1,676 m). Many rivers and deep valleys cut through the landscape, often dropping 2,000 feet (610 m) below the plateau. The highlands are split into two sections by the Great RIFT VALLEY, a geological fault system that stretches 3,000 miles (4,827 km) from southwest Asia to southeast Africa.

The rift cuts through the highlands diagonally, from northeast to southwest. The western highlands is the larger section, running from central Eritrea and northern Ethiopia to Lake TURKANA in the south. The rugged western highlands are divided by the valley of the Abay, also known as the BLUE NILE. The western highlands are also the location of Mount RAS DASHEN, which, at 15,157 feet (4,620 m), is the highest peak in Ethiopia. Inhabitants of the western highlands include the TIGRAY, the descendents of a Semitic people who established the Christian AKSUM kingdom, and the AMHARA, also descendants of Semitic peoples and political rivals of the Tigray. Found in the much smaller eastern highlands is Mount Batu, which stands at an elevation of 14,127 feet (4,306 m).

The Ethiopan Highlands are the most heavily farmed and most densely populated regions of both Eritrea and Ethiopia. They are also home to many forms of wildlife, including the rare Simien fox.

ethnic group Term used to signify people who share a common culture. Other terms frequently used to indicate a distinct cultural identity include *group, people, nation,* and *nationality.* Ethnic identity is based on factors such as common languages, shared customs and traditions, and a common historical past. In certain cases there is a common heroic tradition as well.

One of the better ways to identify a group of people sharing a common culture is by the language they speak, as in "Maninka speaker" or "YORUBA speaker." Among the MANDE-speaking peoples, for example, there are 46 distinct though closely related languages. Some Mande are Muslims and others are not, but both share the common heroic and historic past of the GHANA and MALI empires and the literature of the Epic of Sundiata.

Awareness of a common ETHNICITY AND IDENTITY may be rooted in the ancient past, but in many cases it may also be of much more recent origin. For example it was only after coming under British colonial rule that the IGBO of NIGERIA developed a common ethnic identity.

ethnicity and identity An ETHNIC GROUP is most commonly defined as a group of people united by a common inherited culture, racial similarity, RELIGION, and belief in a common history and ancestry. If a person is to be part of this group he or she must first identify with its membership. Once that is done the person can gain a set of meanings that serve to bind him or her to the group and separate him or her from others.

Where ethnicity comes from is a matter of debate. Some scholars have attributed ethnicity to certain primordial differences between people. This makes ethnic identity a "given" phenomenon, with people being born to a certain ethnicity just as their fathers and mothers

were before them. Other scholars see ethnicity as an instrument. The differences between people—culture, religion, language, even race—are mutable. Thus ethnicity is a tool used by individuals, groups, or elites to gain some greater end, usually something material in nature or possibly the acquisition of power over others. For this reason some scholars have asserted that ethnicity was manipulated by colonial governments in Africa to divide populations and increase the strength of the colonial state.

Dominant views today tend to focus on how ethnicity can be "constructed." Ethnicity is one identity of many that is fluid and created by society. This construction might be influenced by elites as instrumentalists maintain, and they might retain certain primordial attributes over time, but not necessarily. A growing scholarship on this subject, called *ethnogenesis,* considers how few ethnic identities in Africa today existed 150 years ago. Rather, they emerged through ever-shifting social norms.

The ramifications of ethnicity vary. In some cases ethnicity becomes a proxy for nationalism. In Europe ethnic identities—Alsatian, Catalonian, Bolognese, and so on—were largely replaced by monolithic national identities only in the 19th and early 20th centuries. Today most European ethnic distinctions have become more about FOLKLORE and culture than defining identity. People identify with French, German, Spanish, or Greek heritage. But there are some ethnic identities—Kurdish, Basque, Serb, Croat, and so on—that made a resurgence in the late 20th century, often with violent consequences.

In Africa ethnicity has often manifested itself as a struggle between "tribalism"—something that would divide African societies—and national movements that would form Europe-like bonds with state identities. This, scholars argue, transforms much of what happens on a social, economic, and political level into a question of whether people will consider themselves, first and foremost, KIKUYU, HAUSA, or Xhosa, or whether they will see themselves primarily people of KENYA, NIGERIA, or SOUTH AFRICA. In recent African history the mobilization of ethnicity into a nationalist agenda has been neither easy nor peaceful. In countries throughout the continent—Kenya, ZIMBABWE, and ZAMBIA, to name a few—ethnic cleavages have grown with democratization as leaders looked to their ethnic bases to improve their chances of attaining office. Ijaw in Nigeria, for example, have galvanized their identity around a belief in local rights to oil. In the late 1980s and early 1990s the government of RWANDA fostered ethnic differences between the HUTU and Tutsi populations for its own ends. Ultimately this led to ethnically driven genocide in 1994. Avoiding future ethnic conflict in Rwanda, around the continent, and the world, will require an increasingly sophisticated understanding of the complex ways in which people identify themselves.

Ewaso Nyiro River River in KENYA that, along with the Tana River, drains Mount KENYA. The Ewaso Nyiro is a brown, muddy river that winds through the northern Frontier Desert. The rich jungle banks of the river contrast with the surrounding desert and support animal life such as CROCODILES, ELEPHANTS, WATER BUFFALO, LIONS, GIRAFFES, ZEBRAS, and MONKEYS. The Ewaso Nyiro River is part of the Great RIFT VALLEY, a geological fault system extending 3,000 miles (4,827 km) from the Jordan Valley in southwest Asia to MOZAMBIQUE in southeast Africa.

family In African societies an extended family unit naturally consisted of grandparents, parents, children, brothers, sisters, and cousins. In ancient times family units were based within large households or compounds, and the larger the family, the more secure its members felt. The security was not only social but also economic, for the family in Africa traditionally constituted the principal unit of production. Responsibility, obligation, and authority were the cornerstones of family life, but decision making was often left to the wisdom of family elders. In terms of RELIGION African societies viewed the family connections continuing after death, which provided yet another form of security. The living members of a family provided offerings for the deceased, who in turn looked after the welfare of the living.

From an economic standpoint, family structure generated FOOD production and therefore contributed to the economic welfare of the entire family unit. Archaeological reconstructions of the lives of ancient HUNTER-GATHERERS show that while there frequently was a division of LABOR among the sexes, there also was a certain level of gender equality. Among the !KUNG, whose population extended over areas of present-day BOTSWANA, ANGOLA, and NAMIBIA, women looked after the children, supplied the family with water and firewood, and prepared the family dwelling. Women also contributed a large portion of the community's food in the form of wild plants. On the other hand, men were responsible for providing the community with a sufficient supply of meat. As hunters—often of large predators—men performed tasks that were

considered more dangerous and more complex. In spite of this, men may also have assisted within the household and frequently were joined by women in the decision-making process. As AGRICULTURE developed there continued to be a division of labor along gender lines. Among farmers, men usually did the heavy work of preparing the fields while women tended to the crops planted in these fields. In pastoral societies men usually, but not always, handled the livestock with women carrying out other forms of labor.

Because marriage often represented the unification of families, kingdoms, and countries, political power was also tied to family structure. The ancient rulers of EGYPT and NUBIA, for example, often made marriage arrangements between siblings and first cousins precisely in order to exercise political control over a particular region or kingdom. This type of family structure also allowed people, especially wealthy or royal households, to transfer or maintain material resources. Although children were coveted in all societies, the offspring of royal marriages were particularly valued (and rewarded). It was they who were the recipients of the crown or, at the very least, of such inherited forms of wealth as land or CATTLE.

farming techniques Prior to about 10,000 BCE ancient peoples got their FOOD by hunting, gathering, and

FISHING. Groups of people moved seasonally in order to be near food sources. When the transition to farming came, most historians believe that it was made independently in several different regions of the world.

While it was previously believed that the first farming was carried out in MESOPOTAMIA about 8000 BCE, there now is evidence to suggest that ancient peoples harvested barley as early as 16,000 BCE. Likewise, it appears that wild SORGHUM was harvested in the area of KHARTOUM, in present-day Republic of the SUDAN, as early as 9000 BCE. While not yet universally accepted, this evidence has done much to change long-held views of human technological development.

The first food-production method used by ancient Africans was probably gathering and storing grain, or cereal, produced by wild grasses. Gatherers then began actively to encourage the growth of the grasses, possibly by weeding to remove competing plants. Stone hoes were invented to accomplish this task. The next step was collecting and sowing seed from the strongest plants.

The transition to food production was made during the STONE AGE in different ways in different areas of Africa. The people of the NILE VALLEY took advantage of the fact that while the WHITE NILE flowed continuously, the BLUE NILE flooded annually, leaving behind deposits of dark, fertile soil along its banks. When the water receded, the people pushed seeds into this muddy deposit, and a crop would grow as the soil dried out.

Between 8000 and 4000 BCE the climate of the SAHARA DESERT was much wetter than it is today, and a series of rivers and lakes there provided good fishing. As the Sahara gradually became drier, however, from about 3000 to 1000 BCE, the desert spread, and rivers and lakes became smaller and smaller. The emphasis on fishing gradually shifted to farming the savanna grasslands that bordered the desert. Stone Age farmers of the area used sickle blades for cutting grasses and grinding stones to make flour.

The crops chosen for domestication depended on the conditions of the area. For example, along the edges of the spreading desert, pearl MILLET was domesticated, probably because it was fairly drought-resistant. In contrast, in the wetlands of the upper NIGER RIVER, wild rice was grown. The peoples of the tropical forest planted root crops, such as YAMS, instead of cereals. In the highlands of ETHIOPIA farmers grew oil plants and cultivated the banana-like *enset* for its starchy stalks.

The development of farming in forested areas required tools to clear the land. New techniques of grinding and polishing stone resulted in improved axes and adzes. To make them, a stone was ground against a harder stone to create a sloping, sharp-edged surface. This was an improvement over the earlier method of sharpening a stone by striking it against another stone to chip away flakes. Other techniques for clearing forests included killing trees by ringing them and setting fires to burn the undergrowth. Forest farmers also took advantage of natural clearings to grow yams and palm trees for nuts. The IRON AGE brought with it further improvements in farming tools.

Various techniques traditionally were used to produce a rich enough soil to support cereal grains as a primary crop. In the eastern and central regions of Africa, farmers with nothing more than simple hand-held hoes used the technique known as *citemene,* (shifting culture). This entailed clearing an area in a wooded region and building a FIRE from the branches of large trees. Smaller trees were usually reduced in size to a stump and became focal points for new crops. This method, usually carried out by men, occurred near the end of a dry season and before the start of the rainy season. Farmers learned whether or not the soil of a particular area was conducive to growing grain crops by observing the quality of surrounding grasses or even noting the presence or absence of certain types of insects and animals.

Burning dead grass and undergrowth enriched the soil with minerals and nutrients that were useful for planting new crops. After two to three years of crop production the ground was often allowed to lie fallow in order to recover its strength. During that time, a new crop of cereal grains was planted elsewhere or in combination with secondary crops such as pumpkins, beans, or cowpeas. These secondary crops helped ensure proper drainage and supplied other types of nutrients.

The effectiveness of these techniques varied from region to region. In addition, the populations of some regions planted grain randomly. Generally, however, the entire FAMILY had specific tasks in relation to the planting and harvesting of grain. Families sometimes were assisted by the community's AGE SETS during harvest time, when extra LABOR was critical. Harvesting grain required that the crops be dried in the sun, threshed, and then transported to large granaries. In traditional societies the first harvested grain was given as a symbolic gift to wives or other members of the family. Over the centuries, family farmers formed societies that managed to create a surplus that could be traded for needed items or stored for future use. This surplus also left the people time for raising other foodstuffs and for the development of society as a whole.

As the transition to farming spurred Africans to invent new tools and cultivation methods, the social, political, and economic fabric of their lives also changed. People no longer had to move constantly in order to gather food. Consequently, permanent settlements sprang up, and more enduring housing was built. Populations increased, too, as women bore more children who could be kept safe within the settlement. More children meant more hands to work the farms, so surplus food could be

produced and traded to other peoples for raw materials and other necessary items. Not surprisingly, the changes brought about by the rise of AGRICULTURE led to the formation of rich and poor classes, with those who controlled the land and food production becoming the wealthy class.

festivals Celebrations that often combine religious, historic, and cultural themes. Widespread in Africa, festivals frequently occurred on an annual or seasonal basis. In many societies festivals were a means of restoring spiritual balance and maintaining a strong sense of community. Ancient rulers also used community festivals as a way to reinforce their regal power. One of the earliest—and most noteworthy—examples of this was the ancient Egyptian SED FESTIVAL, which was a celebration of divine kingship. In western Africa festival dates are often determined by DIVINATION and are often unknown until the last minute.

Harvest Festivals One of the most important festivals in agricultural communities is the annual harvest festival. The IGBO people of present-day NIGERIA celebrate Ikeji, meaning "new yam eating," by serving only dishes made of YAMS to symbolize the abundance of the crop. The New Yam Festival, marking the end of one planting season and the start of the next, is a time to thank the yam spirits through the ancestors for a bountiful harvest. The king or the oldest man in the community traditionally eats the first yam, his position bestowing on him the role of intermediary between the people and the spirit world. The first day of this four-day festival is the holiest and most important. Sacrifices are offered to the ancestors, who it is believed walk among the living on that day. All male children are expected to attend and offer reverence. The remaining days of Ikeji provide masquerades for the entertainment of guests. Marriages are often contracted at this time.

The peoples of the NIGER DELTA celebrate the Ikwerre, Kalabari, and Okrira festivals in honor of the water spirits. Masqueraders wear MASKS that resemble fish or water birds. Rituals include divinations and sacrifices, followed by songs and dances depicting these spirits, who, it is believed, are present within the masqueraders who wear masks representing them.

Festivals Honoring Ancestors Reverence for ancestors and belief in SPIRIT POSSESSION are important aspects of traditional Yoruban religion. The EGUNGUN festival, which honors the ancestors and requests their blessings, lasts 24 days. On each day of the festival a masked dancer, believed to be possessed by an ancestor, dances through the town or village. The body of the dancer is totally concealed so that he becomes the disembodied spirit of the ancestor his DANCE honors. On the final day of the festival a priest sacrifices animals at the shrine of the ancestors and pours their blood on the shrine. The sacrificed animals are consumed at the feast that follows.

Festivals in Honor of Divinities The YORUBA celebrate many festivals to honor the many DEITIES, or ORISHA, in the pantheon of their traditional belief system. One commonly celebrated festival honors SHANGO, the god of thunder and lightning and the orisha of drum and dance, who is feared and respected among the people. Shango's followers come to him for protection from their enemies, for legal problems, and for solutions to assorted difficulties. Shango's festival lasts 20 days, a period during which his hereditary priest makes sacrifices at Shango's shrine. On the final day, the priest becomes possessed by Shango and gains magical powers, including the ability to eat fire and, much later, swallow gunpowder. A procession ending in a feast concludes the festival.

Festivals of Secret Societies Many peoples throughout Africa have formed SECRET SOCIETIES, bound by oath, in response to a special local or cultural need. The secret societies also conduct festivals. One noteworthy example is the Yoruba Gelede festival, held annually from March until May, before the rainy season. This festival, intended to appease the destructive powers of the ancient mothers, is the remedy for the distress caused by the threat of drought or infertility. Males dance in pairs, their faces uncovered but with female masks perched on top of their heads. The faces on the masks show the serenity and composure considered desirable in Yoruba women. Because the dancers' identities are not secret, they are not thought to be possessed by a god and may walk freely among the people in costume before and after the masquerade.

Other Festivals Celebrations also generally accompanied the RITES OF PASSAGE into adulthood, following CIRCUMCISION or clitoridectomy and their associated rituals. In these and in other ceremonies, the importance of blood must be noted. Spilling blood when making a sacrifice means that life, whether human or animal, is being given back to God, who is the ultimate source of life. Among the MBUTI who live in what is now the Republic of the CONGO, blood shed during circumcision is thought to bind the person to the land and to his ancestors in a solemn covenant or agreement. Once the individual's blood is shed, he joins the stream of his people. There is, however a widespread belief in African societies that menstrual blood is ritually dangerous and taboo, forcing women, even priestesses, to absent themselves from shrines and banning them from handling any ritual objects. Even though women frequently functioned as mediums with the spirit world, the task often belonged to a girl before she reached puberty or to an older woman past childbearing age.

fire Fragments of burned bone found in a cave at Swartkans, SOUTH AFRICA, provide evidence of the intentional use of fire in Africa 1 million years ago. In other parts of Africa, hearths were probably not commonplace as centers of human habitation until about 60,000 years ago, when there was a pronounced rise in social and cultural activity.

Anthropologist Louis Leakey pointed out that the same primitive tool used to make fire—a hard, pointed stick twirled between the palms to make a piece of soft wood smolder—can also be used as a hand drill to make holes in shell and bone. Fire and such drilled objects, perhaps used as personal ornamentation, enter the archaeological record in Africa at the same time.

Fire also has its place in African mythology. For example, in the creation stories of the Dagara people of what is now BURKINA FASO and GHANA, fire is the first element on the wheel of life. Water is the second element. According to these stories, in the beginning there was no world as humans know it, but only a burning ball of fire moving at great speed. When this ball of fire encountered a massive body of water, the shock forced fire into the underworld, leaving a hot, steamy surface that was fertile for living things. This surface, called Earth, is the third element on the Dagara wheel of life. The minerals and stones and other hard components of the earth hold things together and thus make up the fourth element. The fifth element, vegetative nature, came into existence when the clouds of steam in the atmosphere subsided, allowing plant life to grow.

In tropical Africa the nights are close to 12 hours long year-round, and darkness falls abruptly. The first uses of fire were to provide protection from animals and, later, to help in hunting and toolmaking. Control of fire made the night safe. Fires caused by lightning and set by humans helped thin the vast African forests and turn woodlands into grasslands, making cultivation and passage easier. The main areas of migration and settlement in prehistoric Africa tended to be in the savanna regions.

fishing Early inhabitants of Africa were primarily nomadic foragers, but archaeological evidence indicates that several groups also established very early fishing communities. The Ishango people of Lake Albert were active fishermen about 23,000 BCE, as were the inhabitants of Wadi Kubbaniya in EGYPT 5,000 years later. Not until 7000 BCE did fishing communities start to emerge in abundance, however. In addition to the NILE and NIGER rivers, the banks of the Congo and the Zambezi rivers emerged as fishing areas. Harpoons and net weights have been found in some of the settlements, indicating that early NOMADS were able to live a semi-sedentary life for the first time.

With a plentiful FOOD supply, these early fishermen were able to establish villages of up to 1,000 people living in permanent dwellings. Their social structure changed from loose ties between families (which was typical of nomadic peoples) to more structured communities. New concepts, like property and inheritance, emerged as they accumulated nets, harpoons, and other tools necessary for fishing.

Although the social progression of these early fishing communities is unclear, they were successful enough to flourish for thousands of years. As agricultural technology was introduced, fishing villages began to trade fish for the crops and commodities of neighboring villages.

Early fishing techniques were improved upon over time, but the seasonal rhythms of the rural fishing lifestyle remained largely unchanged until the latter part of the 19th century. As the high era of European colonialism began many indigenous fishermen were forced to abandon fishing as a means of sustenence in order to provide LABOR for colonial ventures.

See also: FISHING, COMMERCIAL (Vol. V).

flamingos The African flamingo is reddish with black wing feathers. In ancient EGYPT, however, these birds were frequently found in lakes, a fact that led to a striking difference between the birds of ancient Egypt and those of the rest of the continent. Flamingos actually are white in color; their pink hue comes from eating tiny pink shrimp. Since brine shrimp are rarely found in Egyptian lakes, even today many Egyptian flamingos are only a very pale pink.

During the height of power for the Roman Empire in Africa, flamingo tongues were consumed as a great delicacy. In fact, flamingos were such a popular food in ancient ROME that the birds were threatened with extinction. To protect them, the Romans established a law forbidding the hunting of flamingos.

flies Adult flies measure between .25 and .5 inches (0.6 and 1.2 cm) in width. Some flies are known to carry malaria and other serious diseases. For example, the tsetse fly, which lives throughout tropical areas south of the SAHARA DESERT, is a known carrier of the parasite that causes sleeping sickness.

In ancient EGYPT flies were considered symbols of valor and determination. Often, GOLD medals in the shape of flies were given to accomplished soldiers. Flies were also recognized as pests. Egyptians covered their doors and windows with mats to keep them out. According to the Bible, an infestation of flies was among the 10 plagues sent to Egypt by God to persuade the Egyptians to release the Israelites from slavery.

folklore Proverbs, stories, tales, beliefs, customs, codes, and literature of a culture passed on from generation to generation, usually as ORAL TRADITION. Since the stories and proverbs of ancient African cultures were typically told and not written, much of what we know about ancient folklore comes from the versions of stories that still exist in present-day Africa. Scholars believe that this existent folklore is very old and has been passed down for centuries, enabling people of today to learn a great deal about the people of the past.

In Africa, as in other parts of the world, folklore takes different forms for different purposes. Generally, though, figures in these stories can go beyond the constraints of everyday life. They may amass great wealth, visit imagined places, or perform actions that if carried out in real life would merit punishment or even death. Though folklore can contain magical elements, the rationale for telling the stories is often to help real people better understand their world.

Creation myths are among the most common types of ancient folklore, and they often explain how things came to be. Hundreds of creation myths exist. In almost every such African myth, the gods give humans everlasting life, but someone distorts the message. The YORUBA of NIGERIA have a particularly rich tradition of folklore, and their creation myth is well known. However, even among the Yoruba themselves, the myth varies, showing that, even within a culture, folklore can differ from region to region.

The Yoruba creation myth, like most African myths, includes a god in the sky ruling over earth from above. More specifically, the Yoruba myth tells that before there were people on earth, there was only water and flooded marshland. Therefore, the chief god, OLORUN, decided one day to make land and sent another god to make it, giving him a snail shell containing earth and a hen. Even though he had been given an important task, this god stopped to get a drink on the way, and, as a result, fell into a drunken sleep. His brother, Oduduwa, hearing and seeing what had happened, took the gifts from Olorun and went to earth to accomplish the feat. He poured the earth from the shell and set the hen on it so that the hen could peck and scratch the earth to form land. The hen continued until there was a sizeable piece of dry land. When the drunken god awoke and saw what had taken place, he fought with Oduduwa over the claim to this land. Olorun made Oduduwa ruler over earth, and the other god was given the less important task of creating figures, which became people when Olorun breathed life into them.

One variation of this myth explains that the god who came to form land on earth became bored and began to create humans out of clay but stopped in the middle to drink. Because of the god's drunkenness, some of the humans were not formed well, thus explaining how deformed people came to be. This is another example of how folklore explains a part of real life.

The African trickster tale is another common form of folklore; in fact, it is perhaps the best-known of all. In it, the trickster often outsmarts the gods or gets out of an impossible situation. In one such trickster tale of the Yoruba, the trick is played on the tortoise, as he tries to steal knowledge from the gods. The knowledge is contained in a shell that he carries around his neck, but, angry that he cannot traverse a tree trunk because of the shell, the tortoise breaks it. As a result knowledge spills out and spreads throughout the earth. Scholars speculate that this type of folklore shows the quirks and flaws of humans, as well as the lessons we can learn. ANANSI, a spider figure, is one of the well-known tricksters of western Africa. In Nigeria and the Republic of BENIN, the trickster can also takes the form of a hare or a tortoise.

Much African folklore centers on animals, as well as on spirits of the natural world. In this type of folklore, there are gods and spirits to represent most of the things on earth and in the sky, including animals, the sun, moon, stars, and lightning. A spirit may be strong or weak, depending on the power that its natural counterpart has on earth. For example, a river or a snake has great power because it can kill people, and so both are among the nature spirits that are strong. In folklore, animals often have greater powers than in real life and can talk, climb to the sky, and accomplish other amazing feats, even speaking to the gods.

The purposes of honoring or praising something in nature and of teaching about nature are often served in folklore. For example, in one myth from TANZANIA, a giraffe asks a god for wisdom, and the god consents. The god tells the giraffe that it will be allowed to see and listen but not talk. This, the deity explains, is because those who talk much are foolish, while those who remain silent show wisdom. This, according to myth, explains why GIRAFFES never seem to utter a sound.

Folklore also explains what may at first seem inexplicable. One story of how FIRE was brought to earth is an example. In this myth, the insects and birds came together to find a way to bring fire from the sky so that they could stay warm at night. The Mason Wasp agreed to fly high into the sky, past the clouds, where it was thought the gods kept fire. The vulture, eagle, and crow decided to go with him, but after many days of flying, the vulture died. The eagle, too, died, followed by the crow. Only the wasp remained aloft. After 30 days, the gods did indeed give fire to the wasp to bring to earth. For his perserverence, the wasp was rewarded by the gods as the only animal able to build a nest near fire.

Traditionally, in Africa, those who knew folklore and, in particular, proverbs, were thought to be wise. They were respected and thought of as people who understood the culture and how it functions. One of the reasons why ancestors were revered in many African cultures may have been because of their knowledge of the folklore that was orally passed from generation to generation. Stories, tales, proverbs, customs, explanations, and codes of behavior have all been passed down for centuries in Africa in the great tradition of oral literature. Some of these stories were so elaborate that they took days to tell. This folkloric tradition served to honor or praise, explain, teach, preserve history, pass down morals and virtues, and elevate people in their everyday existence.

food Ancient Africans obtained food in several ways: they hunted, fished, gathered, scavenged, herded, and farmed. The earliest peoples were HUNTER-GATHERERS. Their diet included large and small game, birds, fish, mice, grass-hoppers, crabs, snails, mollusks, fruit, nuts, wild cereals, vegetables, fungi, and other plants. Even in ancient times, hunting and gathering only used a portion of peoples' time, allowing opportunity for other activities, including social interaction and artistic expression. Some historians, therefore, believe that were it not for population growth, ancient peoples would not have taken up farming, since it represented a much more time-consuming activity. (In fact, it has been said that hunger was the motivating force behind AGRICULTURE, migrations, revolutions, wars, and the establishment of dynasties.)

When the ancient African population grew larger than food sources could support, people began to engage in agriculture. While the hunters-gatherers did consume some wild cereal, the advent of farming meant that a steady supply of grain was available and that a surplus could be amassed to provide food in lean times or as currency in trading necessities and other items.

GEOGRAPHY was a determining factor in the diet of the hunters and gatherers. Different regions supported different wild plants and animals. In parts of West Africa, for example, people harvested forest snails, while groups living on the shores of Lake VICTORIA used water FLIES as an ingredient in soup.

In the case of agriculture, the type of terrain and amount of rainfall determined the kinds of crops that grew best. The ancient Egyptians grew barley, beans, cucumbers, dates, figs, grapes, leeks, melons, and wheat. The people of ETHIOPIA domesticated *noog,* an oil plant, and teff, a tiny grain that was not found elsewhere in Africa. Many varieties of wheat and barley were cultivated in Ethiopia, where the altitude was conducive to their growth. The peoples of West Africa's "yam belt" cultivated many plants used in soups, including fluted pumpkins. The IGBO used YAMS as a carbohydrate staple, rolling pounded yams into a ball and dipping them into a sauce before eating them. The peoples of marginal areas experimented with a fluctuating blend of farming, hunting and gathering, and FISHING. CLIMATE change also affected diet. For example, gradual desiccation in the western sudanic belt affected the development of cereals.

VEGETATION and rainfall also determined the type of DOMESTICATED ANIMALS that Africans kept and the patterns of life that they followed. Some people lived as pastoralists, since the generally drier grasslands with relatively low rainfall could not sustain farming. The pastoralists for the most part herded either CATTLE or CAMELS. Sheep were important in North Africa and also in eastern and southern Africa. Pastoralists obtained meat and milk from their herds, diversifying their diets by trading with farmers for other types of food. Other Africans living in better-watered areas often farmed as well as herded livestock. They could thus combine both grown crops and livestock products in their diet. Those farmers living in the more heavily forested areas had smaller domesticated animals such as GOATS and fowl.

Yet another factor influencing the diet of ancient Africans was social mores. The MAASAI were pastoralists and loathed hunting and farming. Consequently, only in times of famine would they take up cultivation and hunting, although some Maasai groups did adopt agriculture.

Foods from Asia were also part of the diet of ancient Africans. It is thought that the settlers of MADAGASCAR brought bananas, rice, and COCOYAM from Asia. It was previously thought that these foods spread to the mainland and then across the continent. However, it is now believed that they probably spread very gradually around the shores of the Indian Ocean.

The importance of food staples was reflected in the languages of ancient Africans. Among the Igbo, a successful yam farmer was referred to as a "yam king," and the Igbo language has numerous words for yams. The Chagga

have 20 different words for banana. To the NUER and Dinka peoples, fish and grain were more important than meat. Thus Dinka priests were referred to as "masters of the fishing spear." In the eastern Sahara the word for life refers to SORGHUM. In the SAHEL the same word refers to MILLET.

The preparation and consumption of food was often associated with rites and rituals. For example, the peoples of the MAGHRIB ate communal meals built around couscous, which was made from pulverized grain. Women prayed aloud during the grinding process, and the communal consumption of the couscous was an expression of solidarity. Among the Igbo, the eating of yams was forbidden before the New Yam Festival. This was most likely done to allow the tubers to grow to maturity.

The amount of food available sometimes determined who would live and who would die. Some hunters and gatherers would be forced to abandon their infants and elders in times of famine. The diets of the ancient Africans also affected their life span and health. A diet lacking in certain nutrients could be responsible for illness, and many people suffered a lifetime of pain due to such health problems as arthritis and tooth decay.

foxes Foxes have long, pointed muzzles, thick coats, and long tails. They generally are solitary animals, living alone most of the year and sleeping in grasses or thickets. During the breeding season, pairs of foxes establish dens, homes burrowed in the ground, to raise their families.

Foxes eat a variety of foods, including insects, small birds, rodents, lizards, eggs, and fruit. They are, in turn, hunted by larger animals like wolves, as well as by humans. The most common fox, the red fox, is found in northern Africa and can be as long as 23 inches (58 cm) and weigh 5 to 10 pounds (2 to 4 kg). The fennec, or desert fox, which is found in the Sahara, has large ears and fluffy cream-colored fur. The desert fox is between 9.5 and 16 inches (24 to 40 cm) long and weighs between 1.5 and 3.5 pounds (3 to 8 kg). It is the smallest type of fox.

Foxes appear in the mythology of various African cultures, often as a mischievous trickster character. In ancient EGYPT, many people carried *was*-scepters, fetishes with carvings of dog or fox heads that were thought to hold life-giving powers.

Fulani See FULFULDE.

Fulfulde (Fulani, Peul) A Niger-Congo language spoken in West Africa. Speakers of Fulfulde are found in a band stretching from CHAD to CAMEROON. *Fulani* is the HAUSA designation for speakers of Fulfulde, *Fula* is the Mandinka term, and *Peul* that of the Wolof.

By the end of the 20th century an estimated 5 to 10 million people spoke one of the six mutually understandable dialects of this language, making it the most widely spoken language in the West Atlantic branch of the NIGER-CONGO LANGUAGES.

funeral customs Burial rites and associated beliefs practiced by various societies. The number of different funerary customs practiced among the populations of Africa provides some idea of their significance. Funeral rites have held an integral place in society from ancient times and often appear to have developed to express a belief in reincarnation or regeneration. These themes influence every aspect of life in Africa and have served as the underlying source of many of its cultural forms. It is a theme most apparent in each new generation, which is believed to embody returning ancestors.

Funerals have long been considered a crossroads where the worlds of the living and the dead briefly coexist. In the unsettling period following death, funerary rites have also offered grieving people a way to reinforce the continuity of kinship while reinforcing the all-important sense of community. The appearance of food, libations, gifts, and personal possessions in and on graves can be traced back to many ancient populations. The custom may have initially begun as an appeasement to the gods or as a way to avert calamities, such as drought or failed crops. In ancient EGYPT, for example, it was customary to bury people with their possessions, and status was a determining factor in how the deceased was to be sustained, protected, and compensated in the next world. Archaeologists have excavated the mummified remains of pharaohs in beautiful sarcophagi with a wide array of grave goods, including precious jewels, weapons, household items, and such means of TRANSPORTATION as chariots and small boats.

In comparison, some 10,000 to 25,000 years ago, the HUNTERS-GATHERER ancestors of the modern day SAN in BOTSWANA and the KHALAHARI DESERT in southern Africa buried their dead with simple possessions, such as stone tools. Some sources indicate that they placed the bodies in a fetal position, knees bound by rope close to the chest, with the body lying on its left side facing east. Archaeologists' excavations have failed to offer a complete picture of what formal funeral ceremonies, if any, the San conducted. Instead, it appears that following the family's farewell, the San dismantled their camps and abandoned the area except for periodic visits. If true, the absence of elaborate rites may reflect the San's nomadic existence.

Many funeral customs were shaped by the environment. Ritual imagery of rivers, lakes, and other bodies of water confirm a widely held view of death as a journey. The Mende of SIERRA LEONE believe that the last gasps of

a dying person are efforts to climb the hill of death. A few days later, a "crossing the river ceremony" acknowledges the person's arrival in the land reserved for the dead. The Lodagaa, farmers in northern GHANA, maintain that the land of the ancestors is found in the west, across a river of death. The fee to cross the river is 20 cowries, and those who attend the funeral pay for the journey. The impact of environment on belief was further demonstrated by the Chagga of what is now TANZANIA, who hold that it takes nine days to travel the rugged desert terrain between the physical and spiritual worlds. As a result, for protection from the sun, their deceased loved ones are "fed" with milk and wrapped in animal hides.

Some of the traditions practiced by the Abaluyia people of KENYA are representative of many African societies. For example, although men and women demonstrate strong displays of grief, widows often have a well-prescribed path to follow. As soon as death is apparent, wives and their cohorts begin to wail and their children take up these laments as well. Wailing is considered by many societies to be an essential rite, and the inability to cry is offensive. Among the people of Manianga, in the present-day Democratic Republic of the CONGO, women whose "strong eyes" shed no tears are considered a disgrace to their FAMILY and community. The underlying impulse involved is reciprocity—"Today we cry for you, tomorrow you will cry for me."

As in many African societies the Abaluyia keep their deceased unburied for a brief period to allow relatives and friends to gather. They hold night vigils and festive ceremonies, which are also common in many societies. Vigils are often organized to ward off the possibility of WITCHCRAFT, generally associated with inexplicable deaths. Festive ceremonies, on the other hand, are traditionally held to please the deceased while offering communal solace to the grieving family. It should be noted, however, that one funerary custom that remains within the cultural sphere of the pastoral Abaluyia society is the recognition given to women who have been faithful to their husbands. At the burial ceremony, such a widow is encouraged to dance holding her husband's spears; if past childbearing age, she may wear his garments.

The timing and logistics of burial are influenced by societal beliefs. For instance, the Lodagaa bury their dead in the morning or evening because in the afternoon the soul of the dead person might be apart from the body, basking in the sun. The Abaluyia, on the other hand, bury everyone except for chieftains in the afternoon; chieftains are traditionally buried at sunset.

While the practice of a "double funeral" is largely misunderstood by outsiders, there is both a practical purpose and a societal purpose behind it. The dead are first buried quickly to prevent a polluting presence. In the interval before the more formal funeral, many traditional rituals intended to elevate the deceased to ancestral status are celebrated. The SHONA people of ZIMBABWE, for example, held a *kugadzira,* a communal meal, a year after death. This meal not only allowed the family to reaffirm kinship ties, it also called for the distribution of former possessions belonging to the deceased, including former wives, lands, and titles. In later times, the Zulu people celebrated the *ukubuyisa idlozi* (bringing home of the spirit), a ceremony held by the bereaved family within two years of death. When the ceremony was performed for men of high position, an ox was sacrificed to the ancestors, and the name of the deceased was then added to the praise list. The ceremony culminated with the eldest son dragging a tree branch, symbolic of the spirit, from the gravesite to the homestead.

Many societies that perform double funerals present sacrificial offerings at shrines during the interim period or participate in sacred DANCE. The Dogon and the Fulani, for example, perform a dance to reunite spirit and community. Not only do these ceremonies "invite back" the departed, in many regions they served as an official notice that the period of mourning, pollution, and disorder that are thought to accompany death is at an end. The formal funeral, a community event, climaxes this period of grief.

Following the funeral, the work of maintaining the memory of the deceased continues. The AKAN of GHANA still invoke their ancient traditions of remembering the ancestors and their continuing deeds for the community through the *adae wukudae* or *kweisidaie* ceremonies performed on Wednesdays and Sundays. Announced by drumming on the morning of the event, the ceremonies begin after ancestor stools are ceremonially blackened and water poured by a female elder. This symbolic gesture allowed the ancestors to wash their hands before eating. Beginning with the oldest stool, rulers or priests traditionally gave an offering of plantains, meats, and wine, and they invited the ancestors to participate:

> *My spirit grandfather,*
> *Today is Wednesday Adae*
> *Come and receive this mashed plantain and eat*
> *Let this town prosper . . .*

Rites such as these continue to be used by many African societies in order to maintain ties to the deceased. Funerary customs have a timeless quality that blends past, present, and future in a celebration of life over death.

G

Gabon   Country covering about 103,300 square miles (267,500 sq km) along the central-western coast of Africa. Today Gabon is bordered by EQUATORIAL GUINEA, CAMEROON, the Democratic Republic of the CONGO, and ANGOLA. Spearheads dating back to c. 7000 BCE have been discovered in the area, but little is known about the early inhabitants who used them. Bantu speaking peoples migrated into the area in the first millennium.

galley   Though galleys had a single mast and sail, the primary source of power for the ships was human. The first galleys had one series of rowers on each side of the long, narrow, shallow boat. Shields, which were sometimes made of animal hide or heavy cloth, hung from a rail to protect the rowers. The galleys were used for transporting goods for trade, but also for war. From about 850 BCE on, galleys often were fashioned with a large ram at the bow.

Around 700 BCE, the PHOENICIANS introduced a new kind of galley, a bireme, which had two rows of oars. These were arranged with an upper and lower bank of rowers on each side of the ship. The Greeks are credited with building the first three-banked galley ship about 500 BCE. These three-banked galleys, or triremes, were also used by ROME and other kingdoms in the Mediterranean, primarily because they acheived greater speed and had more power with which to ram enemy ships. Some of the three-banked ships held two or three masts and sails. Galleys with four and five banks of oars followed.

Galleys were used to carry trade goods in the Mediterranean and Red Seas. Over time, the galleys used in commerce were built differently than those used in war. The merchant ships became deeper and wider, with a greater storage capacity. They also came to rely more on sail and wind power than on the strength of human rowers. In contrast, the long, narrow fighting galleys were primarily powered by rowers and were built for speed and ease of maneuverability.

Gambia, The   Small coastal West African country that is some 4,360 square miles (11,290 sq km) in size and that stretches inland 295 miles (490 km) from the coast along the Gambia River. Varying in width from 15 to 30 miles (24 to 48 km), The Gambia is completely surrounded by SENEGAL except for a narrow coastal strip on the Atlantic Ocean. Gambia is part of the larger Senegambia region.

HUNTER-GATHERERS of the STONE AGE long inhabited the banks of the Gambia River. As AGRICULTURE developed in the interior savanna regions along the NIGER RIVER, it expanded westward to The Gambia. The most important agricultural development was the adoption of African rice (*Oryza glaberima*). Originating in the inland NIGER DELTA, perhaps as early as 3500 BCE, it spread to the coastal zone, where it became a principal FOOD crop from Senegal to GHANA. By 500 CE the region was well populated by farmers who used iron implements and lived in villages.

The people of the Gambia region were possibly in contact with CARTHAGE. About 470 BCE the Carthaginian explorer HANNO (c. 530–470 BCE) made a voyage along the Atlantic coast of Africa that perhaps reached as far as present-day CAMEROON. It is probable that one of the broad rivers his chronicle describes was the Gambia, though it could also have been the SENEGAL RIVER. Whether there were further links between Carthage and the Senegambia region remains unknown, since there are no other records of Carthaginian voyages along the West African coast.

Garamantes   Inhabitants of northern Africa, in the vicinity of the FEZZAN region, in present-day LIBYA, the Graramantes were eventually absorbed into Roman Africa. Although their exact origins are unclear, the roots of the Garamantes are traced to ancient, probably even prehistoric, times. According to some historians, they may be related to the SEA PEOPLE who, at various times, challenged Egyptian power in eastern Africa. Other scholars, however, see the Garamantes as related to the various indigenous STONE AGE peoples of North Africa whose rock drawings and other remains have only recently begun to be studied.

As early as the fifth century BCE the Greek historian HERODOTUS (484–425 BCE) described the Garamantes as successful warriors who were noteworthy for their mastery of four-horse chariots. These war chariots allowed the Garamantes to establish military dominance in the region. For the most part, it seems that these lightweight, maneuverable chariots were used primarily to raid and plunder neighboring areas. The speed and power of the Garamantes' chariots allowed these raids to go on over an area that, according to Herodotus and the Roman geographer Strabo, stretched from ETHIOPIA in the east to the Atlantic coast in the west.

The Garamantes' military power gave them effective control over much, if not virtually all, of the trade passing through their territory. Evidence also suggests that the Garamantes themselves might have used their chariots as part of their own trading efforts: Many of the numerous rock paintings found in the Fezzan depict the Garamantes' vehicles in action, and some seem to show ox-drawn carts that might have been quite suitable for transporting trade goods. In addition, some of the ancient pathways across the region seem capable of handling traffic from vehicles larger and heavier than the Garamantes' war chariots. Unfortunately, there is little other hard evidence—in the form of discoveries from other regions, for example—to support the notion that the Garamantes maintained trans-Saharan or, indeed, any other significant trade routes.

Beyond controlling the trade, the Garamantes also conducted extensive raids against neighboring peoples, including the far more powerful Carthaginians. Even when CARTHAGE was a major force in North Africa, in the sixth century BCE, the Garamantes remained a significant problem for the city-state's outlying regions, and conflicts between the Garamantes and Carthaginians were frequent. The pattern continued after Carthage's defeat in the PUNIC WARS, with the Garamantes raiding and plundering areas that had fallen under Roman dominion. This went on until ROME, determined to solve the problem of the Garamantes once and for all, launched a major military expedition against them. By the year 19 CE, this Roman force had effectively stamped out the Garamantes' opposition and brought them under the rule of Roman Africa. In the sixth century the Garamantes fell under the control of the Eastern Roman Empire.

gazelles   Found in North Africa and eastern and central Africa, gazelles are slender, graceful animals standing from 2 to 3 feet (60 to 90 cm) at the shoulder. They live on open plains and in desert areas. Their fur coats are usually brown, though their bellies and rears are white. Light stripes run down from the sides of their faces from above the eyes to the muzzles. Their horns are short and have slightly upturned rings at their ends. Female gazelles have horns that are usually smaller and more slender than those of males.

There are about 12 species of gazelles. Of these, the Dama gazelle, found in North Africa, is the largest. The most common gazelle found in East Africa is Thomson's gazelle. It has black stripes along its sides and white stripes on its face. No matter what type, gazelles move in herds that usually include five to 10 members, though herds sometimes can number several hundred.

Gazelles were a familiar part of ancient Egyptian life. Egyptians used bows and arrows to hunt gazelles, which had an important place in their diet. Later, some Egyptians even raised gazelles on farms. The animal's appearance in Egyptian mythology underscored its importance. Anunket, a goddess worshiped at ELEPHANTINE, was often associated with the gazelle. Another Elephantine goddess, Sati, is represented with a human head, the crown of UPPER EGYPT, and the horns of a gazelle.

Gebel Barkal   Sacred mountain in the ancient Kushite city of Napata in Upper Nubia. Situated between the third and fourth cataracts of the Nile, Gebel Barkal (also known as Djebel Barkal) was a spiritual center for several generations of Kushite kings. A 303-foot-high (100-meter-high) tabletop mountain made of sandstone, the *gebel* (mountain) was thought by worshipers of the Egyptian god AMUN to have a deity's spirit residing deep within its interior.

Rulers of the KUSH kingdom established Napata as their capital in the eighth century BCE, after which they constructed numerous temples, statues, PYRAMIDS, and stelae at Gebel Barkal. They installed the priesthood of Amun there as well. One of the Gebel Barkal temples, erected by King PIANKHY (r. c. 751–716 BCE), housed a famous example called the Stele of Victory. Comparatively lengthy, the text on this stele contained 159 lines in Meroitic script detailing both Piankhy's military conquests and his responsibilities as king. Other stelae at the site discussed the nature of the Kushite kingdom and proclaimed the supremacy of the god Amun. Similar monuments were constructed by King Shabaka (r. c. 716–701 BCE), who succeeded his brother Piankhy as king and continued the policy of monument building. One of Shabaka's more noteworthy creations was a pyramid, also located at Gebel Barkal, that later served as his burial site.

Other successors, including Piankhy's sons, Shabataka (r. c. 698–690 BCE) and Taharqa (r. c. 690–664 BCE), also built temples at Gebel Barkal. Considered one of the greatest builders of the era, Taharqa demonstrated his devotion to the god Amun by building and restoring temples and sanctuaries at Gebel Barkal as well as at Thebes, KARNAK, MEMPHIS, Kawa, and the Isle of Argo. He also made offerings of precious jewels and gold plate, along with equipment and endowments for the sanctuaries and priesthood. His projects at Gebel Barkal included the reconstruction of the Temple of Amun, to which he added an inner chamber to house his altar. Taharqa's work also included the construction of a series of colossi that stood in the forecourt, a rock temple dedicated to Amun, and a separate temple honoring the goddess Mut, the wife of Amun.

Still later, King ASPELTA (r. c. 593–568 BCE) left several stelae at Gebel Barkal that provide some idea of what it meant to become a king. One of these contains what has become known as *The Enthronement or Coronation Text.* It depicts the Kushite army standing near Gebel Barkal, their leaders consulting the god Amun about Aspelta's kingship. Another of his stelae, the Stele of Excommunication, offers important insights into the authority of the priests of Amun, who reportedly held the power of life or death over Kushite kings. Based on the writings of the ancient historian Diodorus of Sicily, the power of the priesthood at Gebel Barkal ultimately was destroyed by the Kushite king Arkamani.

Gebel Silsila   Narrow gorge on the NILE RIVER in southern EGYPT, forming a natural barrier that, in Egypt's Predynastic Period, marked the boundary between Nubian and Egyptian cultures.

As the Nile flows north past the fertile plain of Kom Ombo, it is hemmed in by nearly barren sandstone hills where the water courses through a tight bottleneck at Gebel Silsila. Beyond the gorge, the river reemerges in limestone cliffs that form the reaches of the lower NILE VALLEY to the Delta. In ancient times, the area extending south from Gebel Silsila to the second cataract and beyond was the territory of lower Nubian farmers and herders. Described by archaeologists as the NUBIAN A-GROUP, these people established themselves in the area some 5,800 years ago, developing a culture that lasted from approximately 3800 to 3000 BCE.

Deluged annually by rising waters, the gorge at Silsila was a site for the A-Group's sacred fertility ritual, which was performed at the time of flooding. These rites were dedicated to the goddess Taweret (also known as Thoueris and Taurt). The protector of childbirth and fertility, she was portrayed as part hippopotamus, part crocodile, and part lion. The narrows were also the location of shrines and offerings to the deity Hapi. Shown as a fat man with pendulous breasts, Hapi represented fertility and personified the annual inundation of the Nile River.

Ge'ez   Ancient language of ETHIOPIA; part of the Hamito-Semitic language family. Ge'ez apparently developed from the language of the Sabean settlers who crossed to Ethiopia from southern Arabia as early as the first millennium BCE. By the third and fourth century, it was being used for written inscriptions. It continued to be used, both as a spoken and a written language, for hundreds of years, in the Ethiopian Orthodox Church, where it is still used today in scriptures and services. The Ge'ez alphabet, which is called *fidel* (meaning "the alphabet" or "the writing system") by its users, dates back to approximately 100 BCE, making it one of the oldest African alphabets and certainly the oldest one still used in modern times. Like English, the Ge'ez alphabet consists of 26 letters, but all of those letters represent consonants.

geography   The second largest continent in the world, surrounded by two oceans and two seas, and home to rich and varied resources and physical features, Africa was first recognized as the continent called AFRICA by the ancient Romans. (The word *Africa* may come from Latin or Greek words that mean "sunny" and "without cold.") Before that, the Greeks referred to the continent as LIBYA.

Africa is bounded by water, with the Atlantic Ocean on its western coast, the Indian Ocean and RED SEA on its east ern coast, the MEDITERRANEAN SEA to the north, and the Indian and Atlantic Oceans to the south. The African

Mount Kilimanjaro, a dormant volcano on the Kenya–Tanzania border, is one of a series of volcanoes formed at the same time as the Great Rift Valley. *© Shama Balfour; Gallo Images/Corbis*

continent comprises more than 11.5 million square miles (4,439,000 sq km), or one-fifth of the land on earth, and is almost as wide from east to west (4,600 miles or 2,882 km) as it is long from north to south (5,000 miles or 3,100 km). Most of the continent has a tropical climate.

Africa is divided by the equator (0° latitude), which passes through GABON, the Republic of the CONGO, the Democratic Republic of the CONGO, UGANDA, and KENYA. The tropic of Capricorn runs through the southern part of the continent and through southern MADAGASCAR. In addition the prime meridian, or 0° longitude, traverses Africa from north to south.

The lowest point in elevation in Africa is at Lake Assal, which is located in DJIBOUTI, near the coast of the Gulf of Aden. It lies 515 feet (157 m) below sea level.

Among the massive continent's unique physical features is one of the largest islands in the world, Madagascar. Africa also contains one of the world's largest bodies of fresh water, Lake VICTORIA, and some of the largest deposits of natural resources, including GOLD, diamonds, and fossil fuels. Africa has the longest river in the world, the NILE RIVER, and the most species of freshwater fish and hooved mammals of any continent.

The CLIMATE and VEGETATION of Africa, which combine with the physical terrain and the latitude to form the continent's ECOLOGICAL ZONES, are thought to have remained basically the same for many years. Most of the ecological changes have taken place during the past 1 million—and especially the past 2,000—years. These changes have been caused, in large part, by the impact of humans on the land as they became more advanced in AGRICULTURE, toolmaking, and building, and as populations increased and cities grew.

In turn, Africa's geography has contributed in significant ways to the history of the continent. The vast amount of desert in the northern part of the continent, in particular, has had a great influence on human settlement. Indeed, for long periods in African history, some areas were entirely unoccupied. Even today, the world's second largest continent contains only 10 percent of the world's population. The continent's mountains and deserts imposed barriers to settlement and communications between settlements, but they also became home to peoples who were able to take advantage of what these areas had to offer.

High Plains In general, Africa is thought of as a massive plateau with three divisions: the northern plateau, in which the SAHARA DESERT and the ATLAS MOUNTAINS lie; the central and southern plateaus, which encompass regions of southern and west-central Africa; and the eastern highlands. Some of the highest plateau land is in ETHIOPIA, within the country's eastern highlands, where the altitude reaches heights of up to 15,000 feet (4,572 m).

Other plateau areas that reach significant altitude are the CAMEROON highlands, the GUINEA highlands (which reach into SIERRA LEONE and LIBERIA as well as Guinea),

the Fouta Djallon, which is also in Guinea, the Jos Plateau in NIGERIA, and the Adamawa area that lies in CAMEROON and Nigeria.

Mountains Although Africa has many groups of mountains and several well-known mountain peaks, mountains comprise a smaller percentage of land in Africa than they do on any other continent. In the Great RIFT VALLEY, which spans almost 4,000 miles (6,437 km), volcanic and seismic events created the highest peaks in East Africa. KILIMANJARO at the border of Kenya and TANZANIA (central Africa), the tallest mountain peak in Africa, rising to 19,340 feet (5,895 m), is actually a dormant volcano. Other tall, volcanic peaks that are now extinct include Mount KENYA (17,058 feet or 5,199 m); Mount Meru (14,978 feet or 4,565 m), in Tanzania, about 40 miles (64.4 km) west of Kilimanjaro; and Mount ELGON (14,178 feet or 4,321 m), which is on the border of Kenya and Uganda. Mount Cameroon, an active volcano in western Africa, peaks at 13,435 feet (4,094 m).

The Atlas Mountains lie in the northwest, crossing through MOROCCO and the northern tip of ALGERIA, near the Mediterranean and Atlantic coasts. The Virunga Mountains, in northwest Democratic Republic of the Congo, are still actively volcanic, and every 10 years or so an eruption produces a lava flow. A lava flow from the distant past was responsible for the creation of Lake Kivu.

The RUWENZORI MOUNTAINS, unlike many of Africa's great mountain ranges, were not formed as a result of volcanic activity. Also called the Mountains of the Moon, these peaks are located in the central African countries of Uganda and the Democratic Republic of the Congo. The highest mountain in this range is Margherita Peak, at 16,795 feet (5,119 m). In southern Africa, the Drakensberg Mountains rise to a height of 11,425 feet (3,299 m) at Ntlenyana (also called Ntshonyana) and to 10,823 feet (3,280 m) at Mont-aux-Sources.

Lakes The western Rift Valley is the location of Lake TANGANYIKA, among others, while lakes found in the eastern Rift include Nyasa, Natron, and Manyara. These equatorial lakes were part of a system that also formed one of the largest freshwater lakes in the world, Lake Victoria. Lake CHAD, another large freshwater lake, is located in the central sudanic region.

Rivers and Tributaries Africa is home to many great and famous rivers, including the CONGO RIVER, the NIGER RIVER, the ZAMBEZI, the ORANGE RIVER, the Vaal, and the NILE RIVER. Water supply and control of water have historically been of concern throughout Africa. As a result, rivers and tributaries have played an important role in AGRICULTURE, irrigation, and drainage, as well as in travel, trade, and politics.

The Nile River, at 4,150 miles (6,677 km), is the longest river in the world. The Nile flows out of Lake Victoria (the Victoria Nile) north into Lake Albert (the Albert Nile), where it continues north as the al-Jabal River, the WHITE NILE, and the Nile. Finally, after winding through Uganda, Republic of the SUDAN, and EGYPT, the Nile spills into the Mediterranean Sea.

Several tributaries join the Nile along its right bank as it makes its journey north, including the Sobat, Atbara, and BLUE NILE. The al-Ghazal is the major tributary on the left bank. Together the Nile and the tributaries flow north and west before entering the Mediterranean. There, the Nile basin covers a vast area of Egypt north of CAIRO.

Another of Africa's great rivers, the Congo River, travels 2,900 miles (4,666 km) from its source in ZAMBIA to the Indian Ocean. It drains most of Central Africa. Like the Nile, it descends rapidly through a series of steep gorges, rapids, and waterfalls, including the Boyoma Falls, which extends for 60 miles (96.5 km).

The Niger River begins in Guinea. Then, with its largest tributary, the BENUE River, it winds through Nigeria before entering the Atlantic Ocean. About 2,600 miles (4,183 km) in length, the Niger has the largest river basin in western Africa. As with the Nile, swamps make parts of the river difficult to navigate.

The ZAMBEZI RIVER travels 2,200 miles (3,540 km) and forms the magnificent VICTORIA FALLS. One of the largest waterfalls in the world, it is located on the border of Zambia and Zimbabwe. The Zambezi's two main tributaries are the Kafue and the Luangwa, which join the Zambezi past Lake Kariba and then empty into the Indian Ocean at the river's 37-mile-wide (59.5 km) mouth. Swamps of reeds and other water plants clog the river in places, impeding travel and FISHING.

The Orange River, flowing from the Drakensberg Mountains to the Atlantic, is, along with its tributary, the Vaal, about 1,300 miles (2,092 km) long. It is one of the six important drainage systems in Africa and drains southern Africa.

Grasslands Two wide areas of vast grasslands (one north of the equator and one south), which used to be known as savannas, lie between the deserts of the north and south and the rain forests near the equator. These are large, open, grassy areas in which only a few trees might be found. Among these is the BAOBAB TREE and the acacia. On average these grasslands receive moderate rainfall of 20 to 45 inches (50.8 to 114.3 cm) per year.

The Highveld grassland area of South Africa is a true grassland, with trees or woody plants comprising 10 percent or less of its land. This is likely due to the natural occurrences of lightning, which often cause fires.

> Grass was long thought of as being "sweet" or "sour." Sweet grass was good for grazing; sour grass was not. One of the best-known sweet grasses in Africa is the *Themeda* variety. *Andropogon* is one of the better-known sour grasses.

Africa has had the longest history of human life on earth. During the period of human habitation, grasslands generally have increased and treed areas have decreased. In part, this has been caused by the burning of woodlands, which has occurred for centuries and has caused tall grasses to take over large areas of plateau. Among these grasses is *Hyparrhenia,* a grass that, although it is quite common, is not good for grazing; tall and coarse, it can be home to disease-spreading insects.

These human-induced grasslands are no longer home to many, if any, original trees. On the other hand, farmers have been domesticating trees for thousands of years, planting them to create park-like areas within their farms. The exact effects of this prolonged human use of Africa's grasslands have been, and probably will continue to be, a topic of great debate.

Africa's grasslands and woodlands are home to many species of animals, among which are LIONS, African ELEPHANTS, RHINOCEROS, antelope, GIRAFFES, deer, ZEBRAS, WATER BUFFALO, BABOONS, CHEETAHS, LEOPARDS, JACKALS, hyena, and various types of MONKEYS. In the equatorial RAIN FORESTS, the magnificent gorilla (the largest ape in the world) lives, as do monkeys, bats, and lemurs.

Deserts The deserts of Africa cover about one-third of the continent. Today, these deserts are among the hottest and driest in the world, but millions of years ago, rain fell there in abundance for long periods of time. The last great rainfall that fell on the deserts of northern Africa occurred about the sixth millennium BCE. Today, the African deserts receive less than 16 inches (41 cm) of rain per year, with some areas receiving only 5 inches (13 cm) per year.

More than 25 percent of Africa is made up of the vast Sahara Desert, which has an area of 3.5 million square miles (9,065,000 sq km). This massive desert reaches from the Atlantic coast in the west to the RED SEA in the east, and it has long been a natural barrier between the northern coastal areas and the rest of Africa. Within the great Sahara are the Nubian and Libyan Deserts, as well as the western Sahara. Fewer types of vegetation grow in the Sahara than in any other arid region in the world. Several animals are found in the Sahara today, including hares, desert FOXES, GAZELLES, and a type of small rodent called a jerboa, which is noted for its ability to jump great distances. However, evidence of a prehistoric hunting culture that probably existed on the edge of the Sahara shows that many animals—including elephants, rhinoceroses, HIPPOPOTAMUSES, and giant buffalo—once roamed what are now desert areas.

Among the driest deserts in the world is the Namib Desert, which is located on Africa's southern Atlantic coast. Being near the ocean coast, some succulents are able to survive on the moisture from the constant fog. The other great desert in Africa is the KALAHARI DESERT, located in southern Africa.

The spread of the desert southward, c. 8000 BCE, caused a change in the way of life of the HUNTER-GATHERERS who lived near these areas. The gatherers, for example, learned ways to plant seeds and grow crops. In north-central Africa, in particular, hunters and gatherers began an AGRICULTURAL REVOLUTION, learning to produce more and more FOOD by planting seeds and improving their methods of FISHING.

Over the centuries, the course of African history also has been affected by the continent's vast supplies of natural resources. These resources have included gold, nickel, fossil fuels, diamonds, COPPER, manganese, platinum, iron, zinc, lead, tin, beryllium, limestone, graphite, and gypsum. They also have included a wealth of animal and marine life and a rich array of vegetation.

geology One of the oldest continents on earth, Africa is particularly rich in such mineral resources as GOLD, silver, COPPER, iron ore, gypsum, limestone, and granite, which were all used extensively by ancient Africans.

Geological History The continent of Africa was not always in the form that it is in today. According to the theory of plate tectonics, the mysterious geological occurrence known as the Pan-African event brought together the West African plate and the Central African plate about 200 to 300 million years ago. After this, Africa became part of a supercontinent called Gondwanaland in which Africa, South America, Antarctica, Australia, and the subcontinent of India were joined. Eventually, a series of geologic events and eruptions, about 175 million years ago, caused Gondwanaland to separate into the present continents. Over time the Atlantic Ocean widened, separating the continents even further.

Rock Formations Several types of rock are found throughout Africa. These contain a wide variety of minerals and natural resources. In western Africa, crystalline rock is found under or outcropping over half of the area and this is known as the West African Shield. The oldest activity that formed shield rock is thought to have occurred over 2.5 billion years ago. The shield rock here and in other parts of Africa contains a rich supply of resources, including gold, manganese, diamonds, copper, lead, iron ore, zinc, low-grade uranium, and several other minerals.

In general, sedimentary rock comprises less of the rock found in Africa than igneous or metamorphic rock. Sedimentary and partially metamorphosed sedimentary rock, however, cover parts of the shield rock throughout

Africa. This type of rock tends to form on or near the surface and is the only type of rock in which certain valuable resources like natural gas are deposited. Limestone, shale, and sandstone are among the sedimentary rocks commonly found in Africa, and they have been often used for building, especially by the ancient Egyptians.

Sedimentary basins formed in the west in the CONGO BASIN and GABON, near the coasts of SENEGAL, SIERRA LEONE, IVORY COAST, and southern NIGERIA, and then later in large basins inland in CHAD and other areas. Within these basins, rich natural resources were formed of petroleum, natural gas, coal, potash, gypsum, zinc, and uranium.

Igneous activity produced many geologic features in Africa, including the cliffs and plateaus in Sierra Leone, Ivory Coast, Guinea, and LIBERIA. When magma intruded and created dikes and plugs and then later eroded, many diamond deposits formed in these areas. Volcanic activity also created cliffs, plateaus, and outcropping that eroded, allowing for the deposits of diamond, tin, and other minerals to form. Granite is a common type of igneous rock found in Africa and was used extensively in building and sculpture by the ancient Egyptians.

Geological Features The geologic features of Africa have had an enormous impact on human settlement and history. For example, the Mediterranean coast along northern Africa has for many millennia been considered uninviting because of its rocky coastline and lack of harbors. Since TUNISIA offers some of the best access to Africa, cultural advances often entered Africa from there and moved westward. As a result, from the time the PHOENICIANS entered Africa and founded CARTHAGE, c. 800 BCE, the east coast of TUNISIA became an important and prosperous area that changed the course of African history.

Geologic resources have been exploited in Africa since prehistory. Archaeological evidence shows the first known mine was dug more than 40,000 years ago in SWAZILAND. This mine was probably dug to locate ochre, which is a variety of the mineral hematite. It was used for ornamentation and funeral customs.

Gold was one of the first metals to be used extensively by humans. As early as about 4000 BCE, gold was found in EGYPT, which was the main producer of gold until the first century CE. In ancient times gold was found in the bottoms of streams and mined from sand and gravel. Bronze (a copper-tin alloy), copper, silver, and iron were other metals used extensively in ancient Africa.

In addition to using the natural mineral resources, ancient people discovered the use of rock for building and sculpting. Egypt, in particular, had a wealth of limestone, sandstone, and granite, all available from the exposed surface of the earth. The development of natural stone resources in ancient Egyptian building marks an era of incredible human and technological achievement, a period when human beings mined, quarried, and con-

structed on a large scale without the benefit of the wheel, the pulley, or smelted iron tools.

The exploitation of mineral and stone resources in Africa contributed greatly to economic wealth in ancient times. The continent contains some of the largest deposits of mineral resources in the world, and at least some or most of the minerals known to exist in the world can be found in Africa. Major deposits of fossil fuels include natural gas, coal, and petroleum, as well as some of the greatest deposits of gold, diamonds, copper, manganese, nickel, platinum, and phosphates. Iron ore, tin, zinc, and lead are among the other important minerals found in Africa.

Ghana Coastal West African country, some 92,100 square miles (238,500 sq km) in size, that borders BURKINA FASO to the north, TOGO to the east, the Atlantic Ocean to the south, and IVORY COAST to the west. Ghana has three distinct ECOLOGICAL ZONES—coastal plains that give way to RAIN FOREST, which turn into savanna woodlands in the northern part of the country.

There is archeological evidence that points to habitation of the coastal zone at least 6,000 years ago. FISHING in the coastal lagoons and river estuaries was an important economic and food-gathering activity. Archaeologists have also unearthed evidence of human communities in the rain forest region dating as far back as 4,000 years ago. In the savanna woodlands to the north, people began to cultivate YAMS as early as 8,000 years ago. They also tended palm trees to produce both palm oil for FOOD and raffia fibers for making raffia cloth. With improved polished-stone tools they were able to move deeper into the forest to clear plots for growing yams and palm trees, both of which required sunlight. After 3000 BCE the addition of African rice (*Oryza glaberima*) to the array of crops aided the further southward expansion of AGRICULTURE, as did the emergence of okra and KOLA NUTS as forest crops. By early in the first millennium BCE, iron metallurgy had also made its appearance.

The commerce of the savanna regions, which dates back to the second millennium BCE, began to penetrate the forest zones of West Africa in the first millennium BCE. Metal goods, along with cloth made of COTTON from the savanna, were exchanged for kola nuts and SALT from the coast zone. By about 500 CE the foundations had been laid for the emergence of states and urban life.

Ghana, ancient   Kingdom founded in the SAHEL between the fifth and eighth centuries; also known as Akwar and Ouagadou. The roots of what was to become one of Africa's richest and most powerful kingdoms lay in migrating NOMADS from the North African coast who began settling in the region before the fifth century. The exact ethnic makeup of early Ghana's inhabitants is unclear. However, they are likely to have been a combination of BERBERS, black Africans, and other ethnic groups. The ancient kingdom and empire of Ghana should not be confused with the modern country of Ghana, located 500 miles (805 km) to the southeast.

Gibraltar   Southernmost area of the Iberian Peninsula. A rocky promontory called the Rock of Gibraltar forms the southernmost point. Gibraltar has an area of 2.3 square miles (5.8 sq km). At its highest point, the rock is 1,396 feet (425 m) above sea level. While the ancient history of the area is obscure, many prehistoric relics, including a Neandertal-type skull, have been found in its caves. No town existed at Gibraltar before 1160 CE.

The narrow waterway that flows between the Rock of Gibraltar and the northernmost point of northwest Africa is called the Strait of Gibraltar. "Pillars of Hercules" is the name given by the ancient Greeks (c. 1100 BCE) to the two peaked rocks that flank the entrance to the straight. Ancient Calpe was the name for the northern rock (Rock of Gibraltar); ancient Abila was the southern rock (Jebel Musa). To the ancient Greeks the Straight of Gibraltar signified the ne plus ultra—the end of the world as it was known at that time—although it was believed that somewhere beyond that point lay Atlantis, the mythical continent supposedly engulfed by the Atlantic Ocean.

From the fourth through seventh centuries there was a thriving Christian civilization. However, the transition from the previous Greco-Roman era to CHRISTIANITY was not without problems. Northern Africa was sharply divided between two cultures. To the west of the Gulf of Syrtis (Sidra) were speakers of Latin, while in Egypt and Cyrenaica were Greek-speaking people. The conflicts within and between the eastern and western arms of the church, and the failure of either sector to bring the marauding ethnic NOMADS in the south into the fold, greatly weakened the region. The invasion of the Roman Empire by the VANDALS, who settled in Africa in 429, set the stage for the arrival of Islam and Muslim rule, which began with the coming of Tarik-ibn-Zeyad in 711.

giraffes   Long-necked, hoofed mammals that belong to the same animal family as the OKAPI, giraffes stand about 18 feet (5 m) and are the tallest mammals on the earth. Giraffes live on the savannas and open grasslands south of the Sahara. Giraffes have highly developed senses of sight, hearing, and smell. Although they move in a trot that might look slow, they are able to achieve speeds up to 30 miles (48 km) per hour. They mainly eat acacia leaves and are preyed upon by LIONS and sometimes LEOPARDS. Though it is commonly thought that giraffes make no sounds, they actually are able to emit a low moan. They live between 15 and 20 years.

Because of their unique appearance, giraffes have been noted throughout Africa's history. In ancient EGYPT giraffes were considered exotic animals and their tails were among the trade items brought from faraway lands. An inscription from ELEPHANTINE shows a giraffe brought by King Wenis of the Fifth Dynasty from a trade expedition. In ZIMBABWE, rock paintings have been found of giraffes, which were considered to have the same essential quality, *nlow,* as humans.

goats   Wild goats often live in rocky areas. Female goats (does) and their offspring (kids) travel in herds of about 30 to 40. Male goats (rams) live alone and only return to the herd during mating season. Wild goats include the ibex, which is found in present-day Republic of the SUDAN.

After DOGS, goats were probably the first animals domesticated by humans, and they have provided meat, milk, and wool to humans for thousands of years. During the BANTU EXPANSION goats were an important part of the people's diet since goats could survive on almost any VEGETATION and required less maintenance than CATTLE.

> Goats appear frequently in African mythology. One CAMEROON myth tells the story of a girl who fed flour to a hungry goat. To thank her, the goat told her about a great flood. Because of this warning, she and her brother were the only survivors.

gold   A yellow, soft, lustrous precious metal that does not tarnish or corrode; gold was mined and panned in several locations throughout Africa from ancient days to the present. Gold has been important in Africa since the time of ancient EGYPT. The pharaohs of Egypt exploited the alluvial gold found in or along streams in Nubia and KUSH. Egyptian gold, categorized as white gold, included a high percentage of silver, whereas yellow gold was

called *noub*. In addition to using gold as currency, the Egyptians used gold to make JEWELRY, to adorn burial furnishings, and to decorate buildings.

Archaeological evidence at sites between the NILE RIVER and the RED SEA reveals the mines of Kush in Nubia as one of the greatest gold-producing operations of the ancient world. Because it remained an essential trading commodity within Nubia well after its conversion to CHRISTIANITY in the middle of the sixth century, some estimates have placed overall gold production of Kush at more than 3.5 million pounds (1.6 million kg).

Trade within Africa between northern merchants and indigenous populations was the first link in the trading chain. More than 2,000 years ago HERODOTUS (c. 490–425 BCE) wrote about the gold trade between the Carthaginians and the chiefdoms in MAURITANIA. The Carthaginians had devised a means of communicating their arrival and desire to trade by creating a large FIRE on the shore near their ships, with smoke serving as a signal. Then the Carthaginians stacked items such as COPPER, cloth, COWRIE SHELLS, and SALT in heaps at a designated site. The Carthaginians then moved away and the local traders came forward to stack gold next to the Carthaginian trade goods. The 10th-century Arabic traveler al-Masudi noted this same method of trade being carried out in various parts of West Africa and commented that the process continued until both sides were satisfied that an equal exchange had been made.

The gold trade first became significant in TUNISIA in North Africa during the fourth century BCE, but the sources of that gold are unknown. Evidence of early mining activities in the Sirba River Valley in what is now NIGER, has led to speculation that the gold of CARTHAGE came from there because the Sirba Valley is closer to Carthage than Bambuk, Bure, or the other gold fields that later became the major African producers of the gold. Archaeologists working in West Africa believe that gold crossed the Sahara as early as the fourth century CE because standard Roman weights used to measure gold have been found from the time of Constantine the Great (r. 307–337). The fact remains, however, that no gold artifacts have been found in sub-Saharan Africa that date from this period. The earliest gold object from West Africa is an earring dating to c. 800 found in the city of ancient Jenne in the upper inland NIGER DELTA of the middle Niger.

government, systems of   The earliest systems of government emerged among bands of HUNTER-GATHERERS. Since the social organization of such bands was not complex, neither was the system of government; it was more of a manner of leadership than a system of government.

However, even at a this level there had to be means of making group decisions and settling disputes, both within the band and with other bands. Such issues became more complex with the advent of AGRICULTURE since this led to an increase in population and to greater social complexity.

Settled, permanent communities with an expanded population provided the basis of systems of government as such rather than the social leadership that was characteristic of hunters-gatherers. Once a community was producing a FOOD surplus, then some individuals could devote their LABOR to activities other than producing food. These came to include providing political leadership and governing. As societies grew in size and complexity, so too did their systems of government.

Many African agricultural communities never became very large and complex, so their systems of government remained relatively simple. Factors such as age, gender, kinship, political abilities, and personal skills were key determinants of leadership. In some settings the institution of chieftainship emerged, but in others government rested with elders, heads of households, or key religious specialists. Where larger states emerged they did so around chieftainship, often with a paramount chief taking precedence over several local chiefs. In such instances there was a greater emphasis on hierarchy, inheritance of ranks, and other indicators of social stratification. This could lead to the institutionalization of sacral chiefship, also called divine rule.

The most complex state in ancient Africa developed in EGYPT, where the state ruled over a large-scale and highly stratified society. At its apex was the pharaoh, who was, in the eyes of the citizenry, a god-king. Of course, complex states did not have to have a system of government centered on a ruler who was a god. In the case of AKSUM, for example, King Ezana (r. c. 320–350 CE) converted to CHRISTIANITY. Such a conversion would have been impossible for a god-king.

Great Pyramid   Pyramid built during the Fourth Dynasty, by King KHUFU (r. c. 2550–2536 BCE). The Great Pyramid of Giza (also called the Great Pyramid of Khufu) is one of three great PYRAMIDS built near the city of Giza, EGYPT. Originally a necropolis of ancient MEMPHIS, it is today part of Greater CAIRO. Built by King Khufu to serve as his tomb, the Great Pyramid of Giza is the only surviving wonder of the Seven Ancient Wonders of the World.

The pyramid is believed to have been built over a 20-year period. However, it is not known how the great blocks of stone from which it was constructed were put in place. One theory is that long levers were used. Another

Four hundred eighty-two feet (147 m) high, the Great Pyramid was built as the tomb of the pharaoh Khufu in 2540 BCE. *© Charles and Josette Lenars/Corbis*

theory suggests that a ramp was assembled and raised as the building advanced. The ramp, which may have been either straight or spiraled, may have been coated with mud and water in order to ease the movement of the blocks as they were put into place.

When first built, the Great Pyramid of Giza was 481 feet (159 m) high. Over the centuries, approximately 30 feet (10 m) has been lost from its top. For more than 43 centuries, the pyramid ranked as the tallest structure on earth. Each side measures 750 feet (248 m) long, is angled at 51 degrees and 51 minutes, and is carefully oriented with one of the cardinal points of the compass. The entire structure consists of around 2 million blocks of stone, each weighing more than 2 tons (1.8 metric tons). A smooth limestone casing once covered the pyramid, but much of this was plundered to provide materials to build Cairo. The vastness of the Great Pyramid of Giza can perhaps best be fathomed by considering that the cathedrals of Florence and Milan, St. Peter's Basilica in ROME, as well as Westminster Abby and St. Paul's Cathedral in London, could all fit inside.

The Great Pyramid of Giza represents the prototype of a private necropolis built on a huge scale according to preconceived, organized plans. This pattern for construction, which was established by King Khufu, was followed by most of his successors during the Fourth Dynasty. On both sides of the Great Pyramid of Giza there are streets of nearly seventy aligned *mastabas,* or platform tombs, built for Khufu's officials. There also are four subsidiary pyramids. The first three were built for Khufu's mother, Hetepheres; Queen Mereyites; and Queen Henutsen, respectively. The fourth pyramid is smaller, and its purpose is debated. Clearly not a tomb, it may have been constructed as a residence for the king's KA, or spirit.

The entrance to the Great Pyramid is located on its north face. Inside are a number of corridors, galleries, and escape shafts, some of which lead to the king's burial chamber. At the heart of the pyramid is the king's sarcophagus, which is made of red granite. The interior walls fit so closely together that not even a card can fit between them, another indication of the sophisticated level of construction. Inside are inscriptions bearing the cartouche, or symbol, of King Khufu, along with the names of the work gangs involved in the project.

Khufu did not rely solely (and perhaps not at all) on slave LABOR for his pyramid-building project. Instead, he utilized those portions of the population that were left idle, unable to farm, during the Nile River's annual flood. This provided more than tens of thousands of Egyptians with FOOD and clothing during what often was a difficult

time. More than this, the project also served to unite the population behind a single, national goal.

Excavations of the site of the Great Pyramids began in 1869 under the leadership of Auguste Mariette, the founder of the Cairo Museum. These excavations continue to this day.

The pyramid currently is maintained as part of a much-visited tourist area that also includes the PYRAMIDS of Kings Khafre and MENKAURE. A museum in the area houses the sun boat, a funerary boat discovered on the site in 1954. This boat is believed to have carried the body of Khufu to his burial place inside his Great Pyramid.

Great Sphinx   Mammoth stone sculpture representing a mythological being that possessed a lion's body and a king's head; created in ancient EGYPT at Giza as the royal portrait of King Khafre (c. 2520 BCE).

Perhaps the most well-known of all Egyptian sphinxes, the Great Sphinx at Giza, was massive, at 187 feet (570 m) long and 66 feet (201 m) high. The entire structure was constructed from limestone. The head of the creature was a sculpted portrait of King Khafre, the fourth king of the Fourth Dynasty. The use of the sphinx as a portrait for royalty continued throughout Egyptian history, and the influence of the mythological sphinx spread from EGYPT to Asia and on to GREECE, where it first appeared c. 1600 BCE. Scholars theorize that the Great Sphinx at Giza was most likely built to serve as the guardian of the royal mortuary complex.

Greco-Roman Period   In northeastern Africa, the epoch (c. 332 BCE–642 CE) comprising the Ptolemaic (332 BCE–30 BCE), Roman (30 BCE–c. 330 CE), and Byzantine dynasties (c. 330 CE–642 CE). For nearly 1,000 years, a succession of three foreign dynasties ruled EGYPT, first from GREECE, then from ROME, and finally from Byzantium. These rulers held sway over a vast empire that covered much of the Mediterranean world. The city of ALEXANDRIA was its administrative center, while its borders at times extended across LIBYA and as far as Syria and the Aegean Sea.

The Ptolemaic era saw the rise of Alexandria as a world center of Greek learning, knowledge, and culture, as well as a crossroads of international trade. Greece sent troops to Africa in support of local rebellions against the Persian rulers of Egypt as early as the mid-fifth century BCE. By 450 BCE, the Greek historian HERODOTUS (484–425 BCE) had journeyed to Egypt. The spread of Greek language and culture, called Hellenization, did not begin in earnest, though, until ALEXANDER THE GREAT (356–323 BCE) of MACEDONIA overthrew the last Persian ruler of Egypt in 332 BCE. Alexander stayed there only a few

months. But during that time he established the port city of Alexandria (naming it after himself) and moved the royal capital there from MEMPHIS. These actions served to reorient Egyptian trade and society outward toward the Mediterranean.

Upon Alexander's death, his empire was divided, and the Greek general Ptolemy became the ruler of Egypt. Taking the title of pharaoh, he founded the Ptolemaic Dynasty that ruled Egypt for more than 250 years. The succession of PTOLEMIES maintained their power, in part, by adopting Egyptian religious iconography, actively promoting Egyptian RELIGION and culture, and claiming the same divine status that the Egyptians had attributed to preceding rulers. At the same time, they guarded and developed free SCIENCE, literature, ART, and culture, and classical Greek literature and drama became popular, especially in the nation's urban centers.

Great mathematicians and physicists such as Euclid (fl. c. 300 BCE) and Archimedes (c. 290–211 BCE) were among the many Greek scholars who worked in Egypt. The desire to encompass all this Greek learning prompted Ptolemy III to found the famous Library of Alexandria. Unfortunately, the thousands of PAPYRUS scrolls that made up the great library have not survived.

As the economic and political power of Alexandria grew, an undercurrent of conflict among Egyptians, Greeks, and the immigrant populations who occupied the crowded streets developed within the city. Faced with popular revolt, depleted finances, and poor international relations, the later PTOLEMIES found themselves gradually reined in by Roman power. The able queen CLEOPATRA (r. c. 51–30 BCE), who was linked to both the Roman general Gaius Julius CAESAR (c. 100–44 BCE) and later to Marc Antony (d. c. 30 BCE), led a war against Rome. Egypt's armies, however, were routed at the battle of Actium, in 30 BCE, and with Cleopatra's suicide the next year, direct rule from Rome began.

Transformed into an imperial province, Egypt served as both a granary and a military stronghold for Rome. For three and one-half centuries the Roman Empire exploited the land and resources of Egypt, extracting grain and taxes in ways that ultimately proved socially and economically ruinous to the local population.

Egyptians were granted Roman citizenship in 212 CE. Under the emperor DIOCLETIAN (284–305), however, the once mighty Roman Empire was divided into East and West, and Egypt was divided into three provinces. By the latter stages of Roman domination, CHRISTIANITY became Egypt's official religion, and soon was the country's predominant faith. When Constantine I (c. 280–337) defeated Licinius in 324 and became sole emperor of the Eastern and Western Roman Empire, he moved the capital of the empire to the city of Byzantium, in Asia Minor, beginning the Byzantine period of the Greco-Roman era. A fifth-century religious split led to the MONOPHYSITE

movement in Egypt in support of a doctrine stating that Christ had only one, divine nature. The persecution of the Monophysite Coptic Church, as it was known, stiffened Egyptian resistance to Byzantine rule. Heavy taxation further disaffected the Egyptian population from the empire, and in 642 the people stood by as the unpopular Byzantine rulers of Alexandria fell to invading Islamic armies.

Jackson, *At Empire's Edge: Exploring Rome's Egyptian Frontier* (New Haven, Conn.: Yale University Press, 2002).

Greece Hellenic city-states of the ancient Mediterranean that influenced African history, SCIENCE, technology, and cultures through settlement and dynastic rule; Hellenic influence was particularly noteworthy in EGYPT in the years 332 to 30 BCE. One of the first discussions of Hellenic influence in Africa is found in *The Histories* of HERODOTUS (484–425 BCE). Written circa 430 BCE, Herodotus's work describes the founding of the Grecian colony of CYRENE almost 200 years earlier. The settlers, according to Herodotus, had come from the drought-stricken island of Thera and had sailed to northern Africa, where they settled at a place called Aziris. After six years they were led by the North African inhabitants to a spring known as Apollo's Fountain, which became the site of the Cyrenean colony. The moist soil of this city, which allowed crop cultivation and horse breeding, enabled the settlement to thrive and expand through the region.

This, of course, was not the only mention of Africa by the ancient Greek historian. Elsewhere, Herodotus maintained that shields and helmets had first entered Greece from Egypt and that the Greek word *aegis* (a goatskin harness) was derived from the goatskin robes worn by North African women. He also claimed that these were the people who had taught the Greeks how to harness a chariot with four horses.

Other descriptions of Greek colonization in Africa are more deeply rooted in myth and legend. In the tale of Jason and the Argonauts, for example, the hero is said to be sailing to the ORACLE at Delphi when a sudden gale blows his ship off course. Landing in northern Africa, Jason gives a tripod to the god Triton in exchange for safe passage from Lake Tritonis. The deity then predicts that when a descendant of the *Argo's* crew removed the tripod, 100 Greek cities would be built there. Upon hearing this, the Africans reportedly hid the tripod.

In the end, however, it was ALEXANDER THE GREAT (356–323 BCE) who ultimately brought extensive Hellenic influence to the African continent. Indeed, Alexander's military victory over Egypt's Persian rulers in 332 BCE inaugurated three centuries of Greek domination. (The name *Egypt* itself comes from the Greek; the Egyptians actually referred to their own country as KEMET.)

Under the Ptolemaic Dynasty (320–30 BCE) founded by Alexander's successors, the new capital city of ALEXANDRIA quickly rose as a place of both commerce and learning, becoming the center of Mediterranean life for centuries. During this time the museum (or temple of the muses) at Alexandria, along with the city's famous library, represented an attempt to encompass all of Greek learning in a center very much like a modern university.

During the era of the PTOLEMIES, Greek poetry, drama, and literature were spread chiefly by Greek immigrants, whose culture remained isolated from the local African communities. Greek science, however, had a wider ranging influence. Among Alexandria's scholars, writers, and artists were Apollonius Rhodius, the composer of the epic *The Voyage of the Argo;* Aristophanes of Byzantium, who was credited with the invention of punctuation marks; Aristarchus of Samothrace, the first grammarian; and Theocritus of Syracuse, the first bucolic poet. The mathematician Euclid (fl. c. 300 BCE), the most important figure in the history of geometry, taught in Alexandria during the reign of Ptolemy I Soter (306–283 BCE). The mathematician Archimedes (c. 290–211 BCE), also a resident of Alexandria, discovered the ratio 3:2 between cylinder and sphere; he also invented the Archimedean screw for raising water, a development that revolutionized irrigation and AGRICULTURE in the NILE VALLEY. Other leading scientists of Alexandria included the geographer Eratosthenes of Cyrene (c. 276–194 BCE), whose map of the world was the first to use lines of latitude and longitude, and Herophilus of Chalcedon (c. 335–280 BCE), the physician who discovered the nervous system.

The Ptolemaic rulers solidified their power by adopting and adapting Egyptian RELIGION and symbols. Following the example of their predecessors, they claimed divine status as pharaohs. They built temples and fostered the cult of Sarapis, a Hellenized version of the Egyptian cult of OSIRIS. Brother-sister marriage was evidently common practice within the dynasty, as well as in the population at large.

The change from HIEROGLYPHICS to the DEMOTIC form of language signaled the new order, as the Hellenized language became the official language of both the state and the bureaucratic elite. Demotic remained predominant until the introduction of COPTIC, much later in time.

For the Ptolemies, ruling Egypt was, to a great extent, a business proposition, and Alexandria served as the center of commerce and trade. Unfortunately, this only served to increase social tensions among immigrant Greeks, Egyptians, and other Africans. With the fall of Egypt to ROME, the social disintegration of Alexandria became inevitable. The Greek culture, science, and ART that

influenced Alexandria's life for that period, however, have endured.

Guinea Present-day West African country some 95,000 square miles (1,246,100 sq km) in size. The name *Guinea* was formerly used to describe the entire western coast of Africa. Modern Guinea borders GUINEA-BISSAU and SENE-GAL to the north, MALI is located to the north and east, and LIBERIA and SIERRA LEONE are located to the south and west. Guinea's history stretches back 30,000 years, with archaeological evidence from the area indicating early agricultural cultivation.

───────────────────────────

Three independent modern nations located on the Atlantic coast of Africa use the name Guinea—the Republic of Guinea, Guinea-Bissau, and Equatorial Guinea.

───────────────────────────

The region closest to the Atlantic coast is called Lower Guinea. Its earliest inhabitants were the Baga and the Nalu peoples, who were later displaced by the Susu and Mandinka. The Lower Guinea forest region, nearest to the borders of present-day Sierra Leone and Liberia, was occupied by the Kpelle (Guerz), the Loma (Toma), and Kissi ethnic groups, who lived in small villages. The NIGER RIVER originates in this dense forest, where the region's heaviest rainfall occurs. Archaeologists studying the southeast areas of the forest have strong evidence that cultivation of YAMS, oil palms, and other agricultural crops was well under way by 100 BCE. Later rice and KOLA NUTS were grown. The Lower Guinea highlands, which rise to their highest peaks in the Nimba Range, are approximately 5,780 feet (1,762 m) above sea level.

The northeastern plains of the region are called Upper Guinea. The area's characteristic grasslands, or savanna, supported a number of useful trees, including the BAOBAB and the shea, which was used to produce SHEA BUTTER. The central area of Upper Guinea contains strong evidence of MILLET cultivation from as early as 1000 BCE. Archaeologists have uncovered many stone figures carved in human and animal likeness. These figures, known as *nomoli,* were made of steatite or granite and were probably made for fertility rites that attempted to ensure successful harvests.

Archaeologists have also been able to create a link between early forms of METALLURGY and the growth of Guinea's early city-states. It appears that iron smelting was done from at least 200 BCE, as a number of tools and pieces that are likely ritual objects have been found throughout the area.

Guinea-Bissau Small, tropical West African country, some 14,100 square miles (36,500 sq km) in size, that is made up mostly of a coastal plain that rises to the savanna in the interior. It shares borders with SENEGAL to the north and GUINEA to the east and south, while its western edge abuts the Atlantic Ocean.

Farmers began their crude forms of AGRICULTURE in the area several thousand years ago, but the most important development was the adoption of African rice (*Oryza glaberima*). Originating in the INLAND NIGER DELTA, perhaps as early as 3500 BCE, it spread to the coastal zone, where it became a principal FOOD crop from Senegal to GHANA. The region's farmers became highly skilled at utilizing the tidal river estuaries for growing rice. Because of its numerous river estuaries, Guinea-Bissau was particularly well suited for this crop. The ocean also yielded SALT, which people became adept at gathering from drying pans along the shore. A trade in salt gradually developed with the interior region of the western Sudan, which lacked salt. In this way, the people of Guinea-Bissau became linked to the vast trading network that included the TRANS-SAHARAN TRADE ROUTES.

H

Hadar Site of the discovery of the skeletal remains of an example of an early primate species. Located in the AFAR region of ETHIOPIA, 217 miles (347 km) northeast of Addis Ababa, Hadar became the focus of media attention in 1974 when archaeologists recovered the remains of an early primate species later identified as *AUSTRALOPITHECUS afarensis (A. afarensis)*. Archaeologists who made the discovery gave these nearly complete skeletal remains of a young woman the name Lucy. Ethiopians, however, refer to her as Dinkenesh (which means "she is wonderful") and regard her as the mother of human civilization.

> **Estimated to be between 3 million and 3.18 million years old, Lucy's bones are among the oldest fossilized remains of the human family ever found.**

With a slender but powerful body, Dinkenesh stood just under four feet tall when she died at about the age of 20. Her robust arms were longer than those of modern humans, although her hands and brain were no larger than those of a chimpanzee. An agile climber, Dinkenesh also was fully bipedal, meaning that she stood upright and walked on two feet. Her upright stance helped her get FOOD from the trees as well as from the ground and allowed her to survive by scavenging meat, hunting smaller animals, and feeding on fruits, vegetables, roots, and tubers. Such food-gathering abilities helped Dinkenesh's species survive and evolve over more than 2 million years.

Hannibal (c. 247–183 BCE) *Renowned Carthaginian military commander*

As commander of the forces for the North African city-state of CARTHAGE, Hannibal led a daring march over the Alps from Spain to Italy. Taking place during the Second Punic War (218–201 BCE), this feat is considered one of the greatest in military history.

Born in Carthage, near present-day Tunis, Hannibal was the son of the great Carthaginian general Hamilcar Barca. Following the defeat of Carthage by ROME in the First Punic War (264–241 BCE), Hamilcar Barca led Carthaginian forces to Spain, where he conquered much of the country. He brought his son to Spain at about nine years of age, making the boy swear undying hostility to Rome.

Hannibal remained in Spain following his father's death in 229 or 228 BCE. There he led troops under the command of his brother-in-law, Hasdrubal, who succeeded in consolidating Carthaginian dominion over the Iberian Peninsula. When Hasdrubal was assassinated in 221 BCE, Hannibal was proclaimed commander in chief by the Carthaginian troops. This field promotion was later ratified by the Carthaginian government.

As commander, Hannibal's first priority was to solidify Carthage's position in Spain. To accomplish this, he married Imilce, a Spanish princess, and conducted a series of battles against various Spanish tribes. In 219 he attacked Saguntum, a city in Spain that, although within Carthaginian territory, was considered a friend by Rome. Although Saguntum fell to Hannibal's troops after an eight-month-long siege, Rome demanded the surrender of the Carthaginian general. Hannibal refused, despite the fact that he had been severely wounded in the siege.

Rome responded by declaring war against Carthage, thus initiating the Second Punic War.

In 218 BCE Hannibal initiated an ambitious attack that targeted Rome itself. Leaving his brother (also named Hasdrubal) to defend Carthaginian Spain and North Africa, Hannibal mobilized his forces. Marching from Cartagena, the capital of Carthaginian Spain, Hannibal's force included between 40,000 and 102,000 troops, HORSES, and 38 ELEPHANTS, which were to be used in battle as well as to carry baggage.

In the autumn of 218 BCE Hannibal's troops marched north along the eastern coast of Spain and over the Pyrenees mountains, where his soldiers battled local peoples. The Carthaginian army then crossed the Rhône River, where Hannibal commandeered small boats for his troops and built rafts for the elephants. The most treacherous part of Hannibal's march, however, was the alpine crossing, which took 15 days. Many troops died, some of exposure, some in landslides or falls from mountainsides, and some from the attacks launched by local mountain peoples.

By the time the Carthaginian army finally arrived in northern Italy, more than half of Hannibal's troops had died, leaving just 20,000 infantry, 6,000 cavalry, and only a few elephants. In spite of this, the Carthaginian army won impressive victories, rallying behind Hannibal and reinforcing his reputation as a great battlefield general. Defeating the Taurini people, Hannibal's troops conquered their chief town, the modern-day city of Turin. The Carthaginians also destroyed the Roman forces in battles at the Trebia River and Lake Trasimene. With each victory, Hannibal added reinforcements, recruiting Ligurian, Gallic, and Celtic soldiers.

After resting throughout most of the summer of 217 BCE, Hannibal's troops resumed their movement south through Italy. In 216 BCE the Carthaginian and Roman armies finally battled in full force at Cannae in southeastern Italy, where the Romans maintained a large supply depot. During the battle Hannibal ordered the center line of his troops to yield, retreating but not breaking their line. By pushing both flanks forward and breaking through the Roman lines, the Carthaginians were able to circle behind the Roman center and surround the Roman army. The Romans were overwhelmed, with an estimated 60,000 soldiers dying in the battle. Fewer than 6,000 Carthaginian troops were lost.

Hannibal's army occupied Italy for the next 13 years. Though Hannibal had hoped to use this occupation to rally the Italian population into a rebellion against Rome, neither his own countrymen nor the subjugated Italians supported him in this effort. Moreover, Rome's dominant strength at sea not only made Hannibal's troops dependent on local provisions but also cut them off from reinforcements. As a result, Rome slowly reclaimed the territories seized by the Carthaginians.

In addition to eating away at Hannibal's victories in Italy, the Romans also began waging successful military campaigns in Carthaginian Spain. In 207 BCE Hannibal's brother Hasdrubal, who had been bringing Carthaginian reinforcements from Spain to northern Italy, was intercepted, defeated, and killed by the Romans.

When Rome invaded Carthage itself in 203 BCE, Hannibal finally abandoned Italy and returned home. The Carthaginians had accepted harsh Roman terms of surrender and had negotiated an armistice when Hannibal attacked Roman troops at Hadrumetum (now Sousse, in TUNISIA). In a battle at Zama later that year, Hannibal's army suffered defeat at the hands of an alliance of Roman troops led by Scipio Africanus and Numidian troops led by Scipio's ally MASSINISSA. In the battle, which brought an end to the Second Punic War, the Carthaginian army lost 20,000 men. Hannibal, however, survived.

Defeated by Rome, Hannibal then served as a civil magistrate in Carthage. While paying the harsh tribute demanded by Rome, Hannibal reformed the government of Carthage. He overthrew the oligarchic power structure, introduced constitutional and administrative changes that reduced corruption, and initiated a renewed period of financial prosperity.

Fearful that the still-powerful Hannibal might initiate another war, the Romans demanded that he surrender. Instead, he fled to Ephesus, in Asia Minor. There, King Antiochus III of Syria, preparing an attack on Rome, put Hannibal in command of a fleet in Phoenicia. Hannibal was inexperienced as a naval commander, and he suffered a quick defeat at the hands of the Roman fleet.

Once again fleeing the Romans, Hannibal arrived in Bithynia, on the southern coast of the Black Sea, in 190 BCE. There he served King Prusias II in his war against Pergamum, another ally of Rome. Once again, however, Hannibal was defeated, and once again the victorious Romans demanded Hannibal's surrender. This time he was unable to escape, and, in the Bithynian village of Libyssa, he killed himself by taking poison.

Hanno (c. 530–470 BCE) *Carthaginian explorer*

The voyage of Hanno was recorded in an 18-line Carthaginian inscription hung on plaques in the Temple of Chronos, the Greek god of time. Translated into Greek as the *Periplus of Hanno,* it was one of the earliest written geographical narratives in the ancient world. Around 430 BCE, HERODOTUS (484–425 BCE) wrote of Hanno's voyages regarding the founding of Carthaginian trade on the Atlantic coast of Africa. According to the *Periplus,* Hanno set out with 60 ships bearing 30,000 colonists, although these

figures have long been disputed and may have been greatly exaggerated. (Five thousand settlers would have been more in line with colonizing missions of the period.)

Also in dispute is the extent of Hanno's voyages. The Roman Pliny the Elder, in his *Natural History*, stated that Hanno had circumnavigated Africa and reached Arabia, a feat that was not impossible. As the places described in the narrative suggest, however, it is probable that he sailed beyond the western SAHARA DESERT and MAURITANIA to SIERRA LEONE, and possibly as far as CAMEROON or GABON. Some of the places mentioned can be associated with known sites, while others remain in dispute. No other subsequent written reports about these regions are known to exist until those of the Portuguese, some 2,000 years later.

Carrying out orders to found colonies along the African coast, Hanno deposited groups of settlers, known as Libyphoenicians, at seemingly suitable places along the way. Afterward, he founded a trading post on an island near Mauritania. The survival of Carthaginian barter methods on the coast was described by the Arab authors Sharif al-Idrisi and Yacout in the 12th and 13th centuries CE, a remarkable persistence that has led some scholars to speculate that trade may in fact have been the primary mission of Hanno's colonizing voyage.

Noted for its literary style, the *Periplus of Hanno* is an early example of popular travel writing. The account, which may not have been written by Hanno himself, contains a report of an active volcano and the earliest extant description of gorillas. It tells of sometimes hostile encounters with indigenous peoples and animals, as well as of MUSIC, raging fires, and aromatic trees, which were seen as potential trade goods. The use of the word *gorilla* may have been a corruption of *kikongo ngo diida,* meaning an animal that violently thumps its chest. The description in the *Periplus* of the gorillas as a race of hairy men and women may cast doubt upon this aspect of the account, but our modern concept of human and nonhuman primate species may cloud our judgment as to exactly what kind of creatures Hanno's men saw (and skinned).

An annotated summary of Hanno's chronicle, based on the Greek translation, follows:

Hanno was sent by the Carthaginians beyond the Pillars of Hercules (Straight of GIBRALTAR), in order to found cities of the Libyphoenicians. He sailed with 60 ships, 30,000 colonists, and provisions. The ships sailed for two days beyond Gibraltar and founded the city of Thymiaterium (Altar of Incense) on a great plain.

The party then sailed westward to Solois (in what is now MOROCCO but which Hanno called LIBYA), a heavily forested area. The voyagers consecrated a temple to the Phoenician lord of the sea and then sailed eastward into thick marshes that were a feeding ground for ELEPHANTS and other wild animals. Sailing one day's journey to the sea, they founded cities called Caricus Murus, Gytta, Acra, Melitta, and Arambys.

They sailed to the River Lixos (or Lixus), where they had friendly relations with a nomadic herding people, the Lixites (BERBERS).

Living above the Lixites were hostile people with "burnt faces," wild animals, and mountains inhabited, according to the Lixites, by cave-dwellers who could outrun HORSES.

Traveling with Lixite interpreters, Hanno sailed southward for 12 days, then turned east for a day's journey. Settlers were left on a small island in a bay, where they founded a city they called Chernah. Based on distance, they judged this place to be situated on the far shore of the land mass around which they were sailing, directly opposite CARTHAGE. Sailing past a great river called Chretes, they came to a lake with three islands (probably the Tidra archipelago, near the coast of Mauritania). A day's journey beyond these islands they came to a mountain range inhabited by people wearing animal skins. These people threw stones at the ships and drove off Hanno's expedition before it could make a landing.

Next, Hanno came to a broad river (probably the SENEGAL RIVER, which the expedition found teeming with CROCODILES and HIPPOPOTAMUSES). Turning back, the party retreated to Chernah.

Sailing southward for 12 days along the coast (probably as far as modern-day GUINEA, SIERRA LEONE, or even LIBERIA), the party encountered "Ethiopians" (possibly Kru speakers) who fled from them and whose speech was unintelligible to the Lixite interpreters.

Dropping anchor by a tall mountain range, the party noted forests of aromatic wood. Two days beyond the forests was open sea with a plain on the landward side, where many nighttime campfires were observed.

Replenishing the party's freshwater supplies, the crew sailed along the coast for another five days (probably reaching present-day IVORY COAST). They then came upon a great bay that the Lixites called the Bay of the Horn of the West (probably Cape Three Points in GHANA, the entrance to the Bight of Benin).

Disembarking on an island, they saw only forests during the daytime. At night, however, the bay was ringed with fires, and they heard flutes, cymbals, DRUMS, and many voices. The sailors were afraid, and their soothsayers advised them to leave the island. Sailing away quickly, the party passed a burning country of aromatic forests, with huge torrents of FIRE flowing down into the sea, making landing impossible.

Hurrying on in fear, they sailed another four days past the burning coastline. In the middle was a taller flame that seemed to rise up to the stars. In daylight, they saw that it was a high mountain called Chariot of the Gods (most likely the active volcano Mount Cameroon).

After three days of sailing alongside the fires, Hanno's party reached a bay called Horn of the South (possibly in Gabon). In the bay they came to an island with a lake,

within which was another island "full of savages." Most of these creatures were "women" with hairy bodies; the interpreters called them "gorillas." Hanno's party gave chase, but the males escaped by climbing trees and throwing stones. Three females were taken, biting and clawing their captors, who killed them, skinned them, and brought the skins back to Carthage. (Here the *Periplus of Hanno* ends.)

Haoulti   Archaeological site of the pre-Aksumite culture of present-day ETHIOPIA, dating to the fourth or fifth century BCE. Haoulti and its archaeological remains demonstrate the influence of South Arabia upon northern Ethiopia in its ARCHITECTURE, ART, and culture.

The objects discovered at Haoulti provide insight into the complex cultural influences on the region before the rise of the ancient Christian kingdom of AKSUM, around the second century CE. The richest example of the influence of South Arabia upon Haoulti in the fourth and fifth centuries BCE are a *naos,* or throne, and various statues that were discovered there. The *naos* was carved from a single block of local limestone and stands 56 inches (142 cm) tall. It has four feet shaped like bulls' hooves that support a base decorated with two bars with a small niche covered with ornamentation. The niche is topped by a dais in the shape of a depressed arch. Along the edge of the niche, two rows of reclining ibexes converge to form a stylized tree, which stands at the top of the throne. Each side of the throne is decorated with a bas-relief of a small figure, holding a staff, who precedes a larger bearded man holding a fan. The figures have aquiline features, which suggest a Semitic appearance, with their eyes depicted as small lozenges. The smaller figure wears a plain robe down to his ankles, while the larger figure wears a baggy loincloth.

The same bulls' hooves on the throne are seen in a marble statuette from Marib, and the reclining ibexes occur in decorations from Saba, including Marib and Haz. The facial features and clothing are parallel to figures represented in bronze SCULPTURE also from Marib. These similarities suggest the South Arabian influence.

The statues also recall artifacts accidentally discovered at Addi Galamo on the western edge of the TIGRE plateau. The Haoulti statue represents a seated woman with her hands on her knees dressed in a long, pleated robe. Over the robe she wears a wide necklace made of three thick, ringed strands. From it hangs a shield that lies across her chest. The shield is counterbalanced by an ornament in the shape of a trapezoid that rests between her shoulder blades. The woman's posture, the position of the hands, and the necklace with its counterweight all bear a strong resemblance to the statues of Addi Galamo. Statues with the same pose of a seated woman wearing a long fluted robe, with a necklace with hanging beads, a

shield, and a counterweight are in the National Museum in ROME as well. However, the posture and decoration of the statue is most similar to statues of women from the region under Syro-Hittite control, which seems to be the real point of connection between Ethiopia and Asia Minor in the seventh and eighth centuries BCE.

Other objects, such as two earthenware AMULETS and a carnelian amulet, were found at Haoulti and are Meroitic in origin. These objects show the relationship between Ethiopia and the NILE VALLEY before the common era. The influence of MEROË on Ethiopia was primarily in metalworking techniques that are seen in bronze, iron, and GOLD objects discovered at the site.

Harkhuf   (governed c. 2290–2270 BCE) *Egyptian trade expeditionist and royal governor*
Harkhuf led notable journeys into NUBIA and to inner Africa during the Sixth Dynasty. Much of what is known about Harkhuf derives from the biography found in his mastaba, the inscribed stone tomb of common Egyptians. Originally from ELEPHANTINE, Harkhuf was appointed as governor of a southern section of UPPER EGYPT during the rule of King Merenre. He was mainly responsible for trade—both the discovery of new trade routes and the safe maintenance of existing ones. In this capacity, he led four documented expeditions into Nubia and Yam (in the Sudan). The Nubian route was a particularly important link to central Africa and the goods to be found there, which included incense, MONKEYS, DOGS, GIRAFFES, EBONY, skins (probably leopard and panther), ivory, and other unusual goods.

During early expeditions through the territories of Irtjet and Zatju, Harkhuf traveled along the NILE RIVER. But when these territories later became hostile to EGYPT's efforts to exploit and colonize Nubia, Harkhuf was forced to take alternate routes or to travel under the protection of the ruler of Yam. He sometimes traveled with his own military or armed escort in order to keep the trade routes open.

One of Harkhuf's most famous journeys was his fourth documented expedition, during which he traveled south to Yam. On this trip, Harkhuf arranged to bring MBUTI people back to the court of King Pepi II, who, as a collector of the unusual, was very pleased with the gift.

Hathor   Ancient Egyptian goddess, known as the protector of pregnant women and patron of MUSIC and DANCE. In the mythology of ancient EGYPT, Hathor was the daughter of Nut and RA. In early myths, Hathor was the mother of the sky god HORUS, but in time this capacity was attributed to ISIS. Hathor became the protector of Horus, and her name translates to "house of Horus." She was depicted either as a cow or as a woman crowned by a sun disk held between a cow's horns.

In the story of Ra, Hathor was created by her father Ra as "Sekhmet," the destroyer of men who wronged him. Later, however, Ra changed his mind and disguised beer as blood, which Sekhmet then drank. Intoxicated, she could no longer kill and became Hathor, goddess of love. Hathor also was worshiped as a goddess of fertility. It was believed that, when a child was born, seven Hathors came to announce the infant's fate. The seven Hathors were regarded as having the power to exchange a prince born to ill fortune with a luckier child, thereby protecting the dynasty and the nation.

In later times, Hathor was also regarded as a goddess of the dead, giving FOOD and water to the deceased as they arrived in the underworld.

Hausa   Nigerian ETHNIC GROUP populating the northern region. The origins of Hausa speakers can be traced to Chadic speakers near Lake CHAD, who have inhabited the area for more than 6,000 years. It is believed that during the 12th century groups of these people migrated southwest into the region that became known as Hausaland.

The Hausa language demonstrates remarkable uniformity of pronunciation, vocabulary, and grammatical structure wherever it is spoken. This probably indicates that Hausa originated relatively recently and spread rapidly through the lands south of the SAHARA DESERT, since older languages tend to have more differences in their variations, which generally evolve based on geographical distance. Hausa also became infused with many Arabic words due to the influence of Islam. Hausa is the most widely spoken language of sub-Saharan Africa because it is spoken as a second language for the purpose of trade.

Hausa oral tradition names the descendants of the Muslim prince Bayajida as the founders of the settlements that became Hausaland, perhaps in the late 10th century. Nevertheless, it is probable that non-Muslim agricultural peoples had established the settlements before Bayajida's arrival.

Hawara, Pyramid of   Along with LAHUN and LISHT, part of the mortuary complex for kings of the Twelfth Dynasty of EGYPT. The pyramid was built between c. 1938 and 1770 BCE by order of King Amenemhet III, and it was one of the most elaborate pyramids of the time. Its vast southern temple was said to have had 3,000 chambers on two floors. Ancient scholars believed that the Pyramid of Hawara, also known as "the Labyrinth," was designed as a meeting place, but it was probably built as a mortuary complex.

The roof of every room was made of stone, and the walls were filled with sculptures. Each court was built of white marble. The Greek historian HERODOTUS (484–425 BCE) speculated that the money and LABOR used to build the Labyrinth must have outweighed all the public works of the Greeks put together.

hawks   In ancient EGYPT, hawks, like falcons, were admired for their grace and power. In Egyptian mythology, the hawk was associated with Menthu, the god of war. Menthu was often depicted as a man with a hawk's head. Because RA, the sun god, was also portrayed as a man with a hawk's head, the two gods were often confused with each another.

healers and diviners   Religious healers who try to cure disease and ailments by appealing to supernatural powers. Common figures throughout history in ancient African societies, healers and diviners have traditionally served as an important link between the real and supernatural worlds. Many traditional African societies believe that offending otherworldly powers causes disease and illness. Therefore it is also maintained that the cures lie in appeasing the spirits. In the appeals they make to otherworldly spirits, the healers and diviners provide hope that diseases can be cured or that illnesses can be avoided. The types of cures vary from culture to culture, or even among various healers within a single culture, and an appropriate cure might involve anything from exorcism to religious ceremonies to herbal remedies.

Healers and diviners were found among some of the earliest inhabitants of Africa, including the SAN, who originated, according to most estimates, between 20,000 to 30,000 years ago. The San traditionally believe in two gods. The first is the Creator; the second is the Creator's subservient messenger, Gauwa. Despite the fact that in San society the healers would often interact with Gauwa, the great Creator is the being who is seen as bringing illness and death. Ironically, it is the same Creator who is seen as instilling the healers with the power to facilitate cures. That power, however, had limits and could easily be disrupted. Therefore the healers are always on guard to avert any bad will that the Creator might send their way through Gauwa.

Healers and diviners abound among the San, with virtually everyone playing the role of healer at some time. The San believe that curing powers can be delivered through DANCE, so large village dances are held several times a month, much as they have been held throughout the San past. At these gatherings, the San believe, the sick will be cured and future evil will be avoided. At a typical dance the healer enters into a trance, placing his hand first on the sick person and then on the rest of the villagers. The healer then grunts softly, fluttering his hands as he does so. His sounds and movements become progressively louder and more animated to draw out the sickness that is affecting the infected person.

As the dance develops and the sickness becomes more difficult to extract, the healer's grunts turn into high-pitched shrieks. He then tramples the FIRE of the dancing area and might even set his own hair on fire in an attempt to spark his healing powers. The villagers might put out the fire in the healer's hair as he hurls flaming sticks into the darkness to chase away Gauwa and the evil spirits. He then goes into a deep trance that enables his spirit to leave his body and confront Gauwa. During the trance the people watch over his body, chanting for his safe return from the state of half-death. When he awakens from the trance, the healer has done all that he can do to cure the sick.

Although each society appeals to the spirits in its own particular way, the purpose of the process is generally the same: They all attempt to alleviate illness by removing evil from the sick. Some groups use ceremonies akin to the dances of the San. Others use good-luck charms, love potions, or sacred objects to drive away evil spirits. Some even use magical remedies involving sacrifice, usually in the form of small, DOMESTICATED ANIMALS.

The concept of evil, and thus the root of a person's illness, varies among groups as well. Evil spirits might come in the form of an all-powerful god such as Gauwa. Other groups, such as the Suku people of present-day Democratic Republic of the CONGO and ANGOLA, believe in WITCHCRAFT. Among the Suku, witches were not gods but instead were people who had been turned into evil spirits after being fed human flesh at birth. As adults these witches could inflict illness or death on humans. Suku healers and diviners perform rituals to protect the people from witches and heal those already cursed by illness.

Heracleopolis Greek name for the ancient Egyptian city of Henen-nesut, the capital of EGYPT during the First Intermediate Period (c. 2213–2040 BCE).

Heracleopolis, the Greek name of the town called Henen-nesut in ancient times, was located in present-day Bani Suwayf. The Ninth and Tenth Dynasties, often referred to as the Heracleopolitans, were founded by King Khety and controlled Middle and LOWER EGYPT from Heracleopolis.

About the same time the Eleventh Dynasty, which claimed UPPER EGYPT, was flourishing in Thebes. The presence of two dynasties, which lasted nearly 75 years, was the source of great conflict. Each dynasty sought dominion over the other, and boundaries continually changed. This period was finally brought to an end about 1968 BCE by King MENTUHOTEP II (sometimes called Mentuhotep I), who defeated the Heracleopolitans, reunified Egypt, and launched the MIDDLE KINGDOM.

Scholars believe that the group of literary works describing the strife of this time was probably written after the reunification of Egypt, during the Middle Kingdom.

herders See PASTORALISM.

Herihor (r. c. 1080 BCE) *Ancient Egyptian official and usurper of the throne*

Herihor was a high official during the reign of Ramesses XI (r. c. 1110–1070 BCE), in the Twentieth Dynasty. (Ramesses ruled from 1100 to 1070 BCE and was the last king of the Twentieth Dynasty.) Although it is known that Herihor was a military officer and high priest during Ramesses's reign, details about his exact origins are obscure. It is thought, however, that he came to EGYPT to help stop a rebellion led by a former high priest of AMUN. The ineffectual Ramesses was unable to stop Herihor from making himself first a high priest, and later VIZIER of both UPPER and LOWER EGYPT. Herihor's fight to control the throne is depicted in reliefs found in the temple of Khons in Thebes.

Herodotus (484–425 BCE) *First Greek historian, often referred to as the Father of History*

Born in Halicarnassus, a Greek colony in Asia Minor, Herodotus devoted himself to literary pursuits during much of his life. His great work, *The Histories*, is the story of the war between the Persian Empire and the much smaller Greek city-states.

Known as the first historian to make investigation the key to history, Herodotus researched his book by traveling extensively throughout the ancient Mediterranean world. His African travels took him to places throughout EGYPT, including ELEPHANTINE, in the southern part of Egypt, as well as the Arabian frontier in the east.

Herodotus was an inquiring reporter, talking to many people, including actual witnesses to the events he later wrote about. Interwoven throughout his book are descriptions of the people and countries he visited. In the course of telling his story, Herodotus reports on the customs of the Egyptians, the HITTITES, and others he met during his travels. Much of what we know today about many of the ancient peoples comes to us from Herodotus.

Native to Africa, the goliath heron is the largest member of the heron family. Ancient Egyptians associated the heron with the phoenix, a symbol of rebirth. © *Brian Vikander/Corbis*

Despite the fact that he has been criticized for including inaccurate and often highly implausible anecdotes in his work, Herodotus greatly influenced later historians by clearly establishing the principle that history must begin with research.

herons   With broad wings, long and straight pointed bills, and soft plumage, herons are usually found in tropical areas, where they wade in streams and marshes and feed on frogs, fish, and other water animals.

Africa is home to the European night heron and the shoe-billed heron, which is found along the WHITE NILE. Also found in Africa is the goliath heron, which has a reddish head and neck, and is the largest heron of all at up to 59 inches (150 cm) in length.

In ancient EGYPT herons were associated with Bennu, the ancient Egyptian phoenix. According to legend, there was only one phoenix and it was a servant of the sun god. Every 500 years this phoenix would build a nest that would serve as a funeral pyre. Once the phoenix was con-sumed by the pyre's flames, a new one would arise from its ashes in a process that represented the rising and setting of the sun, as well as resurrection and eternal life.

Hierakonpolis   City in UPPER EGYPT, c. 3500–3400 BCE, believed to be the earliest African city; also known as Nekhen. Archaeological studies conducted over the past 20 years have uncovered a wealth of information about the life and culture of this city built along the western bank of the NILE RIVER. The remains of palaces as well as artifacts and artwork all indicate that Hierakonpolis was the residence of both early kings and royal officials. Mud-brick and stone temples found there have been proved to be burial sites, which, according to some archaeologists, provided models for the great PYRAMIDS built by later Egyptians. Religious beliefs among the residents of Hierakonpolis included devotion to the god HORUS as the patron deity of the city. In addition, the many temples, as well as the ritual MASKS and grave goods (also known as *nekhen*) that were buried with the dead, suggest a belief in an AFTERLIFE. This would seem to be reinforced by the fact that Hierakonpolis's cemeteries contain some of the earliest forms of mummification found in EGYPT. The dead were padded and wrapped with linen and covered with pitch in order to seal out decay-causing moisture.

Hierakonpolis also is considered the birthplace of Egypt's long tradition of pharaonic dynasties, which developed after periods of warfare with the rival kingdoms of Nekeb and NUBIA. Eventually, between 3200 and 3000 BCE, Hierakonpolis emerged as the dominant kingdom in the region. One of the prime pieces of evidence is a stone tablet called the NARMER PALETTE. The palette's depiction of the famous warrior-king Narmer (also widely known as MENES), who is seen wearing both the RED CROWN of LOWER EGYPT and the WHITE CROWN of UPPER EGYPT, is generally interpreted as a symbol of Egypt's unification into a single nation. Besides King Menes's name, the tablet contains details of the many military victories he won while consolidating his power.

With unification came the earliest form of centralized government in Africa. King Menes reportedly founded the First Dynasty and relocated the capital to MEMPHIS. Egypt then entered a period of rapid development that included the regulation of trade links and the construction of palaces, large tombs, and religious temples. In addition, greater emphasis was placed on creating methods of irrigation to produce the abundant crops needed to sustain Egypt's growing population.

hieratic   Form of ancient Egyptian WRITING used from the First Dynasty (c. 2925–2775 BCE) to about 200 BCE. Hieratic script was a cursive form, which meant that its characters were written in a flowing style in which the

letters of words were joined together. Hieratic script was usually written in black INK with a reed pen on PAPYRUS. It was used in literary and religious texts, as well as such everyday documents as letters, catalogs, and official writs.

Hieratic script was introduced around the time that HIEROGLYPHICS were first being used in carved or painted inscriptions. It represented a simplified form of hieroglyphic writing that was quicker to write, especially on papyrus. Although the symbols used in hieratic script were similar to hieroglyphic writing, hieratic symbols were less detailed. Also, the spelling of words was occasionally different.

Hieratic script was written right to left. It was first written in vertical lines, starting at the top, but later it was also written horizontally. Around 660 BCE, DEMOTIC script began to replace hieratic script in daily use.

hieroglyphics
Egyptian writing system consisting of pictures or symbols that was used in ancient EGYPT for more than 3,000 years. (The name *hieroglyphics* comes from the Greek *hieros,* meaning "sacred," and *glypho,* meaning "inscription.")

Priests and scribes carved hieroglyphics on temples and tombs, public monuments, furniture, and wrote on PAPYRUS. This writing form was popular from the end of prehistory until about 396 CE. The most recent hieroglyphic text appears on the walls of the temple of ISIS on Philae Island.

Hieroglyphics probably were developed to record crop yields, determine tax rates, or set down the histories of kings. The writing form soon took on a religious significance, however. The Egyptians themselves called hieroglyphics *medou netjer*, or "words of the gods." The average Egyptian of the time would not have been able to read hieroglyphics, which can be read right to left, left to right, or in vertical columns. There was no hieroglyphic dictionary; thus, scribes often made up symbols or created new symbols for what they wished to express.

Several hundred picture signs make up the hieroglyphic writing system. There are three basic elements of hieroglyphic writing: phonograms, ideograms, and determinatives. Words could be created by using only phonograms, only ideograms, or by combining the two.

HIERATIC and DEMOTIC were both derived from hieroglyphics. *Hieratic,* a word that comes from the Greek *hieratikos* meaning "priestly," is best described as cursive hieroglyphics. This writing form is as old as hieroglyphics and was written mostly with a brush on papyrus. In it, smaller signs are joined together to form word groups. Like hieroglyphics, hieratic was used mainly by priests and scribes. Demotic, also called enchorial, came into use during the Twenty-fifth or Twenty-sixth Dynasty, about 664–525 BCE. Demotic evolved from hieratic and was a style of penmanship. Demotic pen strokes were

quicker and less defined than hieratic. With demotic, new signs were created, and the connection between hieroglyphics and hand-written text faded. This less formal language was used mostly in official, business, and personal writing.

A *phonogram* is a sound in picture form. Egyptians did not usually include vowels in their writing, so hieroglyphic phonograms depict consonant sounds of the spoken language.

An *ideogram,* or logogram, is a symbol or picture representing a specific object. Typical hieroglyphic ideograms are birds, cats, Egyptian gods, and items connected with daily life, like crops, fish, and boats.

A *determinative* is a type of logogram. There were several hundred hieroglyphic determinatives, which were used to further explain the meanings of words. Because vowels were not shown in the written language, two words with similar consonants would appear alike unless distinguished by determinatives. Both *pot* and *pet,* for example, would be written *pt* according to the Egyptian system. Similarly, with the addition of one particular determinative, the phonogram *mr* would mean "canal"; with a different determinative, it would mean "love." Determinatives also were used to show plurals.

For centuries, the signs and symbols of hieroglyphics were locked in mystery. While many were fascinated by the carvings, they mistakenly believed hieroglyphics were just decorative symbols. The discovery of the ROSETTA STONE in 1799 by Napoleon's soldiers became the key to interpreting the ancient Egyptian writing. The Rosetta Stone features the same text carved in three different languages: hieroglyphics, demotic, and Greek. By comparing the texts, scholars were able to decode the hieroglyphic inscription. The Rosetta Stone has been on display at the British Museum in London since 1802.

When inscribing tombs or memorials to pharaohs, ancient Egyptians often disguised the true meaning of the hieroglyphics by creating new signs or by giving new forms to old signs. Later kings, trying to erase the history of earlier pharaohs, often destroyed monuments to past leaders. With this in mind, coded hieroglyphs were carved inches deep into the stone or statues. For example, one statue to RAMESSES II contained a sun god (RA), the king as a child (*mes*), and a sedge plant (*su*), which was seen as equalling Ra-mes-ses. In this way, the hieroglyphs of the pharaoh's name could be preserved for eternity.

high-water canalization In ancient times man-made waterways were used for irrigation, drinking water storage, drainage, and travel that allowed for greater trade opportunities between eastern Africa and the Persian Gulf. Early canals in the Middle East were probably built to satisfy the need for drinking water and irrigation. However, during periods of high water, travel on the canals was possible. The most notable canal of ancient Africa linked the NILE RIVER to the RED SEA by way of the Isthmus of Suez. Built more than 3,000 years ago as an irrigation canal, it was used during periods of high water by sailors seeking to extend trade between the East African coast from Sofala, on the coast of what is now MOZAMBIQUE, up to the Persian Gulf. This ancient canal is the ancestor of the modern Suez Canal.

Although some researchers believe that excavation may have begun under either SETI I or RAMESSES II, during the 14th century BCE, it also is possible that the ancient canal was built during the period of the Twelfth Dynasty (c. 1981–1820 BCE). Still other researchers say that DARIUS I, king of Persia built the canal around 500 BCE. The canal was maintained and modified until sometime in the eighth century CE.

hillside terracing Process by which crops are grown on hillsides or mountains. Crops grown using this technique are planted on graduated terraces built into the slope. This labor-intensive method of AGRICULTURE has been practiced in sub-Saharan Africa since the IRON AGE, starting around 3000 BCE. Hillside terracing reduces soil erosion and water loss and maximizes the amount of land available for agricultural production.

Each terrace is built on a low, flat ridge of earth that runs across a slope. The terraces are built with a slight gradation so that water may run off. In areas where there is not an excessive amount of rainfall, the terraces may be built on the same level. This type of agriculture has been used in Africa for cultivating cassava, YAMS, rice, MILLET, and SORGHUM, among other crops.

See also: AGRICULTURE (Vols. I).

hippopotamuses Large, amphibious mammals found in the lakes and rivers of sub-Saharan Africa. Tomb inscriptions in ancient EGYPT portrayed serpent-like creatures threatening people and crops. In these inscriptions, hippopotamuses were often pictured being harpooned. According to Egyptian legend, the dead whose hearts failed to be lighter than the feather of Truth (MAAT) were destroyed by a monster named Ammut, who was part hippopotamus, part lioness, and part crocodile.

In spite of these views, hippopotamuses were revered by Egyptians as a symbol of fertility. The hippopotamus was, for example, associated with female pregnancy. During the MIDDLE KINGDOM of ancient Egypt, earthenware sculptures of hippopotamuses became popular.

Hittites Indo-Europeans who established an empire in Asia Minor during the 14th and 13th centuries BCE. Originally known primarily through a brief mention in the Bible, the importance of the Hittite empire has been reaffirmed within the last hundred years by archaeological discoveries in Turkey and Syria. (The name *Hittite* was derived from the Hatti people of Asia Minor.) Around 1400 BCE, during the reign of the great pharaoh AMENHOTEP IV, the Hittite king Suppiluliumas I conquered Mitanni, a Syrian kingdom. This established the Hittites as an empire in Asia Minor and a rival to Egyptian power. This rivalry came to a head in 1285 BCE when the Hittite leader Mutwatallis fought an indecisive battle against the Egyptian pharaoh RAMESSES II at KADESH. Although Ramesses was forced to flee the scene of the conflict, the battle stopped the Hittite advance toward EGYPT. Peace between the two powers was sealed by a marriage between a member of Ramesses's family and a Hittite princess.

At the peak of its power the Hittite empire extended from upper MESOPOTAMIA and Syria to what is now southern Lebanon. During this time the Hittites began smelting iron, signifying the beginning of the IRON AGE. Hittite religion included the worship of thousands of DEITIES, and their literature displays a level of emotion not usually found in ancient Near Eastern texts. In addition the Hittite code of law appears to express more humane treatment than other legal systems of that time and place. The empire flourished until around 1200 BCE, when it was overthrown by the Aegean SEA PEOPLES.

Homo erectus Scientific term used to describe certain members of the Hominidae family; a human-like species living in the prehistoric era. In 1975 scientists working near Lake TURKANA, in ETHIOPIA, recovered the fossilized remains of a 12-year-old boy. Named *Homo erectus* (*H. erectus*) because he stood "upright" and traveled extensively over wide areas, scientists believe that the boy probably traveled from the Ethiopian coast to Harar. From there, the boy, who lived about 1.5 million years ago, traveled to the Awash Valley and then southwest into the Omo Valley and to Lake Turkana. Based on his ability to travel, scientists have theorized that *H. erectus* was the first member of the human family to migrate from Africa to parts of Europe and Asia. This belief is supported by the discovery of other hominid remains in this region.

The features of *H. erectus* seem more human than those of earlier members of the human family. His brain capacity, for example, was 70 cubic inches (1150 cubic cm), and he appears to have had vocal chords, giving him

the ability to speak. *H. erectus* lived a relatively long life as well. He also may have learned varied techniques for survival. Among the most important of these was the use of FIRE, which helped *H. erectus* with cooking, protection, and warmth. *H. erectus* also developed advanced tools like knives, choppers, scrapers, and cleavers, all of which helped him hunt large animals and prepare them to be consumed as FOOD.

See also: HOMO HABILIS (Vol. I); HOMO SAPIENS (Vol. I); HADAR (Vol. I).

Homo habilis Scientific term used to describe certain humans of the prehistoric era who, over centuries, evolved into HOMO ERECTUS; members of the now-extinct Hominidae family that includes the modern human beings known as HOMO SAPIENS. During the 1960s, the remains of six species of *Homo habilis* (*H. habilis*) were

recovered at OLDUVAI GORGE in KENYA and at Lake TURKANA in ETHIOPIA. Scientific analysis indicates that *H. habilis* lived between 1.5 and 2.5 million years ago, providing further evidence that human life began on the continent of Africa.

Scientists distinguish between humans and primates by the size and development of the brain and jaw and by their posture. The first hominids are called *AUSTRALOPITHECUS* (*A. pithecus*). The earliest known hominid, nicknamed "Lucy," is also known by the Ethiopian name Dinkenesh. A nearly complete *A. afarensis* skeleton roughly 3.18 million years old, Lucy is the ancestor of *A. africanus,* a skull of which is shown at the bottom of the chart on this page. After *A. afarensis,* hominid development branched in at least two directions. *A. robustus* (strong), which became an evolutionary dead end, had large molars and powerful jaws but a brain capacity about the same as its predecessor, *A. africanus.* Another branch became the antecedent of modern humans: *Homo habilis* (skillful) developed about 2 million years ago; *H. erectus* (upright in posture) appeared about 1.75 million years ago; and *H. sapiens* (wise) evolved between 300,000 and 400,000 years ago.

Homo erectus and *Homo habilis* were two of several important discoveries made in Africa that relate to early hominids.

Given the name *habilis,* meaning "clever," "handy," or "skillful," *H. habilis* belonged to a group of hunters and gatherers who used simple stone tools. These tools, which often have been found with or near the skeletal remains of *H. habilis,* were stones that had been flaked, or broken off, to form cutting points. They were used as knives, hand axes, or choppers and may have provided some form of defense against large predators. Despite this tool-making ability, *Homo habilis* apparently had a small brain capacity, ranging from 40 to 61 cubic inches (650 to 1,000 cubic cm), according to most estimates.

Homo sapiens Term used by scientists to describe the most evolved members of the Hominidae family, which closely resemble modern human beings. *Homo sapiens* (*H. sapiens*) had the largest brain capacity of all recovered hominids, measuring 79 to 85 cubic inches (1,300 to 1,400 cubic cm). This is a close comparison to modern-day humans, whose brain capacity measures roughly 88 cubic inches (1,450 cubic cm).

H. sapiens, meaning "wise," lived in tropical Africa some 100,000 to 200,000 years ago. The earliest known

example of *Homo sapiens,* dating back approximately 60,000 years, was found in the Dire Dawa region of ETHIOPIA. *H. sapiens* were believed to have traveled over a wide area, leading some scientists to theorize that members of *H. sapiens* eventually colonized other parts of the world. Generations of adaptation, according to some theories, would have caused differences in skin color and appearance between these migrating *H. sapiens* and their African ancestors.

Horemheb   (c. 1348–1320 BCE) *Last king of ancient Egypt's Eighteenth Dynasty*

Horemheb became pharaoh after the death of AY, who died without an heir. A general, Horemheb had risen through the ranks of the Egyptian army, having served under the pharaohs AMENHOTEP III (r. c. 1417–1739 BCE), AKHENATEN (r. 1379–c. 1364 BCE), and TUTANKHAMUN (r. c.1361–c. 1352 BCE). Horemheb's wife, Mutnodjme, may have been the sister of Akhenaten's queen, NEFERTITI.

The main thrust of Horemheb's rule was the restoration of traditional Egyptian religion, law, and order. Seeing himself as the rightful successor to Amenhotep III, the last pharaoh before the Amarna Period, Horemheb sought to erase the memory of the four pharaohs who preceded him, all of whom he believed to be connected to the cult of ATEN. Abolishing the changes and reforms instituted under Akhenaten, Horemheb firmly reestablished devotion to Egypt's old gods, restoring old temples and building many new monuments in the process. Horemheb's death marked the end of the Eighteenth Dynasty.

Horn of Africa   Term used to describe the protruberance jutting out along Africa's northeastern coast on the RED SEA. The Horn of Africa is so named because on a map it looks like the horn of a rhinoceros. The major physical feature of the horn is that it is bisected by the eastern RIFT VALLEY, a part of the Graeben fault line that extends from the Dead Sea in West Asia through the eastern portion of the African continent. The Graeben fault is a fault in which the tectonic plates are moving away from each another, causing the land between the fault cliffs to sink. This has created East Africa's Rift Valley. Seven million years ago the Arabian Peninsula and what we call today the Horn were connected at present-day Yemen. It is predicted that millions of years in the future the Horn will become an island. Today, evidence of this ongoing process can be seen in DJIBOUTI, where fissures of seawater are breaking into the continent.

According to some historians, the Horn was the fabled Land of PUNT that figured prominently in the history of ancient EGYPT and which was visited by Egypt's Queen Hatshepsut. Other sources indicate that trade in a variety of goods, including frankincense and myrrh, flourished at the port of Zeila, on the Horn, as early as the sixth century CE.

Much of the land of the Horn is dry or even arid, forming a semi-desert covering almost 23,000 square miles (59,570 sq km). Its mountainous terrain includes Africa's third-highest mountain, RAS DASHEN, which measures 14,000 feet (4,270 m). Nearby Djibouti has Africa's lowest point, at 455 feet (140 m) above sea level. With one of Africa's longest coastlines, the Horn has the continent's largest area of geological rifting, which occurs when shifts of the earth, over time, form deep valleys.

horses   Many historians believe horses were first introduced to Africa from Asia as long ago as the time of the HYKSOS, who invaded and conquered EGYPT about 1650 BCE. Although it is unclear precisely when horses were first used in battle, images and skeletal remains of horses have been linked to Egypt's NEW KINGDOM (c. 1570–1070 BCE). This suggests that horses played a role in Egypt's war of liberation against the Hyksos. Exactly what that role was, however, is not certain. The iron bits, bridles, saddles, and stirrups unearthed in recent excavations, for example, would have allowed riders to control a horse while simultaneously using weapons. However, it also is possible that, since horses were considered a powerful symbol of prestige, they initially may have been used only for hunting or for pulling chariots. Regardless of their precise military role, it is clear that horses were used in the Saharan trade caravans before being replaced by CAMELS.

By the first millennium BCE horses had become a valuable trade item and were widely used in both the MAGHRIB and the kingdom of KUSH. The geographer Strabo (c. 22 CE) detailed battles in which mounted warriors fought on horseback with javelins, describing the horses as small but spirited and tractable. According to Strabo, the horses wore COTTON or hair collars, from which hung a lead rein. Some of these horses, Strabo continued, were so well trained that they followed the warriors like pet DOGS, without even being led.

Horus   Ancient Egyptian sky god, important for the pharaohs' claim to be his earthly embodiment. In Egyptian mythology, Horus was generally known as the son of OSIRIS and ISIS and was represented by a falcon or a falcon-headed man. The Sun and the Moon were thought to be his eyes. In predynastic times, the followers of Horus

invaded EGYPT, and he was venerated as a triumphant warlord. Horus also was an important part of the state religion. As a result many pharaohs took on his name.

Horus is believed to be a synthesis of two earlier DEITIES, Horus the Child and Horus the Elder. As Horus the Child, he was often depicted as a child suckling at the breast of his mother, Isis, which may have inspired the more modern image of the Madonna and Christ Child. As Horus the Elder, he avenged the death of his father, Osiris, against the evil SETH. Horus lost his left eye in the 80-year battle, but he eventually rallied to defeat Seth and victoriously unite UPPER and LOWER EGYPT. The image of the eye of Horus, a human eye combined with falcon markings, became a powerful Egyptian amulet.

human origins   The commencement of the existence of humans is generally believed to have taken place on the continent of Africa. In 1974 archaeologists working in the region of HADAR, ETHIOPIA, discovered the 3.18-million-year-old remains of a woman. "Lucy," as the woman was called, provides strong evidence of a common human ancestry originating in Africa. Skeletal remains, rocks, and fossils also have been uncovered in Africa's Great RIFT VALLEY—some dating back 5 million years—that help support this theory. More recent discoveries made in present-day CHAD suggest that hominids inhabited Africa as early as 7 million years ago.

Olduvai   One of the most important sites in paleoarchaeology, OLDUVAI GORGE is located near Lake Eyasi in the north-central part of what is now TANZANIA. Located in the area of the Great Rift Valley, the gorge is 9 miles (14.5 km) long and 330 feet (100.6 m) deep and exposes a virtual timeline of prehistory in nearly 2 million years of sedimentary rock. Excavation of the rock layers has revealed the fossilized remains of many ancient hominids, including AUSTRALOPITHECUS, HOMO HABILIS, and HOMO ERECTUS. The discoveries made there, most anthropologists agree, established the African origins of all humankind.

A family of English archaeologists, the LEAKEYS, is largely responsible for Olduvai's fame. Between the 1930s and the 1960s, Louis Leakey unearthed a number of stone tools of the OLDOWAN tradition. His wife, Mary Leakey, was the first to find a hominid fossil in the gorge, a 1.75-million-year-old *Australopithecus boisei* that was unearthed in 1959. Since then, Olduvai Gorge has yielded many fossilized skeletal remains, including some dating back 700,000 to 1.8 million years.

Kenya   Evidence of early human presence, including fossils of *Homo erectus* and *Homo habilis,* has also been discovered in modern-day KENYA. Western Kenya, in particular, where sedimentary deposits have been dated back 12, 14, and even 20 million years, has been a major source of information about the course of human evolution.

In 1972, for example, a hominid skull was unearthed at Koobi Fora, a sand spit east of Lake TURKANA in the northern part of the country. Discovered by Bernard Ngeneo—a member of a team of researchers led by the famous paleoarchaeologist Richard Leakey—the skull was identified as belonging to *Homo habilis* and was dated as being from 1.8 to 1.9 million years old. Designated "1470" for its museum accession number, it has proven a controversial find because its discovery suggests that many types of hominids apparently coexisted in East Africa for many millennia, a fact that makes it hard to delineate any clear path of human evolution.

An even more famous Kenyan hominid specimen was found in 1984 by Kimoya Kimeu, the foreman of another Leakey-led team, this one working at Nariokotome on the western shore of Lake Turkana. The TURKANA BOY, as the discovery was called, represents one of the most complete fossil hominid skeletons ever found. Living approximately 1.6 million years ago, the Turkana Boy was a *Homo erectus* of about 12 years of age. Analysis of the bones has led archaeologists to conclude that a mature *Homo erectus* would have been about 6 feet (2 m) tall and would have boasted a large brain.

Botswana   A lime quarry at Taung, in present-day BOTSWANA, revealed one of the earliest glimpses of the extended human family tree in the form of a small skull, its braincase intact. Found in 1924, it was identified as belonging to a young *Australopithecus africanus*, a new species of upright-walking, intelligent hominid. The TAUNG CHILD, as the discovery was called, was not accepted by the scientific community until additional *Australopithecus* finds were made in the 1960s.

It is believed that the area's three rivers—the Zambezi, Okavango, and Chobe—once formed a single mighty river, which is thought to have flowed across an arid, desert-like northern Botswana. When this river divided, it apparently formed the Okavango Delta, which is the world's largest inland river delta. There, archaeologists have found parts of heavy-duty stone picks and axes, which constitute evidence that tool-making hominid inhabitants were present in the delta somewhere between 200,000 and 600,000 years ago.

hunter-gatherers   Term used to characterize societies whose main form of sustenance is derived from a combination of hunting, FISHING, and the collection of wild plant foods growing in a natural state. Hunter-gatherer societies were widespread on the African continent for thousands of years. Until about 3,000 years ago southern Africans depended exclusively on hunting and gathering.

Many groups lived nomadic lifestyles, tracking game animals and fresh sources of FOOD. They gradually lost most of their land and livelihood to pastoralists, gardeners, and farmers. Eventually the remaining bands were by and large assimilated into neighboring populations. Today relatively few African peoples survive primarily as hunter-gatherers, and much of what is known about hunting and gathering societies of the past is based on observations made more recently. The largest and best-known such population today is the Khoisan group of the arid Kalahari region in southern Africa.

Hunter-Gatherers in Prehistory   Millions of years ago pre-human populations subsisted in Africa by means of hunting and gathering. Fossils found in Bouri, ETHIOPIA, in the 1990s indicate that by 2.5 million years ago hominids were already using stone tools to carve meat and scrape bone marrow. The increase in protein and fat provided by a carnivorous diet may have been a factor in the evolution of bigger brains and longer legs in protohuman populations. Paleolithic evidence remains scarce for the evolutionary period during which the genus *Homo* and the human species emerged in Africa.

Southern African hunter-gatherers have dwelled continuously in the KALAHARI DESERT region since at least 9000 BCE. Although the area is now desert-like, there were also wet periods over the past 11,000 years. Even today, although surface moisture is rare, water trapped below the surface of the absorbent sand sustains hardy species of plant life, including grasses, thornbushes, and fruit-bearing trees. The VEGETATION is thus highly resistant to drought and provides fodder for many animals, including large antelopes. The combination of edible plant life and game animals has enabled nomadic hunter-gatherers to survive in the arid CLIMATE for many generations.

Tools and Weapons   Archaeological research reveals that around 8000 BCE hunter-gatherers in Africa had developed sophisticated means of acquiring food. At Gwisho springs in Zambia's central Kafue Valley, the moist soil has preserved many tools and artifacts, some of which date from c. 2000 BCE and demonstrate the successful adaptation of hunter-gatherers in the region. Microlithic blade technology was in use across vast areas of savanna and forest throughout sub-Saharan Africa. In the drier climates, rock paintings and carvings on cave walls have been preserved from ancient times. Many of these artworks, created using paints mixed from animal fat, vegetable dyes, and ochres, depict beasts of prey and scenes of hunting and fishing. However, in the northern part of southern Africa, there are few paintings, and no Kalahari SAN people are known to have made ROCK ART in historic times.

In heavily forested regions a variety of weapons—from axes and spears to dug-out pits and trap lines—were employed from the Middle STONE AGE and into the Late Stone Age. During the Late Stone Age, prolific hunters of the savanna grasslands killed animals of all sizes with the bow and arrow, as well as with multi-pronged spears fashioned from carefully hewn microliths attached to shafts of wood. Arrowheads of stone or bone were tipped with slow-acting poisons. With this technology, small, highly mobile hunting parties could track and bring down large, fast-moving, far-ranging ungulates such as antelope and buffalo. Small game could be caught in traps, nets, and snares, or tracked with DOGS and clubbed. Reptiles and bird eggs also provided a source of food. In the swampy Okavango of the northern Kalahari, fishing, rather than game hunting, was a mainstay of subsistence.

In addition to meat, one of the main by-products of hunting was bones, which were made into tools, weapons, and ornaments. Skins were another by-product, and hides were scraped with stones, treated to become soft, and made into such useful items as clothes, house-coverings, and carrying bags.

The Gatherers   Far less ancient vegetal material has survived as evidence than the more durable stone and bone. But it is clear that gathered plant and animal foods were an important part of the human diet. Hunter-gatherers living today depend upon gathered foods for more than half of their nutritional needs. The !KUNG traditionally have obtained as much as 80 percent of their food supply from plants, which despite being seasonal are more abundant and reliable sources of food. While men probably were the primary hunters, ranging far afield in pursuit of game, gathering was principally the job of women, who also had to care for the young. The gatherers' principal tools were sharpened digging sticks and carrying bags. They picked fruits, berries, and melons and dug tubers and edible roots. Women also caught insects such as CATERPILLARS, LOCUSTS, and termites, providing a highly concentrated source of nourishment.

Social and Political Organization   The typical political organization of early hunter-gatherer bands was probably loosely stratified, with a relatively undefined social hierarchy compared to later settled populations. The predominant forms of social organization among hunter-gatherer bands have been characterized by anthropologists as communal, reflecting the loose hierarchy and mobility that would allow small, kin-based groups to remain flexible and highly adaptive to the constant challenge of changing environmental conditions. Even today, for example, MBUTI and others living in the RAIN FORESTS of Central Africa maintain few material possessions and do not greatly value private individual ownership. Their hunting territories are strictly defined, however.

Researchers have inferred much about ancient African hunter-gatherer populations from the practices of surviving groups in the Kalahari. Much of this information is

drawn from field studies carried out during the 1950s and 1960s. In the past, these peoples were often thought to have descended from refugees fleeing other regions. However, the combined evidence of ARCHAEOLOGY, historical linguistics, and the highly developed degree of adaptation of these peoples show that they have occupied the Kalahari for millennia. Likewise the societies, cultures, and ways of life of these peoples were thought to have undergone little change over the centuries. More recent archaeological and historical studies, though, indicate that contact with herders and farmers has been influential for the past 2,000 years.

Names and Languages Outsiders referred to these hunter-gatherer groups by a variety of generalized names, none of which reflected historical ethnic origins or the self-descriptions of local and kin groups. Bantu-speaking agriculturalists referred to the hunter-gatherer peoples as Sarwa (or Twa); Khoikhoi herders living to the north knew them as the SAN (or Sonqua); later European settlers called them BUSHMEN. The latter name, originally meaning simply "those without CATTLE or other domesticated livestock," became a derogatory term in the context of the racialized social politics of modern southern Africa. Today the preferred term for the hunter-gatherer peoples of the Kalahari is *San,* a word taken from the Nama language and whose original meaning is obscure. Anthropologists have created a general term, *Khoisan,* to describe the peoples of the Kalahari, who are descended from the historical intermingling of Khoikhoi (Khoekhoen or Hottentot) herders and San hunter-gatherers.

Southern African hunter-gatherers spoke a great many different languages. For the most part, these fall into three major LANGUAGE FAMILIES, all distinguished by the use of "clicks." Cultural differences among modern populations, such as those found between the !Kung in the northwest of southern Africa and their neighbors, suggest that hunter-gatherer societies as a whole were heterogeneous and diverse. Following the introduction of herding, strict divisions between hunter-gatherer societies and pastoralists may not have always existed.

The unusual symbols and letter patterns in the names of the !Kung, /Gui, //Gana, Kxoe, //Ng-!Ke, and /'Auni languages and dialects stand for clicks. The Khoisan family of languages employs three kinds of clicks, almost always as the beginning consonant of a word. These are an ingressive click, for which air rushes into the mouth; an egressive click, for which air rushes out of the mouth; and a labial click, made with the closing of the lips, which sounds like a kiss.

Staple Foods and Diet Studies of Kalahari hunter-gatherers in historic times paint a somewhat different picture than the familiar image of a society of big-game hunters. Although large antelopes were hunted, most meat came from such smaller game as hares, OSTRICHES, guinea fowl, porcupines, and small antelope breeds. In fact, meat provided a relatively small part of the food supply. Gathered foods were the true dietary staples. Throughout the Kalahari edible plant foods included the fruit of the BAOBAB tree, sour plum, and a variety of other species. In addition, the !Kung lived in an area where the nutritious *mongongo* nut grew in abundance.

The chief significance of hunting in Kalahari societies was as a source of status and prestige. Hunters marked their arrows for easy identification, and the kill belonged to the hunter whose arrow first struck the felled beast. He was the one responsible for dividing up the spoils, following strict rules in distributing the meat to the network of kin who made up the band. Everyone received a share and no one ate alone, although the parents of the victorious hunter's wife were favored.

Large animals were butchered by men in the field for easier transport, and women did the cooking. Unlike meat, plant foods were relatively abundant and did not have to be shared beyond the immediate family.

In the dry southern regions of the Kalahari, melons and roots were an important source of water. Calabashes and ostrich eggshells were hung in trees to collect water during the rainy season. Later in the year, groundwater was extracted through sucking tubes. Winter droughts often forced people to move near the few underground springs, even though such sources were still in a relatively dry state.

Nomadic and Settled Lifestyles The scarcity of water and edible plants enforced a regime of movement throughout extensive and well-defined territories of the Kalahari. The !Xo of the dry southern desert remained on the move throughout the year, pausing in their annual rounds only for the boys' puberty ceremonies in the fall. In the central savanna, //Gana and /Gui peoples came together and collected water during the brief rainy season before dispersing. In the western central Kalahari, the Nharo people enjoyed a more abundant water supply and consequently lived in larger and more stable settlements. In the Upper Karoo region, hunter-gatherers known as /Xam camped on hilltops and followed game animals. Prior to colonial contact and Dutch settlement, hunter-gatherers whom the Khoikhoi called the Soaqua inhabited the coastline of the western Cape. They ate shellfish and fish, game animals, ostrich eggs, and tortoises as well as plants. The Soaqua often used caves, generally located at a high elevation, for shelter from the elements; these caves also gave them a panoramic view of the land. The Soaqua may also have gone on seasonal migrations for hunting purposes.

Bands and individuals, as well as FAMILY units, interacted frequently, visiting their neighbors for extended periods. Individuals also could move between bands, which, therefore, were often in flux. Ties of marriage and fictive kinship were built up, facilitating a high degree of social mobility among bands and providing networks for the common sharing of water and other resources in times of scarcity. Families lived in semicircular thatched shelters of branches and twigs. Campfires were central gathering places, with families moving from one hearth to another in ritualized visitation rounds. Marriages were usually arranged between members of different bands. Although POLYGAMY occurred, it was practiced only rarely, since there was a shortage of marriageable females and few men could afford to support more than one wife.

The highly mobile, nomadic lifestyle of most southern hunter-gatherers meant that few material goods or possessions were kept, and manufacturing was minimal. Houses were temporary shelters that were abandoned when people broke camp. Personal items were limited. In addition to clothing, tools, weapons, fire drills, and implements for food gathering and processing, southern African hunter-gatherers made musical instruments, pipes, boxes, and other items of wood, bone, shell, and stone. Later, metal obtained in trade was used for knives and blades.

Clothing and Dress   Typical animal-skin clothing in the Kalahari consisted of loincloths for men and aprons for women. Women also wore cloaks that doubled as slings for carrying babies and for collecting foodstuffs or firewood. Some groups made skin hats and leather sandals. Children's clothing, although varied, was typically patterned after adult garments.

Ornaments were worn by men, women, and children. Small disks made of ostrich eggshell were strung into necklaces and waistbands or sewn onto headpieces and clothing. Other decorative wear was made of roots, seeds, reeds, and animal horn. Young women powdered their hair and painted their faces with either red ochre or a mixture of crushed wood and animal fat. Women also bore ornamental tattoos made by rubbing ash into cuts in the skin of the face, buttocks, and thighs. Men received SCARIFICATION marks during their initiation into adult status; facial tattoos were earned through successful hunting.

The Khoisan People Today   Today, most Khoisan people in the Kalahari are adapted to herding and agriculture, with only about 5 percent subsisting primarily by hunting and gathering. Most of the hunter-gatherer populations have been decimated by disease, assimilation, poverty, economic dependency, and the encroachment of others on their former lands. In BOTSWANA and NAMIBIA, small reserves of land have been set aside for Khoisan people living a traditional lifestyle, but these modern hunter-gatherers live under the constant threat of losing their remaining territory.

Layton, and Peter Rowley-Conwy, eds., *Hunter-Gatherers: An Interdisciplinary Perspective* (Cambridge, UK, Cambridge University Press, 2001); Richard B. Lee and Richard Daly, eds., *The Cambridge Encyclopedia of Hunters and Gatherers* (Cambridge, UK: Cambridge University Press, 2005).

Hutu (Bahutu, Wahutu)   Bantu-speaking people who have long inhabited a region of present-day BURUNDI and RWANDA. Believed to have entered the area as early as the fifth century, the Hutu encountered and overcame the Twa, small-statured hunters who had been in the region for centuries. The Hutu brought with them a way of life dedicated to small-scale farming and cattle herding. Their social structure involved into a CLAN system, with *bahinzas* (petty kings) ruling small regions.

Hyksos   Foreign invaders who occupied EGYPT in the 17th century BCE. Little is known about either the origins of the group of Asians known as the Hyksos or about how they conquered large parts of Egypt. The most common assumption is that they used military force, although political control is another possibility.

Under Hyksos rule Egypt seems to have enjoyed peace and prosperity. The Hyksos respected the native religions, maintained ancient Egyptian as the official language, and allowed many Egyptians to serve at high levels of government. Although later Egyptians depicted the period of Hyksos rule as one of chaos and misery, there were indisputable technological advances during the era, including the use of both copper and bronze. The Hyksos were also the most likely source of many new tools and innovations in warfare, including the use of both horses and war chariots.

Hyksos rule in Egypt enabled the KUSH kingdom to regain control over NUBIA. After a century of Hyksos rule, the southern Egyptian city of Thebes asserted its independence. The war that resulted led to the expulsion of the Hyksos around 1570 BCE.

Hyrax Hill   Archaeological site that is located near Lake Nakuru, in present-day west-central KENYA. Hyrax Hill, which lies within Kenya's portion of the Great RIFT VALLEY, is about 3 miles (4.8 km) from Lake Nakuru and stands about 300 feet (91 m) above the lake level. In 1926, famed paleontologist Louis Leakey first found evidence of prehistoric hominid life in Hyrax Hill. Mary

Leakey (1913–1996), Louis Leakey's wife and fellow paleontologist, began her own work at the site in 1937. Her excavations revealed the remains of a STONE AGE culture, including a walled enclosure and a burial mound. In total there are three separate sites, the oldest dating back 3,000 years and the most recent from two or three centuries ago.

I

idolatry The worship of drawn, carved, sculpted, or painted images that represent religious figures, legends, and myths. The religions of ancient Africa often relied on images to teach and maintain cultural traditions. This frequently was accomplished by the appearance of religious images on such everyday objects as coins, JEWELRY, weapons, tools, and buildings. Egyptians and Nubians, in particular, were noted for such ART, which included representations of the Egyptian moon god Khonsu, the sky goddess, Nut (who sometimes was portrayed as a cow), and APEDEMAK, the Nubian lion god.

Ifa YORUBA divination system made up of a series of verses that are chanted to drive away evil. Ifa was an ancient DIVINATION system practiced by the Yoruba people of the southwestern region of present-day NIGERIA. The Ifa verses were chanted by a learned Yoruba priest to alleviate a client's suffering. Yoruba priests appealed to the gods by reciting the verses that fit a particular sufferer's needs. Different verses applied to different aspects of life, from physical ailments to natural disasters, and they served to encourage the Yoruba standard of ideal tribal life by supporting the accumulation of wealth, wives, and children. These materialistic goals helped instill an entrepreneurial spirit within the community. Through the Ifa chantings (a single recitation of a verse could last several hours), an individual was believed to form a direct connection with the gods.

The Yoruba people originally supported a pantheistic society. They believed that mankind originated in Ife (ILE-IFE), a sacred city that supposedly arose when one of the gods turned water into land. As the first Yoruba city, Ife was the center of Ifa divination. At the height of its influence from the 11th to 15th centuries, Ife was the focal point for surrounding kingdoms. Neighboring kingdoms even sent their deceased rulers to be buried in the sacred town.

Ifa, the divination god, was the backbone of the Yoruba divination system. During a ceremony, a Yoruba priest called on Ifa with an ivory tapper (*iroke-Ifa*). Palm nuts were tossed onto a dusted divination board (*opon Ifa*). The Yoruba priest then studied the pattern left in the dust to determine which verses to recite. The process was repeated until the priest had a complete message to chant.

According to Yoruba belief, Eshu-Elegba, the messenger god, delivered to the other gods the divine messages that had been chanted by Yoruba priests. Eshu's image was used extensively in Ifa art, particularly on divination boards and bowls. His hair was always depicted half-shaved to symbolize his friendship with Ifa.

During an Ifa ceremony a Yoruba priest usually carried a special iron staff that symbolized his power over death. A cock was often sacrificed and tied to the staff because the Yoruba believed that the scream of the bird tricked the gods into believing that a person had been sacrificed, thus avoiding a human death. This Ifa staff

was believed to protect the priest and the sufferer during the ceremony.

〰〰〰〰〰〰〰〰〰〰〰〰〰〰〰〰〰

Yoruba priests shaved their heads to honor Eshu and to symbolize the beginning of an initiation ceremony. Other Yoruba shaved their heads for ceremonies, believing that spirits entered a person through the head.

〰〰〰〰〰〰〰〰〰〰〰〰〰〰〰〰〰

Igbo (Ibo) People living chiefly in the southeastern region of present-day NIGERIA. The Igbo probably originated at the junction of the NIGER RIVER and BENUE RIVER and then migrated about 100 miles (161 km) south to southeastern Nigeria, one of the most fertile regions of Africa. The Igbo speak the Igbo language, part of the Kwa Branch of the family of NIGER-CONGO LANGUAGES. There are linguistic connections between the Igbo and nearby groups including the Igala, YORUBA, and Idoma. These indicate that the Igbo were once part of a much larger group of Niger-Congo-speaking people. The Igbo apparently split off from these other groups about 5,000 to 6,000 years ago.

There is little agreement among historians about the origins of the Igbo people. While the founding myth has the Igbo migrating southward from EGYPT, many maintain that the Igbo culture is a combination of the Nok, Ife, and Benin cultures of the local region.

Ile-Ife YORUBA city in the southwestern region of present-day NIGERIA. The city is also known as Ife and Ife-Lodun. Probably the oldest population center occupied by the Yoruba people, Ile-Ife dates back at least 1,000 years. Excavations at the site have revealed Ile-Ife to have been, even in its early days, a remarkably urbanized community. This has led some historians to theorize that Ile-Ife's first settlers, who supposedly immigrated there from the north, had experience with living in towns or even larger communities.

See also: ILE-IFE (Vol. II).

Imhotep (fl. c. 2650 BCE) *Vizier of the pharaoh Djoser; recognized as a deity during the Third Dynasty of ancient Egypt's Old Kingdom*

One of the few Egyptian gods other than the pharaohs who was an actual historical figure, Imhotep was a priest, scribe, poet, doctor, and a founder of the Egyptian studies of ASTRONOMY and ARCHITECTURE. As the VIZIER of King Djoser (r. 2630–2611 BCE), Imhotep also was skilled in a wide variety of royal enterprises and administration.

As an architect, Imhotep is best known for designing the STEP PYRAMID OF DJOSER, at SAQQARA. Located near MEMPHIS, the step pyramid is known as the first human-made structure to be fashioned entirely from stone. The pyramid was built as a tomb for Djoser. It ultimately moved beyond its intendend purpose, inspiring a style of architecture that embodied the spiritual ideas of the Egyptian people. Containing temples, pavilions, corridors, chapels, halls, and storerooms, the pyramid also was distinguished by fluted columns attached to its limestone walls, a clear link with ancient styles of Egyptian architecture.

Imhotep was first honored as a god during the OLD KINGDOM (c. 2705–2213) because of his wisdom and his work as a scribe. Later, during the NEW KINGDOM (c. 1570–1070), SCRIBES venerated Imhotep as their patron, pouring out a few drops of water as an offering to him before beginning to write.

During the Late Dynastic Period Imhotep was fully recognized as a god. He was associated with the writing god, THOTH, and he was seen as a patron of MEDICINE. Anyone, god or man, who suffered with pain was thought to be tended to by Imhotep, and feats of miraculous healing were attributed to him. This led the Greeks eventually to identify Imhotep with ASCLEPIUS, their god of medicine.

A small temple of Imhotep was built on the Island of Philae during the Ptolemaic Period (c. 332–44 BCE). The Roman emperors Claudius and Tiberius commissioned praises to Imhotep that were inscribed on the walls of their Egyptian temples. In ART Imhotep was represented as a seated priest with a shaved head hold-

ing a PAPYRUS roll. At times he was shown without divine insignias, clothed in the garb of an archaic priest.

initiation rites Culturally based practices designed to introduce adolescents to the values, history, and social guidelines prevalent within their societies. Many of these practices date back to ancient times, and a number of them survived, in one form or another, well into the present era.

In Africa the initiation of the young has always represented an important vehicle for passing on knowledge about community affairs, economics, RELIGION, and such social responsibilities as courtship, sexuality, marriage, and childbirth. Male and female elders were usually assigned the task of directing or participating in specific initiation activities. These activities were drawn from elements of nature, song and DANCE, morality tales, ORAL TRADITIONS, and ritual objects to create a learning experience. The length of the actual ceremonies varied, with some lasting a day and other, more complex rites lasting months or even years. Researchers have noted three common themes in many initiations: The first was separation from the community and familiar surroundings; the second was a period of seclusion; and the third step involved integration or rebirth within the initiate's community.

For many adolescent girls, initiation often began with the onset of menstruation. The AKAN of GHANA, for example, held a sacred feast for young women. It included libations and prayers designed to invoke protective guidance and future fertility. The young initiates remained with older female adults for a specified period in order to learn about taboos, sexuality, marriage, diet, and other social responsibilities. In contrast, young women of the Nandi society in KENYA traditionally underwent rigorous training, including the symbolic cutting of firewood, spirited dancing, and, ultimately, female CIRCUMCISION.

Many societies regard the initiation of young men as a test of strength. The Mbundu of ANGOLA traditionally called their initiation *mukanda.* A rite that sometimes lasted several months, it included feasting, song and dance, and sexual freedom. The young men were taken to a special site known as "the place of dying," a symbolic metaphor for the loss of their youth. After they were circumcised and forced to endure physical ordeals and verbal abuse, they were formally educated in the ways of adult males. They then returned to their villages wearing white clay MASKS to symbolize the process of rebirth. There they performed the dance of war for public recognition of their adult status.

ink Fluid or paste first used for WRITING and drawing in ancient Africa about 2500 BCE. The Egyptians were among the earliest people to use ink, reed pens, and brushes for writing. One of the oldest sources for ink was the cuttlefish, which was fairly common in the MEDITERRANEAN SEA. Later Egyptians began to use colored dyes such as indigo, white lead, charcoal, and soot. They, and later the Ethiopians, used specially designated colors to honor the gods mentioned in sacred texts. Other sources for making ink included extracts from juices, plants, and minerals. After it was molded and dried into sticks or small cakes, lampblack mixed with glue or gum was also used.

Ink and PAPYRUS were used to create the early form of books known as papyrus rolls. Papyrus comes from a reed-like plant found in the marshes of the NILE VALLEY and NILE DELTA regions. The ancient Egyptians sliced these stalks into thin sections. Then they laid them side by side and pressed them into sheets approximately 5 to 6 inches (12 cm to 15 cm) wide. When the sheets were dried in the sun, they achieved a paper-like consistency. Although seemingly fragile, many papyrus documents were preserved beneath Egypt's hot desert sands for more than 4,000 years.

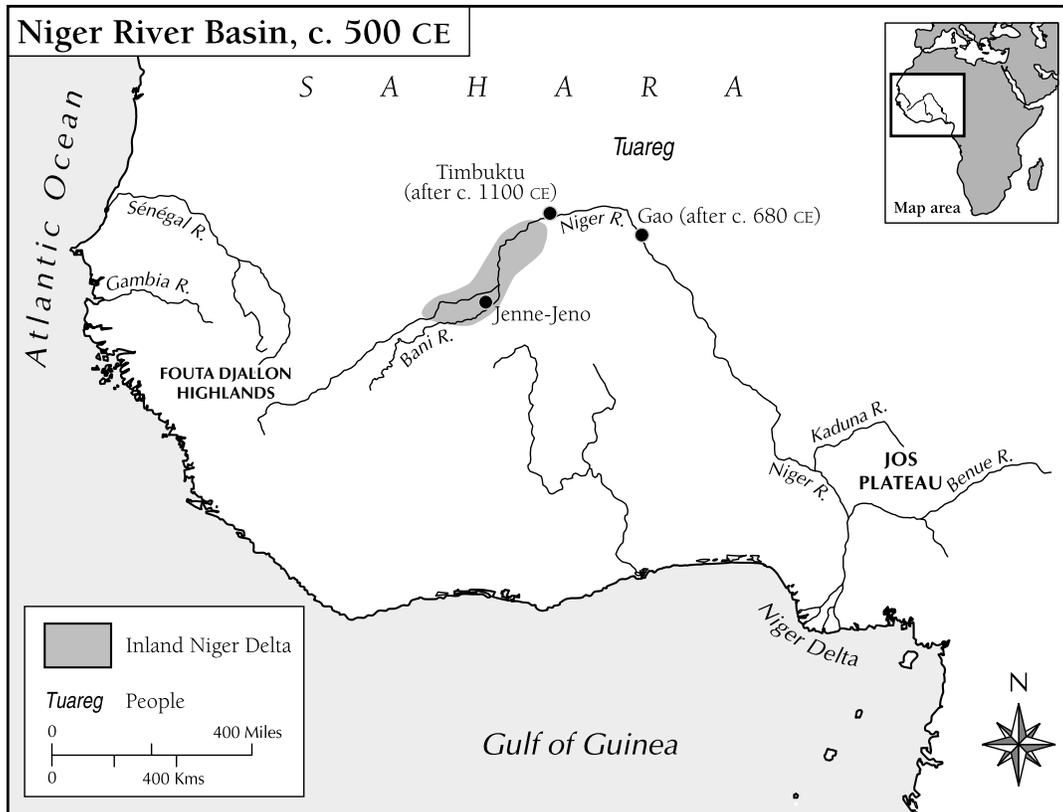
Inland Niger Delta Region in present-day Republic of MALI located between the NIGER RIVER and the Bani River. The Inland Niger Delta covers about 11,583 square miles (30,000 sq km) and features mostly swamps and standing water, although the territory also crosses areas of savanna grassland and SAHEL scrub. The region is flooded for much of the year, but its fertile soil allows for the farming of crops such as MILLET and rice.

The Inland Niger Delta is the result of the geographical history of the present-day Niger River. At one time the

Niger River Basin, c. 500 CE


Niger was two rivers, the Djoliba and Quorra. The Inland Niger Delta was the delta for the Djoliba River, which flowed from its source in the highlands of the Fouta Djallon, in present-day GUINEA, to its mouth at Lake Azwad in present-day Mali. Lake Azwad, a salt lake, dried up as the SAHARA DESERT expanded southward. Geographical contours of the land directed the flow of the Djoliba into the Quorra River, resulting in the Niger River's unique bowed shape.

Prior to European colonization the empires of ancient GHANA, Mali, and Songhai controlled the delta region in succession. During much of this time the main commercial center of the region was JENNE-JENO, which had been founded early in the first millennium CE. Za, another important trading city in the Inland Niger Delta, was located 62 miles (100 km) west of Jenne-Jeno. Founded by a branch of MANDE speakers known as the Nono, Za was a thriving center of commerce by the 10th and 11th centuries. In fact, it was traders originating from Za who are thought to have established the city of Jenne in the 13th century.

Jenne eventually came to rival and even supplant Jenne-Jeno as the region's primary commercial power. Trade items included COPPER, GOLD, SALT, KOLA NUTS, and ivory. By the end of the 15th century there also was a thriving trade in dried fish and cereals. Much of this trade was conducted by BERBERS and Sudanese merchants who used CAMELS and riverboats to transport goods along routes extending northward to the Sahara, North Africa, and the MEDITERRANEAN SEA.

Inscription of Mes Inscription on the walls of a tomb at SAQQARA that details the court records of a land dispute fought over several generations during the 13th century BCE. The inscription was carved to prove the legal right, by inheritance, to the land in question. It also provides evidence of the substantial legal rights of ancient Egyptian women, showing that they had the right to administer property, to serve as witnesses before a court of law, to file lawsuits, and to appeal court rulings.

The subject of the inscription, Mes, was a descendant of Neshi, an Egyptian admiral whom King AHMOSE I (r. c. 1570–1546 BCE) had rewarded with a large tract of land south of MEMPHIS. Before he died, Neshi insisted that the land never be divided, decreeing that his heirs (and their heirs) would hold joint ownership and share in the income generated by the land, but that it would

be under the management of a single heir who would act as trustee.

Mes's descendants, however, eventually separated into two branches, with one branch of the family eventually being, in effect, disinherited from both trusteeship and joint ownership. During the reign of King HOREMHEB (c. 1348–1320 BCE), Werenra, a woman from the disenfranchised branch of Neshi's family, filed suit in the high court of the VIZIER, one of the king's highest civil officials. As a result she won back both trusteeship and joint ownership.

Werenra's sister, Takharu, later sued to demand division of the estate among six heirs. After the vizier decided in Takharu's favor, Werenra and her son Hui appealed this verdict, which, after many years, finally was overturned. Eventually, the position of trustee was inherited by Hui's wife, Nubnefret.

Nubnefret's right to the position was challenged by Khay, a member of the rival branch of the family. Falsely claiming that his trusteeship had been taken from him by Hui and Nubnefret, Khay bribed a court official to forge tax records supporting his claim. With the help of this fraudulent evidence, Khay won the case. Nubnefret's son, Mes, however, reappealed to the vizier. Producing the authentic tax records as well as witnesses who testified to his family's long trusteeship, Mes won a reversal, finally settling the case.

Intertropical Convergence Zone

Meterological term used to describe the weather produced by the convergence of the northeasterly and the southeasterly trade winds over Africa. African seasons are distinguished as wet or dry rather than cold or hot. Different seasons are often a product of the Intertropical Convergence Zone (ITCZ) that lies in a belt near the equator. At these latitudes the intense sun and warm ocean waters heat the air, causing it to rise. As it cools it produces thunderstorms. Variations in the ITCZ can interfere with the seasonal cycle over land by delaying rain, by causing droughts, or by dropping massive amounts of rain, causing floods. This convergence zone is also responsible for huge thunderstorm clusters that grow in intensity to become hurricanes.

Iron Age

Period in ancient times during which iron was the primary metal used for weapons, tools, and other implements. For many years, it has been widely believed that the earliest human use of the metal occurred about 1650 BCE, when the HITTITES of ancient Turkey began making iron tools and weapons. They passed their knowledge of iron-working to the Assyrians who, in turn, used iron weapons to help create an empire stretching from EGYPT to India. Ironworking was also practiced by the PHOENICIANS, whose colony of CARTHAGE lay in what is now TUNISIA. It was probably extensive trade with people in present-day LIBYA, ALGERIA, and MOROCCO that was responsible for carrying Phoenician iron technology to the western Sudan and sub-Saharan Africa.

Ironworking flourished in AKSUM, NUBIA, and, in particular, KUSH. Of all the ancient peoples, the Kushites were the most notable ironworkers. About 750 BCE, 60 years after Shabaka led the Kushites to conquer Egypt, the Assyrians conquered Egypt using their superior iron weapons. The Kushites learned how to identify ore-rich land and how to smelt iron. Realizing that land in the southern reaches of their own empire was rich in iron ore, the Kushites moved their capital from Napata to MEROË, which became a center of iron technology. Even today, tall mounds of iron slag—the waste material removed from iron during the smelting process—can be found among the ruins of Meroë, testimony to the major role ironworking played in Meroitic culture. Europeans have referred to Kush during this period of its history as the "Birmingham of Africa" (relating Meroë to the great Industrial Age iron-producing city of England). Unfortunately for the Kushites, the new iron technology contributed to the fall of Kush. Throughout parts of the kingdom, trees were cut to fuel the fires for iron production. This ultimately led to a deforestation of the region, and the subsequent erosion destroyed the Kush soil.

Recent discoveries have shown that, contrary to some long-held theories, sub-Saharan Africans developed metal-working technology at a very early stage in history. By about 1400 BCE, for example, East Africans were already producing steel in carbon furnaces, even though steel was not invented in western Europe until the 18th century CE. Iron technology, however, spread slowly across Africa, and it was not until the first century CE that the smelting of iron began to rapidly diffuse throughout the continent.

The spread of iron technology across southern Africa went hand-in-hand with the spread of BANTU LANGUAGES. Proficiency with the production of iron tools and weapons made it possible for the Bantu-speaking people to subjugate most of the indigenous HUNTER-GATHERERS with whom they came in contact. As a result, the previous inhabitants of the newly found areas were assimilated into Bantu-speaking culture. Once assimilated, these peoples became proficient in making iron tools and weapons for themselves, enabling many to develop agricultural communities.

In time the use of iron became widespread in sub-Saharan Africa. During the first millennium, for example, the people of what eventually became the kingdom of GHANA used iron weapons to gain prominence in West Africa. At the same time, the use of iron farming tools gave these same people agricultural superiority. No evi-

dence of widespread ironworking within Ghana itself has been found, however, a fact that leads most archaeologists and historians to believe that Ghana used its well-known GOLD supplies to purchase iron weapons and tools from Saharan traders to the north and east.

Elsewhere the people of the NOK CULTURE, located in the northern area of what is now NIGERIA, were smelting iron by 500 CE. Ironwork has been known among the Haya people of western TANZANIA for even longer, possibly, it is believed, for at least 2,000 years.

Ishango Bone Oldest known mathematical tool, which was found in an ancient mountainside settlement near the Lake Edward region in present-day UGANDA and Democratic Republic of the CONGO.

The Ishango Bone is named after the Ishango people, who inhabited the area sometime between the seventh and 10th centuries BCE. Little is known of the Ishango people except that they hunted, fished, and farmed in the area before volcanic eruption destroyed their village.

Although the dates of the Ishango civilization are uncertain, scientists believe the Ishango Bone was made around 8500 BCE. It was originally considered a simple tally record, but recent microscopic analysis has revealed additional notch marks indicating that it may have been used as a lunar CALENDAR. The bone itself has a quartz WRITING tool at one end, while the body is made of bone that is etched with three rows of notched marks, with each row having its own mathematical significance. The first row is a series of calculations based on the number

Found in 1960 and dating back to 8500 BCE, the Ishango Bone is the world's oldest mathematical tool. It is kept in the Royal Institute for Natural Sciences in Brussels, Belgium, and can be seen only by special arrangement.

10, the second row contains prime numbers between 10 and 20, and the third is a multiplication table.

The Ishango Bone is an important indicator of the scientific progress in Paleolithic Africa. With the advancement of trade among societies, knowledge of mathematics and units of measure became increasingly important. Basic mathematical calculations were also used to predict the effects of drought or floods on crop yields. With the discovery of the Ishango Bone, the long-held assumption that African societies were slow to develop mathematical technology was disproved.

Isis Ancient goddess considered the source of life and divine motherhood. In Egyptian mythology Isis was the daughter of the earth god Neb and the sky goddess Nut. The best-known myths about her involve the resurrection of her husband OSIRIS and the virgin birth of her son HORUS. In these myths, she found and then put back together the pieces of her husband's body when he was dismembered by his brother SETH. It is speculated that the recurring themes of resurrection, virgin birth, and the trinity of Isis, Osiris, and Horus came to influence early Christian thought and philosophy.

The worship of Isis occurred in many regions of the ancient world, generating hundreds of images of the goddess that reflect distinct cultures. Isis has been shown holding the sistrum, an instrument believed to have originated in NUBIA, as well as both a healing wand and the Egyptian *ankh,* another symbol of life and immortality. More recently, in the form of the Black Madonna, images of Isis and the infant Horus have been found in regions as far-flung as Afghanistan, Portugal, northern England, France, and Mexico.

The earliest religious rituals honoring Isis apparently took place in prehistoric Nubia among the Anu, an ancient people who inhabited the region that eventually became the kingdom of MEROË. Even after the establishment of Meroë, the ruling queen of the realm—the KANDAKE—traditionally served as a priestess of Isis.

In EGYPT worship of Isis dates back to 2500 BCE, and Egypt became a primary site for rites and ceremonies honoring the goddess. It was commonly held by Egyptian pharaohs, for example, that their prosperity stemmed from the NILE RIVER, which they believed to have been formed by the tears Isis shed for her husband. Egyptian worship of Isis reached its peak during the period spanning the Twenty-seventh through the Thirtieth Dynasties

This statue of the goddess Isis, daughter of the earth god Neb and the sky goddess Nut, from the Twenty-sixth Dynasty (664–525 BCE) is 35.5 inches (90 cm) high. Cairo Museum, Cairo, Egypt.

(525–332 BCE), when worshippers built the great temple at Philae, an island situated in the Nile River.

After Egypt was conquered by the Greeks in 332 BCE, temples devoted to Isis were established in the new city of ALEXANDRIA. In time the religion spread beyond North Africa to GREECE, where it was known as the Eleusianian Mysteries, and even to Italy, where the remains of an Isis temple have been recovered at the site of the city of Pompeii. By 86 BCE, the worship of Queen Isis had become a cornerstone of Roman religion and remained so until being supplanted by CHRISTIANITY.

Itjawy   Capital of ancient EGYPT at the beginning of the MIDDLE KINGDOM (c. 2040–1820 BCE). About 1991 BCE, following a brief civil war, Amenemhet (Amonemhet) seized power from the reigning king, Mentuhotep III. Amenemhet then reunified Egypt under a central government. Previously a VIZIER during the brief reign of Mentuhotep III, Amenemhet was an experienced administrator, and when he became king he recognized the advantage of having a more centrally located capital. Thus he moved the capital from Thebes to Itjawy (also spelled Itj-towy or Itj-Tawy). Located near the Fayyum Oasis, south of MEMPHIS, and on the border of UPPER EGYPT and LOWER EGYPT, the name of the new capital meant "seizer of" or "one who takes control of two lands." The relocation of the capital ushered in a prosperous and powerful period for Egypt, one that saw a rebirth of ART, ARCHITECTURE, and literature.

Ituri Forest   Dense tropical rain forest in Central Africa that is home to two ancient peoples, a group of Bantu-speaking village agriculturalists and the MBUTI, a nomadic HUNTER-GATHERER group. The forest is named for the Ituri River, which flows through it, running east to west.

Though inhabited by the Mbuti for thousands of years, the Ituri Forest, which is home to giant hardwood trees that rise to a height of 170 feet (51.8 m), was thought by many people to be completely impenetrable. Walking through the forest is not easy, as the floor contains a thick mass of plants, trees and tree roots, and fallen fruits and nuts. In some areas the thick tree canopy prevents almost all sunlight from reaching the forest floor. Humid, with a high annual rainfall, the Ituri forest has a wide variety of plants and animals, including the greatest variety of primates of any region in the world. Throughout history, the seeming inhospitable nature of the forest has afforded its inhabitants protection from enemies. Even today, there is no easy access to the forest in the way of improved roads or easily navigable waterways.

As far back as the Sixth Dynasty the ancient Egyptians knew of the Mbuti. POTTERY of ancient EGYPT shows representations of small-statured people, and Pepi II (r. c. 2300 BCE) was known to have some of these people living at his court. Four groups of these peoples, collectively known as the Mbuti, still live in Africa today. Though there is not much archaeological evidence of the ancient Mbuti, scholars believe that they

have inhabited the Ituri Forest since about 2500 BCE, hunting and gathering for subsistence.

Besides the Mbuti a group of agriculturalists has inhabited the Ituri for at least 2,000 years. Most of these people speak one of the BANTU LANGUAGES, and traditionally they have lived in small villages, cultivating crops and raising livestock. In parts of the forest the Mbuti and these agriculturalists trade FOOD and goods with each other and even share languages and customs.

Bailey, *The Behavioral Ecology of Efe Pygmy Men in the Ituri Forest, Zaire* (Ann Arbor, Mich.: University of Michigan, 1991); Roy Richard Grinker, *Houses in the Rain Forest: Ethnicity and Inequality among Farmers and Foragers in Central Africa* (Berkeley, Calif.: University of California Press, 1994); William Wheeler, *Efe Pygmies: Archers of the African Rain Forest* (New York: Rizzoli, 2000).

Ivory Coast (Côte d'Ivoire) West African country approximately 124,500 square miles (322,400 sq km) in size that is bordered to the east by GHANA, to the west by LIBERIA and GUINEA, to the north by the Republic of MALI and BURKINA FASO, and to the south by the Gulf of Guinea. The country's name came from the region's thriving trade in ivory elephant tusks.

Because bones are difficult, if not impossible, to preserve in the region's extremely moist climate, archaeologists have not yet been able to determine exactly when humans first settled the area. Traditional accounts note that the first masters of the land were short and bearded, much like the MBUTI of East Africa, who supposedly lived in trees and hunted with spears and arrows. It is theorized that these people probably arrived in the area by the fifth millennium BCE, having been forced from their previous homelands as the Saharan forests began to disappear. Scraps of tools and weapons that have been found suggest that people were present in greater numbers by the end of the Paleolithic Age (c. 2000 BCE).

J

jackals Typically found in deserts, grasslands, and open brushland, Jackals are nocturnal animals that sleep during the day in holes or hidden in the brush. Like hyenas, jackals usually feed on the dead carcasses of already hunted animals, although they also prey on rodents and young GAZELLES. The golden jackal, found in Northeast Africa, usually hunts in small packs. The black-backed jackal and side-striped jackals are found in southern and eastern Africa. The black-backed jackal is red with a black back. The side-striped jackal is gray with with a stripe on its sides.

Perhaps because they scavenge dead animals, jackals have had a somewhat dark reputation in African FOLKLORE. In ancient EGYPT, Anubis, the god of the dead, was depicted either as a jackal or a man with a jackal's head. Anubis embalmed mummies in the AFTERLIFE. Another jackal-headed god, Wepwawet, was worshiped in Syut, a commercial center south of CAIRO. In Hellenistic times Syut became known as Lycopolis, which means "City of the Wolf."

Jenne-Jeno Ancient city on the Bani River, a tributary of the NIGER RIVER, in what is now MALI. Jenne-Jenno is the most thoroughly excavated site of the early first millennium in West Africa, and much of what is known about that region is the result of these investigations.

For centuries the area surrounding the site of Jenne-Jeno was subject to the regular flooding that typified the INLAND NIGER DELTA at that time. Between the effects of the flooding itself and the diseases that resulted from it, the land remained virtually uninhabitable for centuries.

About 1000 BCE, however, this began to change when, like virtually all of northern Africa, this area became in-creasingly dry. As a result, by the third century BCE, pastoralists and agriculturalists, driven from the once-fertile southern SAHARA DESERT, began to migrate into the region. Archaeological discoveries indicate that a settlement was founded at Jenne-Jeno sometime during this period. Evidence of crowded cemeteries indicates that a substantial town existed on the site by at least 400 CE.

The simplicity of Jenne-Jenno's buildings, which were constructed from sun-dried mud, may have contributed to the town's successful early urbanization, as well as to the development of the region as a whole. Nearby towns using similar building techniques dotted the middle Niger valley, especially at Timbuktu, about 300 miles (483 km) away.

Old Jenne was surrounded by smaller settlements. Although nothing is known of their early agricultural practices, it is very likely that the people there were growing their own FOOD. Unlike the arid conditions in that region today, rainfall was plentiful from about 300 to 1100. There was more than enough rainwater to keep the fertile floodplains around Jenne-Jenno well irrigated for crops.

Iron use existed in this part of Africa even before the beginning of the common era, and the inhabitants of Jenne-Jeno apparently were gifted metalworkers. Their products consisted not only of tools but also of JEWELRY. POTTERY was another local product, and artifacts have been located that indicate an ability to manufacture sophisticated, thin-walled pottery.

Jenne-Jeno was part of a well-developed West African trading system, and TRADE AND COMMERCE was an important part of its ECONOMY. Exactly how extensive this system was is open to some debate. But to some scholars, the absence of any local sources of iron ore for Jenne-Jeno's ironworking industry indicates a trade network

that must have reached well beyond local boundaries. The presence of Roman and Hellenistic BEADS also is indicative of at least some trading contact with peoples having links beyond West Africa.

jewelry With the advent of the IRON AGE in Africa, metal forms of jewelry gained an equal and sometimes higher place than the rocks, shells, or animal bones used by previous generations. Bronze, COPPER, GOLD, and silver reflected societal growth and served as an important medium for communicating social rank, marital status, and age. An expression of cultural affiliation, metal jewelry served as an important form of BRIDE-WEALTH.

The creation of metal jewelry fell within the domain of BLACKSMITHS, who were often associated with magic. Blacksmiths often learned such techniques as the lost-wax process from local or regional craftsmen. This process was used for thousands of years by such groups as the Baule and the Dan of IVORY COAST, who reportedly learned of this technique from the AKAN—workers in gold an early date. Other groups associated with the process from an early period were North African Tuareg BERBERS, and the Fang, Mum, and HAUSA of West Africa. Each of these regional groups refined their techniques of jewelry making over time.

In general the lost-wax process relied on beeswax obtained from honeycombs. The wax was crushed, boiled, and filtered through cold water until hardened. This wax, which served as a mold, was briefly placed in the sun in order to become pliable. Once it was given a form or design, *sprues,* or tubes, were attached to it. While heated metal was being poured into one side, gas and liquids escaped from the other. (Instead of wax, the Tuareg and Hausa used crucibles to obtain the same effect.) Other groups poured heated metal into preset molds and then hammered intricate designs into the finished product. Regardless of how it was created, once the metal jewelry cooled, it was usually given a final coating of wax or oil.

The most intricate and often the heaviest jewelry was cast as a sign of prestige for ruling chiefs or kings. These heavier pieces, which might weigh several pounds,

were also believed to be imbued with ritual power that protected the wearer. Heavy metal collars and necklaces, as well as ankle and arm bracelets, such as those made by the Fang, often required the assistance of the blacksmith since these items were made for permanent wear. Over the centuries metal crafting evolved to make these forms of jewelry hollow to provide more flexibility for the wearer.

Cultural motifs were engraved in most metalwork and consisted of ancestral figures, images of fish, animals, or birds that signified ritual meaning for both the wearers and their peers. The Mum used the image of a spider, for example, to symbolize attainment of inner wisdom. Upon entering adult society, Senufo initiates, of the Ivory Coast region, wore traditional "rings of silence," which were cast in the form of a buffalo head.

In Africa the type of metal chosen for jewelry was especially significant. The belief, for instance, that silver was "pure and blessed" made it the primary choice among the Tuareg and other Islamic groups of the SAHEL. In contrast, brass was preferred by the Baule, who patterned their jewelry by laying decorated strips of wax on a charcoal core. They then poured heated metal on top of it.

Trade imports and the presence of gold in Nubia accounted for the staggering array of jewelry and ritual objects recovered from the ancient kingdoms of EGYPT and KUSH. The Kushites, like their Egyptian neighbors, became experts at the forge, particularly after moving their kingdom to MEROË around 590 BCE. This may account for the high levels of craftsmanship and ornately designed jewelry found throughout the NILE VALLEY region. One of the oldest items that has been recovered is a diadem, a type of crown or headband, made during Egypt's Fourth Dynasty (c. 2575–2465 BCE). Decorated with an array of symbols, including PAPYRUS flowers and ibis, it may have belonged to a reigning queen or other high-ranking person.

In contrast, much of the jewelry of ETHIOPIA denoted Christian themes, including many variations of interlaced design. Like other regions, Ethiopians used the lost-wax process to create AMULETS as well as hand, neck, and processional crosses of brass, iron, silver, and copper. Some crosses were also covered in BEADS or precious stones.

Jos Plateau Centrally located Nigerian highland known for its association with the ancient NOK CULTURE. Measuring almost 3,000 square miles (7,800 sq km), the Jos Plateau has a tropical CLIMATE and is the origin of several rivers that feed the larger NIGER RIVER, Gongola River, and

BENUE RIVER. Parts of the plateau were once a vast forest but have since been turned into grasslands through human intervention.

Although other peoples such as the Biram, Numan, YORUBA, and IGBO have occupied the area, the Jos Plateau is historically known as being the dwelling site of the Nok people. From circa 900 BCE to circa 200 CE, the Nok inhabited the region and produced bronze castings, intricate terra-cotta POTTERY, and tools made out of iron and stone.

Juba I (r. c. 45 BCE) *Ancient king of northern African kingdom of Numidia*

The independent Berber kingdom of NUMIDIA, with its roots in the fourth century BCE, eventually extended from the eastern region of present-day ALGERIA to MAURITANIA. Populated by a mix of nomadic mountain pastoralists and coastal farmers, it became a frequent battleground as the Roman Empire attempted to secure its hold on North Africa.

Juba I was a descendent of a family dynasty that traced its roots to MASSINISSA (d. 148 BCE), who first took power in the neighboring region of CARTHAGE about 206 BCE. According to several legends, Juba, as a child, was publicly humiliated by Julius CAESAR (c. 100–44 BCE), an event that served as a catalyst for his lifelong opposition to Caesar.

During Rome's First Triumvirate, in which power was shared by Pompey, Crassus, and Caesar, Numidia was placed under the jurisdiction of Pompey, and Numidia's king, Juba I, became his ally. When Caesar defeated Pompey in 60 BCE, Juba seized the opportunity to resist the domination of Caesar. By 46 BCE, however, Juba was defeated by Caesar, and Juba's son, Juba II, was taken to ROME. Caesar then extended direct Roman rule over much of what had been the semi-independent kingdom of Numidia. Numerous forts and frontier zones, known as *limes*, were used by the Romans to systematically control both the former kingdom and the surrounding area. As a province of the Roman Empire, Numidia supplied grains and olive oil through enslaved LABOR.

Judaism RELIGION and culture that encompasses the laws, customs, and practices of the Jewish people. The history of the introduction of Judaism to ancient Africa is not altogether clear. The oldest of the world's three major monotheistic religions (CHRISTIANITY and Islam are the others), Judaism arose in the Middle East, in the land of the modern-day state of Israel. In the view of the ancient

Israelites, God (*Yahweh* in Hebrew) rewarded his people with bountiful harvests. But, it was believed, Yahweh also punished wrongdoers with misfortune. According to the Jewish scriptures, the Israelites were descended from a single ancestor, Jacob, whose 12 sons became the progenitors of 12 separate but related Jewish tribes.

During a time of famine, about 1600 BCE, a handful of the tribes migrated to EGYPT, where they were eventually forced into slavery. Later the prophet Moses led them out of Egypt and into the so-called Promised Land. Following their conquest of the land of Canaan in Palestine, the early Israelites began to assert an influence over Egyptian culture. Under the leadership of King Saul in 1020 BCE, and later under King David, the Israelites were able to capture Jerusalem and establish a powerful kingdom. In 586 BCE, however, the Jewish people were conquered and exiled to Babylonia, where early Judaism started to take on some of the characteristics of modern Judaism. After the Persian conquest in 539 BCE, the Israelites were allowed to return to their homeland. Over the next 500 years Judaism was influenced by Greek, and later Roman, culture as these western empires conquered parts of the Middle East.

The basic doctrine of early Judaism centered on the belief that God created the universe and is its sole ruler. God's word and commandments were revealed to his people in the writings known as the Torah, the teachings of which had been revealed to the prophet Moses on Mt. Sinai when the early Semites migrated back from Egypt. The Jewish people believed that a covenant, or *berith*, existed between them and God that stemmed from a promise God made to their ancestors at Sinai. According to that covenant, if the Jewish people acknowledged God as their sole leader and obeyed his laws, he would make them his chosen people and watch over them. God also promised to send his Messiah to offer redemption and restore Jews to the Holy Land. Eventually, the concept of Messianic redemption led to the belief that individuals could hasten the Messiah's arrival by strictly adhering to God's commandments.

The first evidence of Judaism's spread toward Africa occurred in the fourth century BCE when it was established as a valid religion at ALEXANDRIA, the new Ptolemaic capital of Greek Egypt. An important Mediterranean trade center, Alexandria was influenced by all aspects of Greek society, and contact with other Greek trading centers in Egypt facilitated the spread of Judaism to the African coast.

However, the founding of present-day ETHIOPIA contends that Queen MAKEDA (the queen of Sheba), ruler of the kingdom of AKSUM, gave birth to a son, Menelik, who was fathered by King Solomon of Israel. MENELIK I interned with his father in Israel and then returned to Aksum with approximately 100 children borne by Israel's elite. The young Israelites are reported to have brought

with them the ARK OF THE COVENANT, which was pur-portedly kept at the church of St. Mary's of Zion in the city of Aksum.

Prior to this the PHOENICIANS established port towns along the African coastline as they joined the Greeks in de-veloping Mediterranean trade. Historical evidence indi-cates the Phoenicians originally may have come from Palestine, the land occupied by the Israelites, thus linking their ancestors to the Jews. Some of the larger Phoenician settlements were established in present-day TUNISIA, a fer-tile agricultural area inhabited by the Berber people. The BERBERS provided food for the Phoenicians in exchange for Mediterranean products, and, in the process of establishing this trade relationship, many of the Berbers integrated as-pects of the Phoenician's Semitic culture into their own.

By 65 BCE the Hebrew kingdom of Judea had come under control of the Roman Empire. Around the same time, the HORN OF AFRICA and southern Arabia emerged as important sources of frankincense and myrrh, aromatic resins that were important for Roman funeral pyres and perfumes. As Roman trade increased, Judaism spread through these coastal communities. In 70 CE the Romans destroyed Judea, forcing Jews to migrate to new lands. Many settled in Egypt and North Africa, allowing Judaism to penetrate as far inland as the Sahara Oasis. It was dur-ing this period that Judaism fully developed into its mod-ern rabbinic form, with emphasis on the role of study, prayer, and religious observance in personal salvation.

Jugurtha (160–104 BCE) *Militant king of Numidia; grandson of Massinissa (c. 238–148 BCE)*

King Jugurtha struggled not only to gain the throne but also to free NUMIDIA from the Roman domination under which MASINISSA had placed it. After the death of Masinissa's successor, King Micipsa, in 118 BCE, Numidia was divided among his heirs, who included Micipsa's two sons and Jugurtha. Eager to gain even more power, Jugurtha soon managed to have one of his rivals, Hiempsal, killed. The other, Adherbal, was forced to take refuge in ROME. Swayed by a personal appearance by Jugurtha, the Romans divided Numidia between the remaining two heirs.

Mistakenly believing that he had Rome's full support, in 112 BCE Jugurtha attacked Adherbal, and, in the pro-cess of achieving victory, massacred a number of Roman citizens. Incensed, the Roman Senate declared war on Jugurtha. Jugurtha, however, proved himself an able mili-tary leader, using Numidia's desert terrain to avoid major pitched battles and, in general, humiliating the Roman forces. A peace settlement in 111 BCE that greatly favored Jugurtha failed to satisfy the Numidian leader, and war was resumed quickly. Once again, however, Jugurtha managed to defeat the Romans, effectively ending their control of Numidia by 110 BCE.

Ultimately Rome could no longer bear Jugurtha's re-bellion, and, under Gaius Marius, a new Roman offensive was begun in 107 BCE. Initially Jugurtha was able to re-peat his early successes against the Romans, but Marius eventually won the support of King Bocchus I of MAURITA-NIA, Jugurtha's father-in-law, whose betrayal led to Ju-gurtha's capture in 105 BCE. Taken to Rome, the Numidian king was subjected to a series of public humiliations and died there in 104 BCE.

K

ka　In ancient Egyptian religion, the spiritual double of every person and the source of his or her life powers. Ancient Egyptian beliefs held that the spirit, or soul, of a person consisted of three parts: the *ka,* the BA, and the ankh. Egyptians believed that at each person's birth, the god Khnum created that person's *ka.* Upon death, a person was said to have "gone to his or her *ka."* The *ka* needed a body in order to survive, however. As a result, if the deceased was not mummified or if the deceased's mummy decomposed, the spiritual double was thought to die and the deceased lost the chance for eternal life. Egyptians saw the *ka* as the origin and giver of all that is desirable, especially eternal life. The *ka* also was believed to act as a protecting spirit, guarding the deceased against dangers found in the AFTERLIFE.

According to tradition, most mortals had a single *ka.* Kings, however, were thought to have multiple *kas.* The great pharaoh RAMESSES II (r. c. 1304–1237 BCE), for example, was reputed to believe that he had more than 20 *kas.* Gods also had *kas,* and Egyptians worshiped the deities' *kas* in order to receive favors. OSIRIS, for example, was known as the *ka* of the PYRAMIDS. In HIEROGLYPHICS, *ka* was represented as two raised arms bent upward at the elbow.

Kadesh　Ancient Syrian city on the Orontes River and, for many years, a major crossroads of the trade routes in western Syria. During the early 14th century BCE Kadesh was the scene of conflict between EGYPT and one of its main Asian rivals, the HITTITES. During the reign of the Egyptian pharaoh SETI I (r. c. 1318–c. 1304 BCE), Kadesh was captured and brought under Egyptian rule. The Hittites, however, soon advanced on Kadesh and gained control of the city, which they considered to be sacred. For the remainder of Seti's reign, Kadesh remained in the hands of the Hittites, whose home region was located in a region of what is today the country of Turkey.

Around 1300 BCE, just four years after succeeding to his father's throne, the young pharaoh RAMESSES II set out to reconquer Kadesh. However, misinformation from captured spies led the pharaoh into a trap. Ramesses II and a force of 20,000 Egyptian soldiers soon found themselves surrounded by a Hittite army. The rest of the Egyptian army arrived, however, and drove off the Hittites. Ramesses II claimed victory, even putting a victory inscription on the Temple of KARNAK. Historians, however, believe the battle actually ended in a truce.

Kalahari Desert　Arid desert region that stretches over the central plains of southern Africa, covering parts of BOTSWANA, NAMIBIA, and SOUTH AFRICA. The Kalahari region is mostly sandy and lacks surface water, but it is heavily vegetated with brush and low grasslands. The occasional rainfall creates viable grazing areas and collects in basins that support an abundance of wildlife, including wildebeest, ELEPHANTS, GIRAFFES, gnus, ZEBRAS, and springbok. For hundreds of years prior to the great BANTU EXPANSION (c. 1000 BCE–c. 500 CE), the inhospitable Kalahari was inhabited by the !KUNG San, a group of HUNTER-GATHERERS who called themselves the Zhun/twasi, or "the real people."

As the Bantu speakers migrated, the harsh environment of the Kalahari prevented easy passage through the region, and the !Kung therefore remained the sole inhabitants of its interior. They were masters of the desert environment, developing a thorough knowledge of the local

flora and fauna. Though they occasionally killed large mammals for their meat and hides, more often they survived on edible roots and berries, baobab fruits, and *mongongo* nuts. Their diet was supplemented with meat from birds, including FLAMINGOS and geese, and reptiles, including lizards and CROCODILES.

The Kalahari, which covers nearly 360,000 square miles (232,400 sq km), contains the Okavango Delta to the north and the Makgadikgadi SALT pans to the northwest.

kandake Title of supreme royalty held by the ruling queens of ancient KUSH. During its Meroitic Period, Kush had a number of queens who held the title of *kandake,* meaning "queen mother." Reigning by themselves or in conjunction with their husbands or sons, the *kandakes* ruled from royal courts at Napata or MEROË or from the temples established at Musawarat es-Safra. Shankiakhete (r. c. 170–c. 160 BCE) was one of the earliest known *kandakes.* She was followed by Amanishakhete (r. c. 45 BCE) and Amanirenas (r. c. 24 BCE). In addition to being rulers and warriors, *kandakes* often served as priestesses for the Egyptian god AMUN, as well as for the goddesses ISIS and Nut. In addition, the *kandakes* were highly influential in both local and national matters, and their duties even included presiding over coronation ceremonies.

Reliefs and sculptures give dramatic portrayals of the *kandakes*' role as warriors and military leaders. During Greco-Roman times, one of the most celebrated kandakes was Amanirenas. About 24 BCE, she led her soldiers against Kush's Roman overlords, engaging the enemy at ASWAN, 70 miles (112 km) north of Kush's border with EGYPT. There she defeated three units of the Roman army. In a symbolic gesture, she decapitated a statue of Augustus Caesar and buried the head of the statue in the doorway of a public building. After this act of defiance, Amanirenas supposedly led her troops further into the interior of Kush before finally being captured at Primis (Qasr/Brim).

Karnak, Temple of Modern Arabic name for the site of an elaborate series of temples, the largest and most spectacular of which was dedicated to the god AMUN. Karnak is located on the east bank of the NILE RIVER, near the ancient city of Thebes. Covering more than 200 acres (80 ha), the religious complex includes not only temples and chapels, but also obelisks, columns, and statues. Construction of the site was undertaken by a succession of pharaohs and went on for thousands of years. One of the many impressive features of the site's ARCHITECTURE is a series of monumental gateways called *pylons.*

Built during the MIDDLE KINGDOM (c. 1991–c. 1668 BCE), Karnak was originally the site of a modest shrine to Amun. But the rulers of the NEW KINGDOM (c. 1570–1085 BCE) expanded the scope of the temple complex by enlarging it into three sections. The pharaohs who contributed to its basic development during the Eighteenth Dynasty were THUTMOSE I, Queen Hatshepsut, and THUTMOSE III. Their work was continued on an even grander scale by the Nineteenth Dynasty pharaohs SETI I and RAMESSES II.

The Temple at Karnak was at the heart of Egyptian RELIGION, and the ancient Egyptians regarded it as a national shrine, calling it *ipet-isut,* of "the most revered of places." They were dazzled by its magnificent architectural monuments and by the great wealth and power of the priests dedicated to the service of the supreme god Amun. The faithful made Karnak the focus of their devotion to the god. The Opet festival, a yearly celebration held in honor of Amun, was one of the most important religious events to take place there. During the festival, the image of Amun was carried in solemn procession from his great temple to the banks of the Nile. Amid much public rejoicing, the image was then transported on a barge to the temple at LUXOR, where it remained for several weeks before being returned to Karnak with similar solemnity.

Kash (Kasu) Name used for the ancient kingdom of KUSH and its inhabitants. Kash was the Egyptian name for Kush during the MIDDLE KINGDOM (c. 2040–c. 1820 BCE), when Kush was considered a province of EGYPT. *Kasu* was the term generally used by King Ezana of AKSUM, who sent armies to destroy the Kushites about 350 CE. It is widely assumed that the major battle of Ezana's invasion took place at the capital city of MEROË at the junction of the Atbara and Nile rivers.

Further reading: Derek A. Welsby, *The Kingdom of Kush: The Napatan and Meroitic Empires* (Princeton, N.J.: Markus Wiener, 1998).

Kashta (r. c. 806–750 BCE) *Early king of Napata in the kingdom of Kush*

For hundreds of years KUSH had been dominated by EGYPT, but by the Twenty-first Dynasty (c. 1070–945 BCE),

Egyptian power had begun to decline. As time passed the Kush kingdom's trading links propelled it to economic prominence, and the area began to assert its autonomy. Ultimately an independent kingdom was established at Napata, and under King Kashta's guidance, plans were made to invade Egypt.

Just how successful Kashta's invasion was is unclear, but it was not long before Kashta's sons, PIANKHY (r. c. 750–c. 716 BCE) and Shabako (r. c. 716–c. 701 BCE), completed Kush's conquest of Egypt. After this, a succession of Napatan kings ruled in Egypt as the Twenty-fifth Dynasty, holding power over the country as a whole for 50 years and over UPPER EGYPT for more than 100 years. This period represented the height of power for Kushite kings, who ruled a kingdom that extended from present-day KHARTOUM to the MEDITERRANEAN SEA. Beginning about 663 BCE, ASSYRIAN invasions forced a Kushite retreat, but it is clear that their occupation of the area left a mark on customs, RELIGION, and ARCHITECTURE in both lands.

Kei River River emptying into the Indian Ocean on the Eastern Cape of SOUTH AFRICA; also known as the Great Kei River. Although not a particularly large river, the Kei was important geographically to the region's IRON AGE residents. Since the weather north of the Kei River was far more suitable for agriculture than the climate to the south, the river formed a kind of southern border, separating one region from another. As a result the area north of the Kei, which was marked by summer rainfall, ultimately became the home of many SAN- and Bantu-speaking farmers and CATTLE herders.

Kemet Ancient Egyptian word for EGYPT. Ancient Egyptians called their land Kemet, or Kmt, which meant "black land," after the fertile, silt-layered soil left behind during the annual flooding of the NILE RIVER. Black land was distinguished from the surrounding red land (*DESHRET*), so-called because of the reddish-yellow color of the sands. By the time of the ancient Greeks, however, this meaning had been transformed, since, according to some authorities, the Greeks referred to Kemet as the "Land of the Blacks."

Kemet in 2000 BCE covered nearly 400,000 square miles (1,000,000 sq km). Districts were divided into *nomes,* and the entire region was divided into two halves: UPPER EGYPT and LOWER EGYPT. Upper Egypt, to the south, was also known as the NILE VALLEY, and it was made up of a narrow valley on either side of the NILE RIVER. Lower Egypt, located to the north and also known as the NILE DELTA, was the place where the Nile River split before reaching the MEDITERRANEAN SEA.

A vulture symbol was traditionally used to represent Upper Egypt; a COBRA symbol signified Lower Egypt. The

two areas were quite different; they were separate kingdoms before the reign of MENES about 3100 BCE.

Kenya East African country approximately 224,900 square miles (582,491 sq km) in size located along the Indian Ocean coast of East Africa and sharing borders with ETHIOPIA, the Republic of the SUDAN, UGANDA, TANZANIA, and SOMALIA.

Archaeologists have found evidence that supports the claim that Kenya and its neighbors along the RIFT VALLEY supported early hominids. Archaeological finds from the OLDUVAI GORGE on the present-day Kenya-Tanzania border show that hominids lived in the region more than 2 million years ago. Many of these discoveries were made by Louis Leakey and his family, who have served Kenya as archaeologists and museum curators.

Cushitic-speaking groups migrated into the area from 2000 to 1000 BCE and between 500 BCE and 500 CE, Bantu-speaking people such as the KIKUYU migrated into the area from West Africa during the BANTU EXPANSION. Also, peoples speaking NILOTIC LANGUAGES, such as the Luo and MAASAI, came to the area from the upper NILE VALLEY.

Kenya, Mount At an elevation of 17,058 feet (5,199 m), the highest mountain in KENYA and the second highest in Africa after Mount KILIMANJARO, at 19,336 feet (5,895 m). The mountain is naturally divided into three zones: the peak, which is a volcanic plug and is covered with glaciers and snow; the alpine zone, with its distinctive rain forest VEGETATION; and the gentle lower slopes of mountain forests and bamboo jungle. Mount Kenya's vertical CLIMATE (the higher the elevation, the lower the temperature) leads to high amounts of rainfall and mild temperatures on the lower slopes, making lush vegetation possible. Going farther up the mountain, there is less moisture in the air, and Tussock grass and heath are found in the alpine zone up to the snowline.

Viewing the mountain from a distance, the ancient KIKUYU and Kamba thought that the peak resembled a black ostrich and thus named the mountain Kiinyaa, meaning "the area of the ostrich" in the Kamba language. European explorers used the same name to identify the mountain and the countryside where it was located: Kenya.

Kerma Chiefdom or kingdom that flourished in Upper Nubia from c. 2400–c. 1500 BCE; ultimately it became the capital of the kingdom of KUSH. Kerma, which traced its origins to people possibly related to the NUBIAN C-

GROUP, was marked from the first by a highly organized chiefdom or monarchy. Its early history, extending from about 2400 to 2000 BCE, saw the rise of the town of Kerma as a religious and governmental center. Protected by a sophisticated network of walls and ditches, it held not only a large mud-brick royal hut but also a massive religious structure that grew steadily over time.

From 2000 to 1580 BCE Kerma was in virtually constant conflict with its Egyptian neighbors, who called it *Kush*. This conflict, however, seems not to have lessened Kerma's considerable trade with EGYPT. An Egyptian trading post, built at Kerma during the early 1900s BCE, for example, showed signs of both Egyptian and Kushite artisans producing glazed POTTERY, BEADS and other JEWELRY, metalwork, and even cabinetry. For the most part these goods showed a basic functional Kushite style with an overlay of Egyptian influences.

As time passed, however, Kerma's aristocracy seems to have begun to adopt Egyptian styles, language, and customs. Eventually, Kerma's traditional ART and RELIGION also began to succumb to this Egyptianization. This process continued even during the disintegration of Egypt's MIDDLE KINGDOM (c. 2040–c. 1840 BCE) in the 18th century BCE. During this period the Kush kingdom centered in Kerma assumed control of the territories left behind by the retreating Egyptians. (Often, however, they left Egyptians in charge of the territories, allowing the Egyptians to rule on their behalf.) As it gained in power, however, Kerma became increasingly Egyptianized, with its royals and nobles adopting Egyptian-based religion, language, and customs on an even more widespread scale than before.

By the 16th century BCE Egypt began to emerge from the weakness of its Second Intermediate Period. At this time, c. 1660 to 1550 BCE, Egypt became strong enough to launch a number of successful military offensives against its Kushite neighbors, and it was not long before Kerma itself fell to Egyptian invaders.

Khafre's Pyramid Second-largest pyramid complex at Giza. Khafre, also known as Rakhaef or Chephren, was the son of the pharaoh KHUFU. Khafre ruled EGYPT from c. 2520 to 2494 BCE and is most famous for building his pyramid complex, which includes the GREAT SPHINX, a mortuary temple, and a valley temple. Khafre's pyramid is smaller than his father's, but since it is built on higher ground and at a steeper angle, it appears taller. Khafre's pyramid stands 450 feet (137 m) high with a base of 704 feet (215 m). Its overall volume is estimated at 58.1 million cubic feet (1.6 million cubic m). The pyramid is also distinctive in that its topmost layer of smooth stones is the only remaining casing of stones on a Giza pyramid.

More than just a pyramid builder, Khafre also was renowned for the statues he ordered created. These works, which included the Great Sphinx, earned him the reputation as the greatest statue-maker of the Pyramid Age. As many as 58 statues have been found in Khafre's pyramid temples, including four gigantic sphinxes, each measuring more than 26 feet (8 m) long, 23 life-size statues in his valley temple, 19 large statues of himself in and around his mortuary temple, and another 10 colossal statues of himself in the sphinx temple.

See also: PYRAMIDS (Vol. I).

Kharga Oasis Largest oasis parallel to the NILE RIVER in EGYPT. Approximately 138 miles (222 km) long and 16 miles (25.7 km) wide, Kharga is the largest and most advanced of the five oases near CAIRO. The Bagawat Tombs, consisting of 300 painted Christian tombs dating back to the fifth and sixth centuries, are located in the Kharga oasis. The tombs are found in the Temple of Ibis, a sandstone temple supposedly built by the Persian emperor DARIUS in honor of the god AMUN. The al-Nadura Temple, which dates to Roman times, also is located in the oasis. At one time, Kharga was the only stop on the Forty-Day Road, the slave-trade route between North Africa and the tropical south.

Further reading: Gertrude Caton-Thompson, *Kharga Oasis in Prehistory* (London: University of London, 1952).

Khartoum Capital of modern-day Republic of the SUDAN and site of ancient Nubian communities. Archaeological excavations conducted near Khartoum offer strong evidence that the cultivation of crops and the domestication of animals occurred at an early date. In fact, GOATS, sheep, and CATTLE probably have been present in the area since at least the fifth millennium BCE.

Several different types of pottery have been recovered from the region around Khartoum. One of these, probably dating back 6,000 years or more, is distinguished by a basket-weave design made by catfish spines. Another design contains dotted, wavy lines virtually identical to POTTERY found in the Tibetsi region of the Sahara. The similarity of these two potteries has led some archaeologists to suggest that, as the once-fertile Sahara began to dry up, people may have begun migrating to the north and east. Eventually, according to the archaeologists, these people may have colonized EGYPT and, ultimately, the area around Khartoum.

The discovery near Khartoum of pottery dating back earlier than the fifth millennium BCE is another indication of the level of sophistication reached by the hunting and FISHING communities that inhabited the region.

Khasekhem (Khasekhemwy, Khasekemui) (r. c. 2725–2705 BCE) *Last pharaoh of ancient Egypt's Second Dynasty*

Little is known about ancient Egypt's Early Dynastic Period (also called the Archaic Period), which lasted from about 3050 to 2705 BCE. It appears, however, that despite the refinement of Egyptian culture that took place during the First Dynasty, the end of the era was marked by civil strife. The main cause of this apparently was conflict between two religious groups, the cult of HORUS, which dominated the south, and the cult of SETH, which was the main RELIGION of the northern NILE DELTA region.

Struggles between adherents of Horus and Seth continued into the Second Dynasty, leading to a decline in the pharaohs' authority. This seems to have led to rival claims to the throne, each claimant allied with one of the DEITIES. Various rulers made attempts to resolve the conflict, most notably Hetepsekhemwy (also known as Raneb). His name, which means "peaceful in respect of the two powers," is probably a reference to his mediation of the strife.

Hetepsekhemwy, however, was unable to resolve the conflict permanently. The situation worsened, possibly even leading to a civil war between UPPER EGYPT and LOWER EGYPT. Although few details are known, peace seems to have been restored, at least temporarily, by Khasekhem, who reigned from approximately 2725 to 2705 BCE. His royal name translates as "the two lords are at peace in him," suggesting both a meeting of the gods, Horus and Seth, and a temporary resolution of the conflicts disrupting the kingdom. Khasekhem's tomb, the largest in ABYDOS, was discovered in the late 19th century.

Khoisan languages
Least widespread of the four major families of African languages. The Khoisan languages—including Nama and !KUNG—have nearly become extinct today and are kept alive primarily by the Khoikhoi and SAN peoples of present-day SOUTH AFRICA, whose origins apparently lie in prehistoric times.

Like many other African tongues, Khoisan languages use differences in tonality to distinguish meanings. Vocal inflection is employed, especially in the Khoikhoi and San languages, to indicate case, number, and gender. The unique feature of Khoisan languages, however, is the use of special consonants known as *clicks*. (Khoisan is also called the Click family of languages.) English speakers use similar click sounds in a very limited way: *tsk-tsk,* for example, or the *chk-chk* noises used to signal HORSES. In

Khoisan languages, however, these click sounds function not as words themselves, but only as parts of words.

Khoisan languages employ a wide variety of click sounds, all produced through a sucking action of the tongue. By altering the positioning of the tongue and the way one releases air into the mouth, a Khoisan speaker can create a great number of different click sounds. Khoisan speakers produce various clicks by placing the tongue against the teeth, the palate, the alveolus (the inner surface of the gums of the upper front teeth), the inside of the cheek, or the lips. Curling the tip of the tongue up and back so that the underside of the tongue touches the palate produces yet another kind of click.

San languages feature six different types of clicks—though no single San language employs all of them. The Khoikhoi employ four kinds: dental (with the tongue against the teeth), palatal (against the palate), lateral (against the inside of the cheek), and retroflex (with the underside of the tongue against the palate). Over time, the use of some Khoisan click sounds eventually spread to nearby BANTU LANGUAGES, including Zulu, Sotho, and Xhosa.

Maho, *The Few People, Many Tongues: Languages of Namibia* (Gamsberg, Namibia: Macmillan, 1998); Mathias Schladt, ed., *Identity and Conceptualization among the Khoisan* (Cologne, Germany: R. Köppe, 1998).

Khormusan
Early STONE AGE people from prehistoric Nubia. Fishers and HUNTER-GATHERERS, the Khormusan are believed to have settled in Lower Nubia's NILE VALLEY about 50,000 years ago, coming originally from the then-fertile area of the SAHARA DESERT. Excavations at Khor Musa, near Wadi Halfa, and other sites have revealed examples of Khormusan stone tools as well as remnants of the substantial settlements in which the Khormusan lived.

Khufu (Cheops) (r. c. 2550–c. 2523 BCE) *Pharaoh of ancient Egypt who had the Great Pyramid of Giza built*

Assuming the throne in about 2550 BCE, Khufu, also known as Cheops, was the second king of the Egyptian Fourth Dynasty, ruling ancient EGYPT for approximately 24 years. His most notable accomplishment was the construction of the GREAT PYRAMID of Giza, one of the Seven Wonders of the Ancient World.

The construction of the Great Pyramid provides important insights into Khufu's rule, for he transformed the project into a great socializing force for the nation. By using workers who would otherwise have been idle during

the annual flooding of the NILE RIVER, Khufu provided his subjects with both employment and a unifying national goal. Beyond this, the pyramid's construction required major achievements in SCIENCE, ASTRONOMY, mathematics, and ART, all of which were direct results of Khufu's ability to inspire, mobilize, and organize his people.

Khufu's ability to lead, however, was not the result of any liberality or generosity on his part. Indeed, in contrast to his father, the benevolent King Sneferu, Khufu was reputed to be a cruel despot. In spite of this, however, Khufu was renowned throughout Egyptian history, and even as late as the Twenty-sixth Dynasty he was worshiped as a god.

A tiny statuette depicting Khufu, discovered in the temple of OSIRIS at ABYDOS, has become famous. In 1954 a funeral ship belonging to Khufu was also uncovered in a pit near the Great Pyramid. It is currently displayed in the Boat Museum on the site of the original pit.

Kikuyu Language and people of East Africa living in present-day KENYA. Although no exact dating of their arrival in the area is possible, the Kikuyu have long been a diverse mix of tribal peoples who trace their ancestry to the Thagicu, Igembe, Tigania, Gumba, Athi, and MAASAI people. According to Kikuyu oral history, the Kikuyu god (Ngai) commanded Gikuyu, the forefather of the Kikuyu, to build his home near Mount KENYA. The area was full of fig trees, so he named it Mukurue wa Gathanga (Tree of the Building Site). Ngai sent Gikuyu a wife, Mumbi. Gikuyu and Mumbi had nine daughters. Along with one other child, their daughters became the progenitors of the 10 ancestral clans of the Kikuyu.

The merging of multiple cultures produced an eclectic mix of Kikuyu rituals over the centuries. From the Thagicu people they adopted ceremonial dances and INITIATION RITES, and initiation ceremonies became a pillar in Kikuyu life. Young men and women were fully integrated into village life after CIRCUMCISION and clitoridectomy ceremonies. Males became warriors at this time, and female social responsibilities increased beyond the village proper.

Kilimanjaro, Mount At an elevation of 19,336 ft. (5,895 m), the highest mountain in Africa and the highest free-standing mountain in the world. Located in present-day TANZANIA, near its border with KENYA, just south of the equator, Kilimanjaro lies at the southern end of the RIFT VALLEY. It is the largest of an east-west belt of about 20 volcanoes. Kilimanjaro is a triple volcano, having three volcanic cones. The surrounding countryside testifies to the forces of nature and the movement of tectonic plates that created Kilimanjaro and other volcanoes in the region as well as the Rift Valley.

The mountain is divided into three natural zones: the peak, which is a volcanic plug and is covered in glaciers and snow, an alpine zone, with distinctive rain forest VEGETATION; and the gentle lower slopes, which are covered with mountain forests and bamboo jungle. Mount Kilimanjaro receives plentiful rainfall.

In Swahili the name of the mountain is Kilima Njaro, meaning "shining mountain." The MAASAI call it Kilima Dscharo, meaning "white mountain." The majority of the people living around the mountain are Chagga, a Bantu-speaking group.

kola nuts Seeds rich in caffeine, chewed as a stimulant and used in various ceremonies in traditional African cultures. The kola, or cola, tree, native to West Africa, is related to the cacao tree, from which chocolate is made. Its seeds, called *guru* or *goora* nuts in West Africa, are about 1.5 inches (3.8 cm) long and are traditionally chewed as a stimulant. Kola nuts contain large amounts of caffeine as well as smaller amounts of other stimulants and may be mildly addictive. Like gum, they are chewed to quell thirst and refresh the breath. The nutritional value of the kola nut is negligible. Beverages made from kola nuts are prized by Muslims, whom the Quran does not permit to drink alcohol.

In western Africa the kola nut is less important as a crop with value in the ECONOMY than as a tool of communication and ritual. As a stimulant it serves the culturally important function of a social lubricant. Kola nuts have long been a core element in religious and magical ceremonies, used as offerings to DEITIES, to make love potions, and to foretell the future. The nuts also are used as symbolic currencies to pay off debts of a ritual nature.

From September to June the nuts are harvested by climbers. The seeds are extracted from their star-shaped pods and processed by sun-drying or piled into heaps for "sweating."

!Kung Ancient people inhabiting isolated areas of southern Africa for thousands of years; known among themselves as the Zhun/twas, or "the real people." Long subsisting as HUNTER-GATHERERS, the !Kung are believed to have lived in southern Africa for thousands of years before the BANTU EXPANSION began about 2,000 years ago. Over the centuries exposure to the easier lifestyle of their Bantu-speaking neighbors has led many !Kung to modify or even abandon their traditional way of life, although a few !Kung continue their ancient lifestyle, despite its difficulties.

For thousands of years the environment inhabited by the !Kung has been made up of harsh, semiarid areas in what is now BOTSWANA, ANGOLA, and NAMIBIA. Composed

of small hills and flat plains, even today the region's landscape is dominated by brush and grass. Trees and water have always been scarce. The area undergoes extreme temperatures ranging from below freezing in the winter to well over 100º F (38º C) in the summer.

For millennia the !Kung have lived in villages with populations ranging from approximately 10 to 30 people, and the ways of those currently following the !Kung's traditional lifestyle provide a good indication of how these people have lived since prehistoric times. The women spend two to three days each week foraging for FOOD in the desert. Given the nature of the land, this can be an arduous task, although it ultimately yields an apparently adequate supply of fruits, berries, nuts, and roots. !Kung men are responsible for hunting. Game is scarce, however, and the hunters often have to travel long distances before they can find and kill the wildebeest and other animals that are their prey. The hunt remains a communal activity, with the !Kung sharing whatever meat is obtained. Weapons include poison-tipped spears and arrows, which are made and maintained by the hunters themselves.

Traditional !Kung villages consist of an array of small grass huts arranged in a circle. The !Kung consider the middle of the circle to be common space, and it is in this central area that virtually all !Kung life—except sleeping—goes on. The !Kung play and cook here, as well as make the decisions upon which the village's survival depends. Unlike many other groups, the !Kung function without a chief or formal leader, governing, instead, by consensus. Agreement is reached by long discussions in which everyone is given a chance to voice his or her opinion.

The !Kung believe that the spirit world is active in daily events ranging from sickness and death to the presence of water or food. Ills and misfortunes, they believe, are caused by invisible arrows shot at the unfortunate ones by spirits. The !Kung maintain, however, that they can prevent, or even reverse, the action of these arrows through various activities. The most notable of these is the healing, or trance, DANCE. In it, dancers circle a fire until they reach a trance. There, it is thought, they come into contact with *n/um,* a powerful spiritual force that allows everyone gathered around the fire to be healed.

Lee, Irven DeVore, et al., eds. *Kalahari Hunter-Gatherers: Studies of the !Kung San and Their Neighbors* (Cambridge, Mass.: Harvard University Press, 1976); Marjorie Shostak, *Nisa: The Life and Words of a !Kung Woman* (Cambridge, Mass.: Harvard University Press, 2000).

Kurru Part of the area known as Napata, capital of ancient KUSH, in what is now northern Republic of the SUDAN; renowned for the ancient burial grounds of the royalty of Kush (c. 900–c. 700 BCE). Kurru, also known as al-Kurru, was once the burial site of some of the great Kushite kings of the Twenty-fifth Dynasty. The Egyptian tradition of burying royalty beneath a pyramid was passed to the Kushites when they conquered EGYPT, and the first Kushite leaders to build pyramids did so at Kurru. The existence of the burial sites at Kurru is thought to be the first evidence of a Kushite state, though scholars have not confirmed that it is the only burial ground of the Kushites of the time.

Shabaka (also called Shabako or Sabacon), the founder of the Twenty-fifth Dynasty after EGYPT was conquered by the Kushites, and Shebitku (Sebichos), his successor, were both buried in PYRAMIDS at Kurru. A later pharaoh, Tunuatamun (also known as Tanutamon), who was defeated by the ASSYRIANS at MEMPHIS and Thebes, was also buried at Kurru.

Kurundi People who have long occupied the area now known as BURUNDI; also the name of the language they speak. The Kurundi language, a Bantu language, is in the Benue-Congo branch of NIGER-CONGO LANGUAGES.

The Kurundi people, also called Rundi or Kirundi, are made up of three Kurundi-speaking ethnic groups: the Twa, the HUTU, and the Tutsi. The Twa were probably the first Bantu-speaking people to come to the area. The Hutu made their living from AGRICULTURE, while the Tutsi mainly practiced PASTORALISM. The precise reasons for why and how these Bantu-speaking peoples began supplanting the native SAN people are not known. As a result the influx—and dominance—of Bantu-speaking peoples, which dates to the beginnings of the common era, has been attributed to everything from the Bantu speakers' skill at ironworking to their possible control of trade routes. It has even been associated with the Bantu speakers' successful cultivation of the newly imported banana.

Kush Ancient city and kingdom in Upper NUBIA, based between the first and second cataracts of the NILE RIVER. The term *Kush* was apparently first used by Egyptians during their Twelfth Dynasty to refer to the first Kushite kingdom established at the city of KERMA. The Egyptians also used the names *Kash, Kasu,* and *Khenet-hennferwere.* By the 18th century BCE the name *Ta-Seti* (Land of the Bow), was also used in recognition of the kingdom's famed archers known as LUNTIU-SETIU. Kush was actually a series of three major kingdoms that rose to prominence when left in isolation and declined when dominated by EGYPT.

Kerma Period (c. 2400–c. 1570 BCE) Situated between the Nile's third and fourth cataracts, Kerma was the earliest Kushite kingdom, and it went through several phases of development, beginning as an agricultural society that cultivated cereal grains (probably SORGHUM and MILLET).

As in much of the ancient world, these activities fostered Kerma's development and helped to establish a class structure of ruling elites, priests, craft workers, and laborers. Evidence also suggests that cultural practices in Kerma included sacrificial offerings and the use of burial tumuli, or grave mounds.

As time passed, trade relations elevated the Kush kingdom to an important position within the mercantile world of the RED SEA and the MEDITERRANEAN SEA. The kingdom's abundant resources included GOLD, semiprecious stones, livestock, EBONY woods, IVORY, COPPER, and quarried stones. Trade routes were apparently expanded, creating what some historians have labeled a "Nubian Corridor," which linked the NILE RIVER valley to both the Mediterranean and the southern regions of Africa. The Kushites accomplished this by laying a form of track, known as a *doilkos,* that allowed boats to be pulled on land.

Unfortunately for the kingdom of Kush, its resources and accessibility also provided strong incentives for Egypt to assert its trading interests in the border areas of UPPER EGYPT and Lower Nubia. Egypt repeatedly invaded and occupied Kushite territory, reducing it to the status of a province. Archaeologists and historians speculate that these periods saw a process of Egyptianization that was reflected in numerous Egyptian-made artifacts and religious icons.

During the fall of the MIDDLE KINGDOM and Egypt's subsequent evacuation of Lower Nubia, the Kushite kingdom absorbed the territory abandoned by the Egyptians. These lands included the towns of Buhen and Mirgrissa, which had once been held by the Egyptians and in which important trade relations were already in place. A second Kushite rise to prominence occurred when Egypt relinquished political control to the HYKSOS, during the beginning of the Second Intermediate Period (c. 1820–1570 BCE).

Only after the influence of the Hyksos came to an end was Egypt able to resume its domination of Nubia. At this time it even launched a number of military strikes against the Kush kingdom, ostensibly undertaken in retaliation for trade and military alliances that the Kushite rulers had formed with the Hyksos. Kushite soldiers, mostly MEDJAY of the Eastern Desert, reportedly fought on both sides of the war.

Continued assaults against the Kush kingdom culminated in the destruction of Kerma (c. 1550 BCE). With their kingdom annexed and transformed into an Egyptian province, the former inhabitants of the Kush kingdom dispersed to outlying regions, including Napata, and Kush entered a lengthy period of decline. It was not until the end of the Egyptian NEW KINGDOM (c. 1570–c. 1070 BCE) and the beginning of the Twenty-first Dynasty at Tanis (c. 1070–69) that Nubia regained independence and reestablished the Kush kingdom at Napata.

The Napatan Period (900–300 BCE) For more than 100 years, beginning around 900 BCE, the second Kushite kingdom grew in isolation. Although little is known of this transition between the Kerma and Napatan periods, the latter is generally considered to be a period of reconsolidation among the Kushite rulers. This reconsolidation, which took place in the wake of Egypt's internal wars and subsequent invasion by Libyan forces during the eighth century BCE, led to the emergence of a powerful Kushite family dynasty.

Historians speculate that, during the early Napatan period, at least seven generations of kings ruled Kush. Among the earliest of these was King Alara, whose son, King KASHTA (c. 806–750 BCE), was the first of this family dynasty to be documented fully in Egyptian and Kushite records and stelae, which are stone monuments with inscribed texts.

King Kashta was considered a notable leader, and he extended Kushite political control north through Lower Nubia and Upper Egypt. Kashta began his campaigns during a period in which Egypt was wrestling with political disruptions brought on by conflicts with independent nomes, or provinces, and Libyan chiefdoms. As a result he was able to achieve several important victories, which led Kush to reclaim Lower Nubia and to establish control over the outlying city of Thebes (or Waset, as it was sometimes called).

The battle for control of Kush's and Egypt's political structure was continued by Kashta's son PIANKHY (r. c. 750–716 BCE), who defeated an army of Libyans sometime between 750 and 730 BCE. Although Piankhy ruled from Napata, he exercised a strong measure of control over the Egyptian cities of Hermopolis and HIERAKONPOLIS, as well as over smaller nomes in the delta region. Under Piankhy, the Kushite kingdom eventually included a vast tract of territory that extended from its southern base at Napata to the northern NILE DELTA.

Under Piankhy's vigorous rule the Kushites engaged in numerous military expeditions and were prolific builders. Piankhy has been credited with introducing many architectural innovations and traditions at this time, including the development of Egyptian-styled PYRAMIDS for use as burial chambers.

Piankhy was also the first Kushite king to install his sister (in this case, AMENIRDIS I) as a priestess of AMUN. The tradition of creating women priesthoods was probably begun as a means of ensuring political loyalty to the king. It also represented a way to keep enormous wealth and property within the ruling family. In time, Amenirdis

even ruled from Thebes in place of King Piankhy. This, however, was an unusual situation for Kushite women, although they appear to have held other important positions. Royal installation ceremonies at Napata, for example, were generally conducted (or at least strongly influenced) by the *kandakes,* or queen mothers. Kushite women also participated in military campaigns and often served as corulers with their husbands or sons.

Piankhy's heirs ruled all of Egypt for approximately 50 years; they retained control of southern Egypt for another 50 years beyond that. During this time they engaged in strong military expeditions to quell rebellions. They also were known for their architectural innovations, including Piankhy's introduction of Egyptian-styled pyramids for burial chambers. Taharqa, (r. c. 690–c. 664 BCE) was perhaps the family's most prolific builder and religious visionary, and he is credited with building numerous religious temples at MEMPHIS, Thebes, Karnak, as well as in Nubia. He was also considered a model pharaoh, and by some accounts assisted Egypt in regaining its independence. During his reign, however, Assyrian armies sought to oust the Kushite rulers, and despite his skill as a military strategist, Taharqa was eventually defeated by the Assyrians.

Archaeological evidence supports the widely held view that Napata represented a materially wealthy capital city. Excavations of royal tombs at NURI, KURRU, and GEBEL BARKAL indicate that wealthy Kushites adapted many outward displays, emblems, and religious icons of Egyptian culture. These included both the WHITE CROWN and winged sun discs. Kushite nobles also began to use sacred barks for burials in place of their traditional tumuli (the circular structures used to cover burial pits and grave goods). Similarly, burials had formerly positioned the deceased in a fetal position; the deceased were now mummified and laid out in Egyptian-style coffins. Also, the Kushites adopted the use of canopic jars, AMULETS, and *ushabties*—small figures made in human likeness—that were traditionally used by Egyptians in place of the entombment of the royal family members buried with the king.

Speculation about the Kushites' outward displays of Egyptian culture has generated much discussion among historians. Some scholars believe that this Egyptianization represented an attempt, by these kings, to legitimize their rule over Egyptian territories. (Both King Kashta and King Piankhy, for example, used the royal title of King of Upper and Lower Egypt.) Other historians insist that, rather than being subsumed into Egyptian culture, Kushite culture coexisted with Egyptian influences.

The Meroitic Period While headed by King Tanwetamani, the nephew of Taharqa, Kush rule in Egypt finally collapsed about 664 BCE. By 590 BCE the Kushite kingdom relocated to Meroë in the southern region of Nubia.

This relocation brought the kingdom to an area between the fifth and sixth cataracts of the Nile and initiated what is generally known as the Meroitic Period (c. 500–c. 300 BCE). At this time access to the nearby Island of MEROË provided the kingdom with a primary source of forest land and iron ore, which helped make Meroë one of the earliest and largest sites of iron production in the region.

Napata, however, was not completely abandoned. In fact, it remained a holy city and place of burial. This was primarily because of Gebel Barkal and the Temple of Amun, both of which had been established by earlier Kushite kings. Napata was also the site of the royal installment ceremonies that were conducted (or at least heavily influenced) by the *kandakes*.

Among the traditions reclaimed by the Nubians when they reestablished the kingdom at Meroë was matrilineal succession, through which the crown passed from the king to one of his sisters' sons. Another example of the importance of women within the royal family was the fact that, from a religious perspective, the king and his mother personified HORUS and ISIS. As a result the queen assumed much of the king's power and visibility.

Under the reign of ASPELTA (r. c. 593–568 BCE), the Kushites expanded their territories further south and west, developing strong trading ties with both ROME and India. As time passed, its vast resources of gold, ebony woods, and iron-rich deposits helped make the Kushite kingdom in Meroë into a prosperous commercial power. For a period of several hundred years its wealth and power were recognized by traders in Egypt, the Red Sea, and in the regions south of the SAHARA DESERT. By the first century of the common era it had achieved recognition as one of the wealthiest trading cities in the ancient world. This period is also noted for a return to indigenous religious practices, which included the worship of APEDEMAK, a national deity whose origins most likely predated Egyptian rule. No sooner had it reached this peak, however, than the Kushite kingdom began to decline. A number of contributing factors have been cited, including the deforestation caused by the process of smelting iron. Also noted among the causes of Kush's decline are overgrazing and the development of alternative trade routes passing through AKSUM.

The final destruction of the Meroitic kingdom occurred, around 350 CE, when King Ezana dispatched Aksumite troops against the city. Although Ezana left records of his conquering Meroë, little is known of the

reasons for the invasion, the events leading up to it, and its aftermath.

Kyoga, Lake Body of water located north of Lake VICTORIA in the Great Lakes region of central East Africa. Lake Kyoga is about 80 miles (129 km) long and is formed by the Victoria Nile in its middle course. The lake sits at 3,390 feet (1,033 km) above sea level and is shallow, with swampy sections and PAPYRUS reeds covering much of its shores.

L

labor In ancient Africa people engaged in many types of labor, including hunting, gathering, FISHING, herding, AGRICULTURE, and trading. Cooking and other domestic arts were also undertaken. Traditional trades such as woodworking and healing were widespread. In EGYPT copying manuscripts and even library-keeping was necessary. Forced labor probably existed as well.

Hunter-Gatherers Before the advent of agriculture and the purposeful cultivation of FOOD, labor consisted of nomadic wandering in search of the food needed for subsistence. Success for HUNTER-GATHERERS required knowing where to find food sources and then moving on when those sources became depleted. Ancient Africans who hunted and gathered probably formed societies of families that moved around together and stayed in one place for a few days or several weeks. These societies mainly hunted game and gathered wild berries, roots, and herbs. Though hunting and gathering activities were dramatically reduced by the expansion of agriculture, some societies continued this way of life; a few such societies, including the Khoisan of the arid KALAHARI DESERT region in southern Africa, still exist today.

Historically the domestication of animals probably occurred before the cultivation of plants. DOGS may have been the first of these DOMESTICATED ANIMALS, being tamed perhaps as early as 10,000 BCE. In the Middle East the gazelle was probably one of the first grazing animals to be domesticated. Later came pigs, sheep, and CATTLE. Prior to 4000 BCE nomadic societies of cattle herders wandered the vast African savannas that provided pastures for their herds.

Agriculture Near the end of the Pleistocene glaciation, about 10,000 years ago, agriculture is thought to

have begun and, with it, civilization. The agricultural methods developed in early MESOPOTAMIA influenced other parts of the ancient world, including Egypt. Records of ancient agriculture in Egypt show that farming thrived along the NILE RIVER. Ancient Egyptians not only built irrigation and drainage systems employing the use of canals, they also advanced the use of tools for farming.

Agriculture simultaneously took hold in other parts of Africa, and people began to settle into communities, leaving behind their nomadic way of life and becoming full-time farmers. Successful societies raised animals that helped support both herders and farmers and created surplus crops. These surpluses allowed for trade, which helped cities prosper.

Urbanization Trade routes were developed from West Africa south to what is now the Democratic Republic of the CONGO and across the SAHARA DESERT to the coastal regions. Among the goods traded and sold were animal skins and leather, GOLD, ivory, and timber. The trading centers grew into great cities where governing bodies were formed to oversee trade, charge taxes, and control the land.

As farming methods began to produce reliable results, people no longer had to worry about their food supply in the same way they once had. When people had to rely strictly on hunting, gathering, and fishing, they were well fed when food sources were plentiful, but they went hungry when food was scarce. Most members of the hunter-gatherer societies spent their time looking for food. After successful herding and farming systems were invented, not everyone had to labor for subsistence. People then had time for other things, including observ-

ing, thinking, and experimenting. By 3500 BCE, following the example set by the farmers in permanent settlements along the Nile, many people were choosing to live in urban areas, working in a variety of trades. Over time this change in labor patterns allowed for the advancement of SCIENCE, ART, government, and RELIGION, forming the basis of modern civilization.

Some scholars believe that another result of the development of agriculture was the introduction of forced labor. Though forced labor takes many forms and the origin of owning or bonding people is not known, the most common form in ancient times and throughout history was SLAVERY, or the consideration of laborers as property that could be owned, sold, or traded. By the time of the Roman Empire of the second century, slavery had been legalized and was practiced in some North African cultures.

Labor in Ancient Egypt Our knowledge of ancient Egypt gives us insight into the labor trends of one early civilization. By about 1000 BCE most Egyptians lived in houses given to them by the state, for which they worked. Instead of receiving money for their work, they received rations in the form of food, animals, clothes, and other necessary items, and people often traded their extra food or other rations for luxuries.

Some of the male children of the upper classes attended school, but most boys became farmers. Some learned a trade, such as carpentry or POTTERY making, taught to them by a skilled craftsman. Other trades included mud-brick making—such bricks were typically used to build houses for the wealthy—and MEDICINE, which required years of training with a practicing doctor after a boy had completed a regular school career.

Though some Egyptian girls did attend school, most were trained to perform the labor of the home, such as cooking, which called for food to be baked in a clay oven in a kitchen yard. They also learned sewing and other domestic arts. In ancient Egypt, however, this did not seem to imply a lesser status. In contrast to women in other times and places, ancient Egyptian women were allowed to sell, buy, and trade goods, as well as to own property.

Lahun, pyramid of With the pyramid of HAWARA and the pyramid of LISHT, part of the mortuary complex for kings of the Twelfth Dynasty of EGYPT (c. 20th century BCE). Lahun is the site of the ancient Egyptian pyramid built for King Sesostris II (also known as Senwosre II). As the fourth king of the Twelfth Dynasty, Sesostris II ruled Egypt from about 1950 to 1920 BCE. No one is sure why this king chose to build his pyramid 30 miles (48.3 km) from Lisht, where the first two kings of the Twelfth Dynasty built their PYRAMIDS.

Unfortunately, Sesostris II's pyramid, along with many others in ancient times, was repeatedly robbed, but an outstanding collection of JEWELRY was later discovered in the wall in the tombs of the princesses. Technically and artistically, the jewelry is among the best of the time.

Laikipia Escarpment Steep-sided cliff facing Lake Bogoria in present-day KENYA. Both the Laikipia Escarpment and Lake Bogoria are part of the Great RIFT VALLEY, the geological fault system that extends 3,000 miles (4,827 km) from the Jordan Valley in southwest Asia to MOZAMBIQUE in southeast Africa. The Laikipia plateau area leading up to the escarpment has been traditionally occupied by the MAASAI people.

lakes and rivers Lakes and rivers are found throughout Africa and serve as resources for FOOD, as means of TRANSPORTATION between regions, as natural boundaries between various ethnic groups, and, along their banks, as sites for AGRICULTURE.

Lakes are inland bodies of water, usually freshwater, that are formed by rivers, or glaciers. The main lakes of Africa are Lake CHAD of the central sudanic belt, Lake VICTORIA near present-day UGANDA, and Lakes TANGANYIKA and Malawi, found in the RIFT VALLEY of southeastern Africa. These lakes were the focus of several different populations because of the varied resources that the lakes provided.

A rivers is a natural stream of water that is larger than a creek, and its beginning, called its source, is usually found in highlands. A river's course flows toward its mouth, where it may empty into an ocean, a lake, or another river. Some large rivers have impressive deltas at their mouths, where they exit into an ocean.

The longest, and arguably most important, rivers of Africa are the NILE RIVER of EGYPT, the NIGER RIVER of West Africa, the CONGO RIVER of Central Africa, and the ZAMBEZI RIVER of southern Africa. These rivers create arteries for TRADE AND COMMERCE, provide food, and function as a means for the dissemination of ideas and goods by connecting disparate cultures.

Lamu Archipelago Small group of islands off the extreme north coast of present-day KENYA. The island chain includes Lamu, Manda, Pate, and Kiwayu Islands. As early as the 14th century each island was home to autonomous city-states that participated in trade along the East African coast. Lamu was considered a minor trading state. The real commercial powerhouse of the region, Kilwa, is now part of present-day TANZANIA.

See also: INDIAN OCEAN TRADE (Vol. II); KILWA (Vol. II); LAMU (Vol. II); PATE (Vol. II).

language families Since prehistoric times Africa has seen wide linguistic diversity. In part, this is due to the ancient origins of many African languages. It also is the result of centuries of migration and dispersal, which have created a mosaic of languages and dialects that in no way reflects whatever national borders existed at various times in Africa's history. As a result no general linguistic feature can be said to characterize all, or even most, African languages. The languages spoken on the African continent—estimates vary from 700 to nearly 3,000—can be organized into four major languages family categories: Nilo-Saharan, Afro-Asiatic, Khoisan, Niger-Congo.

NILO-SAHARAN LANGUAGES in their earliest forms were spoken near the NILE VALLEY as early as 10,000 years ago. Languages of the Nilo-Saharan family, including Songhai, Saharan, Maban, Furian, Koman, and Chari-Nilebeena, are now spoken in nearly all parts of the continent.

Nearly 4,500 years ago the AFRO-ASIATIC LANGUAGES were spoken throughout North Africa. Although ARABIC, an Afro-Asiatic language, is the original tongue of Islam, it did not become as widespread as the RELIGION on the African continent. By about 1000 CE the Afro-Asiatic languages were still largely confined to North Africa.

Four Major Language Families of Africa

Nilo-Saharan
Main Languages Chadian, Eastern Sudanic, Songhai
Where Spoken South of the Sahara, from the Nile to the middle of the Niger
Comments May have common ancestry with Niger-Congo Languages

Afro-Asiatic
Main Languages Afro-Asian, Amharic, Arabic, Berber Kushite
Where Spoken North Africa and eastward toward Horn of Africa
Comments Many African languages reflect hundreds, even thousands of years of trade and migration between Africa and the Middle East

Niger-Congo
Main Languages Bantu-Congo, Eastern Adamawa, Kwa, Mande, Voltic
Where Spoken Across much of Africa, from present-day Senegal to the Cape of Good Hope
Comments Bantu languages, in all their many forms, are the most commonly spoken on the continent

Khoisan
Main Languages Khoi, San
Where Spoken Southwestern Africa
Comments Distinguished by the use of "click" sounds

The Languages of Africa to 2500 BCE

BERBER?

EGYPTIAN

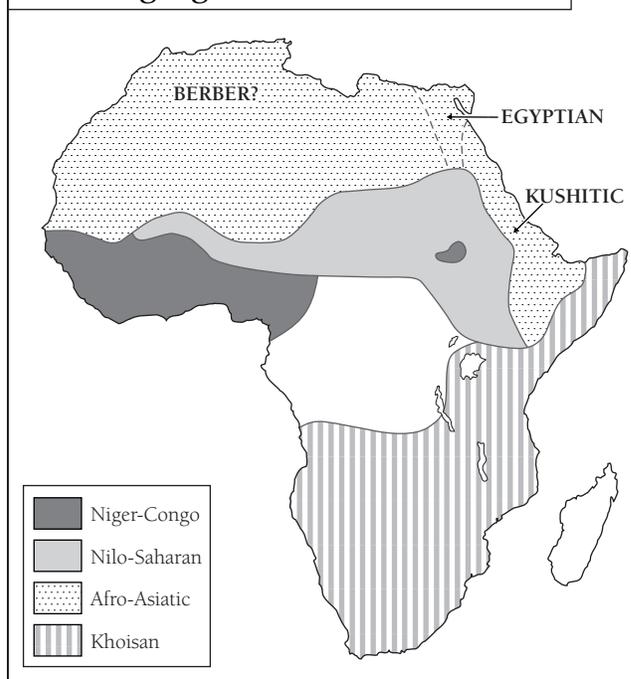
Niger-Congo
Nilo-Saharan
Afro-Asiatic
Khoisan


The map, based on the research of University of California–Berkeley anthropologist Joseph Greenberg, shows the languages of Africa before the expansion of Bantu-speaking peoples (C. 1000 BCE to c. 1500 CE). The Bantu languages, a branch of the Niger-Congo family, eventually reduced the range of the Khoisan languages to just the southern portion of the continent.

Perhaps the most significant change in the Afro-Asiatic languages during the first millennium of the common era was the development of Malagasy, the language of the people of the island of MADAGASCAR. Located in the Indian Ocean off the coast of East Africa, Madagascar was largely uninhabited as late as the seventh century, when Indonesian colonists arrived by sea. Malagasy, based on the Malay (Indonesian) language of the original settlers, also reflected the Bantu, Arabic, and Persian influences of the merchants who frequented the island.

The NIGER-CONGO LANGUAGES, on the other hand, underwent their own remarkable change during the same period, in large part due to the great BANTU EXPANSION that took place between about 1000 BCE and 500 CE. Whereas the Niger-Congo languages were mostly confined to the southern coastal regions of West Africa circa 2500 BCE, by 1000 CE they had spread along a band that stretched from West Africa, through Central Africa, all the way to the southern coast of East Africa. During their southeastward migrations the Bantu-speaking peoples displaced Khoisan speakers, who had inhabited the area for thousands of years. As a result the KHOISAN LANGUAGES that had been spoken almost exclusively through-

out southern Africa and most of coastal East Africa were confined to a pocket in the southwestern corner of the African continent by 1000 CE.

law and justice Prior to 500 CE the concepts of law and justice in Africa varied greatly from region to region and from group to group.

Ancient Egypt The laws of ancient EGYPT were based on MAAT, the Egyptian concept of right. They were founded on customary law and partially codified in HIEROGLYPHICS. Laws were interpreted and applied by councils made up of the pharaoh's trusted advisers—priests and oracles. The pharaoh himself, however, had the final say in all legal matters in his realm. One of the earliest legal systems in human history was drawn up by King MENES about 5000 years ago.

After DEMOTIC script became widespread in the seventh century BCE, legal contracts and deeds became more clearly stated, and legal systems became increasingly codified. Documentation of prior cases led to concepts of legal precedent and the standardization of a penal code. When ROME took control of Egypt about 30 BCE, Romans imposed their legal system on the Egyptians.

Customary Law Prior to the emergence of large, centralized kingdoms, traditional cultures outside of Egypt were governed by customary law. Under this system, customs and time-honored practices governed daily life and interaction. Strict adherence to verbal greetings, ritualized prayers, and public ceremonies all reflected the significance of customary laws within various societies. Generally unwritten, these laws were part of larger ORAL TRADITIONS that were handed down from generation to generation within each society. These oral traditions survived for many centuries, and if they had not survived, we would know almost nothing of the ancient legal systems outside of Egypt.

In traditional cultures the headmen of lineages generally exercised political and executive power over their groups. Their power extended to the areas of law and justice, as well. Typically, when a dispute developed between two members of the same LINEAGE, the arguing parties would appear before the headman, present their cases, and abide by the ruling that was handed down. To settle more complex legal disputes, the headman might confer with village elders, whose collective memory served as a repository of legal precedents.

If members of two different lineages had a quarrel, the individuals would ask the ranking headmen of their lineages to represent them and present their cases, some-

times before the king or chief, who held absolute executive power. In difficult cases a diviner might be called upon to consult the spirits of the ancestors, who were often viewed as the ultimate arbiters of justice.

Customary law was important in nomadic cultures, as well, since the question of the ownership of CATTLE and other animals was a common source of disputes. Little is known, however, of the legal codes followed in mobile, decentralized, hunter-gatherer societies, since there was little incentive for these groups to maintain a detailed oral history. We know that these societies had rules and customary laws of their own, although it is logical to assume that they had fewer causes for legal disputes.

The most serious offenses addressed by customary law included homicide, incest, and adultery. The punishment for these crimes could be the loss of an eye or limb, banishment from the group, or even death. Among groups like the MAASAI, death was preferred to the dishonor that came with being found guilty of the crime.

Leakeys, the Family of anthropologists, archaeologists, and paleoanthropologists noted for their discoveries of early human remains in Africa. The son of missionary parents, Louis Leakey (1903–1972) was raised in KENYA and, despite a formal education in England, remained close to the local KIKUYU and other peoples of the area throughout his lifetime. At an early age Leakey began focusing on the study of early humans, and by the 1920s he had gained wide recognition for his discoveries of artifacts relating to HUMAN ORIGINS. Believing that the human race had its origins in Africa rather than in Europe or Asia, Leakey carried out extensive investigations in Kenya. In 1949 his discovery of a *Proconsul* skull helped establish a clear evolutionary link between MONKEYS and apes. Later discoveries, especially those at OLDUVAI GORGE, contributed to a clearer understanding of the development of early hominids.

Although Louis Leakey garnered the majority of the accolades and fame during his lifetime, his wife, Mary (1913–1996), was generally considered to be not only a better scientist but also a more significant contributor to

The excavations of anthropologist-archaeologist Louis Leakey, shown here in 1972, and those of his wife, Mary, and son, Richard, established that the first humans lived in East Africa rather than in Asia, as was previously thought. © *Hulton-Deutch Collection/ Corbis*

the knowledge of early human beings. After marrying Louis Leakey, in 1936, she carried out major excavations, both with her husband and on her own. Indeed, many of the greatest discoveries made at the Olduvai Gorge site, upon which so much contemporary knowledge of early humans depends, were the work of Mary Leakey. Her discovery of ZINJANTHROPUS (*Australopithecus boisei*) and 3.5-million-year-old hominid footprints preserved in volcanic ash not only brought her and her family fame but also helped revolutionize the way in which early hominids were seen.

It was Richard Leakey (1944–   ), Louis and Mary Leakey's son, however, who seemed destined from the very first to carry their pioneering work to new heights. Learning well from his brilliant and famous parents, Richard became a serious field anthropologist. In the late 1960s, he was working at sites in present-day ETHIOPIA when he began a series of discoveries that rocked the scientific world and did much to fill in the gaps in our knowledge of early hominids. In 1972 he found a fossilized HOMO HABILIS skull; in 1975 he discovered the skull of a HOMO ERECTUS; and in 1984, his team unearthed both a nearly complete *Homo erectus* skeleton (popularly known as TURKANA BOY) and the first skull ever found of the species *Australopithecus aethiopicus*.

Richard Leakey's wife, Meave Gillian Leakey (b. 1942), a trained zoologist, has also made several important discoveries, including an apparently new hominid species, *Australopithecus anamensis*.

In recent years Richard Leakey has focused his energies on both politics and animal conservation, but the Leakey scientific legacy has been ably carried on by both Meave and their daughter, Louise.

Legba shrine Household altar in YORUBA and Yoruba-derived religions; said to protect practitioners' households. Over the years the deity Legba has been known by several names, including Eshu, Elegbara, and Elegba. Legba shrines generally are erected in front of the home or in an entry way. Usually made of carved wood, lacitrite, or stone, they vary in form and appearance. In some regions, a small head and shoulders are set within a dish or bowl. Elsewhere, other types of altars include a slender wooden statue sitting atop a mound (known as a *kpe*). The elements of the shrine, which are said to hold its protective powers, are often hidden in mounds of earth that contain a POTTERY jar. Inside that jar are

leaves, remnants of fabrics, grain, BEADS, or other natural materials.

leopards Solitary, nocturnal animals that live in Africa's bush and forested areas south of the SAHARA DESERT, leopards appear often in Africa's FOLKLORE and history. In ancient EGYPT, leopards were hunted and their skins were extensively traded. Leopards were also associated with OSIRIS, the god of the dead, and Seshat, the goddess who invented math and writing. Among the IGBO people, the leopard was associated with fertility.

In one Nigerian folktale a leopard entered villages disguised as a seductive man. One woman followed this leopard-man away into the forest, where he turned back into a leopard. The leopard then chased the woman, but could not catch her.

Lesotho Small mountainous country, 11,700 square miles (30,300 sq km) in area, that is wholly surrounded by present-day SOUTH AFRICA. More than 80 percent of the country lies at least 5,905 feet (1,800 m) above sea level.

The origins of present-day Lesotho (meaning "the country of the Sotho people") lie with the founding of the Sotho kingdom of Basutoland in the early 1830s, by King Mshweshwe (1786–1870).

Two-thirds of Lesotho is mountainous with highland plateaus. In southern Africa, the western plain gradually rises to form the foothills of the Maluki and the Drakensburg mountains, in the east. (The western side of the Drakensburg Mountains falls within Lesotho.) The monsoon patterns of the Indian Ocean send rain across the Drakensburg Mountains from the east to the west, watering prime grazing land and allowing for limited AGRICULTURE in the lowlands, where most of the population of Lesotho lives.

lesser wives (junior wives) In many African societies, a term describing women who enter an existing marriage arrangement and share husband and household with other wives. In this type of arrangement, known as POLYGAMY, the oldest or senior wife usually acts as the dominant authority figure. Newly married or lesser wives are expected to defer to her age and experience. Often the senior wife is consulted in the selection of junior wives. It is important that the wives get along so that there is harmony in the FAMILY, since a common cause for divorce is that the wives do not get along.

The origin of this practice, widespread in much of ancient Africa, is not known. According to some theories, it may have been handed down by rulers who retained hundreds of wives for political power. It has been speculated that having more than one wife was practical and beneficial to the community. Since more girls than boys are born, there might otherwise be girls who could not find husbands, and this would be seen as a waste of human reproductive resources. Therefore, wealthy men in a community took more than one wife so that all women could marry. Other sources indicate that the practice may have evolved from religious beliefs.

Liberia Independent republic on the Atlantic coast of West Africa that measures about 38,300 square miles (99,200 sq km) and is bordered by the present-day countries of SIERRA LEONE, IVORY COAST, and the Republic of GUINEA. Although Liberia was the only black state in Africa to avoid European colonial rule, from an African perspective, the creation of Liberia was very much a case of colonial conquest.

The land that became Liberia faces the Atlantic Ocean, with a shoreline covered in mangrove swamps. Behind the coast, however, lies forested land—both RAIN FOREST (part of a belt of tropical rain forests ranging from present-day Sierra Leone to CAMEROON) as well as forests with secondary growth. Prior to the founding of Liberia, the secondary growth forests were created by the timber exploitation of peoples living in the interior who used wood for cooking.

Farther inland, in what is called the hinterland, a grassland plateau stretches to the hills of the Nimba Mountain range. Liberia's tropical environment is ideal for the insects that are the vector species of diseases such as malaria, sleeping sickness, and yellow fever.

Libya North African country, approximately 680,000 square miles (1,761,200 sq km) in size, situated on the Mediterranean coast. Libya has a dry and often extreme desert interior and is bordered by TUNISIA, ALGERIA, NIGER, CHAD, the Republic of the SUDAN, and EGYPT.

Libya has a rich history dating back to the eighth millennium BCE; part of the SAHARA DESERT is located in Libya. Ancient farmers of the NEOLITHIC AGE likely occupied the plains of the northern coast from as early as 8000 BCE. Growing crops and raising CATTLE, this society was advanced in AGRICULTURE, More than 5,000 years ago the area that is present-day Libya was a great savanna, or grassy plain. But, except for a narrow strip of land along the Mediterranean coast, most of this area is now part of the Sahara desert. Nomadic people, called *savanna people,* hunted wild game and wandered the great plain with their herds. Some time after 2000 BCE the nomadic society began to fall apart as the desert advanced and other, horse-riding peoples began invading the area. Some of the savanna people moved south into the Sudan, while others became acculturated into the society of the indigenous BERBERS.

The Berber migration into LIBYA was recorded in inscriptions in EGYPT (c. 2700 to c. 2200 BCE). These inscriptions also comprise the first recorded history of Libya. Though the origin of the Berbers is not known, the remains of their culture and language support the idea that they may have come from southwestern Asia. They probably moved into North Africa sometime in the third millennium BCE, and over the next few centuries they migrated from Egypt all the way to the basin of the NIGER RIVER. Egyptians referred to the Berbers as the Levu, or Libyans. The Twenty-second and Twenty-third Dynasties of Egypt, often called the Libyan dynasties, are thought to have been Berbers.

The GARAMANTES, who are the probable ancestors of today's TUAREGS, colonized the FEZZAN area circa 1000 BCE. From their capital at Germa, the Garamantes controlled several oases in the Wadi Ajal area. They also controlled much of the trade in the area, having been hired by the Carthaginians to carry GOLD and ivory on the trade route between the western sudanic region and the Mediterranean coast. It was at this time, too, that Libyans began to deal with Africans living south of the Sahara desert.

Known for their skill in breeding HORSES, the Garamantes also kept herds of longhorn cattle. They were able to cultivate part of their hot, dry land by developing an irrigation system that used *foggares,* a series of connecting underground tunnels that carried water.

Significant remnants of the Garamantes' culture and civilization have been discovered and examined, including more than 50,000 pyramid-like tombs and several cities built of stone, including Germa, the capital; Zinchera; and Saniat Gebril. Researchers also have found Garamante inscriptions in the ancient Berber writing called *tifinagh,*

which is still used by the Tuareg today. The power of the Garamantes was threatened by ROME, which launched several attacks against them. The Garamantes eventually allied with Rome sometime in the first century CE.

In the seventh century BCE Greeks moved into Cyrenaica on the Mediterranean coast of northeastern Libya and established CYRENE, which became known as a city of great ART and SCIENCE. It was to Rome, however, that Libya was most important, since it was situated just across the MEDITERRANEAN SEA from Italy (see map p. 151). Rome's first conquest was the northwestern region of Libya on the Mediterranean coast. Later called Tripolitania, this region became known for exporting olive oil as well as for the gold trade and the slave trade. In 74 BCE Cyrenaica came under the control of the Romans. This region was known for its wine and horses. Although the Romans ventured into the Fezzan and brought it under their control, they were mainly interested in the regions of Africa from which they had something to gain economically. They also sought regions in which local people could be used to defend the area from hostile forces.

Near the end of the first century CE Romans finally secured the route between Tripolitania and Cyrenaica, and for more than 200 years they protected the trade routes between them. With trade and communication guaranteed by Rome, Tripolitania and Cyrenaica generally thrived until circa 400. During this time, they used the same language and legal system as the Romans.

Evidence of Roman influence in Libya, as in virtually every part of the Roman Empire, included baths, forums, markets, and other familiar institutions of Roman urban life. Roman ruins discovered in Libya also show how much the area prospered under Roman rule. Scholars believe that the rich tradition of art and MUSIC that exists today in Libya is due in part to the influence of the Romans, who decorated temples and homes with such ornamentation as beautifully crafted mosaics.

Around 70 CE, after the Romans put down the Jewish revolt in Palestine and conquered the area, significant numbers of Jews made their way to Cyrenaica, where many Jews already resided. Then, in 115, Jews in Cyrenaica led another revolt against the Romans that was stopped within three years. Scholars now believe that perhaps more than 200,000 people were killed during that time.

The term *Libya* was first used as a name for the province by Emperor DIOCLETIAN about 300 CE, when he separated the area of Cyrenaica into Upper Libya and Lower Libya. When the Roman Empire was divided in 395, Libya was governed by the Eastern Empire, which ruled from Constantinople.

The VANDALS, a Germanic warrior people, entered North Africa from Spain and seized power in the regions of Tripolitania and Cyrenaica in about 429 and attacked the city of Rome in about 455. After 100 years of rule in Africa, however, they became less interested in making war and were conquered by Byzantines (c. 533) on behalf of the Roman Empire.

Limpopo River River of southern Africa that measures approximately 1,100 miles (1,770 km) in length and empties into the Indian Ocean. Despite its length, the river is only navigable near its mouth. With its source near Witswatersrand, in present-day SOUTH AFRICA, the river meanders from South Africa to its mouth in present-day MOZAMBIQUE. The Limpopo River marks the border between South Africa and present-day ZIMBABWE and BOTSWANA.

The Limpopo's main tributary is the Olifants River, which flows into the Limpopo about 130 miles (209 km) from its mouth, just north of present-day Maputo, in Mozambique. The upper portion of the river is known as the Crocodile (Krokodil) River. The lower portion irrigates Mozambique's fertile agricultural region. The word *limpopo* may come from the Sotho word meaning "river of the waterfall."

Before the fifth century the fertile valley between the Limpopo and the Zambezi rivers was populated by the Khoikhoi, and later it became home to many other groups. In addition to providing the right environment for PASTORALISM and AGRICULTURE, the region was rich in mineral wealth such as GOLD.

lineage Basic distinction used in social grouping of most African societies. Lineage is a descent group determined through either patrilineal or matrilineal ancestry. The founder of a particular lineage is usually the child or grandchild of the founder of that lineage's CLAN. Though lineages serve as bridges between various segments of a clan, they, unlike clans, are smaller in the number of living members and the number of generations. A lineage represents a single body of members, but the members do not necessarily all share a common name. A lineage may hold property jointly, but a single leader often exercises authority over the members and serves as its representative. Lineages can be traced back for many generations, and, since lineages generally are considered permanent groups, the inclusion of different generations creates a more stable social structure. African lineages also function as basic political units if centralized authority—in the figure of a king or chief—does not exist.

According to a typical social model, various lineages live together as autonomous groups that make up a society. This type of lineage system, sometimes referred to as a "segmentary social order," is common throughout Africa.

It is particularly prevalent among pastoral peoples, who often lack a form of centralized political authority or government. The balance of power among these segmented social groups is usually determined through warfare, with the decision to engage in armed conflict usually made by a member of the group who is believed to possess ritual, or even mystical, authority.

lions   The power and grandeur of the lion has long been admired on the African continent. One of its earliest appearances in mythology occurs with the sphinx. According to Egyptian legend, sphinxes had the bodies of lions and the heads of humans. Lions were also associated with Sakmet, the Egyptian goddess of war and vengeance, and Mahes, the Egyptian personification of the summer heat.

> In GHANA, a popular folktale involved a lion and a clever rabbit. The rabbit overheard the lion saying he would eat him. But instead of running away, the clever rabbit went to the lion's cave and told him of another, more powerful lion. The rabbit led the lion to the lake and pointed to the water, and when the lion attacked his own reflection, he drowned, leaving the rabbit in peace.

Lions are social animals that live in prides with up to thirty members. They usually hunt ZEBRAS, wildebeest, and antelopes. Lions claim their territory by scent-marking and roaring.

Lisht, pyramid of   Along with the pyramid of LAHUN and the pyramid of HAWARA, part of the mortuary complex for kings of the Twelfth Dynasty of EGYPT. Lisht, also called *al-Lisht,* is the site of two notable pyramids that were built by Amenemhet I (r. c. 1938–c. 1908 BCE, also known as Amonhemet I), the founder of the Twelfth Dynasty.

During his reign Amenemhet I moved the capital of Egypt from Thebes to Lisht, where he built his pyramid from mud brick that was then covered with stone. Unfortunately, the pyramid did not survive the ages well and is in ruins. Though Amenemhet I was the first ruler of the MIDDLE KINGDOM period, the style of his pyramid resembled older pyramids.

Sesostris II (also called Senwosre II), the son of Amenemhet I, was the second king of the Twelfth Dynasty and ruled for 10 years with his father. Sesostris II built his pyramid next to his father's. The first layer of his pyramid was made of sand compartments covered with limestone.

Meri, the governor in charge of the construction of the pyramid, is remembered by a stele inscribed with a record of his accomplishments, which can be seen today in the Louvre Museum in Paris.

locusts   Locusts have been considered threats to agricultural crops since ancient times. The desert locust, which is found in EGYPT and other arid parts of Africa, probably formed the plagues that were described in ancient Egyptian records. In the book of Exodus, the Bible also mentions a swarm of locusts as the eighth plague that God inflicted on Egypt.

Logone River   Main tributary of the CHARI (Shar) RIVER, which empties into Lake CHAD. The river is 240 miles (386 km) long and is fed by the Mbere River and its tributary, the Vina, of present-day CAMEROON, and by the Pende. of present-day CENTRAL AFRICAN REPUBLIC. During the rainy season the river becomes linked to the BENUE River system through the swamps of Lake Fiango and Tikem, and the Mayo Kébi River in Cameroon. The regular loss of water to the Benue system is detrimental to the dry region of the Lake Chad basin. Extensive PAPYRUS swamps line much of the river's course.

See also: LAKES AND RIVERS (Vol. I).

Lower Egypt   Delta land of the NILE RIVER; along with UPPER EGYPT, one of the two kingdoms of ancient EGYPT. The annual flooding of the Nile, which overflows its banks and deposits mineral-rich silt over 15,000 square miles (38,850 sq km) of land, turned this one-time swamp into the fertile soil that the Egyptians called *KEMET,* or the "black land."

The Nile River flows northward, and the distinction between the "upper" and "lower" Nile follows that flow. Thus, Lower Egypt refers to northern Egypt, where the river empties into the MEDITERRANEAN SEA. In ancient times, Lower Egypt stretched from just south of present-day CAIRO northward to the city of ALEXANDRIA, located at the NILE DELTA.

Lower Egypt was symbolized by a RED CROWN and had a bee as its emblem. The chief god of Lower Egypt was HORUS, the son of OSIRIS and ISIS. In Egyptian mythology, Horus eventually avenged the murder of his father at the hands of his uncle, SETH, who was the god of Upper Egypt.

Prior to unification with Upper Egypt, about 3050 BCE, Lower Egypt consisted of a great number of independent and autonomous Delta towns. Each one functioned as a trade center, a political center, and a center of cult worship. These towns eventually unified into the kingdom of Lower Egypt.

According to Egyptian legend, MENES (r. c. 2925–c. 2863 BCE) was the founder of the First Dynasty of Egyptian kings and the first king of a unified Upper and Lower Egypt. This unification resulted from Upper Egypt's victory in war in about 3050 BCE. The unification of the two kingdoms not only centralized authority but also facilitated massive administrative, building, and irrigation projects. Widespread FOOD distribution and the regulation of trade also were undertaken, leading to a rapid multiplication of Egypt's wealth.

See also: BADARIAN CULTURE (Vol. I), NAQADAH I AND II (Vol. I); NARMER PALLETTE (Vol. I).

Lualaba River Largest tributary of the CONGO RIVER, flowing over approximately 1,100 miles (1,770 km) and draining the CONGO BASIN while staying completely within the present-day Republic of the CONGO. Considered to be the upper Congo River, the Lualaba River rises in southeastern Republic of the Congo and flows north over rapids and falls to Bukama, where it crosses a large savanna and then pools in a series of marshy lakes. Another tributary, the Luvua River, meets the Lualaba at Ankoro, carrying water from Lake Mweru on the border with present-day ZAMBIA. A third tributary, the Lukuga, flows out of Lake TANGANYIKA and joins the Lualaba as it continues its flow north to Kisangani. From Kasongo to Kibombo the Lualaba River is navigable, but it then descends through a series of waterfalls to become the beginning of the Congo River, the second longest river on the continent and one of the longest rivers in the world.

Archaeological discoveries indicate that several IRON AGE groups had settled along the banks of the Lualaba toward the end of the first millennium. Excavation sites at Katoto and Sanga produced evidence of technologically sophisticated cultures that were involved in trade and small-scale mining.

Lucy (Dinkenesh) Nickname for the earliest *Australopithecine* skeleton found in Africa.

See also: HADAR (Vol. 1).

luntiu-setiu Highly skilled archers of ancient KUSH (NUBIA), who played a prominent role in the military success of the kingdom. In ancient times, the Kingdom of Kush was widely known as Ta-Seti (Land of the Bow) in tribute to these highly trained soldiers who were even more famous for their mastery of the art of the bow and arrow than for their use of swords and javelins. The well-earned reputation of these soldiers was recognized by the ancient Greeks and Romans, as well as by the Arabs, whom they defeated in battle at Dongola (c. 652).

Luxor Famous temple located in the southern part of the ruins of the ancient city of Thebes. The temple of Luxor was commissioned by the late Eighteenth Dynasty king AMENHOTEP III, who reigned from 1417 to 1379 BCE. Built close to the NILE RIVER, the temple runs parallel to the riverbank. Its entrance features a long colonnade of 14 pillars, each 50 feet (15.2 m) tall, which lead to a large court and a complex of halls and chambers. The temple was eventually completed by TUTANKHAMUN and HOREMHEB. RAMESSES II also made additions.

The temple was dedicated to AMUN, the king of the gods, his consort Mut, and their son Khons. The Luxor Temple is linked by an avenue of sphinxes to the Great Temple of Amun at KARNAK, the northern part of the ruins of the city of Thebes.

The peristyle court is one of the oldest parts of the Luxor temple in Thebes, which was built for Amenhotep III in about 1380 BCE. In the foreground is a relief carved for Tutankhamun. *© Roger Wood/Corbis*

M

Maasai African pastoralists named for the Maa language; they are known to have lived a nomadic life in the Nile Valley of Sudan as far back as 500 BCE. Historically, the Maasai people are a part of a larger group of ancient peoples known as the NILOTES (sometimes referred to as Nilo-Hamitic). All Maasai speak the same Nilotic language, which goes by various names— Maa, Ol Maa, or Masai.

Because the ancient Maasai did not leave written records, not much about their life is documented. According to ORAL TRADITION, the Maasai originated in the area near Lake TURKANA. Archaeological evidence suggests that the Maasai may have left the NILE VALLEY of present-day Republic of the SUDAN for KENYA around 500 BCE, probably moving first into the Great RIFT VALLEY, and then on to present-day TANZANIA, sometime in the first millennium CE. The Maasai inhabit areas of Kenya and Tanzania to this day, living a pastoral life rich in tradition, custom, and ceremony.

Much of what is known about the ancient Maasai and their way of life comes from 19th- and 20th-century observations. This is due, in large part, to the firm traditionalism of the Maasai themselves, who are a people with a deep respect for the past. Indeed, 75 percent of today's Maasai (who number between 250,000 and 350,000) continue to follow their indigenous social and religious customs.

The Maasai have a long tradition of religious beliefs and practices that includes many rituals and celebrations. An important part of this tradition is the *laibon,* who serves as a diviner or ritual leader. The *laibon* is expected to be a healer of body and spirit, a rainmaker, and a source of good pasture land.

Maasai mythology plays an important part in explaining the traditional Maasai way of life. According to one myth the Maasai people are divided into two main groups because a great ladder was built to enable the Maasai to climb up the long, steep slope leading to the Gishu basin. When the Maasai climbed the ladder, however, it broke, leaving one group on top of the plateau and the other at the bottom.

Several traditional Massai myths emphasize the importance of CATTLE. One such myth names the god Ngai (also called Nkai) as the creator and explains that his three children were given gifts. The third son, who was given a stick with which to herd animals, became the father of the Maasai. Another Maasai myth explains that when the earth and heavens split apart, the god of rain, Ngai, gave all cattle to the care of the Maasai. In yet another, Ngai uses roots of a holy, wild fig tree to help cattle make their way from the sky to the earth. To avoid harming the sacred root, the Maasai traditionally do not break the ground. In fact, it was not until quite recently that they began to cultivate the earth.

The Maasai have long honored cattle, having lived off them for thousands of years, wandering seasonally to more fertile grazing lands. Not surprisingly, a typical Maasai expression is "I hope your cattle are well." Among the Maasai, a large number of cattle signals wealth, and cattle are traded, sacrificed, used to pay fines, and given as dowry.

The Maasai are well-known for their beautiful ornamentation of beadwork, bangles, coils, and elaborate hair styles. The patterns of beads identify AGE-GRADES as do styles of hair. Hair is sometimes worn long and plastered with ochre; sometimes it is shaved. Another noteworthy Maasai art is dance, as the Massai are famous for their dancers' endurance and high jumps.

Known for being great warriors, Maasai boys pass through an age-grade system in which they go from junior

warrior to senior warrior (at which time they are allowed to marry). From there they pass to junior elder and then to senior elder. *Morans* are men between 14 and 30 who traditionally live alone in the bush, learning the traditional customs and ways of warriors. According to Maasai traditions, a warrior is expected to kill a lion using only his spear.

Young Maasai women typically are married to older men, and they are allowed to have sex prior to marriage (but not outside sex after marriage). In Maasai society, both boys and girls are thought to pass into adulthood around puberty by RITES OF PASSAGE that include CIRCUMCISION and clitoridectomy.

The traditional home of the Maasai is the *enkang* or *kraal*, a complex of 10 to 20 small mud-dung homes enclosed by a fence made from thornbushes. Each structure is built by women and may contain only two rooms with no window other than a small hole in the roof. Traditionally an *enkang* is used temporarily, and a new one built as the band moves on. In typical Maasai culture women tend the home and milk the cows, while the men herd the cattle and protect the home and herd.

Though it is not known for sure how many of the present-day customs and ways of the Maasai date back to ancient times, the Maasai have been resistant to change and modernization. Most prefer to live a traditional nomadic life of herding cattle, as their ancestors have done for thousands of years.

Further reading: Elizabeth L. Gilbert, *Broken Spears: A Massai Journey* (New York: Atlantic Monthly Press, 2003); McQuail, Lisa, *The Masai of Africa* (Minneapolis, Minn.: Lerner Publications, 2002).

maat   The ancient Egyptian concept of truth, justice, and cosmic order. Sometimes the concept was personified as Maat, the daughter of the sun god RA, and associated with THOTH, the god of wisdom. She was usually represented as a figure with a feather in her hair.

According to the RELIGION of ancient EGYPT, all people were judged upon their deaths. During the Judgment of the Dead, the deceased person's heart would be placed on a scale balanced by *maat,* represented only by an ostrich feather.

As a concept *maat* also played an important part in Egyptian understanding of kingship. The king, according to traditional Egyptian notions, was a representative of the gods. His duty was to follow divine will and establish *maat.* This concept was a central part of Egyptian religion and daily life.

Macedonia   Ancient kingdom in the northeastern corner of the Greek penuisula. During the reign of ALEXANDER THE GREAT (c. 330–323 BCE), Macedonia extended its borders to EGYPT by liberating the North Africans from the Persians.

Macedonia was founded during the seventh century BCE. After 338 BCE, Philip II unified the Greeks and strengthened Macedonia, transforming it into an important kingdom. Macedonia was eventually expanded by Philip's son, Alexander the Great, into the Middle East, Egypt, and western India.

The people of Egypt welcomed Alexander, and he was able to take control of the country without a war. According to legend, Alexander traveled to the Oracle of AMUN, where he was told that he was the son of the god. This strengthened Alexander's claim to the Egyptian throne, since, for thousands of years, Egypt's rulers had believed themselves to be the descendants of the country's chief god, Amun. It also furthered Alexander's belief in his own divinity. Upon adding Egypt to the Macedonian kingdom, Alexander founded the city of ALEXANDRIA on the NILE RIVER.

Upon Alexander's death. in 323 BCE, his empire was divided, and Ptolemy I ruled Egypt as a civilian official. Ptolemy's rule continued even after a Macedonian general, Perdiccas, made an unsuccessful attempt to take Egypt from him a few years after Alexander's death.

Madagascar   Indian Ocean island country covering approximately 226,700 square miles (587,200 sq km), making it the fourth largest island in the world. It is located 242 miles (389 km) across the Mozambique Channel from present-day MOZAMBIQUE on the southern coast of East Africa.

The present-day country of Madagascar is made up of the island of Madagascar and several much smaller islands that surround it, including Juan de Nova, Europa, the Glorioso Islands, Tromelin, and Bassas da India.

Madagascar is the African continent in microcosm, exhibiting the vertical climate of Africa's volcanic mountains like Mount KILIMANJARO, with a RAIN FOREST, grassy savannas, and highlands that receive snow. Unlike Kilimanjaro, however, Madagascar was not formed by volcanic eruptions. The island is the product of the Graeben Fault, where tectonic plates are pulling apart. About 165 million years ago, Madagascar was part of the continent. Madagascar's present location in the Indian Ocean puts its population at risk during the Indian Ocean monsoon season. The extreme north and south ends of the island are frequently the sites of cyclones.

Although there is evidence of an older island culture, the majority of the population of the island has a strong Asian ancestry. Malaysians and Indonesians arrived approximately 2,000 years ago, their boats probably blown there by monsoons while participating in the Indian Ocean trade. The Malagasy language that developed has more in common with the languages of Indonesia than those of Africa.

Mafia Island

Island in the Indian Ocean, 170 square miles (440 sq km) and 10 miles off the coast of present-day TANZANIA. Mafia Island has been a stop on the African coastal trade route for possibly 2,000 years. Mafia is the largest island of an archipelago, or group of islands, in the Indian Ocean. Situated south of ZANZIBAR, the island lies close to the Rufiji River delta. The closest city on the mainland, Dar es Salaam in Tanzania, is 80 miles (129 km) away. The surrounding ocean area presents a variety of coral reefs and gardens that are home to a wide variety of fish. The many species of birds on the island differ from the mainland. The island's geography includes beaches, bays, and forests.

Scholars theorize that Bantu speakers were the first inhabitants of the island. An ironworking, agricultural Bantu culture is believed to have crossed from the mainland and settled the island from about 200 to 400 CE. Other inhabitants of the island included a group known as the Triangular Ironware culture. These indigenous people are thought to have come to the island at some time after the Bantu emigrants of 200–400 CE and before about 975, when Arab settlers from what is now Yemen took control of the island.

There are ome scholars who believe that the island called Menouthias, as described in *The Periplus of the Erythraean Sea,* written by PTOLEMY in 50 CE, is Mafia Island, while other scholars think the ancient writing describes Zanzibar or Pemba.

Maghrib (Magrib, Maghreb)

Arabic word for the region in northwestern Africa that includes the areas of present-day TUNISIA, MOROCCO, ALGERIA, and parts of LIBYA. The Maghrib, which was not unified until Arab rule began in about the year 700 CE, was home to many prehistoric and ancient peoples.

Archaeological evidence shows that ancestors of present-day humans inhabited the central Maghrib as early as 200,000 BCE, and tools from Neanderthal people indicate that prehistoric humans were in the area by about 43,000 BCE. Some scholars believe that, by about 30,000 BCE, the population of this area had tools, tool-making methods, and craftsmanship that were highly developed for this era.

At Tassili-n-Ajjer, north of Tamanrasset in the central Maghrib, cave paintings give evidence of a group of prehistoric peoples who inhabited the area between about 8000 and 4000 BCE. These cave paintings depict vivid scenes of prehistoric life in Africa. Research indicates that a NEOLITHIC AGE people, the Capsians, who lived on the plains in the Maghrib region, conquered the original inhabitants.

In ancient times, the people in this region came to be known as BERBERS, and they have continued to inhabit the area since that time; in fact, about one-sixth of the people who live in the Maghrib today still speak a Berber language.

Makeda, Queen (queen of Sheba) (d. c. 955 BCE)
Powerful ruler who played a prominent role in the social and economic history of ancient Ethiopia

According to some sources, Queen Makeda was part of the dynasty originally founded by Za Besi Angabo in 1370 BCE, with her grandfather and father being the last male rulers of the royal line. The family's intended choice to rule AKSUM was Makeda's brother, Prince Nourad, but his early death led to her succession to the throne. She apparently ruled the Ethiopian kingdom for more than 50 years.

Biblical references and ancient texts have often cited the queen's inexperience as the basis of her relationship with King Solomon of Israel, explaining that a young Queen Makeda traveled to Israel seeking advice from the wiser, more experienced Solomon. The historical facts, however, indicate that Queen Makeda had become a well-respected administrator, empire builder, and international trader before her meeting with Israel's famous king. Exactly when she made that visit is uncertain, but it is clear that, while there, Queen Makeda adopted the Jewish faith and conceived a child with King Solomon. This child, named David, eventually was crowned king of ETHIOPIA as MENELIK I.

The empire that Queen Makeda controlled was extensive and encompassed all of present-day Ethiopia as well as parts of Upper Egypt, Syria, Armenia, India, and southern Arabia (where she was known as Belkis). Direct access

to the Mediterranean and the Red Sea, as well as the many land-based caravans that passed through Aksumite territory, also gave Queen Makeda a vast and wealthy trade empire. For the most part, however, this was administered by specially appointed merchants rather than by the queen herself.

Malawi Present-day southeastern African country about 45,700 square miles (118,400 sq km) in size, bordered by the present-day countries of TANZANIA, MOZAMBIQUE, and ZAMBIA. Lake Malawi (Lake Nyasa), which defines the northeastern border of Malawi, is a feature of the Great RIFT VALLEY, which stretches across East Africa. The waters of the lake empty into the Shire River, which joins the ZAMBEZI RIVER before emptying into the Mozambique Channel.

Malawi is the site of important discoveries related to early hominid activity and HUMAN ORIGINS. Areas within the region apparently were inhabited by early hominids about 2 million years ago. Recent studies have unearthed evidence of settlements inhabited by ancestors of the SAN people dating back almost 100,000 years. Much later, beginning in the first millennium BCE, the area came under the influence of the massive BANTU EXPANSION. During this period the indigenous peoples were, like others throughout this part of Africa, dominated by Bantu speakers, who possessed advanced ironworking and agricultural techniques. This pattern continued during the early centuries of the common era as other Bantu-speaking peoples came into the region from the present-day countries of Tanzania and the Democratic Republic of the CONGO.

Mali Present-day landlocked nation located in central West Africa and covering about 478,800 square miles (1,240,100 sq km), stretching north into the SAHARA DESERT, where it shares borders with ALGERIA and MAURITANIA. Other countries bordering modern Mali include NIGER, BURKINA FASO, IVORY COAST, GUINEA, and SENEGAL.

Until about 5000 BCE the Sahara was a great savanna on which the ancestors of West African populations hunted and gathered. After 5000 BCE a changing CLIMATE initiated a systematic drying of the terrain, causing it to turn to desert. About 3000 BCE those people who had turned to farming migrated to the tropical woodland savanna and rivers to be near a water supply for their crops of MILLET, rice, and SORGHUM. These farmers herded animals and engaged in trade for SALT and COPPER with the mines to the north. From about 700 to 300 BCE settlement size decreased as the desert encroached. The Soninke lived in this savanna between the headwaters of the Senegal River and the NIGER RIVER and developed the first of the West African Empires, GHANA.

See also: INLAND NIGER DELTA (Vol. I); MALI (Vols. II, III, IV, V); SONINKE (Vol. II).

mambas Venomous snakes belonging to the COBRA family, mambas are found in tropical and southern Africa and are among the swiftest snakes. The snake's venomous bite, if not treated, is often fatal to humans.

> The SAN people of southern Africa, who have long been familiar with the mamba, have a folktale explaining why the snake has no legs. Long ago, says this legend, there was a terrible drought, and all the people and animals had to move away; only the lazy and arrogant snake was left behind. Eventually, all the grass and food disappeared. The snake decided to leave too, but began to sink in the sand as soon as it started moving. The snake called out for help, and the Moon, taking pity on the snake, shrank its legs, which allowed it to glide on the sand.

Mande (Manding, Mandingo, Mandingue) Family of languages used by a number of diverse populations of some 46 language communities dispersed througout West Africa. While the term *Mande* represents a large number of languages, four of them are mutually intelligible: Mandinka, Maninka, BAMANA, and DYULA. The Mande languages appear to have originated in the region of the headwaters of the Senegal, Gambia, and Niger rivers. By the 10th and 11th centuries CE, Mande-speaking cultures were well-established in the region. Exactly when and how they first peopled the area, however, is unclear. It has been suggested that Mande speakers inhabited the upper NIGER RIVER valley between 5000 and 2000 BCE, but this is not a widely held view.

See also: MANDE (Vols. II, IV).

Manetho (305–285 BCE) *Egyptian author and priest; famous for his study of the history of ancient Egypt*

Manetho lived under Greco-Roman rule in Sebennytos, the capital of EGYPT during the Thirtieth Dynasty, and was a priest during the reigns of Ptolemy I and Ptolemy II. A thorough knowledge of both Egyptian HIEROGLYPHICS and Greek, as well as firsthand experience with Egyptian religious beliefs and customs, made him especially well-suited to the task of studying Egyptian history.

Commissioned by Ptolemy II to write *Aegyptiaca,* a collection of three books about the history of ancient Egypt, Manetho was given access to the archives of the temple in which he served as a priest. Ranging in content from mythological texts to official records, from magical formulas to scientific treaties, the archives were rich with sources needed to write the history of the country. Given the diversity of these sources, it is not surprising that in Manetho's account, myths and folktales are neatly interwoven with the facts of Egyptian history.

When complete, *Aegyptiaca* chronicled the kings of Egypt from the earliest times, when gods and demigods supposedly ruled, to the historical dynasties, from MENES down to ALEXANDER THE GREAT (356–323 BCE). Although many of the specific details—such as the names of kings and the exact dates of their reigns—are often incomplete and inaccurate, Manetho's work remains the basis for the conventional numbering of the dynasties of the Egyptian pharaohs.

Marra Mountains Mountains in the western region of the modern day Republic of the SUDAN. Located halfway between the NILE RIVER and Lake CHAD, the Marra Mountains once formed part of an ancient caravan route—winding northwest toward the Nile at DONGOLA BEND. From there travelers could continue north to EGYPT or south towards KUSH. Some historians believe this was the route known as the Forty-Days Road mentioned in the accounts of HARKHUF (r. c. 2290–c. 2270 BCE), an Egyptian governor who traveled from Egypt to KERMA, the Kushite kingdom.

masks Decorated coverings for the face, often worn at times of religious or social significance. Masks play important roles among many African peoples and are used in everything from agricultural festivals to funerals. They also are used in warfare and in ceremonies for curing the sick.

One of the earliest uses of masks was probably to discipline children. As an extension of a mother's habit of making nasty faces to frighten children into obedience, masks were used to instill discipline. Masks were also often worn by judges, generally either to show that they represented a spiritual or ancestral authority or else to

The Nigerian Epa festival, for which this contemporary Epa Society mask was created, honors the Great Mother, from whom all women and female sorcerers are traditionally said to be descended. The mask is 36.5 inches (92.7 cm) high. *© North Carolina Museum of Art, Raleigh, N.C./Corbis*

protect themselves against reprisals by those they judged. For the same reason, they were worn by secret societies that punished malefactors.

As long ago as the time of ancient Egypt, masks were also an important part of funerals. From as early as 2000 BCE, the faces of the Egyptian dead were covered with

plaster-covered cloths that were painted with representations of the deceased. The funeral masks of important people—such as people of royal blood or very wealthy citizens—often were decorated with gold and silver. Elsewhere in Africa, masks frequently were made of wood and, as a result, archaeologists have found few examples surviving from ancient times.

The YORUBA peoples of present-day NIGERIA and Republic of BENIN are among the most famous African mask makers. Their masks often are used for ritualized reenactments of battles, especially ones featuring the deeds of legendary and heroic warriors. In the Oyo area, masks are also part of elaborate ceremonies honoring the peoples' ancestors. These brightly painted masks are covered with cloth, with a new layer of cloth added each year.

The Dogon of present-day MALI and BURKINA FASO are also noted for their elaborately carved masks. Their masks, some of which date back to the early common era, play an important role in funeral ceremonies. When a family member dies, the survivors make figures, which are intended to house the spirits of the deceased during the official period of mourning. When that time is up, masks are used to drive away the deceased's spirit. Dogon rituals also make use of a Great Mask. This mask is never actually worn. Instead, a new one is made every sixty years to represent the Dogon's primordial ancestor.

Massinissa (240 BCE–148 CE) *Ruler of the ancient North African kingdom of Numidia*

The son of a chief who headed the Massyli society of NUMIDIA, Massinissa was reared in CARTHAGE. Although his father militarily supported Carthage against ROME during their battles on the Iberian Peninsula (present-day Spain), Massinissa aligned himself with Roman forces after 206 BCE, when the Carthaginians were routed and driven out of Iberia. He is noted for assisting Rome in other territorial invasions of Carthaginian-held lands. In return, Roman officials helped him to achieve his goal of becoming the next ruler of Numidia. Syphax, his political foe, was chieftain of the Massaesyl and strongly favored Carthaginian rule. It was Massinissa who provided the cavalry of 4,000 men to the Roman army that brought about Syphax's defeat.

In 201 BCE a treaty drawn up between Carthage and Rome had several important aspects that increased Massinissa's power. It was decreed that Carthage relinquish its fleet and territorial lands and be forbidden to engage in any warfare without notification to Rome. Notably, a written clause within the treaty stipulated that any lands formerly belonging to Massinissa's ancestors could be reclaimed. As a result Massinissa was given the lands formerly held by Syphax, including Zama, which allowed him to extend his rule over both the Massyli and Massaesyl. He effectively organized the settlement of these nomadic societies by replacing early methods of cultivation with the more advanced agricultural methods used in Carthage.

Massinissa established his capital at Cirta, the present-day Algerian city of Constantine, where he ruled for approximately 50 years. Even then Cirta had the urban flavor of a growing city. Carthaginian language, religious rites, and art forms were in evidence, and greater emphasis was placed on limited trading. The coins minted at Cirta and used for trade appear to have been made from bronze, lead, and COPPER.

Massinissa is noted for developing and maintaining his political alliance with Rome, thus ensuring that his political goals and aspirations were met. However, in 155 BCE his power was checked when a Roman commission came to Numidia to settle disputes between Numidian- and Carthaginian-held territories. Over Massinissa's objections, the commission decided to destroy Carthage, and the Romans subsequently burned the city to the ground and performed ritual ceremonies to curse the land.

Matara One of three cosmopolitan centers in ancient AKSUM (c. 300 BCE–600 CE). Situated on the high plateau region near the present-day border between ETHIOPIA and ERITREA, Matara overlooks the RED SEA coast. Once a leading cosmopolitan city, Matara had trade markets that attracted a cross section of ethnic and religious groups, including Egyptians, Kushites, Arabs, Jews, and Indians. Testifying to Matara's wealth and success are the ruins of former structures, including a small palace complex used by the nobility and stelae, or stone monuments. The recovery of Roman and Byzantine objects further confirms Matara's role in Aksum's trade network, which linked the Nile, the Mediterranean, and the Indian Ocean.

Matsieng Figure in TSWANA creation mythology.

Mauritania Present-day country of northwestern Africa, some 398,000 square miles (1,030,800 sq km) in area and bordered by ALGERIA, MALI, SENEGAL, and WESTERN SAHARA. Similar to the populations living in Mali and NIGER, the early inhabitants of Mauritania migrated south

as the SAHARA DESERT expanded. Excavations at Dar Tichitt reveal that, about 1500 BCE, the inhabitants began moving from large unprotected lakeside villages to smaller protected hilltop ones as the climate continued to become increasingly arid.

See also: MAURITANIA (Vols. II, III, IV, V).

Further reading: Anthony G. Pazzanita, *Historical Dictionary of Mauritania* (Lanham, Md.: Scarecrow Press, 1996).

Mauritius Island nation in the Indian Ocean, situated approximately 500 miles (805 km) east of MADAGASCAR and made up of the inhabited island of Rodrigues to the northeast and other scattered coral atolls, such as Cargados, Carajos, and Agalega. Mauritius was formed 10 million years ago by an active volcano, as can be seen by its Trou aux Certs crater in Curepipe and the lava boulders strewn about the island. None are active today, however.

Mauritius has a tropical climate and a wide range of terrain rising from low-lying plains to forests to a central plateau. The island is surrounded by a coral reef that is punctured in many places by wave action and the surf. The island appears to have been uninhabited during prehistoric times, although with all the traffic in the Indian Ocean trade corridor it is possible that traders visited the island on the way to other destinations.

See also: MAURITIUS (Vols. II, III, IV, V).

Mbuti (Bambuti) Group of peoples of the ITURI FOREST in present-day Democratic Republic of CONGO. They are among several peoples whose small stature has led them to be referred to as *PYGMIES,* a term that is no longer popular with anthropologists, who prefer to call them *Mbuti.* The Mbuti reach an average height of 4 feet 9 inches (1.4 m) and an average weight of 100 pounds (45 kg). They have long subsisted by hunting game and gathering fruit. The Mbuti are still masters of the jungle, hunting and gathering as they have for perhaps as long as 4,500 years.

One of the more unusual Mbuti customs is the practice of "sister exchange." In order to marry, a man must find a woman of his own clan to marry with a man of his prospective wife's clan.

The Mbuti peoples, whose groups include the Sua, Aka, Efe, and one called the Mbuti, are probably the original inhabitants of the great Ituri Forest. They are nomadic and territorial, with patrilineal clans of up to 100 members claiming segments of the forest. Clans migrate to new camps within their territory every three to four weeks to follow their herds and maximize their access to plant resources. Their beehive-shaped huts, made of phrynium leaves, require only a few hours to build, thus facilitating their nomadic lifestyle.

Traditionally, the Mbuti have maintained a symbiotic relationship with Bantu-speaking villages and agriculturalists of the southern sudanic belt. In exchange for crops, CLOTH, pots, axes, and SALT, the Mbuti hunt and gather FOOD for the villages, providing them with wild game, as well as honey, fruit, nuts, mushrooms, caterpillars, and termites from the forest. To the west the Sua and the Mbuti have aligned with the Budu people; the Aka live near the Mangbetu; the Efe inhabit the north and eastern areas of the forest with the Mamvu and Lese peoples; and the group that calls themselves Mbuti live near the Bila people in the heart of the forest. The Mbuti take up the languages of their village neighbors and try to stay within several hours' walking distance of them. Relationships between Mbuti individuals and their respective villages are common, and family ties between the two are passed from generation to generation.

The Mbuti were long thought to be only imaginary beings. Four thousand years ago, during ancient Egypt's Sixth Dynasty, an Egyptian expedition reported seeing "dancing dwarfs" in a "land of spirits." But even though the explorer Harkuf reportedly brought back an Mbuti for King Pepi II, these "dancers of god" were thought by most people to be imaginary. Later, tales of these small forest people appeared among the Greeks, Romans, and Arabs. However, since so many of the stories seemed too outlandish to be believed, smaller peoples generally were considered to be only a myth. It was not until the 1800s that the outside world finally had proof of the existence of the small-statured Mbuti.

Hunting techniques among the Mbuti vary. Some use bows and arrows or spears when they track large game, while others rely on nets to catch smaller animals like antelopes. Mbuti women often assist the villagers by tending the fields while the men hunt. Starchy foods like beans, YAMS, and squash acquired from the villages provide the bulk of calories in the Mbuti diet.

A formal political system or social hierarchy does not exist in Mbuti society. Instead, all disputes are settled by general discussions between the disagreeing parties. Music, song, and dance are important to Mbuti culture, particularly during INITIATION RITES or celebration of the gifts of the forest. They worship a forest deity but do not

seem to believe in an AFTERLIFE. The dead are buried near the temporary phrynium huts and are abandoned when the Mbuti move to a new location.

medicine Medicine and the medical arts took many forms in ancient Africa, from simple herbal cures to procedures that were the result of many years of study and training on the part of the healers. As early as the Predynastic Period, the ancient Egyptians practiced medical arts of one kind or another. Indeed, the BADARIAN CULTURE, as well as the subsequent NAQADAH I and II cultures, all seem to have been adept at treating illnesses and other disorders with herbs, drugs, and flowers. By Egypt's Third Dynasty (c. 2700 BCE) the training of physicians had become formalized, and the Egyptian population was treated by the world's first trained, practicing physicians. These healers treated diseases, performed surgery, and prescribed medicines. In large part, this was due to the effects of the legendary IMHOTEP (fl. c. 2650 BCE), who is purported to have been an architect, royal adviser, and, in the eyes of many, the world's first physician. As a minister to King Djoser (r. c. 2630–2611 BCE), it is believed that Imhotep established schools for doctors and produced 20 volumes of medical texts that helped spread the use of medicinal herbs throughout Africa.

In general, ancient Egyptians believed that illness and disease were the result of the activities of the demon goddess Sekhmet. Cures, they believed, were aided by the healing deities RA, THOTH, and ISIS. Because of this, the sick were given a combination of spiritual and physical treatments that included everything from specialized incantations to the applications of herbs and other medicines. The incantations were employed in order to rid the patient's body of any evil demon or god that might be causing a particular ailment. Physicians also gave out prescriptions, set broken bones, and treated wounds.

Though the ancient Egyptians were advanced in the techniques of embalming and doctors were known to have various surgical tools such as forceps, drills, and hooks, they did not have extensive knowledge of anatomy. As a result, with the exception of trepanning, which involved creating a small hole in the skull of an ill patient for the purpose of allowing disease to break free of the body, they performed only a few, relatively minor surgical operations

Among the specialists in medicine in ancient EGYPT were dentists, veterinarians, and gynecologists. The *Kahun Papyrus* (also called the *Kahun Gynecological Papyrus*), which is dated circa 1825 BCE, provides evidence that Egyptian physicians were capable of a wide range of procedures, such as recommending birth-control methods, performing pregnancy testing, and diagnosing reproductive problems. (Sour milk, crocodile dung, and honey were among the contraceptives prescribed.)

A record of disease, deformities, and treatments has been collected from the remains of mummies, art, and medical texts. Two of these texts, the *Edwin Smith Papyrus* and the *Ebers Papyrus,* provide remarkable insights into Egyptian medical practices.

Egypt may have been home to the invention of medicine as a healing practice, but Egyptian medical practices spread to other parts of Africa and influenced the healing arts there. In addition, other traditions and systems developed on their own. One of the most important of these has been linked with the YORUBA people, whose roots can be traced to ILE-IFE and beyond. Primarily herbal and homeopathic in orientation, Yorubic medicine is part of a long line of practice that extends from Africa through the Caribbean to the Americas.

Of equal interest is the tradition of the Djembe, a sacred drum used in healing ceremonies and other important rituals. Dating back to at least 500 BCE, the Djembe has been called "the healing drum" because of its use in traditional healing rituals.

Medinet Habu See DJEME.

Mediterranean Sea Largest inland sea in the world. The Mediterranean borders Europe, Asia, and Africa, and covers an area of 965,000 square miles (2,499,350 sq km). It connects with the Atlantic Ocean through the Straight of Gibraltar, in the west. It is also connected with the Black Sea in the northeast through the Dardanelles, the Sea of Marmara, and the Bosporus. In the southeast, it is connected to the RED SEA by the Suez Canal. In addition to the NILE RIVER, other rivers that flow into the Mediterranean include the Po, Rhône, and Ebro.

Since ancient times cultures have flourished around the Mediterranean. Egyptian merchants navigated it as early as 3000 BCE. The Egyptians were followed by the Aegeans and the HITTITES. Around the 12th century BCE, the PHOENICIANS began to gain prominence in the region. They established trading posts along the North African coast, the largest of which was CARTHAGE. By the fifth century BCE, an entire trading empire, known as the Punic civilization, was based around that city. By the first century CE, however, the Mediterranean was almost entirely dominated by ROME. The Romans called it Mare Nostrum, meaning "our sea." By the fourth and fifth centuries the Byzantine Empire controlled the area, and

eventually, following the conquests of the seventh and eighth centuries, Arabic-speaking peoples controlled the Mediterranean.

Medjay Mercenary troops and traders of the KUSH kingdom who served in the HYKSOS and Egyptian armies. The military relationship between Egyptian rulers and the Medjay appears to have begun sometime between 1700 and 1670 BCE, following the Hyksos invasion of EGYPT in the Seventeenth Dynasty. Based in KERMA in Upper NUBIA, some Medjay soldiers chose to join forces with the Egyptians in opposition to Hyksos rule. Ironically, it appears that the Medjay used many of the same superior weapons that initially led to the defeat of Egypt: bronze swords, powerful bows and arrows, and HORSES and chariots. These fierce Medjay warriors helped expand and develop Egypt's military power, enabling the Egyptian ruler Wadjkheperre (c. 1576–1570 BCE) to begin the process of dislodging Hyksos control. However, it was left to his brother, AHMOSE I (r. c. 1570–c. 1546 BCE), to finally end Hyksos rule and reunite Egypt under the Eighteenth Dynasty (c. 1570–c. 1070 BCE). In retaliation against Medjay soldiers who fought against Egypt, Ahmose waged war on Kerma until about 1450 BCE, when the capital and the Kush kingdom were destroyed. Even this did not obliterate the Medjay's history—it lived on in Egyptian vocabulary in the form of a word that meant "policeman."

Memphis Capital city of ancient EGYPT during the OLD KINGDOM (c. 2705–2213 BCE). Memphis is located south of the NILE DELTA, about 12 miles (19.2 km) from the modern city of CAIRO. Memphis is also the site of a number of ancient necropolises, or cemeteries, including Giza and SAQQARA.

According to legend, Memphis was founded in 2925 BCE by MENES, the king who is believed to have first united UPPER EGYPT and LOWER EGYPT. Memphis was located on the boundary of these two lands and was determined to be a good site for a capital. Its primary god was PTAH, for whom a prominent temple was built. The city was originally named "the White Wall," possibly in reference to the king's palace.

Memphis reached the height of its dominance during the Third and Fourth Dynasties (c. 2705–2465 BCE). Some of ancient Egypt's most spectacular monuments were built during this time. Djoser, the second king of the Third Dynasty, constructed the impressive STEP PYRAMID OF DJOSER entirely of stone.

During the MIDDLE KINGDOM (c. 2040–c. 1840 BCE) and the NEW KINGDOM (c. 1570–c. 1070 BCE), Memphis's influence remained strong, even after Thebes was established as the new capital. Later, during Greek and Roman rule, Memphis was second in importance only to ALEXANDRIA. Memphis was abandoned after the Arabs conquered Egypt in 640 CE.

Menelik I (c. 10th century BCE) *Ruler of ancient Aksum and the son of Queen Makeda and King Solomon*

Menelik was reared in the royal court of the Ethiopian kingdom ruled by Queen MAKEDA. His mother's adoption of JUDAISM led Menelik to observe the traditions of his mother's faith, and he journeyed to Jerusalem at the age of 13. It appears that Menelik may have rejected the opportunity to remain in Jerusalem, however. Instead, after being crowned king of ETHIOPIA by his father, Menelik left Israel, traveling with a number of Israelite nobles. According to the *Kebra Nagast,* Ethiopia's national epic, it was at this time that Menelik and the nobles stole the sacred ARK OF THE COVENANT from Solomon. This traditional account states that Menelik carried out the will of God by removing the Ark of the Covenant from Jerusalem.

Menes (Narmer) (r. c. 3050–2988 BCE) *Legendary first pharaoh of ancient Egypt*

Menes is thought to have ruled circa 3050 BCE and, according to Egyptian folklore, was responsible for uniting UPPER and LOWER EGYPT. He is also attributed with establishing the city of MEMPHIS, which served as his capital.

According to the third-century BCE historian MANETHO, Menes ruled for 62 years before being killed by a hippopotamus. Manetho also wrote that Menes originally came from THINIS, a province in Upper Egypt. Menes has been identified, if inconclusively, with ancient Egyptian kings known as Scorpion and Aha.

Menkaure (r. c. 2500–2480 BCE) *Fifth king of Egypt's Fourth Dynasty; son and successor of Khafre*

Although his pyramid is the smallest of the pyramids of Giza, it was made using costly Aswan granite. Inside the pyramid was a basalt sarcophagus and many fine, slate sculptures. These depicted Menkaure himself, his wife Khamerernebti II, and the god HATHOR. Menkaure's reign lasted about twenty years, and he was said to be a just and pious king. The epitaph on his pyramid—which

his son and successor, Shepseskaf, finished after Menkaure's death—noted that he was called *Man-kau-Ra*, or "the deified one."

Mentuhotep II (Nebhapetre) (r. c. 2040–c. 1957 BCE) *King of the Eleventh Dynasty who reunified Egypt*

Mentuhotep II, sometimes identified as Mentuhotep I, defeated Lower and Middle Egypt of the kingdom of HIERAKONPOLIS and became the first king of the MIDDLE KINGDOM. At the time of his ascension, Mentuhotep II ruled only UPPER EGYPT, which had been battling the kingdom of Hierakonopolis in LOWER EGYPT for about sixty years. During the 14th year of his reign, Mentuhotep II began a new military campaign against Hierakonopolis, and by 2000 BCE he had gained control of all of Egypt.

Once Egypt was unified Mentuhotep II established Thebes as his capital and built many monuments commemorating his military victories. His most memorable building is his funerary complex in Thebes.

Meroë Capital of the Kush kingdom established between the fifth and sixth cataracts of the NILE RIVER. Meroë was founded circa 500 BCE and became one of the leading cities of the ancient world. Its growth and development were linked to international trade, iron smelting, agriculture, and the expansion of its territories. Recovered evidence suggests that between the third and second centuries BCE, MILLET served as a chief diet staple. Flax and COTTON were cultivated and spun on an early type of loom.

Archaeologists had hoped that the recovery of a written script would help to address many aspects of Kushite culture. Known as Meroitic writing, it had apparently been inscribed on various monuments and stelae. (Stelae are stone monuments, of various sizes, that usually bear inscriptions regarding important people and their deeds.)

The pyramids of the kings of Kush at Meroë (300 BCE–300 CE), in ancient Sudan, were built on a smaller scale than the pyramids in Egypt's Valley of the Kings. *© Jonathan Blair/Corbis*

However, archaeologists have not yet been able to decipher the texts. As a result their attention currently is focused on various art forms recovered in the region. Meroitic pottery, considered by some to be among the most well-made pottery in the ancient world, shows evidence of Egyptian, Greek, and Roman influences, along with distinctive Kushite motifs. Highly detailed wall reliefs confirm the presence of CATTLE and HORSES in Meroë, and there are also reports that ELEPHANTS were trained there for use in military battles. Archaeologists have also recovered the ruins of a temple dedicated to Meroë's national deity APEDEMAK, and the speculation is that this temple signals a return to traditional cultural beliefs after a period dominated by foreign influences.

Various ruins in Meroë have also provided a strong sense of the kingdom's prosperity, including the recovery of a royal palace and bathing compound. There also was a proliferation of pyramids used for royal burials. (Although created using the same principal as Egyptian pyramids, Meroitic pyramids were built on a much smaller scale.) The homes of the wealthy appear to have been built in fired red brick, while other homes were constructed of more modest materials.

Ironically, the destruction of the kingdom may have been hastened by the use of its iron foundries. Dependency on timber for fuel most likely resulted in deforestation, which in turn had a significant impact on agriculture. Little is known about this period or the events that led to repeated clashes with Ezana, the king of AKSUM. However, in 350 CE, the Ethiopian king dispatched armies to Meroë, and the kingdom was razed. Its inhabitants may have retreated from the Ezana's army or they may have been absorbed by other ethnic groups that overran the region. Because of the uncertainty about who occupied the region in the aftermath of its destruction, archaeologists collectively refer to this population as the Nubian X-GROUP.

Ali Hakem, *Meroitic Architecture: A Background of an African Civilization* (Khartoum, Sudan: Khartoum University Press, 1988); Frank Snowden, Jr., *Blacks in Antiquity* (Cambridge, Mass.: Belknap, 1970).

Meroë, Island of   Part of the ancient kingdom of KUSH, with its northern end situated between the fifth and sixth cataracts of the NILE RIVER. Once the city of MEROË was established as the capital of Kush, the neighboring Island of Meroë became an important part of the kingdom's economic life. There, the combination of climate and fertile land produced a wealth of fast-growing agricultural crops, including tropical cereals such as SORGHUM and MILLET. The land also proved to be excellent for grazing CATTLE and other livestock.

Rich in hardwood timber, the Island of Meroë also contained numerous deposits of iron ore, and iron smelting flourished on the island. Axes and plows were produced for clearing and cultivating the land, while spears and arrows, used to defend the kingdom from invaders, were highly valued by traders. Resources and activities like these helped make Kush a major political and commercial competitor to both Egypt and the kingdom of AKSUM.

metallurgy   The art and science of extracting metals from ores and modifying the metals for use. Metallurgy has been practiced in Africa since ancient times. The early metalsmiths of SUMERIA, Babylon, and EGYPT were highly prized members of their society. These people were so valuable that invading armies made a special effort to capture them and carry them off.

At Gerza, on the NILE RIVER just south of the modern site of CAIRO, a civilization developed based on the metallurgy of COPPER. The people of this GERZEAN CULTURE had learned basic copper metallurgy from immigrants from MESOPOTAMIA by about 3500 BCE.

Copper was the basic metal used in ancient Egypt, as important to the ancient Egyptians as iron has been to the modern technological world. Early metal workers quickly learned that copper became less brittle and easier to shape if it was heated before hammering. Called *tempering,* this process put an edge on a tool or weapon that was both hard and durable. Tools made with this process were so strong that they were used to construct the pyramids and other great buildings of Egyptian civilization. The Egyptians also learned that copper was malleable, meaning that it could easily be hammered into useful and artistic shapes.

Copper was especially valued for its color and luster. As a result it often was used to create beautiful and intricate jewelry, such as rings, bangles, chains, necklaces, and hair ornaments. Copper was also used to decorate weaponry. Knife handles were inlaid with copper designs, spear shafts were bound with fine copper wire, and shields were embellished with burnished copper nails. The ancient Egyptians also used copper for more practical purposes, such as water pipes.

Many examples of copper craftwork were preserved in ancient Egyptian tombs. Most of the surviving relics are made of cast copper. The Egyptians are commonly credited with inventing the lost-wax method of casting metal, which uses as a mold a beeswax model of the object to be cast. Molten liquid copper is then poured into the mold, and the metal is allowed to cool and harden. The mold fi-

nally is broken away to reveal the cast metal object, which is finished with a chisel and other hand tools.

Iron was being worked in Anatolia as early as 2000 BCE, and it soon became a valuable commodity, both in wrought bars and in such weapons as dagger blades and spears. Iron technology spread across Africa along with the BANTU LANGUAGES, but it was not until the first century CE that the smelting of iron was common throughout the continent.

Around 1000 BCE, ancient Egyptians also developed the technology for making elementary forms of steel. Hot iron was hammered to expel impurities. Then it was broken into pieces and heated with wood chips in clay containers until the pieces of iron absorbed carbon and melted. This converted it into steel. The steel pieces could be reheated and forged into bars for later use. There is evidence that East Africans began producing steel in carbon furnaces around 1400 BCE.

See also: LOST-WAX PROCESS (Vol. II).

metals Various opaque, malleable substances used to create durable tools, works of art, and other goods. Metals, especially COPPER, bronze, GOLD, and silver, were an essential part of Egyptian culture from the earliest dynasties onward. To a large extent, the civilization of ancient Egypt depended on these metals.

Most copper is not found in a usable form. Instead, copper usually has to be extracted from ore, such as the mineral malachite. (Ore is a mineral or aggregate of minerals from which a substance, usually a metal, can be extracted.) The Egyptians mined malachite, preferring it over other copper ores like azurite and cuprite because of the ease with which usable copper could be extracted from it. The Egyptians mined for copper in the Sinai Peninsula on such a large scale that it can be considered the first real industry of the ancient world

The Sumerian city-states were the first great metal-using civilization. The Sumerians traded up and down the Euphrates River, transporting copper from Armenia to the north. The Sumerian word for copper, *urudu,* is also used for the Euphrates, which was their "copper river."

The process of extracting copper from ore is known as smelting, and it requires a fire that is much hotter than a normal cooking fire. In order to achieve this intense heat, early metalsmiths had to design intricate bellows systems and special ovens. Smelting was also used to make bronze, an alloy, or mixture of metals, made from copper and tin. Bronze appeared between 3000 and 2500 BCE, beginning in the Tigris-Euphrates delta. Although it is possible that independent development of bronze occurred in different regions, it is more likely that the bronze culture spread through trade and migration, beginning in the Middle East and then moving on to Egypt, Europe, and possibly China.

Brass, an alloy of copper and zinc without tin, did not appear in Egypt until about 30 BCE, when it was rapidly adopted throughout the Roman world. Brass was especially valued for making coins.

The ability to work iron probably first emerged in the Near East, in Egypt and Mesopotamia. Several drops, special forges used to harden metal, have been found in Egypt and have been dated to about 3500 BCE.

Middle Kingdom (c. 2004–1840 BCE) Eleventh and Twelfth Dynasties of ancient EGYPT. Following the period of decline known as the First Intermediate Period (c. 2213–c. 2040 BCE), the Eleventh Dynasty emerged as a powerful and unified force under the leadership of MENTUHOTEP II.

Founded by Amenemhet I (r. c. 1991–1950 BCE) the Twelfth Dynasty continued this period of prosperity. The dynasty included such notable pharaohs as Sesostris II and Amenemhet II and III, who oversaw Egypt as it regained the wealth, power, and glory that it had once had during the OLD KINGDOM. A hallmark of the era was the Egyptian conquest of NUBIA (c. 2000 BCE). By the 17th century BCE, however, the kingdom was in decline. This culminated in what has been come to be called the Second Intermediate Period (c. 1820–c. 1570 BCE), an era during which Egypt was dominated by the HYKSOS.

millet Edible cereal grain widely cultivated in Africa; altnernatively called *gero* and *acha*. Easy to cultivate and quick to grow, millet seeds are extracted from Poaceane grass and its many varieties. Similar to SORGHUM, millet seeds were domesticated in various regions of Africa as far back as the late STONE AGE, circa 18,000 BCE, and even earlier.

Pearl millet (*Pennisetum*), which originated in the western Sahel, is one of the heartiest types of this grain, and it comes from a variety of grass known to grow as tall as 10 feet (3.05 m). The early cultivation of pearl and bulrush millet has been linked to the inhabitants living on the border areas of the SAHARA DESERT. Archaeologists

have documented its use as far back as between the second and third millennium BCE, at a site known as Dhar Tichitt, where these crops were likely to have been planted in response to the growing impact of desiccation. Another variety of millet is known as eleusine (*Eleuisine coracana*). Described as a type of finger millet, it is indigenous to eastern Africa, particularly ETHIOPIA, where archaeologists have identified its cultivation in the former kingdom of AKSUM.

Ground into flour by women using stones, or *kerns,* millet is rich in protein and has a bitter, nutty taste. It has been traditionally cooked as porridge or used as a side dish with meats and stews. It also was fermented to make beer. The enduring popularity of millet in Africa stems from the variety it provides and its ability to flourish under extreme environmental circumstances, including drought.

Mokele-mbembe Giant mythological animal believed to live in West Africa. Its name comes from a Lingala word meaning "one that stops water." According to MBUTI lore, Mokele-mbembe has the body of an elephant, a long neck, one horn, three-toed claws, and an enormous tail. Although believed to be a vegetarian, Mokele-mbembe has been purported to attack HIPPOPOTAMUSES and small boats.

Mokele-mbembe is said to inhabit the swampy Likouala region of the present-day Republic of the CONGO, going on land only to travel or eat. Although proof of its existence has not been confirmed, some believe Mokele-mbembe to be closely related to sauropod dinosaurs. In recent times, the native people of Likouala, a region that has not changed much since the age of dinosaurs, have identified Mokele-mbembe with pictures of sauropod dinosaurs.

Mokele-mbembe is said to be between 16 and 32 feet (4.9 and 9.8 m) long, not including a neck between 5 and 10 feet (1.5 and 3 m) long, and a tail that is also between 5 and 10 feet (1.5 and 3 m) long. It is reputed to have reddish-brown skin and a ruffled hood of skin on its neck, like the comb of a male chicken. According to the Mbuti, Mokele-mbembe feeds mostly on the malombo plant. In the 20th century, a number of scientists attempted to confirm Mokele-mbembe's existence but were unable to do so.

money and currency Money developed independently in different parts of the world, eventually replacing barter as the principal means of trade. In ancient Africa there were several driving forces that spurred the development of common currencies. For example, rulers imposed taxes, and prospective bridegrooms were required to compensate the head of the bride's family for the loss of their daughter's services (this was called the BRIDE-WEALTH). Also, payments of tribute or sacrifices of one kind or another often were made to fulfill religious obligations. Many societies even had laws requiring people who committed crimes of violence to compensate their victims (or victims' families) in one way or another.

Types of Money To accomplish all this, ancient Africans, like people all over the world, experimented with different types of money. At first, commonly desired commodities were used. This *commodity money,* as it is called, had value independent of its value as money. By around 9000 BCE, African people were herding CATTLE and growing crops, and various African societies began to use both cattle and grain as commodity money.

COWRIE SHELLS and manillas were other common forms of money in ancient Africa. A type of mollusk shell found in the shallow waters of the Pacific and Indian oceans, cowries are both rare and beautiful. As a result they acquired a value that often led to their use as decorations and ornaments. They also were used as money, and they represent one of the most widely and longest-used currencies in history. Manillas, which are ornamental metallic objects worn as jewelry in West Africa, also were used as money for thousands of years.

Since the domestication of animals generally came before the cultivation of crops in ancient Africa, it is likely that cattle are the oldest form of African money.

Precious METALS, which had ornamental uses before they were adopted for use as money, served as currency in many ancient societies. As early as 2500 BCE, for example, the peoples of Mesopotamia were using silver as a means of payment. Similarly, Egyptian tomb paintings show gold rings being exchanged according to weight, indicating that these were being used as a type of currency. Precious metals in weighed quantities were a common form of money in ancient times; there was a gradual transition to the use of quantities that could be counted (such as coins) rather than weighed.

Money in Ancient Egypt The monetary history of ancient EGYPT appears to be based on AGRICULTURE. Egyptian farmers deposited their grain in local warehouses for safety and convenience. This practice eventually led to a vibrant banking industry.

When Egypt came under the rule of the PTOLEMIES (c. 305–c. 30 BCE), the traditional system of warehouse banking reached a new level of sophistication. The Ptolemies linked the regional warehouses into a network and established a central bank in ALEXANDRIA, where all the accounts were kept. Farmers continued to deposit their grain in local warehouses, but payments were now transferred from one account to another all over Egypt without any paper actually changing hands.

Grain banks continued to enable local transactions even after coins were introduced. However, in an effort to economize on the use of the precious metals that went into coins, the Egyptians used coins primarily for foreign purchases and for activities involving the military. (This was also a tacit recognition that grain deposited in a bank in Egypt would be of little use to a third party in Asia Minor.) Eventually, however, a metal-based monetary system replaced grain as a medium of exchange.

The Use of Gold   Gold eventually emerged as the preferred money, with virtually a universal appeal to peoples across the world. In addition to its aesthetic beauty, gold resists corrosion and does not change color as it ages. There are other characteristics that make gold suited to monetary transactions, including its associa-

Cowrie shells, one of the earliest forms of money in ancient Africa, were valued because they were beautiful and difficult to obtain. *© Chris Hellier/Corbis*

tions with magic, divinity, and the sun. For these and other reasons, gold ultimately became a common denominator and was generally accepted everywhere, unlike cattle, grain, salt, or cowrie shells, all of which had limited value outside of the local areas in which these commodities had appeal. As gold (and silver) money grew in popularity, other types of money were used less frequently.

Money was one of several criteria, along with owning livestock and the ability to mobilize militias, that enabled societies to increase in size and complexity. In western Africa, a number of kingdoms emerged, including GHANA and MALI, that depended on their control of the gold trade routes linking the land south of the SAHARA DESERT to North Africa and the world.

See also: GHANA EMPIRE (Vol. II); MALI EMPIRE (Vol. II); MONEY AND CURRENCY (Vols. II, III, IV, V).

monkeys   With their intelligence and resemblance to human beings, monkeys have often attracted the attention of people in Africa. As a form of tribute, ancient Nubians would give monkeys to the Egyptians, who viewed these animals with great respect. In their mythology, African peoples often portrayed monkeys as servant guardians. To make crops grow, for example, the BAMANA carved masks representing the monkey. Among the Baule people, the Gbekre, a figure that was half-man and half-monkey, was a spirit that protected good people in the AFTERLIFE and punished the wicked ones. The Gbekre was often represented in the carved sculptures made by the Baule.

Monophysite   Referring to a fourth- and fifth-century theological controversy based on the belief that Jesus Christ has a single nature, which is divine; it is also known as Eutychianist, after the Greek monk Eutyches (c. 378–c. 454 CE), one of its early proponents. The beliefs of Monophysite theology were declared heretical by the Council of Chalcedon but remained a central tenet of the COPTIC Church.

The word *monophysite* is from two Greek words meaning "one nature." Belief in the single nature of Jesus Christ was strong among Coptic Christians, whose church was governed by the Patriarch of ALEXANDRIA, in Egypt. However, at the Council of Chalcedon in 451 CE, church leaders from the rival partriarchates of ROME and Constantinople upheld the church's traditional belief in two separate human and divine natures within Jesus Christ and declared the Monophysite belief heretical. The declaration of the council caused a schism, or split, within the church; some Coptic Christians submitted to the council's authority, but many broke with the council and set up an independent Coptic church with its own bishops and

clergy. Monophysite congregations continued to exist thereafter in EGYPT, Syria, and Mesopotamia.

Further reading: W. H. C. Frend, *The Rise of the Monophysite Movement: Chapters in the History of the Church in the Fifth and Sixth Centuries* (Cambridge, U.K., University Press, 1972).

monotheism   Belief in a single supreme being. Along with pantheism, monotheism is one of two critical elements found in indigenous African RELIGION, thought, and philosophy. Molded to fit cultural identity, place of origin, and language, the same supreme being that was known as OLORUN among the YORUBA was called Mwari among the SHONA, or Chukwu in Igboland (in present-day NIGERIA). Numerous origin myths surround the concepts of these supreme beings, providing an important way for religious beliefs to be passed from generation to generation. Rituals that were performed on a daily or seasonal basis by community-based mediums, prophets, or priests served to reinforce these beliefs and concepts. These rituals often called for the use of special shrines and altars.

Further reading: David Klinghoffer, *The Discovery of God: Abraham and the Birth of Monotheism* (New York: Doubleday, 2003); Jacob Neusner, *Three Faiths, One God: The Formative Faith and Practice of Judaism, Christianity, and Islam* (Boston: Brill Academic Publishers, 2002).

Morocco   Present-day North African country, about 279,400 square miles (723,600 sq km) in size, that is bordered by ALGERIA, WESTERN SAHARA, and the MEDITERRANEAN SEA. The name *Morocco* derives from Marrakech, the first of four imperial capitals established by the Almoravids in the middle of the 11th century.

The original people of present-day Morocco were the BERBERS, who inhabited the region as long ago as the second millennium BCE. Like much of North Africa, the area fell under the influence of Phoenicia, when, as early as the 12th century BCE, the PHOENICIANS established trading posts along Africa's Mediterranean coast. From these posts there eventually developed an empire that stretched from North Africa to the Iberian Peninsula—an empire that was dominated by CARTHAGE (near present-day TUNISIA). The fall of Carthage in 146 BCE left the area under the control of ROME.

Roman rule lasted for more than 500 years, coming to an end when the VANDALS invaded North Africa in 429 CE. This was followed, beginning in 533, by a period during which Morocco was under the control of the Byzan-tine Empire. Ultimately, however, Morocco was swept up in the Islamic invasions of the seventh century, and the area fell to Arabic-speaking Muslims, in 682.

Mozambique   Country located in southeastern Africa bordered by SOUTH AFRICA and SWAZILAND to the south, ZIMBABWE and ZAMBIA to the west, and MALAWI and TANZANIA to the north. Mozambique covers 297,800 square miles (771,300 sq km) and has a 1,750-mile (2,816-km) coastline on the Indian Ocean. While the coastal regions are generally low-lying, the elevation in the central and northwestern areas of the interior rises to 5,000 feet (1,524 m), with several higher points. The ZAMBEZI RIVER and the LIMPOPO RIVER flow through Mozambique to the Indian Ocean, and Lake Malawi (Lake Nyasa) forms the border with Malawi.

As early as 2 million years ago, HUNTER-GATHERERS were living in present-day Mozambique. About 2,000 years ago Bantu-speaking peoples began migrating into the area in small groups, intermarrying with the local populations amd bringing iron technology to the region. As the population grew and spread, coastal urban centers arose, eventually growing into trading ports like the one at Sofala. Merchants at these ports participated in the Indian Ocean trade.

See also: INDIAN OCEAN TRADE (Vol. II); MOZAMBIQUE (Vols. II, III, IV, V); SOFALA (Vols. II, III).

Further reading: Mario Joaquim Azevedo, Historical Dictionary of Mozambique (Lanham, Md.: Scarecrow Press, 2003); Malyn Newitt, *A History of Mozambique* (Bloomington, Ind.: Indiana University Press, 1995).

mummy   For the ancient Egyptians, the mummification process, by which the body of a dead person was preserved prior to burial, was closely linked to their religious beliefs concerning the AFTERLIFE. The process began with the ritual cleaning of the corpse. An incision was made into the side of the corpse, and the vital organs were removed, treated with preservatives, and placed in special jars. The body was then placed on an embalming table and covered with dessicating (drying) preservatives. After 40 days the corpse was wrapped in linen bandages. In all it took 70 days for a body to be properly mummified.

Although some mummies of ancient EGYPT were destroyed over the centuries by robbers, many still exist, some dating back 5,000 years. The best-preserved mummies usually belong to pharaohs, who had elaborate funerals and burials. Mummies of some of the later

African music is often discussed in three broad categories by musicologists. Movement, for example, has always been an essential part of music, and in many societies, song is inseparable from DANCE. Timing is another category that has been discussed by musicologists because it provides African music with a distinctive flavor and a cohesive element that allows for the layering of complex polyrhythmic patterns. Tonality is the last category, and it includes natural harmony and pitch levels akin to human speech. The YORUBA of present-day NIGERIA, for example, use a polyphonic tone that reflects their own language patterns. The resulting sound has dual or overlapping melodies and is viewed as a unique art form. In some societies, music substitutes for speech and is punctuated by movement or facial expressions that may be used to educate or to entertain.

Evidence of how long music has been present in Africa comes from one of the oldest surviving relics from ancient times, a rock painting made in Tassili-n-Ajer in present-day ALGERIA. This painting depicts music and dance styles that some sources say are comparable to modern movements. Archaeologists note that this scene dates back to the time of Africa's Neolithic hunters (c. 6000 to c. 4000 BCE). An early form of a harp with six strings has been depicted on a rock painting, dated circa 700 BCE, uncovered in the SAHARA DESERT. The instrument was apparently in common use when the painting was made.

This harp and its many variations belong to the category of African instruments known collectively as *chordophones,* which included simple music bows in ancient times and, in later periods, harps, lutes, and zithers. Another category of instrument that is common in Africa but varies among regions is the *aerophone*. Included are such instruments as reeds, bullroarers, flutes, horns, and oboes. Their use is sometimes practical. In Lesotho, for example, herders use a *lesiba,* or mouth bow, to graze their CATTLE. *Membranophones* encompass primarily DRUMS in various forms, such as the ones depicted in terra-cotta in the ancient Yoruba city of IFE. Drums were often associated with the royal court and were used to accompany unique praise-songs. They were also used for announcements concerning the king or queen and the society over which they ruled. *Indiophones* are rhythmic instruments such as rattles or bells and include *lamellophones* like the *mbira,* or thumb piano, which was reportedly used in religious rites and SPIRIT POSSESSION dances, as well as for entertainment. The human voice has always been considered one of the greatest of all instruments in Africa.

Like instrumental music, songs have often been described as multilevel or polyrhythmic in structure. Some songs held central or controlling themes while relying on repetitive phrases. RELIGION undoubtedly influenced music since it has played an integral role in nearly all RITES OF PASSAGE from birth to the grave. Music was also influenced by community, and among the most notable features of

The mummified body of Ramesses II (r. 1304–1237 BCE) is located in the Mummy Room at the Egyptian Museum in Cairo. © Richard T. Nowitz/Corbis

pharaohs are so well preserved that it is possible to determine some of the pharaohs' medical problems. For example, scholars have learned from the mummy of RAMESSES II that the king suffered from both poor circulation and arthritis. Originally, only kings were mummified, but later their courtiers were also preserved to serve the kings in the afterlife. Sacred animals, such as cats, DOGS, and hawks, also were embalmed.

music African music has often been described as highly innovative. Its wide diversity and inherent power reportedly stem from the keen ability of early societies to translate the sounds of the natural world into a vital social framework. These efforts form the underlying structure of African music and impart a unique vitality that lends itself to improvisational patterns.

African music are the call and response associated with vocal skills or instruments. This style of music may have derived from the simple "call and response" of pastoralists, agriculturists, or other workers in the ancient world.

N

Naga, temples at Great center of worship in the steppe-country south of MEROË. Among the key figures in the construction of the complex were King Natakamani (r. c. 15 BCE–c. 15 CE) and his coruler Queen AMANITARE (c. 12 BCE–c. 12 CE), who were among the greatest builders in the Meroitic Period. Their names have been found on many monuments, including the eight temples they constructed at Naga. Among these is the Temple of AMUN, built for the high god worshiped by Egyptians and Nubians alike. This temple, despite its recognizable Meroitic features, appears to have been influenced by both Roman and Egyptian ARCHITECTURE, the latter of which is particularly evident in its decorated entrance.

The most famous temple at Naga, however, is the Temple of the Lions, with its impressive wall reliefs paying tribute to APEDEMAK, the warrior god of Kushite origin. (See photo on facing page.) Lions played an important, though presently uncertain, role in the religious ceremonies of royal officials at Meroë. Other Kushite gods were immortalized at Naga as well.

King Natakamani and Queen Amanitare's efforts resulted in the last of the great construction projects during the Meroitic period. Several of their temples have survived into the modern era.

Namibia Mineral-rich country located in southwest Africa on the Atlantic Ocean. The German colony of South West Africa from 1884 to 1915, Namibia measures 318,300 square mile (824,400 sq km) in area and has a mostly arid and semiarid climate. It is bordered by ANGOLA, BOTSWANA, and SOUTH AFRICA. The most influential groups in Namibia include the Ovambo (who make up about 50 percent of the population), the Herero, and Nama, as well as Afrikaner and German minorities.

The land of Namibia is dry because its weather patterns bring rain from the faraway Indian Ocean on the other coast. The monsoon patterns of the Indian Ocean send rain across the Drakensburg Mountains as they pass from the east to the west depositing rain in present-day South Africa. By the time they reach the western portion of present-day Botswana and Namibia, the rains are all but nonexistent. Consequently these lands are marked by the Namib Desert, on the coast, and KALAHARI DESERT, in the interior. The sand dunes of the Namib Desert rise 500 feet (152 m) over the beach and the coastline. Because of its forbidding coastline, early European explorers bypassed the region. However, they could not escape its dangers. The nearby Humbolt current parallels the coast, bringing icy water up from the Antarctic Ocean, producing fog along this coast. Later, the coast was called the "Skeleton Coast" because of all the shipwrecks caused by the fog.

The region's earliest inhabitants were probably the SAN, who settled in the area as early as 8000 BCE. The San extended family organization allowed them to adapt to the severe landscape. The San later converged with the Khoi peoples to form the ethnic groups known as the Khoikhoi. The Khoikhoi raised livestock and were pottery makers. By 500 CE Nama herders moved into the region, documenting their lives there with their ROCK ART.

On the wall of the first-century BCE Temple of the Lions at Naga, in present-day Republic of the Sudan, the lion-headed god Apedemak is depicted receiving offering. © *Paul Almasy/Corbis*

Naqadah I and II Two early cultures of predynastic EGYPT dating roughly from 4200 to 3050 BCE; named for the town in UPPER EGYPT in which artifacts from these cultures were first excavated. Also known as the AMRATIAN and GERZEAN cultures, respectively, the Naqadah I and II periods followed the earlier BADARIAN CULTURE in Upper Egypt. Excavations have revealed advanced cultures that apparently possessed skills such as POTTERY making and mud-brick architecture.

The Naqadah I, or Amratian period (c. 4200 BCE), was clearly influenced by the Badarian culture, which was the earliest known Egyptian civilization to farm, hunt, and mine. Like the Badarians, the people of Naqadah I based their economy on AGRICULTURE, hunt-

ing, FISHING, and CATTLE raising. Unlike the Badarians, however, the people of the Naqadah I period lived in fairly large settlements, usually in homes made out of mud-brick.

The pottery of this era also was more highly developed, usually featuring black-topped red or dark red burnished ware. Whereas Badarian pottery was decorated with simple bands of paint, the Naqadah I artisans used geometric designs and pictures of animals on their ceramics, either painted on or carved into their surfaces. One well-known fragment shows a drawing of a RED CROWN, the earliest known representation of the red pharaonic crown of Upper Egypt.

The Naqadah II, or Gerzean, period dates back to 3400 BCE and was a further development of the Naqadah I period. This culture was based around Naqadah and HIERAKONPOLIS in Upper Egypt and Sayala in NUBIA. Artifacts from this period include pottery made from buff-colored desert clay decorated in dark red paint, a tube-shaped drill used for stonecutting, and flint knives. Naqadah II culture also developed irrigation systems and traded with people from other regions. The presence of foreign materials like lapis lazuli indicates that trade was conducted with places as faraway as present-day Afghanistan.

As the Naqadah II culture developed, displays of wealth increased. In particular, graves became increasingly elaborate and featured remarkable vases made of stones that came from remote areas of the Eastern Desert. The tombs also included large ceremonial knives as well as cosmetic palettes decorated with elaborate designs in the form of animals, birds, or fish.

Around this time, pictographic writing first appeared and was inscribed on pottery, slate palettes, and stone. These objects usually bore the iconography of the earliest known line of pharaohs. The pottery indicates that late in the Naqadah II period (c. 3200 BCE), a dominant political force was already beginning to form the first united kingdom of ancient Egypt. The resulting dynastic culture, which followed the Naqadah II period, was heavily influenced by its predecessor.

Narmer Palette Slate tablet dating from the First Dynasty (c. 3050–c. 2988 BCE) that depicts the legendary Egyptian king Narmer uniting EGYPT. The tablet, measuring about 25 inches (63.5 cm) tall, was discovered in HIERANKOPOLIS, the capital of Egypt during predynastic times. It is hypothesized that the palette was originally used as a table on which cosmetics were pulverized. The engraving shows Narmer defeating his enemies and creating one state from UPPER EGYPT and LOWER EGYPT. On one side of the palette, Narmer is shown wearing the WHITE CROWN of Upper Egypt and on the other the RED CROWN of Lower Egypt.

The palette depicts Narmer as a powerful figure. Near the top, he is associated with bulls. Further below he is portrayed in a procession, passing in front of the decapitated corpses of ten enemies, lying on the ground with their heads between their legs. Over the corpses, a ship is drawn that contains a harpoon and a falcon. These images are believed to symbolize a conquered region in Lower Egypt. On the back of the palette Narmer is shown ready to strike a foe, whom he is grabbing by the hair.

Some scholars believe that Narmer was MENES, the king traditionally associated with Egypt's unification circa 3050 BCE. Since the unification might have taken place over several generations, though, other scholars speculate that the figure of Narmer represents several kings, including his probable successor, Aha.

Nefertiti (Nefer-Nefer-Aten) (c. 1402–c. 1367 BCE)
Queen of ancient Egypt's Eighteenth Dynasty and "Great Royal Wife" of Akhenaten (Amenhotep IV)

Nefertiti played a prominent role as Akhenaten's queen. Along with her husband, she frequently presided over the rites connected with the worship of the god ATEN. The Aten rites represented radical changes in Egypt's state religion of the time and are sometimes referred to, collectively, as the AMARNA PERIOD, or the Amarna Revolution. Depictions of Nefertiti participating in the cult's religious observances were part of the temples at el-Amarna, the new capital that Nerfertiti and AKHENATEN (r. c. 1379–c. 1364 BCE) established for the cult. In the service of the new religion, Nefertiti was renamed Nefer-Nefru-Aten, meaning "Beautiful is the Beauty of Aten."

However important a role Nefertiti may have played in the early years of Akhenaten's reign, it appears that, by the 12th year, she had fallen into obscurity or died. At that time, one of her daughters, Merytaten, assumed the role of Akhenaten's principal wife. There is evidence that Nefertiti was buried in the royal tomb at Amarna, but her remains have never been found.

Renowned as a great beauty in her own time, Nefertiti's fame grew with the discovery of a painted limestone bust that is now in the Egyptian Museum in Berlin, Germany. Dramatically depicting Nefertiti's graceful and delicate features, the statue is one of the most familiar of the Egyptian art treasures to have survived from that period.

Nekhbet Vulture-goddess of ancient Egyptian mythology. In Egyptian ART Nekhbet was often portrayed as a vulture or as a woman with a vulture's head, wearing the WHITE CROWN of UPPER EGYPT.

Nekhbet was the protector of the kings of Upper Egypt, often portrayed with her wings spread above the pharaoh, and she was often associated with the cobra-goddess, BUTO. Together they guarded the pharaoh and symbolized a united Egypt.

Nekhbet was also a goddess of childbirth and was said to be present at the births of gods and kings. In ancient times she was worshiped in al-Kab and in HIER-AKONPOLIS (also known as Nekhen), on the west bank of the NILE RIVER.

Neolithic Age Period that witnessed the advent of a series of sophisticated and specialized stone tools. The era most likely began shortly after the area comprising the present-day SAHARA DESERT began to dry up, beginning about 8000 BCE. In addition to stone-ground and polished tools, other innovations of the Neolithic Age included the invention of baskets and POTTERY, which took place by about 2000 BCE. These new creations allowed people to store and transport goods. Another innovation—permanent huts for shelter—came at about the same time. Perhaps the most important advance, however, was the discovery that animals could be domesticated and seeds could be planted and cultivated. This helped transform HUNTER-GATHERERS into herders and farmers.

As a result of these innovations, Africans were no longer limited to small bands that seasonally trekked through the wilderness in search of wild animals, wild plants, and water. Larger, more sophisticated and organized settlements could now be located close to bodies of water. Likewise, FOOD could be preserved both for human consumption and for the feeding of livestock. In short, life could be sustained year-round, usually without fear of drought or flood.

These changes led to larger concentrations of people, which meant that some people could be assigned to such tasks as producing pottery or baskets. Others could take on the jobs of making weapons and tools, administering justice, running the government, or making war. Along with the Neolithic invention of writing and the discovery of methods for smelting metal ores, these developments would forever change of mankind, allowing civilizations to emerge in Africa and in many other regions of the world.

New Kingdom (c. 1570–1070 BCE) Following the glories of the MIDDLE KINGDOM (c. 2040–1668 BCE), EGYPT entered a period of decline and foreign domination known as the Second Intermediate Period, which lasted from approximately 1650 to 1575 BCE. The emergence of the Eighteenth Dynasty, however, saw the re-emergence of a revitalized Egypt, during which the Egyptians drove out the HYKSOS, who had dominated them since the end of the Middle Kingdom. This coincided with a realignment of the forces within Egypt's state religion that brought to the forefront the god AMUN. As the New Kingdom went on, Egypt expanded its territories in Asia, eventually, under the pharaoh Thutmose III, reaching the banks of the Euphrates River. The period also saw Egypt's renewed influence in the lands to the south, as it reestablished control over KUSH and Nubia.

The New Kingdom was also marked by what has become known as the AMARNA PERIOD, during which the pharaoh Amenhotep IV changed his name to AKHENATEN and attempted a wholesale transformation of Egyptian religious life. This included everything from the institution of an entirely new state religion based upon monotheistic principles to the movement of the seat of governmental power from Thebes to el-Amarna, 300 miles (480 km) to the north.

Akhenaten's actions, which took place during the mid-14th century BCE, plunged the nation into unrest, which, despite the era's many artistic achievements, doomed the Amarna experiment. The turmoil was quelled only upon Akhenaten's death and the succession of the young king TUTANKHAMUN, who began the process of reinstituting the traditional Egyptian religion. This process was continued by HOREMHEB, the last of the dynasty's kings.

The New Kingdom managed to survive for several hundred more years, flourishing under such noted rulers as RAMESSES II and the other warrior-kings and monument builders of the Nineteenth Dynasty. Ultimately, however, like the OLD KINGDOM before it, the New Kingdom fell victim to strife between ambitious officials and priests, and the nation fell into disarray.

Tyldesley, *Egypt's Golden Empire: The Age of the New Kingdom* (London: Headline Book Publishing, 2001).

Niger Landlocked country covering approximately 458,100 square miles (1,186,500 sq km) of mostly arid territory in eastern West Africa. Today Niger is bordered to the north by ALGERIA and LIBYA, to the east by CHAD, to the south by NIGERIA and the Republic of BENIN, and to the west by BURKINA FASO and the Republic of MALI.

Prior to the NEOLITHIC AGE (beginning c. 8000 BCE), the Niger region was relatively wet, very unlike the inhospitable climate that exists there today. Rock paintings and etchings of animals made by hunting and pastoralist peoples have been found at numerous sites in the desert areas of Niger. One expertly rendered sandstone engraving, discovered in 1997, is of a giraffe nearly 18 feet (5.5 m) tall, and more than 800 smaller etchings have been found, as well. In the first century CE, Roman expeditions from the northern provinces crossed the Sahara and explored the Aïr Massif region but did not develop any settlements. Since the Sahara was becoming increasingly dry, few permanent settlements were established until the fifth century CE, when TUAREGS probably began moving into the region. Within a few centuries the Tuaregs were dominating the emerging trans-Saharan caravan routes.

Niger-Congo languages One of the four major families of African languages. Niger-Congo is comprised of more than 900 separate languages and is the most widely distributed of all the African LANGUAGE families and is spoken in all parts of the continent. Most of the indigenous languages of Central and southern Africa belong to the Niger-Congo family. Speakers of Niger-Congo languages cover an area that stretches through virtually all of West Africa south of the SAHARA DESERT—from SENEGAL to SOUTH AFRICA. In addition, migration of Niger-Congo peoples brought this language family as far as eastern and southern Africa. The Niger-Congo family includes six related branches: West Atlantic, Mande, Gur, Kwa, Benue-Congo, and Adamawa-Eastern.

Languages in the West Atlantic branch include Wolof, spoken in Senegal; Temne, a language of SIERRA LEONE; and FULA, a language spread by NOMADS south of the Sahara from Senegal to present-day CHAD, though primarily in present-day NIGERIA and GUINEA. The best-known Mande languages are Mende, a Liberian tongue, and Malinke, of MALI, as well as languages spoken along the valley of the NIGER RIVER and in Sierra Leone. The Gur, or Voltaic, branch of the Niger-Congo family includes Mossi, a Burkina Faso tongue, as well as Dagomba and Mamprusi, languages from northern GHANA. The best known of the Kwa tongues are YORUBA and ASHANTI.

The BANTU LANGUAGES, spoken throughout Central and southern Africa are the best known of the Benue-Congo languages. Others include Tiv, Jukun, and Efik, which is spoken in Nigeria and CAMEROON. The Adamawa-Eastern branch includes Banda, Zande, and Shango, spoken primarily in Nigeria and Cameroon.

Kordofanian, the primary group of languages of southern Kordofan (the central sudanic belt), is often classified as a seventh branch of the Niger-Congo family. Made up of about 30 languages, classified in five small groups (Koalib, Tegali, Talodi, Tumtum, and Katla), the Kordofanian is considered by some linguists to be a completely separate language family.

Like many African tongues, Niger-Congo languages employ different tones to indicate shades of meaning. Nouns are divided not just according to gender (masculine, feminine, or neuter), as in many Indo-European languages, but according to as many as twenty classes—for example, human beings, liquids, and animals. Each noun class employs a unique pair of affixes (i.e., suffixes or prefixes) to indicate singular or plural. Verbs consist of a verb root, which seldom changes, with attached particles or auxiliary verbs used to denote tense or mood. (The use of the infinitive, for example, indicates the future tense in many Niger-Congo languages.)

Like most African languages, the Niger-Congo group has maintained ORAL TRADITIONS. With the significant exceptions of Swahili (a major Bantu tongue) and Vai—a Mande tongue that developed an indigenous script during the modern era—the Niger-Congo languages remained entirely unwritten until quite recently. Similarities between the Niger-Congo tongues and members of the family of NILO-SAHARAN LANGUAGES suggest that these two families may share the same ancestor language.

Niger Delta Largest river delta in Africa. Located in NIGERIA, the delta covers about 150 miles (241 km) of coastline and extends over about 14,000 square miles (22,531 sq km). The delta lies at an elevation of 500 feet (152 m) below sea level. It is made up primarily of mangrove swamps, which join with freshwater swamps to the north. It is through a series of channels in the Niger Delta that the Niger River flows into the Gulf of Guinea.

At the town of Lokoja the Niger merges with its main tributary, the BENUE RIVER. Together, they form a stretch of river measuring 2 miles (3 km) in width. At Aboh the river separates into a network of channels (known as rivers) within the delta. The Nun River is considered the Niger River's most direct link. Among other important channels are the Forcados, the Brass, the Sambreiro, and the Bonny. Sandbars block almost all the mouths of these channels. Because the palm trees that produce oil-bearing kernels grow abundantly in the region, the Europeans later referred to these channels of the delta as the "Oil Rivers."

A boat crosses the Niger River at the present-day town of Mopti in Mali. © *Nik Wheeler/Corbis*

Further reading: C. M. Sorgwe, *A Textbook of Niger Delta History: from Earliest Times to the Present* (Oyo State, Nigeria: Rescue Publications, 1997); E. J. Alagoa, F. N. Anozie, and Nwanna Nzewunwa, eds., *The Early History of the Niger Delta* (Hamburg: H. Buske, 1988).

Niger River Main river in West Africa and the third-longest river on the continent after the NILE RIVER and CONGO RIVER. It flows about 2,600 miles (4,184 km) through present-day Republic of MALI, NIGER, and NIGERIA to the Gulf of Guinea.

The Niger River flows in a northeasterly direction, rising in present-day GUINEA about 150 miles (241.4 km) from the Atlantic Ocean. It receives its upper tributaries—the Mafou, the Niandan, the Milo, the Sankarani, and the Tinkisso—before entering Mali. Past Bamako, Mali's modern capital, the river drops about 1,000 feet (305 m), within 40 miles (65 km), into a valley. The rapids of this section have been submerged in the backed-up waters of the Sotuba Dam near Sansanding.

From here the Niger flows about 1,000 miles (1,610 km) in an east-northeastward direction. At Mopti, it is joined by a main tributary, the Bani, then flows into a region of lakes and creeks known as the INLAND NIGER DELTA. The largest lake in this region is Lake Faguibine, which is almost 75 miles (121 km) long, 15 miles (24 km) wide, and more than 160 feet (49 m) deep in places.

The lake region ends at Kaburu, a major port in TIMBUKTU. Here the river runs in an almost eastward direction. It then narrows at a rocky ridge before moving in a southeastward direction and widening to a floodplain that flows through Gao. This is the northernmost bend of the river, running through the southern edge of the SAHARA DESERT.

From Jebba, in Nigeria, the river flows southeastward through a broad, shallow valley. Soon afterward it is joined by two important tributaries, the Kaduna River and the BENUE RIVER. Once joined with the Benue, the Niger opens to a 2-mile (3.2-km) wide stretch that is occasionally interrupted by small islands and sandbanks. At the city of Aboh the Niger breaks off into many branches, moving through the Niger Delta into the Gulf of Guinea.

The river passes through such diverse vegetation as grasslands, rain forests, and swamps. Among the wildlife living in and along the Niger are HIPPOPOTAMUSES, three

different types of CROCODILES, HERONS, and storks. The average rainfall along the Niger varies from more than 160 inches (406 cm) in the NIGER DELTA to less than 10 inches (25 cm) in Timbuktu. Depending on the region the annual flood season occurs at different times of the year. In upper Niger the river floods in June. In the middle Niger flooding first occurs between July and October, and is known as the "white flood" because of the light sediment in the water. The "black flood" occurs in December, when the water is carrying more sediment from upstream.

For thousands of years the Niger River has served as a key source of irrigation, fish, and transportation for humans. Between the fourth century BCE and the second century CE the NOK CULTURE, the earliest known people of Nigeria, lived on the JOS PLATEAU, the area above where the Niger and the Benue join.

See also: NIGER EXPEDITIONS (Vol. III); NIGER RIVER (Vol. III).

Nigeria Large West African country, some 356,700 square miles (923,900 sq km) in size, located on the Atlantic Ocean coast. Today Nigeria is bounded by CHAD, CAMEROON, NIGER, and the Republic of BENIN. The dominant ethnic groups in Nigeria are the Fulani-speaking Hausa in the north, the YORUBA in the southwest, and the IGBO in the southeast, near the NIGER DELTA.

The geography of present-day Nigeria varies from the tropical rain forests on the coast to forest, savanna, and an interior sahel. The area was sparsely populated by HUNTER-GATHERERS and farming peoples who had domesticated plants and animals by around 2000 BCE. From about 800 BCE to 200 CE the Neolithic NOK CULTURE lived on the JOS PLATEAU, where they left remains that included fine terra-cotta sculptures and remnants of an iron-producing culture. By the beginning of the second millennium the Nok had virtually disappeared.

Nile Delta Marshy, alluvial plain in northern EGYPT where the NILE RIVER empties into the MEDITERRANEAN SEA. In ancient times, the Nile split into at least seven smaller channels just north of the city of CAIRO. As long ago as 4000 BCE farmers cultivated the borders of this marshland, which contained exceptionally fertile soil.

By pharaonic times (c. 3000 BCE) farming dominated the area, and, by the time of the NEW KINGDOM (c. 1570–c. 1070 BCE), the cultivated area of the delta exceeded the area of the entire Nile Valley. During ancient times, the arms of the Nile River were named the Pelusiac, the Tanitic, the Mendesian, the Phatnitic, the Sebennyic, the Bolbitine, and the Canopic. Today, because of heavy cultivation and a changing climate in the area, there are only two arms, the Damietta and the Rosetta.

Further reading: Robert O. Collins, *The Nile* (New Haven, Conn.: Yale University Press, 2002).

Nile River World's longest river, located in northeastern Africa. Measuring about 4,150 (6,677 km) long, the Nile is one of only two rivers in the world that flow from south to north from twin sources: the WHITE NILE in UGANDA and the BLUE NILE IN ETHIOPIA. Described by geologists as an "exotic stream," the Nile travels for 2,000 miles (3,218 km) across the desert to KHARTOUM, where the two tributaries meet above the Shabluka Gorge. The Nile continues its route through present-day Republic of the SUDAN, where it is joined by a third tributary, the Atbara River. Eventually the Nile empties into the MEDITERRANEAN SEA.

Over thousands of years the erosion caused by the powerful ebb and flow of the Nile created the narrow corridor known as the NILE VALLEY. The rise of Nile Valley civilizations such as Nubia (KUSH) and EGYPT was largely documented in Egyptian sources and the writings of ancient Greek and Roman travelers. From a geographical perspective, Egypt's location between the Eastern and Western deserts made it the beneficiary of fertile alluvium carried by the river during its journey north. As early as 6000 BCE Nile Valley inhabitants were cultivating food crops, including SORGHUM, and MILLET. People planted seeds in the mud and dirt left behind when the floodwaters receded.

Over time the Egyptians experimented with other agricultural techniques, and their efforts led to the establishment of settled farms by 5000 BCE. This allowed people to supplement their hunting-and-gathering activities with the cultivation of other crops such as clover, wheat, beans, cotton, corn, and rice.

The Nile influenced the creation of the world's earliest CALENDAR. The first season of the year was called *akhett,* named for the floodwaters that began to rise and saturate the fields for four months at a time. The next season, *peret,* was named for the receding waters. The third and last season of the year was known as *shemou,* or the harvest.

The seasonal cycle of the flooding and receding of the Nile River repeated itself for thousands of years until the Aswan Dam was completed, in 1970. The dam allowed the flooding of the Nile to be controlled, assuring sufficient water for irrigation and other purposes in both Egypt and the Sudan.

Ancient Egyptians noted each year that Sothis, or Sirius—the largest star in the constellation Canis Major—would rise on the horizon just before Nile's waters would

swell. Therefore, the early study of astronomy was directed, to a great extent, toward predicting the timing and the causes of the rising of the Nile in order to prevent the disastrous effects of flooding.

Irrigation and Agriculture along the Nile In addition to the calendar and astronomy, life along the Nile prompted the development of other technologies and sciences. The Egyptians became experts in irrigation, building dikes, dams, and canals in order to protect and water their fields. Before the invention of irrigation, people typically gathered food as it grew in the wild. By about 5000 BCE, however, effective irrigation techniques were widespread. The river was particularly well suited to this since it descends at a gradual pitch of 5 inches per mile (13 cm/mi).

King MENES, the legendary Egyptian ruler who supposedly unified UPPER and LOWER EGYPT in about 3000 BCE, was credited with improving Nile irrigation with the construction of canals. According to tradition, he asked his engineers and laborers to redirect the course of the river and build his capitol of MEMPHIS on the land where the Nile River had run. By 2000 BCE, after more than a thousand years of developing basin irrigation, both sides of the Nile River featured intricate patterns of basins, dikes, levees, canals, and sluices.

Under this system the fields on the Nile floodplain were divided into great basins by earth embankments. The largest basin may have covered as much as 50,000 acres (20,235 ha). A system of high-water canalization carried the water from the Nile at flooding time to the basins through a series of dikes, levees, and feeder canals. Feeder canals connected the river to the basins, typically filling by mid-August, a few weeks before the river crested. After about 40 days of filling, the entrance was unblocked, allowing the water to fill the lower basins. The water soaked the ground and the rich layer of silt and soil from the river settled onto the land. In October, as the Nile floodwaters receded, water was drained out of the basins into discharge canals, which fed the water back to the river.

Drainage was important to Nile irrigation, and the Egyptians were known to have built underground drainpipes made of COPPER by about 2500 BCE. The refinement of drainage pipes led Egyptians to produce clay pipes that were used to drain the lower areas of the Nile valley.

As a result of irrigating the Nile River, Egyptians were able to support a growth in population, which led to the development of urban areas and civilization in general. Those areas of Africa that had not yet discovered irrigation, and where the climate or land did not lend itself to farming, experienced little population growth as people continued to hunt and gather for subsistence.

Other notable aspects concerning the Nile include its impact on religious belief. The deity HATHOR came to represent the rising waters of the Nile as a symbol of fertility;

Hapi represented the actual flood or inundation. Equally important was the Nile's role in international trade, linking Egypt and Nubia to the RED SEA trade and the lands to the south and east of the African continent.

Nile Valley   Region where the Egyptian civilization began to develop from aproximately 3500 to 3000 BCE. Because of the annual flooding of the NILE RIVER, the land on either side of the river is exceptionally fertile. Intensive cultivation of the Nile Valley has sustained the population of the Egypt for almost 5,000 years.

Nilo-Saharan languages   One of the four major African LANGUAGE FAMILIES. Nilo-Saharan has been spoken in nearly all parts of the continent, from the SAHARA DESERT southward to present-day Democratic Rebublic of the CONGO and TANZANIA, as well as among some pastoral peoples in eastern Africa. The wide dispersal of the speakers of Nilo-Saharan languages has made this family difficult to study and classify. Linguists have nonetheless identified six branches of the Nilo-Saharan family: Songhai, Saharan, Maban, Furian, Koman, and Chari-Nile.

Like the family of NIGER-CONGO LANGUAGES, most Nilo-Saharan tongues traditionally use tones to differentiate meaning. Also like the Niger-Congo family, the Nilo-Saharan languages remained largely unwritten oral tongues (with the important exception of the Nubian language) until modern-day attempts at transcription using the Arabic and Roman ALPHABETS AND SCRIPTS.

These similarities to the Niger-Congo family of languages suggest that these two families may share a common ancestor language. Yet unlike the Niger-Congo languages, some Nilo-Saharan tongues use inflection to indicate the case of nouns, some have gender classifications for nouns, and many feature conjugation of verbs—characteristics that

mark the Nilo-Saharan tongues as unique among African language families.

Nilotes A people of the Late IRON AGE who were pastoralists in southern Sudan and who, beginning about 200 BCE, migrated to various areas of eastern Africa. There they mixed with the indigenous peoples and formed new cultural groups. The languages of the original Nilotes belonged to the Nilo-Saharan group, and they organized their societies on the basis of kinship. Nomadic pastoralists, they moved with their herds or flocks.

Ninetjer (Nynetjer) (r. c. 2765–2725 BCE) *Egyptian pharaoh and third king of Egypt's Second Dynasty*

Ninetjer ruled for almost 40 years and established MEMPHIS as his capital city. He was renowned for his festivals and temples. A military expedition during the 13th year of Ninetjer's reign is chronicled on the PALERMO STONE.

Little is known about the kings of the early Second Dynasty, but the name of Hetepsekhemwy, the first king of the dynasty, means "the two powers are in peace," which may suggest a reunification of EGYPT following the tumultuous First Dynasty. The Second Dynasty kings are believed to be of Lower Egyptian origin, as evidenced by the relocation of the capital to Memphis and placement of the royal burial grounds at SAQQARA, in LOWER EGYPT.

Nkisi (Nkondi and Nkongi) Power, or spirit, figures used by the Kongo people of what are today western Democratic Republic of the CONGO and northern ANGOLA. Their use is believed to date to ancient times. Generally carved from wood, the Nkisi, which were sometimes erroneously referred to as a "nail sculpture," are considered by many to be among the most complex ritual objects in Africa. Although the creation of the sculptures traditionally has been controlled by a ritual authority or priest, the work has often been based on specific requests by those who came for consultation. Made in the form of humans, they were considered spirits from the realm of the dead who would carry out specific assignments if the appropriate sacrifices were offered. The spirit could then be grounded or controlled when placed within a natural object, such as a special bag, gourd, or shell.

Several types of Nkisi figures have been used in this way to represent good or evil. Benevolent types have been said to embody ancestral spirits; when the nose or forehead of the figure was rubbed, it was comparable to praying or communicating with the dead. Smaller types of Nkisi have been used for healing or for overcoming personal difficulties; these contained bags of medicine and herbal remedies. Menacing figures armed with spears or knives have been used to represent opposing or malevolent forces of evil.

Opinions vary as to the function of these figures. There have been some reports that certain Nkisi figures have been meant to cause suffering or death, while others have reportedly been used to protect property. There are also those who believe that the primary function of the Nkisi was to destroy those who practiced WITCHCRAFT.

When the Nkisi were created to cause harm, mixtures known as *bilongo,* consisting of grave dirt, blood, gunpowder, and other potent magical substances, were inserted into open cavities of the wooden figure, usually in the abdomen or the back of the head. These mixtures were then covered with mirrors, COWRIE SHELLS, or clay and were activated by inserting metal blades or nails into the figure. Some believe that each such blade or nail was supposed to represent a specific request being made. It was not unusual for a figure to be almost completely covered by blades or nails, suggesting that numerous requests were being made.

Norton, 1973); Benjamin C. Ray, *African Religions: Symbol, Ritual and Community,* 2nd ed. (Upper Saddle River, N.J.: Prentice Hall, 2000).

Nok culture Modern name given to the IRON AGE society whose sculptures, iron tools, and stone artifacts were found near the Nigerian town of Nok. The figures are the earliest known sculptures of a highly developed

people from sub-Saharan Africa and date from roughly 900 BCE to 200 CE.

The Nok culture, also called the Nok Figurine culture, was both highly skilled and technologically advanced. It is best known for its terra-cotta sculptures of humans and animals, which ranged from life-size to 1 inch (2.5 cm) tall. It also is known for its early use of iron. Nok sculptures are remarkable for their craftsmanship and intricate design. Heads are often long and tubular, an exaggeration typical of Nok style. It is thought that many of the surviving heads may have been part of life-sized sculptures. Faces were created with much care and detail, sometimes showing teeth, mustaches, curved brows, full lips, open mouths, delicate eyes with representations of eyelashes, and scars or tattoos.

Though the exact function of the sculptures created by Nok culture is not known, scholars speculate that the elaborate human figures may represent a god or a notable deceased person, while the plainer sculptures may indicate a person of lower social status. Some sculptures, in which the animal or person is supported by a round base, may have been used as decorations for the outside of homes, tombs, or shrines.

Most sculptures were formed from coarse clay, made by hand and covered with a mixture of finer clay and water called *slip*. The sculpture was then polished until the surface was smooth, giving the finished piece the appearance of a person with shiny skin. The large heads were hollow, with holes in them. Though scholars do not know the exact method used for firing these sculptures, today's firings in NIGERIA last about two hours, and the clay pieces are first covered with grass, leaves, and sticks.

The first sculpture was found in 1928 in Nok, a town in central Nigeria near the confluence of the Niger and Benue rivers. Since the style of sculpture had never been seen before and nothing was previously known of the people who created it, the culture was named after the town. Since that time, hundreds of sculptures, tools, and other artifacts belonging to the Nok have been discovered in the area. The Nok figures are the earliest known examples of sculpture in Nigeria, but similarities to modern YORUBA art lead scholars to believe that the Nok tradition may have continued throughout the region for thousands of years.

Because of the discovery of iron-tool artifacts at Nok, scholars know that the IRON AGE was ushered into West Africa at least 800 years earlier than in the northern plains. The oldest known iron-smelting works is attributed to the Nok as early as the fourth century BCE. Scholars do not know if this Iron Age technology was brought to this area from outside or if the Nok discovered it themselves. It is believed, however, that the Nok, unlike most other cultures making the transition from the NEOLITHIC AGE to the Iron Age, did not first use bronze or COPPER, but progressed directly from stone to iron.

nomads   Also called nomadic pastoralists, wandering herders have lived in Africa for millennia, residing in the desert and semi-desert environments of the SAHARA DESERT in northern Africa and, to a lesser extent, the KALAHARI DESERT and Karoo Desert regions of southern Africa. Although semi-nomadic and nomadic cultures exist in present-day Africa, their way of life was much more common in ancient and prehistoric times. Prior to the development of towns and cities, nomads had to compete only with HUNTER-GATHERERS for resources. Today, however, their way of life is increasingly threatened on many fronts.

Spatial mobility has always been the key to the viability of the nomadic lifestyle, but in today's world, nomads often face unsympathetic states. This leads to their political marginalization and a lack of input into policies that affect their livelihood. Africa's recent population growth is also impinging on their pasture lands, as farmers push into these areas to bring new land under cultivation. Also, drought and desertification are taking their toll. In the past, nomads in regions such as the HORN OF AFRICA could survive such natural disasters by finding sufficient pasturage and water for some of their herds. Today, however, relief agencies working to alleviate famine and hunger in such situations seek to divert nomads to a sedentary way of life. Relief workers and the states and agencies they serve think in terms of modernization, and they thus view the nomadic way of life as out of place in the modern world. As a result of these many factors, nomadism is very much on the decline. With this decline comes the loss of distinctive and diverse cultures that were many centuries in the making.

Nomads wander, but their life is certainly not without direction. On the contrary, they have great knowledge of the land, seasons, CLIMATE, and habits of animals, and they use this knowledge to direct their movements. When AGRICULTURE became known, some nomads cultivated crops in one area, moving from time to time in order to find more fertile areas.

One of the earliest known nomad societies in Africa is that of the BERBERS, considered the original people of North Africa. Living there since about 3000 BCE, the Berbers occupied settlements west of EGYPT and south of

the MEDITERRANEAN SEA. Throughout their history they have been known as nomadic desert wanderers. Aided by CAMELS, many Berber merchants did indeed travel the Saharan trade routes to bring goods from the south to the cities of the north. The truth, however, is that most Berbers became settled farmers.

By the beginning of the first millennium, as cities and urban areas grew, settlers increasingly came into conflict with nomadic peoples. Berber nomads, however, never posed much of a serious threat to the settlers, although it took Roman governors years to suppress a rebellion that took place in an area that is within present-day ALGERIA, in 23 CE.

When ROME took control over most of North Africa, it opened up land, leading to the spread of urban life. During this time it is thought that as many as 80,000 people moved into Africa from Rome and its surrounding area. Only in such locales as the ATLAS MOUNTAINS did North African culture remain outside the sphere of influence of the new settlers. The influx of Roman conquerors forced more and more North African nomads to move into the Sahara to avoid the fighting and the accompanying turmoil. As a result, competition for resources became fierce and the desert oases increasingly came under attack by nomads like the Sanhaja, a Berber group that advanced by camel.

Evidence shows that as more people moved into an area, more interdependence was created, more trade occurred, and nomads were forced to become more mobile. Continued Roman expansion and urban settlements, along with advances in agriculture, irrigation, and tool making, led to a decline in the number of North Africans leading a nomadic way of life.

nomarch Title assigned to rulers of small villages that became provinces of ancient EGYPT. In predynastic Egypt (c. 3500 BCE) a number of small villages cropped up along the banks of the NILE RIVER. Their rulers controlled and organized the villages' trade, which was based on POTTERY, alabaster vessels, and glass beads. The most successful of these villages developed into larger chiefdoms, which, after the Egyptian state became politically organized, were recognized as provinces called *nomes*. Their rulers were referred to as *nomarchs*.

Nuba (Noba) Agricultural ETHNIC GROUP indigenous to present-day southwestern Republic of the SUDAN. The Nuba have lived in the area since ancient times, appar-

ently subsisting on a diet based on SORGHUM and the meat from their domesticated CATTLE and GOATS. More than 100 languages have been attributed to the Nuba clans, which include such subgroups as the Anag, Karla, Tagali, Tumtum, and Temein. For centuries the Nuba's most significant religious rituals have been performed by the Kudjur, or priest, whose responsibilities include making rain and contacting departed ancestors.

Among the many unanswered questions about the Nuba is their exact origin. Various burial sites and artifacts have led some archaeologists to suggest that the Nuba were one of several ethnic groups (collectively known as the NUBIAN X-GROUP) who migrated to MEROË some time after its decline from power (c. 350 BCE). Later, they retreated inland, where the Nuba Hills formed a natural barrier that protected them from marauding NOMADS and Arab slave traders.

Faris, *Southeast Nuba Social Relations* (Aachen, Germany: Alano, Edition Herodot, 1989); International Nuba Coordination Center, *The Right to be Nuba: The Story of a Sudanese People's Struggle for Survival* (Lawrenceville, N.J.: Red Sea Press, 2001); George Rodger, *Village of the Nubas* (London: Phaidon, 1999).

Nubia Ancient region of northeastern Africa located along the NILE RIVER in what is now southern EGYPT and the Republic of the SUDAN. Nubia is divided into Upper and Lower Nubia for geographic and political analysis; due to the northward flow of the Nile, Upper Nubia is in the south and Lower Nubia is in the north. Before 500 CE this region was inhabited by various ethnic groups, and at times different sections of the region were ruled by large, politically complex kingdoms.

Major Nubian Civilizations and Kingdoms

A-Group	c. 3800–c. 3100 BCE
C-Group	c. 2300–c. 1550 BCE
1st Egyptian Rule	c. 2000–c. 1800 BCE
Kush Rule (Kerma Period)	c. 2000–c. 1550 BCE
2nd Egyptian Rule	c. 1600–c. 1000 BCE
Kush Rule (Napatan Period)	c. 1000–c. 500 BCE
Kush Rule (Meroë Period)	c. 500 BCE–c. 300 CE
X-Group	c. 300–c. 550 CE

The earliest Nubian culture was the NUBIAN A-GROUP (c. 3800–c. 3100 BCE). Located in Lower Nubia, the A-Group people lived primarily by farming near the Nile. In the 1960s, remains and artifacts were found in large tombs in a cemetery at QUSTUL. These finds demonstrated the A-Group's wealth and provided evidence that they were possibly ruled by early Egyptian pharaohs. The A-

Group traded copper, incense, gold, and semiprecious stones with the north for manufactured goods and agricultural products. The rise of the First Dynasty in Egypt (c. 3050 BCE) ended the A-Group's culture.

There are no archaeological finds from the area for the next 500 years, until the emergence of the Nubian C-GROUP culture (c. 2300–c. 1550 BCE). Lower Nubia was known then as WAWAT. The C-group settled along the Nile River from ASWAN to the second cataract, and they were highly dependent upon cattle. As Egypt began to fragment politically, the C-Group migrated to the north. Some members rose very high in Egyptian society, playing a pivotal role in the struggles that founded the MIDDLE KINGDOM around 2040 BCE.

About 2000 BCE Egypt conquered Lower Nubia, controlling the region for approximately 800 years. The C-group cultures remained culturally distinct under Egyptian rule, and in Upper Nubia the KERMA culture and the Medjay people of the Eastern Desert remained independent from Egyptian rule. (The city of Kerma was known as *Kush* to the Egyptians, and eventually this term became synonymous with the kingdom located in Kerma, even as the kingdom's capital moved to different cities.) During the Second Intermediate Period (c. 1800 BCE), when disunity threatened Egypt, the Kush kingdom took advantage of Egypt's weakness and claimed power over Lower Nubia as well, ruling over the C-Group populations and the Egyptian soldiers. Both Upper and Lower Nubia then looked to the ruler of the Kush kingdom as their leader, and he was represented as a pharaoh. The Nubian culture was greatly influenced by the ruling Egyptian in areas such as the arts, RELIGION, and language.

In the 16th century BCE Egypt launched military strikes against the Kush kingdom, culminating in the destruction of Kerma, circa 1550 CE. For several centuries after that, most of Nubia was under Egyptian rule. During the second period of Egyptian rule in Nubia (c. 1600–c. 1000 BCE), the C-Group people of Lower Nubia became increasingly Egyptianized, and their culture eventually disappeared. Little is known of Lower Nubia between 1100 and 750 BCE.

As Egypt's power waned at the end of the NEW KINGDOM (c. 1070 BCE), the Kush kingdom again began to gather strength. The capital of the kingdom was moved south, from Kerma to Napata. During the Napatan Period (c. 1000–c. 500 BCE), the Kush kingdom regained control of Lower Nubia and established control over the outlying city of Thebes (WASET). Notable kings of the period include Kashta (r. c. 806–c. 750 BCE) and his son PIANKHY (r. c. 750–c. 716 BCE), whose vast rule extended into much of Egypt.

In approximately 500 BCE, MEROË, in Upper Nubia, was founded as the new capital of the Kush kingdom. Although Nubia was independent of Egyptian rule, the Kush leadership was still pharaonic. Meroë was a wealthy city with large industrial complexes and enormous temples. A distinct Nubian language was used at the time, with a written language based upon Egyptian hieroglyphics. There is no known spoken version of this language today, and much of what is written in this Meroitic language remains unknown.

After battling the Romans in the north, the Meroites reached an agreement in 23 BCE, establishing Aswan in the north as a new home for their settlers. This event launched an age of prosperity for Lower Nubia. The wealth of trade created many achievements in art and architecture. Meroitic culture continued to dominate the region until around 300 CE, when it was subsumed by the Blemmyes of the Arabian Desert.

Around 300 CE the northern kingdom of Nobatia, also known as Ballana, was established, with its capital near the present-day Egypt-Sudan border. Evidence of this post-Meroitic culture, also known as the NUBIAN X-GROUP, was found in archaeological remains in cemeteries and villages along the Nile. The remains of the culture did not show a dramatic break with the Meroitic traditions, but the formal differences in the POTTERY—especially in its size, shape, and design—show the new characteristics of the X-Group culture. Great tombs with jewels, crowns, and weapons of the X-Group culture were found at Qustul. The iconography of these objects showed that the X-Group used pharaonic symbols and worshiped ancient gods, just as the Meroites did. The Nobatian kingdom ended around 550 CE with the rise of CHRISTIANITY in Egypt and Lower Nubia.

See also: NUBIA, CHRISTIAN (Vol. II).

Nubian A-Group

Nubian A-Group   Farmers and herders who established themselves, circa 3800 BCE, in the area south of GEBEL SILSILA in the lower NILE VALLEY, an area that was also known as Ta-Seti (the land of the bow). Many modern researchers believe that the politically centralized Lower Nubian A-Group was ruled by kings, making it the earliest kingdom in the Nile River basin. Before unification of UPPER and LOWER EGYPT, circa 3050 BCE, the Nubian A-Group civilization, which lasted from about 3800 BCE to 3100 BCE, evidently was a dominant power in Upper Egypt. Nubian A-Group burials and artifacts found upriver from the modern site of Aswan resemble those of the Upper Egyptian Amratian culture NAQADAH I.

While the Nubian A-Group apparently preceded the kingdoms of Upper and Lower Egypt, archaeologists disagree over whether the Nubian culture developed independently or as an offshoot of the AMRATIAN CULTURE. Icons associated with the Nubian A-group's political elite, most notably the symbols of the HORUS-falcon and the WHITE CROWN, were later adopted by the rulers of the unified Egyptian state. Cave temples built at Gebel Silsila

by Egypt's Eighteenth Dynasty ruler HOREMHEB depict his disputed claim of military victory over the Nubians.

Further reading: William Adams, *Nubia: Corridor to Africa* (Princeton, N.J.: Princeton University Press, 1977); David O'Connor, *Ancient Nubia: Egypt's Rival in Africa* (Philadelphia: University of Pennsylvania Press, 1994).

Nubian C-Group   Cattle-raising PASTORALISTS of Lower NUBIA who established a culture that lasted from about 2300 to 1550 BCE. The C-Group, which apparently moved eastward into the NILE VALLEY circa 2300 BCE, was, like the earlier NUBIAN A-GROUP, organized into structured chiefdoms. Throughout their 700-year history they remained dependent primarily upon CATTLE herding, a fact that was reflected in their ART and POTTERY as well as in their leather clothing.

During the Egyptian First Intermediate Period (c. 2213–c. 2040 BCE) the C-Group was basically under constant threat from EGYPT, which used its military and economic might against the smaller culture. Despite frequent conquests by the Egyptians, however, the C-Group successfully maintained its own traditions well into Egypt's MIDDLE KINGDOM (c. 2040–c. 1840 BCE). As the Middle Kingdom came to an end and Egyptian power in the area waned, however, the C-Group fell victim to another invader, this time from the Nubian culture based at KERMA. In time the C-Group was absorbed into the kingdom of Kush and Egypt, and C-Group people began adopting Egyptian customs on a major scale. Eventually C-Group culture assimilated into that of the Egyptians.

Further reading: David O'Connor, *Ancient Nubia: Egypt's Rival in Africa* (Philadelphia: University of Pennsylvania Press, 1994).

Nubian X-Group   Beliefs, ART, religious institutions, and behavior of the people who coexisted in ancient Ballana, a northern province of NUBIA. Although Byzantine texts referred to the inhabitants of Ballana as Nobatians, modern archaeologists generally use the term *X-Group* to describe them. This term suggests just how little firm information—either archaeological or historical—exists about the people who shared Ballana culture from approximately 300 to 550 CE.

The ancestors of the people of Ballana apparently were nomads pastoralists who migrated to lower Nubia from lands west of the NILE RIVER. Although this migration may have taken place as early as the third century, Ballana's royal tombs suggest that the Ballana kingdom was established sometime after the fall of MEROË, in the fourth century.

The way of life of the X-Group remains almost as mysterious as their origins. In part this is due to the inconclusiveness of archaeological findings at the site of Ballana itself. It is also because of the absence of historical records for the period following the destruction of nearby Meroë. Excavations of Ballana, however, do show that its culture combined elements from Byzantine, Meroitic, and Sabean societies.

According to some sources, after 250 CE Ballana burials offer the most obvious signs of this mixed culture. The kings of the region had long been associated with a tradition of burial in pyramids, much like Egyptian monarchs. During the Ballana period, however, ruling kings were buried in tumulus mounds. These mounds of earth were large enough to include the king and his various wives, servants, horses, camels, and household effects—all of which were deemed necessary for the king's journey to the beyond.

The inhabitants of Ballana gradually adopted CHRISTIANITY between the sixth and 13th centuries. Religious institutions unearthed in the region, however, confirm that the people infused their Christian faith with images and practices of their Nubian past.

Nuer   Seminomadic group that has lived for thousands of years in areas of present-day Republic of the SUDAN and ETHIOPIA. According to their own oral tradition, the Nuer originally made their home in Koat-Liece, a village west of Bahr al-Jebel. There, a sacred tamarind tree, its branches laden with offerings of bracelets and tobacco, was a living altar to the Nuer's supreme being, Kwoth Nhial. The Nuer traditionally have had no kings or chiefs. Instead, prophets and religious leaders were the most powerful and influential members of the Nuer communities, which usually consisted of several extended families or CLANS. These religious leaders frequently have been members of the Spear Master clans, a group that has long been deeply rooted in Nuer culture.

Considered sacred by the Nuer, CATTLE have played a number of roles in the lives and beliefs of these people. Ritual sacrifice of a cow, for example, has been an important part of Nuer RITES OF PASSAGE, including the birth of a child, the onset of puberty, marriage, and funerals. Cattle also have been considered a symbol of manhood, and, upon reaching the age of 16, Nuer boys have traditionally been given an "ox name" as part of their initiation ceremonies. Beyond this, however, cows have been important to the Nuer for their survival, especially for milk, which traditionally has made up a large part of the Nuer diet. Although cattle hides, bones, and internal organs have been used in the construction of beds, tools, weapons, and even musical instruments, there is some question about whether or not the Nuer consumed the meat.

numeration systems

numeration systems Methods of numerical calculation. Traditional systems differed from group to group, expanding and evolving as mathematical needs changed. Although it is impossible to date the development of numeration systems, descriptions of finger counting, believed to be the earliest forms of reckoning, are found in the Egyptian BOOK OF THE DEAD. A reverence for the ability to calculate is described.

The most common numbering system is to express a greater number in terms of the sum of two smaller numbers. In the system that the Mawha language of MOZAMBIQUE uses, for instance, the word for six means "five plus one," the word for seven means "five plus two," the word for twenty means "two tens," and the word for thirty means "three tens." Some languages use a base-10 system; some use base-5; other languages, such as YORUBA, use 20 as a base for counting.

The Yoruba system perhaps originated from using the combined digits of hands and feet to count off. Numbers are more precisely defined by subtraction and, to a lesser extent, addition. For example, the word for forty means "two twenties," and the word for seventy means "four twenties minus ten." Sometimes smaller numbers from one to five are employed in the enumeration.

The subtractive system is thought to have developed from counting COWRIE SHELLS, an early Yoruba currency. Large bags of shells would be swiftly grouped by a counter into lots of 20, and these groups would then be reckoned into whatever amount was needed by subtracting shells from the nearest multiple of 10. As the economy and numbers developed, the system expanded to accommodate larger sums, with multiples of 200 forming the base. The Yoruba concept of infinity is illustrated by the image of countless swarming locusts.

Yoruba children still learn their numeration system in the traditional way, with their parents at marketplaces and through the use of mathematical games. The Yoruba language has adapted to the use of larger numbers.

The Bambara of present-day MALI and GUINEA have a 10–20 system that exemplifies the everyday origin of many traditional counting systems. The word for *twenty* means "one person" because one person has 20 digits in all; the word for *forty* means "mat" because, as it is explained, a husband and wife sleeping on a mat together have 20 fingers and 20 toes, 40 digits in all.

Gesture systems of counting are used by some peoples. The Yao people of MALAWI and Mozambique point to the first four fingers of their left hand to count from one to four and then make a fist to indicate five; to make 10, the fingers of both hands are raised and the hands are joined. In other gesture systems, a tap on the chin means ten.

The most elementary system of written notation is the tally mark. Use of this kind of notation, as shown on the ISHANGO BONE, dates as far back as 8500 BCE.

The Fulani people of West Africa measure their wealth in terms of the number of CATTLE or other animals they own. They place sticks in patterns in front of their houses to display their wealth to neighbors. Sticks placed in the shape of a V mean "100" cattle. Sticks crossed in the shape of an X mean "50." Placed flat, the sticks each stand for ten; placed upright, the sticks stand for ones. Thus, the owner of a house with sticks in the pattern *VVX——|||* in front of the house is telling neighbors that he or she possesses 273 cattle.

Numidia

Numidia Area in present-day ALGERIA that was part of the empire of CARTHAGE before the PUNIC WARS. During the second Punic War (218–201 BCE), the East Numidian king MASSINISSA allied himself with ROME; following the Roman victory over Carthage in 210 BCE, Massinissa was rewarded with the throne of a united Numidia.

For almost 150 years Numidians maintained their independence. King Massinissa's grandson, King JUGURTHA, however, engaged in several conflicts with Rome, the last of which led to his downfall in 105 BCE. Later, during the Roman civil wars of the first century BCE, Numidia's King JUBA I sided with Pompey against Gaius Julius CAESAR (c. 100–44 BCE), a decision that, following Caesar's victory, cost Numidia its independence. Numidia continued, however, as a subject kingdom and, under King Juba II, even enjoyed a period of revival that lasted until the invasion of the VANDALS during the fifth century CE.

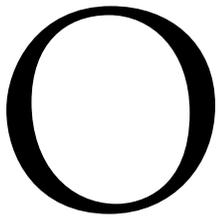
Nuri

Nuri Ancient Kushite city on the NILE RIVER at the fourth cataract. Nuri is the site of the royal burial grounds of Egypt's Twenty-fifth Dynasty, also known as the Napata dynasty (c. 780–c. 644 BCE). The Napata kings battled with EGYPT over control of the NILE DELTA. Their culture was a unique fusion of African and Egyptian influences.

More than 20 generations of kings are buried in Nuri. The Napata tombs at Nuri feature stepped PYRAMIDS made of stone. Built against the eastern face of these pyramids were small chapels where priests could make offerings to the dead. Napata pyramids were much smaller than those built in Egypt. The pyramid of King Taharqa is the largest, measuring 90 feet (27 m) along the base. In contrast, the GREAT PYRAMID AT GIZA measured 750 feet (229 m). Napata pyramids were also steeper than their Egyptian counterparts. Each pyramid usually had two or three small rooms underneath it. The king's body was placed in the room directly below the pyramid. Like Egypt's pharaohs, these kings were mummified, and their bodies were placed in wooden or stone coffins. Napata

queens also had pyramid tombs, though they were smaller and less elaborate than those of the kings.

Although they have been looted by thieves, the tombs at Nuri shed light on the culture and history of the Napatan period. Many of the goods and inscriptions found at the tombs attest to the strong influence Egypt had on the culture.

O


oasis Depression in the desert featuring springs, wells, and trees. The word *oasis* is derived from an ancient Egyptian word, *wah,* which means "a fertile place in the desert." Oases vary in size; small ones can support a few families, and larger ones can support whole villages. Scattered across the vast, dry landscape of the SAHARA DESERT, which receives annual rainfall of less than 8 inches, there are about 90 large oases in which people live in villages and grow crops. Most of these oases support populations of fewer than 2,000 people. Crops commonly grown in oases include figs, peaches, dates, barley, and wheat. The most significant oases in the Sahara are found in the Western Desert and include Fayyum, Kharga, Dakhla, Paris, Farafrah, Bahereya, Siwa and the QATTARA DEPRESSION.

Obatala In traditional YORUBA religion, the creator of the human body. Obatala, also known as the "owner of all heads," is among the most important Yoruba deities. According to lore, Obatala created the human body, and his father, the supreme being OLORUN, breathed life into it. Obatala represents purity, coolness, clarity of thought, and wisdom. He is depicted as an old man wearing white robes, and his priests and priestesses always dress in white. He is associated with white substances, including platinum, silver, white flowers, white meats, coconut, milk, rice, and cotton. Obatala is also the patron god of handicapped people, since according to tradition, he created them while under the influence of palm wine. Among the northern Yoruba, he is known as the god of the north.

Ogun (Ogoun) In traditional YORUBA religion, the god of iron and of war. Ogun is one of the earliest of Yoruba divinities. Two traditions exist regarding his origins. In one, he is a deified ancestor, a heroic individual who made important contributions to the people. In the other, more prevalent tradition, he is a primordial being who, when the gods first came to earth in the dawn of days, cut a path for the other gods through an impassible thicket by using his sharp iron machete. Thus, Ogun is associated with clearing away barriers, protecting against accidents, and opening a path for health and prosperity. He is the tutelary, or guardian, divinity of hunters, BLACKSMITHS, goldsmiths, and butchers.

In still other traditions Ogun reigned over a territory in Yorubaland. In one such telling (perhaps a myth for the origin of iron), Ogun is the first king of the town of Irè. On coming home from a battle, he discovers that empty kegs of palm wine, instead of being turned upside down as they should have been, were left standing upright. Ogun becomes enraged and slaughters many of his subjects until, realizing what he has done, he repents, dramatically drives his sword into the ground, and sits on it until both he and his sword sink slowly deep into the earth, promising to return when they are needed.

In modern times Ogun has become the divinity of truck drivers, mechanics, and others who work in or with iron and steel. In law courts, traditional believers swear on Ogun instead of the Bible or the Quran and kiss a piece of iron that represents him. Swearing falsely breaks a covenant with Ogun and can supposedly lead to ghastly accidents.

okapis Cud-chewing, hoofed mammals belonging to the same animal family as GIRAFFES. Unknown to science until the early 20th century, the okapi, because of its stripes, was at one time thought by Europeans to be a kind of zebra.

Because the okapi seemed to be a combination of several creatures, the ancient Egyptians associated the creature with the god SETH, the troublesome deity who killed his brother, OSIRIS. Often depicted with a dog's body, a forked tail, and a long, pointy nose, images of Seth incorporated elements of several creatures. As a result, the okapi often was considered a kind of inspiration for the deity, as were similar creatures such as the aardvark and long-nosed mouse.

Okavango River Major river, with its source in the Bie Plateau of ANGOLA, where it is known as the Cubango River. The Okavango flows eastward and forms the present border between Angola and NAMIBIA. It then turns toward the southeast and runs across the Caprivi Strip before flowing into BOTSWANA. As it enters Botswana the Okavango River drops through a series of rapids known as Popa Falls. Unlike many rivers that empty into the ocean, the Okavango disappears into the sands of the KALAHARI DESERT, forming the Okavango Swamp and the Okavango Delta. The Okavango Delta consists of a maze of meandering channels, often choked with dense masses of PAPYRUS and other aquatic plants. Following flooding, the excess water drains into Thamalakane River. The Okavango River seasonally fills Lake Ngami in Botswana via the Okavango Delta.

Old Kingdom Period in ancient Egyptian history lasting from approximately 2705 to 2213 BCE. Following the initial unification of UPPER EGYPT and LOWER EGYPT, the nation was ruled, for a period of almost 400 years, by two royal dynasties. This period is known as the Early Dynastic Period and preceded the Old Kingdom. Early Egyptians not only developed their life-sustaining irrigation system but also constructed the first of their impressive architectural wonders, the PYRAMIDS.

The first pyramid ever built is thought to be the STEP PYRAMID at SAQQARA. Not long after this the great pyramids of KHUFU and Khafre were constructed at Giza. The organization necessary to perform these feats not only testified to the sophisticated level of Egyptian society but also helped create a social fabric that endured for several millennia.

By the beginning of the Old Kingdom, the Egyptian government had been centralized enough to take effective control of both public life and public works. The resulting burst of pyramid and monument building forever changed the social and physical landscape of the country.

The six dynasties of the Old Kingdom ruled relatively successfully for 500 years. Then, however, unrest and conflict among the ruling elite of priests and public officials led to a decline in royal power. By the end of the Eighth Dynasty, about 2213 BCE, EGYPT fell into the hands of several dynasties of weak, ineffectual rulers. As a result, the kingdom suffered a decline from which it did not emerge until the dawn of the MIDDLE KINGDOM, more than 200 years later.

Oldowan tools One of the oldest known sets of stone tools used in the Early STONE AGE, or Paleolithic period (c. 2.5 million years ago). Oldowan tools, named for their discovery at OLDUVAI GORGE, in KENYA, were used by inhabitants of the region at least 1.75 million to 2 million years ago. Sometimes described as Oldowan Technology, the tools represent an improvement over the earliest digging sticks and simple stones that gave the Stone Age its name.

The series of stones with flaked, or sharpened, edges made at Olduvai were used for cutting, scraping, and chopping food. Scientists have determined that to create a flaked tool, our human ancestors had to strike one stone against another repeatedly. Gradually pieces were chipped away until a sharpened edge was formed. About 1.5 million years ago, a more advanced set of instruments, called the acheulean toolkit, came into use.

Olduvai Gorge Area in the Great RIFT VALLEY that has been the source of many important discoveries in paleo-archaeology; located near Lake Eyasi in present-day TANZANIA.

Olorun (Olodumare, Oludumare) Creator deity in traditional YORUBA religion. According to traditional belief Olorun is present in all of creation as the intrinsic energy that brought about its being. In this view, the tree, the rock, and other aspects of nature are manifestations of Olorun's essence, and it is this essence that believers revere and worship, not their visible forms. Accordingly, Yoruba see the Creator in all things and see themselves as

part of creation, thus strengthening the connection between themselves and the world in which they live.

Oludumare See OLORUN.

oracle Generally considered an oral response from a divine god accomplished through the use of human mediums. From ancient times oracles have served various populations in Africa, providing dire predictions, meting out appropriate justice, and offering solutions and guidance. These various oracles were believed to have been the embodiment of living gods, and they spoke at specially appointed sites or times through chosen mediums. Oracular predictions also occurred in dreams and as visions, or took place when individuals were in the throes of SPIRIT POSSESSION. In this way oracles represented a critical aspect of RELIGION in Africa and were honored with traditional rites, customs, and the observance of taboos. In ancient EGYPT and Nubia, the primary oracle shared by both regions was AMUN, who was believed to reside in the holy mountain of GEBEL BARKAL. Similarly, in what is now NIGERIA, the Arochukwu oracle represented an important divinity for the IGBO people.

    Although the traditions and rites of each region varied, the men and women serving as oracles usually received many years of training. In a number of societies, priests or priestesses served as the primary mediums and offered responses in everything from parables and riddles to symbolic figures. Many of the men and women who spoke on behalf of the gods also acted in the capacity of divine kings.

    Others, such as the priests and priestesses of GHANA, who were known as Okomfo, were community-based. Relying on the oracle for guidance, they were able to cure illnesses and to provide tangible, communal solutions to social problems. The Okomfo worked with attendants trained to interpret their words and remedies. In other communities, oracles were recognized as village elders, healers, or doctors.

Fossils 2 million years old have been dug from the walls of 25-mile-long (40 km) long Olduvai Gorge in the Great Rift Valley. © *Brian Vikander/Corbis*

The ORAL TRADITIONS of the Chwezi, from the region of Lake VICTORIA, relate stories of oracles in place prior to the advent of early kingdoms in the 15th century. The long-standing practice of Chwezi spirits reputedly was to enter the body of several women at a time. Members of the FAMILY then consulted these spirits about specific matters. In the past these mediums traveled widely through Chwezi territory, stopping at specific regional shrines. Others worked directly with the king.

One of the most notable aspects of oracular DEITIES was their choice of who would receive the gift of mediumship. In the society of the Lugbara, of present-day UGANDA, it was believed that a deity would choose a young girl to serve as a divine representative on earth. Once identified, the girl was left in the woods, where certain divine revelations or visions were revealed. After returning to her village she presided over a specially built shrine.

It appears that many societies commonly retained women as oracles, although the reasons are not completely clear. These women were often responsible for the upkeep of the religious site, which often meant performing purification rites, maintaining appropriate materials, and other sacred duties.

oral traditions The social values, guidelines, and history that form the spoken record of societies. From ancient times, oral traditions have enabled African societies to remain connected with their past as part of an endless cycle of regeneration. Belief in this cycle of regeneration (and the sense of community that it fosters) has shaped oral traditions into a relative chronology rather than a timetable of absolute dates.

In some African cultures, conveying knowledge about the past in spoken form was considered a sacred responsibility. Accordingly, there was an associated belief in the divinity of the spoken word. Among the Fulani, for example, it was believed that the spoken word, or *haala,* had the power to activate all things. Similarly, the Dogon tell of how the seventh of eight ancestral spirits became the architect of world order by weaving a cloth that conveyed the power of the word, known as *soy,* to humans. These examples underscore why oral tradition should be understood as encompassing a wide body of songs, folklore, myths, and proverbial wisdom, yet transcending each specific form.

One reason why oral traditions transcend each specific form is that traditions have the ability to make the distant past a present, living reality. Africanists and historians in general have remarked that oral traditions in African societies appear to embody three distinct forms. The first form of oral tradition has been linked to the creation myth. Many societies created these early traditions by using mnemonic devices to retain their founding histories, religious ideals, and other vital information. Mnemonic devices often contained formulaic words that, when combined in certain ways or repeated as an incantation, were known to bring about solutions or resolve hardships. This interplay of historical events and religious beliefs has led many historians to reduce to the level of myth the oral traditions associated with the ancient period, to question their historic validity, and to criticize their limited reality and "coded messages."

The second form of oral history is said to reflect the societal development and interaction of early city-state formation. These were the oral traditions that were not shared with outsiders. Early city-states had powerful political systems with accomplishments that its rulers sought to preserve through an organized system of oral history. The griot, or court historian, often served this purpose as a "talking mouth." These oral traditions, often set to MUSIC, incorporated the genealogy of early founders, the lives and exploits of kings, and the formation of dynasties. In societies where a high value was placed on such traditions, those entrusted with the position retained their knowledge by chanting or by undergoing a long period of memorization.

Oral traditions of this type are generally considered most reliable. Described by some historians as a fixed text, they cover up to eight centuries or more of a people's history. In this way, the epic deeds of kings such as Sundiata (r. c. 1230 CE) of ancient Mali were maintained and embellished, while keeping many historical details intact. The Kuba peoples of southeastern Democratic Republic of the CONGO can relate historical data that dates back more than 15 centuries.

The third form of oral tradition is based on the memory of the oldest living members of a population. These oral traditions, described as free texts, are not the responsibility of any single individual. In many instances, a council of elders might serve the purpose of transmitting oral traditions; this is an important way of maintaining many of Africa's oldest institutions, such as AGE SETS, SECRET SOCIETIES, and INITIATION RITES. Within this time reference, oral traditions also aided in settling property disputes and agricultural concerns and were significant in religious ritual, incantations, and prayers. Such traditions have also influenced the social aspects of courtship, marriage, and family life.

Because free texts often embody the personality of the teller, controversy continues as to their reliability or selective memory. These views have been challenged by African scholars who argue that the purpose of all history

is to select that which is most courageous, productive, or artistic about a particular society. They also maintain that written history has often been based on "firsthand accounts" supplied by the oral traditions of informants. While there are disadvantages in dealing with oral history—such as the oversimplification of ideas, the years it takes for outsiders to understand them, and concerns about the errors of informants—oral traditions represent an important source of historical information and cultural insights from a unique African perspective. These traditions have played a crucial role in leading archaeologists to ancient sites in East Africa and have been used to explain ruins in other regions. Although many historians have begun to see how well oral traditions work with written records and archaeological projects, holders of the oral tradition and their "living memories" are quickly vanishing from the cultural landscape of Africa.

Orange River River in southwest Africa near the Cape of Good Hope. From an early date the Orange River aided in the migration and settlement patterns of the KHOIKHOI, the SAN, and other peoples. The lush landscape and wildlife along its banks offered a variety of food resources for HUNTER–GATHERERS, pastoralists, and farmers alike. The river and nearby pastures also supported livestock such as goats, sheep, and CATTLE, which were present in the region by about the second or third century BCE. However, it is not completely certain how they arrived there. Sometime later, pastoralist clans settled into community clusters around the springs and tributaries of the river. Later these communities were formed into the nation-states that eventually played major roles in the history of SOUTH AFRICA.

orisha In traditional YORUBA religion, forces in nature that act on behalf of humans. Believers in traditional Yoruba RELIGION use DIVINATION, prayer, DANCE, ritual, and sacrifice to ask the *orisha* to intervene in human affairs and correct or heal a bad situation. The *orisha* are part of nature, too, but they exist at a higher plane, closer to OLORUN, the Creator. They represent the ability of humans, through their powers of reflection, to enter into a consciousness of the divine. Worship of the *orisha,* it is said, leads to balance and harmony. Each of the some 400 *orisha* has its own cult and priesthood.

Orisha Oko YORUBA deity associated with AGRICULTURE and general fertility; his emblem is an iron rod. The Yoruba, who have probably inhabited the savannas west of lower NIGER since the fourth millennium BCE, are largely dependent upon agriculture for their survival, and, not surprisingly, Orisha Oko is one of their primary DEITIES, honored by many temples and served by numerous priests. The most important festival in honor of Orisha Oko is celebrated at the time of the yam harvest. Beyond a general sharing in the harvest, in which virtually everyone eats YAMS, there is a general sense of freedom and license. In ancient times, it is believed, this even included a degree of sexual license that allowed men unrestricted access to women from certain groups or classes.

Oromo (Galla) Cushitic people of ETHIOPIA, formerly called the *Galla* (a term now considered pejorative). Studies of ancient LANGUAGES show that the Oromo were one of several groups present in Ethiopia at least 7,000 years ago. Beyond that, the Oromo trace their origins to the dry savanna northeast of Lake TURKANA and to the southern highlands near the Shabeele and Juba rivers. For thousands of years, CLAN systems have been based on patrilineal descent, a system that helped maintain their ancient tradition of PASTORALISM. In Oromo society all male children of the same generation form an indissoluble group that moves through all the AGE SETS together. The Oromo also used this system, sometimes called the *gada* system, to address political, social, and economic issues within their society. Except for subgroups such as the BORAN OROMO, their way of life continued relatively uninterrupted until the Islamic-Ethiopian wars of the 15th and 16th centuries.

See also: OROMO (Vols. II, III, IV, V).

Osanyin YORUBA deity presumed to be the younger brother of IFA, the god of DIVINATION. Osanyin is generally seen as being in control of the principles that govern Yoruba MEDICINE. For the Yoruba, medicine invariably involves an understanding not just of the human body but also of the patient's emotional and spiritual nature. For this reason, Yoruba healing traditionally is seen not simply as a matter of medical practice but also as a matter of RELIGION, involving the visible and invisible worlds. This results in a complex system governing everything from how certain herbs or other materials are gathered to how and when they are applied. Even the movements, gestures, and sounds of the healer are prescribed. It is this entire system that is seen as being controlled by the deity Osanyin.

According to an ancient and well-known Yoruba myth, as soon as Ifa entered the world, he wanted to have a slave to work for him. He sent the slave to work cutting grass. As the slave started to work, he noticed he was about to cut the grass that was used to cure fever, so he adamantly refused to destroy the useful grass.

Moving on to another kind of grass, the slave started to cut. But, as before, he noticed that he was about to destroy a useful grass. This one he recognized as the grass that was used to cure headaches, and again he refused to cut it. This continued with the next kind of grass as well, which turned out to be a cure for stomachaches.

Astonished at how much the slave knew, Ifa asked the slave, who turned out to be Osanyin, to teach him everything he knew about the uses of plants, herbs, and other materials.

Osiris One of the major deities of the state RELIGION of EGYPT; the principal god of the dead and lord of the underworld. The cult of Osiris first began during the OLD KINGDOM, at which time Osiris became fused with the funerary god Khentimentiu, "Foremost of the Westerners," and became associated with the rebirth of the earth after the flooding of the NILE RIVER. The myth of Osiris relates that Osiris's parents were the earth god Geb and the sky goddess Nut. His brother was the god SETH, and his sister, the goddess ISIS. Osiris married his sister, and eventually they produced a son, the god HORUS.

According to the story Seth became so jealous of his brother that he drowned Osiris in the Nile. Isis retrieved the body of her dead husband, but the evil Seth intervened. Dismembering his brother's corpse, Seth scattered the pieces throughout Egypt. However, the resourceful widow managed to collect her husband's remains and put them back together again. Using her magical powers, Isis resurrected him and eventually became pregnant with Horus. Later, Horus went on to avenge his father's murder, defeating Seth in battle and establishing himself as an earthly ruler much like the pharaohs.

According to Egyptian belief Osiris began to rule the underworld once he was resurrected. Together with a tribunal of 42 other deities, he sat in absolute judgment over the souls of the departed. By the time of the MIDDLE KINGDOM, Osiris was firmly established as the most important deity associated with the cult of the dead. The cult was centered at ABYDOS, where, according to common belief, Osiris's head was buried.

Osiris's prominence was a constant throughout the history of Egyptian RELIGION. In fact, his position as "weigher of souls" and judge of all mortal beings lasted well beyond the rule of the pharaohs and traveled beyond the boundaries of Egypt.

ostriches Large, long-legged, flightless birds. Male ostriches, which can measure 8 feet (2.4 m) in height and weigh more than 300 pounds (111.9 kg), are the largest living birds in the world. The ostrich's powerful thighs have no feathers but instead help it to run up to speeds of 40 miles (64.4 km) per hour.

In prehistoric times ostrich eggs were used by ancient people for ornamentation. The SAN and Nubian peoples, for example, would engrave patterns and pictures of animals on these eggs. The ancient Egyptians made beads out of ostrich shells.

The San people of southern Africa were fascinated by the odd, flightless behavior of ostriches. According to one of their legends, the ostrich once held fire beneath its wings. Humans, however, tricked the ostrich and stole the fire. Afterward, the ostrich no longer flew and kept what little fire it still had tucked underneath its wings.

P

Palermo Stone Stone fragment from the Fifth Dynasty (c. 2465–2350 BCE) of ancient EGYPT that is inscribed with hieroglyphic symbols. It is a valuable source of information about Egypt's history during the first five dynasties (c. 3050–2350 BCE).

The Palermo Stone is made of black basalt and was once part of a larger stone that probably stood in an ancient Egyptian temple. The stone is inscribed on both sides with HIEROGLYPHICS, which are arranged in horizontal rows. At the top of the stone is a list of predynastic rulers followed by time lines for different kings that list the memorable events of that king's reign by year. It includes, for example, information about the extent of the flooding of the NILE RIVER under various rulers.

The Palermo Stone is a fragment of a larger original tablet that is thought to have measured approximately 7 feet (2.1 m) in length, 2 feet (0.61 m) in height and 2.5 inches (6.3 cm) in thickness. This larger tablet was probably a detailed chronicle of all of Egyptian kings from the First to the Fifth Dynasty. The last king mentioned on the Palermo Stone is Neferirkare, the third of nine kings of the Fifth Dynasty. Other, smaller fragments of the original monument are found in the Egyptian Museum in CAIRO and the University College of London. The Palermo Stone is named after the Italian city where it is kept.

pantheism Belief that the sacred essence of DEITIES is represented in all aspects of the natural world; a view found in virtually every region of the African continent. The term *pantheism* has been widely used to describe the way in which many African religions were organized around the natural cycles of their environment. During ancient Egypt's OLD KINGDOM (c. 2705–2213 BCE), for example, a family of nine deities represented every element of the universe. Known as the Ennead, this family included Atum, identified with the sunset; Shu, god of the air; and his twin sister, Tefnut, goddess of the dew.

Other aspects of pantheism can be seen in the beliefs of the AKAN farmers of present-day GHANA, who expressed their reverence for the earth in a myth in which the supreme deity, Nana Nyame, created the sky, the earth, order, and destiny. According to the myth, Nana Nyame completed the task in the northern region on a Thursday (Asase Yaa) and in the southern region on Friday (Asase Efua). It therefore was decreed that on those days the earth could not be plowed, defiled by the spilling of blood, or subjected to any other misuse.

papyrus Common name for the *Cyperus papyrus* plant from which the Egyptians made their WRITING material. For centuries papyrus, which resembled parchment, was the main writing material of ancient EGYPT. Its use was probably widespread by about 3000 BCE, although the earliest known example dates back only to 2500 BCE. Eventually papyrus was also used in GREECE, the Middle East, and ROME. Books, as we know them today, are more closely related to the papyrus rolls of ancient Egypt than to any ancient writing material that preceded it.

The papyrus plant was cultivated along the banks of the NILE RIVER. According to Pliny the Elder, the paper was made by first removing strips of the pith from the stem of the plant. The strips were then laid alongside

each other, and another row of strips was placed crosswise over the first row. The two rows of strips were dampened with water and pressed together. The sap of the plant acted like glue and sealed the strips together into a sheet that was hammered before drying.

The result was a sheet of white material that, if all went well, had no marks or defects. The size of the sheet varied, but a typical sheet was 5 to 6 inches (12 to 15 cm) wide. The sheets were then pasted together to form long rolls. The length of the rolls varied, but usually no more than 20 sheets were pasted together into a roll. Sheets could be added to a roll as needed.

Perhaps the best-known use of papyrus was for the mortuary texts collectively known as the Egyptian BOOK OF THE DEAD. Egyptians, preoccupied with an interest in the AFTERLIFE, wrote texts that they thought would safely see the dead to another world. Many of these papyri remained well-preserved. Being an organic substance, papyrus was subject to gradual deterioration. Keeping the material out of the light and free of organisms helped to preserve it, as did the dry CLIMATE of Egypt.

Just as scribes working with clay tablets had previously created a decorative style of writing that incorporated HIEROGLYPHICS, papyrus inspired Egyptians to create new styles of handwriting. Two cursive styles were created, one considered priestly and called HIERATIC, and the other a more simplified style of hieratic called DEMOTIC. The actual writing was usually done by a SCRIBE, a well-respected government official who worked in the temples and PYRAMIDS. Papyrus was also used to write down prose, poetry, religious and scientific texts, myths, and stories.

Although the main use of the papyrus plant was to make paper, ancient Egyptians also used it to make sails, rope, mats, sandals, garlands, wreaths, and baskets. When dried, the roots of the plant were used for fuel. Caulk was derived from the pith of the stem, and the pith also was boiled and eaten.

The papyrus plant is a perennial and comes back year after year. An aquatic plant, it thrives in flowing water and has been described as grass-like and graceful. The common variety grows to approximately 15 feet (4.6 m) in height, although a dwarf variety is often used today as an ornamental plant.

pastoralism Way of life characterized by the upkeep of DOMESTICATED ANIMALS, including CATTLE, GOATS, sheep, CAMELS, zebus, and yaks. Pastoralists and their animals have a long history of mutual dependence. According to archaeological evidence, one of the earliest African pastoralist cultures dates back to the period 3800 to 3000 BCE (and perhaps to as early as 7000 to 5000 BCE). Excavations from Kadero and Esh Shaeinab in the NILE VALLEY suggest that these early pastoralists, generally known as the NUBIAN A-GROUP, migrated through this region with their herds, eventually encountering the STONE AGE Akban culture near the second cataract of the Nile.

Herds supplied many products for these and other ancient pastoralists. Meat, milk, and blood provided nutritional FOOD products. Animal skins were used for making clothing and tents, while bones were made into tools and other household items. Because their animals were so vital to their survival, it was important to early pastoralists to maintain the health and numbers of their herds.

The populations of the pastoralists' herds were maintained by the techniques commonly associated today with animal husbandry to control the breeding of the animals. Food supplies for the animals were equally important, and they often were maintained by a migratory process known as transhumance. In some areas transhumance was affected by seasonal changes. In wet seasons, for example, groups frequently remained sedentary, cultivating grains of various kinds. In dry seasons, however, entire communities often had to pack their belongings onto their animals and go in search of new pastures. The Fulani of the

This undated drawing from the tomb of Puimre shows papyrus plants being harvested in the time of Thutmose III (C. 1504–1450 BCE).
© Bettmann/Corbis

western SAHEL, the MAASAI, Turkana, and NUER of East Africa, and the Khoikhoi of the south all practiced forms of transhumance. Other forms of herding, usually described as nomadic, occurred in drier regions in or near the SAHARA DESERT. The TUAREGS, Moors, and Bedouin of these areas maintained herds that consisted mainly of camels and goats. These herds were successful because of these animals' ability to feed on tree leaves when pastures could not be located.

Over the centuries pastoralism determined where people lived and influenced their economic, social, and cultural outlook. Ownership of animals defined wealth and power, often causing local wars over pasturelands and water rights. From a social and cultural standpoint, herding became a tradition passed down from one generation to the next via RITES OF PASSAGE. Other traditions among pastoralists included celebrations, from sacrifices to dances, that acknowledged the importance of herds to the people's culture and survival.

Persian conquest

Persian conquest   Period during which EGYPT was conquered and ruled by Cambyses II of Persia; lasted from 525 BCE to 405 BCE. With roots in parts of present-day Iran and Afghanistan, ancient Persia became the center of a vast empire under its most famous rulers Cyrus the Great (r. c. 550–530 BCE), DARIUS I (550–486 BCE), and Xerxes I (r. 486–465 BCE). Cyrus the Great first vanquished the Medes, Persia's neighbors on the Persian Plateau. He then began a series of conquests that established the Persian Empire: Lydia fell around 545 BCE, and by 539 Cyrus had been named king of Babylon.

The Persian Empire soon included most of the known world, from North Africa and southeastern Europe in the West to India in the East. At the height of its power, Persia ruled an area almost as large as the continental United States.

Cyrus's successor, Cambyses II (r. c. 529–521 BCE), crossed the harsh Sinai Desert in 525 BCE and attacked Egypt, which was well into the 700-year-long period of decline and foreign domination that began in 1070 BCE, toward the end of the Twentieth Dynasty. Betrayed by the Greek mercenary soldiers they had hired, the Egyptians were defeated by the Persians in the battle at Pelusium.

Cambyses II was succeeded by Darius I and then by Xerxes I, who faced revolts in Babylon as well as Egypt. Egypt revolted against Persian rule in 405 BCE, during the reign of the Persian emperor Artaxerxes II, and remained an independent state until it was conquered again, first by the Persians in 341 BCE, and then, in 332 BCE, by ALEXANDER THE GREAT (356–323 BCE), the Macedonian ruler who added Egypt to his growing empire.

Phoenicians

Phoenicians   Ancient Semitic seafaring people who were noted as merchants, traders, and colonizers. They inhabited the area that is now Lebanon and part of Syria and Israel. Phoenician civilization flourished in the first millennium BCE. Little is known of the Phoenicians' roots, but the Greek historian HERODOTUS (484–425 BCE), among others, placed their original homeland in the Persian Gulf. The Phoenicians migrated to the Mediterranean region about 3000 BCE and soon began to extend their influence along the southeastern coast of Asia Minor, with settlements at Joppa (or Jaffa, now Yafo), Acre, Dor; at Ugarit, in EGYPT, where they carried on extensive trading; and the northern coast of Africa, where, between 814 and 750 BCE, they founded CARTHAGE. That city became a wealthy trading center, the head of a western Phoenician empire, and one of the most important cities of Africa.

Perhaps the most significant Phoenician contribution to culture and progress was the development of a 22-letter alphabet that became the basis of the Greek alphabet and the ancestor of the Roman alphabet, in which most European and African languages are written. The Phoenicians are also credited with using Polaris, the North Star, as an aid to navigation. Their name for themselves was the Kena'ani and they are probably the Canaanites of the Bible. Their chief cities or, more properly, city-states, exclusive of their colonies, were Tyre, Sidon, Byblos (now Jbail), and Berot (now Beirut), each of which had its own king. Sidon was famous for its embroideries; Tyre was well known for its fine cloth, dyed with Tyrian purple made from the snail *Murex;* and Byblos—the word *bible* is derived from its name—was a trading center for PAPYRUS. Ivory and wood carvings and metalwork became Phoenician specialties. It is thought that the Phoenicians originated the art of glassblowing, or shaping glass without the use of molds, during the first century BCE.

The Phoenician Homeland   Phoenicia's early history is intertwined with that of Egypt's. By the 16th century BCE, the two states were carrying on extensive TRADE AND COMMERCE. Egypt controlled the Phoenician city-states for a time, but by the 14th century BCE, Egypt had lost its hold over them, and the Phoenician city-states were independent once more. Their independence was threatened again in the ninth century BCE when they came under attack by the ASSYRIANS. In 868 BCE the Assyrian king Ashurnasipal II exacted tribute from the Phoenician city-states and began a pattern of Assyrian supremacy over and occasional collection of tribute from the Phoenicians that lasted almost 200 years. In 678 the city-state of Sidon rebelled against the Assyrians, but they destroyed the city and rebuilt it on the mainland. Tyre re-

sisted Assyrian sieges in 672 and 668 but succumbed toward the end of the reign of Ashurbanipal (668–627 BCE), the last great king of Assyria.

As patterns of dominance in the Middle East shifted, so did Phoenician independence. Nebuchadnezzar II, the king of the new Babylonian empire from 605 to 562 BCE, sacked Jerusalem in 597 and then besieged Tyre, which held out for 13 years before it finally fell. The Persians were next, capturing the Phoenician states in 538 and making them—along with Syria, Palestine, and Cyprus— a province of the Persian Empire. The ships of Tyre and Sidon were considered the finest vessels in the fleet that Persian emperor Xerxes assembled in 480 BCE to invade GREECE. They fought at, and were defeated in, the famous battle of Salamis, which helped end the Persian threat to Europe. In 345 BCE Persia quelled an unsuccessful revolt against its empire by Tyre and Sidon.

The pattern of domination by the major empires of the age continued unabated. ALEXANDER THE GREAT (356–323 BCE) captured Tyre in 332 BCE and brought Phoenicia under Macedonian rule. His successors fought among themselves for control of the Phoenician city-states and their commercial resources. At the same time, the cities prospered and became centers of learning as well as trade, and the distinctive Phoenician cultural identity began to disappear. Greek replaced Phoenician as the language of culture and learning, and Aramaic became the language of the common people. In 64 BCE the Roman general Pompey the Great made Phoenicia part of the Roman province of Syria, although Tyre and Sidon remained self-governing. Phoenicia and the rest of Syria fell to Muslim invaders in the seventh century CE.

Phoenician Colonies   The Phoenicians never developed any kind of central federation or common government. The city-states had their own kings, whose power always seemed to be limited by wealthy merchant families. Because their primary interest was commercial, the Phoenicians were not looking for lands to settle; instead, they were in search of anchorages and staging points from which they could mount trading expeditions. They often chose offshore islands and impregnable-looking promontories that offered maximum protection and safety.

The Phoenicians had settlements on the island of Cyprus in the Mediterranean in the ninth century and on Malta by the seventh century BCE. Both islands were stops on the route to Spain, an important source of silver and tin. Tradition has it that a Phoenician colony was founded at Gades (modern Cádiz) as early as 1130 BCE, but no Phoenician artifacts dating back earlier than the eighth century BCE have been found. Gades became one of the most important outposts of Phoenician power and, around 205 BCE, the Romans seized it from the control of the Phoenician colony of Carthage. Later, after the Muslim invasions of Spain, it became a Moorish stronghold.

The oldest Phoenician colony in Africa was Utica, founded in the seventh century BCE and located about midway between Tunis and Bizerte, TUNISIA. Utica and its neighboring colony of Carthage, which was founded around 750 BCE on a peninsula near modern Tunis, were almost equal in power. These colonies, along with Motya (now Mozia) in Sicily, gave Phoenicia practical control of the Strait of GIBRALTAR. Carthage itself established a number of settlements in what is now Tunisia, ALGERIA, MOROCCO, the Balearic Islands, and southern Spain.

Carthage was unique among Phoenician colonies because it was not politically dependent on the city-states back home. Babylonian pressure on the city of Tyre in the Phoenician homeland forced Carthage to act independently and respond to Greek pressure on the Mediterranean island of Sicily. The Carthaginians successfully defended their colonies of Motya and Panormus (now Palermo) and limited the Greek presence in Sardinia. An alliance in 450 BCE with the Etruscan cities on the Italian mainland successfully kept the Greeks from contact with Spain. The worth of the alliance was short-lived, however, as Etruscan power declined after 500 BCE. In 480 the Greeks vanquished a Carthaginian army at Himera, in Sicily. Because the Phoenician fleet, sailing in Persian service, was all but destroyed by the Greeks at the battle of Salamis that same year, the Phoenician homeland could offer no help.

Carthage's presence in Sicily began to increase about 410 BCE. Eventually Carthage came to rule much of Sicily, though the extent of their rule varied at different times. In the years following 265 BCE, however, an expanding ROME vied with Carthage for control of the island. Carthage lost the three PUNIC WARS fought against Rome from 264 to 241 BCE, from 218 to 201 BCE, and from 149 to 146 BCE. During the second Punic War, a daring invasion of Italy was launched by the famed Carthaginian general HANNIBAL (247–183 BCE), who almost won the war for Carthage. Hannibal led an army of 60,000 soldiers from Spain across the Pyrenees, into France, and across the Alps to invade the Italian Peninsula. In 216 BCE, at the battle of Cannae, he dealt the Romans their worst military defeat up to that time. Nonetheless, Carthage lost the second Punic War when its army was defeated at the battle of Zama, in North Africa. Totally destroyed at the end of the third Punic War but rebuilt as a Roman colony in 44 BCE, Carthage later became an important city in the Roman Empire. Punic, the last extant dialect of the ancient Phoenician language, was spoken in North Africa until the fifth century CE, when it, too, died out.

The city was overrun by the VANDALS around 430 CE. The final destruction of Carthage came in 698 at the hands of Arabs.

Piankhy (Piye, Peye) (r. c. 750–716 BCE) *King of ancient Kush*

Piankhy appears to have inherited the throne of KUSH from his father, King KASHTA (c. 800–750 BCE), who first initiated Kush's invasion of EGYPT. A number of conflicting dates are given for Piankhy's continuation of his father's efforts, but it is generally believed that the Kushite conquest of Egypt was completed by around 750 BCE. In the course of this invasion, Piankhy had to rid LOWER EGYPT of the last of the ASSYRIANS, and he also quelled growing rebellions initiated by Tafnak, prince of Sais, in the northern delta region.

On a monumental stone stele now housed at the Cairo Museum, Piankhy left engraved details of both his life as a king and his many battles. The Stele of Victory, as it is known, contains a long description of Piankhy's martial achievements. Another stele describes the Kushite empire and proclaims the glory of the supreme being known as AMUN.

Despite his victories Piankhy did not remain and rule in Egypt (something his successors would do over the next 100 years). Instead, he and Kenensat, his "Great Royal Wife," ruled Egypt from Napata.

The kings who founded Egypt's Twenty-third Dynasty (c. 850–725 BCE) started a long-standing tradition of powerful women priests. Their purpose was to diminish the growing power of the priesthood by transferring the power held by the priests to the daughters of the royal house. The women acquired large estates, as well as political authority. Given the title "Divine Wife of Amun," they became priestesses, living only in Thebes and remaining celibate for life. They were attended by servants who also were expected to be celibate.

Images of the priestesses are prevalent in Egyptian artwork, where they generally are depicted making the ruler's ritual offerings to the gods. The tradition continued for 200 years, with each female successor symbolically adopting a daughter of the ruling king. When the priestesses died they were given royal burials, and memorial temples were established in their honor. This tradition was well established when Piankhy conquered Egypt. Adapting it for his own ends, he installed his sister AMENIRDIS I (r. c. 760–c. 747 BCE) on the throne as "Divine Wife Apparent." Amenirdis was then "adopted" by the priestess Shepenupet I and, in turn, adopted her own niece—Piankhy's daughter—Shepenupet II.

polygamy

Generic term for plural marriage, or marriage to more than one spouse at the same time. The word *polygamy* refers to plural marriage in general. The marriage of a woman to more than one man is more specifically called *polyandry*. The marriage of one man to more than one woman is called *polygyny*. Of the two forms, domestic situations involving polygyny are far more common. It is said that about 80 percent of the world's societies recorded by anthropologists have practiced polygyny. Polyandry often takes the form of brothers sharing the same wife. Polygyny often takes the form of sororal polygyny, in which two or more sisters are married to the same man.

Historically, bigamy, or marriage to additional spouses, appears to be the most common form of polygyny, although Muslim law permits a man four wives, provided that he can support them. Hindu religious law and customary marriage, as practiced in Africa and other places, puts no limit on the number of multiple spouses.

Marriage patterns followed in remote rural areas may shed light on probable practices of centuries ago. In West Africa, where polygyny was common, families often consisted of a man married to several wives, each of whom was the head of a household that included herself and the children she bore. The children might address each woman as "mother," but everyone knew to which subfamily the children belonged. The first, or senior, wife in such circumstances often had some measure of primacy or authority over the other wives. Such ranking, which extended to LESSER WIVES as well, was an attempt to avoid or decrease the possibility of jealousy among wives. It was also intended to lessen rivalry between children, especially when there was something of significance, such as a royal title, to inherit. Traditionally, the oldest son of the senior wife was the heir apparent.

BRIDE-WEALTH, or a bride-price, was traditional among many African peoples, such as the matrilineal Makonde of what is now TANZANIA, as well as many patrilineal societies in sub-Saharan Africa. The bride-price involved the groom's giving items of high value to the bride's father. The practice, seen as an act of respect for the bride and her FAMILY, compensated them for the loss of her services and gave the husband the right to future children. (Wives and children were considered the property of the husband.) The CATTLE herders of East Africa paid their bride-prices in cattle. Among the MAASAI, the NUER, and the Turkana, the groom often had to borrow cattle from kinsmen to pay the bride-price and, as a result, stayed in debt to older male relatives for many years.

Polygynous marriages most often occurred among kings, chiefs, very wealthy merchants, and nobles. Concu-

binage was rare due to polygyny. Most males could afford only one wife, or, at the most, two wives.

In contemporary Africa polygyny in traditional societies is disappearing under pressure from church, governmental, and civil rights groups that are committed to protecting the rights of women and children.

polytheism   In Africa, the sacred belief in lesser DEITIES as an extension of a supreme being. Many African religions observe both MONOTHEISM and polytheism. As recent studies have shown, throughout history a number of significant African religions have recognized a supreme being. Although not every group supported the idea of lesser deities, the groups who did appear to have been widespread. For example, the Dogon of present-day MALI, one of the more ancient ethnic groups of West Africa, recognized eight mythical ancestors, known as the Dyongou Serou (the Octad). The Dogon believed that, along with a supreme being known as Amma, these ancestors were the creators of civilization. In a somewhat different vein, ritual possession by the Mboatsia, or "little people" of the forest, was considered a high religious calling among the Fante of present-day GHANA. However, the Fante also acknowledged that the Mboatsia derived their power from the high god Nyame. Similarly, Wennam, the supreme deity of the Mossi, designated power to earth custodians known as Tenga Soba Nama. Through offerings, these custodians controlled the natural environment and enabled farmers to survive.

pottery   Vessels molded from wet clay and hardened by applied heat. Recovered pottery in Africa has been linked to the rise of early civilizations whose economies developed as a result of the mass production, storage, and trading of FOOD. The range of pottery types and sizes provides some idea of the variety of food grown and consumed in ancient periods.

The Process of Pottery Making   Some of the earliest evidence of pottery making comes from the fishing and foraging communities that inhabited the banks of the NILE RIVER near KHARTOUM, about 7000 BCE. Since the process of making pottery almost always begins with the collection of clay, it is not surprising that archaeologists recovered pottery shards, or fragments, in this region. Using digging sticks and hoes, the clay was collected from pits, transported to a designated site, and allowed to dry. Then it was pounded with mortars, cleaned of unwanted

particles, and left to soak in water for several days. Potters often used tempers to strengthen the clay, including straw, animal dung, chaff (grain husks), river pebbles, and old pottery. Adding this material also helped reduce shrinkage and avoid cracking during the firing process. For example, around 5200 BCE, inhabitants of Faiyum, 45 miles (72 km) southwest of present-day CAIRO, made pottery from coarse clay tempered with chaff. This community produced small bowls, cups, cooking bowls, and pots with knobbed feet or rectangular patterns.

Specialized techniques used to create pottery included the coil technique, which was developed by women potters along the West African coast. This technique involved adding and shaping a continuous roll of wet clay to the pot with one hand while it was rotated on a flat surface with the other. Other societies used a convex mold method. It involved pounding a flattened piece of clay on a rounded surface.

Adaptation to particular soils led to variations in these methods. When the clay achieved the desired shape, two final phases completed the process. During the pre-firing phase, the pots were turned down over small fires that helped dry out any remaining moisture from the clay. Direct firing was the final phase, usually taking place in wide-open areas. The clay pots were stacked over layers of fuel such as dried grass, MILLET chaff, or wood. Then, after being "fired" for a few hours, they became hardened, serviceable vessels.

<hr/>

As the methods of pottery improved, distinctive styles and patterns were linked to specific societies. Archaeologists have been able to determine that these styles and patterns spread to neighboring regions. For example, during the Early IRON AGE, dimple-based pottery was first used along the northeastern shore of Lake VICTORIA and some time later in Urewe, KENYA, southern UGANDA, northwestern TANZANIA, RWANDA, BURUNDI, and the Kivu province of the Democratic Republic of the CONGO. Named for the thumbprint found on the base of recovered bowls and pots, dimple pottery was notable for its decorative patterns.

<hr/>

Pottery-Making Cultures   Pottery shards found at archaeological sites generally indicates a settled farming community. IRON AGE farmers were skilled in making baked clay pots, which they decorated with patterns of grooves and other shapes. These pots were used to carry and store water and other liquids and to cook foods.

The region that is now NIGERIA is particularly rich in examples of pottery. Some of the oldest examples are from

the NOK CULTURE, which flourished from about 500 BCE to 200 CE. The Nok left behind many terra-cotta figures, some as large as 4 feet (1.2 m) tall, that show evidence of a highly advanced mastery of technique. Animal figures are presented very naturalistically, while humans are in stylized poses. Most of the Nok figures are heads, which appear to be parts of larger figures.

Examples of small, fine, thin-walled pottery dating from before 450 CE have been found at JENNE-JENO, an ancient city on the inland delta of the NIGER RIVER in the western Sudan region. Most of their ceramics have been dated from 1400 to 500 BCE, though this timeframe is questionable, since many of the items were not originally found by archaeologists.

Mbata pottery made by peoples living near Mabveni in southern ZIMBABWE date from the second century. Later pottery styles in the region are usually grouped as Gokomere-Ziwa ware and date from the third through the fifth centuries. Found near Lydenburg, SOUTH AFRICA, were a number of hollow ceramic heads dating from about 500 that historians think were used as religious or ceremonial MASKS.

See also: POTTERY (Vol. II).

praying mantis   Large, slender, slow-moving insect. The praying mantis measures between 1 and 5 inches (2.5 and 12.7 cm) in length. It has two large eyes and long, spiny front legs that it uses to hold the insects on which it preys. While waiting to feed, the mantis stands with these front legs raised, in a "praying" position. These insects are usually green or brown, which allows them to blend in among dried leaves and twigs.

The word *mantis* means "diviner" or "prophet" in Greek. The Greeks, however, were not the only people who thought these insects had supernatural powers. In southern Africa, the mantis is associated with Kaang, the creator god of the SAN people. Many myths are told about Kaang, including some in which he comes back from the dead.

According to one San myth, Kaang, a praying mantis, was eaten by an ogre, who then vomited him up. In another myth, Kaang was killed by thorns and had his bones picked clean by ANTS. Kaang then reassembled his skeleton and rose again. The San believe that Kaang created the moon from an old shoe.

prehistory   Time before recorded history. Africa's prehistory may be categorized as several linked phases including the Evolutionary Period, Early STONE AGE, Middle Stone Age, Origin of Modern Humans, Late Stone Age, Origin and Spread of Food Production, and the IRON AGE. The earliest phase of evolutionary history relating to primates dates back 80 million years. During this era primates went through changes that left them with an enlarged brain, improved vision, a better sense of smell, and more effective use their hands. Later, as they continued to develop, they spread to Asia, Europe, North America, and South America. From this group emerged a group that walked upright, *HOMO ERECTUS,* which is thought to be an ancestor of modern humans. Remains of such a group from 4 million years ago were found in the RIFT VALLEY in East Africa. In the Early Stone Age, which started about 2 million years ago, human ancestors began to make rudimentary tools from stones. Evidence relating to this period has been found in both East and South Africa. The Middle Stone Age, extending from about 200,000 to 100,000 years ago, showed greater advancement in tool production and subsistence patterns—including hunting, FISHING, and FOOD gathering. The period that followed, lasting from about 100,000 to 50,000 years ago, was one during which primates similar to modern humans inhabited Africa.

Ptah   Creator god of Egyptian RELIGION and patron of arts and crafts. Always depicted in human form, Ptah was especially venerated in MEMPHIS, the oldest and longest-lasting capital of ancient EGYPT and the city that, according to popular belief, owed its commercial success to the patronage of Ptah. Though supported by a strong and wealthy priesthood, his cult enjoyed little popularity throughout the rest of ancient Egypt. As a result, although there was a temple dedicated to him at Karnak, Ptah never attained the rank of a national god in the state religion in the manner of OSIRIS or AMUN-RA. In the myth of Ptah, the ideas of creation and creativity were closely linked. The theology developed at Memphis taught that the God had made the universe from nothingness by his thought and speech. He was believed to be the driving force behind even the most ordinary human activities, but particularly those of an artistic nature.

Ptolemies   Dynasty founded by loyalists to ALEXANDER THE GREAT (356–323 BCE) that ruled EGYPT from the fourth to the first centuries BCE. After Alexander's death, control of Egypt passed to one of his leading generals, Ptolemy. Assuming the throne, Ptolemy quickly launched a series of moves that in the following years effectively merged Egyptian and Greek cultures. Settlement by Greeks and Macedonians was encouraged, improvements in AGRICULTURE were made, and new industries were introduced. African trade with the Greek-oriented world increased, as did intellectual and literary ties.

Like the dynasty's founders, succeeding Ptolemaic rulers continued to balance Greek and Egyptian interests, leaning heavily, however, toward Greek culture. Nevertheless, during the Ptolemaic period, Egypt regained much of its lost splendor, if not its territorial and military power. The great Library of Alexandria became a center for learning and scholarship. Leading thinkers in everything from philosophy to mathematics to SCIENCE took part in the Egyptian revival.

In the end Ptolemaic Egypt lacked the military power to stand up to the growing influence of ROME. As a result, by the time the famous Queen CLEOPATRA came to the throne, she had to rely on political intrigue in order to maintain Egypt's independence. Eventually, about 30 BCE, a victorious Octavian claimed Egypt as a province of the Roman Empire.

Punic Wars   Series of wars, fought between 264 and 146 BCE, in which ROME vanquished the North African city-state of CARTHAGE. The first conflict (264–241 BCE) erupted over Carthage's attempt to exert its power in Sicily, just off the Italian coast. Rome, which had limited sea power at the time, was forced to develop its naval forces in order to meet the Carthaginian threat. However, after more than 20 years of primarily naval strife in which both sides suffered significant losses, Rome's fleet vanquished the Carthaginians and forced their retreat.

Barely 20 years later, in 218 BCE, war broke out again, this time over Rome and Carthage's competing interests on the Iberian Peninsula. During the conflict, Carthaginian forces, led by HANNIBAL (c. 247–183 BCE), succeeded in crossing the Alps and invading the northern and central Italian provinces, which they eventually occupied. Ultimately, however, Hannibal's forces were unable to subdue Rome, and their defeat in 202 BCE led to the end of the Second Punic War, in 201 BCE.

The peace terms that ended the second conflict exacted a great toll on Carthage in terms of monetary payments, loss of territory, and restrictions on its further development. In light of this, Carthage rebelled, sparking the Third Punic War (149–146 BCE). Once again, Carthage was defeated, this time even more soundly than before, and it never again became an force in the region.

See also: GRECO-ROMAN PERIOD (Vol. I).

Punt   Ancient trading region situated between the RED SEA and the Gulf of Aden in present-day coastal ETHIOPIA and DJIBOUTI. For centuries, Punt was a source of great wealth for EGYPT. Because of the abundant luxury goods they obtained there, including ivory, animal skins, and ostrich feathers, Egypt's pharaohs were in the habit of referring to Punt as "God's Land" and the "Land of Spirits."

Trading expeditions between Egypt and Punt began as early as the First and Second Dynasties, c. 3100–2686 BCE. The water route led traders first to ELEPHANTINE, then to the Red Sea ports of Koseir or Leucos Limen, and south to Punt. In contrast, trading caravans made their way from Punt to Egypt via overland routes along the BLUE NILE and Atabara Rivers. By the Fifth Dynasty (c. 2494–2345 BCE), local residents along the way were making such extensive demands for tax and tribute that traders abandoned the routes. They were replaced by direct sail, with most of the journeys being made during the summer months of June, July, and August.

Although others had journeyed there before, Egypt's King Sahure (r. c. 2708–2697 BCE) made the first recorded attempt to reach Punt by boat. Inscriptions tell how, during his journey, Sahure acquired vast quantities of myrrh, electrum (a natural alloy of GOLD and silver), and EBONY, as well as staves of wood for making storage containers. In return, the Egyptians supplied the Puntites with hatchets, daggers, and JEWELRY.

The HYKSOS invasion of Egypt, about 1700 BCE, temporarily halted expeditions to Punt, but trade resumed once the NEW KINGDOM was established, in 1570 BCE. One of the most famous expeditions of this era was made in 1495 BCE by Queen Hatshepsut. Images and inscriptions detailing that journey appear on three wall reliefs in Hatshepsut's temple of Deir-el-Bahri in Thebes. There, ships "journeying in peace to the land of Punt" are shown returning with myrrh resin, myrrh trees, ebony, ivory, "the green gold of Emu," and eye cosmetics. The reliefs also depict Puntites and their children being brought on board waiting ships, along with apes, MONKEYS, DOGS, and the skins of the southern panther.

Punt remained an unconquered region, and its trade with Egypt continued until the reign of RAMESSES II (r. c. 1304–1237 BCE. Punt's own trading networks eventually spread to AKSUM and East African ports. In time, these links extended to the MEDITERRANEAN SEA, Arabia, and Persia, as well as to India and the islands of the Indonesian archipelago.

Pygmies   Name, considered pejorative, for four small-statured, nomadic HUNTER-GATHERER societies, collectively called MBUTI. They have inhabited the ITURI FOREST in the northeastern part of present-day Democratic Republic of the CONGO for millennia. The word *pygmy* derives from the Greek word meaning "fist," which was used as a measure of length; the Mbuti were first described by Europeans in the writings of Greek authors.

pythons   Constrictor snakes found in warm, tropical areas. Pythons are not venomous. Instead, they usually kill by strangling their prey with their coiled bodies. The largest pythons have expandable jaws that allow them to swallow large prey, such as GOATS and pigs, whole.

The Naayire people of BURKINA FASO consider pythons to be sacred, noble animals. Long ago, according to one legend, a group of Naayire hunters decided to sleep in the jungle around a giant tree. During the middle of the night a python fell from the tree onto one of the hunters. The hunter woke up and discovered that a group of enemies was about to attack them. Because the python alerted the hunters to the attack, the Naayire decided never to hunt pythons again.

The African python, or rock python, often reaches a length of 21 feet (6.4 m). The 5-foot (1.5-m) ball, or royal, python lives primarily in equatorial western Africa. It curls itself into a tight ball with its head inside.

See also: COBRAS (Vol. I).

pyramids   Ancient stone structures that have a square base and triangular walls that meet at a point at the top. In the 27th century BCE King Djoser's architect, IMHOTEP, built Egypt's first step pyramid at SAQQARA, on the west bank of the NILE RIVER, near MEMPHIS. He built the pyramid by stacking six bench-shaped mounds, called *mastabas,* each smaller than the one beneath.

The largest pyramid in Africa, the GREAT PYRAMID at Giza, was constructed about 2540 BCE as a tomb for the Egyptian pharaoh, KHUFU. Rising to 481 feet (147 m), the Great Pyramid was the tallest structure on earth for more than 43 centuries. Two other major pyramids were built for Khufu's son, King Khafre, and a successor of Khafre, MENKAURE. Many smaller pyramids were erected over the millennium that followed the building of these massive structures. Pyramids were also built south of Egypt in ancient Nubia, north of present-day Republic of the SUDAN. In fact, there were more pyramids in ancient Nubia than in Egypt.

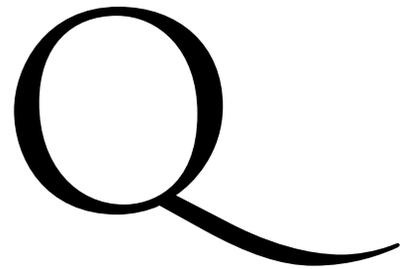
Q


Qada culture Late STONE AGE culture that flourished in NUBIA from about 15,000 to 10,000 years ago. Made up of people who were HUNTER-GATHERERS, the Qada culture is the source of the earliest human remains recovered from the NILE VALLEY. These remains have been found in cemetery-like areas clearly separated from other settlement areas, with corpses carefully arranged in fetal positions.

Qattara Depression Low area in the SAHARA DESERT of the northwest EGYPT. It measures about 200 miles (322 km) long and 100 miles (161 km) wide at its widest point. Its lowest point lies 440 feet (134 m) below sea level. It is the second lowest point below sea level in Africa after Lake Assal, in DJIBOUTI. The Qattara Depression has uninhabited oases and a variety of landscapes, flora, and animal life.

quartzite A commonly found rock made up largely of quartz; related to sandstone and granite. Quartzite comes from sandstone, which changes to quartzite when silica is deposited between the grains of quartz found in the sandstone. Quartzites are usually powdery white in color, although some forms are pink and gray. They are granular rocks that have smooth surfaces when broken. Many quartzites are ancient rocks, belonging to the Cambrian or Precambrian systems. Since they weather slowly and little soil accumulates on them, they are often found on the surfaces of hills or mountains.

In EGYPT, sandstone and granite—a rock that is also mainly composed of quartz—were often found in deposits above ground. Around the time of Egypt's Fourth Dynasty (c. 2575–c. 2465 BCE), cut blocks of sandstone and granite were used to construct temples and PYRAMIDS. Prior to that time, buildings were generally made of sun-dried mud bricks. Quartzite blocks were often used inside these sandstone monuments, and they have been found inside the burial chambers of Neferhotep and Ankh-Hor, in the city of Thebes. Quartzite blocks were also used in the LUXOR temple and in the shrine to RAMESSES II (r. c. 1304–c. 1237 BCE) in Tanis. The gold coffin of King TUTANKHAMUN (r. c. 1361–c. 1352 BCE) was placed in a quartzite sarcophagus, which was then enclosed in four gilt shrines. Quartzite was also used for carvings, including a large sculpture of Tutankhamun, a statue of Nedjem from the reign of Ramesses II, and a door lintel depicting Senwosret III between the minor gods Atum and Re-Horakhti.

Qustul Burial site of the rulers of the NUBIAN A-GROUP culture. Between approximately 3800 and 3100 BCE, Qustul was the center of a kingdom, known as Ta-Seti (The land of the bow), that was situated between the first and second cataracts of the NILE RIVER. Qustul was also the royal burial site of the later Nobatian dynasty.

The wealth and grandeur of the stone-lined pit graves in Qustul equal or surpass the Egyptian royal tombs found at ABYDOS, NAQADAH I AND II, and HIERAKONPOLIS. By about 3050 BCE the A-Group's kingdom was destroyed by a newly unified Upper Egyptian state based in Hierakonpolis. Then, during the First Dynasty (c. 3050–c. 2890 BCE), MENES conquered Lower NUBIA. It was probably about this time that the royal cemetery at Qustul was looted and destroyed.

Thousands of years later Qustul would again be a royal burial site, this time for the kings of the Nobatian dynasty. The Nobatians (also known as the X-GROUP) came from east of the Nile and took over much of Lower Nubia around 350 CE. The Nobatian kings used pharaonic symbols and worshiped ancient gods.

The Nobatian graves were made up of a collection of rooms with brick walls and vaulted roofs built inside a large pit dug into the earth. Aside from the body of the ruler itself, these rooms were filled with the furniture, POTTERY, FOOD, and weapons that kings believed they would need in the AFTERLIFE. Often animals were sacrificed at the tomb's entrance. The tomb would then be buried in a mound of earth.

The Nobatian dynasty ended around 550 CE, when they were defeated by the Nobatae, a group of recently converted Christian Nubians.

R

Ra Sun god and one of the most important of all DEITIES in the Egyptian RELIGION. Since Ra was worshiped in the city of Heliopolis, an ancient center of the cult of the sun, he is often referred to as "Ra of Heliopolis." The cult of Ra began in the early dynasties of the OLD KINGDOM, at which time he assumed many of the attributes of an earlier god, Atum. His prominence as the sun god is closely associated with the architectural development of the PYRAMIDS. Ra is depicted as a man with the head of a falcon, on top of which is a COBRA.

Ra is the god most closely identified with the pharaohs of ancient Egypt. About the time of the Fifth Dynasty (c. 2494–c. 2350 BCE) the concept that the pharaohs were the sons of the deity was firmly in place, and Sa-Ra, "Son of Ra," became part of the royal title. This divine claim continued throughout the rest of Egyptian history until the end of pharaonic rule.

Later, in the NEW KINGDOM (c. 1570–1070 BCE), Ra merged with AMUN, the sun god worshiped at Thebes. He thus become Amun-Ra, the supreme god of the state.

rain forests Regions in which heavy rain falls throughout the year, resulting in dense VEGETATION and plant cover. Tropical rain forests receive a minimum of 80 inches (203 cm) of annual rainfall. In addition they have warm temperatures of 70 to 80 degrees throughout the year. Rain forests are typically found close to the equator.

Contrary to popular belief Africa is not dominated by rain forests, which cover less than 7 percent of the conti-

nent. (The region with the greatest concentration of rain forests is Central and South America.) African countries with tropical rain forests include the Democratic Republic of the CONGO, GABON, CAMEROON, CENTRAL AFRICAN REPUBLIC, GHANA, NIGERIA, IVORY COAST, and TOGO.

See also: ECOLOGICAL ZONES (Vol. I).

rainmaker Ritual authority believed to hold the power of producing rain. Pastoral and agricultural societies look to the life-giving qualities of rain for their survival, since their lives are dependent upon crops and animal herds. Rain is considered a sacred occurrence, particularly in the arid eastern and southern regions. These societies center their beliefs and expectations around special intermediaries or ritual authorities who either acquire or inherit the appropriate knowledge and rites necessary to produce rain. Rainmakers perform annual public rites and lead FESTIVALS in order to focus community awareness. Privately they perform formulaic prayers, invocations, and sometimes even animal sacrifices in order to keep the proper balance between rainy and dry seasons.

Similar to the person chosen to perform as an ORACLE, a traditional rainmaker wields great power, serving alternately as a king or other ruling official. Rainmakers, for example, have been prominent among the Tonga, Bantu speakers of southern ZAMBIA, northern ZIMBABWE, and BOTSWANA, who have DEITIES that may be invoked to create rainfall. Similarly, the Lotuko of southern Republic of the SUDAN defer to the rule of rainmakers. Having inherited the title and ritual knowledge, Lotuko rainmakers traditionally preside over nine designated rain areas, and they also control the AGE SETS of their region.

Members of rainmaking castes often organize to regulate fees, notably among such peoples as the Mwari of SOUTH AFRICA and the Ibibio speakers of southeast NIGERIA. The rainmaking castes among the Fur people of Republic of the Sudan inherit their abilities and collectively carry out ritual sacrifice at designated shrines, including the tombs of their ancestors.

With few exceptions, rainmakers are men. The Lovedu of South Africa, however, traditionally chose a queen to perform the rainmaking rites. Their rain queen served as the political and divine ruler of the kingdom, with powers so closely tied to rainmaking that her death or anger could, according to the Lovedu, create a drought. The knowledge she used to make or stop rain was inherited from her predecessors and decreed by the gods.

In ETHIOPIA, Koma rainmakers take up residence in caves. Their rainmaking ritual calls for petitioners to bring gifts along with animal skins containing water. Ideally, once the water is consumed by the Koma in a public ceremony, rain follows. In contrast, the Udhuk, who also are from Ethiopia, use colored rain stones, which they maintain have fallen from the sky for that purpose. Other traditional practices include the burning of special leaves whose smoke pulls the rain down.

Aside from mystical rites associated with rainmaking, many of the ritual authorities traditionally relied more on methods involving the study of nature, the stars, the sky, and the habits of animals. Many were reportedly taught at a young age about the names and characteristics of leaves, roots, and tree barks in their surroundings. When coupled with ritual practices, their practical and esoteric knowledge created a formidable body of information. Occasionally, when such knowledge failed to produce rain, or to stop it, rainmakers were imprisoned or killed.

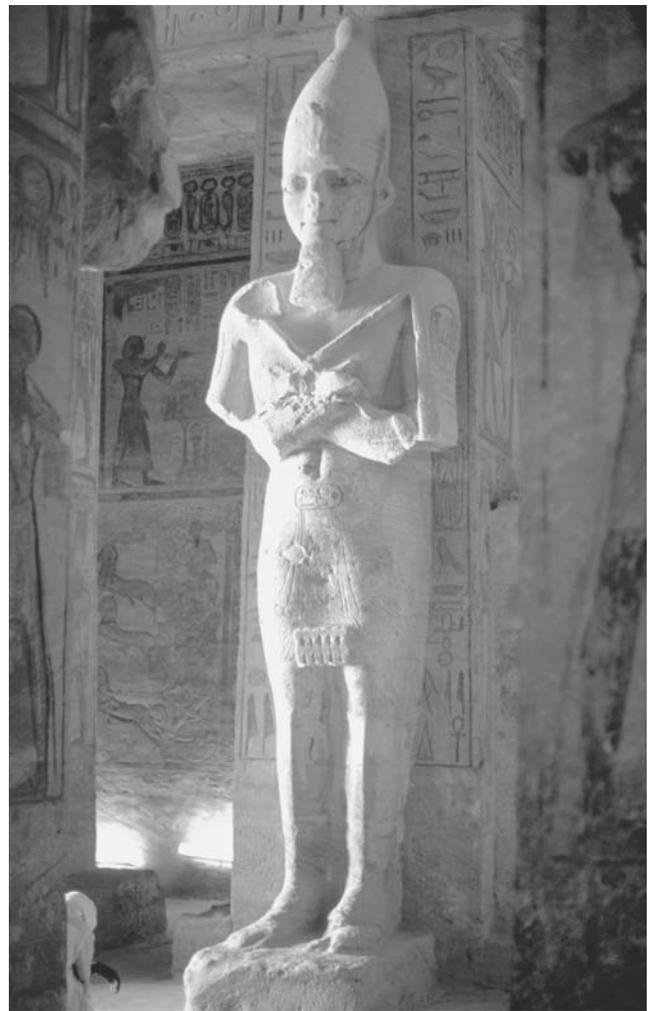
Ramesses I (Ramses I)   (r. c. 1320–1318 BCE) *Founder and first pharaoh of ancient Egypt's Nineteenth Dynasty*

Ramesses I came to the throne at a fairly advanced age, succeeding HOREMHEB, the last king of the Eighteenth Dynasty. Like Horemheb, Ramesses I was a military officer, and he might have been favored by the heirless Horemheb because they had been comrades in arms.

Ramesses was not without experience when he came to power, however, having held a number of important government posts after leaving the army. Both his per-


Ramesses II (r. c. 1304–1237 BCE) is depicted as the god Osiris in this 33-foot-tall (10 m) statue from the Temple of Ramesses II in Abu Simbel, Egypt. © *Gian Berto Vanni/Corbis*

sonal name (Ramesses, meaning "RA has fashioned him") and his royal name (Menpehtyre, meaning "Eternal is the power of Ra") emphasize his devotion to the traditional RELIGION of Egypt, rather than the newer cult of the AMARNA PERIOD. His reign lasted barely two years, and he was succeeded by his son SETI I.

Ramesses II (Ramses II, Ramses the Great, King Useraf, Ozymandias)   (r. c. 1304–1237 BCE) *The third pharaoh of ancient Egypt's Nineteenth Dynasty*

Ramesses II is considered by many the greatest pharaoh ever to rule ancient EGYPT, and he is surely the best known. The "Ozymandias" of the ancient Greeks, he

may also have been pharaoh at the time of the biblical exodus of the Jews from Egypt. The son of SETI I and Queen Tuya, Ramesses was co-regent with his father before becoming pharaoh in his own right at the age of about 25.

Ramesses was a great warrior whose victories over the HITTITES restored Egypt's supremacy over its neighbors. He resolved his final conflict with the Hittites with a masterpiece of diplomacy that is generally considered one of history's first international peace treaties.

Ramesses carried out building programs on a massive scale. The most impressive were his mortuary temple, the Ramesseum, at Thebes and Abu Simbel, a temple containing four gigantic seated figures of Ramesses. Another of his important constructions was a temple dedicated to OSIRIS, which was located at ABYDOS. A master in the art of self-promotion, Ramesses was not content with simple monument building. In his campaign to make his presence felt throughout his kingdom, he went so far as to put his name on the monuments built by other pharaohs.

In addition to having several concubines, Ramesses married many times throughout his very long life, fathering, it is reported, more than 100 children. His first and most important "Great Royal Wife," however, was Queen Nefertari. After her death, she was succeeded as queen by Istnofret.

Ruling for 67 years, longer than any other Egyptian pharaoh, Ramesses II lived to about the age of 90, outliving all but his thirteenth son, Merneptah, who succeeded him about 1237 BCE.

Ramesses III (Ramses III, King Usermare-Meryamen)   (r. c. 1198–1166 BCE) *Second king of Egypt's Twentieth Dynasty*

The last great warrior-pharaoh and temple builder of the NEW KINGDOM and the son of Sethnakhte, the founder and first king of the Twentieth Dynasty, Ramesses III came to the throne after his father's short, three-year reign.

Ramesses III was eager to follow in the footsteps of his illustrious predecessor and hero RAMESSES II. Although he fell short of this goal, Ramesses III nevertheless managed several significant accomplishments during his 30-year reign. As a warrior, he waged two successful campaigns against the Libyans and defeated the confederation of invaders the Egyptians called the SEA PEOPLE. As a monument builder, his major achievement was the mortuary temple at DJEME (modern Medinet Habu).

Unlike many other pharaohs, Ramesses III lived well into old age. He not only survived a failed assassination attempt plotted by one of his minor wives, but he also outlived many of his sons and daughters. Ramesses III

was buried in the VALLEY OF THE KINGS and succeeded by his son and heir, Ramesses IV.

Ras Dashen   The highest mountain in ETHIOPIA and the fourth-tallest peak in Africa. Reaching 15,157 feet (4,620 m), Ras Dashen's nine jagged peaks and round craters tower above Ethiopia's northern landscape. Bordered by the Tacazze River to the north and south, the mountain is often capped by snow during the winter season. Ras Dashen is part of the Simien mountain range, which was formed more than 25 million years ago as a result of volcanic activity.

red crown   Crown of the ancient Egyptian pharaohs that represented northern or LOWER EGYPT, also called *DESHRET*. Until UPPER EGYPT and Lower Egypt were unified under one rule, c. 3050 BCE, each region had its own representative crown: red for Lower Egypt and white for Upper Egypt. The tradition of wearing both the red and white crowns is credited to MENES, or Narmer, founder of the First Dynasty.

Red Sea   Long, narrow waterway separating the Arabian Peninsula from the African continent. Measuring more than 1,400 miles (2,240 km) long and 220 miles (352 km) wide at certain points, the Red Sea reaches depths of an estimated 1,765 feet (582 m) to 9,974 feet (3,291 m). This waterway is part of the Great RIFT VALLEY system extending

from eastern Africa to southwestern Asia. Geologists speculate that the Red Sea was formed millions of years ago, when Arabia and Africa broke apart as a result of great pressures within the earth's core. Its name comes from the unusual underwater algae found beneath its surface, which creates a reddish-brown appearance.

For centuries, scholars have debated whether the Red Sea might actually have parted during Moses' escape from EGYPT, as described in the Torah, Bible, and Quran. There is little doubt, however, that the Red Sea was one of the most active and important waterways of the ancient world. Its southern end was important to ancient expeditions from Egypt to PUNT, and sometime later, the trading ties between AKSUM and ROME, GREECE, and Asia. The Red Sea also provided a route for Egyptians, Romans, Arabs, BERBERS, and Turks to transport enslaved Africans from Nubia and the NILE VALLEY.

religion   Because of the various excavations in Africa, archaeologists have been able to formulate significant theories about the place that religious rites held for *HOMO SAPIENS* or *HOMO ERECTUS* prior to recorded history. Physical and cultural remains such as fossils, bones, and artifacts suggest that many early rites and worship practices were in place in this period.

In part the development of these religious practices may have been linked with the growth of hominid populations, as, apparently, a relatively large hominid population existed at the time. The size of this population may have generated the need for a social structure that formally recognized RITES OF PASSAGE such as birth, marriage, and death. Eventually, growing FOOD, raising animals, and other aspects of the struggle for survival also became part of these rites. Indeed, based on evidence found among the Samo in present-day BURKINA FASO and the IGBO in present-day NIGERIA, it is believed by some historians and archaeologists that early hominid settlements or villages were generally organized around a central altar.

Burial patterns have also helped archaeologists understand early belief systems. At sites located in ZAMBIA, ZIMBABWE, and MALAWI, archaeologists have identified scenes in which various kinds of funeral rites were being performed. Elsewhere, particularly in northern and southern Africa, excavations of mid-Paleolithic grave sites have uncovered stone tools that apparently were buried along with the remains of *Homo sapiens.* Caves located at Afalou-bou-Rhummel, in ALGERIA, and Taforalt, in MOROCCO, also show evidence of use as burial sites.

Excavations made at the NAQADAH I AND II sites, which date to the Predynastic Period (c. 4800–3050 BCE) of ancient EGYPT, also have revealed artifacts bearing directly on prehistoric religion. Archaeologists at the sites have unearthed engraved POTTERY, axes, stone pots, tools, and both arrow- and hammerheads, as well as COPPER objects, all associated with BADARIAN CULTURE. A number of the objects found in the graves at these sites contain drawn figures, and it is believed that some of these figures were used for ritual purposes. The exact meaning of these drawings—or exactly what those rituals were—is not clear. However, the rituals may be linked with the fact that a number of the graves, which generally are oval or circular in shape, contained multiple burials; beyond this, some of the corpses in these graves apparently had been deliberately dismembered.

Finally, there are many ancient megaliths in Africa, such as those found in present-day SENEGAL, The GAMBIA, and the CENTRAL AFRICAN REPUBLIC. Many of these burial sites, which also apparently represented belief in the AFTERLIFE, date back to the NEOLITHIC PERIOD. Although much about these sites is not clearly understood, they may have been dwelling places for those buried within.

religion, traditional   Since ancient times, there have been literally thousands of religions in Africa, each shaped by the society that created it. The common thread that ties them all together is the underlying structure of social order they represent.

For centuries the interpretations of outsiders concerning non-Christian and non-Islamic worship practices in Africa have often been clouded by prejudice and ignorance because of the lack of comparable church structures, holy texts, or other sacred forms in Africa with which they could identify. This often led to a complete misreading of ritual devotion in the form of sacrifice, prayers, song, DANCE, artwork, myth, and ORAL TRADITIONS. Time-honored rituals were derided as well, including animal sacrifice, libations, and highly expressive forms of prayer.

For this reason, some ancient Greek and Roman travelers remarked that Africans had no RELIGION. This view has prevailed for many centuries, somewhat influencing even modern historians and anthropologists who attempt to establish interpretations or terms for aspects of religion they could not otherwise understand. For example, outmoded words like *paganism, fetish,* and *animism* were coined by anthropologists to describe highly complex and sophisticated concepts of deity, the physical tokens of this devotion, and the spiritual essence that animates the universe. These forms of expression have been passed down through generations, dating back to the prehistoric period.

Like the people of most ancient societies throughout the world, African peoples have learned how to make sense of the natural universe and its predictable and unpredictable attributes. Often, they did this by observing the cycles of night and day, plant life, the stars, and the phases of the moon. Such attempts to understand the

mysteries of the universe also meant learning to cooperate with the forces that ranged from life and death to the disastrous occurrences of floods, famine, and desertification. Cooperation and placation may have given way to forms of prayer incorporated into the routines of daily life in various forms of worship. These adaptations added a deeper meaning to life and attempted to answer essential questions about existence and purpose. Based on archaeological evidence of burials, remnants of offerings, and sacrificial remains, it appears that religion and religious rites were organized to depict the relationship between humans and the unknown.

Characteristics The term *traditional religion* generally refers to religious thought and philosophy that has its roots in African culture before and separate from contact with CHRISTIANITY or Islam. Traditional religion includes specific beliefs, ceremonies, and rituals carried out by designated ritual specialists, who include elders of the community, priests, RAINMAKERS, ORACLES, medicine men, and prophets. The values associated with these rituals are embodied in the presence of the ritual specialists and then passed down from generation to generation, during the process of which they are, of course, modified. It this way religion incorporates the history of the society through oral sources such as myths, proverbs, personal names, and language.

Rather than formalized patterns of liturgical prayer, the traditional worship that typified much of ancient Africa found expression in outward actions that included invocation, poured libation, offerings, prayer, and forms of MUSIC. (The latter usually called for drumming accompanied by song and dance.)

Ancient African societies generally made no distinction between sacred and secular activities; a devotional act was a vital force regardless of whether it was performed at designated shrines, in daily work chores, or in community FESTIVALS. Although no two societies worshiped in exactly the same way, there were many shared beliefs. Scholars find four common threads that are present in most traditional belief systems: believing in a Supreme Being, the religious pantheon, honoring ancestors, and believing in the afterlife.

Supreme Being Each ancient culture had a different name for the supreme being. In the IGBO language spoken in NIGERIA, the supreme being is called *Chukwu;* the AKAN of GHANA use the name *Onyame,* while the Ewe used *Mawu.* The YORUBA of Nigeria used the name *OLORUN,* or *Olodumare,* and the Mende of SIERRA LEONE refer to *Ngewo.* Considered the great creator, from time immemorial the supreme being has been viewed as omnipotent, omniscient, and compassionate—the highest form of life and the shaper of human destiny.

Many African societies, even in ancient times, have shared common myths that tell of the supreme being's omnipotence. These myths also explain that, while com-

munication between this being and humans continued, direct contact was somehow altered by the folly of humans. This contact was also affected by the fact that the deity placed intermediaries within the human sphere to meet the daily needs of people. The Mende of Sierra Leone provide an example of this pervasive belief, for, even in ages long past, they maintained that at one time Ngewo was close to humans. The Mende say that this changed when, after being given permission to ask Ngewo for what they needed, the people made so many requests that, in order to escape their demands, Ngewo retired to the heavens. In spite of the prevalence of such beliefs among ancient Africans, it was widely understood and accepted that the deity continued to be active in their lives but that divine intermediaries were the appropriate means through which people were to communicate their needs.

The Religious Pantheon The pantheon of gods represents various aspects of the natural world, and the gods serve as intermediaries to the supreme deity. The names of many gods and goddesses linked to the natural world have survived in traditional FOLKLORE and myths.

Annual FESTIVALS, many of which are still celebrated today, represent one of the earliest traditional forms of communal thanksgiving. These are especially common as expressions of gratitude to DEITIES for a successful or bountiful harvest of YAMS or other such crops. For the Mbaye of CHAD, for example, water, light, and the sun have long been considered powerful spiritual influences that require specific ritual offerings. In much the same way, the goddess Anuket, who personified the way in which the NILE RIVER nourished the fields in the regions bordering ASWAN, was honored in ancient EGYPT.

Sun and moon gods were worshiped by early Sabeans who crossed the RED SEA from Yemen, bringing their religious beliefs to the highlands of ETHIOPIA. It has been reported by some that MAKEDA, queen of Sheba, who ruled over AKSUM and the region of southern Arabia, was originally a sun worshiper. But following her involvement with Solomon and the embrace of his religious convictions, Ethiopia's unique form of JUDAISM came into being.

The *ORISHA,* who are associated with YORUBA religion, represent the most widely known intermediaries in Africa. Like other lesser gods or deities, each *orisha* has its own attributes of nature, as well as its specific favorite foods and taboos. There are also prayers, songs, and dances performed on certain days of the week. Generally, Yoruba devotees become aware of and familiar with the requirements of their own *orisha* through DIVINATION.

Ancestors The honoring of ancestors in Africa is not a religion in itself, nor is it a cult, as it has erroneously been portrayed by some historians. Instead, it represents a misunderstood aspect of African culture. In traditional African cultures, ancestors may personify the male and female founders of society. They also may be kings or even family members who provide a good exam-

ple of morality in their daily lives. As such they are viewed as important parts of the ongoing social structure.

Many forms of power have been attributed to ancestors, especially in ancient times, but this power generally lies within the scope of the society's needs and the ability to seek and receive help in a crisis. To offer the ancestral spirits both recognition and gratitude, certain types of shrines are erected at which prayers, animal sacrifices, masquerades, or similar ceremonies are performed.

In Chad the *qir ka,* for example*,* has long been regarded as a powerful ancestral male figure and plays a prominent role among the Sara people. Since theirs is a patrilineal society, legal rights, identity, and land are part of the power that is conferred to succeeding generations through links to this ancient individual.

Death, the Afterlife, and Burial Rites In Africa, death has always been considered the final of the RITES OF PASSAGE. Viewed as an act of inevitable fate from prehistoric times, the grave goods buried by early *HOMO SAPIENS* underscored an early belief in an AFTERLIFE. As time passed, these beliefs evolved, and the stone tools once found in prehistoric graves gave way to JEWELRY and to money for use in the afterlife. Belief in the hereafter, which often was held to be a replica of life on earth, sometimes supported the practice of human sacrifice, such as that carried out in CARTHAGE. It also spurred the construction of the burial tumuli of Nubia, which contained royal families, their close advisers, and their servants.

A number of ancient African societies also believed that, when death occurred, the deceased had to give accountings of their lives. This belief is reflected in ancient temples, most famously in EGYPT. There, wall paintings and other artifacts show the gods of the underworld waiting to devour the dead as their hearts are weighed on the sacred scales of justice by MAAT. Similarly, some societies, such as that of the Akan, believed in what they referred to as Asamando, the place at which the dead are judged for their past behavior. According to the Akan, this judgment was carried out by former kings, and wrongdoers were returned to earth, possibly to be born blind, lame, or deformed.

Many ancient African societies held two burial rites. The first was often done to remove the polluting presence and disruption caused by death. The second was to apply every possible ritual aspect to ensure that the spirit of the deceased had been satisfied. Because the second funeral often was one of extravagance, accompanied by appropriate displays of mourning, it was remembered long after by younger generations. In this way African religion was self-perpetuating, creating an endless cycle of birth and rebirth that affirmed the creative abilities of the deity.

rhinoceroses Large mammals found in Africa and Asia. In mythology, rhinoceroses served as inspiration for the unicorn, a mythical horned horse. Rhinoceroses are also associated with the ancient Egyptian mythological creature Amenti, a serpent that devoured sinful people in the AFTERLIFE. The rhinoceros was an exotic animal to ancient Egyptians. According to inscriptions, it was one of the prizes King THUTMOSE I brought back with him from an expedition in Nubia. Later, the people of AKSUM exported rhinoceros horns to lands as far away as China.

rhythm pounder Uniquely carved wooden figure used in funeral processions. Throughout the history of the Senufo people of IVORY COAST, the rhythm pounder has symbolized respect for the elders who were once important within the community. When these elders pass away, certain rites are needed to help them achieve the status of ancestor. As a rite of passage, this wooden carving, about 3 feet (1 m) high, is carried by a procession of mourners, who sway in accompaniment to the MUSIC of DRUMS and horns.

Rift Valley Geological fault system that spans 3,000 to 4,000 miles (4,828 to 6,437 km) from southwestern Asia to eastern Africa and was home to the earliest prehistoric people on Earth. The Rift Valley—*rift* meaning "depression," "trough," or "crack"—is also known as the Great Rift Valley, the Afro-Arabian Rift Valley, and the Eastern Rift Valley. It is one of the longest rifts on the planet. Geologists think the valley was created in a fault zone more than 50 million years ago. The Rift Valley has a wide variation in elevation, from around 1,300 feet (396 m) below sea level in the Dead Sea to about 6,000 feet (1,830 m) above sea level in KENYA. The width of the valley is 30 to 40 miles (48 to 64 km) on average. It measures only a few miles wide at its narrowest point and expands to 100 miles (160 km) at its widest point. From space, the Rift Valley in Kenya is clearly visible.

The Rift Valley enters Africa from the RED SEA, moves into ETHIOPIA, stretches southwest into Kenya, extends south through TANZANIA and MALAWI, and finally proceeds into MOZAMBIQUE, going through the lower ZAMBEZI RIVER valley to the Indian Ocean. The Rift Valley in Africa

is typically considered to be the main valley, with a western branch extending north along the eastern border of the Democratic Republic of the CONGO. Several freshwater and alkaline lakes are in the valley, the largest of which are in the western rift valley and include Lake Nyasa (also called Lake Malawi) and Lake TANGANYIKA.

Of the several Rift Valley lakes in Kenya, the largest is Lake TURKANA. It was along the shores of this lake that archaeologist Dr. Richard Leakey discovered hominid remains thought to be millions of years old. Using archaeological discoveries and oral history, scholars have gathered evidence that seems to support the theory that the human race originated in this area of Rift Valley. Evidence suggests that as early as the STONE AGE (c. 50,000 BCE) people lived near Lake Turkana and manufactured stone hand-ax tools. Then, around 10,000 BCE, the discovery of fire allowed for the invention of new ways of toolmaking. Cultures of hunting-and-gathering people developed in the area, and AGRICULTURE began around 1000 BCE in the Rift Valley, probably having been introduced by Kushites from Ethiopia.

Ancient irrigation systems have been discovered from this time, too. The Rift Valley is the location of an important IRON AGE site at Engaruka. This area in northern Tanzania was home to a large settlement of agriculturalists who irrigated the land for more than 1,000 years.

Several other lakes fall in the Rift Valley, including lakes Naivasha, Nakuru, Baringo, and Bogoria. Lake Naivasha is a freshwater lake and the highest of the Rift Valley lakes. Lake Nakuru is noted for the million or so pink FLAMINGOS that make their home there. Within the Kenyan part of the Rift Valley, animal life is abundant, including HIPPOPOTAMUSES, ZEBRAS, white and black RHINOCEROSES, LEOPARDS, GIRAFFES, buffalo, waterbuck, and several hundred species of birds.

rites of passage Term used by anthropologists to describe the special ceremonies that mark a person's development. Rites of passage occur in all societies of the world, the most common ones marking birth, the onset of adulthood, marriage, and death. Many of these rites have remained intact for thousands of years. Most have been carried out in culturally distinctive ways that include the use of ritual objects, feasts, song or DANCE, and special CLOTHING AND DRESS or JEWELRY.

Marriage in Africa offers a prime example of a series of smaller rites that culminate in a final ceremonial rite of passage. Some societies begin this process during early childhood. The Udhuk of ETHIOPIA, for example, traditionally marry at an early age, but individuals are permitted to choose their future spouses. After approaching their parents and gaining approval, the future bride wears BEADS, indicating that she is engaged. In contrast parents in the Kiga society of UGANDA make all the arrangements for marriage, and the young bride and bridegroom do not meet until the day of the wedding. Prospective husbands of the Wolof culture, in what is now The GAMBIA, ask intermediaries to carry KOLA NUTS, clothing, and other gifts to the FAMILY of the prospective bride. The presenting of gifts, known as BRIDE-WEALTH, is a crucial rite of passage that dates back to the times of Egyptian rule. The ruling elite, in particular, required that contracts be drawn between the groom and the father of the bride. It was generally held that the gifts strengthened the relationship between families united by marriage.

The actual marriage ceremony is the culmination of these rites and ranges from a simple act to highly demonstrative displays. Toro bridegrooms in Uganda carry their new wives on their shoulders to their new home in order to demonstrate to the community the high esteem that they have for their brides.

Funerals have traditionally been the most elaborate rite of passage performed in Africa, and they provide insight into the life of the deceased, while also affirming belief in the AFTERLIFE. For example, many societies bury their deceased with personal objects, a practice that dates back at least to the early Egyptian and Nubian kings who built lavish tombs to ensure a comfortable setting in the afterlife. In contrast, many nomadic hunting-and-gathering societies conduct a more simple form of burial, although it is no less significant to the living.

Among the lesser rites associated with funerals is the act of purification. In GHANA, when a married man or woman dies, the family of the deceased performs a traditional rite that simultaneously protects the surviving partner from the polluting effects of death and dissolves the marriage. When the period of mourning is completed, the former spouse is free to marry again.

rock art Engravings and paintings, often in color, made by ancient peoples on stone surfaces. The earliest rock paintings date from the period 5000 to 2000 BCE and contain depictions of game animals. Some 30,000 examples of ancient rock art have been found in the SAHARA DESERT alone. Human figures, if shown, carry clubs, bows and ar-

rows, and other weapons for hunting. Rock ART is probably connected to the creators' religious beliefs or rituals.

Rock art in the Sahara, SOUTH AFRICA, and the NILE VALLEY offer strong examples of the relationship between the human and the unknown. In the Nile Valley, between Wadi Abbad and Wadi Hammama, for example, archaeologists have found evidence on rocks and POTTERY that show images and rituals that may preserve the roots of Egyptian RELIGION.

Early rituals are more clearly depicted in southern Africa, where paintings of the eland have been attributed to the SAN. In these drawings, the animals appear to symbolize prosperity, and the scenes generally include ritual DANCE that probably recognized this. Likewise, archaeologists have found rock art in the Congo region that dates back to the Late STONE AGE. Modern-day interpretations by people in the region indicate that one such rock bears moon and star symbols that have been in widespread use since ancient times.

A number of rock paintings with religious themes have been found in BOTSWANA, including scenes of a rainmaking ceremony in which a sacrificial animal is seen being led by what may have been priests. In caves found in Natal, South Africa, a rock painting of what is probably a religious scene shows women clapping for masked dancers. Elsewhere, in the Sahara region, including southern Oran and Tassili N'Ajjer, images have been found that show oxen with Egyptian-style discs, which many archaeologists believe predate the human form later assigned to the Egyptian deity HATHOR. Similarly, images of a ram with a sphere apparently predate the similar figure, but with a human form, later assigned to the Egyptian god AMUN.

In southern Africa, no site has been reliably dated to any time before the common era. The San, among others, continued the tradition of rock painting well into the 19th century, although some of these sites may contain the work of KHOIKHOI and Bantu-speaking artists.

Rome Italian city-state, republic, and empire that, by the beginning of the common era, ruled much of the European and Mediterranean world. The area of the Palatine Hills was originally settled by a people known as the Latins, who were inhabiting the area by about 1000 BCE. For a brief period the Latins fell under the dominance of a rival Italian people, the Etruscans, but they eventually freed themselves of Etruscan rule and, in 509 BCE, established the Roman Republic. Over the next 225 years, Rome gradually conquered neighboring peoples and territories until it had control of the entire Italian

Peninsula. Then Rome battled with CARTHAGE, its main rival in the western Mediterranean, in a series of conflicts known as the PUNIC WARS (264–146 BCE). In the ensuing conflicts, in which Rome defeated the powerful Carthaginian Empire in three separate wars, Rome came to dominate the islands of Sicily and Sardinia and, later, parts of Iberia and the North African coast.

By the end of the Punic Wars, however, the Roman republican system was crumbling. During the period dominated by Julius CAESAR (c. 100–44 BCE), Rome was caught up in turmoil that eventually brought an end to its relatively democratic form of government. Eventually, the republic was replaced by an empire in 27 BCE, when Octavian, the adopted son of Julius Caesar, assumed the name Augustus and became the first Roman emperor. During these years, c. 130–30 BCE, Rome expanded into northern Europe, Asia, EGYPT, and North Africa, forging an empire that controlled the region for almost 500 years.

Rome in Egypt As Rome expanded its power into Asia, it encountered the Egypt of the PTOLEMIES, the rulers who assumed control of Egypt after the death of ALEXANDER THE GREAT (356–323 BCE). Egypt finally fell securely into the Roman sphere of influence during the period of Queen CLEOPATRA (r. 51–30 BCE), who struggled to maintain her nation's independence by playing one side against the other in the dangerous game of Roman politics. She first sided with Pompey, an adversary of Julius Caesar, in their bitter and violent rivalry. Then, switching sides, she supported the victorious Caesar. Her subsequent affair with the Roman leader—and the birth of their son, Caesarion—helped her achieve an uneasy peace with the Mediterranean power, which gave Egypt a semblance of autonomy.

After Caesar's assassination, however, Cleopatra and her country were once again drawn into Roman politics. Marrying Caesar's protégé, Marc Antony, she set about trying to reestablish Egypt's full independence, as well as its position of power in Africa and Asia. The combined forces of Cleopatra and Antony, however, proved no match for Octavian, who defeated them at the famous naval battle of Actium, in 31 BCE. After his victory, Octavian assumed full control of Rome. Egypt became a Roman province, which it remained until the empire split into eastern and western spheres in 355 CE.

Rome in Kush and Nubia Once it was in control of Egypt, Rome began to exact tribute from the nearby kingdom of KUSH in Nubia. Despite this tribute, however, Roman forces repeatedly made advances into Kush territory, penetrating ever deeper towards Nubia. As a result Kushites began to attack Roman outposts, which led to quick retaliatory attacks by the Romans. Roman forces seized several Kushite towns and then marched on Napata, which they soon conquered and destroyed.

Although this three-year conflict resulted in a clear victory for Rome, the Kushites did benefit from the re-

sults. The KANDAKES, who played a major role in the Kushite military and government, appealed to the Roman leader, Julius Caesar, who, feeling that he was putting Rome in a tenuous position by overextending his troops, pulled back the Roman forces. He then restored the Egyptian-Kushite borders to their previous state, leaving Kush and Nubia relatively independent of Rome in the years that followed.

Rome in North Africa   Rome became a major power in North Africa as a result of its victories in the Punic Wars. Inheriting the power of the once-dominant Carthaginian Empire, Rome at first tried to rule northern Africa through a series of colonies—known as Africa Vetus—and client states, including NUMIDIA and MAURI-TANIA. For the most part, these client states, ruled by indigenous kings, enjoyed a great deal of autonomy, and they were able to prosper despite both the Roman presence and the occasional raids of indigenous BERBERS. However, JUGURTHA (160–104 BCE), one of the kings of Numidia, abused his power, angering the Romans and plunging Numidia into a six-year war that ended in Jugurtha's public humiliation in Rome. Later, in the turmoil that resulted from the conflict between Julius Caesar, Pompey, and Crassus (c. 55–46 BCE), another Numidian king, JUBA I (r. c. 45 BCE), managed to consolidate power and establish a substantial degree of independence for his kingdom. The final victory of Julius Caesar in 46 BCE, however, marked the beginning of the end of this independence, as Juba's young son was taken to Rome to be raised, in Roman fashion, in Caesar's own household. As time passed, Caesar extended Roman rule, eventually transforming Numidia into what became known as Africa Nova. Later, in 33 BCE, the death of King Bocchus left Mauritania under Roman rule as well. Increased resistance to the Romans, which followed the death of Juba II, led to further Roman intervention. By 40 CE Rome had firm control of the region, retaining it until the empire crumbled in the fourth and fifth centuries.

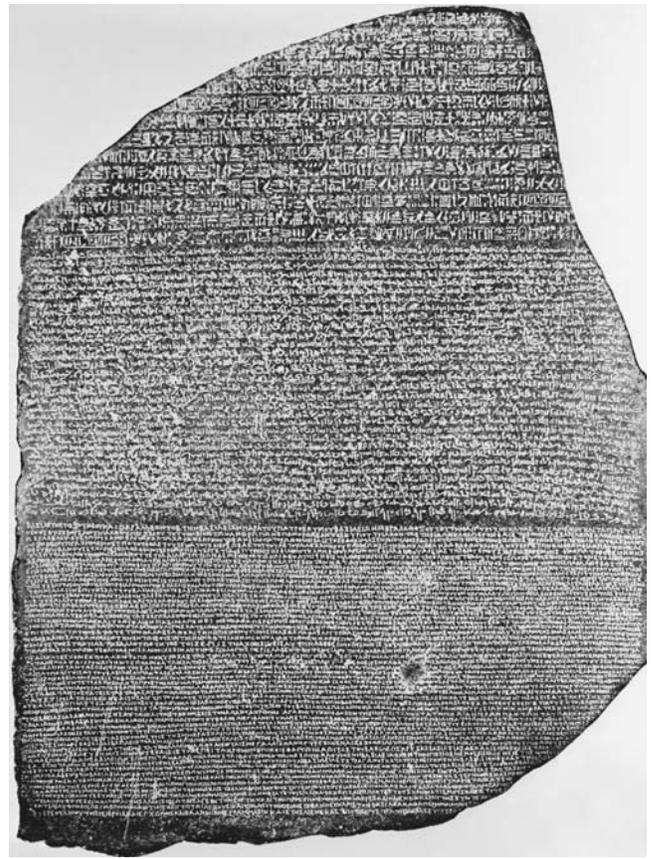
Rosetta Stone   Ancient stone bearing an inscription written in HIEROGLYPHICS, DEMOTIC, and Greek; it provided the linguistic clues that led to the first translation of Egyptian hieroglyphics. The Rosetta Stone was discovered by one of Napoleon's soldiers in August 1799 during the French military expedition to EGYPT. It was found near the NILE DELTA town of Rashid, whose ancient name was Rosetta. The stone itself is a slab of black basalt 46 inches (115 cm) high by 28.5 inches (72 cm) wide. The text of the stone is basically an inscription written in 196 BCE by the reigning king's priests. It honors the Egyptian


Because it provided the same text in three different languages, the Rosetta Stone enabled Champollion and Young to decipher the riddle of hieroglyphics. British Museum, London, England *© Bettmann/Corbis*

king Ptolemy V Epiphanes using three different writing systems—hieroglyphics, demotic (a simple version of hieroglyphics), and Greek. Through a comparison of the Greek and Egyptian texts, for the first time linguistic scholars were able to decipher ancient Egyptian hieroglyphics. From their study, they concluded that hieroglyphs are mainly phonetic, not the symbolic signs they previously were thought to be.

In 1802 Johan David Akerblad and the French scholar A. I. Silvestre de Sacy were the first to make headway in the translation of the markings on the stone. After identifying a few of the letters and some of the proper names in the demotic section of the text, the two scholars compared them with the same names found in the Greek section. Thomas Young, a British physicist, built on these findings by proving that proper names in hieroglyphics had phonetic value. Young also introduced the concept of *cartouches,* the writing of proper names enclosed by ovals. In 1814 Young further revealed that hieroglyphics should be read by studying the direction in which the bird and animal signs were facing.

The final breakthrough in the translation, which occurred in 1822, is credited to the French scholar Jean-François Champollion. Champollion recognized the signs used to write royal names such as Ptolemy. He then was able to draw on his knowledge of COPTIC Egyptian to unlock the phonetic values of the remaining hieroglyphs. One year later Champollion published his work in the famous *Lettre à M. Dacier.*

In 1802, under terms set forth in the Anglo-French Treaty of Alexandria, the Rosetta Stone was given to the British Museum in London, England, where it is still displayed.

Ruvuvu River (Ruvubu)   One of the major rivers in the largely mountainous East African nation of BURUNDI. Fed by streams seeping from the plateaus east of Lake Kivu and Lake TANGANYIKA, the Ruvuvu originates not far from Bujumbura, the capital of present-day Burundi. The river, approximately 300 miles (483 km) in length, flows northeast across the country, forming a portion of the present-day eastern border with TANZANIA. After it joins with the Kagera River in RWANDA, the two rivers together form the southernmost source of the NILE RIVER and finally spill into Lake VICTORIA.

See also: LAKES AND RIVERS (Vol. I).

Ruwenzori Mountains   Mountain range in eastern Central Africa on the western branch of the RIFT VALLEY. The Ruwenzori Mountains stretch along 80 miles (129 km) of the present-day border between UGANDA and the Democratic Republic of the CONGO. The widest point spans 30 miles (48.3 km) and the highest point reaches over 16,700 feet (5,090 m) at Mount Margherita. Though this range lies just north of the equator, it has a permanent snow line at around 14,800 feet (4,511 m). The peaks typically lay under a blanket of mist or clouds. Several lakes, glacial lakes, and glaciers are found in the mountains. Ancient crystalline rock makes up the range, but the mountains contain substantial deposits of cobalt and copper. In ancient times these mountains were mistakenly thought to be the source of the NILE RIVER. Scholars think that the famous "Mountains of the Moon" described in the second century by Ptolemy are the Ruwenzori Mountains.

Ruzizi River (Rusizi)   River that marks part of the borders between the present-day Democratic Republic of the CONGO to the west and BURUNDI and RWANDA to the east. The Ruzizi River traverses a 100-mile (161-km) course through the western RIFT VALLEY from Lake Kivu, the highest lake in Africa, south to Lake TANGANYIKA. Providing drainage for Lake Kivu, the river flows along the Rwanda-Congo border before entering the Imbo valley in Burundi. Forming the Burundi-Congo border, the Ruzizi River then enters Lake Tanganyika. Volcanic activity forces Lake Kivu's drainage to flow south through the Ruzizi River.

In Burundi the Ruzizi basin of the Imbo plains forms a freshwater system that includes 22 rivers and is one of the systems that contributes to the ample supply of freshwater in the area.

Rwanda   Landlocked country in eastern Central Africa covering approximately 9,600 square miles (24,900 sq km) and bordered by UGANDA, TANZANIA, BURUNDI, and the Democratic Republic of the CONGO. Lake Kivu lies on Rwanda's eastern border. The first inhabitants of the area were probably the TWA people, short-statured HUNTER-GATHERERS who had settled there prior to the arrival of Bantu-speaking people early in the first millennium.

S

Sahara desert The world's largest desert and the only true desert found at 0° longitude. The Sahara, which means simply "desert" in Arabic, covers one-third of Africa, including most of North Africa, and extends approximately 3,320,000 square miles (8,598,800 sq km), an area roughly the size of the continental United States. The great desert measures 3,000 miles (4,827 km) from east to west and between 800 to 1,200 miles (1,287 to 1,931 km) from north to south. It stretches from the Atlantic Ocean in the west to the RED SEA in the east. Its northern boundaries are the ATLAS MOUNTAINS and the MEDITERRANEAN SEA; its southern boundary lies along latitude 16° N and extends through parts of CHAD, NIGER, and the Republic of the SUDAN. The Sahara is one of the harshest environments on earth.

Geography The Sahara is crossed by the NILE RIVER and the NIGER RIVER, which sustain most of the region's human population. Only 2.5 percent (80,000 square miles/ 200,000 sq km) of the Sahara are oases, which are areas of farming and settlement. The water in an OASIS (which is almost always below sea level) comes from wells or springs fed by underground basins. The Sahara has about 90 large oases and many small ones that may support only one or two families. Some large oases have thousands of date palm trees planted, and farmers grow barley, wheat, and other crops. However, even the largest settlements on the oases sustain fewer than 2,000 inhabitants.

The main geographic features of the Sahara include shallow basins called *chotts* and *dayas;* gravel-covered plains called *regs;* rock-strewn plateaus; and sheets, dunes, and seas of sand, collectively called *ergs,* which cover about one-quarter of the desert's surface. The shifting, wind-blown sands in an *erg* can form dunes as high

as 600 feet (183 m). (Scientists have yet to explain the "singing" or booming of the sand dunes.)

Mountains and uplands cover the central portion of the Sahara. The plateaus of the Sahara, such as the Tademait Plateau in ALGERIA and the ENNEDI Plateau in Chad, are covered with angular weathered rocks. The Ahaggar Mountains in Algeria rise 9,573 feet (2,918 m) high. Mount Koussi in the Tibesti Mountains of Chad reaches a height of 11,204 feet (3415 m). The lowest point in the desert is Egypt's QATTARA DEPRESSION, 436 feet (133 m) below sea level.

Climate The highest temperature recorded is 136° F (58° C) at al-Aziziyah in LIBYA; yet in other places, frost can be seen in the wintertime. The annual rainfall measures no more than 0.08 inches (2 mm), and some areas may go for years with no rainfall at all. Due to ocean currents a narrow strip of the western coast enjoys a relatively cool, uniform temperature year-round. Most of the Sahara, however, experiences a cycle of extremely hot summers and mild to cool winters.

Climatologists estimate that the Sahara has been a desert since the Early Pliocene epoch, or for roughly 5 million years. It has been subject over time to a cycle of drier and more humid conditions, though for the past 2,000 years, its CLIMATE has been very stable.

Strong winds, given such names as *sirocco, khamsin,* and *shahali,* can blow unpredictably for days. They move vast amounts of sand and create an ever-changing landscape, burying everything in their path and decreasing visibility to hazardous levels.

Animal Life Most desert animals can go for long periods without drinking and are able to take some water from the plants in their diet. The smaller animals are noc-

Most Saharan oases, such as this one in Algeria, are large enough to support only a handful of families. © *Robert Holmes/Corbis*

turnal, staying in their burrows during the heat of the day and exiting during the cooler night to find FOOD. These animals include gerbils, snakes, lizards, and small foxes called fennecs. Among the larger animals living in the Sahara are white gazelles and a rare antelope called an addax, an extremely hardy animal that resembles its much larger relative, the oryx. Barbary sheep live in the rocky plateaus.

Archaeology and History   The region of Africa that includes the Sahara had a much wetter climate during the ice ages of the Pleistocene epoch, which ended about 9500 BCE. Archaeological evidence indicates that forests and grasslands covered the region, which was home to antelopes, ELEPHANTS, GIRAFFES, extinct buffaloes called bubaluses, RHINOCEROSES, OSTRICHES, and warthogs.

The widespread presence of stone artifacts, fossils, and ROCK ART gives evidence of human habitation throughout the region. Almost 30,000 engravings and rock paintings date from the fifth millennium BCE. Archaeologists have also found bone harpoons and accumulations of shells on the shores of long-dried-up Saharan lakes. Evidence of the presence of domestic livestock and

the associated lifestyle of nomadic PASTORALISM in the region can be traced as far back as 5000 BCE. Direct evidence of formal AGRICULTURE—the cultivation in EGYPT of barley and emmer wheat introduced from Asia—dates from as early as 4000 BCE. Native African plants were first domesticated by the Gangara people, ancestors of the modern Soninke, in roughly 1000 BCE.

About 4000 BCE the climate became more arid, and the region began to turn into a desert. At the same time, trade began between neighboring settlements and, eventually, between the Sahara region and the outside world. By 2000 BCE COPPER from MAURITANIA had found its way to the BRONZE AGE people of the Mediterranean. The people of CARTHAGE, one of the great cities of ancient times, apparently continued these Bronze Age trade relationships as their city rose to prominence after 600 BCE.

The growing aridity of the Sahara had its effect in the transition from CATTLE and HORSES to CAMELS, which were better adapted to life in the desert. Camels were used in Egypt by 600 BCE, although in other parts of the Sahara they were unknown until some 600 or more years later, when they were introduced from the Middle East.

Camels all but replaced cattle as the pack animals of choice on the trade routes.

The Movement of Peoples The North African city of Carthage, destroyed at the end of the Third Punic War in 149 BCE, later became an important city in the Roman Empire. After the city was overrun by the VANDALS, a Germanic people, around 430 CE, a major shift in population occurred. Various clans of BERBERS, camel-mounted nomads who lived along the northwest coast of Africa, entered the desert to avoid the anarchy and warfare following the defeat of the Romans and gradually became established throughout the Sahara. The clans often plundered caravans and attacked oasis dwellers. Later, other groups of Berbers—prompted by the rise of Islam—and Arab peoples who desired to maintain traditional beliefs also moved into the Sahara. Within 500 years Islam had spread to the southern borders of the Sahara, and Arabic became the main language of the desert.

Of the major black African kingdoms known to the Arabs at the beginning of the Islamic period, most were located north of Lake CHAD and the Senegal and Niger rivers, close to the southern edge of the Sahara. Historians speculate that these kingdoms found it more beneficial to locate themselves closer to the ends of the trade routes than in lands more suited to agriculture. In exchange for GOLD, ivory, foodstuffs, and slaves, these kingdoms could import luxury goods and, most important, SALT, a precious commodity readily available only on the coastlands.

There is archaeological evidence for a mixed pastoral and agricultural economy among an intermingled group of Libyan Berbers and black agriculturalists in the Sahara by 4000 BCE, about the same time Egypt began to flourish. However, the growing desertification of the Sahara region seems to have forced its black population to migrate to the more fertile and welcoming savannas of the SAHEL region south of the Sahara.

See also: SAHARA DESERT (Vol. II) TRANS-SAHARAN TRADE ROUTES (Vol. II).

Further reading: David Ball, *Empires of Sand* (New York: Bantam Doubleday Dell, 1999); Gianni Guadalupi and Paolo Novaresio, *The Sahara Desert: From the Pyramids of Egypt to the Mountains of Morocco* (Cairo: American University in Cairo Press, 2003).

Sahel Hot, dry band of grasslands that lies south of the SAHARA DESERT. The Sahel, which means "border" in Arabic, extends through present-day SENEGAL, MAURITANIA, MALI, BURKINA FASO, NIGER, NIGERIA, CHAD, and Republic of the SUDAN. The area was initially populated by the southward migration of desert-dwelling black peoples in search of more hospitable living conditions. All the major black kingdoms of ancient West and Central Africa arose in the Sahel as way stations and terminus

points for the trade routes to northern Africa. The largest and the longest lasting was ancient GHANA, which originated in the late fourth century but did not reach its peak until about 1000 CE. Ancient Mali, the Songhai Empire, and Kanem-Bornu were influential Sahelian trading kingdoms that came into being after the decline of Ghana.

See also: KANEM-BORNU (Vols. II, III, IV); MALI EMPIRE (Vol. II); SONGHAI (Vol. III).

salt One of Africa's major natural resources and an item in great demand in trade in the ancient world; in ancient Africa, it was often used as a form of currency. Salt has been used as money and in barter for thousands of years in Africa. In fact, the word *salary* is derived from a Latin word meaning "salt." Like all things used as currency, salt was easy to distribute, readily transported, not perishable, and valuable beyond its use as money. In hot climates like that of western Africa, salt was used to season and preserve FOOD. Ingesting salt helped prevent a person from losing bodily fluids.

The rise of AGRICULTURE may have contributed to the increased use of salt. Nomadic people who lived off meat that was either raw or had been roasted to keep in the natural salt, had little need for salt. The proliferation of trade around the MEDITERRANEAN SEA, however, gave rise to settlements and urban trading areas, which led to an increase in agriculture. As agriculture increased, diets changed to include more vegetables, grains, and boiled meats, all of which required salt as a supplement.

In this way salt became a valuable item and one of the most commonly traded commodities in ancient times. In fact, to some ancient peoples, it was pound-for-pound more valuable than GOLD. It is believed that North African trade routes for salt and gold began crossing the SAHARA DESERT by at least the fourth century.

See also: MONEY AND CURRENCY (Vol. I); SALT TRADE (Vol. II).

In ancient times, because they valued salt so much, the people of West Africa frequently traded equal weights of salt for gold.

San (Bushmen) HUNTER-GATHERERS who probably were the original inhabitants of present-day BOTSWANA, NAMIBIA, and northwest SOUTH AFRICA. The San belong to the linguistic group speaking KHOISAN LANGUAGES, which includes the Khoikhoi, !KUNG, G/wi, and other speakers of "click" languages. Despite similarities in language and

appearance, the San and Khoikhoi represent two distinct ethnic groups who, at various periods of history, coexisted in the same regions. The name *San* reportedly comes from their word *sa,* which means "gatherers of fruit" or "harvest." As such, it is a better description of the San way of life than BUSHMEN, a term that is now considered to be derogatory and unsuitable.

The San's longevity in southern Africa ranges between 20,000 and 30,000 years, although the San actually may date back to an even earlier period. The complex nature of their society has been avidly studied and offers critical insights into the Late STONE AGE period. For instance, a recovered collection of tools associated with the San dates back some 15,000 years, and is known as the Wilton Stone Kit. The tools were named for the cave shelter in Cape Province, South Africa, where they were discovered. The kit demonstrates an advanced level of toolmaking ability, including scrapers, borers, and microliths, which are long, blade-like pieces of stone produced by striking a larger stone or core. These tools were probably used to butcher animals. Although the San hunted in small groups, they developed highly effective methods for bringing down animals like the eland, kudu, impala, and bushbuck using nets and animal traps, along with spears and arrows coated with a poison made from vegetables. After a successful hunt, every part of the animal was consumed, and the skin made into clothing and bags.

It remains uncertain how often meat could be made available by hunting, and women and children, who were primarily the gatherers, provided nearly 80 percent of the San diet. FOOD items that were probably consumed on a daily basis included honey, berries, *mongongo* nuts, insects such as grasshoppers, fruit, and smaller animals such as tortoises and mole rats. Recovered digging sticks and grinding stones suggest that women also obtained wild roots and plants from the more than 100 types available in the region. Adding further variation to their diet, San who lived closest to the coast caught fish, rock lobsters, seals, and mussels in reed baskets.

This cooperative system of hunting and gathering allowed the San to share food resources among the members of their FAMILY group or bands. These groups ranged from 10 to 60 people, but often shifted in size as a result of polygyny, as well as resettlement and natural loss from death or disease. San society has often been described as egalitarian because of their emphasis on shared work responsibilities and leadership chosen from a group of elders.

Between 20,000 and 15,000 BCE, San culture had developed to the point of burying the dead in accordance with specific rites. Their spiritual belief system centered around a single, all-powerful God as well as lesser DEITIES. However, notions of land ownership remain questionable since the San were a highly mobile society. Their homes,

made of interlocking branches and thatch, were designed for transport over long distances.

Because they applied time limits and organized efforts to their subsistence activities, the San were able to devote a generous amount of time toward developing their cultural practices. As a result their cave paintings and ornamental JEWELRY made from the eggs of OSTRICHES represent one of the most widespread forms of prehistoric ART in southern Africa. A variety of musical instruments have also been attributed to the San and may have been used in social or ritual practices. For example, the !Kung San who live in KALAHARI DESERT bordering Botswana, have been depicted in cave paintings as participants in healing dances performed as a safeguard against spirit-induced illnesses or similar misfortunes.

One of the questions that still remains about the San involves the recovery of their skeletal remains at sites as far away as TANZANIA, UGANDA, southern Republic of the SUDAN (called NUBIA in ancient times), ETHIOPIA, and SOMALIA. Archaeologists are uncertain whether these findings reflect forced resettlement following the BANTU EXPANSION into southern Africa some 2,000 years ago or whether it relates to hunting-and-gathering activities.

São Tomé and Príncipe Present-day nation made up of two large islands, São Tomé and Príncipe, and a number of smaller islets located off the coast of GABON, in the Gulf of Guinea. Measuring about 390 square miles (1,010 km) in all, São Tomé and Príncipe is the smallest country in Africa. It is believed that São Tomé was uninhabited before the 15th century.

Saqqara Site of an ancient burial ground, known for its elaborate private tombs from the era known as the OLD KINGDOM (c. 2705–2213 BCE). As the primary burial site of the ancient Egyptian capital of MEMPHIS, Saqqara was used by almost every dynasty at least through the First Intermediate Period. The most elaborate *mastabas,* or private tombs, at Saqqara were built as "houses of eternity." These structures sometimes contained more than 20 separate chambers, with numerous burial shafts for FAMILY members. Thousands of hieroglyphic inscriptions decorated the multicolored walls.

Private tomb ARCHITECTURE of the Old Kingdom culminated at Saqqara in the mastabas of the Fifth and Sixth Dynasties (2465–2250 BCE), in which the greatest variety of wall scenes may be found. These tombs were intended for such high-ranking administrators as Ti and Ptahhotep

The step pyramid of Djoser at Saqqara, dating from the Third Dynasty (2630–2611 BCE), is thought to be the first pyramid ever built. © *Richard T. Nowitz/Corbis*

and were dominated inside by large-scale figures of the deceased. On one level, these figures were meant to signify the importance of the deceased. On another level, these scenes of people, objects, and activities were believed to have been endowed with reality in the AFTERLIFE. Thus they offered provisions for the spirit of the deceased. Other scenes included craftsmen at work, herdsmen leading bulls, boating games, and ritual pilgrimages.

Mastabas at Saqqara have become a major source of information about the Old Kingdom, providing the opportunity to reconstruct a picture of daily life during the period. As a result the site remains a primary Egyptian tourist attraction.

Satire on the Trades　Name given to the ancient Egyptian text, written around 2000 BCE, that recorded the hard life of trade laborers, as well as the scorn with which the upper class regarded the laborers. Sometimes described as a poem and sometimes as a text, *Satire on the Trades* is thought to have been written by an aristocratic father who wanted to warn his son of the dangers of the trades and to persuade him instead to enter a training school for SCRIBES. According to the author of the satire, scribes remain free of an employer's control, are not subject to heavy or dirty LABOR, and want for nothing as members in the court of the king. As a scribe, the son is promised "life, prosperity, health."

The text describes the life of trade laborers as hard, dirty, miserable, and dangerous. The builder, for one, is portrayed as being covered with clay, physically battered, and miserable. The arrow maker is similarly miserable as he ventures into the desert looking for flint. The launderer, meanwhile, lives a dangerous life because this work is done on the riverbank where CROCODILES also reside.

This poem or text also shows the disdain that the ancient Egyptian upper class shows the working class, claiming that the people of the trades are thought to be "wretched through and through." The author of the satire speaks from his experience and seems to sum up his view of the tradesman when he writes, "I have seen how the belabored man is belabored."

scarab beetles Large, heavy-bodied oval insects that often have colorful, metallic-looking bodies. In ancient EGYPT scarab beetles would occasionally appear in great numbers along the muddy banks of the NILE RIVER. As a result scarab beetles became one of the most sacred Egyptian religious symbols. They were associated with resurrection, renewal, and immortality. Re-Khepri, a form of the sun god Ra, was often depicted as a scarab or as a man whose head was surmounted by a scarab. According to tradition, Re-Khepri rolled the sun before him across the sky, carrying it safely to the other world after sunset in order to renew it for the next day. A probable explanation for this association between the scarab and the ball of the sun is the fact that scarabs are a kind of dung beetle, insects that roll balls of dung along the ground. They use the dung balls for food and also as a safe place to lay their eggs.

The ancient Egyptians used exquisitely carved and inscribed stone figures of scarabs as decorative pendants and also as seals to commemorate important events. Scarab figures have also been found buried with mummies. Roman soldiers often wore scarab rings as military symbols.

scarification Marking the body or face for the purpose of cultural identity, status, group affiliation, or as a health practice; also known as *cicatrix*. Although it has not been determined when the practice of scarification began, evidence of its antiquity has survived in an ancient terra-cotta recovered in the Fayum region of EGYPT. The SCULPTURE, which appears to have been made during Roman occupation of Egypt, is of a Sudanese woman whose cheeks bear distinctive scarring. It serves as an important reminder that scarifications appeared on many MASKS and human-like figures sculpted from wood, metal, or clay. Created to represent ancestors or DEITIES from the spiritual realm, these identity marks were also created in imitation of the living, whose incisions or burns of distinctive patterns on the skin raised keloid scars. The formation of keloids, part of the normal healing process for many dark-skinned populations of Africa, resulted from the re-growth of connective tissue. Some ethnic groups also practiced scarification in order to put MEDICINE directly under the skin.

When taken collectively, the scarifications displayed in representational ART and by particular groups offer a

visual statement concerning spirituality, social origins, and a sense of community, past and present. For instance, the Sonjo of TANZANIA traditionally marked their left shoulders with an *ntemi* scar, a symbol representing their ancient founder. Although the exact reasoning behind this practice is unclear, it is known that one of the Sonjo's primary beliefs centered on the necessity of recognizing this being when he made his eventual return to earth. In a somewhat similar vein, the Lozi of BOTSWANA marked their arms and ears, apparently in order to gain recognition in the spiritual realm after death. Elsewhere, in societies in which infant mortality rates were high, children were given special identity marks that supposedly would change their appearance and prevent their return to the spirit world.

Over the centuries, scarification evolved into one of Africa's most widespread forms of BODY ADORNMENT. However, scarification clearly had more important roles to play than simple ornamentation, especially in the RITES OF PASSAGE undergone by the young men and women of many peoples. Such rites have often required some form of modification to the head, limbs, or torso. Initiation into adult society required Okiek women to have their heads and eyebrows shaved. Among the Mende of SIERRA LEONE, "teeth marks" of the Poro deity are made with a razor on the backs of male initiates. Tooth modification has also been associated with transitional rites and often involved the removal, chipping, or filing of incisor teeth. Both the NUBA of the Kordofan region of central Republic of the SUDAN and the Luo of KENYA traditionally removed the lower front incisors as part of initiation. Other forms of body modification have included the wearing of wooden plugs designed to stretch the earlobes. This has been a common practice among the MAASAI and Turkana of Kenya, as well as the Ndebele of SOUTH AFRICA, who begin to wear wooden earplugs at 10 years of age.

science The role of Africans in the history of the physical sciences has often been overlooked in modern academic studies; however, because it can be argued that the history of natural science begins with the dawn of humanity, it was likely that humans in Africa were the first to explore the laws of science and use their accumulated scientific knowledge to their advantage.

From the beginning, humans had to face the issues of subsistence—locating nourishment, building shelter, and manufacturing clothing—and the first pseudoscientific observations were likely made in conjunction with the development and utilization of tools for hunting. Humans probably came to understand the basic laws of physics and mechanics as they learned to manufacture weapons, shelters, and tools.

When AGRICULTURE developed in EGYPT nearly 17,000 years ago, knowledge of ASTRONOMY and mathematics, as well as the development of units of measure and time, became of paramount importance. In fact, the CALENDAR the Egyptians developed more than 6,000 years ago is a prototype of the one we use today.

Egypt was a highly advanced society thousands of years before the European civilization of ancient GREECE, so the Greeks considered Egypt the center of scientific study. Much of what the Greeks knew of astronomy and geometry was handed down from the Egyptians, and the most brilliant Greek scholars studied in Egypt.

The Egyptians also made advances in the fields of mining, METALLURGY, AGRICULTURE, SHIPBUILDING, and MEDICINE, and the extensive engineering knowledge of Egypt's pyramid builders still perplexes scientists today.

Due to adverse climatic conditions on the continent below northern Africa, there is a dearth of early archaeological evidence from these regions. It is difficult, therefore, to ascertain the scientific and technological advances made in those areas. However, discoveries such as the ISHANGO BONE in Central Africa have forced archaeologists to rethink prior theories regarding the scientific knowledge of ancient African peoples. This notched bone, which is thought to be an early calendar and counting tool, dates to c. 8500 BCE, suggesting that the peoples of Central Africa were capable of rather sophisticated mathematics during the Paleolithic era. The knowledge of mathematics and units of measurement that the Ishango Bone represents are the bedrock of scientific thought.

scribes   Practitioners of the ancient profession of WRITING and transcribing records, letters, and texts of various kinds. Typically, in ancient EGYPT, scribes were highly respected priests or government officials. The scribe profession dates back nearly to the time that writing was invented, around 3200 BCE. According to Egyptian myth, the scribe of the gods, THOTH, invented writing and then gave it to the people. Though PAPYRUS is fragile, it revolutionized writing, and the earliest known example dates back to about 2500 BCE. Stone carvings show men carrying rolls, indicating that scribes may have been writing on papyrus even earlier. Although papyrus was the most common writing material of scribes, they also wrote on POTTERY, pieces of limestone, and wooden boards. Scribes used a pen or brush made of reed as well as INK made of various pigments. (Red and black were the most common colors.) More complex than alphabetic systems of writing, Egyptian HIEROGLYPHICS contained approximately 700 separate signs that could be used individually or in combination with other signs. As a result the number of literate people in Egypt was low, and well-trained scribes were greatly respected.

The profession of scribe was thought to be a noble one, and individual scribes were often honored by representation in ART. Egyptians were generally aware that writing was a major aspect of the greatness of their civilization and so they respected their scribes. The School of Life, a training school for scribes, was so named because scribes achieved a sort of immortality through writing; it was thought that their books and records had the potential to last forever.

Scribes were required to pass through a difficult and laborious training. (In fact, the Egyptian word for teach was *seba*, which means "to beat.") After a long period of training and apprenticeship, scribes were certified to practice their profession. Some schools for scribes during the NEW KINGDOM (c. 1570–1070 BCE) were part of a government department. Having completed their training, scribes typically were employed as priests or officials of the government. They usually worked in temples, at PYRAMIDS, or in the service of the pharaoh. They were thought of as educated people, and they were allowed to advance in position, often obtaining important posts in government.

Scribes wrote or transcribed many different types of records, including letters, taxes records, legal reports, religious texts, hymns, poetry, stories, myths, medical and scientific texts, and official proclamations of the court. It is apparent that scribes were involved with written communications and records of almost every kind. Perhaps the most famous works of the scribes were the mortuary texts that are now collectively called the Egyptian BOOK OF THE DEAD. On tomb walls, coffins, and on papyrus, scribes wrote magical formulas and other texts intended to help guide the deceased safely to the AFTERLIFE. This funerary text writing is thought to have provided much work for the scribes at the time.

sculpture   Human artistic expression using three-dimensional or relief forms; found in ancient Africa as early as c. 6000 BCE. Archaeological excavations so far have not told the entire story of ancient African sculpture. Evidence, however, suggests that sculpture was created far back in prehistoric times. Rock carvings of the Tassili and ENNEDI found in the SAHARA DESERT date to as early as 6000 BCE.

Other ancient African sculpture includes the small fired-clay animals found at Daima near Lake CHAD. These works, which were done by a NEOLITHIC AGE people, date back to the fifth and sixth century BCE. Many scholars believe that these suggest the existence of even earlier non-fired clay sculptures.

About the same time, in what is now NIGERIA, the Nok people, an advanced IRON AGE culture, were making their amazing terra-cotta figures. The NOK CULTURE produced hundreds of fired-clay figures ranging from pendant size to life size. Plain features and holes in the eyes typified these sculptures, which were masterful in technique and detail.

The ancient Sao culture of the Chari Valley in CAMEROON also sculpted human figures. These most likely were depictions of ancestors or gods and were made from about the fifth century BCE and continue to be made even today. Elsewhere, in the area near Lake VICTORIA and Lake TANGANYIKA in UGANDA, a sculpted head and torso are regarded as the earliest ART of this part of Africa. Although much of this ancient African sculpture proba-

bly was created at about the same time, each culture produced a distinct style.

Unfired clay was perhaps one of the earliest and most commonly used materials for sculpture in ancient Africa. Other media for sculpting included fired clay, wood, stone, and METALS such as GOLD, COPPER, and iron. Ivory and bone also were used. Ancient sculptors probably carved, cast, modeled, or built sculptures in ways similar to methods used by artists today, using tools such as hammers, gauges, chisels, and saws. Large stone carvings, sometimes created in pieces and fixed together, required additional support.

The people of ancient EGYPT were prolific in sculpture and other arts for at least 3,000 years before the common era. Egyptians sculpted monuments and portrait statues, as well as relief sculpture honoring the gods and royalty. Another common subject of Egyptian sculpture was the SCRIBE, usually depicted with PAPYRUS and pen in hand. Much of what is left of ancient Egyptian sculpture today is mortuary sculpture, originally created for tombs and temples. Relief sculpture in tombs dates back to the Third Dynasty (c. 2705 BCE). Egyptian sculpture is also known for the colossi, or larger-than-life sculpture, of which the GREAT SPHINX, and the mammoth portrait sculptures of RAMESSES II are perhaps the best known.

In ancient times, sculpture was not created for artistic expression alone and went beyond the simple function of decorating a house, building, or tomb. Portrait statues of rulers often were created to make a political statement that attested to the greatness of a kingdom. Honoring the dead was another common reason for sculpting, as was paying homage to a god. In Egypt, sculpting may have been thought of as an early recording of history, RELIGION, and culture, as kings, ancestors, and gods were sculpted in three-dimensional forms and in reliefs that often accompanied hieroglyphic texts. Sculpture was also thought to aid the deceased in making a safe journey to the AFTERLIFE, which was of particular concern to the Egyptians.

Ancient African sculpture ranged from simple, plain figures made from one medium by one artisan to the work of many highly skilled craftsmen assembling one mammoth piece. Though the creation of the colossal sculptures of ancient Egypt were unique to that time and place, many of the techniques used by ancient sculptors are still used today, and many of the traditions of early African sculpting continued into the common era.

Sea People   Groups of forceful traders and explorers who roamed the MEDITERRANEAN SEA and Aegean Sea and warred with settled coastal peoples such as the HITTITES and the Egyptians. The Sea People generally wreaked havoc in the ancient world around the Mediterranean and the Aegean. Some scholars say that the Sea People were the ancestors of the PHOENICIANS, while others say they were Philistines from what is now southwestern Palestine. Still other scholars trace the origin of the Sea People by using Egyptian documents that may identify them as several different peoples, including Greeks, Sicilians, Sardinians, the Teresh (from whom the Etruscans in Italy descended), as well as the Philistines. Whatever their origin, they were widely known by the name "Sea People" in the ancient world.

During the NEW KINGDOM, EGYPT gained more territory than it had ever controlled before or after, and then it actively defended its borders. Two known wars between Egypt and the Sea People took place, one during the reign of King Merneptah and the other during the reign of RAMESSES III (r. c. 1198–1166 BCE) .

The Sea People were also known to have destroyed the great trading port of Ugarit, which Egyptian merchants and travelers often visited to trade. Also credited with the destruction of the Hittite empire, the Sea People were infamous in the ancient world. Their skill at sea was advanced, and some scholars even credit the Sea People with making the first trip around the African continent about 600 BCE. If true, this feat was not to be duplicated for another 2,000 years.

secretary bird   Bird indigenous to SOMALIA that is renowned for its ability to hunt reptiles. Except for their long, powerful legs, secretary birds closely resemble HAWKS or EAGLES. Standing taller than 4 feet (1.2 m) and having superior vision, secretary birds are able to stalk their prey from afar. The secretary bird's primary mode of attack is surprise. It grips its victim with its powerful, razor-sharp talons, flapping its wings after attacking to avoid getting bitten.

Ancient Egyptians who visited the land of PUNT, as present-day Somalia was known, probably observed the secretary bird's hunting skills. There is speculation that these visitors may have woven fables or myths about the creature's power. Primary examples of this are the Egyptian myths of HORUS, who was immortalized as a falcon hawk, and SETH, the serpent he successfully battled.

secret societies   Formal organizations united by an oath of secrecy. In Africa members of secret societies generally have come from a vast cross-section of age groups and regions. Since ancient times these groups have used distinctive symbols, language, CLOTHING AND DRESS, and

special rituals to reinforce group identity and to gain public recognition. Because of the secretive nature of these groups, little is known about their inner workings or when they first developed in Africa. Some groups may have been formed in response to adverse conditions such as war or its aftermath. They may have also developed to promote political goals, to maintain ritual activities, or to protect isolated communities. Like other independent groups, these societies found various ways to maintain themselves through monthly dues or accepting fees in return for special services.

The Mende people in present-day SIERRA LEONE in West Africa, for example, established two of the best-known societies. These apparently were created in order to strengthen the community, its traditional beliefs, and its way of life. Male members of the Poro society served as a judicial team, handling personal disputes or disagreements over land, property, and other aspects of Mende life. On the other hand, the women of the Sande society were responsible for the care and maintenance of ritual objects used in special ceremonies. Equally important, the women cultivated the herbs that were made into special medicines and sold to generate the group's income. Both groups played a traditional role in the INITIATION RITES of young boys and girls into Mende society.

Sed festival Celebration held by ancient Egyptian pharaohs symbolizing a renewal of their leadership of the world and a long reign in the AFTERLIFE. The Sed festival (also known as Heb-Sed) was usually held after a pharaoh's thirtieth year on the throne and repeated every three years thereafter. The festival was a joyous event that included ceremonies representing a ritual reenactment of the unification of EGYPT under MENES, Egypt's first pharaoh.

The ceremony began with the pharaoh's presentation of offerings to the gods. Then, sitting on a double throne, the pharaoh was crowned twice. His first crown would be white, symbolizing UPPER EGYPT; the second crown was red, symbolizing LOWER EGYPT. Finally, the pharaoh put on a short kilt with an animal's tail in the back and ran a ritual course four times. This race was held to prove the pharaoh's vitality. He was then carried away in a great procession to visit shrines to the gods HORUS and SETH. During the ceremony the pharaoh held an oar and a ritual object. The ceremony was also performed in front of a statue of Min, a god of masculine fertility.

Much of what is known about the Sed festival has been learned from wall-reliefs and paintings, including a large granite gateway found in Bubatis. Another source of information concerning the festival is the Heb-Sed court in the STEP PYRAMID OF DJOSER, in SAQQARA. The funerary complex was built during the Third Dynasty, in approximately 2700 BCE. Its design was credited to IMHOTEP, an adviser of King Djoser, who was later deified for his work as a doctor. The structure was a walled compound made from stone, rather than the mud bricks of earlier buildings; the roof was made of timber. A long colonnade led to a court that held two altars. It was in this court that the Sed Festival was held. Although the complex was in ruins for many centuries, it has been rebuilt in modern times.

Some scholars believe that the Sed festival was held in place of human sacrifice. Long ago, these historians believe, the pharaoh was killed during the prime of his life so that his virile power could be transferred to his successor. By dynastic times this custom was replaced by a ceremonial sacrifice—the Sed festival. Later, when Egyptian pharaohs were closely associated with OSIRIS, the periodic Sed festival apparently dramatized the pharaoh's death and resurrection, which echoed that of Osiris himself.

Semitic languages Group of languages spoken in northern Africa and in the Middle East. Semitic languages make up a branch of the AFRO-ASIATIC LANGUAGES and are among the oldest languages in the world. The other branches of the Afro-Asiatic language family are Cushitic, Berber, Egyptian, and Chadic. The most widespread Semitic language in Africa is ARABIC, which is spoken throughout North Africa. Three other Semitic languages, AMHARIC, TIGRÉ, and TIGRINYA, are written in Ethiopic characters and are spoken in the HORN OF AFRICA. Tigrinya is derived from the old Abyssinian language. Amharic has the oldest literature among the living African languages. It is also the official language of ETHIOPIA.

Semitic languages spoken in Africa are divided into the South Central group (which includes Arabic), the Southern Peripheral group (which includes the languages of northern Ethiopia, including GE'EZ), and the North Central group (which includes Punic, formerly spoken in CARTHAGE in North Africa). The Semitic group also includes Hebrew and Aramaic. The Quran, the sacred book of Islam, is written in Arabic. During the spread of Islam following the seventh century, converts generally learned Arabic because it was the language of prayer and the scriptures, which even illiterate believers often committed to memory.

Semna forts Series of military forts established in southern EGYPT along the kingdom's southern border with NUBIA during Egypt's MIDDLE KINGDOM (c. 2040–c. 1820 BCE). To protect Egypt's trading interests, King Senwosret III (r. c. 1900 BCE) erected 11 mud-brick forts

at Semna, near the second cataract of the NILE RIVER. He also ordered a blockade of the Nile in order to restrict Nubian travel and limit trade to that designated by the king. Senwosret strictly enforced the complete subjugation of Nubia, leaving behind an inscription boasting of how he had established boundaries farther south than any other ruling pharaoh.

Senegal

Country covering an area of about 76,000 square miles (196,800 sq km) in West Africa. It is bordered by MAURITANIA to the north, MALI to the east, and GUINEA and GUINEA-BISSAU to the south. Its western border runs along the Atlantic Ocean. Dakar, located on the westernmost point of mainland Africa, is the country's largest city and its capital.

Senegal is largely a low-lying country, with semi-desert area in the north and northeast and forests in the southwest. Its principal waterways are the SENEGAL RIVER in the north and the Casamance in the south. Archaeological finds in the area indicate that Senegal was inhabited from prehistoric times, as discoveries have been made of the remains of Paleolithic and Neolithic civilizations. Ancestors of the Wolof and Serer peoples were among the first inhabitants if the region, migrating from the northwest about 500 CE.

See also: SENEGAL (Vols. II, III, IV, V); SERER (Vol. II); WOLOF (Vols. II, IV).

Senegal River

West African waterway that flows from the Fouta Djallon highlands in present-day GUINEA for more than 1,000 miles (1,610 km) north and west through the Republic of MALI, forming the border between SENEGAL and MAURITANIA before entering the Atlantic Ocean. One of the major African rivers, the Senegal River is the only permanent river between MOROCCO and Senegal. It empties into the Atlantic Ocean at St-Louis, on the border of Senegal and Mauritania. Its major tributary is the Falémé River, which forms the border between Mali and Senegal.

The river's seasonal cycle has had a strong impact on the AGRICULTURE of the area, with crops being produced only after the recession of floodwaters. For thousands of years, pastureland in the valley has been used by the CATTLE of NOMADS.

Since ancient times the bed of the Senegal River was known to contain great deposits of GOLD. The famous voyage of HANNO of CARTHAGE, who led exploratory trade expeditions in western Africa, may have been motivated in part by the knowledge of gold to be found in the regions between the Senegal River and NIGER RIVER. Scholars believe that Hanno probably explored the Senegal River around 500 BCE. In *The Periplus of Hanno,* Hanno writes what many scholars believe is a description of the Senegal River: "Sailing thence, we came to another river, very great and broad, which was full of crocodiles and hippopotami. . . ."

Well after 500 CE, the ancient empires of GHANA, Mali, and Songhai each controlled the local trade in the Senegal River valley.

Seth (Set or Suetekh)

Ancient Egyptian god of chaos, war, deserts, and storms. According to the mythology of ancient EGYPT, Seth was the son of Geb and Nut, the gods of earth and sky. He also was supposed to be the brother of ISIS, Nephthys, and OSIRIS and the husband of both his sisters Nephthys and Taurt, the protectress of childbirth and fertility. He is most often represented as a dog-like figure, although he is sometimes portrayed as a pig, jackal, donkey, or hippopotamus. For almost 2,000 years Egyptians thought of Seth as a god of exclusively positive qualities, especially as a protector against storms and warfare. Many pharaohs even named themselves after him as a tribute and offering to his power.

However, after the unification of UPPER EGYPT and LOWER EGYPT, about 3050 BCE, the perception of Seth changed. According to mythology the god's predilection for causing trouble increased. He supposedly resisted the authority of his brother, Osiris, and ultimately murdered him. This in turn led to an 80-year war that pitted Seth against HORUS. Eventually Horus was victorious, emerging as the ruler of the unified kingdoms of Upper and Lower Egypt. By the Twenty-sixth Dynasty Seth's reputation among the Egyptian people had turned so negative that he was usually depicted with red eyes and hair, the embodiment of evil.

Seti I (Sethos)

(r. 1318–1304 BCE) *Second pharaoh of Egypt's Nineteenth Dynasty and a noteworthy warrior and monument builder*

The son of RAMESSES I and Queen Sitre, Seti succeeded to the throne after the end of his father's brief reign. Like Ramesses, Seti served in the military and held several prominent government posts before becoming pharaoh, or king, of Egypt.

Concerned with legitimizing his family's right to the throne, Seti sought to establish a link between himself and the pharaohs who preceded AKHENATEN (r. c. 1379–c. 1364 BCE, also known as Amenhotep IV). In what is called the King's List (also called the Royal List) at his temple at ABYDOS, Seti celebrated the memory of monarchs, from the beginning of dynastic rule in EGYPT to himself. King's lists were subjective. Often omitted were lesser kings, usurpers,

and those whom the current ruler considered illegitimate. Conspicuously absent from that list were those who had reigned during the AMARNA PERIOD (1379–1364 BCE), during which all gods but ATEN were banished along with Queen Hatshepsut (1504–1482 BCE).

Seti's military expeditions in foreign lands demonstrated his intent to restore Egypt to the glory it had seen before Akhenaten's reign. To reach this goal, he conducted several campaigns in Syria and Palestine, the last of which pitted the Egyptians against the HITTITES near the city of KADESH. Seti also waged war against LIBYA.

An impressive number of monuments were either built or restored during Seti's reign. Among the finest examples of these was the Hypostyle Hall, with its massive columns, in the Temple of AMUN at KARNAK. Other architectural achievements included the temple dedicated to

The temple of Seti I at Abydos, Egypt, commemorates the Nineteenth Dynasty (1320–1200 BCE) pharaoh, who was an important warrior and monument builder during his reign from 1318–1304 BCE. © Robert Holmes/Corbis

the god OSIRIS at Abydos and Seti's own tomb in the VALLEY OF THE KINGS at Thebes.

Seychelles Island country measuring approximately 180 square miles (470 sq km) located off mainland Africa, north of MADAGASCAR, in the Indian Ocean. Victoria is the capital and largest city. Seychelles is made up of at least 115 islands, of which Mahe, measuring about 60 square miles (155 sq km), is the largest. Other major islands are Praslin and La Digue. Most of the islands are granitic, with hills rising as high as 3,084 feet (940 m) above sea level. The remaining islands are coralline and are flat, with no fresh water.

Because of the southwest trade winds and equatorial currents, Seychelles has well-developed coral reefs on the east coast. Plant life abounds on the islands, and some local animals species are found nowhere else in the world. There are no records of human habitation on the island until the 16th century.

Shango (Sango)   In traditional YORUBA religion, Shango is the divinity associated with lightning and thunder. Yoruba divinities are sometimes primordial spirits and sometimes deified ancestors—heroic individuals who made important contributions to the life of the people. In popular legend, Shango had human origins. He may once have been the fourth *alafin,* or king, of the town of Oyo, which much later became a city-state of some importance in the region. Shango discovered a charm that let him call down lightning and thunder but destroyed his own palace and family when he used it. The loss so horrified him that he hanged himself. As the god of lightning and thunder, Shango may have displaced worship of Jakuta, an earlier deity who hated immorality and would hurl stones of fire at those who ignored the will of OLORUN, the great creator.

Other versions of the Shango legend paint him in darker terms. In one version, he was a tyrannical ruler who abandoned his family. He was drawn up into the sky on a chain and had to express his godliness through lightning and thunder. In other versions, he was versed in magic and instilled fear in his subjects by breathing FIRE. Despite the stories, however, devotees revere Shango for his sense of justice and his hatred of sorcery.

Shango communicated by means of SPIRIT POSSESSION. The spirit of Shango was said to "mount" a human spokesperson as a person might mount a horse. The person lost consciousness, and the god spoke through his mouth. The one possessed became capable of performing

When crushed, shea nuts yield a waxy butter suitable for cooking. This material has also been used as a form of margarine and as a key ingredient in chocolate. For centuries it has been widely used in Africa and elsewhere as a remedy for dry skin. The ability to store shea butter over long periods undoubtedly made it a useful and long-standing export item. Women reportedly did much of the work involved in producing shea butter, and they have long regarded it as an important source of income.

Sheba, queen of See MAKEDA, QUEEN (QUEEN OF SHEBA).

shipbuilding Since ancient times various types of boats have been used for the transport of people and goods in Africa. The design of the first boats is a matter of speculation. They may have been constructed from single trees, hollowed out to form dugout canoes, or from logs crafted together to form rafts. The first paddles were probably human hands. Surviving Egyptian clay tablets record the use of boats for TRANSPORTATION as early as 4000 BCE. The earliest record of sailing ships is found on a Theban tomb painting from around 1400 BCE that shows a grain ship being unloaded in EGYPT.

Egypt, with its Nile-centered riverbank culture, is credited with many innovations in ship design. Since the NILE RIVER flows northward but the prevailing winds in the region blow south, these innovations allowed the Egyptians to take full advantage of the river in both directions for transportation and communication.

The oldest Egyptian boats were made from bundles of PAPYRUS reeds lashed together to form a spoonlike hull. Between 4000 and 3000 BCE the Egyptians discovered sails and used them to propel the boat. The first sails were probably leafy branches that caught the wind, but by 3500 BCE Egyptian boats had stronger, more watertight hulls made from planks of wood. These boats also featured square sails, probably woven from reeds, attached to a mast.

By 2500 BCE Egyptian ships made the transition from paddles to oars. A ship pushed by hand-held paddles requires a low waterline, limiting the size and displacement of the vessel, so that the paddles can reach the water. Oars, on the other hand, are attached to fixed points on the hull. This design allows the sides of the vessel to rise higher and lets the oars be longer, providing the additional leverage needed to move stone blocks and other heavy cargoes. Later, as vessels increased in size, multiple rowers manned each oar. A large steering oar was used at the stern of these vessels. The Greeks and Romans later improved on these designs by adding more banks of rowers, as many as 12, in cargo ships called GALLEYS.

shea butter Wax-like, fatty matter extracted from the nut of the shea tree. As long ago as prehistoric times, the shea tree (*Butyrospermum*) was present in West Africa as part of the continent's ecological mix. However, archaeologists have not established a starting date for either its economic value or its widespread use in cooking and as a cosmetic item.

A third major Egyptian innovation was the repositioning of the mast. By 1800 BCE the mast had been moved from its position at the bow of the ship to a more advantageous position amidships, where the sail could catch crosswinds, not just tailwinds, to push the boat forward. These sails still had booms, or long poles, at the bottom of the sail. By 900 BCE, the PHOENICIANS improved on these designs by using a loose-footed square sail, which was more practical for a seagoing vessel.

By the fifth century BCE merchant ships weighing 400 tons were carrying cargoes across the MEDITERRANEAN SEA. Heavier ships were not built in the West until the 19th century. The largest ship of ancient times was a 2,000 ton merchant ship built by Hiero II (270–215 BCE) of Syracuse to carry grain from Egypt.

Leone has been inhabited for thousands of years, and the Bullom people are thought to have been the earliest inhabitants of region. Linguistic studies indicate that the coastal Bullom (also called Sherbro), Temne, and Limba peoples have occupied the area for a long time, with sporadic immigration by MANDE-speaking peoples from the east, including groups of Vai, Loko, and Mende.

sisal Plant grown for its strong fiber. Sisal is used to make twine, rope, doormats, and bags. The natural fiber is extracted from the long leaves of sisal plants by crushing the leaves. The green pulp is then scraped away to leave long fibers, which are then dried and prepared for weaving. Major producers of sisal in Africa include TANZANIA, ANGOLA, KENYA, and MADAGASCAR. It is grown both along the hot, humid coastal regions as well as in cooler, drier areas in the interior.

Sirius The brightest star in the constellation Canis Major; noted by ancient Egyptians as rising just before the annual flooding of the NILE DELTA and so signaling the beginning of a new growing season and year. The rising of the NILE RIVER was an important event in ancient EGYPT, as it brought much-needed water and nutrients to the soil. It even brought new soil from the mountains to the plain for the start of a new growing season. As a result Sothis, as Sirius was called by ancient Egyptians, became associated with fertility and a prosperous harvest. The Egyptians believed that the star made the river rise, and according to at least one myth, Sirius was also known as the female god Sopdet.

Sirius, which is a binary star, is roughly double the size of the Sun. It also is relatively close to the earth and is the brightest star in the constellation Canus Major, which is located to the southeast of Orion's Belt. Many Egyptian temples were designed so that the inner chambers received the light of Sirius—evidence of the importance of this great star to the ancient civilization.

slavery For many people the term slavery has come to be associated exclusively with the inhumane practices that characterized the transatlantic trade in human captives from Africa. Prior to this time, however, what we think of as slavery is more accurately called *servitude*. It is awkward to refer to a person as "one who is in a position of servitude," so the term *slave* is often used as a matter of convenience.

Servitude was rare among ancient HUNTER-GATHERERS because their societies generally lacked social or class distinctions among members, a key condition that allows slavery to flourish. Servitude among more developed societies in Africa has a long history. Individuals in positions of servitude—in other words, slaves—were used in ancient EGYPT and Nubia and are known to have been killed to accompany their owners into the AFTERLIFE and tend to their needs. The Old Testament Book of Exodus chronicles the end of the Egyptian enslavement of the Jews during the reign of the pharaoh RAMESSES II (r. c. 1304–1237 BCE), when the prophet Moses led his people to freedom. The tasks that slaves in Egypt performed are uncertain; it is now thought, for instance, that peasant LABOR, rather than slave labor, was used between growing seasons to build the PYRAMIDS.

CARTHAGE in North Africa, a Roman province after its conquest in the PUNIC WARS (264–146 BCE) and a major commercial center until its decline towards the middle of the third century, probably followed the Roman model and used slaves to row its GALLEYS and to tend its farms. It is thought that Carthage acquired at least some of its slaves through trade with sub-Saharan Africa, although most of the slaves were probably Nubians or indigenous black inhabitants of North Africa.

The extent to which slavery was practiced in sub-Saharan Africa is not known.

Smendes (r. c. 1070–1044 BCE) *Founder of ancient Egypt's Twenty-first Dynasty*

The High Priest of AMUN who shared power with HERIHOR when the latter usurped the throne of Ramesses XI, Smendes ruled LOWER EGYPT during the earlier half of the 11th century BCE. He founded his capital at Tanis, a northeastern city on the NILE DELTA. A damaged inscription on a pillar found at Gebelen is the only record of Smendes' reign.

Smenkhare (Smenkhkared) (r. c. 1363 BCE) *The tenth king of the ancient Egypt's Eighteenth Dynasty, and successor to Akhenaten*

Smenkhare married Merytaten, the daughter of AKHENATEN. Merytaten had succeeded her mother, NEFERTITI, as Akhenaten's Great Royal Wife, or principal wife. Evidence suggests that Smenkhkare was co-regent during the latter part of Akhenaten's reign and that he assumed the religious name, Neferneferuaten, of his mother-in-law, Nefertiti. This new name, which some scholars believe

means "Perfect One of the Aten's Perfection," seems to indicate that, during his two-year reign, he perpetuated the cult of the god ATEN at el-Amarna.

After the death of Merytaten, Smenkhare married another of Akhenaten's six daughters, Ankhesenpaaten, who later became the wife of Smenkhare's successor, TUTANKHAMUN (r. c. 1361–c. 1351 BCE). The condition of the royal MUMMY suggests that Smenkhare was in his early twenties when he died.

Somalia Country measuring approximately 246,000 square miles (637,100 sq km), located in northeastern Africa. It borders DJIBOUTI to the northwest, KENYA to the southwest, and ETHIOPIA to the west. Located north of the equator between the Gulf of Aden and the Indian Ocean, Somalia, together with Ethiopia and Djibouti, is referred to as the HORN OF AFRICA. Mogadishu is the country's capital city and main port. The country has also been known as Somaliland.

Somalians are part of the major language group of Eastern Cushitic speakers that includes the OROMO and AFAR of Ethiopia, as well as the Reendille and Boni of Kenya. Known for their vibrant poetry and verse, Somalians emphasize a shared identity borne of family clans. Their poetry reflects the freedom and hardships associated with being farmers and NOMADS. However, since the region's people have long made up a stateless society, much of Somalia's history is known from studying early patterns of migration and trade links in the ancient world.

Several theories have attempted to explain the origins of Somali peoples. Initially historians believed that they came from the west coast of Africa or southern Arabia. However, recent evidence suggests that they migrated from southern Ethiopia. When they began to migrate is not clear, but archaeologists generally believe that they settled along the Omo and Tana rivers, near Lake TURKANA, centuries before the common era. The Somali, known as the Samaale or Sam, reportedly migrated away from the main group in Ethiopia during the first millennium BCE. By the first century CE the Samaale had established communities along the Tana River as far as the coast of the Indian Ocean. It is also believed that, in this same period, segmented groups of the Samaale crossed the Ogaden Plain along the southern shore of the RED SEA.

The CLAN structure of the Somali appears to have been in place at an early period. Made up of descendants who traced their lineage to a common ancestor, Somali clans spoke a common language and maintained similar cultural and religious beliefs.

The region's dry, grassy plains undoubtedly influenced the tradition of nomadic herding. The mobility of animals like CATTLE, oxen, and CAMELS offered an escape during both catastrophic droughts and the rainy seasons,

which occurred from March to May and October to December. Other animals, such as sheep and GOATS, added important staples like milk products to the Somali diet. The maintenance of their herds was critical, and clans frequently clashed as a result of strong competition for grazing land and water.

Somalia's social and economic structure has long involved the widespread tradition of female CIRCUMCISION. Believed to date back thousands of years, the Somalian form of circumcision was one of the RITES OF PASSAGE for young women. A crude surgical procedure that altered the female genitalia, circumcision was intended to ensure sexual abstinence before marriage. It was also considered a sound economic practice that emphasized entitlement to BRIDE-WEALTH, a critical factor for prospective brides and their families.

Known to the ancient world as the Land of PUNT, Somalia was an important link to the Red Sea, MEDITERRANEAN SEA, and Indian Ocean TRADE AND COMMERCE. The recovery of Parthian coins from the first and second century, as well as Roman coins dating back to the third century CE, confirm the existence of widespread trading activities. Trade also encouraged the rise of Somalian civilization, whose economic advantages once rivaled EGYPT, KUSH, and its neighbor, Ethiopia. Expeditions from Egypt to Punt began as early as ancient Egypt's First and Second Dynasties (c. 3050–c. 2705 BCE) and initially consisted of caravans that followed overland routes through the NILE RIVER valley. These methods of TRANSPORTATION were abandoned by the time of the Fifth Dynasty, and King Sahure (r. c. 2458–c. 2446 BCE) made one of the first recorded attempts to reach Punt by boat. Egyptians grew dependent upon Somalia for its rare goods, including GOLD, ivory, incense trees, animal skins, and other rare items. In return Somalia received weapons, such as daggers and hatchets, and valuable pieces of JEWELRY.

A notable visitor to Punt in this early period was Hatshepsut (c. 1479–1457 BCE), whose tomb at Deir el-Bahri contained images of her journey. These scenes offer one of the few portrayals of the ancient world, with its inhabitants living in cone-shaped huts reached by ladder. A local chief, known as Perehu, and his wife, Ese, were also depicted. Centuries of trading also introduced elements of Egyptian culture into Somalia, including the worship of AMUN and the observance of an annual holiday known as the Feast of the Pharaoh.

Much later in history, Arabs who traded in Somalia established commercial ports there, exporting cinnamon,

tortoiseshell, ivory, rhinoceros horn, and palm oil. By the end of the fourth century these ports included Zeila and Berbera. Down the Indian Ocean coast, ports including BARAWA, Marka, and Kismayo had grown into thriving settlements.

sorghum   Cereal grain made from a domesticated plant indigenous to Africa. Sorghum is one of the most important cereal grains in Africa. Evidence of its earliest use has been traced to the Late STONE AGE. However, more is known about its use in various regions of the Sudan during the period between approximately 6000 to 5000 BCE. Sorghum initially grew in the wild, and its cultivation has been linked to the development of microlithic, or small, sharpened blades and grinding tools. It became domesticated over centuries of planting and harvesting and is therefore linked to the settlement and growth of sedentary populations.

The Sudan's regional variety of sorghum, also known as *durra*, was also popular further north, along the NILE RIVER, and it is known to have been a diet staple in EGYPT and the neighboring Kushite kingdom of MEROË.

A good source of carbohydrates, sorghum was made into porridge or served with fish, meat, or other vegetables. It was common for many families to consume this staple from a shared dish, a tradition reflecting the value of shared labor.

Sorghum plants were transplanted to other regions through trade, changing in form and texture in response to environmental conditions. Consequently, at least five different varieties flourished throughout Africa. The plant reportedly reached ETHIOPIA and regions bordering the SAHARA DESERT between 3500 and 2500 BCE. In East Africa sorghum was called *mtama*, while in West Africa it eventually became known as Guinea corn. Southern Africa was the last region of the continent to cultivate sorghum; it was probably transplanted there by migrating Bantu speakers. By 1000 BCE this popular African staple had been transported to India, where it was widely cultivated.

South Africa   Country covering about 470,700 square miles (1,219,100 sq km) of southernmost Africa. South Africa is bordered by the Atlantic Ocean to the west, the Indian Ocean to the east and south, BOTSWANA and ZIM-BABWE to the north, NAMIBIA to the northwest, and MOZAMBIQUE and SWAZILAND to the northeast.

The oldest indigenous people in the region are the SAN, who occupied the area while it was still in the midst of the last Ice Age, some 20,000 years ago. Remnants of the San still live in the KALAHARI DESERT.

About 2,000 years ago, cattle-raising KHOIKHOI people migrated southward, perhaps from present-day Botswana, settling mainly in the southern coastal region. This Khoikhoi migration displaced the San, who were HUNTER-GATHERERS. Some San groups integrated into Khoikhoi society, but the majority moved into the surrounding deserts or mountains, areas where the difficulty of raising cattle precluded the Khoikhoi from settling. As Bantu-speaking peoples migrated into the region starting about the fifth century, the Khoikhoi began trading with them to acquire metal for tools and weapons.

spiders   Spiders live in many different terrains and exist in more than 34,000 species. The spider is a common figure in African lore, and the Ashanti spider trickster ANANSI is especially well-known.

spirit possession   Condition of being physically and mentally controlled by spiritual entities. Although widely misunderstood, for centuries spirit possession has served as an integral component of African RELIGION. As such, it is a common feature and has existed in most societies from an ancient period. Individuals who have undergone possession have variously described it as being taken over, invaded, or displaced by an entity over which little or no control can be exerted. Some individuals in the throes of possession shake violently; others become sick and may faint. After the initial shock to the body, the person possessed serves as a medium for the spirit and often counsels those in attendance.

In Songhai society, in what is now NIGER, women traditionally served as mediums. Their ability to become a medium for the spirits was reportedly acquired from relatives or friends. Once chosen to perform this task, mediums were expected to pay homage to the spirit by performing helpful acts within their society.

There are a number of ways in which the spirits are "called" into action. The Songhai *godji* has long been considered a sacred instrument used for this purpose. Sometimes compared to a one-string violin, the *godji* is made from a calabash gourd covered with animal skin. When played, it produces a unique sound as a result of the tautness of the string, usually horsehair, and the empty cavity of the calabash. Some have even compared the sound produced by the wooden bow to a high-pitched cry.

Other groups, such as the YORUBA and Tiv of NIGERIA, have traditionally used DRUMS along with specific songs and DANCE to induce spirit possession among initiates and devotees. Sacred or ritual dance often involves complex movements, and the drum is said to create a higher awareness through its deeply rhythmic tones. The drum has traditionally offered many societies the ability to tap into an important source of mystical power.

These aspects, while highly significant, have always represented only a small portion of the concept of spirit possession. While in this state, individuals have been known to effectively heal infertility or cure bodily illness with a "laying on of hands" to specific parts of the body. Medicinal herbs and communal treatment might also be employed to correct personal or societal imbalances. Mediums usually maintain their ability to act as a voice for the gods by tending a special SHRINE and performing ritual offerings consisting of FOOD, cowrie shells, or other forms of currency, as well as sacrificial gifts of small animals.

(New York: Routledge, 1996).

step pyramid of Djoser   Built about the 27th century BCE, this large structure is considered to be the first pyramid in history and the earliest stone building in ancient EGYPT. Located in SAQQARA, commissioned by the pharaoh Djoser (r. c. 2630–2611 BCE), and designed by the architect IMHOTEP, it represents a dramatic and innovative departure in tomb ARCHITECTURE from the flat-roofed, mud-brick mastabas that preceded it.

Scholars believe that when Djoser, the second king of the Third Dynasty, ordered the building of his tomb at Saqqara, he intended to have a mastaba, which is a an oblong-shaped tomb. The royal tomb is in the original building and is found 90 feet (27 m) under the ground, with a vertical shaft leading to it—a design typical of previous mastabas. However, the architect Imhotep departed from the tradition of using mud bricks and constructed this building entirely of stone, which, as far as historians know, had never been done before. A block of granite weighing 3 tons (2.7 metric tons) was used to close the tomb, and the face was covered in Tura limestone.

The building was enlarged in the next phase of construction, and, in a third phase, a second tier was added. In addition to the innovation of stone as the sole building material, the shape became square instead of rectangular, and the tomb building no longer had the traditional flat top. Plans developed to add two more tiers, each one smaller than the one below it, thus creating a stepped building. Two more steps were added to the four that already existed, creating the final, six-stepped pyramid. When the six phases of building were completed, the pyramid rose to a height of about 200 feet (61 m).

Inside this great pyramid, passageways link several chambers, some of which are tiled in blue. The walls of the tomb chamber bear inscriptions stating that its intended purpose was burial use. Outside, white limestone temples and other buildings stood around the pyramid. Surrounding the entire area was a wall, believed to be a reproduction of the MEMPHIS walls.

Some of the casing blocks used to support the tiers of the pyramid are still intact today, but the outer limestone casing has disappeared, as has part of the stone structure. A statue of Djoser was found in the tomb chamber by excavators in the 1920s, and can be seen today in the Egyptian Museum in CAIRO.

Stone Age   (c. 2.5 million–3200 BCE) Early period of human development characterized by the use of stone tools. Over the years Africa has been a significant source of information about both these tools and the early humans who created them. Many archaeological excavations have been carried out on the continent, and discoveries made in present-day KENYA, SOUTH AFRICA, TANZANIA, and ETHIOPIA added significantly to our understanding humankind's earliest ancestors. Thousands of fossilized remains have been found at these archaeological sites, some dating back more than 4 million years. From these discoveries, scientists have been able to establish that Africa is the probable birthplace of humankind. They also have been able to establish a clear chronology of human development during the period we now call the Stone Age.

Early Stone Age   The earliest known stone tools recovered with the *Homo* species have led archaeologists to determine that the Early Stone Age began about 2.5 million BCE and was divided into two parts. The first part is known as the Oldowan phase. It was named for the tools found at OLDUVAI GORGE in Tanzania and is linked with both *HOMO HABILIS* and *HOMO ERECTUS.* (Archaeologists have found examples of these tools among the fossilized remains of *Homo habilis.*) These tools signify a great advancement over the digging sticks and simple stone tools that first gave the Stone Age its name.

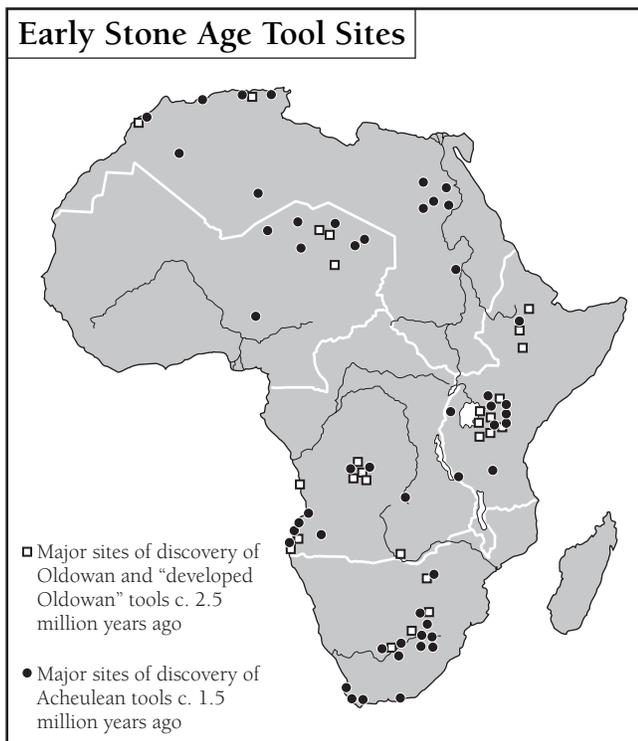
The tools made at Olduvai had flaked or sharpened edges and were used to cut, scrape, and chop FOOD. (The food was probably obtained through scavenging.) These tools probably were made by repeatedly striking one stone against another, gradually chipping away pieces until the tool was left with a sharpened edge.

Middle Stone Age (Acheulean Period)   This middle phase of the Stone Age lasted from c. 1.5 million to 40,000 BCE. This period is known for the widespread use of what has become known as the ACHEULEAN TOOL-KIT, a distinctive set of hand axes and scrapers. (The name comes from the region in southern France where the tools of this type were first discovered.)

Although these and other Acheulean tools have also been unearthed in Europe and Asia, the vast majority of the items have been recovered in Africa, particularly in an area spreading from the MAGHRIB to the Cape of Good Hope.

Regardless of where they have been found, however, these tools all exhibit a remarkably similar shape and rely on a similar method of construction. This has led some archaeologists to speculate that *Homo erectus*, the human species dominant in Africa through most of the Middle Stone Age, was the first human species to use the tools. These archaeologists also believe that *Homo erectus* later crossed early land bridges and migrated to places outside Africa.

In comparison to OLDOWAN TOOLS, Acheulean tools are sharper and heavier. They have chipped flakes on both sides as well as sharpened points. Some of these tools seem to have had religious or ritual functions, including the burial of the dead. But most of the tools were used, in one way or another, for preparing FOOD. The use of these tools allowed the diet of early humans to become more diverse, and there is evidence that *Homo erectus* consumed hares, warthogs, and antelopes, as well as fish and seals caught along Africa's western and southern coasts. *Homo erectus* also mastered the use of FIRE during this period and began moving in groups to specific sites or camps as the seasons changed. These camps often were located in wooded landscapes or in areas that allowed these early humans to take advantage of natural caves and rock shelters. Investigations at these sites have found signs of regular social activities, including cooperative food preparation, communal cooking, and providing protection from a dangerous environment.

Scientists use several dating methods to unlock the mysteries of the past. One of the most prominent methods is radiocarbon (carbon 14 or C14) dating. Radiocarbon dating can analyze evidence dating back to 40,000 BCE. This system is based on the radioactivity present in the atmosphere of the earth. All living matter ingests trace amounts of carbon 14. When death occurs, carbon 14 is released at a rate that can be measured in fossils, charcoal, burned bone, shell, hair, and other organic materials. Using this system, archaeologists have been able to reconstruct a chronology of human history starting with the Stone Age and progressing to the agricultural revolution and the Iron Age.


About 150,000 years ago, near the end of the Middle Stone Age, the hominid species we now know as *HOMO SAPIENS* emerged. *Homo sapiens*, the same species as modern humans, used an even more varied stone toolkit, all made from a prepared "core" or model. This form of tool production produced sharper knives and scrapers, as well as the spearheads they attached to wooden shafts using lashes and a kind of vegetable glue. Archaeologists speculate that during this period, *Homo sapiens* built the first houses, using such natural elements as branches, grass, and stones. In the cooler regions of northern and southern Africa, however, groups of *Homo sapiens* continued to live in rock shelters.

Late Stone Age   During the Late Stone Age, which lasted from c. 40,000 to 3200 BCE, *Homo sapiens* dominated the African landscape. Although the tools they used varied from region to region, *Homo sapiens'* use of microliths (tiny stones) marked the most advanced phase of stone tool production. Microliths, which archaeologists have found in savanna grasslands and dry woodlands, are stone flakes that have been refined into tiny points and blades, sometimes shaped into triangles or crescents.

One of the best-preserved Late Stone Age sites is found at Gwisho Springs in present-day central ZAMBIA. Microlith artifacts, along with the skeletal remains of ap-

Early Stone Age Tool Sites

● Major sites of discovery of Acheulean tools c. 1.5 million years ago

proximately 30 early humans, have been found in the waterlogged soil of Kafue Valley.

Late Stone Age hunters fashioned weapons with sharp rock tools, including, in the savanna regions, the earliest known form of the bow and arrow. The sharp stone tips were coated with a form of poison that slowly killed large animals. Other tools included decorated stones with bored holes designed to fit over digging sticks, harpoon barbs made of bone, awls, needles, fish-hooks, and an assortment of fine bone tools. In the woodland regions, people still used many of the Acheulean tools developed in the Middle Stone Age, including hand axes and spears. Late Stone Age hunters also set carefully concealed traps and pits to catch animals.

The widespread use of these and other tools by 10,000 BCE indicates a broad and well-defined range of human activity. It is probable that early humans lived in kinship groups, with men hunting wild animals to provide meat and women and children gathering wild fruit, nuts, melons, and edible insects like termites, CATERPILLARS, and LOCUSTS. They also used digging sticks to find roots and tubers beneath the soil.

Excavations have shown that, during the Late Stone Age, humans wore body ornaments made of eggshell, bone, or stones, and animal skins were used for clothing and shelter. Much about life at this time has been learned from ROCK ART, and various scenes of ancient life have been found in desert caves. These include images of animals, grain harvests, women performing ritual dances, and symbols whose meanings are not yet understood.

Sudan, Republic of the Country measuring approximately 966,800 square miles (2,504,000 sq km) located in northeastern Africa. It is bordered by EGYPT and LIBYA to the north, ETHIOPIA and ERITREA to the east, CHAD and the CENTRAL AFRICAN REPUBLIC to the west, and KENYA, UGANDA, and Democratic Republic of the CONGO to the south. Sudan is the largest country in Africa. The capital city of KHARTOUM is located at the confluence of the BLUE NILE and the WHITE NILE in the north-central part of the country. Among the earliest inhabitants of the region were the nomadic pastoralist BEJA people, in the east, and the seminomadic NUER, in the south.

Archaeological evidence indicates that, as early as c. 2400 BCE, the kingdom of KERMA was a regional trading center in Upper Nubia, territory that is now northern Republic of the Sudan. Located between the first and second cataracts of the Nile River, Kerma combined with other local kingdoms and evolved into the kingdom of KUSH. By about the eighth century BCE, the Kush kingdom dominated local trade and stretched from Khartoum to present-day southern Egypt. In fact, Kushite kings ruled a weakened Egyptian state from the ninth to the sixth centuries BCE.

A variety of goods, including metals, jewels, incense, ivory, weapons, human captives, and agricultural products passed through Kush's busy markets. Trade routes converging on the kingdom ran south to the African interior, north to Egypt and the Mediterranean coast, and east to AKSUM and the RED SEA coast.

About 500 BCE the Kushite kings were forced south to MEROË, where they established a powerful trading kingdom that also became known for its people's iron-smelting technology. For centuries, Meroë controlled trade in southern Nubia. However, in the fourth century CE, Aksum's King Ezana led an invasion from the east and quickly conquered much of southern Nubia, razing Meroë in the process. Ezana then controlled the flow of goods through the prosperous markets of most of Nubia, leading Aksum to supplant Meroë as the regional power. In the seventh century CE, Muslims from the Arabian Peninsula conquered Egypt and soon came to control Nubia, as well.

Sudd Vast swamp in southern Republic of the SUDAN, approximately 200 miles (320 km) long and 225 miles (360 km) wide. *Sudd* is an Arabic word that refers to the barrier created by floating water plants, dense PAPYRUS, VEGETATION, tangled reeds, and marshes. Although the swamp is fed by the tributaries of the WHITE NILE, the Sudd's floating matter forms thick, stagnant islands, due largely to the lower gradient of the land.

In ancient times the Sudd prevented the Egyptians from exploring lands south of the Nile. Later the Roman commentator Seneca claimed that the Sudd prevented Emperor Nero's Roman army from being able to penetrate ETHIOPIA. Infested with deadly diseases and inhabited by dangerous wildlife, including CROCODILES, HIPPOPOTAMUSES, snakes, and biting insects, the Sudd has, for centuries, been the homeland of the Dinka and NUER peoples, seminomadic pastoralists who inhabit the grassy plains between water courses.

Suswa Ancient volcano located in western KENYA, near Lake Laivasha. Mount Suswa is located on the floor of the

Great RIFT VALLEY and is made up of two concentric craters. The outer crater has a diameter of about 6 miles (9.7 km), with its south and east sides eroded. The outer crater also contains numerous caves. The inner crater has a diameter of between 2 and 3 miles (3.2 and 4.8 km) and appears to be a sloping island surrounded by a sort of natural moat. No eruptions of Mount Suswa have been recorded, although geologists believe that the volcano may have erupted at least once during the past 10,000 years.

Swaziland   Present-day landlocked nation in southeastern Africa. The country measures approximately 6,700 square miles (17,400 sq km) and is bordered by present-day SOUTH AFRICA to the north, south, and west, and by MOZAMBIQUE to the east. Archaeological evidence of human habitation in the area dates back to the Early STONE AGE (c. 2.5 million BCE). Thousands of rock paintings have also been found throughout the area. Created perhaps as early as the seventh century, these paintings of animals and hunters are attributed to the SAN people.

T

Tallensi (Talis)   Sedentary agriculturists who have long been situated primarily in the northeastern region of present-day GHANA. The Tallensi appear to be one of the few peoples in Africa who have maintained an ancient way of life. As long ago as the IRON AGE, and possibly earlier, the Tallensi began to live in a highly organized CLAN structure, tracing their descent from a single male figure. Elected clan leaders rule the group.

One of the most important political institutions that developed in Tallensi society is called Tendana, which means the "custodians of the earth." This organization emphasizes the life-sustaining properties of the earth. Those chosen to serve as custodians inherit the responsibility from clan members. Traditionally, they are identified by the animal skins they wear, and they participate in rituals and work at special shrines to ensure the fertility of the earth. Priests and ritual specialists among the custodians also are supposed to mediate between earth and water.

See also: RELIGION, TRADITIONAL (Vol. I).

Ta-Meri   One of the original names for EGYPT; Ta-Meri means "beloved land" or "land of love." The name *Egypt* comes from the Greek word *Aigyptos*, the Greek misspelling and mispronunciation of *Hikuptah*, or the temple of Ptah in MEMPHIS. The people of Egypt also called their land *KEMET*, meaning the "black land," a term that describes the fertile black earth in the valley of the NILE RIVER. Egyptians referred to themselves as "people of Kemet." In contrast, *Ta-Meri* was used in a general way to describe one's homeland, much in the same way that people use the English word "country."

Tanganyika, Lake   Second-largest of the East African lakes, located on the border between present-day TANZANIA and the Democratic Republic of the CONGO in the southern portion of the western RIFT VALLEY. Along with extensive mountain ranges and other lakes, Lake Tanganyika forms the boundary between West and East Africa. Tanganyika, at 440 miles (708 km) in length, is the longest freshwater lake in the world, as well as the second-deepest at 4,710 feet (1,436 m). The narrow lake is only 45 miles (72 km) across at its widest. Three large rivers flow into the lake (the Malagarasi, the RUZIZI, and the Kalamabo) and its only outlet is the Lukuga River, which flows into the LUALABA RIVER.

See also: TANGANYIKA, LAKE (Vol. II).

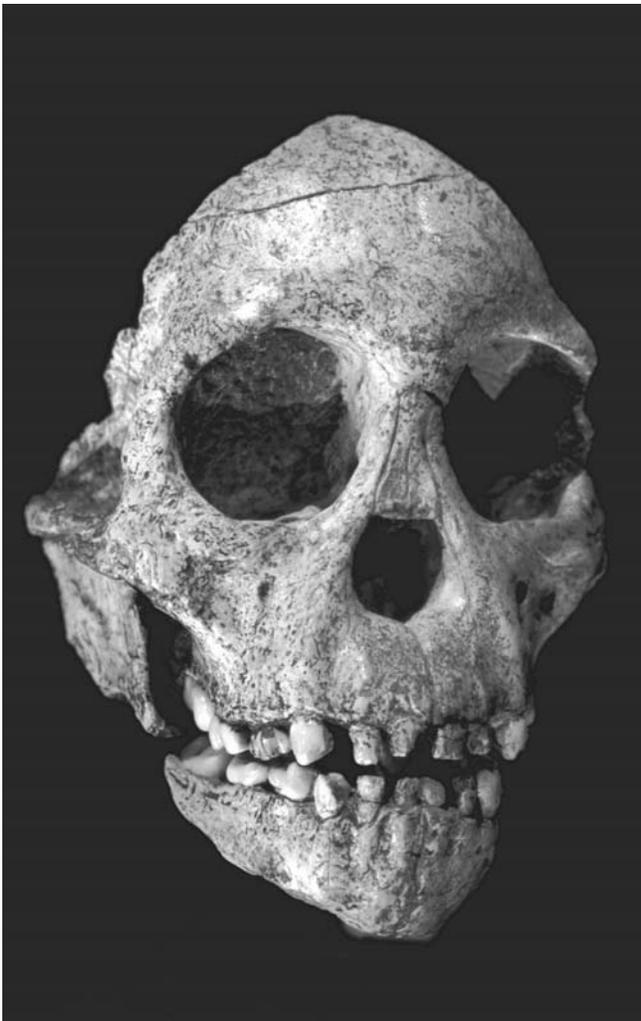
Tanite   The Twenty-first Dynasty of ancient EGYPT; seven Tanite kings reigned from about 1070 to 945 BCE. During their rule, Tanite kings maintained control over the priests at Thebes, but their power in areas like Palestine and Syria weakened.

The name *Tanite* is derived from the city of Tanis, which SMENDES, the first Tanite king, established as his capital. Located on the eastern part of the NILE DELTA, Tanis was a commercial center of Egypt. However, the accumulation of silt in the mouth of the Nile near Tanis diverted trade to ALEXANDRIA. Tanis was also the capital of the HYKSOS kings of Egypt in the 17th century BCE.

After a rebellion against ROME in 174 CE, Tanis was destroyed. The ancient city now sits in ruins, its site partly occupied by the fishing village of San. Studying these ruins, archaeologists have found the remnants of several temples, statues, and a royal necropolis.

236

Tanzania   Country in East Africa covering approximately 342,100 square miles (886,000 sq km) and made up of a mainland portion and the offshore Indian Ocean islands of Zanzibar, Pemba, and Mafia. Tanzania is bordered by UGANDA and KENYA to the north, the Indian Ocean to the east, MOZAMBIQUE, MALAWI, and ZAMBIA to the south, and RWANDA and BURUNDI to the west. Tanzania also features shorelines of major bodies of fresh water, including Lake TANGANYIKA, Lake VICTORIA, and Lake Malawi.

The Tanzania region is generally considered the origin of humankind. It is known for the discovery of ancient remains dating back as far as 2.1 million years ago. Fossilized remains of HOMO HABILIS, a hominid that lived about 1.75 million years ago, have been found at OLDUVAI GORGE, in northeastern Tanzania, along with early stone


The skull of the 1- to 2-million-year-old Taung Child (*Australopithecus africanus*), uncovered in Botswana, fluoresces in black light during a 1985 research study at the National Physical Research Laboratory in Pretoria, South Africa. *© Jonathan Blair/Corbis*

tools. About 500 CE small groups of iron-working, Bantu-speaking agriculturalists entered Tanzania and other parts of eastern and Central Africa. By 1000 CE all of Tanzania was populated, however sparsely.

Tefnakhte (Tefnakht)   (r. c. 727–712 BCE) *First king of Egypt's Twenty-fourth Dynasty*

Tefnakhte has been variously described as a delta prince, a Libyan prince, a lord or chieftain of Sais, and a prophet. As ruler of LOWER EGYPT, Tefnakhte advanced south in an ultimately unsuccessful attempt to capture UPPER EGYPT from PIANKHY, the king of NUBIA.

From his capital of Sais, in the NILE DELTA, Tefnakhte succeeded in gathering allies and claiming territory to the west and as far south as Lisht. He then turned his campaigns toward the east and conquered several towns on the eastern bank of the NILE RIVER. Looking to claim Upper Egypt for his own, Tefnakhte moved on and conquered the Middle Egyptian town of Hermopolis. Piankhy was stirred to action by this and quickly drove Tefnakhte's forces back to MEMPHIS.

At Memphis, according to historian MANETHO, Tefnakhte organized 8,000 soldiers for battle, while Tefnakhte himself rode north on horseback in an effort to rally other delta princes to his aid. Piankhy defeated Tefnakhte's forces at Memphis, after which Tefnakhte submitted and swore an oath to obey the king who had defeated him. Inexplicably, Piankhy returned to his home at Napata, and Tefnakhte then declared himself king of EGYPT.

Tetisheri   (r. c. 1600 BCE) *Queen of ancient Egypt's Seventeenth Dynasty*

Tetisheri paved the way for the powerful female rulers who succeeded her, including her descendant Hatshepsut (Eighteenth Dynasty), one of the few women pharaohs of ancient EGYPT. Unlike women in other ancient male-dominated cultures, Egyptian women, even commoners, had legal rights, could own and inherit property, and held public office. Tetisheri was one such non-royal woman who married Tao I and became queen in Thebes. During the late Seventeenth Dynasty, the role of the queen changed into a more powerful and influential position in which queen consorts like Tetisheri probably acted as regents, or members of a governing body. Tetisheri and the queens who succeeded her, Ahhotep II and Ahmose-Nefertari, all contributed to the general understanding of women as influential and capable rulers, paving the way

for Hatshepsut to become one of the most remarkable female pharaohs in the history of ancient Egypt.

Tetishiri lived to be 70 years old and was honored for her service to her country. She has been called the "mother of the NEW KINGDOM" due to her influential role and because of the importance of her son, Tao II, and grandsons, WADJKHEPERRE (also called Kamose; last king of the Seventeenth Dynasty) and AHMOSE I (first king of the New Kingdom). She was given an estate and a tomb, in addition to the monument that was erected for her at ABYDOS. Information about Tetisheri is known from a stele describing the words of King Amosis in which he speaks of the great deceased queen. Although two statuettes of Tetisheri are thought to have come from her tomb at Thebes, the one brought to the British Museum in 1890 was proved a forgery.

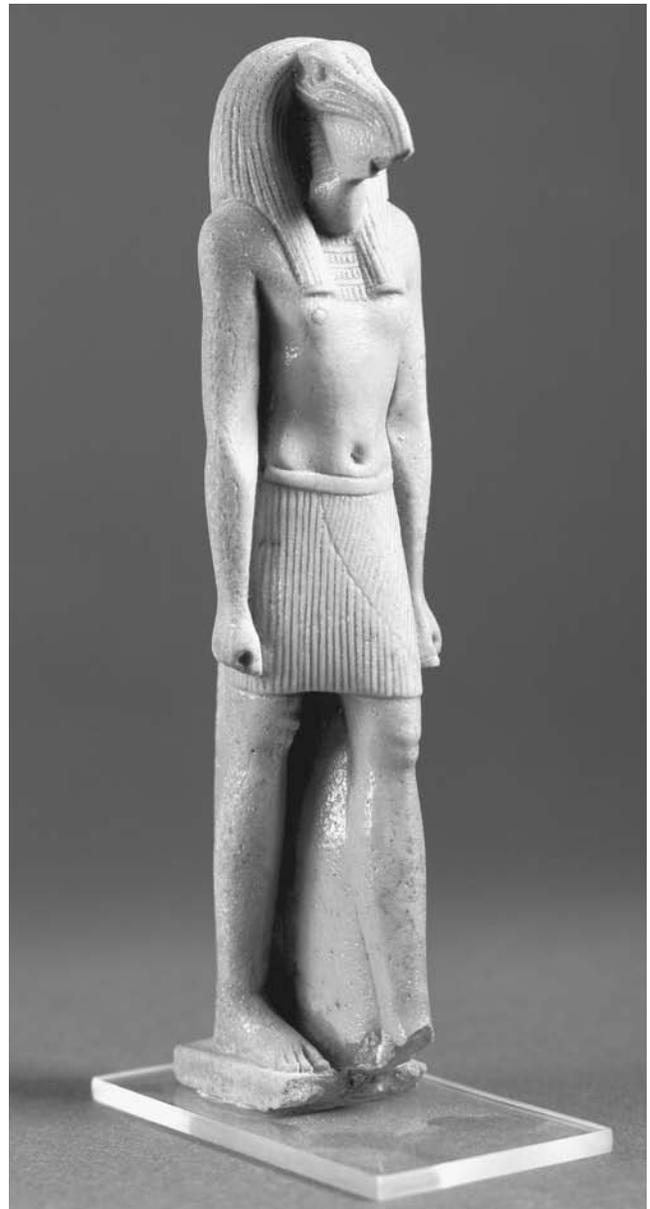
Thinis (This) Ancient town in UPPER EGYPT, south of CAIRO, long thought to be the origin or capital of the First and Second Dynasties (c. 3050–2705 BCE); most modern scholars now doubt the accuracy of this assertion. Excavations at ABYDOS, near Thinis, uncovered several mastabas, or open stone tombs, that were thought to be the burial sites of the Egyptian First Dynasty rulers. The historian MANETHO (c. 300 BCE) claimed that Thinis was the capital of both the First and Second Dynasties. However, larger and more elaborate tombs of the same period have been found elsewhere, as have other important mastabas. This has led scholars to question the claims that the early dynasties originated at Thinis. It is not known whether the mastabas near Thinis were used for burials or just for memorials.

Two notable figures from Egyptian history are often associated with Thinis. One was the mythical god of hunting and war, Anhur, whose cult began in Thinis. In addition, MENES (also known as Narmer), the figure who gained renown for uniting the lands of UPPER EGYPT and LOWER EGYPT, was reputedly born in the town of Thinis.

Thoth (Tehuti, Hermes) Greek name for the ancient Egyptian god of wisdom, WRITING, learning, and the moon. According to legend, Thoth invented HIEROGLYPHICS and possessed magical powers; also according to legend, he was present at the reckoning of the dead.

As a SCRIBE of the AFTERLIFE, Thoth was credited with writing the Egyptian BOOK OF THE DEAD. As the representative of the sun god, RA, Thoth used a balance scale to measure the heart of the deceased against the weight of the feather of Truth, supposedly in order to see if the heart was light. Thoth reported on the deceased to other gods who passed judgment.

The method of picture-writing called hieroglyphics is credited to Thoth, and he is often represented carrying a writing instrument and a scroll. Also, the moon is said to have come into being because of Thoth's desire to rid the nighttime world of darkness. Since he possessed magic powers and created the magical arts, Thoth is credited with inventing the tarot deck, which is sometimes called the Book of Thoth.

Thoth was typically pictured as a human with the head of an ibis, a bird that is a member of the stork family, although sometimes he was depicted as a baboon. According to legend, Thoth and MAAT, the goddess of truth, had eight children, including the god AMUN.


Thoth, the Egyptian god of wisdom, writing, learning, and the moon, is often depicted as a human with the head of an ibis. The Louvre Museum, Paris, France © *Gianni Dagli Orti/Corbis*

Thutmose I (King Akheperkare Thutmose I, Thutmosis I) (r. c. 1525–1512 BCE) *Third king of the ancient Egyptian Eighteenth Dynasty*

Thutmose legitimized his claim to the throne that his brother-in-law, AMENHOTEP I, had left him by marrying Amenhotep's sister, the princess Ahmose. Their marriage produced four children. One of the siblings, a daughter named Hatshepsut, later succeeded to the throne of EGYPT, following the reign of her half-brother THUTMOSE II.

A great warrior, Thutmose I conducted several military campaigns against Egypt's old enemies, the Nubians and the HYKSOS. The king's ferocity is immortalized in the story of his triumphant return from a Nubian campaign with the body of a Nubian chieftain hanging from the prow of his ship. Thutmose was so successful in waging war against the Hyksos in Syria that he extended his empire as far as the Euphrates River. Thutmose's empire building set a pattern that his successors emulated throughout the remainder of the Eighteenth Dynasty.

Thutmose's two sons by Queen Ahmose both died before him. Thutmose II, the king's son by a lesser wife, succeeded his father to the throne.

Further reading: Joyce Tyldesley, *Egypt's Golden Empire: The Age of the New Kingdom* (London: Headline Book Pub., 2001).

Thutmose II (King Akheperenre Thutmose II, Thutmosis II) (r. c. 1512–c. 1504 BCE) *Fourth king of the Eighteenth Dynasty in Egypt*

The son of THUTMOSE I and a wife named Mutnofret, Thutmose II married Hatshepsut, his half-sister. Their marriage produced no son to succeed him. Although it appears that Thutmose II suffered from poor health, he managed to oversee successful military campaigns in both Syria and NUBIA. He died at about the age of 30, leaving the throne to Hatshepsut, and THUTMOSE III, his son by a woman of his harem.

Further reading: Joyce Tyldesley, *Egypt's Golden Empire: The Age of the New Kingdom* (London: Headline Book Pub., 2001).

Thutmose III (King Menkheperre Thutmose III, Thutmosis III) (r. c. 1504–c. 1450 BCE) *Fifth king and great military leader of the ancient Egyptian Eighteenth Dynasty*

The son of THUTMOSE II and a concubine, Isis, Thutmose III was not old enough to rule when his father died. As a result he shared the throne with his late father's queen, Hatshepsut, ruling with her for about two years until Hatshepsut abandoned the co-regency and seized the throne for herself. She pushed Thutmose III into the background, where he remained until her death c. 1482 BCE. When he finally regained the throne, Thutmose III sought to erase the memory of Hatshepsut's reign by destroying the monuments she and her supporters had built.

While Hatshepsut reigned as pharaoh, Thutmose III apparently spent his time in the army. Ironically, his military exile ultimately served him well: As soon as he became pharaoh in his own right, Thutmose III was faced with a Mitanni revolt in Asia Minor. The struggle with the Mitanni, one of Egypt's greatest enemies, continued throughout Thutmose III's reign. He is reported to have engaged in 17 campaigns before he conquered them. It was these military expeditions, more than any others he conducted, that established Thutmose's reputation as a great general.

Thutmose III was as enthusiastic about erecting buildings as about waging war. In the last years of his reign, during a period of peace and prosperity for Egypt, he built and transformed many splendid monuments. One of the most important of these was the Temple of KARNAK at Thebes, dedicated to the god AMUN.

Thutmose was succeeded by AMENHOTEP II, his son from his marriage to his second wife, Hatshepsut-Merytre. Well into his eighties when he died, Thutmose III was buried in a tomb in the VALLEY OF THE KINGS.

Further reading: Donald B. Redford, *The Wars in Syria and Palestine of Thutmose III* (Boston: Brill, 2003); Joyce Tyldesley, *Egypt's Golden Empire: The Age of the New Kingdom* (London: Headline Book Pub., 2001).

Thutmose IV (King Menkheprure Thutmose IV, Thutmose IV) (c. 1425–1417 BCE) *Seventh king of the ancient Egyptian Eighteenth Dynasty*

Son of AMENHOTEP II and his sister, Queen Tio, Thutmose IV married Mutemwiya, who most likely was a Mitanni princess. The reign of Thutmose IV was for the most part uneventful, except for two military campaigns, one in NUBIA and the other in Syria. The Syrian campaign earned him the title "Conqueror of Syria."

Thutmose IV was succeeded by AMENHOTEP III, his son by Queen Mutemwiya. Buried in the VALLEY OF THE KINGS, the MUMMY of Thutmose was found in 1898 in the tomb of AMENHOTEP II, along with those of other pharaohs.

tigil   Ancient Ethiopian competition involving fists and wrestling positions. Hieroglyphic inscriptions in EGYPT give evidence that the sport had spread northward from Ethiopia through the NILE VALLEY as early as 4000 BCE. From Egypt the sport made its way to the Mediterranean world and sometime later became an essential part of Greek and Roman sport.

Tigil held a significant place in ancient Ethiopian culture because it provided an outlet for the aggression of young males. It also served as a source of entertainment at public celebrations, holiday events, and harvest FESTIVALS. Generally, young men were matched with opponents of the same age, height, and level of skill or strength. Winners were subsequently paired off to fight against competitors from other villages.

See also: SPORTS AND ATHLETICS (Vol. V).

Tigray   Remote highland region situated near the present-day border between ERITREA and northeastern ETHIOPIA; also the name of the people who live there. At least 4,000 years ago small communities of farmers and pastoralists dominated the mountainous landscape of Tigray. Primarily Cushitic speakers, they included the Amarar, the Hassaub, and the BEJA. By about 1000 BCE, these groups were joined by traders who crossed the RED SEA from southern Arabia. Centuries of intermarriage between these groups and others followed. The result was a culture that combined the traditions of many different groups and a WRITING script, known as GE'EZ, that grew out of such languages as TIGRINYA, ARABIC, and Hebrew.

Between 800 BCE and 300 BCE the cities of Damot, near present-day Eritrea, and Saba (Sheba), across the Red Sea in Arabia, flourished as centers of TRADE AND COMMERCE. The rulers of this trading network built temples with inscribed altars and stone sculptures. The Temple of Ilmuqah, considered the oldest building in Ethiopia, is one of the few surviving relics attesting to the former greatness of Damot and Saba. Eventually, Damot and Saba were supplanted as the Red Sea's most prosperous trading centers by the kingdom of AKSUM.

See also: BETA ISRAEL (Vol. I); DAMOT (Vols. II, III); TIGRAY (Vols. IV, V).

Tigre   A primarily Muslim, Tigré-speaking people who share a common heritage with the Christian TIGRINYA-speaking people called TIGRAY. Both the Tigré and the Tigrinya languages are related to GE'EZ, the ancient liturgical language of Ethiopia. The two peoples and the two languages are sometimes confused by outsiders. Thus, the Muslim Tigre are sometimes called the Northern Tigre in order to distinguish them from the Tigray who are the Tigrinya speakers living to the south. It is thought that the ancestors of the Tigre migrated into the region shortly before the first century. The nomadic pastoralist Tigre, however, were converted to Islam by Muslim traders who brought the religion to the lands bordering the Dahlak Islands and down the coast during the early eighth century. Politically, the Tigre are organized into clans based on FAMILY ties.

See also: PASTORALISM (Vols. I, IV); ISLAM (Vol. II).

Tigrinya   Spoken in the highlands of ERITREA, a Semitic language belonging to the family of AFRO-ASIATIC LANGUAGES. Tigrinya is spoken by the TIGRAY people, whose ancestors resulted from an intermingling of indigenous Cushitic speakers with Semitic immigrants who came to Africa from Arabia. The Tigrinya language developed from GE'EZ, the ancient Ethiopian written language that has been traced as far back as the kingdom of AKSUM. Unlike Ge'ez, however, Tigrinya is primarily a spoken language.

Togo   Present-day West African country 22,000 square miles (57,000 sq km) in size, located on the Gulf of Guinea; Togo shares borders with GHANA to the west, Republic of BENIN to the east, and BURKINA FASO to the north. The southern parts of Togo are tropical and the CLIMATE is hot and humid year-round. The northern regions are higher in elevation and semi-arid. Areas of Togo were probably inhabited by at least 6000 BCE. However, little is known about the activities of people or where they came from. In the northern savanna woodlands, people probably hunted and gathered FOOD and cultivated YAMS. Along Togo's short Atlantic coastline, which measures 35 miles (56 km), archeological evidence indicates that people fished for food and traded simple goods with other coastal peoples.

Tonga   Bantu-speaking ETHNIC GROUP living along the shores of Lake Malawi, in MALAWI, as well as in parts of MOZAMBIQUE, ZAMBIA, and ZIMBABWE.

topography   Physical or natural features of a region. Africa is largely an ancient plateau. It has been a landmass for more than 500 million years. At about 2,100 feet (640 m) above sea level, Africa's average elevation is higher than those of the other continents.

Africa's highlands include the ATLAS MOUNTAINS in the north, the RUWENZORI MOUNTAINS in the east, the Cape ranges in the south, and a series of basins and plateaus in between. These are divided in the east by the RIFT VALLEY and its associated highlands, which include

Mount KILIMANJARO, the highest point on the continent. The Rift Valley also holds lakes VICTORIA, TANGANYIKA, and Malawi. To the east, in the HORN OF AFRICA, are the highlands of ETHIOPIA, ERITREA, and SOMALIA. Africa also contains immense rivers with huge river basins. These include the NILE RIVER, NIGER RIVER, Volta River, ZAMBEZI RIVER, and the CONGO RIVER.

The largest desert in the world, the SAHARA DESERT, stretches across northern Africa from the Atlantic Ocean to the RED SEA, covering almost 30 percent of the continent. The Libyan and Nubian deserts are minor continuations of the Sahara. The Namib desert, on the southwest African coast, and the KALAHARI DESERT receive less than 5 inches of rain per year.

Also considered part of the African continent are the offshore islands of Zanzibar, MADAGASCAR, MAURITIUS, Réunion, the SEYCHELLES, the COMOROS, the Canary Islands, the CAPE VERDE ISLANDS, and SÃO TOMÉ AND PRÍNCIPE.

More than three-fourths of the continent is situated in the tropics. Much of the variation in the CLIMATE is a result of the INTERTROPICAL CONVERGENCE ZONE, which affects the rain and wind patterns across the continent. The diversity of the topography and the climate results in a variety of VEGETATION and plant cover, including RAIN FORESTS, tropical savannas, scrubland, and mangrove swamps.

See also: GEOGRAPHY (Vol. I).

totemism   Ancient system of belief that recognizes divine spirits through symbols or objects associated with nature. For thousands of years the people of Africa have created totems representing animals, plants, trees, rivers, and even sacred sites. More than just symbols of the divine, these totems served as companions and guides. They also served to foster cultural identity among ancestral clans, and in this way they often played important roles in funerals, FESTIVALS, and other important events.

Totemism in Africa dates back at least to ancient EGYPT, where, prior to 3200 BCE, a number of Egyptian DEITIES were identified with various natural phenomena. In the NILE VALLEY, for example, OSIRIS originally was represented as a god of VEGETATION. Similarly, devotees of Sobek, the Egyptian water god, revered CROCODILES, and the goddess HATHOR was seen in terms of the sacred nature of cows. This totemism remained an important part of Egyptian religious and cultural life down through the Roman occupation.

See also: RELIGION, TRADITIONAL (Vol. I).

towns and cities   Outside of EGYPT and NUBIA, the Mediterranean city of CARTHAGE (in present-day TUNISIA), was one of the largest cities in ancient Africa. When Carthage was founded in the ninth century BCE, African

settlements of more than 1,000 people were generally FISHING communities that developed on rivers and along the ocean coasts. The earliest of these were probably founded beginning about 7000 BCE.

Inland, until about 4000 BCE the people of Africa roamed across vast expenses with relatively few living in permanent settlements. Nomadic pastoralists, or NOMADS, wandered in search of pasture for their herds. Others, called HUNTER-GATHERERS, wandered in search of game and wild edible plants. However, when AGRICULTURE developed, many people began living a more sedentary lifestyle.

Northeast Africa   In UPPER EGYPT, where advanced FARMING TECHNIQUES allowed for larger settlements, the cities of Naqadah and HIERAKONPOLIS were founded in the Predynastic Period (c. 3050). About the same time, large settlements such as KERMA grew in Upper NUBIA, to the south of the Egyptian settlements. During the Dynastic Period (c. 3050–525 BCE), Egypt became more thickly settled, with people living in such towns as Giza, MEMPHIS, and Thebes. By about 1000 BCE the city of Napata had been chosen as the capital of the KUSH kingdom. Several hundred years later the capital was moved southward to MEROË. As social organization and irrigation and farming techniques improved, towns along the NILE RIVER were able to grow even larger.

In addition to farming, fishing and maritime trade also led to the development of African towns and cities. On the shores of the Mediterranean, the Greek-influenced settlement of CYRENE, in present-day LIBYA, was typical of the relatively dense cities of BYZANTINE AFRICA. Along the RED SEA, settlements included Suakin, ADULIS (a city within the kingdom of AKSUM), and Asmara. Ancient trading towns on the Gulf of Aden included Zeila and Berbera. Further south, on the Indian Ocean coast, settlements were growing at BARAWA, Marka, and Kismayo.

Western Sudan   Until approximately 200 BCE people living in the western Sudan (near present-day Republic of MALI) were largely nomadic HUNTER-GATHERERS scattered over vast territories. However, as the region became increasingly dry, both pastoralists and agriculturalists began to migrate closer to the NIGER RIVER bend. Evidence of crowded cemeteries indicates that a substantial town existed on the site of JENNE-JENO by 400 CE.

Similar to the agrarian cultures in northeast Africa, the dwellings and buildings at Jenne-Jeno were constructed from sun-dried mud. The growing Saharan trade city of TIMBUKTU, located about 300 miles (483 km) away, was also constructed of sun-dried mud.

Southern Africa   Large settlements came into existence somewhat later in southern Africa since agricultural production, and hence social complexity and settled populations in fixed locations, took place later in the south that it did in the north.

See also: TOWNS AND CITIES (Vols. II, III, IV, V).

trade and commerce Trade in Africa dates back to the earliest times, when HUNTER-GATHERERS of the STONE AGE simply exchanged tools, FOOD, weapons, livestock, and other items. In this type of trade, called barter, goods are exchanged for other items deemed to be of equal value. Barter probably has been practiced since humans first began interacting with one another, and long before the invention of MONEY AND CURRENCY people were exchanging items they had in abundance for items they needed.

In many parts of Africa, however, there soon developed more elaborate systems of exchange, and in some areas extensive trade routes emerged. Ancient EGYPT was in the forefront of this development, not only utilizing marketplaces but also sending out trading expeditions to faraway regions. These, as the records of the voyages of HARKHUF (c. 2290–c. 2270 BCE) make clear, ventured far down the NILE RIVER and into the region known to the Egyptians as PUNT.

Elsewhere, along the Mediterranean coast, Phoenician and Greek sailors and merchants established settlements in various locations. The most notable of these was CARTHAGE, which was founded about 800 BCE and which quickly developed into a regional economic and military power. By the sixth century BCE it was arguably the most influential city in the world, trading extensively in food, slaves, cloth, and metal goods. Its merchants also held monopolies in the trade in GOLD, silver, tin, and iron. Carthage ruthlessly maintained its monopoly of the barter trade, minting gold to pay its vast mercenary army and even sinking the ships of interlopers. Carthaginian sailors and traders led extensive expeditions along the Atlantic coasts of present-day Spain and Portugal, France, and MOROCCO, venturing, it is believed, as far south as present-day SIERRA LEONE.

In eastern Africa, Arabian hunters and traders began crossing the RED SEA to do business in present-day ETHIOPIA before 500 BCE. They traded with indigenous Africans at the settlements that became the trading centers of MEROË and AKSUM. Meroë served as a nexus for trade between the Roman Empire, other merchant towns, including those along the Red Sea, the Indian Ocean, and beyond. Merchants in the region that is now northern SOMALIA also participated in trade with Meroë. Somali and Arab traders bartered ivory, aromatic gums, slaves, and tortoiseshell for cloaks, tunics, COPPER, and tin from the Arabian peninsula as well as for COTTON cloth, grain, oil, and sugar from Asia.

The Meroë trading empire flourished for several hundred years before entering a period of decline around 200–300 CE. Later, during the Aksumite period, this northeastern trade became even more extensive. Aksumite traders ventured on a regular basis as far as Egypt, Persia, Arabia, India, and Ceylon. Their exports included obsidian stone and rhinoceros horn, while their imports came to include luxury goods such as wine, olive oil, and lacquerware.

The Aksumite economic empire was backed by force, and it conquered lands as distant as southern Arabia in order to maintain its domination of the trade between the Roman Empire and the lands to the east. These militarily protected trading routes were made until Aksum declined midway through the first millennium of the common era.

See also: TRADE AND COMMERCE (Vols. II, III, IV, V).

Trajan's Kiosk Beautiful but unfinished building supported by 14 huge columns with carved tops; it was begun by the Roman emperor Trajan, the ruler of EGYPT from around 98 CE to 117 CE. Trajan's Kiosk was one of several buildings in a complex on Philae Island (or Pilak, in ancient Egyptian). Construction of the complex began at the time of Ptolemy II and extended 800 years, to the rule of the Roman emperors. Though simple in ARCHITECTURE and design, the 14 columns of the kiosk bear capitals of floral carving. Trajan is depicted in relief on the inside of the kiosk, where he is shown as a pharaoh, or king, making offerings to the gods. The island was often associated with the goddess ISIS, who, according to legend, left her sacred ship at the kiosk while on the island.

Tswana Bantu-speaking people whose ancestors migrated into the area of the TSWAPONG HILLS, near present-day BOTSWANA, during the first century CE.

See also: TSWANA (Vol. III, IV).

Tswapong Hills Area in present-day BOTSWANA that rises 980 to 1,300 feet (300 to 400 m) above the sand of the surrounding KALAHARI DESERT. The hills are a source of archaeological evidence regarding Bantu-speaking peoples who migrated into the area about the first century CE.

Tuaregs Subgroup of the Berber people. For centuries the nomadic Tuaregs have inhabited the SAHARA DESERT and SAHEL regions of North Africa. The Tuaregs' presence in northern Africa was noted as long ago as the fifth century BCE by the Greek historian HERODOTUS. Since then, much about these indigo-robed warriors has been shrouded in mystery. Despite pressures that have forced many Tuaregs to adopt a more sedentary way of life than their nomadic ancestors, many continue to follow traditions that were established thousands of years ago. They have remained fiercely independent.

Throughout most of their history, the Tuaregs' economic lifeblood depended on Saharan TRADE AND COMMERCE and running the CARAVAN ROUTES that stretched

across the desert between the MEDITERRANEAN SEA and the cities to the south. Carrying primarily luxury items (high-profit goods, including slaves, that could be easily transported by the caravans) these merchants brought items to the coast for distribution to the rest of the world. Many Tuaregs settled in the communities through which they passed, often serving as agents for the Tuaregs who continued to operate the caravan trade.

Traditionally the Tuaregs maintained a feudal society. At one end of the social order were the nobles and clergy, followed by the nobles' vassals and the craftspeople. At the lower end of the social hierarchy were the *iklan,* laborers who probably were former slaves. Tuareg society was divided into two groups: farmers and traders. Farming was regarded as lower-class work, while trading was reserved for the upper classes. Over the centuries, however, this distinction was blurred as many sedentary farmers accumulated a great degree of wealth and as the caravan trade lost its importance.

Although Tuaregs consider themselves BERBERS and not Arabs, most are Muslims, reciting daily prayers and observing the major feasts of Islam. Beginning at about the age of 25, Tuareg men begin wearing a veil, concealing all of their faces except for their eyes. In contrast to other Muslim populations, however, Tuareg women never wear veils.

Tunisia North African country measuring approximately 60,000 square miles (155,400 sq km) that borders the MEDITERRANEAN SEA to the north and east, LIBYA to the southeast, and ALGERIA to the west. The earliest evidence of human habitation in Tunisia dates back 200,000 years and was discovered near the southern OASIS town of Kebili. Archaeological discoveries in the area include ancient stone tools belonging to *HOMO HABILIS* that were made more than 2 million years ago as well as tools made by the later *HOMO ERECTUS*. In ancient times the area was home to native BERBERS. Due to its proximity to Europe and the Middle East, Tunisia was dominated by a variety of people and kingdoms, including CARTHAGE, the Roman Empire, and the VANDALS.

The PHOENICIANS settled in the northern coastal areas of the African continent for purposes of TRADE AND COMMERCE, bringing with them new ideas and innovations about farming and city life that influenced the native Berbers. One of these ancient trading posts became Carthage, the capital and largest city of the Carthaginian Empire. Believed to have been established about 814 BCE under the rule of Queen Dido, Carthage was located near present-day Tunis.

The powerful Carthaginian empire came to rule most of the North African coast and a large part of Spain, as well as most of Sicily, Corsica, and Sardinia. The great empire ruled for centuries with no serious threats to its control. That changed, however, with Rome's rise to power.

Even though ROME had signed treaties with the Carthaginians, the Romans clearly were seeking opportunities to conquer their rival. The PUNIC WARS, a series of three epic struggles fought between the Roman and the Carthaginian Empires, began about 264 BCE and ended about 146 BCE. These conflicts resulted in the destruction of the great city of Carthage and the final conquest of North Africa by the Romans.

For the next several centuries most of Tunisia was known as the Roman province of Africa, or Africa Vetus, and Carthage became an important site of Christian learning and thought. The great Christian theologian St. Augustine, for example, is said to have been educated at Carthage.

As with other areas under Roman rule, Tunisia's natural resources were exploited and its land was cultivated by its overlords. Olive oil, wool, wood, and wheat were among the major goods produced in Roman Tunisia. The valley of the Majardah River was the location of an ancient Roman granary, and the area is still one of the largest producers of grain in Tunisia.

The influence of the Roman Empire began to fade by the fifth century, providing an opportunity for a foreign invasion. The Vandals, a Teutonic or Germanic people, ruled Jutland (now Denmark) and invaded lands on the Iberian Peninsula before conquering areas on the northern Mediterranean coast. In 533 CE, after 100 years of Vandal rule, the Byzantines, under the command of General Belisarius, again claimed Tunisia for the Eastern Roman Empire.

Turkana, Lake Large body of water in northwest KENYA and southwest ETHIOPIA; also known in modern times as Lake Rudolph (see photograph on page 244). Covering an area of about 2,500 square miles (6,475 sq km), Lake Turkana is Africa's fourth-largest lake. HUNTER-GATHERERS are believed to have first inhabited the area surrounding Lake Turkana about 8000 BCE. Five thousand years later Cushitic peoples moved into the region, probably sharing it with the original inhabitants. Beginning in the first millennium BCE, Bantu-speaking people migrated into the vicinity, bringing with them both their iron smelting and more advanced FARMING TECHNIQUES.

The Lake Turkana area is rich in archaeological evidence of hominids. The LEAKEYS, a family of archaeologists and paleoanthropologists from Kenya, made some of their most significant finds around Lake Turkana. As recently as 2003 Louise Leakey (1972–), the daughter of renowned paleoanthropologists Maeve and Richard Leakey, was conducting digs around the Turkana Basin and making significant finds.

Tutankhamun (King Nebkheprure TutbeAnkh-Amen, Tutankhaten, King Tut)   (r. c. 1361–c. 1352 BCE) *Tenth king of Egypt's Eighteenth Dynasty*

Tutankhamun became pharaoh at the age of eight or nine and died at about the age of 18. He was married to Ankhesenamun, one of the six daughters of AKHENATEN and Queen NEFERTITI. Tutankhamun and Ankhesenamun produced no male heirs.

The young royal couple began their lives in Akhenaten's new capital at Amarna. But, after Akhenaten's death, they fell under the influence of AY and HOREMHEB, Tutankhamun's successors, and moved to MEMPHIS. There Tutankhamun was crowned king, and steps were taken to reestablish the old RELIGION abandoned by Akhenaten. By changing their royal names so that they ended in -*amun* instead of -*aten,* Tutankhamun and his queen gave a clear sign of their dedication to the restoration of the traditional religion. It was during this time that Thebes once again became the religious capital of EGYPT.

There is a great deal of speculation as to the cause of Tutankhamun's death. It was once commonly believed that he had succumbed to tuberculosis, and it has also been suggested that he died of a brain hemorrhage. However, based on the examination of Tutankhamun's MUMMY, most scholars agree that he died as a result of a blow to the head. Whether this wound was caused by an accident, a blow sustained during battle, or was the result of an assassination remains a mystery.

After Tutankhamun's death, Ankhesenamun took the unusual action of seeking the help of the Hittite king, Suppiluliumas I. Without a son to succeed her late husband as pharaoh and continue the royal line, she asked to marry one of the Suppiluliumas's many sons. The king assented and sent one of his sons to Egypt. But the prince never reached his destination, as he was murdered just as he reached the border, possibly on orders from Horemheb.

Tutankhamun's reign was unremarkable. His most important legacy is his tomb, which British archaeologist Howard Carter discovered in 1922, practically untouched more than 3,200 years after his burial. Its contents included magnificent artifacts of GOLD and precious jewels, intricately carved furniture and weapons, luxurious clothing, and, perhaps best known to the modern world, the life-like gold mask that adorned the case of Tutankhamun's

mummy. This tomb was probably not intended as Tutankhamun's final resting place. There is evidence to suggest that it was intended for his predecessor, SMENKHARE, or possibly his VIZIER and successor, Ay.

U

Ubangi River   The main northern tributary of the CONGO RIVER system. The Bomu and Uele rivers meet to become the Ubangi River, which forms part of the present-day border between the Democratic Republic of the CONGO and the CENTRAL AFRICAN REPUBLIC. The Ubangi River is also the present-day border between the Democratic Republic of the Congo and the Republic of the CONGO. After a 1,400-mile (2,253-km) journey through equatorial RAIN FOREST, around river islands, and down rapids, the Ubangi enters the Congo River near Lake Tumba in the Democratic Republic of Congo.

The river is navigable for roughly half its length, from present-day Bangui, the capital of the Central African Republic, to the confluence of the Ubangi and the Congo rivers. The land along its banks is equatorial rain forest and swamp. The MBUTI were the original inhabitants of this somewhat sparsely populated, tropical land. Starting 2,000 years ago other peoples, ancestors of the Kongo, the Teke, and the Sanga, began to migrate into the region to farm or fish.

See also: SANGA (Vol. II).

Uganda   East African country measuring approximately 91,100 square miles (236,000 sq km) that borders the Republic of the SUDAN to the north, KENYA to the east, TANZANIA and RWANDA to the south, and Democratic Republic of the CONGO to the west. Kampala is the largest city and capital.

The migration of Bantu-speaking people into the southwestern part of Uganda started about 500 BCE. Uganda, with its favorable CLIMATE and location in the East African RIFT VALLEY was suitable for herders as well as for people who cultivated crops. The farmers used their iron technology to make tools to clear the land. By 400 BCE a few groups in Uganda were involved in mining iron ore and producing iron implements. With the increase in the population due to the expansion of Bantu speakers, the people evolved patterns of governing themselves. This gave them an advantage over the more scattered HUNTER-GATHERERS, who were forced to move to higher altitudes where AGRICULTURE was more difficult. By about 1000 CE the Bantu speakers were organized into large political units.

Unas   (r. c. 2498–2323 BCE) *Last king of ancient Egypt's Fifth Dynasty*

Unas was the first pharaoh to inscribe the inner walls of his tomb with spells, formulas, and descriptions of rituals to aid him in the AFTERLIFE. This practice continued to be used in the tombs of the Sixth Dynasty. Called Pyramid Texts, these inscriptions were later transcribed onto PAPYRUS and became known as the Egyptian BOOK OF THE DEAD, which is considered to be the world's earliest preserved text.

The pyramid of Unas is located south of the great step pyramid of DJOSER, near MEMPHIS. Rather than signaling a new belief in helping the dead in the afterlife, the Pyramid Texts mark an evolution in the idea of WRITING. Scholars believe that many of the texts were old when they were first inscribed. According to myth, the Pyramid Texts show that OSIRIS, the god of the dead, aided the deceased in the journey to the afterlife. Osiris may have

been gaining in importance at this time over the sun god, RA, who was considered an important deity during the earlier part of the Fifth Dynasty. Magical or religious spells, offerings, hymns, and instructions were added to the tomb to help alleviate fears about the afterlife, to provide for a prosperous life after death, and to help a ruler find his proper place in the afterworld.

The autobiographical information found in these writings is the source of our modern knowledge of many ancient practices, beliefs, and ideas. The inscriptions in the tomb of Unas, for example, tell of trade with Middle Easterners, famine, and the TRANSPORTATION of granite for the construction of the temple. They also show the first battle ever to be recorded in HIEROGLYPHICS. Other inscriptions, which later were made not only in royal tombs but also in the tombs of administrators and officials, have led scholars to conclude that the power of the royalty was diminishing at the time, with more governance coming from nonroyal officials.

Upper Egypt   Land along the NILE RIVER south of the NILE DELTA region; along with LOWER EGYPT, one of the two kingdoms of ancient EGYPT. Upper Egypt was a plain surrounded by desert. For about two months every summer, when rains caused the waters of the Nile to rise above its banks, the floodplain of Upper Egypt lay under water. The receding waters, however, left a fertile mud that proved ideal for AGRICULTURE.

Although located south of Lower Egypt, Upper Egypt was so named because it was situated upriver, closer to the source of the Nile (which flows northward). It extended from just south of present-day CAIRO to Lake Nasser, which was formed by the construction of the Aswan High Dam in the 1960s.

Upper Egypt was symbolized by a WHITE CROWN and chose the sedge plant as its emblem. Its chief god was SETH, who, according to Egyptian mythology, killed his brother OSIRIS, father of HORUS (the chief god of Lower Egypt).

Upper Egypt has a rich cultural heritage. The Tasian culture and the BADARIAN CULTURE, both of which flourished in the late fifth millennium BCE, were pastoral people with little central political organization. Settlements in Upper Egypt became more concentrated with later predynastic peoples, including the AMRATIAN CULTURE and the GERZEAN CULTURE. Outside of the Nile River valley region, NOMADS roamed the desert, probably until the late third millennium BCE.

Not until late predynastic times did the settlements of Upper Egypt unify into a single kingdom. When, about 3050 BCE, King MENES is thought to have led Upper Egypt to defeat Lower Egypt in war, the two lands united, founding the first Egyptian dynasty. The combined resources of the two lands and the large-scale projects undertaken after the unification added greatly to the wealth of the Egyptian dynasty and its kings, known as pharaohs.

Userkaf (Useraf, Userkhaf)   (c. 2465–2435 BCE)
Founder of ancient Egypt's Fifth Dynasty

Userkaf is best known for enhancing the importance of the mythological sun god RA and for building the first sun temple. His marriage to Queen Khentkaues may have ended strife between two branches of the Fourth Dynasty.

Userkaf was responsible for significant changes in how ancient Egyptians thought about Ra. Usually depicted as a hawk or a man bearing the head of a hawk, Ra was thought of as a creator. According to legend, Userkaf was asked to be the high priest of Ra, and the term *Sa-Ra* (Son of Ra) was added to the titles of the kings.

Userkaf built the first of five or six sun temples, monumental obelisks erected to honor Ra. Userkaf's obelisk, a stone pillar rising from a square base in a fashion similar to a pyramid, was thought to have been modeled after an ancient stone in Heliopolis, the city of Ra, and was thought to represent the Sun's rays. The sun temple built by Userkaf at Abusir is one of only two remaining temples. It is in poor condition today due to its original construction of mud brick.

Though not much is known about the origins and reign of Userkaf, he was probably the descendent of a Fourth Dynasty king named Redjedef (r. c. 2530 BCE). Scholars believe that Userkaf may have married Queen Khentkaues, who was of royal descent, in order to gain prominence as a ruler. This marriage may have ended a period of disharmony between two factions of the Fourth Dynasty. Archaeological evidence suggests that Khentkaues may have ruled Egypt on her own for a time or may have been a co-regent with Userkaf.

Userkaf built his pyramid and mortuary temple at SAQQARA. Although it is smaller than the PYRAMIDS of the Fourth Dynasty, the splendor of his pyramid is an example of the artistic mastery of this period. Square granite columns, relief sculptures, busts, and a great red granite statue of Userkaf were known to have existed in the pyramid and temple. Though the pyramid complex is now in ruins, the head of Userkaf's statue is preserved in the Egyptian Museum in CAIRO.

V

Vaal River Longest tributary of the ORANGE RIVER, in SOUTH AFRICA. The source of the Vaal River is in the Drakensberg Mountains, east of Johannesburg. The Vaal flows southwest for approximately 750 miles (1,207 km) and marks the boundary between the provinces of Transvaal and Orange Free State before merging with the ORANGE RIVER near Kimberley.

Valley of the Kings Royal city of the dead, or necropolis, situated in the desert hills on the west bank of the NILE RIVER across from the ancient capital of Thebes. The Valley of the Kings came into existence at the beginning of the NEW KINGDOM (c. 1570 BCE). THUTMOSE I (r. c. 1525 BCE), the third pharaoh of Egypt's Eighteenth Dynasty, is credited with having erected the first tomb there.

Archaeologists divide the site into two sections, the East Valley and the West Valley. It is the East Valley that contains the most royal tombs, which were cut into the solid rock of the cliffs surrounding the valley's barren landscape. The interior of each tomb consisted of a series of complex passageways and rooms leading to a central burial chamber. The many decorations on the walls inside the tombs focus on the activities of the AFTERLIFE found in the texts of the Egyptian BOOK OF THE DEAD. The most elaborate tomb found in the valley is that of the Nineteenth Dynasty pharaoh SETI I (r. c. 1318 BCE).

The tombs in the Valley of the Kings represented a new approach to the construction of royal mortuary buildings. Prior to the advent of the New Kingdom, pharaohs were buried in PYRAMIDS, with attached temples in which funerary rituals were performed. In the new location at Thebes, the two buildings were separated, with the mortuary temple for each ruler built apart from his or her tomb and placed in a different part of the valley on a plain closer to the Nile.

The Valley of the Kings continued to be the traditional royal burial ground until the end of the Twentieth Dynasty (c. 1069 BCE). However, by the time of the succeeding Twenty-first Dynasty, most of the tombs there had fallen prey to grave robbers who vandalized them and stole a good deal of their precious contents. The one notable exception to this plunder was the tomb of the boy-king TUTANKHAMUN, which was discovered almost intact in 1922. As a result of the widespread ravaging of the royal tombs at Thebes, pharaohs of later dynasties were forced to abandon the site, establishing their final resting places in other locations throughout EGYPT.

Vandals Christian people of Germanic origin who conquered CARTHAGE in 439 and occupied North Africa. Vandals settled the province of Africa Proconsularis in Roman North Africa, part of present-day LIBYA.

In 429 King Genseric of the Vandals led 80,000 of his people across the Strait of GIBRALTAR on a quest to secure land and establish a kingdom. Within 10 years the Vandals had conquered Carthage, wresting power from ROME, and by 455 they controlled the eastern zone of Roman Africa. Eventually Vandal control extended westward into the region of Djemila-Cuicul. It is difficult, however, to determine precise boundaries for the Vandal empire, primarily because the Vandals seem to have been perpetually warring along their frontiers with the indige-

nous North African Moors for control of their southern and western borders.

Roman Africa was nominally Christian, but during the fifth century the Church was in crisis. Roman military might had declined in Africa, and local peoples had begun plundering churches and massacring clergy. This was compounded by the arrival of the Vandals, who practiced a form of CHRISTIANITY that had been officially branded a heresy by the leadership of the Church. Called Arianism, it had first been introduced to the Vandals by missionaries to the Danube River region.

Determined to establish Arianism in North Africa, Genseric embarked on a policy of political and religious persecution of Catholics. He exiled Catholic bishops and refused to allow the church to replace them. He also confiscated lands from the Catholic nobility. This policy was continued after Genseric's death in 477 by his son Huneric (r. 477–484), who shared his father's fierce determination to establish the Arian doctrine. Huneric gathered together all the Catholic bishops in his empire in 484 and imposed an ultimatum to convert to Arianism or face exile.

Ultimately, however, the Vandals were unable to impose the Arian faith on North Africa, in part because the Vandals were greatly outnumbered by the larger population of Romano-Africans. As a result, the actual administration of the Vandal territories was left to the local Catholic nobility. The failure also stemmed from the fact that Huneric's successors, Gunthamund (r. 484–496) and Thrasamund (r. 496–523), did not defend Arianism as vigorously as their predecessor.

The Catholic Church, however, did not benefit from the failure of the Vandals to impose their faith on North Africa. In fact, Catholicism fell from power, due in part to persecution by the Vandals and in part to the decline of the towns that were the centers of the church. One constant in the area, though, was the Latin language, which remained in use among the conquered people of North Africa in spite of the Vandal occupation. Examples of that language, in the form of the poetry of Luxorius and Dracontius, have survived into the modern era.

The Vandal domination of North Africa lasted about 400 years. But even before then, NOMADS from the desert to the south and southeast began making inroads into Vandal territory. During the latter part of the reign of King Thrasamund, the Vandal army was badly defeated by invading nomads known as the Louata. Independent kingdoms ruled by BERBERS also emerged, and by 533 the Byzantine general Belisarius finally destroyed the weakened Vandal kingdom.

While some historians insist that the Vandals had no lasting influence on North Africa, others argue that some modern Berbers with blond hair and blue eyes clearly are descended from these Germanic invaders.

See also: BYZANTINE AFRICA (Vol. II).

vegetation   Vegetation, or plant cover, is determined by climatic conditions. Regions of equatorial RAIN FOREST receive heavy rainfall throughout the year and have warm temperatures that create good conditions for the growth of dense vegetation. These rain forests cover most of the CONGO BASIN, as well as parts of the African west coast from SIERRA LEONE to the mouth of the CONGO RIVER, near Cabinda, ANGOLA. Rain forests have luxurious plant growth and develop only in areas that receive more than 80 inches of rainfall annually. Besides harboring numerous kinds of smaller plants such as ferns and mosses, rain forests also contain valuable hardwoods, including mahogany.

In eastern GHANA, TOGO, and the Republic of BENIN, the forests are occasionally interrupted by savanna. The most common types of vegetation in Africa are the shorter trees and shrubs found in the light woodlands and grasslands that cover the savannas. Vegetation there is less dense than that found in the rain forests.

In the Mediterranean climates of both northern and southern Africa, large trees such as oaks, pines, and cedars can be found. Due to the cooler temperatures, temperate prairie and grasslands are also found in southern Africa.

In the SAHEL region, a semi-arid belt located between the SAHARA DESERT and the tropical regions, trees and grasses receive 5 to 12 inches of rain annually, with some thicker vegetation growing along rivers and streams. In the desert proper, very little vegetation grows outside of the oases, where desert grasses, date palms, and fig trees are fed by underground springs.

Victoria Falls   Widest waterfall in the world, located on the ZAMBEZI RIVER, along the border between ZAMBIA and ZIMBABWE. Known by the local people as the Mosi-o-Tunya, meaning "the smoke that thunders," Victoria Falls measures about 1 mile (1.6 km) at its widest point and features cascading water that drops anywhere from 300 to 400 feet (91 to 122 m). The falls were formed by a deep rift in the rock below Zambezi River. In 1856 David Livingstone, the Scottish missionary and explorer, was the first European to see the falls, and he named them in honor of the British queen who had supported his expedition.

See also: LIVINGSTONE, DAVID (Vol. IV).

Victoria, Lake   Largest lake in Africa, located in present-day TANZANIA and UGANDA, and bordering on KENYA. Lake Victoria, also called Victoria Nyanza, is a freshwater lake and the chief reservoir of the NILE RIVER. The lake covers about 26,838 square miles (69,510 sq km), with its greatest length from north to south being 210 miles (338 km), and its greatest width across being 150 miles (241 km). Its basin area covers 92,240 square miles

(238,900 sq km). The lake sits at an altitude of 3,720 feet (1,134 m) above sea level in a shallow depression that lies between the western and eastern RIFT VALLEY; it reaches a depth of 270 feet (82 m). Victoria is fed by the Kagera and Katonga rivers on the western side, and its only outlet is the Victoria Nile, located to the north. The lake has three different gulfs: the Kavirondo, in the north; the Speke, in the southeast; and the Emin Pasha, in the southwest. At the lake's northwestern corner is the Sese Archipelago, which is made up of 62 islands. The lake holds more than 200 different species of fish, which have long provided food for the surrounding populations.

See also: VICTORIA, LAKE (Vol. V).

vizier   High official in the government of ancient EGYPT. The vizier was the head of Egypt's elaborate bureaucracy and reported directly to the pharaoh, or king. He held power as the chief justice, head of the treasury, and overseer of records.

The office of vizier dates back at least as early as the Fourth Dynasty (c. 2575–c. 2465 BCE). By the reign of Ses-ostris III (r. c. 1900 BCE) the vizier controlled the entire bureaucracy of ancient Egypt.

Below the vizier were the nomarchs, or governors, of the provinces of ancient Egypt. These nomarchs were appointed by the pharaoh and reported to the vizier. Later

on the term *vizier* also was applied to the high government officials in Muslim states.

See also: NOMARCH (Vol. I).

Volta River   River system in present-day GHANA. The Volta measures about 1,000 miles (1,610 km) and is formed by the confluence of the Black Volta and the White Volta rivers.

See also: VOLTA LAKE (Vol. V).

vultures   Scavenging birds of prey, related to HAWKS and EAGLES, found in temperate and tropical areas. Most vultures have dark feathers and bare heads. They are usually solitary animals, soaring in the sky on their broad wings. They have keen sight, which they use to locate dead or dying animals.

Northeastern Africa is home to the Egyptian vulture, which grows up to 24 inches (61 cm) long. In ancient times Egyptians associated the vulture with a number of DEITIES, including the goddess NEKHBET, the protector of UPPER EGYPT and its rulers. She is often depicted as a woman with a vulture's head and a white crown. Nekhbet is also the goddess of childbirth. She was worshiped in the towns of Nekhen (HIERANKOPOLIS) and al-Kab.

W

Wadjkheperre (Kamose) (r. c. 1576–c. 1570 BCE)
Son of Sekenenre Tao (Seqenenre), brother of Ahmose I, and the last king of Egypt's Seventeenth Dynasty

During his brief rule Wadjkheperre warred with both KUSH and the HYKSOS in an attempt to unify EGYPT under Theban control. The Hyksos had at first controlled the NILE RIVER delta from their capital at Avaris, but they later extended their territory. Some scholars believe that Sekenenre Tao was at war with the Hyksos when he died. Apparently his son, Wadjkheperre, continued this war upon his succession to the throne of southern Egypt. He also attempted to drive out the Kushites. In this latter campaign, Wadjkheperre forced the Kushites south, taking control of the Buhen fort. Wadjkheperre is also credited with regaining territory from the Hyksos, including the OASIS of Bahriya.

There is evidence that the Kushites and the Hyksos may have joined forces against the Thebans. Although Wadjkheperre sought to remove both enemies from Egypt, he died before he could accomplish this. Wadjkheperre's brother, AHMOSE I (c. 1570–c. 1546 BCE), succeeded him as king and reunified Egypt to begin the NEW KINGDOM.

Walls of the Ruler (Wall of the Prince)
Fortresses on the east bank of the NILE RIVER built to protect EGYPT from the threat of the Libyans, Asiatics, and the Nubian archers known as LUNTIU-SETIU. It is believed that the Walls of the Ruler were built during the reigns of Amenemhet I (r. 1938–1908 BCE) and his son, Sesostris I (r. c. 1950 BCE), about the beginning of the Twelfth Dynasty (c. 1991–1820 BCE).

Amenemhet I led campaigns against the Libyans and Asiatics before taking over the rule of Egypt and establishing the Twelfth Dynasty. Some scholars believe that Amenemhet I envisioned ruling a great Egypt like that of the pharaohs of the OLD KINGDOM, but he seemed also to have considered his rule as the beginning of a new era. In an effort to guard the eastern borders, he built the Walls of the Ruler. Though the exact location of the fortresses is not known, it is believed that they were built on the eastern bank of the Nile. Amenemhet's son, Sesostris I (also called Senwosre I or Senwosret I), completed construction of the walls.

waret
Administrative department of ancient EGYPT created by Sesostris III (Senwosret III) during ancient Egypt's Twelfth Dynasty; warets served to strengthen Egypt's central government. Sesostris III ruled Egypt in about 1900 BCE. During this time he significantly reorganized the government of Egypt and created three or four *warets,* or districts, whose administrators reported to the VIZIER. In addition to the ministry of the vizier, Sesostris created departments for the oversight of war, LABOR, AGRICULTURE, and the treasury. This reorganization of the government of Egypt marked a strengthening of the main government and a rise of the middle class. It also added the administration of the KUSH kingdom to the central government of Egypt for the first time.

warfare and weapons
In ancient Africa peoples or rulers went to war for many reasons. They may have sought to add to their land or wanted a protective barrier

from a neighbor's attacks. They may have desired to gain wealth by collecting taxes and tribute from subject peoples, as ALEXANDER THE GREAT (356–323 BCE) did when he attacked the Persian Empire in 334 BCE. They also used warfare to increase their power in a region and dominate or destroy a rival, as was the case when ROME fought the three PUNIC WARS (264–241 BCE, 218–201 BCE, and 149–146 BCE) against CARTHAGE.

Early Warfare A few types of weapons, notably spears, stones, and clubs, are known to have been in use for many thousands of years, and it is probable that weapons used for hunting were used at times to kill other human beings during conflict.

The earliest archaeological evidence of warfare was discovered in the 1960s near Wadi Halfa in the present-day Republic of the SUDAN. A large burial plot, dating from c. 12,000 BCE, was found to contain 59 skeletons and a variety of stone projectiles. Projectile points located in the skulls, spines, pelvises, and limb bones of the skeletons indicated violent deaths. Scholars suggest this massacre was the result of an unstable agricultural system in the NILE VALLEY, where crop output varied. As a result, when any population increased or when crop yields decreased, there would be competition for FOOD. Thus the violence that led to the graves in the burial plot was probably the result of intense competition for the limited resources of the area. Whether the deaths were the result of an organized military campaign or a brutal skirmish between neighbors is unknown.

There is a difference between fighting and organized warfare. When groups of warriors fight, they often engage each other in individual combat with minimal regard for long-term strategy and tactics. Campaigns can end in a day or a few days once some goal has been met or vengeance taken. When larger groups of warriors band together, they may fight as an undisciplined hoard, swarming over and capturing or destroying whatever is in their way. True war requires a disciplined army of soldiers that can march in columns, take orders, and fight in line. A truism of military science says that a disciplined army always has the advantage over one that lacks military training and teamwork. When primitive societies began to transform themselves into states, armies became important organs of the state.

Early Weapons The first spears were made of fire-hardened wood and played an important role in both hunting and conflict between peoples. During the Late STONE AGE (c. 40,000–3200 BCE) stone spearheads were attached to the ends of spears, increasing their durability and lethality. The earliest spears were short—shorter, in fact, than the hunters and warriors who carried them. As the body armor of soldiers grew heavier, however, spears grew in size. By the time Alexander conquered EGYPT in the fourth century BCE, the spears carried by his soldiers had reached 18 feet (5.5 m) in length.

Evidence found near the MEDITERRANEAN SEA indicates that by 10,000 BCE the bow and arrow had been invented. The bow represented a major innovation in weaponry. It held an advantage over the throwing spear in both the distance it could cover and in the volume of fire an archer could produce as compared to a spear thrower.

Early hunting bows gave people the ability to surprise their prey and strike from a relatively safe distance. The first war bows did much the same, allowing archers to shoot high-velocity missiles with deadly accuracy and force. As time passed, more sophisticated bows were produced. The reflex curved bow, for example, concentrated the strength of the bow in its curved center. Later bows added a layer of bone or horn to the belly of the bone, reinforcing it and giving it even greater strength. The front of the bow was then overlaid with sinew to make it even more powerful. Bows like these were so highly stressed that, when unstrung, they unbowed and reversed their curvature.

By 7000 BCE the sling, a weapon more accurate than the early simple bow, had been devised. Projectiles from a sling were especially deadly when the stones used were the size of fists. The bow and sling were the weapons of choice in many parts of the ancient world even during the BRONZE AGE (c. 3500 BCE), until the mace was developed. This heavy weapon, which was of little or no use in the hunt, became the first tool designed exclusively for war.

The NARMER PALETTE is one of the most famous artifacts from ancient EGYPT. It contains the earliest known inscription about a historical person, describing the accomplishments of King MENES (r. c. 3050 BCE), also known as Narmer, the legendary pharaoh who unified UPPER and LOWER EGYPT. The palette's illustration of Menes ritually smashing an enemy's forehead with a war mace gives a glimpse of what warfare of the time was like. The palette also depicts Menes slaying his enemies and reviewing their headless bodies under the banners of his army.

The Size of Armies Despite the ancient world's significantly smaller populations, ancient armies could sometimes be quite large. The Egyptian army in the times of RAMESSES II (c. 1300 BCE) numbered about 100,000 men, mostly conscripts. At the battle of KADESH in 1303 BCE, the first battle for which historians have reliable troop-strength figures, an Egyptian force of 20,000 soldiers faced an army of HITTITES numbering about 17,000.

Ramesses II (r. c. 1304–c. 1237 BCE), riding a chariot, storms a Syrian fortress in this relief from the Great Temple at Abu Simbel. © *Roger Wood/Corbis*

The ASSYRIAN army of 800 BCE, the first in history to be entirely armed with iron weapons, numbered between 150,000 and 200,000 infantry and cavalrymen. At the battle of Cannae in Italy in 218 BCE, the Roman consuls Lucius Aemilius Paulus and Gaius Terentius Varro faced HANNIBAL (c. 247–183 BCE) of CARTHAGE with an army of 80,000 soldiers. Hannibal's victorious troops killed or wounded more than 50,000 Roman legionnaires in a single day of fighting.

The Bronze Age and the Chariot The Bronze Age (c. 3500–1000 BCE) saw the development of cast bronze weapons, which featured sharper cutting edges than earlier STONE AGE weapons had, and a limited introduction of body armor. At the same time, cities began to build defensive walls behind which the populace could protect themselves from marauders. Up to that time most combat took place at a sword's, spear's, or axe's length from one's opponent. During the third millennium BCE, on the plains between ancient Egypt and its Mesopotamian neighbors, a major advance in weaponry changed the face of combat when the bow and arrow, the wheel, and the domesticated horse were combined to create the war chariot. For the

first time soldiers could advance on a position in a surprise attack, deliver a deadly javelin or arrow attack from a mobile platform, and quickly race away to regroup or engage in lethal pursuit of a terrified and broken foe. Chariot-borne warriors became the elite strike force of the Egyptian army and gave Egypt a tactical advantage over its opponents.

The first chariots were four-wheeled carts with solid wooden wheels without pivoting front axles and pulled by onagers, fast-running relatives of DONKEYS. Over time the war chariot evolved into a lightweight car with spoked wheels and metal axles and pulled by three or four HORSES. The Persian army of Cyrus the Great used deadly scythed chariots, with sharp blades extending from the axles, in battle with Alexander the Great in the sixth century BCE.

The breeding of horses with sufficient strength and stamina to carry armed riders into battle led to the decline of the chariot as a weapon of war, starting at the end of the second millennium BCE. The Assyrians were responsible for the development of cavalry in the ancient world. Riders used their legs to control the animal, maintaining their seats on the backs of their horses with the aid of neck and belly straps. The stirrup, which allowed riders to stay in the saddle and deliver a strong blow from a lance or sword without being unseated by the movement, had not yet been invented. It would reach Europe from India by way of China during the Middle Ages and shift the balance in battle from infantry to mounted men, very often knights.

Iron Age Advances Bronze weaponry prevailed for centuries in much of the known ancient world until it was displaced by the superior edges and strength of iron weaponry. Not surprisingly, it was iron weaponry—as well as such new, sophisticated war machines as the catapult—that helped the Romans transform northern Africa into a Roman province.

The IRON AGE came to Africa at different times and in different places. In northeast Africa, by 750 BCE the Kushite kingdom of MEROË produced iron tools and weapons that contributed to that kingdom's regional dominance. The NOK CULTURE on the JOS PLATEAU of present-day NIGERIA was one of the first cultures in sub-Saharan Africa to produce and use iron. Evidence shows that these people used iron tools and weapons as early as 400 BCE.

The discovery of iron had an important impact on warfare. Iron weapons were forged, not cast like bronze, so that they were less brittle and more reliable than earlier weapons made from bronze. Furthermore, unlike bronze, which required hard-to-find tin to produce, iron was widely available, allowing armies to obtain a plentiful supply of inexpensive weapons. The Hittites were the first to make iron weapons, doing so about 1300 BCE. Within 100 years the technique had spread into Egypt

and Mesopotamia. Elsewhere, iron weapons aided the Bantu-speaking peoples as they expanded into sparsely populated parts of Africa during the last half-millennium before the common era.

Whereas for centuries the common people had been conscripted into the army only in time of war, the IRON AGE saw the growth of standing armies in peacetime and the resulting permanent corps of professional soldiers needed to train and lead them. Egypt was among the first to practice wartime conscription. In the Iron Age, conscription gave birth to the standing peacetime army.

Other Advances Perhaps the greatest advance in warfare in the ancient world was the Roman legion, which Hannibal faced in Italy and which was instrumental in the destruction of Carthage in North Africa. A legion was made up of ten 360-man units called cohorts, each of which contained up to three 120-man companies called maniples. A maniple, in turn, contained two centuries, each led by a centurion. (The 100-man century was eventually reduced to 60 men because it was judged easier to command.) The basic battle formation of the Roman legion had three lines. The first two were javelin-armed heavy infantry; the third was a mixture of light and heavy infantry and cavalry. The lines were staggered to allow for great flexibility and movement. Roman generals relied on massive frontal assaults that took full advantage of the soldiers' discipline and the power of the Roman short sword, or gladius, to inflict severe wounds in close, hand-to-hand combat. Legions were powerful but not invincible. At Cannae in 218 BCE, Hannibal capitalized on his cavalry and encircled the Roman legions from behind, annihilating them.

Warfare in Ancient Sub-Saharan Africa Very little is known of warfare in sub-Saharan Africa prior to 500 CE. Although foreign accounts and oral histories indicate that there were episodes of military strife prior to colonialism, virtually no archaeological evidence exists.

At the same time, a warrior tradition was part of many cultures. After growing up and gaining strength and skills, a young male often underwent INITIATION RITES, becoming an adult and a warrior. Ready to fight when the elders commanded, warriors were expected to protect their people and CATTLE from predators and neighbors as well as engage in cattle raids on other villages. The MAASAI have traditionally valued the stoic endurance of pain. In earlier times it was a custom for the warrior in training, armed only with a dagger, to prove his manhood by killing a lion.

The newly initiated warrior was given a sword and spear. He wore a special garment and let his hair grow long, braiding it and decorating it with ochre and sheep fat. His life was strictly governed by Maasai law and custom. A warrior drank no alcoholic beverages and ate only in the company of his age set. He also avoided sexual relations until 10 or more years after his initiation into

manhood, whereupon he was then promoted to senior warrior and allowed to marry. Throughout his term of service, until he became an elder, he served his people with honor. Little is recorded about the strategy and tactics that these warriors used or about the duration and the ferocity of the battles they fought.

Waset   Centralized state in ancient EGYPT, also known as Thebes and LUXOR, founded during the Eleventh Dynasty (c. 2000 BCE). Waset, which means "scepter," was established by the pharaoh MENTUHOTEP II (r. c. 2008–c. 1957 BCE), as the MIDDLE KINGDOM began. This was following a period of widespread political upheaval among the lesser kings and regional rulers (called *nomarchs*) of UPPER EGYPT and LOWER EGYPT. By the Twelfth Dynasty and the reign of Amenemhet II (c. 1929 BCE), peace and stability had been restored, and Egypt entered what historians have called "the literary age." The realms of RELIGION and ART saw major achievements. Some of the literary works, usually written on PAPYRUS by SCRIBES, served to advertise the deeds of ruling kings or to garner support for the administration. Still others works, such as the classic tale called *The Story of Sinuhe,* were written simply to entertain.

During this period Egypt also returned to the practice of pyramid building. Sometimes this meant creating new structures from the ruins of old tombs at Giza, SAQQARA, and Dahshur. The white limestone pyramid built for Amenemhet II at Dahshur, standing 166 feet (55 m) high, was one example of this. A different style tomb was created for Mentuhotep II. He was buried in the cliffs at DEIR EL-BAHRI in what is known as a mastaba, usually a bench made of mud brick. His tomb was unusual in that it was surrounded by columns with a ramp at the entrance.

Over a period of 2,000 years, numerous temples were built in the former city of Waset. One of the largest of these complex structures was the sacred Temple of KARNAK. Few, if any, structures have been built with equal mathematical precision. It was even built on an angle that caught the first rays of the summer solstice and, like a telescope, projected them into the temple.

Waset's development came to an abrupt halt when HYKSOS invaders occupied the region from the Fifteenth through Seventeenth Dynasties (c. 1700–1570 BCE). Once Egyptian power was restored, however, Waset went on to evolve into a magnificent city of palaces and great temples. When the Greeks appropriated the city during the first few centuries of the common era, they renamed it Thebes. Later, the Arab name for the city, L'Ouqsor, evolved to become the westernized version, Luxor.

water buffalo   Large mammal belonging to the same family as the cape buffalo and CATTLE. Water buffalo have been domesticated as draft animals since the beginning of history. Originally an Asian animal, the water buffalo was introduced into EGYPT relatively late, about 600 BCE. Egyptian farmers used the animals for plowing and also for milk, meat, and fertilizer.

Domesticated water buffalo are gentle, hardy creatures that rarely catch disease and can live up to 35 years, even under harsh working conditions. In the wild, water buffalo are fierce masters of their territory when threatened. Otherwise, they spend much of their time peacefully wallowing in mud and grazing on water plants.

Wawat   Ancient Egyptian name for a region in Lower Nubia. Beginning under Pharaoh AMENHOTEP I (r. c. 1546–c. 1525 BCE), EGYPT launched a series of invasions against the KUSH kingdom in NUBIA. The first of these resulted in Amenhotep's conquest of Wawat. As a result of this invasion and the ones that followed, the Kush kingdom was to pay Egypt yearly tributes of GOLD, ivory, EBONY, ostrich feathers, animal hides, grain, CATTLE, and enslaved laborers.

Western Sahara   North African country covering approximately 103,000 square miles (266,800 sq km) that borders on MOROCCO to the north, ALGERIA to the northeast, and MAURITANIA to the southeast. The entire western part of the country borders on the Atlantic Ocean. The largest city is Laayoune, which is the capital.

Evidence suggests that the people who first inhabited the Western Sahara region about 400 BCE were engaged in trade with European seafarers. The land is mostly low, flat desert with some small mountains in the south and northeast. Because of the desert environment, the introduction of CAMELS in the region about 50 CE made a great impact, facilitating travel and enhancing trade with the region's BERBERS and, later, Arabic-speaking NOMADS. The camels were used to transport goods including SALT, GOLD, and CLOTH AND TEXTILES.

white crown The crown of UPPER EGYPT (southern Egypt). One of the royal emblems of the kings of ancient Egypt, the white crown was cone-shaped and bore the *uraeus,* or the COBRA emblem, on its front. The cobra represented the fiery eye of RA, the Egyptian sun god, and was a symbol of protection. (The Egyptians believed that the cobra would spit fire at any enemy that approached.) When Upper and LOWER EGYPT were united, in about 3050 BCE, the white crown of UPPER EGYPT was joined with the RED CROWN of Lower Egypt to form a double crown that symbolized the union.

MENES (Narmer), who founded the First Dynasty (c. 3050 BCE), is the first pharaoh depicted wearing the double crown. Pharaohs are also shown wearing a royal headcloth called a *nemes.* The *nemes* was pulled tight across the forehead and had two broad flaps hanging at the sides. On the front were a cobra and a vulture, another symbol of protection.

White Nile Tributary of the NILE RIVER, flowing between the vast swamp known as the SUDD and KHARTOUM, in Republic of the SUDAN. Along with the ATBARA RIVER and the BLUE NILE, which it joins at KHARTOUM, the White Nile forms one of the Nile's three main tributaries.

witchcraft The use of ritual magic or sorcery to bring about a specific, usually negative, outcome. Still a powerful force in many African societies today, witchcraft was common throughout Africa's history and has been mistakenly linked to traditional African RELIGION.

Many African cultures maintain that very little happens by chance. In light of this belief, witchcraft has been associated with negative or opposing displays of power. It has been blamed for disasters, afflictions, declining health, and sudden death. Practitioners are thought to send harmful representations of their power, such as insects, animals, bats, or snakes. Among the Kuranko of SIERRA LEONE, witches were believed to shift form, becoming fearsome animals. Objects designed to cause harm were often found buried under the earth of failed crops, under doorways, or hidden in the houses of intended victims.

Attempts to answer the question of witchcraft's existence can be found among the YORUBA of present-day NIGERIA, who maintain the belief that humans were created with the power to select their destinies on earth and therefore have the power to choose to become witches. In contrast, the Manianga of the Congo region believe that witchcraft involves a secretive initiation process that begins at a very young age; it is, they believe, a fate assigned to children by their mothers.

Regarding witchcraft, especially in ancient times, each society formed its own recognition and language concerning magical power and those who wield it. The Manianga know this power as *kindoki.* The Ngombe—a Bantu-speaking people who have populated the northwestern regions of the Congo, RWANDA, and BURUNDI—call individuals with the ability to manipulate power the *bemba.* The practitioners of witchcraft may be male or female, but women are overwhelmingly identified as witches, particularly in matrilineal societies. In contrast, the use of witchcraft in other societies sometimes entails the participation of entire groups, such the elders.

Individuals can sometimes be accused of being witches because of their acquisition of ritual knowledge, wealth, or property. The jealousy of their accusers, often the younger members of a particular society, may be linked to larger social issues involving societal control and the maintenance of order.

The task of identifying witches is traditionally accomplished through the use of a human ORACLE or traditional ritual practices. Among the Azande of northern Central Africa, witches are tortured with poisonous bark to get them to confess; other groups subject suspected witches to public beatings or apply stinging ointments or herbs. Priests of the Fante people, who are a subgroup of the AKAN peoples of present-day GHANA, traditionally use the sacred *asfo* drum to extract confessions. Accused individuals, forced to drink a special mixture of herbs along with water used to wash the drum, are expected either to confess their actions or die. In contrast, the Vagala, a pastoral society of present-day BURKINA FASO, guard against the effects of witchcraft by drinking *tagdunna,* a protective potion. In other societies "witch cleansing" is accomplished by destroying medicines and associated ritual objects.

Witchcraft involves an awareness of the duality of power. Therefore, its practitioners usually acknowledge that the same ability to cause willful destruction can also be used to combat witchcraft and promote beneficial healing. For this reason the ritual knowledge acquired by priests, priestesses, healers, initiation circles, or village councils has often been cloaked in secrecy. But, despite widespread fear of witchcraft's disruptive and dangerous power and the occasional call for reform, the powerful magical arts are greatly respected and continue to exert influence in African society.

women in ancient Africa   Recent scholarship concerning women in Africa has begun to examine the multifaceted role they play in economic, social, and cultural development. This interest is a reaction to a critical imbalance in earlier scholarship created by the absence of women in historical literature and too great a focus on royalty rather than on the day-to-day activities of average people. The large body of ORAL TRADITIONS, which includes myths, origin stories, and other forms of folk wisdom, has also sparked renewed interest in the role of African women. It appears that viewing women as universal mother figures and creators or co-creators of the universe and humankind was fairly widespread. The numerous examples of female divinities include Eka-Abassi among the Ibibio of NIGERIA and the dual creator god known as Mawu, the female who represents fertility, and Lisa, her male counterpart, among the Ewe of present-day GHANA and the Fon of what is now the Republic of Benin. In EGYPT, the numerous shrines and temples erected to ISIS, HATHOR, and many other female DEITIES help to confirm the Egyptians' traditional beliefs concerning AGRICULTURE, motherhood, fertility, and FAMILY.

Archaeologists in Egypt have discovered clay female figurines dating from c. 3000 BCE; similar figurines from between 3100 and 2780 BCE have been found in the graves of royal leaders in KUSH. These figures and the rock and cave images found in present-day ALGERIA and SOUTH AFRICA appear to support widespread reverence for agricultural or fertility goddesses. The evidence also confirms that in some regions, RELIGION and political leadership of women were once closely intertwined.

Women and Religion   Many religious systems appear to have been tied to agricultural LABOR, viewed as a form of regeneration. Female reproduction may have also shaped early forms of worship and in some cases allowed women to transcend traditional roles as mother and wives. This was true of the women related to the Nubian founders of Egypt's Twenty-fifth Dynasty (c. 750–663 BCE). Wives, sisters, and daughters served as priestesses of AMUN, gaining power, land, and wealth, and forming their own dynasty. AMENIRDIS I (r. c. 760–747 BCE) was among the first to adapt this long-standing Egyptian tradition. Women in ancient sub-Saharan Africa commonly functioned as priests, with a variety of ritual and judicial functions; as traditional doctors, often mistakenly labeled witch doctors, providing ritual cleansings and protection from evil forces; and as mediums and diviners, playing an essential, if secondary, role in facilitating SPIRIT POSSESSION and relaying messages from the other world.

Oral and historical accounts of women include some hints about the *negbe Sande,* the powerful rites and practices associated with Mende and Gola women who preside over the SECRET SOCIETIES known today as the Sande. Erroneously described as a cult, it is an age-old institution that embodies solidarity and social power.

Food Production and Early Societies   Until approximately the first millennium BCE, social organization revolved around the activities of HUNTER-GATHERERS. Studies of various Bantu-speaking farmers, Cushitic pastoralists, and other early groups have concluded that women worked longer hours than men as a result of agricultural work that involved the tending, harvesting, and preparation of FOOD along with child rearing and other duties that tied them to the home. Modern studies of the SAN, for example, have attempted to reconstruct what life was like in the Late STONE AGE. Although some questions have been raised as to how much the San's present-day subsistence lifestyle can be considered representative of the past, the studies generally surmise that women looked after their children's welfare, supplied the family with water and firewood, and maintained the family dwelling. They also contributed a large portion, possibly 60 percent, of daily subsistence in the form of wild plants. The men were primarily responsible for supplying the community with sufficient meat by hunting large game. There is ongoing debate as to whether men and women played equal roles in all decision-making processes.

Once various foods had been domesticated in approximately the second millennium BCE, the family became an essential unit in food production in many African societies. Women's labor and the future labor of her children shaped the various forms of BRIDE-WEALTH, or bride price, provided by the prospective groom. Designed to emphasize the value of women within the economy, bride-wealth might have taken the form of farming implements or CATTLE; among the IGBO of southern Nigeria and the NUBA of the Republic of the SUDAN. The groom might be expected to cultivate the land of the prospective bride prior to marriage.

Once married, a woman was assigned many prominent food staples for exclusive cultivation, harvesting, trading, or marketing activities, sometimes through organized trade collectives. The AMHARA women of ETHIOPIA owned, cultivated, and harvested their own plants for centuries. In regions of West Africa, the COCOYAM, a root vegetable, traditionally provided a notable source of income for women farmers.

Women in Africa also contributed to the economy through craftsmanship. In many societies, POTTERY, weaving, beaded JEWELRY, and numerous other crafts were considered women's work. In both Egypt and NUBIA, there have been conflicting reports concerning the division of labor in terms of pottery making, spinning, and weaving cloth. Although weaving appears to have been carried out primarily by women, some sources indicate that men also did some weaving. When they began to gain acceptance as commodities at trading markets, many of these crafts were shifted to the control of men. This was true among the Kono of SIERRA LEONE, where women were the spinners and men were the weavers of cloth. This was also true

among the Baoule of present-day IVORY COAST. Significantly, women of the Yoruba and Nupe peoples played an essential role in long-distance trading.

Consequently, the domestic economy—agriculture, pottery, textiles, and other forms of potential wealth produced by women—helped to build political power that was reinforced through marriage. Rulers often arranged marriage between siblings and first cousins in order to maintain this political control with the family.

Queen Mothers and Female Regencies A number of women were reigning queens, regents, or other high-ranking officials in the ancient world. They acquired power in at least three distinct ways. The first was the direct outgrowth of egalitarian societies and their beliefs. One example can be seen among the Lovedu, in what is now SOUTH AFRICA, who traditionally chose a rain queen as the political and divine ruler of the kingdom. Her powers were so great that it was believed that her anger could generate drought. The TUAREGS were also considered an egalitarian society, as the tomb of Queen Hinan attests. Her skeletal remains and the GOLD and silver jewelry archaeologists recovered from her tomb reflect the high regard Tuareg society had for her.

A second way in which women assumed power in the ancient world was through inheritance. In Napata and MEROË, queens, or *KANDAKES,* acquired power as the mothers or wives of kings, including Queen Shankiakhete (r. 170–160 BCE) and Queen Amanishakhete (r. 41–23 BCE). Queen Amanishakhete was in fact co-ruler at the height of the economic and social power of Meroë, which was built from its reputation as an international trading port. The queen's elaborate tomb still remains in the northern region of Meroë, although excavations have resulted in the removal of much of her elaborate jewelry and other artifacts. Nubian queens officiated at coronation ceremonies and provided invaluable counsel. They built numerous public works and, when necessary, engaged enemies of the state in battle.

The legendary Queen MAKEDA (queen of Sheba) was typical of many queens reigning in Ethiopia who inherited power through familial links. She was widely known for establishing important trade networks, commanding armies, and collecting vast wealth from the many regions she ruled over prior to her romantic entanglement with King Solomon. Queen Hatshepsut, who, along with THUTMOSE III (r. c. 1504–1450), ruled Egypt in the 15th century BCE, inherited her notable abilities as an independent ruler from her father. During her rule, she built numerous monuments and authorized many expeditions to the fabled land of PUNT; however, much of the evidence of her reign was destroyed after her death.

The rights of nonroyal women in Egypt are equally insightful. Among the numerous documents that have survived in Egypt are legal documents indicating that at times in Egypt's history, such as the NEW KINGDOM (c. 1570–1070 BCE), men and women lived as equals under the law. Women could own property, enter into business transactions, and arrange marriage and divorce contracts. There are even records that show women sued for monetary relief in courts. Problems associated with these laws can be seen in the fact that women were almost always the defendants in monetary claims of nonpayment or the wrongful sale of property. One case involved a woman named Heria of Deir el-Medina who reportedly stole tools. Although she denied it, the tools were later found in her house with other items. The fact that she was sent outside of the court's jurisdiction to another and perhaps higher court indicates that it was considered a highly unusual circumstance. Women typically received the same kinds of punishment for crimes as men, including being beaten.

A third way that women gained power was through matrilineal descent. Women in matrilineal societies could be "king-makers." It has been suggested that in some societies these powerful women were postmenopausal, since women were sometimes ostracized during menstruation or following childbirth because of taboos related to blood. This assertion, however, has not been conclusively proved, and evidence indicates that some titled women were young or married when they assumed power.

Societies south of the Sahara ruled by powerful female leaders included the AKAN of Ghana, whose royal line of queen mothers began as the State of the Elder Woman. Described as an *ohemma,* or female king, her divinity was linked to her ability to bring forth new life. As king she ruled over informal groups of family clans that eventually became city-states. Her symbol, a knotted cloth tied around a long staff, has also been noted among women rulers and goddesses associated with the Tuaregs and GARAMANTES.

writing In ancient Africa, EGYPT was probably the earliest society to develop writing. Recent archaeological discoveries, including the ones made during the 1980s at

ABYDOS, confirm that Egyptian writing began as early as the fourth millennium BCE and that it was a fully developed, highly sophisticated system by 3300 BCE. This dating challenges the long-held belief that the earliest writing was the cuneiform system invented by the Sumerians of ancient Mesopotamia, who used long sharpened reeds, called *calams,* to impress characters onto soft, wet clay tablets. When the clay hardened, the writing became a permanent record.

Similar to hieroglyphics but more abstract, cuneiform texts of Egyptian origin have been found in and around Egypt. In time, as they came to dominate Mesopotamia, the Assyrians and Babylonians transformed cuneiform into a syllabic alphabet, and the great ASSYRIAN king Hammurabi used it to compose one of the first legal codes in history. Cuneiform remained in use until the first century CE.

Given Egypt's frequent floods and droughts, it is believed that Egyptian writing began with basic forms of calendars. The need to collect and record taxes and keep accounts of commercial transactions also played a significant role in the development of writing. At first, writing was done on objects such as clay jars and vases, ivory, and even pieces of bone. Examples of these, marked with records of tax payments and with the origins of various goods, have been found dating as far back as c. 3200 BCE. Later, stone became a common medium for Egyptian writing, with the NARMER PALETTE, a stone tablet inscribed with the conquests of King MENES (Narmer), being one of the earliest examples recovered thus far.

In time, however, the Egyptians developed PAPYRUS, on which they wrote with INK using reed pens and brushes. Papyrus became so important that the Egyptians kept a carefully controlled monopoly on its production until the use of parchment became widespread some 2,000 years ago.

Called *medu netcher* (the words of the gods) by the ancient Egyptians, writing was considered a sacred gift from THOTH, the god of universal wisdom and intelligence. Priests, not surprisingly, played an important role in the writing process, writing prayers, burial rituals, magic spells, and formulas on stone tablets, as well as on the walls of temples, tombs, and monuments. Since the majority of the Egyptian population could not write, the priests and SCRIBES who could do so usually held high positions within the kingdom's government and courts.

With 24 picture-letters and syllables, Egyptian HIEROGLYPHICS were made up of consonants rather than vowels. Words could be created using these phonograms,

ideograms (symbolic pictures), or a combination of the two. However, as time went on, the Egyptians developed three different scripts for writing. Of the three, the system of hieroglyphics was the oldest, dating back to before 3000 BCE. The later HIERATIC script was a type of shorthand that priests and scribes used for writing on papyrus. The third form of Egyptian writing, DEMOTIC, was a faster, cursive style that appeared about 600 BCE. Not as regularized as the traditional hieroglyphics, demotic varied greatly in appearance, depending on everything from geographical differences to the type of text being written (business letters, legal documents, religious texts, and so on), and even to differences in individual handwriting.

The neighboring kingdom of KUSH also developed a form of sacred writing. Known as Meroitic script, it was made up of 23 symbols used with colon signs separating the words. Religious themes have been identified on the temples at NAGA, and at GEBEL BARKAL, where inscribed stone monuments, called stelae, date back to at least the eighth century BCE. Researchers have been able to decipher and classify a number of recovered Meroitic scripts, but as many as 800 more still await translation.

Other ancient African systems of writing developed in what is now ETHIOPIA. For the most part, these can be traced to Arab settlers who crossed to Africa from the Arabian Peninsula about the fifth or sixth century BCE and founded the kingdom of Saba. The Sabaeans developed a script that, in time, evolved into the classic Ethiopian writing system, which has remained in use, in one form or another, until the 21st century.

Basically a syllabic system, the Ethiopic writing system had 26 letters, all representing consonants, which become syllables when vowel sounds are added. Sentences were written from right to left and then back to the right.

A form of writing that developed from Ethiopic, called Lessana Ge'ez (the language of the free), emerged centuries before the common era. GE'EZ is considered the classic script of Ethiopia, and is read left to right rather than right to left in the manner of other Semitic-based languages. Popular until the seventh century, Ge'ez was utilized for numerous Aksumite inscriptions on coins, stelae, and monuments. After the seventh century, the use of Ge'ez became less prevalent, primarily restricted to the religious writings of the Ethiopian Orthodox Church.

Ancient Ethiopic writing had 26 letters. Twenty-four of these were derived from the Sabaean writing system. To these were added two other letters, representing the *p* sound, which was not represented in Sabaean.

Ethiopian scribes were required to rule the pages of religious books with a reed and awl. Ink was made from natural elements and dispensed from special cow horns, one with black ink for script and another with red ink for sacred names and references. While religious works were emphasized, especially the stories of saints, writing was also used to preserve poetry, law, MEDICINE, and rituals.

Other African societies placed greater emphasis on ORAL TRADITIONS, but, in many of these groups, SECRET SOCIETIES developed writing very early on. These "secret scripts," which documented rituals for priests, initiation ceremonies, and other RITES OF PASSAGE, were created to transmit cultural knowledge to future generations. Among the groups using these secret writings were the Vai, BAMANA, Benin, Kongo, Peul, and the AKAN.

Y

yams Tuberous roots grown principally in the equatorial forest regions of West Africa. Considered the foremost crop of West Africa, yams hold a special place in the region's economic and social history. There are two main varieties of yam grown in Africa. The yellow Guinea yam *(Dioscorea cayensis)* grows in the wild and may be toxic when it is either not fully mature or prepared improperly. The other type is the white Guinea yam *(Dioscorea rotundata),* which was probably first domesticated about 5000 BCE. Other varieties of yam in Africa evolved from various cultivating methods or were introduced from Southeast Asia during the second century CE.

In northern regions of present-day GHANA, yams were grown using early forms of hoe AGRICULTURE. Although they had little nutritional value, the yams were usually eaten with animal proteins. Yams could also be stored for long periods without spoiling. Archaeologists have discovered evidence of yam plantings in central Ghana and CAMEROON that date back more than 3,000 years. Farmers in these regions usually created numerous mounds, sometimes measuring 3 to 5 feet (0.9 to 1.5 meters) high. During January, small portions of the plant, used as seeds, were placed on either side of the mound to generate a new crop. This new generation matured in about seven months, depending on the quality of soil. Secondary crops such as MILLET were often planted between yam mounds. This method had many variations in western Africa. In central NIGERIA, for example, the Tiv people planted secondary crops at the bottom of the mound.

From an economic and cultural perspective, yams have long held an important place in many African societies. Some societies created myths and proverbs that emphasized their value, while others, such as the IGBO of Nigeria, held annual FESTIVALS that centered around yams and their cultivation. These festivals continue today.

Yoruba General term used to describe the language, peoples, and kingdoms of Yorubaland; also known as Nago. Occupying a region stretching from the savannas west of the lower NIGER RIVER to the forest regions near Africa's coast, the Yoruba can be found in present-day NIGERIA and Republic of BENIN, as well as parts of GHANA, NIGER, SIERRA LEONE, and TOGO.

From an ancient if undetermined period, the Yoruba labored as farmers, hunters, and traders and lived in small, scattered communities. The population grew as a result of long-distance trade conducted by inhabitants of the SAHARA DESERT. By about the middle of the IRON AGE (c. 500 BCE–1000 CE), the growing trade economy had caused Yoruba villages to expand. At the same time, cooperative work projects led villages to join together under the authority of a central ruler or king. As a result the region inhabited by the Yoruba became one of the earliest models for urban life in Africa.

By their own accounts, from ancient times most Yoruba people have followed a powerful and enduring religious tradition. Their creation stories trace human origins to the city of ILE-IFE, giving credit to the god Oduduwa for founding the city and, hence, the original Yoruba state. Although there are several versions of the tale, the basic story recalls how Oduduwa was lowered to earth by OLORUN, the god of the sky, carrying a snail shell filled with earth and a chicken to spread that earth over the waters. Oduduwa also carried a chameleon that tested the suitability of the earth for humans. Based on the chameleon's

positive response, he named the place *Ile-Ife, whihc is* loosely translated as "a home that is wide enough." Oduduwa represented divine kingship and so did his sons, who went on to found other Yoruba kingdoms. Reigning

Yoruba kings, known as *ooni,* claim descent from this first king.

Z

Zambezi River (Zambesi)   Great river that flows from west to east across southern Africa to MOZAMBIQUE, draining the central plateaus before emptying into the Indian Ocean. Flowing nearly 2,000 miles (3,220 km), the Zambezi is the principal waterway in southern East Africa.

The Zambezi's headwaters flow along the border between present-day ANGOLA and ZAMBIA. The river snakes its way east through the dry central plateaus before entering present-day ZIMBABWE. The river is then joined by two of its largest tributaries, the Kafue and Luangwa, before flowing into Mozambique. There it is also joined by the Shire River before emptying into the Mozambique Channel.

Before being dammed in the 20th century, the Zambezi River carried so much silt and sand to the shore that its several mouths could shift drastically in a short amount of time.

See also: ZAMBEZI RIVER (Vol. III).

Zambia   Country in southern Africa covering approximately 290,600 square miles (752,700 sq km) and bordering the Democratic Republic of the CONGO and TANZANIA to the north, MALAWI and MOZAMBIQUE to the east, ZIMBABWE, NAMIBIA and BOTSWANA to the south, and ANGOLA to the west. Lusaka is the country's largest city and is the capital.

Archaeologists trace the origins of humanity to the Great RIFT VALLEY, which extends from southwest Asia to the Lower ZAMBEZI RIVER, in southern Zambia. Artifacts unearthed at STONE AGE sites in Zambia suggest that early humans were present between 1 and 2 million years ago. The most significant of these sites are at Kalambo Falls in the north and VICTORIA FALLS in the south. Also, at Kabwe, north of Lusaka, archaeologists have found evidence of activities by *HOMO SAPIENS* that dates back 100,000 years.

Examples of ROCK ART are found in Kasama District, where some 700 of the more than 1,000 rock art sites in Zambia exist. The sites in Zambia lack the sophistication of comparable sites in Zimbabwe and SOUTH AFRICA, and the seasonally humid climate of Zambia has probably caused many rock paintings to fade and disappear. It is thought that Zambian rock art had religious or ritual uses; the eland, an animal sacred to Late Stone Age peoples in South Africa, appears in Zambian rock art as well.

Early IRON AGE peoples settled in the region with their AGRICULTURE and domestic animals about 2,000 years ago. By 350, COPPER came into use both for currency and for adornment. The Bantu-speaking ancestors of the present-day TONGA people reached the region between 800 and 1000 CE. These newcomers kept CATTLE, made POTTERY and metalwork, and lived in lathe and plaster houses. They totally supplanted the indigenous Stone Age peoples of Zambia, who probably resembled the SAN in appearance and lifestyle.

See also: ZAMBIA (Vols. II, III, IV, V).

Zanzibar   Island in the Indian Ocean that is part of present-day TANZANIA. Made up of the two major islands of Unguja and Pemba, Zanzibar is famous for its spice plantations, which have produced cloves, cinnamon, nutmeg, vanilla, and cardamom for hundreds of years. The name Zanzibar is of Persian origin and comes from *Zanjbar*, meaning, "country of the blacks."

See also: ZANJ (Vol. II); ZANZIBAR (Vols. II, III, IV, V).

zebras   Striped, hoofed mammals belonging to the same animal family as HORSES and DONKEYS. Most zebras live in the plains or brush areas of eastern and southern Africa, although one type of zebra, the mountain zebra, inhabits the rocky hillsides of NAMIBIA. Zebras usually live in small groups made up of one stallion (a male zebra) and several mares (female zebras) along with their (foals) offspring. Among the natural enemies of zebras are LIONS and LEOPARDS.

The zebra has long fascinated the people of southern Africa. One group, the MBUTI, even invented a myth to explain how the zebra got its stripes. Long ago, according to Mbuti legend, water was very scarce. A white zebra approached a pool of water guarded by a baboon, who was sitting by a fire. The baboon was unwilling to share his water and challenged the zebra to a fight. During their battle, as the zebra kicked the baboon into the mountains, he fell on the baboon's fire. This left the zebra with dark stripes across his white fur. While the baboon stayed in the mountains, the burnt zebra ran away to the grassy plains, where it has remained ever since.

Zimbabwe   Country in southern Africa measuring approximately 150,900 square miles (390,800 sq km) that borders on ZAMBIA to the north, MOZAMBIQUE to the east, SOUTH AFRICA to the south, and BOTSWANA to the west. Harare is its capital and largest city.

Archaeologists have found evidence of hominid activity at numerous stone age sites in the country. Some of the finds date back to approximately 500,000 years ago. The SAN people inhabited Zimbabwe as early as about 200 BCE. Evidence of their activity in the area includes ROCK ART, which can be found in high-elevation granite shelters throughout Zimbabwe. Zimbabwe is also the site of IRON AGE archaeological finds dating from 180 CE. Later, about the fifth century CE, Bantu-speaking people settled throughout the area.

See also: BANTU EXPANSION (Vol. I); ZIMBABWE (Vols. II, III, IV, V).

Zinjanthropus   Name once used to describe a certain fossilized human. Recovered in 1959 by archaeologists Louis and Mary Leakey, *Zinjanthropus* lived approximately 1.5 million to 1.75 million years ago. Archaeologists originally used the name *Zinjanthropus,* or "The Man of Zinj," after the Arabic name for the region in which the fossilized human was found. The current name used by archaeologists for this fossilized find, however, is *Australopithecus boisei* (*A. boisei*), which places him in the same scientific category as other australopithecines unearthed in the neighboring regions. Those regions include the Omo Valley in TANZANIA, Koobi Fora in KENYA, and Taung in the South African Transvaal. The size of *A. boisei's* skull indicates that he had a brain about one-third the size of that of modern human beings. Like other australopithecines, he was approximately 4 to 5 feet (1.3 to 1.6 m) tall, able to stand upright, and walked on two legs. *A. bosei* used chipped pebble tools, which were recovered as well.

GLOSSARY

agriculturalists Sociological term for "farmers."

agro-pastoralists People who practice both farming and animal husbandry.

alafin Yoruba word for "ruler" or "king."

Allah Arabic for "God" or "Supreme Being."

Americo-Liberian Liberians of African-American ancestry.

ancestor worship Misnomer for the traditional practice of honoring and recognizing the memory and spirits of deceased family members.

al-Andalus Arabic term for Muslim Spain.

animism Belief that inanimate objects have a soul or life force.

anglophone English speaking.

apartheid Afrikaans word that means "separateness"; a formal system and policy of racial segregation and political and economic discrimination against South Africa's nonwhite majority.

aphrodesiac Food or other agent thought to arouse or increase sexual desire.

askia Arabic word meaning "general" that was applied to the Songhai kings. Capitalized, the word refers to a dynasty of Songhai rulers.

assimilados Portuguese word for Africans who had assimilated into the colonial culture.

Australopithicus africanus Hominid species that branched off into *Homo habilis* and *A. robustus.*

Australopithicus anamensis Second-oldest species of the hominid *Australopithicus.*

Australopithicus ramadus Oldest of the apelike, hominid species of *Australopithicus.*

Australopithicus robustus A sturdy species of *Australopithicus* that came after *A. africanus* and appears to have been an evolutionary dead end. *Australopithecus robustus* roamed the Earth at the same time as *Homo habilis.*

balkanization The breaking apart of regions or units into smaller groups.

barter Trading system in which goods are exchanged for items of equal value.

bey Governor in the Ottoman Empire.

Bilad al-Sudan Arabic for "Land of the Blacks."

bride price The payment made by a groom and his family to compensate the bride's father for the loss of her services because of marriage.

British Commonwealth Organization of sovereign states that were former colonies under the British Empire.

caliph Title for Muslim rulers who claim to be the secular and religious successors of the Prophet Muhammad.

caliphate Muslim state ruled by a caliph.

caravel A small, maneuverable ship used by the Portuguese during the Age of Discovery.

caste A division of society based on wealth, privilege, rank, or occupation.

circumcision The cutting of the clitoris (also called clitorectomy or clitoridectomy) or the prepuce of the penis; a rite of passage in many African societies.

cire perdu French for "lost wax," a technique used to cast metals.

clan A group that traces its descent from a common ancestor.

conflict diamonds Gems that are sold or traded extralegally in order to fund wars.

conquistadores Spanish for "conquerors"; term used to describe the Spanish leaders of the conquest of the Americas during the 1500s.

constitutional monarchy State with a constitution that is ruled by a king or queen.

customary law Established traditions, customs, or practices that govern daily life and interaction.

degredados Portuguese criminals who were sent to Africa by the Portuguese king to perform hazardous duties related to exploration and colonization.

dhow Arabic word for a wooden sailing vessel with a triangular sail that was commonly used to transport trade goods.

diaspora Word used to describe a large, readily distinguishable group of people settled far from their ancestral homelands.

divination The interpretation of supernatural signs, usually done by a medicine man or priest.

djembe African drum, often called "the healing drum" because of its use in healing ceremonies.

emir A Muslim ruler or commander.

emirate A state ruled by an emir.

endogamy Marriage within one's ethnic group, as required by custom or law.

enset Another name for the "false banana" plant common in Africa.

ethnic group Term used to signify people who share a common culture.

ethno-linguistic Word used to describe a group whose individuals share racial characteristics and a common language.

eunuch A man who has been castrated (had his testicles removed), generally so that he might be trusted to watch over a ruler's wife or wives.

francophone French speaking.

government transparency Feature of an open society in which the decisions and the policy-making process of leaders are open to public scrutiny.

griot Storyteller, common in West African cultures, who preserves and relates the oral history of his people, often with musical accompaniment.

gross domestic product (GDP) Total value of goods and services produced by a nation's economy, within that nation. GDP is measured within a certain time frame, usually a year.

gross national product (GNP) Total value of goods and services produced by the residents of a nation, both within the nation as well as beyond its borders. Like GDP, GNP is measured within a certain time frame, usually a year.

hajj In Islam, a pilgrimage to Mecca.

hajjiyy "Pilgrim" in Arabic.

hegira Arabic for "flight" or "exodus"; generally used to describe the move of the Muslim prophet Muhammad from Mecca to Medina.

hominid Biological term used to describe the various branches of the Hominidae, the family from which modern humans descend according to evolutionary theory.

ideology A coherent or systematic way of looking at human life and culture.

imam A spiritual and political leader of a Muslim state.

imamate The region or state ruled by an imam.

indigénat Separate legal code used by France in its judicial dealings with the indigenous African population of its colonies.

infidel Term used as an epithet to describe one who is unfaithful or an unbeliever with respect to a particular religion .

infrastructure Basic physical, economic, and social facilities and institutions of a community or country .

Janissary From the Turkish for "new soldier," a member of an elite Ottoman military corps.

jebel "Mountain" in Arabic.

kabaka The word for "king" in Babito and Buganda cultures.

kemet Egyptian for "black earth."

kora Small percussion instrument played by some griots.

kraal Enclosure for cattle or a group of houses surrounding such an enclosure.

lineage A group whose individuals trace their descent from a common ancestor; usually a subgroup of a larger clan.

lingua franca Common language used by speakers of different languages.

Luso-African Word that describes the combined Portuguese and African cultures, especially the offspring of Portuguese settlers and indigenous African women. (The Latin name for the area of the Iberian Peninsula occupied by modern Portugal was Lusitania.)

madrasa Theological school for the interpretation of Islamic law.

Mahdi Arabic word for "enlightened one," or "righteous leader"; specifically, the Muslim savior who, in Islamic belief, is to arrive shortly before the end of time.

mamluk Arabic for "one who is owned"; capitalized, it is a member of an elite military unit made up of captives enslaved and used by Islamic rulers to serve in Middle Eastern and North African armies.

mansa Mande term for "king" or "emperor."

marabout A mystical Muslim spiritual leader.

massif A mountainous geological feature.

mastaba Arabic for an inscribed stone tomb.

matrilineal Relating to descent on the maternal, or mother's, side.

medina Arabic word for the old section of a city.

megaliths Archaeological term meaning "large rocks"; used to describe stelae and such features as cairns and tumuli that mark important places or events for many ancient cultures.

mestizo Adjective meaning "of mixed blood."

mfecane Zulu word meaning "the crushing." When capitalized, the word refers to the nineteenth-century Zulu conquests that caused the mass migration of peoples in southern Africa.

microliths Archaeological term meaning "small rocks"; used to describe sharpened stone blade tools of Stone Age cultures.

Monophysite Related to the Christian tradition that holds that Jesus Christ had only one (divine) nature.

Moor An Arab or Berber conqueror of al-Andalus (Muslim Spain).

mulatto The offspring of a Negroid (black) person and a Caucasoid (white) person.

mwami Head of the Tutsi political structure, believed to be of divine lineage.

negusa negast "King of kings" in Ethiopic; traditional title given to the ruler of Ethiopia.

neocolonialism Political or economic policies by which former colonial powers maintain their control of former colonies.

Nilotic Relating to peoples of the Nile, or Nile River basin, used especially to describe the languages spoken by these peoples.

Nsibidi Secret script of the Ekoi people of Nigeria.

oba Yoruba king or chieftain.

pasha A high-ranking official in the Ottoman Empire.

pashalik Territory or province of the Ottoman Empire governed by a pasha.

pass book A feature of apartheid-era South Africa, pass books were identification documents that black Africans, but not whites, were required by law to carry at all times.

pastoralists People whose livelihood and society center on raising livestock.

patriarch Male head of a family, organization, or society.

patrilineal Relating to descent through the paternal, or father's, side.

poll tax A tax of a fixed amount per person levied on adults.

polygyny The practice of having more than one wife or female mate at one time.

prazeros Portuguese settlers in Africa who held prazos.

prazos Similar to feudal estates, parcels of land in Africa that were leased to Portuguese settlers by the Portuguese king.

primogeniture A hereditary system common in Africa by which the eldest child, or more commonly, the eldest son, receives all of a family's inheritance.

proverb A short popular expression or adage. Proverbs are tools for passing on traditional wisdom orally.

pygmy Greek for "fist," a unit of measurement; used to describe the short-statured Mbuti people.

qadi Arabic for "judge."

Quran (also spelled Koran) Arabic for "recitation," and the name of the book of Muslim sacred writings.

ras A title meaning "regional ruler" in Ethiopia.

rondavel Small, round homes common in southern Africa.

salaam Arabic for "peace."

sarki Hausa word for "king."

scarification Symbolic markings made by pricking, scraping, or cutting the skin.

secret society Formal organizations united by an oath of secrecy and constituted for political or religious purposes.

shantytowns A town or part of a town consisting mostly of crudely built dwellings.

sharia Muslim law, which governs the civil and religious behavior of believers.

sharif In Islamic culture, one of noble ancestry.

sheikh (shaykh, sheik) Arabic word for patrilineal clan leaders.

sirocco Name given to a certain type of strong wind in the Sahara Desert.

souk Arabic word for "market."

stelae Large stone objects, usually phallus-shaped, whose markings generally contain information important to those who produced them.

stratified Arranged into sharply defined classes.

stratigraphy The study of sequences of sediments, soils, and rocks; used by archaeologists to determine the approximate age of a region.

sultan The king or sovereign of a Muslim state.

sultanate The lands or territory ruled by a sultan.

syncretism The combining of religious beliefs to form a new religion.

taboo (adj.) forbidden by custom, usually because of the fear of retribution by supernatural forces; (n.) a prohibition based on morality or social custom.

tafsir Arabic for "interpretation," especially as regards the Quran.

taqwa In Islam, the internal ability to determine right from wrong.

taro Another name for the cocoyam, an edible tuber common throughout Africa.

tauf Puddled mud that, when dried, serves as the foundation for some homes in sub-Saharan Africa.

teff A grass native to Africa that can be threshed to produce flour.

theocracy Government of a state by officials who are thought to be guided by God.

ulamaa Islamic learned men, the inheritors of the tradition of the prophet Muhammad.

vizier A high-ranking official in a Muslim state, esp. within the Ottoman Empire.

CONTRIBUTORS

Editor of First Edition

Willie F. Page is professor emeritus (retired) of Africana studies at Brooklyn College, in Brooklyn, New York. He is the author of numerous reviews and journal articles. His published works include *The Dutch Triangle: The Netherlands and the Atlantic Slave Trade 1621–1664.*

General Editor of Revised Edition

R. Hunt Davis, Jr., Ph.D., is professor emeritus of history and African studies at the University of Florida. He received a Ph.D. in African studies from the University of Wisconsin, Madison. Dr. Davis is an expert on the history of South Africa, African agricultural history, and the history of education in Africa. His published works include *Mandela, Tambo, and the African National Congress* (1991) and *Apartheid Unravels* (1991), along with numerous articles and book chapters. He served as director at the University of Florida Center for African Studies and is also a past editor of the *African Studies Review.*

Contributing Editors of Revised Edition

Agnes Ngoma Leslie, Ph.D., outreach director, Center for African Studies, University of Florida

Dianne White Oyler, Ph.D., associate professor of history, Fayetteville State University

LIST OF ENTRIES

HOW TO USE THIS ENCYCLOPEDIA

This encyclopedia is organized chronologically, dividing the African past into five major eras. This division serves to make it easier to study the vastness and complexity of African history and culture. It also allows students and general readers to go directly to the volume or volumes they wish to consult.

Volume I, *Ancient Africa,* deals with Africa up to approximately 500 CE (roughly, in terms of classical European history, to the Fall of the Roman Empire and the dissolution of the Ancient World on the eve of the emergence of Islam). The volume also includes articles on the continent's key geographical features and major language families. In addition you will find articles that deal with certain basic aspects of African life that, in essential ways, remain relatively constant throughout time. For example, rites of passage, funeral customs, the payment of bride-wealth, and rituals related to spirit possession are features common to many African societies. Although these features can evolve in different cultures in radically different ways, their basic purpose remains constant. Accordingly, rather than try to cover the evolution of these cultural features in each volume, we offer a more general explanation in Volume I, with the understanding that the details of these cultural touchstones can vary widely from people to people and change over time.

On the other hand there are entries related to key cultural and social dimensions whose changes are easier to observe over time. Such entries appear in each of the volumes and include architecture, art, clothing and dress, economics, family, music, religion, warfare, and the role of women.

Volume II, *African Kingdoms,* focuses on what may be loosely termed "medieval Africa," from the sixth century to the beginning of the 16th century. This is the period that witnessed the rise and spread of Islam and, to a lesser degree, Arab expansion throughout much of the northern and eastern regions of the continent. It also saw the flowering of some of Africa's greatest indigenous kingdoms and empires. Other Africans, such as the Maasai and Kikuyu living in and around present-day Kenya, did not live in powerful states during this time yet developed their own dynamic cultures.

Volume III, *From Conquest to Colonization,* continues Africa's story from roughly 1500 to 1850. During this era Africa became increasingly involved with the Atlantic world due to European maritime exploration and subsequent interaction through trade and cultural exchanges. This period also included the rise of the transatlantic slave trade, which in turn created the African Diaspora, and the beginnings of European colonization. As a result, it marks a period when the dynamics shaping African culture and society began to shift.

Volume IV, *The Colonial Era,* covers Africa during the years 1850–1960. This historical period begins with Europe's conquest of the continent, leading to the era of colonial rule. Political control enabled Europe to extend its economic control as well, turning Africa into a vast supply depot of raw materials. Volume IV also covers the rise of nationalist movements and the great struggle Africans undertook to regain their independence.

Volume V, *Independent Africa,* deals with the continent since 1960, when Africans began regaining their independence and started to once again live in sovereign states. (This process, of course, took longer in the southern portion of the continent than in other parts.) In common with the rest of the world's people, however, Africans have faced a host of new and challenging problems, some of which are specific to Africa, while others are of a more global nature.

In addition to the aforementioned cultural entries that appear in all five volumes, there are entries for each of the present-day countries of the continent as identified on the Political Map found at the front of each volume. Readers can thus learn about the key developments in a given country within a given time period or across the entire span of African history. There are also articles on individual ethnic groups of Africa in each of the volumes. Since there are more than a thousand identifiable groups, it has been necessary to limit coverage to the major or key groups within a given period. Thus, a group that might be historically important in one period may not be

sufficiently important, or may not even have existed, in a period covered by one or more other volumes. Likewise, there are entries on the major cities of the continent for given time periods, including, in Volume V, all the present national capitals. Another key set of entries common to all volumes concerns historically important persons. In general, historians are more readily able to identify these individuals for recent periods than for earlier times. As a result the latter volumes contain more individual biographical entries. An exception here is the case of Ancient Egypt, where historical records have enabled us to learn about the roles of prominent individuals.

In preparing these volumes, every attempt has been made to make this encyclopedia as accessible and easy to use as possible. At the front of each volume, readers will find an introduction and a timeline specific to the historical era covered in the volume. There are also three full-page maps, two of which appear in all five volumes (the current political map and a physical map), and one that is specific to the volume's time period. In addition the front of each volume contains a volume-specific list of the photographs, illustrations, and maps found therein. The List of Entries at the front of each volume is the same in all volumes and enables the reader to quickly get an overview of the entries within the individual volumes, as well as for the five-volume set. Entries are arranged alphabetically, letter-by-letter within each volume.

Entry headwords use the most commonly found spelling or representation of that spelling, with other frequently used spellings in parentheses. The question of spelling, of course, is always a major issue when dealing with languages utilizing an alphabet or a script different than that used for English. Changes in orthography and the challenges of transliteration can produce several variants of a word. Where there are important variants in spelling, this encyclopedia presents as many as possible, but only within the entries themselves. For easy access to variant and alternate spelling, readers should consult the index at the end of each volume, which lists and cross-references the alternate spellings that appear in the text.

Each volume contains an index that has references to subjects in the specific volume, and the cumulative index at the end of Volume V provides easy access across the volumes. A cumulative glossary appears in each volume and provides additional assistance.

The entries serve to provide the reader with basic rather than exhaustive information regarding the subject at hand. To help those who wish to read further, each entry is linked with other entries in that volume via cross-references indicated by SMALL CAPITALS. In addition the majority of entries are followed by a **See also** section, which provides cross-references to relevant entries in the other four volumes. The reader may find it useful to begin with one of the general articles—such as the ones dealing with archaeology, dance, oral traditions, or women—or to start with an entry on a specific country or an historically important state and follow the cross-references to discover more detailed information. Readers should be aware that cross-references, both those embedded in the text and those in the **See also** section, use only entry headword spellings and not variant spellings. For those readers who wish to research a topic beyond the material provided in individual and cross-referenced entries, there is also a **Further reading** section at the end of many entries. Bibliographical references listed here guide readers to more in-depth resources in a particular area.

Finally, readers can consult the **Suggested Readings** in the back of each volume. These volume-specific bibliographies contain general studies—such as atlases, histories of the continent, and broad works on culture, society, and people—as well as specialized studies that typically cover specific topics or regions. For the most part, these two bibliographic aids contain those recently published works that are most likely to be available in libraries, especially well-stocked city and college libraries. Readers should also be aware that a growing number of sources are available online in the form of e-books and other formats. The World Wide Web is also a good place to look for current events and developments that have occurred since the publication of this encyclopedia.

INTRODUCTION TO THIS VOLUME

There is no era in Africa's history that exemplifies its greatness and grandeur more than the medieval, or middle, period, from roughly 500 to 1500 CE. This period is, on the one hand, replete with activity, from the ongoing great Bantu expansion—possibly the largest and most prolonged dispersal of peoples in human history—to the development of centralized states. It is also an era that saw the rise of many of Africa's most noteworthy kingdoms and empires. Some, like Great Zimbabwe, Ghana, and Mali, are well known. Others, however, are less familiar but equally fascinating. There is, for example, Mapungubwe, the kingdom that preceded Great Zimbabwe, which, well before the 12th century, grew into an urban center with a population of more than 10,000. There also is the Kongo kingdom of the 14th century, with its complex system of royal rule that lasted for almost 200 years, and the Wolof empire, which maintain a rigid, autocratic caste system and a military so powerful that, by the 16th century, it could assemble an army of 10,000 cavalry and more than 100,000 foot soldiers. Even more remarkable was the Songhai Empire, which by the 15th and 16th centuries became the most extensive empire in West Africa, controlling even the states that made up the once-dominant empires of Ghana and Mali. This was also the era that saw the emergence and flowering of the city-states of the Swahili coast. There were also less dramatic but equally important developments such as the expansion and consolidation of the Akan in the West African forest zone and the emergence of the Luba chiefdoms in south-central Africa. Such developments led to the emergence of significant new states after 1500.

This period is also of great interest because of the further links that were established with the world outside of Africa. It was during these years, for example, that Islam spread through much of Africa, creating a bond between the continent and realms as far away as Spain, Turkey, and Persia. It was also during this medieval period that the great trans-African trade routes developed, carrying African products to the world at large but also bringing to Africa goods from lands as far away as China.

The rise of these trade routes also caused the growth of the fabled cities of Gao, Timbuktu, and Kano, which contributed to the mystique that came to surround much of Africa. North-south trade and Indian Ocean trade brought gold, and ivory and other trade goods from Africa to markets along the Mediterranean Sea and across vast oceans.

While iron, salt, copper, and other, more prosaic items were the major trade goods within the continent prior to the end of the 15th century, the major item sought from outside the continent was gold. Gold from the West African interior was the foundation of the trans-Saharan trade routes, and gold from the region of today's Zimbabwe helped fuel Indian Ocean trade. Ultimately, the presence of gold in Africa was a magnet that drew European explorers and merchants to the continent, an event that would change Africa forever. The 14th century pilgrimage to Mecca by Mali's Mansa Musa I attracted the attention of people throughout the whole world. It has been estimated that Mansa Musa assembled between 24,000 and 30,000 pounds of gold dust for his hajj, during which he dispersed so much gold that he almost ruined the gold market in Cairo. Tales about the wealth of Mansa Musa I circulated around Europe for more than a century before Prince Henry the Navigator of Portugal commissioned explorers to find a route to West Africa's coast. The quest for African gold clearly was one of the primary motives behind this Portuguese exploration. The sheer volume of the gold acquired in this effort is staggering, with estimates running to as much as one hundred and 43 tons between the years 1472 and 1696—and that is for Portugal alone!

Gold, of course, was not the only magnet that drew Europeans to Africa. Another one—and the one that scarred the continent, its people, and his history more than any other—was the traffic in human beings. The domestic slave trade in Africa was almost totally overshadowed by the gold trade during the middle period. And while a thorough discussion of slavery in Africa during the middle period is not feasible in this introduc-

tion, a few words are necessary to clear up some misconceptions. The vastness of Africa and the diversity of its peoples make it impossible to list all the various forms of bondage and servitude that existed. However, scholars of African culture have isolated a few universal factors, most of which differed significantly from the brutal form of slavery practiced in the Americas from the 16th to the 19th centuries.

In Africa, slaves traditionally were not chattel, or property, and they enjoyed certain rights. (Among the most important of these rights was the right not to be separated from their families.) In general, slaves had been captured in war, convicted of a serious crime, or had been found guilty of defying or violating traditional mores such as disrespecting the ancestors. As Basil Davidson, the eminent scholar of African history, has noted, the bondage that was traditionally found in African societies involved a kind of enforced service, often by men captured in war or even by certain lawbreakers—something far different from the "plantation slavery" that was put into practice in the Americas. There even were individuals held in a kind of debt bondage, bound for a specified period of time in order to settle an outstanding debt of some kind. As a result, as Suzanne Miers and Igor Kopytoff have found, in many African societies, the distinction between enslaved and free individuals was so fluid that, in some cases, people considered to be "slaves" owned slaves themselves, while some individuals considered to be "free" were able to be bought or sold.

Unfortunately, European observers—and even scholars—often did not see or even ignored these complex levels of social stratification. As a result, they lumped all traditional African forms of bondage under the convenient term "slavery," a misstatement as severe as a commentator on European medieval or Renaissance history overlooking Europe's complex social strata of serfs, peons, vassals, helots, and villeins and simply calling all of these individuals "slaves." Also ignored (or at least not widely acknowledged) is the fact that, because slavery was, in various forms, practiced throughout the world during this period, there actually was a slave trade bringing European and Asian slaves into both North and West Africa at this time.

While the topic of slavery is crucial to this era—and is virtually inexhaustible—it is not the focus of this volume. Instead, we have tried to present the full scope of African history and culture during this period. And it is our hope that in doing so we can help readers understand and appreciate the grandeur of the continent, its people, and its history.

TIME LINE (400–1513)

400–1400	Ga-Dangme people inhabit south-eastern area of present-day Ghana
	Hutu begin to migrate into area occupied by the Twa, around Lake Kivu
450	Jenne-Jeno becomes a major settlement
c. 500	Taghaza, in central Sahara, becomes major point on gold and salt trade routes
500	Byzantine emperor Justinian takes control of northern Africa
500–1000	Bantu speakers displace indigenous Twa people in Rwanda. Migrations of Bantu-speaking peoples continues through much of central Africa
541	Christian era begins in Nubia
c. 600	Aksumites relocate to Amhara and Shoa, in present-day northern Ethiopia
	Takedda, in present-day Mali, becomes the major trading center in western Sudan
622	The prophet Muhammad flees from Mecca to Medina; the Hejira (Hijra) marks the start of the Muslim calendar
c. 650	Muslim Arabs invade northern Africa

c. 700	Soninke people found al-Ghaba, the twin city to Kumbi
c. 700	After much resistance, the Berber people of North Africa begin to accept Islam
	Kaniaga flourishes in the area of present-day Mali
c. 800	City of Zeila serves as a trading nexus between Aksum and Arabia
	Songhai people found the city of Gao
	Beja people begin to take control of Eritrea from Aksumites
c. 800–c. 1846	Sefuwa dynasty rules in Kanem and, later, Kanem-Bornu
850	Bornu is founded in the area of present-day Nigeria
	Ile-Ife is established in the south-western region of modern-day Nigeria
900–1100	Audaghost flourishes as the terminus of trans-Saharan trade route
900–1240	Ghana Empire flourishes
900–1300	City of Sijilmasa flourishes as a trading center in Morocco
c. 900–c. 1700	Tekrur kingdom flourishes in western Africa

915	The Indian Ocean city of Sofala, the oldest port in southern Africa, is founded
c. 916–1270	Zagwe dynasty rules in Ethiopia
950	Karanga people establish their kingdom in eastern Zimbabwe
969	Fatimids take power in Egypt
	Cairo is founded
970	Mosque of al-Azhar is built in Cairo
c. 1000	Akan peoples migrate toward the Guinea coast.
	Bagauda founds the Hausa state of Kano.
	Legendary founding of Old Oyo by Prince Oranmiyan
	Four trans-Saharan trade routes carry goods across Africa
	Kangaba established in western Sudan; it becomes the foundation of the Mali Empire
1000–1200	Hausa states are established.
	Mombasa founded by Arab merchants
	Mining of salt begins at Idjil in modern-day Mauritania.
c. 1050	Barmandana brings Islam to Mali
	Sanhaja Berbers found the Almoravid empire; by 1150 it controls the Maghrib and Muslim Spain
c. 1063	Tunka Manin rules in the Ghana Empire
c. 1075	Mapungubwe is founded in southern Africa
c. 1085–1097	Mai Umme converts Kanem-Bornu to Islam

c. 1100	Tuaregs found a seasonal camp at Timbuktu
c. 1100	Bamako, in Mali, becomes an important center of Islamic learning
	The city-state of Kilwa is founded along the Indian Ocean
1100–1200	Golden age of Gedi, a trading city in present-day Kenya, begins
c. 1119–1159	Zagwe emperor Lalibela oversees construction of rock churches in al-Roha (Adefa)
c. 1133	Tuaregs under Chief Akil rule Timbuktu
1147	The Berber Almohad empire, inspired by Ibn Tumart and led by al-Mumin, supplants the Almoravid Empire in the Maghrib and Spain
c. 1150–1270	Jenne is founded near Jenne-Jeno
	Kilwa becomes a major trading port on the East African coast
	Sumanguru establishes the Kaniaga kingdom
1200–1500	Tutsi people migrate, possibly from the upper Nile Valley, into Hutu lands in present-day Burundi and Rwanda
c. 1221–1259	Dibbalemi rules as *mai*, or king, of Kanem-Bornu in West Africa
1230	Sundiata comes to power in Mali
c. 1235–1250	Sundiata conquers Ghana Empire and founds Mali Empire
1235–1400	Mandinka empire of Mali flourishes
c. 1250	Great Zimbabwe is established in southern Africa; the Hill Complex and the Great Enclosure are built
1250–1800	Gabu kingdom flourishes in West Africa

1270	Yekuno Amlak overthrows the Zagwe dynasty in Ethiopia
1270–1700	Solomonic dynasty rules Ethiopia
1275–1400	Sabbatarians are in conflict with the state in Ethiopia
1285–1300	Mansa Sakura restores lost glory to Mali
c. 1300	Husuni Kubwa Palace is built in present-day Tanzania; it is the largest building in sub-Saharan Africa at the time
	Tanga is established by Persian merchants as a trading port linking the interior of East Africa with lands as far away as China
	Wolof people migrate into the area of present-day Senegal and Gambia and establish the Wolof Empire
	Timbuktu in Mali flourishes as a center of the trans-Saharan gold and salt trade and as a Muslim center of learning
1307–1337	Mansa Musa I reigns in Mali
	Kongo kingdom is formed
1314–1344	Emperor Amda Siyon expands Christian Ethiopia
1324	Emperor Mansa Musa I of Mali begins his hajj to Mecca
1341–1360	Mansa Sulayman rules during height of Mali Empire's political and economic power
1349–1385	Sarki Yaji becomes the first Muslim Hausa king
c. 1350–1400	Chwezi dynasty rules Kitara Complex in East Africa
	Buganda founded; it eventually becomes the most powerful kingdom in East Africa

c. 1400	Kanem-Bornu enters a period of decline
c. 1400	Akan begin to develop organized states along the Guinea coast
	Bonny becomes an important Atlantic coast trading center
c. 1400–1590	Songhai Empire flourishes in present-day eastern Mali and western Niger
	Jenne-Jeno is no longer a functioning city
	The mines at Taghaza in the Sahara near Morocco become the main source of salt in West Africa
1404, 1433	Chinese admiral Cheng-Ho voyages to Africa
1434	The first Portuguese explorers sail past Cape Bojador in West Africa and began to exploit the region, especially for African captives
1441	Portuguese begin to enslave black Africans
1443–1468	Tuaregs regain control of Timbuktu.
1448	Portuguese build the Arguin trading fort off the West African coast
1448–1450	Bornu becomes a major gold-producing state
c. 1450–1470	Mwene Mutapa state founded in southern Africa
1450–1600	Lunda kingdom established in Central Africa
1465	Sarki Muhammad Rumfa makes Islam the official religion of Kano
1468	Sunni Ali captures Timbuktu for the Songhai Empire
c. 1475–1490	Sunni Ali expands the Sonhghai Empire

1473–1480	Ewuare the Great rules in the kingdom of Benin
c. 1480	Portugese explorers land on the coast of the Kongo kingdom
c. 1490	The Changamire empire, later the most powerful Central African kingdom until its fall c. 1830, is established
	Ouagadougou becomes the capital of the Mossi states
	Nzinga Mbemba, ruler of the Kongo kingdom, converts to Christianity and takes the name of Afonso I
1497–1498	Vasco da Gama of Portugal sails around the Cape of Good Hope, at the southern tip of Africa, on his way to India

1500	Queen Eleni dominates Ethiopian political and religious affairs
	Luo-speaking Bito clan founds Bunyoro-Kitara kingdom in East Africa
1502	Vasco da Gama establishes Portuguese presence in Mozambique and Sofala
c. 1505	Portugese take over Kilwa, the preeminent East African trading city for more than 300 years
1513	Askia Muhammad Touré of Songhai captures all the Hausa States except Kano. Songhai Empire reaches its fullest territorial extent

A

Aba A branch of the IBIBIO people and the city in present-day NIGERIA named after them. The Ibibio are the ninth-largest ethnic minority in Nigeria, and the members of the Aba branch share similar customs with the IGBO, one of Nigeria's ethnic majorities. The Aba are an agrarian people, but they are also known for their mastery of woodcarving. Their villages are organized around paternal lineages and individual spirits. Councils, made up of the heads of each household, dominate village life.

The city of Aba is located on the Aba River and was once a market town for the IGBO people. Excavations have suggested that the Igbo had settled in the area as early as the ninth century and remained active traders until the arrival of European explorers toward the end of the 15th century.

Abba Libanos One of 11 monolithic churches built in the 13th century at the city of al-Roha (later called LALIBELA) in the highlands of northern ETHIOPIA. The churches are clustered into two groups and are connected by elaborate underground tunnels and mazes. Along with Amanu'el (House of Emmanuel), Marqorewos (House of Mercurios), and GABREL-RUFA'EL (House of Gabriel), Abba Libanos is encircled by a 36-foot (11-m) trench and is partially detached from the volcanic tuff that surrounds it. Its four walls are freestanding and its roof is connected to a rock cliff.

King LALIBELA (c. 1119–1159) of the ZAGWE DYNASTY, for whom the city of al-Roha was renamed, is credited with commissioning these churches, which remain an archaeological wonder to this day. Tradition claims that it took Lalibela 24 years to build the 11 churches, although most archaeologists agree that, on the basis of the immensity of the buildings and the meticulous nature of the workmanship, it had to have taken much longer.

According to legend, Maskal Kabra, Lalibela's queen, built the church as a monument to Lalibela, following his death. The legend states that she, with the help of angels, completed the church in only one night.

Abd Alla ibn Yasin (Abdallah ibn Yasin) (d. c. 1059) *Founder of Almoravid reform movement of Islam*

Abd Alla ibn Yasin, a Muslim scholar from the SANHAJA BERBERS of MOROCCO, was sent by a religious leader to bring ISLAM to the BERBERS of northern Africa. There he met resistance to his insistence on the strict observance of Islamic law, and around 1042 Yasin waged an unsuccessful attack on the Berbers. By about 1050, Abd Alla ibn Yasin retreated to a *ribat,* or "fortified place of seclusion," that lay to the south. Followers who learned of the *ribat* and followed him to it came to be known as *al-murabitin,* meaning "the people of the fortress," or more commonly, ALMORAVIDS. Gaining strength as time passed, the Almoravids invaded Morocco around 1056.

Considered extreme by the Juddala Berbers, Abd Alla ibn Yasin later united these and other groups under Islam by declaring a JIHAD, or holy war, against both the non-Muslim SONINKE of the GHANA EMPIRE and a group of Berber Muslims whom the Almoravids considered to be heretics. By the time he died, Abd Alla ibn Yasin had laid the groundwork for the Almoravid empire that eventually unified the MAGHRIB area under Islamic Berber rule.

Abd al-Mumin (Abd al-Mu'min Ibn 'Ali) (c. 1094–1163) *Berber caliph and warrior as well as one of the great Almohad leaders of North Africa*

In 1117 the young Abd al-Mumin heard the founder of the ALMOHAD movement, MUHAMMAD IBN TUMART (1080–1130), preach at Mellala. In keeping with Almohad doctrine, Tumart urged his followers to adhere to strict Islamic law and to profess their allegiance to the doctrine of the oneness of Allah. Al-Mumin was so taken with the Almohad faith that he joined Tumart on his journey to MARRAKECH. Al-Mumin continued to follow Tumart when, sometime later, Tumart declared himself the MAHDI (the divinely guided one) and asserted his opposition to the ALMORAVIDS. So loyal a follower was al-Mumin that he became Tumart's second in command after the death of Al-Bashir, Tumart's designated successor. Upon Tumart's death in 1130, al-Mumin became the Almohad leader and assumed the title of *caliph.*

As the new Mahdi, al-Mumin gathered an army and attacked the Almoravids and the Christian knights who served them. Al-Mumin's forces gradually extended the areas under Almohad control, winning a major victory, in 1145, near TLEMCEN, a town on the eastern edge of the Moroccan kingdom.

By 1147 al-Mumin had conquered Marrakech and killed the Almoravid citizens. Rather than abandon the city, which had become a symbol of Almoravid power and theology, al-Mumin destroyed its palaces and mosques so that he could transform the city into the capital and center of his new Berber empire.

For the next few years, al-Mumin continued conquests across North Africa, capturing the city of Constantine and its surrounding areas in 1151. Seven years later, al-Mumin conquered TUNISIA and Tripolitania. This made him one of the most powerful rulers in North Africa and brought Berber power in the Muslim world to its peak.

Al-Mumin restructured the governments of his conquests, replacing the traditional Berber clan system with a *makhzan* (central administration) modeled after similar Muslim governments in al-ANDALUS (southern Spain). To supplement government revenue, al-Mumin established a land registry. Until his death in 1163, al-Mumin used this income to rebuild mosques in his newly conquered cities. Abd al-Mumin was succeeded by his son, ABU YAQUB YUSUF.

Abdullahi Burja (r. 1438–1452) *Ruler of the Hausa kingdom of Kano*

Abdullahi Burja ruled the Muslim kingdom of KANO, in what is now NIGERIA, and was known for establishing trade relations with BORNU, a KANURI kingdom south and west of Lake Chad. Kano had become a tributary state of Bornu during the reign of Abdullahi Burja's predecessor, Sarki DAUDA (1421–1438).

See also: HAUSA STATES (Vols. II, III); KANEM-BORNU (Vols. II, III, IV).

Abu al-Hasan Ali (Ali al-Hasan)   (1297–1351) *Sultan of Morocco*

Abu al-Hasan Ali became king of MOROCCO after the death of this father, Abu Said. As king, he led armies into battle in al-ANDALUS (present-day southern Spain) and ALGERIA, winning important victories at Algeciras and Gibraltar, in 1333, and at TLEMCEN, in 1337. Ultimately, however, he was forced to retreat from al-Andalus, at which time he turned his attention to TUNISIA, where he extended his control by marrying the daughter of an important Tunisian ruler, ABU BAKR (r. 1274–1285). Abu al-Hasan managed to take more lands in Tunisia, including the city of TUNIS in 1347. But he soon suffered a major defeat at Kairouan at the hands of Tunisian forces. After this, Abu al-Hasan returned to Algeria, trying to maintain his rule. In 1351, however, he was forced to abdicate the throne in favor of his son, Abu Inan, and died soon thereafter.

Abu Bakr   (r. 1274–1285) *Grandson of Sundiata and ruler of the Mali Empire*

The great ruler of the MALI EMPIRE, SUNDIATA (r. c. 1235–1255) was succeeded by his son, Mansa Uli, who died in 1270. A dynastic struggle ensued, with the primary candidates for the throne being Sundiata's sons Mansas WATI and KARIFA, and his grandson, Abu Bakr. Eventually, both Wali and Karifa came to the throne, but neither proved to be either an effective or a long-term ruler. Ultimately, Abu Bakr assumed power, ruling until the throne was seized by SAKURA (r. c. 1285–1300). One of Sundiata's generals, Sakura went on to restore the empire to its former strength and prosperity.

Abu Salih (I) (eighth century) *Turkish-born governor of Egypt*

Appointed governor of EGYPT during the Abbasid period of Muslim rulers (c. 750–945), Abu Salih reported back to the caliphate in Baghdad. While the Abbassid caliphs turned their attention to the east and incorporated many non-Arab elements into the Islamic empire, Abu Salih and other Abbassid governors of Egypt set about emphasizing both law and order and

commercial and intellectual progress. Individual freedoms were restricted by new laws dictating ways of living, behaving, and dressing. (Doors were left open, for example, since people caught stealing were summarily executed.) At the same time, the Egyptian rulers of the Abbassid period, like those elsewhere, encouraged the study of MEDICINE, mathematics, and astronomy. Eventually, however, the introduction of non-Arab and even non-Muslim elements into the empire's armies led to a general weakening of the authority of the caliphate. In Egypt, this led to the rise of the MAMLUKS, who eventually seized power.

Abu Salih (II) (Abu el Marakim) (13th century)
Armenian author and historian

Although he was not a firsthand witness to the events he recorded, Abu Salih used existing documents to compile one of the few comprehensive texts of early North Africa history. His writings on Nubia, ETHIOPIA, and the ZAGWE DYNASTY provided the foundation for much of our present-day understanding of these regions.

Abu Yaqub Yusuf (Yusuf I) (r. 1163–1184) *Berber caliph of the Almohad dynasty and son of Almohad founder Abd al-Mumin*

In 1147 the ALMOHADS, who held a belief in the unity of God, succeeded the ALMORAVID dynasty, which controlled most of the MAGHRIB (northwestern Africa) and al-ANDALUS (southern Spain). Yusuf was appointed governor of al-Andalus in 1156 and succeeded his father, ABD AL-MUMIN (c. 1094–1163) as the Almohad caliph in 1163. By 1172 he had crushed the few Almoravid strongholds in al-Andalus that had managed to survive al-Mumin's reign. The Almohad conquest of the rest of Muslim Spain soon followed.

Intellectual activities thrived under Yusuf's leadership, and he supported the study of ART and SCIENCE. The renowned Muslim philosopher Ibn Tufail (d. 1185) introduced Yusuf to his student Averroës (Ibn Rushd) (1126–1198). So impressed was Yusuf with Averroës, that he elected him chief judge and physician. With Yusuf's help Averroës completed his celebrated commentaries on Aristotle (384–322 BCE).

Despite Yusuf's military achievements, he often had to deal with the opposition of MASMUDA chiefs, who resented the fact that al-Mumin had selected his son instead of their choice, Abu Hafs Umar (d. c. 1175), to be the next caliph. Yusuf's son, Abu Yusuf YAQUB AL-MANSUR (c. 1160–1199) led the caliphate upon his father's death in 1184.

Accra West African coastal city located on the Gulf of Guinea. As early as the 13th century, GA-DANGME people settled in the region after traveling down the VOLTA RIVER. Sitting on a high plateau rising approximately 40 feet (12 m) above sea level, Accra became a major settlement during the 15th century. In the 1480s, Portuguese merchants arrived in the area and began trading with its Ga-Dangme inhabitants. Accra has since become the largest city and capital of the present-day country of GHANA.

See also: ACCRA (Vols. III, IV, V); PORTUGAL AND AFRICA (Vol. III).

Acholi (Shuli, Gang, Acoli) People of UGANDA and the region named after them; the Acholi also occupied parts of the modern-day Republic of the SUDAN. Located on a plateau, Acholi comprises nearly 11,000 square miles (28,490 sq km) of lightly wooded grasslands. The numerous rivers that divide the grasslands provide essential water in an otherwise dry climate. The Acholi peoples speak a language from the Nilo-Saharan family.

Information about the Acholi people prior to the 17th century is sparse. Their ancestors may have arrived as early as the 11th century, when the area's historically wet climate became dry enough to support AGRICULTURE. Riverbanks were natural settlement sites because they offered fish, rich farmland, a variety of native trees, and protection from invaders. The early Acholi may have faced devastating periods of famine because of the inconsistent rainfall in the area. Their region receives most of its rain from April to October, followed by a harsh dry season.

The ancestors of the modern Acholi were a mix of central Sudanic, eastern Nilotic, and western Nilotic LUO peoples. Each group retained its own language and established separate communities throughout the Acholi region. Evidence of early farming throughout eastern and central Sudan indicates that the central Sudanic speakers, some of the earliest of eastern farmers, probably settled in Acholi around the second or first century BCE. Eastern Nilotic speakers migrated to Acholi between 1000 and 1600, pushing the central Sudanic people further west. A limited number of Luo-speaking people probably arrived in Acholi in the early 15th century, settling on the outskirts of the region. These three groups of people settled into small communities throughout Acholi. While these peoples were politically and geographically independent of one another, the communities shared many economic and social practices. Collectively they became known as

the Acholi. Early Acholi settlers were farmers, growing millet, sesame, sorghum, bulrush millet, and vegetables.

The crops cultivated by the early Acholi, particularly eleusine millet (used for FOOD and for making beer), are still staples for the many Acholi who live in the region today.

The Acholi relied on two types of IRON hoes to work the land—a straight stake and an angled stick. The central Sudanic speakers, who were known as early ironworkers, probably introduced iron tools to the region. Without these implements farming the savanna would have been nearly impossible for the early Acholi. Cultivation required intensive LABOR, and Acholi men did most of the farming in small groups that worked large plots of land. The men would also do the fishing and hunting, relying on local wild game. Women gathered firewood, picked wild fruits and vegetables, prepared food, made beer, and cared for the children.

Early Acholi villages were small, lineage-based communities dominated by the senior paternal male. However, marriages were always conducted outside the lineage. Dowries given to the bride's family reinforced the paternal structure of the village. Evidence suggests that the Acholi had no formal political structure until the 17th century, when chiefdoms were introduced.

Adal Eastern lowlands of ETHIOPIA bordered by Shoa, ZEILA, the Awash Basin, and Ifat, on the Harer Plateau. Recognized as an important trade center, the region was originally populated by agriculturists and nomadic cattle herders. Later, during the second millennium, it grew into a defined state inhabited by Muslim traders who controlled the trade routes leading from the port of Zeila to Ethiopia's central regions. By the early 14th century it had become an independent kingdom led by members of the Walashma dynasty who had rebelled against the leaders of HARER.

Ethiopian rulers had never been able to resurrect the level of trade experienced during the rule of AKSUM. It appears, however, that resumption of trade was a critical task for successive generations of Solomonic rulers aligned with the Ethiopian Orthodox Church. Their lack of success has been attributed to their decision to exercise indirect con-

trol rather than permanent occupation of rebellious Muslim-held territories. Therefore, the Walashma, the founding members of an Islamic dynasty created in the 12th to 13th centuries, continued to grow, moving from DAMOT to Shoa, then to Ifat, and ultimately to Adal. This resulted in a succession of raids, and border skirmishes that lasted from the 14th to 16th centuries.

By the 15th century Adal leadership had won many religious converts, which led to the establishment of a standing army made up of both SOMALI soldiers and AFAR cavalrymen. Under the leadership of Ahmad GRAÑ (c. 1506–1543), whose militant strategies were sanctioned by his belief in ISLAM, these troops engaged in battles with the forces of the Christian Ethiopian Empire. These conflicts lasted until 1445, when the Muslim army was routed by Ethiopia's noted emperor and military leader ZARA YAKOB (r. 1434–1468). Despite Zara Yakob's pursuing Adal forces as far as the Awash River, Adal continued to cause problems for Ethiopia for several more decades. During the reign of the Baeda Maryam (r. 1468–1478), for example, two of that Ethiopian leader's trusted generals were reportedly killed in Adal when they attempted to discourage a planned attack against Christian regions.

The matter was left unresolved by Maryam's death, and rulers of Adal attempted to create a new capital city near Dakar in the Ethiopian Lowlands. An ill-advised raid by Ethiopian emperor Eskender (r. 1478–1494), the son and royal heir of Baeda Maryam, led to the destruction of this capital city in 1478. A counter raid led by Sultan Shams al-Din ibn Muhammad (r. 1472–1487) immediately followed, resulting in the death or imprisonment of most of Eskender's army. Chronicles written about the young emperor's miraculous escape credited holy intervention and led to his building a church known as Debra Meshwa'e to commemorate the sacrifice of his men.

Adefa See LALIBELA, TOWN OF.

Aden, Gulf of Body of water located between the Arabian coast and the Horn of Africa. The coastal region of the Gulf of Aden is known to be one of the earliest areas of Arab settlement in northeastern Africa. Even though the coastal peoples continued to follow their traditional religions into the 10th century, ISLAM probably was established in the gulf region as early as the eighth century. Little is known about the African peoples who migrated to the coast of the Gulf of Aden before Arab settlement oc-

curred, but it is thought that they spoke various dialects of the Eastern Cushitic languages. They may have been ancestors of the SOMALI peoples.

The most important port city on the Gulf of Aden was ZEILA (modern Saylac), located in the far northwestern area of present-day SOMALIA. By the ninth century Zeila had become an important Arab community for trade between ETHIOPIA and Arabia. CARAVAN ROUTES linked Zeila with the Ethiopian kingdoms of the region, including Shoa and Amhara. Traders exchanged IVORY, hides, incense, and captives from Ethiopia and its trading partners in the interior for metal products and CLOTH AND TEXTILES from the Arabian Peninsula.

See also: AMHARA (Vols. I, III, IV); ARAB COASTAL TRADE (Vols. I, II); RED SEA TRADE (Vol. II).

Adulis (modern Zula)

Important port city of the kingdom of AKSUM. The Aksumite kingdom reached the height of its influence from the fourth to the sixth centuries, but Adulis remained an important trade center well into the eighth century. Strategically located in the northeastern region of the Ethiopian Highlands, Adulis became the center of a network of trade routes emerging from the interior regions of the continent.

The fertile land in Adulis and the surrounding Aksumite kingdom was well suited for an agrarian ECONOMY. Its location, agricultural success, and diverse population that included Semitic immigrants from southern Arabia enabled the kingdom to grow rapidly after it was founded in the first century CE. A complex social system soon emerged that centered on a monarchy supported by three classes of citizens: the elite, the middle class, and the peasant class.

As a result of the thriving commercial activity in trading centers like Adulis, Aksum became the first African kingdom to mint coins of GOLD, silver, and COPPER.

Adulis's trade contacts extended from Rome to southern Arabia, and into SOMALI territory, Meroë, and India. IVORY, gold, emeralds, hippopotamus teeth, rhinoceros horn, animal hides, tortoiseshell, obsidian, and live animals were the chief exports. Imported goods consisted of metal, glass, and ceramic wares, cloth, wine, sugar cane, vegetable oils, and spices. The trade in human captives also played a significant part in Adulis's prosperity, with captives arriving from the Nile Valley, Mediterranean countries, the Horn of Africa, and the East African coast. Put up for sale in a carefully supervised market, the captives were shipped across the Red Sea to the Arabian Peninsula. Late in the sixth century the military activities of Sassinian Persians disrupted Adulis's RED SEA TRADE, leading to a decline of Aksumite influence and, therefore, Adulis's trading influence.

See also: ARAB COASTAL TRADE (Vols. I, II); ERITREA (Vol. II).

Afar (Denkel, Danakil, Adalis)

Ethnic group primarily inhabiting the arid coast and hinterland of the eastern Danakil province in ETHIOPIA, as well as most of ERITREA; also the language these people speak. The Afar have been described as sedentary pastoralists, and their history dates back to the prehistoric era. Their early settlements were established in close proximity to the region's limited sources of water. Over time, as their numbers increased from small, segmented groups to chiefdoms, diminishing water supplies led the Afar to repeatedly clash with neighboring SOMALI clans.

For much of the history of Ethiopia, the Afar remained beyond the sphere of Christian culture and influence. This was due to the independence they attained as suppliers of rock salt shaped into bars. Known as *amoles,* these rock salt bars were so valuable a commodity that they were often used as currency and in exchange for GOLD. Another important factor in the Afar's independence was their geographical distance from Ethiopia's seat of government.

The Afar eventually became embroiled in Christian-Muslim conflicts during the 14th century. At that time large segments of the population were organized under the central rule of Islamic sultans based in ADAL. Some Afar men, however, became a crucial part of the cavalry recruited by the Christian Ethiopian emperor AMDA SIYON (r. 1314–1344). In 1329 a Muslim-led combined army of Afar and Somali troops launched three successive assaults on Amda Siyon's forces, all of which failed. The Afar-Somali troops subsequently retreated to their region, where they were pursued and eventually conquered by Amda Siyon and his army.

See also: AFAR (Vols. I, III); SALT TRADE (Vol. II).

Agaw (Agau, Agew)

An early Cushitic-speaking people who lived in parts of present-day ETHIOPIA and ERITREA. As the original inhabitants of the region, the Agaw are considered the ancestors of modern Ethiopians, along with the Amhara and Tigray. Their language, also called Agaw, contributed to the development of the AMHARIC language. Historically the Agaw were a distinct group of people living in the Amhara, Gojjam, and Shoa regions. After centuries of intermarrying with local people, the true Agaw largely disappeared (although a small group

still lives in Ethiopia today). Groups that trace their heritage to the Agaw people include the Aweya, Kemant, Kayla, Quarra, Kamta, Kharmir, and Bogos.

Historically the Agaw were small-scale agriculturalists who had little political influence over ancient Ethiopia until the early 12th century. Previously, the ancient Ethiopian kingdom of AKSUM had dominated RED SEA TRADE, but by the early ninth century the Aksumites, pressured by BEJA conquests from the north, were forced to migrate south into Agaw territory. These Orthodox Christians subdued the Agaw people, established military settlements, and implemented a feudal social order.

The Agaw were slow to integrate with the Aksumites, rebelling against Aksum during the 10th and 11th centuries. Aksum eventually quelled the Agaw insurgence, but its monarchy emerged from the conflict weakened. The waning of Aksumite power and the integration of the Agaw into the greater Ethiopian state continued. Between the 11th and 12th centuries the Agaw gained control of the Ethiopian royal line. Around 1137 Agaw monarchs known as the ZAGWE DYNASTY established a new Ethiopian capital at al-Roha (or Adefa), later known as the town of LALIBELA.

With a decline in Red Sea trade, Ethiopia became isolated from coastal ARABS as well as from inland trading groups. Ties with Egyptians, to the north, also were mostly severed. The Agaw did maintain ties with the Egyptian Church, though. Following the death of LALIBELA (r. c. 1119–1159), considered the greatest of the Agaw rulers, the Zagwe dynasty faced a period of gradual decline. Lalibela's nephew, Na'akuto Le'ab (r. c. 1159–1207), had to abdicate the throne when Lalibela's descendant, YITBAREK (r. c. 1207–1247), defeated him. This shift in power weakened the Zagwe dynasty, as did regional opposition from Tigray, Amhara, and Shoa; opposition within the Christian church caused further turmoil. In 1270 the Agaw were overthrown by YEKUNO AMLAK (r. c. 1270–1285), a claimant to the SOLOMONIC DYNASTY of Ethiopian rulers.

According to one legend, Yekuno Amlak murdered Yitbarek in a church in which Yitbarek sought refuge. Yekuno Amlak then proclaimed himself the emperor of Ethiopia, and, as a descendant of Solomon, the restorer of the "rightful" Solomonic rule. The Solomonic dynasty maintained the throne from 1270 until the country became a republic in 1974.

Agbor IGBO settlement located in southeastern NIGERIA. Little is known about the history of Agbor, although it is thought that its earliest inhabitants may have come from EDO territory to the west and settled in the region between 4,000 and 5,000 years ago. By the end of the 13th century Agbor was a collection of about 20 clans that were led by a chief and subsisted mostly through AGRICULTURE. By the beginning of the 16th century Agbor was part of a complex, MARKETPLACE economy that traded handicrafts, cloth, and beads with other Igbo villages.

Age of Discovery Period during which European nations launched expeditions in search of riches and territories beyond their immediate boundaries in continental Europe. During the 15th and 16th centuries, many European nations, beginning with Portugal, took part in these voyages, some of which were aimed at securing trade routes to the riches of either the Far East or Africa and some of which sought to explore the newly found lands of the Americas.

The initial phases of the Age of Discovery were fueled by the lucrative trade, in spices and other goods, that had developed between Europe and the Far East during the Renaissance. For many years this trade was dominated by such powerful, seagoing Italian city-states as Venice and Genoa. By the early years of the 15th century, however, other nations, most notably Portugal, began to look for ways to share in the riches offered by this trade. Also providing motivation to the Portuguese was their military victory at Ceuta, in MOROCCO, which by 1414 had made Portugal's leaders aware of the profits to be made in African trade. As a result the Portuguese, under the leadership of Prince HENRY THE NAVIGATOR (1394–1460), initiated a number of important voyages that greatly extended European knowledge of the world at large.

Early Portuguese Voyages of Discovery

1433 Gil Eannes sails around Cape Bojador, the "point of no return" for many early sailors.

1435 Gil Eannes finds evidence of human habitation in an area located 50 leagues (150 miles/241 km) south of Cape Bojador.

1436 Portuguese reach Río de Oro.

1441 Portuguese reach Cape Blanco, bringing two indigenous Africans back to Europe.

1445 Dinis Dias sails around Cape Verde.

(Cape of Good Hope)
(1488)

These Portuguese explorations began as relatively short voyages that grew in size and scope until they ultimately disproved most of the misconceptions Europeans had about everything from the distance to the Far East to the supposedly boiling temperature of the sea to the south. By 1418 the Portuguese had established forts, in-cluding the well-known Elmina, along the African coast, and by the 1440s they had initiated what became the trade in African captives.

These voyages continued after the death of Prince Henry and culminated in 1484 with the expedition of Bartolomeu Dias (d. c. 1500) expedition around the CAPE

OF GOOD HOPE and the successful round-trip journey of Vasco da GAMA (c. 1460–1524) to Calcutta, India. These 15th century voyages set the stage for the more extensive Portuguese explorations and settlements that followed in the next century.

For many years, European sailors were faced with a major obstacle to any long-range journeys. Their ships, which were equipped with square sails, performed well in fair weather. They sailed poorly, however, in bad weather and northward winds—precisely the kind of weather they would encounter when traveling back to Europe from a long voyage to the Far East.

The Portuguese eventually solved the problem with a new type of ship, called the caravel, created especially for these long-distance voyages. Small in size and light in weight, the caravel was fast. It also had three masts, each carrying a triangular, or lateen, sail. These sails, although not as effective in fair weather, were ideal for the winds and conditions that prevailed on the voyages home to Europe. So, by sacrificing some speed on the outbound journey, the caravels made it possible for Portuguese sailors to return home safely.

Although Spanish leaders were committed to their efforts to drive the last remnants of Moorish power from their country, they too saw the value in seeking direct trade routes to the East. Unable to afford the more extensive explorations of the Portuguese, however, in 1492, Spain ultimately dispatched Christopher Columbus in quest of a shorter, western route to the Far East. Columbus did not find that route, but he did open the way to the Americas. With Columbus's voyages Spain joined in the hunt for new routes and new lands to exploit, and by the early 16th century the English, French, and Dutch followed suit.

agriculture Farming was the primary economic activity of most African peoples during the sixth through 15th centuries. Crops were principally grown for FOOD, and they were primarily the crops that had developed in Africa, such as sorghum, millet, cowpeas, teff, *enset,*

rice, and yams. In North Africa, on the other hand, farmers grew crops that included wheat, barley, and olives, all of which originated outside the continent but that had all become well established long before the fifth century. These crops remain widely cultivated today. In addition Africans grew crops such as COTTON and flax, which were cultivated for their fibers for use in the production of CLOTH AND TEXTILES. Raising livestock also was an important part of agriculture. DOMESTICATED ANIMALS included cattle, sheep, goats, camels, and fowl, again depending on the region of the continent. Agricultural patterns varied. Some people engaged almost exclusively in growing crops, and some were strictly herders. Other engaged in both growing crops and raising livestock.

The BANANA, an important new crop to Africa that originated in Southeast Asia, made its appearance on the continent during the second half of the first millennium and quickly spread across the tropical regions. In some areas it even replaced yams as the staple food, while in other areas it enabled farming to become established for the first time. Another important development was the further spread of agriculture in sub-equatorial Africa in connection with the BANTU EXPANSION. To a considerable extent this was a filling-in process and an expansion of nodules of agriculture that had been established by the fifth century. Overall, the history of agriculture in the 1000 years from the sixth through 15th centuries was largely one of already-established agricultural patterns and practices.

Aïr Massif Mountain range located in present-day NIGER, long associated with the Tuareg ethnic group. With its tallest peak reaching 6,628 feet (2,020 m), the mountains of the Aïr Massif rise up in central Niger and stretch northwest toward present-day ALGERIA.

The French word *massif* translates as "massive" or "solid."

The mountains, oases, valleys (known as *koris*), and surrounding areas that make up the Aïr Massif region have been inhabited mostly by the pastoral Tuareg peoples from about the 14th century onwards. With their original kingdom of TAKEDDA located to the west of Aïr, the TUAREGS dominated the region by controlling the local TRANS-SAHARAN TRADE ROUTES and COPPER MINES. The

copper trade was an especially lucrative business during this time, as copper was a common medium of exchange used throughout western Africa.

During the 15th century the Tuaregs conquered the trading city of Agades, located on the southern end of the Aïr Massif, and made the city the seat of their new kingdom. From Agades the Tuaregs held sway over CARAVAN ROUTES, along which commodities such as salt and GOLD were traded.

In 1496 the SONGHAI leader Askia MUHAMMAD TOURÉ (r. 1493–1528) displaced Tuaregs living around a large Aïr oasis and established a Songhai settlement. Even though the Songhai Empire later conquered regions around the Aïr Massif, including the city of Agades, Tuaregs continued to lay claim to the mountainous region and still remain in the area to the present day.

See also: AGADES (Vol. III); AÏR MASSIF (Vol. III).

Aja (Adja) Subgroup of the EWE group that established several powerful kingdoms, including DAHOMEY. Known for their expert ironwork, the Aja also engaged extensively in trade with the HAUSA STATES and the SONGHAI of the Niger River valley.

See also: AJA (Vol. III).

Akan People, region, and language of West Africa. The Akan speak numerous Akan languages, all of which belong to the Niger-Congo language family. The early Akan were agriculturalists. They lived in villages dominated by matrilineal clans headed by a senior male. The members of each clan traced their lineage to a common female ancestor. The head of each clan was responsible for maintaining peace in his clan and for connecting the earthly realm to the spiritual world. The early ancestors of the Akan migrated to the Guinea Coast over a period of several hundred years, beginning about the 11th century.

> Oral tradition says that the progenitors of the Akan were called the Nta (or Ntafo). These ancestors probably came from the north, but the various subgroups of the Akan do not agree on the exact location. Some groups, like the Akan residents of the present-day city of Hani, have origin myths that say that their descendants fell from heaven or emerged from a crack in the earth near Asantemansano.

Why the Akan came to the Guinea Coast is largely unknown. Most groups believe that they were forced to leave their homeland after an invasion, possibly by FU-LANI pastoralists. Others speculate that the Akan may have originally lived on the outskirts of the GHANA EMPIRE but left in the 11th century, when ISLAM spread through the region. A refusal to accept the new religion would have reduced the social position of the Akan in the region.

The majority of the early Akan peoples probably migrated in three phases. The first wave consisted of the Guan, followed by ancestors of the FANTE, and then by Twi-speaking people. The early Akan states founded by these peoples were established by the end of the 15th century. Akan traders established routes between neighboring villages and eventually formed a conglomerate of powerful states. Their kings pushed the Akan to the forefront of the GOLD trade. Indeed, when Europeans landed on the Guinea coast in the 15th century, the Akan were already established as successful traders.

Traditional Akan religion was centered on the worship of one god, Onyame, who created the earth and heavens, but each lineage also recognized lesser gods and ancestral spirits.

Akil, Chief (r. 1433–1468) *Tuareg ruler of Timbuktu*

The TUAREGS, descendants of the BERBERS, lived in the region between the trading city of WALATA and the Niger Bend, in the western SUDAN. They founded TIMBUKTU as a seasonal camp in the early 12th century.

> According to tradition, Timbuktu was named after an old woman who looked after the camp while the Tuaregs were traveling in the Sahara. Her name was Tomboutou, Timbuktu, or Buctoo, meaning "mother with a large navel."

During the 14th century, Timbuktu fell under the control of the MALI EMPIRE, and it soon became an important nexus for the trans-Saharan GOLD and SALT TRADES. As part of the Mali Empire, it also became an important center for Muslim learning and culture. In 1433, however, the city was recaptured by the Tuaregs under Chief Akil. Although Akil ruled Timbuktu from the desert, rather than from within the city itself, his conquest cost the Mali Empire control over important

TRANS-SAHARAN TRADE ROUTES and helped contribute to the empire's eventual decline.

According to tradition, toward the end of the 15th century, Muslims of Timbuktu asked their SONGHAI neighbors for assistance in overthrowing Akil. With the assistance of Timbuktu's Muslims, the Songhai army, led by Sunni ALI (r. c. 1464–1492) conquered the city without a struggle, taking control of it in 1468. To the dismay of Timbuktu's residents, however, Sunni Ali proved to be an even more ruthless and oppressive ruler than Chief Akil, and one they were unable to so easily overthrow.

akofena A short sword used by AKAN people during ritual and political ceremonies. The Akan began to develop organized states along the GUINEA coast as early as 1400, and the *akofena* became the symbol associated with state authority.

The *akofena* was used in the oath-taking ceremonies of Akan kings and their subjects as well as on diplomatic missions. The purpose of the mission was designated by a symbol emblazoned on the knife's sheath. The *akofena* appears often as a symbol in Akan culture. Represented by a pair of crossed swords, it signifies state authority and the legitimacy of a ruler.

Aksum Kingdom and capital city in ancient ETHIOPIA that dominated RED SEA TRADE from the third to seventh centuries. The Aksumite kingdom reached the height of its power in the middle of the fourth century, under King Ezana (r. c. 320–350 CE). Ezana is remembered as the first Aksumite king to be converted to CHRISTIANITY. He later declared Christianity the official RELIGION of Aksum, in part to solidify relations with Constantine, the Christian emperor of Rome, who controlled trade throughout the Hellenic Empire. Several centuries after Ezana, Aksum aligned itself with the Egyptian Christian Church, but this alliance did not spare the kingdom from a decline in power that began when the Roman Empire began to crumble in the fifth century.

In the seventh century Muslim conquests of EGYPT and North Africa cut off Aksum from its trading partners. When the important trade center of ADULIS fell, the Aksumites were forced to abandon their trading lifestyle. Pressured by BEJA attacks from the north, they migrated south and settled in the Amhara and Shoa regions. There they met resistance from the AGAW, Cushitic-speaking people present in Africa from ancient times. The Aksumites gradually lost their power, and the Agaw became the new rulers of Ethiopia, probably as early as the 10th century, initiating the ZAGWE DYNASTY.

Akure Major YORUBA city in what is now NIGERIA. Although several versions exist, the most common account of Akure's early history traces its origins to ILE-IFE, a city probably founded during the 11th century (although perhaps as early as the ninth century). According to traditional sources the first Ife king, Asodeboyede, was given the title of *ajapada*, and it was under Asodeboyede's descendants that Akure was established. During a journey to the kingdom of BENIN, the seventh *ajapada,* Owa Atakunmasa, stopped in Akure and fathered a child. This boy, Ogunja, became the first ruler of Akure. Upon taking the throne, Ogunja was renamed Deji, which became the honorary title taken by all subsequent Akure kings.

Akure soon developed into the primary center for Benin trade. IRON casting, particularly of weaponry and tools, was an important aspect of Akure life. An annual festival in honor of Ogun, the iron god, is still held in the city today. Aside from trade, AGRICULTURE was an important means of subsistence for the people, and products included yams, cassava, corn, bananas, palm oil, okra, and pumpkins.

Akyem AKAN people who are concentrated along the Guinea Coast, particularly in present-day GHANA and TOGO. The Akyem speak Twi, a language of the Niger-Congo family. The Abuakwa, Bosume, and Kotoku peoples are all members of the Akyem group. With their Akan relatives, the Akyem migrated to their present location beginning in the 11th century. By the 15th century they had established several cohesive, powerful states that thrived on AGRICULTURE and trade.

> **Akyem elders were elected to village councils and served as custodians of the sacred lineage stools. These stools were an important part of Akyem society, representing a symbolic link between the human and spiritual realms.**

Akyem social order was established by hierarchical clans that were organized into compact villages ruled by a chief. The importance of clan ties was underscored by the traditional religious beliefs of the Akyem, which centered on ancestor worship.

alafin Traditional YORUBA title of the ruler of the OYO KINGDOM. According to Yoruba mythology, the first *alafin*

was Oranmiyan, who supposedly was the grandson of Oyo's founder, ODUDUWA. Traditionally, the *alafin* was selected with the assistance of *obas* (chiefs) and the OYO *MESI*, or ruling council.

The *alafin*'s power, though great, was not absolute, and he could be deposed by the people. The exact mechanism for this is unclear, with some traditions stating that an *alafin* was informed of his fate by the delivery of an empty calabash or parrot's eggs, and others claiming that the prime minister, or *basorum*, of the Oyo *mesi* informed the deposed *alafin* with the words, "The gods reject you, the people reject you, the earth rejects you." At this point, the rejected leader was obliged to commit suicide.

The mechanism for succession to the throne is equally unclear. According to some traditions, when an *alafin* died, his eldest son, known as the *aremo*, was obliged to commit suicide. The Oyo *mesi* then chose a new *alafin* from a group of royal candidates. Other traditions assert that it was a member of the Oyo mesi, not the king's son, who committed suicide as a way to encourage the Oyo mesi to hesitate before making a decision.

Algeria Country in North Africa about 919,600 square miles (2,381,800 sq km) in size, bordering the MEDITER-RANEAN SEA to the north, the present-day countries of NIGER and the Republic of MALI to the south, MAURITANIA and WESTERN SAHARA to the west, TUNISIA and LIBYA to the east, and MOROCCO to the northwest. Over the course of its long and storied history, Algeria has fallen under the rule of various peoples, from the Phoenicians to the Romans to the ARABS.

From around the first century BCE to the fifth century CE, Algeria was controlled by the Roman Empire. With the decline of Rome, though, Algeria fell into the hands of the Vandals, a Germanic people. They, in turn, were overthrown in the sixth century by the Byzantine emperor Justinian (r. 527–565), who sought to restore the Roman Empire to its past glory. Justinian's dreams of a restored and revitalized Roman Empire, however, foundered not long after the establishment of ISLAM, as Muslim ARABS conquered Algeria in the seventh century. The Arabs had a profound influence on Algeria and its native BERBERS, many of whom married Arabs. Many Berbers also adopted Islam as their RELIGION and ARABIC as their language.

Some Berbers, like Queen DAHIA AL-KAHINA (d. c. 705), a high priestess of the Jawara Berber confederation, tried to resist the Arab invasion. But such efforts proved largely unsuccessful, and Algeria soon became an Arab-ruled province of the UMAYYAD caliphate. By the eighth century the Berbers of North Africa had formed Islamic governments in a number of kingdoms. These included both the Rustamids, who flourished at Tahert in central Algeria in the eighth and ninth centuries, and the FA-TIMIDS, who rose to power during the early 10th century in northeastern Algeria.

Between the 11th and the 13th centuries the AL-MORAVIDS and the ALMOHADS came to power. These Berber dynasties, which were centered around Morocco, controlled most of northwestern Africa, and their dominion spread across the Strait of Gibraltar to al-ANDALUS (Muslim Spain).

The Almohad capital of TLEMCEN became the religious and academic center of the dynasty, while the Algerian seaports of Annaba and Algiers conducted trade with European cities. The main Algerian exports at this time included fine leather, fabrics, and the famous Barbary horses.

Ali, Sunni (Sunni Ali Ber, Ali the Great, Sonni Ali, Sunni Ali Kolon) (r. c. 1464–1492) *Ruler who built the kingdom of Gao into the powerful Songhai Empire during the second half of the 15th century*

Sunni Ali's place in life began as a matter of chance. Two of the wives of his father, Za Yasiboi, gave birth on the same night. As was custom, the infants were not bathed until the light of the next day. Sunni Ali was the first infant to be washed, thereby gaining the rights of the eldest child. At some point in his youth he was taken to the MALI EMPIRE, apparently as a hostage. In 1464 he returned to the SONGHAI Empire as its ruler, initiating a period of great expansion for the kingdom.

A member of the Muslim Sunni ruling dynasty of the kingdom of GAO, in the western SUDAN, Sunni Ali was a good administrator. Backed by a strong CAVALRY and an organized fleet of ships to take control of the Niger River, he began to expand his native kingdom, filling the power vacuum left by the declining Mali empire.

According to the *Ta'rikh al-Sudan,* an Arab chronicle of the history of Sudan, Ali once demanded 30 virgin concubines from the port city of Kabara to be brought to him. The women were making the journey on foot, and, because they stopped to rest, Sunni Ali ordered that they all be executed.

A great conqueror with a brilliant military mind, Sunni Ali also was a ruthless despot. His reign was marked by a series of military campaigns as he expanded the Songhai Empire and united the western Sudan. In the meantime he also fended off incursions by the neighboring TUAREGS and Mossi and FULANI peoples. He repulsed

the Mossi in large part because of his strategic cavalry maneuvers. The Fulani DENDI region also fell to him.

In 1468 people of the prosperous Sudanese trading center of TIMBUKTU asked for Sunni Ali's help in overthrowing the oppressive Tuareg Chief AKIL. Ali took advantage of the opportunity to add Timbuktu to his growing empire. The city's residents found out too late that Ali's rule would prove to be even more oppressive than Akil's. In the process of liberating the city, Sunni Ali displayed a tyrannical nature, killing many of the Muslim residents who failed to fully support his efforts against the Tuaregs.

In 1473 Sunni Ali took the important merchant city of JENNE, located at the junction of the Bani and Niger rivers, after a protracted battle that, according to Arab histories of the region, lasted more than seven years. Sunni Ali continued to expand and strengthen his empire, failing only in his attempts to subjugate the Mossi people to the south of Gao. In 1492 Sunni Ali died, apparently by drowning, under uncertain circumstances. At the time of his death the Songhai Empire was the largest in West Africa.

The Muslim scholars and historians of the Sudan never forgave Sunni Ali for the devastation he wrought on Timbuktu or his treatment of the city's Muslim clergy. As a result many of the surviving accounts of Sunni Ali cast him as an unjust and capricious despot, and an impious and unworthy Muslim. In contrast, the Songhai viewed him as a nearly mythical warrior-king. They praised him for being both an inspiring leader on the battlefield and a strong political administrator.

Sunni Ali's importance in history was minimized by the scholars and historians of the time. One of the reasons may have been that the Muslim scholars probably did not look favorably upon a king who, although he professed to follow the ways of ISLAM, still clung to some traditional African ways, even incorporating elements of traditional Songhai RELIGION with Muslim rituals.

See also: KINGDOMS AND EMPIRES (Vols. II, IV); KINGDOMS AND EMPIRES OF THE WEST AFRICAN SAVANNA (Vol. II).

Allada (Alladah, Arda, Ardah) Kingdom in present-day Republic of BENIN. Prior to being incorporated into the kingdom of DAHOMEY in the 18th century, Allada was ruled by the Agassuvi ("children of the Agassu") ethnic group. They probably migrated from present-day TOGO to the Allada region in the 15th century.

Oral tradition traces Allada's origin to the kingdom of Tado. Supposedly, the founder of the universe divided Tado into separate kingdoms, giving one to each of two brothers. The first brother established the kingdom of Ife, the home of the YORUBA people, while the other founded Tado. According to legend, the King of Tado had several daughters, one of whom was seduced by a wild panther and had an exceptionally strong son. His children tried to take control of the Tado throne but failed, so they migrated eastward and established Allada.

Allada became an important center for European traders, especially the Portuguese.

See also: ALLADA (Vol. III).

Almohads Muslim Berber dynasty that controlled North Africa and al-ANDALUS (Spain) during the 12th and 13th centuries. The Almohad dynasty began as a movement of religious and social reform led by MUHAMMAD IBN TUMART (c. 1080–1130). Under the leadership of Tumart's successor, ABD AL-MUMIN (c. 1094–1163), the Almohads dismantled the preceding ALMORAVID dynasty. Tumart's followers were known as Almohads (*al-muwahhidun*), meaning "unitarians," or "those who believe in the unity of God."

Tumart was a member of the MASMUDA, a Berber confederation of the Atlas Mountain region, in southern MOROCCO. After studying Islamic thought, Muhammad ibn Tumart came to the conclusion that the reigning Almoravid dynasty had strayed too far from traditional Islamic law. When he failed to win support in the important city of MARRAKECH, he returned to the Atlas Mountains in 1120 and began to gain a following among ARABS and Berbers. He proclaimed himself the MAHDI ("the one who is divinely guided") and created an advisory council made up of his 10 oldest followers. Later, ibn Tumart formed an assembly of 50 leaders from various North African groups. In 1125, under his leadership, the Almohads began to attack the Almoravids in such major Moroccan cities as Marrakech and Sus.

After Muhammad ibn Tumart's death in 1130, his successor, Abd al-Mumin, named himself caliph of the Almohads. Tumart had appointed many of his relatives to powerful positions and established the Almohad dynasty as a traditional monarchy. By 1147 Abd al-Mumin had successfully defeated the Almoravids, capturing most of the MAGHRIB, including Marrakech, the future Almohad capital. By the end of al-Mumin's reign, the Almohads had gained control of the entire Maghrib in

addition to conquering much of al-ANDALUS (Muslim Spain and parts of Portugal).

Following al-Mumin's death in 1163, his son ABU YAQUB YUSUF (r. 1163–1184) and grandson, Abu Yusuf YAQUB AL-MANSUR (r. 1184–1199), controlled the Almohad dynasty during the height of its power. Under al-Mansur, the Almohads captured Seville and the rest of Muslim Spain. Then, during Yaqub's reign, the Almohads fought off Christian crusaders in Spain and put down rebellions in their eastern Arab provinces. In contradiction of the puritanical Tumart, Yaqub built a number of richly ornamented monuments. Eventually the Almohads put aside Tumart's teachings altogether.

By the early 13th century the strain of fighting both Christian crusaders abroad and Arab rebels at home proved too much for the Almohads. In 1212 the united forces of the Spanish kings of Castile, Aragón, and Navarre defeated the Almohad army in the Battle of Las Navas de Tolosa. By 1232 the Almohads had lost control of Spain. Another group of Berbers, the MARINIDS, succeeded the Almohads in North Africa. The Marinids took the last Almohad stronghold, Marrakech, about 1271.

Further reading: Michael Brett and Elizabeth Fentress, *The Berbers* (Malden, Mass.: Blackwell Publishing, 1997); Julia Clancy-Smith, ed., *North Africa, Islam, and the Mediterranean World: From the Almoravids to the Algerian War* (Portland, Ore.: Frank Class, 2001).

Almoravids Muslim Berber dynasty that ruled MOROCCO and al-ANDALUS (Muslim Spain) in the 11th and 12th centuries; the term *Almoravid* is Spanish for the ARABIC *al-murabitun,* meaning "monks" or "the people of the fortress."

The Almoravid movement developed early in the 11th century among the SANHAJA BERBERS of the WESTERN SAHARA, a confederation of the Lamtuna, Djodala, and Messufa peoples. The Lamtuna made up the ruling class within the clan and held all important administrative and military positions. During the 11th century, Sanhajan control over TRANS-SAHARAN TRADE ROUTES was threatened from the south by the GHANA EMPIRE and from the north by the infiltration of Zanatah BERBERS into southern MOROCCO. About 1048 Yahya ibn Ibrahim al Jaddali, a leader of the Lamtuna people, returned from his HAJJ. Accompanying him back from this pilgrimage to the holy city of MECCA was a Moroccan scholar, ABD ALLAH IBN YASIN (d. c. 1059), who, he hoped, would institute religious reforms that would increase the unity and power of the Sanhaja people.

At first ibn Yasin focused on increasing the level of Islamic knowledge and practice among his followers. By

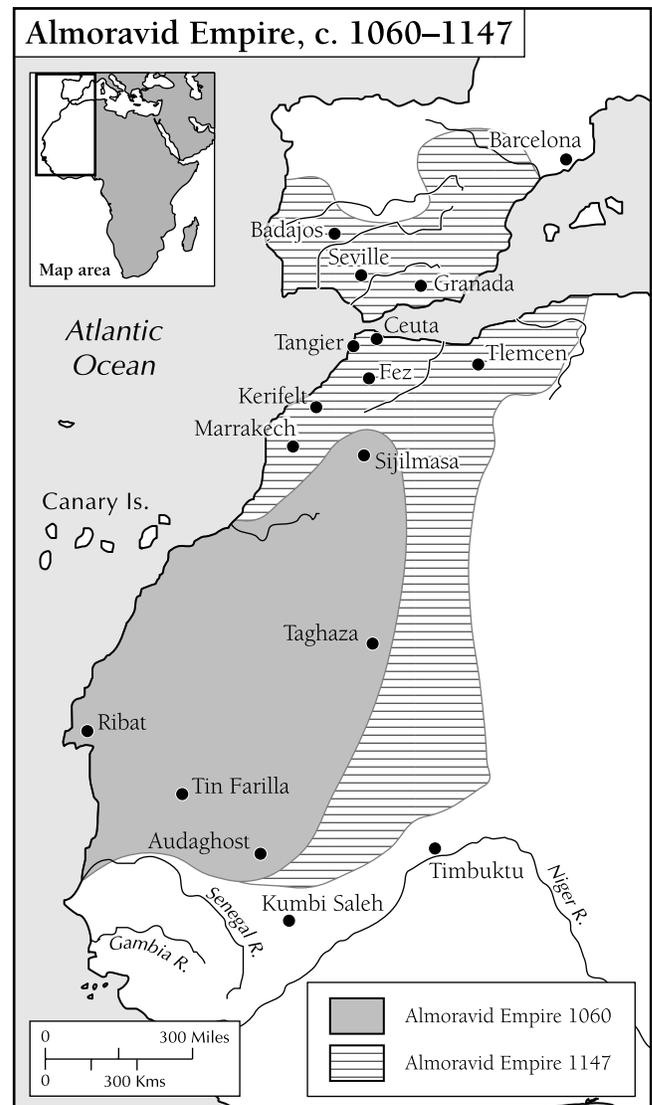
Almoravid Empire 1060
Almoravid Empire 1147


1054, however, the focus of the Almoravid movement shifted from religious reform to military conquest. After consolidating their control over SIJILMASA, in 1056, the Almoravids invaded Morocco. In 1059 ibn Yasin was killed during an attack on the Barghawata confederation on the Moroccan coast. Abu Bakr ibn Umar (d. c. 1087) became the new leader of the Almoravids. Military expansion continued, with Abu-Bakr and his forces pushing into the interior and those of Abu-Bakr's cousin, YUSUF IBN TASHBIN (d. c. 1106) moving north through Morocco and Spain.

Soon the Spanish Muslims appealed to the Almoravids for help in fighting off military advances by Christian forces. The efforts of the Almoravids were successful, and the Almoravids became masters of the whole of Muslim Spain up to the Ebro River. They also conquered Morocco and the MAGHRIB as far east as Algiers. They had religious influence over their territories and controlled

the region's lucrative GOLD trade. The capital of their expanded empire was MARRAKECH.

Although it was not an entirely peaceful time, North Africa thrived both economically and culturally during the Almoravid period, which lasted until 1147. The Lamtuna ruled forcefully, and as the empire grew, so did abuses of power, and many Berber groups resented the often oppressive dynasty. One of these, the Zenata Berbers of North Africa, unified and, calling themselves the ALMOHADS, declared a JIHAD against the Almoravids. In 1147 the Almohads took Marrakech, bringing an end to the Almoravid Empire, and by 1172 they controlled all of Muslim Spain.

Alur Nilotic-speaking people related to the LUO. The Alur primarily inhabited parts of present-day UGANDA and Democratic Republic of the CONGO. Historians suggest that the Alur originally inhabited what is now the Republic of the SUDAN. Probably during the late 14th century, they migrated south, supplanting the rulers of the CHWEZI DYNASTY, who ruled over the KITARA COMPLEX of kingdoms and smaller chiefdoms. The Alur considered each individual household to be a self-sustaining economic unit. Although they were agriculturalists, the Alur relied more on raising cattle, bananas, and root crops than on seed AGRICULTURE.

Alwa (Alwah) Southernmost of the three kingdoms of Christian NUBIA, with its central area in the old heartland of Meroë, south of the sixth cataract on the Nile River. Its capital was Soba, which is near the modern city of Khartoum. Alwa came under the influence of CHRISTIAN-ITY when the Byzantine missionary Longinus baptized its king in 580 CE. Alwa continued as a strong state until the 16th century. Soba was also a bishopric, with six individual bishops having been identified by name. As late as the 10th century an Arab writer described Soba as a city with fine houses and buildings, including churches. The bishop reported to the patriarch of Alexandria. Alwa was a diverse city despite its Christian majority, and a number of Muslims lived in a separate quarter of the town. Alwa survived as a Christian island for centuries. Eventually, however, repeated Arab attacks weakened it until it collapsed. By 1523 a Jewish traveler described Soba as a city largely in ruins with its people living in huts.

Amda Siyon (Amda Tsyon) (r. 1314–1344) *Christian emperor of Ethiopia*

Emperor Amda Siyon was a celebrated Christian ruler whose reign in ETHIOPIA resulted in the expansion of the kingdom into the southern highlands and former AGAW strongholds near Lake Tana. He was also noted for using military force to subdue a number of rebellions that took place in the Muslim states of ADAL, Ifat, and Dawaro during the 14th century. These rebellions stemmed from Amda Siyon's demands for tribute from those Muslim states, in return for which he offered them a degree of autonomy.

Amda Siyon's policy toward these Muslim states often had disastrous results, however. One example involved an alliance that developed between Sultan Ad-Din II (fl. c. 1328) of Ifat and a government official named Haydara, who had been appointed by Amda Siyon and stationed in Dawaro during the latter part of the 14th century. The two plotted to topple Amda Siyon, going so far as to murder the emperor's servants and seize the expensive goods they were carrying. In retaliation, Amda Siyon torched Dawaro, killing the men and taking women and children as prisoners.

See also: SOLOMONIC DYNASTY (Vol. II).

Amharic Afro-Asiatic language of the Southern Semitic branch. Amharic is distantly related to the Cushitic languages and is the national language of ETHIOPIA. The predecessor to Amharic was GE'EZ, the original language of the Ethiopian Christian Church. Early Amharic, known as Agaw, emerged around the ninth century as the language of the AGAW people. Both the Agaw and their language combined Semitic and Kushite ancestral roots. Songs and poems, the first written records of the Amharic language, did not surface until the 14th century.

See also: AMHARIC (Vol. I); KUSH (Vol. I).

al-Andalus (bilad al-Andalus) Region of the Iberian Peninsula also known as Muslim Spain. Although the origin of the word *Andalus* is unknown, the name first appeared around 716. In the early eighth century Spain was a Visigoth kingdom, having been unified during the late sixth century when the Visigoths took control of the native Ibero-Celtic and invading Germanic peoples. This Visigoth kingdom was torn apart by constant feuds between the NOBLES and serfs and was ripe for conquest when Musa ibn Nusayr (c. 640–715), an Arab leader who had just captured parts of northern Africa, sent an army to invade the coastal kingdom. Beginning in 711 Musa was able to take most of the peninsula, securing Arab access to Spain. Within a few years he crossed the Pyrenees and also captured Avignon, Arles, Lyons, and Narbonne (areas in present-day France).

The eighth-century boundaries of al-Andalus ran all the way to Galicia in the northwestern part of the peninsula. Within the Arab army, made up of both ARABS and their African Berber allies, tensions began to arise. As more non-Arab BERBERS migrated to al-Andalus, the Arab position weakened. Internal conflict among rival Arab clans exacerbated the problem. Nonetheless, the Arabs managed to convert many of the native Andalusians to ISLAM, although the Arabs considered these new converts (*muwalladun*) inferior in social rank.

For 30 years the Arabs controlled al-Andalus under the authority of 30 short-lived emirs. In 755 the Umayyads, under the leadership of Abd al-Rahman ibn Muawiya (known as "The Immigrant"), overthrew the Arabs and established the UMAYYAD dynasty at Córdoba. The Umayyads would rule for the next 300 years. The only great leaders during this period were the founder of the dynasty, Abd al-Rahman (r. c. 756–788), Abd al Rahman III (r. c. 961–978), and al-Mansur (d. c. 1002). Arab, Berber, and peasant rebellions plagued the remainder of Umayyad rule. At the same time, the Christians (Mozarabs) who inhabited al-Andalus and neighboring areas offered minimal resistance to Umayyad rule.

In the 10th century the Umayyads had to confront the FATIMIDS, religious reformers who were advancing along the coast of MOROCCO. Despite internal conflict, the Berbers and Christians rallied to keep the radical reformers out of their country.

In 1031 the Umayyad reign ended with the death of Hisham III. Ruling regents divided al-Andalus into numerous city-states that remained intact for 60 years, albeit in a condition of constant disarray. By 1085 the Spanish king, Alfonso VI (1040–1109), had taken advantage of al-Andalus's weakened political position and began to reconquer parts of the country. At the same time, the ALMORAVIDS penetrated the area and recruited Berbers to join their cause. Under the leadership of YUSUF IBN TASHBIN (r. c. 1061–1106) they defeated King Alfonso, but the remaining Andalusians were slow to accept their new leaders. Ultimately, after 10 years of battle, the Almoravids conquered Muslim Spain.

Fifty years later the ALMOHADS, another Muslim group, conquered al-Andalus. The Almohads controlled al-Andalus until 1212, when the army of Pope Innocent III defeated them at the Battle of Las Navas de Tolosa. By end of the 13th century Muslim Spain was confined to the southern kingdom of Granada, and the powerful Christian kingdoms of Aragón and Castile forced the Islamic inhabitants of al-Andalus to convert or be persecuted.

Angola   Southwestern African country some 476,200 square miles (1,233,358 sq km) in size that is bordered on the west by the Atlantic Ocean, to the north and east by the Democratic Republic of the CONGO, to the south by NAMIBIA, and to the southeast by ZAMBIA.

Archaeological discoveries in the Angolan region have been limited, but evidence suggests that people may have inhabited the area since the Late Stone Age (40,000 to 3200 BCE). Between 1000 BCE and 500 CE, Bantu-speaking peoples moved into the region. Historically the Bantu were fishermen and farmers, using IRON tools to clear forests and plant their traditional crops of yams and cocoyams. Limited livestock herding and POTTERY manufacturing soon spread throughout the region.

The inhabitants of Angola were isolated from the rest of world until the 15th century. The MBUNDU played a central role in the commercial development of the Angola region, building the kingdom of Angola on the southern edge of the KONGO KINGDOM. Prior to the 15th century the Mbundu were salt traders, but during the late 15th century they developed extensive commercial ties with the Portuguese, who had landed on the Angolan coast. Partly due to their early contact with the Portuguese, Angola became an important trading center in the 16th century.

Arab coastal trade   Trade between Arabs and coastal Africa, especially along the Red Sea coast, can be traced back to the first century bce. At first extensive, Arab coastal trade declined from the third to seventh centuries with the fall of Rome, warfare in ETHIOPIA, and internal conflict among African groups.

In the seventh century, Arab trade along coastal Africa increased dramatically with the rise of ISLAM. The decline of AKSUM as a trading center provided an open market for the renewed flood of Arab immigrants who settled in Ethiopia under the direction of the Muslim prophet Muhammad (570–632). He encouraged his followers to migrate to Ethiopia to avoid discrimination in MECCA. Many settled along the coastal regions and revived RED SEA TRADE and INDIAN OCEAN TRADE. Between 639 and 705, Muslim Arabs captured EGYPT, LIBYA, TUNISIA, and much of the African coastline along the MEDITERRANEAN SEA. During this period of increasing Arab dominance, trade between eastern Africa, Arabia, and the Persian Gulf increased. Some of the Arabs settled among the Swahili population of coastal trading towns and ZANZIBAR island. In this way, the SWAHILI COAST became an important center for Middle Eastern trade.

By the 11th century Islam had spread inland across the Sahara along the trade routes, which increasingly involved Arab as well as Berber merchants. These caravan routes transported GOLD, salt, honey, CLOTH AND TEXTILES, BEADS AND JEWELRY, and other goods from the African interior to the Arab-dominated coastal ports. Along the way, Islam spread to the HAUSA STATES, KANEM-BORNU, and

This illustration from a 13th-century manuscript owned by the sultan of Oman shows the kind of dhow, or ship, that Arab coastal traders used to sail up and down the Indian Ocean coast of Africa. © Arne Hodalic/Corbis

Arabic Semitic language spoken in much of North Africa and the Middle East. As the sacred language of ISLAM, it is a major unifying characteristic of the Arab people. Semitic languages have existed for thousands of years, but the widespread use of Arabic did not occur until the seventh century with the rise of Islam.

As the holy language of all Muslims, Arabic is spoken extensively in Islam-dominated regions like North Africa and the Middle East. According to Islamic doctrine, the QURAN was revealed to the prophet Muhammad (560–632) in Arabic. Prior to the Quran, Arabic had not yet developed into a standardized written form. Those who spoke the Semitic precursor to the Arabic language had not established a universal language, so several varieties of early Arabic developed simultaneously. As the Arabian empire expanded, the need to standardize the Arabic language became imperative, and, after the Arab conquest of North Africa in the seventh and eighth centuries, much of the region adopted classical Arabic as the dominant language.

During the first few centuries after the introduction of Islam, many non-Arabic languages in Muslim territories virtually disappeared. Arabic became the language of religious, political, and scholarly discourse. In EGYPT, Arabic had begun to replace the native Coptic language as early as the 10th century, and by the 14th century the only surviving Coptic speakers were limited to rural areas. As Arabic spread along the Nile from northern Egypt through the western SUDAN to present-day CHAD, four distinct Egyptian dialects emerged: Upper Egyptian, Middle Eastern, CAIRO, and Delta Arabic.

neighboring kingdoms of the interior. Over the next few hundred years, they incorporated the ARABIC language, particularly in terms of its connections with Islam, and Arab customs into their own cultures.

In the 12th century SHIRAZI ARABS, merchants from Iran, began mixing with indigenous Bantu-speaking peoples along Africa's eastern coast, thereby starting the Swahili culture. KISWAHILI, the language they spoke, incorporated many words from Arabic.

As Arab trade increased, knowledge of Africa's treasures expanded overseas, sparking interest from other countries. By the 16th century increasing competition from Portuguese traders ultimately led to the decline of Arab coastal trade in the Indian Ocean.

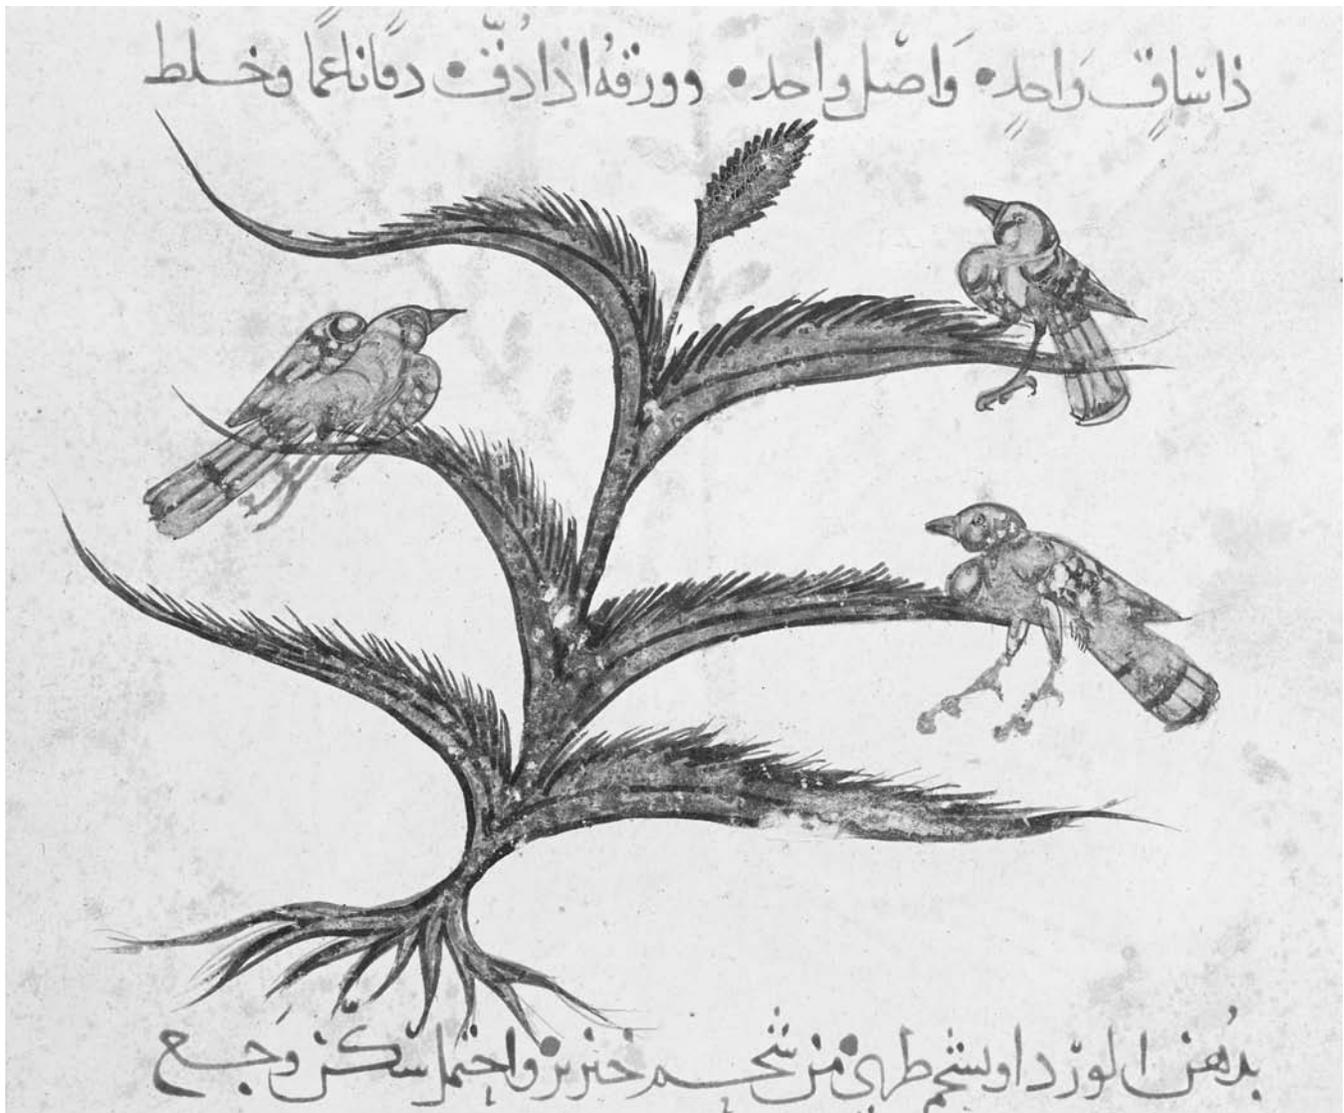
Spoken Arabic is more guttural than Western languages, with the words formed at the back of the mouth and throat. Like Hebrew, another Semitic language, Arabic is written from right to left. The basic sentence structure of Arabic presents a verb followed by its subject and object. The standard Arabic alphabet has 28 consonants and three vowels. Each consonant and vowel is written by placing dots above or below one of eight shapes that form the Arabic script. Simple nouns and verbs are typically represented by three-consonant roots attached to various vowels. The meaning of words is derived from a combination of vowels attached to any standard root. Prefixes or suffixes are attached to these basic root and vowel combinations to make more complicated nouns or verbs. Nouns and adjectives have multiple plural patterns with many irregular formations. Verbs are more standard, with simple alterations in stems used to conjugate and change their meaning.


Arabic became the language of business and religion in Africa wherever Islam gained a foothold. This illuminated manuscript, *Plant with Birds*, by Abdullah ibn al-Fadl, was created in 1222. *© Burstein Collection/Corbis*

Arabic spread through Africa along trade routes and in conjunction with the spread of Islam. In many places Arabic coexisted with local languages; in other regions languages mixed to form new dialects. For example, the KISWAHILI language, spoken by traders along Africa's east coast beginning in the 12th or 13th century, has a Bantu structure but borrows many words from Arabic.

Arabs The ancient and modern peoples who inhabit the Arabian Peninsula; the name *Arab,* in ARABIC, means "speaker of Arabic," underlining the common bond and symbol of cultural unity Arab peoples share.

Before the rise of ISLAM the early Arabs were nomadic, Semitic pastoralists who herded sheep, goats, and camels in the harsh environment of the Arabian Peninsula. Islam brought together the desert-dwelling, nomadic Bedouins with the town dwellers and farmers who lived at the oases to form a missionary force of great fervor and purpose. These oases served as centers of commerce and trade. The caravan routes that brought GOLD and spices from Arabia to northern and southern Africa became conduits for the spread of Islam. Today, the word *Arab* may name any number of people from North Africa, EGYPT, the Republic of the SUDAN, the Arabian Peninsula, Syria, and Iraq who speak a common language and often share a common RELIGION, culture, and customs. Not all Arabs are Muslims; about 5 percent

are Christian, Jewish, animist, or Druze, which is an 11th-century offshoot of Islam.

Arabs, influence of   ARABS came to the continent of Africa as early as the first century BCE. They crossed the Red Sea and established trading kingdoms along the eastern coast and Horn of Africa. These early trading kingdoms exported GOLD, IVORY, honey, and captives. In ETHIOPIA, Arab traders intermarried with the local inhabitants and a new race, the Aksumites, emerged to establish a powerful trading empire at AKSUM. Around the same time, other Arabs crossed the Red Sea at the Strait of Mandeb, where they settled farther south along the coast. The sub-Saharan coastal region was an ideal location to establish trade routes to the African interior. Despite substantial early Arab settlement along the east coast, few Arabs immigrated to the western coast, perhaps because BERBERS already dominated that region of Africa.

Like the Greeks and Romans before them, early Arab immigrants were actively involved in the slave trade. Nubian and Abyssinian captives were the most common, but various other captives were also sold abroad.

The impact of these early Arab traders on Africa was more than economic. Their native Semitic language and Sabaean RELIGION were gradually integrated into the local languages and religions. In many places they introduced basic WRITING and building techniques. Most early Arabs were nomadic pastoralists. This lifestyle, combined with a trade ECONOMY, hastened the penetration of the Arab culture to new areas of Africa.

Ties between Africa and Arabia increased in the sixth century when Aksum conquered the Christian Arab state of Yemen. By the end of the century a new wave of Arabs began to migrate to Africa at the recommendation of the prophet Muhammad (570–632). Around 615, Muhammad encouraged his followers, facing persecution in MECCA, to migrate to ETHIOPIA. Despite the domination of CHRISTIANITY in Ethiopia at this time, the Ethiopian king Ella Saham (r. c. early 600s) was receptive to the new immigrants, and the two religions were able to coexist for many centuries. For the most part the Christians remained in the central highlands, and the nomadic Muslims resided in the northern and western lowlands.

The seventh century brought a renewed influx of Muslim Arabs to Africa. They conquered EGYPT at the end of the century and incorporated high-ranking officials from the Egyptian court into their political system. Arabs entered the continent through Egypt and dispersed throughout the northern parts of Africa. By 705 they had

overtaken LIBYA, Nubia, Northwest Africa, Byzantine North Africa, TUNISIA, the Mediterranean coast from the Gulf of Sirte to the Atlantic, and parts of the interior. The renewed interest in Africa also meant an increase in the number of African captives shipped abroad. Prior to the spread of ISLAM, the Arab slave trade was small. As Muslim power grew, the need for slaves increased, both on the African continent and abroad. Slaves were used for manual LABOR, domestic work, military conquests, and as concubines.

With control of Nubia (modern-day Republic of the SUDAN), Arabs were able to penetrate the African interior for the first time. The Baqt, a treaty signed in 651, established trade relations between Arabs and Nubians and ensured peace between the Muslims and Christians in the region. ARAB COASTAL TRADE continued to flourish, and by the 13th century many nomadic Arabs had penetrated inland to the Middle Nile Valley. By the 15th century powerful Muslim kingdoms emerged in the region, including Funj, Tagali, and DARFUR. As in other regions, a diverse culture developed as Arabs and Nubians intermarried.

Like the Nubians, the North Africans largely accepted their Arab conquerors. Ironically, Arabia had enlisted thousands of Africans to conquer North Africa. The Banu Hilal and Banu Salim, two of the larger Arab groups, ruled over the native Berber people by the eighth century and established the Muslim kingdoms of Idrisis, Murabitin, and Muahadin.

In West Africa, Arab MERCHANTS, scholars, and travelers from the seventh century onward led the formation of several powerful Muslim communities. Islam was first accepted by the upper class in this area, thus facilitating the spread of the religion to the rest of the population. By the 11th century Arab traders moving along TRANS-SAHARAN TRADE ROUTES leading to the western Sudan had brought Islam to the Upper Niger, the HAUSA STATES, and KANEM-BORNU regions in the African interior. Between the 13th and 16th centuries the West African kingdoms of MALI and SONGHAI also emerged as Muslim states. Arab influence was increasingly evident in native literature and poetry. The first written forms of such languages as Hausa appeared in ARABIC script, and Islamic doctrine was integrated into traditional religious customs.

Despite this widespread integration of Islam into African culture, indigenous populations did not simply become Arab. Rather, they adopted the Arab religion and language for religious purposes and often for trade practices while retaining the core of their traditional system. In many areas Islam did not spread as quickly among people in the countryside, who held on to traditional beliefs long after town dwellers embraced Islam. The dominance of Arabs in the overseas trade markets soon sparked international interest in Africa. European traders arrived in the late 15th and early 16th centuries and took over much of the Arab territories in Africa.

archaeology Many of the most important African archaeological sites related to the medieval period are associated with the rise of powerful African states, which resulted from conquest, trade, and migration. Some of the richest archaeological deposits of the continent have been found in the YORUBA states of West Africa, where populations were densest. For example, ILE-IFE in southwest NIGERIA was one of the most formidable city-states in the region. It is thought that approximately 20 early city-states were organized and ruled by dynasties that traced their descent from Ife's founding hero, ODUDUWA.

Artifacts recovered from the Ife site suggest the extent of its role as both a governmental force and a center of industry and trade. As a center of government, for example, Ife controlled surrounding farming settlements, which provided the city with FOOD and other goods in return for governmental and military protection. Similarly, the city was an important location for the production of IRON and glass, examples of which have been found in abundance. Archaeological discoveries have also borne out traditional views that Ife was involved in the creation of brass and BRONZE, the most notable examples of which were produced at the important brass works during the 11th and 12th centuries.

Another important medieval site was Igbo Ukwu, also in present-day Nigeria. Items found there date back as far as the ninth century and have done much to add to the archaeological record. The excavation at Igbo Ukwu, which took place about 1960, was conducted at several compounds and led to the recovery of a royal burial site, the origins of which have largely remained shrouded in mystery. The individual recovered in a wood-lined chamber was seated and wearing a crown and beaded necklaces. Archaeologists have indicated that other items surrounding the figure—including a ceremonial staff—could be considered royal regalia.

Beginning in 1977 major fieldwork was carried out at the one-time trading center of JENNE, situated within the INLAND NIGER DELTA in the present-day Republic of MALI. This site has yielded innumerable artifacts—especially remnants of POTTERY and beads—and has the unusual distinction of having been built on a preexisting town, which is also known as Jenne or JENNE-JENO (Old Jenne). Although Jenne was abandoned in the 15th century, it is known to have been an important trading center at which

kola nuts and GOLD were frequently exchanged. Although work continues at the site, progress has been made difficult by annual flooding, which erodes the soil and washes away artifacts.

The recovery in Ife of *crucibles* (vessels used for melting materials at high temperatures) indicates that IRONWORKING was important to Ife even in the city's early days. Likewise, the discovery of molded glass beads, at the deepest levels of the archaeological digs as well as in burial sites, suggests the extent to which glass-making was a major activity of the city. Archaeologists have found evidence that these beads were traded both locally and in long-distance transactions.

Archaeological sites have also been explored in East Africa, where artifacts dating back to the ninth and 10th centuries confirm the rise of the city-states along the SWAHILI COAST, including the town of Manda in the Lamu Archipelago. Consisting of nearly 50 acres, Manda flourished between the ninth and 11th centuries. Its population of approximately 5,000 reportedly lived in houses made of blocks of coral solidified by lime mortar. Evidence of a surrounding wall and the recovery of glazed pottery give some indication of its wealth, derived from the INDIAN OCEAN TRADE.

One of the most prosperous of the Swahili city-states was KILWA, where archaeological excavations have unearthed evidence that COPPER coins were being minted there by the 13th century. Here, as in the Lamu archipelago, prosperity apparently was linked to merchant traders. Small CARAVANS carried trade goods—including COTTON cloth, glass beads, and luxury items—to the interior regions of East Africa. The trade caravans returned with, among other goods, gold dust and copper ingots. By the end of the 13th century Kilwa's ruling Hasan dynasty was replaced by the Mahdali dynasty, founded by al-Hasan ibn Tulut. This dynasty remained in power until the arrival of Portuguese traders late in the 15th century. Archaeologists have identified the Mahdali rulers' cliff-top residence, the HUSUNI KUBWA PALACE, that included a bathing pool, reception court, apartments, and a warehouse.

Phillipson, *African Archaeology* (2nd ed.; New York: Cambridge University Press, 1993); Thurstan Shaw [et al.], eds., *The Archaeology of Africa: Foods, Metals, and Towns* (New York: Routledge, 1993).

architecture   Precolonial Africa's traditional housing structures have been called the most complex in the world. Contributing to this complexity are the wide range of styles that were in common use and the various building materials that were employed by the hundreds of ethnic groups that populate the continent. Traditional building methods took into account a people's cultural and religious beliefs and needs. Other building styles developed as a result of migratory patterns or were influenced by interaction with other peoples through trade.

The earliest homesteads were often constructed in response to the environment. The materials used reflected harmony with nature rather than a depletion of natural resources. In CAMEROON, for example, the Mousgoum people living on the floodplains near the Shari River traditionally constructed houses with incised decoration, that resembled overturned mud pots. It is believed that this style and its design helped prevent erosion of the house. Similarly, in the grass valleys of Cameroon, the traditional homesteads of the Mileke people were made of square rooms with a peaked roof made of thatch or local grasses. Such houses were frequently built and rebuilt as needed and reflected the permanence of community among new generations.

Since the FAMILY unit was responsible for building the homestead, houses could be custom-built to place emphasis on cultural, social, and economic identity. A homestead, therefore, typically consisted of many buildings, with each building functioning as a kitchen, bedroom, storage hut, or granary. A fence or wall often surrounded the compound. Stylistically, however, homesteads varied greatly across regions, and at least 20 or more regional styles or categories have been identified. Noted differences included size and use of building materials. For example, the Nuba, who inhabit the hills of the Kordofan region of what is now the Republic of the SUDAN, once built traditional homesteads made of red clay and gravel with thatched roofs. Several buildings served as sleeping rooms, a storeroom with grinding stones, and enclosures for animals.

Similarly, the traditional cliff dwellings of the DOGON, who live in isolation on the Bandiagara Escarpment in present-day MALI, reflected their religious beliefs. Ancient and medieval Dogon villages were laid out in the form of a *nommo,* the ancestral "first humans" made by their creator god. The smithy and men's houses formed the head; the houses of clan leaders were the chest; the women's houses were its hands; its genitals were an altar and a heavy grinding bowl; and the feet were shrines to the gods. The elaborately carved doors on their buildings ritually protected community FOOD supplies and sacred objects.

Cultural identity was also important to the Batammaliba of TOGO, whose name literally means "people who are the architects." They decorated their houses with the same scarification patterns worn by Batammaliba women. The Pende people of the lower Congo River region placed carved figures called *tungunlungu,* representing the female ancestry of the clan, in front of the house of the chief, who succeeds to the throne by matrilineal descent.

Also prominent among the housing styles of Africa were circular designs, such as the ones used by the Somolo of the upper VOLTA RIVER. Their circular homesteads varied, but some were multilevel structures of mud, with a palm frond roof supported by posts. Each household had its own courtyard and a house or room for members of the extended family, as well as kitchens, storerooms, and grinding rooms. Other circular styles included the *domical,* or beehive, a cylinder-shaped house topped by a thatched cone roof, which, if wide, might be supported by surrounding poles. There were also long, gable-roofed houses with adjoining portions, which found most often in central Africa.

The rectangular building was present in Africa from an early period and often reflected the wealth or the high social status associated with urbanized areas. In the forests of GHANA and western NIGERIA various groups, including the AKAN, YORUBA, and EDO, constructed their houses as a type of rectangular compound. Houses with open doors faced a large courtyard with a number of other smaller intersecting yards to let in air and light.

A distinctive feature of these homesteads was the sunken courtyard known as an *impluvium.* This feature was also found in the excavation of ancient houses in EGYPT and Kush.

Quadrangular-style buildings made of mud housed the large extended family of the king or local chief and included rooms for wives and children and workrooms for making craft items. These buildings were surrounded by a continuous wall, important in the protection of the city. Islamic influences also accounted for the rectangular homes of 14th-century Mali. When Mansa MUSA I (r. c. 1313–1337) returned from MECCA with Abu Ishaq AL-SAHILI, a poet-architect from Grenada in al-ANDALUS (Muslim Spain), he reportedly introduced the use of sun-dried or baked mud brick. These bricks made it easier to create and maintain rectangular buildings of several stories. Other rectangular housing styles influenced by Islamic techniques included the clay box with a dome structure found throughout the SUDAN. In the 15th century, in KANO, a city in northern Nigeria, the Hausa created many high-domed structures. Built without blueprints and with simple tools, such buildings used imported timber arches to buttress the high interior ceilings. Four distinctive spires marked the exterior.

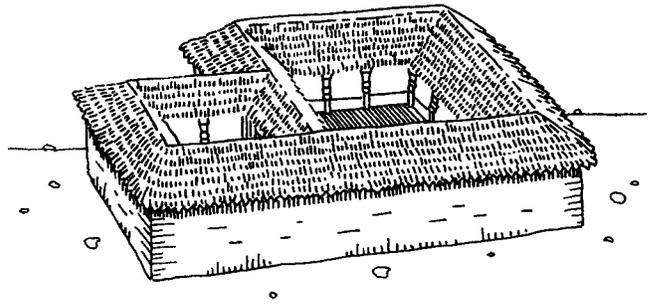
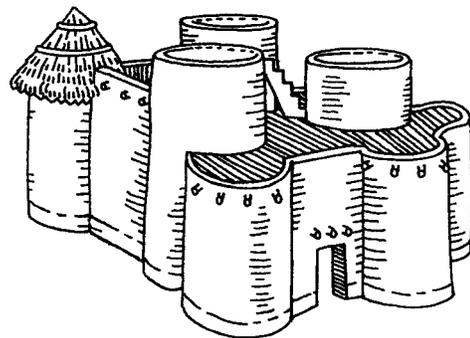
1. Nuba-style house
The Nuba of what is now the Republic of the Sudan traditionally built dwellings made of a number of buildings set in a ring pattern, with walls connecting the individual structures. The buildings provided living and storage space and sometimes pens for domesticated animals.


2. Yoruba-style house
The Yoruba people of what is now Nigeria traditionally built dwellings along one large courtyard and sometimes secondary courtyards. These courtyards let in light and helped to collect rainwater. Elaborately carved pillars served as roof posts. Rooms were used for living, storage, and cooking space.


3. Somolo-style house
The Somolo of present-day Burkina Faso traditionally built multi-story houses with mud brick walls and roofs thatched with palm leaves. These dwellings had as many as 20 rooms, including living quarters, storage rooms, kitchens, and grinding rooms.

Arguin trading fort   Fifteenth-century trading post built by the Portuguese off the Saharan west coast (present-day MAURITANIA). Portuguese traders had been active in the area as early as the 1440s, and they built the Arguin Island fort in 1448, hoping to capitalize on the West African coastal trade. The island was located in rich fishing waters that supported a large seal population. The Portuguese sent fish, sealskins, and oils back to Europe and simultaneously began to establish trade contacts with various Arab and nomadic peoples from the African continent.

Another reason for the choice of Arguin as the location for the trading fort was so that the Portuguese might intercept some of the goods carried by the GOLD caravans on their way to MOROCCO. Gold, however, was not the only reason for Arguin's prosperity. From the time they first arrived, the Portuguese raided coastal communities in order to secure African captives for the slave trade. By the end of the 15th century Arguin was a flourishing trading center at which the Portuguese exchanged cloth, luxury goods, and horses for gold and other items.

Arochukwu Oracle (Arochuku)   The authority through whom Chukwu, the supreme god of the Aro people, spoke. Well before the arrival of Europeans in the 16th century, Arochukwu was an Aro trading settlement, located about 60 miles (96.5 km) from the coast in what is now southern NIGERIA. The Arochukwu Oracle was established as the final judge in all disputes among the Aro, an IGBO subgroup. The oracle, therefore, provided the Aro with tremendous power, which they used to organize a lucrative trade network. Through their successful trading efforts, the Aro became the primary merchant class of Igboland, helping them to accrue wealth and power that continued to increase even after the arrival of Europeans. The process continued well into the 16th century.

art   During much of Africa's history, art, especially in the regions south of the Sahara, was designed to reflect all aspects of life. Many of these works were highly functional, including such items as BEADS AND JEWELRY, POTTERY, household furnishings, cups and spoons, CLOTH AND TEXTILES, and even certain types of weaponry.

Other works gained importance or value because they were created with certain methods of production or in accordance with particular religious beliefs, cultural practices, or inspirations. Products like these frequently are based upon societal myths as well as on both FAMILY and regional history. One of the best-known forms of such art is the various masks used for initiation rites and FESTIVALS, as well as for the ceremonies and activities of secret societies. Other such art forms include sculptured figures linked to ancestor veneration, ritual objects, shrines, and burial displays.

The LUBA people of the Congo traditionally made wooden memory boards, known as *lukasa,* whose shape, beadwork, and engravings were codes that expressed ancient myths, clan lineage, and medicinal formulas.

One of the most fascinating examples of this traditional art is produced by the BOBO people, in present-day BURKINA FASO, who still make traditional leaf masks based on ancestral practices and beliefs that regard leaves as a revelation of the creator god, Wuro. Similarly, KONGO groups like the Pende traditionally make small IVORY faces, which are worn as pendants and which represent venerated figures.

Archaeological excavations at Igbo Ukwu have unearthed a wealth of artwork associated with a former palace and adjoining temples. Of the nearly 800 bronze sculptures recovered at that site, many were naturalistic and stylized images of deities, ancestor figures, and totem animals. Others involved forms, symbols, and styles linked to the rituals of reigning kings and their lineage clans. Radiocarbon dating methods have dated some of this recovered art to the ninth century.

Wood, stylized with seashells, beads, or feathers, was by far the most widely used material for these works made in accordance with long-standing traditions. Styles varied greatly from region to region and were influenced by their intended use. Those objects associated with the DOGON of the MALI EMPIRE, for instance, have always been invested with symbols that convey the people's spiritual beliefs. These beliefs are extended to the Grand Mask worn at celebrations of renewal every 60 years. The making of the Grand Mask required appropriate prayers and

offerings to the tree that was used for the mask's wood, as well as protective measures taken by the individual who chopped it down. Another traditional art form of the Dogon involved the ancestor figure with raised arms. Preserved in the caves of the Bandiagara Escarpment, these figures have been dated by radiocarbon methods to the 15th century. The upraised arms on these figures have been interpreted by some to be either a symbolic appeal for rain or a gesture associated with rites of harvest.

Other artworks, and ones that are perhaps even more widely associated with the middle centuries, make up the body of art created to acknowledge the formality and rank associated with divine kingship. With the advent of the Iron Age, artists appear to have been supported and commissioned by the rulers of the state. These artists increasingly turned to IRON, BRONZE, and COPPER for their durability. These metals also were desirable because they potentially offered a number of different results, depending upon which methods were used. Bronze, copper, and brass were often melted and

These Ashanti fertility statuettes, now in the Musée Nationale des Arts Africains et Océaniens, in Paris, were created in a traditional Ashanti style. To enhance her fertility, a woman would carry one of these statuettes on her back, nurturing it and bathing it as if it were a real child. © Archivo Iconografico, S.A./Corbis

shaped in casts, in open molds, or through the LOST-WAX PROCESS, also known as ciré perdue.

In addition, steel and iron were forged and hammered. As a result, in some regions, metalwork was placed within a ritual context, largely under the domain of local BLACKSMITHS. BAMBARA blacksmiths, or NYAMAKALAW, for example, were organized into special clans responsible for making iron sculpture. Their power, known as NYAMA, was associated with the gods. In order to harness nyama, the nyamakalaw fashioned small protective iron amulets, the creation of which became one of their specialities.

The YORUBA, considered by many to have been the most prolific producers of sculptured art in Africa, created works that honored their kings as well as the deities that were known as orishas. At ILE-IFE, the city-state associated with the beginnings of Yoruba culture, naturalistic sculptures in terra-cotta and bronze have been recovered. These sculptures appear to have been made between the 12th and 15th centuries. This Yoruba art influenced the neighboring kingdom of BENIN at some point during or shortly after the 15th century, leading to the production of a brilliant range of commemorative artwork in that state as well. Although numerous detailed plaques and naturalistic busts of human figures have been recovered from excavation of sites related to this former kingdom, little is known of these sculptures original context except that the busts likely represented former reigning kings, or obas.

Further reading: Rosalind J. Hackett, *Art and Religion in Africa* (London: Cassell, 1996); Laure Meyer, *Art and Craft in Africa* (Paris: Terrail, 1995); Jocelyn Murray, ed., *Cultural Atlas of Africa* (New York: Checkmark Books, 1998).

Ashanti (Asante) Subgroup of the AKAN people who have long lived in regions of present-day GHANA, TOGO, and IVORY COAST. The Kumasi, Mampong, Bekwai, Kokofu, Nsuta, Dwaben, Effiduase, Asokore, Ejisu, Bonwire, Assumigya, and Senfi are all Ashanti peoples. They speak a Twi subset of the Niger-Congo language family.

Ashanti life prior to the 16th century is known only through oral history. Several versions of their beginnings exist, but they all concur that the Ashanti were originally part of a unified Akan clan that included the FANTE, Wassaw, and other Twi-speaking peoples. It is probable that an invading group forced the Akan people to flee south toward the forest. They eventually migrated to the coast and settled in small villages.

Sometime along their journey to the coast, the Akan split into two groups, the Ashanti and the Fante. Accord-

ing to one legend, FULANI invaders destroyed their crop fields, forcing the Akan to forage for FOOD. They collected *fan* and *shan,* two types of edible wild plants. The two groups then separated and were henceforth called the *Fan-dti* and *Shan-dti* (*dti* means "to eat").

Another oral history attributes the splitting and naming of the Akan people to a dispute with a ruling king. According to this version, a group of loyal subjects offered the king some *fan* out of tribute, while a group of rebellious subjects attempted to poison the king with the deadly herb *asun.* The groups derived their names from their offerings to the king, *Fan-ti* and *Asun-ti.*

Still another version attributes the split to a dispute between two factions of the Akan. In this version, one group left the kingdom and became known as the *Fa-tsiw-fu* (people who cut themselves from the main body). The Akan who remained rejected a request by the king to restore peace among the two groups. As a result the latter became known as the *Asua-tsiw-fu* (people who refused to listen).

The Ashanti traditionally organized themselves into matrilineal clans. Their primary means of subsistence was farming, but they were also known as master weavers, potters, and metalworkers. They practiced ancestor worship, but the traditional religion centered on the worship of a single deity known as Onyame.

Further reading: Ivor Wilks, *Forests of Gold: Essays on the Akan and the Kingdom of Asante* (Athens, Ohio: Ohio University Press, 1993).

Asmara (Asmera)   City established as the capital of ERITREA during the 14th century. According to traditional folklore, the name *Asmara* symbolizes unity, a testimony to the efforts of local women who worked together to bring an end to the bloodshed among their warring villages. Historically, Asmara functioned as an important trading port during the time when it was part of the former kingdom of AKSUM. After that, Asmara may have declined for a brief period. It was later restored through the efforts of Emperor ZARA YAKOB (1434–1468), becoming a vibrant, cosmopolitan city that attracted traders from Arabia, Europe, and India.

See also: ASMARA (Vols. III, IV); RED SEA TRADE (Vol. II).

Audaghost (Awdaghost, Awdaghust)   Important West African commercial center during the ninth through 11th centuries. Audaghost was a town bordering the southwestern SAHARA DESERT and was the terminus of one of the main TRANS-SAHARAN TRADE ROUTES. As a primary trade town within the GHANA EMPIRE, it attracted North African merchants, who took advantage of the lucrative GOLD trade controlled by Ghana's kings.

Despite its location, Audaghost had an abundant supply of water. This allowed for widespread AGRICULTURE and animal husbandry, enhancing its role as an important trade center. As a result Audaghost was a wealthy town whose residents lived in relative luxury. By the end of the 11th century, it had been incorporated into the Ghana Empire. During the 11th and 12th centuries, however, as Ghana's power was declining, new trade routes to the east diminished Audaghost's importance.

Augila (Aujila, Aoudjila)   North African commercial trading center that flourished during the height of ARAB COASTAL TRADE. Located near ancient Cyrenaica in LIBYA, Augila was a Berber settlement, largely shaped by the extensive Arab trade routes that passed through it over the centuries. Before the arrival of the ARABS in the seventh century, Augila supported traditional patrilineal clans (*qabila*). Clan leaders (sheikhs) served as the political heads of the villages. Although exposed to CHRISTIANITY in the sixth century, Augila was more extensively influenced by ISLAM. The first contact with Muslims probably occurred in 641 when Arab invaders conquered the North African coast. Islam quickly took root in places like Augila, thus facilitating Arab trade in these areas.

Augila was an important stop along the trade route connecting trade cities near Lake Chad, in the interior, to CAIRO, a central Fatimid commercial center. This same trade route also served as a Muslim pilgrimage road, which helped to spread Islam throughout North Africa. Through slavery, humans were the primary trade commodity, although cloth and leather were also sought from the Sahara interior.

al-Azhar   Mosque and university in EGYPT and an ancient center of Islamic and Arabic studies. The mosque of al-Azhar was built in central CAIRO in 970, shortly after the FATIMIDS came to power in 969. Although the origin of the mosque's name is uncertain, it is believed to be linked to Fatima al-Zahra, the daughter of the Prophet MUHAMMAD (c. 570–632).

Al-Azhar was originally used as a place for religious worship and Islamic celebrations of the Ismaili-Shiite sect. Soon after its construction, however, the Fatimid caliph established a *halaqa,* or tutoring circle, which quickly became the basis for Azharite education at al-Azhar. Under Fatimid rule the university became a focal point for the teaching of Islamic law and theology, as well as of the ARABIC language. Al-Azhar was financially supported by the Fatimid caliphs, who were interested in spreading Ismaili-Shiite doctrine throughout Egypt. When the Ayyubids

took hold of Egypt, during the 12th century, al-Azhar's teachings were changed over to Sunni teachings, and it lost its importance as a place of learning in the Islamic world. After 1250, under the leadership of Mamluk vice-sultan Izz al-Din Aydmer, al-Azhar's importance was re-vived, and it attracted a large number of scholars, making the university a center of teaching for the Islamic world once again.

B

babalawo The highest ranking of the YORUBA priests. *babalawo,* who are known as "the fathers of the mysteries," are priests of the oracle divinity Orunmila in the Yoruba faith, which developed its recognizable forms by 500 CE.

The Yoruba practice Ifa is a divination system that utilizes priests like the *babalawo* to connect with different gods. As one of those gods, Orunmila is an important part of Yoruba daily life. He is consulted before an individual starts any major project. The Yoruba believe that only the *babalawo* can connect spiritually with Orunmila. Through the *babalawo* the Yoruba can ascertain Orunmila's wishes and act accordingly.

To become a *babalawo,* a Yoruba man must spend several years studying Ifa divination. During his apprenticeship, he learns the sacred chants and recitations that will be used to summon Orunmila and the other gods. A *babalawo* apprentice abstains from certain foods and lives an ascetic life to prepare for his role as priest. The Yoruba believe that purity allows the *babalawo* to connect with the divine through prayer. If the *babalawo* succumbs to evil, Orunmila may become angry and call for his death.

Once initiated, the *babalawo* traditionally dresses in white to symbolize his purity. He wears a palm-fiber charm and carries a fly whisk. For ritualistic ceremonies,he will also shave his head. At the beginning of a ceremony for a client, the *babalawo* sits on a mat in front of a traditional divining board. He then scatters a thin layer of special dust, *iyerosun,* on the board and invokes Orunmila by tapping on the tray and chanting. When the spirit has been summoned, the *babalawo* takes 16 sacred palm nuts (Ikin) in his left hand and passes as many as he can into his right.

Depending on the number of nuts remaining in his left hand, he will make a mark on the dusted board. The process is repeated eight times, until a pattern emerges in the dust. By reading the pattern, the *babalawo* interprets Orunmila's wishes and passes the message to his client. After he has interpreted Orunmila's message, the *babalawo* recommends the appropriate ritualistic sacrifice that will please the gods and solve his client's problem.

Baganda See GANDA.

Bagauda (c. 1000) *Founder of the Kano kingdom*
Bagauda was the first in a long line of *sarkis,* or kings, who ruled the KANO kingdom and served as both political and spiritual leaders. According to lore, Bagauda's grandfather, Bayajida (or Bayajidda), was the common ancestor of the founders of the Hausa states. The traditional "Song of Bagauda" gives some insight into the history of the Kano kingdom, but most of what is known about Bagauda has been attained from the KANO CHRONICLE, which was written down in the Hausa language around 1890.

Baggara (Bakara, Baqqara) Pastoral group of people who have long inhabited the region from Lake Chad to the Nile River, an area that comprises the modern-day countries of CHAD, CENTRAL AFRICAN REPUBLIC, and Republic of the SUDAN. Baggara—from the Arabic *baqqara,*

meaning "cow"—is a collective term which describes the cattle-raising peoples who began migrating from the area near the Red Sea during the 12th and 13th centuries. As they migrated, the Baggara maintained their traditional nomadic way of life. Baggara peoples traditionally identified themselves as members of their subgroups before the collective group. Those subgroups include the Shuwa Arabs, the Hawazma, the Ta'isha, and the Habbania, among others.

al-Bakri (c. 1094–unknown) *Arab scholar*

Al-Bakri was noted for his work in the fields of geography, RELIGION, philosophy, and botany. Best known for the work *Book of the Roads and Kingdoms,* which discussed the political, social, economic, and cultural environment of al-ANDALUS (Muslim Spain) and North Africa through the middle of the 11th century. Although he never traveled abroad, al-Bakri meticulously gathered information from the personal accounts of those familiar with the region. The result was an amazingly accurate and detailed historical study.

Bali Southern Ethiopian state bordered by the Shebelle and Ganale Doria rivers. Originally inhabited by the SIDAMO people, who followed a traditional, animistic RELIGION, the area had been extensively penetrated by ISLAM by the 15th century. At that time the Muslim Walashma dynasty, which became a dominant force in the region, rebelled against the tributary rule imposed by Ethiopian emperor ZARA YAKOB (r. 1434–1468). Many smaller traditional societies followed suit, as did the Muslim chieftain Mahiko of neighboring Hadya. The combined forces of these groups attacked the indigenous Christians of the region. Conflict continued during the reign of Yakob's son, Baeda Maryam, who ruled from 1468 to 1478. Bali is also noted for its holy mountain, Abul Qasim, to which people made pilgrimages to pay homage to Muslim sheikh Hussein for the miracles he reportedly performed there.

Bamako Located on the Niger River, the capital and largest city of present-day Republic of MALI. From the 11th to the 15th centuries, Bamako was one of the important ISLAMIC CENTERS OF LEARNING of the MALI EMPIRE. When the Mali Empire fell in the 16th century, the town became a BAMBARA trading center.

Bambara (Bamana) MANDE people who settled in regions of present-day Republic of MALI. The Bambara were a part of the powerful MANDINKA empire (fl. 1235–1400). They speak Bamana, a language of the Niger-Congo family of languages. Prior to the arrival of Islam in the region, the Bambara were known as the Bamana. They rose to political prominence after 1600, when they established independent Bambara kingdoms at Segu and Kaarta.

Fashioned in the form of a woman, this 20th-century Bambara wood-and-metal door lock from Mali is 19 3/4 inches high and 15 1/8 inches wide (47.7 cm high and 38.5 cm wide). It utilizes methods, materials, and designs that are hundreds of years old. © *North Carolina Museum of Art/Corbis*

> **The people who make up the Bambara did not refer to themselves as such. The name *Bambara* means "infidel" or "unbeliever," reflecting the fact that they staunchly resisted ISLAM after the Muslim leader SUNDIATA (d. 1255) came to power in the 13th century. Though many were nominally converted to Islam, most Bambara continued to practice their traditional RELIGION based on ancestor worship. They also worshiped a creator god, Ngala (sometimes called Bemba), and several lesser gods related to air, fire, water, and earth.**

Early Bambara society centered on AGRICULTURE, animal husbandry, and trade. The Bambara are recognized as one of the first groups to develop advanced plowing techniques. Their staple crops included rice, millet, and sorghum.

banana   Vitamin-rich fruit that is a staple crop grown in present-day ETHIOPIA, CENTRAL AFRICAN REPUBLIC, CAMEROON, GUINEA, NIGERIA, and UGANDA, among other tropical countries. It is from the genus *Musa* and the family Musaceae. Native to India and China, the banana was introduced to Africa by East Coast traders—either by Indonesian MERCHANTS, or Arab merchants who had obtained it from the Indonesians—during the second half of the first millennium. By the 10th century it had spread to the African interior and replaced the yam in many areas as the staple FOOD. Knowledge of the banana presumably spread from the Pare Mountains to the eastern interior. In the West, it spread from MALAWI and the Zambezi River basin through the CONGO BASIN and West Africa.

Simultaneous with the spread of the banana, revolutionary agricultural techniques emerged to accommodate its production. Highland planting, used in places like eastern TANZANIA, was a system of regulated irrigation and manure fertilization that produced a superior banana crop. In other regions of Africa, agricultural techniques similar to highland planting were developed independently of the Tanzanian methods.

Several types of bananas have been cultivated in Africa since their introduction more than 1,000 years ago. The Cavendish, or dwarf, banana is found in southern Africa; the plantain is grown in warm coastal regions; and the common banana (*M. sapientum*) is found throughout the continent. The banana plant flourishes in loose, well-drained soil and humid climates like those of tropical Africa.

Growing up to 30 feet (9 m) high, the banana plant is a giant shrub with an underground stem called a rhizome. Above ground, the stem forms a false trunk of leaf-stalk bases and resembles a tree trunk. Towering 10 to 20 feet (3 to 6 m) tall, the trunk is topped by many large leaves measuring 10 to 11 feet long (3 to 3.5 m). A flower emerges from the top of the plant that bends to the ground, heavy with clusters of fruit. Each cluster, known as a hand, has 50 to 150 individual bananas.

The banana plant does not require pollination to bear fruit. Therefore, fruit production is essentially continuous after the first harvest. When the first crop matures, in 10 to 15 months, the plant is cut to the ground to regrow. The stem sprouts several new growths, some of which are pruned, while others are allowed to grow into mature plants. Within six months a new banana crop will be ready to harvest, and the cultivation process is repeated throughout the life of the plant.

When ripe, bananas are an excellent source of potassium, carbohydrates, and vitamins C and A. For this reason they were an important addition to the early African diet. Most varieties are eaten raw, except the plantain, which must be cooked. A plantain has the highest starch content of banana fruits because it does not become sweet when it ripens like other varieties. Today, most bananas are picked when green and sent to distribution centers for final ripening to ensure freshness for shipping throughout Africa and abroad. Although it has been grown in Africa for hundreds of years, the banana remains an important staple of African FOOD production.

Banda   AKAN trading state located in the forest zone of present day GHANA. Banda reached its height of influence in the 14th and 15th centuries. Banda was probably founded around the same time as the founding of the neighboring Akan state of BONO. Though little is known about the Banda kingdom before the 17th century, it is referred to in ARABIC texts from the 14th century, and it is likely that the kingdom emerged in the 13th century, along with development of the West African GOLD trade.

Banda was ruled from the city of Begho, a forest trade center located in the southern region of the kingdom. By the 15th century DYULA traders had established settlements in Begho to take advantage of the important trade routes between the Akan states and the MALI EMPIRE. During the 16th century the gold trade in the area was curtailed considerably and, though Begho would remain an active commercial center, the Banda kingdom no longer wielded influence in the area.

See also: BANDA (Vol. III); BEGHO (Vol. III); WANGARA GOLD FIELDS (Vol. II).

Banjul Present-day capital city of The GAMBIA, located at the mouth of the GAMBIA RIVER. Archaeological evidence suggests that the coastal area around Banjul was inhabited as early as 750. Portuguese explorers visited the area in the 15th century, and British traders followed soon after.

See also: BANJUL (Vols. III, V); PORTUGAL AND AFRICA (Vols. III, IV, V).

Bantu expansion Massive movement of Bantu-speaking peoples across subequatorial Africa. This process took place over a couple of millennia. The origins of Bantu-speaking people can be traced to the border region of present-day NIGERIA and CAMEROON beginning about 1000 BCE. At that time they began to migrate to the surrounding savanna regions and tropical rain forests. They settled along the GABON coast, where they initially split into two distinct groups, the Western and Eastern Bantu.

The reasons for the split and subsequent expansion are unclear. Early historians speculated that they coincided with advances in IRON technology, but new theories place more emphasis on the introduction of new crops. Other theorists believe that the Bantu expansion was driven by pressure from encroaching neighbors, or that they were forced to migrate in response to changing climatic conditions in the Sahara. The Western Bantu moved toward ANGOLA, while the Eastern Bantu headed southeast toward the Great Lakes region. The bulk of Bantu expansion occurred during the first millennium CE.

The Bantu-speaking peoples prospered in their new territories, adapting to the region and local customs. Although most of the Bantu dispersion had occurred by the 11th century, the Bantu speakers continued to merge with native groups. Organized Bantu towns and kingdoms began to emerge, replacing the early loose associations. In the Indian Ocean coastal areas, Bantu speakers developed more complex societies as they came in contact with Arab traders. Shungwaya, an extinct Bantu kingdom along the East African coast, reached its height from the 12th to 15th centuries. The success of the kingdom of Shungwaya indicates that the Eastern Bantu were prospering by the 12th century.

Three distinct Bantu groups emerged along the eastern coast: the Sabaki, Waseuta, and Ruvu. These groups, particularly the Sabaki, intermixed with and influenced the local hunters and gatherers. Farther to the south, the Waseuta were known for integrating Indonesian crops into their traditional planting techniques. The Ruvu split into two groups, the East Ruvu and the West Ruvu. The East Ruvu inhabited the lush lowlands, enabling them to grow the same Indonesian crops as their Waseuta neighbors. In contrast, the West Ruvu subsisted on grains and livestock due to the drier climate. At the same time several Bantu groups settled along the southern edge of the eastern coast near Lake Nyasa. Between 1100 and 1600,

the Kilapwa and Songea Bantu migrated throughout the region, absorbing local populations along the way. In the area around Lake Victoria, Bantu-speaking peoples settled between Mara and the Kavirondo Gulf. A second group settled further to the south, near Mount Elgon.

Further inland, in KENYA and TANZANIA, scattered Bantu groups had settled among the Nilotic and Southern Cushitic people by the 12th century. Their willingness to shift from traditional root crops to the millet and sorghum of the native inhabitants allowed the Bantu population to increase rapidly. By the 16th century major expansions and diversification in these areas occurred among the Takama Bantu. The Bantu in the mountain regions of Kilimanjaro and Kenya were responsible for the development of highland AGRICULTURE that could support an essential new crop, the BANANA. Closer to the Great Lakes, the Bantu intermixed with pastoralists.

The expansion of the East Bantu-speaking peoples continued pushing to the south. The Shona (or their immediate ancestors) were responsible for developing the major state centered at GREAT ZIMBABWE. Located on the central plateau inland from the coastal lowlands, it thrived from about 1100 until 1450. The southern-most Bantu speakers were the Nguni sub-group, with the Xhosa, who settled in what today is the Eastern Cape Province of South Africa.

The Bantu expansion came to a halt when it reached land that was unsuitable for rain-fed agriculture and insufficient to support grazing. It did not, for example, extend into the more arid regions of southern Africa such as Karoo and the Namib Desert.

There were too many Bantu-speaking subgroups to chart them all in detail. Each developed its own customs and traditions as it intermixed with local peoples. As a result, Bantu speakers are connected by the language they speak, and not by social, economic, or religious customs.

Banu Marin See MARINIDS.

Banyoro See NYORO.

Bariba (Borgawa) Ethnic group of the Borgu region in present-day northern Republic of BENIN and NIGERIA. In precolonial times Bariba was best known for its IRONWORKING. The Bariba are one of the three subgroups of the Bargu (the Borgo and Borgenci being the other two)

that speak a Voltaic dialect belonging to the Niger-Congo language family. Early Bariba people may have been the Wasangari. The Wasangari were precolonial raiders of Batonum, Mokole, Boko, and FULANI descent. Other theories attribute Bariba ancestry solely to the Batonum.

Traditional Bariba dwellings were mud-brick structures organized around a courtyard that served as the kitchen. The Bariba were accomplished CRAFTSPEOPLE, sometimes recognizable by their unique woven hats (which some older Bariba still wear today), but they were mostly known for their work with metal.

The Bariba ethnic group still has a presence in regions of Nigeria and the Republic of Benin and also in parts of BURKINA FASO and TOGO.

See also: BARIBA METALLURGY (Vol. II); NIGER-CONGO LANGUAGES (Vol. I).

Bariba metallurgy Metalworking techniques of the BARIBA, an ethnic group that inhabited the Borgu region in NIGERIA and and present-day Republic of BENIN. Due to the abundance of IRON ores found just beneath the earth's surface in Borgu, IRONWORKING was common in traditional Bariba societies. For the Bariba, ironworking involved mining, ore preparation, fuel collection, furnace building, smelting, refining, and smithing.

Mining was a FAMILY affair that occurred over a period of several months in order to build a reserve large enough for smelting. The most common fuels used by the Bariba were slow-burning hardwoods, which were placed in termite clay furnaces where smelting techniques were used to separate the iron from slag. The iron was then worked by a smith, who was held in high esteem in Bariba culture.

Like other groups, the Bariba considered metalworking a sacred rite, so elaborate ceremonies accompanied the smithing process. They believed that knowledge of ironworking was passed to smiths from God through an earthly intermediary. This intermediary existed in the form of a sea crab, which the Bariba believed lived in the anvil of the smith's forge. The Bariba often sacrificed goats out of respect for the crab, and they believed that anyone who touched the smithing tools would be cursed with illness.

See also: METALLURGY (Vol. I); METALWORKING (Vol. I).

bark fiber The soft inside layer of the protective outer covering of trees. For centuries, it has been woven into a light, versatile cloth throughout Africa. The history of bark fiber production is not clear. Archaeological evidence suggests that it originated in Central Africa and moved east into KENYA, TANZANIA, MOZAMBIQUE, and MALAWI. While it is unknown when bark fiber production began, the most prolific periods of bark cloth production on record occurred in the 18th and 19th centuries, before Europeans brought substantial amounts of their own cloth to Africa. By the mid-20th century bark fiber production had virtually disappeared in favor of more durable and easily obtainable European cloth.

Bark cloth was typically produced by harvesting the inner bark of *Ficus* and *Brachystegia* trees. Both of these trees could survive only in the wet regions of Africa, so bark cloth was not made in the desert regions. The trees were easy to cultivate and matured quickly. They were ready to harvest only three years after planting. The first harvest always yielded poor quality fiber, but by its fourth harvest, the tree reached its prime. Trees could be harvested for 20 to 30 years if the bark was stripped annually to prevent the healing skin from becoming too stiff.

Many African peoples practiced a bark harvesting ritual. Those who participated in the harvest had to abide by strict rules. For instance, the cutter was not allowed to drink anything or have any oil on his body before cutting. It was considered bad luck if he perspired on the bark, and he had to wash the bark in cold water if the tree had an unusually large amount of sap. To prevent the trunk from drying, the cutter worked in the early morning or late afternoon. He would cut a horizontal slash around the base and top of the trunk and then make a vertical cut down the length of the tree. He could then peel off the bark in large rectangular sections. In UGANDA, a harvester covered the tree trunk with animal dung and wrapped it in BANANA leaves to accelerate the healing process.

The harvested bark was soaked in water for several days until it was soft enough to remove the inner bark fibers. A wood mallet was then used to beat the bark pulp, which caused the fibers to intertwine. After folding and pounding the cloth numerous times, the cloth maker would wring out the excess water and set the cloth out to dry. The cloth would then be stretched and kneaded by hand for several hours, making it soft and pliable. The best cloths were thin, yet strong, and relatively free from holes or patches.

By the time the cloth was finished, the bark fibers had become tightly intertwined into the fabric. Although it was not particularly strong, good bark cloth could be used for a variety of purposes. Many peoples used it as clothing, particularly for cloaks. It was also used to make burial shrouds. For instance, the bodies of dignitaries in southern Uganda would be wrapped in 50 or 60 of the cloths in preparation for burial. It could also be sewn into sacks to store grain, salt, or personal belongings. Many groups made lightweight bedding or floor mats from the cloth. The European settlers used it to make cushion covers and roofs for temporary shelters. Today, with modern technology, the arduous process of turning bark fiber into cloth is a dying African ART.

Barmandana (Baramendena) (fl. c. 1050) *Muslim ruler who brought Islam to the Mali Empire during the 11th century*

Barmandana, a MANDINKA king, governed the MANDE-speaking peoples of the MALI EMPIRE as a *mansa,* or appointed caste leader. His position eventually evolved into that of a king.

〰〰〰〰〰〰〰〰〰〰〰〰〰〰〰〰〰〰〰〰〰

During Barmandana's rule, Mali suffered a debilitating drought. According to legend, a visitor to the Mandinka court advised Barmandana that his conversion to ISLAM would bring rain. So the *mansa* adopted the faith and, so the story goes, the rains fell, thus encouraging several of Barmandana's subjects to convert also. The *mansa* didn't force any of his subjects to accept Islam, however. Instead, many Mandinka maintained their old beliefs, enjoying a religious freedom that was maintained for hundreds of years.

〰〰〰〰〰〰〰〰〰〰〰〰〰〰〰〰〰〰〰〰〰

Mali, which during Barmandana's rule was a subordinate kingdom to the powerful GHANA EMPIRE, was served well by his conversion to Islam (even though most of the people of his kingdom continued to practice their traditional, non-Muslim RELIGION). Mali's status as a Muslim kingdom helped it to become incorporated into the developing Sudanic and TRANS-SAHARAN TRADE ROUTES, which were controlled by Islamic interests. Within a few centuries after Barmandana's rule, Mali would be the most powerful empire in West Africa.

Basoga See SOGA.

Batoro See TORO.

beads and jewelry Items often used in Africa for trade and body ornamentation. Although many African groups used them differently, beads and jewelry were an important part of both special rituals and daily life. Beads often decorated clothing, jewelry, sheaths for staffs, masks, and various religious objects. Depending on custom, jewelry was made in a variety of styles and materials. Items made of GOLD, silver, COPPER, cowrie shells, IVORY, beads, and clay have been found in different parts of Africa. To gain a broader understanding of practices throughout Africa, the individual groups must be explored.

A rich display of bone, BRONZE, ivory, and gold jewelry as well as glass beads was found at archaeological sites of the IGBO culture in present-day NIGERIA, in West Africa. It is thought that these materials were imported in the eighth century from lands in the ancient GHANA EMPIRE Early Berber traders probably brought them to the area. The Ghana Empire, located in the western SUDAN, was a powerful and wealthy kingdom, with vast supplies of gold, ivory, and silver. Intricate bracelets, necklaces, and pendants have been found at early sites in the region. Stylistic similarities between early Ghanaian jewelry and that of neighboring kingdoms indicate extensive contact between early Sudanese civilizations.

The SAO people of the Chari Delta near Lake Chad got their inspiration from Mediterranean and Nilotic traders. Their copper, silver, and clay jewelry has an international flair that emerged sometime in the 10th century. In the region of present-day Democratic Republic of the CONGO, Bantu speakers made copper wire bracelets, copper beads, and ivory necklaces as early as the eighth and ninth centuries. For many of the semi-nomadic people of the African interior, jewelry was made from materials more easily obtainable like shells and beads. Although contact with coastal traders influenced the jewelry stylistically, it was not until ARABS penetrated the African interior in the ninth century that jewelry began to reflect external influences.

Around the same time, the ASHANTI of present day GHANA, along the Gold Coast, prospered as gold traders. Masks, pendants, and jewelry were produced in large quantities. They were primarily used in religious ceremonies and worn by royalty. Gold rings on chains were popular among aristocrats. Beads, prevalent in Ashanti society, decorated ceremonial items like masks and were even used as currency in the early SALT TRADE and other transactions.

Some African peoples like the FULANI of West Africa used decorative body painting as a form of jewelry. They also braided cowrie shells, silver, or beads in their hair and decorated their garments with chains. Copper anklets were worn to indicate the age and status of the wearer.

Beja Ethnic group, also known as Hedareb nomads, located in the eastern Republic of the SUDAN, and parts of ERITREA, ETHIOPIA, and EGYPT. For much of their history, the Beja were considered "pagans," and they were one of the few groups to resist both CHRISTIANITY and ISLAM. However, as early as the sixth century, some Beja did become Christians when the regions of Ethiopia and Eritrea they inhabited made up the Christian kingdom of AKSUM.

When it was discovered that Beja territories held many GOLD mines, Muslim rulers in what is now Iraq dispatched troops to the region. After a few skirmishes, these troops subdued the Beja and forced them to pay annual tribute in gold. By the 14th century most Beja had been converted to Islam, primarily as a result of frequent intermarriage with the ARABS who settled in the region. Despite their embrace of Islam, however, many Beja groups continued to practice their traditional beliefs.

Benin, Republic of Country in coastal West Africa measuring approximately 43,500 square miles (112,700 sq km) that shares borders with NIGER and BURKINA FASO to the north, TOGO to the east, the Atlantic Ocean to the south, and NIGERIA on the west. During the medieval period, the history of the northern regions of Benin was tied to the wider trends in the history of the western Sudanic belt. Northern Benin became a center of large-scale iron making because of its rich and readily exploitable deposits of IRON ore plus the large quantities of trees that made excellent charcoal for smelting. These resources led the BARIBA people to develop their renowned BARIBA METALLURGY.

Perhaps as early as the 12th century the AJA, who were an EWE-speaking people, moved from what is now Togo into the southern part of the country. Their principle village, ALLADA, emerged by the 16th century to become the capital of the area's most powerful state. That kingdom, also known as Great Arda, was ruled by a king aided by a body of elders, who wielded considerable political power. In the early 17th century a political dispute within the royal family led to the founding of the state that became DAHOMEY.

See also: BENIN, REPUBLIC OF (Vols. I, III, IV, V).

Benin, kingdom of Ancient EDO state located in present-day southern NIGERIA. (The Benin kingdom should not be confused with the present-day country of the same name.) For nearly 3,000 years Edo peoples have inhabited a large area west of the Niger River in what is now the Benin province of southern Nigeria. Originally, single-family settlements dominated the area; however, about the fifth century, village communities formed to provide families with greater defense and allow them more efficient use of natural resources.

While these communities developed a network of trade routes, successful villages grew into towns. One such town, Benin, evolved into a hereditary monarchy ruled by a king, or OBA, and a court of hereditary chiefs, called UZAMAS. Benin remained a small Edo state until the 15th century, when, sometime after 1480, it was conquered by EWUARE (c. 1440–1480), a great warrior chief. Ewuare rebuilt the destroyed city around a centrally located grand royal palace. In the palace he housed the skilled artisans who created the ART for which Benin is known today.

During his reign Ewuare instituted the law of primogeniture, by which the son's reign would follow that of his father. Ewuare also expanded the borders of Benin, creating a sprawling kingdom by conquering neighboring peoples. There is some debate as to whether Ewuare was still *oba* when Portuguese MERCHANTS arrived late in the 15th century, but, in any case, Benin was powerful enough to maintain peaceful and cooperative trade with the Europeans.

This bronze head of an unnamed princess was made in the kingdom of Benin (c. 1360 to 1500). It is displayed at the Fogg Art Museum in Cambridge, Massachusetts. © *Burstein Collection/Corbis*

Benin art from the 14th, 15th, and 16th centuries is widely regarded as some of the best African art from that period. Artisans and CRAFTSPEOPLE were commissioned by the *obas* to create detailed BRONZE castings in the likenesses of celebrated royal family members. These bronze sculptures also had distinctive markings that helped the royal FAMILY to record its history. Other interesting items made by Benin's artists included IVORY carvings, bronze bells, and special hip or belt masks, which were worn by the *obas* during special ceremonies.

Benue River   Longest tributary of the Niger River, in West Africa. During the medieval period, the Benue was an important water highway for the TRANSPORTATION of trade goods and people. The Benue originates in the highlands of northern CAMEROON and flows into central NIGERIA. The fertile triangular region around the confluence of the two rivers has been home to a number of peoples, including the Nupe and Kwararafa (who established two of the minor HAUSA STATES), IGALA, Igbira, and Jukun. During the 14th and 15th centuries, these peoples were able to take advantage of the ideal farming conditions to carry on trade with the YORUBA states downstream and with the land CARAVANS that brought goods to and from the SUDAN to the north.

See also: KWARARAFA (Vol. III); NUPE (Vol. III).

Berbers   Ethnic group of northwest Africa and the Sahara who established ruling dynasties that controlled much of North Africa and southern Spain from the 11th century to the 13th century. In the fifth century the Berbers constituted two distinct groups: agriculturalists who settled along the southern coast of the MEDITERRANEAN SEA, and nomadic pastoralists who lived in the mountain passes and on the steppes of northern Africa. As early as the fifth century some of the Berbers who lived along the coast had become MERCHANTS and traded their agricultural goods and foodstuffs for manufactured Mediterranean goods.

The Berbers of the interior were largely assimilated by invading Arab Muslims beginning in the seventh century. By the 10th century Fatimid Berbers controlled much of EGYPT and the Red Sea coast, and the SANHAJA BERBERS controlled vast areas of the Sahara. By the 11th

century practically all of the Berbers of North Africa had converted to ISLAM. From the 11th to the 13th centuries these Islamic Berber clans dominated North Africa. Their most powerful ruling dynasties were the FATIMIDS, ALMORAVIDS, ALMOHADS, MARINIDS, Zayyanids, and Hafsids.

At the height of its power, the Berber empire included the African regions of MOROCCO, ALGERIA, LIBYA, EGYPT, and northern NIGER. They also controlled most of southern Spain, an area they called al-ANDALUS. Berber-controlled cities in Africa included TUNIS, MARRAKECH, TLEMCEN, and al-Qahira (CAIRO) in the north, and TIMBUKTU and AUDAGHOST, trans-Saharan trade centers of the western SUDAN. By the end of the 13th century Berber dynasties no longer held sway in the western Sahara, but the Berber people did assimilate into the Islamic Arab culture that assumed power in the region.

During the 14th and 15th centuries many of the trading routes in the Sudan were run by a semi-nomadic people called TUAREGS, who claim descent from the original Berber clans of North Africa.

Beta Israel (Falasha)   Ethiopian agriculturalists who long practiced the Jewish faith. The origins of the Beta Israel are unclear, and the many legends about their beginnings often conflict. However, it is clear that they were practicing their faith within various parts of ETHIOPIA well before the beginning of the Common Era.

The Beta Israel subscribe to religious and cultural practices similar to Judaism; their name, Beta Israel, means "House of Israel." They practice an ancient biblical form of Judaism, guided by the Orit (the Pentateuch, or first five books of the bible, translated into GE'EZ), but possess none of the post-biblical laws and interpretations collected in the Talmud. However, unlike conventional Jewish practice, they pray in Ge'ez, the ancient Ethiopian vernacular and liturgical language, and practice both male and female circumcision.

In the second half of the 12th century the legend of Prester John—a Christian priest who ruled over a vast empire in the East—began to circulate throughout Europe. In some versions of this legend, Prester John's kingdom is identified with Ethiopia (called Abyssinia at the time). Rumors based on these legends claimed that

the Beta Israel were at constant war with Prester John and that their armies were advancing on Rome.

Various traditions explain the origins of the Beta Israel. One holds that they are an AGAW people who were converted to Judaism before the ancient Ethiopian kingdom of AKSUM was Christianized in the fourth century. The contrary tradition holds that they are Jewish migrants from EGYPT, possibly connected to the house of Dan (the fifth of the Twelve Tribes of Israel descended from the 12 sons of Jacob) who entered Ethiopia early in the common era. The word *falasha* means "stranger," "exile," or "immigrant" in Ge'ez and characterizes the distinctiveness of the Beta Israel within Ethiopian culture.

Although there is evidence that the Beta Israel were persecuted for assisting the Agaw, who resisted the rule of AKSUM (c. 900–1000), few facts are known about the Beta Israel until the Christian emperors of the SOLOMONIC DYNASTY began persecuting them in the 14th and 15th centuries. They had begun to be regarded as an identifiable group during Ethiopia's Heroic Age that began c. 1270, when many legends about Ethiopia's past began to take form. In the following century they had grown into a populous and prosperous community numbering in the many thousands.

By the 15th century ruling Ethiopian monarchs such as ZARA YAKOB (r. 1434–1468) and his son Baeda Maryam (r. 1468–1478) were actively engaged in warfare against the Beta Israel. These organized massacres led to heavy losses among the Beta Israel.

Betsimisaraka Ethnic group of the island of MADAGASCAR, located off East Africa. Primarily fishers, traders and farmers, the Betsimisaraka lived along a narrow section of the eastern Madagascar coast. Their ancestors were a mix of African, Malayo-Indonesian, and Arab peoples who spoke the West Austronesian language of MALAGASY. This diverse group of people became known as the *Betsimisaraka,* which translates literally as "the inseparable multitude." Before establishing their own kingdom in the early 18th century, the Betsimisaraka were pirates, sailors, whalers, and fishermen.

See also: BETSIMISARAKA (Vol. III); INDONESIAN COLONISTS (Vol. II).

Bigo (Bigo bya Mugenyi) Archaeological site in present-day UGANDA, dating to the 14th and 15th centuries, known for its massive earthworks. Located on the Katonga River, Bigo was probably one of the capitals of the rulers of the CHWEZI DYNASTY, who ruled the KITARA COMPLEX of chiefdoms. Archaeological evidence points to its origins around the mid-14th century. Excavations revealed that the site's inhabitants raised a substantial number of cattle and abandoned the area in the mid-16th century when the Nilotic-speaking LUO people encroached on their territory.

Bigo is best known as the site of large earthworks built and occupied between about 1350 and 1550. The longest of these vast ditches stretch for approximately 6.5 miles (10.5 km). In many places carved from solid rock, the earthworks are up to 20 feet (6.1 m) deep and 30 feet (9.1 m) wide. The purpose for these earthworks is not fully understood, but they clearly required a large LABOR force to construct.

Bilad al-Sudan Expression in ARABIC meaning "Land of the Blacks." Bilad-al Sudan was the term generally used by ARABS to describe the area south of the Sahara in western Africa and located above the forest belt. ISLAM came to Africa in the seventh and eighth centuries. The Dyago dynasty of the kingdom of TEKRUR converted to Islam in 850 and were the first black people to become Muslims. Their territory was given the name Bilad-al Sudan by Islamic geographers and historians.

In geography, the term *the SUDAN* refers to the strip of semiarid land between the lower edge of the Sahara and the equatorial rain forests, as well as the region south of the Sahara in the present-day Republic of the SUDAN.

The introduction of Islam led to increased trade, wealth, and literacy in western Africa. Within this dynamic setting, the three great empires of GHANA, MALI, and SONGHAI developed. The work of Muslim scholars of the time has allowed a great deal to be known about the history of Bilad-al Sudan prior to the era of European contact and exploitation that became prevalent after 1500.

Biram   One of the seven independent HAUSA STATES located between the Niger River and Lake Chad. According to Hausa oral traditions, Biram was founded and ruled by a man named Biram, the son of Bayajida and the princess Magira, of Bornu. As with the other Hausa states, Biram was an important trading center. It was also the original seat of the Hausa government.

Bissau   Important port city of the MALI EMPIRE from the 13th to the 15th centuries. Located at the mouth of the GEBA RIVER on the Atlantic Ocean, Bissau was populated primarily by the Balanta, Fula, and Manjaca peoples. Bissau's ECONOMY was based on AGRICULTURE because of its warm, rainy climate. Local crops included yams, beans, kola nuts, millet, rice, and other grains.

Bito (Babito)   Nilotic people who established several East African kingdoms, including the influential BUNYORO state. The LUO-speaking ancestors of the Bito originally inhabited the southern areas of the present-day Republic of the SUDAN, living peacefully along the Bahr al-Ghazal tributary of the White Nile, where they grew millet and raised cattle.

During a period that extended from the seventh to the 11th centuries, some of these Luo-speaking pastoralists migrated toward the Agoro Mountains, where they intermarried with the local people and lived as hunters and farmers. After an outbreak of disease devastated their livestock, many Luo migrated across the Nile. According to oral traditions, it was these Luo who, in the latter 14th century, headed south to the Great Lakes region of interior East Africa. At that time the chiefdoms of the region, known collectively as the KITARA COMPLEX, were ruled by WAMARA, a king of the CHWEZI DYNASTY, who had only recently come to power. Despite attempts by Wamara to integrate them into the local governing structures, the Luo immigrants never fully assimilated. Political unrest between the people living in Kitara was exacerbated by a severe famine, leading to the end of Chwezi rule and the rise of the Luo.

According to some traditions, a military commander who was appointed to office by Wamara ultimately killed the Chwezi king. This commander, Kagoro, founded the new state of BUNYORO, also called Bunyoro-Kitara. Kagoro was followed by Owiny I and then by Prince Rukidi. Rukidi's ruling clan was probably the first Luo group to be officially recognized as Bito people, or Babito. The Bito rulers encountered much hostility from the Bantu speakers within their new kingdom and were eventually forced to move their capital to BUGANGAIZI. As their power increased, they expanded their territory south into TORO and even claimed parts of the HINDA states of NKOLE and RWANDA. In addition, Rukidi's brother moved east to found BUSOGA, thereby creating another Bito kingdom.

In Bunyoro, the people under Bito rule continued to practice agriculture and raise livestock. They were open to various forms of RELIGION and emphasized loyalty to the king above all else. At first, kings were given almost divine status and were freed from such traditional practices as appointing tribal chiefs according to heredity. Instead the kings were able to make autonomous decisions regarding the kingdom. However, before long, the Bito returned to their traditional government structures, relying more on hereditary rights and clan lineage than on a centralized political power.

blacksmiths   See BLACKSMITHS (Vol. I); CRAFTSPEOPLE (Vol. II); IRON (Vol. II); IRONWORKING (Vol. II); *NUMUW* (Vol. II); *NYAMAKALAW* (Vol. II).

Bobo (Bwa)   Ethnic group of the Volta River basin in West Africa. The Bobo are a subgroup of the Mossi peoples who settled in areas of present-day BURKINA FASO and IVORY COAST. Prior to the 15th century the DYULA established a trade settlement in Bobo territory, south of JENNE. Called Bobo-Dioulasso, it was part of a network of trade routes that connected it with OUAGADOUGOU, the capital of the GHANA EMPIRE and the center of the West African GOLD trade.

> The Bobo have long been known as excellent CRAFTSPEOPLE and artists. Their traditional masks, some of which measure 6 feet high, are popular items on the modern African ART market.

Like other Mossi people, the Bobo lived in autonomous, village communities dominated by paternal lineages and maintained using a caste system.

See also: MOSSI STATES (Vols. II, III, IV).

Bonny   Atlantic port city located in NIGERIA. Bonny served as the capital of the kingdom of Bonny beginning in the 1400s, and it was the primary trading center of the

IJO people. In 1505 the Portuguese captain Pacheco Pereira reported a "large village of some 2,000 dwellings," which has been identified as Bonny. The name of the city is derived from *Ibani,* the local name of the area.

See also: BONNY (Vol. III).

Bono People and state located west of the VOLTA RIVER in what is now the country of GHANA. Bono was founded in the first half of the 15th century by the FANTE, a subgroup of the AKAN people, who occupied the forests of coastal Ghana. Bono contained numerous GOLD fields, and quickly developed into a major supplier in the trans-Saharan gold trade. Bono's capital, Bono-Mansu, was an active stop on the trade route from the northern city of JENNE.

The kings of Bono, and especially Obunumankoma, who reigned from 1450 to 1475, are thought to have increased Bono's gold production by introducing advanced mining technology to the Akan fields.

The original Fante founders of Bono were not converts to ISLAM. However, Muslim DYULA traders in Bono and the neighboring kingdoms of BANDA and Begho were instrumental to the prosperity of the region. During the late 15th and 16th century some rulers of Bono were Muslims.

See also: BEGHO (Vol. III); BONO (Vol. III).

Borkou (Borku) Southeastern SAHARA DESERT region located in CHAD, between the Tibesti Massif and the Ennedi Plateau. The most important settlement in the region is the oasis town of Faya. Although the harsh climate made life difficult, a small number of nomadic ARABS, BERBERS, and TEDA people populated the area, perhaps as early as the seventh century. By the 13th century Borkou was crossed by TRANS-SAHARAN TRADE ROUTES that linked West Africa with Cyrenaica, in LIBYA. Muslim pilgrims en route to MECCA from West Africa also passed through the region.

See also: CYRENE (Vol. I); TIBESTI (Vol. III).

Bornu Early kingdom in present-day NIGERIA. Founded about 850 on the southwestern shores of Lake CHAD, Bornu was originally inhabited by the SAO, a group known for their trans-Saharan trading activities. As early as the 11th century, Bornu came under the control of the *mais,* or kings, of the SEFUWA dynasty from the neighboring kingdom of KANEM, with its capital at NJIMI, east of Lake Chad. Under the Sefuwa rulers, Bornu's borders expanded. Trade routes north brought great wealth to the kingdom, and the CITY-STATE of KANO, to the west, even payed tribute. By about 1240 both Bornu and Kanem had largely been converted to Islam, and the combined kingdoms became known as the trading empire of KANEM-BORNU. About 1488 the Sefuwa moved their capital from Njimi to NGAZARGAMU, in Bornu.

Botswana Present-day landlocked country of approximately 231,800 square miles (600,400 sq km) in southern Africa that is located on the African Plateau. Botswsana is bordered by present-day ZAMBIA, ZIMBABWE, NAMIBIA, and SOUTH AFRICA. Botswana is mostly semiarid desert and sparse savanna. The terrain is dominated by the Okavango Swamp to the northwest, rocky hill ranges to the east, and the KALAHARI DESERT to the south. Other than the Chobe, Okavango, and LIMPOPO rivers, no other dependable water source exists in Botswana. Thus the country is sparsely inhabited, albeit by diverse groups of people. Approximately half of the population is ethnic Tswana, while the remainder is composed of Kgalagadi, Ngwato, Tswapong, Birwa, and Kalanga peoples.

The early inhabitants of Botswana were the nomadic San and KHOIKHOI peoples, both of whom were pastoralists whose ancestors lived in the region for thousands of years. Bantu-speaking people migrated to the area around the first century CE. Settling throughout Botswana, by the eighth century the Bantu speakers migrated as far east as the Kgalagadi region. By the 13th century new kingdoms had been established at Gabane to the south and in the Tsodilo Hills to the north.

The most numerous people in Botswana, the Tswana, migrated to present-day SOUTH AFRICA in the 11th and 12th centuries. They established dynasties near the Vaal River, where they farmed and raised cattle. These seminomadic people did not establish extensive permanent settlements in Botswana until the 18th century.

See also: BANTU EXPANSION (Vols. I, II); BANTU LANGUAGES (Vol. I); BOTSWANA (Vols. I, III, IV, V); PASTORALISM (Vols. I, IV); SAN (Vols. I, III); TRANSVAAL (Vol. IV); TSWANA (Vols. I, III, IV).

Brass (Nembe) Kingdom or chiefdom located in present-day NIGERIA at the convergence of the Niger and Brass rivers, in the Niger Delta. Originally a fishing village called Nembe, Brass was founded in the 12th century by NEMBE people (an IJO subgroup). By the middle of the 15th century, the Nembe people had a monarchy, and in the 17th century the port became a slave-trading center known to Europeans as Brass.

Brong West African ethnic group and the region that they occupy in present-day GHANA. A subgroup of the AKAN people, the Brong traditionally have lived in regions of present-day IVORY COAST and the Brong region of Ghana. Their language, Twi, belongs to the Kwa branch of the NIGER-CONGO family. Archaeological evidence suggests that the early inhabitants of the Brong region were pastoralists who also engaged in a limited amount of agriculture. The chief components of Brong civilization, which emerged from the sixth to 11th centuries, included METALWORK, urban development, long-distance trade, and the formation of a state-based political system.

See also: AHAFO (Vol. III); BRONG (Vol. III); PASTORALISM (Vol. I).

bronze Alloy of COPPER and tin used in metalworking throughout Africa. The use of copper alloys developed in the northern regions of the continent, but by the fifth century coppersmithing technology had spread into SUB-SAHARAN AFRICA via TRANS-SAHARAN TRADE ROUTES.

Due to its softness and scarcity, copper was primarily used for decorative objects. Bronze, on the other hand, was a much harder metal, so it was often used to make weapons and tools. Bronze was not used exclusively for practical purposes, though. Archaeological evidence indicates that as early as the ninth century, peoples of GUINEA and CAMEROON were casting bronze ornaments using the LOST-WAX PROCESS.

See also: BENIN, KINGDOM OF (Vol. II); BRONZE AGE (Vol. I).

Buganda Early East African kingdom established by the GANDA people near Lake VICTORIA, in present-day UGANDA. Founded near the end of the 14th century, Buganda became the most powerful kingdom in East Africa in the 19th century.

Modern historians refer to the clans that settled in the Buganda area from the 13th to the 16th century as making up the Kintu complex, a collection of loosely aligned, multiethnic states that also included Busoga and Bugisu, on the western slopes of Mount Elgon. These peoples established settlements as they migrated southward from their homelands in what is now northwestern Uganda. According to Ganda oral tradition, the people of Buganda were first united under a *kabaka* (king) called SEKABAKA KINTU. However, some historians believe that the first Buganda king was a prince named Kimera (fl. early 15th century), a member of the LUO-speaking BITO aristocracy who was sent from the neighboring kingdom of BUNYORO, to the west.

Buganda social structure was based on paternal lineages. Regional chiefs served beneath the king, who acquired his wealth and power largely by raiding weaker neighboring kingdoms. The inhabitants of Buganda, sometimes called the Baganda, relied primarily on AGRICULTURE for their livelihood. They grew bananas, in particular, which were a major source of nourishment and were used to make beer. Buganda reached the height of its power in the 19th century.

Ganda oral tradition says that Sekabaka Kintu (a name meaning "First Man") and his wife, Nambi, not only founded Buganda along the shores of Lake Victoria, but also made the first cattle and BANANA plants in the region.

See also: BUGANDA (Vols. III, IV, V); BUSOGA (Vol. III).
Further reading: M. S. M. Semakula Kiwanuka, *A History of Buganda from the Foundation of the Kingdom to 1900* (New York: Africana Pub. Corp., 1972).

Bugangaizi Early kingdom of the Great Lakes region of East Africa. During the 10th and 11th centuries Bantu-speaking agriculturalists migrated to the region in large numbers, forming several small kingdoms, including Bugangaizi. By about 1250 several other small, Bantu-speaking kingdoms had emerged as offshoots of Bugangaizi. During the 14th century these small pastoral kingdoms were ruled by NDAHURA, the semimythical first king of the CHWEZI DYNASTY. Over the next half-century, he and his Chwezi successors united the region's many kingdoms into what is now called the KITARA COMPLEX. By the early 15th century, however, most of Kitara, including Bugangaizi, had fallen under the control of LUO-speaking pastoralists, who had invaded from the north.

See also: BANTU EXPANSION (Vol. I).

Bulala (Boulala) Nomadic people from the area around Lake Fitri, east of Lake CHAD, who invaded Kanem in the 14th century. The Bulala took advantage of Kanem's weakened SEFUWA dynasty, whose kings, or *mais,* had ruled the KANEM-BORNU trading empire since about the 10th century. Without a strong and unified military force defending it, the kingdom was especially vulnerable. Bulala attacks forced the Kanem *mai,* or king, Umar ibn Idris (r. 1382–1387), to abandon his capital at NJIMI, east of Lake Chad. He subsequently led his Kanuri-speaking Kanembu people to settle in Bornu, on the western shore of Lake Chad. After ousting the Sefuwa *mai*, the Bulala ruled Kanem into the early 16th century, when the Sefuwa rulers retook their original kingdom.

Bunyoro (Bunyoro-Kitara) Kingdom of the NYORO people in present-day UGANDA. The early Nilotic-speaking ancestors of the Nyoro probably arrived in the region during the eighth century. Once there they mixed with Bantu-speaking people who arrived from the west about the same time. The new groups that emerged from this cultural mix spoke Bantu and grew BANANAS as well as sorghum and other grains in their small villages. They also raised cattle.

Eventually the villages grew into a collection of small states. According to local oral histories, in the mid-14th century these states came under the control of rulers of the CHWEZI DYNASTY, who founded a loosely organized empire that became known as the KITARA COMPLEX. During the reign of the second Chwezi king, WAMARA, the Kitara complex was invaded from the north by Nilotic LUO-speaking pastoralists. Although the Chwezi and Nyoro traditions do not agree on exactly what happened next, it is clear that the Luo ultimately overthrew the Chwezi king and established their own monarchy in Bunyoro; some of the former Chwezi subjects were incorporated into Bunyoro. The Luo rulers of Bunyoro imposed many of their own traditions, but they did adopt the Bantu language spoken in the region.

By 1500 the BITO clan of the Luo was well established as the Bunyoro aristocracy. Bito members also left Bunyoro to conquer other settlements in the region and eventually founded the states of BUGANDA and TORO, as well as Buruli and Busoga.

Burkina Faso Landlocked West African country of some 105,900 square miles (274,300 sq km) bordered by present-day Republic of BENIN, IVORY COAST, GHANA, Republic of MALI, and TOGO. Lying on a sloping plateau, Burkina Faso's terrain includes extensive plains, low hills, and high savannas, as well as a northern desert. Apart from Stone Age axes that have been found in the north, the region's first inhabitants left few clues as to who they were and how they lived. The most widely accepted theory is that they were agriculturalists who settled the savanna west of the Mouhoun (Black Volta) River, perhaps around 1100.

By the 13th century the ancestors of the Mossi people began migrating into the area from the east. By 1500 they were joined by horsemen from the north who subjugated the peoples they found in the region. From these groups eventually arose the MOSSI STATES.

See also: BURKINA FASO (Vols. I, III, IV, V); KINGDOMS AND EMPIRES (Vol. II); UPPER VOLTA (Vols. IV, V).

Burundi Landlocked country in east-central Africa, some 10,700 square miles (27,700 sq km) in size, bordered by RWANDA to the north, TANZANIA to the east and south, and Lake TANGANYIKA and the Democratic Republic of the CONGO to the west.

With its rich volcanic soils, Burundi saw a steady growth of AGRICULTURE as practiced by Bantu-speaking farmers in the years between 500 and 1500. The use of IRON for weapons and tools steadily increased among these people, who were the ancestors of the modern HUTU. With forests providing plenty of wood for making the charcoal used to smelt the iron, Burundi quickly was on the way to becoming one of the most densely populated parts of the continent. Paradoxically, the clearing of land for farming and the felling of the forests for making charcoal opened up the region for pastoralism. This ultimately paved the way for TUTSI pastoralists to move into Burundi with their herds. By the 17th century the Tutsi had established the Burundi kingdom with themselves as the ruling elite.

Byzantine Africa Region of North Africa, including EGYPT and part of present-day LIBYA, that belonged to the Byzantine Empire from the third century CE until the rise of ISLAM, in the seventh century. Africa held an important place in the scheme designed by Byzantine emperor Justinian (r. 527–565) for reuniting the Roman Empire and driving out the Germanic Vandals, who had invaded Africa near the end of the fourth century. While Justinian's own invasion attempt was unsuccessful, his general, Belisarius, later succeeded. In 533 Belisarius landed in North Africa and within a year had destroyed the Vandal kingdom.

Justinian and his wife, Theodora (c. 502–548), were instrumental in the construction, and particularly the decoration, of churches in Byzantine Africa as well as in the reestablishment of Christian orthodoxy. Little is known of Byzantine Africa after the death of Justinian. The power of the military in the provinces grew, and between 585 and 591 a new official, the *exarch,* was placed in charge. The court of Constantinople tended to neglect Africa because of the more immediate dangers on the eastern and Balkan borders, and the *exarch* functioned as the court's deputy in Africa. In 610 Heraclius (575–641), son of the ruling *exarch*, sailed from Carthage to Greece in revolt against the unpopular emperor Phocas (r. 602–610). Heraclius succeeded Phocas the same year.

Africa still held some importance to the empire in the early seventh century. The Persians had overrun much of the eastern part of the empire, including Egypt, and at one point reached the walls of Constantinople. Only Africa appeared able to provide the resources and recruits needed to keep the empire secure. Heraclius briefly entertained

The Byzantine basilica called Hagia Sophia in Constantinople was once one of the premier churches in Christendom and the administrative headquarters of the Church in Africa. The building, which dates to around 535, became a mosque after the fall of Byzantium to the Ottomans. It is shown here in a lithograph by Louis Haghe (1826–1885), as based on a drawing by Chevalier Caspar Fussati. © *Historical Picture Archive/Corbis*

leaving Constantinople to return to Carthage but, heeding popular sentiment within the capital, decided to stay.

The rise of Islam, however, ended the Persian threat and also removed Egypt from Byzantine rule. Muslim Arab armies invaded Persia and defeated the Persian army in 637. In 639 Arab Muslims invaded Egypt, and by 642 they had captured Alexandria, the capital. Soon after losing Alexandria, the Eastern Roman Empire was no longer a force in Africa.

C

Cairo Capital of EGYPT and largest city in Africa. Cairo was officially founded in 969. Prior to this, the city had a variety of names—Memphis, Heliopolis, Babylon, al-Fustat, al-Qataei, and al-Askar being just a few of them. During its history it has been governed by an equally long list of rulers, from the ancient Egyptians, Greeks, and Romans to the ARABS, Turks, French, and British.

About 5,000 years ago, Menes, the legendary pharaoh who united the kingdoms of Upper and Lower Egypt, supposedly founded the city of Memphis, approximately 15 miles (24 km) south of modern-day Cairo. In 525 BCE, invading Persians established a fort, called Babylon, north of Memphis, from which they controlled Egypt. Babylonian domination continued until the arrival of Alexander the Great in 332 BCE. The region later fell under the rule of the Romans. The arrival of Islamic Arabs, around 640 CE, led to the founding of the town of al-Fustat, the seed from which contemporary Cairo sprang.

In 969 the FATIMIDS invaded Egypt from what is now TUNISIA. A new walled city called al-Mansuriyah was established northeast of the existing settlements. In 973 the Fatimid caliph al-Muizz (c. 931–975) renamed the city al-Qahirah, or Cairo, making it the capital of a dynasty that lasted for 200 years. Al-Qahirah and al-Fustat coexisted until 1168, when al-Fustat was set on fire during the CRUSADES. Eventually the Crusaders were defeated by an Islamic army from Syria. Their commander, the famous SALADIN (1137–1193), founded the Ayyubid dynasty, which claimed Cairo for the seat of its rule.

Under Saladin, Cairo became a thriving metropolis. He constructed mosques, palaces, colleges, hospitals, and a fortress, named the Citadel, which has remained one of Cairo's most important landmarks. After his death, Saladin was succeeded by male family members until the rule of Shagaret-el-Dorr (c. 1250), a Mamluk who was the wife of the last Ayyubid sultan, al-Saleh. One of three women ever to rule Egypt, Shagaret-el-Dorr had a great influence on Cairo. After her murder in 1260, Cairo became the capital of the Mamluk empire with Baybars I as sultan.

By 1340 Cairo was at its height, with nearly 500,000 people living in an area five times larger than the original Fatimid walled city. Under the MAMLUKS, Cairo became the greatest city of Africa, Europe, and Asia Minor. The city's al-AZHAR University was the undisputed center of Islamic scholarship. Cairo also was an important link in the lucrative East-West spice trade. This was also the period during which many of Cairo's architectural masterpieces were built.

In 1348 Cairo's population was decimated by plagues, including the infamous Black Death that later swept across Europe. Decline set in soon after. Another blow came in 1497, when Vasco da GAMA'S (c. 1460–1524) voyage from Portugal to India broke Cairo's spice-trade monopoly. Then, in 1517, the Turks conquered Cairo.

Cameroon Modern-day country in western Central Africa approximately 183,600 square miles (475,500 sq km) bordering CHAD, CENTRAL AFRICAN REPUBLIC, Republic of the CONGO, GABON, EQUATORIAL GUINEA, NIGERIA, and the

Gulf of Guinea. The region that became Cameroon was occupied by various peoples, including the Sudanic-speaking SAO and FULANI, and the Bantu-speaking DYULA, FANG, and Mileke, during the fifth through the 15th centuries.

Between the ninth and 15th centuries, the Sao established a kingdom that covered large parts of northern Cameroon and Nigeria. The Fulani, a Muslim people who first came to Cameroon in the 11th century, lived on the Adamawa Massif. They dominated the peoples inhabiting the valleys of the Logone, Kebbi, and Faro river valleys, converting many of them to ISLAM.

The Mileke lived in the area that is now western and southern Cameroon. They were mainly farmers whose staple crops include corn and taro. Like other Bantu-related groups, they migrated to Cameroon from equatorial Africa.

Cape of Good Hope Though not the southernmost point on the African continent (that honor lies with Cape Agulhas some 170 miles [280 km] to the east), the Cape of Good Hope was the point at which the cold waters of the Atlantic Ocean met the warmer waters of the Indian Ocean. The Cape received its name (Cabo da Boa Esperança, in Portuguese) in 1488, when the Portuguese explorer Bartolemue Dias (c. 1450–1500) rounded it on his search for a new sea route to India. Today, the Cape is part of a nature preserve and national park.

Cape Verde Islands Archipelago 1,560 square miles (4,040 sq km) in size, located in the Atlantic Ocean, 385 miles (620 km) from the coast of present-day SENEGAL. Consisting of 10 islands and five islets, Cape Verde is historically associated with the Portuguese olive trade to the Americas. Cape Verde was discovered, in 1460, by the Portuguese navigators Diogo Gomes and António de Noli. There is little evidence to support the assertion that the islands were inhabited before the European arrival, although it is believed that the Moors may have sought salt here in previous centuries. In 1462 the first settlers arrived and founded the oldest European city in the tropics, Ribeira Grande. A governor and bishop were installed on the island of Santiago to administer to political and spiritual affairs.

Under the Charter of 1466, Portuguese settlers were allowed to trade freely with the Upper Guinea coastal cities, from Senegal to SIERRA LEONE. After securing trading posts on the islands, settlers began to establish trading settlements on the African mainland. As a result, the settlers merged with the African societies with whom they traded, taking African wives and establishing trading alliances with the leaders and local traders. These alliances gave rise to a new society called *lancados,* European or half-caste traders, who became acculturated in the African communities.

Although fishing and cane farming were established as principle industries early on, Cape Verde's limited rainfall, frequent droughts, and significant soil erosion were, and are still, incompatible with large-scale crop cultivation. Instead, grazing, subsistence farming, and fishing supplemented a limited BANANA and SALT TRADE. Much more significant to the islands' economy was their location, which made Cape Verde a logical point of departure for trade between Africa and the Americas.

caravans Traders and others traveling together for mutual safety with their baggage and other goods through difficult or dangerous terrain. In Africa, the caravan is most often associated with trans-Saharan trade, although caravans were used on trade routes throughout Africa. Muslim pilgrims also traveled to MECCA in caravans.

The earliest animals used to cross the desert may have been pack oxen, as depicted in Saharan rock art, dating from before 4000 BCE, found at Tassili in ALGERIA. The record here is unclear, however, because many scholars question the validity of using those paintings to establish historical fact. Reliable sources indicate that the Arabian camel, introduced into North Africa in the first century CE, became, by the fifth century, the pack animal of choice among the Berber nomads. Although it could not carry much more than a pack ox, the camel could maintain a steady pace over longer distances and travel without water for up to 10 days. The camel's broad, splayed feet gave it secure footing when walking on shifting sand, and it was able to endure both the extreme heat of the desert day and the chilling cold of the desert night.

Loads of 350 pounds (160 kg) or more were equally divided and loaded onto a camel's back. Strings of 40 or more camels were tethered together by a rope from each camel's nose ring to the saddle of the camel in front. Commonly, three or four strings of camels traveled abreast, moving at a speed of 2 to 3 miles (3 to 5 km) per hour for 10 to 14 hours daily, often at night for protection from the heat. It was a two-month journey, under the direction of a caravan chief with the assistance of local guides, to travel the TRANS-SAHARAN TRADE ROUTE from SIJILMASA in North Africa to WALATA in the MALI EMPIRE. Caravans taking this route often made a stopover at the Taghaza salt mines in the desert. Many caravans were lost

to raiders or the elements. Gaining or keeping control of the staging areas were important goals of all the trading empires of West Africa.

The size of the trans-Saharan caravans was significant. Caravans averaged 1,000 camels. The Tunis-born Arab historian Ibn Khaldun (1332–1406), who wrote a definitive history of Muslim North Africa, records caravans of 12,000 camels between West Africa and Egypt. The largest caravans were involved in the all-important salt trade or in taking Muslim pilgrims on pilgrimage to Mecca in Saudi Arabia, one of the most important spiritual duties of the observant Muslim. These pilgrim caravans had to arrive in Mecca on the prescribed eighth day of Dhu al Hijjah, the last month of the Muslim year.

Casamance River River located in the coastal floodplain region of West Africa between present-day countries of The GAMBIA and GUINEA-BISSAU. The river is 160 miles (257 km) long and flows to the west, emptying into the Atlantic Ocean. During the period prior to European colonization, the land on either side of the river was populated by the Balanta, the DYULA, and the Felupe peoples. During the 1500s Portuguese explorers sailed through the estuaries and inlets of the river to penetrate inland, thereby transforming the Casamance River into a thoroughfare for the exchange of goods and ideas between the two civilizations.

cassava Edible starchy tuber also called manioc, mandioc, and yucca. Along with maize (corn), tobacco, and peanuts, it originally came from the Americas and was introduced to Africa about 1500. Cassava is cultivated throughout SUB-SAHARAN AFRICA and is used to make flour, breads, and *fufu,* a gelatinous food common in West Africa. Cassava, which also is cultivated in East Africa, has long been a staple in the diet of African peoples.

Cassava, unlike millet and other grain CROPS, is easy to cultivate, which usually leads to a successful harvest. The plant itself is perennial and has palm-shaped leaves. It can thrive in dry areas and can grow in alkaline soil or in acidic mud banks along rivers. It is an extremely adaptable species and comprises many different varieties. Certain species produce a sugar derivative that contains cyanide (hydrocyanic acid). The poison, which is manu-

factured by a system of grating, pressing, and heating the roots, is used as the toxin on poison darts and arrows.

cavalry Military branch whose members ride horses in battle. In Africa, horses were traded via the TRANS-SAHARAN TRADE ROUTES from North Africa and the Middle East to the western SUDAN, where the region's empires and kingdoms used horses in their military conquests.

African cavalry units often came from the highest levels of society. The cavalry of the MALI EMPIRE, for example, was an elite corps of the military, and membership was reserved for the aristocracy. The members of the cavalry were called the *ton-tigi,* or "quiver and bow bearers."

The powerful SONGHAI Empire of the 15th century also possessed an impressive cavalry, with as many as 10,000 horse-mounted soldiers. Because of the high cost of the horses (each horse was equivalent in cost to 10 captives), the Songhai cavalry, too, was composed only of members of the aristocracy.

At the start of the 12th century, horses were brought from areas north of the SAHARA and traded for GOLD and IVORY. By the end of the century, however, they were being bred in the Niger River valley.

Near Lake Chad, in NJIMI, the capital of the kingdom OF KANEM-BORNU, North African merchants traveled to the city to trade for horses during the 15th century. These horses were referred to as "war horses" since they were larger and stronger than the ones owned and bred in other parts of the the empire. It is reported that the *mai,* or king, of Kanem had a cavalry of more than 40,000 horses, which illustrates the enormous impact of trade upon Kanem-Bornu's prosperity.

Central African Republic Landlocked, equatorial, Central African country, some 240,300 square miles (622,400 sq km) in size, that is bordered on the north by CHAD, on the east by the Republic of the SUDAN, on the south by the Democratic Republic of the CONGO and the Republic of the CONGO, and on the east by CAMEROON. During the fifth through 15th centuries the population of the Central African Republic was made up of farmers who followed a shifting pattern of slash-and-burn AGRICULTURE. They belonged to extended family clans and

lived for the most part in isolated and small villages. Gradually trade linked these villages, leading to the larger states that began to emerge until the 16th century.

Chad Country in western Central Africa approximately 496,000 square miles (1,284,6000 sq km) in size. This region of Africa is marked by the Tibesti Massif to the north, Lake Chad to the west, the savannas of the Sahel to the south, and is separated into two distinct northern and southern regions by the Chari River. It is bordered by the modern country of LIBYA to the north, NIGER to the west, EQUATORIAL GUINEA to the southwest, the CENTRAL AFRICAN REPUBLIC to the south, and Republic of the SUDAN to the east.

Because of the importance of Lake Chad, the region saw many kingdoms and conquests during its history. In the eighth century, BERBERS migrated into the area in order to escape the droughts of the Saharan borderlands. By the 11th century, Muslim ARABS from the north had begun regularly raiding the area for captives, establishing ISLAM as they came and went. As a result Arab culture gradually superseded the native African ones and undermined the autonomy of the local kingdoms.

Kanem, located to the northeast of Lake Chad, was a kingdom originally made up of nomadic peoples who spoke Nilo-Saharan languages and were dominated by the ZAGHAWA people. Local oral traditions say that the Arab Sayf ibn Dhu Yazan united these people and began the SEFUWA dynasty, which ruled Kanem, and, at times, the larger KANEM-BORNU empire, from the ninth century to the 19th century.

Changamire (15th century) *Ruler of Mwene Mutapa state, located in what is now Zimbabwe*

During the middle of the 15th century the Bantu-speaking KARANGA people created a powerful kingdom that eventually came to include the majority of the southern part of present-day ZIMBABWE. The kingdom's ruling dynasty, the founding of which is variously ascribed to the warrior kings Mutapa or Nyatsimba, successfully dominated the region for a number of years. In the late 15th century King Matope expanded the kingdom significantly. By the time Matope's son Mokombo came to the throne in 1480, however, the MWENE MUTAPA, as the ruler was known, faced increasing unrest among the kingdom's various provincial governors and other vassals. The kingdom, too, became known as Mwene Mutapa.

Mwene mutapa, **the title used by Changamire's rulers, means "master pillager." Instead of being considered an insult, the term was thought of as a title of respect.**

Ultimately, in about 1490, one of Mokombo's governors, CHANGAMIRE, led a full-scale insurrection. According to various legends, Changamire believed that Mokombo wanted to kill him, and, in response, led a group of soldiers to Mokombo's capital, GREAT ZIMBABWE. There the majority of Mokombo's soldiers deserted him, leaving only a handful of guards and courtiers to defend him. Entering the royal quarters, Changamire quickly beheaded Mokombo with a single blow of his sword and proclaimed himself king.

Changamire then attempted to make his position more secure by trying to have all 22 of Mokombo's children killed. One of the princes escaped, however, and, four years later, led an army against Changamire. The battle that resulted apparently lasted for several days until Changamire was killed by the young prince.

Mokombo's son then became the *mwene mutapa*. While much of the country recognized Mokombo's authority, a number of Changamire's supporters resisted. Strife between the two factions continued for a number of years, with Changamire's allies eventually establishing a small, independent kingdom centered around the remnants of the city of Great Zimbabwe. During this period, both mining and the GOLD trade suffered significantly, which apparently led the Portuguese to take more direct control of the region. By the beginning of the 16th century, power had begun to pass to the Portuguese, and even the kingdom of the *mwene mutapa* fell under Portuguese domination.

Further reading: David N. Beach, *The Shona and Zimbabwe, 900–1850* (Gwelo, Zimbabwe: Mambo Press,

1980); Innocent Pikirayi, *The Zimbabwe Culture: Origins and Decline in Southern Zambezian States* (Walnut Creek, Calif.: AltaMira Press, 2001).

Chemama   Region and river valley on the northern bank of the SENEGAL RIVER in present-day MAURITANIA. It was part of the MALI EMPIRE during the 14th century, and later, in the 16th century, became part of the HAUSA STATES. A biologically diverse region, Chemama has a complex ecosystem created by the annual flooding of the Senegal River. Its land has rich alluvial soils that have long supported farming and herding.

Chinese trade   Despite reports of the presence of Chinese traders in Africa as early as the seventh century BCE, Chinese trade did not begin in earnest until the expeditions of Cheng-Ho (1371–1433) between 1405 and 1433. Cheng-Ho, a grand admiral of the Chinese navy, commanded a large squadron of ships that landed on the SWAHILI COAST at the port of KILWA in East Africa. The relatively late arrival of the Chinese to Africa is explained by the fact that it was not until after the 11th century that Chinese vessels sailed south or west of the Indonesian island of Java. Then, in 1402, a Korean map was published that included an outline of southern Africa.

The ships in Cheng-Ho's fleet were up to 500 feet long (152.4 m), making them five times larger than any of the Portuguese-made vessels that arrived at the same East African port in the early 16th century. The squadron was equally large in number. On previous voyages, which had gone to ports in Southeast Asia and the Red Sea, Cheng-Ho had commanded fleets of up to 62 ships, carrying as many as 27,800 men.

The African products that Cheng-Ho brought back—including GOLD, amber, IVORY, and captives—were highly valued in China. It is reported that in 1417 he returned with a delegation from Malindi who presented the royal court at Beijing with a giraffe.

Chinese trade was dominated by the import of porcelain in East Africa. Pieces created during the rule of China's Song dynasty have been documented through excavation in several homes of wealthy Swahili traders during the period. Bluish white, Ming porcelain arrived in the 15th century at the port of GEDI. Chinese trade—along with Persian, Arab, and Indian trade—contributed both to the cultural and economic development of Swahili civilization in the 15th century. By the end of the 15th century, however, China returned to a policy of isolation. From that time on, trade with Africa was curtailed.

Chokwe (Cokwe, Ciokwe, Bajokwe)   Bantu-speaking Central African people. A mixture of many indigenous and immigrant peoples, they trace their origins to the Mbuti, hunter-gatherers who came under the demonstration of agricultural by Bantu-speakers about the sixth or seventh century. Around 1500 the Chokwe came under the rule of the LUNDA KINGDOM when a disinherited Lunda prince moved west into the area straddling present-day ANGOLA, Democratic Republic of the CONGO, and ZAMBIA. Conquering the people in his path, the prince created a kingdom for the Chokwe people.

See also: CHOKWE (Vol. III); LUNDA EMPIRE (Vol. III); MBUTI (Vol. I).

Christianity   The religion based on the teachings of Jesus Christ; Judaism, Christianity, and ISLAM, are the world's three great monotheistic religions. Chapter 2 of the Gospel of St. Matthew, the first book of the New Testament of the Christian Bible, records the flight of the holy family from Judea in Palestine into EGYPT to keep the infant Christ from falling into King Herod's hands. Although this visit, otherwise undocumented, antedated Christian missionary activity by several hundred years, it points to the long-term connection between Africa and Christianity.

Doctrinal disputes were frequent in the early days of the Christian Church. Some, like Arianism, originated in Africa. Others arose elsewhere but soon engulfed the universal church. The patriarch of Rome, the pope, was beginning to emerge as the central authority of the church in the West, but patriarchates also existed in Constantinople, Jerusalem, Antioch, and Alexandria, and each patriarch, or bishop of the highest rank, jealously guarded his prerogatives. Dogma and doctrine were shaped and refined as church leaders convened in ecumenical councils, including the Council of Nicea in 325 (at which the Nicene Creed, or statement of beliefs, was developed), the Council of Constantinople in 381, and the Council of Chalcedon in 451. These ecumenical councils, attended by the bishop from every local church, determined the official position of the universal church on the major theological disputes of the period.

Donatism and Pelagianism   The church in North Africa in the fifth century continued to be embroiled in its own internal disputes, some stemming from theology and others from juridical concerns that had originated in earlier centuries. Donatism and Pelagianism remained issues in the North African Church and in the church at large. The Donatist schism between Rome and large seg-

ments of the church in North Africa persisted until the rise of Islam in the seventh century effectively ended a meaningful Christian presence in the region. Many historians believe that these internal theological and political disputes turned the church's energies inward, not just in Africa but across the whole Byzantine Empire, and left the empire in a diminished position to temper the inroads made by Islam in the seventh century.

Donatism, which had persisted since the third century, was based on disagreements on the question of whether an unworthy minister may worthily administer the sacraments. The African Church took the position, condemned by the church at large, that the minister himself had to be holy. Rome's position was that the validity of the sacraments came from God, not man.

The Pelagian heresy, prompted by the teachings of the early fifth-century British monk Pelagius, centered on the more speculative matters of free will, predestination, original sin, and divine grace.

Arianism The Arian heresy, which arose in Egypt in the third century, dominated the Greek-speaking Eastern Church in the fourth century and then spread through the Western Church, remaining a force in Europe until the eighth century. The Vandals who invaded North Africa from Europe in the fourth century and captured Carthage were Arian Christians. The Visigoths who established a large empire in what is now Spain and France, were also Arian Christians as were the Germanic groups that sacked Rome in the late fifth century. Their cause was both political and theological.

Monophysitism The Council of Chalcedon of 451, which affirmed traditional beliefs in the dual nature of Christ as god and man, alienated Monophysite believers in Egypt and Syria, who held that Christ had a single, divine nature. During the next 250 years the Byzantine emperors and patriarchs sought to reconcile the Monophysites but in vain. The Armenian Apostolic Church, Coptic Orthodox Church, Ethiopian Orthodox Church, and Syrian Orthodox Church were formed in schism with Constantinople, the city that was the center of the church in the Eastern Roman Empire, and were outside the mainstream of Christian thought.

From the seventh century on, many, but not all, members of the Coptic Church converted rather than suffer the periodic bouts of persecution waged by Islamic rulers. Nevertheless the Coptic Church has remained intact to modern times. Similarly, in Nubia, Christians were pressured to adopt Islam, but after a brief standoff they retained their right to Christian worship.

The Ethiopian Orthodox Church The church in Ethiopia, though sometimes beset by its Muslim neighbors, kept its independence but became a church turned in on itself, with few influences from the outside world. Although its bishops were named by the Coptic Church of Egypt (a practice that ended in the 20th century), neither church was in communion with the main centers of Christianity in Rome or Constantinople because of their adherence to Monophysite beliefs. The Ethiopian Church's main contact with the outside Christian world was through the Ethiopian monastery in the holy city of Jerusalem. Since the late 1100s, this group has maintained control of a chapel in Jerusalem's Church of the Holy Sepulchre, thought by believers to be the burial place of Jesus Christ.

The kingdom of AKSUM established Christianity as its state religion in the fourth century. Surrounded by regions in which traditional African religion flourished, the Ethiopian Orthodox Church remained highly conservative. Christian beliefs won converts through interaction with local populations, and its rites and religious practices were infused with traditional African elements. For instance, many of Ethiopia's monasteries attracted priests who were highly politicized and outspoken advocates on behalf of the poor. The church celebrated the Virgin Mary in keeping with its belief in the divine nature of Christ but also recognized many martyred saints. Church officials were known for performing exorcisms to rid the population of evil spirits. A widespread belief held that these spirits were kept at bay by amulets containing prayers and formulas carried in little books or leather cases. These were worn around the neck or arms by local populations as well as by visiting Islamic merchants, who held similar beliefs. The observance of fasts, feasts, and Jewish practices related to diet were also among the Christian practices of Ethiopia. Ethiopia's imperial leadership resisted the advance of Islam through its powerful alliance and support by the church. After Aksum declined in the seventh and eighth centuries, subsequent leadership maintained Christian traditions in the face of repeated clashes involving the establishment of powerful Muslim states within its interior.

Christianity began to spread southward from Ethiopia in the 12th and 13th centuries, but only slowly, because of Arab naval supremacy in the Indian Ocean. It remained for missionaries from Europe to return Christianity to a greater level of importance, but that did not occur until the colonial era.

Christianity, influence of Between the fifth and 15th centuries, the influence of CHRISTIANITY was strong in North Africa, EGYPT, Nubia, and ETHIOPIA until the rise of ISLAM and all but nonexistent in SUB-SAHARAN AFRICA. Despite the decline of Christian influence during this period, many events that happened in the early centuries of the church in Africa had long-term repercussions for the Christian Church outside Africa.

Christian culture in the fifth century kept Africa in contact with the broader world of Mediterranean culture in the same way that Islam in the eighth century placed Africa in the cultural orbit of Muslim Baghdad and Damascus in the Middle East. In the fifth century, however, Rome and Constantinople were the dominant cultural and religious influences in the region. The major figures of the church in Africa in previous centuries, notably St. Augustine (354–430), the bishop of Hippo Regius (modern Annaba, Algeria), near Carthage, influenced religious thought throughout the Christian world. As the fifth century began, the church in Africa faced the same questions about its core beliefs that challenged the Church at large.

The Church in Sub-Saharan Africa Until Portugal's attempt to introduce Christianity into sub-Saharan Africa during the reign of Prince HENRY THE NAVIGATOR (1394–1460), indigenous Christianity existed primarily in North Africa and along the eastern regions of the continent—in Egypt, Nubia, and Ethiopia. Besides being motivated by religious zeal to Christianize the lands south of the Sahara, Prince Henry, some authorities conclude, may have been attempting to outflank ISLAM, Europe's main rival, from the rear as well as gain a political and commercial foothold in the region. These attempts at conversion, though successful in such places as the KONGO KINGDOM, had no long-term results, and Christianity vanished almost without a trace in these regions until missionaries returned in the 1800s.

The Church in North Africa From the end of the second century, Carthage had its own bishop, and North African Christianity was in the mainstream of the Western Church centered in Rome.

Throughout the fourth and fifth centuries, the North African Church was beset by Pelagianism and the schism caused in 311 by the Donatists, which was to last until Roman Africa fell to Islam in the mid-seventh century.

Pelagianism, the doctrine preached by the fifth-century British monk Pelagius, denied the orthodox doctrine of original sin and the need for God's grace. St. Augustine was its fiercest opponent. Pelagianism was condemned by the Council of Carthage in 418 and finally disappeared by 529.

At its height, Donatism, a separatist movement led by a North African bishop named Donatus (d. 355), held the allegiance of 500 bishops in North Africa; the Donatists successfully exploited the differences between the wealthy Latin-speaking peoples in the coastal cities and the poor Punic-speaking people in the hinterlands by, among other ways, celebrating the liturgy in Punic rather than in Latin. The Donatist schism survived into the seventh century.

The Arab invasions of North Africa (640–711) effectively ended the presence of Christianity in North Africa. Christianity had never taken root among the Berber peoples in the west, and Islam had no greater success at this time. Early Arab rulers in North Africa made few efforts to convert the hinterlands; it took more than a century for Islam to spread beyond the coastal towns. As long as they paid tribute to local Arab rulers, the BERBERS were left alone.

The Church in Egypt COPTIC CHRISTIANITY was strongly influenced by the Monophysite belief in the single divine nature of Jesus Christ. In 451 the Council of Chalcedon, a meeting of important church leaders, declared Monophysitism a heresy, leading the Coptic Church to break with Rome and establish the Coptic Orthodox Church, with the patriarch of Alexandria as its head. Popular feelings ran high. In Alexandria, a group of Monophysite monks was boiled in oil in front of the cathedral. There were bloody uprisings among the people, and the dispute about the single or dual nature of Jesus Christ raged on for years. These internal conflicts very likely weakened Egypt and the empire and left both less able to resist the single-minded threat of Islam. By the sixth century, three distinct Monophysite churches had developed, the Jacobite Church of Syria, the Orthodox Church in Armenia, and the Coptic Church in Egypt and Ethiopia.

After the Muslims invaded Egypt in 639, the Coptic Church used the opportunity to assert its independence from Constantinople, its rival, and set up an autonomous Monophysite Church under the patriarch of Alexandria. The Coptic Church, however, moved to the periphery of Egyptian life because the majority of Egyptians converted to Islam.

The Church in Ethiopia Ethiopia was converted in the fourth through sixth centuries by Monophysite missionaries from the Coptic Church of Egypt. When the power of AKSUM waned, other Ethiopian states arose in the highlands; of their history, little is known. Through their influence, some of the characteristic features of Ethiopian

Christianity began to emerge, including its emphasis on its alleged Old Testament roots and its strong identification with Zion. Like the Egyptian Coptic Church, from which it received most of its metropolitans, or heads of church, the Ethiopian Church had a strong monastic tradition, and its monasteries were centers of learning. Ethiopia's isolation at this point in its history, and not the traditionally held descent from a lost tribe of Israel, may be the factor that led the church to link itself so closely in life and worship to the Old Testament.

During the 11th and 12th centuries kings of the ZAGWE DYNASTY built many churches in honor of the Christian religion, the most famous of which are the underground stone churches at the capital city of al-Roha, later renamed the town of LALIBELA after the builder-king of the same name. The Zagwe kings traced their ancestry to the daughter of the last Aksumite king, from whom the Zagwe rulers usurped the throne. The church legitimized their seizure of power, it is thought, in return for sizable donations. Yemrehana Christos (r. c. 1039–1079), Lalibela (r. c. 1119–1159), and Na'akuto Le'ab (r. c. 1159–1207), three renowned church builders who were members of this dynasty, were canonized by the Ethiopian Church.

The Ethiopian Church traces its stewardship of one of the chapels in the Church of the Holy Sepulchre, the reputed burial site of Jesus Christ, in Jerusalem, to a gift from the Egyptian sultan SALADIN (c. 1137–1193) to King Yemrehana Christos and the Christians of Ethiopia.

The successor of Yemrehana Christos, his cousin Harbe I (r. c. 1079–1119), attempted to break the dependence of the Ethiopian Church on the Coptic Church by demanding that the Ethiopian bishop Abba Mika'el ordain more bishops, a privilege Abba Mika'el said was restricted to the patriarch of Alexandria. With more bishops, Harbe thought, the Ethiopian Church could consecrate an archbishop and free itself from Egypt. Although Muslim authorities in Egypt supported Harbe's move, the patriarch did not, warning that it could cause hostility between Muslims and Christians. The issue was dropped, and Egypt continued to name the head of the Ethiopian Church until 1959, when Ethiopian emperor Haile Selassie (1892–1975) finally made the break.

The Church and the Byzantine Empire The Byzantine emperor Justinian I (r. 527–565), a strong defender of religious orthodoxy, attempted to unite the Church across the empire. Under his absolute power, the Church was to achieve its greatest influence in the East. Among his accomplishments in religious matters, he made sure that the bishops of all the major centers of Christianity—Rome in Italy, the empire's capital at Constantinople, Antioch in southern Turkey, Alexandria in Egypt, and Jerusalem in Palestine—were officially given the title of patriarch, with extensive privileges and an official income.

The rise of Islam in the following century, however, drastically lessened the authority of Alexandria, Antioch, and Jerusalem as centers of Christianity. With the loss to the ARABS of these patriarchates and the marginalization of their influence in the Christian world, religious power became more concentrated in the hands of their ancient rivals, Rome and Constantinople. Eastern Christianity centered ever more strongly on Constantinople as the church in the East and West drifted culturally and politically apart. As Europe drifted more deeply into its Dark Ages (c. 400–1000), learning and culture, at an ebb in Europe, centered on and flourished in Constantinople, which finally broke with Rome in 1054. The eastern portion became known as the Orthodox Church; the western branch, the Catholic Church.

The Church in Nubia Christian missionaries converted Nubia in the sixth century. Theodora (497–548), the wife of the Byzantine emperor Justinian I, was an outspoken defender of Monophysite doctrines, although the emperor himself was orthodox in his beliefs. In 543, at Theodora's request and at the request of the Egyptian Coptic Church, the monk Julian traveled to NOBATIA, one of the three kingdoms that made up the Nubia of the day. By 580 the last of the three kingdoms of Nubia were converted. Christian NUBIA left the world a substantial legacy of religious art and architecture from this period. The Nubian church, however, had little effect on the church at large.

By 652 a Muslim army captured the CITY-STATE of Dongola, the last Christian stronghold in Nubia, and forced it to pay tribute to Egypt. In a highly unusual move for the time, the Muslim conquerors and the Nubian Christians lived under a treaty, called a *bakt,* that guaranteed a strong measure of autonomy and religious freedom to Nubia. Dongola remained Christian until the 14th century, and another Nubian city, ALWA, remained Christian until the 16th century, when each fell to the Ottoman Empire.

Chwezi dynasty (c. 14th–15th century) Line of semi-mythical rulers that came to prominence in the KITARA COMPLEX of chiefdoms, in present-day western UGANDA. According to oral tradition, the founder of the Chwezi clan was NDAHURA, the leader of the BUGANGAIZI chief-

dom. About the middle of the 14th century Ndahura came to rule much of the Kitara Complex by appointing local chiefs to represent him in the outlying areas.

The Chwezi dynasty was in power for a relatively short period. Its kingdoms were characterized by small populations with a sophisticated system of government. The elite class, mostly cattle-owning pastoralists, and the common people, mostly agriculturalists, were subject to different laws. The burden of tribute and taxation fell heavier on the farmers.

Although the oral traditions do not agree, Ndahura was probably captured while invading a neighboring territory and, upon his release, he migrated far from the kingdom to avoid disgrace. A second Chwezi ruler, Mulindwa, may have had a brief reign before Ndahura's son, WAMARA, was chosen to assume leadership of the Chwezi clan. Wamara attempted to integrate several migrating ethnic groups into his kingdom. However, these groups, especially the LUO-speakers from the north, never fully accepted Chwezi authority. This political unrest may have been exacerbated by severe famine and disease among the local livestock.

Chwezi tradition says that one of Wamara's military commanders, Kagoro, massacred Wamara and the rest of the Chwezi clan, bringing and end to the dynasty. (However, the HINDA royal clan of the future states of NKOLE, BURUNDI, and KARAGWE claimed that they descended directly from Wamara.) Soon the BUNYORO state, ruled by the pastoralist BITO clan, supplanted most of the former Chwezi kingdoms.

For their heroic qualities and their ability to unite the disparate kingdoms of the Kitara complex, Ndahura, Wamara, and other Chwezi chiefs are still much revered among certain ethnic groups living in present-day Uganda and TANZANIA.

city-state Political, social, and territorial system in Africa in which a city governs its surrounding regions; city-states generally are the smallest system of organization as compared to kingdoms and empires. In Africa, the populations of such cities and their neighboring regions usually were of a common culture and were united under the leadership of a sovereign king.

The HAUSA STATES of NIGERIA and the city-states of the YORUBA are among the most notable examples of this system. In each case the city-state was run by a sophisticated system of cultural and political codes. A mother city, DAURA for the Hausa city-states and ILE-IFE for the Yoruba, served as the locus for all activities.

Historically, city-states often evolved into larger kingdoms or empires by means of the acquisition of new territories. (This usually was accomplished through military conquest.) KANEM-BORNU in the land of present-day CHAD, for example, emerged from two independent city-states, KANEM and BORNU. The 13th-century city-state of GREAT ZIMBABWE in southern Africa is another example of a powerful city-state, although it was abandoned by 1450 and did not evolve into a larger political and social structure. The city-states of the SWAHILI COAST, united in culture and language but politically autonomous, are yet another example of the importance of city-states in African history and culture.

cloth and textiles Usually made by loom, cloth and textiles were used to make CLOTHING AND DRESS as well as for ceremonial purposes. In parts of Central and West Africa the finest cloth was even used as currency. Unfortunately, because of the climate and the fragility of cloth, few African textiles of any substantial age have survived to the present time.

All loom-woven cloth, no matter its origins, is created in similar ways. The long parallel threads that run lengthwise in a piece of cloth are called the warp. The warp threads are attached to both the base and the top of the loom. The warp is usually made up of two separate sets of alternating threads that are moved apart to allow a cross thread to be passed between them by means of a device called a shuttle. The cross threads are called the weft or the woof. Using different colors of thread in the weft creates a design. The development of the heddle is considered the most important single advance in loom technology. Its origin is not known. A heddle is a device that separates the warp threads so that the shuttle can be inserted and passed between them. The width of the cloth is determined by the width of the loom but, narrow strips of cloth can be sewn together to produce wider sheets.

Of the two main types of looms used in Africa, the oldest is the pit loom, which may have been used originally in Arabia. A pit loom utilizes a frame built over a pit, into which extend the treadles used to separate the warp threads. The weaver's hands are thus left free to operate the shuttles. The other common loom is called a heddle loom, which, in its earliest forms, used movable rods to separate the warp threads to either side of the main sheet of cloth. Both the narrow-strip loom and the vertically mounted, single-heddle loom were probably developed in Africa.

Some of the earliest fragments of pit-loom cloth date back to about the ninth-century and were produced by the

A weaver in the Royal Weavers Village of Bonwire, near Kumasi in modern Ghana, demonstrates how cloth was woven on the traditional heddle loom. The long threads are the warp. © *Owen Franken/Corbis*

IGBO people in what is now NIGERIA. Elsewhere, in parts of CAMEROON and throughout East Africa, simple ground looms were widely used. Vertical heddle looms were used in what is now the Democratic Republic of the CONGO. These were used to produce raffia cloth from palm frond fibers. In West Africa, in the area of present-day Republic of MALI inhabited by the DOGON people, fragments of loom-woven cloth dating from the 11th century were found in burial caves along the Bandiagara cliffs. Some historians think that the need to supply West African converts to ISLAM with appropriate religious attire helped spread weaving technologies throughout the region.

Some types of cloth were exchanged in internal trade with other African peoples, but most were kept to satisfy domestic needs. Fine cloth, including Chinese silk, was brought to North and East Africa by Arab traders and sold to inland peoples. In some cases the silk was unraveled and the threads were combined with local cloth to make the garments of a high-ranking individual.

Kinds of Cloth   Embroidered raffia cloth, made from the leafstalks of a number of varieties of palm trees, was once produced across Central Africa. For example, the Kuba people, who lived between the Kasai and Sankuru rivers in what is now the Democratic Republic of the Congo, produced long raffia dance skirts and embroidered cloth panels for court ceremonies and rituals. Generally it was only the Kuba men who were allowed to operate the looms to make raffia cloth. In other regions throughout Africa, grass cloth was handwoven into bold geometric patterns and used to make baskets, headdresses, and other objects.

In addition to raffia, cloth was made from other fibers. Prior to the advent of weaving, textiles were made from tree bark. Among the notable examples of barkcloth producers were the GANDA people of what is now UGANDA, who wore tree bark cloth during ceremonies to honor ancestors. COTTON, too, was grown locally and spun into thread for weaving. In North Africa and the Sahel, camel hair and sheep hair were spun and woven to make cloth. Jute and flax were used in West Africa.

Gender roles often defined weaving and other occupations. In SUB-SAHARAN AFRICA, sculptors and blacksmiths were most often men, but potters were women. The weavers who used the double-heddle narrow strip looms and Central African raffia looms were men, whereas it is thought that female weavers, especially among the YORUBA and the Igbo peoples, most often used single-heddle looms, which were propped vertically against a house wall. The single-heddle loom was used to produce wider cloths. Among the Yoruba and the SONINKE, indigo dying was women's work, yet among the Hausa, males did the dyeing. There are also religious overtones to the work. Among the Yoruba, cloth was taken to a dyer called an *aloro,* who was believed to work under the protection of the ORISHA *(*minor divinity*)* Iya Mapo.

Designs   African weavers often wove intricately patterned fabrics, but they also made plain cloth for daily wear. The plain cloth was decorated in a variety of ways. The most common were dyeing, embroidering, or sewing on contrasting fabrics. Vegetable dyes were used as coloring agents. Indigo plants produced a deep blue color; kola nuts and the bark of camwood and redwood trees produced reddish brown colors. A variety of other plants and tree barks were used to produce greens, yellows, and blacks. Cloth was sometimes dyed by using a dye-resistant substance such as cassava paste or wax with which

to draw a pattern on the cloth. Then, when the fabric was dipped into the dye the treated portions did not accept the color, and the pattern emerged. Soninke women applied the paste with a comb to produce wavelike designs. The BAMBARA applied the paste to produce a speckled pattern. Other fabrics were colored by tie-dyeing, a process in which raffia thread was used to tie off patterned bundles of the fabric, keeping the dye from penetrating them.

In North Africa, Arab and Berber patterns appeared in textile designs. Sub-Saharan Africa had its own indigenous designs, the most famous of which was the richly textured *kente* cloth. It dates back to the 12th century and was first worn by the king of the GHANA EMPIRE. The name of this cloth comes from an ASHANTI word that means "basket," after its resemblance to the texture of a woven basket. *Kente* cloth was traditionally made of silk obtained in trans-Saharan trade and, later, in the Indian Ocean coastal trade. The traditional *bogolonfini* fabric, or mud cloth, made by Bambara women of ancient Mali used colors and designs seen also in TIMBUKTU and other cities of the MALI EMPIRE. Garments made of this cloth were worn in ceremonies marking birth, coming of age, marriage, and death. The first indigenous printed fabric, the *adinkra* cloth made by the Ashanti, was not produced until the early 1800s.

The Cloth Trade Between the fifth and 15th centuries, commercial cloth production was important in some parts of Africa. In fact, weavers and dyers formed guilds in TUNISIA as early as the 10th century. By the 15th century the Kofar Mata dye pits in the Hausa state of KANO, the oldest in Africa, were known to European traders along the Mediterranean coast. Their cloth was frequently transported along the TRANS-SAHARAN TRADE ROUTES. The distinctive blue veil that male TUAREGS traditionally wore was made from cloth purchased from Hausa traders.

Kuba raffia cloth appeared in 16th-century European markets, brought there by Portuguese traders. In southern Africa the presence of imported cloth, probably the result of contact with Arab traders along the Indian Ocean, was noted at MAPUNGUBWE and GREAT ZIMBABWE prior to 1450. A local cloth-making tradition was likely, but few details exist. It is known that by the 1530s the Portuguese controlled all the trade exits to the coast at the mouth of the Zambezi River, on Africa's southeast coast. There, at trade fairs run by the Portuguese, large amounts of IVORY and GOLD from the interior were bartered for beads and cloth.

coffee Beverage brewed from the roasted and ground seeds of a tropical evergreen plant. Coffee is valued for, among other things, its stimulating properties, which are derived from caffeine, an alkaloid that is present in green coffee.

According to a popular legend, the stimulating effects of coffee were first discovered in ETHIOPIA when a goatherd observed the effects the plant's berries had on his goats. Although exactly when the plant and its effects were discovered is unknown, its origins are believed to lie in Africa, possibly in the city of KAFFA (hence, the word *coffee*). From there the plants apparently were brought to southern Arabia, where they were cultivated as early as 1200. In the years that followed, coffee was used as everything from a food to a medicine before it finally became a popular beverage.

Comoros Volcanic archipelago in the western Indian Ocean, some 840 square miles (2,180 sq km) of land surface, that is located between MOZAMBIQUE and the island of MADAGASCAR off the southern East African Coast. The earliest human inhabitants were of Malay-Polynesian descent who settled on the islands by 500 CE or perhaps even earlier. Africans from the East African mainland subsequently settled on the islands, as did Arabs and people from Madagascar.

The Comoros, a group of islands that derive their name from the Arabic word *kamar* or *kumr,* meaning "moon," became a major center of trade and Islamic culture with the rise of the Shirazi dynasty in the 15th and 16th centuries. Legend has it that seven brothers set sail from the Persian town of Shiraz, perhaps as early as the 12th century, and landed at KILWA and PEMBA, on the East African coast, and on the islands of Njazidja and Nzwani. They encountered mangrove and palm-laden islands with diverse wildlife, including lemurs, tortoises, and whales, which were hunted for food and other uses. The Shirazi sultans established colonies, which they soon extended to include the other islands of the Comoros, Mwali and Mayotte. They also introduced to the islands Arabic techniques of cotton weaving, rice cultivation, and building with coral, as well as the Persian solar calendar. The Arab and African populations mixed to form the city-states on East Africa's SWAHILI COAST.

Congo basin Area in tropical wester Central Africa that is drained by the Congo River. The basin covers 1,600,000 square miles (4,100,000 square kilometers) and occupies most of present-day Democratic Republic of the CONGO and the Republic of the CONGO, as well as parts of northern ANGOLA, western ZAMBIA, TANZANIA, and

southern CENTRAL AFRICAN REPUBLIC. The basin consists of an intricate system of tributaries and channels, which are surrounded by dense tropical rain forest. In ancient times, the area was inhabited by Mbuti people. Between 500 and 150 BCE, Bantu-speaking peoples brought IRON technology to the region and established fishing and farming communities along the river.

In the period prior to European colonization, the region was dominated by various empires, which often traded in goods such as COPPER and IVORY. The KONGO KINGDOM (after which the river is named) was founded in the 14th century, with boundaries extending over modern ANGOLA, between the Congo and Loge rivers and from the Cuango River to the Atlantic. This kingdom was led by a king elected from the descendants of Wene, the founding ruler.

Congo, Democratic Republic of the (Congo-Kinshasa; formerly Zaïre)

Large country in western Central Africa measuring approximately 905,400 square miles (2,345,000 sq km). It is bordered by the CENTRAL AFRICAN REPUBLIC, the Republic of the SUDAN, UGANDA, RWANDA, BURUNDI, TANZANIA, ZAMBIA, ANGOLA, and the Republic of the CONGO. The country has a narrow outlet to the Atlantic at the mouth of the CONGO RIVER, which, along with the UBANGI RIVER, makes up the country's eastern border with the Republic of the Congo. The Mitumba Mountain Range runs along the country's eastern edge, bordering the RIFT VALLEY.

By the late first millennium CE there were agricultural settlements dotting the land throughout most the Congo. Although some new crops were later introduced, those associated with the BANTU EXPANSION constituted the basis of AGRICULTURE. The technique of shifting cultivation allowed fields to lie fallow for long stretches to allow the regeneration of the soil. As the size of the population grew, so did trade. By about 900, mining of the rich COPPER deposits of the Copperbelt that extends on both sides of the Congo-Zambia border began to get underway. Mining and its related commercial activity led to the appearance in the southern savanna of cowrie shells and other goods from the Indian Ocean. In the early centuries, the pattern was that of relay trade, that is from community to community. By the 14th century, however, a huge trading network linked the SWAHILI COAST with the Copperbelt region, which in turn was tied with a trading network stretching to the Atlantic coast.

With the growth of trade, the nature of the societies in the Congo began to diverge. People living in the tropical rain forest lived largely in small-scale segmentary societies structured around lineages or clans. Often the political organization did not extend above the village

level, but a powerful leader occasionally could group several villages together to create a small state. By contrast, states became the characteristic political system of the southern savanna.

About 1000 CE the technologically sophisticated Katoko and SANGA cultures emerged in the LUALABA RIVER basin in the Katanga region of southwestern Congo. Modern LUBA oral traditions see this as the ancestral area for the emergence of the Luba kingdom in the 15th century. By 1450 or so, along the upper Kasai River the LUNDA KINGDOM was taking shape. Along the Atlantic and astride the lower Congo River, the KONGO KINGDOM began gaining power after 1400. When the Portuguese encountered this well-organized state in 1483, it had a population of about 500,000 people and covered an area approximately 250 miles (420 km) wide and another 250 miles north to south.

Congo, Republic of the (Congo-Brazzaville)

Equatorial African country, approximately 131,900 square miles (341,600 sq km) in size and occupying the northern portion of the CONGO BASIN. To its north are CAMEROON and the CENTRAL AFRICA REPUBLIC, while the UBANGI RIVER and the CONGO RIVER, which are major river highways, constitute its western and southern border with the Democratic Republic of the CONGO (except for the small Cabinda enclave inland from the Atlantic). The coastal Atlantic plain gives way to the southern or Niari River basin, which in turn rises to the sandy Central, or Téké, Plateau. The Central Plateau gives way to the Congo Basin, which constitutes nearly half of the country. Astride the equator, most of the country consists of tropical forests.

As with the dense tropical-forest regions of the neighboring Democratic Republic of the Congo, the people of the tropical rain forest lived in small-scale segmentary societies structured around lineages or clans. Often the political organization did not extend above the village level, but at times a powerful leader would be able to group together several villages and create larger chiefdoms. In this way kingdoms eventually emerged in the areas closest to the Atlantic Ocean. The largest of these, the Tio kingdom, was located inland on the Central Plateau. Its origins lay in smaller chiefdoms that began to develop by about 1200. By the 15th century acceptance of a common kingship united the otherwise autonomous rulers over the various Tio territories. About the same time, the Loango kingdom was emerging among the Vili people stretching along the Atlantic coastal plain from the mouth of the Congo River northward into the area of present-day GABON. The KONGO KINGDOM was the third of the powerful kingdoms to emerge in the area, though its

core area was on the south side of the Congo River. It became the most centralized of the three kingdoms and evolved into a full-fledged state.

Conical Tower
Stone structure located in the Great Enclosure of the GREAT ZIMBABWE ruins. Great Zimbabwe is a stone ruin located in the southeastern region of present-day ZIMBABWE on the Zimbabwe plateau. Lying to the south of the Hill Complex, the Great Enclosure is the largest single structure in ancient SUB-SAHARAN AFRICA. Construction of the Great Enclosure and the Conical Tower began in the 12th century and took more than a century to finish. Both were built with mortarless stone construction. The Conical Tower is 33 feet (10 m) high and 16 feet (5 m) in diameter. One scholar has described it as one of precolonial Africa's most remarkable structures. Its purpose is unknown, but many experts have theorized that it was a symbolic grain bin or a phallus symbol. The Great Enclosure is made of an outer wall that is 820 feet (250 m) in circumference with a height reaching as much as 80 feet (25 m). An inner wall runs beside the outer wall, forming the narrow, long passage that leads to the Conical Tower.

See also: ARCHITECTURE (Vol. II).

copper
A reddish mineral that, when processed, is an extremely ductile metal. Copper is readily found in its free metallic state in nature and has a long history as a precious metal in Africa. Copper was mined throughout SUB-SAHARAN AFRICA in the medieval period in the kingdoms of the western Sudan, in the Hausa kingdoms of present-day NIGERIA, in the kingdom of GREAT ZIMBABWE in southern Africa, and in the region known as the Copperbelt of present-day ANGOLA and ZAMBIA.

Copper was used throughout Africa for making BEADS AND JEWELRY for the elites and for use as money in the form of small bars, or ingots. About 1000 CE the Copperbelt was the first place in Africa that circulated copper ingots as a form of money. Smaller pieces of copper served as everyday currency. In the 14th century, Mansa MUSA (c. 1307–1337) of the MALI EMPIRE mined red copper at TAKEDDA and then exported it to the south, where it was exchanged weight-for-weight for GOLD. Throughout Africa, copper was traded and exchanged for other goods, including salt and COTTON.

See also: AGE OF METALS (Vol. I); COPPER (Vols. I, IV); COPPER MINES (Vol. II); COPPERBELT (Vol. IV).

Further reading: Eugenia W. Herbert, *Red Gold of Africa: Copper in Pre-colonial History and Culture* (Madison, Wis.: University of Wisconsin Press, 1984).

copper mines
During the period prior to European colonization, copper was mined throughout Africa, from the MAGHRIB in the north to the northeastern Transvaal in southern Africa. In southern Africa there is evidence of copper mining from the eighth century at the site of Phalaborwa in the northeastern Transvaal. TAKEDDA was the main center of copper mining in the eastern Maghrib; its copper was exported to the MALI EMPIRE, HAUSA STATES, KANEM-BORNU, and central SUDAN. By the 14th century, Takedda was a thriving mining center for copper.

In southern Central Africa, the main mining center in the 15th century was Chedzurgwe, a site at the heart of the Copperbelt in present-day ZAMBIA. Another major copper mine of the region was Urungwe, which was worked by the people of Ingombe Ilede. Their copper was sold to people throughout the region from north of the Zambezi River to the peoples of the lower valley.

See also: COPPER (Vol. I,); COPPERBELT (Vol. IV); INGOMBE ILEDE (Vol. III); MINING (Vol. III).

Coptic Christianity
The Christian Church in Egypt before and after the Arab conquest of the seventh century. Tradition has it that Mark, one of the four Evangelists, brought CHRISTIANITY to EGYPT in the first century during the reign of the Roman Emperor Nero (37–68 CE) and established the Patriarchate of Alexandria in 61. The Coptic Church (from the ARABIC word *qubt,* which means "Egyptian") expanded over the next three centuries, despite Roman persecution of Christian converts throughout the empire. The year 202 started almost a century of Roman persecution of Coptic Christians, culminating in a bloody massacre in 284 at the start of the reign of the emperor Diocletian (245–305). In 313, the emperor Constantine the Great (c. 288–337) granted freedom of worship to all religions in the Roman Empire. By the late fourth century, Christianity had become the official religion of the empire. Among the Coptic Church's contribution to the Church at large was the work of the theologians St. Athanasius (293–373) and St. Cyril the Great, who was patriarch of Alexandria from 412 to 444.

Monasticism Christian monks such as the Benedictines are credited with preserving Western civilization during the Dark Ages in Europe. The monastic movement got its start in Egypt in about 291 when St. Anthony of Thebes (251–356) went into the desert to live a life of prayer and fasting as a hermit. In 320 a Coptic monk named St. Pachomius organized the first monastery, eventually establishing nine monasteries for men and two for women. Among the most important are the monasteries of St. Catherine, St. Paul, and St. Anthony and those at Wadi Natrun and Sohaag. Pachomius's monastic regulations became the model on which all other monastic rules, especially St. Benedict's and St. Basil's, were modeled.

The Coptic Break with Rome Before the fifth century, a single Christian Church existed, with Rome as its epicenter but with many local differences in language, liturgy, and sometimes theology. Beginning in the fifth century, the churches in the Eastern Roman Empire began to drift away from the authority of Rome and the church in the West. The MONOPHYSITE beliefs of the Coptic Church led to the first schism between East and West.

Coptic Christianity emphasized belief in the single divine nature of Christ, as opposed to the more widely accepted belief that Christ had both human and divine natures. Adherence to this belief led to the persecution of the Copts by Roman authorities and eventually to the condemnation of Monophysite beliefs in 451 by the Council of Chalcedon, the fourth ecumenical council of the Christian Church. The Coptic Church broke with the authority of the Roman Church and established the Coptic Orthodox Church, its head the patriarch of Alexandria. The church in Ethiopia also adhered to Monophysite beliefs and split with Rome to form the Ethiopian Orthodox Church. Apart from these differences, however, the Byzantine Empire's rule over Egypt remained relatively stable until the coming of ISLAM. In 639, Arab Muslims invaded; by 642 they had captured Alexandria, the capital. Islam transformed Egypt, which gradually adopted the Arabic language and converted from Coptic Christianity to Islam.

cotton An important crop and trading commodity. In Africa, cotton has long been cultivated, primarily for making CLOTH. Cotton also was an important commodity that was traded among different populations, similar to the trading of COPPER or GOLD. In the MOSSI kingdoms (c. 1450–1500) south of the Niger bend in West Africa, weaving was an important economic activity that led directly to the development of trade with its neighboring kingdoms. In this case, cotton strips were used as freight merchandise between traders. Cubits of cotton also served as a standard of currency in trade between northern Africa, which supplied salt from the Sahara, and lands to the south, which supplied kola nuts and gold. The SONGHAI Empire (c. 1400–1591) also cultivated cotton. Because of the abundance of indigo in the savanna region, the Songhai were known for their dyeing techniques. The HAUSA STATES, in what is now NIGERIA, also used indigo dyeing techniques on the cotton fabrics they produced.

See also: COTTON (Vols. I, III, V).

craftspeople It is difficult to define a segment of African society as "craftspeople," because more often than not, the individuals who created handicrafts functioned also as artists, priests, historians, and storytellers. They created goods ranging from useful but unremarkable baskets and wooden cups to the sacred and mysterious masks and musical instruments that were used in elaborate ceremonies.

For many African peoples, like the ASHANTI, BAMBARA, and DOGON of West Africa, arts and crafts were considered a sacred means by which to express mystical power or religious belief, and craftspeople and their objects were seen as mediums for the messages of the gods and spirits. In these cultures, skilled artisans were highly regarded members of society.

In the kingdom of BENIN, the *igbesanmwan,* a guild of IVORY carvers, were given special quarters in the royal palace compound of King EWUARE (C. 1440–1480). Some groups, like the GANDA of BUGANDA, rewarded their craftspeople with government positions and large expanses of land.

Some African societies, however, did not hold their artisans in such high esteem. In parts of ETHIOPIA and among certain ethnic groups in West Africa, the highly stratified WOLOF society, for instance, craftspeople were relegated to the lower strata of society and were not allowed to marry outside of their castes. The Amhara of Ethiopia associate leather workers, weavers, and iron workers with the evil eye.

Crusades, the Christian religious and military movement initiated against Muslim rulers of the Holy Land between 1095 and 1291. This series of military expeditions sought to restore Christian control to lands important in the life of Jesus Christ. Although the Crusades, which occurred in eight successive phases, were a major preoccupation of the European monarchs and affected many parts of the Muslim world, they spent very little time on African soil. It was not until 1146, during the Second Crusade, that the Muslim city of TRIPOLI, in present-day LIBYA, was seized by a force of Sicilian Normans. (A crusader state called the County of Tripoli was established during this time period, but it was located in the Middle

East and not in North Africa, between the crusader kingdom of Jerusalem to the south and the crusader Principality of Antioch and the County of Edessa to the north.) The occupation of Tripoli in North Africa lasted only until 1158.

Africa's major contribution to the Crusades was in the person of SALADIN (c. 1137–1193), the Muslim sultan of EGYPT before and during the Third Crusade (1191). His armies, fighting in the Middle East, captured Jerusalem in 1187, bringing to an end the Christian Franks' 88-year occupation of the holy city.

D

Daboya Important source of salt on the White Volta River in the region that is in northern GHANA. Near the end of the 15th century Daboya fell into the hands of the growing kingdom of DAGOMBA, whose rulers were eager to take control of the SALT TRADE from the DYULA, whose hold on trade from the area was weakening. In 1464, invasions by the SONGHAI Empire forced Dagomba to move its capital from near Daboya to a site further east.

da Gama, **Vasco** See GAMA, VASCO DA.

Dagomba Gur-speaking people of Dagbon, a kingdom that flourished in the northern part of present-day GHANA. The Dagomba people emerged after the local Gur people were conquered by horse-mounted invaders in the middle of the 14th century. According to tradition, a warrior by the name of Nyagse conquered the indigenous people and executed their priests (*tindamba*), religious leaders who had extensive authority. The new rulers adopted the native language, Dagbane, and called the kingdom Dagbon. Nyagse established an aristocratic caste system in which social status was acquired through competition, although children could not gain status higher than their father's. For the royal class, descent from a certain grandfather was most important. Thus, the royal lineage of the Ya-Na, or chief, was preserved in Dagomba society. The Dagomba royal line still hails only from the Ya-Na. The Dagomba retained much of the Gur culture. Like the Gur, their primary means of subsistence was farming, with millet, sorghum, peanuts, and yams their main crops.

Dahia al-Kahina (Queen Dahia, al-Kahinah) (unknown–c. 705) *Seventh-century Algerian queen of the Jawara Berbers remembered for her strong resistance to invading Islamic Arabs*

Known by her Arabic name *al-Kahina* (the priestess), Queen Dahia ruled a Jawara kingdom located in the eastern regions of the Aurés Mountains of ALGERIA. Legend says that Dahia and her people had been converted to the Jewish faith, and it was due in part to this adherence to JUDAISM that she so intensely resisted the Muslim ARABS who invaded North Africa in the mid-seventh century.

Al-Kahina inherited the battle against Islamic rule from Kuseila (d. 688), or Kuysayla, the chief of the Awraba peoples, who was himself a leader of the SANHAJA BERBERS in the central MAGHRIB. The battle for the region began as early as 670 when advancing Arab armies invaded the northern region of the continent, then known as IFRIQIYA. Initially, Kuseila, like thousands of other BERBERS, embraced the Islamic faith, even assisting Muslim armies in their conquest of many local towns formerly governed by Berber chieftains. After an Arabic governor invaded and plundered Kuseila's homeland of TLEMCEN, however, Kuseila sought revenge. Taking the title of governor, he organized armed resistance against any further absorption into the growing Islamic empire.

By about 687, the Berber kingdom established by Kuseila bordered Queen Dahia al-Kahina's territory. Upon Kuseila's death, about 688, she joined the battle, and by 698 she had become a formidable force, successful at driving Arab armies from the region. After suffering a stunning defeat in 701, Arab forces regrouped, adding converted Berbers to their ranks. The Arab army, led by Hassan ibn an-Nu'man, advanced on northern Africa again. In 705, a

major battle took place near Carthage, in modern-day Tunisia, during which al-Kahina was killed.

〰〰〰〰〰〰〰〰〰〰〰〰〰〰〰〰〰〰〰〰〰〰

Queen Dahia al-Kahina supposedly used a "scorched-earth" policy in her efforts to resist the Muslim invaders. She ordered her capital, Baghaya, to be burned to the ground rather than let it be taken by Hassan and his forces.

〰〰〰〰〰〰〰〰〰〰〰〰〰〰〰〰〰〰〰〰〰〰

Dahlak Archipelago   The largest of several islands situated off the Red Sea coast of MASSAWA in today's eastern ERITREA. Approximately 32 miles (51.2 km) long and 18 miles (28.8 km) wide, Dahlak's history as a commercial trading center extends back to the time of Roman occupation in Northeast Africa. The Dahlak Islands have also been cited as one of several trade routes that introduced Islam into the Horn of Africa. During the eighth century Arabian merchants dominated the markets of Dahlak, using religious ties to exclude Greeks and other traders. During this same period, Aksum's primary port of ADULIS was destroyed by ARABS in retaliation for raids that Aksumite rulers orchestrated in southern Arabia.

Noted for their pearls and exotic tortoiseshell, the Dahlak Islands were well known by the ninth century, when the Arabian geographer al-Yaqubi described the Dahlak Islands as the primary trading port of ETHIOPIA. However, by the 16th century intermittent skirmishes over the control of trade at Dahlak and other Ethiopian ports escalated between Muslims and the Amhara nobles of the SOLOMONIC DYNASTY.

Dahomey (Danxome, Danhome)   Kingdom of West Africa located between the Niger River and the Atlantic Ocean, in the southern part of the present-day Republic of BENIN. Little is known of Dahomey prior to the 17th century, but evidence suggests that the region was inhabited by the AJA people, agrarian EWE speakers who migrated there during the 12th and 13th centuries.

Dala Hill   Early capital of the KANO kingdom of NIGERIA. Dala Hill was the home of the Dala people, members of the Medi subgroup of the Kuri people. Although the date of the founding of Kano is unknown, Dala Hill served as its capital until about the year 1000. Kano was captured by the Habe people at the end of the 10th century and became one of the true HAUSA STATES. For a brief period the name Dala Hill was changed to Sheme, but by 1100 it had changed again to Kano City.

Damot   Kingdom originally located south of the Blue Nile River; until the late 13th century, the territory included Wolamo and the entire Shoa Plateau. Damot's most famous king was Motolomi, who ruled during the 13th century. The Damot monarchy was very similar to the kingdom of KAFFA. Its hierarchical structure included subordinate kings and other members of the royalty, as well as various palace officials and governors, all of whom answered to a king whose rule was supreme.

About 1316–1317, Damot was conquered by AMDA SIYON (c. 1314–1344) of the Christian kingdom, to the north. As a result, for the next two centuries Damot was part of this Christian Ethiopian kingdom, although it managed to retain much of its traditional RELIGION. The Damot kingdom fell into further decline towards the end of the 16th century when the OROMO forced the people of Damot across the Blue Nile. By the 17th century the kingdom was completely absorbed and became a sub-district of the region of Gojjam.

Dangme (Adangme, Adangbe)   See GA-DANGME.

Darfur   Mountainous region in the modern Republic of the SUDAN situated between Wadai, to the west, and Kordofan, to the east. Darfur is populated by sedentary peoples and nomads of Arabian origin, including the BAGGARA. Prior to 1200, Darfur was fairly isolated from its neighbors, and there was an absence of trade. The region was governed by the Daju, who lived in the central Jebel Marra massif and established the first known dynasty in the area after dominating the local peoples. Though the Daju rulers had ARABIC names and came from the east, their tradition holds that they were not of Arab origin.

Migrations from the east began around 1350, along the Darb al-Arbin, or Forty Days Road. There is evidence that some trading took place at this time between Darfur and EGYPT. During the migrations, incoming Arab nomads brought new breeds of cattle and new pastoral practices. One group of people, the Tunjur, arrived in Darfur and pushed the Daju southward. The Tunjur assumed power in Darfur in a peaceful fashion. They may

have come from Nubia and been aided and influenced by Arab nomads, whose language the Tunjur adopted. Some historians believe that the Tunjur had come from TUNISIA.

Around 1450, the Tunjur ruler, Shau, was deposed by his half-brother, Dali, who made many political changes in Darfur. He instituted a new legal system, which was later recorded in the *Kitab Dali*, or "Book of Dali," and he divided Darfur into five provinces.

A visitor to the eastern SUDAN around 1500 wrote an account of the founding of a kingdom by a runaway slave that may be the story of Dali, the founder of the Kayra dynasty, or of his father. The account reports that in Gaoga, which some historians believe to be Darfur, a servant murdered his master, stole the master's goods and weapons, and ran away to be protected by his nearby relatives. The servant later acquired wealth through raiding and became a powerful ruler.

Dauda, Sarki (r. 1421–1438) *Islamic ruler in Kano*

During Dauda's reign, KANO became a tributary state of the BORNU kingdom. Unlike previous periods of Kano's history, Dauda's reign was characterized by an increase in commercial activities and trade. A newly established TRANS-SAHARAN TRADE ROUTE brought prosperity to the area, along with its CARAVANS of salt and agricultural products. This peaceful prosperity and the flourishing of Muslim culture contributed to the increasingly cosmopolitan population of HAUSALAND.

Daura Ancient settlement in northern NIGERIA, ruled by queens during the ninth and 10th centuries. As a CITY-STATE, Daura became the first of the seven original HAUSA STATES. According to legend, Abuyazid, a prince of Baghdad, Iraq, became famous for aiding the sultan of BORNU and was given the name *Bayajida* by the people of Bornu. When the sultan became jealous and plotted against Bayajida, the prince fled and eventually came to the town of Daura. There he gained renown by slaying a snake that had prevented the townspeople from drawing water from a well. As a reward, he married Daurama, the queen of Daura, and ruled with her. Their son, Bawo, had six sons, who went on to found the Hausa people. These sons also founded the remaining six of the seven original Hausa states, which became emirates named BIRAM, GOBIR, KANO, KATSINA, RANO, and ZAZZAU.

Daura, whose name means "blacksmith," was peopled primarily with farmers and artisans. In addition, it was located on the savanna at the intersection of roads leading to Katsina, Kano, Zango, and territories in present-day NIGER. As a result it became an important center for trade, with salt and potash arriving from the SAHARA DESERT, and human captives, leather, and cloth coming from the south.

Further reading: M. G. Smith, *The Affairs of Daura* (Berkeley, Calif.: University of California Press, 1978).

Daza Saharan ARAB nomads who settled in the northwestern areas of present-day CHAD. These central African people are part of the Dazaga clan of the TEDA ethnic group. Due to the arid climate and sandy terrain of their homelands, the Daza are primarily nomadic cattle herders. Historically they relied on limited amounts of trade as well as village raids to supplement their nomadic lifestyle. In the 16th century they were forced by Ottoman rulers to give up much of their nomadic lifestyle, long before the arrival of the French and Italian colonists in the 19th century.

Debo, Lake Body of water located in the central region of present-day Republic of MALI, on the Niger River between Mopti, to the south, and TIMBUKTU, to the northeast. Lake Debo is part of the network of lakes, creeks, and backwaters that join the Niger River. Lake Debo was one of the boundaries of the SONGHAI Empire, which prospered from the 14th to the 16th centuries.

Debre Birhan (Mountain of Light) Former kingdom in northeast ETHIOPIA associated with the medieval rule of ZARA YAKOB (r. 1434–1468). The kingdom reportedly gained its name from bright stars visible from its high perch on the Ethiopian plateau. During the 14 years Emperor Yakob lived at Debre Birhan, he transformed the isolated region into a renowned center of cultural and literary achievement. Much of this cultural renaissance has been attributed to Yakob, who wrote many religious texts during his reign. Historians also cite the infusion of culture generated by the building of the king's palace and

surrounding structures. Many artisans, both from within and outside Ethiopia, were attracted to the region. After Zara Yakob's death, in 1468, the site fell into disuse but was eventually reclaimed and restored by later successors of the SOLOMONIC DYNASTY.

Further reading: Harold G. Marcus, *A History of Ethiopia* (Berkeley, Calif.: University of California Press, 1994).

Debre Damo Monastic region of ETHIOPIA situated east of Adowa, in the TIGRAY highlands. Founded during the fifth century by Abba Aregawi, one of the Syrian monks known as the NINE SAINTS, Debre Damo still remains an active place of worship. Access to the site is the same as in ancient times: monks and visitors use a rope to scale the steep cliff on which the original monastery was founded. Despite these limitations, over several centuries the positive efforts of the monks attracted to Debre Damo many devout Christians, who worked to establish a self-sustaining refuge by creating adjoining buildings and cultivating the grounds.

Debre Damo's remarkable architecture also provides an important glimpse of the distinctive style of the ancient kingdom of AKSUM. One of the earliest churches built in the region by King Gebra-Masqal during the sixth century was constructed of stone and wood with an interior ceiling pattern of cross-beams. The interior of this church and other churches in the region characteristically have small recessed areas, archways, and carvings of animals, plants, and abstract forms. Large crucifixes, complemented by intricate borders, dominate the church.

A feature of the old Aksumite churches is their patterned windows and doors, many of which recall the towering stelae of the region. This corroborates a general belief that Aksum's stelae were tombs or "spiritual houses" built for deceased kings.

Further reading: Harold G. Marcus, *A History of Ethiopia* (Berkeley, Calif.: University of California Press, 1994). Taddesse Tamrat, *Church and State in Ethiopia, 1270–1527* (Oxford, U.K.: Clarendon Press, 1972).

Dendi Region in the northwestern part of present-day NIGERIA that is the original home of the SONGHAI people. Dendi also refers to the name of these people, a sub-

group of the Bariba people, and the language they speak. The Songhai people, who emerged from the Dendi region of Nigeria near the Niger River, are thought to have descended from the ZA kingdom of the eighth century. By about 800, and possibly earlier, the Songhai had moved north, establishing the prosperous trading city of GAO. Eventually, the MALI EMPIRE took control of both Gao and the Dendi region. When Sunni ALI (r. c. 1464–1492) began the great expansion of the Songhai Empire about 1465, he regained control of the Dendi region, and the Songhai people once again inhabited their homeland.

The SORKO people, who also speak a Songhai language, were known to have lived, fished, and traded in the Dendi region. The FULANI lived in the Dendi region during the time when Sunni Ali reconquered it for the Songhai Empire.

Diara (Zara) SONINKE kingdom of the ancient GHANA EMPIRE of West Africa. Diara was influenced by Muslim traders, known as the DYULA, as early as the eighth century, when it appears that many of the MANDE-speaking Soninke natives converted to ISLAM. In the 11th century the ALMORAVIDS gained control of Diara. They also took AUDAGHOST, a Saharan trade center to the north of Diara, and most of the Ghana Empire. Toward the end of the 15th century Diara fell to SONGHAI invaders.

See also: SUDAN, THE (Vol. II); SONGHAI (Vol. III).

Dias (Diaz), Bartolomeu (c. 1450–1500) *Portuguese navigator and explorer*

Dias is considered by many historians to be the most important of the Portuguese explorers who explored the Atlantic Ocean during the 15th century. His voyages took him along the coast of Africa and across the Atlantic to the coast of Brazil. Rounding the Cape of Good Hope at the southern tip of Africa in 1488, he helped to open India to Portugal's commercial ventures by showing his king, John II (1455–1495), that a sea route to India was possible. Portugal then had the opportunity to control the shipment of trade goods from the East. These goods had previously been transported by caravan to Europe through Muslim-held lands.

Dibbalemi, Mai (Dunama Dibbalemi, Dabbalemi) (r. c. 1210–1248) *Ruler of Kanem-Bornu*

The SEFUWA Mai (or King) Dibbalemi led the KANURI people, a nomadic group that had migrated into

KANEM, northeast of Lake Chad, around 1100. Born into Kanem's ruling dynasty, Dibbalemi, like other Kanuri kings, was considered divine.

Kanem means "south" in the Kanuri language.

Dibbalemi mobilized Kanem's considerable military forces, including more than 40,000 horses, in his efforts to establish a trading empire. Declaring a JIHAD, or holy war, against Kanem's neighboring states, he successfully conquered the surrounding areas and gained control of the lucrative TRANS-SAHARAN TRADE ROUTES north of Lake Chad. As a result, CARAVANS traveling between the central SUDAN and North Africa had to pass through Kanuri territory. The commercial activity that developed from this transformed the lifestyle of the previously nomadic Kanuri. Becoming more sedentary, the Kanuri began to focus on trade.

These conquests also encouraged Dibbalemi to further increase his empire's territory through military action. Dibbalemi expanded his territory from east of Lake Chad to the north, adding Kawar and the FEZZAN region. He also expanded the empire eastward to Wadai, westward to Bornu and KANO, and south to the Adamawa grasslands, in present-day CAMEROON. At its height, Dibbalemi's territory, called the KANEM-BORNU or Kanuri empire, extended from LIBYA to Lake Chad to the HAUSA STATES.

Dibbalemi's reign was both long and effective. In addition to his military successes, he established diplomatic relationships with sultans in North Africa. A devout Muslim, he was concerned with promoting religious observances among his people and established a special hostel in CAIRO for those making the pilgrimage to MECCA.

To encourage and reward his military leaders, Dibbalemi gave commanders authority over the people they conquered. This system of power sharing, which helped motivate his armed forces, ultimately proved problematic because commanders attempted to pass their positions on to their sons. As a result these posts evolved into a new hereditary ruling class. Dibbalemi was able to control this during his lifetime, but after his death, dynastic feuds developed. These soon degenerated into civil war. People in the outlying districts stopped paying tribute, and the great empire Dibbalemi built began to break apart.

Dinka Pastoralist people, closely related to the Nuer, who since the 10th century have inhabited an area on both sides of the White Nile in what is now the Republic of the SUDAN. The Dinka speak a language of the NILOTIC subgroup of the NILO-SAHARAN family; they are subdivided into independent peoples, including the Agar, Aliab, Bor, Rek, and Malual, each of which is segmented into smaller political patrilineal clans with great autonomy. They are an intensely religious people whose rituals and practices permeate everyday life.

Dinka Religion The Dinka religious system is based on the pervasive relationship between the deity and humans, one that influences every facet of Dinka life. Among the Dinka, the deity is recognized as Nhialic or Nhial, which has been translated as "the sky." Access to Nhialic is accomplished through spirit possession.

Three primary ancestor figures also represent an important aspect of the Dinka belief system. One, known as Deng, is the founder of the Dinka nation. As in other religions that assign qualities of the natural world to specific deities, Deng is associated with thunder and lightning. He is also worshiped at a large shrine known as Luak Deng. Other important deities are Garang, who represents men, and Abuk, a female deity. These latter deities have often been compared to the myth of Adam and Eve associated with the Judeo-Christian tradition. In the origin stories of the Dinka, which were created centuries before the birth of Jesus, Nhialic warns the people about forbidden fruit and its consequences.

Many lesser deities are recognized by the Dinka and are divided into warrior or priestly clans. Described as totemic spirits, they included *ring,* or "flesh," the spirits that give voice to members of the priestly clans. These priests, known as Masters of the Fishing Spear, derive their powers from Aiwel, or Ayuel, or Longar, who was the heroic figure of Dinka myths. The priests are recognized by their symbolic fishing spears, which are considered the sacred tool of Longar, who, their myths explain, was conceived in the river. He was also credited with leading the Dinka to the site of their present nation.

According to Dinka origin myths, Longar, following a long period of drought, attempted to persuade the Dinka elders to relocate to new lands. Unfortunately, he failed. In retaliation, he refused to find more water sources and simply traveled away from the region. At some point the Dinka attempted to follow him, and, when they encountered obstacles such as mountains and rivers, they began to seek out his assistance. Longar apparently refused at first, even going so far as to kill several Dinka as they attempted to cross the river. Finally, however, a member of the priest clan wrestled his spear away. It was at this point that Longar began to stop fighting and started to help them across, giving his fishing spears to the first men to cross the river. These men formed the first members of the priest clan.

One of the most important elements of worship among the Dinka is the large number of animal sacrifices they dedicate to their gods. The Dinka view bulls or oxen as significant gifts from Nhialic, which are returned to him through the act of sacrifice. It has been said that each of their cattle receives a name and its memory is preserved in the naming process of newborn calves. Spear master priests are responsible for maintaining traditional acts of worship and prayer. They voluntarily relinquish their hold of the title when they grow too old to reign. Dinka traditions called for them to give a final consultation before being buried alive.

disease in medieval Africa In ancient Africa, where the majority of peoples lived at a distance from each other and were connected by trade only sporadically, disease tended to be local and seasonal. Parasitical infections caused by *Echinococcus* larvae in the feces of domestic animals, schistosomes from infected lakes, and *Leishmania* from sand flies were common; the sickness they caused very likely lessened during the dry season and during times of drought. However, as Africa became less local through trade contacts with other regions and the world outside, the migration of peoples inside Africa, and the development of larger communities, the diseases that people faced also changed.

North Africa In the sixth century bubonic plague, which existed in northern Africa as early as the fourth century BCE, swept from EGYPT through Syria and Asia Minor all the way to Italy. Records do not show if the plague penetrated SUB-SAHARAN AFRICA at this time. However, the sixth-century epidemic was the same highly contagious disease of the lymph glands, known as the Black Death, that originated in Mesopotamia and proved fatal to roughly 25 million people in 14th-century Europe.

Sub-Saharan Africa Beginning in the third century BCE and continuing through colonial times, migrations across the African interior broadened the scope of previously isolated diseases. The BANTU EXPANSION that began in the first millennium facilitated the spread of diseases to the susceptible inhabitants of central Africa. Some of these early African people acquired disease through contact with animals that were often their domestic stock. Called zoonoses, diseases spread by animals have been prevalent throughout the history of Africa. Rabies, trypanosomiasis, leishmaniasis, yellow fever, trichinosis, and anthrax are all spread via infected animals.

One of the most common parasite-caused diseases in Africa is trypanosomiasis, or sleeping sickness, an infection transported by the blood-sucking TSETSE FLY. This large fly thrives only in sub-Saharan Africa, where it feeds on wild animals, cattle, and humans. Living in the blood, lymph nodes, or cerebrospinal fluid, trypanosomiasis infects the host and usually causes death within a few days. For centuries, sleeping sickness has limited the amount of animal husbandry in sub-Saharan Africa, thus inhibiting the growth of both precolonial and colonial settlements in the area.

Changes in Lifestyle As peoples abandoned their nomadic lifestyle to live in settled, agrarian societies, disease became more prevalent. Prior to the emergence of AGRICULTURE, small nomadic groups of people helped keep disease at bay because a pathogen had fewer hosts to infect; an outbreak of a deadly virus was essentially restricted to the handful of nomads or animals it infected, and once the last surviving host died, so did the disease. As people became more settled, infectious parasites and microbes were able to reproduce at rapid speeds before killing their hosts and moving on to new, healthy victims. Thus, the natural balance between life and death was disrupted, and pathogens often emerged as the victors.

Malaria is a parasitic disease, transmitted by female mosquitoes, that has been common to Africa since precolonial times. It often results in kidney failure, coma, and death.

The malaria parasite (*Plasmodium*) has existed for millions of years. With the advent of agricultural societies, malaria was able to pass quickly throughout densely populated communities. In tropical Africa, the long history of the disease enabled the indigenous populations to develop a genetic mutation to combat the parasite. The sickle-cell gene, which emerged by the seventh century, provided protection against malaria, but was itself deadly. If inherited from both parents, the gene usually caused death from severe anemia. Those who have only one parent with the gene can survive with increased immunity to malaria. Thus, the sickle-cell trait emerged only in those parts of Africa where malaria was common, particularly the western parts of the continent.

Disease thrived in these close-knit communities, where viruses such as smallpox were spread by daily contact among their members. The increased population density had disrupted the natural cycle of life and death

between humans and diseases. Disease-carrying hosts, especially mosquitoes, multiplied as forests were cleared for crops. Outbreaks shortened the immediate labor supply, making simple but crucial tasks like clearing fields or harvesting the crops difficult. Adding to the devastation, a poor crop yield could cause food shortages, which in turn led to malnutrition and an increased susceptibility to new diseases.

Finally, the development of Arab and European trade provided new conduits for transmitting old and new diseases. Coastal people, who had the most contact with foreigners, quickly developed a tolerance for many of the new diseases, but those who lived further inland were devastated by unfamiliar pathogens. Foreign traders brought home with them diseases previously limited to the African continent, such as malaria.

A similar case of immunity among Africans can be found in a separate malaria strain that kills only children. Evolution has made adults resistant to the disease, but young children are very susceptible. However, after a prolonged period away from the infected regions, adults lose their immunity. These types of genetic evolution have been very important in shaping African civilization. Without immunity, Africans would not have survived in the areas where diseases were most common.

divine rule Practice of worshiping monarchs as gods. The concept of divine kingship, which existed as far back as the pharaohs of ancient EGYPT, was a popular form of government throughout Africa from the fifth through the 15th centuries

The ZANJ of southeast Africa called their king *WAQLIMI,* which means "son of the great god." Among the pastoral Shilluk of Malakal, located near the White Nile, the practice of electing kings who claimed divine rule was based on the moral order established by their mythic founder, Nyikang. It was believed that the spirit of Nyikang passed down from king to king. The YORUBA chose kings through Ifa divination because it represented the voice of their ancestors. Their kings were considered an essential link between the people, their ancestors, and their spiritual deities.

By the ninth century the practice of divine kingship was common among other African societies as well. The SEFUWA dynasty of KANEM-BORNU established the royal *mai* line of divine kings. To maintain their divine image, the *mais* always spoke from behind a screen to keep themselves from having direct contact with their people.

In the West African forest, the WOLOF and SERER people elected their kings to positions of divinity. Once they gained power, the kings were protected by tribal taboos.

Similarly, the Shona people of ZIMBABWE worshiped their kings like gods, bestowing elaborate gifts upon them. Among many Bantu-speaking peoples, divine kingship was closely intertwined with social and religious customs like fertility and ancestor worship.

diwan (divan, dewen) Islamic financial and administrative system first used in the seventh century during the Arab conquest by Umar I (r. 634–644), the second caliph to succeed the prophet Muhammad after ABU BAKR (r. 1274–1285).

Members of the *diwan,* mostly Arab rulers (including Muhammad's descendants) and warriors, were paid a share of the state's plunder and taxes (called *jizya*), in the form of a pension. The income was separated into two categories: movable and immovable. Movable funds were those distributed after setting aside 20 percent for the state's immovable reserve.

The *diwan* took on a bureaucratic significance in later years. By the end of the seventh century its meaning encompassed all levels of government infrastructure. The term was used similarly by Iranians and, in the 16th century, by Mughal Indians and the Ottoman Empire.

djallaba Word from ARABIC meaning "traders;" often used to describe merchants from eastern savanna regions of the SUDAN. The *djallaba* were instrumental in the development of trade with the Sultanate of Fur, one of the Islamic kingdoms of the Sudan.

Djibouti Modern East African coastal country some 9,000 square miles (23,300 sq km) in size that is on the Strait of Mandeb. Djibouti was an important Arab trade state until the 16th century. Bounded by ERITREA, ETHIOPIA, Somaliland, and the Gulf of Aden, Djibouti is a small country populated by a diverse group of people. The majority of the native people were AFAR, or SOMALI of the Issa clan. The Afars, concentrated in the north and western parts of Djibouti, traditionally were nomadic people, as were the Somalis to the south.

The livelihood of Djibouti's inhabitants has been dictated by the area's dry climate and barren terrain. Saltwater

basins are found amid the arid, volcanic plateaus in southern and central Djibouti, lightly wooded mountains dominate the northern landscape, and coastal plains line the eastern shore. Temperatures rise to 106° F (41° C) in the summer, with lows of only 84° F (29° C) in the winter. With a scant 5 inches (12.7 cm) of rainfall each year, the climate is largely unsuitable for agriculture or animal husbandry. Less than 1 percent of Djibouti is arable, and only 9 percent can sustain livestock. Flora is limited to thorn scrub and grasses in the desert, although the mountains do support some date palms, castor-oil palms, tamarind, and euphoria. Fauna includes jackals, antelopes, hyenas, gazelles, and ostriches.

Strategically located at the junction of the Red Sea and the Indian Ocean, Djibouti has been an important link between Africa and the Middle East for thousands of years. The earliest SEMITIC speakers migrated from the Middle East to Ethiopia via Djibouti in prehistoric times. Even the primary occupation of the Afar and Somali people, nomadic pastoralism, was introduced to Djibouti via the Strait of Mandeb.

As an important access point to the Middle East, the Djibouti region was enticing to many early settlers. The Afar people first settled in the countryside around the third century BCE, although Somali Issa settlements would push them to the north in the ninth century CE. Prior to the arrival of Muslim missionaries in 825, an Arab and Persian trade town bordering present-day Djibouti was established. Called ZEILA, the town became a successful silver and slave export center. Its success gave rise to the extended Abyssinian kingdom of ADAL, which encompassed much of present-day Djibouti. Zeila was named the capital of Adal.

By the ninth century ISLAM had penetrated the African coast via Zeila. Muslim Adal eventually gained its independence from Christian Abyssinia, but it would face ongoing battles with the Christians for many years to come. From the 13th to the 16th centuries, this religious struggle weakened Adal and allowed western invaders to conquer the kingdom late in the 16th century.

Dogon West African people concentrated in southern MALI and northern BURKINA FASO; they speak Dogon, a Gur dialect of the Niger-Congo family of languages. Oral history suggests that the Dogon probably fled their original homeland between the 10th and 13th centuries because they refused to convert to ISLAM. However, archaeological evidence, coupled with the fact that they speak the Gur language, indicates that the Dogon had a much earlier presence in their current home.

Even today, the Dogon are primarily farmers and hunters. They settle in secluded areas and grow millet as

The cliffside village of Irel in the Bandiagara region of Republic of Mali shows the traditional dwellings of the Dogon people. The Dogon fled to the Bandiagara escarpment in 1490 to escape an invading army from the Mossi state of Yatenga. *© Charles & Josette Lenars/Corbis*

a subsistence crop. These areas have historically been shared with FULANI pastoralists who exchange dairy products for Dogon grains and produce.

Dogon society centers around extended patrilineal families, with an occupational class structure that places farmers at the top of the hierarchy. In the absence of centralized authority, a *hogon,* or headman, provides religious and judicial leadership for the village. His authority is weak, however, as all decision-making power rests with a council of elders.

Traditional Dogon religion focuses on the belief in one creator—Amma. Ancestor worship also plays an important role in the Dogon faith. A comprehensive mythology dictates the order of the universe and the Dogon's place in that order.

While today nearly 35 percent of the Dogon people consider themselves Muslim, their isolated location has

left them relatively untouched by outside influences. Therefore, their cultural and religious traditions have remained intact.

domestic animals Animals that are integrated into human society. The existence of domesticated animals in Africa can be traced to early Neolithic civilizations when the natural supply of wild animals became insufficient to feed local populations. Wild animals were subsequently bred in captivity to increase the food supply. The only animals actually domesticated on the African continent were the guinea fowl, cat, donkey, and shorthorn cattle. Other species, like the domestic dog, pig, and chicken, arrived in Africa from other countries.

In many areas diseases limited the spread of domestic animals. Trypanosomiasis, a deadly disease spread by the TSETSE FLY, limited the sustainability of domestic animals in much of southern Africa.

In order for an animal to be domesticated, it must submit to human ownership, and some animals adapt to captivity more easily than others. Thus, animals like antelope are difficult to domesticate, whereas fowl, cats and dogs, pigs, goats, donkeys, horses, and cattle have a high tolerance for humans.

Fowl Archaeological evidence indicates that domestic chickens from India and Asia were in Africa by 800 CE. They were probably bred from the red jungle fowl. Early Malaysian traders may have introduced the chicken to coastal Africa, where it was able to spread quickly throughout the continent. Although 16th-century Portuguese explorers named the guinea fowl, native peoples had domesticated them long before. In the western parts of the continent, the helmeted guinea fowl was bred in captivity, and peoples of eastern Africa raised a breed of guinea fowl as well.

Cats and Dogs Domestic cats were bred from the common wildcat that thrived throughout much of Africa. Even after domestication, the housecat would breed with the wildcat, making the separation of the species difficult. Dogs arrived on the African continent several thousand years ago from western Asia and Europe, where they were

bred from wolves. Dogs had many uses in traditional African societies. Although some dogs were human companions, others were eaten or used in ritual ceremonies. They were also raised for their hides or bred as hunters.

Goats Goats were also brought to North Africa from Asia and had dispersed throughout the southern parts of the continent by the fourth century CE. Dwarf goats, raised for their meat and hides, evolved in western Africa and the SUDAN, while short-eared varieties multiplied in semiarid zones. Other prominent domestic goat varieties include the red Sokoto, whose valuable hide is used to make Moroccan leather, and the small East African goat.

Pigs Descendants of the wild boar, pigs were popular in ancient EGYPT but never became major factors in the African ECONOMY. Although European settlers brought new varieties in the 15th century, African pig populations remained small because they were vulnerable to disease.

Donkeys, Horses, and Camels The domestic donkey was probably first bred by the Egyptians from its wild counterpart native to North Africa and Arabia, possibly as early as 4000 BCE. Domestic horses have long been present in Africa, but their numbers have been limited because—in contrast to camels—they do not adapt especially well to the arid Saharan climate, and they are susceptible to many diseases in SUB-SAHARAN AFRICA.

The lineage of camels is unknown because wild species have long been extinct. Domestic camels played an important role in making the previously uninhabitable desert regions suitable for limited agriculture and trade. The one-humped camel was probably brought to northern Africa from Arabia more than 5,000 years ago. With its tolerance for desert conditions, the camel thrived in the Sahel and northern KENYA. But due to the camel's susceptibility to trypanosomiasis, it was not able to survive in rainy climates where the tsetse fly thrived. Nonetheless, more camels are found in Africa than anywhere else in the world, and they have long been raised for milk, meat, and TRANSPORTATION.

Cattle Among domesticated animals, cattle, prized for their hides, meat, milk, and manure, have had the greatest social and economic impact on Africa. Domestic cattle in the arid North African regions include long- and shorthorn varieties as well as the Asian zebu, mostly found in ETHIOPIA. The Asian zebu interbred with local varieties to create the common sanga variety. Despite the presence of several deadly diseases in this region, more cattle are raised here than anywhere else on the continent. Several regional tribes, including the DINKA, Nuer, and Shilluk, virtually worship their cattle.

In western Africa, the large number of trypanosomiasis-carrying flies makes the area uninhabitable to many cattle breeds. The N'Dama and West African shorthair breeds were able to cope with the disease and made up most of the cattle population. Pastoralists and agriculturalists raised these and a limited number of dwarf cattle.

Cattle populations in the Sahel and central Africa are smaller in number. In the Sahel, a region including parts of the present-day countries of BURKINA FASO, CHAD, Republic of MALI, MAURITANIA, NIGER, and SENEGAL, the arid climate and frequent drought make the region unsuitable to many types of cattle. Zebu cattle are found in limited numbers, but camels are much more common. In central Africa, some zebu and sanga varieties were native to the area, but most cattle arrived much later with European settlers. A similar phenomenon occurred in the southern regions of Africa, where precolonial breeds were limited to sanga cattle. With the arrival of European coastal explorers in the late 15th century, new breeds were introduced and intermixed with indigenous herds.

Sheep Domestic sheep from Asia were abundant in ancient Egypt and early North African kingdoms. Next to cattle, they are the most important domesticated animals in Africa, although their lifespan is often abbreviated due to their susceptibility to disease. The three principal African sheep varieties are the thin-tail, fat-tail, and fat-rump. Thin-tailed sheep have been present on the continent for several thousand years. In the savanna regions dominated by cattle-herders, species of sheep called the Sudanese Desert, the FULANI, and the Tuareg prevail.

To the west, where agriculture is the primary economic activity, West African dwarf and Nilotic sheep are common. In the Sahel region, thin-tailed sheep thrive in the semiarid desert. This thin-tailed variety is prized not just for its coarse wool coat; it also provides an abundant supply of milk and meat to native pastoralists. The related fat-tailed variety has also inhabited the African continent for several millennia. They are used primarily for their milk, although their heavy tail has long been coveted as a source of thick, oil-like fat used in traditional cooking. The most common fat-tailed varieties are found in present-day Ethiopia and parts of East, central, and southern Africa. Fat-rumped sheep, prized for their fatty meat, as well as their hides and milk, are more prevalent in arid parts of the continent. They are also excellent sources of wool.

Donatism North African theological position within CHRISTIANITY that held that the clergy who administered the sacraments had to be holy themselves. This doctrine was at odds with the Church in Rome that took the position that the sacraments came from God, not man, and thus God, not the individual administering the sacraments, made them holy. Rome considered Donatism as a heresy. This dispute, which erupted about 300 CE, led to a split between North African Christian BERBERS, who were the principal adherents of Donatism, and Rome. This religious schism weakened Roman North Africa in the face of, first, the Vandal invasion (c. 430 CE) and then the inroads made by ISLAM in the seventh century. Donatism disappeared from North Africa along with the disappearance of Christianity as the Berbers converted to Islam.

Dyula (Douala, Jula, Diula, Wangara, Kangan)

MANDE-speaking traders who prospered in West Africa from the 14th through the 16th centuries. Dyula trading activities go back as far as the GHANA EMPIRE (as early as the eighth century CE). The MANDINKA called them *Dyula*, which means "Muslim trader," but West African ARABS knew them as Wangara. By the 14th century the term *Dyula* was widely used to name the many different traders—Malinke, BAMBARA, and SONINKE—who were doing business across the African savanna. The Dyula held prosperous commercial trade routes from SENEGAL to NIGERIA and from TIMBUKTU to the northern IVORY COAST. Eventually they became agents, brokers, and financiers.

They primarily traded in GOLD, salt, and kola nuts, but, as their trading networks grew, the Dyula moved into goods such as livestock, cloth, COPPER, silver, IVORY, beads, and glass. They also played a significant role in the trade from the western SUDAN to northern Africa, and their commercial expertise allowed them to trade with European MERCHANTS, who arrived in the 16th century. Besides being excellent merchants, they excelled in the arts. In their communities, Dyula traders usually separated themselves from their peasant neighbors, although they were themselves often treated as second-class citizens in some of the towns in which they settled.

As converts to ISLAM, the Dyula spread their religion to the various communities in which they settled. These included the SONGHAI trade centers of Timbuktu, JENNE and GAO, as well as to many BARIBA and Hausa towns. As a result they contributed enormously to the expansion of Islam in West Africa.

E

economy Subsistence agriculture continued to expand in Africa in the 1000 years after 500 CE and came to constitute the basis of the economy for most African societies. Farming was the most important form of AGRICULTURE, but herding was also an important activity. The availability of water sources and grazing land determined whether a pastoral group pursued a stationary or a nomadic form of subsistence. Among many of these peoples, cattle raising became the dominant means of meeting their subsistence needs, while for others camels were the main animals. Sheep and goats were also important in some societies. In addition to providing meat and dairy products for human consumption, cattle were used as currency, as bridewealth, and as a means of settling debts. In this way cattle became a determining factor in social stratification.

Shelter Thatched-roof homes provided shelter for people in wetter, heavily forested areas; mud and clay structures did the same for people in more arid climates. Some Africans, however, had more elaborate buildings. In the trading cities of the SWAHILI COAST, for example, well-to-do merchants lived in fine houses and also helped finance elaborate mosques, such as the one in KILWA. Similarly, in JENNE, located near the Inland Niger Delta in present-day Republic of MALI, the local Muslim rule oversaw the construction of the Great Mosque, made from adobe, in the 13th century. About the same period, the MAMLUKS, who ruled over EGYPT from their capital at CAIRO, presided over a major expansion of the city's economic activity.

Natural Resources Settling in close proximity to fertile fields and mineral deposits often was the means for acquiring immense power. The GHANA EMPIRE was a perfect example of the exploitation of both types of re-sources. Because of its proximity to the WANGARA GOLD FIELDS and its taxation of commercial traffic on the trade routes, Ghana received immense revenues without any substantial capital outlay. This wealth facilitated the production of IRON tools, which in turn provided the kingdom with a distinct advantage in agricultural production. These high agricultural yields provided the GHANA EMPIRE with an additional source of revenue apart from the goods that flowed along the TRANS-SAHARAN TRADE ROUTES.

Trade The gold and SALT TRADE, which developed in later years between Sahara merchants and the empires of Ghana, MALI, and SONGHAI, was crucial for three reasons. First, it was the source of tremendous wealth for the rulers of these ancient empires. Second, because salt was scarce in the western regions of the SUDAN and gold was so abundant, salt assumed a higher value than gold. Third, due to the secrecy associated with the location of the Wangara gold fields, trade was conducted by dumb barter. In this process, merchants did not actually meet face to face but instead left appropriate amounts of goods in a prescribed place in exchange for the gold. In North Africa cities such as SIJILMASA became major economic centers as a result of the burgeoning trans-Saharan trade that expanded into other goods well beyond the trade in gold and salt.

Art and Crafts Artists, BLACKSMITHS, and other crafts-people and artisans increased their contribution to the African economy as the population grew and the economy expanded on the basis of trade and agricultural productivity. While the art and goods produced often had functional purposes, decorative aspects were also important.

Edo (Bini) People of the southern part of present-day NIGERIA who once ruled the historic kingdom of BENIN from c. 1400 to c. 1800. Prior to the colonial era the Edo, also called the Bini, made their living from farming, hunting, and trading their wares, eventually becoming one of the first African groups to trade with the Portuguese. They were also known for their intricate IVORY and BRONZE sculptures and plaques, which adorned, among other places, the palace of the *oba,* or king, and portrayed Benin's distinguished history. Other traditional skills were passed down through the generations, such as woodworking, metal arts, and the weaving of ceremonial CLOTH AND TEXTILES.

The Edo speak the Kwa language of the NIGER-CONGO LANGUAGE family and have historically been ruled both religiously and politically by their *oba.* The first *oba,* Eweka, was the son of Prince Oranmiyan of ILE-IFE, who arrived during the 13th century to govern the Edo people. It is traditionally believed that the Edo became discontented with the ruling dynasty of the semi-mythical kings known as the *ogisos.* The most celebrated *oba,* however, was EWUARE (c. 1440–1480), who extended the power and size of the kingdom of Benin and introduced the idea of a hereditary line of succession to the throne.

While today many of the Edo practice either ISLAM or CHRISTIANITY, there are many who still practice the traditional religion, which is based on allegiance to their gods, heroes, *ogisos,* and spirits of the afterlife.

Egypt Present-day nation in the northeastern part of the African continent approximately 386,700 square miles (1,001,600 sq km). Egypt is bordered by the MEDITERRANEAN SEA, the Red Sea, and the modern-day countries of Israel, the Republic of the SUDAN, and LIBYA. The character of Egypt changed radically with the rise of ISLAM in the Arabian Peninsula. Before the year 1000, Egypt had been both Arabized and Islamized.

For thousands of years, Egypt has been an influential force on the African continent, as its ancient history attests. With the division of the Roman Empire in the late fourth century, Egypt became part of the Byzantine Empire, and by the fifth century Egypt had been subdivided into numerous provinces under local authority. However, political unrest soon led to a more centralized, authoritarian government. At the same time, the rapid spread of CHRISTIANITY led to conflict with adherents of the traditional religion.

The tenuous Byzantine grip on power ended around 639. At this time Arab Muslims invaded Egypt and forced the Byzantine rulers to retreat from Egypt to Anatolia (present-day Turkey). The Muslim conqueror, Amr ibn al-As (d. 663), established the new Egyptian capital at al-Fustat. In general, non-Muslims were tolerated, although they were required to pay special taxes. Around 668 a new Muslim dynasty, the Umayyads, took the throne. During their reign, Muslim Arab immigrants arrived in large numbers.

Around 750 power in the region shifted to the Sunni Muslim Abbasid dynasty. From their capital in Baghdad, Iraq, the Abbasids ruled Muslim North Africa for more than 150 years. In 868 Turkish slaves united under Ahmad ibn Tulun (868–884) and overthrew the Abbasids. Tulun's reign was short-lived, as power shifted back to the Abbasids by 905. The FATIMIDS, a Shiite Muslim sect, captured Egypt in 969. They established their capital at CAIRO and conquered much of the Arabian Peninsula and North Africa.

Although the Fatimid rulers (969–1141) espoused an esoteric branch of Islam called *Ismaili Shiism,* the majority of Egyptians adhered to the orthodox Sunni branch and were generally tolerant of the dwindling number of Coptic Christians and Jews in the population. Ismaili Shiism was a religious and political movement that stressed esoteric knowledge and distinguished between the ordinary believer and the initiate. The Fatimid desire to propagate these beliefs and the development of al-Azhar mosque and university made Egypt a center of Islamic scholarship and missionary activity during this period.

Fatimid power in Egypt lasted more than 200 years until a Syrian army commander, SALADIN (c. 1137–1193), overthrew the dynasty in 1171. Saladin reestablished an Abbasid allegiance and formed the Ayyubid dynasty (1171–1250).

The Rise of the Mamluks The Ayyubid dynasty returned Egypt to Sunni Islam. Determined to build up Egypt's independent military strength, they took into their military service large numbers of Turkish slaves called MAMLUKS (from the Turkish word for "slave"). The Mamluks exploited a palace feud to put one of their own into power, and in 1250 began the Mamluk Period, which lasted until 1517. The non-Arab, non-Muslim Mamluks saved Egypt from Mongol attacks, defeating the invaders in 1260 at Ayn Jalut, near Nazareth in modern-day Israel. Mamluk strength made Egypt a stable country and an important center of the ARABIC-speaking world. Accompanying this growth, however, was a diminution of the rights of Coptic Christians, who were openly persecuted. Some historians believe that the Mongols' use of Christian auxiliaries in battle may have turned the Mamluks against Christianity.

Mamluk power began to decline after the plague, a disease known in Europe as the Black Death, beset Egypt in 1348 and often thereafter. Egypt's commercial rivals, the Portuguese, began to dominate trade with India in the early 1500s after a sea route around Africa to the Far East

was discovered in 1498. Even the strong Mamluk sultan Qait Bay (r. 1468–1496), who built a fort at Alexandria from the stones of the city's ancient lighthouse of Pharos, could not preserve Egypt's freedom. The land was beset by Turkish attacks from Anatolia and Azerbaijan near the Black and Caspian Seas.

By the end of the 15th century the Portuguese had displaced Egyptians as the dominant sea traders in the region. And, as internal conflict among the Mamluks increased, Turkish Ottomans easily conquered Egypt in 1517. Although the Ottomans retained ultimate authority over the Egyptian people, the Mamluks continued their administrative authority for the next 200 years.

Ekiti Ethnic group related to the YORUBA located in present-day southwestern NIGERIA and known for their frequent conflicts with the kingdom of BENIN. The Ekiti were an agrarian group who lived in a patrilineal society based on the *ilu,* or town, which was headed by various chiefs from each village. The kingdom was ruled by the *oba,* or king, who held powers such as the ability to administer punishment and give out honors to his people. The power of the *oba* was kept in check, however, by a council of chiefs who acted as advisers on both palace and village matters.

The Ekiti trace their origins to ODUDUWA, the founder of the first Yoruba city of Ife. They believe that one of Oduduwa's sons migrated from Benin and established their capital and first kingdom of Ado. In the 15th century the kingdoms of Oye, Ikole, Ido, Ise, Ijero, Otun, Emure, Obo, Itaji, Effon, Ikere, Okemesi, Ogotun, Ise, Ara, and Isan developed when competing ruling factions broke away from Ado to form their own settlements.

The Ekiti people began their long history with the kingdom of Benin when their kingdoms became tributaries during the reign of EWUARE (r. c. 1440–1480). Until the colonial era in the 19th century the kingdoms of the Ekiti periodically went back and forth between being ruled by Benin and regaining their independence.

Eleni (Elleni, Illeni, Ileni) (c. 1468–c. 1522) (r. c. 1507–1516) *Regent and queen mother of Ethiopia*

Born a Muslim princess in the Ethiopian town of Hadya, Eleni married Baeda Maryam (r. 1468–1478) and began to have an impact on ETHIOPIA when her husband came to power.

During her time as Baeda Maryam's *itege* (chief wife), she converted to CHRISTIANITY and wrote two works on the subject, all the while managing to continue good relations with the Muslim world. Known for her gentleness and intelligence, Eleni continued to be influential after the death of her husband and acted as either a respected adviser or a regent for the subsequent four young rulers of Ethiopia.

During the reign of Eskender (1478–1494), another Ethiopian faction under the rule of Amda Michael attempted to gain control of the country. They were overthrown, however, by Empress Eleni and some of her aristocratic allies. Eskender's son and successor, Amda Siyon, (not to be confused with the earlier emperor of the same name) was a young boy when he came to power and died after a reign of only six months.

After Amda Siyon's death, another of Baeda Maryam's sons, Naod (r. 1494–1508), came to power. When Naod died, Eleni was instrumental in securing the throne for her grandson, Lebna Dengel (r. 1508–1540), for whom she served as regent for about the first half of his reign.

Initially, Eleni was also a powerful force in the relations between Ethiopia and Portugal, sending envoys c. 1509 to King Manuel (1469–1521), laden with gifts and expressing her country's desire to form an alliance with Portugal to defeat the Moors. The party sent in return by King Manuel did not arrive until 1520, though, and by then Eleni's influence was fading. By this time Lebna Dengel had become known as a greedy and despotic ruler and, disregarding Eleni's prior call to action, he did nothing to ensure the alliance with Portugal, thereby diminishing the authority of Ethiopia's SOLOMONIC DYNASTY in the region.

Engaruka City in the northern part of present-day TANZANIA that, from the 14th to the 17th centuries, possessed one of the best systems of effective irrigation. Engaruka was originally inhabited by farmers who built stone houses and devised an intricate irrigation system. Using gravitational force, they directed the water of the Engaruka River into inland waterways. This irrigation system, the earliest of its kind so far discovered in Africa, was enhanced by highly advanced aqueducts, sluices, and trenches, some with slopes of 1 degree or less, which were used to help channel the water flow.

The builders of the irrigation system also constructed stone terraces to aid in the cultivation of their land. These terraces were used to prevent erosion by acting as a

break on the steep slopes, which lowered the amount of sediment the water would carry down to the farmland.

Little is known about the people of Engaruka, who probably spoke a Cushitic language. In time, a decrease in the annual rainfall led to deforestation and overgrazing, which changed the area in significant ways. As a result the land was no longer easily cultivated, and the inhabitants migrated from the area.

Ennedi Region in the northeastern part of present-day CHAD, known for its ancient rock art. Stone, cave, and cliff paintings dating back to as early as 6000 BCE have been found on the massif of the Ennedi region. The types of rock art have changed considerably over time, with different colors and styles used in the representation of animal species, dress, and weaponry, but they are generally classified into three periods: Archaic, Bovine, and Dromedary (or Equine).

The ART of the Archaic Period, which ended around 2000 BCE, consists mainly of depictions of animals and human figures wearing loincloths and jewelry and carrying clubs and sticks. Art from later in the Archaic Period also shows life scenes, including dancing, running, and women carrying baskets on top of their heads.

The Bovine Period, extending from 2000 BCE to 1000 CE, represents a significant change in the rock art of Ennedi. To a great extent this is due to the domestication of cattle and sheep as well as to the emergence of dogs as companions. Since these animals are consistently depicted as being healthy-looking and plentiful in number, it has been suggested by some scholars that the appearance of these domestic animals during this period is linked to climatic changes that brought about a general increase in prosperity in the area.

Human figures from the Bovine Period are shown as wearing more elaborate jewelry than the figures from the earlier Archaic Period. This ornamentation includes adornments for the ears and head as well as more extensive garments, such as headdresses, robes, and long, full skirts. Their weaponry also was more sophisticated, with spears, shields, and curved clubs all being depicted. The life scenes increased in scope as well, with depictions of containers filled from grain harvests, women in conversation or dancing, and musicians playing instruments.

The third period of Ennedi rock art ranges from the years 1000 to about 1700 and is called the Dromedary, or Equine, Period because camels, and later, horses, are widely represented. During this era, art initially was abundant, only beginning to decline with the introduction of ISLAM about the 11th century. The human figures from the Dromedary Period are less like hunters and more like warriors, using shorter spears and adding spikes to the bridles and tails of their horses. As the period went on, the art became increasingly stylized, losing the realism of the previous eras.

It has been estimated that, over the centuries, there have been 15 or more styles of rock art in the Ennedi region, each differing in its depiction of humans, animals, and daily life.

Equatorial Guinea Country in tropical west-central Africa, some 10,800 square miles (28,000 sq km) in size that is made up of a mainland coastal enclave of Río Muni and five Atlantic Ocean volcanic islands. Rio Muni features coastal plains and interior hills, and it borders CAMEROON to the north and GABON to the east. The largest island is Fernando Po (now Bioko), which is about 780 square miles (2,030 sq km) in size and, along with the small islands of Corisco and Great and Little Elobey, lies in the Gulf of Guinea about 100 miles (161 km) northwest of the mainland part of the country. The present-day capital city of Malabo is on Bioko. The country's fifth island, Annobon, is also small and is 350 miles (563 km) southwest of mainland Equatorial Guinea.

As in the rest of tropical west-central Africa, the farming population gradually expanded between 500 and 1500 CE. A dramatic new development took place in the last quarter of the 15th century, when Portuguese explorers began working their way down the coast of the western side of the continent. In 1472 Portuguese navigator Fernando Po came upon the island that initially was called Formosa (beautiful) but eventually was to bear his name. He also explored the coastal mainland. Portugal gained formal recognition of its claims to the area through the Treaty of Tordesillas with Spain in 1494. In the meantime Portuguese planters had already established sugar plantations on both Fernando Po and Annobon, hoping to profit from the rich volcanic soils and the supply of slave labor from the mainland.

Eritrea Country some 46,830 square miles (121,200 sq km) in size located on the Red Sea, northeast of ETHIOPIA, in the Horn of Africa. Eritrea also shares borders with the Republic of the SUDAN, in the far northwest, and with DJIBOUTI, to the south. Southern Eritrea was the site of part of the Aksumite kingdom, which flourished about 400 to 600 CE. The most important Aksumite port, ADULIS (modern Zula), was located in Eritrea.

In the eighth century Muslim traders began to settle in Eritrea. From the ninth through the 13th centuries, Eritrea was controlled by the BEJA, a nomadic group also known as the Hedareb. During this time, AKSUM dimin-

ished in power and later came under the control of rulers of the ZAGWE and SOLOMONIC dynasties.

See also: ARAB COASTAL TRADE (Vol. II); ASMARA (Vol. II); BEJA (Vol. I); ERITREA (Vols. I, III, IV, V); GE'EZ (Vols. I, II); RED SEA TRADE (Vol. II); TIGRAY (Vols. I, IV, V).

Ethiopia Country in northeastern Africa approximately 435,100 square miles (1,126,900 sq km) bordered by present-day ERITREA, SOMALIA, DJIBOUTI, KENYA, and the Republic of the SUDAN. Following the expansion of ISLAM in the seventh century, the Christian kingdom of AKSUM went into a decline, and by the middle of the ninth century Red Sea and INDIAN OCEAN TRADE had been taken over—initially by the Persians and later by Arabic Muslims. At that time, remnants of the kingdom regrouped in the southern interior, where a semblance of Christian rule continued until the 10th century. The kingdom was then destroyed by an alliance of Muslim, Bejan, and AGAW rebels led by Queen GUDIT (d. c. 970). Her open defiance of Christian rule was rumored to have culminated in the death of the last reigning king of Aksum.

Rise of the Zagwe Dynasty Few records are available to give a complete view of the disarray that followed. However, it is clear that a new ruling class, comprised primarily of Agaw-speakers who professed Christian beliefs, became known as the ZAGWE DYNASTY. The rise of this powerful ruling clan has been attributed to the value of the land they held and to their ability to create a FOOD surplus. Arranged marriages and tributary taxes added to the kingdom's wealth, which remained within the hands of the ruling elite. In power from as early as 916 to 1270, the Zagwe kings eventually established a capital city at al-Roha (Adefa). Located to the south, less than 240 miles (400 km) from the former kingdom of Aksum, this capital was later renamed the town of LALIBELA in honor of its most famous ruler, King LALIBELA (r. c. 1119–1159).

The Zagwe kings openly traded with Muslim MERCHANTS, but they reportedly set strict guidelines for those merchants' attempts to win converts to the Islamic faith. The groups most critical of the Zagwe were concentrated among the AMHARA, as well as in TIGRAY and the northern highlands of Eritrea. These groups were also the most resistant to Islamic conversion. The elite class that developed among these groups was extremely vocal in their condemnation of the Zagwe kings, whom they considered usurpers of the throne that they believed belonged to the SOLOMONIC DYNASTY traditionally thought to have been founded by Menelik I, supposedly the son of King Solomon and Makeda, the queen of Sheba (c. 10th century BCE).

Supported by the Ethiopian Christian Church, a powerful group of Amhara nobles seized the Zagwe throne in 1270. This restored the Solomonic Dynasty, bringing to power King YEKUNO AMLAK (r. 1270–1285) and helping the Ethiopian Church to amass both land and wealth. Considered a legitimate heir to the throne, Amlak reasserted the original Christian character of Ethiopia, ushering in a period that many historians describe as a heroic or chivalrous age of warrior kings that included AMDA SIYON (r. 1313–1344), Dawit I (r. 1380–1409), and ZARA YAKOB (r. 1434–1468).

Centered in the Amhara region in the central highlands, this imperial kingdom was ruled by the Ethiopian Church and men whose exploits were chronicled by their closest advisers and royal scribes. In many instances, references are made to their royal queens or consorts, who not only participated in warfare but also had highly visible roles as state diplomats and administrators, mediators, and writers. Many of these queens also were Christian devotees known for their piety and good works.

However, the Solomonic dynasty was not without internal problems. After Amlak's death in 1285, his royal descendants engaged in their own battles for control well into the 16th century. To control succession rights, all but duly appointed sons were permanently imprisoned within a royal prison situated on an inaccessible mountain. By some reports, this prison fortress also supplied potential candidates for the throne when an unexpected death occurred. Other problems of the dynasty included centuries of Christian and Muslim conflicts.

Christian-Muslim Conflicts As the first of the Solomonic rulers, Amlak was able to extend his direct control over the northern highlands, the outlying Muslim states, and traditional societies to the south and east by using what historians describe as a "mobile kingdom," or tent city. In each region he settled, Amlak was supported by tribute. This led to grievances among the growing number of Muslim settlements. As Muslim trading sites expanded into city-states, Islamic conversion grew stronger among the SEMITIC and Cushitic speakers. By the ninth century Islam had gained a solid foothold along the southern coast of ADEN, the East African coast, and neighboring societies. This was accomplished largely through the efforts of Arab merchants.

One of the most persistent problems faced by Ethiopian monarchs was the kingdom of Ifat, also known as Wifat or Awfat, which was reportedly ruled by descendants of the prophet Muhammad. Established in the 12th century, Ifat became one of the richest Islamic city-states because of its close proximity to the trade between the port city and the country's central regions. This position also allowed Ifat's rulers to incorporate many traditional societies, including pastoralists and nomadic herders. Ironically, the first sultan of Ifat was Umar Ibn Dunya-Huz (d. 1275), appointed by King Amlak.

Other Muslim strongholds included Dawaro west of Harer, Sharka in Arusi, as well as BALI and Hadeya. The conflicts which arose from these established sultanates, or Muslim kingdoms, was based in part on their objec-

tions to demands for tribute. However, because they generally were allowed to maintain their local chieftaincies and cultural religious practices, they inevitably attempted to organize rebellions against their Amharic overlords.

Etosha Pan Extensive salt pan of approximately 1,900 square miles (4,920 sq km) located in northern NAMIBIA. By 1500 Etosha was inhabited by the HERERO and OVAMBO ethnic groups. The Herero were generally pastoralists, and the Ovambo were farmers and hunters. Bands of nomadic hunter-gatherers also roamed the area.

It is from the dry season that Etosha, meaning "place of mirages," gets its name. The intense heat reflects off the greenish white expanse of flat land and mirages make it seem as if the animals searching for water are iridescent and walking on air.

Consisting of both salt and clay that is hard but rich in minerals, the Etosha Pan harbors an abundance of fauna during both the dry and wet seasons, as well as relatively seasonal and area-specific vegetation. The animals, including roan antelopes, zebras, elephants, leopards and black rhinoceroses, use the outcroppings of mineral-laden clay as a salt lick to nourish themselves during the demanding heat of the dry season. During the wet season, however, the vegetation flourishes and a wealth of bird species, including the pink flamingo, flock to the Pan and add color to the extensive landscape.

Ewe Ethnic group located on the Guinea Coast in West Africa. The ancestors of the Ewe probably migrated from the OYO area of NIGERIA during the 15th century and set up villages in areas of modern-day GHANA, TOGO, and Republic of BENIN. These villages were based on the principle of *frome* (lineage), in which the eldest male in the

family acted as a judge, administrator, family representative to the village, and even the religious connection to the spirits of the dead. The power surrounding these communities remained decentralized, however, and the villages tended to band together only during a war or other intense strife.

While some of the Ewe who lived along the rivers and coastline were strictly farmers, historically many were known to use their crops for trade as well as for sustenance. The Ewe were also known to be skilled potters, blacksmiths, and weavers.

The Ewe traditionally have spoken variations of the Ewe language, which is a dialect of the Kwa language branch of the Niger-Congo language family. Their religion is based on allegiance to Mawa, their god of creation, and Trowo, a series of minor gods whom the Ewe worship and from whom they gain direction for their daily lives.

Ewuare (Ewuare Ne Ogidigan, Ewuare the Great) (c. 1440–1480) *Oba, or king, of the West African kingdom of Benin*

Generally regarded as the most powerful and influential ruler of the kingdom of BENIN, Ewuare the Great was known as the *oba* who successfully expanded his kingdom's territory and created a hereditary line of succession to the throne. Ruling from about 1473 to around 1480, Ewuare built many roads and surrounded EDO, his capital, with an extensive arrangement of protective moats and walls. He also is credited with changing the political structure from that of the UZAMAS, a powerful group of chiefs based on heredity, to that of selected chiefs known as the "town" chiefs and the "palace" chiefs. Through their taxation of the towns within the kingdom, these two groups of chiefs supplied the *oba* with his income, which usually consisted of such provisions as yams and palm oil. Under Ewuare's new political structure, any free man could vie for titles of power and seniority.

In Benin oral tradition, Ewuare is a larger-than-life figure. He is associated with the leopard and the viper, two animals that he believed foretold his destiny as a powerful and opportunistic ruler.

Beyond his political stature, Ewuare was also known as one of the greatest warrior kings of Benin. According to legend, he won more than 200 battles and assumed control of

each town he captured. His stature was made even greater by his reputation as an innovator—or even a magician—in the use of herbs for medicinal purposes.

Ewuare was eventually succeeded by a long line of powerful *obas* including his son Ozolua and his grandson Esigie, both of whom continued Ewuare's tradition of strong central authority in matters of religion, politics, and economics.

F

Fada-n-Gurma (Gurma, Fada Ngourma) King-dom considered one of the MOSSI STATES, located near the northern bend of the NIGER RIVER, in present-day BURKINA FASO. About the beginning of the 16th century Fada-n-Gurma came under the rule of the warrior Mossi people, along with the four other main states of YATENGA, MAM-PRUSI, DAGOMBA, and OUGADOUGOU. The Mossi were known for their cavalry forces and their resistance to Islam, which made them a threat to the surrounding Muslim kingdoms, such as the SONGHAI Empire, through-out the 16th century.

family As African societies continued to develop over the first and early second millennia CE, families both as-sumed new roles and continued familiar ones. These roles had to do with their social as well as their economic func-tions. In addition to providing comfort and support, fami-lies served to socialize children. Within these families children learned not only about the culture and values of their societies but the various forms of LABOR necessary for family continuity over the generations. For example, children in farming cultures learned good agricultural practices by working alongside their parents in the fields. The sons of blacksmiths, on the other hand, learned the skills and secrets of the profession. One reason that African societies placed great value on large families was for the labor they provided. Indeed, for most families the best way to insure a sufficient work force to meet eco-nomic needs was by producing a large number of chil-dren. Another way was through marriage, which brought both productive and reproductive labor into the family.

Because of the dual value of women, many societies practiced bride-wealth, which compensated the family of the bride for the loss of her labor. For wealthy and pow-erful families, polygamy served to expand a family's so-cial, political, and economic standing. The spread of ISLAM in Africa from the seventh century onward intro-duced some new elements into African families. For ex-ample, Islamic law allowed men to have up to four wives and gave full family recognition to the children of such marriages versus the children born outside legal unions.

The economic role of the family flowed readily out of its social role. As one author has written, "African fami-lies are family businesses." As businesses they could rely on members that had come to the family both by birth and through marriage. This dimension of African families greatly facilitated the expansion of TRADE AND COMMERCE on the African continent in the period following the fifth century. For example, families involved in trade stationed family members at key points on the TRANS-SAHARAN TRADE ROUTES to insure the safe purchase, sale, and trans-port of goods.

Fang Bantu-speaking people living in parts of West Africa. The Fang inhabit the areas of CAMEROON south of the Sanaga River, mainland EQUATORIAL GUINEA, and

the forests of the northern half of GABON south to the Ogooue River estuary. The earliest Fang groups migrated to the area before the arrival of the Portuguese in the 15th century, but the history of these peoples prior to that time is unclear.

The Fang speak a Niger-Congo language. Among the various Fang groups, there are three main linguistic divisions. The first, the Beti, is found in the north of the area inhabited by the Fang, and is spoken by the Yaounde, or Ewondo, and Bene. The second is Bulu, which is spoken by the Bulu, Fong, Zaman, and Yelinda. The third group is known as the Fang, which is spoken in the south by the Fang, Ntumu, and Mvae.

Some groups of the Fang, including the Balu, have traditionally been nomadic farmers, rotating their crops and moving on an annual basis in order to avoid soil erosion. Their traditional farming implement is the hoe, and their staple crops have included cassava and corn.

The Fang traditionally lived in bark houses arranged in a pattern along a straight central throughway. The various Fang subgroups belong to patriarchal clans and share similar political systems. Each village has a leader who is a descendant of the founding family of that village. The leader often serves as a judge in disputes and leads religious rituals.

Traditional Fang religion involves the honoring of ancestors, who are believed to wield powers in the afterlife. Even the skulls and bones of deceased leaders are believed to influence the fortunes of the family.

Fang ART consists of simple masks and figures. Typical of this is a *bieri,* a carved box containing the skeletal remains of ancestors. Some authorities believe the figures to be abstract portraits of the deceased ancestors, while others suggest that they are meant to protect the ancestral spirit from evil. Fang masks are worn by entertainers, as well as by sorcerers involved in hunting and meting out punishment. The masks are painted white and are detailed with black outlines.

Fante (Fanti) West African ethnic group located along the coastal regions of present-day GHANA. The Fante and the ASHANTI are the major subgroups of the AKAN ethnic group, and both speak a Niger-Congo language called Akan. It is thought that the ancestors of most of the coastal peoples, including the Fante, migrated west from regions around Lake Chad and the BENUE RIVER. They first crossed the lower Niger River and the VOLTA RIVER, then moved through the forest into what is modern-day Republic of BENIN and TOGO before reaching the coast. The Fante migration through the forest is supported by the connection between Akan and the Twi language of the forest peoples. The final leg of Fante mi-

gration to the coast was probably from the north, near Tekyiman, in central Ghana. When the Portuguese arrived in the 1470s, the Fante were one of the established Akan kingdoms along the Guinea Coast, with their capital at Mankessim.

Like other coastal peoples, the Fante lived in an autonomous kinship society. Their kings and queen held centralized power with the help of a priest who oversaw clan rituals and ceremonies. In the 15th century Fante society was largely organized around the production and trading of GOLD, which was mined in the region. They also traded captives with the MANDE and HAUSA peoples to the north and east.

All able-bodied Fante men were expected to be members of their kingdom's *asafo,* a military group that defended against invasion. Organized by patrilineage, the *asafo* was a common feature of Akan societies. Fante women could also be members of the asafo, and some even were respected war captains.

Faras Settlement along the banks of the Nile River below the second cataract in Lower Nubia; it rose in importance during the period from the third century BCE to the fourth century CE. When Meroë ruled the region, Faras became the seat of one of the six bishoprics of Christian NUBIA and the site of a major cathedral. The list of bishops at Faras numbered at least 29, with the first dating from the third decade of the seventh century and the last to the end of the 12th century. The cathedral, which was begun in the second half of the seventh century, was built of stone. Even more remarkable than the construction were the 67 frescoes that decorated its walls. These unique pieces of art point to the existence of a well-developed school of Christian Nubian mural painters by the late eighth century. The last of the frescoes dates to the 14th century.

The site of Faras was inundated by Lake Nasser, which was formed in 1970 with the completion of the Aswan High Dam in upper EGYPT. Fortunately for posterity, a team of Polish archaeologists excavated Faras between 1960 and 1964. In the process, they uncovered the cathedral and its frescoes, which drifting sands had hidden from sight for centuries. The frescoes have thus been preserved in museums in Poland and the Republic of the SUDAN.

farim Titled leaders of the MALI EMPIRE, which flourished in West Africa from the 13th through the 15th centuries. *Farim*, meaning "ruler," refers to the representatives of the ruling power in the small states throughout the Mali Empire. *Farim* is equivalent to the title *farma* given to the leaders dispatched by Mali's *mansa,* or emperor, to represent his power in the widely dispersed outposts of the empire. The *farim* had power over the local chiefs in the states where they ruled. The decline of the empire in the 16th century increased the *farim's* autonomy, and they eventually ruled their states without allegiance to the *mansa.*

Fatimids Ruling dynasty of EGYPT from 969 to 1171. The Fatimids were Shiite Muslims who, early in the 10th century, came to the eastern MAGHRIB region of North Africa from Arabia. Claiming to be descended from Fatima, the daughter of the prophet Muhammad, they believed that they were the legitimate spiritual leaders of SHIISM, a sect of Islam that broke with the Sunni-led Abbasid caliphs of Baghdad, in present-day Iraq. The Fatimids converted many BERBERS during their conquests of North Africa and soon controlled most of TUNISIA and AL-GERIA. They also wrested Egypt from the rule of Baghdad. In 969, under Caliph al-Muizz, the Fatimids established their capital at al-Qahira (CAIRO).

Initially, the Fatimids enjoyed great prosperity in Egypt, especially as the country's ruling class. They controlled Egyptian AGRICULTURE and collected great revenue from taxes generated by Mediterranean trade and RED SEA TRADE. A major part of their success depended on a thriving textile industry that developed under the direct control of the caliphs. Through the extensive trade of COTTON and linen, MERCHANTS and caliphs alike grew wealthy.

Taxation was the main source of government income, but the Fatimid tax system was rife with corruption and contributed to the dynasty's downfall. By paying a certain sum to the caliph, for example, Fatimid Berbers were allowed to become "landlords" of the Nile Valley, with the right to institute unlimited taxes of their own. The Berbers frequently failed to pay the caliph, however, leaving him unable to pay for even the upkeep of his army. By the mid-12th century the situation had deteriorated to the point that soldiers were looting the countryside. At the same time, violence among MAM-LUKS, Berbers, and Sudanese disrupted trade and farming, leading to further weakening of Fatimid power. In the 1160s Christian crusaders from western Europe were on the verge of overrunning the Fatimids but were thwarted by SALADIN (c. 1137–1193), an army leader from Kurdistan. When the last Fatimid caliph, al-Adid, died in 1171, the vizier Saladin became ruler of Egypt and founded the Ayyubid dynasty.

Though devout Muslims, the Fatimids maintained peaceful relations with Christian and Jewish traders early in their rule. This contributed to their prosperity, as the riches that would be spent waging wars were used instead to glorify ISLAM. The situation changed, though, toward the end of the 11th century, when European Christians launched the first of several CRUSADES to reclaim the Holy Land.

festivals Festivals are a long-standing tradition in Africa, and they often have been used to reinforce cultural values and to unify a community around common goals. Festivals have also served as traditional markers for significant rites of passage. The earliest festivals may have been initiated to mark the advent of agricultural seasons, including the success of a harvest or, as in ancient Egypt, to acknowledge the annual inundation of nourishing silt from the Nile River. In farming communities south of the Sahara, seasonal harvest celebrations like the new yam festivals, were held by many societies with widespread variation. These festivals frequently were marked by the wearing of specific colors and masks as well as by dance movements that were dictated by a specific tempo and style of drumming. Singing on the part of the spectators was another common feature.

The IGBO of NIGERIA, for example, traditionally incorporated many symbolic rituals into their yam festival, which marked the beginning of a new year. The festival, which dates back to antiquity, is still held yearly. In preparation, the homes of the Igbo are cleaned and painted in the traditional colors of white, yellow, and green, while the remnants of former harvests are discarded. One of the primary objectives of the festival is to honor the earth goddess Asase Yaa as well as the ancestors of specific clan lineages. As a result, the event begins with the sacrifice of the new yams to the regional deities and ancestors. This is followed by a feast that includes palm wine and the popular regional dish known as *yam foo-foo.*

Among the other societies with a long history of harvest festivals are the KAMBA and KIKUYU of KENYA, the Shilluk of present-day Republic of the SUDAN, the Shona of ZIMBABWE, and the Sonjo of TANZANIA.

Another type of festival was historically held in the ancient city of ILE-IFE, where special priestesses held a

time-honored festival that stretched over several weeks. Dominated by women, the celebration began with the decoration of a special shrine to the *orisha* of sickness and disease, Babaluaye. The painters of the shrine were women, and the special colors of the deity—red, black, and white—were applied. In addition, all objects within the shrine were thoroughly cleansed. The women then chanted, danced, sang, and painted in a sacred performance known among the YORUBA as *Oro*.

The FANTE of Cape Coast in central GHANA traditionally have held an annual Oguaa-Afahye festival that also is noteworthy. Meaning "the adorning of new clothes," this 17-day purification festival involves the ritual sacrifice of a cow to obtain the blessings of the 77 gods of Oguaa (the Cape Coast). Among the rituals is a procession (*durbar*) of the chiefs and major warrior societies.

Among the most important rites of many African festivals are those that honor the ancestors of a group. A long-standing tradition of offering gifts is maintained in many of these celebrations because this is believed to solidify the reciprocal relationship between humans and the spiritual world. In addition, festivals of this type often call for the reenactment of origin myths. Some of these festivals, like one celebrated by the EDO people of present-day Republic of BENIN, trace the arrival of the first inhabitants into the region. Other festivals, some of which involve animal sacrifice, honor specific deities. The Efutu, in present-day Ghana, have traditionally held a deer hunt as part of their annual festival. Their objective is to honor their most important deity, Penkye Out, who is considered to be the guardian of the people. Similarly, Ntoa, the spirit of Brong Ahafo, an AKAN state of West Africa, is honored at their annual Apoo festival through a special dance involving the use of ritual swords. This dance apparently symbolizes the origin of the nation's female founder, who is believed to have emerged from a cave near the Basuaa River. Other highlights of the festival include verbal dueling competitions between groups ordinarily divided by social rank or economic status.

One of the most important functions of festivals has been the recognition of divine kingship. Among the Akan, the Akwasidae festival honors the royal ancestors who were traditionally "enstooled," meaning that they were installed in the office of kingship. These stools, which came to embody the essence of the king, have been noted in rites of the *odwira* festival, which traditionally was held by the ASHANTI between August and September. In this festival, all the royal stools are purified, starting with the "First Paramount Stool" and proceeding until every stool, one by one, is purified. Specially inscribed brass bowls called *kuduo,* highly revered by the king, are also part of the festival activities. Believed to have first originated among the Akan during the 15th century, the *kuduo* most likely came from the northern Islamic cities

as a result of trans-Saharan trade. During the festival they hold water that is sacred and used to symbolically purify the souls of the reigning monarchs.

Fetha Nagast (Judgment of Kings)   Codified laws developed in ETHIOPIA between the 14th and 15th centuries. The Fetha Nagast made up a body of laws adapted from the COPTIC CHURCH of EGYPT and modified for civil use during Ethiopia's medieval period. Judges were appointed by the ruling king or emperor and served under the direction of provincial governors. Responsible for cases involving civil suits, land disputes, and money debts, the defendants and their accusers usually sat on either side of the judge with an array of witnesses, jurors, and onlookers.

Local judges were sometimes passed over in favor of a higher court judge known as a *wambar*. These officials were capable of dispensing justice in the form of floggings, imprisonment, or when necessary, the death penalty. In the case of failure to repay debts, money lenders and those who owed them money were chained together and imprisoned until witnesses could be called to verify the facts or for terms of repayment to be arranged.

Fez   City in north-central MOROCCO, on the banks of the Wadi Fes River. The eastern bank was settled by Idris I, around 789, and the western bank was settled in 809 by Idris II. Idris I used a silver and gold pick axe, called a *fas* in ARABIC, to mark the boundaries of the city, hence the city's name. These two parts of the city were merged in the 11th century under the rule of the ALMORAVIDS.

Located on the trade routes that connected areas south of the SAHARA DESERT to the Atlantic Ocean, Fez had a busy market, or souk, and became an busy commercial center. There are more than 100 mosques in Fez, including some of the oldest and holiest shrines in North Africa. Pilgrims traveled long distances to visit the tomb of Idris II (r. c. 803–828). The al-Qarawiyin Mosque, the oldest and one of the largest mosques in northern Africa,

is located in the old city. Also in the old city, which is known as the Medina, is the mosque of Mawlay Idris, the city's founder, which is considered so sacred that non-Muslims and animals may not approach its entrance.

Residents during this period enjoyed a rich and varied existence. Scholars, for example, came to Fez to study at al-Qarawiyin University, which was founded in 859. It is one of the oldest institutions of higher learning in the world. A new section of the city, called Fes el-Jedid, was founded by the MARINIDS in the 13th century. They also built the Royal Palace and adjacent Great Mosque, known for its distinctive minaret. The Jewish quarter, called the *Mellah,* south of the Royal Palace, was home to the city's Jewish goldsmiths, silversmiths, and jewelers.

Traditional crafts flourished in Fez, including leather, POTTERY, jewelry, wrought IRONWORKING, and carpets. Different districts of the city became known for particular specialties, and professional guilds ensured that the quality of these goods remained first-rate. Up until modern times, this was the only place in the world to buy one of the most familiar items of Muslim dress in the Middle East: the brimless, round, red felt hat, known as a *fez.*

Fezzan (Fezan) Saharan region of LIBYA. Fezzan is among the most scenic areas of the SAHARA DESERT. Known in ancient times to both the Greeks and Romans, it was conquered in 666 by the ARABS, under whom ISLAM replaced Christianity throughout the region.

Fezzan was on the TRANS-SAHARAN TRADE ROUTES that connected the MEDITERRANEAN SEA with the SUDAN. Caravans carrying GOLD, IVORY, and slaves from the western Sudan to markets on the Mediterranean regularly passed through Fezzan, stopping at the oases along the way. Arabs ruled Fezzan until the 10th century, when the region regained its independence under various native Berber dynasties, who were supported by the FATIMIDS in EGYPT. In the 13th century the king of KANEM-BORNU, an African Muslim trading empire in the Lake Chad basin, invaded Fezzan from the south, and the KANURI rulers of the Bornu kingdom maintained control over the important trade routes until the early 16th century.

Filippos (c. 1314–1341) *Abbot of the early Christian monastery of Asbo in Ethiopia*

As CHRISTIANITY expanded through ETHIOPIA in the 13th and 14th centuries, monasteries emerged as the primary vehicles for the expansion. One of the more important monastic groups was the House of Tekla Haymanot. Tekla Haymanot (c. 1270–1285) was a Christian reformer

who founded a monastic community called Asbo in his hometown of Shoa. (A famous 18th-century Ethiopian king was also named Tekla Haymanot.) Shoa had become an important center of the Christian state, so Asbo was able to win the support of both Egyptian bishops and the Ethiopian emperor, Amda Siyon.

Abba Filippos, the abbot of Asbo in the mid-14th century, led a revolt against two Ethiopian emperors, AMDA SIYON (r. c. 1314–1344) and his successor, Sayfa Arad, also known as Newaya Christos (r. c. 1344–1372). Although Christian, the emperors still adhered to the age-old practice of polygamy. Filippos won the support of a large number of Tekla-Haymanot followers, but he was soon captured by the emperors and sent into exile. With their leader in exile, Filippos's followers left Shoa and settled in surrounding areas in the central highlands with little Christian influence. In this way Abba Filippos's rebellion played an important role in the spread of Tekla Haymanot Christianity throughout Ethiopia.

Fouta Djallon (Futa Jalon) Mountainous region in what is now west-central GUINEA, covering an area of more than 30,000 square miles (77,000 sq km), and the site of FULANI migration from the 13th to 15th centuries. The terrain of Fouta Djallon is mostly stepped sandstone plateaus with trenches and gorges. At 5,046 feet (1538 m), its highest point is Mount Loura (Tamgue) near the border with present-day Repbublic of MALI. The central plateau of the Fouta Djallon gives rise to the majority of the rivers of Upper Guinea, including the Gambia, the Senegal, and the Niger.

The region is named after the YALUNKA (Djallonke) ethnic group, its early inhabitants. The nomadic Fulani people, who had been moving south in search of grass and water for their cattle, settled in the region in the 13th century. In the 15th century, a second wave of Fulani, resisting assimilation into the sedentary peoples with whom they had been living in the GHANA EMPIRE and TEKRUR, began their great migration through the grasslands of the SUDAN, eventually reaching as far east as Adamawa in eastern NIGERIA. By the 15th century a large number of Fulani had settled in Fouta Djallon.

See also: FOUTA DJALLON (Vol. III); GHANA (Vol. I); NIGER RIVER (Vol. I).

Fulani (Fulbe, Peul, Pulo) West African people living in the sub-Saharan savanna and grasslands, from Lake Chad to the Atlantic Ocean coast. The Fulani were one of the few pastoralist groups of West Africa, and their lives were organized around their herds.

The ethnic group referred to here as the Fulani call themselves *Fulbe. Fulani* is the Hausa name of these people and the name by which they are known generally in English. In Fulfulde, the Fulani language, the singular of *Fulbe* is *Pulo.* Hence, the Fulani are called the *Peul* in French historical literature, which is abundant because of French colonization in West Africa in the 19th century.

Until the 11th century the Fulani lived primarily on the outskirts of the GHANA EMPIRE. As Ghana's power declined in the 12th century, some Fulani people merged with the local settled population who had formed a new Islamic state called TEKRUR. The union of these two groups, the Fulani and the people of Tekrur, formed the TUKULOR, who spoke Fulfulde, the Fulani language. However, a large segment of the population chose instead to preserve their pastoral and religious traditions and migrated east. By the 15th century, after years of migration to the south and east, the Fulani had settled in the FOUTA DJALLON massif, Fouta Toro, the Bundu region of present-day GUINEA, and MACINA in present-day Republic of MALI.

The Fulani then began intermarrying with the nomads and other herdspeople of the Sahel region under the rule of the MALI EMPIRE. The Fulani remained independent from the Mali Empire in terms of their social and political customs, but they were required to pay rent on their grazing lands and to render military services to the local authorities. By the beginning of the 16th century the Fulani migration had reached the region of the HAUSA STATES and KANEM-BORNU, in present-day NIGERIA.

The social organization of the Fulani was determined by each autonomous clan, which had a leader or headman. Descent was partrilineal, and these lineage groups formed the basis of social organization. Because the Fulani were nomadic, they lived in small populations throughout the regions of West Africa and were never a dominant population themselves. The Fulani merged with other populations during this migration and gave rise to the many different groups who were all known as Fulani. As a group, the Fulani displayed distinct physical similarities, such as lighter skin, long, straight hair, and aquiline features. They also shared a common moral code known as *pulaaku.*

G

Gabon Coastal country in western Central Africa measuring approximately 103,300 square miles (267,500 sq km). Present-day Gabon borders CAMEROON, the Republic of the CONGO, the Atlantic Ocean, and the mainland of EQUATORIAL GUINEA. After the 12th century the Gabon area was extensively settled by Bantu-speaking groups, including the Mpongwe and the Orungu. Evidence of earlier settlers includes spearheads dating back to c. 7000 BCE. Little, however, is known about these early inhabitants.

Gabu (Kaabu, Quebu) Kingdom of West Africa, founded in the mid-13th century and lasting nearly six centuries, until it fell to FULANI attacks, in 1867. Gabu was founded by General Tiramakhan Traore, a subject of the famed MANDINKA emperor SUNDIATA (d. 1255) of the MALI EMPIRE. Gabu's first emperor, or *mansa,* was Mansa Sama Coli, who was said to be either Traore's son or grandson. Other historians credit Mansa Sama Coli himself, and not Traore, with founding Gabu.

The Mali Empire used Gabu to extend its influence into the SALT, GOLD, and slave trades along the coast. Gabu was well situated for this purpose. Kansala, located on the present-day border between GUINEA-BISSAU and SENEGAL, was the capital of the three royal provinces of Gabu. Pachana province bordered the headwaters of the Geba River. Jimara province was on the GAMBIA RIVER. Both of these rivers flow into the Atlantic Ocean. The third province, Sama, was located near the CASAMANCE RIVER in the southern region of what is now Senegal.

While Gabu was still a secondary kingdom of the Mali Empire, provincial governors had considerable local authority. Each had his own army and symbolic war drums. If there was no heir to succeed, a new king was chosen from the eldest leaders of these provinces. In time of war, command of these armies could be given over to the king. The *mansa* was considered sacred. In contrast to the system of inheritance that prevailed for people of lesser rank, the royal line of succession was matrilineal, or from a mother's side, rather than patrilineal, or from a father's side.

By 1500 most of the Mali Empire had come under the control of the SONGHAI Empire, which stretched from the Atlantic Ocean to what is now central NIGERIA. Despite its powerful neighbor, however, Gabu was able to maintain its independence and even expand.

Ga-Dangme (Ga, Ga-Adangme, Ga-Dangbe) Ethnic group located in the southern regions of the present-day countries of GHANA and TOGO. In the 13th century the closely related Ga and Dangme people probably

79

migrated together from present-day NIGERIA, settling in small villages and subsisting mainly through hunting, foraging, and some AGRICULTURE. They eventually developed IRON technology, which helped them increase their crop yield. Villages subsequently became bigger, and by the 15th century the Ga-Dangme had developed complex social structures.

Recent archaeological finds suggest that, prior to 1400, the Ga-Dangme had settled in Accra Plains, Gbegbe, Little Accra, Lolovo, Ladoku, and Shai. They organized themselves into small states with the capital or controlling town, known as an *akutso,* situated on the coast. Village economy was supported by coastal fishing and, in the inland regions, by the cultivation of crops such as yams, oil palms, and plantains.

Ga-Dangme society reflected patrilineal kinship ties. Great emphasis was placed on the circumcision of boys, particularly the first-born male. In addition, each patrilineal group, known as a *we,* was considered a political group, ranking its members by birth order and generational standing. Ritual authority among the Ga-Dangme was embodied in the village priest and the council of elders, who represented secondary, but no less important, leadership to the reigning chief. Among their various responsibilities, these village leaders directed the harvesting of crops, officiated during the celebration of a successful year of fishing, and performed rites of passage, such as male initiation and ritual planting of millet. One of the most prominent of these public ceremonies was the Homowo Festival, which called for special rites and songs, both known as *kpele.*

Ga-Dangme women, who acted as trade intermediaries between the coastal and inland populations, held some rights in Ga-Dangme society. They were able to succeed to public office and own property based on inheritance. Marriage was traditionally initiated and negotiated by the male's family. After marriage, women lived in their own compounds, which generally belonged to the husband's *we.*

Within the framework of RELIGION, the Ga-Dangme recognized a supreme being, whose omniscient presence has been equated with a natural, unseen life force. A strong belief in life after death has always been an influential factor among the Ga-Dangme as well, and has traditionally been symbolized in lavish funerary customs, one of the most important rites in their society. Their belief system maintains that, after death, the deceased must successfully cross a river to reach the land of the departed. Reaching this goal is dependent upon the rituals performed by the living. In addition, male and female mediums are often "called" by the gods to channel divine communications. Suitable candidates were generally isolated from society to the point of dissolving marital ties. While in a trance-like state called spirit possession, Ga-Dangme mediums have been known to participate in extraordinary feats of endurance that could not be accomplished otherwise.

Gama, Vasco da (c. 1460–1524) *Portuguese navigator who founded the colonies of Mozambique and Sofala in Africa*

In 1497 da Gama was commissioned by King Manuel I of Portugal (1469–1521) to sail from Portugal to India by way of the CAPE OF GOOD HOPE at the southern tip of Africa. The purpose of the expedition was to establish a sea trade route from western Europe to the East. For hundreds of years, caravans from the East had brought the spices and riches of the Orient to the tables and fine houses of Europe, but these caravan routes across Asia were now a monopoly of the Muslims. In a first-of-its-kind voyage by a European, da Gama arrived in Callicut, the most important trading center in southern India, on May 20, 1498. His voyage made the small country of Portugal a major commercial power and initiated a period of extensive European exploration and expansion. Along his route to India, da Gama stopped in MOZAMBIQUE, MOMBASA, MALINDI, and ZANZIBAR. Unable to establish a trade center in India, da Gama returned to Portugal in 1499.

A second expedition was commissioned in 1502 with the goal of asserting Portuguese authority over parts of East Africa. It was on this journey that da Gama established Mozambique and SOFALA, which the Portuguese ruled until 1729.

After establishing Portuguese sovereignty in East Africa, da Gama continued his commercial efforts in India. In 1524, King John III (1502–1547) appointed him the Portuguese viceroy to India. He died three months after assuming his new position.

Gambia, The Small country in West Africa approximately 4,360 square miles (11,290 sq. km) in size, situated midway between the Tropic of Cancer and the equator. With the exception of its eastern coastline, The Gambia is completely surrounded by SENEGAL. One of the smallest countries in present-day Africa, The Gambia's terrain is a mostly flat. The country is essentially a nar-

row strip of land 15 to 30 miles (25 to 48 km) in width flanking the banks of the GAMBIA RIVER.

Scholars have long been puzzled by the hundreds of stone circles found in the area. Most of the circles are cylindrical in shape with flat tops, although some are square and taper upwards. Made from a relatively common stone known as laterite, they are remarkably uniform in size. Most circles are made up of 10 to 24 stones ranging from between 2 and 8 feet (0.6 and 2.5 m) tall and 1 and 3 feet (0.3 and 1 m) in diameter. The largest stones weigh about 10 tons (10.1 m tons) each.

Studies undertaken at Wassu and N'jai Kunda suggest that the GAMBIA STONE CIRCLES, which date to somewhere between 640 and 860, most likely were the burial mounds of important chiefs or kings. V-shaped stones, it is thought, indicate that two members of a family died on the same day and were buried together. A small stone standing close to a larger one possibly means that a child was buried with a parent.

See also: GAMBIA, THE (Vols. I, III, IV, V).

Further reading: Charlotte A. Quinn, *Mandingo Kingdoms of the Senegambia: Traditionalism, Islam, and European Expansion* (Evanston, Ill.: Northwestern University Press, 1972); Donald W. Wright, *The World and a Very Small Place in Africa: A History of Globalization in Niumi, the Gambia* (Armonk, N.Y.: M. E. Sharpe, 2004).

Gambia River A 700-mile-long (1,126-km-long) river in West Africa that originates in the highlands of FOUTA DJALLON in present-day GUINEA and flows west to the Atlantic Ocean. It has two large tributaries, the Sandougou and the Sofianiama, and smaller creeks, or *bolons,* that include the Bintang, which joins the river at its southern end. In the middle region of the Gambia River, many small islands have formed, including Elephant and McCarthy islands.

In the period prior to European colonization, the pastoralist FULANI people lived near the Gambia River, having migrated to the area bordering the river around 1000 in search of grazing land for their cattle. In the 12th or 13th century the WOLOF people, whose language is in the same family as the Fulani's, migrated as far west as the Atlantic coast following the fall of the GHANA EMPIRE.

In 1455 Alvise Ca'da Mosto (1432–1488), a Venetian explorer and trader in the service of Prince HENRY THE NAVIGATOR (1394–1460) of Portugal, was the first European to visit the Gambia River. He sailed 150 miles (241 km) inland but turned back when he found the inhabitants hostile. The second European to investigate the Gambia River was Diogo Gomes (d. 1484), a Portuguese-born explorer whom Prince Henry sent in 1456 to explore the coast of West Africa. He sailed as far south as the GEBA RIVER. On his way home, he sailed 200 miles (322 km) up the Gambia until he reached the market town of Cantor (modern Kuntaur), which was under the rule of the MALI EMPIRE. The Portuguese closely guarded the information that Gomes's expedition reported regarding the area.

Geologists note that the high saline content of the Gambia's waters have contributed to the formation of 100-foot-high mangrove swamps in the lower inland regions of the river. These swamps have long been the home of diverse wildlife including hippopotamuses and crocodiles. Hundreds of wild birds, including the heron, sunbird, and hawk, also live within the swamplands, as does the deadly TSETSE FLY, which breeds in its waters. Some regions that border the Gambia have used its enriched silt, or sediment left by annual flooding, for the cultivation of rice and peanuts. Oil palm trees, an important dietary source and trade item, have also been found growing wild in the valley regions of the river as well.

The Gambia River has long been considered exceptional for its ease of navigation. Unlike other African rivers, which frequently hindered navigation with rock outcroppings, rapids, or waterfalls, the Gambia provided even large sailing vessels with a navigable waterway that allowed entry into the interior of the region. This proved advantageous to the other European traders who arrived in the 16th century.

Gambia stone circles Clusters of stone pillars found in the Senegambia region along Africa's western coast. The stone circles of Senegambia, which are located north of the GAMBIA RIVER, are actually a series of sites extending over more than 11,583 square miles (30,000 sq km) from Farafenni in the east toward Tambacounda in SENEGAL. Generally known as *megaliths,* Greek for "large stones," the circular clusters are most concentrated at Dialloumbere, where 54 circles consisting of two or three pillars each were erected. Some pillars measure 26 feet (8 m) across and 3 to 7 feet (1 to 2 m) high. At other sites, they stand nearly 10 feet (3 m) high. Many of the pillars have rounded tops, while others were sculpted with a cup-like shape, possibly created to hold offerings. The different shapes, sizes, and styles of the pillars, and the fact that some stones are *dressed* or worked, are what first led archaeologists to suspect that the megaliths were built by a number of different groups at various times.

Scientists at the University of Dakar in Senegal have confirmed this theory by using carbon-dating methods to

gain an approximate idea of the age of the megaliths. They have determined that the oldest stone pillars were located at Sine and Saloum in Senegal and date back to the fourth century. In the region of N'jai Kunda, in The GAMBIA, the stone pillars date back to c. 750, a time when IRON smelting was widespread. Since the stones are made of laterite, scientists have suggested a probable connection to iron making.

Based on archaeological evidence and recovered materials, the earliest burials within the stone circles may have initially been limited to the DYULA population, the most ancient inhabitants of the region, who may have been present when the circles were first created. Most archaeologists agree that the site became an exclusive burial ground for kings, chiefs, and priests at some point in history, with the sizes of the stones corresponding to rank. There is a possibility that some of the groups that built the megaliths to honor their rulers were linked by similar cultural practices regarding royalty. These grounds are believed to hold the remains of kings associated with the WOLOF or MALI EMPIRES, or the smaller coastal kingdoms established at Walo, Kayor, Baol, Sine, and Saloum. During the 11th century, when Islamic rulers governed the Senegambia region, they too were reportedly buried in this fashion. In some ways, the megaliths of Gambia compare with those types found in central Africa and the MAGHRIB. However, as Africa's smallest republic, Gambia is notable for having the greatest number of stone megaliths.

Ganda (Baganda, Luganda, Waganda) Bantu-speaking people who, today, are the largest ethnic group in UGANDA. According to oral tradition, the founder of the Ganda was a semimythical figure named SEKABAKA KINTU, a member of the BITO clan living in northwestern Uganda around 1400. When the Bito moved to the shores of Lake VICTORIA, they founded the kingdom of BUGANDA.

See also: GANDA (Vol. III).

Ganwa Ruling descendants of TUTSI royalty in BURUNDI; also known as the "ruling princes." Burundi was one of several lake-district kingdoms that existed between the 11th and the 18th centuries that included BUGANDA, BUNYORO-KITARA, RWANDA, Burundi, Buha, and Buzinza. Abundant rainfall and fertile soil led to ample harvests, and trade between the various kingdoms brought in additional wealth. As a result the region attracted one of the highest population densities of any region south of the Sahara.

Burundi, Rwanda, and their neighboring areas were originally inhabited by the TWA people, who are believed to have occupied the region for as long as 70,000 years. It is believed that Bantu-speaking HUTU migrated into the area later, perhaps as early as the fifth or sixth centuries.

Although it has not been possible to determine exactly when the Hutu arrived, it is clear that they certainly were in place by the 11th to 14th centuries, at which time the Tutsi also invaded Burundi. Subsequently, the Twa were effectively marginalized by both the Hutu and Tutsi, and the Tutsi eventually gained preeminence over both the Twa and Hutu.

Once they had settled in the area, the Tutsi established a well-organized feudal system, within which the Ganwa served as a political arm of the Tutsi royals. The Tutsi maintained social control by demanding cattle as payment for their field labor and agricultural products. This practice, which resulted in a highly complex society, ensured that the Tutsi would not be limited to the single—and socially inferior—role of farmers. Through their participation in this system, many Hutu rose in status to become healers or judges, positions usually held by Tutsi pastoralists. The interchangeable roles of the peoples created a common social identity, known as *kwihutura,* which was based on shared work patterns and religious worship as well as a shared language known as Kirundi. Intermarriage between the two groups also was common.

In spite of these interconnections, however, the wealthiest cattle holders were traditionally Tutsi. The royal title also remained in their hands, and a series of dynastic families developed that were ruled by the *mwami,* or king, and the queen mother. Under the Tutsi system, the Ganwa received their power directly from the *mwami,* who made them responsible for controlling the land and ruling the provinces. The Ganwa also served as military leaders. Because so much of their authority came directly from the *mwami,* competition among the Ganwa was intense, often leading to fierce power struggles.

See also: BURUNDI (Vol. III); TWA (Vol. I).

Gao (Kawkaw) Important city of the SONGHAI kingdom and empire, located on the Niger River at the southern tip of the SAHARA DESERT, bordering ALGERIA, BURKINA FASO, and TIMBUKTU. The development of Gao has been difficult to trace, and the historical evolution of the area is not clear. It is believed, however, that the city of Gao was founded as either a fishing center in the seventh century or by Berber traders engaged in the GOLD trade. In time, it became one of the first great trading bases in West Africa. By the early 11th century Gao had become an important city within the Songhai kingdom, as well as a thriving center for trans-Saharan trade. The Songhai continued to rule the city for almost 500 years, and it eventually became the Songhai capital.

In the early 14th century Gao was annexed into the MALI EMPIRE, only to return to Songhai rule less than 50 years later. When MOROCCO took control of Gao, in 1591,

the city permanently disengaged itself from Songhai control and fell into decline soon thereafter.

Geba River A river situated at BISSAU, the coastal city and capital of present-day GUINEA-BISSAU. The Geba and its tributary, the Colufe River, are notable for having supported agricultural activities by groups such as the FULANI, MANDINKA, and Balanta in the period prior to European colonization. The river fostered the region's development as a center of trade because of its ease of navigation and access to the ocean. Following Portuguese exploration and settlement beginning around 1450, the river soon became the chief means of TRANSPORTATION for thousands of captives destined for overseas markets.

Gedi Walled CITY-STATE situated along the coast of KENYA. Africa's eastern coast, also called the SWAHILI COAST, has been an active trading region for centuries. According to the Greek sailing guide, *Periplus of the Erythrean Sea,* written in approximately the second century CE, commercial trade in the region dates back 2,000 years or more. Commerce most likely began with indigenous inhabitants of the coast trading with those of the interior for items ranging from agricultural produce to salt and IRON tools. POTTERY also was apparently traded, and recovered remnants indicate that it was produced prior to the arrival of Arab settlers. Unglazed, with minimal decoration or color, these early forms of pottery have a marked resemblance to those types produced in various regions of central Africa as well as in ZIMBABWE and MAPUNGUBWE, in present-day SOUTH AFRICA. Cooking pots with distinct fingernail designs have also been recovered at Gedi and may have been an early trade item. Their designs were similar to those made by the GIRIAMA.

Between 500 and 800, trading had become well established within the interior. Seagoing trade, which was associated with MERCHANTS from Arabia, Persia, and India, also was well established. The latter merchants and traders, who came to refer to the region and its population as al-ZANJ, or "the Blacks," subsequently settled in the region. Glazed earthenware from as far away as China suggests that these people expanded their commercial trading links quite far. To support this expanding trade, hundreds of independent ports flourished along the 3,000-mile coastline that stretched from MOMBASA, in the north, to SOFALA in the south. Some of these ports, like Gedi, became permanent city-states, but many others lasted only a brief time before being abandoned.

During the golden age between the 12th and 13th centuries, Swahili traders exported a wide range of items that included GOLD, IVORY, ambergris, tortoiseshell, leopard skins, sandalwood, and hard ebony woods. These were traded with merchants from the Middle East, Greece, Asia, and Europe. Enslaved individuals were also part of the trade, destined for the overseas markets of the Arabian Peninsula, Iraq, and India, where their labor was used for agricultural expansion.

A mere 10 miles from MALINDI, Gedi developed into a major city under Islamic rule. The cultural mix formed by ARABIC- and Bantu-speaking populations took many forms, including a distinctive language known as KISWAHILI. Although the word *swahili* is Arabic for "the coast," the language was primarily Bantu; however, it had strong Arabic elements, including its alphabet and many borrowed words and phrases. Swahili societies formed a class structure that consisted of ruling families of mixed Arabic and African ancestry. Within the main population were transient groups of merchants, buyers, and seamen.

Although largely in ruins today, the architectural style of Gedi was once a testament to a great culture. A large enclosing wall surrounded a former palace with courtyards, a large mosque, and many smaller ones, as well as many large houses and pillars said to be grave markers. These extensive ruins have contributed to the region's current status as a national monument.

Traditional forms of Swahili MUSIC have survived as well. One of the most distinctive forms is *taarab,* described as a poetic song that infuses Arabic and Indian melodies. Played on an *oud,* an Arabic type of lute, and the *darbuk,* a leather-topped drum with a pottery bottom, *taarab* was originally performed at such rites of passage as wedding ceremonies and male circumcision rites, as well as female initiation ceremonies.

After Vasco da GAMA (c. 1460–1524) arrived at the coast in 1498, a shift in power led to the Portuguese seizing Mombasa and establishing a monopoly over INDIAN OCEAN TRADE. As part of their conquest of the coastal city-states, they built Fort Jesus at Mombasa along with a customhouse on nearby Pate Island. Although Swahili trade merchants tried to resist Portuguese rule, they were forced to abandon their activities in many of the Swahili port cities for a period. Portuguese attempts to align themselves with the city of Malindi against Mombasa failed, but it was not until the late 17th century that Portuguese political dominance was broken, largely by a series of conflicts involving the imam of Oman.

ciety (Malden, Mass.: Blackwell Publishers, 2000); Michael N. Pearson, *Port Cities and Intruders: The Swahili Coast, India, and Portugal in the Early Modern Era* (Baltimore: Johns Hopkins University Press, 1998).

Ge'ez (Geez) Afro-Asiatic language primarily associated with liturgical documents and literature of ETHIOPIA. Ge'ez is still used in liturgical celebrations of the Ethiopian Orthodox Church. Ge'ez, among Africa's earliest written languages, is the source of an extensive body of religious and historical writings. Sometimes identified as *Lessana Ge'ez* (the language of the free), Ethiopians consider Ge'ez a classical language because of its antiquity and the fact that it reflects the evolution of culture in the northern highlands. Although Ge'ez may have incorporated some indigenous elements of Cushitic speech patterns, its written form is largely attributed to Sabaean or Semitic ARABS who migrated from the southern Arabian Peninsula. Traders and agriculturists, the Sabaeans settled in the highlands during the first millennium BCE.

The early structural form of Ge'ez reportedly differed from other Semitic languages. It is written in a cursive script and is read from left to right. Ancient Ge'ez, like ancient Hebrew, had no letter forms for vowels; instead, it relied on small marks next to consonants to indicate the vowel sound to be used. By the second century CE, this script had developed sufficiently to include letter forms for vowels.

During the fourth century Ge'ez was largely associated with the Ethiopian Church. The resulting body of religious works emphasized stories of Christian saints, religious poetry, sacred law, and rituals. MONOPHYSITE monks translated the Bible into Ge'ez between the fifth and seventh centuries, and religious scholars note that the apocryphal books of the Bible—the Book of Enoch, Book of Jubilees, and others—were translated into Ge'ez as well. These translations may represent one of the few complete versions of these ancient texts in the world, an important contribution to biblical studies.

The language of Ge'ez also played an important role in the royal kingdom of AKSUM, appearing, for example, on numerous inscriptions, coins, stelae, and monuments created between the fourth and ninth centuries.

Ge'ez ceased to be used as a spoken language by 1200 but it was preserved until the 19th century as an official vehicle for religious writings. In addition, its widespread influence has had a direct bearing on the development of many of Ethiopia's modern languages including Tigrinya, Tigray, and AMHARIC.

al-Ghaba The non-Muslim section of KUMBI SALEH, which was the capital of the GHANA EMPIRE and location of the palace of the king. Sometimes referred to as one of the "twin cities" of Kumbi Saleh, al-Ghaba traces its history to about 700 CE and the arrival of SONINKE peoples under the leadership of a *kaya maghan* (lord of the gold). The twin to al-Ghaba, called Kumbi, was located more than 3 miles (4.8 km) away at the time Kumbi Saleh was first established.

Never intended as a commercial center, al-Ghaba boasted no marketplace but instead was comprised of the mud and thatch homes of non-Muslim residents of Kumbi Saleh and the grand timber and stone palace of the king. *Al-Ghaba,* a name that means "woods" or "forest," was indeed surrounded by woodlands. According to legend, the area was once prohibited to ordinary people because the forest was the provenance of the snake spirit OUAGADOU-BIDA. Each year, it was here that sorcerers would sacrifice a young virgin girl in order to appease the god. Al-Ghaba stood also as a symbol of religious tolerance: Although Kumbi Saleh was segregated along religious lines, native Ghanaians and Muslims peacefully coexisted here until about 1040, when a Muslim leader attempted to convert non-Muslims by force. After a decade of struggle the Muslims took control of the entire city.

Ghana Present-day coastal West African country, some 92,100 square miles (238,500 sq km) in size, that borders BURKINA FASO to the north, TOGO to the east, the Atlantic Ocean to the south, and IVORY COAST to the west. It has three distinct ECOLOGICAL ZONES—the coastal plains that give way to the rain forest that in turn give way to savanna woodlands in the northern part of the country.

By 500 CE the foundations were in place for the emergence of states and urban life in Ghana. The beginnings of the exploitation of the GOLD fields of central Ghana provided a new impetus for long-distance trade and contributed to the further development of TRANS-SA-HARAN TRADE ROUTE Around the middle of the first millennium CE the AKAN began moving from the savanna woodlands of northern Ghana deeper into the rain forest. By 1500 they fully occupied the rain forest areas, where they developed the gold fields. They also established states, the first of which was the city-state of BEGHO in their original woodland area. It was founded about 1000 CE and became a major hub for the trade routes that connected the forest Akan communities with the western SUDAN and the Sahara. A series of small Akan states centered on a large village began to emerge. Their economies were based on AGRICULTURE that now included the BA-NANA as a new FOOD crop and the production of kola nuts and gold for trade.

By 1200 CE or so, towns also began to emerge among the people along the lower reaches of the VOLTA RIVER, most notably among the GA-DANGME. Further north, new political developments took place in the 14th century.

Gur-speakers, who had earlier established Dagbon, fell to CAVALRY forces that established DAGOMBA, while MAMPRUSI also emerged in northern Ghana about the same time. ISLAM played an increasing role in the life of these northern Ghanaian states, and it also spread southward along the trade routes into the forest zone among the Akan.

The arrival of the Portuguese on the coast in the late 15th century provided new trade opportunities for both the coastal people and those of the interior. The Portuguese were particularly eager to obtain gold as well as ivory and pepper, and they had important trade items, including cloth, metal wares, and guns, to offer in exchange. Indeed, due to the plentiful trade in gold, the Europeans soon called the coast the Gold Coast. In 1482 the Portuguese began construction of a trading castle named Elmina, which means "the mine," to better tap this trade. During this early period, the Akan, who needed additional labor for clearing the forests, imported slave laborers, whom they purchased from the Portuguese for gold. The Portuguese also introduced important new crops from the Americas, particularly cassava, groundnuts (peanuts), and maize (corn), that were well suited for the agricultural conditions of the area.

ghana, the   Official title for the succession of ruling kings of ancient Ghana. Called Ouagadou by its people, the GHANA EMPIRE flourished from the seventh through the 13th centuries. Although the origins and use of the title are not definitely known, the term _ghana_ was a title of prestige that may have come from the MANDE language in which the word _ghana_ means "warrior king." Kingship in ancient Ghana was based on matrilineal descent and traditionally passed to the son of the king's sister. As a result, women were often referred to as "king-makers" because they were in full charge of rearing children. Successors were installed as kings following a number of prescribed ceremonies held in a specially appointed sacred grove.

Based on the descriptions of Islamic historians, including al-BAKRI (c. 11th century), as well as early travelers in the region, the _ghana_ ruled in sumptuous surroundings that included a domed palace that housed the royal family and members of the court. The king was reportedly adorned with golden bracelets and a gilded cap encased in a turban of the finest cloth. He was guarded by members of the state's large standing army, whose swords and shields were also trimmed in gold.

Both at court and in his travels the king retained a large entourage of official drummers, dancers, and jesters that served as a source of entertainment and as a means of heralding his appearance when he toured the kingdom. Among the king's many functions was the responsibility of serving as the nation's highest-ranking judge. He also created policy, presided over land disputes and capi-

tal cases, and addressed complaints. When necessary, the _ghana_ was also responsible for leading the nation in war.

Rulers in ancient Ghana were entombed within large earthen mounds in the same sacred grove in which they were officially installed. Prior to entombment, however, they apparently lay in state for several days on a large wooden bier lined with special carpets and cushions. One of the most important traditions surrounding the death of the _ghana_ was that all of the eating and drinking vessels used by the king during his lifetime were filled with offerings and placed by his side. Along with those were placed innumerable household comforts, including his servants. The traditional belief was that servants and household amenities should be made available to the king during his journey to the beyond.

Ghana Empire   (c. 900–1240) Ancient empire of West Africa that thrived, along with the empires of MALI, KANEM-BORNU, and SONGHAI, along the Niger River. The economic prosperity of the Ghana Empire was based on trade in, among other items, IVORY, GOLD, and kola nuts. The word _ghana_ means "warrior king" and was the title given to the rulers of the original kingdom whose SONINKE name was Ouagadou. _Kaya Maghan_ (lord of the gold) was another title for these kings. Ancient Ghana was one of the earliest Sudanic kingdoms of West Africa, with its original geographic borders established within the western part of present-day Republic of MALI and the southeastern part of MAURITANIA. The modern-day country of GHANA, situated 500 miles (805 km) to the southeast, named itself after ancient Ghana.

A great deal of mystery has surrounded the origins of ancient Ghana. Archaeological findings, oral traditions, and a thorough reassessment of accounts of the empire made by Arabic historians and cartographers have led to the current hypothesis that Ghana emerged as a CITY-STATE as early as the third century. It apparently was founded by SONINKE peoples as an arm of their extensive trading networks.

> **Ghana's original name, Ouagadou**, derives from the name of the ancient Soninke god, OUAGADOU-BIDA, who was considered the guardian of the nation. Bida took the form of a snake.

The Soninke established KUMBI SALEH, which was located at the edge of developing TRANS-SAHARAN TRADE ROUTES, as the area's first capital city. Trade, along with a strong agricultural base, contributed to the early wealth

of the empire. A diverse number of ethnic groups existed within the capital, including BERBERS and, later, various Islamic groups. The EWE, MANDE, and ancestors of the GA-DANGME were also inhabitants of early Ghana.

By the eighth century North African traders had spread word of Ghana's prominence as the "land of gold" across vast international territories. Its reputation continued to grow after the 10th century, when the kingdom of Ghana conquered the important Saharan trading center of AUDAGHOST and began to emerge as an empire. Several small kingdoms to the north and south—including TEKRUR, SILLA, DIARA, and KANIAGA—also were conquered and became vassal states. The kings of these states were permitted to continue individual rule over their respective kingdoms, while the ruler of Ghana maintained centralized control over the empire.

At this point Ghana's wide-ranging trade network, which had been accumulating vast wealth from the caravan trade, expanded to include items such as salt, gold, COPPER, horses, and human captives. Many of these captives were enslaved and put to work in the gold mines that were located to the south. Slaves were also used for agricultural labor, which led to the production of even greater quantities of such crops as millet, sorghum, and COTTON.

Much of Ghana's wealth came from the taxes that it collected on trade. A donkey- or camel-load of copper, for example, reportedly was taxed at a rate of approximately half an ounce (14 grams) of gold. General merchandise apparently was taxed at the rate of 1 ounce (28 grams) of gold per load. These taxes made it possible for Ghana to maintain a standing army of as many as 200,000 warriors, which was used to provide MERCHANTS with security and safe passage along the trade routes.

Ghana's proximity to the gold-producing regions of Bambuk, Bure, and Wangara placed it in the unique position of controlling vast amounts of the gold being transported north by caravan. Although great amounts of gold were transported out of the region, there were also strict policies that helped reserve solid gold nuggets for the king. A certain amount of gold dust was also reserved for the regional population. In addition Ghana controlled the trade to the south, especially the trade in salt, which was a rare and highly prized item in West Africa.

By the 11th century Kumbi Saleh had developed to the point that the state was reportedly divided between traditional Ghanaian rulers and Islamic merchants who were invited to participate in the day-to-day affairs of the royal court. This era also saw the first stages of the crumbling of Ghana's infrastructure as a result of trading rivalries and internal conflicts. There is some speculation that because Ghana never fully embraced ISLAM, religious conflicts also had a role in this social disintegration.

However most of the causes and details of the final waning of Ghana's empire still remain unclear. It appears that Ghana's great wealth attracted competitors bent on loosening the empire's hold on trade. Led by a radically devout Muslim known as ABD ALLA IBN YASIN (d. c. 1059), BERBERS calling themselves ALMORAVIDS attacked Ghana's capital in the 11th century. Some reports claim that the Almoravids destroyed the Ghana Empire, while others assert that the Ghanaians converted to Islam and joined the Almoravid movement in order to spread Islam in Africa. It is not clear whether the Almoravids completely destroyed the capital or gained an appreciable measure of political and economic control over its inhabitants.

Ancient Ghana was rich in gold and blessed with an abundance of rain. According to Soninke legend, this prosperity was bestowed upon the land by the god Ouagadou-Bida, who took the form of a snake. In return for Bida's generosity, a virgin was sacrificed in his honor each year. The days of glory supposedly ended under the rule of ancient Ghana's seventh king, when the lover of the sacrificial virgin slaughtered the snake during the annual ceremony. In retribution, Ouagadou-Bida dried up the land and moved all the gold to Bure on the Upper Niger River. With the Ghana empire in ruins, the people were forced to leave their impoverished and barren homeland. Many Soninke clans trace their ancestry to this legend.

A number of feudal states rose within the void left by the Ghana Empire's demise, including the SUSU kingdom, in the northern part of the former empire, and the small KANGABA state, in the area that soon was part of the growing MALI EMPIRE. The Susu kingdom launched a second attack against Ghana about 1203. It has been reported that the Susu ruler, Sumanguru, successfully captured Kumbi Saleh, thus bringing a violent end to Ghana's economic and military power. Two decades later, in about 1240, SUNDIATA (d. 1255), the leader of the Kangaba, initiated a successful attack against Sumanguru and gained control of the area's gold trade. Remnants of the former kingdom of Ghana were then incorporated into the Mali Empire founded by Sundiata.

giraffes The world's tallest mammals. The giraffe's appearance has made it the frequent subject of comment, even among Africa's diverse and unusual animal kingdom. In the 14th century Arab historian and philosopher Ibn Khaldun (c. 1332–1400) documented the startled reaction of the royal court at TUNIS when a giraffe was presented to the ruling sultan from the *mai,* or king, of the KANEM-BORNU empire. The Chinese admiral Cheng Ho (1371–1433), who led a series of expeditions to Africa's Indian Ocean coast between 1405 and 1433, returned to China in 1417 with a delegation from MALINDI, who presented the royal court at Beijing with a giraffe.

Giriama Ethnic group of the northeast coast of KENYA. Inhabitants of relatively isolated areas, the Giriama reportedly have occupied this region of Kenya since the beginning of the common era. Primarily farmers who supplanted their ECONOMY by hunting, fishing, and raising livestock, they eventually played a prominent role in providing grain to the ships involved in the transatlantic slave trade.

Although this part of the African coast was strongly influenced by ISLAM in the 10th century, the Giriama apparently were less affected by this than were neighboring peoples. They retained many of their own linguistic forms and cultural modes of expression, including their distinctive POTTERY, which was decorated with fingernail designs. The Giriama were also noted for creating grave posts with intricately designed tops.

Gisu (Bagisu) Bantu-speaking people of present-day UGANDA and KENYA; descended from the Luhya people, they speak a Western-Bantu language called Luluyia. From the time of the BANTU EXPANSION, the Gisu people, also known as Bagisu, have lived primarily around Mount Elgon, along the Uganda-Kenya border. While their society traditionally has been organized through paternal lineages, they generally have been less cohesive than the neighboring KARAMOJONG, Teso, and Soga peoples. The Gisu political structure is based on clans, with each clan

having an elder known as *umwami we sikoka,* or "chief of the clan." These leaders, whose job it was to preserve the clan and maintain law and order within it, generally were selected from among the richest members of the group. In spite of their fairly long history, the Bagisu remained divided, with no single clan or clan leader gaining any long-lasting prominence.

In Gisu culture the circumcision of young men remains one of the most basic rituals. Generally performed as part of an initiation into adulthood, the circumcision ritual also represents the young man's availability for marriage.

Giyorgis, St. (St. George) Rock-hewn church situated at the town of LALIBELA (formerly al-Roha) in the Lasta Mountains of ETHIOPIA. The architectural splendor of St. Giyorgis Church has been credited to King LALIBELA (c. 1119–1159) of the ZAGWE DYNASTY. Lalibela's rock-hewn churches grew out of the king's religious visions in which, he claimed, he was instructed to build structures that represented a "New Jerusalem." He reportedly built two groups of churches, both considered to be monoliths, over a period of 25 years.

According to legend, after the completion of these churches Lalibela had a dream in which St. George, Ethiopia's patron saint, scolded him for not building a church in his name. Lalibela's promise to honor the saint resulted in a monumental structure that sources say was built by workers recruited from EGYPT.

The site where Beta Giyorgis (House of St. George) was built was first hollowed out in what has been described as a perfect cube. The three-tiered church was then sculpted from a rock pedestal within the center and shaped in the form of a religious cross. The church, measuring approximately 39 feet (12 m) high, had an adjoining courtyard surrounded by stone walls. In them are many small, sculpted caves, which over the centuries have served as homes to monks and priests as well as tombs for the dead.

Goba Ancient site noted for its rock-hewn church, located within the southeastern state of Bali, or Bale, in ETHIOPIA. Ethiopian sources maintain that Goba's church was built in an ancient tradition that predates the rock-hewn churches credited to King LALIBELA of the ZAGWE DYNASTY (r. c. 1119–1159 CE). Similar rock churches have been found in such regions as AKSUM, TIGRAY, and ERITREA. The Ethiopian sources maintain that these edifices were built by Christian communities whose faith moved them to build churches able to withstand the ravages of time.

Gobir One of the HAUSA STATES established between the 10th and 13th centuries. In the Hausa-speaking regions of northern NIGERIA, several towns came to be the original Hausa settlements. These sites included Gobir, KANO, ZAZZAU, and KATSINA, among others. Most historical knowledge concerning these sites has come from the recorded observations of Islamic travelers in the region. According to their descriptions, Gobir and the other sites were part of a feudal system of walled towns called *birnis*. These *birnis* were regarded as ruling capitals governed by a *sirki,* a local ruler who controlled a number of armed horsemen. The towns were able to develop as a result of intensive AGRICULTURE that took place outside the walls. Crops probably flourished as a result of underground water sources. Within the walled town itself, marketplaces were established. There also were centers in which CRAFTSPEOPLE—blacksmiths, tanners, weavers, brewers, musicians, and ritual specialists—plied their trades.

The town of Gobir also has been mentioned in relation to the adaptation of Islamic teachings, which first began in the 14th to 15th centuries. Until that time the walled towns had continued to develop without interference but with a limited export market. By the 16th century trade routes established by TUAREGS had developed to such a degree that Hausa traders were able to incorporate their COTTON and leather goods into the North African and overseas trade markets. In addition, trading in the Sahara region led to a political alliance between the Hausa and the Tuaregs, who received a tax on trade items. In turn, the Tuaregs established a Gobir representative in their territory to serve as the sultan of Agades.

See also: AGADES (Vol. III); GOBIR (Vol. III).

gold Gold was obtained by mining or panning in several locations throughout Africa from ancient days through precolonial times. Gold was used by kings and traders to buy goods and services from other parts of the known world and was also used locally for adornment.

In EGYPT, gold was found in some abundance along streams in Nubia and Kush. Gold sources in non-Egyptian

Africa included the area of the headwaters of the Niger and Senegal Rivers, in what is now the countries of GUINEA and Republic of MALI. In the eighth and ninth centuries, gold was mined in southeast ZIMBABWE by means of excavations in the form of steps, or stopes. The ores were then crushed by pounding stones. Gold became important politically and economically in SUB-SAHARAN AFRICA as a trade item in the seventh century. African kings knew that their fame and wealth depended on precious metals, and they took measures to control the export of gold. Arab travelers and traders were forbidden to enter areas where gold was found lest they divulge the locations of the gold fields.

Located in the western SUDAN, near the great bend of the Niger River, the ancient GHANA EMPIRE became an important part of the trans-Saharan trade. The kingdom lay north of the region of WANGARA, which was rich in gold, and south of the salt mines of Taghaza. Ancient Ghana thus became the intermediary—the place where salt, rare in West Africa, was traded for gold.

In Ghana, by tradition all gold nuggets belonged to the king, and gold dust belonged to the people. The king

This 19th-century Ashanti gold plate is on display in a museum in Ghana. The plate gives testimony to the historical importance of gold in the African economy. Gold from the gold fields of Bure and Akan were important in trans-Saharan trade. © *Charles & Josette Lenars/Corbis*

carefully controlled the flow of gold. Because the locations of the gold fields were kept secret, merchants from North Africa had to come to designated places on the border and leave their goods. Buyers of goods brought gold and left it beside the goods. The sellers returned and either took the gold or left it; if the gold was left, the buyers returned and added more gold. The process was repeated until the buyers accepted the amount offered by sellers by taking away the gold.

By about 950, Ghana's ruler was described as the richest in the world. He was known as the *kaya maghan*, or "lord of the gold." A visitor to court wrote that the emperor had a receipt for 42,000 gold dinars, obtained from trade. A dinar was a coin that represented the sovereignty of certain North African rulers. The gold from Ghana was one of the most prized forms of currency in trans-African trade.

The rulers of the MWENE MUTAPA kingdom, in present-day ZIMBABWE, also had titles related to gold. Named after its ruler, Mwene Mutapa controlled many of the mines supplying gold for the southern African gold trade. The title *mwene mutapa*, meaning "master pillager," was a reference to the king's ability to amass gold-wealth. The *mwene mutapas* used their gold to purchase Chinese porcelain, brocades, silks, and other luxuries for their courts. They also purchased fine weapons, which added to their stature.

Mansa MUSA I (r. c. 1307–1337), the ruler of the MALI EMPIRE, used gold to hire architects, writers, and priests. In 1324 he made a pilgrimage to MECCA, taking with him great amounts of gold, which he circulated so freely that the value of the Egyptian dinar was depressed for several years.

The gold of Africa became the lifeblood of trade, which brought new goods to sub-Saharan Africa from Asia and Europe. In the 14th century African gold became the basis for Europe's currency.

The Sources of Gold   Although gold was produced on a large scale to meet the demands of northern traders and overseas markets from an early period, it played a prominent role in local regions as well.

During the rule of Georgios I (c. 856–915), a Nubian monarch in the Dongola region in present-day Republic of the SUDAN, foreign trade included gold and IVORY. The gold was extracted from mines situated near Abu Hamed and became the focus of armed conflicts between Georgios's forces and Arab-led armies.

Among West African gold producers was the GHANA EMPIRE, where the metal was panned at the Bambuk and Bure gold fields, situated to the south of Ghana near the head of the Niger and Senegal rivers. Based on the written sources of early Arabic traders, gold was produced on a rather large scale during the eighth and ninth centuries. According to these accounts, alluvial panning was optimal between January and May.

Other gold mines in West Africa included Lobi, in present-day BURKINA FASO. The Lobi gold mine helped to establish JENNE-JENO as a prominent trading depot between the 14th and 16th centuries. The WANGARA GOLD FIELDS, located south of the MALI EMPIRE in a place not yet identified by scholars, was the source of the gold that helped SUNDIATA (d. 1255) enrich his growing empire.

The method of alluvial panning was common in areas where swollen rivers and tributaries would recede, leaving behind gold dust and nuggets. This practice, still in use today, was shrouded in mystery for centuries, and as a result, a number of erroneous myths circulated. There were beliefs that gold represented a type of agricultural product that grew as a result of rainfall. Others believed that the gold traveled underground with the help of ants. One official in the North African city of TUNIS even proposed that wells be dug from MOROCCO to West Africa to extract the gold there. Because mines were always subject to collapse or other dangers, it is thought that many belief systems and rituals developed in response. These rituals may in fact have been the actual mystery that the gold miners sought to preserve from outsiders.

Gold mining also took place in various regions of southern Africa. One of the largest producers of gold was GREAT ZIMBABWE, where the mines and methods of extraction were concealed from outside traders. The resulting myths generated by the Portuguese included the notion that a permanent labor force lived within the mines, including whole families that raised children there. While these accounts were highly exaggerated, entire families apparently carried out panning and working with the ore.

Gold ore was in fact very near the earth's surface in territories stretching from the Mazoe River, in the northeast region of Zimbabwe, to the LIMPOPO RIVER in the southwest. Alluvial gold was found in tributaries of the Zambezi River as well. Men were responsible for digging the gold ores retrieved, in some cases, from more than 100 feet (30 m) below the surface. A method of alternately heating and cooling the ore was then used to split it, at which point women were often responsible for extracting the gold from the ore. Combined techniques were used as well. For example, IRON picks could be used to collect ore, which was then crushed with a rock. The crushed rock could then be panned in order to retrieve the gold. Many historians surmise that these mining activities may have represented an alternative, seasonal means of supplementing family earnings.

The African Gold Trade   There is little doubt that gold was one of the most highly valued commodities in Africa. Between the eighth and 16th centuries, much of Africa's gold was produced in West Africa and was transferred to the ports of North Africa by means of camel CARAVANS. After leaving these northern ports, the gold figured prominently in the economies of India, Arabia, and the Far East. The archaeological finds in West Africa of Roman-era weights for gold confirms the prominence of the gold trade to Europe as well and dates it back as far as the fourth century CE. The use of gold within Africa also was significant, especially in the building of the Sudanic empires, such as Ghana, Mali, Songhai, and KANEM-BORNU.

Once gold was exchanged for goods, the important task of transporting the gold came next. The development of a complex set of procedures provided checks and balances for the gold-producing countries as well as northern MERCHANTS. One aspect of these procedures involved the use of standardized weights, reportedly introduced to West African regions by Arab traders. In later centuries the use of gold weights was subsequently adapted and developed by the ASHANTI, in present-day Ghana. They created highly distinctive figures and symbolic shapes to weigh gold. Significantly, it was also in this century that the Islamic world began to mint gold for currency. It was therefore necessary for men such the 10th-century Arab traveler el-MASUDI to make accurate maps of the locations of the gold-bearing regions along with the routes used by merchants. Two of the better known routes were the road from Taghaza-Timbuktu and the route that passed through Wargla, TAKEDDA, and GAO.

The TRANSPORTATION of gold was often a dangerous proposition. On the trade routes, the transporters were faced with both the possibility of robbery and the very real chance of being stranded without water in the desert. The difficulties associated with transporting gold were underscored by the archaeological discovery of an entire gold caravan that perished in the Sahara centuries ago. The demise of the transporters was possibly the result of a surprise sandstorm but could have been caused by any number of reasons.

There are many conflicting views as to the amount of gold carried by these caravans. On one hand, the archaeological evidence suggests that 30 to 40 camels at a time might have been used to carry between 2 and 3 tons of the unrefined gold dust that Islamic traders called *tibr*. On the other hand, many historians maintain that this figure is too low, given the documented significance of the gold trade. To facilitate the transfer of gold received from the inland caravans, the gold was usually converted into ingots, or solid bars, at the trade depots of Timbuktu or SIJILMASA. The gold was then ready for transport to northern ports such as CAIRO. Merchants who purchased

the gold in its refined state offered to the northern transporters a return trade of COPPER, brassware, sword blades, and textiles.

The gold trade also effectively linked the eastern or SWAHILI COAST with other parts of southern Africa. For example, the gold trade south of the Zambezi River reached its height between the 12th and 15th centuries. A reported one-and-a-half tons of gold were extracted from the gold-producing regions of Zimbabwe and made its way to KILWA, one of the numerous city-states that formed the trade network of the Swahili coast. By the 16th century, the gold trade in the region had shifted to Portuguese traders, who exchanged cloth, IVORY, and other items. For reasons that are not entirely clear, the gold trade declined in the area by 1500. It is possible that the mines had been exhausted.

Although it is impossible to determine the exact amounts of gold exported from Africa in the precolonial period, estimates of the gold traded during the first millennium of the common era range from around 7,000 pounds (3,175 kg) up to 18,000 pounds (8,165 kg).

government, systems of   Contemporary Western-style governments, divided into executive, judicial, and legislative branches, did not exist in the Europe or the traditional African societies of the medieval period. Most European governments, including the government of Portugal, the country with the closest links to Africa in the 15th century, were monarchies headed by a king or an emperor. Sometimes they had a judiciary system, but rarely was there a formal or regularized legislature. In traditional African societies of the time, the governing of the kingdom was the duty of the chief or king. Islamic government inside and outside Africa was also monarchic, with no formal legislative bodies and with a system of religious law called SHARIA.

Non-Muslim Stateless Societies   Some traditional, non-Islamic African societies were loosely organized or had no defined governing bodies. Sociologists sometimes refer to these types of societies as *stateless*. The TWA of central East Africa, for example, lacked an organized government, making it impossible for them to defend their territory against the HUTU agriculturalists who moved into their territory in the fifth through the 11th centuries. The seminomadic Nuer of what is today the Republic of the SUDAN also maintained a society with minimal government. Their movement over vast areas and their constant struggle for subsistence left them little time to be concerned about a central, organizing body.

Such stateless societies were generally organized according to age sets and lineage, the latter being a system under which the older members of a clan established and maintained the rules of conduct between group members. The clan leaders were responsible for conducting ritual ceremonies, raids, and trade with other groups.

Non-Muslim Monarchies   When IRON tools became widespread in the early part of the first millennium, agriculturalist groups discovered that it was possible to occupy one area or region for an extended period of time. These settled, or sedentary, societies found it necessary to organize themselves in a more structured way than people who were (or had been) hunter-gatherers and nomadic pastoralists. Though they still relied on age sets and lineages, they also organized their groups into hierarchies that were most often led by a clan headman.

If the headman became powerful enough, he would assume the title of chief or king (the African title often meant the equivalent of "the head man of the men" in the local tongue) and the society took on the aspects of a kingdom with a monarch. Monarchies were widely distributed throughout Africa. Among the larger, better known examples were the ASHANTI, GANDA, and KONGO.

Though most African societies were run by kings, some kingdoms were run by very capable female monarchs, whose power was equal to that of a king. Examples of these include ELENI, of ETHIOPIA, and DAHIA AL-KAHINA, of ALGERIA. Other women ruled as regents, governing a kingdom until the male inheritor of the throne reached a suitable age.

The chief or king always had a number of associates who shared the role of ruling the general population; the bigger the population, the more associates he might have. These aides most often included relatives, respected headmen from other lineages, the primary wife, diviners, healers, and military advisers.

As the leader of his people, the king had certain responsibilities, which included settling disputes, leading the group in the planting and harvesting of crops, controlling the importing and exporting of economic goods (in societies that traded), and, of course, the important task of producing male heirs to the throne. For this last duty, a king would often take multiple wives.

Under a monarchy based on lineage, a king rarely had to worry about rebellions, or what we today would call coups d'etat, from within his own group. The methods of government in traditional societies did not change quickly. The standard hierarchy of governing monarchs

did change, though, when monarchies arose whose power was based on military might rather than lineage. This development caused tension between lineage head men and military leaders, since the military chiefs were a threat to the traditional authority of the patriarchs and clan elders, whose right to rule depended on their supposed connection to the spirits of their ancestors.

In the agriculturalist societies of much of SUB-SAHA-RAN AFRICA, it was the responsibility of the chiefs to distribute FOOD in their villages. As a result they usually maintained large stores of foodstuffs for themselves, even when food was scarce for the rest of the people. Corpulence, then, became a sign of prestige, and the fatter the chief was, the more powerful an image he was able to project to his people and to foreign visitors.

Whether military monarchs or lineage headmen, the kings of African societies could generally control the affairs of their kingdoms through the use, or even just the threat, of force. Many kings, even those who did not maintain a military, would surround themselves with loyal armed retainers. In non-Islamic African societies during this period, there are no examples of kingdoms that were governed according to a written body of laws, or constitution. Instead, the rules of government were based on convention, passed down by village elders.

Islamic Government   In Islamic societies of the time, the governments were theocracies rather than monarchies, run by religious leaders rather than kings. (Though non-Islamic kings commonly held their positions by rights of DIVINE RULE, their secular duties kept their kingdoms from being considered theocratic.) For Muslim leaders, the laws of government are to be found in the sacred writings of ISLAM: the QURAN and the *Sunna*.

The Quran leaves some rules of government open to interpretation, and, in practice, Muslim law is supplemented by regulations derived from local custom. Indeed, within the wider Muslim world, the Sunni branch of Islam, dominant in North Africa, often differed with the Shiites over matters of law and governance. These differing viewpoints meant that Muslim governments, though based on common principles, were not always consistent in their interpretations of the Quran, and the effects of local customs varied greatly.

The North African empires that were governed by Islamic BERBERS—including the ALMORAVIDS and ALMOHADS—were true theocracies. The conflicts among these groups were generally created by their different interpretations of Quranic law.

The Islamic kingdoms of Sub-saharan Africa were more diverse than the Saharan empires. Since Islam penetrated these kingdoms along trade routes, it was common for kings to convert to Islam primarily so that their kingdoms could participate in trade with Muslim traders. As a result, kingdoms like ancient Ghana were governed by kings who were avowed Muslims but ruled their subjects according to conventional, or customary, law.

The title *caliph* was given to the titular head of the entire Islamic world. Below the caliph were local sovereigns who, from the 11th century, in Africa as well as in other regions of Islam, generally bore the title *sultan.* Provincial governors and military leaders were given the title *emir,* a designation also sometimes adopted by rulers of independent states. *Sheik (sheikh)* is an Arabic title of respect accorded to chiefs, heads of villages, and males in other positions of influence.

Great Kei River   River in the eastern Cape Province of present-day SOUTH AFRICA. The Great Kei River originates at the junction of the White Kei and Black Kei rivers southeast of Queenstown. From that point it flows nearly 140 miles (224 km) toward the southeast, eventually draining into the Indian Ocean. It has several tributary rivers, including the Tsomo. A number of early Xhosa-speaking chiefdoms, including the Galeka and the Thembu, developed in the 15th and 16th centuries.

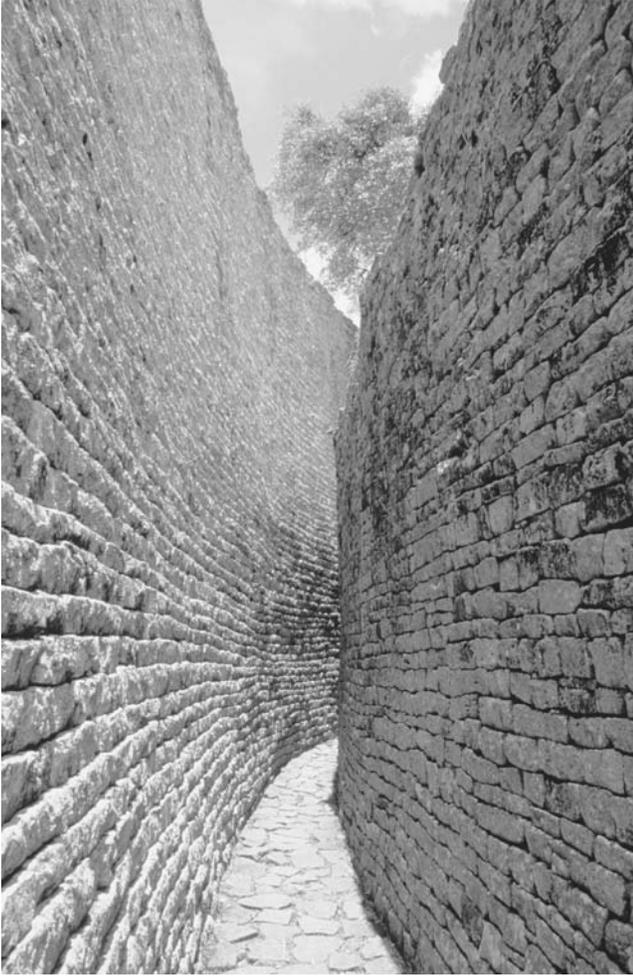
Great Zimbabwe   City in the southeastern region of present-day ZIMBABWE that was the heart of a major trading empire between 1100 and 1450. Population estimates vary, but at its height, the people living in or around Great Zimbabwe numbered between 11,000 and 18,000. By 1450 the region could no longer support its population; the site was abandoned and now lies in ruins. Oral tradition refers to a shortage of salt, but it is thought that the land was no longer suitable for AGRICULTURE and sources of wood for cooking and building had dwindled.


The wall of the Great Enclosure in Great Zimbabwe is 33 feet (10 m) high,16 feet (5.5 m) thick at its widest point, and more than 800 feet (244 m) in circumference. The tapered wall is broader at the base than at the top. © *Colin Hoskins; Cordaiy Photo Library Ltd./Corbis*

Built by the Late Iron Age ancestors of the Bantu-speaking SHONA people, Great Zimbabwe is one of some 300 known stone enclosure sites on the Zimbabwe Plateau. The name *Zimbabwe* in Bantu probably means "stone building," although it has also been taken to mean, very appropriately, "sacred house" or "ritual seat of a king." The ruins cover nearly 1,800 acres (728.5 hectares) and are divided into a hilltop complex and a valley complex. The site of Great Zimbabwe was well chosen to support a large city. The Zimbabwe Plateau offered a wide range of seasonal grazing land for the cattle that were the core of the region's economy. Game, especially elephants for the IVORY trade, was abundant; the soil was fertile and suited to AGRICULTURE; and timber, too, was in plentiful supply. From its location at the head of the Sabi River valley, the city could control passage between the gold fields of the western plateau and the trad-

ing city of SOFALA on the coast; in the 12th and 13th centuries, taxes levied on the trading CARAVANS were a major source of Great Zimbabwe's revenue. Its rulers ate from porcelain made in China and Persia. Its artisans produced fine GOLD and COPPER jewelry and ornaments for the king and royal court as well as for trade.

When, in the late 1500s, Portuguese traders began to hear rumors of Great Zimbabwe's existence, they thought it was a city of the legendary queen of Sheba or the biblical city of Ophir, from which the queen of Sheba raised gold for the Temple of Solomon in Jerusalem. Unwilling to admit the city's sub-Saharan African origin and arguing that these peoples had no history of building in stone, later visitors to the ruins surmised that Phoenicians, Arabs, Egyptians, or even the fabled Christian king, Prester John, had built Great Zimbabwe. The fact is, however, that unlike other regions of Africa where stone suitable for building is scarce, the Zimbabwe Plateau offers an abundance of stone outcroppings that have weathered into layers easily split into building blocks. The fact that Zimbabwean builders used no mortar to join the stone blocks indicates to archaeologists that these builders originated their own techniques for handling stone and are not indebted to Arab builders for their methods. Some 200 stone ruins can be found on the Zimbabwe Plateau, a memorial to these builders' craft. Stone was used whenever builders needed to create a structure of considerable size; ordinary dwellings were still made in traditional fashion of dried mud with a pole and thatch roof.

From its perch atop a granite dome, the Hill Complex, started about 1250, overlooks the rest of Great Zimbabwe. Construction of the Valley Complex began in the early 1300s, about the same time as construction of the outer wall of the Hill Complex.

All significant entrances and exits of the Great Enclosure were designed to ensure that access to and from the complex could be easily monitored. As a further security measure, the long, narrow passage to the Conical Tower allows only single-file movement.

Lying to the south of the Hill Complex, the Great Enclosure was the largest single structure in ancient SUB-SAHARAN AFRICA. The Great Enclosure is made of an outer wall that is 820 feet (250 m) in circumference with a height reaching as much as 80 feet (24 m). An inner wall runs beside the outer wall, forming the narrow, long passage that leads to the Conical Tower. The Conical Tower is 33 feet (10 m) high and 16 feet (9 m) in diameter. Its purpose is unknown, but many experts have theorized that it was a symbolic grain bin.

Researchers theorize that the original structures in the Hill Complex may have been intended for defense, but they point out that the high walls of the later structures offer no access to the top from which to hurl weapons or repel invaders. The walls may simply have been meant to impress people with the prestige and power of the king. Inside the Valley Complex was the palace of the king, where he and the court lived in luxury. Inside both the Hill Complex and the Valley Complex, archaeologists have found remains of mud-brick structures that may have matched the stone buildings in distinction.

griot Oral historian or "praise singer" trained to recite the history, myths, and cultural beliefs associated with a kingdom, village, or individual lineage. No one has been able to say with any degree of certainty when griots first came into being, but it appears that they were certainly present in many regions of Africa prior to the period of European colonization, perhaps associated with the rise of city-states.

One of the earliest references made concerning griots occurred in Mali. After traveler IBN BATTUTA (1304–1369) visited the royal court of the MALI EMPIRE in 1352, he wrote of the man known as Dugha, the king's royal griot. Wearing a symbolic bird mask, Dugha stood before the king and recited the story of his predecessors, their accomplishments, and family history. However, Battuta, a staunch Muslim, was unable to see past appearances or protocol to understand Dugha's actual function, which entailed lengthy recitations. Details concerning births, deaths, members of the royal family, the results of various wars, achievements of the king and his predecessors, and countless myths associated with the original founders of their society were also important aspects woven into the repertoire of the griot.

Counterparts of the griot in West Africa were known in the eastern SUDAN as *wali*. In some Islamized North African regions they were called *marabouts*. More often than not, griots were single men who traveled without restraint. Their freedom was often weighed against responsibilities that ranged from simple to extraordinarily complex. For example, some griots were relegated to the category of a public musician-singer and played the *kora,* a small percussive instrument. Griot styles varied from region to region and sometimes included background singers who also played musical instruments. In other regions such as present-day GAMBIA, griots performed special chants.

At public events griots often created songs designed to invoke memories and emotions surrounding specific incidents or circumstances of the past. At other times, songs were related to experiences unfolding at the moment, such as rites of passage including baptisms, initiations, and funerals.

The range of the griots' artistry often included audience participation, and many historians have likened the call and response between griot and audience to modern day African-American church traditions.

It should be noted that the griots who performed for the public were often denied recognition beyond their caste. Reasons for this are not fully understood but may have been influenced by the class stratification of West African kingdoms. Within the WOLOF and SERER societies, griots were among the lowest echelon, which also included blacksmiths, butchers, leatherworkers, and other CRAFTSPEOPLE. These individuals were never able to rise above their occupations, which were positions usually passed on from father to son.

In contrast, griots who were part of the royal kingdoms of West Africa gained recognition, fame, and wealth but had much more complex responsibilities. Among the BAMBARA, griots were known as *dyeli-faama* meaning "royalty." They were also considered custodians or "keepers of words." In addition to the ability to entertain, they served as court historians, teachers, and mediators during disputes and trading transactions. They helped to facilitate political marriages by bringing together not only bride and groom but entire families. They kept history alive for the king, members of the court, and royal descendants by narrating their entire genealogy. Among the AKAN, the griot performed for local inhabitants when a new king was installed. This enabled them to judge the king's abilities and virtues based on the oral recitation given by the griot.

Griots therefore embodied the entire history of a people and, when able to pass their craft on to younger members of the caste, formed a continuous oral tradition that could be preserved for many generations. In many instances, modern griots' presentations have aided archaeologists and historians in significant ways, helping them to interpret the reconstruction of physical remnants of the past or supplying missing aspects about the life and culture of ancient and medieval Africa.

Gudit (Judith, Yodit, Esato) (d. c. 970) *Ethiopian queen who seized the Aksumite throne*

Very little is known about Queen Gudit beyond scattered references in ancient texts and oral history. It is an accepted fact that she was violently opposed to the Monophysite beliefs of the Ethiopian Christian Church and orchestrated the destruction of the Aksumite kingdom in the late 10th century. Her followers razed churches and killed hundreds of Christian followers. Gudit's origins have been traced to the kingdoms in the country's southern region, specifically to DAMOT. It is believed that she was an AGAW speaker from the southwest whose reign either ushered in or influenced the rise of the ZAGWE DYNASTY (c. 12th century), who, like her, were originally Agaw speakers. She may also have been associated with the BETA ISRAEL (Falasha), since rumors persist that she was the daughter of their leader, Gideon.

Following the destruction of AKSUM, Queen Gudit maintained a 40-year rule over a region historians believe may actually have been Aksum. Islamic texts have reported how after claiming the throne, her co-ruler, known only by the title of Habani, was forced into exile in Shoa, where he died circa 970. Other sources that mention the queen include a letter sent by the last Aksumite king to church officials in Alexandria, EGYPT, that pleaded in vain for their intercession.

Guinea Modern-day country on the Atlantic coast of West Africa that is some 95,000 square miles (246,100 sq km) in size and is bordered by GUINEA-BISSAU and SENEGAL to the north, Republic of MALI to the north and east, IVORY COAST to the east, LIBERIA and SIERRA LEONE to the southwest, and the Atlantic Ocean to the west. The name was also used to describe the coast of West Africa south of the western SAHARA DESERT. Guinea once included what European traders labeled the Gold Coast (present-day GHANA).

The name *Guinea* is possibly derived from a Berber word meaning "land of the blacks."

Metal objects, especially IRON pieces from perhaps as early as 200 BCE have been found throughout Guinea, but it was GOLD that became the region's most valuable product, especially with the development of TRANS-SAHARAN TRADE ROUTES. Many peoples have dwelled within Guinea's boundaries, the largest groups being the MANDE-speaking MANDINKA and SUSU and the Fulfulde-speaking FULANI.

Geography and Peoples Lower Guinea makes up the alluvial coastal plain that borders the Atlantic Ocean from present-day Ivory Coast, across Ghana, TOGO, and the Republic of BENIN to NIGERIA. Its earliest inhabitants were reportedly the Baga and the Nalu peoples, who were later displaced by the Susu and the Mandinka. The forest region, nearest to the Sierra Leone and Liberia borders, was inhabited by the Kpelle (Grerz), the Loma (Toma), and the Kissi peoples, who lived in relatively small villages. The forested Guinea highlands, which peak at the Nimba Range, are approximately 5,780 feet (1,752 m) above sea level. The Niger River originates in this dense forest, where the region's heaviest rainfall occurs. Archaeologists believe that yams, oil palms, and other crops were cultivated in the southeast part of the highlands by 100 BCE. Rice was grown in the swampy areas; elsewhere, kola nuts, mangos, and COFFEE were grown.

Rising some 3,000 feet (914 m) above the coastal plains at the headwaters of the GAMBIA RIVER, the mountainous FOUTA DJALLON region of Middle Guinea became prominent during the 15th and 16th centuries. Although the Fulani appear to have been present in this region from an early date, by at least the 15th century they were joined by additional Fulani migrants, many of whom were converts to ISLAM from Senegal. In the 18th century the Fulani developed what has been described as a theocratic state steeped in Islamic RELIGION and culture.

Upper Guinea, or the northeastern plains, was largely inhabited by the Mandinka. This region's characteristic grasslands supported a number of income-producing trees such as the baobab and the shea. The central area of Upper Guinea gives strong evidence of millet cultivation as early as 1000 BCE. To ensure successful harvests, many regional farmers created ancestral stone figures in human and animal likenesses. These figures, known as *nomoli*, were sometimes made of steatite or granite and were associated with fertility rites. They have been recovered by archaeologists in open fields and at sites that may have once been family or community shrines.

Archaeologists have also been able to create a link between early forms of metallurgy and the growth of Guinea's early city-states. Iron-smelting appears to have been actively done from at least 200 BCE to create a wide number of tools and perhaps some ritual objects.

Political Developments Three gold-trading empires developed in the West African savanna and controlled much of Guinea: Ghana, Mali, and Songhai. The GHANA EMPIRE (c. 900–1240) dominated the region between the third and 11th centuries. It was succeeded by the MALI EMPIRE (c. 1235–1400), whose most prominent CITY-STATE in the northeast region was NIANI. A major trading center situated along a tributary of the Niger River, Niani engaged in the gold, salt, and kola nut trade.

The SONGHAI Empire (c. 1375–1591) was the third prominent kingdom that arose in the region.

By the 15th century word of Guinea's gold had attracted Portuguese traders. Their caravels—sturdy, oceangoing ships with high sterns and broad bows—enabled the Portuguese to overcome the complex navigational problems associated with the west coast of Africa, and they soon made contact with groups of the interior regions. The Portuguese found Guinea's rich resources and location highly advantageous to trade, and in the 16th century the region supplied them with many captives. In later centuries the French, English, and Dutch also participated in trade in the area.

Further reading: George E. Brooks, *Landlords and Strangers: Ecology, Society, and Trade in Western Africa, 1000–1630* (Boulder, Colo.: Westview Press, 1993).

Guinea-Bissau Small, tropical West African country, some 14,100 square miles (36,500 sq km) in size, that is made up mostly of a coastal plain that rises to the savanna in the interior. It shares borders with SENEGAL to the north and GUINEA to the east and south, while its western border fronts on the Atlantic Ocean.

A Growing trade, which evolved out of the expanding coastal farming population and the demand for salt in the interior, led to increased interaction with the wider world by the 13th century. One specific impetus was the break-up of the GHANA EMPIRE, which led to mass migrations from the interior to the coast. In the mid-1200s, under the influence of the expanding MALI EMPIRE, the kingdom of GABU was founded. Mali's control of Gabu helped it to establish control over the trade routes run by DYULA traders from the interior to the coast. These trade routes thus linked the people of Guinea-Bissau via the western SUDAN and the TRANS-SAHARAN TRADE ROUTES to the Mediterranean and to EGYPT, the Middle East, and beyond. In addition to facilitating the exchange of goods, trade also helped facilitate the introduction of new ideas, including ISLAM.

Guinea-Bissau had thus been in contact with the wider world via land routes for several centuries before the arrival of the Portuguese in the middle of the 15th century. Beginning in the 1440s, the Portuguese began to trade with Guinea-Bissau, opening up sea-borne trade. The Portuguese MERCHANTS were particularly interested in securing slave labor for the development of the CAPE VERDE ISLANDS, where they had established colonies. They also sought GOLD, IVORY, and pepper. Later they also sought skilled CRAFTSPEOPLE to develop a weaving and dyeing industry to take advantage of the COTTON and indigo that they were growing on the islands' plantations. On the mainland, a Luso-African population known as *lançados* emerged who facilitated trade between the Portuguese and the local population. The Portuguese did not establish trading posts as such until as late as 1600, when they began to face competition from other European powers.

H

hajj (hadjdj, hadj)   Pilgrimage to the holy city of MECCA located in present-day Saudi Arabia. The hajj is the fifth of the five pillars, or fundamental duties, of ISLAM; every believer, both male and female, who is physically and financially able is expected to make the hajj at least once in his or her lifetime. The leaders of the Muslim kingdoms in SUB-SAHARAN AFRICA were known to take this religious duty seriously. Mansa MUSA (d. 1332), who ruled the MALI EMPIRE from 1307 to 1332, undertook a famous hajj to Mecca in 1324 that had the further effect of bringing the wealth of Mali to the attention of the Muslim world. Similarly, Askia MUHAMMAD TOURÉ (r. 1493–1528), ruler of the SONGHAI Empire, made the hajj in 1495, two years after he ascended the throne.

The pilgrimage to Mecca—the city where the QURAN, the holy book of Islam, was revealed to the prophet Muhammad (570–632)—serves as a unifying force in the Muslim world. Rich and poor, ruler and ruled are expected to perform this holy ritual. The hajj begins on the seventh day of *Dhu al-Huijjah*, the last month of the Islamic year, and ends on the 12th day. According to tradition, the prophet Muhammad himself established the rituals the pilgrims follow.

The first part of the ritual begins when the pilgrim, or *hajjiyy*, is 6 miles (10 m) outside of Mecca. At this point, the pilgrim enters a state of holiness known as *ihram* and puts on an *ihram* garment made of two pieces of seamless white cloth, which will be worn for the rest of the journey. Until the second part of the ritual, pilgrims may not cut their hair or nails and must refrain from sexual activity and any impurity.

Upon entering Mecca, the pilgrims walk around the shrine in the Great Mosque, known as Kabah, seven times, and then, going inside, proceed to the Black Stone, which they must kiss or touch. The rituals commemorate Ibrahim and his son Ismail's rebuilding of a shrine first erected at the site by Adam, the scriptural father of the human race. (This story suggests the likelihood that the Kabah antedates Islam as a site of pilgrimage.) The pilgrims then bend down to pray in the direction of the Magam Ibrahim and the Kabah, after which they run seven times between two small hills, Mount Safa and Mount Marwah.

When Muslims pray, it is toward the Kabah that they turn. In 622 Muhammad fled from Mecca to Medina in present-day Saudi Arabia to escape persecution. Muslims date the start of the Muslim era from this event, called the *hegira* (ARABIC for "flight"). Muslim dates are often preceded by the initials AH, which stand for *Anno Hegirae*, Latin for "In the year of the Hegira." Muhammad died, for example, in AH 10, or 632 CE.

When Muhammad returned from Medina and captured Mecca in 628, he had the pagan idols in the building surrounding the Kabah destroyed. The building has been a major site of Muslim piety ever since.

The second phase of the ritual begins on the eighth day of the month and ends on the 12th day. During this

Engraved for Middleton's Complete System of Geography.

The March of the GRAND CARAVAN from Cairo to Mecca.

Making the hajj, or pilgrimage to Mecca, located in modern Saudi Arabia, is an important duty of every observant Muslim. Pilgrims on the annual Grand Caravan from Cairo to Mecca, shown here in a woodcut from 1779, often numbered in the thousands. © *Hulton-Deutsch Collection/Corbis*

period, the pilgrims visit the shrines of Jabar ar-Rahmah, Mina, and Muzadalifah outside Mecca. On the eighth day they pass through Mina and Muzadalifah and end their day ascending the mountain named Jabar ar-Rahmah. On the ninth day, the pilgrims spend the day in prayer, performing the ritual of *wuquuf,* or "standing"; then they go to Muzadalifah and stay the night. On the 10th day, the pilgrims return to Mina, where they gather stones to be used in a later ritual. They sacrifice an animal to commemorate Ibrahim's sacrifice. The pilgrims' heads may then be shaved. They then throw seven stones they have gathered at the pillars (called Jamarat) of Mina, symbolically reenacting Ismail's stoning of the devil. Once these rituals have been performed, the hajj is officially over. At this point the pilgrims usually shave their heads, and then they return to Mecca, where they will once again circle the Kabah before returning home. A muslim who does the hajj is entitled forever after to add the title *al-hajj* to his name.

Hambarketolo   City located in the upper Niger Delta in a region located in what is the present-day Republic of MALI. Based on archaeological evidence, historians believe that Hambarketolo was part of a 100-acre (40.5-hectare) town complex that included JENNE-JENO. Both of these sites show that by the fifth century the towns had rather developed societies, used cemeteries, used a sophisticated system of AGRICULTURE, and traded with other cultures. Excavations have uncovered beads from Rome and COPPER and GOLD imported from distant mines. The region had access to major river channels and possessed excellent soil for growing rice.

The excavations at Hambarketolo and Jenne-Jeno are important. Findings from these sites revealed that complex social structures, urban settlements, and trading economies existed at an earlier date than previously thought. Before these discoveries, it was believed that the ARABS brought this type of social organization and trading to the the Sahel during the seventh and eighth centuries as TRANS-SAHARAN TRADE ROUTES developed.

Harer (Harar, Harrar)   Capital of ADAL, a Muslim state in ETHIOPIA. The market town of Adal was originally established during the seventh century by Muslim Arab migrants. Located atop a plateau in the Chercher Mountains, Harer thrived as the capital of the state until 1577, when it was overthrown by Christian Ethiopians.

Hausa States (Hausaland)   Collectively, the seven true Hausa States (Hausa Bakwai) and the seven illegitimate Hausa States (Banza Bakwai), in what is now NIGERIA and NIGER. Hausa villages in the region can be traced back as far as the fifth and sixth centuries, although it was not until about the early 11th century that they came together in states ruled by semidivine kings. Hausa legends trace the origin of the kingdoms to Prince Bayajida of Baghdad, but scholars believe that these stories are an attempt on the part of the Hausa, after ISLAM began to filter into the region in the late 1300s, to align themselves with what they perceived to be the mainstream of history.

Each Hausa state played a specialized role based on need and location. RANO and KANO, the "chiefs of indigo," grew COTTON and produced fine CLOTH AND TEXTILES for export to other Hausa states and regions beyond Hausaland's borders. Kebbi, one of the lesser Hausa states, was the original seat of government. ZAZZAU, the "chief of slaves," supplied LABOR. KATSINA and DAURA were the "chiefs of the market" because they were important stops for the CARAVANS that brought salt from the Sahara as well as cloth, leather, and slave traders from the south. GOBIR was the "chief of war," protecting the Hausa States from both BORNU and the neighboring states of the GHANA EMPIRE. Each of the Hausa cities was a walled city ruled by a king. A considerable rivalry existed among the states over land and control of trade routes, leaving them open to periodic attacks from KANEM-BORNU and SONGHAI.

According to Hausa oral history, Prince Bayajida journeyed from Baghdad (in what is now Iraq) to Bornu, near Lake Chad, at the request of its king. After a poor welcome, Prince Bayajida left Bornu and traveled west until he came upon a city ruled by Queen Daura. Prince Bayajida killed the snake that was terrorizing the city and then took Queen Daura as his bride. Daura bore him a son, Bawogari, whose six sons would become the chiefs of the first six Hausa states—Kano, Daura, Gobir, Zazzau, Katsina, and Rano. A son by another wife was the founder of the seventh Hausa state, BIRAM.

Islam came to Hausaland in the 1300s, but its progress was slow and mainly limited to the cities. Rural Hausa people maintained their traditional religion and their belief in a semidivine monarchy. However, in the 1450s, as a result of increasing desertification in northern Africa, large numbers of FULANI people began migrating into Hausa territory in search of land to support their cattle. Mostly Muslims, the Fulani set up Islamic schools throughout Hausaland and ultimately dominated their new territory. By the early 1800s all power was in their hands.

Henry the Navigator, Prince   (1394–1460) *Portuguese prince whose sponsorship of voyages of exploration began Europe's Age of Discovery and Portuguese expansion into Africa*

Portuguese maritime exploration began in 1420 with voyages along the Atlantic coast of MOROCCO and continued, after 1441, with voyages along the West African coast as far south as SIERRA LEONE. Henry himself never set foot in West Africa or sailed on one of the many voyages he sponsored, but he bears the title "navigator" in honor of the developments in SHIPBUILDING, cartography, and navigation that took place during his lifetime. The third son of King John, Henry never assumed the throne, mostly because he never wanted to rule. His eldest brother, Duarte, became king in 1433 and ruled until 1438. The voyages that Henry sponsored are often seen as part of a grand scheme to outflank ISLAM, one of the major religious political forces of his day, by establishing contact with lands below Muslim North Africa and also by establishing direct contact with Asia.

Early Portugal and Africa   Portugal, with its capital at Lisbon, is a small country along the Atlantic coast of the Iberian Peninsula, which it shares with Spain. Portugal became an independent monarchy in 1139.

Portuguese contact with Africa began early in its history. The region of the Iberian Peninsula that Portugal now occupies became Christian in the third and fourth centuries. In 406 it was captured by the Vandals, a Germanic people who were forced out in 416 by the Visigoths (another Germanic people) at the instigation of Rome. The Vandals fled to North Africa and established a short-lived Kingdom of the Vandals (428–534). When the Muslims invaded Spain in 711, Berber soldiers occupied central Portugal and Galicia to the north. The UMAYYAD dynasty under Abd ar-Rahman I (fl. 750–788) established its capital at Córdoba in Spain in 756. By

1037, following rebellions by local lords against the Córboba caliphate, about three-quarters of the Iberian Peninsula, including Portugal, was divided into 10 constantly feuding emirates. By 1142, during the reign of Ali ibn Yusuf (1106–1142), most of the Iberian Peninsula had been annexed by the expansionist ALMORAVID dynasty of Morocco, and the union between Spain and Africa was consolidated. The Almoravids, however, were being pressured on two sides: in the Iberian Peninsula by a period of Christian reconquest that began at Saragossa in 1118 and in North Africa by the revolt of the ALMOHADS in 1125. In 1139 Alphonso I (c. 1109–1185) became the first king of Portugal, winning independence from the kingdom of León in 1139 and capturing the city of Lisbon from the Muslims in 1147. In the rest of Spain, however, Muslim domination persisted. Under ABU YAQUB YUSUF (r. 1163–1184) and his successor, Abu Yaqub Yusuf al-Mansur (r. 1184–1199), Muslim Spain reached the height of its power. Muslim rule in Spain did not end until 1492, after a long period of conflict between Muslims and Christians.

The Development of Commercial Interests Acquiring direct control of trade was a major concern in the European nations of Prince Henry's day, since goods from the Far East usually passed through the hands of Muslim traders before reaching Western Europe. The famed Venetian trader, adventurer, and traveler Marco Polo (c. 1254–1324) had already traveled overland to China and India between 1271 and 1295 by way of the caravan routes across Asia. In 1428 Henry read a copy of *Il Milione* (The million), known in English as *The Travels of Marco Polo,* that his brother Pedro had brought back from a trip across Europe. By that time he had already begun his sponsorship of African exploration.

Prince Henry and Africa Henry's personal contact with Africa began in 1415 when, as a young man, he became governor of the city of Ceuta in Morocco after he convinced his father, King John, to attack it as a way for him and his brothers, Pedro and Duarte, to win their spurs as knights. In 1419 he returned home, retired from court, and formed a small princely court of his own at Sagrès, at the southern tip of Portugal, attracting seafarers, shipbuilders, and instrument makers. In 1420 he became Grand Master of the Order of Christ, a secular papal order that had replaced the Knights Templar. Funds made available by the Order of Christ for the conversion of pagan lands provided Henry with the monies he used to finance his expeditions; for this reason, the sails of his ships always bore a red cross. Starting in 1420, Prince Henry began to sponsor voyages along the Atlantic coast of Morocco.

By 1434 voyages sponsored by Prince Henry had sailed past Cape Bojador on the Atlantic coast of Africa, a point beyond which it had once been thought no ship could ever sail. After 1438, looking for additional sources of funding for his voyages and basing his hopes on information from the Muslims at Ceuta, Henry hoped to find a source of African GOLD. In 1441 one of his captains returned from West Africa with gold dust and captive Africans. By 1448 his ships had sailed as far south as the GAMBIA RIVER, and trade in the region had increased. Henry then ordered the building of Portugal's first trading outpost, the ARGUIN TRADING FORT, on Arguin Island off the coast of modern-day MAURITANIA. In 1450 the king of Portugal granted Henry the sole right to send ships and trade with the GUINEA coast. Despite this provision, so great was Henry's investment in his voyages that he died penniless.

Herero Bantu-speaking ethnic group that settled in regions of present-day BOTSWANA, southern ANGOLA, and NAMIBIA. Subgroups of the Herero include the HIMBA, Tijimba, and Mbanderu. Their oral tradition indicates that the Herero originated in the Great Rift Valley in East Africa. Cattle-keeping nomads and hunter-gatherers at the time of their migration, the Herero are unique among the peoples of southern Africa in recognizing both patrilineal and matrilineal descent. The roles of chief and priest, however, descended only through the male line. Traditional Herero RELIGION was based on animism and the honoring of ancestors.

See also: ANCESTOR WORSHIP (Vol. I); BANTU EXPANSION (Vols. I, II); HERERO (Vol. III, IV, V); PASTORALISM (Vol. I); RIFT VALLEY (Vol. I).

Hima (Bahima) Related to the TUTSI, the cattle-owning upper class in several Bantu-speaking states located in the southern part of present-day UGANDA. Originally the Hima's Nilotic ancestors were pastoralists who survived almost exclusively on the products of their cattle. However, between the 10th and 14th centuries, they slowly migrated south into the Great Lakes region and peacefully assumed political control of a number of widespread, agriculturally based, Bantu-speaking settlements.

The HINDA clan made up the ruling aristocracy of the Hima caste. By the end of the 15th century Hima groups had established several chiefdoms in the area that became known as the KITARA COMPLEX. Hima chiefs called *mugabes* maintained their power by collecting tributes from local sub-chiefs.

See also: PASTORALISM (Vol. I, IV).

Himba (Ovahimba) Bantu-speaking people who belong to the HERERO ethnic group. By the mid-16th century the Himba had migrated to the region known today as Kaokoland, in northwestern NAMIBIA.

The Himba are nomadic pastoralists who are dependent upon their cattle. They are a politically decentralized ethnic group that recognizes both patrilineal and matrilineal systems of kinship and descent. The RELIGION of the Himba centers around the god Nyadami (sometimes called Karunga or Huku). They believe that Nyadami is the creator of the world but does not interfere with human activities.

The Himba practice the divination of future or past events through the inspection of animal entrails.

The Herero believe in a spiritual force known as *makuru*, which leads the hierarchy of ancestors, who have the ability to make their presence felt in the lives of their descendants. Rituals revolving around sacred fire, which symbolizes the continuity between the dead (ancestors) and the living (descendants), are other important religious practices of the Himba.

See also: ANCESTOR WORSHIP (Vol. I); BANTU EXPANSION (Vols. I, II); DIVINATION (Vol. I); KAOKOLAND (Vol. III); PASTORALISM (Vols. I, IV).

Hinda (Bahinda) Royal clan of the cattle-owning HIMA caste of East Africa. As early as the 14th century Hinda aristocrats monopolized political power in a number of loosely organized states of the East African interior. The origins of the Hinda clan, also known as the Bahinda, are unclear. Their oral tradition claims that they descended directly from Wamara, the last ruler of the CHWEZI DYNASTY. In the latter half of the 14th century, Chwezi kings ruled the KITARA COMPLEX and dominated the surrounding Bantu-speaking chiefdoms in what is now western UGANDA. By the beginning of the 15th century, however, the Chwezi dynasty had been overthrown by LUO-speaking pastoralists. For years, Hinda and Luo rulers vied for political supremacy of the Kitara region. However the diversity of the inhabitants made the region difficult to control, and it was not until about 1500, with the rise of the Luo state of BUNYORO, that the region coalesced into a centralized state.

The ruling BITO clan forced the Hinda to move to the south, where they came to control a number of Bantu-speaking agricultural states, including NKOLE, BURUNDI, KARAGWE, Kyamutwara, and Ihangiro. In some kingdoms, including Nkole and Burundi, Hinda were also known as TUTSI. Hinda aristocrats also formed states in the northwestern regions of what is now TANZANIA.

Hombori Mountain range near TIMBUKTU in the southeastern region of the present-day Republic of MALI; also the name of a city in the Hombori Mountains. The highest point in Mali is Hombori Tondo, which has an altitude of 3,789 feet (1,155 m). It is a rugged and sparse landscape that gradually slopes westward toward the Niger River valley. To the southeast, the highlands end in steep cliffs.

The Hombori Mountains are home to the DOGON people who moved there sometime between the 10th and 15th centuries to preserve their culture and traditions in the face of advancing Muslim invaders. The Dogon cut homes and burial caves out of the cliffs and also constructed small huts at the base of the cliffs using stone walls topped with straw roofs.

Husuni Kubwa Palace Immense palace built in KILWA, an Islamic CITY-STATE on the East African coast, in present-day southern TANZANIA. At the time of its construction in the late 13th or early 14th century, the Husuni Kubwa Palace, with more than 100 rooms, was the largest single building in SUB-SAHARAN AFRICA.

Husuni Kubwa Palace was probably built around the time that the Kilwa throne was taken by the Shirazi Arab leader Abu al-Mawahib. At that time Kilwa was the most prosperous of the trading centers on the SWAHILI COAST, trading cloth and glass, and controlling the GOLD trade with SOFALA, farther south along the East African coast. The city's riches were reflected in the splendor of its palace, whose design served as a model for the later dwellings of notables in Kilwa.

The ARCHITECTURE of the building was of an Arabic style and reflected a change in building materials in the 13th century from coral and mortar to stone. The palace had extensive ARABIC inscriptions and displayed new architectural features, including columns, cupolas, ornamental bas-reliefs, semicylindrical vaults, and carved wooden doors. The rooms in the palace were long, narrow, and parallel and did not have much light, since they lacked windows on the courtyard. There was a space that was probably a pool, and the back corner of the palace had indoor toilets.

See also: ARAB COASTAL TRADE (Vols. I, II).

Hutu (Bahutu, Wahutu) Bantu-speaking agricultural people who live in RWANDA and BURUNDI. The Hutu first came to the Rwanda-Burundi area during the BANTU EXPANSION, which occurred mainly from about 500 BCE to 1000 CE. That they spoke Bantu indicates that they must have come from Central Africa. The Hutu, who were farmers, took over the land from the TWA, who were accomplished hunters and potters.

The Hutu's new land was temperate, with a year-round temperature of about 70° F (20° C) and above. Their settlements were mostly in the mountains near hills and fertile valleys that were good for growing crops. The only major drawback of this type of land was that rainfall was uncertain.

The Hutu worshiped clan deities, and their religious practices also included animism, the belief that natural phenomena have souls. The social and political structure of the Hutu was kinship-based. Large family clans were ruled by clan chiefs called *bahinza.* The Hutu formed small kingdoms around a hill or a group of neighboring hills. This system of government worked well for administering work and settling disputes at a local level.

Around 1400 the TUTSI moved south from the Nile River and invaded Hutu lands. A Nilotic-speaking people, the Tutsi were warriors and pastoralists who came in search of better grazing land for their cattle. The nonmilitant, agragian Hutu soon became vassals to the Tutsi lords, a social organization that used the strengths of each group. The Hutu cared for the Tutsi's cattle and used the manure to fertilize their fields. Tutsi military might protected both Tutsi and Hutu villages. The two cultures gradually became integrated, with the Tutsi adopting the Bantu language of the Hutu. Some historians believe that the Tutsi also adopted the clan system of government from the Hutu; others, however, assert that the Tutsi brought this type of government with them and introduced it to the Hutu system. Regardless, the Hutu were ruled by a succession of *mwamis,* or Tutsi kings. The social order included HIMA and IRU castes, with the mostly Tutsi Hima caste being socially and politically superior and having wealth and high status. The Iru caste, on the other hand, made up mostly of Hutu and Twa people, was socially inferior. By the 15th century larger states began to emerge, some of which eventually grew to include more than 1 million subjects.

I

Ibibio Ethnic group located in present-day southeast NIGERIA. The Ibibio speak Efik-Ibibio, a language belonging to the Kwa branch of the Niger-Congo family of languages. Different subgroups of the Ibibio include the Ibibio proper, Efik, Enyong, Eket, Andonio-Ibeno, and Annang. The first written records of the Ibibio date from the 1800s, but it is certain that they were present in the area before that time. There is no strong, single tradition of origin among the Ibibio, but Efik oral tradition asserts that the original home of all Ibibio people was the Akwa Akpa, or the western bank of the Cross River; the Andoni-Ibeno claim to have migrated from ancestral homelands in CAMEROON.

> **The Ibibio believe in an earth deity named Ala, who is celebrated during the Ogbom ceremony, which is performed for eight weeks in the middle of the year. The ceremony is supposed to encourage fertile crops and childbirth.**

The Ibibio are primarily agricultural people, cultivating traditional crops like yams, cocoyams, and cassava. They were also known as accomplished CRAFTSPEOPLE, sculptors, and wood carvers (especially for masks). Early Ibibio villages were ruled by village elders known as Ekpe Ndem Isong and the heads of extended family. Rich male members of the village could become members of the Ekpe society, which granted them social status and political power. Ekpe society members acted as messengers of their ancestors (*ikan*) and enforced the decisions of village leaders. The highest rank of Ekpe society, *amama,* often controlled most of a village's wealth. Ibibio people have long honored their ancestors, particularly those who achieve high social status during their lives.

See also: IBIBIO (Vol. III).

Ibn Battuta (Shams ad-Din) (c. 1304–c. 1369) *Arab traveler and author of the* Rihlah, *an important historical record of the Muslim world during his time*

The *Rihlah,* which translates as "Travels" or "Journey," chronicles the visits Ibn Battuta made, over a period of 25 to 30 years, to almost every Muslim country of his time as well as to many adjacent non-Muslim territories. Describing his adventures and brushes with death, it also includes details about the social, cultural, and political life of the places he visited, including China, Sumatra, Ceylon, Arabia, Syria, EGYPT, East Africa, and TIMBUKTU. Adhering to a self-imposed rule never to travel the same route twice, Ibn Battuta covered approximately 75,000 miles (120,700 km) by land and sea.

Abu Abdullah Ibn Battuta, also known as Shams ad-Din, was born in Tangier, in present-day MOROCCO. His well-educated family included several Muslim judges, and Ibn Battuta received a traditional juristic and literary education in his native town of Tangier. He left there in 1325, at the age of 21, to make his pilgrimage to MECCA and continue his studies there.

Instead of pursuing a career in the law, however, Ibn Battuta decided to see as many parts of the Muslim world as possible. Unlike his contemporaries, who traveled for such practical reasons as trade, pilgrimage, and educa-

tion, Ibn Battuta traveled for the pleasure of seeing new places, learning about new countries, and meeting new people. He made a living from his scholarly status and later from his increasing fame as a traveler. Thanks to the generosity of the kings, sultans, and princes he met on his travels, at times he lived surrounded by luxury. On more than one occasion, however, he lost everything he owned and had to survive on almost nothing until he could regain the favor of another ruler.

Toward the end of his travels, Ibn Battuta befriended Sultan Muhammad, the ruler of Delhi, who appointed him the *qadi,* or judge, of that city. He held the post for several years before finally returning to his native Morocco in 1353. Toward the end of that year, he dictated his reminiscences at the sultan's request. Ibn Battuta's story was introduced to the Western world in 1829 with a translation of an abridged text of the *Rihlah.*

Further Reading: Noel King, *Ibn Battuta in Black Africa* (Princeton, N.J.: Marcus Weiner Publishers, 1994).

al-Idrisi (Abu Abdallah Muhammad ibn Muhammad ibn Abdallah ibn Idris al-Qurtubi al-Hasani) (c. 1100–1165) *Arab geographer, cartographer, and author of the most important geographical text written in the 12th century*

Al-Idrisi was born in Sabtah (present-day Ceuta), MOROCCO, to an aristocratic family that traced its ancestry to the prophet Muhammad. He was educated in Córdoba, in al-ANDALUS (Muslim Spain), and traveled throughout Europe, England, and the Mediterranean. About 1145 al-Idrisi moved to Palermo at the invitation of Roger II of Sicily, himself an amateur geographer. It is believed that al-Idrisi spent the rest of his life in Sicily, working first under the patronage of Roger II and then under that of Roger's son, William I. Among al-Idrisi's accomplishments were the making of a world map that divided the earth into seven horizontal climate zones and the construction of a planisphere made of silver and engraved with a detailed map of the world. His masterwork, though, was the *Kitab nuzhat al-mushtaq,* also known as *Kita Rujar* (The book of Roger). The study was published in 1154, shortly before the death of Roger II.

Al-Idrisi's text is a unique combination of Islamic and European scholarship and the results of al-Idrisi's own travels and research. The book offers the era's most comprehensive look at the geography of the world and is especially accomplished in the study of the Mediterranean and central North Africa. *Kitab nuzhat al-mushtaq* is striking in its detail, derived in part from al-Idrisi's interviews with travelers, sailors, and fellow cartographers. Some scholars fault al-Idrisi for his weak handling of known scientific data and for his less-than-accurate description of the geography of the Baltic area. Despite these critiques, the treatise, with its rich descriptions and dy-

namic prose, is considered a classic. The world map it contained was used hundreds of years later by Columbus.

In addition to his groundbreaking work in geography, al-Idrisi was interested in the natural sciences, studied medicinal plants, had a familiarity with several languages, and wrote poetry.

Ifriqiya Early name for the region of the MAGHRIB that includes present-day LIBYA, TUNISIA, and ALGERIA south of the MEDITERRANEAN SEA. Muslims invaded the region in the seventh century, calling their newly conquered land Ifriqiya. Over the next centuries, various dynasties ruled Ifriqiya, including the Aghlabites, the FATIMIDS, and the Zeirids.

See also: ARABS (Vol. II); ISLAM, INFLUENCE OF (Vol. II).

Igala A people of present-day NIGERIA, related to the YORUBA who inhabit the left bank of the Niger River where it meets the BENUE RIVER. The Igala speak a Kwa dialect of the Niger-Congo family of languages.

> **Igala oral tradition tells of Ayagba, or Ajagba, an outsider of royal descent who was raised by a leopard and came to the city of Idah. Upon his arrival, he settled a heated dispute between two men and was immediately proclaimed the new *ata,* or king, of the region. Ayagba subsequently became the chief of the clan that would become the Igala.**

The Igala probably separated from the Yoruba people who lived across the Niger River, to the west. They were an agricultural people who cultivated crops such as yams, maize, cassava, millet, and beans in the fertile triangular region of the Niger-Benue river confluence. Some traditions, though, link the Igala to the IGBO and the Jukun

Between the 12th and 14th centuries nine Igala settlements, known as the Igala Mela, moved toward greater economic and military unity as the kingdom of BENIN began to make advances into their territory. The Igala *ata,* or king, was considered divine and held absolute power over the kingdom. Traditionally the Igala also ruled over two other peoples, the Bassa Nge and the Bass Nkome, who are found by the Benue River. The Igala traded along the Niger and Benue rivers, exchanging items such as IVORY, BEADS AND JEWELRY, and textiles. They fought and lost a territorial war against Benin in 1516, then made attempts to expand into Lokoja, Idoma, and Igboland.

Igbo (Ibo) People living chiefly in the southeastern region of present-day NIGERIA who speak the Igbo language. Archaeological evidence indicates that traditional Igbo customs and traditions are more than 1,000 years old. Considered one of the largest stateless societies, the Igbo did not unite into a single kingdom as many of their neighbors did despite plenty of FOOD, a dense population, and substantial trade. Instead, they lived in small autonomous communities scattered over a wide geographical area. There were five main cultural groups: the Onitsha (northern), the Abakaliki (northeastern), the Cross River (eastern), the Owerri (southern), and the Ika (western). The Igbo language evolved into several distinct versions among these various Igbo communities, some of which were far apart from each other.

The Igbo were independent and democratic, with no centralized government and no dynasties of hereditary lineages. Except for the eastern Igbo, who tended to form larger units, usually referred to as clans, their largest political unit was the village group, a federation of several villages, encompassing on average about 5,000 people. Each village group shared a common market and meeting place. The leadership of each village group was entrusted to a village council made up of lineage heads, elders, and other influential and wealthy men. With no hereditary aristocracy, any Igbo man could become council leader through personal success. All Igbo men participated in important decisions that affected the village group. Decisions had to be unanimous, so even the young men in the village group were empowered politically. Women were not included in this political arena, although they played an essential role in the Igbo ECONOMY, growing much of the food and participating in the commercial life of the village.

Except for the northeastern groups, most Igbo lived in rain forest country. They were subsistence farmers, and there was a distinct gender-based division of LABOR in the fields, with the men in charge of yam cultivation, which was the Igbo's staple crop. The yam harvest was a time for great celebration. The women grew all the other crops, including cassava, taro, melon, okra, pumpkin, beans, and, after the Portuguese introduced it from the Americas, corn (maize). The Igbo also kept some livestock, which was a valued commodity that added to the owners' prestige in the community and was mostly for ritual use in sacrifices. Land was owned communally by groups of kinsmen and was made available to individuals for farming and building. An Igbo village consisted of a cluster of huts belonging to individual household units, usually of the same patrilineage.

Traditional Igbo religion included belief in a creator god, an earth goddess, and many other deities and spirits. Most Igbo religious practices revolved around ancestor worship. The Igbo believed that their ancestors could protect and help them with everyday life, and they relied on oracles and divination to receive messages from the spirit realm. But if their dead ancestors were angry, the Igbo believed that these restless spirits could cause tremendous trouble in the village. The Igbo had secret men's societies, which were called *mmo* among the northern Igbo. (Other Igbo groups had similar societies, but with different names.) The *mmo* conducted many rituals to appease these spirits and held elaborate funeral ceremonies to show their respect for their more recently departed kinsmen.

See also: IGBO (Vols. I, III, IV, V).

Ijebu The name of a people and their kingdom, found in southwest NIGERIA. The Ijebu are related to the YORUBA and, like other Yoruba people, are believed to have come from the central SUDAN in a series of migrations that began as early as 700. By the 16th century, when they first appear in written records, the Ijebu had for centuries dominated the trading routes between the ports of Lagos Lagoon and the area where Ibadan is now located. The Ijebu were renowned for their woven cloth, which they traded mostly with other Yoruba peoples.

The capital of the Ijebu kingdom was Ijebu-Ode, located between Benin City and Shagamu. Ijebu-Ode was the home of the *awujale,* the Ijebu spiritual and political leader. In the early 16th century a Portuguese sailor named Pereira described Ijebu-Ode as being "very large" and with "a great moat."

See also: ABEOKUTA (Vols. III, IV); IJEBU (Vol. III).

Ijo (Ijaw) Ethnic group found throughout the Niger River Delta region of NIGERIA. The Ijo speak a language that belongs to the Niger-Congo family of languages. The Ijo never formed a unified kingdom but rather settled in city-states, including BRASS (or NEMBE), BONNY, and Old Calabar. The Ijo occupied the forest around the Niger Delta but were widely respected for their mastery of the water. They were very capable boat handlers whose economy was based on fishing and some trade.

The original homeland of the Ijo people varies according to tradition. One claims that they are originally from Ogobiri and, hence, have always lived in the Niger Delta. Another tradition claims that they came from EGYPT. A third tradition, that of the Brass, claims that they migrated from kingdom of BENIN. According to the Brass tradition, a Benin king sent a group of soldiers on an expedition accompanied by the king's son. When the prince was killed, these soldiers were afraid to return and settled

in the delta. BRONZE objects found in the area support this claim.

Ijo clans were governed by village assemblies known as the *amagula,* which were led by the oldest member of the village, called the *ama-okosowei.* A younger man known as the *ogulasowei,* or spokesman, usually carried out the decisions of the assembly. Each clan had a high priest, known as the *pere*, who conducted rituals honoring a local deity. Among the Ijo of the western and central delta, a single common ancestor often unified clans. In the east, clans were linked more by language and culture.

Out of small settlements, the Ijo developed a number of city-states, each led by a different king. By around 1500, when the first European written records of the area appear, these Ijo states were thriving and conducting trade among themselves. Shortly after making contact with Europeans, the Ijo began trading with them as well, exporting products from the Niger Delta, including palm oil, for manufactured goods.

This terra-cotta portrait head of an Ile-Ife king dates from be-tween the 12th and the 14th centuries. It is 10 inches (26.7 cm) high. © *Kimbell Art Museum/Corbis*

Ilebo Town and river port in the central western region of present-day Democratic Republic of the CONGO, lo-cated near the junction of the Kasai and Sankura rivers. Prior to the year 1000 the region to the east of the Kasai was inhabited by the TWA people. Between around 1000 and 1500, however, people from the KUBA ethnic group began to migrate into the area from their previous home-land north of the Sankura River. Eventually the Kuba people absorbed the Twa population and transformed their numerous small villages into an empire of sorts that would flourish in the 17th century.

The Kuba economy around Ilebo was based on fish-ing and farming, with their major crops being maize and millet. Ilebo was also an important trading center for high-quality Kuba cloth, especially raffia cloth, which was greatly valued throughout Central Africa and even used as currency in some villages.

Ile-Ife (Ife) City in southwestern NIGERIA that is recog-nized as the oldest settlement of the YORUBA people. It is thought that Ile-Ife was established around 850. Accord-ing to Yoruba tradition, Ile-Ife was founded by a legendary ancestor named ODUDUWA, who subjugated 13 nearby set-tlements and established a monarchy. Oduduwa's descen-dants would later leave the city to form Yoruba's six kingdoms—Ila, Ketu, Oyo, Owu, Popo, and Sabe—as well as the kingdom of BENIN.

By the 10th and 11th centuries Ile-Ife was a flourish-ing city with a lavish court for its ruler, who was known as the *oni.* In addition to his political leadership, the *oni* was also considered the spiritual leader of all the Yoruba. Although Benin and Oyo were more powerful cities, Ile-Ife was revered for its religious and cultural importance, especially its ART and sculpture. The artists of Ile-Ife were famous for their naturalistic terra-cotta sculptures of human heads, which were used to honor the *oni,* and are said to share traits with Nok sculpture, the work of a West African culture that flourished between 650 BCE and 200 CE. Ile-Ife was also renowned for its BRONZE castings, which were made using the LOST-WAX PROCESS, the same technique used by the ancient Greeks.

> According to tradition, Benin's king was over-thrown in a revolt and replaced by an Ile-Ife prince named Oranmiyan. Based on this story, a custom emerged whereby the king of Benin would be de-capitated after death and buried in Ile-Ife in a sa-cred enclosure known as the *orun oba ado.* A head sculpted out of brass would be sent to Benin, where it would be placed on the altar of royal ancestors.

Ile-Ife reached the height of its power early in the 14th century, but by the 15th century Benin and Oyo had begun to assume much of the commercial and cultural influence that had previously been Ile-Ife's.

Indian Ocean trade Goods have long been exchanged across the Indian Ocean, the large body of water that borders the East African coast south of SOMALIA. Trade on the Indian Ocean allowed contact between the African cities and faraway places like Arabia, southern Persia, and India, whose MERCHANTS sailed on wooden vessels known as *dhows*. Items of trade included exotic goods such as IVORY, rhinoceros horn, and tortoiseshell, and also more utilitarian goods like tools, glassware, and wheat.

Beginning about 700, Arab traders arrived on Africa's east coast south of present-day Somalia. They named the land the "Land of al-ZANJ" (*Zanj* was a name given to the region's black inhabitants). In the 10th century Arab traders also shipped GOLD from SOFALA in MOZAMBIQUE. Excavations conducted in the town of Manda, near LAMU, on the coast of KENYA, revealed that people living there in the ninth century were prosperous and heavily influenced by Persian culture. There may have also been an IRON-smelting industry in Manda.

Indian Ocean trade resulted in human migration. Between the second and 10th centuries Indonesians settled in MADAGASCAR and brought to Africa bananas and a canoe known as the *ngalawa*. Meanwhile some Arab traders founded communities on the African coast or on nearby islands, bringing ISLAM with them. At ZANZIBAR an inscription describing the construction of a mosque by Sheikh as-Sayyid Abu Imran Musa ibn al-Hasan ibn Muhammad indicates the establishment of a large Muslim settlement by the early 12th century. During this time the Muslim traders intermarried more readily with the local populations of the trade centers that dotted the coast. KISWAHILI became the trade language along the East African coast. Kiswahili is the maternal tongue of the Swahili, a loose association of East African coastal ethnic groups. Swahilized ARABS who lived on the coast from the Horn of Africa to MOZAMBIQUE used Kiswahili as the lingua franca for trade. This present-day, distinctly Bantu language reflects borrowed words from Arab regions, Persia (present-day Iran), India, and China.

Other trading posts along the Indian Ocean included Rhapta and MAFIA ISLAND, in present-day TANZANIA, and MOGADISHU, in present-day Somalia. By the 13th century Mogadishu competed for trading dominance with KILWA, which was located in southern Tanzania and ruled by the SHIRAZI ARABS, a powerful trading dynasty that controlled Zanzibar and PEMBA ISLAND.

Arab Coastal Trade in 1000 CE

Indonesian colonists People who settled the island of MADAGASCAR, off the southern coast of East Africa, during the first millennium. Although linguistic evidence suggests that they may have arrived several centuries earlier, it is clear from archaeological evidence that Indonesian colonists had arrived in Madagascar by the 10th century, at the very latest. How and when they came to the island is still a topic of debate among historians and scholars.

According to one theory, the Indonesian colonists stopped in India, Arabia, and eastern Africa along the way, absorbing local customs and traditions from all of these places. This resulted in a mesh of Indian, Arabian, and African cultures that helped shape the development of Madagascar. Other historians account for this mixture of cultures with the theory that the Indonesian migrations were followed by separate migrations from other regions.

The language spoken by most of the inhabitants is MALAGASY, a member of the Malayo-Polynesian family of languages and related to the Maanyan language of Borneo. Malagasy contains many loan words from Sanskrit, ARABIC, and Bantu that linguists believe have been part of the language for a long time. Their presence may indicate contact with the speakers of these languages while taking a coastal route from India, along the Indian Ocean, and along Africa, on their voyage to the island. Other researchers posit a direct route from Indonesia. However, the Bantu elements may also have entered the language because of an earlier Bantu presence on the island, perhaps as early as 700. Arab and African influences after the 14th century may also account for the presence of Arabic words. Supporting the two-route theory is the fact that the people of the interior plateau exhibit many Indonesian genetic traits, whereas the coastal peoples have more African and Arab traits.

See also: BANANA (Vol. II).

iron The production of iron implements, mostly weapons and agricultural tools, significantly affected many aspects of African AGRICULTURE and trade, as well as its ART, culture, and history. The archaeological discovery of slag heaps, the remnants of iron production, indicates that during the first millennium CE, iron was being used along IVORY COAST as well as in Bahili in present-day CHAD and in Koulikoro in the modern-day Republic of MALI.

Iron swords and spears were used in West Africa from an early date. The SONINKE people, founders of ancient Ghana and the eventual GHANA EMPIRE, probably had the benefit of an advanced iron-making technology, giving them the superior weaponry they needed to seize better grazing lands from neighboring peoples. By the 13th century southern Africa had developed a prosperous trade in iron ore, with raw iron being shipped from SO-FALA to locations as far away as India, across the Indian Ocean. Higher-quality Portuguese iron implements began arriving in Africa by the 15th century, however, and the more sophisticated products quickly transformed not only the native Africa iron industry but also the balance of power among many kingdoms.

See also: IRON AGE (Vol. I); IRONWORKING (Vol. II).

ironworking Ironworking was introduced into Africa at various times, beginning, in ancient EGYPT and elsewhere, as early as the second millennium BCE. Opinions vary among scholars as to whether ironworking was learned from other cultures or whether African ironworking developed without outside influence. Archaeologists long held that the smelting of iron spread by a process of diffusion from a single point, probably in an area located in present-day Turkey. Recent research, however, based on differences in the slag heaps found in Europe and in Africa, indicates that smelting may have occurred independently in Africa.

Generally the ironworking process began with the mined iron ore being heated to temperatures of 1470° to 1650° F (800° to 900° C). The shape of the actual furnaces varied widely in design and shape. The Chewa of ZAMBIA and the SHONA of ZIMBABWE both used furnaces shaped like domes. In East and Central Africa, however, ironworking furnaces generally were made with shafts or with open hearths. Regardless of their shapes, the ironwork often was done near forested areas, since trees were needed to provide the necessary firewood and coal for the flames of the furnaces.

The iron produced frequently needed to be hardened, and this generally was done by means of a complex process of hammering the raw iron and heating it with charcoal. The iron that was produced could then be forged into tools, weapons, or even ornaments by BLACKSMITHS, who, because of the importance of their jobs, held a high place in many iron-producing societies.

Iru (Bairu) Caste of agriculturalists in some states in the region west of Lake VICTORIA, in the southwestern part of present-day UGANDA. Mostly Bantu-speaking HUTU people, the members of the Iru caste were the subjects of the pastoralist HIMA caste in NKOLE society. Iru also served the cattle-owning royalty of BUNYORO-KITARA, the kingdom that dominated much of what is now Uganda, from the 16th century to the 19th centuries. Iru generally grew millet and lived in settlements of about 40 homesteads. In exchange for Iru services, Hima warriors defended the grazing land and protected Iru villages from attack by outsiders.

Islam   Religion based on the teachings of the seventh-century Arab prophet Muhammad (570–632). Originating in Arabia, Islam soon spread throughout northern and SUB-SAHARAN AFRICA (as well as the Middle East and Asia).

Islamic Theology   Islam, ARABIC for "submission to God," is one of the world's three major monotheistic religions. Muslims believe in a solitary, omnipotent God (in Arabic, *Allah*), who created and sustains the universe. Belief in more than one god is rejected. Allah's divinity does not extend to any person and, as a result, in Islamic theology Allah has no equal.

In Islamic belief, Allah plays four primary roles with respect to the universe and humankind: creator, sustainer, guide, and judge. As creator, Allah brought the world into being. As sustainer, Allah is obligated to maintain the world that he created. As guide, Allah teaches humanity proper moral and spiritual conduct. As judge, Allah will punish or reward individuals, communities, and nations on the basis of their actions.

According to Islamic thought, Allah created the universe as an act of mercy. Every element of this creation has been instilled with certain rules that govern its behavior. So while the universe is independent in that everything has its own inherent rules of conduct, it is not self-governing because the behavior has been set and limited by Allah. The universe, therefore, is harmonious and provides the ultimate proof of Allah and his oneness.

Violations in nature have occurred in the form of miracles. Allah, for example, saved Ibrahim from the fire, Noah from the flood, and Moses from the pharaoh. Islam recognizes these prophets and their miracles. However, Muhammad is considered to be the final and most perfect of the prophets. His miracle is the QURAN.

Although Muslims have developed sects that vary somewhat in their faith and practices, all Muslims adhere to certain central beliefs in addition to the belief in Allah. Most Muslims regard Muhammad as the last (and most perfect) of a line of prophets that includes Adam, Noah, Moses, and Jesus, among others. Muslims hold that God put humans—and especially Muslims—on earth in order to reform it. The struggle to do so, both individually and as a society, is known as JIHAD. Muslims stress the importance of FAMILY and fidelity in marriage, and consider it their duty to benefit humanity and improve human society. Muslims also believe in final judgment, a day when God will reward (through admission to the Garden, or Heaven) or punish (by consigning to Hell) individuals according to their deeds during life.

In order to keep central in their minds their obligation to serve Allah throughout their lives on earth, Muslims perform five duties, together known as the Pillars of Islam. A public profession of faith—using the words, "There is no God but Allah and Muhammad is his Prophet"—marks a Muslim's membership in the Islamic community. Every day Muslims say five prayers (known as *salah*), intoned at different times of day and according to strict observation of ritual (e.g., facing MECCA). Muslims also have a duty to pay ZAKAT to help the poor. (Originally, *zakat* was a tax on the rich used not only to relieve poverty but also to support efforts to gain converts and to wage holy war.) The fourth duty of all Muslims is to fast during the daylight hours throughout Ramadan, the ninth lunar month of the Muslim calendar. (Anyone who cannot fast during Ramadan—due to illness, pregnancy, military service, or other unavoidable reasons—must do so for a month at the earliest opportunity.) The fifth duty is a pilgrimage (HAJJ) to Mecca, which must be completed at least once in the lifetime of each Muslim.

Muhammad, a rich merchant in Mecca (in modern-day Saudi Arabia), believed himself to be chosen by Allah (God) as the Arab prophet of a new religion. Muhammad received revelation of Allah's word through the angel Gabriel. He began preaching in 610 but was scorned and ridiculed by Meccans. In 622 he left for Yathrib (later MEDINA, Saudi Arabia), where he was accepted as a prophet. The year 622 marks the beginning of the Muslim calendar. Islam rapidly attracted converts among Arab peoples. Growing in numbers, Muslims declared war against Mecca, conquering the city in 630. By the time Muhammad died two years later, he had built the foundations for a long-lasting Islamic Arab kingdom.

History of Islam   Within a few centuries after Muhammad's death, Islam had spread throughout North Africa, as well as sub-Saharan Africa, MADAGASCAR, and Asia. This expansion, which took place from the seventh through the 11th centuries, resulted primarily from three factors: Arab military conquests, the migration of Arab traders, and Sufi missionary work.

From the seventh to the 10th centuries Muslims from Arabia invaded and conquered lands throughout North Africa. The first Arab invaders conducted military campaigns from a base in EGYPT from 642 to 669. The first Islamic dynasty, the UMAYYADS (661–750), operating from their capital city of Damascus, later recognized the strategic importance of using the Syrian army to establish a Mediterranean presence. The Umayyads established a base in TUNISIA in 670 and launched many military expeditions from there. In 682, after establishing an alliance with Kusayla, the Berber leader in ALGERIA and a convert from CHRISTIANITY to Islam, the Umayyads conquered MOROCCO, where ARABS would remain in power for 150

years. By 711 the Umayyads controlled the MAGHRIB (present-day Morocco, Algeria, Tunisia, and LIBYA), establishing a new province they called IFRIQIYA.

By the middle of the eighth century Arabic Muslims had created a powerful empire that spread as far west as the Atlantic Ocean and into Morocco, MAURITANIA, and SENEGAL. In conquering African lands, the Muslim empire won many converts from both Christianity and indigenous religions, forcing both Islam and the Arabic language upon the vanquished. Arab Muslims treated these African converts to Islam poorly, imposing heavy taxes on all and enslaving some. Oppressed, the BERBERS eventually rebelled against Arab rule—but never against Islam. Around 740, Kharijites, an egalitarian sect of Muslims that believed that good works, rather than faith alone, defined Islamic life, led a revolt against the Arabs in the Maghrib. The Kharijites founded a number of short-lived Muslim tribal kingdoms before the Abbasids (750–1258), a second dynasty that succeeded the Umayyads, reestablished authority over Ifriqiya. West of Ifriqiya, the central Maghrib was ruled by the KHARIJITE Rustumid imams from 761 until the early 10th century.

The Spread of Islam throughout Africa In 909 FATIMIDS, leaders of a sect of Muslims called the Ismaili Shiites, conquered most of North Africa, imposing Shiite rule on Egypt and the Maghrib. The Muslim warrior SALADIN (c. 1137–1193), who deposed the Fatimid caliphs and founded the Ayyubid dynasty, in 1171, restored the supremacy of the more orthodox Sunni Islam throughout North Africa.

Beyond geographical and political conquest, another factor that helped spread Islamic influence through Africa was the spice trade. The Middle East had long been an important location along the trade routes from Africa to Asia. With the rapid spread of Islam, Muslims eventually controlled the spice trade. Breaking from the previous tradition of buying spices from local MERCHANTS and selling them nearby, Muslim traders eliminated the intermediaries by traveling the whole trade routes themselves. While traveling these routes, Muslim traders also spread the word of God as heard by Muhammad.

In East Africa, traders (as well as settlers and missionaries) from the Arabian Peninsula won many converts. Arab merchants also married into African families and began converting communities from within. In West Africa, Berber traders from the Maghrib, after converting to Islam, spread the religion south along the trade routes of the SENEGAL RIVER and the Niger River. By the beginning of the 11th century they were joined by the SONINKE people of Mauritania, who themselves had converted to Islam and then carried the word farther south and east.

The third influence that helped spread Islam was the movement of Sufi missionaries after the 12th century. The Sufis—Muslim mystics—won many converts to Islam as they moved westward across North Africa and later through sub-Saharan Africa. Since SUFISM tolerated the preservation of local religious customs and beliefs alongside the adoption of Islam, the Sufi vision of Islam seemed less threatening than that of Arab invaders. As a result Sufism spread quickly, and Africans, especially in the countryside, came to revere Sufi holy men, bowing to their moral authority and wise judgment.

The spread of Islam through military force, trade, and missionaries had a greater impact on North Africa than anywhere else on the continent. By the mid-11th century the Maghrib had been ruled by Muslims—either Arabs or Egypt's Fatimid dynasty—for 350 years, and the majority of indigenous North Africans had adopted this new faith. Islam became even more entrenched in North Africa with the rise of two major Muslim dynasties that ruled over a unified Maghrib from the 11th to the 13th century: the ALMORAVIDS (c. 1060–1147) and the ALMOHADS (c. 1147–c. 1271).

A militant Islamic movement, the Almoravids arose from the Saharan Muslims in Mauritania around 1035. The cause of religious reform helped unify the disparate groups. By 1042 Almoravids had launched a jihad against heretics and nonbelievers. The Almoravids invaded Morocco in 1056, founded MARRAKECH as their capital in 1062, crushed the GHANA EMPIRE by 1076, and established an Islamic empire that stretched from Mauritania to Algiers by 1082. Conquests north, east, and south enabled the Almoravids to gain control of the GOLD trade throughout the region and to force Islam upon its neighbors. By 1110 the Almoravids ruled all of al-ANDALUS (Muslim Spain) as well. After gaining power the Almoravids set up a political state that strictly applied the principles of Islam in all judicial and ethical matters.

Yet the narrow and restrictive rule of these applications of Islamic law gave rise to revolutionary movements. The Almohads, Islamic reformers who stressed the unity of God and urged a return to the Quran and the traditions of the prophet Muhammad, began organizing in the Atlas Mountains around 1120. Within five years Almohads had begun attacking Moroccan cities under Almoravid control. Between 1140 and 1158, the Almohads wrested all power from the Almoravids and conquered Morocco and all of North Africa west of Egypt. Muslim Spain, too, had fallen under their rule by 1172.

The Almohad dynasty ultimately broke up into factions. By 1269 the Almohads had been ousted from Marrakech, ending the rule of a united Maghrib by a Muslim dynasty. The Maghrib was divided into three separate Muslim states ruled by Berbers: the MARINIDS in Morocco; the Hafsid in Tunisia, eastern Algeria, and Tripolitania; and the Zayyanids in western Algeria. Under these Muslim rulers, who no longer imposed a single dogma on the people, Islamic culture and religion flourished. The rulers erected new mosques and colleges in their capital cities, which quickly became renowned as places to study Islam.

Muslims have long emphasized the importance of education. Universities in both Africa and the Middle East, originally founded as places to study Islam and train religious leaders, soon became centers for the study of literature, philosophy, mathematics, MEDICINE, and SCIENCE as well. Al-AZHAR, for example, founded in CAIRO during the 10th century by the Fatimid dynasty, is still one of the most important centers for Islamic studies in the world.

Today, Muslims still make up the vast majority of Arabic-speaking people in North Africa, from Mauritania to Sudan. Islam remains the primary religion of the peoples of GUINEA, SENEGAL, The GAMBIA, Mauritania, Morocco, Republic of MALI, Algeria, Tunisia, NIGER, Libya, Egypt, Republic of the Sudan, DJIBOUTI, SOMALIA, and the island of ZANZIBAR. In addition, large populations of Muslims reside in GHANA, NIGERIA, CHAD, ERITREA, ETHIOPIA, and Tanzania.

Islam, influence of ISLAM held great political, religious, and social prestige in Africa from the seventh through the 15th centuries. After the death of the prophet Muhammad in 632, Islam became highly influential in Africa. The traditions, or *Sunna,* of the prophet formed the cornerstone of Islam, governing worship, the law, education, and the promotion of a worldwide Islamic community. The mission to spread the truth of Islam began in the seventh century, the century of the *hijira,* or flight from Mecca, by Muhammad. *Dar al-Islam,* or Islamic expansion, became a holy obligation and the religion spread from Arabia to the Atlantic coast of MOROCCO and Spain.

Arab trading communities gathered significant knowledge about the interior regions of Africa. In the territories where the message of Islam was carried, Arab proselytizers encountered ethnic groups with deeply entrenched traditional beliefs as well as others who were Christians or Jews. The primary reasons given for the widespread appeal of Islam included its simple teachings, identification with the ruling class, and relief from forced tribute in exchange for the less burdensome taxation levied by Islam conquerors. Non-Muslims were forced to pay a *djizya,* or poll tax, which built the newly installed Islamic state treasury. This in turn supported those carrying the word of Islam.

Egypt and Nubia In 642 Egypt became the first African country to convert to Islam. Egypt may have been especially susceptible to conversion because the rule of the Byzantine Empire in Africa was oppressive and corrupt. The ARABS established the capital city of CAIRO near the ruins of the ancient city of Memphis, although not without some resistance from the departing Byzantine

government. The resulting influx of Arabic Bedouins into the region led to intermarriage and the dominance of ARABIC culture and language. However, small groups of Coptic Christians and Jews have been able to retain their religious practices up to modern times.

Islam spread from the north into Nubia where, in the eighth century, nomadic Arabs settled between the Nile Valley and the shores of the Red Sea. Attempts to conquer Nubia were militarily rebuffed. The *bakt,* or treaty, of 652 stabilized social and trade relations between Islamic Egypt and the Nubian regions of Noba (Nobatia), Makurra (Makouria), and ALWA (Alodia), collectively known as Christian NUBIA. In the neighboring BEJA region, a stronghold of traditional religion, intermarriage among Arab and Beja ruling families created powerful lineage networks known as the *hadariba* and *ababda.* Most Beja converted to Islam by the 14th century but maintained their traditional practices as well.

North Africa In the MAGHRIB Arabs met renewed resistance from the Byzantine forces as well as the BERBERS. They entered into extended battles, defeating the Byzantine navy and combating various Berber groups, such as the Jarawa, led by legendary DAHIA AL-KAHINA (575–702). Some Berber peoples along the coast openly adopted Islam but reverted to their original religion many times—a recurring theme in Africa. To solidify the religion among the Berber population, imprisoned young NOBLES were reportedly freed and encouraged to embrace Islam and join the Arab army. By the eighth century Islam and Arabic culture was widespread. This Islamized Berber army was reportedly responsible for the Arab conquest of Spain in 711.

However, even when the tenets of Islam were observed, Arab domination did not necessarily follow. The Islamized Berbers in regions including IFRIQIYA and Morocco cultivated KHARIJITE doctrines, which, although Islamic, espoused democracy along with puritanical and fundamentalist practices. The Berber belief in frugality gave religious authority to their opposition to the luxury of the Arabic overlords. By the 10th century the Islamic FATIMIDS had destroyed many of the Kharijite states and established an empire in Egypt.

Sub-Saharan Africa At approximately the same time, Islam spread to regions south of the Sahara. Long-distance trade forged commercial contacts between the MERCHANTS of the north and the rulers of kingdoms, TOWNS AND CITIES of the SUDAN and West Africa. After initial exposure to Islam, Africans from these regions often transmitted the teachings of Islam to members of their population. The primary converts at these early urban sites were members of the royal hierarchy as well as traders exposed to the outside world. Other converts were attracted by Islamic rites that seemed similar to their own religious practice, such as belief in divination, use of charms and amulets, and praying to bring rain.

The coexistence of Islam with traditional African religion occurred in the ancient GHANA EMPIRE and its successor empires of Mali and SONGHAI. It was long thought that the Almoravid conquest in 1076 resulted in Ghana's forced adoption of Islam. However some historians now suggest that Islam was introduced through a social alliance rather than conquest and even then only to the Ghanaian ruler and not the entire population. This view is based on Ghana's long-standing trade contacts with North Africa and the fact that they were among the first to establish separate quarters for Islamic merchants in their city. It is also believed that the Islam first brought to the Ghana Empire was of the Kharijite type established centuries earlier in the Maghrib. However, these theories throw large-scale migration and resistance by groups of SONINKE into question. It is known that the Soninke who embraced Islam were largely from the merchant class known as the Wangara (or DYULA). They spread the religion further into the Sudanic savanna regions by establishing commercial networks in the Sahel and tropical forest regions.

In the MALI EMPIRE, Islam was first practiced among the rulers who descended from SUNDIATA (d. 1255) during the 13th century. Sundiata's son Mansa ULI (d. 1270) was the first known member to have journeyed to MECCA and established the pilgrimage as a yearly tradition. The building of mosques and schools proliferated under the rule of Mansa MUSA I (r. c. 1307–1337) and Mansa SULAYMAN (r. c. 1341–1360). Returning from his HAJJ (pilgrimage) to Mecca in 1324–25, Mansa Musa I visited al-AZHAR University in Cairo to convince Islamic clerics to join him in instituting the new Sankore University of TIMBUKTU. As a result, the region generated Islamic religious leaders known as the Torodbe. Another group to embrace the religion included the Hausa, who became actively involved in commercial trade and, along with the Dyula, carried Islam west, to the Gold Coast regions.

However not all African kingdoms south of the Sahara embraced Islam. From the lower SENEGAL region to Lake Chad, and particularly among the BAMBARA of Mali and the MOSSI STATES situated near the Niger bend, resistance was strong. After the Mossi, centered in what is now BURKINA FASO, began to expand, they incurred the wrath of Askia MUHAMMAD TOURÉ (1493–1528). A devout Muslim, Touré made annual pilgrimages to Mecca and used Islam as a unifying force in his vast kingdom. Already angered by the refusal of the Mossi to convert, in 1497 he launched an unsuccessful JIHAD, or holy war. The Mossi, however, maintained their traditional practices until the 17th century.

Islamic centers of learning   While Europe was emerging from its Dark Ages (c. 400–1000), Muslim culture and scholarship were rising toward their height. The major centers of learning in the Islamic world were at Baghdad in Iraq, CAIRO in EGYPT, and at Córdoba and Toledo in Spain. The Moorish kingdom of al-ANDALUS ruled large territories within the Iberian Peninsula from 711 to about 1492. (*Moor* is from the Latin word *Maurus,* meaning "inhabitant of Mauritania" or "Moroccan.") There are scholars who believe that the European Renaissance of the 14th–16th centuries had its roots in the Moorish renaissance in Spain. Islamic scholars in Spain and the Middle East made significant contributions to astronomy, MEDICINE, mathematics, and other secular fields. Islamic scholars in West Africa were more religion-directed and contributed to the development of Islamic law.

The major centers of Islamic learning in Africa were at Cairo and at TIMBUKTU, GAO, KANO, and KATSINA in West Africa. Centers of trade often became centers of learning. Funded in the 10th century by the Fatimid dynasty, the university of al-AZHAR, which is attached to the al-Azhar Mosque in Cairo, may be the world's oldest institution of higher learning; it is still in operation today, as it was in the 10th century, as a major Muslim theological school. Al-Azhar first taught Shiite doctrine, but when the Ayyubid dynasty came to power in Egypt in the late 12th century, al-Azhar became a center of the more traditional Sunni doctrine, which the vast majority of observant Muslims follow.

The regular subjects of study in the 10th to 15th centuries at al-Azhar University included grammar (*nahw*), literary style and rhetoric (*balaghah*), logic (*mantiq*), and the study of the QURAN. The latter included study of the Sunna, the body of traditional Muslim social and legal custom and practice, and *fiqh*, or jurisprudence, considered the most important subject in the curriculum. In classic Islamic thought, the four sources of Islamic law, or SHARIA, were called the *usul al-fiqh.* These were the Quran; the Sunna; *ijma*, or the consensus of scholars; and *qiyas*, or finding analogies with past practices and beliefs as guides to solve a present problem.

Ever since Islam's first appearance in West Africa, the *ulama*, or religious scholars, the leaders of prayer in the mosques, and the reciters of the Quran have been indigenous Africans. Thus, the mosque and the school attached to it, with living quarters for resident and itinerant scholars, was an important feature of a major Islamic African city and a point of contact with the Muslim world out-

side. The university at the Sankore Mosque in Timbuktu on the Niger River became second only to al-Azhar as the most important center of Islamic learning in Africa. Its cadre of clerics had been drawn for al-Azhar University by Mansa MUSA (r. c. 1307–1337) in 1325. This university attracted the sons of the local elite and scholars reputedly from as far as the Arabian Peninsula. Its graduates were widely respected and influential.

As was true of other Muslim universities, Sankore was made up of several independent schools, each run by a single master, or *imam.* Students associated themselves with a single teacher and studied with him in the open courtyard of the mosque or at a private residence. As the number of students increased, topics of study extended beyond the Islamic sciences of Quranic interpretation (*tafsir*), doctrinal theology (*tawid*), jurisprudence (*fiqh*), and the sources of the law (*usul*) to include secular studies also.

It is thought that at its height, as many as 25,000 students studied at the Sankore Mosque in a 10-year program

This manuscript illumination of a clock-making system from Al-Dzajari's *Book of Knowledge of Mechanical Processes,* created in 1206, is on display at the Topaki Library in Istanbul, Turkey. It gives evidence of the flourishing of Islamic science after the year 1000 and shows the type of books that would have been available to scholars throughout the Muslim world. © *Gianni Dagli Orti/Corbis*

that covered astronomy, medicine, history, cartography, mathematics, and Islamic sciences. Visiting non-Muslim traders and travelers were encouraged to meet the scholars in residence and were often converted to Islam.

The fortunes of the school depended on political realities. The SONGHAI leader Sunni ALI (r. 1464–1492), reviled as a tepid Muslim, almost an infidel, by the Muslim clerics of Timbuktu, persecuted the scholars of Sankore when he wrested Timbuktu from the MALI EMPIRE early in his reign. Under his successor, the fervent Muslim Askia MUHAMMAD TOURÉ (r. 1493–1538), Sankore once again thrived. When the northern Muslim kingdom of Morocco captured Timbuktu from the Songhai Empire in the early 1590s, however, Sankore's best scholars were deported, and the school never regained its former importance. Around the same time, the Moroccans also took control of Gao, the capital of the Songhai Empire.

Traders brought Islam to Kano, one of the HAUSA STATES, in the 14th century, during the reign of Sarki YAJI (r. 1349–1385). A mosque was built and a court established to hand down judgments in religious matters. By the time Sarki RUMFA (1463–1499) came to power, Islam was firmly rooted in Kano. Scholars connected with Sankore are thought to have opened schools in Kano to teach and preach Islam.

The Hausa state of Katsina had become a seat of learning in the 1400s. Both Katsina and Kano were known to have been visited by the famed 15th-century Muslim theologian al-MAGHILI from Tuat, in present-day ALGERIA, who wrote his influential treatise about Islamic government, *The Obligation of Princes,* during his stay at Sarki Rumfa's court late in the 15th century.

Itsekiri Ethnic group and kingdom located in what is today southern NIGERIA. Legend states that the kingdom of Itsekiri was founded by a former prince of the kingdom of BENIN named Ginuwa (or Iginua), who moved to the Niger Delta area of WARRI in the 15th century after being passed over as a potential OBA (king) of Benin. Evidence suggests, however, that the precursors to the Itsekiri peoples were of YORUBA origin and had already established a society based on AGRICULTURE and fishing by the 11th century.

By the time the Portuguese came into contact with Itsekiri in the 15th century, the inhabitants were skilled in trading their coastal wares with their inland neighbors. The kingdom thereafter became a significant center for European trade—even surpassing the powerful kingdom of Benin in importance—with commodities such as fish, palm oil, salt, and slaves.

The kingdom of Itsekiri was ruled by the *olu,* or king, who exercised priestly functions and headed a centralized government with a large governing council. The council, which included an *ologbotsere,* or military com-

mander, and an *iyasere,* or prime minister, acted in conjunction with the *olu* to decide important legislative matters. Succession to the throne could be from either the matrilineal or patrilineal side, so long as descent from Ginuwa could be claimed, therefore ensuring descent from the original *oba* of Benin as well.

The Itsekiri people, who share their origins with other groups such as the Yoruba and EDO, mainly practice a traditional religion based on worship of a creator-god, Ortise, and other lesser gods such as Umale Okun, the god of the sea.

ivory   Dentin harvested from elephant tusks that has long been prized for its color, texture, and durability. Ivory has been an important trade commodity throughout much of African history. It has been considered a luxury item since ancient Egyptian times, when it was carved into small sculptures, jewelry, and a variety of other decorative items. As Muslim ARABS began settling in northern Africa during the seventh and eighth centuries, the ivory trade continued to flourish. Arab MERCHANTS obtained ivory from sub-Saharan market towns such as KUMBI-SALEH, the capital city of the GHANA EMPIRE, as well as from TIMBUKTU and GAO. In exchange for this prized item, peoples from south of the Sahara were able to obtain salt, silk, COPPER, and weaponry from Arab traders.

By the 12th century a renewed demand for African ivory developed in Europe. Ivory was exported to Europe via North African port towns, and later, along the western coast by Portuguese traders. At the same time, the ivory trade developed along the SWAHILI COAST in eastern Africa. The Swahili coast received its ivory supply from the interior, particularly from kingdoms in present-day KENYA, TANZANIA, and MOZAMBIQUE. The primary recipient of East African ivory was India.

Ivory Coast (Côte d'Ivoire)   West African country, approximately 124,504 square miles (322,465) sq km) in size, that is bordered to the east by GHANA, to the west by LIBERIA and GUINEA, to the north by the Republic of MALI and BURKINA FASO, and to the south by the Gulf of Guinea. Although reports of North African trade CARAVANS operating in the area of Ivory Coast date to Roman times, little is definitively known of the original population of the region. According to some scholars, the earliest inhabitants were probably small-statured peoples who were eventually pushed out or absorbed into subsequent populations. By the second millennium, however, the area had come under the partial control of various Sudanic empires, particularly the MALI EMPIRE, which occupied the northwestern corner of the region during the early 14th century. Searching for IVORY and African captives, Portuguese explorers began visiting the region by the 15th century.

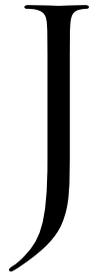
J


Jenne (Djenné) City between Mopti and Segu in present-day Republic of MALI; it replaced the nearby ancient city of JENNE-JENO as a commercial center when the latter city went into decline and was abandoned around 1400. Jenne is located near the Niger and Bani rivers, its location providing a direct connection by water to the city of TIMBUKTU. This geographical placement attracted traders from throughout West Africa as well as the SUDAN. It was at the head of the trade routes from the GOLD mines at Bitou, in present-day IVORY COAST, and was an important center of the SALT TRADE.

The often-photographed Great Mosque of Jenne, is not the original one. The first Great Mosque was built in the 13th century by Koy Konboro, Jenne's first Muslim ruler, who erected the mosque on the site of his former royal palace. This building fell into ruin and was replaced in the early 19th century.

Jenne was captured by SONGHAI emperor Sunni ALI (r. c. 1464–1492), who transformed Songhai from a kingdom to an empire. A Muslim city since its foundation, Jenne became an Islamic center of learning in the 1600s.

See also: ISLAMIC CENTERS OF LEARNING (Vol. II); JENNE (Vol. III).

Jenne-Jeno Ancient African city, inhabited from around 200 BCE to 1400 CE, located in the western SUDAN, in what is present-day Republic of MALI. Jenne-Jeno is a mound, located about 2 miles (3 km) from the modern city of JENNE. According to oral tradition, Jenne-Jeno was the original settlement of the town of Jenne. Excavations of the mound in the 1970s and 1980s have provided information about life in Jenne-Jeno.

By around 450 Jenne-Jeno had grown into a settlement that covered about 62 acres (25 hectares). The excavations indicate that the houses of this time were built on foundations of puddled mud, or *tauf.* There were also organized cemeteries, with human remains buried in urns as well as in simple pits.

From 450 to 850 much painted POTTERY was made at Jenne-Jeno. The population grew during this period, and Jenne-Jeno expanded to cover an area of about 82 acres (33 hectares). This expansion was probably due to the development of trade routes along the border between the dry savanna and the region to the south. The success of both the COPPER and GOLD trades in and around Jenne-Jeno probably led the city to become the center of the local government. One of the neighboring towns, HAMBAR-KETOLO, was connected to Jenne-Jeno by means of an earthen dike, and the two towns may have functioned as one. In the ninth century cylindrical bricks replaced the *tauf* foundations. The cylindrical bricks were also used to construct a city wall 12 feet (3.7 meters) wide and more than a mile (1.6 km) long that surrounded the town.

The presence of rectilinear houses and brass suggest that Jenne-Jeno had contact with North African Muslims in the 11th and 12th centuries. The people of Jenne-Jeno probably converted to ISLAM in the 13th century, but urn burial continued into the 14th century, suggesting that not all the residents had embraced the Muslim faith.

Excavations of Jenne-Jeno reveal that IRON, copper, and BRONZE adornments were produced in the area by middle of the first millennium. The absence of natural iron ore deposits in the INLAND NIGER DELTA region indicates that Jenne-Jeno was involved in long-distance trade long before the arrival of Muslim traders in the eighth century.

In the 13th century the nearby town of Jenne, (modern Djenné) was founded and became a center of trade between the central and western Sudan and the tropical forests of GUINEA. Jenne became a great center of trade in gold, slaves, and salt. The city was conquered in 1468 by SONGHAI and later became a center of Muslim learning.

Jenne's rise seems to have coincided with Jenne-Jeno's decline. By 1400 Jenne-Jeno was completely deserted. One theory to explain the desertion is that the dry climate started to become even drier around 1200, and there was no longer enough water for crops and herds. Another explanation is that people converted to Islam and moved to neighboring Jenne. Whatever the reasons, the decline of Jenne-Jeno was gradual and took place over a period of about 200 years.

Jeriba Ancient city in the western SUDAN. Jeriba was the location from which SUNDIATA (r. 1235–1255), the 13th-century MANDINKA ruler, established the MALI EMPIRE.

jihad (jehad) Muslim holy war or struggle against those labeled "infidels." In North Africa the religious reformer MUHAMMAD IBN TUMART (d. 1130) proclaimed himself the MAHDI, a messianic leader expected to initiate a period of righteousness, and called for moral reform and a return to fundamental Muslim beliefs. Ibn Tumart then waged a series of military campaigns that led to the fall of the ALMORAVIDS, the ruling dynasty of a Berber state in present-day MOROCCO and the establishment, in c. 1120, of the ALMOHAD dynasty. In earlier years an Almoravid jihad against nonbelievers within the GHANA EMPIRE, located across the desert to the south, led to the capture in 1076 of Ghana's capital city of KUMBI SALEH. The fall of Kumbi Saleh initiated the period of Ghana's decline.

The concept of jihad is rooted in the QURAN, the holy book of ISLAM, and its practice goes back to the seventh century and the earliest days of Islamic conversion and expansion. The laws defining jihad are laid out in the Quran and the Hadith (sayings), which instruct Muslims to wage war on nonbelievers who refuse to convert to Islam. One of the most important of the laws is that a *shahid,* a Muslim who has perished during combat, is considered a martyr. It is believed that the *shahid* is revered in paradise for sacrificing his life for Islam. Because jihad is a religious struggle its laws forbid unnecessary pillaging or the slaughter of women, children, religious leaders, the sick, the elderly, and anyone else not directly involved in the war.

After the death of prophet Muhammad in 632, the first jihad was launched by Muhammad's successor and father-in-law, Caliph ABU BAKR (c. 573–634), also called *as-Siddiq* (the Upright). During this period the major targets of the jihad were polytheists. (Because Jews and Christians were monotheistic and were considered to be people of the book, they were given a certain amount of immunity by early Islam. Instead of being killed, they were allowed to convert or at least submit to Islamic rule and pay a tax, called the *jizya.*) During the next two years the jihad became a war of conquest. Arab forces under the second caliph, Umar I (c. 586–644) the Caliphate spread into Mesopotamia and Syria and began the conquest of Iran and EGYPT.

Juhaynah (Juhayna, Juhaina, Djoheina) Large group of pastoralist peoples of present-day CHAD and eastern parts of the Republic of the SUDAN. The Juhaynah come from the upper portion of the eastern Sahara, near Aswan. By the 1400s they had migrated south into the the eastern Sudan, introducing ISLAM as they mixed and intermarried with local Nubians. Later the Juhaynah spread around the Nile River valley, converting local peoples they encountered as they moved.

The northern Juhaynah consider themselves ARABS, since they speak ARABIC, and they practice Islam almost exclusively. Some groups inhabiting the portion of the Sudan farther to the south, though, prefer to be called Africans and are either Christian or remain faithful to their traditional African religions. Primarily a nomadic people, the Juhaynah are divided into subgroups, including the Kababish, BAGGARA, Kawahla, and Shukriyah, who make their living herding either cattle or camels.

K

kabaka Title given to the king of the GANDA people of BUGANDA. According to Ganda tradition, in the 14th century the legendary ruler SEKABAKA KINTU became the first Ganda *kabaka.* As *kabaka* he held supreme authority. However, he was not considered divine or sacred, nor was he associated with any gods. He was, instead, simply a monarch who reigned over his people in a feudal-like system of government.

Chiefs appointed by the *kabaka* ruled over the various regions of the kingdom, and the *kabaka* had full authority to dismiss, promote, or transfer these chiefs. Chiefs, therefore, tended to remain extremely loyal to the *kabaka*. However, the *kabaka* did not rely on this loyalty alone. Rather, he appointed another group of officers, the *mutongole,* as lesser chiefs, who were given authority over large estates and their people and who were used by the *kabaka* to spy on the greater chiefs.

Because the Ganda people did not practice primogeniture, an elder senior counselor selected the *kabaka* from among men whose father or grandfather had been a *kabaka*. Once selected, the *kabaka* ruled for life, since the system provided no way to depose him.

Kaffa (Kafa, Kefa) African kingdom established in the forested mountain range of southwestern ETHIOPIA. Kaffa, known for its abundant rainfall, lush vegetation, and unusual animal species, is probably the area where COFFEE was first cultivated for export.

It is thought that Arab farmers first cultivated the coffee plant and brewed a beverage called *qahwah,* which became so popular that the plant and its beans quickly became lucrative export items. Other trade items in Kaffa included cattle, horses, musk, and IVORY, along with manufactured cloth, IRON spears, and daggers.

The discovery of coffee's stimulating effects have been explained by a popular Ethiopian legend involving a young goatherd named Kalid. The story tells how Kalid observed the animated behavior of his goats after they consumed the red berries of a plant that grew on the mountain slopes. When the young boy tasted the plant, he also became animated, so he brought the beans to a nearby monastery. The monks there discovered the invigorating properties of a brew made from the roasted beans and felt that it could help them stay alert during the long hours that they spent praying. One of the monks then took a coffee plant to Lake Tana, where it was cultivated and came into widespread use by local people.

The indigenous people of Kaffa, believed to have been the Minjo, relied on hereditary rule to establish their kings, who took the title *tato.* One of their earliest known rulers was Minjo Tato, who became king in 1390. Crowned rulers in Kaffa were reportedly subject to the control of the Mikrichos*,* a council of governing priests who controlled succession to the throne. From the capital city situated at Andrachi, the *tato* and council of priests dominated the border states, eventually establishing an

empire made up of the regions of Jimma, Kulo, Konta, Koshya Mocha, and Enareya. These states were populated by ethnic groups that included the SIDAMO and OROMO. Forced to pay tribute to the *tato,* these groups eventually initiated widespread rebellion in the region. During the 15th century Emperor ZARA YAKOB (r. 1434–1468) promoted CHRISTIANITY in the region, but after his death the influence of the Christian faith diminished and traditional religious practices were restored.

Kalahari Desert Vast, arid region located in present-day BOTSWANA, NAMIBIA, and SOUTH AFRICA inhabited by the !Kung San people and by Bantu-speaking peoples since the first millennium. The Kalahari lacks permanent surface water, and the only landforms that rise above the uniformly level plain are occasional outcroppings of old rock that form hills in the northwest, southeast, and southwest regions.

While technically not dry enough to be classified as a desert, the Kalahari is largely unsuitable for any form of AGRICULTURE. Its early inhabitants subsisted by hunting, foraging, and some herding of cattle. Due to the severe climate, little has changed in the Kalahari since before the period of European colonization. In the late 1400s and early 1500s the Kalahari was a barrier to the eastward expansion of the pastoral HERERO people and the agriculturalist OVAMBO people. The increasing competition for arable and grazing land between these peoples would lead to a series of bitter wars between them during the 1800s.

Kamba East and Central African Bantu speakers who have long inhabited the highland regions of KENYA. The Kamba are related to the KIKUYU ethnic group, and they trace their ancestral homeland to the plains below Mount Kilimanjaro. In the 16th century the powerful MAASAI people forced the Kamba to flee and settle in their present location. Traditionally agriculturalists, the Kamba have also maintained substantial herds of cattle, sheep, and goats. They were also shrewd MERCHANTS, later controlling the coastal trade of Kenya for many years because of their access to IVORY from the interior.

Kamba society is patrilineal, with extended families living on large homesteads. Several homesteads form a village. No chieftains dominate Kamba society; rather, individuals are organized into age sets with the eldest members forming village councils. The traditional religion of the Kamba people focuses on the belief in a supreme god and ancestral spirits.

Kanajeji (r. c. 1390–1410) *Ruler of the Kano kingdom*
From around the end of the 14th to the beginning of the 15th centuries, Kanajeji was *SARKI,* or king, of KANO, one of the prominent HAUSA STATES. Under Kanajeji the inhabitants of Kano were a mixture of both converts to ISLAM and adherents of the local indigenous religion. Kanajeji is best known for introducing IRON helmets, chain mail, and *lifidi* (protective armor for horses) to the Kano armies, all of which aided them in their aggressive southward expansion of the kingdom during his reign.

Kanem Kingdom centered on Lake Chad. Originally founded by Duguwa and Zaghawa people, with their capital at Manan, Kanem came under the rule of the SEFUWA *mais,* or kings, in the early 11th century. The *mais* ruled over a mostly KANURI-speaking population from their capital at NJIMI, east of Lake Chad. By the middle of the 13th century, Kanem controlled most of the Lake Chad area. Kanem's traders worked TRANS-SAHARAN TRADE ROUTES to the FEZZAN, in present-day LIBYA, as well as routes to the GOLD-bearing forest regions to the west. In the 14th century the BULALA people invaded Kanem, forcing the Sefuwa *mai* to move his capital to BORNU, southwest of Lake Chad. In the 15th century, still under Sefuwa rule, Bornu and Kanem essentially constituted one large trading empire known as KANEM-BORNU.

See also: ZAGHAWA (Vol. III).

Kanem-Bornu Large trading empire that was made up of the separate kingdoms of KANEM and BORNU and was centered on Lake Chad. At various times during their histories, Kanem and Bornu were separate states; at other times they were merged. In general, the histories of the countries are so closely aligned that they are usually discussed together.

According to records kept by Arab scholars, the kingdom of Kanem existed prior to the ninth century. Originally confined to the northeastern shore of Lake Chad, its subjects were a mixture of pastoral TOUBOU, Berber, Duguwa, and Zaghawa peoples. The kingdom of Bornu, on the other hand, was located southwest of Lake Chad. Founded by about 850 CE, Bornu was dominated by the SAO people, who were trans-Saharan traders.

The kings, or *mais*, who led Kanem ruled with the help of a council of peers, although the people apparently considered their kings to be deities. According to the kingdom's oral traditions, the *mais* were descendants of Sayf Ibn Dhu Yazan, a charismatic Arab who migrated to Lake Chad from the Sahara. He is generally considered the first ruler of the SEFUWA dynasty, which soon established dominion over the Lake Chad region, including most of Bornu. From the start, however, Kanem-Bornu was based more on trade than on military might. Its original capital was NJIMI, located northeast of Lake Chad. With its strategic location, Njimi became a crossroads for trade routes passing from North Africa, EGYPT, and the Nile Valley to SUB-SAHARAN AFRICA.

About the 10th century, ARABS brought ISLAM to the area, and by the end of the next century Kanem's Sefuwa Mai UMME (r. c. 1085–1097) had abandoned his people's indigenous RELIGION and converted to Islam. This association with Islam brought Kanem-Bornu into contact with the Arab world and its ideas, but the extent of this influence was limited, as the KANURI people under Sefuwa rule refused to completely abandon their ancient beliefs.

For the next two centuries Kanem's kings enlarged the kingdom through warfare, using NOBLES and slaves trained as soldiers to do the fighting. Mai Dunama DIBBALEMI (r. 1221–1259), also of the Sefuwa dynasty, oversaw the greatest growth of Kanem. Dibbalemi's reign marked the beginning of diplomatic ties with North African kings, and it also saw the establishment of lodgings in CAIRO for Kanem's Muslims traveling to MECCA. In addition, Dibbalemi declared jihads in order to subdue neighboring states.

Eventually Kanem's empire extended as far west as the Niger River, east to Wadai (now part of eastern CHAD), and north into the SAHARA DESERT. This huge area, from Lake Chad to the HAUSA STATES, was directly in the path of those wanting to trade in North Africa, an enormous strategic advantage to Kanem. Another result of this accumulation of land and power was that the local Kanembu people became increasingly settled, exchanging their nomadic lives for sedentary ones. In time, however, dynastic disputes and other problems caused a decline, and by the late 13th century the Kanem-Bornu empire had begun to lose control of much of its territory.

Dibbalemi's death about 1259 also brought into the open a struggle for control among his sons, eventually

leading to armed strife. The peoples in the outlying kingdoms of Kanem-Bornu saw no reason to continue to pay taxes to a preoccupied and chaotic government, and the power of the *mai* dissipated.

In the late 1300s, with Kanem waning, the empire's internal struggles escalated. Around 1380 the BULALA people, who had chafed under the control of Kanem, rebelled. They fought aggressively until Kanem's leader, Mai Umar ibn Idris (r. c. 1382–1387), had no choice but to leave his capital at Njimi and move to the western shore of Lake Chad. The Bulala killed five of the six *mais* between 1376 and 1400, leaving the kingdom in disarray. This period also led to warfare between the armies of the leaders who hoped to ascend to the throne.

This internal strife marked the emergence of Bornu as the region's primary power. For the next several centuries, Bornu dominated the Kanem-Bornu alliance. Bornu rulers, like those of Kanem, were converts to Islam. Also like the Kanem *mais*, the Bornu leaders retained some indigenous practices. In the Bornu culture women had significant power; the queen mother, for example, advised the sitting king and enjoyed chief-like status. *Mais*, for their part, were elected by a group of elders and given divine status, an indigenous system that predated the people's conversion to Islam. Like Kanem before it, Bornu thrived on trade. Among Bornu's exports were slaves, eunuchs, livestock, saffron-dyed cloth, and salt.

The early years of the 15th century saw yet more turbulence in the kingdom. Between c. 1400 and 1472 there were at least 15 different *mais*. Finally, Mai Ali Gaji (r. late 15th century) stabilized the Kanem-Bornu region and solidified control of the outlying areas. He also established a new capital in NGAZARGAMU. Located west of Lake Chad, it was the first real capital of Kanem-Bornu since the Bulala captured Njimi.

Kangaba Ancient city in the western SUDAN, believed to have been established before 1000, that became part of the great MALI EMPIRE. Located on the Upper Niger River, Kangaba was inhabited by the MANDINKA (also called Mandingo), a West African people who spoke a MANDE language and who acted as mediators in the GOLD trade of the area. In the 13th century SUMANGURU (d. c. 1235), the ruler of neighboring KANIAGA, invaded Kangaba. Mandinka oral tradition says that Sumanguru killed all of the royal heirs but one, SUNDIATA (d. c. 1255), who could not walk and was not seen as a threat. Sundiata, whose name means "hungry lion," went into exile, where he learned to walk and became an expert hunter and horseman. He then returned to Kangaba. Aided by a coalition of Mandinka

chieftains as well as by the support of his people, Sundiata won the Battle of KIRINA in 1235 and restored Kangaba to its people.

In the coming years, Sundiata and his successors expanded the region they ruled, which came to be known as the Mali Empire. Ultimately, it comprised most of present-day SENEGAL, The GAMBIA, and Republic of MALI. Parts of modern BURKINA-FASO, GUINEA, NIGER, and MAURITANIA also fell within his empire's borders.

The Mali Empire remained strong until it grew too large to be controlled by its military resources. GAO rebelled around 1400, TIMBUKTU was taken by the TUAREGS, and the MOSSI STATES, in the southern reaches of the empire, refused to obey the Mali ruler. As a result, by about 1550 Mali had declined as a political power.

Kaniaga (Diafunu) Kingdom of the SUSU, a sub-group of the MANDE-speaking SONINKE, located in present-day Republic of MALI. Kaniaga was a thriving chiefdom by the eighth century, and it remained a major power as the trans-Saharan trade ECONOMY reached its peak after the ninth century.

In the 13th century Kaniaga was ruled by SUMANGURU (d. c. 1235), a despotic leader who lost his kingdom to SUNDIATA (r. 1235–1255), the MANDINKA warrior and chief. Kaniaga was then incorporated into the MALI EMPIRE.

Kano Capital of the Kano state in present-day northern NIGERIA; historically one of the larger and more powerful of the ancient HAUSA STATES. An 11-mile (17 km) wall encircled the city of Kano. The wall was from 30 to 50 feet (9 to 15 m) high and up to 40 feet (12 m) thick in some places. Along the wall there were 13 gates with entrance towers that served as portals into the city within, which included the town, the palace, fields, and a pond. The town was divided into 14 neighborhoods of various ethnicities each with its own leader.

The Kano area boasts a rich past dating back hundreds of years. According to tradition, Kano was probably founded in the late 10th century by BAGAUDA, a descendant of Bayajida, the legendary Hausa forefather. Growing trade in the area quickly helped Kano become an important commercial center. ISLAM, introduced to Kano by way of the MALI EMPIRE, was adopted in the mid-14th century and has remained the dominant religion.

Kano's prosperity sparked long-lasting rivalries with other Hausa states, particularly with neighboring KATSINA, which was the largest and most politically influential state in Hausaland. As a result of the rivalries, throughout its history Kano was forced to become a tributary

state of several regional powers, including BORNU, of the KANEM-BORNU empire, to the west, as well as the SONGHAI Empire.

Kano Chronicle Document that traces the history of the Hausa State of KANO, an important CITY-STATE and emirate in present-day northern NIGERIA. Many historians consider the chronicle to be not only a critical account of Kano itself but also the most important native history of the Hausa people. Written during the 19th century, it is believed to be the oldest written record of the area, and it is said to document the ancient kingdom from about the year 1000 to the early 20th century.

The chronicle follows the developments of Kano, from its founding as one of the Hausa Bakwai (the seven true HAUSA STATES) in the 10th century by its first king, BAGAUDA. It traces the growth of the kingdom, its dealings and competition with the other Hausa city-states, and the introduction of ISLAM to the city by 14th-century religious scholars from the MALI EMPIRE.

Kanuri People who have lived in the Lake Chad region for about 1,000 years; also the language spoken by this group. Languages related to Kanuri include TEDA, Daza, and Kanembu. By 1100 the Kanuri were settled throughout the KANEM kingdom. During the 13th century Kanem was led by Mai Dunama DIBBALEMI (r. c. 1210–1259), who converted the kingdom to Islam.

Much of the commercial traffic that went to northern Africa passed through Kanem. In light of the military and commercial activity in their territory, the Kanuri subsequently abandoned their nomadic lifestyle to adopt a more sedentary one based on trade. Near the end of the 14th century, however, Kanem was invaded from the east by the BULALA people. The Kanuri subsequently abandoned their capital at NJIMI and moved in large numbers to BORNU, on the western shore of Lake Chad. About 1488 the SEFUWA king, or *mai,* Ali Gaji (r. c. 1473–c. 1503), established NGAZARGAMU, in Bornu, as the new Kanuri capital. At the peak of its success, the Kanuri trading empire of KANEM-BORNU dominated the territory from present-day southern LIBYA to Lake Chad and as far west as the HAUSA STATES.

Karagwe East African chiefdom located west of Lake Victoria, near the modern border of UGANDA and TANZANIA. According to oral histories, in the 14th century the Bantu-speaking Sita clan ruled Karagwe (then called Bunyambo). At that time, the kingdom was considered part of the KITARA COMPLEX, a collection of chiefdoms ruled by kings of the CHWEZI DYNASTY. At the beginning of the 15th century, however, the Chwezi rulers were overthrown by invading LUO-speaking pastoralists. Displaced by these Luo newcomers, the royal chiefs of the HINDA clan, former Chwezi subjects, moved south and took control of a number of kingdoms, among them Karagwe. According to oral history, Ruhinda, a wealthy Hinda chief and, by some accounts, the brother of WAMARA, the last Chwezi king, founded Karagwe. The kingdom became a regional center of Hinda culture by the 17th century.

Karamojong (Bakaramoja, Ikaramojong) Nilotic pastoralists from East Africa whose lineage can be linked with the Jie, Teso, Dodoth, Labwor, and Turkana peoples. The seminomadic Karamojong are one of the largest ethnic groups in UGANDA. From about 1000 to 1600 their ancestors migrated south from areas in present-day southern ETHIOPIA and Republic of the SUDAN. The exact origins of the Karamojong are unknown, but their oral tradition points to either KAFFA or possibly the Omo River valley as their original homeland. They first moved toward a plateau in western KENYA that they called Moru Apolon and then continued on to locations north of Mount Elgon. The area in which they subsequently settled became known as the Karamoja region.

For centuries the Karamojong have engaged almost exclusively in cattle herding, the traditional form of subsistence. Despite drought and disease, over the centuries the Karamojong have been able to raise substantial herds for their milk, meat, and blood. Their entire culture centers around these prized animals that not only provide nourishment but also serve as a symbol of social status.

Karanga Bantu-speaking people who have lived in the eastern region of present-day ZIMBABWE since around 950; the rulers of the great MWENE MUTAPA empire, which flourished from c. 1450 to c. 1650, were SHONA peoples, a subgroup of the Karanga. Beginning about the middle of the 10th century, the Karanga inhabited the area long known as the Acropolis, supplanting the indigenous Khoisan-speaking peoples. In time the Karanga established trading networks that reached as far as the Indian Ocean. Their trade items included GOLD, IVORY, and salt.

The center of the Karanga empire was located in the valley below the Acropolis known as the Great Enclosure or GREAT ZIMBABWE, meaning "stone dwelling." This massive compound, which was built about 1200, included the CONICAL TOWER, small houses, and a surrounding wall of granite block that measured 32 feet (10 m) high and 800 feet (244 m) long.

About 1420, however, the Karanga abandoned Great Zimbabwe, probably because the city had grown so large that the surrounding land could no longer support it. By the beginning of the 16th century the Karanga empire had moved north, toward the Zambezi River, and had evolved into the MWENE MUTAPA state, which dominated the region for the next 200 years.

Karifa, Mansa (Khalifa) (c. 13th century) *Minor king of the Mali Empire*

Karifa was one of several sons of SUNDIATA (r. 1235–1255), the founder of the MALI EMPIRE, and the brother of Mansa ULI (r. 1255–1270), Sundiata's successor. After the death of Mansa Uli, Karifa and his brother WATI (also known as Wali) fought for control of the empire. Both had short reigns that left the empire weakened and in disarray. After Karifa's death power eventually passed to ABU BAKR (r. c. 1274–1285), Sundiata's grandson, who ruled until being overthrown by SAKURA (d. c. 1300).

Kasonko Site along the Katonga River, in the grasslands of what is now western UGANDA, known for its ancient ditches, or earthworks. The earthworks at Kasonko were dug by people under the rule of the CHWEZI DYNASTY. Like the neighboring BIGO and Munsa earthworks, which also date from the 14th or 15th centuries, the Kasonko ditches measure more than 10 feet (3 m) deep. Due to the absence of archaeological evidence at Kasonko, the purpose of the ditches remains unclear. However, excavations at Bigo and Munsa suggest that the structures there served some sort of agricultural or pastoral function. Some speculate that the earthworks formed a monument around which the local people would gather to worship hero spirits.

Katsina City and emirate in present-day north-central NIGERIA, near the border with NIGER; one of seven major HAUSA STATES, dating back to the 11th century. For hun-

dreds of years, Katsina played a vital role as a center of trade, culture, politics, and RELIGION.

Katsina's history can be traced to the 10th or 11th century, when it was founded and named after Kacina, a princess of the CITY-STATE of DAURA, some 50 miles (80 km) to the east. Katsina began as a walled-in community that, over time, added other walled-in sections for new arrivals. This gave the city a unique architectural structure that reflected its growth and diversity.

Keita clan Traders from the upper Niger Valley who ruled over the West African MALI EMPIRE. The Keita, originally from lower Niger, were MANDE-speaking traders. In 1235, under SUNDIATA (r. 1235–1255), they defeated the armies of SUMANGURU (d. 1235) of KANIAGA and gained control of the newly formed kingdom of Mali. Over the next 200 years the Keita-led Mali Empire expanded eastward, conquering the important trans-Saharan trade cities of TIMBUKTU, JENNE, and GAO. At the height of its power the empire expanded over much of present-day SENEGAL, The GAMBIA, and Republic of MALI, as well as parts of MAURITANIA, NIGER, BURKINA FASO, and GUINEA.

One of the clan's best known members was Sundiata. A MANDINKA warrior known as the "Lion Prince," Sundiata was the founder and first ruler of the Mali Empire. According to legend, Sundiata miraculously overcame a childhood disability that made him unable to walk. He later became one of the most powerful princes in the Keita clan.

The Mali Empire flourished under the rule of Sundiata's descendants, who continued the Keita clan's dominance. Mansa MUSA I (r. 1312–1337), one of Sundiata's relatives, encouraged the institution of ISLAM as the imperial religion of Mali. Musa was recognized as the Islamic ruler, or caliph, of West Africa, and he used his power to consolidate Mali's imperial authority. Under Musa's influence, trade flourished, new GOLD reserves were discovered, and Timbuktu became an important center for Islamic education.

By 1430 Keita control over Mali began to decline. When the autonomous kingdoms in the Mali confederacy asserted their independence, Mali's armies were unable to bring them back under control. By the close of the 15th century the kingdom of SONGHAI had captured what remained of the Mali Empire.

Kenya East African country approximately 224,900 square miles (582,488 sq km) in size, bordering the Indian Ocean and sharing borders with ETHIOPIA, the Republic of the SUDAN, UGANDA, TANZANIA, and SOMALIA.

Present-day Kenya has been home to more than 30 different peoples. One of the earliest groups to inhabit the region were the KHOIKHOI, who subsisted primarily by hunting and foraging. Other early residents included Cushite agriculturalists and Nilotic peoples, who migrated to areas in western Kenya from their homelands in the SUDAN. Kenyan chiefdoms prior to the era of European colonization were largely decentralized, with most groups practicing AGRICULTURE and animal herding, although both internal and coastal trade played an important role. FOOD, cattle, salt, IRON tools, and POTTERY were common trade commodities.

Limited commercial activity along the Kenyan coast greatly expanded with the arrival of Arab traders, who came in greater numbers beginning in the 11th century. IVORY, GOLD, beads, cloth, rhinoceros horns, tortoiseshell, and slaves were valued export items at Arab markets.

As the ARABS intermarried with the coastal people, a new ethnic group, the Swahili, emerged. Beginning in the 12th century the Swahili dominated Kenyan coastal trade, and by the 15th century the port town of MOMBASA was one of the most important trading centers along the East African coast.

When Portuguese merchants arrived in the late 15th century, they aligned themselves with the Swahili in an attempt to gain control of coastal trade. However, tension between the Portuguese and Swahili soon developed, and in 1529 the Portuguese gained autonomous control over this portion of the East African coast.

The word *swahili* is derived from the ARABIC word *sahel*, meaning "coast." The Swahili, then, were known as the "people of the coast." The same Arabic word is used to name the southern border of the Sahara, the Sahel.

Keta Coastal town located on the Gulf of Guinea in present-day GHANA, between the mouth of the VOLTA RIVER and the border with present-day TOGO. As early as 1475 Keta was an important trade center of the Anlo people, a subgroup of the EWE. When European traders arrived in the latter half of the 15th century, Keta, which means "head of the sand" in Ewe, was a prominent Atlantic coast market for the trading of GOLD, silver, IVORY, and spices.

Kharijite Fundamentalist Muslim sect to which many North African BERBERS converted during the eighth century. Originally the Kharijites, or Khariji sect, supported Ali (r. 656–661), the fourth caliph and son-in-law of the prophet Muhammad (c. 570–632). This was during the civil war in Arabia between Ali's supporters and the Umayyads over control over the Caliphate, often called the Arab Empire. Unlike Shiites, the Karijites held that anyone, even a servant, rightfully could be elected caliph if he was pious and morally pure. For their fanatical devotion to Ali's cause and puritanical, deeply fundamentalist beliefs, the Kharijites have been called the earliest Islamic sect. The movement was suppressed in its native Abbasid Caliphate, in present-day Iraq, during the seventh century but, in more moderate forms, it spread to eastern Arabia, North Africa, and eastern Africa—carried by missionaries and believers—where it survives even today.

Kharijite doctrines were appealing to the non-Arabic-speaking Berber peoples in North Africa because they seemed to offer alternatives to Arab political domination of the Muslim world and allow rebellion against a ruler when the ruler acted in an unrighteous manner. Berber resentment against the ARABS stemmed in part from the way Berber warriors were treated when they served in the Muslim armies that invaded Spain in 711. They were treated as *malawi*, or clients, of the Arab states, paid less for their services, not allowed to share in the spoils, all of which went to Arabs, and forced to offer human tribute—slaves, especially female slaves—to the Arab rulers.

In 740 the Berbers rebelled against Arab rule in Tangier, in MOROCCO. By 742 they had taken all of present-day ALGERIA. At the same time, all of Tripolitania, in present-day northwest LIBYA, was won over to Kharijite control by the conversion of the Berber peoples who lived in the region.

In 750 the Abbasid dynasty (r. 750–1278) overthrew the reigning UMAYYAD caliph in Damascus, moved the capital to Baghdad in present-day Iraq, and turned the focus of the Caliphate eastward, toward Persia. For the first time, the Caliphate did not rule over the entire Muslim world. In EGYPT, North Africa, and Spain, local dynasties claimed the status of caliph, or ruler, of the local Muslims. In North Africa four separate Muslim

states claimed power, one of which nominally accepted Abbasid authority and three of which rejected it outright. The only state in Berber hands was the relatively insignificant state of the Banu Midrar, in Morocco. Their principal town, SIJILMASA, was primarily a trading community. The Banu Midrar fell to the FATIMIDS in 909.

Khoikhoi (Khoe Khoe, Namaqua, Khoi, Hottentots)

Khoisan-speaking pastoralists of southern Africa. Seminomadic herders, the Khoikhoi have inhabited present-day NAMIBIA for the majority of the second millennium. Descendants of an ancient Ethiopian people, the Khoikhoi migrated south to what is now Namibia in the 14th century, later moving on to the Cape of Good Hope, in present-day SOUTH AFRICA. They subsisted by hunting, gathering, and raising sheep, cattle, and goats. Their handicraft skills included POTTERY, basketry, weaving, and metalworking.

When the Portuguese arrived in 1488, the Khoikhoi responded aggressively, killing dozens of the foreign invaders. In retaliation the Portuguese slaughtered the Khoikhoi in large numbers several years later. By the mid-17th century European settlers had forced the Khoikhoi from their Cape homeland.

Kigali

Capital city of present-day RWANDA, located in the rural highlands along the Ruganwa River. During the late 15th century Kigali served as a major trade center of the separate TUTSI monarchies that soon unified as the Rwanda kingdom.

Kikuyu

East Africa people living mostly in present-day KENYA; also the language these people speak. Today numbering 4 million, the Kikuyu make up the largest percentage of Kenya's population. Although a well-defined Kikuyu ethnic group emerged only in the 17th century, it is theorized that the clans that made up the Kikuyu peo-

ple began moving into present-day Kenya from present-day southern SOMALIA during the great BANTU EXPANSION of the first millennium. The merging of multiple cultures produced an eclectic mix of Kikuyu rituals over the centuries. From the Thagicu the Kikuyu adopted ceremonial dances and initiation rites, which became common in Kikuyu culture. Young men and women were fully integrated into the social circles of the village, called *itura*, after circumcision and clitoridectomy ceremonies. After their initiation males became warriors, and the females' social responsibilities increased to include duties beyond the village proper.

According to oral tradition, Ngai, the Kikuyu god, commanded Gikuyu, the forefather of the Kikuyu, to build his home near Mount Kenya. Gikuyu settled in the center of the land. It was full of fig trees, so he named it the Tree of the Building Site (Mukurue wa Gathanga). Ngai sent Gikuyu a wife, Mumbi, who bore Gikuyu nine daughters. Along with one other child, these women became the progenitors of the 10 ancestral clans of the Kikuyu.

As early as the eighth century the proto-Kikuyu groups practiced clearing their woodlands for AGRICULTURE. Preparing land to sustain a single FAMILY required approximately 150 days of LABOR, so groups of men joined together to accelerate the process. These small groups (*mbari*) would clear a large plot of land and then divide it among themselves. Once the land was cleared, the *mbari* served as the political leaders of the area. The revered elders in each *mbari* were given the most power. Subsequent settlers (*ahoi*) could not become members of the ruling *mbari* council.

Famine was often a major problem in East Africa. Kikuyu agriculture suffered from the arid climate, and regular harvest failure affected the local *mbari* communities. Approximately every 70 years a major catastrophe struck that extended beyond the local *mbari,* and these severe famines resulted in massive death throughout the Kikuyu lands.

From the Thagicu the proto-Kikuyu learned irrigation techniques that became vital to their expanding agricultural ECONOMY. Combined with their enterprising spirit, irrigation allowed them to produce enough FOOD to sell to neighboring people, such as the KAMBA and MAASAI. They initially grew bananas, yams, millet, and sorghum. (Maize, cassava, and rice became important items in the 19th century, when the Kikuyu traded with European MERCHANTS.)

Mugo, *Kikuyu People: A Brief Outline of their Customs and Traditions* (Nairobi, Kenya: Kenya Literature Bureau, 1982); Godfrey Muriuki, *People round Mount Kenya: Kikuyu* (London: Evans Bros., 1985); David P. Sandgren, *Christianity and the Kikuyu: Religious Divisions and Social Conflict* (New York: P. Lang, 1989).

Kilwa (Kilwa Kisiwani) One-time trading center on the East African coast. ARABS and MERCHANTS from the Iranian plateau established Kilwa as a trade center in the late 10th century. Spurred by a demand for GOLD and IVORY, Kilwa became the preeminent coastal trading city in eastern Africa by about 1200. Kilwa was able to gain control of the gold exports from SOFALA, a port city south of the mouth of the Zambezi River, through which MWENE MUTAPA gold flowed. By the end of the 15th century a series of internal struggles had greatly weakened the city's economic power. When the Portuguese seized Kilwa in 1505, Swahili traders responded by using other ports; within 10 years the city's role as a principal gold-trading center was greatly diminished.

kingdoms and empires Historical records and the archaeological study of the ruins of palaces, mosques, royal cemeteries, and walled enclosures indicate that a substantial number of kingdoms and empires flourished in Africa between the fifth and the 15th centuries. A kingdom is a large territory or political unit that has a monarchical form of government usually headed by a king or queen. An empire, on the other hand, consists of a number of states or territories united by conquest or by diplomatic means and ruled by a central sovereign authority. Before the period of European colonization, Africa had many kingdoms, some large, most small, but usually inhabited by a single people or by a dominant cattle-raising people and a subject agriculturalist people. The major indigenous empires of West Africa encompassed vast territories and many different peoples under a single ruler.

In the lands of North Africa, collectively known as the MAGHRIB ("West," in ARABIC), empires flourished between 534 and 1554: first Byzantium and then, after the rise of ISLAM, the Caliphate, the empires of the AL-MORAVIDS and the ALMOHADS, and the Ottoman Empire. In SUB-SAHARAN AFRICA, both kingdoms under local rule and empires under central rule flourished. By the 11th century ancient Ghana had transformed itself from a kingdom into an empire and began the process that culminated in 1464 with the rise of SONGHAI, the largest in-

digenous empire in the history of Africa. The kingdoms and empires of Africa were often highly complex and stratified societies that developed from modest beginnings as obscure villages, as commercial centers or depots established along trade routes, or as agricultural settlements. Although each was governed by its own political, social, and cultural beliefs, interregional trading probably exposed groups to different practices.

Dynastic rule was a feature of some African kingdoms. A dynasty is a series of rulers from the same FAMILY or a select group that maintains ruling authority over several generations. The royal line of the Christian kingdom of ETHIOPIA offers one such example. Known as the SOLOMONIC DYNASTY, it dates back allegedly to the marriage, about the 10th century BCE, of the Jewish king Solomon and the mythical Queen Makeda (queen of Sheba). According to Ethiopian legend, the son of this union, Menelik I, was considered the first dynastic ruler of the nation. The rulers of the ZAGWE DYNASTY gained control beginning in the 10th century, but they were violently overthrown by the Solomonic warrior king YEKUNO AMLAK (r. 1270–1285), who restored the dynasty to power.

The Importance of Diversification and Specialization Many kingdoms evolved because, once populations became self-sustaining, areas of specialization could be developed. One segment of the population would serve as an agricultural LABOR force to raise crops for sustenance and trade while others developed specialized skills and thus generated additional sources of income to bolster the ECONOMY. Specialists often included CRAFTS-PEOPLE, artists, and ironworkers, who all produced articles for trade. Specialized skills might also include the ability to perform religious rites as a way to reinforce ancient moral codes and religious values. Armies capable of defending the kingdom's resources represented another form of specialization. The kingdoms of ILE-IFE, GREAT ZIMBABWE, and KONGO show the effect of diversification and specialization on the development of kingdoms.

The 12th-century YORUBA kingdom of ILE-IFE in present-day NIGERIA was noted for its agricultural success in producing yams and oil palms and in raising livestock. Ile-Ife expanded as a result of cooperative work and the joining of villages. It had a central ruler or king and a profoundly important religious focus that fostered many areas of specialization, including the production of artistic metalwork. The layout of Ile-Ife, which included a royal compound on the city's interior and the farming

community on the outskirts, served as one of several early models for the cosmopolitan CITY-STATE.

The kingdom of Great Zimbabwe (c. 1100–1450) in southern Africa developed in a way similar to that of Ile-Ife, with farming serving as an important base. Although MAPUNGUBWE was the first kingdom in the region, Great Zimbabwe was the most notable, spread over 2.8 square miles (7.2 sq km) of open woodland and encircled by hills. Like Ile-Ife, the city of Great Zimbabwe was enclosed by a large wall, known as the Great Enclosure, which measured nearly 40 feet (12 m) high and had a circumference of approximately 800 feet (244 m). Equally notable were the odd shaped boulders that marked Great Zimbabwe's Hill Complex as a site of religious activities.

During the 15th century the KONGO KINGDOM grew even larger than Zimbabwe. The Kongo kingdom had landholdings of approximately 200,000 square miles (517,997 sq km) and a population estimated at between 4 and 5 million people. This large region was made up of six small states, each headed by a chief, who in turn was governed by the king, known as the *manikongo*. The Kongo people were primarily an agricultural society, but they also developed many diversified specialties that included weaving, ironwork, and the LOST-WAX PROCESS of casting metal. The goods they produced became valuable trade items.

The Importance of Trade The ability to engage in large-scale trade was also a common factor in many self-sustaining nations. The empire that began as the kingdom of KANEM, for example, was directly impacted by TRANS-SAHARAN TRADE ROUTES. In the early 1200s it developed lucrative trade networks that included sending large shipments of salt from Bilma, Agram, and other neighboring regions into the Sahel. Kanem also supplied alum to EGYPT and countries in the Maghrib, along with elephant tusks, ostrich feathers, live GIRAFFES, embroidered garments, and IRON weapons.

The most expansive trade links usually developed within regions that were in close proximity to the coast. Trade explains the rise in eastern Africa of the SWAHILI COAST region, which included approximately 170 city-states. These states extended along the coast from the southern region of present-day SOMALIA to present-day MOZAMBIQUE.

kingdoms and empires of eastern Africa and the interior There are two parts to the story of East Africa. One part traces the development of the Swahili trading states along the Indian Ocean coast that developed as a result of pre- and post-Islamic Arab trade. These mercantile city-states were wholly directed toward the sea and commerce and, until the 19th century, had little direct political impact on inland peoples; they were mainly transfer points for IVORY, GOLD, and other trade goods to their final destinations outside Africa. The second part records the rise of the inland kingdoms that resulted from the migration of Bantu-speaking peoples into the region.

Arab Coastal Kingdoms The East African coast was known to Greek and Roman traders of the first centuries CE. Arab traders settled in the region and intermarried with the local peoples, but there is no record of their living anywhere but in existing fishing and trading communities. The rise of ISLAM in the seventh and eighth centuries helped boost INDIAN OCEAN TRADE and the Arab presence along the coast. In the eighth century Shiite refugees from the Arabian Peninsula who were fleeing persecution by the dominant Sunni sect settled along the East African coast. They also intermarried with the local peoples, learned their language, and began trading with the rest of the Muslim world. Arab writers of the time called this portion of the coast the "Land of ZANJ." By the 13th century ARABS had also successfully established colonies along the eastern coast, including MOGADISHU, LAMU, MOMBASA, KILWA, PATE, and SOFALA, where they traded slaves, ivory, and gold.

> African ivory, easier to carve than ivory from India, was especially prized in China and even in India, where it was used to make ceremonial objects and sword hilts.

The city-states along the coasts were commercial rivals but rarely military rivals. One historian notes that until the Portuguese arrived in the 15th century, there is little record of piracy. Relations with the inland peoples were generally good, as well, since it was to the advantage of the commercial states to stay on good terms with those who provided the goods that made their cities prosperous. There were occasional attacks from inland, often in retaliation for cattle raids or slave raids staged by rulers of the coastal cities, notably the sultans of Kilwa. These sultans gained their wealth from the Sofala gold trade to the south, and they did not fear risking a small portion of their wealth if it might eventually return greater gains. Leaders of other coastal cities were more cautious.

The Arab coastal cities never developed any kind of central authority or transformed themselves into a united kingdom or trading empire. They maintained their independence until the early 1500s when the Portuguese began a systematic conquest of the East African coast.

Linguistic and archaeological evidence and the oral traditions of the modern peoples of the region provide most of the information available about the kingdoms of the interior before the 19th century.

Kingdoms of the East African Interior With some exceptions, the East African interior is the story of peoples rather than kingdoms. Governance was local—by clan or village—rather than by central authority. In northwestern TANZANIA, for example, the Bantu-speaking Sukuma and Nyamwezi peoples were governed by chiefs called *ntemi,* whose duties were as much religious as political. This style of governance spread southward to include the Nyamwaga, the Hehe, the Safwa, and other peoples of the region. The other inhabitants of the region were the Nilotic, or Nilo-Saharan-speaking, peoples who moved into the northern and northwestern parts of East Africa under pressure from the Cushitic OROMO peoples from the Horn of Africa. They, as well as the Oromo, lacked a tradition of kingship; individual leaders were less important than the elders of the clans. Exceptions occurred where Nilotic peoples established dominance over peoples who previously evolved a form of political leadership. Such a kingdom was founded by the LUO people at the beginning of the 15th century, displacing an earlier kingdom ruled by the CHWEZI DYNASTY that had flourished in the lake region.

The lake region, Great Lakes region, and interlacustrine (meaning "between the lakes") region are the names given to the area of land between Lakes Albert, Victoria, Tanganyika, Kyoga, and Edward.

The Chwezi rulers were known for their development of several sites, including KASONKO, Mubende, BIGO, Bugoma, Kibengo and Munsa, in what is now western UGANDA. At Bigo are the remains of an extensive earthen and stone channel network more than 6 miles (9.6 km) long that is thought to have encompassed both the capital and an ample grazing pasture for herds of cattle. These ditches also indicate that the Chwezi were sufficiently well-organized to field large teams of laborers to construct such a system.

In the early 15th century, Nilotic LUO-speaking people from present-day Republic of the SUDAN took over most of the KITARA COMPLEX, a region first unified by the Chwezi Dynasty during the 15th century. As the Luo in-

vaders established a new kingdom called BUNYORO-KI-TARA, HINDA clan leaders, who claimed to be direct descendants of the Chwezi rulers, moved south to establish TUTSI monarchies in regions already inhabited by Bantu-speaking HUTU farmers.

Further south are the ruins of an extensive city called GREAT ZIMBABWE, after which the present-day country of ZIMBABWE is named. At its peak between the years 1100 and 1450, Great Zimbabwe supported a population estimated between 10,000 and 20,000 people in the city and the surrounding valley. Built by the Bantu-speaking SHONA people and supported by a local economy based on AGRICULTURE and cattle, Great Zimbabwe was the center of a flourishing trading empire that sent gold and other trade goods as far east as the Arab trading towns on the Indian Ocean coast. There is some speculation based on the monoliths and sculptures found in the ruins that the city was also a religious center. By about 1450, however, the balance of trade had shifted to the north, and the city was abandoned. It is thought that local resources, including salt, had dwindled to dangerously low levels.

South of Great Zimbabwe, on the borders of present-day ZIMBABWE, BOTSWANA, and SOUTH AFRICA, lay the city of MAPUNGUBWE, claimed by some to be South Africa's first urban center. Having started as a large village, it rapidly developed into a town of perhaps 10,000 people. Mapungubwe was abandoned during the 12th century, very possibly because trade routes to the coast shifted northward and became dominated by Great Zimbabwe as that city grew into its prime. Both Great Zimbabwe and Mapungubwe, like other settlements of the Bantu speakers, were generally ruled by chiefs who had considerable power but who had to consult the elders on matters of importance. These settlements were highly stratified according to age, wealth, and gender.

Further south, in the Transvaal region of present-day South Africa, the Bantu speakers called Sotho-Tswana began to gather into larger settlements in the 13th and 14th centuries. The Fokeng and the Rolong were two of a number of powerful dynastic chiefdoms that started to emerge in the region. The Fokeng chiefdoms spread southward, and the Rolong chiefdoms spread over lands controlled by peoples of the KALAHARI DESERT, who either accepted Rolong rule or moved further west across the Kalahari. The Rolong cities developed as centers of farming, cattle raising, and commerce and featured a strongly hierarchical social structure. At its height in the late 16th century, Taung, the capital of the Rolong chiefdoms, had a population of as many as 15,000 to 20,000 people. The great kingdom of the Zulu peoples, so closely associated with this region in the popular mind, did not rise until the 18th century.

kingdoms and empires of the Lower Guinea and Atlantic coast

In West Africa the Lower Guinea coast was home to several important kingdoms. Below the GAMBIA RIVER lived the MANDE, among the last people to settle along the coast. The kingdom of GABU, which they founded around 1250 in what is now GUINEA-BISSAU, was originally a tributary state of the MALI EMPIRE and provided Mali, which controlled the GOLD-producing regions of the upper SENEGAL RIVER and the upper Niger River, with access to the sea. The Gabu kingdom held power over various indigenous, non-Mande chiefdoms, such as the Kokoli, the Biafada, the Niumi, and the Badibu, that it conquered and reduced to servitude. Contributing to Gabu's autonomy in the late 15th and early 16th centuries was the weakening of Mali by attacks from the growing SONGHAI Empire. The Gabu state survived until the 19th century.

Farther down the Lower Guinea coast were the kingdoms of BIGO, BONO, BENIN, ILE-IFE, OYO, Nri, Ganeboafo, and AKAN. They evolved from the cultures of coastal peoples such as the Akan, the BRONG, the GA-DANGME, the EDO, and the peoples of YORUBALAND, whose success was intrinsically linked to the development of IRON technology. This technology enabled them to produce more crops and the appealing trade goods that brought them prosperity.

The Brong developed a site at Bigo between 965 and 1125 along the coast of what became modern GHANA. Bigo was a trading center from the 11th century onwards and reached its peak in the 14th century. At its height, 5,000 people lived in the compounds within the settlement. Archaeological evidence indicates that the city was divided into five different districts soon after the establishment of the permanent trade route to JENNE in the first half of the 15th century. Little else is known about Bigo other than that leadership fell to clan leaders rather than to any central authority. Trade was more important than political life.

Bono, located where the forest and the savanna meet, was a center of trade for the region, especially for gold and kola nuts (prized as a nonalcoholic stimulant by Muslims), which Mande traders from the north sought out for the Arab trade. Bono quickly dominated nearby settlements. Bigo and Bono gave rise to the Akan kingdoms of the 15th century.

Prior to 1400 the Ga-Dangme settled such sites as Gbegbe, Little Accra, Prampram, and Lolovo. These settlements supplanted Ladoku and Shai, which had emerged between 600 and 1400. Life in these newer settlements revolved around pastoralism, fishing, the production of salt, and the cultivation of crops.

The YORUBA people established both Ile-Ife and Oyo. According to tradition, Ile-Ife was ruled by ODUDUWA, who founded it in the 11th century. Ile-Ife became one of the first kingdoms south of the Sahel. The sovereign power of the king was based on common territorial residence, common law, and his authority over the various Yoruba-speaking states. The city-states that made up the kingdom were organized around one city and its surrounding villages. Archaeological evidence suggests that the Ile-Ife dynasty was overthrown in the 16th century. This evidence includes the disappearance of potsherd floors—found throughout the kingdom from the 12th to the 16th century—that suddenly vanished from the local ARCHITECTURE.

The Oyo kingdom, which is believed to have evolved at approximately the same time that Oduduwa founded Ile-Ife, was another major center. There the Yoruba traded with peoples of the Sahel and the forest region. It became a substantial city by the 14th century but did not reach its zenith of imperial power until the 17th century.

The other major kingdom, Benin, was located southeast of Ile-Ife and became a kingdom in the 12th century. In the 14th century the people of Benin asked the king of Ile-Ife to send them a prince. The rule of the prince, who was named Oranyan, was limited by the powers of the local chiefs, known as UZAMAS. It is not clear whether or not the *uzamas* were allies of the king of Ile-Ife because the fourth ruler of Oranyan's dynasty battled with the *uzamas* to gain more power. He ultimately succeeded and upon his victory built a palace in his own honor and established titles as grants rather than birthrights. The *uzamas* did not concede, however, and still exercised their power until the 15th century, when an autocracy was installed under the leadership of EWUARE (r. 1440–1480).

Under Oba (King) Ewuare, the city of Benin was renamed Edo. During his rule, which lasted from 1440 to 1473, the political organization of the empire was created. Three groups of titled chiefs—the *uzamas,* the palace chiefs, and the newly created title of town chiefs—were responsible for Edo's leadership. During this period, Ewuare conquered the eastern and southern Yoruba territories, thereby consolidating the neighboring regions into his empire. Ewuare maintained Edo's independence from European control and established a peaceful relationship with the Portuguese upon their arrival to the region in 1472.

By the end of the 15th century at least 12 small kingdoms of coastal peoples, including Afutu and Gomoa, could be counted among the major kingdoms of Benin and Oyo. These major kingdoms held the reins of trade with other states in the region, a factor that made it very easy for the Portuguese to tap into the vast trading net-

work by establishing an economic relationship with a few major kingdoms.

Atlantic Coast Kingdoms Kingdoms south of the equator on Africa's west coast originated with Bantu speakers and flourished between the 13th and 17th centuries. The kingdoms of Loango and KONGO had governments that were generally built on clan structures. AGRICULTURE, cattle-raising, and trade were the important elements in their economies. Toward the end of the 15th century, the kingdom of Loango, north of the Congo River, was settled by the Bantu-speaking Vili people.

To the south of the Congo River lay the KONGO KINGDOM, which was formed by Bantu-speaking peoples in the 14th century. It occupied an area stretching into what is now ANGOLA and the Democratic Republic of the CONGO.

The Kongo kingdom was ruled by a king, the *manikongo,* who was elected by a council of the ruling elite and presided over lesser kings and local hereditary governors. The *manikongo* ruled over a network of settlements spread out over a large geographical area. By the 14th century a sophisticated trading system with widely accepted currencies, including raffia cloth and shells, gave the various settlements of the Kongo kingdom a sense of unity.

kingdoms and empires of the Maghrib

kingdoms and empires of the Maghrib The history of North Africa is almost entirely that of empires rather than kingdoms. From 428 until 534, the Kingdom of the Vandals, founded by invading Germanic warriors, supplanted the Western Roman Empire in the lands bordering the MEDITERRANEAN SEA. In 534 present-day ALGERIA and TUNISIA were subsumed into the Byzantine Empire, whose dominion lasted until 675, when all of North Africa fell to Muslim invaders and became part of the Caliphate, or Arab Empire. This included the Berber kingdoms of FEZZAN and LIBYA, in central North Africa. In 909 Algeria and Tunisia came under the control of the FATAMIDS, who ruled the region until 1015, and then the Hammadid dynasty, which ruled from 1015 until 1152. The empires of the ALMORAVIDS, centered in present-day MOROCCO, and the Berber ALMOHADS contended for dominion from 1152 until 1360, when the Almohad empire gained firm control and united the MAGHRIB for the first time under a single ruler. The region remained under Almohad control until it became part of the Ottoman Empire in 1554.

From the fifth to 14th centuries and later, the cities of the Maghrib were the African end points of the vast trans-Saharan networks of trade routes that brought GOLD, foodstuffs, and METALWORK from SUB-SAHARAN AFRICA for shipment to Europe, the Middle East, and other lands that ringed the Mediterranean. The African goods were traded for European textiles, COPPER, beads, jewelry, and other items.

kingdoms and empires of Senegambia

kingdoms and empires of Senegambia Arab historians of the 10th and 11th century writing about the SENEGAL RIVER mention a number of black African states along its banks, the most important of which were TEKRUR and SILLA, just up river from the salt-exporting coastal town of Awil. It is thought that Tekrur, founded by the ancestors of the TUKULOR people, was established as early as the first century CE. By the 10th and 11th centuries it had become an orderly kingdom with a large army and an important commercial center, shipping GOLD and salt to North Africa in exchange for wool, COPPER, and BEADS AND JEWELRY, among other items. The local ECONOMY depended on farming, raising cattle, camels, and goats, and weaving the cloth that gave Tekrur considerable fame. Tekrur was one of the first kingdoms in western Africa to accept ISLAM and became for a time the staging area for a JIHAD, or holy war, against non-Muslim elements of the SANHAJA BERBERS, who were persecuting Muslim missionaries.

By the 11th century the GHANA EMPIRE, located further inland between the Niger and Senegal rivers, was the most important power in West Africa and had incorporated Tekrur as a semi-independent state within its empire. Eventually Tekrur joined forces with the militant Islamic force later known as the ALMORAVIDS in a war that led to the conquest in 1076 of Ghana's capital at Kumbi Saleh. Ghana's fall, however, did not increase Tekrur's power. The FULANI and WOLOF peoples, among others, carved kingdoms from Tekrur territory and weakened it. The WOLOF EMPIRE, originally a confederation of small, independent village-states in Walo, eventually consisted of the states of Kayor, Baol, and Walo and the former SERER states of Sine and Saloum, the rulers of each acknowledging kinship with the Wolof ruler, known as the *burba jolof.*

The Wolof system of government, based on individual wealth and the preservation of personal privilege and power, became one of the most autocratic systems of government in West Africa. Hereditary griots sang the praises of the divine leader and their aristocratic masters and transmitted the history of the people from generation to generation. A rigid caste system was in place, made up of royalty, nobility, free persons, and a class of forced laborers. Military service was an important element in Wolof life. In the early 16th century the Wolof empire could field an army of 10,000 CAVALRY and 100,000 foot soldiers. Islam made almost no inroads in this society, which

owed its achievements to few outside influences. The empire began to decline in the 16th century when Kayor, one of its constituent states, asserted its independence.

The former Serer states were similar to the Wolof empire in their deification of the king, or *bur*, and their rigid class structure. At the top was an influential warrior class from which rulers, soldiers, judges, and tax collectors were selected; at the bottom were those bound to domestic and agricultural service. The underclass did contribute to the growth of the Serer states, though, through their advanced farming techniques, which included crop rotation and the swampland cultivation of rice. The Serer states vigorously resisted conversion to Islam.

kingdoms and empires of the West African savanna
The West African savanna was home to the three great empires of Africa before 1450 (GHANA, MALI, and SONGHAI), as well as numerous smaller, often tributary, kingdoms.

Ghana Empire   One of the oldest states in West Africa, founded according to some scholars as early as 300 CE, ancient Ghana was a powerful GOLD-trading kingdom situated between the SENEGAL RIVER and the Niger River, 500 miles (805 km) northwest of the present-day nation of GHANA. Originally called OUAGADOU by its SONINKE founders, the kingdom later adopted the name *Ghana,* or "war chief," after the title of the ruler, who enjoyed semidivine status as both king and chief priest of all the traditional cults.

By 1068 Ghana was the largest and wealthiest state in West Africa. The capital, KUMBI SALEH, was the most important trading center of the region, where salt, horses, and luxury goods from North Africa were exchanged for gold, ostrich feathers, IVORY, and other goods. The GHANA collected customs duties on all these goods. Kumbi-Saleh was actually two connected towns: Kumbi-Saleh proper was the Muslim section, with commercial areas, 12 mosques, and many North African merchants and Muslim scholars in residence. Set apart from this was the royal city, where the palace of the *ghana* was located. Buildings there were constructed in the traditional mud-and-thatch style, in contrast with the stone buildings of the Muslim quarter. Between these two were the houses of Soninke commoners. ISLAM was the religion of the commercial class, but, as commonly happened in many African societies, most Soninke practiced their traditional religion.

To govern the empire, which included many non-Soninke peoples, two types of provincial governments were used. In Soninke regions, the governor was often a close relative or friend of the *ghana;* in non-Soninke provinces, the governor was the local ruler selected according to local custom and confirmed in office by the

ghana. In return, after mutual exchanges of honors and expensive gifts, the *ghana* provided protection, the rule of law, and opportunities for trade. An important factor that enabled ancient Ghana to extend its borders was its military prowess. In the 11th century Ghana could field an army of 200,000 infantry and CAVALRY. The Soninke probably learned early on how to work IRON. Their well-equipped army carried metal swords and hurled iron-tipped spears and arrows at foes armed sometimes only with wooden war clubs and stones.

The rituals of the royal court were both splendid and rigid. The *ghana* held audiences inside a magnificent pavilion of state, which was guarded by armed warriors bearing shields and swords decorated with gold and by the king's constant companions, dogs in collars made from gold and silver. No petitioner was allowed to address the *ghana* directly. Non-Muslim petitioners approached the *ghana* on all fours, with dirt sprinkled on their shoulders. On tours of his kingdom, wild animals were driven into a town in advance of the *ghana's* arrival, to signify his power over man and beast.

Ghana fell in 1076 after a 14-year JIHAD, or holy war, led against it by the SANHAJA BERBERS, Muslim neighbors to the north who founded the Almoravid empire and were bent on purifying the "pagan" Soninke people of Ghana. Undoubtedly they were also interested in gaining control of the gold trade. Although this takeover was temporary and Ghana reasserted control over the empire at the beginning of the 12th century, Ghana never fully recovered from the Almoravid invasion. Internal discontent, fueled by rivalries between client states as well as the desire of local chiefs to stop paying tribute to the central government may have been contributing factors. This was compounded by the fact that during the 11th and 12th centuries new gold fields and trade routes made Ghana less important to the gold trade. By the 13th century Ghana had lost its trading power and dispersed into small states. The power vacuum in the region was filled by the rise of the SUSU kingdom, also a warrior state ruled by a high priest-king. Susu acquired much of the territory of Ghana and existed until it fell, in 1235, to the rising power of the MALI EMPIRE.

Mali Empire   Mali, founded in the 13th century by the MANDINKA prince SUNDIATA (r. 1235–1255), became heir to the Ghana Empire and the largest empire in West Africa up to that time. While Ghana was supreme, the Mandinka lived in scattered settlements between the upper reaches of the Senegal and Niger rivers. The Mandinka city

of KANGABA was founded in response to the despotic rule of the Susu king SUMANGURU (r. c. 1220), whose tyranny forced merchants to flee from Kumbi, thereby ruining the former capital of Ghana as a trading center. Sundiata's forces crushed the Susu at the battle of KIRINA, razed Kumbi, and destroyed all resistance within the kingdom of Susu. Sundiata then molded the conquered lands into an empire by restoring them to the rule of their rightful kings, not as independent monarchs but as sub-kings under his authority. In this way Sundiata became the first *mansa* (king) of Mali. He built up the region as an agricultural center, with COTTON as the prime crop. He captured the WANGARA GOLD FIELDS and diverted the gold trade through the city of NIANI, which attracted merchants from North Africa. The gold trade, plus the reputation Sundiata built for law and justice, made Mali prosper.

A *mansa* of Mali was expected to give expensive presents to his followers. Victorious warriors were given anklets, bracelets, necklaces, and other gifts and ornaments. The most distinguished received an enormous pair of trousers—the wider they were, the more esteemed was the wearer.

Dynastic disputes and power struggles following the death of Sundiata's son Mansa ULI (r. 1255–1270) left the kingdom in disarray until the most important ruler of Mali, Mansa MUSA I (1312–1337), came to power. He restored order and, because of his famed pilgrimage, or HAJJ, to MECCA (1324–26), he advertised the power and extent of his empire throughout the African and Muslim worlds. Mansa Musa was a strict Muslim who established ISLAM as the religion of the nobility and commercial class. Under his rule, the city of TIMBUKTU became an important center of trade as well as Muslim scholarship and law, adding further to the renown of Mali. This adherence to Islam also helped Mansa Musa consolidate his empire. Although his position as a semidivine priest-king of the Mandinka people might have worked to his disadvantage in the many non-Mandinka areas of Mali, when the rulers of those areas converted to Islam, they had a religious obligation to obey him as long as he acted justly. Thus he achieved unity and extended the greatness of his empire.

Mali's decline was gradual and was brought on by a combination of weak rulers and frequent struggles for power. By late in the 14th century, however, Mali had suffered substantial blows from which it never recovered, first at the hands of the MOSSI STATES, which captured TIMBUKTU in the late 1330s, and then from SONGHAI, which rebelled and gained its independence in the 1460s.

The BERBERS and TEKRUR nibbled at its western flanks. After 1464 all that remained was the Mandinka homeland. Songhai became the dominant power in the region. The Mali Empire continued its gradual decline until the mid-17th century.

The Mossi States The Mossi states were located to the southeast of Mali. By the 16th century five Mossi states had formed in the region of the upper VOLTA RIVER. These included OUAGADOUGOU, YATENGA, Nanumba, MAMPRUSI, and DAGOMBA. Ouagadougou became the Mossi capital about 1495, when the first king, called the *mogho naba,* reigned. These states managed to maintain their independence until the 19th century when they fell to French colonial forces.

The Songhai Empire After Songhai declared its independence from Mali, it rapidly surpassed Mali in size and became the largest empire of West Africa. The original peoples of the area were the Da, who were farmers, the Gow, who were hunters, and the SORKO, fishermen whose boats gave them great mobility along the Niger River. The Sorko established a tyrannical dominance over the Gow and the Da that lasted until sometime between 690 and 850, when nomadic Zaghawa invaders from the Lake Chad region overran the Sorko, established the ZA dynasty, and began the Songhai state. The first important Za ruler was KOSSOI (r. c. 1000), who converted to Islam and moved the capital to the city of GAO, which was closer to the TRANS-SAHARAN TRADE ROUTES. Gao gradually attracted merchants from North Africa and became a major commercial center. The success of Gao made it attractive to Mali, whose army captured the unfortified city during the 13th century.

Not yet a military power, Songhai chafed under Malian rule. It gained its independence after the death of Mali's Mansa Musa I (d. 1337) but was mainly involved in fending off attacks from neighboring Mandinka, Mossi, and Tuareg peoples. The kingdom expanded slowly until the reigns of the warrior Sunni ALI (c. 1464–1492) and Askia MUHAMMAD TOURÉ (r. c. 1493–1528), who usurped the throne in 1493 and ruled until 1538. It was under Sunni Ali and Askia Muhammad that the Songhai Empire acquired most of its vast territory.

By all accounts Sunni Ali was a tepid Muslim, a fact that incurred the wrath of the *ulama,* Timbuktu's religious leaders, who considered him an infidel. However, as a semidivine king in the minds of traditional believers, Sunni Ali was all-powerful. Sometimes arbitrary or savagely cruel, he was also an outstanding soldier and strategist. His cavalry, according to Songhai oral tradition, never lost a battle. His large fleet of war canoes both protected the empire and helped it expand along the Niger. Sunni Ali captured JENNE in 1473, giving Songhai access to the gold resources of the region. In 1483, at the battle of Jiniki To'oi, he shattered the power of the Mossi but never incorporated them into the empire. Perhaps to

break the Muslim hold on trans-Saharan trade, he opened the empire to the Portuguese, allowing them to set up a trading outpost at Wadan, near the Atlantic coast.

Askia Muhammad, in contrast, was a devout Muslim. To solidify his power, he won the loyalty of his fellow Muslims with royal patronage and attention to their religious needs. To gain the support of the rural Songhai people, he made no attempt to convert them to Islam and allowed the Songhai chief priest to hold a high office in his government. He reorganized the government, deftly combining decentralization and strong central control and encouraged trade and education. In 1499 he began to send his armies westward. By 1507 his territorial conquests extended as far as Galam, at Mali's westernmost border, near TEKRUR. By 1513 he had marched southeast into the HAUSA STATES and plundered all its major cities except for KANO, which offered fierce resistance. He attacked the sultanate of Aïr (on the AÏR MASSIF) in an attempt to defeat the TUAREGS and control Hausa trade. His success did not last, however. His allies, especially the Hausa state of Kebbi, rebelled, and the Hausa states once again became free.

Hausaland, located to the southeast of Songhai, was a group of large and small city-states that arose between the 10th and 11th centuries. Kano, KATSINA, Kebbi, Kwararafa, Nupe, and ZAZZAU (with its capital of Zaria) were among the most notable. Although these states were unified culturally, they never established themselves as a kingdom or empire. When Kebbi broke free from Songhai in 1516, it assumed control over most of Hausaland.

In the last decade of Askia Muhammad's life and for the 50 years that followed, Songhai was shaken by dynastic struggles. By 1591 it was past its prime. That year, the Songhai army was defeated by the firearm-bearing forces of MOROCCO at the battle of Tondibi, near the Songhai capital of Gao. The collapse of Songhai was immediate. Moroccans occupied Gao, Timbuktu, and Jenne and established a local government at Timbuktu. The Moroccan victories all but destroyed trans-Saharan trade. Law and order in the region collapsed. The Tuaregs, the Mandinka, the Fulani, and the Mossi raided the lands of their former overlords, and the Moroccans themselves were more interested in taking what gold they found in Songhai cities than in developing large-scale commercial ventures. In this way, the fall of Songhai caused the economic collapse of the region.

Kanem-Bornu The empire of KANEM-BORNU (sometimes called the KANURI empire, after its founding people)

lay to the east and north of Songhai. Kanem-Bornu established its own sphere of influence to the north, across the Sahara, far distant from Mali and Songhai. The kingdom of KANEM, founded by the nomadic Kanuri people, emerged around 800 CE and built its wealth on its domination of the trade routes to FEZZAN and Tripoli on the Mediterranean coast, to CAIRO in EGYPT, and to the Arab traders of East Africa. It exported gold, ivory, and other products in exchange for, among other items, salt, COPPER, and horses. It is thought that by the 11th century Kanem had largely converted to Islam. By 1230, led by *mais* (kings) of the SEFUWA dynasty, it had expanded its territory as far north as Waddan, more than 1,000 miles (1,610 km) from its capital at NJIMI.

Pressured for years by attacks from the nomadic BULALA people to the east, the people of Kanem fled west, abandoning much of their Saharan territory. The Sefuwa *mai* founded their new capital in BORNU about 1386. For a time Bornu and Bulala-dominated Kanem were separate states, but in 1526 Bornu regained control of its former lands. One can properly speak of the trading empire of Kanem-Bornu after this time. Kanem-Bornu forged trade links with its neighbors, once again dominated the trade routes to North Africa, and competed with Songhai to expand into the Tuareg sultanate of Aïr and into the Hausa States. When Songhai collapsed in 1591, Kanem-Bornu was the most powerful empire in West Africa.

Kinshasa Important trading center, located on the Congo River about 320 miles (515 km) from the Atlantic Ocean, in present-day Democratic Republic of the CONGO. Although little is known about the early settlement of Kinshasa, by the 14th century it had become one of the most important ports of the KONGO KINGDOM.

See also: CONGO RIVER (Vol. I); KINSHASA (Vols. III, V); CONGO (Vol. III).

Kirina Ancient MANDE city in present-day Republic of MALI. In the 13th century Kirina was the site of an important battle between the SUSU and Mande. The early Mande inhabitants of southwestern Mali united under central rule in the 12th century. In the early 13th century, however, Mande peoples, including the Camara, Keita, Konate, and Traore clans, were confronted by Susu invaders. Under the leadership of SUNDIATA (r. 1235–1255),

the united Mande defeated the Susu, who were led by SUMANGURU (r. c. 1220), at the Battle of Kirina. The victory not only became a symbol of ancient Mali's emerging power but, since the Susu leadership had been anti-Muslim, it also enabled ISLAM to spread southward into the SUDAN.

Kiswahili Language spoken among the various groups along Africa's Indian Ocean coast in regions of present-day SOMALIA, KENYA, TANZANIA, UGANDA, MOZAMBIQUE, and the COMOROS (countries whose shores collectively make up the SWAHILI COAST). Though it is difficult to ascertain information on the early development of Kiswahili, language historians believe that a form of proto-Kiswahili may have been spoken by trading communities in the region as early as the ninth century.

True Kiswahili did not emerge until the 13th century, when extensive coastal trade between Arab and African MERCHANTS required a common tongue in which to conduct business. Early Kiswahili was a Bantu-based language that had many borrowed words—up to 50 percent in some poetic forms—from the ARABIC language. The earliest written forms of true Kiswahili are probably East African folk tales written in Arabic script in the early 17th century.

Kiswahili stands out among African languages because it appears as a written language a few hundred years prior to the arrival of Europeans.

In many East African coastal communities, Kiswahili served as the main language or, at the very least, as a second language. Today, it is considered one of the 12 major languages of the world.

Kitara Complex Collective name for kingdoms and smaller chiefdoms located in the Great Lakes region of present-day northwest UGANDA. The term *complex* is used to emphasize the multiethnic nature of the region as well as to point to the varied traditions, both ritual and political, that characterized the region. Sometimes referred to as an empire, the Kitara Complex traced its roots to the

middle of the first millennium CE, when Nilotic peoples migrated to the region from what is now the Republic of the SUDAN. During the 10th and 11th centuries large numbers of Bantu-speaking agriculturalists began moving into the region from the west, joining the Nilotic pastoralists. The mixing of these cultures led to the rise of the Tembuzi kings, who reigned until the middle of the 14th century. Tembuzi rulers were succeeded by a new line of rulers, the CHWEZI DYNASTY, which established the first semi-centralized system of government in the Kitara Complex.

According to oral tradition, the greatest ruler of this period was the semimythical warrior king, NDAHURA. Ndahura eventually expanded his holdings and transformed them into an empire extending over much of the Great Lakes region of East Africa, as far south as present-day RWANDA. However, Ndahura had difficulty maintaining control over his empire. He was succeeded by his son WAMARA, who endured an equally unstable reign. For Wamara, the biggest obstacle to stability was the massive immigration into the Kitara Complex of LUO-speaking pastoralists from the north. Striving to appease them, Wamara gave many high-level posts to the leaders of the new arrivals. The immigrants were not satisfied, however, and they ultimately rose in rebellion, overthrowing the Chwezi aristocrats. Soon the Luo, led by their own aristocratic BITO clan, founded Bunyoro (also known as BUNYORO-KITARA), as well as a number of other states, including TORO and parts of NKOLE and BUGANDA. For their part the HINDA, a clan of aristocrats from the former Chwezi states of the Kitara Complex, moved south to found new states.

Kongo (Bakongo) Bantu-speaking people of present-day ANGOLA, Republic of the CONGO, and Democratic Republic of the CONGO. Several groups, including the SUSU, Pombo, Solango, and Ashiluanda make up the Kongo people. They all speak the Bantu language of Kikongo.

Kongo ancestors lived in the Congo forest, in Central Africa. In the 14th and 15th centuries, the Kongo developed a loose confederation of local states that would become the KONGO KINGDOM. The coastal Kongo region was sparsely populated, but the central area was lush with rich soil and was densely populated. AGRICULTURE became the predominant subsistence activity of these early Kongo people.

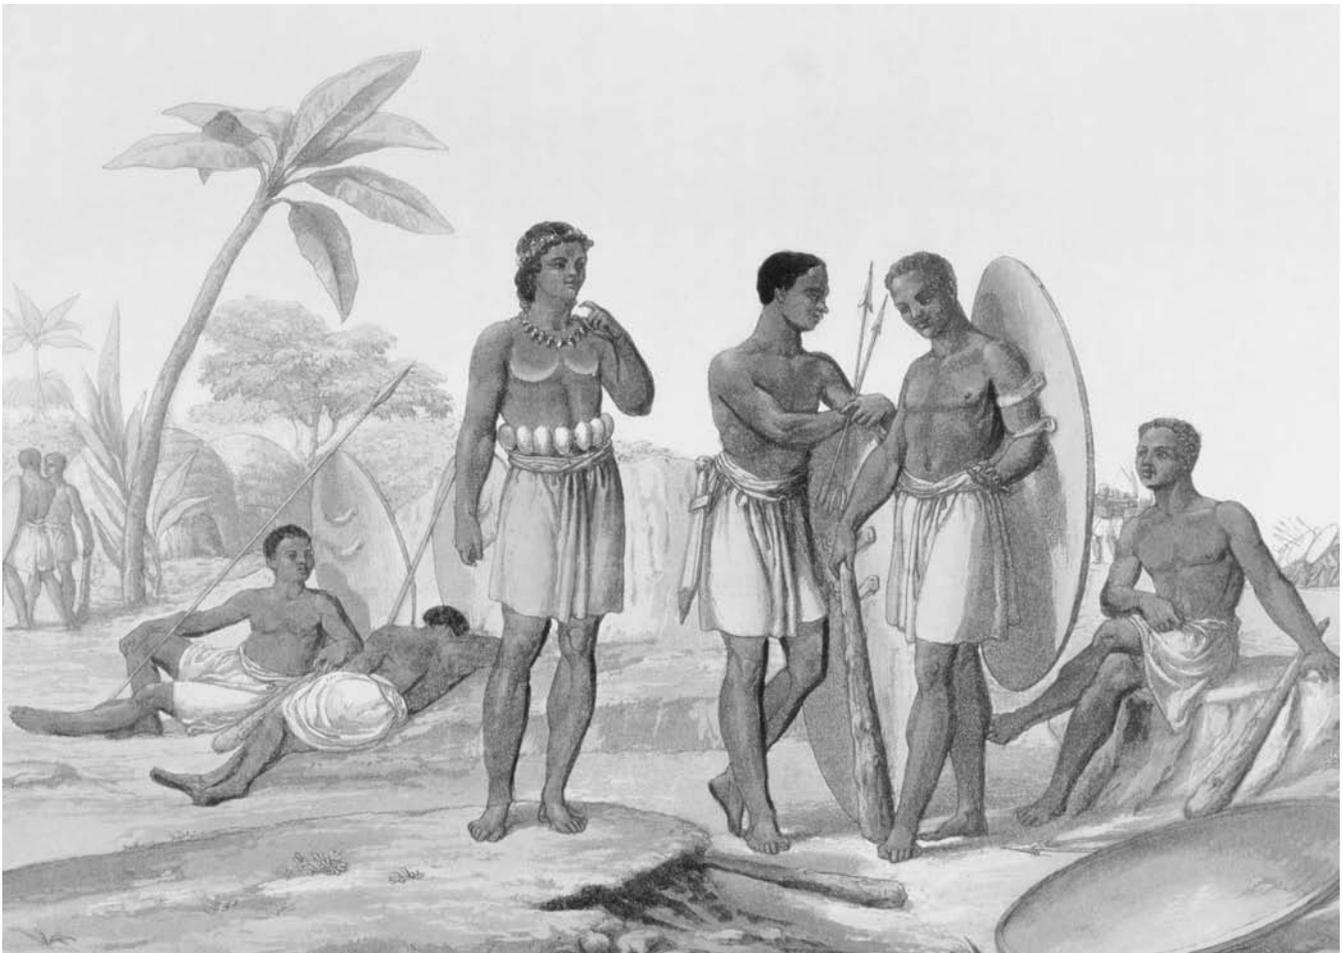
See also: KONGO (Vols. III, IV).

Further reading: Wyatt MacGaffey, *Religion and Society in Central Africa: The BaKongo of Lower Zaire* (Chicago: University of Chicago Press, 1986); Robert Farris Thompson and Joseph Cornet, *The Four Moments of the Sun: Kongo Art in Two Worlds* (Washington, D.C.: National Gallery of Art, 1981).

Kongo kingdom Bantu-speaking state in western Central Africa that became a powerful trade kingdom in the 15th century. At the height of its influence, the Kongo kingdom covered much of the area along the Atlantic coast to the south of the Congo River and spread east as far as the Kwango River. In the 12th century the area that would become the Kongo kingdom was settled by agriculturalists. By the beginning of the 15th century many of the small, loosely organized farming communities had formed a cohesive kingdom. The settlement of MBANZA KONGO, located on the Congo River, became the center of this early kingdom.

The Kongo kingdom was strategically located at the junction of several West African trade routes. This enabled the Kongo king, known as the *manikongo,* to secure adequate wealth to dominate neighboring peoples. The *manikongo's* means of conquest were generally peaceful, relying more on alliances and intermarriage than on warfare, and he increased his kingdom's wealth by levying taxes on the surrounding provinces. The *manikongo* managed a delicate balance of complex alliances in the king-dom through his distribution of prestige items to his supporters. One such prestige item was captives. All captives from conquests belonged exclusively to the *manikongo,* who then redistributed them.

The ECONOMY of the early Kongo kingdom was based on trade and subsistence farming. Women typically tended the fields, while the men were responsible for more LABOR-intensive tasks, such as clearing forestland and building homes. The men also tended to the palm-tree crops, which were valuable sources of wine, fruit, oil, and raffia.

The Kongo kingdom was exposed to European culture around 1483, when Portuguese explorers landed on the coast. The Kongo people, also known as Bakongo, were surprisingly receptive to the Europeans, and a number of Kongo emissaries even returned to Portugal along with the explorers. In 1491 the Portuguese returned to Kongo, but this time with Christian missionaries. Shortly thereafter the reigning *manikongo*, Nzinga Mbemba, converted to CHRISTIANITY. (He later renounced the religion.) After a period of civil strife Nzinga Mbemba's son, a con-


This nineteenth-century illustration of Kongo people shows African peoples through European eyes. © *Leonard de Selva/Corbis*

vert who adopted the Christian name Afonso I (1506–1543), came to the throne. Admiring Portuguese material culture, especially firearms, Afonso requested that the Portuguese king send him firearms, mercenaries, teachers, and artisans to teach the Bakongo their European trades. During Afonso's reign, the Portuguese took advantage of their friendly relationship with the Kongo kingdom, trading extensively at Kongo markets up and down the Atlantic coast. In time they were able to undermine the *manikongo*'s ability to distribute prestige goods by directly trading such goods at the local markets. In this way the Portuguese destroyed the alliances that the *manikongo* held in balance.

By the beginning of the 16th century Portugal had begun pressuring the people of Kongo into supplying them with captives taken from surrounding villages. In return, the Portuguese traded firearms, and they also assisted the Bakongo in the continuing warfare that stemmed from the raids that they instigated.

Kono People who have long occupied eastern regions of present-day SIERRA LEONE; their language belongs to the family of Niger-Congo languages. Primarily rice farmers, the Kono also have grown palm oil, cassavas, millet, and groundnuts (peanuts), among their subsistence crops. For centuries, they have practiced a form of AGRICULTURE known as slash-and-burn, or shifting, cultivation. This involves establishing new farms every year between December and March, when hot, dry winds blow from the SAHARA DESERT. By cutting the brush of their former homesteads and burning it, the Kono create a thin layer of ash that fertilizes the land for future crops. These practices also helped bring the forest environment under their control by scaring off wild animals and, according to Kono belief, placating unseen forces.

Along with farming, raising livestock and producing such traditional handicrafts as woven cloth, leatherwork, baskets, and POTTERY supplemented the ECONOMY. Age and patrilineal ties have been two important elements of Kono society. Traditionally, only a select number of married men could receive farmland from village elders and rise to a position of social recognition.

Konso Cushitic-speaking ethnic group of present-day ETHIOPIA, KENYA, and UGANDA. Related to the OROMO, the Konso are made up of Garati, Takadi, and Turo peoples, all of whom have long inhabited the Ethiopian Highlands. The group's patrilineal society is largely egalitarian. AGRICULTURE historically has been the traditional means of subsistence, but they also raise cattle and goats.

Traditional Konso RELIGION centers on Waga, the sky god, who supposedly manifests his authority through village elders. Konso woodworkers are known for their statues, called *waga*, that commemorate the deeds of Konso warrior heroes.

Kossoi (early 11th century) *Early ruler of the Songhai Empire in West Africa*

Little is known about Kossoi, the *dia* (king) of the early SONGHAI kingdom. He is thought to have converted to ISLAM in 1009 or 1010, becoming the first in a line of Muslim Songhai rulers. Although Dia Kossoi converted, the customs of the royal court remained traditional and therefore non-Muslim. During his reign Kossoi moved the capital of his empire to GAO. Gao then became an important city for both Muslims and the Songhai people, serving as an Islamic center of learning and a major commercial center, especially for GOLD and the SALT TRADE.

See also: ISLAMIC CENTERS OF LEARNING (Vol. II).

Kotoko Ethnic group of West Africa that is descended from the SAO ethnic group. Mostly Muslims, the Kotoko ruled a large kingdom in present-day CAMEROON and NIGERIA until the 15th century. After that, they became subjects of the KANURI trading empire of KANEM-BORNU.

Kukiya (Kukya, Kaw Kaw) Earliest city of the SONGHAI people. Located on the Niger River, Kukiya eventually

became the capital of the Songhai Empire. Kukiya was located in what is presently NIGERIA, down the Niger River from the city of GAO. Kukiya was the Songhai people's first major city, existing well before they acquired more territory and became recognized as an empire. When it became the capital of the Songhai Empire, Kukiya prospered as the rulers acquired more and more territory. Between 1000 and 1100, Songhai's rulers moved the capital to Gao, but when the MALI EMPIRE conquered Gao about 1300, the weakened Songhai moved back to Kukiya. They remained there until the 1400s, when the Songhai recaptured Gao after the fall of the Mali Empire.

Arab reports of Kukiya dating back to around the year 1000 CE state that COTTON, millet, and wheat were grown in the area. The land was said to be so fertile near the river that farmers could plant and harvest twice in a growing season. The catches of the SORKO fishermen were also known to be significant to the city. GOLD was found in the area around this time as well.

Kumbi Saleh (Koumbi Saleh, Koumbi Salih, Kumbi Salih) Capital of the GHANA EMPIRE, the first great trading empire in West Africa. Kumbi Saleh was located 200 miles (322 km) north of the city of BAMAKO, in present-day Republic of MALI.

During the 11th century Ghana was widely known as the "land of GOLD," and Kumbi Saleh—sometimes called simply Kumbi—was the empire's capital. The most important desert trading town of the time, Kumbi Saleh became a commercial and intellectual center. Its population grew to between 15,000 and 20,000 people, making Kumbi Saleh perhaps the biggest West African city of its time.

Like other cities of its era, Kumbi Saleh was made up of two towns. One town, called al-Ghana (the word *ghana* being the king's title), was the home of the king. Al-Ghana was fortified with strong walls that enclosed the king's palace. The MANDE-speaking SONINKE people, who founded the Ghana Empire in the sixth century, lived away from the king's royal quarters in Kumbi's second town. This second town, which was larger, was home to Muslim traders and included as many as 12 mosques. About 6 miles (10 km) apart, the two towns were surrounded by farms that provided FOOD for the large population.

Trade was the lifeblood of the city, and gold was the empire's principal commodity. Ghana's MERCHANTS brought gold from the southern part of the empire to Kumbi, where it was traded, often for salt, which came from the SAHARA DESERT to the north. CARAVANS traveling along the TRANS-SAHARAN TRADE ROUTES also brought food, which was exchanged for such locally produced goods as COTTON, cloth, metal ornaments, and leather products. Regardless of the commodities involved, however, the king

taxed trade, which brought the empire enormous wealth and great quantities of natural resources.

> **With an abundance of wealth, Ghana's rulers could indulge themselves. TUNKA MANIN, for example, who was caliph of Ghana from about 1065, put glass windows in his palace. He even maintained a private zoo stocked with elephants and GIRAFFES.**

Attacks from the ALMORAVIDS, a militant Muslim religious group from present-day MOROCCO, began to weaken the empire during the 11th century. In order to expand their territories and convert the indigenous peoples to ISLAM, the Almoravids declared a JIHAD, or holy war, against their neighbors. Led by Abu Bakr (d. c. 1087), the Almoravids invaded Ghana, seizing Kumbi in 1076. The Almoravids forced many of the SONINKE to convert to Islam, but the Soninke's military and religious activities disrupted trade, making the Almoravid empire difficult to control. In 1087 the Soninke regained control of Kumbi. They tried to rebuild their empire, but a number of states had adopted Islam and others were forming separate kingdoms, all of which prevented the empire from being reestablished. By 1203 Kumbi Saleh was under the control of one of these kingdom-states. King SUMANGURU (r. c. 1220), chief of the KANIAGA people called the SUSU, overthrew the Soninke king and ruled Kumbi Saleh for a short time. The city finally was destroyed by the Mande emperor SUNDIATA (r. 1235–1255), in 1240.

Kuranko (Koranko, Kouranko) West African ethnic group of MANDE descent. Related to the MANDINKA, the Kuranko were, and still are, a mixed group in a religious sense, with some converting to ISLAM, and others practicing non-Muslim religions. They were a loosely organized group who had settled in the forests of present-day GUINEA. Beginning in the 15th century, however, they, along with the neighboring VAI and Kano peoples (not of the Hausa confederation), were driven from their homeland by migrating Mandinka traders and warriors; they eventually settled in the forests of present-day SIERRA LEONE.

Kurmina One of the two provinces, along with DENDI, that comprised the SONGHAI Empire, which flourished in the 15th century. Kurmina, the western province of the

empire, was considered more important than southeastern province of Dendi. The ruler of Kurmina, called the *kurmina fari* or *kanfari,* was second in power to the Songhai emperor. The *kurmina fari* was generally the crown prince of the region and ruled the territory west of TIMBUKTU. Kurmina was very important because of the many trade routes that crossed it, and its administration required strong leadership. To that end, the *kurmina fari* maintained a powerful army that not only kept peace in the region but also was used to keep the power of the Songhai monarch in check.

Kwahu (Akwahu, Kwawu, Quahoe) Ethnic group of present-day GHANA; also a plateau region in that same area. The Kwahu, a Twi-speaking subgroup of the AKAN people, inhabited Ghana's Kwahu Plateau as early as the 11th century. Archaeological evidence from the area suggests that these people hunted, fished, and raised some cattle. It is known that most Akan groups were involved in the West African GOLD trade, as well. Archaeologists also have found items that indicate that Kwahu artists were skilled woodcarvers and made elaborate funerary ceramics.

Kyoga, Lake Body of water located in present-day central UGANDA. Between the 11th and 14th centuries, the KITARA COMPLEX, one of East Africa's earliest state systems, formed in the area between lakes Albert, Kyoga, and Victoria.

See also: KYOGA, LAKE (Vol. I).

L

labor From the sixth through 15th centuries patterns of labor in Africa continued along previously established lines. Africans were increasingly farmers and herders, for the most part producing their own FOOD through AGRICULTURE.

While growing crops and raising livestock provided Africans with greater control over their food supplies than did the preceding hunting-and-gathering modes of existence, agricultural labor was in many ways more demanding. Indeed, the biggest constraint to agricultural production was a shortage of labor. Partly for this reason and partly because of the nature of the soils and rainfall patterns, African agriculture was extensive rather than intensive in nature. Except in highly favored environments like the Nile Valley, in most regions there simply was not enough labor available to engage in intensive agricultural practices.

In addition to agriculture there were more specialized forms of labor. As IRON metallurgy continued to expand during this era, blacksmiths became increasingly important in many African societies. Other crafts such as basketry and POTTERY making were important at the local level. States such as GREAT ZIMBABWE, with its massive stone walls, and the kingdom of BENIN, with its extensive system of earth walls, engaged in major building projects of a "public works" nature. Such projects required skilled artisans as well as a large number of unskilled laborers. Likewise, the fine houses, mosques, and other buildings of the cities of the SWAHILI COAST required both skilled CRAFTSPEOPLE and builders.

The Swahili cities were built around trade. The ships that carried the INDIAN OCEAN TRADE required large numbers of sailors and supported a merchant class, while the trade CARAVANS into the East African interior required large numbers of porters. Similarly the TRANS-SAHARAN TRADE ROUTES depended on the skills of those who managed the camels that were the beasts of burden for the desert. This trade connected with the shipping of the Mediterranean, which again employed large numbers of sailors as well as stevedores to load and offload the ships in North Africa's port cities.

Although warfare was a feature of African political relationships, most African states in this period did not deploy professional armies. The states of North Africa, however, were an exception. During the Abbasid era, which lasted from about 750 to 945, rulers employed rigorously trained professional soldiers knows as MAMLUKS. These continued as the professional soldiery after the end of the Abbasid caliphate, and in the 13th century they seized control of EGYPT to become that country's rulers.

Lalibela (c. 1119–1159) *Ethiopian king known for directing the construction of the stone churches at the town that bears his name*

Lalibela was the most famous king of the ZAGWE DYNASTY, which ruled in northern ETHIOPIA during the 10th through the 13th centuries. His reign was marked by several accomplishments, including the construction of a series of churches carved out of volcanic rock.

The Zagwe kings were devout Christians who claimed to be descended from biblical ancestors. They identified themselves with Moses, who, according to them, came into Abyssinia and married the king's daughter, an Ethiopian woman.

Lalibela, like many other famous rulers the world over, is surrounded by legends of all kinds. One such legend tells how Lalibela came to have his name. According to it, a cloud of bees swarmed around the newly born Lalibela. Seeing the bees, the infant cried out: "Lalibela!" which means "the bees know he will rule."

Another legend tells of Lalibela as a youth, at a time when Lalibela's brother was king. Knowing of the legend surrounding Lalibela's name, the king was afraid that the bees' prophecy would come true. So the king poisoned the young prince, sending young Lalibela into a coma that lasted three days. During that time, says the legend, Lalibela was in Heaven, where God told the youngster that he would indeed survive to become king; God also commanded Lalibela to construct a series of unique stone churches. Lalibela survived and eventually came to power. The new ruler immediately started work on the churches, helped, according to the legend, by angels who had been sent by God to make sure that his command was carried out quickly and precisely.

The Church of St. Abba Libanos in Lalibela, Ethiopia, and its sister churches nearby are carved from solid rock. © *Roger Wood/Corbis*

Under Lalibela's direction, 11 churches were carved out of pinkish rock at the Zagwe capital of al-Roha, about 435 miles (700 km) from present-day Addis Ababa. Until this time, there had been very little Christian influence on African ARCHITECTURE. Because Jerusalem had fallen under Muslim control, Lalibela made every effort to recreate the Christian Holy Land of Jerusalem, hoping that his new city of churches would become a major place of pilgrimage, since journeys to Jerusalem had become difficult. As part of this, he even gave biblical names to places in the city: A local hill, for example, was called Calvary, and a stream was renamed Jordan. After Lalibela's death, the city of al-Roha was renamed in his honor.

Further reading: Ralph Shepherd, ed., *Invisible Africa: Contributions to a Coming Culture* (Cape Town, South Africa: Novalis Press, 1996).

Lalibela, churches of Group of churches carved out of the rock in the Lasta Mountains of ETHIOPIA, probably during the ZAGWE DYNASTY (c. 916–1270). So far, 11 churches have been discovered, built over a series of passages and tunnels that form an elaborate maze. Though the exact purpose of the churches and the dates of their construction remain a mystery, Ethiopian tradition asserts that they were built during the reign of King LALIBELA (r. c. 1119–1159), who ruled from his capital, al-Roha, in the 12th century.

Ethiopian legend says that King Lalibela was magically transported to Jerusalem, where he was instructed to build the churches out of the rocks of the LASTA MOUNTAINS. Upon his return to al-Roha, Lalibela instructed his men, who were supposedly aided by the angels sent to help, to build the churches.

Lalibela's 11 churches were hewn out of solid rock entirely below ground level. To build these churches, trenches were dug in rectangular shapes, leaving isolated blocks of granite. Carvers worked from the top, carving both inside and outside the rock. There are two main clusters of churches, and they are linked by underground tunnels. One group of churches is surrounded by a trench that is 35 feet (11 m) deep and includes the House of Emmanuel, House of Mercurios, ABBA LIBANOS, and the House of Gabriel. All of these churches were carved from the same hill. Nearby, the House of MEDHANE ALEM has an external colonnade of pillars on all four sides. Medhane

Alem is also the largest church, measuring 109 feet (33 m) long, 77 feet (23 m) wide, and 35 feet (11 m) deep. The House of St. GIYORGIS is shaped like a cross, while the House of Golgatha is thought to contain Lalibela's tomb.

Recent archaeological excavations of the site indicate that the style of the construction is very similar to ancient Aksumite ARCHITECTURE, which would date the construction of the buildings to centuries before the Zagwe dynasty. An earlier construction date is also suggested by the architectural anomaly of the churches, which are not facing east, as would have been customary of religious architecture. This detail suggests that the buildings might not have been places of worship at all, and were perhaps palaces or royal residences for people of the Aksumite culture. However, the site was revered as a religious one, so much so that it was referred to as "New Jerusalem" after Lalibela's death.

Lalibela, town of (Adefa, Edessa, al-Roha)
Ethiopian town that was the capital of the ZAGWE DYNASTY for 300 years. Lalibela was originally called al-Roha, but the town was renamed after the famous 12th-century Zagwe king who oversaw the construction of 11 massive rock-hewn churches there. Al-Roha was also known to some as Adefa (sometimes spelled Edessa) because of its proximity to that nearby city. The remarkable rock churches made al-Roha a religious center and a place of pilgrimage over the centuries.

The Zagwe dynasty (r. c. 916–1270) was made up of a line of fiercely Christian kings who ruled most of northern and central ETHIOPIA from the 10th through the 13th centuries. Their capital city, al-Roha, was nestled safely in the LASTA MOUNTAINS. The Zagwe were descended from the AGAW people and led nomadic military lives. Their strong belief in CHRISTIANITY led them to erect many churches and monasteries. An early Zagwe king, Yemrahana Christos (c. 1039–c. 1079), built one of the finest cave churches of Lasta. But of all their buildings, the monolithic churches of Lalibela remain the most impressive. The Zagwe dynasty had come to an end by the close of the 13th century, replaced by the SOLOMONIC DYNASTY, a line of rulers who claimed to be descendants of King Solomon of Israel and Makeda, the queen of Sheba.

Lamu
Oldest town in present-day KENYA, as well as a port, island, and archipelago in the same region. Known as a distribution center in the GOLD, IVORY, spice, and slave trades, the area was settled by immigrants from Arabia in the late 12th century.

By the 15th century the islands of the archipelago, particularly PATE, had become centers of trade between Asia and Africa. Portugal, seeing the area's strategic economic value, began to exert influence over the islands. By the end of the 15th century Portugal had a firm grip on commerce in the region and continued its dominance until the 17th century.

Further reading: Patricia Romero, *Lamu: History, Society, and Family in an East African Port City* (Princeton, N.J.: M. Wiener, 1997).

Lango
Large ethnic group of that, during the 15th century, settled in what is now UGANDA; also the language of these people. Unlike their Bantu-speaking neighbors, the Lango were part of a Nilotic migration and spoke LUO, a language that evolved into Lango.

Lango society was very decentralized, and conflicts were settled by a council of elders from the various clans. Traditionally the Lango were governed by nonhereditary chiefs, called *rwot,* who oversaw the hereditary chiefs. Relations between different groups were controlled by kinship, and descent was patrilineal. Typical Lango villages were small, and the villagers practiced pastoralism and also grew millet and sorghum.

Traditional Lango RELIGION revolves around a creator whom they call Jok. They practice ancestor worship and believe that every person has a guardian spirit that must be ritually freed from the body after death. They also believe in a shadow self or soul, which is thought to join the creator after the person dies.

Lasta Mountains
Range located in southern ETHIOPIA that was the site of al-Roha, the capital of the ZAGWE DYNASTY, which ruled from the 10th through the 13th centuries. Al-Roha, renamed the town of LALIBELA in the 13th century to honor the great Zagwe emperor of the same name, is known for its monolithic churches, which were carved out of the rock in the mountains' highlands.

See also: LALIBELA, CHURCHES OF (Vol. II).

law and justice
The concepts of law and justice varied greatly from group to group in Africa between the fifth and 15th centuries, but all societies had rules that its members thought it right to obey.

Non-Muslim Law and Justice in Traditional Societies In most traditional societies of non-Muslim Africa, the responsibility for maintaining the rules of conduct and the right to exercise judgment in disputes were assumed by the headmen of the social group. Laws were never preserved in written form but instead were incorporated into the social customs through example and practice.

Sometimes, as in the case of the Kuba, an ethnic group of Central Africa, the headmen constituted a kind of court whose job it was to examine disputes, recall customary law, and then make rulings based on consensus. The IGBO, who have inhabited parts of present-day southern NIGERIA for more than 1,000 years, long had a similar system. The *okpara,* or oldest male member of a lineage group, conferred with other lineage headmen and then exercised the authority of his judgment over younger, lower-ranking individuals.

The KAMBA people carried out a judgment called *kingolle,* whereby a member of the society would be condemned to death by the ranking elders who reviewed his case. In most instances, the offending individual was accused of a heinous crime like homicide or incest. However, there are cases of *kingolle* in Kamba lore that tell of a man who failed to pay back his debts, and another of a man who was remiss in his duties as a father and husband. Usually a close relative of the offender would approve of the *kingolle* judgment and promise not to avenge the death.

Among societies that were large enough to constitute kingdoms, judging disputes was one of the prerogatives of the chief or king. In cases in which the king held his power through military might (rather than through lineage ties), he might designate a special judge to help him settle disputes. This judge usually would be a wise, respected elder whose authority was based on his age and experience. Despite his position, though, the judge typically did not have the power to exercise the punishment he recommended. Instead, he would give his opinion, and the ultimate decision was left to the king.

The concept of an organized "police force" to enforce the laws was foreign to most traditional societies. Still, some chiefs employed armed retainers who kept them safe and maintained peaceful relations in the kingdom. Usually the mere presence of a chief (or one of his family members or wives) would be enough to keep the peace. For this reason many chiefs who practiced polygamy would install a wife in a village that was in upheaval.

Among pastoralists like the Nuer of the Republic of the SUDAN, the judgment in homicide cases might be paid in heads of cattle. Generally the person who owed the debt did not volunteer the cattle, but when the cattle were taken by the representatives of the offended, the theft would not be contested.

Muslim Law and Justice Prior to the spread of ISLAM, ARABIC-speaking North African peoples did not have a formal legal system, but they did have long-standing customary laws that guided their actions. After the seventh century CE, the concept of law and justice in many areas of North Africa was defined by the religious tenets of Islam, a religion that spread westward from Arabia. The system of Islamic law, called *SHARIA,* is based on the QURAN and the Sunna, texts based on the words and deeds of the prophet Muhammad. Since Muhammad was an Arab, the *sharia* actually incorporated many tenets of Arab customary law. In this way, the law that came to rule Muslim theocracies in parts of North Africa and the SUDAN was not that different from the law that was already in place. With Islam's emphasis on literacy, however, it became much more highly codified.

Eventually, differing interpretations of the Quran and Sunna led to the division of Islam into its major sects. For members of the Maliki Sunni sect of Islam, the most important legal interpretation of the Quran was presented by their founder, MALIK IBN ANAS (c. 715–795), a great jurist (legal scholar) and Islamic holy man. Differing interpretations of the Quran also led to the North African reform movements that created the dynasties of the ALMORAVIDS and ALMOHADS.

In the West African Muslim states, Islamic law had a different aspect. Often peoples in these states would nominally convert to Islam, which would allow them to participate more actively in the lucrative GOLD trade, which was also tied into the region's crucial SALT TRADE. These commercial ventures were run mostly by Muslim traders, such as the DYULA.

Lesotho Small, mountainous country, 11,716 square miles (30,344 sq km) in area, that is wholly surrounded

by present-day SOUTH AFRICA; more than 80 percent of the country lies at least 5,905 feet (1,800 m) above sea level.

The origins of present-day Lesotho (pronounced *lesutu* and meaning "the country of the Sotho people") lie with King Mshweshwe (1786–1870) and his founding of the Sotho kingdom of Basutoland in the early 1830s.

Until the end of the 16th century the region was populated by Khoisan people. At that time the Sotho migrated into the region seeking the high grasslands for their herds. The Sotho intermarried with the Khoisan, formed small chiefdoms, and began trading grain and hides for IRON tools.

Liberia   Independent republic on the Atlantic coast of West Africa 43,000 square miles (111,370 sq km) in area, bordered by the present-day countries of SIERRA LEONE, IVORY COAST, and GUINEA. Although Liberia was the only black state in Africa to avoid European colonial rule, from an African perspective, the creation of Liberia was very much a case of colonial conquest.

There were 16 ethnic groups that made up Liberia's indigenous population, including the Kpelle, Bassa, Gio, Kru, Grebo, Mano, Krahn, Gola, Gbandi, Loma, Kissi, VAI, and Bella. While the early settlers in the area were probably Mel-speaking relatives of the Kissi, Kruan, and Gola groups, the 15th century saw migrations into the region by members of such MANDE-speaking peoples as the Loma, the Mende, and the Bandi. The Kpelle, who settled in central and western Liberia, make up the largest ethnic group today. They moved into the region from the African interior in the 16th century. The Vai, who began their migration from the MALI EMPIRE, arrived about the same time, displacing Grebo people as they made their way to the coast. The Vai moved into the Cape Mount region, residing among the existing Gola inhabitants. Coastal peoples like the Bassa and the Kru were there to meet European explorers and traders when they first arrived. In fact the Kru became involved with European trade both as traders and as sailors.

In 1461 Portuguese sailor Pedro de Sintra was the first European to explore the Liberian coast. From that time forward the peoples of Liberia engaged in trading with Europeans for goods such as GOLD, spices, IVORY, dyewoods, and Malaguetta pepper, the highly prized commodity that became a major trade item and gave Liberia its nickname of the Grain Coast. However, the Mande- and Mel-speaking chiefdoms in the northern part of the region sought to profit from the slave trade and conducted raids into the interior to trade for firearms, knives, jewelry, and liquor. In 1602 the Dutch and the English established trading ports around Cape Mount.

Libya   North African country located on the MEDITERRANEAN SEA, that is approximately 680,000 square miles (1,770,000 sq km) in size. It is bordered by present-day TUNISIA, ALGERIA, NIGER, CHAD, the Republic of the SUDAN, and EGYPT. Between the fifth and 15th centuries the strategic geographical location of Libya between the Mediterranean to the north, the Sahara to the south, and its eastern border with Egypt, made it an important trade region, as well as a key entry point for the dissemination of ISLAM into SUB-SAHARAN AFRICA.

In the seventh century, Arab armies brought Islam to North Africa with the objective of conquering the vast continent. By the middle of the century ARABS controlled Tripolitania, the ancient Roman province on the Mediterranean coast, and proceeded to extend their influence westward into the region they called IFRIQIYA. During this period Libya was controlled first by a Muslim dynasty of emirs called the Aghlabids, and then by the Fatimid dynasty, which ruled from CAIRO. The region of Cyrenaica came under the control of the Arabs at this time as well. Despite the Arab dominance, Cyrenaica maintained its close political and economic ties with Egypt. (The Egyptian influence had begun in the fourth century when Christians in Cyrenaica came under the influence of the Egyptian Coptic Church.) It was Bedouin Arab chiefs, however, who maintained real political and economic control over Cyrenaica by taxing the CARAVANS of pilgrims and MERCHANTS on their way to Egypt.

Islam arrived at FEZZAN, located in the interior of the country, 20 years after it had reached Cyrenaica. The peoples of this region lived in oasis communities developed along the TRANS-SAHARAN TRADE ROUTES between the central SUDAN and the Mediterranean Sea. The Islamic KHARIJITE rulers established an Islamic theocracy at the oasis city of Zawilah, which guaranteed Islamic control of an important arm of the trans-Saharan trading route.

During the 11th century a massive influx of Hilalians moved into Tripolitania and Cyrenaica after being forced out of Egypt by drought, famine, and the political turmoil caused by the FATIMIDS. One Bedouin Arab group, the Banu Salim, resided in Tripolitania for the next two centuries. These migrations marked a linguistic shift for the

BERBERS, who had previously maintained their linguistic and cultural autonomy but now began to adopt the language of the Arab-speaking Muslim elite.

In the 13th century the Muslim Hafsids established a dynasty that would last three centuries. Under their rule, Tripolitania developed into a thriving Mediterranean trading center. This period of prosperity lasted until Christian and Muslim powers began to compete for control of the important Libyan seaports.

By the 14th century the Fezzan region was the northernmost boundary of the kingdom of KANEM-BORNU, which stretched as far as Wadai in the east. By controlling Zawilah in the Fezzan, Kanem-Bornu was guaranteed an important route to the Mediterranean coast for the SALT TRADE.

Limpopo River   A 1,100-mile (1,770-km) river located in southeast Africa that passes through the present-day countries of SOUTH AFRICA, BOTSWANA, ZIMBABWE, and MOZAMBIQUE before emptying into the Indian Ocean. The word *Limpopo* may come from the Sotho word meaning "river of the waterfall." Its main tributary is the Olifants River, which flows into the Limpopo about 130 miles (209 km) from its mouth, just north of Maputo, in Mozambique. The upper portion of the river is known as the Crocodile (Krokodil) River. The lower portion waters Mozambique's fertile agricultural region.

As early as the eighth century the Limpopo was an important artery connecting trade routes between the interior of southern Africa and the towns on the SWAHILI COAST. These connections made it possible for peoples of the interior to participate in INDIAN OCEAN TRADE. For instance, Africans brought IVORY, animal skins and, later, GOLD and COPPER from the interior and traded these goods for Arab wares. Archaeological finds at interior sites—in Botswana, GREAT ZIMBABWE, and present-day South Africa—attest to the vast distances traveled by Indian Ocean trade goods.

Before the fifth century the fertile valley between the Limpopo and Zambezi rivers was populated by the KHOIKHOI, whose culture did not reach its zenith until between the 11th and 15th centuries, after they converted to pastoralism from being nomadic hunter-gatherers. About 1100, Bantu-speaking peoples, including the Sotho, Chopi, and Tsonga, moved into the lower valley of the Limpopo. The SHONA, VENDA, and Shaba peoples also populated the region between the middle Zambezi and the Limpopo before the 15th century.

In 1498 Portuguese explorer Vasco da GAMA saw the Limpopo River for the first time and renamed it the Espiritu Santo (Holy Spirit) River.

lost-wax process   Method of hollow metal casting that dates to approximately 3000 BCE. Also known by the French term *ciré perdue,* this type of casting was used in Africa during the 13th and 14th centuries, most notably by the YORUBA of present-day NIGERIA and the inhabitants of the kingdom of BENIN. Art historians consider the BRONZE sculptures of these peoples to be masterpieces. The strikingly realistic Yoruba and Benin sculptures portrayed kings and other members of the aristocracy, in whose tombs many of the sculptures were placed. Images of nature were also important subjects for the Benin and Yoruba sculptors

The lost-wax process, still in use today, begins with a wax mold that is encased between two heat-proof layers. The wax is melted and drained off, and the resulting hollow form is filled with molten metal, which assumes the desired form of the original wax mold. This process is also used to cast bronze sculptures using clay models. In this case a figure or shape is made out of beeswax and then covered in liquid clay and cooked over a fire. The heat of the flames dissolves the wax, and the wax is then replaced by empty space. At this point, tin and COPPER, which are the alloys used to make bronze, are melted and then poured into the cavity of the hardened clay. Once the object has cooled, the clay is knocked away from the metal and the bronze sculpture is cast.

Lualaba River   Headstream of the Congo River, located entirely in present-day Democratic Republic of the CONGO. The river is about 1,100 miles (1,770 km) long. Archaeological discoveries indicate that several Iron Age groups had settled along the banks of the Lualaba toward the end of the first millennium. Excavation sites at Katoto and SANGA produced evidence of cultures that were involved in trade and small-scale mining.

The lakes formed by the Lualaba River created an important link for trade between the Shaba peoples of the savanna with peoples of the LUBA and LUNDA kingdoms, located to the west of the Lualaba. The region between the Lualaba and the Luapula rivers contained salt mines and COPPER deposits, which were mined, refined, and exported to the coastal regions by the kingdoms.

See also: CONGO RIVER (Vol. I); LAKES AND RIVERS (Vol. I); SALT MINING (Vol. II).

Luba (Baluba) Ethnic group of present-day ZAMBIA and the Democratic Republic of the CONGO. The Luba are regarded as one of the earliest peoples to practice IRON-WORKING in Central Africa. Their ancestors were farmers who, as early as 400 CE, inhabited the Lake Kisale region in what is now Katanga Province of the Democratic Republic of the Congo.

Oral tradition mentions Luba chiefs in MALAWI and Zambia, but very little is known about their early history. The area in which the Luba lived was well suited to the growth of powerful chiefdoms. The COPPER mines of the Katanga region were nearby; the soil was fertile and good for growing crops, especially cereals; nearby woodlands provided hunting grounds; waterways were an excellent source of fish; and ease of movement through the savanna stimulated trade. The Luba were an agricultural people whose communities slowly grew into small trading and farming chiefdoms. Between 1300 and 1400 they came under the sway of the Nkongolo dynasty, which, in turn, was conquered in the early 1400s by Ilunga Kalala, whom oral tradition describes as a fierce hunter. Ilunga Kalala expanded the kingdom's boundaries and took control of the Katanga copper mines and the trade routes to East Africa. Later in the 15th century, members of the Luba aristocracy left the kingdom and moved west, where they centralized their power among the Lunda people, beginning the ascendency of the LUNDA KINGDOM.

See also: LUBA EMPIRE (Vol. III); LUNDA EMPIRE (Vol. III); MINING (Vols. I, II, III, IV, V).

Further reading: Thomas Q. Reefe, *The Rainbow and the Kings: A History of the Luba Empire to 1891* (Berkeley, Calif.: University of California Press, 1981).

Lunda kingdom Monarchy in Central Africa on the upper Kasai River. The area is within the boundaries of present-day ANGOLA and the Democratic Republic of the CONGO. Some histories place the foundation of the kingdom of the influential Bantu-speaking Lunda around 1450, when members of LUBA aristocracy—disappointed in their failed attempts to gain power in their own land—moved southwest into Lunda territory. Other histories suspect an earlier starting date for the kingdom but note that the Lunda state remained a loose confederation and did not develop strong centralized government until about 1450.

The Luba newcomers married into the families of the Lunda chieftains. Initially they made no major changes in Lunda political structures; they simply collected tribute from their Lunda subjects. In time, however, the Luba chiefs began centralizing their authority, paving the way for the emergence of the Lunda empire that became a major regional trading state from the 16th through the 19th centuries.

The Lunda kingdom practiced "perpetual kingship," whereby a new king assumed the identity of the one he replaced. In essence, the successor to the title became the previous king. Through perpetual kingship, alliances and agreements could remain in force from generation to generation because they were made by the "same" king.

Luo (Lwo, Lwoo, Dholuo, Kavirondo) Pastoralist people of the Great Lakes region of East Africa who steadily migrated there from the Nilotic SUDAN, perhaps as early as the late 14th century. Their language, Luo, belongs to the Chari-Nile branch of the family of Nilo-Saharan languages.

Luo society, governed by clan leaders and bound by ties of patrilineal kinship and marriage, was traditionally decentralized. The people lived in scattered homesteads and survived by hunting, fishing, farming, and cattle herding. Unlike many of their neighbors, they did not practice circumcision or group themselves in age sets. Their traditional RELIGION, still practiced by some today, is animist.

As they moved into what is now western UGANDA, the Luo displaced the people living in the KITARA COMPLEX of states, who were under the rule of the CHWEZI DYNASTY. The Luo reorganized Kitara as the kingdom of BUNYORO-KITARA, and, led by the aristocratic BITO clan, they established a number of kingdoms north and west of Lake VICTORIA, including Buddu, BUGANDA, Buruli, and Busoga.

M

Maasai (Masai) Nomadic people of present-day central KENYA and northern TANZANIA. The Maasai ethnic group emerged around 500 BCE along the Nile River; however, it was not until the 16th century that they migrated into Kenya and Tanzania. As the Maasai moved through the Great Rift Valley of Kenya, they found the highland region inhabited by numerous pastoral groups. In order to open up pastures for their herds, the Maasai forced the local peoples from their lands. As a result they became a feared group that ultimately gained control over much of East Africa's best grazing lands.

Maasai society was based on age sets, which were established for military purposes. In the system of age sets, children, young adults, and elders each had their own duties and responsibilities. Young boys were given extensive military training because they were expected to serve as soldiers during their young-adult years. Their job was to guard the herds and secure grazing lands. Unlike many other African societies, Maasai society did not operate under a centralized authority, such as a monarch. Instead, it were organized into villages made up of several extended families and governed by a council of elders.

Madagascar Indian Ocean island country of 226,700 square miles (587,200 sq km), the fourth-largest island in the world, located 242 miles (390 km) across the Mozambique Channel from present-day Mozambique, on the southern coast of East Africa. The present-day country of Madagascar is made up of the island of Madagascar and several much smaller islands that surround it.

Although significantly closer to Africa than to Asia or the islands of the Pacific, the first inhabitants of this mountainous island were probably INDONESIAN COLONISTS, who arrived by sea between 400 and 900. To account for the Bantu influence on the island, anthropologists theorize that en route to Madagascar in the ninth or 10th centuries, a second wave of Indonesian emigrants picked up Bantu-speaking peoples along the East African coast. It is also possible that the country's Bantu influence came with the arrival of Antalaotra traders in the 11th century. These ARABS, Bantu speakers, and Persians, (a cultural mixture known as MALAGASY), engaged in extensive trade with Arabia and the African coast.

Portuguese traders arrived in 1500, but they were not successful at colonizing the islands. By the middle of the 16th century three Malagasy groups, the Antemoro, Sakalava, and Merina, had developed monarchies. None of these groups, however, was able to dominate the greater part of the country until the Merina, operating from the central highlands, conquered many of the neighboring kingdoms almost 200 years later.

See also: ANTALAOTRA (Vol. III); ANTEMORO (Vol. III); INDIAN OCEAN TRADE (Vol. II); MADAGASCAR (Vols. I, III, IV, V); MERINA (Vols. III, IV).

Mafia Island Island located off of TANZANIA on the East African coast, south of ZANZIBAR. For centuries, possibly as long as two millennia, ARABS and Persians traded from the port of Mocha, which is now located within present-day Yemen, down the African coast as far as MOZAMBIQUE, and including MADAGASCAR, ZANZIBAR, and Mafia Island. Though KILWA was the major port on the

Indian Ocean, Mafia Island was an important stop on the trade route.

According to the *Kilwa Chronicle,* the Mwera people lived on the island but were ruled by Muslim settlers from Songo Songo before Arab rule. This chronicle also records that the SHIRAZI ARABS bought the island of Kilwa around 975. The reigning sultan sent his son Bashat to rule Mafia Island. Kua and Kisimani, two ancient towns built around 1000 that are now in ruins, may have been founded by Bashat. For centuries the Shirazi were powerful in this area at the same time that ISLAM was being introduced throughout eastern Africa.

As was the case with much of the East African coast, the first Europeans to arrive were the Portuguese, led by explorer Vasco da GAMA (c. 1460–1524), in about 1498. Within seven years Arab control was minimized, and the Portuguese claimed Mafia Island, along with much of the coast, as their own. The ARABIC name for the island, *Morfiyeh,* or *Manifiyah*, meaning "archipelago," remained in use. Scholars speculate that the name *Mafia* could also be derived from the KISWAHILI words *mahali pa afya,* meaning "healthy dwelling place."

See also: INDIAN OCEAN TRADE (Vol. II); MAFIA ISLAND (Vol. I).

Maghan, Mansa (r. 1337–1341) *Son of Mansa Musa I and short-term leader of the Mali Empire*

Son of empire builder Mansa MUSA I (r. 1307–1337), Mansa Maghan assumed control of the MALI EMPIRE after his father's death. Little is known about Maghan's rule, but at the time he came to the throne, Mali was a powerful and prosperous nation. Brief references to Maghan by scholars make it clear that he was not able to lead with the same ability as his father, which led to invasions of Mali's territories, including GAO.

al-Maghili (late 15th century) *Arab cleric from the Saharan oasis region of Tuat, in present-day Algeria*

As a young man Muhammad al-Maghili was a North African Muslim scholar known for persecuting Jews. Around 1490 he left Tuat and traveled south to Agades, TAKEDDA, KANO, KATSINA, and GAO, where he converted many people to ISLAM. His primary goal was to get Muslim rulers to apply the teachings of Islam to state rule. He stressed the need for a militant foreign policy, limited or nonexistent taxation, and a good advisory board. During this time sharifs gained social prominence in Muslim society because al-Maghili adamantly encouraged states to respect them and compensate them generously. (*Sharif*, an ARABIC word meaning "noble" or "high born," is a title of respect given to members of the prestigious Hashim clan, of which the prophet Muhammad was a member.) Al-Maghili's work played an important role in shaping the early HAUSA STATES, particularly the areas from Lake Chad to the middle Niger River.

In his *Obligations of Princes,* al-Maghili outlined his teachings. This work was commissioned by Sarki RUMFA (r. 1463–1470) of Kano, one of the first rulers in early Hausaland to accept Islam. Rumfa commissioned al-Maghili to write guidelines for princely behavior so that he could better serve his people. A few years later Askia MUHAMMAD TOURÉ (r. c. 1493–1528), a Muslim leader who took control of the SONGHAI Empire at the end of the 15th century, also called upon al-Maghili for guidance. For Askia Muhammad, al-Maghili wrote a treatise called *Answers to the Questions of the Emir al-Hadjdj Abdullah ibn Abu Bakr.* Askia Muhammad commissioned al-Maghili to help him face the challenge of ruling a largely non-Muslim population, although it seems he did not heed much of al-Maghili's advice.

Despite al-Maghili's efforts, Islam did not penetrate more than a handful of small states, and it was almost 100 years after his death that al-Maghili's teachings reached the height of their influence.

See also: ISLAM, INFLUENCE OF (Vols. II, III, IV, V).

Further reading: John O. Hunwick, *Shari'a in Songhay: The Replies of Al-Maghili to the Questions of Askia Al-Hajj Muhammad* (Oakville, Conn.: David Brown Book Company, 1985).

Maghrib (Maghreb)   Region of Northwest Africa along the MEDITERRANEAN SEA; it extends from the Atlas Mountains to the coast and includes present-day MOROCCO, ALGERIA, TUNISIA, and part of LIBYA. The Maghrib was originally inhabited by BERBERS. However, after the ARABS conquered EGYPT in 642, they extended their military campaign west into the Maghrib, which they also referred to as Bilad al-Maghrib, or "Lands of Sunset." The first capital of the Maghrib was Al-Qayrawan (Kairouan), founded just south of TUNIS by Uqbah Ibn Nafi (Sidi Okba), who was in charge of the Arab army that occupied TUNISIA in 670. Uqbah's successful military campaigns and dramatic death in battle made him a legendary hero of the Muslim conquest of the Maghrib.

The Maghrib became a province of the Arab Muslim empire in 705. ISLAM spread rapidly among the Berbers, and by the 11th century it had replaced CHRISTIANITY in almost all of the Maghrib. But the Berbers were not content under Arab rule, which was often oppressive and benefited only the Arab ruling class. The Arabs took Berber captives, especially women, which further infuriated the population.

In the ninth century the Berbers rebelled against the Arabs, fragmenting the Maghrib into separate Muslim states. The uprising was not a total success, however. In the end, only the small principality of SIJILMASA, in south-

ern Morocco, was ruled by Berbers, who came from the Banu Midrar confederation. The other states remained under Arab rule.

This changed during the 11th century, when the AL-MORAVIDS came to power. This Muslim Berber dynasty ruled Morocco and al-ANDALUS (Muslim Spain) in the 11th and 12th centuries and unified the Maghrib for a second time. The Almoravids were succeeded by the AL-MOHADS, Zenata Berbers who declared a successful JIHAD, or holy war, against the Almoravids, ending their empire.

See also: MAGHRIB (Vols. I, III, IV, V).

Maguzawa   Ethnic group that has long inhabited the region south of KANO, one of the HAUSA STATES. Also called the Maguje, the Maguzawa probably settled in the area even before the founding of Kano by Sarki (King) BAGAUDA, around 1000. Though the Maguzawa share the Hausa culture and language, they historically have distinguished themselves from other Hausa people by rejecting ISLAM. In fact the name Maguzawa probably evolved from the ARABIC word *majus,* meaning "pagan."

Mahdi   According to Islamic prophesies dating to around 680, the Mahdi is a messiah-like deliverer who is to arrive shortly before "the end of time" to restore justice and spread ISLAM throughout the world. The word *mahdi* means "enlightened" or "one who is divinely guided." The prophet Muhammad is reported to have promised that a descendant from his family would come to earth seven to nine years before the end of the world. This person would bring equity and justice to a world that would, at the time, be filled with neither. While some believe that Muhammad said that the Mahdi would bring people to God through Islam, others dispute this part of the prophecy.

Over the last two millennia several people have identified themselves as the Mahdi. Ubayd Allah, who declared himself the first Fatimid caliph in 909, is one of the best known. During the seventh century followers of Islam split into two factions, the SUNNI and the Shiites. Then, about 900, Shiite Muslims converted the Kutama BERBERS of LIBYA to Islam, which led to war between Shiites and Sunni Muslims in Libya over territory. The victorious Shiites installed Ubayd Allah, also known as Ubaidalla Said, as their political leader and imam. (The imam was the Shiite religious leader, believed to be the successor of the prophet Muhammad.) Berbers asserted that Ubayd Allah was the Mahdi, and the city of Mahdia was so-called in his honor.

Later, in the 12th century, the Shiite MUHAMMAD IBN TUMART (c. 1080–1130) emerged as the leader of the AL-MOHADS. As a reformer of the established order, ibn Tumart was believed to be the Mahdi by many of his followers.

Maimonides (Musa ibn-Maimon)   (1135–1204)
Jewish physician and philosopher

Moses Maimonides has been called the most important figure in medieval Judaism. Son of a rabbi, he was born in Córdoba in al-ANDALUS (Muslim Spain) in 1135. The full freedom of RELIGION that the people of Córdoba enjoyed was abrogated in 1148 when Córdoba fell to the fundamentalist ALMOHADS of MOROCCO, who demanded that all nonbelievers submit to ISLAM or leave the city. For 11 years, Maimonides' family remained in the city, secretly practicing Judaism while living as Muslims. In 1159 they decided to flee Spain and move to FEZ in North Africa. Maimonides continued his religious studies at Fez and also began to study medicine. Fez, also under Almohad rule, was no more welcoming to Jews than Córdoba was. Thus Maimonides moved to Palestine in 1165 but soon left for EGYPT, where Jews were accorded freedom of religion. Maimonides stayed until his death in 1204.

In Egypt, he was at first the rabbi, or religious leader, of the Jewish community of al-Fustat (now CAIRO), the Egyptian capital. In need of money to support himself, he also became court physician to Sultan SALADIN (c. 1137–1193), the Egyptian leader who was victorious over the English monarch Richard the Lion-Hearted (1157–1199) in the Third Crusade (1189–92). Maimondes also served as a physician to Saladin's elder son, Sultan al-Malik al-Afdel.

It is as a writer and philosopher that Maimonides has had his greatest impact. At the age of 23 he wrote, in ARABIC, a commentary on Jewish law, the *Kitab al-Siraj.* In Hebrew he wrote a major codification of Jewish law, the *Mishne Torah* (The Torah reviewed), which he completed in 1178. He also translated many Arabic medical texts into Hebrew, making them accessible for subsequent translation into Latin. Maimonides' most famous and influential book, written in Arabic and completed in 1191, was his philosophical work, *Dalalat al-Hai'ran,* or *The Guide of the Perplexed,* in which he tried to reconcile logic and faith.

Further reading: Kenneth Seeskin, *Searching for a Distant God: The Legacy of Maimonides* (New York: Oxford University Press, 2000).

Malagasy   Ethnic group of the island of MADAGASCAR; also the language they speak. Malagasy dialects evolved exclusively on Madagascar, beginning with the arrival of the Malayo-Polynesian peoples who first colonized the island, perhaps as early as the fifth century CE. By the

10th century the original INDONESIAN COLONISTS had mixed with Bantu-speaking peoples from the African mainland, and the Malagasy language subsequently adopted many Bantu words. The diverse mix of African and Indonesian peoples established several agricultural chiefdoms on the island and also practiced animal husbandry and fishing.

After the 10th century Malagasy culture began to reflect the influence of the East African SWAHILI COAST kingdoms that were active in INDIAN OCEAN TRADE. Because of their influence, Malagasy came to include many ARABIC words as well. In the early 16th century Portuguese explorers visited Madagascar and came into contact with the Malagasy kingdoms of the Antemore, Antaisaka, and Merina. Fortunately for the Malagasy, the Portuguese were more interested in establishing strongholds on the East African mainland than they were on an offshore island and, therefore, never conquered or colonized Madagascar.

Malawi Present-day southeastern African country approximately 45,700 square miles (118,400 sq km) in size, bordered by the present-day countries of TANZANIA, MOZAMBIQUE, and ZAMBIA. During the BANTU MIGRATION small groups of Bantu speakers gradually moved into the region and intermarried with the indigenous peoples. The Bantu speakers brought with them new technology in terms of ironworking and agricultural techniques. In the 12th century the Maravi peoples, for whom Malawi is named, migrated to the region.

Mali, Republic of Present-day West African nation approximately 478,800 square miles (1,233,400 sq km) in size, stretching north into the SAHARA DESERT, where it shares borders with ALGERIA and MAURITANIA. Other countries bordering Mali include (east to west) NIGER, BURKINA FASO, IVORY COAST, GUINEA, and SENEGAL. Mali derives its name from the MALI EMPIRE, which thrived from the 13th century into the early 16th century.

Mali Empire Empire in western Africa that flourished from the mid-13th century through the 15th century. At its zenith, Mali commanded not only the entirety of the ancient GHANA EMPIRE but surrounding territories from the coast of the Atlantic Ocean on the west to TADMAKKA on the east. As the empire of Ghana (c. 900–1240) declined, the once prosperous land became the target of invaders. Among those was the legendary MANDINKA leader SUNDIATA (r. 1235–1255), considered the first unifying king of Mali. Tradition holds that Sundiata (which means "the hungering lion") was a sickly boy who grew into a powerful ruler through sheer determination and remarkable skill. In 1230, after wresting control of Mali from SUMANGURU (d. c. 1235), king of the SUSU, Sundiata was declared the undisputed king of Mali. At the time of Sundiata's death in 1255, Mali was a greatly expanded, thriving empire. Sundiata had revived the GOLD trade and the SALT TRADE, started a rich agricultural system, and de-

veloped a political infrastructure with provinces and towns attended by royally appointed governors.

Sundiata was succeeded by a series of kings who did little to advance the empire. In 1307, however, Mansa MUSA I (r. c. 1307–1337), a descendant of Sundiata, began his extraordinary reign. Mali was at the peak of its political and economic influence when Mansa Musa made the HAJJ, or pilgrimage, to MECCA—a longstanding tradition of the Muslim rulers of Mali. In an impressive display of wealth and power, his journey, which took place in 1324, included an entourage of some 60,000 retainers. It also included so much gold that it depressed the CAIRO gold market. A man of culture and learning, Mansa Musa's renown spread to Western Europe, bringing the empire of Mali international fame. Moroccan traveler IBN BATTUTA (c. 1304–1369) chronicled his visit through Mali in 1352–53, further enhancing the empire's reputation as a land of plentiful lodgings, bustling markets, safe roads, and well-followed rules. Mansa Musa brought Muslim scholars into Mali and made the city of TIMBUKTU a center of learning for all ISLAM.

The golden age of the Mali Empire began to decline after Mansa Musa's death in 1332, although it enjoyed a

brief return to glory from 1351 to 1359, during the reign of Mansa SULAYMAN (r. 1341–1360). Gradually, however, the rival SONGHAI Empire supplanted Mali in the lands that it once dominated; the city of GAO in Mali became the center of this new empire.

Askia MUHAMMAD TOURÉ, often called "Askia the Great," ruled Songhai from 1493 to 1528. During his reign, he seized vast lands from Mali as well as from the HAUSA STATES and the BERBERS. In those years, Timbuktu flourished again as an Islamic center of learning. Invaders from MOROCCO overran Songhai in 1591.

Malik ibn Anas (Malik ibn Anas ibn Malik ibn Abi ʻAmir al-Asbahi) (c. 715–795) *Medina's leading Islamic legal scholar and theologian*

Malik came from a family dedicated to the study and passing on of knowledge. His great-grandfather is be-

lieved to have been a companion of the prophet Muhammad (c. 570–632). The *Muwatta* is Malik's most famous work. It is heralded as being the foundation on which Islamic law is built and consists of Malik's interpretation of the doctrines and discussions of Muhammad and his companions and followers, as well as the most respected legal scholars of the city of MEDINA in what is today Saudi Arabia. The word *muwatta* means "the approved," and the work was so named because it was accepted by 70 of Malik's contemporaries in Medina. The title also means "the clear book" in that it can be understood by anyone interested in attaining knowledge. Ash-Shafii, Malik's most renowned student, declared that besides the QURAN, the *Muwatta* was the most important book in the world.

Malik was so respected and admired in his time that at the end of the UMAYYAD dynasty (c. 660–750), when the caliph, Abu Jafar al-Mansur, was trying to usurp political control from his rival Muhammad ibn Abdallah, the people of Medina sought Malik's advice as to where their loyalties should lie. Malik reasoned that allegiance to Mansur was not binding because it had been given under force. Malik eventually paid for his frankness: after securing power, Mansur executed Muhammad and had Malik beaten for his disloyalty during the rebellion.

In honor of their teacher, Malik's students formed the Maliki sect, which began in Medina but flourished throughout North and West Africa and in much of Arabia. Tradition, reason, and tolerance were the hallmarks of Malik's philosophy and the ideology of those who followed him.

Further reading: Mansour H. Mansour, *The Maliki School of Law: Spread and Domination in North and West Africa 8th to 14th Centuries C.E.* (Bethesda, Md.: Austin and Winfield Publishers, 1994).

Maliki Sunni doctrine One of four Sunni schools of Islamic law. Sunni ISLAM is the mainstream, traditionalist branch of the Muslim faith and also its largest. The Maliki sect is one of the four major orthodox Sunni sects and the one dominant in North and West Africa.

Sunnites, as the follower of Sunni law are called, believe that the rightful successors of the prophet Muhammad (c. 570–632) were the first four caliphs (a title, from the Arabic *kalifa,* meaning "successor," given to the civil and religious head of the Muslim state that came into being following Muhammad's death). These were ABU BAKR (c. 573–634), Muhammad's close companion and adviser, and the three caliphs that immediately followed. According to the Sunni, all caliphs thereafter were required to be descendants of Muhammad, although in practice they accepted the authority of any ruler who maintained order and promoted Islam, whatever his ori-

gins. In contrast, the minority Shiite sect of Islam, which followed the tenets of Shiism, believes that authority belongs solely to Muhammad's son-in-law, the fourth caliph, Ali, and his descendants. Disagreements regarding the source of political, and ultimately spiritual, power outlasted the end of the Caliphate in the 13th century.

The Hanafi, the Shafii, and the Hanbali are the three other orthodox Sunni sects. Each sect acknowledges three sources of Islamic law: the QURAN; the Sunna, or the words and deeds of Muhammad; and *qiyas,* or reasoning by analogy to similar situations at the time when Muhammad lived. The sects differ only in the amount of emphasis they give each legal source. The Maliki school, founded by MALIK IBN ANAS (c. 715–795) and centered in MEDINA, is the dominant Sunni sect in North and West Africa. Malik, an eighth-century imam, or religious leader, wrote the earliest surviving Muslim book of laws, the *Muwatta.* Malik's writings focus on practicing Islam in accordance with the Sunna of Muhammad. His followers established a school of *fiqh,* or religious law, called the Maliki Madhhab that is modeled after his teachings.

By the 13th century Islam had spread throughout much of Africa. Shortly thereafter, the ALMOHADS announced a return to the Maliki school of Islam. Maliki remains the most widely practiced sect of Islam in Africa today.

Malindi Settlement on the SWAHILI COAST that was an important source of IRON ore in Africa as early as the 11th century. Like other East African coastal towns, Malindi attracted a large number of Arab, Persian, and Indian MERCHANTS. Although iron ore was the primary export, seashells, pearls, turtle shells, and fish were also traded in Malindi. The goods imported included glass beads, painted ceramic tiles, and POTTERY.

Mamluks Members of an elite military unit made up of captives enslaved by Abbasid or other Islamic rulers to serve in Middle Eastern and North African armies. The term *mamluk*, or *mameluke*, from an ARABIC word that means "one who is owned," has been used to describe the young children who were removed from their homelands to serve the Abbasid dynasty caliphs in North Africa from about 750 to 945. Rigorously trained as mounted horsemen and skilled archers, the Mamluks became powerful soldier-kings who enforced the payment of tax revenues to the ruling class. Many Mamluks were converted to

Traditional Mamprusi society was patrilineal, with a strong emphasis on ancestor worship. Their agricultural ECONOMY focused on hoe cultivation to produce millet, corn, and yams. Hunting and fishing were a secondary means of subsistence. Mamprusi, like most of the kingdoms south of the Niger bend, also participated in exchange along TRANS-SAHARAN TRADE ROUTES.

According to oral tradition, Na Gbewa, the son of a semimythical figure named Kpogonumbo, was the founder of the Mamprusi kingdom. The three youngest sons of Na Gbewa led the three kingdoms of Mamprusi, Nanumba, and Dagomba.

Manan   Pre-Islamic capital of the ancient KANEM kingdom, located in the Lake Chad region. Historical evidence suggests that the ancestors of Kanem's SEFUWA dynasty of rulers were the Duguwa, relatives of the Zaghawa people, who established their capital at Manan as far back as the sixth century. Nearly 100 years later, the Sefuwa *mais,* or kings, took control of Kanem and moved the capital to NJIMI. Sefuwa oral tradition, however, maintains that Manan remained the capital until the 13th century. This probably reflects changes in Sefuwa oral history that took place shortly after their conversion to ISLAM. These changes probably represent an attempt by the Sefuwa to establish a clear hereditary claim to Manan, which was the supposed birthplace of 13th-century Muslim sultans.

The Mamluk rulers of Egypt (r. 1250–1517) were descended from an elite force of fighters of Turkish, Afghan, Balkan, and Circassian origin whom the Ayabbid sultans of Egypt (r. 1099–1250) bought out of slavery as children, trained, and put into royal service. This 19th-century illustration gives a very romantic view of a Mamluk cavalryman. © Gianni Dagli Orti/Corbis

ISLAM and rose to positions of great influence and even royalty. Although guaranteed their freedom at age 18, the Mamluks were still restricted by their enslaved status and were unable to pass their status as soldier-kings or landowners on to their descendants. In the 13th century the Mamluks seized power and established a Mamluk state that encompassed Arabia, Syria, EGYPT, and parts of LIBYA and Nubia.

See also: MAMLUKS (Vol. III).

Mamprusi (Manprusi, Mampruli, Dagbamba)
People who inhabit the region between the White Volta and Nasia rivers in present-day GHANA and BURKINA FASO; they established a West African kingdom during the 14th century. The Mamprusi speak a language of the Gur branch of the Niger-Congo language family. Known as the Dagbamba in ancient times, the Mamprusi changed their name to avoid confusion with the neighboring DAGOMBA.

Mande   (Manding,   Mandingo,   Mandingue)
Language group of West Africa that includes the BAMBARA (Bamana), SONINKE, SUSU, and MANDINKA peoples. Mande-speaking people are credited with introducing AGRICULTURE, IRONWORKING, and advanced political systems to western Africa. They are divided into two groups, the Mande-tan and the Mande-fu.

The Mande-tan inhabited the region surrounding the upper Niger River. This area includes parts of present-day GUINEA, LIBERIA, Republic of MALI, SIERRA LEONE, and SENEGAL. The Mande-tan traditionally established strict hierarchical class structures, with farmers holding the highest rank in society. In contrast, CRAFTSPEOPLE and other artisans were of lower social rank.

This almost 22-inch (52-cm)-tall mask in the form of a face with comb-like horns is of Mandinka origin. The mask is of a type used by the N'Tomo (Ndomo), a secret society that initiates young males into adulthood. © *Bowers Museum of Cultural Art/Corbis*

The Mande-fu migrated away from the Mande homeland and developed more egalitarian societies Most Mande-fu settled in present-day BURKINA FASO, The GAMBIA, GUINEA-BISSAU, IVORY COAST, and Senegal.

The Mande were among the first agriculturalists in Africa. They domesticated millet, sorghum, African rice, okra, and, later, groundnuts (peanuts), all of which became staple crops of SUB-SAHARAN AFRICA. The mining of GOLD became the primary source of income for some of the more powerful Mande kingdoms. Both the GHANA EMPIRE, which flourished from c. 900 to 1200, and the MALI EMPIRE, active especially from c. 1200 to 1400, traded gold for salt and textiles. Nonetheless small-scale agriculture remained the primary economic activity of most Mande peoples prior to European colonization.

Mande social structures varied from group to group. Most were patrilineal and practiced polygamy. Those who converted to ISLAM (after their early contact with Arab traders starting in the seventh century) integrated Middle Eastern customs into their own traditions.

See also: MILLET (Vol. I); SALT (Vol. I); SORGHUM (Vol. I).

Mandinka (Malinka, Malinke) West African people who are part of the larger MANDE group; founders and rulers of the great MALI EMPIRE (c. 13th–15th centuries); also the name of the language spoken by these people. Historically, the Mandinka people have made their home in West Africa. As one of the Mande cultures, the Mandinka probably descended from the ancient agriculturalists who invented crop cultivation in western Africa. In addition to AGRICULTURE, the Mande were known to be skilled CRAFTSPEOPLE and traders.

One of the most famous, oldest, and largest of the Mande kingdoms was the Mali Empire, which was founded by SUNDIATA (r. 1235–1255), who is credited with unifying the people of his homeland of KANGABA in western Africa. Soon afterwards, Sundiata organized the Mandinka chiefs to fight in a war of independence against the SUSU people, and in the process he extended his rule over the ancient GHANA EMPIRE. In time the gold fields of western Africa also became part of the Mali Empire, and GOLD was added to the list of commodities traded by the Mandinka.

Unlike many other Mande peoples, the Mandinka adopted ISLAM. Although most Mandinka retained some of their traditional beliefs and spiritualist leanings, the majority had become Muslim by the 13th century. The people of the Mali Empire had religious freedom, even though their ruler, Sundiata, was Muslim.

In the male-dominated Mandinka culture, the oldest man in an extended family was considered the head of the whole family. Clans, or groups of families with the same name, lived together in a village, and LABOR was divided along gender lines, with men tending the farm and women the home. Traditionally, Mandinka homes were round, made of mud, and covered with a thatched roof. A wall generally enclosed the groups of homes that formed a village.

MUSIC always has been an important part of Mandinka culture, and the influence of Mandinka musical traditions is present in 21st-century music. Traditional drum music is used in many rituals, such as the marriage ceremony.

Mapungubwe City located in what is now ZIMBABWE, just south of where the Shashe (Sashi) and the Limpopo rivers meet. About 1075 a great influx of the Leopard's Kopje people, a Bantu-speaking group, emigrated from their site northwest of Mapungubwe, where they established a sophisticated community that thrived culturally, politically, and economically. Though they were a pastoral and agricultural society, the majority of their wealth came from the local and long-distance trading of GOLD, IRON, COPPER, IVORY, livestock, and BEADS AND JEWELRY. Local CRAFTSPEOPLE also produced and traded fabric, ceramics, bone tools, and sculptures. Spindle whorls, which were used as weights for weaving, were first introduced in this part of Africa.

The social structure of Mapungubwe was three-tiered. At the top of the political ladder were the chiefs or kings, who lived in stone houses high up on the hill. The second tier was occupied by their wives and associates, who lived nearby but separate. The third tier, the majority of the population, was made up of the peasants—craftspeople and laborers who were dependent on the elite. This system in which the aristocracy lived isolated from their subjects is one of the earliest found in southern Africa.

Initially there was much debate about the origin of the Mapungubwe inhabitants. Archaeologists who excavated sites in and around the region were slow to acknowledge the influence that the Leopard's Kopje people had on the area, for they felt that the society they were uncovering was so complex that it must have been heavily influenced by Muslims from the northern or eastern parts of Africa. But later discoveries of skeletal and cultural remains proved that the people of Mapungubwe were of sub-Saharan African descent. Between the 13th and 14th centuries the people of Mapungubwe headed north to GREAT ZIMBABWE for better trading resources and wealth.

Maqurrah Christian kingdom on the upper Nile River with its capital at Dongola. One of three Nubian kingdoms, Maqurrah was Christianized between 543 and 575 CE by a missionary named Julian and his successor, Longinus. From religious texts it would appear that the people were enthusiastic in embracing CHRISTIANITY. Christian churches were built along the Nile, and ancient temples were converted into Christian places of worship. By the seventh century Maqurrah had absorbed its neighboring kingdom, NOBATIA. After this missionary effort, there is little known about Christianity in this area until the Muslim ARABS spread southward into the upper Nile region after their invasion of Egypt, in 639. The Muslims marched south into Maqurrah, laying siege to the town before capturing it and destroying the Christian cathedral. At that time, the king of Maqurrah asked for an armistice. The Arabs, who had suffered heavy losses themselves, agreed. According to the treaty, the two groups established a working relationship in which they would engage in trade but not settle in each other's territory. This relationship lasted for 600 years and was beneficial to both parties; the Arabs gained a secure southern border, and Maqurrah was able to maintain itself as an independent entity.

Marinids Berber people who conquered the ALMOHADS in the 13th century. The Marinids, also called the Banu Marin, ruled MOROCCO and other parts of North Africa until the early 15th century. The Marinids were a nomadic group of Zanatah BERBERS. During the early part of the 13th century they began to migrate into northeastern Morocco from ALGERIA, as the Almohad empire slowly weakened. In 1248 the Marinid sultan Abu Yahya conquered the Almohad towns of FEZ, Taza, Meknes, Sale, and Rabat. Fez was rebuilt as the Marinid capital. During the reign of Abu Yusuf Yaqub (1258–1286), who was unrelated to the earlier Almohad ruler of the same name, MARRAKECH and the remaining Almohad-ruled lands of the High Atlas region came under Marinid rule. With the capture of Marrakech in 1269, the Almohad dynasty effectively came to an end.

By the beginning of the 15th century the Marinid dynasty was in chaos. After failed attempts under ABU AL-HASAN ALI (1297–1351) to reconquer Christian Spain and to expand their territory in North Africa, Marinid resources were depleted. In Morocco they were overtaken by a related branch of people known as the Wattasids, who ruled until Fez was captured by the Sadian sharifs in 1548.

Marka (Marca, Merca) Indian Ocean port city located in present-day SOMALIA. Arab traders founded the city in the 10th century, but by the 13th century SOMALI immigrants had settled extensively throughout the area. Soon, the Somalis became involved in inland trade via the caravan routes from the African interior. Although the Indian Ocean coastline of Somalia does not have good harbors, Marka and the nearby towns of Brava and MOGADISHU are suitable ports. For this reason the stretch of coast where these towns are situated became known as the *Benadir Coast,* from the Persian word *bandar,* which means "port."

See also: ARAB COASTAL TRADE (Vol. II); BENADIR COAST (Vol. III); BRAVA (Vol. III); INDIAN OCEAN TRADE (Vol. II).

marketplaces There is little evidence to suggest that marketplaces were a regular feature of village life in most regions of SUB-SAHARAN AFRICA between the fifth and the eighth centuries. It is thought, however, that it was common for small villages to create marketplaces to facilitate barter between peoples living in close proximity. Later, as villages evolved in sub-Saharan Africa, peoples like the IGBO of present-day NIGERIA set up complex systems of organized markets that would be held on a regular basis, perhaps at intervals of four, 10, or 20 days, depending on the season. The commodities usually traded at these village marketplaces were local crops and foodstuffs and handmade items like baskets or jewelry. People who had no goods to trade would often barter for items by offering their LABOR in fair exchange.

Village markets existed primarily to balance the FOOD surpluses and deficits between neighboring villages. Until about the eighth century these local markets rarely played a role in long-distance trade, the exception being the local market that possessed rare items of high value—like beads or shells—or large volumes of less exceptional goods, such as certain grain crops. In these cases, goods might travel through a complex trade network run by professional merchants. The goods moved along with the merchants from village to village before eventually finding their way to a larger regional marketplace.

Village markets were also differentiated by function. For example, in seaside villages such as Yoff, in SENEGAL, a large marketplace traditionally would open when fishermen returned to shore with their catches. Hundreds of women would be involved in buying fish in bulk and then cleaning and preparing them for the village marketplace. In villages that had a mosque, the mosque served as a social center for the men, and the marketplace had the same function for the women. Many villagers visited the market once a day, if not more often, to obtain the goods they needed.

The larger regional markets usually developed along trade routes or near centers of government. In these places, unlike in the villages, there were always laborers for hire and accommodations for the traders and their pack animals.

A public market or market district in North Africa was called a souk, the ARABIC word for "MARKETPLACE." In the larger cities such as TUNIS, these would also have been places to import and export goods from the Mediterranean region. Visitors to the souk in 13th-century FEZ in MOROCCO would smell bread being made and sold, see piles of olives, peppers, and spices for sale, and be able to buy goods made from leather produced at the nearby tannery or purchase a variety of silk, COTTON, or woolen thread dyed in town. All of this took place within sight of the Qarawiyin Mosque and theological school, which was founded in 859 and is one of the oldest universities in the world.

Marrakech (Marrakesh) City in west-central MOROCCO, on the fertile Haouz Plain. Marrakech has long been one of the principal commercial centers of Morocco. The old section of the city, called the *medina,* was surrounded by a large palm grove and featured fortified walls that were built in the 12th century. The *medina* is also known as the "red city," because its buildings and ramparts, built during the Almohad period, are made from beaten clay of a rusty color. The heart of the *medina* is the Jema al-Fna square, a busy souk, or MARKETPLACE. Nearby is the 12th-century Koutoubia Mosque with its 253-foot (77-m) high minaret. Other buildings of historic significance include the 16th-century Sadi Mausoleum, the 18th-century Dar el-Beda Palace (now a hospital), and the 19th-century Bahia royal residence. Much of the *medina* is still surrounded by 12th-century walls.

The city was founded in 1062 by YUSUF IBN TASHBIN (r. 1061–1106), the leader of the militant religious Muslim reformers called the ALMORAVIDS. As the Almoravid movement shifted its emphasis from promoting ISLAM to engaging in military conquest, the empire came to include territory as far east as ALGIERS as well as parts of Spain up to the Ebro River. Although it was not an entirely peaceful time for the region, North Africa benefited economically and culturally during the Almoravid period.

In 1147 Marrakech was captured by the ALMOHADS, who between 1152 and 1160 were able to conquer all of the eastern MAGHRIB. Then, in 1269, Marrakech passed into the hands of the MARINIDS, who moved their capital to FEZ, in northern Morocco. New caravan routes began to bypass Marrakech, and the city suffered economically. By the time the Sadian dynasty seized control of the city in 1525, it was a poor place, largely in ruins. The Sadian dynasty revitalized Marrakech, making it the new capital of southern Morocco. By the end of the 16th century Marrakech was once again the leading city of Morocco, culturally and economically, with about 60,000 inhabitants.

Masmuda Group of sedentary BERBERS from MOROCCO who established the Almohad dynasty. In the 12th and 13th centuries the Almohad dynasty stretched from North Africa to Spain. The dynasty's founder, MUHAMMAD IBN TUMART (c. 1080–1130), was recognized by the Masmuda as the messiah-like figure known as the MAHDI, meaning "righteous leader."

The Masmuda lived in the High Atlas region of southern Morocco. Unlike nomadic Berbers, the Masmuda settled in permanent homes, farmed the land, and domesticated animals. The Masmuda were devout Muslims who often spoke both ARABIC and their native Berber dialect.

The ALMOHADS, like the Almoravids who preceded them, were Berbers. The Almohad founder, Muhammad ibn Tumart, was a Masmuda leader who sought to reform the excesses of the ALMORAVIDS. After studying in cities like Baghdad and MARRAKECH but failing to gain support, ibn Tumart returned to his home, where his teachings became popular among his fellow Masmuda. With their support, ibn Tumart began a rebellion against the ruling Almoravids by attacking their centers in Marrakech and Sus.

After ibn Tumart's death, his successor, ABD AL-MUMIN (c. 1094–1163), expanded the Almohad dominion to include Spain. Al-Mumin, who did not belong to the Masmuda, changed the Almohad leadership into a traditional monarchy based on heredity. As a result al-Mumin fought with Masmuda chiefs for control of the dynasty. Between the pressures of unrest at home and long wars against Christian crusaders in Spain, the Almohad empire collapsed in the middle of the 13th century.

Massawa (Metsewwa, Mitsiwa) Vital port city in northern ERITREA, extending from the region's coast to the neighboring islands of the DAHLAK ARCHIPELAGO. During Aksumite rule in the early Christian era, Massawa provided an essential link between MERCHANTS of the RED SEA TRADE and the exotic export items they sought in the interior of ETHIOPIA. It is thought that in the early part of the eighth century, Muslims captured Massawa and the entire Dahlak Archipelago, subsequently destroying the mainland city of ADULIS in reprisal for raids that the Aksumite rulers had made on southern Arabia.

Arab traders in Ethiopia made it impossible for AKSUM to resume its former status in the lucrative Red Sea trade. However, under the ZAGWE DYNASTY (c. 916–1270) trading briefly flourished, perhaps as a result of mutual cooperation between the Zagwe rulers and the early Muslim settlers in the region. By the time the SOLOMONIC DYNASTY reclaimed the Ethiopian throne about 1270, these Muslim settlements had developed into formidable city-states that dominated trade in Massawa and other ports along the Ethiopian coast.

Despite the attempts of several Solomonic rulers to restore control over trade, it was not until the mid-15th century that Emperor ZARA YAKOB (r. 1434–1468) was successful in regaining dominance. He accomplished this by organizing military units and keeping a watchful administration on the region.

Masudi, el (Masudi, Abd al-Hasan Ali ibn al-Husayn; Mas'udi, al-; Mas'udi, al-Fustat; al-Mas'udi, Abu al-Husayn 'Ali ibn al-Husayn) (888–957) *Arab writer and traveler*

Masudi was born in Baghdad, in present-day Iraq, and exhibited a great capacity for learning from a young age. Not wanting to rely only on books and teachers for his knowledge, he chose to wander most of his life, learning about things firsthand and from those he met on his travels. He visited the east coast of Africa, Armenia, the Caspian Sea, China, India and the Indus Valley, Iran, Oman, Russia, Spain, Sri Lanka, and Syria before finally retiring to EGYPT about 947.

Masudi was a prolific writer and chronicler of all of the knowledge he gained on his travels. Though the manuscripts no longer exist, it is known that he wrote at least 20 titles, including volumes on Muslim beliefs and even one on poisons. It was his historical works, however, that earned him the title "Herodotus of the Arabs." Covering the breadth of world history, *Akhbar az-zaman* (The history of time) filled 30 volumes.

As a follow-up to this ambitious work, Masudi wrote *Kitab al-awsat,* a companion work probably covering history from a chronological standpoint. Masudi's best-known work, however, was *Murujadh-dhahab was ma'adin al'jawahir* (The meadows of gold and the mines of gems). This work covered the same material as the previous two books but in far less detail, only 132 pages, thereby making it more accessible and readable. The book began with the creation of the world and covered a wide range of topics, everything Masudi deemed intriguing or of use, including reflections on the geography, climate, economies, calendars, RELIGION, literature, customs, and history of the various places he had visited. He described weather conditions, oceans, and the solar system as well. Masudi's final work was *Kitab at-tanbih wa al-ishraf* (The book of notification and verification) written in the year before his death. In it Masudi revised and recapitulated his earlier works.

Matope (d. 1480) *Ruler of the Mwene Mutapa kingdom in southern Africa in the 15th century*

Little is known of Matope's life. He left the throne to his son Mokombo, whose rule became a period of unrest. Finally in 1490, Changa, the governor of the southern and central provinces of the MWENE MUTAPA kingdom, rebelled against Makombo, declared the provinces independent, and named them the Rozwi kingdom. Changa added the

ARABIC title *amir* (commander) to his name and has became known to historians as CHANGAMIRE. The Rozwi kingdom is often called *Changamire,* after the Changamire dynasty, which was founded by Changa's son Changamire II. Changamire eventually became the greatest power in Central Africa until its fall, in 1830.

Mauritania   Present-day country of northwestern Africa, approximately 398,000 square miles (1,030,800 sq km) in size and bordered by ALGERIA, Republic of MALI, SENEGAL, and WESTERN SAHARA. As early as the third century, BERBERS from North Africa migrated into Mauritania. Many of the indigenous inhabitants were enslaved, while others were integrated into a feudal system. The Berbers succeeded in monopolizing trade in the Western Sahara over the next few centuries. Three dominant Berber clans, the Lamtuna, Messufa, and Djodala, formed an alliance known as the Sanhaja Confederation. By the ninth century the SANHAJA BERBERS administered all trade between KUMBI SALEH, AUDAGHOST, TIMBUKTU, and the salt mines of the northwestern Sahara.

In the late 10th century the armies of the Ghana Empire captured Audaghost, greatly cutting into the Berber trade monopoly. By the middle of the 11th century the AL-MORAVIDS, who had organized in the coastal Mauritanian capital of NOUAKCHOTT, conquered most of the Saharan Berbers and converted them to the Maliki Sunni school of ISLAM. The Almoravids also gained control of the western Sahara trade network established by the Berbers. They ruled Mauritania well into the 13th century.

During the mid-13th century ARABS from North Africa moved west. For nearly four centuries they fought with the region's established Berber inhabitants, until finally gaining control over them by the middle of the 17th century.

Mauritius   Island nation in the Indian Ocean, spread over 720 square miles (1,870 sq km) and situated approximately 500 miles (805 km) east of MADAGASCAR. It includes the inhabited island of Rodrigues, 350 miles (563 km) to the northeast, as well as scattered coral atolls, including Cargados Carajos and Agalega. In the 10th century ARABS discovered the island, and it began to appear on maps by about 1500 under its Arabic name, *Dina Arobi*. While Arabs visited, they did not stay. The Portuguese arrived in the 16th century, bringing with them monkeys and rats. However, they also did not settle or develop the island. From 1638 to 1710 it was colonized by the Dutch, who named it after Prince Maurice of Nassau.

Mbanza Kongo (Mbanza Congo)   Capital city of the KONGO KINGDOM during the early 15th century. This southwest African town, originally inhabited by the KONGO people, became an important trade port for early Portuguese explorers. As early as 1490, Portuguese missionaries arrived at Mbanza Kongo. The Portuguese then imported masons, carpenters, and artisans, enabling them to build a large town in a few years.

In 1491 Nzinga Mbemba, the son of the Kongo king Nzinga Nkuwu, was greatly influenced by the Portuguese missionaries. He converted to CHRISTIANITY and changed his name to Afonso I. Nzinga Mbemba succeeded his father to the throne around 1505 and ruled for nearly 40 years as the Christian king of Mbanza. Portuguese customs were integrated into Kongo society along with the Christian religion. Mbanza Kongo was renamed São Salvador, in 1534.

Mbundu   Bantu-speaking ethnic group of ANGOLA, in Central Africa. They are sometimes called the North Mbundu or Kimbundu to distinguish them from a related Mbundu-speaking group, who call themselves OVIMBUNDU in their own language.

The North Mbundu descended from three distinct Bantu-speaking groups who arrived in what is now Angola during the 15th century. They introduced several technologies to the region, including IRONWORKING, new agricultural techniques, and superior hunting methods. In the absence of a centralized political system, North Mbundu society was organized around loose clan affiliations. However, toward the end of the 15th century the emergence of the powerful KONGO KINGDOM to the north forced the North Mbundu to centralize their leadership. They aligned themselves with the king of the Ndongo people, who were building an agricultural and trade kingdom at Kubasa.

The North Mbundu capitalized on their location to control the coastal trade routes, which brought them into contact with the Portuguese MERCHANTS who arrived on the coast around the same time that the Kongo kingdom emerged.

Mecca   City in what is now Saudi Arabia, located approximately 50 miles (80 km) from the Red Sea. Because Mecca is the birthplace of the prophet Muhammad (c. 570–632), the city is of central importance to the religion of ISLAM. In the seventh century, during the lifetime of Muhammad, Mecca was an important commercial center, bustling with trade from the CARAVANS crossing the Arabian Peninsula. Born into the influential Qaraysh family, Muhammad preached a monotheistic doctrine and sought to reform traditional Arab religious and social life. He quickly gained followers and became a threat to Mecca's established leadership. In 622 he accepted an invitation to go to the city of Yathrib, later known as MEDINA, where he successfully spread his teachings.

In 630, after a series of conflicts between rival sects in the city of Mecca, Muhammad returned to Mecca, accompanied by 10,000 troops. He quickly consolidated and expanded his power, and by his death in 632, he had become the spiritual and political leader of all Arabia.

By the end of its first century of existence, Islam had expanded westward into Africa and east and north into Asia. As time passed, however, the focal points of Islamic power moved as well, and by the ninth century the major centers of Islamic influence were located in EGYPT and India, far from Mecca and Medina.

Muhammad's move from Mecca to Medina in 622 is called the *Hegira* (Hijra). The year of this move is considered the beginning of the Islamic era and is commemorated by the annual Muslim pilgrimage to Mecca. According to Islamic doctrine, this pilgrimage, or HAJJ, is the duty of every true Muslim and is to be completed at least once during each believer's lifetime. The hajj takes place between the eighth and the 13th days of the last month of the Muslim year, and annually brings more than 2 million pilgrims to the city of Mecca. Among the many rituals and observances that are part of the hajj is each pilgrim's passage around the Kabah, the rectangular brick structure that the Muslim faithful believe was built by Ibraham and his son, Ismail.

Medhane Alem   The largest of the underground churches carved out of rock in the LASTA MOUNTAINS of north-central ETHIOPIA. In the 12th century, LALIBELA, a

devout Christian king belonging to the ZAGWE DYNASTY, directed the construction, or excavation, of the churches. Among the other churches are Golgatha, St. GIYORGIS and ABBA LIBANOS.

medicine   The approach of traditional African medicine to restoring good health has been described as a combination of finding both the right cure along with the disease's underlying cause. In many traditional African societies, illness or premature death was viewed either as part of a larger, hidden problem within the FAMILY or community or as something associated with other, unseen forces. These possibilities inform the work of traditional healers, many of whom made extraordinary efforts to heal the ill. The efforts of these healers included everything from divination and intuitive knowledge to special rites and ceremonies. Another source of traditional cures, herbal remedies, were drawn from a vast knowledge of herbs and roots. Some of the ingredients used were gathered in the wild, some were cultivated, and others, such as fats or milk from DOMESTICATED ANIMALS, were commonly found in the home.

Traditional treatments might involve healing bath solutions, inhaled or ingested potions, or the fumigation of the sick person's home with special sprays. Someone with a fever might receive cooling substances made of water, plant essence, and ash. Incisions might be made to the skin so that medicine could be applied. Some healers used specially prepared medicine bundles that were intended to work as a type of charm. Beyond these physical treatments, one of the most potent aspects of medical treatment within many societies was the spoken word, which represented an important part of traditional healing; ritual chants and incantations were often used as part of the regimen.

The art of divination was also essential in the role of medicine and was considered the first step in understanding the underlying cause of illness. The results of the divination process might identify that cause as misdirected anger, envy, or even a deliberate act meant to inflict harm on another member of the community.

Divination might also be used to detect the effects of witchcraft, which many societies believed to be a prime cause of illness. Once the cause of an ailment or illness was identified, the healing medicine was dispensed. This could be done in a variety of ways. Often, special rites or ceremonies—sometimes including dancing and drumming—might be part of the process. Patients also might be asked to wear amulets containing certain protective medicines. The ASHANTI of present-day GHANA, for example, have traditionally worn a personal talisman, called a *nsuma,* that they believe has been made with the assistance of divinities known collectively as the Abosom.

Members of other societies often stored medicine within wooden carvings that appeared at first glance to be works of ART. Known as "power objects," these were mainly depictions of human figures. Some of these held medicines that were meant to remain hidden from public view, while others were meant to inflict harm upon unsuspecting members of the community. Other carved forms were made especially for public display. These were filled with or surrounded by medicine and then placed on shrines or used in rituals. For example, medicines were routinely applied to the masks of the Komo Society, a group associated with the BAMBARA of present-day Republic of MALI. The mask, in turn, was thought to be able to transmit healing at specially organized rites. The Bambara also used large sacred sculptures called *boliw* as repositories for their potent medicines.

Similarly many societies of Central Africa used wooden sculptures as a part of the healing process. Among the KONGO people, for example, sculptures known as *nkisi* were used to magnify the healing properties of traditional medicines. Kongo healers typically inserted herbal remedies, known as *bwanga,* into the head or abdomen of one of these figures. Thus, it was believed, the herbs were transformed into more potent forms of medicine known as *mankishi.* Peoples who used such methods, such as the Songye, often claimed that knowledge of this type of medicine was given to the first humans by their supreme being.

In some regions of southern Africa, divining "bones" were used to diagnose and treat illness. These items, which often consisted of an assortment of special stones, shells, nuts, or other sacred objects, were usually thrown onto a flat surface. The patterns that formed were then "read" by a healer, who was then able to determine the appropriate treatment.

Medicine also played an important role in societies that ascribed to DIVINE RULE. Inserted into the crown or royal headdress of ruling kings, certain medicines were considered an essential protective agent. YORUBA kings, for example, had medicine sewn into the top portion of their crowns, always hidden beneath beads or a symbolic bird perched at the top. It was generally believed that herbal medicines aligned the king's divine power with the *orisha,* the pantheon of spiritual deities who embodied the life-force referred to as *ashe.* The Yoruba also buried special medicine*s,* known as *oogun,* under shrines dedicated to specific deities.

The Haalpulaaren people of northern SENEGAL practice a unique form of traditional healing. They were organized in lineage groups, each with its own special expertise in a certain craft. These crafts then determined an individual's status as healer. For example, BLACKSMITHS treated external burns and abscesses, while members of the societies who were weavers of cloth used specially tied knots to alleviate the pain of headaches and toothaches.

Medina   Sacred city located in western Saudi Arabia, 110 miles (180 km) east of the Red Sea and 200 miles (320 km) north of MECCA. The prophet Muhammad (c. 570–632) fled to Medina in 622 but returned in triumph to Mecca in 630. His remains are buried in Medina, making it one of the holiest places of Muslim pilgrimage. Originally called Yathrib, the city came to be known as *Madinat an Nami* (the city of the Prophet), which was later shortened to *Medina*, ARABIC for "the city."

Muhammad's monotheistic beliefs met with great opposition in his native city of Mecca. In 622 he and his followers were forced to leave the city, and they chose Yathrib to be the administrative center of the new Muslim community. This flight, known as the Hegira (Hijra), marks the beginning of the Islamic calendar.

Despite constant conflict with the Meccans, Muhammad continued his attempts to unify the Arab people, and his teachings attracted a great following. As a result, Mecca began to decline as prominent citizens moved to Yathrib to follow ISLAM.

In 630 Muhammad and 10,000 of his disciples seized Mecca, and by 632 all of Arabia was united under Islam. While leading the annual pilgrimage to Mecca in 632, however, Muhammad died in Medina, before he could appoint an heir. This provoked a major crisis among his followers and later led to dynastic disputes that brought schism and civil war. Muhammad was buried in Medina, and a mosque was subsequently built around his grave. His daughter, Fatima, and Omar, the second caliph of the Muslim empire, are also buried within the mosque.

For nearly 30 years after Muhammad's death, Medina remained the capital of the Islamic community, serving as the administrative, cultural, and intellectual center of the Muslim empire. Years later it became a primary center for the legal discussions that codified Islamic law.

Mediterranean Sea   Body of water that provided a key link between the African continent, southern Europe, and the Middle East. Prior to the seventh century northern Africa and the Mediterranean Sea were controlled by the Byzantine Empire. Although a handful of Mediterranean coastal towns were still under Byzantine influence at the beginning of the seventh century, the arrival of Arab Muslims put an end to Byzantine rule. On a quest to spread ISLAM, these Arab immigrants used military force to dominate ancient coastal towns and establish new Muslim cities. EGYPT was the first access point of the Arab conquests as they made their way west, into the MAGHRIB. As a result the Mediterranean became an essential factor in the introduction of Islamic culture to Africa.

Equally important was the rapid economic growth in the area sparked by the Arab interest in Mediterranean trade. TRANS-SAHARAN TRADE ROUTES linked the Mediterranean coast with the African interior, where export goods, such as GOLD and slaves, were in high demand. The influx of gold into Western Europe enabled countries like Spain, which had previously relied solely on silver, to diversify their currencies and increase their financial stability. In addition, the growth of Mediterranean trade brought advances in SHIPBUILDING technology and sparked interest in areas as diverse as geography, banking, and astronomy. Partly because of this economic prosperity, Islam was fully incorporated into Mediterranean coastal towns by the 11th century and gradually began to spread southward along the trans-Saharan trade routes.

For the next several hundred years the Mediterranean figured prominently in shaping North Africa's history. It was as often the site of power struggles as it was a busy trade center. The Muslim ALMORAVIDS, centered in MOROCCO, dominated the western Mediterranean in the late 11th century and supplanted the UMAYYAD dynasty, which had ruled al-ANDALUS (Muslim Spain) since 756. (Spain had been invaded and conquered by Berber Muslim forces in 711.) At the same time, Christian crusaders attempted to wrest the Holy Land from its Muslim rulers. Control of much of the Mediterranean coastline passed to the ALMOHADS, another Muslim reform group, in the late 12th century. Over the next 300 years, Christians and Muslims battled for control of Mediterranean trade and coastal dominance. Toward the end of the 15th century the Christians temporarily conquered the Mediterranean under the armies of the Spanish monarchs Ferdinand of Aragón and Isabella of Castile. Important North African port cities under Spanish control included Melilla, Oran, Ténès, Algiers, Bidjaya, and Tripoli.

The Ottoman Empire, which had steadily been growing in size and power since the early 14th century, began to seriously threaten Christian dominance of the Mediterranean by the beginning of the 16th century. After conquering key Egyptian cities, the Ottomans used their powerful navy and began raiding Mediterranean commerce vessels. By the middle of the 1500s the Ottomans controlled the North African coastal towns of TUNIS, Algiers, and Tripoli, thus shifting Mediterranean control to the Turks.

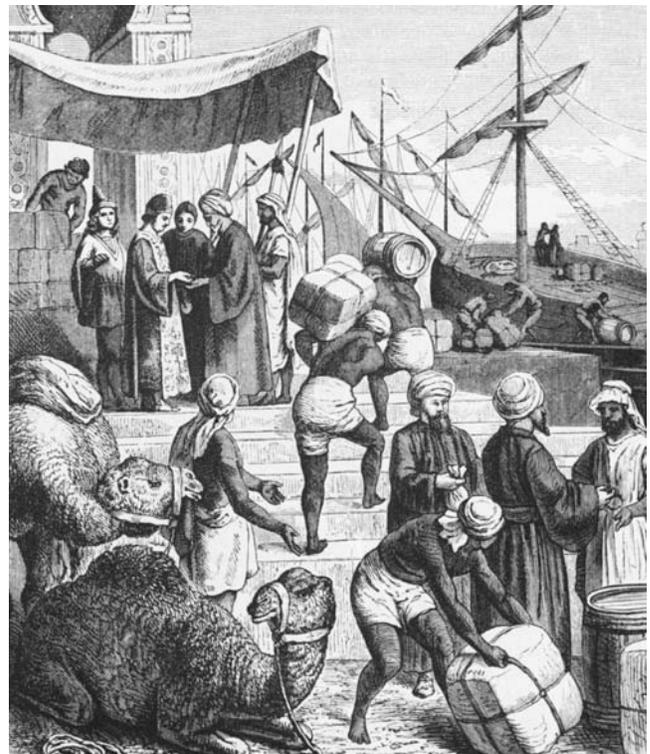
merchants A professional merchant class emerged in Africa as TRANS-SAHARAN TRADE ROUTES and INDIAN OCEAN TRADE developed after the rise of ISLAM in the seventh century. The BERBERS of North Africa brought their Islamic faith with them as they crossed the Sahara and converted many of the merchants who had traditionally dealt with the Arab traders. The conversion of a large percentage of traders brought many benefits to the region. It opened up markets for African trade goods in the Middle East and North Africa, and it provided a common language—ARABIC—that was spoken by both Arab Muslims and black African Muslims. (Until the 20th century the QURAN, the holy book of Islam, was read only in Arabic, which most believers learned.) Islam also provided the bond of Islamic law, or SHARIA, making it easier to solve disputes under one common legal system.

A powerful and influential merchant class existed in all the major cities of Muslim West Africa—TIMBUKTU, GAO, JENNE, KUMBI SALEH, KANO, KATSINA, and the other HAUSA STATES. By the 14th century clans of DYULA (meaning "itinerant traders"), or Wangara, as the Muslim traders of the Mali Empire came to be called, were active throughout West Africa and were known for organizing the large-scale movement of goods from the African interior to the coastal commercial markets and trade depots of the Sahara.

In other parts of Africa, notably the central and southern regions, there were merchants with little or no contact with North African traders or with Arab traders from the Indian Ocean cities. Significant among these in the early 15th century were the merchants of MWENE MUTAPA, a kingdom bearing the same name as the its king, whose most important trading center was the city of GREAT ZIMBABWE, south of the Zambezi River. As Mwene Mutapa expanded its trade routes by military means, their merchants gained access to the Zambezi region's salt, fabrics, and IVORY. They neither had nor sought direct contact with the cities of KILWA, SOFALA, MOMBASA, MALINDI, and others along the East African coast but were instead intermediaries who controlled


Arab and medieval European merchants conduct business at a port. © *Bettmann/Corbis*

the inland trade networks that brought Zimbabwean GOLD and goods to the Indian Ocean coast. These goods were carried by foot or by pack oxen to Arab traders on the coast.

Mogadishu Port city and present-day capital of SOMALIA, founded by Arab traders in the 10th century. Early Mogadishu, also known as Hammawein or Xamar Weyne, was one of the first Arab trading ports on the African mainland. Although originally established and ruled by Arab and Persian families, by the 13th century Mogadishu was governed by both ARABS and Arab-influenced SOMALI clans. Arab customs were integrated into local tra-

ditions, and many Somalis converted to ISLAM because of the influence of these ruling families.

The GOLD trade from southern Africa made the city prosperous, but leather, timber, pitch, and civet musk were also shipped abroad. Captives from the interior quickly became an important commodity, along with livestock and IVORY.

The strong influence of Islam was in evidence in the 13th century, when Fakhr al-Din established the first sultanate of Mogadishu. As the city's international prominence grew in the 15th century, political power shifted to the Muzaffar dynasty. Although the Muzaffar rulers were able to fend off Portuguese invaders, they could not resist the great influx of the Hawaya, a group of indigenous Somali nomads. Cut off from the interior, Mogadishu, along with the port cities of MARKA and Brava to the south, lost much of its trade. By the end of the 16th century Mogadishu was falling into a state of rapid decline.

Mombasa City in present-day KENYA that is the largest port in East Africa. Established as a trade center by Arab MERCHANTS in the 11th century, Mombasa quickly became a prominent marketplace for GOLD, IVORY, and slaves. It soon surpassed the coastal city of KILWA in importance, becoming East Africa's premier commercial center by the 15th century.

Portuguese explorer Vasco da GAMA (c. 1460–1524) visited Mombasa in 1498, and several years later the Portuguese captured the city in an effort to control INDIAN OCEAN TRADE.

monotheism Belief in one god, as typified by religions introduced to Africa like Judaism, CHRISTIANITY, and ISLAM. Unlike pantheistic religious traditions, which are common throughout SUB-SAHARAN AFRICA, monotheistic religions center on one god, who actively intervenes with humankind. This god typically sets moral standards and is worshiped as the supreme creator. Monotheists often consider other religions intolerable, a fact that has resulted in friction between religious groups throughout much of African history.

The monotheistic religions commonly found in Africa differ in their interpretation of the supreme authority of the one god. The oldest of the three great monotheistic religions, Judaism, centers on the belief in an all-powerful creator sustained and revealed through human action. While early Jews tolerated the existence of other gods, monotheistic principles came to dominate Judaism as it

developed. Christianity, which emerged from Judaism, adheres to monotheistic principles as expressed in the Old Testament of the Bible. Catholicism and many Protestant denominations express their belief in a Holy Trinity of three persons in one God: the Father, the Son, and the Holy Spirit, as set forth in the New Testament of the Bible in the Gospel of St. Matthew and St. Paul's Letter to the Corinthians.

The concept of a single god may have originated in Africa during the reign of the pharaoh Akhenaten IV (c. 1379–1364 BCE), known also as Amenhotep IV. Akhenaten replaced the traditional worship of Amun with rites honoring Aten and the innovation that Aten was to be the only god. The so-called Amarna Period that he initiated was a time of religious and political turmoil in Egypt.

In contrast to Judaism and Christianity, Islam, which began in the seventh century, is a purely monotheistic RELIGION. Muslims strictly deny the validity of other religions, believing that Allah (the ARABIC word for "God") is eternal and unequaled and is the creator, sustainer, and restorer of the world. Islam views Adam, Noah, Moses, and Jesus Christ, among others, as members of a long line of prophets ending in Muhammad, whose revelations consummate and supercede the work of the prophets who preceded him.

See also: AKHENATEN (Vol. I); PANTHEISM (Vol. I); MONOTHEISM (Vol. I).

Morocco Country along the coast of North Africa, with the MEDITERRANEAN SEA to the north, the Atlantic Ocean to the west, WESTERN SAHARA to the south, and ALGERIA to the east; officially known in the present day as the Kingdom of Morocco. The Atlas Mountains in central Morocco separate the fertile coastal plain to the north from the Sahara Desert to the south.

The BERBERS, the indigenous people of Morocco, are an ancient group who were subjected to the invasions of a succession of foreign powers. The Mediterranean coast of Africa was under Roman rule until the area was invaded by the Vandals in 429 and later by Byzantium in 533. Although CHRISTIANITY spread throughout Morocco during Roman times, only pockets survived the Arab invasion that began in the seventh century.

Muslim ARABS came to Morocco around 685, replacing Christianity with ISLAM. (A few areas with Jewish populations were allowed to keep their RELIGION.) ARABIC influence extended beyond religious reform, eventually

including the written language that has remained the primary language of business and culture ever since.

The Berbers did not accept Arab rule, however, and there were many conflicts between the two groups. In 788 Morocco became an independent state under the royal family of the *sharif* (descendant of the Prophet) Idris ibn Abd Allah, who was invited there by Ishaq ibn Abd al-Hamid, the chief of the Berber Awraba confederation, to lend religious authority to al-Hamid's rule. Arab and Berber dynasties succeeded the Idrisids. The first were the ALMORAVIDS (1062–1147), a Berber Muslim dynasty that united the country through religious reform and military conquests. They were succeeded by the AL-MOHADS (1147–1258). Morocco became the center of the Almohad empire, which included modern-day ALGERIA, TUNISIA, LIBYA, and large areas of Spain and Portugal.

The Marinid dynasty (1259–1550) seized control of Morocco from the Almohads, but they could not entirely unify the country. The Berbers and Arabs continued their civil war, and the region was thrown into disorder.
