The Yomut are in the Caspian area and in northern Turkmenistan. By allying themselves with the Uzbek khans of Khiva, they gained power (1600–1873) and dominated several other groups whose weaving are lumped with theirs into a homogenous Yomut group that to this point has not been differentiated. Yomut rugs have more variations in design than do other Turkmen weavings, no doubt because they were made by various groups dominated by the Yomut. Another distinct weaving group, the Chaudor, produces the darkest and least attractive Turkmen rugs overall. They are also the least likely to depend on red and blue, featuring colors such as brown, often with an olive-green cast.

Uzbek Rugs

One of the most prolific non-Turkmen weaving groups is that of the Uzbek people. Because they frequently copy the rugs of their Turkmen neighbors, it is difficult to distinguish Uzbek rugs, and for many years, most Uzbek rugs were sold as Turkmen. In the 1990s, experts began to attribute many of the so-called Afghan Turkmen rugs to the Uzbek, particularly those with less evenly spaced patterns. Yet even today significant numbers of rugs described as Turkmen, particularly those coming from Afghanistan, are actually

Uzbek. Complicating this is the fact that Uzbek carpets include some made by Tajik weavers, and it is unclear how to tell one from the other.

Not all Uzbek carpets are village-made. Carpet workshops in Bukhara and other cities wove excellent large carpets (c. fifteenth to twentieth century). Some Uzbek formal-workshop carpets that date to the sixteenth century are much like the best Persian rugs of the Safavid dynasty (1501–1722/1736) in quality, differing only in colors and designs. These masterpieces are referred to as Salting carpets (1588–1598), after a magnificent carpet in the Victoria and Albert Museum in London. Based on color, artistic style, and writing (lines of poetry woven into the borders), some were probably produced in the Uzbek courts at Herat and Bukhara around 1590.

Rugs of Other Central Asian Peoples

A number of Turkic weaving groups produce small numbers of wool pile rugs primarily for domestic use: the Karakalpaks, Kazakhs, Kyrgyz, and Mongols. Because these groups were never encouraged to produce rugs for export, they stayed truer to the old traditions. The Turkmen and Uzbek, on the other hand, wove the majority of their rugs for sale. The designs reacted first to Russian and then to Western market forces. The noncommercial weaving groups tended to weave objects suited to their lifestyle, such as bags, door covers, yurt or *gur* wrappings, horse trappings, and odd-shaped small rugs.

CASHMERE INDUSTRY Cashmere hair from varieties of cashmere goats is a major agricultural product of China and Mongolia. Cashmere is the down hair shed by goats living in the high, dry altitudes of Eurasia. Cashmere lies beneath the coarse outer hair and provides insulation from the cold. This rare precious natural fiber has been known since Roman times for its lightness, warmth, and softness. For hundreds of years, it was used exclusively in luxury fabrics that only royalty could afford. Napoleon gave cashmere shawls to his empress, Eugenie, and Queen Victoria prized the fabric. In the 1920s, it was developed into fashionable clothing by the Parisian designers Coco Chanel and Jean Patou.

China is the world's largest producer of cashmere, generating around 10,000 tons per year, over 60 percent of the world market of 16,500 tons. Mongolia is the second-largest producer with about 3,000 tons annually; the cashmere industry has been a major component of the Mongolian economy. Other cashmere-producing countries are New Zealand, Nepal, Iran, Afghanistan, Australia, and the United States.

Originally the cashmere-manufacturing industry developed in Scotland, which was noted for its specialized-weave knit techniques in underwear. In the second half of the twentieth century, cashmere processing and manufacturing increasingly moved to the countries of fiber origin, especially China, although Scotland still produces very high quality cashmere clothing.

It takes a Kashmir goat four years to produce enough hair for one sweater. To collect the hair, the herders comb the goats by hand every spring, and the hair is sold in bales. The cashmere industry is divided into three distinct sectors: raw (greasy) cashmere gathered by herders; processed (dehaired) cashmere, the product of a refined combing, cleaning, and sorting process; and finished (manufactured) cashmere products, including yarns and clothing, usually knit on hand-operated machines. Two kilograms of raw cashmere yield one kilogram of dehaired cashmere.

The Cashmere Industry in China

Cashmere-down hair in China comes from goats grazing on the plains of Inner Mongolia, Xinjiang, and the Himalayan Mountain highlands leading to the Tibetan Plateau—regions surrounding the Gobi Desert.

The fibers are locally combed, cleaned, dyed, and spun before being knitted into fabric in North Chinese mills or before being exported. In 1997, China produced 9,742 tons of raw cashmere and imported 827 tons of raw cashmere, exporting no raw greasy cashmere. A sum of 5,285 tons was processed; half was used in the domestic market, and half was exported. The half that remained in China was made into finished goods, about a quarter of which went into domestic sales, while the rest was exported.

The Cashmere Industry in Mongolia

Cashmere is the second-largest hard-currency-earning export of Mongolia. In 1997, Mongolia produced 2,558 tons of raw cashmere. A total of 1,731 tons remained in the domestic market, while 827 tons were exported to China. Some 866 tons were processed in the country, and 603 tons were exported. Mongolia manufactured 263 tons of cashmere finished goods, exporting all but 38 tons of it.

At the end of 1997, Mongolia had over 10 million cashmere goats, double the herd size of 1990, grazing mainly in the eight Gobi provinces. The number of goats has been increasing from 12.3 percent to 18.5 percent annually in the past decade. If such increases continue, the U.S. Agency for International Development postulates that by 2014 goat numbers will increase to 14 million head and will supply 4,200 tons of raw cashmere.

Cashmere Trade and Future Prospects

During Mongolia's socialist era (1921–1990), cashmere was exported mainly to Europe. Exports shifted dramatically to China in the democratic era since 1990, with the prime beneficiaries being the Mongolian *arat* (nomadic herder) producer and the Chinese manufacturing establishment. With the rapid growth of cashmere loans from the Western banking system, Mongolian customers were unable to buy the nomads' raw cashmere, so that the nomads increasingly turned to Chinese traders who came to them in the Gobi Desert. With a change of government from Communist Party rule to a coalition of democratic parties in 1996, the Mongolian authorities were convinced to lift their mid-1990s ban on the export of raw cashmere and replace it with a 30 percent export tax on raw cashmere. The tax was poorly implemented, as corrupt senior officials realized that they could make fortunes by selling raw cashmere tax free to Chinese factories. It is estimated that at least 50 percent of Mongolian raw cashmere is smuggled to China with no duties paid on either side. This has enabled China to capture the

Mongolian raw cashmere-export market, depress the Mongolian manufacturing sector, and take control of the world cashmere market.

The Chinese now mix the longer Mongolian hair fibers with shorter Chinese fibers to increase yarn strength. In the 1990s, Chinese dominance of the world's cashmere market and rapid expansion of Mongolian goat herds led to what most experts agree was an oversupply of low-quality cashmere. World prices of raw cashmere dropped from about \$60 per kilogram in 1989 to \$15 per kilogram in 1998. Mongolia's lower-quality fibers come from its older goats. Diseases and the collapse of the Russian goat-meat market in the 1990s reduced Mongolia's goat slaughter. The older goats produced thicker, lower-quality fibers, which added to the Chinese hair resulted in a less luxurious and less expensive product. This accounts for the flood of finished cashmere goods at greatly reduced prices, which became available on the world market in the 1990s. However, two successive disastrous winters in 1999–2001 in Mongolia and Inner Mongolia killed off millions of goats, which will improve fiber quality in the short term. It is expected that breeding-improvement-programs are needed to improve quality in the long run.

CASPIAN SEA The Caspian Sea divides the Eurasian landmass, separating the mountainous Caucasus region to the west from the deserts of Central Asia to the east. At 372,000 square kilometers in area, the peanut-shaped Caspian Sea is the world's largest inland lake, enclosed by Azerbaijan, Iran, Kazakhstan, Russia, and Turkmenistan. The Caspian basin is twenty-eight meters below sea level and is fed mainly by the Volga River, which flows southeast from Russia. The salty lake plunges to a depth of about one thousand meters in the south, but is only somewhat over three meters deep in the northern waters. The Caspian is a seasonal habitat for birds migrating from Europe and Asia, including flamingos and the rare

white-tailed eagle. Baku, Astrakhan, Aqtau, Atyrau, and Makhachkala are the most important ports.

Oil and Natural Gas

The Caspian Sea contains some of the world's largest deposits of oil and natural gas. Hydrocarbon exploitation in the Caspian Sea was limited during the Soviet era, but since the dissolution of the Soviet Union in 1991, the Caspian basin's huge, undeveloped natural resources have been the source of much international attention. Previously, the sea's legal status was governed by 1921 and 1940 treaties between the Soviet Union and Iran, but since Azerbaijan, Kazakhstan, and Turkmenistan received their independence, the Caspian littoral states have been unable to agree on a new legal regime governing the use of the surface, water, and subsea hydrocarbon resources. Despite the absence of a multilateral agreement, several countries already have begun oil and natural gas exploration in the Caspian. International energy consortiums, such as the Azerbaijan International Operating Company, have invested billions of dollars in developing infrastructure to develop and export the oil and natural gas.

Caviar

The Caspian Sea is also the source of about 90 percent of the world's caviar. However, the lack of an international agreement safeguarding the sea's environment has led to overfishing and poaching of sturgeon, the fish whose roe or eggs are used to make the delicacy, resulting in dwindling fish stocks. Environmentalists have warned that poaching of beluga, the largest and rarest sturgeon, is threatening to push the species into extinction. Legal trade in Caspian caviar is estimated to be worth \$100 million per year, but the illegal catch in the four former Soviet republics is believed to be ten to twelve times higher. In spring 2001, the United Nations Convention on International Trade in Endangered Species (CITES) banned exports of caviar from Azerbaijan, Kazakhstan, Russia, and Turkmenistan. Despite opposition from environmentalists in March 2002, CITES lifted the export ban on the former Soviet republics, citing improved management of their sturgeon stocks.

CASTE "Caste" refers to a rigid system of ranked social inequality with significant barriers to mobility or to intimate associations between different strata. The word also refers to one of the ranked strata or subgroups that make up such a system. Traditional India is considered the classic example of a caste system, but the concept has also been used to describe extreme forms of racial, ethnic, and class segregation in other societies. "Caste" comes from the Portuguese *casta*, meaning lineage, breed, race, or category (first attested used in English in 1613).

Caste in Traditional India

Hindus usually describe the caste system with one or both of two ancient concepts: *varna* and *jati*. *Varna* (color) refers to the categories that are described in the early Indian religious texts such as the Rig Veda (origins 1500–1200 BCE; present form c. 200 BCE) and the *Laws of Manu* (c. 200 BCE–100 CE). These texts describe four ranked categories: priests (Brahmans), warriors (Kshatriyas), farmers and merchants (Vaisyas), and laborers and servants (Sudras). The first three categories are considered "twice-born" (*dvijias*) and are allowed to study the sacred scriptures. A fifth category of outcasts is referred to in *The Laws of Manu* as *chandala*. They are supposedly outside Hindu society, but historically are an integral part of it. Westerners have referred to this group as untouchables. They were usually associated with activities considered to be polluting, such as removing feces or dead animals. In contemporary India, the government refers to these groups as Scheduled Castes. Mohandas (Mahatma) Gandhi (1869–1948) called them *Harijans* (children of God). Many of them have adopted the name *Dalits* (the oppressed).

The actual social structure in India has long varied from the *varna* scheme described in the sacred texts. Society has been differentiated into several thousand named social categories usually referred to as *jatis* (lineage, species, race). Scholars do not know whether *jatis* developed from *varnas*. It is clear that the *varna* scheme has long served as a simplified indigenous model of the caste system, whose legitimacy was advocated primarily by Brahmans and other high-caste groups. The description of the *jati* system that follows attempts to summarize the information developed during the period that Britain ruled India (1848–1947 CE) and the views of social scientists in the first quarter-century after Indian independence.

Most *jatis* were associated with a particular traditional occupation or ritual activity, such as barber, drummer, cow herder, priest, and so forth. These categories were ranked in a rough hierarchy based to a

significant degree on their supposed ritual purity, with Brahmans at the top and untouchables at the bottom. Ritual purity was partly an attribute of birth, and partly due to the fastidiousness with which individuals and castes conformed to certain lifestyle norms. Bathing before meals, purification of cooking areas, being a vegetarian, minimizing associations with those of low caste, keeping women relatively secluded, not allowing widows to remarry, and avoiding manual work in the fields were a few of the behaviors usually associated with ritual purity. The status of a caste was also affected by the members' wealth, political power, and the *varna* category with which they were associated. For example, Rajputs, who are common in much of northern India, are usually classified as Kshatriyas and hence claim a higher status than the Vaisya or Sudra castes in their region.

These *jati* categories were divided into—or more accurately composed of—numerous regional subcastes, ranging from a few hundred families to tens of thousands. Subcastes were usually endogamous, (composed of families who intermarried with one another and refused to marry others). Because of endogamy, many members of a subcaste were kin by birth or marriage. Most castes also practiced commensality; that is, they ate only with members of their own or a higher caste.

Most castes participated in agricultural production or modern occupations. In only a few artisan and service castes, such as clothes washers, barbers, and goldsmiths, did most members earn their living by carrying out their traditional occupation. Many castes, however, performed their traditional functions on specific occasions. For example, drummer castes in south India serve as drummers for certain festivals or rituals. The great majority of castes were classified as Sudras, though their ritual status varied from quite high to very low. Some of the most common Sudra castes were barbers, carpenters, blacksmiths, goldsmiths, oilseed pressers, farmers, potters, cow herders, shepherds, flower growers, vegetable gardeners, grain parchers, sweetmeat makers, tailors, weavers, clothes washers, and bangle makers. The three higher *varnas*, as well as the category of untouchables or Scheduled Castes, each contained a number of distinct castes.

A typical village might include members of from five to twenty-five castes. There were nearly always some type of Brahman and an array of Sudra castes in a local area. In some places, there were castes that claimed to be Kshatriyas or Vaisyas, but in many areas of the South, those *varnas* were not represented. Typically, a dominant caste or coalition controlled most local political and economic resources—especially land and the labor needed to work it. While caste rank was associ-

CASTE

Edgar Thurston's *Castes and Tribes of Southern India* is an attempt to provide a full accounting of all the castes of the region. Although incomplete, it remains the most comprehensive list. The following is a sample of the listings.

Baita Kammara.—The name, meaning outside blacksmiths, applied to Kamsala blacksmiths, who occupy a lowly position, and work in the open air or outside a village.

Bajantri.—A synonym of Mangala, indicating their occupation as professional musicians.

Bakuda.—A sub-division of Holeya.

Balanollu.—Balanollu and Badranollu are names of gotras of Ganigas, the members of which may not cut *Erythoxylon monogynum*.

Balasantosha.—The Balasantosha or Balasanta vandlu (those who are children) are described in the Kurnool Manual as "ballad reciters, whose chief stories are the Bobbili katha, or the story of the siege of the fort of Bobbili in Vizagapatam by Bussy"; the Kurnool settled in the Tamil district of Madura.

Bovi.—The name of the palanquin-bearing section of the Mogers of South Canara. Some Besthas from Mysore, who have settled in this district, are also called Bovi, which is a form of Boyi (bearer).

Boya (see Bedar).—Boya has also been recorded as a sub-division of Malam, a name for Ekari.

Source: Edgar Thurston and K. Rangachari. (1909) *Castes and Tribes of Southern India*. Madra, India: Government Press, 266–267.

ated with economic and political power, the correlation was very imperfect. In most areas, the controllers of land and labor were not Brahmans; frequently they were higher-status Sudra castes. The dominant caste was often able to mobilize considerable physical force to protect its interests. Members of this dominant group typically served as patrons (*jajmans*) for whom Brahman priests performed religious rites in return for gifts and fees. The dominant caste was also the patron of a variety of specialist castes—barbers, blacksmiths, sweepers, and so forth—who provided various goods and services. In return for their services, these clients were given a portion of the patron's grain at harvest time. Where the integration of the division of labor at a village level was accomplished by patron-client (*jajmani*) relationships, markets and extreme forms of coercion (for example, slavery or serfdom) may have been less prevalent. Scholars disagree about how extensive this system was.

In contrast to a caste, which was a category of people of similar rank and characteristics, a subcaste was

an actual social group or network. Families were linked to members of their subcaste in other villages in the region. In many areas, daughters had to marry men from other villages, creating intervillage networks of kin and in-laws. Many subcastes had a council of respected leaders (*panchayat*) who settled disputes and disciplined errant members. These regional subcastes were usually endogamous; that is, husbands and wives had to be from the same subcaste. In turn, their children were members of this subcaste. Endogamy was the primary determinant of subcaste boundaries. The exception was a number of castes in north India and a few in south India who practiced what anthropologists refer to as hypergamy. That is, males could marry women from a caste of slightly lower rank. In all castes, parents arranged most marriages. While a local *jati* or subcaste was a circle of peers, there were important variations in the status of the families in a subcaste. These differences were related to wealth, influence over other families, and lifestyle, especially ritual purity. A family's status could be increased if it arranged marriages with higher-status families.

Typically, a local caste category was segmented into several endogamous subcastes. For example, there was often more than one subcaste of cow herders in a given area or even in the same village. From the perspective of others, the cow herders belonged to the same caste; from their perspective, enough differences existed so that they neither intermarried nor ate with one another. Most people in a village knew the broad caste category of everyone else, though they often did not know their subcaste.

In principle, individuals and groups could not change their caste, but in practice there was considerable social mobility—usually involving small shifts in rankings. This typically occurred when a subcaste or lineage increased in wealth or political power. It then emulated the lifestyles of higher castes, adopted a new name, or claimed that it belonged to a higher *varna*. In a local area, the exact ranking of groups was subject to dispute and debate. Most disagreement was over whether a caste was just above or just below another local caste.

Most religious minorities in India, including Muslims, Christians, and Sikhs (who together make up about 15 percent of the population), also had caste-like divisions. Marriages were usually within these caste subgroups, and various forms of deference were shown to high-ranking strata. Non-Hindus are, however, usually less concerned about purity and pollution and commensality. The representation of these groups in any given area is, however, enormously variable. For example, in some areas of the Punjab, Sikhs constitute the overwhelming bulk of the population, while the same is true for Christians in a few areas of south India.

There have long been protests against the caste system, including those by the historical Buddha (563–483 BCE), the bhakti (devotional movements; 800–1800), and the anti-Brahman movement in south India (c. 1916–1940).

Theories of Caste

Scholars have proposed various explanations for this system of inequality. Louis Dumont has argued that the patterns found in Hindu India are due to its unique ideology, which values hierarchy based on distinctions of ritual purity and pollution. This notion contrasts with Western ideology, which places a high value on equality and individualism. McKim Marriott has emphasized even more strongly the distinctive nature of the Hindu caste system. In contrast to the Western dualistic understanding of biology and morality, Hindus, according to Marriott, have a monistic concept; there is no clear line between biol-

ogy and morality. The substances that make up the body are inherited from parents. They affect not only one's physical capacities, but shape one's moral capacities. Conversely, the morality of an individual's behavior eventually affects the quality of the substances that make up the body. Both Dumont and Marriott have been criticized for overemphasizing the role and ideas of Brahmans and for neglecting the resistance of lower castes, alternative indigenous ideologies, and the frequent deviation of actual behavior from these largely Brahmanical ideals. Moreover, their theories provide little insight into the changes that are occurring in contemporary India.

Beginning with A. M. Hocart, another scholarly tradition sees those with significant political and economic power (kings, lesser rulers, and dominant castes) as the creators and sustainers of the caste system. Specialized groups of subordinates provide rulers and dominant castes with services, and eventually these groups develop into castes. Kings and local rulers enforce this division of labor and the related status distinctions. An obvious criticism of this theory is that while most agrarian societies have had kings and local rulers, only India developed an elaborate caste system. Gerald Berreman has suggested that castes emerged as tribal and ethnic groups were incorporated into larger state structures. Nicholas Dirks has argued that the extreme elaboration and rigidity of the caste system did not fully emerge until the *pax Britannia* of the early nineteenth century. The colonial regime gave upper castes nearly unqualified control of property and prevented lower castes from using force to resist upper caste domination and ideology. The government census attempted to record officially the ranking of castes, which made the system more rigid than it had been.

Murray Milner, Jr., argues that in traditional India, status was a crucial form of power and, relative to most societies, independent of economic and political power. Hence, castes are best understood as an extreme form of status group. Milner proposes a theory of status relationships based on four characteristics of status. Status is not expandable; hence, if some move up, others must move down; therefore, mobility tends to be restricted. Status is inalienable; property and wealth can be stolen or taken by force, but status is dependent on the opinion of others and cannot simply be appropriated. Hence, once status systems are institutionalized, they are relatively stable; some form of the caste system has existed in India for three thousand years. Status is acquired through conformity to the norms of the group; hence, those with high status tend to elaborate and complicate the norms to make conformity difficult. The extensive norms governing

ENDING CASTE DISCRIMINATION

The founders of modern India believed that discrimination and the lack of opportunity for many Indians associated with the caste system was a serious hurdle to modernization and political stability. Caste discrimination was banned and "affirmative action" as a remedy was accepted in India's first Constitution, adopted on 26 January 1950.

Prohibition of discrimination on grounds of religion, race, caste, sex or place of birth.

(1) The State shall not discriminate against any citizen on grounds only of religion, race, caste, sex, place of birth or any of them.

(2) No citizen shall, on grounds only of religion, race, caste, sex, place of birth or any of them, be subject to any disability, liability, restriction or condition with regard to—

(a) access to shops, public restaurants, hotels and places of public entertainment; or

(b) the use of wells, tanks, bathing *ghats*, roads and places of public resort maintained wholly or partly out of State funds or dedicated to the use of the general public.

(3) Nothing in this article shall prevent the State from making any special provision for women and children.

(4) Nothing in this Article or in Clause (2) of Article 29 shall prevent the State from making any special provision for the advancement of any socially and educationally backward classes of citizens or for the Scheduled Castes and the Scheduled Tribes.

Source: Ministry of Information and Broadcasting. (1957) India's Constitution. Delhi: The Ministry.

purity and pollution are an obvious example of this process. Status is acquired through associations: associating with superiors increases your status; associating with inferiors decreases it. This is especially so for intimate associations. Eating and sex are symbols of intimacy in all societies: hence the strong emphasis on dining with and marrying those of similar status. (As the theory suggests, these behaviors are found in other caste-like systems such as aristocracies, racially segregated societies, and adolescent cliques.)

Feminist scholars have elucidated the role of women and gender differences in the understanding and significance of caste and the centrality of gender inequality and male dominance in the caste system. Male dominance may be a necessary but not sufficient condition of the caste system.

Caste in Contemporary India

The Constitution of 1949 outlawed untouchability and government discrimination based on caste. Places in Parliament, universities, and government jobs were specifically reserved for the Scheduled Castes, or former untouchables. In 1990, the government expanded the number of government jobs and university admissions reserved for disadvantaged castes from 22.5 percent to 49 percent. In addition to Scheduled Castes, positions were reserved for Other Backward Classes (OBC), which includes mainly lower- and middle-status Sudra castes. The openings available to upper-caste members were significantly reduced—in a job market where there was already high unemployment. This action led to violent protests in many parts of India and to increased emigration of professional

Villagers view the victims of a massacre in India on 22 April 1999. The low caste villagers were killed by the Ranvir Sena militia in retaliation for the earlier killing of 35 upper caste farmers by Communist rebels. (AFP/CORBIS)

families to developed countries. The reservations program was upheld by the Indian Supreme Court, but it has accentuated the mobilization of castes as political entities.

In 1996, a coalition of parties called the United Front and dominated by OBC gained control of the government of India; the cabinet contained only one Brahman—an indication of the increased influence of lower castes. Political parties dominated by upper castes mobilized in the name of Hindu nationalism (*Hindutva*), and in March 1998 they gained control of the government. The emergence of Hindu nationalism was associated with the sometimes violent persecution of Muslims, Christians, and lower-caste groups. Similar caste-linked political struggles and conflict took place for control of many of the state governments. Hindu nationalist parties and organizations have recruited some lower-caste members into leadership positions. Of course, many factors (in addition to caste) shaped political coalitions and outcomes.

With greater urbanization and industrialization, it has become impractical for people to be overly concerned about who is sitting next to them in public restaurants or factory lunchrooms. Hence, the norms of commensality have been greatly weakened. Even in arranging marriages, wider categories of people are considered appropriate as potential spouses, and increased attention is paid to their education and financial resources rather than to their subcaste. Public statements about the superiority or inferiority of castes are now unusual and considered inappropriate, though in private they are still expressed and taken into account in arranging marriages. Subcaste councils (*panchayats*) have few effective sanctions for deviant members, though more inclusive caste associations (*shabas*) are increasingly active in pressing the economic and political interests of their members. These changes are occurring in villages too, though their intensity varies by region and caste. Muslims and other minorities are even more likely to reject the legitimacy

or presence of castes within their communities, claiming that it is a Hindu institution. Just as Westerners differ greatly on the meaning of class or race, the very meaning of caste for Indians has become more variable and ambiguous.

CATHAYA TREE The cathaya tree (*Cathaya argyrophylla*) belongs to the pine family (*Pinaceae*). The only two living species of the cathaya are found in southwest China in the southeastern parts of Sichuan, the northeastern parts of Guizhou, the southwestern parts of Hunan, the northeastern parts of Guangxi, and in the Kunming area of Yunnan. The cathaya is an evergreen tree bearing cones and grows to about twenty meters. It was only in the 1950s that this species

was discovered, and the extent of the cathaya, as far as can be ascertained, is limited to some three thousand trees. It has therefore been considered an endangered species, and cathaya seedlings are being raised by Chinese conservation organizations. One fossil species of the cathaya has been found in Germany.

CATHOLICISM, ROMAN—PHILIPPINES

The Philippines is the only Christian nation in Asia. Although more than 80 percent of Filipinos are said to be Roman Catholic, many fewer are genuine Catholics. There is a wide gap between professing Catholics and orthodox Catholics. Most people believe in a Christianized Bathalism (from the name Bathala, or God), and the traditional indigenous religions and respect for nature have profoundly shaped religious beliefs and practices in the Philippines.

Introduction of Catholicism

The Roman Catholic faith was introduced by the Portuguese navigator Ferdinand Magellan (c. 1480–1521) in 1521, but the expedition led by the Spanish explorer Miguel Lopez de Legazpi (c. 1510–1572) brought a permanent presence. As was the case in Latin America, the mendicant orders (orders combining both cloistered and community work) were responsible for bringing and spreading the Catholic religion among the local inhabitants.

BAROQUE PHILIPPINE CHURCHES—WORLD HERITAGE SITE

For representing a unique interpretation of sixteenth-century Spanish Baroque by traditional Filipino and Chinese craftsmen, the churches of Manila, Santa Maria, Paoay, and Miag-ao were designated World Heritage Sites by UNESCO in 1993.

THE CONVERSION OF FILIPINOS TO CATHOLICISM

Perhaps the most enduring of Spain's influences on the Philippines is Roman Catholicism. In 2001, nearly five centuries after Spanish arrival, a majority of Filipinos are Catholics and the Philippines is the only Christian nation in Asia. The following is the account of the first baptism of Filipinos by Magellan's companion Antonio Pigafetta on 7 April 1521.

After dinner the priest and some of the others went ashore to baptize the queen, who came with forty women. We conducted her to the platform and she was made to sit down upon a cushion, and the other women near her, until the priest was ready. She was shown an image of our Lady, a very beautiful wooden Child Jesus, and a cross. Thereupon she was overcome with contrition and asked for baptism amid her tears. We named her Johanna after the emperor's mother; her daughter, the wife of the prince, Catherina, the queen of Mazaua, Lisabeta, and the others each their (distinctive) name. Counting men, women and children, were baptized eight hundred souls. The queen was young and beautiful, and was entirely covered with a white and black cloth. Her mouth and nails were very red, while on her head she wore a large hat of palm leaves in the manner of a parasol, with a crown about it of the same leaves, like the tiara of the pope; and she never goes any place without an attendant. She asked us to give her the little Child Jesus to keep in place of her idols; and then she went away. In the afternoon the king and queen, accompanied by numerous persons came to the shore. Thereupon, the captain had many trombs of fire and large mortars discharged, by which they were most highly delighted. The captain and the king called one another brothers. That king's name was Raia Humabon. Before that week had gone, all the persons of that island, and some from the other islands were baptized. We burned one hamlet which was located in a neighboring village because it refused to obey the king or us. We set up the cross there for those people were heathens. Had they been Moros, we could have erected a column there as a token of greater hardness, for the Moros are much harder to convert than the heathen.

In addition to the six Augustinian friars who accompanied Legazpi's expedition, twelve Franciscans came in 1577, and Dominicans and Jesuits arrived in 1581; all carried on programs of evangelism and indoctrination. Financially supported by the Spanish crown, the friars represented a political as well as a religious presence. The Spanish friar was often the figure of authority outside Manila.

The early optimism that had characterized Spanish missionary work was later replaced by a disillusion-

ment partly caused by the realization that the Filipinos were not passive recipients of this new religion. Catholicism in the Philippines was to a certain extent unique because the Filipinos added aspects of their traditional religion to it.

Nature of Filipino Catholicism

Catholicism provided a world of metaphors that Filipinos continue to use, particularly in times of crisis. Their enthusiasm for certain aspects of Catholi-

St. Williams Cathedral and the Ten Commandments at Laoag, Ilocos Norte, in 1998. (STEPHEN G. DONALDSON PHOTOGRAPHY)

cism should not, however, be mistaken for total acceptance of it. For example, in Philippine culture, where women had been equal to men and had often been in positions of power as priestesses, the Virgin Mary became the symbol of the new faith. In addition, where childhood had been idealized, the Santo Niño, or Holy Child, was venerated.

The foreignness of Catholicism was demonstrated in at least two areas: education and the clergy. Although the Spaniards established a number of schools and colleges (for example, the University of Santo Tomas in 1611), these were closed to Filipinos. The religious orders were also closed to Filipinos because of the Spanish concept of purity of blood—the requirement that the applicant prove that his or her family had been Christians for four generations. It was not until the eighteenth century that Filipinos were trained to be priests, and even then they became only "lay" priests and were not allowed to become friars (members of mendicant orders) or regulars. Regulars are those who belong to a *regula*, or order, such as Augustinian or Dominican.

During the Spanish domination of the Philippines, the various orders (with the exception of the Franciscans) amassed large tracts of land, often as the result of donations or by direct purchase. Prior to the Philippine Revolution in 1896, the orders owned 25 percent of the farming land in the provinces surrounding

Manila. Thus, the church became a major economic force, in addition to its religious and political importance, and this fact had social consequences. Those who worked with and for the friars in managing their haciendas became an emerging elite at the beginning of the nineteenth century.

The conflict between the Philippines and Spain that culminated in the Philippine Revolution was in part an extension of the ongoing hostilities between secular Filipino priests and Spanish friars and as such can be viewed in religious as well as political terms. The execution of three Filipino priests, Mariano Gomes, José A. Burgos, and Jacinto Zamora, on 17 February 1872 illustrated the lengths to which the friars would go. The three were falsely accused of participating in the Cavite Mutiny in January 1872 and were put to death.

After independence was declared on 12 June 1898, the new constitution included a provision for the separation of church and state, and this policy continued with the arrival of the United States.

Philippine Catholicism in Recent Times

Vatican II (1962) and the declaration of martial law (1972) resulted in significant changes in the role of the Roman Catholic Church in the Philippines. The cause of social justice was taken up by priests and nuns, often at the risk of their lives.

The imagery or metaphors of Catholicism were sometimes associated with those opposing the regime of Ferdinand Marcos (1917–1998) and the martial law imposed at that time. For example, Al Santos used the *sinakulo*, a dramatic presentation of the Easter story, to illustrate the condition of those living in the slums of Manila, who are presented as suffering Christs, oppressed by those in power. Other uses of Catholic metaphors were unintentional. The political martyr Benigno Aquino, Jr. (1932–1983), came to be viewed as the slain savior, and his widow Corazon Aquino (b. 1933) as the suffering Mary Magdalene. She spoke of her husband's death as the country's resurrection.

Yet, despite the changes introduced in recent years, Catholicism in the Philippines has remained much the same as it had been from the beginning. The ancient animistic deities have been transformed into Christian figures, and ancient beliefs have continued to permeate religious beliefs and practices.

CATHOLICISM, ROMAN—VIETNAM Although an estimated 80 percent of Vietnam's population practice Buddhism to some extent, there are an estimated 3 million Roman Catholics in Vietnam, approximately 3.75 percent of the nation's population. Catholicism first reached Vietnam in the sixteenth century with the arrival of Portuguese missionaries. By the early seventeenth century, Catholic priests from Portugal and France had established several missions in Vietnam. In 1624 there were an estimated twenty-one Jesuits in the nation. At first the Portuguese priests were dominant in numbers and in influence. In fact, the Vietnamese referred to Catholicism as the "Portuguese religion," and they tended to view all Europeans as Portuguese.

Alexandre de Rhodes

Despite the early predominance of Portuguese Jesuits, the most influential missionary in Vietnam in the

seventeenth century was Father Alexandre de Rhodes (1591–1660), a Frenchman. De Rhodes, born in Avignon, possessed an unusual gift for learning and for understanding languages, and his major contribution to Vietnamese history was the development of *quoc ngu*, the romanized script of the Vietnamese language. This process of alphabetizing the Vietnamese vernacular had been undertaken earlier by a Portuguese missionary, but de Rhodes pursued the work further, believing that the development of *quoc ngu* would help the spread of Catholicism in Vietnam. *Quoc ngu* is now the official writing system of Vietnam. De Rhodes also codified the Vietnamese language and produced a number of written works, including the famous *Dictionarium Annamiticum* and a Vietnamese language catechism. In addition, de Rhodes wrote several memoirs and a history of Tonkin.

While in Vietnam, on and off between 1627 and 1645, de Rhodes did not limit himself to academic pursuits. He is said to have trained Vietnamese catechists and to have baptized an estimated nine thousand Vietnamese.

Persecution

Throughout the seventeenth and eighteenth centuries, missionaries continued to attempt to spread Catholicism throughout Vietnam. Several Catholic orders, such as the Jesuits and the Dominicans, were present. In addition, there were also orders of Catholic nuns who established convents in various parts of the country. At times, the missionaries were tolerated by the Vietnamese government, but more often than not they were persecuted. Some missionaries, Alexandre de Rhodes among them, were simply expelled from Vietnam; others were executed. These persecutions were more pronounced during the eighteenth century, and they tended to follow the political climate in Vietnam. Persecution of Catholics tended to occur when the Vietnamese government needed to consolidate its power or assert its authority. At such times, Catholicism's doctrine was the principal problem. The facts that Catholicism is monotheistic and that its claims to spirituality are exclusive brought it into conflict with the traditional, Confucian order of things in Vietnam. In spite of this, by the early nineteenth century, there were hundreds of thousands of Vietnamese Catholic converts.

Catholics and the Colonial Government

Following the creation of the Société des Missions Étrangères (the Society of Foreign Missions) in 1664, French missionaries became the most active and the most numerous in Vietnam. The Société's principal aim was the spread of Catholicism in Asia, and it re-

ceived not only the support of the papacy, but also of the French monarchy. Often dependent on merchant ships to transport them to Vietnam, French missionaries developed close ties with French merchants. As a result, in the eyes of many Vietnamese officials, there was little difference between French missionaries and French merchants. French interests in missionary activity in Vietnam followed the political situation in France itself—waning during the French Revolution, but waxing again on the eve of French consolidation of power in Vietnam in 1885 when Emperor Ham Nghi was forced to flee the capital. By the time France had colonized Vietnam, Laos, and Cambodia in the late nineteenth century, there were an estimated 2 million Vietnamese Catholic converts. In fact, repression of Catholic missionaries and Catholic converts provided a rationale for bringing French troops in to Vietnam to protect them.

Despite the strong anticlerical sentiments of many French administrators, French colonial authorities were not averse to missionary activity since it was hoped that Catholicism would foster Vietnamese acceptance of the French colonial government. In addition, some Catholic missions in Vietnam served a useful purpose in the eyes of the French administration, since many offered Catholic schooling to Vietnamese children at little, if any, cost to the French colonial government. French colonial administrators appreciated these schools both for their cost efficiency and for the fact that they helped inculcate Vietnamese children with French cultural and social values. Among the most famous of these schools was the Collège d'Adran, founded in 1861. There were also a number of girls' schools established by orders such as the Sisters of St. Paul de Chartres.

Because of their close ties with the French administration, Vietnamese Catholics tended to dominate in the fields of business and education. Vietnamese Catholics were more likely to hold civil-service positions within the colonial administration, and their higher levels of education meant that they were also more likely to become professionals. As a result, Vietnamese Catholics tended to be wealthier than their non-Catholic compatriots. In spite of the fact that the majority of Vietnamese Catholics, particularly in the northern area of the country, were peasants, the influence of the educated Catholics was significant.

During the Franco-Viet Minh War (1946–1954), many Vietnamese Catholics favored independence from France, but most were wary of the Viet Minh leadership's Marxist leanings. As a result, they supported, in 1949, the institution of the Bao Dai government, which the French supported. Following

St. Joseph's Cathedral in Hanoi. The cathedral was built in 1886. (CHRISTOPHE LOVINY/CORBIS)

France's defeat at Dien Bien Phu and the Geneva accords of 1954 that established a demilitarized zone at the seventeenth parallel, an estimated 600,000 to 700,000 Vietnamese Catholics from northern Vietnam made their way to the south of the country in order to support the government of Ngo Dinh Diem (1901–1963), himself a Catholic. This influx of Vietnamese Catholics in southern Vietnam raised their numbers from approximately 450,000 to 1.1 million. This Catholic community in the south became the backbone of Ngo Dinh Diem's government. They were to become a formidable presence thanks to Diem's patronage. Diem's government gave key positions in the military and in the government to Vietnamese Catholics. Diem's brother, Ngo Dinh Thuc, was archbishop of Hue.

Catholics in the Vietnamese Government

The favored position of the Vietnamese Catholic minority in southern Vietnam created conflict with the

majority Buddhist population. Buddhist protests resulted in severe repression of Buddhist monks and communities during the Ngo Dinh Diem government. The tension and the repression of Buddhists subsided somewhat following the assassination of Diem and his brother Ngo Dinh Nhu, who headed South Vietnam's police and security forces, in 1963 and during Nguyen Van Thieu's government (1965–1975).

Following the end of the war with the United States and reunification of Vietnam in 1975, a considerable number of Vietnamese Catholics left Vietnam for fear of reprisals and persecution for having supported the Ngo Dinh Diem government and the government of South Vietnam. Many have made their way to the United States and to France. In Vietnam today, Catholicism is protected by the Vietnamese constitution. In spite of such safeguards, Catholicism has been monitored closely by the Vietnamese government and Catholic activities have been significantly curtailed. There are presently an estimated 3 million Catholics in Vietnam.

CAUCASIA Caucasia is an isthmus bounded by the Black and Caspian Seas and by the steppes of the southern tier of the Russian federation and Iran. The region is dominated by the Caucasus Mountains. Historical Caucasia encompasses not only the central region of Georgia and the southern region of Armenia but also Caucasian Albania and Azerbaijan in the east and the diverse peoples of northern Caucasia. The preeminent communication and commercial arteries are rivers, especially the Terek in the north, the Kura in Georgia and Azerbaijan, and the Araks in Armenia. Caucasia's historical importance rests upon its central position in Eurasia and the endurance of local cultures in the face of tremendous imperial pressures.

To medieval Arab geographers, Caucasia (al-Kabk) was "the mountain of languages." Although Armenian

belongs to the Indo-European linguistic group and Georgian anchors the separate Caucasian linguistic family, both languages show evidence of intimate contact with Persian and with one another. Connections between Georgian and Sumerian and between Georgian and Basque (ancient Greek writers referred to both ancient Spain and Georgia as "Iberia") have been hypothesized but remain unproven. Many of the languages of northern Caucasia—including Chechen, Ingush, Avar, Lak, Lezgian, and Udi—belong to the northeast subgroup of the Caucasian family.

Caucasia has long been an arena for Eurasian cross-cultural encounters. Some investigators have situated the Garden of Eden in the area, a notion seemingly reinforced by the Judeo-Christian tradition that the ark of Noah came to rest on Mount Ararat in present-day Turkey. Historically, Caucasia was affected by five of the great periods of Eurasian integration: the period when the ancient Silk Road flourished, the period of the Hellenistic civilization of Alexander of Macedonia, the period of Islamic expansion, the period of the Mongol empire, and the period of the Russian empire and the Soviet Union.

Caucasia and the Persian Sphere

For much of its early history Caucasia was the northern limit of Persian (Iranian) civilization. The Scythians, Sarmatians, and other nomads of ancient northern Caucasia were Persianized. The sedentary Georgian and Armenian peoples, too, were members of the expansive Persian commonwealth. Scholars have exposed many links between Caucasian and Persian civilizations, including linguistic parallels, the sharing of Persian proper names, Zoroastrianism, long-distance trade, conceptions of kingship (including *farnab*, or divine radiance), and legendary and historical traditions—particularly the Persian epic tradition crystallized in the eleventh-century CE *Shahnameh* by the Persian poet Firdawsī. Achaemenid and Sasanid inscriptions demonstrate that the Persians were cognizant of the social and cultural bonds with their Caucasian neighbors.

Greco-Roman influence already had penetrated Caucasia by the time of the Greek city-states, as is symbolized by Jason and the Argonauts, who reputedly journeyed to Colchis in western Georgia. However, classical influence was limited mostly to coastal regions. Although Greek was adopted by some of the local elites as their written language, Aramaic—the scribal language of Achaemenid Persia—seems to have been more widespread. More important, classical civilization did not displace the Caucasians' traditional orientation toward Persian-dominated western Asia.

The Effect of Christianity

Georgian and Armenian, along with Caucasian Albanian, became written languages only with the conversion of local dynasts to Christianity in the first half of the fourth century. In some respects Christianization was truly revolutionary. Armenian and Georgian developed into literary languages, and distinctive written historical traditions were created. Conversion also enabled a possible future alliance with Christian Byzantium. With the destruction of Zoroastrian Persia by the Muslims in the seventh century, the sedentary peoples of Caucasia increasingly came to identify themselves with Christian Byzantium.

Sasanid Persia's campaigns to restore Georgia and Armenia to the Persian political and religious sphere were unsuccessful. They did, however, nudge Georgia and Armenia into the Byzantine orbit. Beginning in 387 CE, Armenia was often partitioned between the Byzantines and the Persians. In 428, the Sasanid "King of Kings" managed to disband the Armenian Arsacid monarchy; a similar fate met its eastern Georgian counterpart by the year 580. Georgian political elites subsequently associated themselves with Constantinople in the seventh century. A result of this association was their acceptance of the Council of Chalcedon (in 451) definition of Christ as both divine and human in nature, and this, in turn, sparked lasting tensions between the Georgians and the Armenians, who leaned toward Monophysitism—the doctrine that Christ's nature was purely divine.

Rise of the Bagratids

The destruction of Sasanid Persia in 651 and the subsequent occupation of much of Caucasia by the Muslims upset the noble hierarchy of central and southern Caucasia. The Armenian Bagratid family took advantage of the tumultuous situation and established itself throughout the Armenian districts, also seizing power in neighboring Georgia. The Bagratids, who were Christian, then assumed the charge against the Muslims. Simultaneously, its Georgian branch established itself along the Byzantine-Georgian frontier and entertained close relations with Constantinople.

From the late ninth to the eleventh century, the Bagratids carved Armenia into a number of kingdoms and principalities, although one realm, Vaspurakan, was ruled by the rival Artsruni family. Pressures from the Seljuk Turks and the Byzantines and the rivalries among the Bagratids themselves led to the Byzantine annexation of the Armenian kingdoms in the mid-eleventh century. As a result, some Armenian elites migrated to southeastern Asia Minor and established the independent Armenian Cilician kingdom.

It was the Georgian branch of the Bagratid family that was to have lasting success in Caucasia itself. These Bagratids gathered the disparate Georgian territories, creating the first politically unified Georgian enterprise in the early eleventh century. They subsequently annexed much of Caucasian Armenia. Although the Muslim Seljuks were the chief adversary, the Georgian monarchs minted Islamic-type coins, patronized Sufis (Islamic mystics), and sponsored epic literature at their court written along Persian lines, such as the thirteenth-century *Knight in the Panther's Skin* by Shota Rustaveli. In many respects, Caucasia was still oriented toward the Near East.

The Georgian pan-Caucasian empire fell into disarray with inept rule early in the thirteenth century and was dismantled shortly thereafter by the Mongols. At this time, several autonomous principalities and kingdoms appeared in Caucasia. Following a number of particularly destructive invasions led by Timur (Tamerlane) in the late fourteenth century, the Christian princes of Caucasia lost one of their most important allies when Constantinople fell to the Ottomans in 1453. In the following century, Caucasia again became the arena of imperial competition with the Ottomans and Safavids of Persia vying for control. One historian considered the period from the fall of Armenian Cilicia in 1375 until the reign of Shah Abbas in the early seventeenth century to be the dark ages of Armenian history.

The Rise of Russian Influence

In the sixteenth century, the Persians and Ottomans waged a bloody competition for control of Armenia. At the same time, the Russians were expanding southward. In 1554, the Russians captured the city of As-

trakhan, giving them dominance over the Volga River and a foothold in the vicinity of the Caspian. Shortly thereafter a series of Russian embassies was dispatched to the Georgian kingdoms. This marked the first substantial and sustained contact between Caucasia and the Russian empire. Indeed, after the dissolution of Byzantium, many Caucasian Christians looked to Orthodox Russia as a potential savior. The eastern Georgian realm voluntarily became a protectorate of Russia in 1783. In 1801, the Russian czar, Alexander I, unilaterally annexed eastern Georgia. In the ensuing decades, much of Caucasia—*Zakavkazia* (Transcaucasia), a concept reflecting Russian imperialism—was brought under czarist authority. However, not all of Armenia fell under Russian rule. A large part of historical Armenia was controlled by the Ottoman government and remains part of Turkey today. The genocide unleashed upon the Armenians in 1915 is a lasting memory of this division.

Although Russian occupation halted indigenous political autonomy, it also brought unprecedented stability to Transcaucasia. Standardized written languages, educational systems, infrastructure, and unprecedented national consciousnesses for the Georgians, Armenians, and Azeris were created during Russian rule. Through Russia, Caucasian elites acquired access to European intellectual ideas, including socialism, Marxism, and nationalism.

When Nicholas II was removed from power in February 1917, political authority in Transcaucasia fragmented. In November 1917, the Transcaucasian Commissariat was formed to govern the entire region. By the following January, the Democratic Federative Republic of Transcaucasia was established. The federation was short lived, however. After a month, it dissolved into three independent republics: Georgia, Armenia, and Azerbaijan. All were crushed by Bolshevik troops in 1920–1921. They were reunited in the Federal Union of Soviet Socialist Republics of Transcaucasia in 1922, and then each emerged as an independent constituent republic of the USSR in 1936. The three retained this status until the collapse of the Gorbachev revolution in the early 1990s. By the end of 1991, Armenia, Azerbaijan, and Georgia emerged from the turmoil as independent nations.

CEBU (2000 est. island pop. 2.4 million; est. city pop. 718,000), City and island in the Philippines. The oldest city in the Philippines, Cebu City (the capital of Cebu province, on the east coast of Cebu Island) is the third-largest metropolis in the country and the major city in the southern Philippines. Cebu Island lies in the central Philippine archipelago, surrounded by the Bohol Strait in the southeast, the Tanon Strait in the west, the Visayan Sea in the north, and the Camotes Sea in the east. The island is approximately 196 kilometers long and 32 kilometers wide, with a land area of 4,422 square kilometers. Overpopulated, the island suffers from environmental degradation because of the dense population.

According to historical records, the island hosted the first European settlements in the Philippine archipelago. Ferdinand Magellan (c. 1480–1521), the Portuguese explorer, landed on Cebu on 7 April 1521 in the course of discovering the Philippines (he was later killed at nearby Mactan Island). An Italian traveling with Magellan, Antonio Pigafetta (1491–1534?), in an account of his experiences on the voyage, wrote that he saw ships from Siam, China, and Arabia at Cebu when the Portuguese sailed into the port; thus the city was already an important settlement before the Europeans arrived.

Miguel López de Legazpi (c. 1510–1570) founded the first Spanish settlement and Catholic mission on the island on 27 April 1565. Cebu City remained the capital of the Spanish possessions in the Philippines until 1571, when Manila on Luzon Island became the main administrative center. In Cebu City are the oldest church in the Philippines, the Basilica Minor del Santo Nino, in front of which is the cross that Magellan erected for the first Mass celebrated in the Philippines; the oldest school—San Carlos, founded in 1595; and the oldest street—Colon.

Today, Cebu City is an important economic center not only for Cebu Island but for the Visaya Islands and Mindanao as well. Cebu Island's economy includes agriculture, mining (coal, copper, limestone, silver), and small-scale manufacturing, such as food processing, textile, footwear, and furniture. Cebu City is also the educational center of the southern Philippines, with several major universities and colleges. The city has an international airport, and the port has maintained its international importance through the centuries.

CELEBES SEA The Celebes Sea (Sulawesi Sea) is a roughly triangular section of the western edge of the Pacific Ocean, located just north of the equator between the east coast of Borneo, the south coast of Mindanao Island (Philippines), and the northern reaches of Sulawesi. It occupies a total area of around 427,000 square kilometers (165,000 square miles), stretching approximately 675 kilometers (420 miles) north-south and 837 kilometers (520 miles) east-west. The Sulu archipelago and Mindanao Island form the northern borders of the sea; the Sangi Islands lie to the east; Sulawesi (Celebes) Island borders the south; and Borneo is on the west. The Celebes Sea opens on to the Philippine Sea in the east and is connected to the Java Sea through the Makassar Strait in the southwest.

The deepest area is around 6,220 meters (20,406 feet). In the area close to the major islands and archipelagos, however, the sea is warm and not very deep. There are numerous seamounts, many of them volcanic, rising from the sea floor and capped with corals. The warm tropical water (annual average 26° C) makes the Celebes Sea an abundant fishing ground. Many areas around the numerous beautiful islands are suitable for diving and attract foreign tourists, contributing scarce hard currency to the Indonesian and Philippines economies.

CENTRAL ASIA—EARLY MEDIEVAL PERIOD

The history of early medieval Central Asia is distinguished from that of other regions by the transition from a primarily Iranian population to a Turkic population. This region, particularly the part of Central Asia between the Syr Dar'ya and Amu Dar'ya Rivers, was traditionally home to nomads as well as a sedentary population located around cities and oases. The inhabitants were originally composed of Iranian stock, mixed with other groups. However, as the ancient period ended in the sixth century CE, a new dominant group entered Central Asia. Originating from Mongolia, the nomadic Turks began as overlords of a more sedentary Iranian population but eventually supplanted the Iranians as the majority population by the thirteenth and fourteenth centuries, as nomadic migrations brought more Turkic groups to the region.

The Turkic Empire

The Turks originated in present-day Mongolia, in or around the Altay Mountains. Ethnically and linguistically heterogeneous, the Turks are thought to have been a subgroup of the Juan-Juan people. Under the leadership of Tumen, the Turks became independent in 552 CE.

Unsatisfied with only independence, Tumen then led the Turks against the Juan-Juan and defeated them, which allowed Tumen to carve out a new empire. Although much of their new Turkic empire centered on the former Juan-Juan lands in Mongolia, Turkic forces marched west into the areas of modern-day Kazakhstan, Xinjiang, and other regions of Central Asia in pursuit of the fleeing Juan-Juan. Tumen remained in Mongolia, ruling the eastern Turks as the *qaghan* (emperor); he died in 552, while his brother Ishtemi ruled Central Asia as the *yabghu* (prince). By 558, Ishtemi (reigned 552–576) had extended Turkic rule to the Volga River.

Although the eastern Turks had been in contact with major sedentary powers since the rise of Tumen, the western Turks had limited contact with sedentary powers until they crossed the Syr Dar'ya River. In 557, Ishtemi allied with the Sasanid dynasty (224/228–651) of Persia against the Hephthalite empire that occupied much of Mawarannahr (the territory between the Amu Dar'ya and Syr Dar'ya Rivers) and present-day Khurasan and Afghanistan. By 565, the Hephthalite empire had fallen, and the Amu Dar'ya served as the

border between the nomadic Turks and the sedentary Sasanids. The Turks, however, continued to expand their power westward through the steppes, eventually reaching the Black Sea.

At this time, the Turkic empire remained heterogeneous not only in ethnic and linguistic terms but also in terms of its religions. Zoroastrianism had existed in the region for hundreds of years, and Nestorian Christianity had made inroads, as had Buddhism from India, although most of the Turks remained pagans.

Under the Turkic regime, trade grew steadily. The trade routes, particularly the famous Silk Road, fell under the protection of the Turkic *qaghans*. Furthermore, Central Asia served as a key intermediate region for the exchange of goods from China for those of Persia, Siberia, and even present-day Europe. The result of international trade in the region was a growing cross-cultural influence in Central Asia due to the stability of the Turkic empire.

The importance of trade came to the forefront when war broke out between the Turks and the Sasanids in 569 over trade issues. Although the Turks crossed the Amu Dar'ya and invaded the region of Khurasan, their efforts were fruitless because they could not overcome the fortification systems and the resilience of the Sasanid army. War erupted again in 588–589 between the two powers, again with negligible results.

The Turkic empire was fairly short lived, however. Due to a severe famine and a resurgence in Chinese power under the Sui dynasty (581–618) and later the Tang dynasty (618–907), combined with a succession crisis, the eastern Turkic empire collapsed. The western Turks, fairly distant from China, continued, but also underwent a period of civil war. The eventual winner of this war was T'ung Yabghu (reigned 618–630). Again, trade began to flourish, but with his assassination in 630, civil war again erupted, effectively disrupting not only the empire but also trade. For almost a hundred years, Central Asia was in a state of civil war fought between a number of factions for mastery of the former western Turkic empire.

A second empire formed under Su-Lu (reigned 717–738), who accepted the suzerainty or overlordship of China. Essentially this amounted to sending a mission to China to offer tribute: China's authority was only nominal. In addition, Su-Lu maintained close ties with the Sasanids, who were under attack by a rapidly rising Arab empire with a new religion. Under Su-Lu, the Turks successfully foiled the invasions of the Arabs, defeating them in 737, shortly before Su-Lu's death. After his death, however, a central figure

failed to emerge among the Turks, and the armies of Islam conquered the rest of Mawarannahr.

Muslim Conquest of Central Asia

After the decline of the Turks, numerous local dynasties of Turkic and Sogdian origin arose in the cities and trade centers. (The Sogdians were the Iranian population dwelling in much of Central Asia before the arrival of the Turks; during the time of Alexander of Macedon, much of the region was known as Sogdia.) Little unity existed among these dynasties, although they soon would have reason to establish a common cause.

The collapse of the Sasanid dynasty in Iran under the attacks of the armies of Islam brought the Arabs to the Amu Dar'ya River. In 655, Muslim troops crossed the river to raid rather than conquer. The true invasion did not occur until 682, the delay being due to the first Arab civil war, which lasted from 656 to 661. Another civil war in 680–692 also delayed the penetration of Islam in Central Asia because it shifted considerable forces from Mawarannahr to the Middle East.

The first Muslim governor of Mawarannahr did not take power until 705, when Qutayba ibn Muslim (reigned 705–715) arrived. He settled soldiers in the towns, which helped maintain Muslim control over the conquered lands. Furthermore, to increase his troop strength, Qutayba also demanded troops from the conquered dynasts. Relying more on brutality than diplomacy, Qutayba expanded his province while destroying much of the pre-Islamic culture. His tenure of office ended abruptly in 715 when he was killed. His death led to the defeat of the Muslim armies; thus much of the territory that Qutayba had conquered was lost.

The Abbasid caliphate replaced the Umayyad caliphate after a brief war lasting from 744 to 750. The Abbasids, who found most of their support in Khurasan, bordering Central Asia, established a new caliphate. Due to their Khurasanian origins, the Abbasids evidenced Iranian and Central Asian influences. During this period, Central Asia truly became part of the Islamic world.

Two other powers also had designs on Central Asia. The Tang dynasty reestablished Chinese presence in eastern Turkistan (the region of present-day Central Asia and Afghanistan). At the same time, an emerging Tibetan empire also expanded into Central Asia. The Tang armies, however, defeated the Tibetan armies. By 749, the Tang armies reached the Fergana Valley. In 751, at the Talas River in present-day Kyrgyzstan, however, the Tang efforts fell short as Zayid ibn Salih, an Arab general in command of the Umayyad caliphate

forces in Central Asia, defeated their armies. With the defeat of the Tang and Tibetan empires, combined with the decline of the Turks, the Abbasid caliphate began to assert its control firmly over Central Asia.

Despite these conquests, Islam as a religion penetrated more slowly as it competed with well-established religions such as Buddhism, Zoroastrianism, Nestorian Christianity, and even Judaism. Despite the population's slow conversion to Islam, a new culture emerged in Central Asia combining elements of Islam and nomadic, Persian, and traditional sedentary cultures.

Although Islam triumphed, unity was not guaranteed. Eventually, the local dynasties that had remained in power either through submission or conversion to Islam, as well as new dynasties, began to assert themselves against the Abbasid caliphate. The dynasty that came to the fore in the ninth century became known as the Samanids (864–999).

In 738, Saman-Khudah, the Persian ruler of Balkh, a region in modern Afghanistan, converted to Islam. His grandsons all became governors of Mawarannahr in the ninth century, but the true founder of the dynasty was Isma'il ibn Ahmed (892–907), who became governor in 893 and ruled until his death in 907. Under his leadership, the Samanids defeated the Karluk Turks north of the Syr Dar'ya as well as the emerging Saffarid dynasty (873–900) in Iran. Isma'il maintained his allegiance to the caliph, although he effectively acted as an independent ruler. With the defeat of the Saffarids, the Samanids added the province of Khurasan to their domains.

Isma'il and the Samanids ruled a confederation of tribes and cities in which regional dynasts ruled the provinces. The key to the Samanids' success came through their army, the core of which was based on the *ghulam* (slave) system. Slaves, usually Turks, were purchased and then trained as warriors or administrators. This gave rise to a professional army and civil service or bureaucracy. In turn, the role of the nobility, who had formerly occupied border fortresses, was reduced. They then moved into the cities, making a transition from involvement in a military elite to involvement in local affairs. Despite their normal loyalty to their master, the *ghulams*, like all professional soldiers, could overthrow the ruler and place one who better represented their interests on the throne.

Certain conditions promoted prosperity. First, the rulers ensured security for the growth of trade and agriculture. Second, the ruling powers had an interest in their subjects' welfare. This was usually demonstrated by taxing fairly rather than taxing for exploitative gain. The Samanids carried out both of these

conditions, which resulted in urban growth and maintenance of the irrigation system that was central to the regional agriculture. Furthermore, under the Samanids, trade expanded in all directions.

A cultural renaissance also occurred. The Samanids, as well as the nobles who now lived near the cities, became patrons of knowledge and the arts. With the spread of Islam, Arabic, as the language of Islam, also spread. Persian, however, remained the vernacular. The Samanids also attracted many of the great scholars of the Islamic world, such as Ibn Sina (Avicenna) (980–1037) and Firdawsi (940–1020).

Despite the Iranian origins of the Samanids, Central Asia slowly became Turkicized through the importation of Turkic *ghulams*. Turkification became more rapid, however, as more Turkic tribes entered Samanid territory. By 1000, Turks had overrun the Samanid realm, and local governments asserted their own authority in the ensuing chaos. Two Turkic governments replaced the last Iranian rulers of Central Asia, yet they maintained strong ties to the system of government used by the Samanids.

Ghaznavids and Karakhanids

The Ghaznavid dynasty (977–1187) arose from *ghulams* who established their own state in Khurasan, Afghanistan, and northern India. Sebuk Tegin (reigned 977–997), the governor of the city of Ghazni in eastern Afghanistan, established the Ghaznavid empire in 977. His son, Mahmud (reigned 998–1030), became its most renowned ruler after gaining control of the empire in a civil war. Mahmud also established the empire's independence from the Samanids by renouncing Samanid suzerainty. Furthermore, he sought and secured the recognition of the Abbasid caliph. The Ghaznavids, particularly under Mahmud, fought as *ghazis* (frontier soldiers, often religious fighters along the frontiers of the Islamic world) and expanded the influence of Islam into India. Despite an impressive army, the Ghaznavid empire was eventually eclipsed by the Seljuks, who settled in Khurasan.

The Karakhanid dynasty (999–1212) ruled Mawarannahr, East Turkistan, and the lands north of the Syr Dar'ya. It is thought that the Karakhanids originated from Karluk Turks around Kashi in modern Xinjiang Uygur in western China, who converted to Islam through the influence of Sufi Muslims. Under Sufi influence, Islam continued to find converts in Central Asia, particularly among the Turks beyond the Syr Dar'ya. The emergence of the Karakhanids marked the shift to the Turkification of the region as well.

Initially, the Karakhanids fought the Samanids and slowly conquered Mawarannahr, achieving final victory in 999 with Nasr Ilis's (d. 1012) conquest of Bukhara. In 1001, Nasr Ilis and Mahmud of Ghazni completed a treaty that drew the Amu Dar'ya as the border between their respective states. With the Karakhanid domination of Central Asia, the Turkic language replaced Iranian as the primary language and even emerged as a medium for literature with the publication in 1069 of *The Wisdom of Royal Glory*, which was a mirror for princes on how to rule, based on Turk, Muslim, and Sufi traditions. In addition, the Karakhanids maintained the Samanid administrative apparatus but ruled from the steppe. Unlike the Samanids and Ghaznavids, the Karakhanids relied on conscription of nomadic cavalry rather than professional armies of *ghulams*. Still, these two empires were eventually supplanted by another group of Turks.

The Seljuks

The Seljuks (1038–1157) were part of the Oghuz Turkic tribes and were named after their khan, or ruler, Seljuk. In 985, Seljuk converted to Islam, like the Karakhanids, through the influence of Sufis. Seljuk and his tribespeople first served as mercenaries for the Samanids and the Karakhanids but eventually crossed the Amu Dar'ya and were allowed to settle in Khwarazm, the region from the lower Amu Dar'ya River valley west to the Caspian Sea and east to Bukhara.

After Mahmud of Ghazni conquered Khwarazm, he realized the growing power of the Seljuks and defeated them. The Seljuks, however, persevered, and soon more entered the region during the reign of Masud (b. Mahmud; reigned 1031–1041). At first the Seljuks wished to settle in the region in return for their military services. Masud, however, also feared their growing numbers and engaged them in war.

The Seljuks defeated Masud and eventually brought most of the Ghaznavid empire under their dominion. By 1055, their armies had reached Baghdad and defeated the Shi'ite Buyid dynasty (c. 945–1055). As a reward, the caliph named Toghril (founder of the Seljuk dynasty; reigned 1038–1063) sultan, thus effectively making Toghril the secular leader of Islam.

Using armies of nomadic tribesmen and *ghulams*, the Seljuks expanded their empire from Central Asia into Anatolia. Alp Arslan (reigned 1063–1072) led the onslaught into Anatolia by defeating the Byzantines at Manzikirt in 1071. In Central Asia, Alp Arslan's successor, Sultan Malikshah (reigned 1072–1092), conquered Mawarannahr in 1074 and captured the cities of Bukhara and Samarqand. Like the Ghaznavids and

Karakhanids, the Seljuks maintained the Samanid system of government by governing through local dynasties and were heavily influenced by the great *wazir* (vizier) Nizam al-Mulk. As the leaders of the Islamic world, the Seljuks spread Sunni Islam.

The decline of Seljuk power began with the death of Malikshah in 1092, followed shortly by the assassination of Nizam al-Mulk. This period also marked the end of the great conquests, resulting in less plunder for nomadic groups and a slow ascension of several local dynasties. Sultan Sanjar (reigned 1118–1157) attempted to maintain order, but his authority declined after his defeat by the Kara Kitai in 1141. In 1155, Oghuz tribesmen captured and killed Sanjar, effectively ending a unified empire. Although local Seljuk dynasties continued to rule in parts of Iran, Anatolia, and the Arab lands, Central Asia fell to the Kara Kitai.

Kara Kitai

The Kara Kitai initially ruled northern China and part of Mongolia as the Liao dynasty (907–1125). The Kara Kitans, a Mongolian people, were however driven out of China in 1124/5 by a Manchurian group, the Jurchen. A group of Kara Kitans fled west under the command of Yeh-lu Ta-Shi (reigned 1124–1143). Although the ruling corps was made up of predominantly Kara Kitans, other ethnic groups joined them.

In 1129, the Kara Kitans conquered Kashi and Hotan, also in western Xinjiang Uygur. Choosing the city of Balasaghun in the Chu Valley in southeast Kazakhstan as their capital, Yeh-lu Ta-Shi ruled as the Gur Khan. In 1137, his armies entered Mawarannahr and began its conquest, ending with the defeat of Sanjar at the Qatwan steppe in 1141.

Like previous conquerors, the Kara Kitans left the local dynasties as their governors but maintained their dominion through the use of fast-moving nomadic armies. Kara Kitai was a very diverse state. The majority of the subjects were Muslim, but the ruling elite were Buddhists and of non-Iranian or Turkic heritage. Although order was maintained, the arrival of Kuchluq, prince of the Turkic Naimans and a rival of Genghis Khan, ignited underlying emotions as he persecuted Muslims and deposed the Gur Khan to set up his own short-lived kingdom, which lasted from 1211 to 1218.

As the Seljuks declined, the province of Khwarazm steadily increased in power. It had benefited greatly from Ghaznavid rule, and even during the rule of the Seljuks, Khwarazm remained fairly independent. Its rise to the height of its power began in 1097 with the appointment of Muhammad ibn Anushtegin (a vassal

of the Seljuk sultan; reigned 1097–1127) as governor. He received the title of Khwarazmshah and accepted Seljuk suzerainty.

Muhammad's son Atsiz (reigned 1127–1156) followed his father's example for much of his reign. However, with the defeat of Sanjar in 1141, Atsiz shifted his tribute to the Kara Kitai and rejected the Seljuks as his overlords. The caliph also recognized Atsiz as an independent sultan, boosting the legitimacy of his rule. Atsiz, no longer fettered by the Seljuks, then expanded northward by conquering land on the Syr Dar'ya and Mangishlai on the Caspian Sea.

After the death of Atsiz in 1156, Atsiz's son II-Arslan (reigned 1156–1172) continued to build the kingdom into a powerful state that controlled the trade routes from the Kipchak steppe (stretching from the Black Sea through modern Kazakhstan), the Middle East, China, the Russian principalities, and Siberia. Although he continued to pay tribute to Kara Kitai, the Khwarazmshah was fairly independent. Khwarazmian expansion continued under the next ruler, Tekesh (1172–1200), who conquered Khurasan.

Tekesh's successor, 'Ala al-Din Muhammad II (1200–1220), brought the empire to its apogee and also caused its destruction. With the aid of Kuchluq, Muhammad II defeated the Kara Kitan armies near Talas. While Kuchluq received the territories north and east of the Syr Dar'ya, Muhammad II received Mawarannahr. The vainglorious Muhammad II soon considered himself to be the second Alexander of Macedon. Because his empire stretched from the Syr Dar'ya to Iraq, it was difficult to refute his claims.

Despite his military success, his empire was fragile. Muhammad II suffered from poor relations with the Abbasid caliphate, which he failed to conquer in 1217. Furthermore, his power base rested on Kipchak tribesmen, whose primary loyalty rested with his mother, the daughter of a Kipchak khan. Muhammad II also alienated the local nobility by breaking with Samanid tradition. Instead of relying on the local dynasties, he appointed numerous family members as governors and local rulers.

Muhammad II's downfall began when a caravan arrived in Otrar on the Syr Dar'ya River (in present-day Kazakhstan) from Mongolia. Merchants, sponsored by Genghis Khan and his newly created empire, had come to trade. In addition they wished to establish friendly diplomatic relations with the Khwarazmshah on behalf of the great Mongol ruler. Muhammad II, whether through ego, greed, or other motives, allowed Inalchuq, the governor of the city of Otrar, to massacre the merchants and offend Mongolian ambas-

sadors who sought reparation before hostilities escalated. The ambassadors returned to Genghis Khan highly insulted, thus setting the Mongol armies in motion and resulting in the complete collapse of the Khwarazmian empire.

CENTRAL ASIA—HUMAN RIGHTS The five republics of Central Asia (Kazakhstan, Kyrgyzstan, Tajikistan, Turkmenistan, and Uzbekistan), which emerged after the collapse of the Soviet Union in 1991, began their existence as independent countries with a common Soviet heritage in regards to human rights. For both governments and citizens, economic and social rights are now at least on a par with freedom of expression, association, religion, and other traditional measures of human rights. None of the states has a particularly good record in implementing internationally recognized human-rights standards, though all insist that they respect those standards and aspire to put them into practice. Some Central Asian officials point to their Asian as well as their Soviet heritage to justify the problematic human-rights records of their countries. The Central Asian republics have subscribed to the standards laid out in the Universal Declaration of Human Rights.

While each Central Asian state has a distinctive record in the observance of human rights, some shortcomings are common to all. Human-rights problems most frequently cited by citizens of the Central Asian countries include law enforcement that has failed to abandon the Soviet-era belief that it is more important to have a high rate of success in "solving" crimes than it is to catch the actual perpetrator, with resultant police brutality directed at extracting confessions; lack of an independent judiciary, with the result that those in power misuse the courts for political purposes, and there is little opportunity to challenge arbitrary actions of

officials or to seek redress for human-rights violations; pervasive corruption, leading to a host of perceived human-rights violations; and poor prison conditions.

Kazakhstan

When Kazakhstan began its existence as an independent state, it had the beginnings of a civil society, in the form of numerous grassroots public organizations, some of which were engaged in human-rights monitoring. A large number of independent print and broadcast media developed throughout the country and began reporting abuses by officials. The national parliament actively opposed some actions of the executive branch. In view of these developments as well as the Kazakstani leadership's commitment to privatization and a rapid transition to a market economy, the country gained the reputation in the international community of making a respectable start on the road to democracy.

But postindependence elections have been consistently criticized, by domestic monitors and by foreign observers, for falling short of international standards. After complaining that the national parliament was hampering his plans for the economy, President Nursultan Nazarbaev in 1995 dissolved the legislature and for a time ruled by decree. He obtained additional powers for himself under a new constitution that also limited the powers of parliament, thereby weakening the system of checks and balances that had begun to develop.

In 1999, two opposition politicians were refused registration as presidential candidates on grounds of previous minor legal infractions (in one case, having taken part in an unauthorized public meeting), and opposition parliamentary candidates were harassed by the authorities. In at least four cases, government complicity was alleged in physical assaults on candidates.

The problems of government opponents did not end with the elections. Former Prime Minister Akezhan Kazhegeldin, one of the disqualified presidential candidates, fled the country to avoid prosecution on charges of embezzlement, which he insisted were invented by the government. Official attempts to have him detained abroad and to have his foreign bank account frozen were unsuccessful until July 2000, when he was arrested in Italy on an Interpol warrant. An Italian court promptly freed him.

Despite progressive encroachments on political rights, in the opinion of many of the country's citizens, Kazakhstan's most serious human-rights violations occur in the socioeconomic field, where living standards have declined, salaries and pensions have frequently been in arrears for months if not years, and

unemployment has spread. Corruption has remained pervasive. Strikes and unauthorized public protests over living conditions have often led to arrests and beatings; in a major strike in southern Kazakhstan in 1998, demonstrators beat police.

In the early years after independence, several non-governmental organizations developed specifically to monitor the observance of human rights. Among the most active on the national level were the Kazakhstan International Bureau for Human Rights and the Rule of Law and the Kazakhstan Helsinki Federation, but many more, including the independent trade unions, were involved in human-rights monitoring and reporting. A human-rights commission was set up in 1996 to report to the president, but its findings were never made public. The commission's initial advisory board included leaders of two human-rights monitoring groups who almost immediately became involved in a dispute with the executive secretary, after the latter publicly attacked all nongovernmental organizations as a threat to the state. The commission was subsequently weakened, in the view of independent human-rights monitors, by the appointment of members unfamiliar with human-rights concepts.

After 1995, the media were subject to increasing government restrictions and sometimes to outright harassment. The government used its ownership of all printing facilities to exert control over the print media. In 1997, a redistribution of broadcast frequencies took place; the government took the opportunity to close down a number of critical private television and radio stations by rejecting their bids for frequencies. In 1999, the government closed some independent newspapers and pressured the media to limit coverage of opposition presidential and parliamentary candidates.

Although Kazakhstan's leadership is officially committed to maintaining ethnic balance, and stirring up ethnic enmity is a serious criminal charge, policies favoring ethnic Kazakhs have become more and more prevalent. A law requiring half of all broadcasting to be in Kazakh, which has the status of a state language, has been resented not only by non-Kazakhs but also by ethnic Kazakhs whose first language is Russian. Nongovernmental groups representing the interests of the Slavic community have been regularly harassed by the authorities. Groups representing Cossack interests were not allowed to function legally until several years after independence.

Kyrgyzstan

Kyrgyzstan acquired an international reputation as the Central Asian state farthest advanced on the road

to democracy. But the promise of its early postindependence years has been unfulfilled, as the government of President Askar Akaev has become more authoritarian and gains in implementation of human rights have been eroded. The sharpest decline occurred in 2000, when the Kyrgyz leadership harassed and even imprisoned opposition politicians and human-rights activists to limit their success in parliamentary and presidential elections.

More than in any other Central Asian state, Kyrgyzstan's parliament has acted as an active check on the power of the executive branch. Political parties, ranging from the Communists to liberal democratic groups, have played a considerable role in the life of the country and have ensured a healthy opposition, though they were subjected to increasing harassment by the authorities in 1999 and 2000. Pressure on the opposition culminated in 2000 with the disqualification and subsequent arrests of several well-known opposition candidates for the parliamentary election; some candidates were disqualified between the first and second rounds of voting. Felix Kulov, the most credible opponent of President Akaev in the presidential election of October 2000, was arrested during the parliamentary election. Although Kulov was freed after an international outcry, the sentence was later reconfirmed by a higher court, and he remains in prison, facing additional charges. The parliamentary election was judged by international observers to have fallen short of international standards.

In the immediate postindependence period, Kyrgyzstan developed relatively liberal conditions for the information media. Attacking government officials for corruption and abuse of office became a favorite theme, especially in the print media. Some officials retaliated by charging journalists and editors with libel, which remained a criminal offense despite the efforts of the president to persuade the parliament to change the law. Several prominent journalists spent time in jail or faced heavy fines as a result of such charges; the independent media regarded these cases as government intimidation.

A broad spectrum of grassroots nongovernmental organizations has formed in Kyrgyzstan, where the concept of civil society seems to have become well rooted. Several groups monitor human rights, including social and economic rights. Some groups have clashed with the police during unauthorized demonstrations in support of pensioners and others who have suffered severe declines in their living standards. In 1998, the government deregistered the most prominent of the human-rights monitoring groups, the Kyrgyz Committee for Human Rights. It was later

reregistered, but experienced constant harassment by the authorities, culminating in 2000 with an attempt to arrest the group's chairperson, who sought refuge with the International Helsinki Federation in Vienna.

Although attempts have been made to reform the judiciary and free it from government influence, many citizens consider that the strong role of the state prosecutor, who is seen as a guardian of the government's interests, ensures that courts do not protect the interests of ordinary people.

A human-rights commission was established under the president's office in 1997. Human-rights activists have complained that though a well-known opposition politician was appointed to head the commission, none of its members has any experience in the field of human rights. As of 2000, Kyrgyzstan was in the process of creating an ombudsman's office with help from international organizations.

Tajikistan

Tajikistan's existence as an independent state has been overshadowed by the civil war that began in mid-1992. A peace accord was signed in 1997 between the two main combatants, the government in Dushanbe, representing primarily former Communist elements from the southern region of Kulyab, and the Islamic and democratic opposition. Large segments of the political spectrum in the country were excluded from the peace agreement, which resulted in sporadic fighting and armed attacks on individuals.

During the civil war, scant regard was given to human rights, though this situation began to change as active fighting wound down and the thousands of refugees who had fled to Afghanistan and other neighboring countries returned to their homes. International organizations, in particular the United Nations High Commissioner for Refugees and the Organization for Security and Cooperation in Europe, assisted in the resettlement and reintegration of the refugees to ensure that their basic human rights were respected. Reports indicate that this process has been largely successful.

National and local officials, journalists, businesspeople, and others continued to be assassination targets well into 2000. Some killings have been attributed to rival government factions. Attempts to disarm former opposition fighters were not completely effective, and large numbers of weapons remain in circulation, making it easy for small independent groups to arm themselves. In addition to assaults by political rivals on one another, the government's security forces have attacked civilians, sometimes holding individuals for ransom. The country as a whole was reported to have

serious problems with the kidnapping and rape of women. The inability of the government to establish control throughout the country has meant that law enforcement remains ineffective and unable to protect citizens' rights. In 1996 the Tajik government promised to establish the post of human rights ombudsman, but nothing came of it.

Once opposition political parties were legitimized as part of the peace process, some of them began to publish their own newspapers. The government has closed or harassed these and other independent publications. A number of independent television stations obtained licenses but also experienced government harassment.

President Imomali Rakhmonov, a former Communist official, has repeatedly described Islam as a political threat, but bowed in 1998 to international pressure and persuaded the parliament to drop a ban on political parties with a religious orientation. Despite the participation of officials of the Islamic Revival Party in the government, the Muslim community is still overseen by the State Committee on Religious Affairs, and private religious instruction is restricted.

Turkmenistan

Turkmenistan is considered by many in the international human-rights community to have the poorest human-rights record of any state in Central Asia. Political and economic reform has hardly begun, and some of the gains of the late Soviet era in freedom of speech, association, and religion have been undone. The country's leader, President Saparmurat Niyazov, has not only surrounded himself with a personality cult outdoing that of Stalin, but is in the process of creating a state ideology focusing on the president as the omnipotent father figure of the nation, so that there is no need for civil society. In any case, an independent entity, whether a nongovernmental institution or a genuinely private enterprise, is regarded with great suspicion by the authorities.

Opposition political groups were always small and weak in Turkmenistan; by 2000, the few individuals who actively opposed government policies were either in prison or under close supervision of the National Security Committee, and their influence was nonexistent. Several grassroots environmental organizations were able to register in the early 1990s and enjoyed some degree of cooperation with the Ministry of Nature Protection because environmental protection was perceived by the authorities as apolitical. At least two of these groups later drew governmental ire when they began monitoring human-rights problems. There

were no groups engaged specifically in human-rights monitoring, but a number of unregistered nongovernment organizations tried to deal with specific human-rights issues, such as the rights of the handicapped, hospital patients, and refugees. Few nongovernmental organizations could register with the Ministry of Justice after 1995.

In 1999 and 2000, thousands of prisoners were released under a series of amnesties. This may have been in reaction to international criticism of prison conditions in which many prisoners died of disease and extreme heat. At the end of 1999, the People's Assembly formally abolished the death penalty.

The information media have been under tight government control. Both print and broadcast media were used by the state as propaganda devices rather than as providers of information. Foreign, including Russian, newspapers were available by subscription but were too expensive for most citizens. Satellite antennas could be purchased and installed, but few outside the cities could afford them. In the years after independence, a number of private Internet providers appeared in Turkmenistan; they were closed down in May 2000.

In Ashgabat, thousands of people were displaced from their homes as part of the grandiose presidential scheme to reconstruct the capital. Some were offered apartments in poor-quality Soviet-era housing developments, but many received neither compensation nor other living quarters. Under a presidential decree issued in 2000, the police were prohibited from searching private homes. The government cited this as an example of state concern for human rights, but oversight for implementation of the decree was handed to the very agencies (the Ministry of Internal Affairs, the State Prosecutor's Office, and the security service) that had most abused citizens' privacy.

Uzbekistan

Since 1992, the leadership of Uzbekistan has used the threat of Islamic extremism to justify its authoritarianism and disregard for human rights. Socially conservative pious Muslims have been a particular target of government harassment, especially after the Tajik civil war broke out in 1992, and again in 1998 when the murder of a policeman in the conservative Fergana Valley town of Namangan was the pretext for the arrests of thousands of Muslims. In February 2000, a series of bombs was detonated in Tashkent. President Islam Karimov announced that he was the intended target and unleashed another round of arrests of "Muslim extremists," which swept up a number of

human-rights activists. Some were incarcerated in a new prison that had become notorious for the number of deaths of inmates, from both police brutality and disease.

Genuine political opposition is not tolerated, though a number of political parties exist. Opposition groups (the mildly nationalist Birlik Movement and the Erk Democratic Party) that were allowed not only to exist but to publish their own newspapers until a few months after independence were stripped of their registration in 1993. The few people who later considered themselves members of these groups were harassed by the authorities; many of those who did not leave the country were jailed in 1999–2000. Some members of opposition groups formed organizations to monitor human rights. The government used this as an excuse to refuse registration to all but one human-rights nongovernmental organization, claiming that the other groups were merely fronts for banned political organizations.

An ombudsman's office was set up under the parliament in 1997 to deal specifically with human-rights problems. In her annual reports, the ombudsman noted that the majority of cases brought to the office involved problems with the law enforcement and judicial systems. The office's success rate in dealing with these problems was low.

As is the case elsewhere in Central Asia, law enforcement officials in Uzbekistan are notorious for beating detainees. They are also reported to plant evidence, usually small amounts of narcotics, a few bullets, or weapons, on persons arrested for political reasons. Independent media exist in Uzbekistan, but they function under fairly strict government scrutiny. Criticism of the government is not tolerated.

CENTRAL ASIA—LATE MEDIEVAL AND EARLY MODERN Central Asia entered modernity in the wake of Russian conquest in the last quarter of the nineteenth century. Russian penetration into

the Kazakh steppe from western Siberia began in the seventeenth and eighteenth centuries and was completed in the 1840s with the suppression of the Kazakh hordes. In 1864, Russian resumed its conquest, finishing in 1884 with the capture of the last Turkmen oasis of Merv. The imposition of Russian rule in Central Asia resulted in the distortion of "native" capitalism in the area, which was subsequently turned into a major supplier of raw materials, predominately cotton, to Russian industries.

The Kazakh Steppe and the Start of Russian Conquest

At the beginning of the eighteenth century, the Kazakh ethnic groups, who lacked political unity, coalesced into three confederations. These were Uly Juz (the Greater Horde), occupying the Jetysu (Seven Rivers) district in the southeast portion of present-day Kazakhstan; Orta Juz (the Middle Horde) in the central part; and Kishi Juz (the Lesser Horde) between the Aral Sea and the Ural River in the west. The division was the result of varying conditions for cattle rearing, which prevailed on the Kazakh steppe.

Each horde, composed of a number of ethnic groups, was ruled by a khan with a group of subordinate sultans, who claimed to have descended from Genghis Khan. The Genghisid descent was also a central factor in the peculiar vertical division of Kazakh society into two groups—the Aq Suyek (White Bone) people, of high status, and the Qara Suyek (Black Bone) people, who were commoners.

Islam, which began penetrating into the southeastern Kazakh steppe after a battle at the Taras River in 751, had very little effect on the social structure of Kazakh society, although descent from eminent Muslim ancestors could also entitle some individuals, called *qojas*, to prestigious White Bone status. The main effect of Islam on the Kazakhs was in culture, that is, education and literature, and even here its impact was limited due to their nomadic lifestyle.

Kazakh justice was to a large extent based on the principle of *qun* (retribution), which varied from the death penalty to fines, depending on the offense. Kazakh customary law had three sources: custom, practice in the court of the *biis* (the nobles), and resolutions taken at regular meetings of the *biis*.

The social and political structure of Kazakh society was highly codified in what is known as *Jeti Jarghy* (Seven Verdicts) during the reign of the Middle Horde's khan Tauke (1680–1718), who succeeded in briefly reuniting the three Kazakh hordes.

The eighteenth-century Kazakh economy was based on cattle breeding, although the encroachment of the Kazakh ethnic groups on the regions south of the steppe in the sixteenth century had resulted in some urban and agricultural development and trade with the settled population. To the north and west, commercial relations with the Russians had also begun.

The Russian advance into the Kazakh steppe was a gradual process, the actual beginning of which is usually associated with the request by Khan Abulhair (Abilay; 1693–1748) to Russia to be a suzerain (overlord) of the Lesser Horde. The request was granted in 1731. Nevertheless, the founding dates of such Russian towns as Uralsk (now Oral), Guryev (now Atyrau; 1645), and Ust-Kamenogorsk, or Oskemen (1720) indicate that the actual Russian encroachment into the western and northeastern steppes started long before.

A bloody invasion by the Jungars (a subdivision of the Mongols) in 1723 and threats constantly emanating from the east forced the khans of the Middle and Greater Hordes also to accept Russian suzerainty in 1740 and 1742, respectively.

While signing an oath of allegiance, the Kazakh khans pledged to protect adjacent Russian borders, to defend Russian trade caravans, to provide troops when needed, and to pay tribute to Russia. Until the end of the eighteenth century, the political picture of the area remained unchanged, because during that period Russia was engaged in subduing the Caucasus.

Beginning in the early nineteenth century, Russia initiated a more aggressive policy toward the Kazakh hordes in an effort to annex their territories. New strategic goals led Russia to abolish the Middle Horde in 1822, the Lesser Horde in 1824, Bukey's (Bukeevskaia) Horde (formed c. 1800 to the west of the Lesser Horde) in 1845, and the Greater Horde in 1848. With the suppression of the Kazakh hordes, the first stage of Russia's conquest of Central Asia was completed.

Transoxiana in the Eighteenth Century

By the start of the eighteenth century, Transoxiana, the territory between the Amu Dar'ya and Syr Dar'ya Rivers, was dominated by three principalities—the Bukhara emirate, the Quqon khanate, and the Khiva khanate.

The Bukhara emirate, the most populous (3 million people in the nineteenth century) and influential of the three, was situated in the basin of the Zeravshan River. It was ruled by the Uzbek dynasty of Mangyt,

who rose to power in the early eighteenth century as *ataliq* (majordomo) under the Astrakhanid (Janid) dynasty (1598–1785), which was of Genghisid origin.

The first Mangyt *ataliq* was Khudoyar Bi, who began his service in 1714 and made the position hereditary. In 1722, he was succeeded by his son Muhammad Hakim Bi, whose term (1722–1740) was marked by fighting with the Kazakh hordes who were escaping from the conquests of the Jungar Mongols from Xinjiang in western China. The next Mangyt *ataliq*, Muhammad Rahim Bi (reigned 1740–1758), further consolidated his power, although the throne was nominally occupied by the Janids until 1785.

The actual start of the Mangyt dynasty is associated with the accession of Shah Murad (reigned 1785–1800), who assumed the title of emir, which was most probably derived from *amir-al-muminin* ("commander of the believers"). The shift to an emirate was a significant step, aimed at stressing an Islamic, rather than tribal, legacy and consolidating Bukhara's leading position in Transoxiana.

Administratively, the emirate was divided into *vilayats* (*viloyat*, *velayat*: provinces), ruled by *bokims* (heads of provincial administration). The *vilayats* were subdivided into *tumans* (districts) and finally into *kents* (settlements). The principal function of *bokims* was collection of taxes and distribution of water. There were two types of taxes—*zakyat*, a tax on merchandise, movable property, and cattle; and *tanap*, a tax on land property. The land tax constituted the bulk of the emir's revenues, and it was generally paid in cash, although calculated as a percentage of the harvest. In the Bukhara emirate, the land, being the most valuable commodity, was of several types: *waqf* (possessions of religious institutions), *mulk* (freehold), and *tankhwah* (gift-lands handed over, usually to the military, by the emir, largely exempt of taxation).

The system of justice was based on Islamic *shari'a* (canon) and *adat* (customary) laws. The chief judicial official was the *kazi* (judge), assisted by the *aglian* (barriers). The muftis (jurists) were the exponents of the law; the chief mufti was the emir's chief counselor.

The Bukhara economy was based on irrigated agriculture and trade. The main trade items were cotton and textiles, and the main trading partner was Russia. Among other exports were silk, dyes, and fruits, whereas from Russia Bukhara imported pottery, metal products, sugar, paper, tin, fur, mercury, candles, textiles, and other manufactured goods. Although other towns also conducted trade directly with foreign countries, Bukhara was the emirate's most important commercial center. It was also the center of silk production

and astrakhan-cloth trade. Domestic trade developed as well, serving as a unifying factor.

For the eastern part of Transoxiana, the Fergana Valley, the eighteenth century was marked by the rise to power of the Ming dynasty of Uzbek origin (distinct from the Chinese Ming). It eventually led to the establishment of the Quqon khanate, with a population of a million people, in 1798. Quqon rulers Irdana Biy (reigned 1740–1769) and Narbuta Biy (reigned 1769–1788) succeeded in consolidating the state.

Starting from the nineteenth century, the Quqon khans fought to expand their territories in the north and northwest into the steppe along the north bank of the Syr Dar'ya River. In 1803–1809, they conquered the cities of Tashkent, Shymkent (Chimkent), and Sayram. Akmeshit (now Kyzyl Orda) was founded in 1820. A stronghold was built in Pishpek (now Bishkek, capital of Kyrgyzstan) in 1846. Quqon's military campaigns led to a series of wars with Bukhara and the Kazakh and Kyrgyz ethnic groups during the first half of the nineteenth century. The Kyrgyz accepted Russian suzerainty in 1855–1876.

The Quqon khanate reached the zenith of its might during the rule of Madali Khan (reigned 1822–1842). The khanate then consisted of modern-day southern Kazakhstan, northern Uzbekistan, the Pamir regions of Tajikistan, and almost the whole of Kyrgyzstan.

The administrative system of Quqon was virtually the same as that of Bukhara, except that the subdivisions of the *vilayats* were known as *beklik* instead of *tuman*. Quqon's economy was also based on irrigated agriculture, trade, and silk production. The Quqon khans were known for their patronage of the arts.

During the eighteenth century, the khanate of Khiva (500,000 people), situated on the lower Amu Dar'ya River, was ruled by the Uzbek Yadigarid dynasty (1603–1804) and was subsequently replaced by the Kungrat (Inakid) dynasty (1804–1920). In 1804, Iltuzer, an Uzbek noble holding the hereditary position of *inak* (prime minister), proclaimed himself khan of Khiva and established a new dynasty.

Unlike Bukhara and Quqon, Khiva had no subdivisions, and its towns enjoyed more autonomy. The majority of land was in the possession of the khan and of Muslim institutions. Extensive irrigation canals, fed by the Amu Dar'ya, were maintained by forced labor, usually made up of one male from each family. About 75 percent of the population was settled and carried on irrigated cultivation of wheat, millet, cotton, and fruit. Both internal and external trade evolved but to a lesser extent than in Bukhara and Quqon. Khiva's

foreign-trade partners were Afghanistan, Persia, and Russia. The Amu Dar'ya was extensively used for the conveyance of goods.

The Karakalpaks, another Turkic people living around the Amu Dar'ya delta, frequently revolted. Khiva's north and southwest borders were raided by Kazakh and Turkmen groups. The latter were the principal supplier of Persian slaves to the Khiva and Bukhara markets. The nomad Turkmen, lacking political unity, consisted of a number of separate ethnic groups, the most remarkable of which were Tekke, Tomud, and Ersary, occupying the territories immediately south of the Khiva khanate and the southern portion between the Caspian and Aral Seas.

At the middle of the nineteenth century, the ruling and living standards in Central Asia were much lower than those in medieval Europe, where large-scale foreign invasions, pillage, and devastation had ended some two hundred years earlier than they did in Central Asia. This situation, along with the absence of agreement between the three principalities, made them vulnerable to Russian conquest.

The Second Stage of Russian Conquest (1864–1884)

Russia's engagement in the Crimean War (1853–1856) and the pacifying of Sheikh Shamil's mutiny in the Caucasus (1843–1859) resulted in an interval of relative calm for several years between the suppression of the Kazakh hordes (1848) and the start of the final stage of Russian conquest (1864). Yet during this period, the Quqon strongholds of Ak Mechet and Pishpek were seized in 1853 and 1862, respectively. In addition, in 1854 Russians founded Fort Vernoe (now Almaty) in order to have access to Transoxiana across the Syr Dar'ya. The Russians resumed their conquest in 1864 with the seizure of the Quqon towns of Shymkent and Aulie Ata (now Zhambyl) in what is now southern Kazakhstan. Tashkent was routed in 1865. In 1868, after losing several battles to Russia, the emir of Bukhara, Muzaffar al-din Bakhadur Khan (reigned 1860–1885), signed a peace treaty. Under the treaty, Bukhara became a Russian protectorate and lost a considerable portion of its territories, including Samarqand.

In 1869, Russian troops reached the eastern shore of the Caspian Sea from the Caucasus and established the harbor of Krasnovodsk (now Turkmenbashi), a stronghold for future advances into Khiva and the Turkmen lands. In 1873, Khiva became a Russian protectorate, lost its western lands, and pledged to pay tribute. In 1876, the Quqon khanate was abolished.

In 1879, Russian troops moved against the Turkmen ethnic groups but were defeated at Geok-Tepe. In 1881, after the second attempt, Geok-Tepe fell. With the seizure of the last Turkmen stronghold of Merv in 1884, Russia's military conquest of Central Asia was completed. From Merv, Russia brought its troops farther to the south, close to the Afghan border, which caused a brief military clash (the Kushka Incident) between Russia and Afghanistan in 1885.

In the early 1890s, Russia pushed farther from Fergana to the Pamirs, close to British India. To avoid further confrontation, in 1895 Russia and Great Britain reached an agreement on their mutual respecting of zones of interest. This agreement was confirmed by the Anglo-Russian Convention of 1907.

As a result of the Russian conquest, new administrative divisions were introduced in Central Asia. The territories acquired in Transoxiana were united into the governorate-general of Turkistan, with headquarters in Tashkent. The governorate-general was divided into five oblasts (districts), namely Syrdarya (with the capital in Tashkent), Semirechie (Vernyi), Fergana (Skobelev), Samarqand, and Zakaspiyskaia (Ashkhabad). The emirate of Bukhara and the khanate of Khiva became Russian protectorates.

The western part of the Kazakh steppe was converted into the Uralsk oblast (center Uralsk), the central part into the Turgai and Akmolinsk oblasts. The Akmolinsk oblast was united with the eastern Semipalatinsk oblast to form the governorate-general of the steppe.

The Russian conquest of Central Asia was overwhelmingly motivated by economics. After the establishment of Russian rule, the area became a valuable market for Russian industrial goods and a source of raw materials, primarily cotton. By 1914, more than 50 percent of the cotton used by Russian light industry was supplied from Central Asia. The region's industrial development centered on cotton. Two-thirds of the local labor force was employed in cotton-processing and textile enterprises. At the same time, Central Asia was heavily dependent on Russia's grain imports. The construction of railroads and a telegraph network, crucial for exercising control over the new territories, also aided the region's development.

The other major consequence of Russian conquest was colonization by agricultural settlers, mainly Russians and Ukrainians. In 1895, a special Russian mission was sent to the Kazakh steppe to establish a land fund for newcomers. The nomads' grazing lands in the northern, eastern, and western steppes were expropriated.

The Russians did not interfere with the natives' general way of life, although they did abolish slavery.

Education continued to be based on the Qur'an and on Arabic-Persian tradition. At the same time, the Russians opened a number of schools for natives where Russian was the language of instruction. Jadidism, the Muslim progressive movement for cultural reforms that arose in Central Asia in the early twentieth century, was to a large extent catalyzed as a result of the introduction of Western cultural achievements in the wake of Russian colonization.

Thus, in the eighteenth and first half of the nineteenth century, Central Asia was distinctly divided into the nomad Kazakh steppe to the north and the three Transoxianan principalities to the south. The Kazakh hordes, who had failed to produce any efficient political unity by that time, felt insecure in the face of the constant invasions of Jungars from the east, and this insecurity caused their submission to Russian suzerainty. Russia's subsequent penetration into the area, followed by a military conquest (1864–1884), was firmly consolidated by the end of the nineteenth century. By imposing its rule in Central Asia, Russia sought to meet economic and geopolitical goals. For Central Asia proper, the capitalization of its agriculture and the acceleration of segmental industrialization had little impact on the traditional way of life and left feudal socioeconomic structures to a great extent intact.

CENTRAL ASIA—MODERN The modern era of Central Asian history begins with the Russian empire's conquest of the region. Russian expansion toward Central Asia was facilitated by the absence of any physical obstacles; having consolidated their hold over the steppe lands inhabited by Kazakh nomads, Russian armies moved rapidly southward between 1853 and 1873, winning easy battles against each of the three states in the region—Quqon, Bukhara, and Khiva, all in modern Uzbekistan. Russian armies annexed parts of their territory and reduced the remaining parts to vassal status. Quqon was fully annexed in 1878, but Bukhara and Khiva continued as protectorates until 1920. The annexed territories were formed into the Russian province of Turkestan, with the capital at Tashkent. The Kazakh lands became the Steppe province.

The Colonial Order

Although Central Asia was physically contiguous with European Russia, its relationship to the center was typical of the high age of European imperialism. Russians saw little in common between themselves and the indigenous population and built new "European" cities there for themselves.

In northern Central Asia the nomadic lands (both in the Steppe province and in northern Turkestan) became targets for planned settlement by Russian peasants from European Russia and the Ukraine. The floodgates opened with the creation of the Resettlement Administration as an organ of the imperial Russian government. This resettlement was intended to ease the pressure on Russia's agricultural regions by settling allegedly "excess" land not used by the nomads.

Southern Central Asia, already densely populated, saw little Russian settlement except in the cities. Here the colonial relationship was based on the production of cotton, which fed Russia's textile industry and freed it from dependence on imported cotton. The introduction of long-fiber American varieties in the 1880s started a boom that continued until World War I and transformed local Central Asian society and economy, as older elites suffered a loss of status, while new groups rose to prominence. Among the successful were merchants, who benefited from the new economic situation, and urban intellectuals. At the same time, the region became increasingly dependent on European

Russia for its food supply, as more and more land was devoted to cotton cultivation.

The new Central Asian intellectuals, called the Jadids ("proponents of the new method," from the new, phonetic method of teaching the Arabic alphabet that they advocated), sought to articulate a new vision of the future for their society. Intensely aware of their lack of political power, they argued that only through education and the acquisition of modern knowledge could they take their rightful place in the world. They favored thorough cultural reform, beginning with elementary school education. In advocating social and cultural reform, the Jadids also introduced new visions of identity based on the idea of the nation, replacing the dynastic and tribal identities of the past. Their conception of the nation was rooted primarily in the common Muslim faith of Central Asia, but they gradually came to emphasize the people's Turkic ethnic roots as well. The Jadids faced opposition from both conservative elites in their own society and from the Russian state, always suspicious of unauthorized political activity. The rural population, however, remained outside these debates.

The Crisis of the Colonial Order

Peace ended in Central Asia in 1916, when, after two years of debilitating losses in World War I, the Russian government revoked Central Asians' exemption from military service and mobilized them for work behind the lines. The announcement heightened existing tensions, especially among nomads who had recently lost their land to Russian settlers. The result was a massive uprising of the local population in which government bureaucrats and Russian settlers were attacked. Official vengeance was swift and brutal. The government confiscated large amounts of the nomads' land, forcing thousands of families to flee to Chinese territory. In some districts as much as 20 percent of the nomadic population died.

The crisis was heightened by the fall of the Russian monarchy in March 1917, but the Russian Revolution brought great hope to Central Asians. The Jadids saw the revolution as an opportunity for inclusion in the mainstream of a liberal democratic Russia. For the rural population, however, concerns were much more immediate. The grain harvest was poor in 1917, and with Central Asia's dependence on imported food, a full-fledged famine raged in the region by the end of the year.

The famine, far more than any empirewide trends, defined the political struggle in Central Asia during the course of the Russian Revolution and the civil war that followed. The Russian community in Central Asia

MODERN CENTRAL ASIA TIMELINE

- 1853-1873** The Russian empire consolidates control of the region through a series of military conquests. Varieties of long-fiber American cotton are introduced and start a boom that continues until World War I and transforms Central Asian society and economy.
- 1880s** The Jadids, a new intellectual movement, articulate a new vision of the future for Central Asian society based on education and the acquisition of modern knowledge.
- 1916** The Russian government, which had previously exempted Central Asians from military service, conscripts them for work behind-the-lines in World War I. Massive uprisings by Central Asians are severely repressed by the Russians.
- 1917-1920** The Russian Revolution ends the rule of the Russian empire. Central Asian efforts to achieve political independence are crushed by the Soviets. In 1917 the region experiences a serious famine.
- 1920s-1930s** Islam is repressed by Soviet authorities with Islamic schools replaced with public education, mosques closed, clerics persecuted, and Arabic writing replaced with Latin script and then Cyrillic in 1940.
- 1924-1925** The Soviets bring their policy of creating "ethnic-based" republics to Central Asia and the Soviet Socialist republics of Uzbekistan and Turkmenistan are created.
- 1929** Agriculture is collectivized and nomadic pastoralism repressed.
- 1929** Tajikistan is established as an autonomous republic in the Soviet Union.
- 1936** Kyrgyzstan and Kazakhstan are established as autonomous republics in the Soviet Union.
- 1953-1982** A period of relative political stability in the region, with national and local leaders loyal to the Communist leadership in Moscow.
- 1986** Nationalist riots erupt in Almaty, the capital of Kazakhstan when the Soviet leadership replaces the Kazakh Communist leader.
- 1991** The Soviet Union dissolves and the five Central Asian republics become independent nations and join the post-Soviet Commonwealth of Independent States.
- 1991-2001** The nations seek to establish economic and political stability, establish relations with Western nations, and control internal unrest tied to political corruption and the emergence of Islamic nationalism.

sought to maintain its privileged access to food during the political crisis. In Tashkent, Russians seized power in the name of the Soviets in October 1917, even before the Bolshevik Revolution had taken place in Petrograd, and sought to exclude the Muslim population from the new institutions of power. The violence against the Kazakh nomads that began in 1916 never abated, and indeed it intensified under a new revolutionary guise. An autonomous government proclaimed by the Jadids in Quqon on November 1917 as an alternative to the Tashkent Soviet regime was destroyed by military force in February 1918.

In this chaos emerged the Basmachi, armed bands, locally organized and owing allegiance to individual

commanders, who provided basic protection to Muslim peasants and attempted some alleviation of the terrible famine. Although they have been both reviled as counterrevolutionary bandits and celebrated as heroes of national liberation, their goals were local. They did not have a well-articulated political program but instead reacted to the situation as it developed. Because of the famine, the struggle in Central Asia became one between the cities and the countryside; the cities ultimately triumphed, thanks to the might of the Red Army. The Basmachi were won over by what turned out to be temporary political and economic concessions. Many Basmachi leaders fled to Afghanistan; others were captured and tried.

The Soviet Order

When Moscow finally acquired control over Central Asia in 1920 with the Red Army's victory in the civil war, it set out actively to recruit Central Asians in the new institutions of power. Among the Central Asians entering the new institutions were many Jadids, who saw in the new order an opportunity to transform their society. There was indeed a great deal in common between the programs of change espoused by the Jadids and those of the Bolsheviks in the early years of the Soviet period. The Bolshevik agenda included universal literacy and elementary education, improving the position of women, and transforming cultural conceptions of hygiene and public health. Much of this coincided with the program of change the Jadids had articulated.

Bukhara provided the best example of the community of interests between the Jadids and the Bolsheviks. The Russian Revolution of 1917 gave Bukharan Jadids hope that the emir, or local ruler, might proclaim reforms, but the hope was dashed and the Jadids were brutally suppressed. They escaped to Turkestan, where they organized openly under the name of the Young Bukharans. Desperation radicalized their political stance, while the Bolsheviks provided a clear example of what was possible. The Young Bukharans drew closer to the Bolsheviks, who helped them overthrow the emir by armed force in September 1920. The emir escaped into the mountains of present-day Tajikistan, and the Young Bukharans proclaimed a Bukharan People's Soviet Republic (BNSR). Broadly similar events led to the installation of a people's republic in Khiva, now renamed Khorazm.

The BNSR had a short and traumatic life. Throughout its existence it faced insurgency in the mountainous eastern area of the country. The Soviet government recognized its independence, but was not inclined to let its leaders choose policies entirely independently. It pushed the BNSR government to adopt radical social and economic policies and to tie its economy more closely to that of the Soviet Union. Frustrated by this pressure, some Young Bukharans went over to the insurgency in 1921, while others continued to seek compromise.

The Soviets were committed to the process of national self-determination for the many nationalities inhabiting the vast country, and to the creation of territorial entities in which this self-determination could be exercised. This countrywide process arrived in Central Asia in 1924 and, among other things, spelled the end of the BNSR. Turkestan, Bukhara, and Khorazm were all entities whose boundaries bore no resemblance to the ethnic composition of their populations; such dis-

regard for ethnic boundaries had been common in the premodern world. By 1924 central authorities in Moscow had decided that this abnormal situation could not be allowed to continue. The territory of Central Asia was divided so that each "national" group had its own republic. During 1924 and 1925 the demarcation was completed with the full participation of local party and state officials, and the three existing republics were replaced by the Soviet Socialist republics (SSRs) of Uzbekistan and Turkmenistan. Uzbekistan included in it the autonomous republics of Tajikistan and Kyrgyzstan, which were upgraded to SSR status in 1929 and 1936, respectively. At the same time, certain areas of Turkestan were ceded to the Russian Federation, where they were combined with other Kazakh-inhabited areas to form the autonomous republic of Kazakhstan, which in turn became an SSR in 1936.

This political organization in Central Asia was based on a radically new principle of national identity, and the division into five republics presumed a clear-cut division that did not always exist in fact. Nevertheless, over the next several decades, these new national identities were endowed with great power through state-sponsored cultivation of individual national languages, literature, arts, and education.

What the regime brought about was nothing short of a cultural revolution: rapid modernization and forced secularization of society and culture. The traditional system of Muslim education, of which Bukhara was especially a major center, was dismantled through economic pressure in the 1920s and overt repression in the 1930s. In its place appeared a widespread system of modern schools. The literary languages were reformed and brought closer to the vernacular. In 1928 the Arabic script universally used in Central Asia was replaced by the Latin and in 1939–1940 by the Cyrillic. State funding also allowed for books and newspapers to be printed in unprecedented quantities.

The Jadids were enthusiastic participants in this revolution, although they had no control over its direction or scope, and indeed it went much further than they had envisaged. This was especially the case with the campaign against Islam that the Soviets pursued from the mid-1920s on. As a result Islamic education was pushed underground, and religious observance decreased greatly. Mosques were closed by the thousands, and Muslim scholars arrested, exiled, or executed in great numbers.

Central Soviet policies also called for the "nationalization" (*korenizatsiia*) of the state apparatus in the non-Russian parts of the Soviet Union. Members of

**JOINT STATEMENT OF THE MEMBER STATES
OF THE UNITED NATIONS SPECIAL PROGRAMME
FOR THE ECONOMIES OF CENTRAL ASIA (SPECA),
U.N. ECE, AND ESCAP AT
THE PRESENTATION OF SPECA**

Following the demise of the Soviet Union and establishment of independent nations in Central Asia, these nations faced major economic problems. In March 1998 at Tashkent, agreement was reached on programs to develop the economic infrastructure and those programs were supported by a statement issued in Akmaty, Kazakhstan, in April 2000.

New Stage of Implementation of the United Nations Special Programme for the Economies of Central Asia (SPECA)

The Republic of Kazakhstan, the Kyrgyz Republic, the Republic of Tajikistan, the Republic of Uzbekistan, United Nations Economic Commission for Europe (ECE) and Economic and Social Commission for Asia and Pacific (ESCAP) actively develop international cooperation aimed at accelerating economic development of all the states of Central Asia. We do appreciate that further strengthening of economic ties among the Central Asian states and their economic integration with Europe and Asia will contribute in a positive way to the process of their transition to a market economy.

It was for this purpose that in March 1998 our States have adopted the Tashkent Declaration on the United Nations Special Programme for the Economies of Central Asia (SPECA). Since that time, a serious progress has been registered at some priority areas of the Programme. SPECA Project Working Groups on Rational and Efficient Use of Energy and Water Resources in Central Asia, on Transport Infrastructure and Border Crossing Facilitation and on International Economic Conference on Tajikistan in the Regional Context of Central Asia have started their work. These inter-state groups have agreed their Programmes of Work and have come close to the stage of developing and implementing concrete projects of regional importance. We have finished with organisational issues of SPECA and have improved environment for the implementation of the Programme by adopting the Concept of the Programme.

Today we reconfirm our dedication to the aims and purposes of the SPECA Programme and officially announce the beginning of a new stage in its implementation. We shall join our forces in order to progress in solving priority tasks of the Programme for the benefit of the peoples of our states. We appeal to the world community to share with us both the difficult tasks of implementing the Programme and the benefits of developing regional cooperation.

local populations were to be inducted into positions of authority to overcome the imperial past that the new regime had inherited. In Central Asia nativization never went far enough to completely eliminate Russian influence, but nevertheless, it was a resounding success in terms of creating a new political class completely at home in the Soviet order. During the 1920s this class edged out older intellectuals from positions of power.

In 1929 the state decreed the collectivization of agriculture. This campaign was conducted with great violence, especially in nomadic areas, where it also entailed the sedentarization of the nomads. In Kazakhstan the dislocation of the nomadic economy created a tragedy that assumed genocidal proportions. Although no indisputable figures exist, perhaps as many as 1.5 million Kazakhs died in the 1930s. Between 1928 and 1932 alone, 80 percent of herd animals were destroyed. Along with collectivization came a centrally planned economy, which concentrated decision making in Moscow, as well as a purge of public figures in which two generations of local political and cultural leadership were destroyed in Central Asia. Thousands were executed, and many times that number sent off to prison camps. Leadership passed to a new generation.

The centrally planned economy in Central Asia meant, above all, the predominance of cotton. The Soviet Union pursued a policy of "cotton independence" for its textile industry, and Central Asia was assigned the task of ensuring this independence. Central Asia was turned into a massive cotton plantation, so that at the end of the Soviet period, Uzbekistan alone was producing more cotton than the United States. The ecological consequences were devastating. Relentless irrigation led to the shrinking of the Aral Sea, while reckless use of pesticides and fertilizers produced lethal levels of pollution.

Nevertheless, in the peaceful years after Khrushchev (who led the Soviet Union from 1953 to 1964), cotton also provided a way for Central Asian political elites to reclaim some local autonomy. As stability became the most important virtue in Soviet political life under Brezhnev (who led the country from 1964 to 1982), party elites in the republics were largely left to their own devices as long as they fulfilled centrally imposed economic obligations and did not rock the boat politically. During this period all five republics were headed by long-serving Communist Party leaders who headed largely autonomous political machines serving, on the one hand, to deliver cotton to the center and, on the other, to distribute political influence locally. While these leaders enjoyed all the benefits of power

in the Soviet order, they also emerged as *national* leaders. These political arrangements, built on informal ties among a cohort of politicians, are only now being understood by historians.

Post-Soviet Central Asia

These political arrangements were questioned by Brezhnev's successors, Yuri Andropov (1982–1984) and Mikhail Gorbachev (1985–1991), in their attempts to root out corruption in Soviet life. A federal investigative commission found massive corruption in Uzbekistan. Numerous high-ranking officials were dismissed and disgraced. But such measures, which were seen as attacking the autonomy of Central Asian republics, produced national resentment. In December 1986, when Moscow summarily dismissed Dinmuhammed Kunaev, the long-serving Kazakh Party secretary, and replaced him with a Russian functionary sent from Moscow, nationalist riots erupted in Almaty, the capital of Kazakhstan. Nevertheless in the following years, as the Soviet order weakened for reasons having little to do with Central Asia, the republics of Central Asia remained the most stable parts of the Soviet Union and supported the USSR's continued existence to the very end. The economies of Central Asian republics were much too tightly tied to the rest of the Soviet Union to make independence an attractive option.

Events in 1991, however, left the countries of Central Asia no choice. As the Soviet Union dissolved, they emerged on the international stage as sovereign states. Their leaderships, still rooted in the political machines that had crystallized in the 1960s, appealed to strong national identities forged in the Soviet years to provide legitimacy to the new states. At the same time there has been a strong impetus to rediscover aspects of national history and culture that were taboo under the Soviet regime. The region has witnessed a substantial re-Islamization, as people have sought to rediscover their spiritual heritage. The collapse of the centralized Soviet economy has generated massive crises, leaving the newly independent countries to overcome their dependence on cotton and to attempt to enter a global marketplace to which they had little exposure in the previous century.

The complex heritage of modern Central Asia defies easy categorizations. The period of Russian and Soviet rule saw the merciless exploitation of the natural resources of the region. It witnessed two terrible famines, a civil war, and a prolonged period of political bloodletting in which the flower of two generations perished. The same period, however, saw the elimination of illiteracy, the establishment of modern state forms, and the creation of national identities that

undergird the regimes of the post-Soviet period. Central Asia today embodies the contradictions inherited from the twentieth century.

CENTRAL ASIA-CHINA RELATIONS Following the collapse of the Soviet Union in 1991, China faced the challenge of managing bilateral relations with the newly independent Central Asian states. The independence of these states exacerbated long-smoldering ethnic unrest in China's Xinjiang Autonomous Region, which borders several of the Central Asian states. After establishing relations with the Central Asian republics in early 1992, China signed more than twenty agreements on boundaries and economic and cultural cooperation with these nations within a short period.

Boundary Settlements

The China–Central Asian boundary was originally established by "unequal" treaties—the 1860 Treaty of Beijing, the 1864 Protocol on the Northwest Boundary, the 1881 Sino-Russian Treaty of Ili, and the 1884

Sino-Russian Treaty of Kashgar. According to the Chinese, by these treaties, Czarist Russia gained 440,000 square kilometers of territory at the expense of China. After the independence of the Central Asian states, China was willing to accept the unequal treaties as the basis for new boundary agreements.

Following several years of negotiations, on 4 July 1996, China concluded a boundary agreement with Kyrgyzstan. China and Kyrgyzstan have since concluded agreements to open new border crossings and construct a rail line linking the two countries. On 4 July 1998, leaders signed a Sino-Kazakhstan boundary treaty. This marked the comprehensive settlement of questions unresolved by history concerning the unsettled 1,700-kilometer Sino-Kazakh boundary.

Beijing has not concluded an agreement resolving the historically complicated Sino-Tajik boundary dispute. China has consistently asserted that Russia violated the 1884 Sino-Russian Kashgar Boundary Treaty in 1892 and occupied more than 20,000 square kilometers of Chinese territory in the Pamir Mountains and that the boundary remains undelimited. Nevertheless, the leaders of the two nations have negotiated many agreements, including an agreement to open a road connecting China and Tajikistan to ease border trade.

Regional Strategic Concerns

The Central Asian states see China as a potential economic and demographic threat. One concern is China's dramatic population growth. With its large territory and abundant natural resources, Central Asia is logically a place for China to covet. More than 300,000 Chinese have settled in Central Asia, and this may grow to 500,000 over the next few years. Kazakh officials believe that if the flood of Chinese coming to Kazakhstan continues, Chinese will overwhelm Kazakhstan in ten to fifteen years. Chinese traders have purchased considerable amounts of real estate in Kyrgyzstan.

China is also very apprehensive about instability along the border. Following a Shanghai summit, on 26 April 1996, Russia, Kazakhstan, Kyrgyzstan, and Tajikistan signed an agreement with China on confidence-building measures along the border. On 24 April 1997 they agreed to withdraw military forces 100 kilometers along the 3,500-kilometers boundary. A third agreement of 3 July 1998 emphasized cooperation to dampen ethnic unrest in the region. Each government pledged to take steps to fight against arms smuggling and not to allow its territory to be used for activities undermining the national sovereignty, security, and social order of any of the five countries.

Ethnic Unrest

Since the independence of the Central Asian states in 1991, ethnic unrest in Xinjiang has been a major concern for Beijing. A continuing source of tension in China–Central Asian relations are the sensitive issues of pan-Turkic nationalism and the Xinjiang separatist movement. Historically, China has struggled to maintain central government control over the region. Russian and Soviet intrigue and local independence movements have been recent issues. An Eastern Turkestan Republic was briefly established in 1944, in what is now Xinjiang; it had a national anthem and a national flag—a white crescent and star against a blue background. Led by Islamic scholars, the Uighurs of Xinjiang wanted a homeland free of Chinese influence. In 1962 China crushed a revolt by tens of thousands of Kazakhs who then fled across the border to Soviet Kazakhstan. Chinese now feel that the smoldering independence movements in Xinjiang are the main threat to stability in western China.

A central issue in most all communiqués and agreements between China and other Central Asian states is a commitment not to support any separatist movements. Both Kazakhstan and Kyrgyzstan, with 200,000 and 80,000 Uighurs respectively, have agreed to suppress such movements. Several separatist movements have moved from Kazakhstan to Turkey, and Kyrgyzstan has prevented organization of an ethnic Uighur political party. The Uighur nationalist organizations that continue to operate from within the Central Asian states remain a major cause of tension in Central Asian relations with China.

Countries with fundamentalist Islamic orientations are a factor in promoting ethnic unrest in the region. The Jama'at-e-Islami, based in Pakistan, has encouraged Islamic activism in Xinjiang, as have other Islamist movements, such as the Taliban (when it was in power in Afghanistan). Uighurs do receive religious training in Pakistan, and Afghan and Islamic militants have smuggled arms into China. The number of Islamic schools in China has grown rapidly; in 1997 the government closed down as many as three hundred "illegal" schools. Many small neighborhood mosques have become the focal point of anti-Chinese activities. The Chinese have clamped down on what it considers "illegal religious activities" and has closed many mosques.

The rise in ethnic unrest and pro-independence demonstrations and other activities in the 1990s have deep historical and religious roots and will persist for the foreseeable future. Many leaders are not simply religious fanatics, but are Pan-Turkic nationalists. The support for the movement comes from neighboring Turkic-speaking countries. Despite the pledge by the

governments of Kazakhstan and Kyrgyzstan not to support the Xinjiang separatist movement, supporters of the movement openly operate from these countries. Uighurs living in Turkey also support the movement. Pan-Turkic nationalism and anti-Chinese colonialism are important causes of the unrest. Uighurs are trying to preserve their cultural identity and to resist the mass influx of Chinese settlers into their region.

Economic Interests

In the 1990s Central Asia quickly became an important center of China's economic attention. Border trade is an important part of the growing economic ties. In 1989 Xinjiang's trade with Soviet Central Asia amounted to only \$118.5 million. Trade has continued to grow and now accounts for 60 percent of the region's foreign trade. In 1995 total trade between China and Central Asia was an estimated \$718 million, of which \$500 million was accounted for by border trade. Since 1991, China has emerged as the second-largest trading partner for the Central Asian countries, significantly displacing Russian influence in the region. China is now Kazakhstan's major trading partner, and 25 percent of Kyrgyzstan's foreign trade is with China.

The development of oil and gas is an area of important strategic economic cooperation. In 1994 China signed an agreement with Turkmenistan to construct a Turkmenistan-China-Japan gas pipeline. In 1997 China won the bid to develop Kazakhstan's Uzen oil field and construct a 3,000-kilometer oil pipeline from Kazakhstan's Caspian oilfields at Tengiz to Xinjiang and then to China's eastern coast. Additionally, China signed agreements with Kazakhstan to develop the Aktyubinsk oil fields along the Russian-Kazakh border. Total Chinese investment in developing oil resources in Kazakhstan is estimated at \$9.7 billion, equivalent to 50 percent of Kazakhstan's gross national product. These agreements are a clear indication that China and Central Asia are developing an important economic and strategic link. China not only is seeking to ensure its energy security for the future, but also is attempting to shift the focus of Central Asia's global vision toward China and away from Russia and Turkey.

CENTRAL ASIA—RUSSIA RELATIONS

Political, cultural, and military clashes have strongly affected Central Asia—Russia relations. In the nineteenth century, Russia tried to put the territories of today's Central Asian states under its control in order to benefit from the region's natural resources and fertile agricultural lands. Russia also hoped thereby to play an active role in the Middle East and South Asia. The Central Asian states strongly opposed Russian policies and fought to preserve their national identities and economic and political autonomy.

The Czarist Period

Until the 1860s, czarist Russia occupied the entire Kyrgyz Steppe (in present-day central Kazakhstan). Turkistan was under the political control of three Turkish khanates, Bukhara, Khiva, and Quqon (Kokand). These khanates had simple social, military, and administrative organizations, and they were often in conflict with one another. To gain a commercial advantage by controlling the historic Silk Road, at that time the main commercial link between Europe and Asia, the Russians attacked the Quqon khanate. In 1865, they occupied the city of Tashkent in the Bukhara khanate and then created a separate Turkistan province, whose area included today's Kazakhstan and parts of Uzbekistan and Kyrgyzstan. The emir of Bukhara asked the Russians to leave Tashkent, but the Russians defeated the Bukharans and seized the cities of Khojend (present-day Khudzhand) and Uroteppa.

In January 1868, General K. P. von Kaufman, the first governor-general of Turkistan, signed a peace treaty with Quqon that made the latter a vassal of Russia. In June 1868, the emir of Bukhara was forced to sign a similar treaty, which made his khanate part of Russia. In 1873, General Kaufman organized a military operation to Khiva and forced the khan to accept the Russian protectorate. Thus all three khanates became vassals of Russia, and much of their territory was absorbed into Turkistan province.

After building a strategic railroad from the Caspian Sea to Turkistan, Russia defeated the Turkmen in 1881 and created the Transcaspian province. In 1884, the Turkmen were forced to recognize Russian authority. By 1886, Russia had divided the Turkistan governorship-general into three parts: Syr Dar'ya province, Fergana province, and Zeraushan district.

Although czarist Russia tried to solidify its dominance over Central Asia, three problems emerged. First, Russia encouraged an increased production of cotton in the region, which created a grain deficit that led to a famine. Second, because Russians were encouraged to colonize Turkistan, the native Turkic inhabitants were forced to move to less fertile lands. Third, the Russian settlers began to dominate commercial activities. Thus the Turkic communities in Central Asia came to resent Russian domination and hoped to put an end to Russian colonization and settlement.

After the 1905 Revolution by Russian workers and military officials in Central Asia against the czarist regime, Muslim nationalists, known as Jadids, began to surface in the Kyrgyz Steppe and Turkistan. In 1909, the Jadids established their first political organization in Bukhara and advocated setting up schools that taught both religion and such secular subjects as Tatar, Arabic, and Russian languages and literatures; history; philosophy of history; history of Islam; sociology; arithmetic; geography; agriculture; physics; and chemistry. They supported the unification of Turkistan under the Russian empire, but their opinion ultimately failed to carry the day.

The October 1917 Revolution

Leftist groups—the Bolsheviks, Mensheviks, and members of the Social Revolutionary Party—had begun to appear in Turkistan in 1917. On 7 April, the three leftist groups set up the Turkistan Committee of the Provisional Government, which then arrested General Aleksey Nikolayevich Kuropatkin (1848–1921), the czarist governor-general of Turkistan. A soviet (council) of workers and soldiers was also established in the city of Tashkent. The Turkish communities, however, did not involve themselves in the conflict between the czarist regime and the leftists. At a May 1916 congress of the Muslims in Russia, delegates elected a Central Muslim Council, dominated by the Jadids. At congresses in May and September 1917, the Turkish inhabitants of Central Asia demanded the creation of an autonomous federated republic of Turkistan in the new Russia.

At the same time, the leftist groups in the Tashkent soviet had diverging views of the new regime in Rus-

sia. On 19 November 1917, the Bolsheviks of Tashkent created their own government, the Council of People's Commissars. In turn, another All-Muslim Congress met in Quqon on 26–27 November 1917 and set up the Muslim Provisional Government of Autonomous Turkistan. But because this government lacked military power, it decided to join an anti-Communist organization called the Southeastern Union of Cossacks, Mountain Caucasians, and Peoples of the Steppe. Upon the military suppression of the Tashkent soviet by the Moscow Bolsheviks, the emir of Bukhara signed an agreement with the Tashkent administration of the Bolshevik government in Moscow, in which the latter recognized the independence of Bukhara.

In 1919, at the Third Congress of the Communist Party of Turkistan in Tashkent, a struggle between the Muslims and the Russian settlers emerged at the governmental level. The Fourth Red Army drove the Russian anti-Communist forces out of Turkistan in July. In September, the Eighth Congress of Soviets and the Fourth Congress of the Communist Party of Turkistan met in Tashkent. During the sessions, the Russian settlers rejected direct participation of native people in local governmental organs. But when the Soviet troops of the Fourth Red Army returned to Tashkent to suppress the growing uprising there (encouraged by British forces, which desired to control Iran and the Transcaspian region), the political situation altered in favor of the Muslims. To solve the problem in Tashkent, the Moscow government authorized the Fourth Red Army to investigate the situation. The Fourth Red Army Party Conference overruled the previous decision concerning the nonparticipation of Muslims in local Soviet organizations.

Near the end of the civil war (1918–1920) in Russia, the Soviets decided to reorganize Khiva. On 25 December 1919, Soviet troops from Russia crossed the Khivan borders, and a pro-Soviet Revolutionary Committee was set up. On 4 April 1920, Khiva became the People's Republic of Khorezm. The Soviet government in Moscow used similar tactics with Bukhara, when the Russian workers and the small revolutionary Young Bukharan group staged a revolt there. In September 1920, with the assistance of Russian troops, the People's Republic of Bukhara was established.

Formation of Soviet Central Asia

In the Declaration of the Rights of the Peoples of Russia, Vladimir Lenin (1870–1924), the founder of the Soviet Union, declared all people in Russia to be equal and sovereign. Everyone had a right to self-determination, and during the civil war people were allowed to freely develop their native cultures, a mea-

sure enacted to obtain the support of local Muslims in Central Asia for the Bolshevik regime in Moscow. But in 1918, when the Bolsheviks began to consolidate their power in Moscow, they discussed the right of self-determination within the framework of debate on the future structure of the Soviet regime. Two conflicting proposals appeared. The first was a loose political arrangement in which socialist states would remain sovereign entities, thus rejecting the founding of an integral Soviet federation. The second was a proposal put forward by Joseph Stalin (1879–1953) for autonomization, which meant withdrawing state sovereignty from independent socialist republics and providing them with only limited autonomous status. Lenin chose the middle way. The socialist republics would have a right to self-determination, but only the workers could participate in this decision.

The Turkic communities were disappointed with this new policy. Some nationalist groups rebelled against Soviet authority, but they were ultimately forced to become part of the Soviet federation. At Lenin's request, Stalin prepared a new policy for non-Russian nationalities, which promoted a process of nation building. At the same time, independent socialist republics would have only limited autonomous status.

In December 1922, the Communist Party granted the larger non-Russian nationality groups the status of republics in the Soviet Union. In October 1923, the Fourth Congress modified the Soviet Union's constitution, and on 29 September 1924, the Fifth Congress decided to change the name from People's Republic to Socialist Republic. In October 1924, the Central Executive Committee of the Soviet Union voted to establish two socialist republics in Central Asia (Uzbekistan and Turkmenistan), as well as two autonomous republics (Tajikistan and Kazakhstan). (A socialist republic was a sovereign Soviet state that had united with other Soviet republics in the USSR, exercising independent authority in its territory and having its own constitution; an autonomous republic was a constituent part of a socialist republic.) On 5 December 1929, Tajikistan became a republic of the Soviet Union, and on 5 December 1936, the same status was granted to Kyrgyzstan and Kazakhstan. These republics together made up Soviet Central Asia.

The Cold War Period

Under the Soviet regime, Russian dominance over Central Asia reached its highest level. In the political arena, the Communist Party of the Soviet Union put all regional and local organizations under its control. The decisions of the republics had to conform with the policies of the central authority in Moscow.

Although in each republic the first secretary of the republic's Communist Party was a native inhabitant, the second-secretary, who was a Russian, controlled and managed all administrative, economic, and governmental affairs. Thus the native people were absent from the policy-making process of the Soviet Union.

In the economic field, Moscow planned and regulated the economic policies of each republic of the Soviet Union. The Soviet regime encouraged Russian specialists and workers to migrate into the non-Russian republics.

In the cultural field, the Soviet regime tried to create a unified Soviet nationality; thus non-Russians were subjected to a Russification policy. In the 1930s, the number of Russian schools in the non-Russian republics was increased. The Russian language was promoted as the first language of all the Soviet peoples. Finally, Russian became the official language of the republics and had to be used in all official communications.

The Central Asian republics were sensitive about their traditions and national identities and reacted against Russian dominance, particularly the nationality policy. Despite Moscow's policies, native inhabitants tried to preserve their identities and objected to the Russians' view of themselves as civilizers of primitive people.

Collapse of the Soviet Union

Mikhail Gorbachev (b. 1931), the last secretary-general of the USSR, proposed that the Soviet Union preserve its powerful position while granting more autonomy to the various republics. The president of the Russian Federation, Boris Yeltsin (b. 1931), wanted to retain some form of union among the Soviet republics, and this was the view of the Central Asian states as well. On 23 April 1991, Gorbachev and the leaders of Russia, Ukraine, Belarus, and the five Central Asian members signed an agreement for a new treaty that provided for a union of sovereign states to replace the Soviet Union. The Communist Party of the Soviet Union and officials of the Red Army and KGB attempted a coup against Mikhail Gorbachev's administration in Moscow (19–21 August 1991) in the name of restoring order and law in the USSR, but they failed to overthrow the government.

But the August coup intensified the nationalistic feelings of the Soviet republics and their desire for independence. During the election campaign Boris Yeltsin had maintained that Russia should become independent in order to solve domestic economic and social problems. Ukraine and Belarus had the same idea. After the aborted August coup, Yeltsin became

more popular and powerful. Ukraine became concerned that implementation of the new union treaty was not possible, and therefore held a referendum in which voters opted for independence. Russia for its part realized that without Ukraine, the new union treaty would be meaningless. As a result, on 8 December 1991, without consulting with the Central Asian states, Russia, Ukraine, and Belarus signed a formal agreement announcing the formation of the Commonwealth of Independent States (CIS).

This agreement angered the Central Asian states, because it destroyed their hopes of retaining a strong center. The Central Asian states held a meeting on 12 December 1991 in Ashkabad, the capital of Turkmenistan, and discussed the establishment of a Turkistan federation. At the request of Nursultan Nazarbaev (b. 1940), the president of Kazakhstan, the other members accepted the idea, and joined as cofounders. After the Slavic republics (Russia, Belarus, and Ukraine) accepted the proposal, the CIS recognized the independence and the existing borders of its eleven cofounders: Armenia, Azerbaijan, Belarus, Kazakhstan, Kyrgyzstan, Moldavia, Russia, Tajikistan, Turkmenistan, Ukraine, and Uzbekistan. The agreement created only a loose federation, because its governing bodies, a council of heads of states and a council of heads of governments, lacked authority to impose decisions on any member. The council was to be assisted by committees that focused on areas such as foreign affairs, defense, and economics. The agreement did not settle questions about a common military policy and nuclear-weapons control.

Post-Cold War Era

From 1991 to 1993, the Russian authorities viewed any close relations with the Central Asian states as destructive to their economic and democratic reforms—in their eyes, the Central Asian leaders had failed to establish democratic regimes, maintaining instead authoritarian regimes that violated human rights. For that reason, the Russians refused any form of union with the Central Asian states. Russia introduced economic reforms without consulting the Central Asian states, stopped financial assistance to Central Asia, and followed protectionist economic policies that created difficulties for Central Asia. In short, Russia's economic and monetary policies prevented the Central Asian states from conducting independent economic, budgetary, and financial policies. As a result, the Central Asian states introduced national currencies and limited their relations with Russia. They attempted to gain direct access to world markets. In 1993, they even decided to create a Central Asia Regional Council, ex-

cluding Russia. Under the influence of ultranationalist and Communist groups, Russia changed its policy toward Central Asia in 1993, attempted to create a CIS customs union, and increased its financial assistance to these states.

In December 1991, at the first summit of heads of CIS member states in Minsk, the CIS decided that each state should be free to create its own national army. On 15 May 1992, Armenia, Kazakhstan, Kyrgyzstan, Russia, Tajikistan, and Uzbekistan signed the Treaty on Collective Security during the summit of heads of CIS member states in Tashkent. The treaty established a collective security council consisting of heads of member states and commanders of CIS joint armed forces. In addition, the member states were to refrain from the use of force or threat of force in their relations with one another. They were to abstain from entering into blocs hostile to one another, and they agreed to conduct consultations on security issues and coordinate their defense policies.

In October 1992, the CIS reached an agreement on military security in Bishkek, Kyrgyzstan. The CIS decided on the establishment of collective observer and peacekeeping forces to end armed conflicts in the CIS. But the attitudes of Russia and other member states jeopardized the agreements regarding collective security. Central Asian members were concerned that such agreements might be dominated by Russia. During the CIS summit in February 1995 in Almaty, Kazakhstan, Russia proposed a common defense of CIS frontiers, including airspace. This proposal was rejected.

On the question of Russians living in the region, the Central Asian states tried to avoid any confrontation with Russia. They were concerned that Russia might use these Russians as an excuse to intervene militarily in their domestic affairs. Nevertheless, despite Russia's demands, the Central Asian states (except Turkmenistan) refused to grant dual citizenship.

In the case of transportation of oil and gas reserves of the Caspian Sea region, the Central Asian states prefer to follow a multiple pipeline-network policy. They do not want to see Russian dominance over their regional resources. There is still a debate among the Central Asian states on the nature of Russia's involvement, its percentage share, and the transportation routes.

Present-Day Relations

The Central Asian states today completely oppose any continuation of Russian dominance over the region; they prefer to develop alternative economic, political, and security relations with other major countries, such the United States and the European Union,

while preserving their relations with Russia. The Central Asian states want to preserve their independence and territorial integrity and intend to become members of the international community.

In military affairs, the Central Asian states see Russia as a potential ally in their struggle against domestic opposition, radical Islam, and ethnic and territorial conflicts in the region. They welcome the Russian presence to balance the power of neighbors such as China, Iran, and Afghanistan.

CENTRAL ASIAN LANGUAGES An enormous number of languages are spoken by the various ethnic groups that inhabit Central Asia. Turkic languages, which belong to the Altaic family of world

languages, are the most frequently spoken in Central Asia, followed by the Iranian (mainly Tajik) and Slavic languages (Russian and Ukrainian), which belong to the Indo-European family. The numerous languages of Central Asia reflect the various peoples who moved into and through the region and demonstrate the significance of this area not only for its natural resources but also for its strategic role as a major crossroad in Asia.

The Russian language has been an important influence in Central Asian education, administration, and interethnic communication since the time of imperial Russia and during the Soviet regime. Each ethnic language used in the area was given its own Cyrillic alphabet by the Soviet regime during the 1940s. In post-Soviet Central Asia, however, the independent states changed their language policies, declaring the language of the ethnic majority as the state language. Uzbekistan and Turkmenistan have also changed their alphabets from Cyrillic to Latin. Central Asian states use their state languages increasingly in education, although they are having difficulties in finding course materials in these languages. There is a growing demand for courses in English as a foreign language, rather than Russian, because there is a desire to integrate with the international community.

Languages of Kazakhstan

The official language of Kazakhstan is Kazakh, a Turkic language, although Russian is also commonly used and is the language of interethnic communication. Most of the population is bilingual in Russian as well as their own ethnic languages. The languages spoken in Kazakhstan are Kazakh, Russian, Ukrainian, German, Uzbek, Tatar, and "other", a category that includes languages as diverse as Armenian, Bashkir, Korean, Polish, and Romanian.

Languages of Kyrgyzstan

The official language of Kyrgyzstan is Kyrgyz, a Turkic language. Russian is used as the interethnic language of communication. Seventy percent of the population can speak Kyrgyz. One-third of the Kyrgyz and many of the minorities speak Russian fluently. The most commonly used languages are Kyrgyz, Russian, Uzbek, Dungan, Ukrainian, Uighur, Crimean Tatar and Tatar, Meskhetian Turkish, Kazakh, Tajik, German, and Korean. As in Kazakhstan, a large number of other languages are also present in small numbers.

Languages of Tajikistan

The official language of Tajikistan is Tajik, an Iranian language. Russian is used as the interethnic lan-

guage of communication. Major languages used are Tajik, Uzbek, Russian, Tatar, Kyrgyz, and "other."

Languages of Turkmenistan

The official language of Turkmenistan is Turkmen, a Turkic language, spoken by 77 percent of the population. Other major languages are Uzbek, Russian, Kazakh, and "other."

Languages of Uzbekistan

The official language of Uzbekistan is Uzbek, a Turkic language. It is spoken by 74.3 percent of the population, of which ethnic Uzbeks make up 80 percent. Russian is the other main language. Although Russian may act as the interethnic language of communication, the minorities are increasingly learning Uzbek. Other languages spoken in Uzbekistan include Tajik, Kazakh, Karakalpak, Tatar, and "other."

Turkic Languages of Central Asia

Although almost all Turkic languages are represented in Central Asia, the Turkic languages with the most speakers in the area are Bashkir, Crimean Tatar, Karakalpak, Kazakh, Kyrgyz, Volga Tatar, Turkmen, Uighur, and Uzbek. Most of the Turkic languages are closely related, and it is sometimes difficult to draw the distinction between languages and dialects. Spoken forms are generally mutually intelligible, with intelligibility decreasing the greater the distance separating two languages. The imperial Russians and later the Soviets classified and named the Turkic languages to fit their own political aims, sometimes naming dialects as separate languages and giving them their own alphabets. Because of population movements—voluntary or forced migrations (such as those initiated by Stalin during the 1940s)—Turkic-speaking groups have been mixed. The influence of Islam can be seen in the Arabic and Persian words in the lexicons of the Turkic languages. The influence of Iranian languages is greater in some languages, such as Uzbek, because of the speakers' geographical proximity to and history shared with speakers of Iranian languages. The influence of Russian, which was the main language of administration and education during both imperial Russian and Soviet periods, is felt especially in the lexicons of individual languages and in the sound systems. Since the early 1990s, Uzbeks and Turkmen have worked to eliminate Russian and other foreign words. The Turkic languages spoken in Central Asia were written in Arabic script before the 1920s. During the late 1920s, there was a common Latin alphabet for all Turkic languages, but around 1940 the Soviets decided to give the Turkic languages and dialects their own

Cyrillic alphabets. After 1990, Uzbekistan and Turkmenistan adopted Latin alphabets. Kazakhstan, Kyrgyzstan, and Tajikistan still use their versions of the Cyrillic alphabet.

Similarities between the Turkic languages start with vowel harmony, which is the main aspect of their sound systems. Vowel harmony is the agreement of vowels in a word according to where they are produced in the mouth; that is, whether they are pronounced in the front or the back of the mouth, or whether the lips are rounded or not, and so forth. The main feature of the syntactic system of Turkic languages is agglutination through a rich system of inflectional and derivational suffixes. For example, the verbs carry time and aspect suffixes as well as personal endings, along with suffixes for negation and question; therefore it is possible to have very long words rather than the sentences typical of other languages. Nouns can be made into verbs and into other nouns; verbs can be changed into nouns and into other verbs through adding suffixes. Adjectives and genitives always precede the noun, and the position before the verb is reserved for the new information that is the focus of the sentence. The normal word order is subject-object-verb; thus the subject occurs at the beginning of the sentence, and the direct object immediately precedes the verb. Instead of prepositions, Turkic has postpositions, and the nouns take dative, accusative, ablative, locative, genitive, and possessive suffixes.

Bashkir Bashkir belongs to the Kipchak (Uralian Kipchak) branch of the Turkic languages. It is spoken in Russia as well as in Central Asia. It is close to Tatar. Its dialects are Kuvakan, Yurmaty, and Burzhan. It was given its own Cyrillic alphabet by the Soviets.

Crimean Tatar Crimean Tatar belongs to the Kipchak (Ponto-Caspian, or Southern) branch of the Turkic languages. It was written in Arabic script until 1928, but between 1928 and 1938 the Latin alphabet was used; this was followed by Cyrillic, and after 1990 the Latin alphabet was adopted. The standard language is based on the Central dialect, but there are also Northern and Southern dialects. It is spoken in Central Asia due to forced migrations from the Crimea in the 1940s.

Karakalpak Karakalpak belongs to the Kipchak (Central) branch of the Turkic languages. It has two main dialects, Northeast and Southeast. It is spoken in the Karakalpak region of Uzbekistan, as well as in Afghanistan, Kazakhstan, Kyrgyzstan, and Turkmenistan. It is very close to Kazakh, although the region where it is spoken is part of Uzbekistan.

Kazakh Kazakh belongs to the Kipchak (Central) branch of the Turkic languages. Its dialects are Northeastern Kazakh, Southern Kazakh, and Western Kazakh. It is the official language of Kazakhstan; outside Central Asia it is spoken in China, Mongolia, Iran, and Afghanistan, as well as by small groups in Turkey and Germany. Kazakh and Karakalpak are closely related; the latter can be regarded as almost a dialect of Kazakh.

Kyrgyz Kyrgyz belongs to the Northern branch of the Turkic languages. It has Northern and Southern dialects. Outside Central Asia, it is spoken in Afghanistan and China, where the Kyrgyz are an official nationality and use an Arabic script. It is also used in Turkey by Kyrgyz immigrants.

Tatar Tatar belongs to the Kipchak (Uralian Kipchak) branch of the Turkic languages. It has three main dialects, which are sometimes referred to as languages: Volga Tatar (also known as Middle Tatar or Kazan Tatar), Western Tatar (also known as Misher), and Eastern Tatar (Siberian Tatar). Tatar is spoken in the Republic of Tatarstan in Russia and in a number of districts in Bashkortostan, Mari, El, Udmurtia, Mordvina, and many other regions of European Russia, as well as in Uzbekistan, Kazakhstan, Azerbaijan, Kyrgyzstan, Tajikistan, and Turkmenistan. The oldest surviving Tatar texts date to the thirteenth century. The modern literary language has developed under the influence of spoken Tatar since the nineteenth century. The writing system was based on Arabic script until 1927, when a Latin alphabet came into use; it was replaced in 1939 by a Cyrillic script. Recently a decision to switch to the Latin alphabet was made.

Turkmen Turkmen belongs to the Southwest (Oghuz) branch of the Turkic languages. Its major dialects are Yomut, Teke, Salir, Sarik, Goldeng, Arsar, and Chowdr. The standard, based on the Yomut and Teke dialects, was developed in the 1920s. As a literary language, Turkmen appeared during the eighteenth century in Arabic script. A Latin alphabet was introduced in 1929 and was replaced by a Cyrillic alphabet in 1940. In 1993, a new Turkmen alphabet in Latin script was adopted.

Uighur Uighur (Eastern Turki) belongs to the Eastern branch of the Turkic languages. It is the official language of the region of Xinjiang Uygur (along with Standard Mandarin) in northwest China and the native language of ethnic Uighurs. In Kazakhstan the Taranci dialect and in Uzbekistan the Kashgar-Yarkand dialects of Uighur are used. Soviet Standard Uighur was written in the Latin alphabet, and later a

Cyrillic alphabet was introduced. In China, Cyrillic was introduced during the 1950s, followed by Latin in the 1960s, and in 1983 an Arabic alphabet was reinstated.

Uzbek Uzbek belongs to the Eastern branch of the Turkic languages. It has been the official language of Uzbekistan since 1989. It is used also in Afghanistan and China as well as in the states of the former Soviet Union. Written standard Uzbek is based on the form of the language spoken in Tashkent and the Fergana valley, areas under the influence of Iranian languages, namely Tajik. Its major dialects are Qarlug, Kipchak, and Oghuz. Uzbek is known as the direct descendant of Chagatay, a medieval literary language commonly used in Central Asia. After being written in various forms of the Arabic alphabet until the late 1920s, a Latin alphabet was used until the 1940s, when a Cyrillic alphabet was given to the Uzbeks by the Soviet administration. In 1993, after independence, Uzbekistan adopted a Latin alphabet and started a language-cleansing project to get rid of borrowed Russian words.

Indo-Iranian Languages in Central Asia

The Iranian branch of this group is common in Central Asia, mainly in Tajikistan, where it is known as Tajik, a dialect descended from Middle Persian.

In the Iranian languages, the nouns are inflected for case, number, gender, and definiteness or indefiniteness. There are prepositions and postpositions (which mark belonging or definiteness). Another typical feature of these languages is the distinction between absolute and oblique cases. The absolute case is used for the predicate nominative, and the oblique case is the marker of indirect, postpositional, or prepositional objects. The verb system is complex, with conjugations and suffixes. The basic word order is subject-object-verb. Relative clauses follow the noun they describe, and most adjectives follow rather than precede the noun.

Tajik Tajik belongs to a subgroup of the West Iranian languages that includes Farsi and Dari, the languages spoken in Iran and Afghanistan, respectively. Because of intense contact with Turkic-language speakers and a high rate of bilingualism with Uzbek and Kyrgyz, Tajik has been influenced by the Turkic languages. Its lexicon also has many terms from Russian. The main dialect division in Tajik is between the Northwestern and Southwestern groups. The Northwestern dialects, which are the basis of Standard Tajik, are also spoken in southern Uzbekistan. The most northern Northwestern dialects have the most Turkicized structure. The language has no grammatical gender or articles, but person and number distinctions are

maintained. Nouns are marked for specificity: one marker in the singular and two in the plural. Objects of transitive verbs are marked by a suffix. Verbs are formed using one of two basic stems, present and past; aspect is as important as tense. Verbs agree with the subject in person and number. Tajik verbs are normally compounds consisting of a noun and a verb. Word order is subject-object-verb.

Tajik was written in Arabic script until the early 1900s. A Latin alphabet was introduced in 1928 and was used until replaced by the Cyrillic alphabet in 1940. A modified Cyrillic alphabet is in use, but recently the government has attempted to return to the Latin alphabet.

CENTRAL ASIAN REGIONALISM Central Asian regionalism is a somewhat abstract notion that suggests cohesion among the Central Asian states of Kazakhstan, Kyrgyzstan, Tajikistan, Turkmenistan, and Uzbekistan based on common circumstances of geography, ethnicity, language, culture, history, and religion.

Geography and History

Geographic proximity is the main influence in shaping regional understandings, and Central Asia is no exception. Located at the crossroads of the old Silk Road, the Central Asian states have historically shared the same fate when confronted by expansionist powers—conquest. Invaders came from all sides; the geography

of Central Asia (Russia and the open steppes to the north, mountains to the south and east and the Caspian Sea to the west) lent itself to the strategic pursuit of power and wealth. The ancient cities of Bukhara, Samarqand, Osh, Merv, and Almaty served not only as trade centers for the settled urban populations of the region, but also as trophies for foreign invaders.

Dating back to the Scythian conquest of the Cimmerian state between 750 and 700 BCE, the peoples of Central Asia have suffered a long succession of foreign invasions. Invading peoples have included the Greeks, the Mongols, the Huns, the Avars, the Khazars, the Turks, the Arabs, the Russians and the Soviets. As a result of these conquests there were great infusions of language, culture, and religion that worked to shape the region by blending foreign and local customs. In this fashion many of the more distinctive features of Uzbek and Kazak society, for example, became diluted in favor of a more homogenous "Central Asian" identity.

Ethnicity

The interplay between ethnicity and identity in Central Asia is a major contributor to the notion of Central Asian regionalism. As waves of conquerors moved through the region the indigenous Central Asia peoples mixed with ethnically similar and dissimilar peoples. Over time, whole ethnic groups were moved in and out of the region in order to create a more manageable political situation for the invading armies. Accordingly, ethnic identity became relatively fluid, as past influences, such as a sedentary or nomadic lifestyle and "traditional" geographic homelands and bloodlines became intertwined or even eliminated. Today, tribes and clans are most commonly described as the institutions that exercise localized control of politics and economics. Historically they are perpetuated through family bloodlines, geography, and past allegiances. Regional power groupings maintain local bases of support, while national offices preserve regional and local connections. Today government ministries are often dominated by members of a single clan, as is the case in Uzbekistan and Turkmenistan.

To complicate matters, however, the term *clan* is employed differently across Central Asia. In Kazakhstan, Kyrgyzstan, and Turkmenistan the clans are based on lines of descent, emanating originally from the Kazakh Greater, Lesser, and Golden Hordes. Their respective political and social structures are based on kinship, which was traced patriarchally. Their territories are named after the inhabiting groups (Turkmen in Turkmenistan, Kazakhs in Kazakhstan, Kyrgyz in Kyrgyzstan, and Karakalpaks in Karakalpakstan). This nomadic model of clan identification con-

trasts with the sedentary model of clan organization and identification in Uzbekistan and Tajikistan, where clans are based on regional networks of patron-client relations, themselves based on the political and administrative institutions of their respective states. As a consequence of this structure, clan names are a derivative of their geographic locale, most often an oasis city, rather than blood lines. Uzbek examples include the Samarqand, Bukhara, and Tashkent clans. Examples from Tajikistan include the Khujandi and Kulabi clans. As is the case in Afghanistan, Central Asia's southern neighbor, the institutions of tribes and clans and their direct connection to ethnicity and identity can produce social, political, and economic instability on a grand scale. And yet it is these same institutions that provide the fundamental logic for the assertion of Central Asian regionalism.

Language

A common Turkic linguistic heritage, except in Tajikistan, where the dialect is a derivation of the Persian Farsi, and the accompanying cultural markers, such as festivals and customs, underscores the ethnicity and identity elements of regionalism. It is important to note that while each of the Central Asian states has experienced a cultural renaissance since their independence, most notably expressed by the official adoption of the titular languages, Russian remains the lingua franca of the region. This holdover from the colonial past serves as a unifying factor across the region for the conduct of business, science, and other cooperative affairs.

Religion

Finally, the prevalence of Islam across the region is yet another factor that contributes to the construction of Central Asia as a single collective unit. The ability of Islam to cross ethnic, linguistic, social, political, or territorial boundaries makes it both a great force for consolidation and peace and a force for instability and violence. After the terrorist attacks of 11 September 2001, Islam in Central Asia is seen as a threat to the Western powers, and as such something that needs to be contained. To date the leaders of the Central Asian republics have been all too happy to oblige the West in its attempts to suppress "radical" or "fundamentalist" Islamic movements. Religious-based political parties, or popular fronts, as they are better known in the region, are outlawed in all five of the Central Asian states. No other factor, including the independence of the region from the former Soviet Union, is considered more important as a defining factor for the future of the region.

Regionalism in Central Asia will continue to evolve as the leaders and populations of those republics seek to define and establish their place within an increasingly integrated world.

CENTRAL HIGHLANDS OF VIETNAM

(1990 pop. 2.9 million). The central highlands of Vietnam comprise three provinces—Gia Lai–Kon Tum, Dac Lac, and Lam Dong. They include 55,569 square kilometers or 16.6 percent of the country's total area but only 4.1 percent of its total population. The population density of the central highlands is 52 persons per square kilometer, compared to 215 for the country and more than 1,000 in the Red River Delta. While the Kinh-Vietnamese are the dominant ethnic group in the low coastal areas, the central highlands are the home of indigenous peoples such as the Xo-dang, Ba-na, Giou-rai, E-de, Mo-nong, and Ma. These Austroasiatic and Austronesian groups arrived from southern China and settled in the highlands around 2500–1500 BCE because of the fertile soils, rich fauna, and favorable climate. Some groups are still practicing swidden (slash-and-burn) agriculture and living in longhouses.

In the sixteenth century CE, the Kinh-Vietnamese conquered the eastern lowlands, and traders bartered salt, fabrics, and ironware for bush products without endangering the indigenous cultural patterns. In the middle of the nineteenth century, a few French priests moved near the city of Kon Tum in order to evangelize the hill tribes. From 1888 onward, the French administration encouraged Kinh settlements in the central highlands to relieve the overcrowded Red River Delta and, at the same time, to procure labor for the new plantation sector. By 1954, French colonists had extended the tea, rubber, and coffee plantations to about 110,000 hectares, and the number of Kinh working there had risen to at least 150,000 people. One-half to two-thirds of the Kinh in the central highlands, as well as some ethnic Chinese people, lived in towns associated with the plantations, such as Kon Tum, Pleiku, and Buan Me Thuot.

During the Vietnam War (1954–1975), the peoples of the central highlands were suspected of disloyalty by both the Communist Viet Minh and the South Vietnamese government, and they suffered ill-treatment from both sides. Defoliation programs during the war caused large areas to become toxic. Altogether, between 200,000 and 220,000 people died. In the postwar period about 2 million Kinh were sent to "new economic zones" in the highlands, greatly affecting the cultural patterns of the hill tribes, who now comprise less than a quarter of the population of the central highlands.

CERAMICS-JAPAN The radical changes that Japan has undergone over the last hundred years to become a major world economic power have not resulted in the loss of the country's rich and diverse ceramic tradition. In the early 2000s, Japan's ceramic artists and craftspeople are among the most numerous of any country in the world.

The art of the tea ceremony (*chado*) is connected to the history of ceramics in Japan. The old imperial capital city of Kyoto is one of many localities known for its ceramics, particularly the low-fired *raku* pots that are associated with the tea ceremony's founding tea master, Sen no Rikyu. *Raku* means "leisure," but it is also the family name of the Kyoto potters who made tea bowls using what is now generically called the *raku* process, in which a highly porous, partly fired clay pot is glazed, fired to maturity, and cooled quickly. The red-hot pot is removed from a small kiln and quickly placed in leaves or other material that smokes and creates accidental effects through the uneven removal of oxygen from the glaze, carbon deposits on parts of the pot, and sometimes crackles in certain glazes. These tea bowls epitomize the aesthetic sense of *shibui*—quiet, simple beauty.

Kaiseki, the food served to guests at a tea ceremony, also required special ceramics. *Kaiseki* originally consisted of a combination of simply prepared foods pre-

sented in an elegant way that incorporated ceramics as an important element. The appropriate foods must look well in a dish, and both dish and food must fit the season and be compatible with the space in which the meal takes place. Even prior to the development of *kaiseki*, Japanese party food was served in small individual and separate dishes, because mixing items on one plate or bowl compromised the purity of the unique flavors of each item. This preference is expressed in the proliferation of various shapes, sizes, glazes (or lack of glazes), colors, and textures used in ceramic plates, bowls, and teapots that are part of the same feast. The ware used must also fit the type of food or drink: coffee or English tea requires special European-style cups with saucers, while Japanese tea and rice wine (sake) require their own ware.

Other traditional arts that utilize ceramics have contributed to the development and appreciation of pottery: the tiny water bottles used with ink stones in calligraphy, clay incense holders for altar offerings, vases for ikebana (flower arrangement), and pots for miniature tree cultivation (bonsai). Motifs from ceramic decorations appear in other forms, for example, on kimono silks, fans, and wrapping paper. Ceramic objects are a ubiquitous part of Japan's consumer culture, which, in turn, has ensured the vitality of ceramics as an artistic as well as commercial enterprise.

Origins

The people who inhabited Japan during the Jomon period (10,000–300 BCE) were named after the traces they left in clay—rope impressions made when cords of fiber were pressed onto soft, moist clay. Jomon culture evolved into the more complex Yayoi culture (300 BCE–300 CE), during which time Japan partook of the spread of Chinese influence and the economic transformation introduced by rice cultivation.

Japanese ceramics, like other aspects of Japanese culture, were affected by the recurring waves of contact with China and Korea. Along with the introduction of new technology and techniques for kiln building, firing, glazing, and forming, Buddhist and Confucian ideas affected the way in which potters and their patrons and clients approached the craft.

Arita, Imari, and Porcelains

In the early sixteenth century, a Japanese is said to have returned from a five-year visit to China, where he learned porcelain manufacture with blue-and-white decoration (*some-tsuke*). He introduced to Japan the technique of using cobalt salts to paint designs on pots formed of the white clay brought from China, which

were then glazed and fired. Production was not to last, however, since this type of clay was not available in Japan until the early seventeenth century, when abundant China clay (porcelain) deposits were discovered in the Arita region of Kyushu. In the mid-seventeenth century, the Dutch East India Company began to import Japanese porcelain made by potters using the cobalt salts technique in Arita. A large-scale export industry developed, and because the porcelain ware was shipped from Imari port in Arita, the export ware was called Imari ware by Europeans.

Arita designs were originally influenced by Korea and China, but in time Chinese and European potteries began in turn to copy Japanese Imari designs. Arita is also known for two other types of porcelain, Nabeshima and Kakiemon, which had styles distinct from the export porcelains. Both are highly valued by Japanese collectors and have ornate designs that reflect the tastes of the Tokugawa period (1600/1603–1868). Arita continues to be a major pottery region in Japan.

Another major ceramic-producing locality is Seto, located near Nagoya City; Seto has a variety of different potteries, some small and some with automated

A Bizen ware sake bottle, c. 1392–1573. (SAKAMOTO PHOTO RESEARCH LABORATORY/CORBIS)

BIZEN WARE

Glazes are not applied to Bizen ware before firing, instead the unique characteristics spring from the firing process. The chemical oxidation and reduction of the iron rich clay found in the Bizen region during the firing, plus flying ash from the pine wood used as fuel, create the delightful effects that are prized.

Pots touching each other protect the clay surface from some of the effects caused by the kiln atmosphere to create interesting "shadows" that contrast with the surrounding surface. Ash flying about in certain parts of the kiln reacts with the superheated clay surface of pots to create rough textured glaze spots called *goma* (sesame seeds). A blue-black hue (*ao-Bizen*) is produced when the oxygen content of the kiln's atmosphere is reduced, causing iron oxide and metallic iron to appear on the clay body. Cords of straw soaked in brine and wrapped around pots create *hidasuke* (fire-cord markings) during the firing: the straw burns away, allowing sodium from the salt to react with the clay to form bright red glaze streaks on the neutral background of the pot's surface. All of these effects and their variations (pots coming from the same kiln vary), give Bizen its distinctiveness. Bizen's spontaneity, directness, and simplicity evoke its subtle aesthetic.

production-line methods of turning out huge numbers of pots. Seto, like many pottery-producing areas of Japan, dates back to feudal times and is an area that has good supplies of natural clay.

Scattered throughout Japan are numerous active kiln sites, many of which trace their histories to the Momoyama period (1573–1600), when Korean craftspeople were brought (often forcibly) to Japan to produce various wares. The six old kiln sites that have survived from these times are Tamba, Bizen, Shigaraki, Echizen, Seto, and Tokoname. Many potters had been supported by feudal lords, but with the Meiji Restoration in 1868, the fief system was abolished, and clan potteries went into decline. Some of the craftspeople active today in these areas, however, are considered direct descendants of the founding potters.

Western Influences

The most important Western influences on ceramics came after the opening of Japan to the West

in 1853. Beginning in the late 1800s, new techniques, including mass production, rapidly entered Japan with the Meiji government's efforts to destroy feudal institutions and to industrialize and modernize the nation. The German chemist and engineer Gottfried Wagner (1831–1897) was hired as a government adviser, and through his work in Arita, potters and manufacturers were introduced to plaster molds, new glazes and pigments, use of coal for firing kilns, and other Western approaches to pottery making. Trade schools were established to train workers for modern industries, including ceramics.

The mass production of ceramic ware created a new industry, but some traditional potteries continued. Revitalization of traditional methods began primarily after World War II. For example, Toyo Kaneshige (1896–1967), a seventy-eighth-generation potter in Bizen in Okayama prefecture, noting the decline in quality of Bizen ceramics over the generations, revived interest in the high artistic standards set by the tea

bowls of the medieval period and began experimenting with the firing methods (such as using no kiln furniture to stack the pots) of his ancestors, creating spectacular examples of Bizen ware. In recognition of Kaneshige's contributions, the national government designated him a Living National Treasure.

Over the years, ancient kiln sites that had fallen into disuse and near oblivion were in many cases later reestablished by potters attempting to revive and reproduce the ceramic traditions of the site, while claiming that the new pottery had authentic connections with the distant past. Thus there is a certain myth-making aspect to the history of ceramics in Japan that smoothes over discontinuities by implying an unbroken tradition.

Japan also was influenced by the European reaction against mass-produced ware. This revolt was articulated in Victorian England by William Morris (1834–1898), who called for the recognition and appreciation of the beauty of traditional arts and crafts in the industrial age. In Japan, Soetsu Yanagi (1869–1961), with the celebrated potters Shoji Hamada (1894–1978) and Kanjiro Kawai (1890–1966), started the *mingei* ("people's crafts") movement and founded the Japan Folk Art Association. Yanagi wrote essays on the philosophy of *mingei*, and his work *The Unknown Craftsman* represents a fusion of Buddhist philosophy and the ideals of the Arts and Crafts Movement. Yanagi was concerned about the decline of traditional village potteries and worked to create an appreciation of the ceramic works produced in villages. He was also especially interested in the revival of the folk arts of Korea (which Japan ruled from 1910 until the end of World War II) and Okinawa. At the same time, he helped the formation of an aesthetic mystique of the anonymous crafts-artist who works intensely, but is not driven by individualistic ego, which continues to inspire Japanese and Western craftspeople. The English potter Bernard Leach (1887–1979) was a strong supporter of the Japanese *mingei* movement and formed close friendships with Yanagi, Hamada, and Kawai.

Hamada, originally from Tokyo, established himself in the pottery village of Mashiko, where he lived the life of a *mingei* potter, not signing his pots in the belief that the collective tradition was the author.

Proliferation of Styles

Some potteries have been established more recently, born of the fact that ceramic styles proliferate depending on the market. Many potters adopt the style that is in fashion, while others work in the same style for several generations.

The variety of ceramic ware found in Japan is partly due to local conditions—clays vary widely depending on the site, and potters enjoy treating unique characteristics of the clay body as elements in the design of a pot. For example, tiny stones found in the clay in the old city of Hagi (Yamaguchi prefecture) can burst through the clay during firing, forming various subtly colored effects that make some Hagi ware highly prized.

The variety is also due to the periods of influence from abroad—Chinese and Korean cultures have greatly affected Japanese ceramics, just as they did other arts. As mentioned earlier, a major influence occurred in the Momoyama period, when the warlord Hideyoshi brought Korean master potters to Japan.

Some potters in villages today are direct descendants of the original potters from Korea, and Karatsu ware (named after its locale, a castle town on the coast of the Sea of Japan) is a notable example of Korean influences. One type of Karatsu ware uses a suspension of iron oxide in water, which is painted onto a glazed ware before it is fired. After the iron oxide painting of a tree or other design dries, a thin overglaze is applied, and when the pot has been fired, the effect is that of an elegant brush painting on the teacup or dish. Another type of Karatsu ware utilizes impressed patterns on the moist clay that is covered with a white slip (a creamy mixture of clay and water), which is carefully scraped off so that the white slip remains in the impressions. This inlay technique is called *mishima* (named after a shrine in Japan's Mishima city) by international potters, though the technique actually originated with the captured Korean potters brought to Japan. In Korea, the *mishima* technique was taken to elegant heights in the gray-green celadon porcelain ware of the Koryo dynasty (918–1392). Much of the signature work of the potter Tatsuzo Shimaoka (b. 1919) uses this technique in a unique way: impressions made by cords (reminiscent of ancient Jomon earthenware patterns) are inlaid with white slip and high fired using a transparent glaze.

Toward Modern Expression

The ceramic artist Kenkichi Tomimoto (1886–1963) freed the art of pottery from its traditional constraints, including *mingei*. Along with Bernard Leach, Torimoto used the potter's wheel, rather than having workers make the pots that the potter then glazed. Tomimoto also excelled in creating original works and in 1949 started the first ceramic arts department in a college in Japan: the Kyoto Municipal College of Fine Arts. Since Tomimoto, Japan has seen a growth of studio ceramists who create contemporary expressions in clay, some inspired by artists such as America's revolutionary Peter Voulkos

(b. 1924), who treated ceramics primarily as an expressive medium, breaking out of the constraints of its utilitarian functions. Two examples of this opening of Japan to the international contemporary movement in ceramics are Mutsuo Yanagihara (b. 1934), who studied under Tomimoto, and Kimpei Nakamura (b. 1935), whose father Banzan makes tea bowls in the traditional manner.

CERAMICS—KOREA Korea has a long history of pottery making, dating back to the prehistoric era, and for the last two millennia it has been a leader in ceramic arts. A sizable portion of the ceramics work

A Longquan ware celadon jar with lotus petal lid created c. 1279-1368. (ASIAN ART & ARCHAEOLOGY, INC./CORBIS)

in the world today owes its genesis to techniques developed by Korean craftspeople. Early Korean pottery was highly influenced by that of neighboring China, but truly indigenous ceramic ware appeared in Shilla early in the Three Kingdoms period (220–265 CE). High-fired stoneware first appeared in the fourth century, and ceramics took the form of jars, pots, cups, urns, figurines, and roof tiles. The pottery of this period came to be identified by the kingdom in which it was produced. Koguryo and Paekche ceramics were noted for their brown and green glazes, while Shilla ceramics were recognized by more random color in the glazes.

Koryo Celadons

Ceramics reached their zenith in the twelfth century during the Koryo kingdom (918–1392). This period is most noted for its exquisite greenish celadons (glazes). Early Koryo plain celadons were influenced by Song China, but later works show a unique and distinct style. Some celadons were painted with white or black slips or iron oxide, while others were inlaid using an ingenious Korean technique. The pattern was incised and filled with white or black slip. The work was then fired, covered with celadon glaze, and refired. With the Mongol invasions in the thirteenth century, slight changes in firing methods and simplification of techniques led to degradation in designs, decorative patterns, and color quality.

Choson Porcelain

The decline of Koryo celadon gave rise to an unusual type of pottery known as *punchong* ware, which was the only pottery allowed for use by commoners in the first two centuries of the Choson dynasty (1392–1910). Although the glazing was similar to that of Koryo celadon, the decorative technique was different. The most typical type of *punchong* decoration was the stamping-and-inlaying technique. It consisted of stamped-on designs with white slip brushed on. After the set slip was scraped off, the stamped designs remained filled with white clay. During the Japanese invasions of 1592–1598, exquisite pieces of celadon and *punchong* ware were seized and kilns were destroyed, bringing an end to the production and use of *punchong* ware.

After the Japanese invasions, Choson white porcelain developed under royal patronage. The Confucian state required a more simple style than the elaborate designs of Koryo. Choson white porcelain was first characterized by an opaque whiteness, later by cobalt-blue decorations, and later still by folkloric designs. In the twentieth century, Koryo kilns in the far southwest were excavated by South Korea in an at-

tempt to research the techniques used and duplicate these fine ceramics.

CHAEBOL A *chaebol* is a type of Korean conglomerate, similar to the prewar *zaibatsu* of Japan, which has multiplied in the Republic of Korea (South Korea) since the 1960s. A *chaebol* may be defined as "a diversified business group which is exclusively owned and controlled by a person and that person's family" (Kang 1997: 31). Its two major characteristics are that it is a business group that is owned and governed by the dominant shareholder and his family (a divergence from the legal definition of a *chaebol*—according to the Fair Trade Law of Korea—as a large-scale business group), and that it is a diversified business group with coverage extending from manufacturing to services, and from small retailers to multinational corporations.

The fact that it is family-owned, however, constitutes a major difference between the Korean *chaebol* and the prewar Japanese *zaibatsu*. The Japanese *zaibatsu* "family" was not always made up of blood relatives. An excellent manager could belong to the "family" in Japan, but not in Korea. The ownership of currently existing corporate groups in Japan has been diversified to their affiliates, main banks, and the public. To make another comparison, in the United States in the 1960s, conglomerates were diversified in business and assets, but not necessarily owned by dominant families.

Thirty *chaebol* are famous: their names are announced officially as the thirty largest business groups on the first of April every year. In 1998 they accounted for 46 percent of total sales in the manufacturing sector, 24.1 percent of value added (comprised of wages, cost of borrowing, rent, depreciation, and net profit before corporate tax), and 12.9 percent of employment in the same manufacturing sector.

Chaebol have been the leading force in Korean economic development. At the same time, however, they

are the target of strong and widespread criticism. That is, the *chaebol* are successful but are not necessarily fair competitors.

The Development of the *Chaebol*

Historically, the *chaebol* have grown under a government-led development strategy. The South Korean government selected as "national champions" certain companies in the major industries during the first Five Year Economic Development Plan in the early 1960s, and subsidized them through financial aid, tax exemptions, suppression of the labor movement, and so forth. The firms singled out by the government received enormous economic benefits and were able to rise to a level of international competitiveness.

With their information-gathering and lobbying power, the *chaebol* leadership could influence government officials to approve policy loans, which were obtained by forcing the banks to follow government policy. The *chaebol* thus were able to borrow continuously under favorable conditions, based not on the soundness of

Daewoo Group chief Kim Woo-choong in July 1999. After promising major reforms, the organization, the second largest chaebol in South Korea, collapsed in August 1999. In 2001, Kim was reported by Korean officials to be hiding in Europe to escape prosecution (AFP/CORBIS)

their operations but on their lobbying power. In addition, the *chaebol* got special tax exemptions.

This unhealthy development policy eventually drove the Korean economy to the financial crisis of 1997. In November 1997, bad loans held by Korean banks comprised about 15 percent (32.2 trillion won) of their total loans, while the corresponding figure for advanced countries is generally less than 1 percent. Most of these nonperforming loans had been granted to the thirty largest *chaebol*.

The Korean *chaebol* have diversified through various related and unrelated fields of business including electronics, the automotive sector, heavy industry, textiles and garments, petrochemicals, banking, information, and telecommunications. Often depicted as an octopus, the typical *chaebol* has grown many different business legs in order to diversify its operations and thereby minimize its risks so as to secure financing at low interest rates.

Two strategies were used by the *chaebol* to facilitate their rapid expansion: mutual loan guarantees between related companies within the same *chaebol*, and cross investments between the affiliated companies of one *chaebol*. These strategies allowed the *chaebol* to increase their leverage while maintaining the unity of their corporate governance.

Negative Impact of *Chaebol* on Korea

While the *chaebol* have helped Korea attain rapid economic growth and are the manufacturers of world-renowned brand names, they have also become an obstacle to further economic development. First, the *chaebol* have hindered and distorted efficient market development through their wielding of both market and nonmarket power. This has allowed them to block the normal development of small and medium-sized industries, due to unfair distribution of resources and entry barriers. Second, they hinder smooth industrial development in this time of transition from traditional to information- and communication-based industries. The problem is that the *chaebol* still operate via traditional mass-production systems for standardized products, using unskilled or semi-skilled laborers. Third, the development of the financial industry itself has been stunted because capital from the financial institutions is concentrated in *chaebol* loans—as shown by the large number of nonperforming loans. Fourth, the *chaebol* have distorted the distribution of income and assets.

Reforms

In response to the 1997 financial crisis, the Korean government has carried out reforms of banks and

corporations. The *chaebol* reforms include enhancing transparent business management through the early introduction of consolidated financial statements, banning the system of cross guarantees between individual subsidiaries of a business group, defining core sectors and cooperation with small and medium-sized firms, making majority shareholders and management more accountable for their actions, banning *chaebol* dominance of nonbanking financial institutions, prohibiting mutual investments between subsidiaries, and banning illegal hereditary transfer of *chaebol* ownership.

Some of the reforms have shown good results, but others have yet to bear fruit. By the end of 1999, the *chaebol* had eliminated almost all mutual loan guarantees between affiliates—loans which for the top thirty business groups amounted to four times their own capital in 1997. The average debt/equity ratio of the top five groups, excluding Daewoo, fell from 386 percent in 1998 to less than 200 percent by the end of 1999. By June 1999, the top thirty *chaebol* had spun off 484 firms; this has helped them focus on their core competencies and has enhanced their competitiveness.

Reform of the corporate governance structure is still incomplete. Until transparent corporate governance systems are set up, *chaebol* reform cannot be termed a success. Until recently, the corporate governance structure of a *chaebol* was centered in the owner and the *chaebol* subsidiaries, whose average combined shareholdings reached 50.5 percent in 1999 but declined to 44 percent in 2000. The *chaebol* head dominated decision making, a practice that is criticized because of the consequent lack of surveillance, supervision, and accountability.

Since the foreign exchange crisis of 1997, the Korean *chaebol* have begun to change their corporate structures (e.g., by establishing protections for minor shareholders and by allowing directors from outside the firm) including their governance, though management is still dominated by the owner-manager head.

In the twenty-first century, the new model for corporate governance ought to ensure proper surveillance from both inside and outside the firm. The decision-making power should be shifted from the dominant family to a board of directors that represents the greater number of shareholders. A 1999 law required that companies whose assets are more than two trillion Korean won must nominate directors from outside the firm for more than half the total board members. In addition, the group-suit system will be legalized in 2002. Along with these reforms bank management should be allowed to be independent from

government manipulation. One important reform will be to shift the *chaebol's* traditional group management system to an independent management system, as the group system is contrary to fair market competition.

Korea will probably choose to replace its rent-seeking model with the market-based corporate governance model that is popular in Western countries such as the United States and the United Kingdom, where household and institutional investors are the main shareholders: they empower the board of directors, which in turn supervises management and hires and fires the CEO. This is the desirable and expected direction of *chaebol* reform in the twenty-first century.

CHAGANG PROVINCE (2002 pop. 1.5 million). Chagang province (Chagangdo) is located inland along the northern border of North Korea. The Amnok (Yalu) River, which flows between Korea and China, marks the province's border. North Korea created Chagang province in 1949 from portions of North P'yongan and South Hamgyong provinces. Since then, Chagang has been reconfigured four times and currently has an area of 16,764 square kilometers, divided into 15 counties (*kun*). The provincial capital is at Kanggye, and the other two cities are Manp'o and Hich'on.

The Nangnim mountain range accounts for the province's high average elevation. The province also has many rivers because of the numerous tributaries of the Amnok River. Abundant waterways and fertile soil support a robust agriculture, whose key products are rice and grains, beans, fruits, and vegetables. Nearly a thousand species of trees and plants thrive

throughout the province. Lead, zinc, gold, copper, lime, and coal are mined, among other minerals.

CHAGATAY Chagatay, also known as Chaghatay, Chagatai or Jagataic, was the Turkic literary language of Central Asia in the fifteenth to early twentieth centuries, written in the Arabic or (in a few early manuscripts) the Uighur script. Some of the greatest works of Islamic literature were written in Chagatay, including the autobiography of the emperor Babur (1483–1530) and the poems of Nava'i (1441–1501). Chagatay was also the language of the Khivan tradition of historiography, which spanned four centuries, and was the official chancery language of the khanate of Khiva (1804–1873).

The present name of the language is ultimately identified with the Mongol prince Chagatai (d. 1242), one of the sons of Genghis Khan, whose name in subsequent centuries came to be applied to the state centered on his original *ulus*, or portion of the Mongol Empire, including the Central Asian oasis region of Transoxania. Having outlasted the end of the Chagatai state and the rise of the Timurids (fifteenth century), the term Chagatai denoted the nomadic Turkic population of this territory, and later to some extent the Turkic literary language of the region, though Turki or *Turk tili* (Turk language) remained the usual native name for this language down to the first decades of the twentieth century. The designations Chagatay and Eastern Turkish were popularized in the nineteenth century by European Orientalists, some of whom restricted Chagatay to mean the classical language of the fifteenth and early sixteenth centuries. Soviet scholars have used the term *Starouzbekskii iazyk* (Old Uzbek language) to denote a group of spoken and written forms including Chagatay.

Over its entire history Chagatay could claim to unite, in a developed and flexible idiom, a widespread and diverse literate population from Khorasan to Kashgaria, and from European Russia beyond the Aral Sea to the steppes of Kazakhstan. Besides numerous works of poetry and fiction, writings in Chagatay include histories, biographies, religious literature and hagiographies, genealogies, geographical works, travels, various treatises (*risalah*), and a wide variety of documents and correspondence.

The Language

Chagatay is classified as a Central Asian Turkic language, with some linguistic traits related to Kipchak and Oghuz Turkic. Chagatay followed the Karakhanid (eleventh–thirteenth centuries) and Khorezmian (thirteenth–fourteenth centuries) literary languages in the Eastern Middle Turkic period. Its vocabulary was considerably enriched by borrowings from Persian and Arabic. The position of Chagatay as a precursor of the modern literary Uzbek and Uighur languages is assumed but has not been fully investigated.

Throughout the period of its use Chagatay coexisted with literary Persian. There were many bilingual writers, and most Chagatay authors adopted Persian and Arabic expressions extensively. Nevertheless, the language contributed to a distinctive Turkic ethnic consciousness in Central Asia. The fifteenth-century poet Nava'i devoted his last composition, *Mubakamat al-Lughatayn* (Judgment of Two Languages, 1499), to a vigorous argument on the superiority of Turki (Chagatay) over Persian.

The Literature

With few exceptions, poetry in Chagatay was modeled closely upon Persian examples. The oldest surviving works of Chagatay belles lettres belong to the early fifteenth century. During this period, Sakkaki and Ata'i wrote panegyrics and other court poetry for Timurid royal patrons, including Ulugh Beg (1394–1449). Some poems in the single *divan* (collection) of Ata'i record Turkic proverbs, adages, and folk meters. Lutfi (1370?–1460?) was a master of the *tuyugh*, a difficult native Turkic quatrain form with an *aaba* rhyme scheme in which the rhyming words must all be homonyms. Mir 'Ali Shir Nava'i, or Nava'i, wrote in both Chagatay and Persian, though his Chagatay works earned greater renown. Nava'i brought the Chagatay language to its full development as a mode of literary expression and presided over its classical era. Among his numerous works in all genres are four *divans*, a five-part cycle of verse tales (*mathnavi*) entitled *Khamsab*, a translation from Persian of a Sufi hagiographic work by his friend the poet Jami (1414–1492), and *Mubakamat al-Lughatayn*. One of the most important sources on Timurid society is Nava'i's biographical compendium in Chagatay, *Majalis an-Nafa'is* (Assemblies of Refined Men, 1490/1), which gives biographies and literary samples from over four hundred men of letters, many of whom Nava'i knew. It is virtually the only source of information on the lives of the forerunners of Nava'i in Chagatay literature. The emperor Zahir ud-Din Muhammad Babur, founder of the Mughal dynasty in India, was also a celebrated au-

thor. His memoir, the *Babunamah* (Book of Babur), is treasured as a work of biography for its lucid depiction of events in the life of a compelling historical personality. Babur also wrote excellent poetry. His *divan* contains all types of the poetic art characteristic of his times, including examples of the virtuosic *tuyugh* quatrain. Chagatay poetry continued to be composed down through the era of the nineteenth-century khanates of Khiva and Quqon, though the artistic ideal was generally imitative.

Perhaps the most popular and influential work of religious literature in Chagatay was a *divan* of prayers and hymns supposed to be the work of the famous twelfth-century Sufi Hoja Ahmad Yasavi, though the collection is known only from much later manuscripts. The genre of Islamic hagiography (stories of the lives, works, and lineages of holy men) also produced several original works in Chagatay.

The oldest histories in Chagatay were produced for the early Shaybanid Uzbek rulers, whose invasions from the steppes drove the Timurids from power at the beginning of the sixteenth century. The *Zubdat al-Atbar* (Cream of Annals, after 1525) by 'Abdallah Nasrallahi was the first example in Chagatay of the Islamic general history. Subsequently, Chagatay historiography was written mostly in Khiva, and to a lesser extent Quqon. The Khivan king and historian Abu'l Ghazi Bahadur Khan (1603–1663) wrote his general history, *Shajarah-i Turk* (Genealogy of the Turks), by himself because, he said, he could find no one else in his realm who was qualified to do so. This book was one of the first Central Asian historical works to become known in Europe. In the nineteenth century, Khivan historians beginning with Shir Muhammad Munis (1778–1829) wrote an uninterrupted series of original works that chronicled the rulers of the country, the Qongrat dynasty (eighteenth century–1873). One of the last works in late Chagatay was Muhammad Yusuf Bek Bayani's *Khwarizm Tarikhi* (History of Kwarizm [Khiva], 1921), which, though written in medieval manuscript form, featured the innovated use of punctuation, apparently in imitation of Russian writing.

In the 1920s, the Soviet government's intensive efforts to construct and promulgate an Uzbek literary language finally supplanted Chagatay, and the latter disappeared from use. The Chagatay documents in the archives of the khanate of Khiva (preserved in Saint Petersburg, Russia) remain a valuable and largely untouched body of source material on the history of medieval Central Asia.

CHAGOS ARCHIPELAGO The Chagos Archipelago (formerly called the Oil Islands) is a cluster of islands in the central Indian Ocean, administered by the United Kingdom, and having a total land area of 197square kilometers. They are actually a group of atolls arranged in a circle around the Chagos Bank and lie 500 kilometers due south of the most southerly island in the Maldive Republic. The only product is coconut oil.

In 1971 the Chagos inhabitants, who are mainly French Creole in origin, were ordered to leave by the British government and most were resettled in Mauri-

tius, where the archipelago had been administered. This move was mandated so that the large island of Diego Garcia, where most of the people lived, could be leased to the United States as an intercontinental air base. However, in 2000 the British High Court ruled that the inhabitants had been illegally evicted, and ordered that those who wanted to return there from Mauritius be allowed to do so. Most of the returnees would resettle Peros Banhos or Salomon, but not Diego Garcia 150 kilometers to the south of those islands.

Paul Hockings

CHAJON NORI *Nori* means "play" or "game" in Korean. Chajon Nori is one of the traditional massive battle games in Korea. This game dates from about 1000 CE, during the latter Three Kingdoms period. The game commemorates victory in battle; nowadays, it celebrates the harvest.

This battle game, also known as the "War of Moving Bodies," is held around the fifteenth day of the first month of the lunar calendar. It is played in most parts of Korea. Villagers make chariots with oak trees after supplicating the Mountain God for his approval. The villagers are divided into two teams, the East and the West, on the festival day. Everyone has his own part to play in this game. The players in the lead, with their arms crossed, push their opponents with their shoulders, or mount an attack against the opponent, pulling down the opponent commander. The game comes to an end when the chariot of either team is pulled down to the ground or the commander falls to the ground. It sometimes lasts until midnight. The players on the winning team celebrate their victory by throwing their straw sandals high up into the air, or throwing away the parts of the enemy chariot. Winning is supposed to portend a good harvest.

CHANDIGARH (2001 est pop. 808,000). Chandigarh became the capital of the Punjab and Haryana states in northwestern India in the 1950s. After partition in 1947, when Punjab's principal city Lahore was

claimed by Pakistan, the new state needed a capital. Premier Jawaharlal Nehru (1889–1964) seized the opportunity to realize his vision of a city symbolic of the future of India. The originally chosen architect, Matthew Nowicki, was killed in a 1950 airplane crash. Swiss-French modernist architect Charles-Édouard Jeanneret (called Le Corbusier; 1887–1965) produced the master plan. Chandigarh is orderly and regulated, with modern concrete buildings, broad boulevards, and open parks; it has an air of prosperity and is considered the cleanest and healthiest city in India. Yet it has been controversial ever since it was completed in the 1960s. Detractors complain that its design was flawed, self-indulgent, and "un-Indian," with provision for fast-flowing traffic, unnecessarily large parking lots, and buildings requiring expensive air conditioning. The premier attraction of Chandigarh is the Rock Garden, a series of interconnected rocky grottoes, walkways, and landscaped waterfalls, including more than five thousand animal and humanoid figures fashioned from discarded materials. Also of interest are the Museum and Art Gallery, the Science Museum, and a large Rose Garden containing over a thousand varieties of roses.

CHANG FEE MING (b. 1959), Malaysian artist. Chang Fee Ming is known for large watercolor paintings depicting traditional Asian arts and ways of life in a photo-realist style. A native of Dungun in Terengganu in northeastern Malaysia, Chang is a self-taught artist with a background in commercial design. As he developed his distinctively detailed and colorful style, Chang was inspired during travels in Bali and became committed to recording vanishing arts and preindustrial scenes in his work. Evoking an atmosphere of timeless, sun-drenched calm, Chang's paintings are often detailed depictions of traditional arts, such as intricately woven and decorated fabrics.

Chang's work was shown at "The Road to Mandalay," an exhibition and sale held in Jakarta in 1995, to which only patrons of his work were invited. Traveling for several months every year to make sketches for the exacting paintings executed in his studio in Terengganu, Chang has journeyed to India, Nepal, and Thailand as well as to Myanmar (Burma), in addition to frequent excursions within Malaysia and to Bali. As his reputation grows, collectors in distant

cities have sought to acquire Chang's paintings, a few of which are available in the form of prints.

CHANG RIVER Called the Changjiang (Long River) in Chinese, the Chang (Yangtze) at 3,900 miles is the third-longest river in the world and the longest one in Asia. It originates in the Tanggulashan on the border of Tibet and Qinghai Province and then runs south until it empties into the East China Sea near Shanghai. The river derives its name from the ancient kingdom of Yang, which settled regions along it.

The Chang originates in the Kunlun Mountains and then runs south through the high mountain valleys in Qinghai, Tibet, and Yunnan Provinces before turning northeast at Shiigu. From there, the Chang flows through Sichuan Province before entering the famous Three Gorges. It then crosses central China through Hubei, Hunan, Jiangxi, Anhui, and Jiangsu Provinces before emptying into the East China Sea at Chongming Island, ten miles north of Shanghai. Stretching the length of the country, the Chang has served as the unofficial boundary between north and south China—no bridge was built over the eastern section of the Chang until 1969, when the Changjiang Daqiao Bridge was built at Nanjing.

THE YANGTZE

Writer and editor Simon Winchester had the rare opportunity to travel the length of the Chang (Yangtze) River. In the excerpt below, he reflects at the end of his journey.

I reached into my pocket for the little prayer block that the monk had given back in Dêgê—I had hoped, I think, that I might imprint a few good thoughts on the waters and send them scurrying down to sea level. But it was not there: I had left it behind, carelessly. It was back in the army base. In any case, I told myself, for me to do such a thing was more than a little out of character: I was no Buddhist, I had no real idea what sentiments had been inscribed on the wood, and would feel plagued that I had performed some disingenuous act, just for the symbolic sake of it.

So instead I got out a cigar. A friend had given it to me in Hong Kong. The Mandarin Hotel had imported a Cuban maestro from Cohiba in Havana, and had set him to work hand-rolling cigars in a corner of the hotel lobby. My friend had bought two for me, for some exorbitant sum. One, he said, was to be smoked at the start of the Yangtze journey, and the second was to be savored in the mood victorious if, and only if, I reached the headwaters. This battered and somewhat stale object that I pulled from my jacket pocket was the very one.

I straightened it as best I could and listened to it: there was the slightest crackle of a few stale leaves, but not too much—it seemed to have kept most of its supple softness, and it might not be too bad. So I tilted my head out of the breeze and lit it slowly and carefully, then blew a cloud of pure blue smoke out into the chilly air.

Once, a few weeks back, this had been a grand cigar; now, old and tired from its journey, it had just a hint of its glory: in any restaurant it would have been sent right back. Out here, though, it was the best smoke I could ever, ever imagine. And so I sat there in a state of utter contentment, listening to the gurgling of the stream, listening to the lone Tibetan behind me marshaling the yaks from a herd that had been scattered in the storm, and listening to the souging winds. They began to pick up again, and they started to scatter the grass and ruffle the calm surface of the river waters once more.

Throughout Chinese history, the Chang has featured prominently in the development of culture and trade. As far back as the Neolithic period, settlements have been found along the lower Chang. Qin dynasty founder Qin Shi Huangdi built waterways and canals to allow trade from Yangzhou to

Guangzhou, a distance of 1,200 miles. Since then, the Chang has been the main transportation artery across central China as it passes through many of its economic and industrial centers. Since the Tang era, the Chang delta has become a center for growing and shipping rice.

About 1,800 miles of the Chang is navigable year-round. In the early 1990s, the Chang and its major tributaries drained an area of 1.8 million square kilometers—a quarter of China's total cultivated land—in which 386 million people live. The network of rivers and associated canals carries some 85 percent of China's domestic waterborne traffic. It passes through many of its major cities, including Kunmin, Chengdu, Chongqing, Wuhan, Shanghai, and Nanjing. The gross value of industrial product of the areas along the Chang makes up about 40 percent of China's total.

CHAO ANOU (1767–1829), Lao monarch. Chao Anou, or Anuvong, was the last ruler of the Lao kingdom of Viang Chan (present-day Vientiane, capital of Lao People's Democratic Republic) and a significant patron of Lao Buddhism. Born in Viang Chan, Chao Anou ascended the throne in 1805 and initiated construction of many temples, including Vat Si Saket. He also undertook repairs to the Phathat Luang temple complex and added the cloister surrounding the stupa, a dome-shaped structure that serves as a Buddhist shrine.

Chao Anou improved relations with the reigning Nguyen dynasty of Vietnam and united the central and southern kingdoms of Laos by placing his son on the throne of Champasak, the southern Lao kingdom. In 1826, Chao led an unsuccessful attempt to win independence from Siam, Viang Chan's suzerain, and recover lost territory on the Khorat plateau. The Siamese retaliated, destroying Viang Chan, except Vat Si Saket and Phathat Luang. The Siamese troops took tens of thousands of the people in Viang Chan and its vicinity captive and relocated the prisoners of war to Siam. Chao Anou fled to Vietnam but returned in 1828 to find his capital in ruins. The Siamese eventually captured Chao Anou, who died cruelly in a Bangkok prison a year later. Chao Anou is considered a national hero for his attempts to unify the Lao kingdom and gain independence from Siam and for his contributions to Lao Buddhism.

CHAO PHRAYA RIVER AND DELTA The Chao Phraya River is the primary river in Thailand, formed by the confluence of the Ping and Nan Rivers. The headwaters meet near the city of Nakhon Sawan in western central Thailand. The river is more than 230 kilometers in length and flows south to the Gulf of Thailand. It is key to the region's transportation and economy.

The river drains one-third of the nation, including the central plains and lowlands. Its numerous tributaries are part of the delta, which serves as the watershed for western Thailand.

The Chao Phraya River is entirely navigable by watercraft and continues to be important to the Thai economy. The river valley is the nation's most productive agricultural region. The World Bank helped finance irrigation of the river basin beginning in the 1960s. Its waters continue to irrigate various crops, primarily rice. Thailand is consistently one of the world's leading rice exporters (usually ranked first or second). The delta's tributaries are interconnected by a series of canals, also used for transportation.

CHART THAI Chart Thai is one of Thailand's major political parties, founded in the 1970s by General Chatichai Choonhavan (1922–1999). In the July 1988 election, Chart Thai and its political allies won a majority, giving it the right to form the coalition government. Chatichai was credited with restoring democracy as he became the first prime minister in twelve years to have been elected following a string of appointed prime ministers, though appointment was constitutionally legal and Chatichai himself did not do anything to restore democratic rule. He rose to power on the urban middle-class support that had grown substantially during the 1980s, and enjoyed a high degree of legitimacy owing to the restoration of democracy

and rapid economic growth. Chart Thai had a probusiness platform and oversaw significant deregulation of the Thai economy between 1988 and 1991. But Chart Thai politicians were hampered by constant allegations of corruption, and in the 1990 election, Chart Thai was accused of spending \$120 million in vote-buying. Rampant corruption on the part of Chatichai and his government was the military's justification for the February 1991 coup d'état, led by Generals Suchinda Kraprayoon and Sunthorn Kongsompong, though in reality the military's fear of losing power to powerful business interests was the prime motivation of the coup and Chatichai's arrest.

In the March 1992 election, the Chart Thai finished second with 73 seats and joined the military-led coalition government. Throughout the 1990s Chart Thai served as an opposition or minor coalition partner, but, tarnished by corruption scandals, it has been unable to regain its popularity. Chart Thai joined the Democrat Party-led coalition government in November 1997 and the Thai Rak Thai-led coalition government in February 2001. Chart Thai is the party most associated with vote-buying and money politics and has been unable to broaden its base of support.

CHATTERJEE, BANKIM CHANDRA

(1838–1894), Indian writer. Born to a high-caste Brahman family in Kantalpara, Bengal, British India, Chatterjee, or Bankim, as he is known to Bengalis was a noted scholar of Bengali, English, and Sanskrit as a student. He was in the first group of students to pass the Entrance (1857) and the Bachelor of Arts examinations of the Calcutta University. In 1869, he obtained a Bachelor of Law degree.

Bankim joined the Provincial Executive Service in 1858 and served at various places as deputy collector and deputy magistrate (the highest ranks achievable by Indians at that time). He was greatly respected for his judicial wisdom and for his impartial and effective management of areas under his jurisdiction. However, his independent spirit often caused trouble with his British superiors, most of whom did not have his erudition.

Bankim was a prolific author in Bengali, writing poems, prose, and drama. He was the first major Bengali

author and set the style followed and modified by subsequent authors, especially in prose. He also was an acclaimed journalist, the founder of and frequent contributor to *Bangadarsban* (Review of Bengal), a successful periodical. His prose works included romances, historical fiction, and essays, which in the guise of humor examined and criticized the many absurdities, wrongdoings, and injustices of the British and the Indians of the times. While his poems were not of as high a standard as his prose, one, *Vandemataram* (Hymn to Mother), became a rallying cry for the seekers of Indian independence.

Bankim vehemently protested demeaning articles on Hinduism by a British missionary. He went to write extensively on Hinduism, going back to the original texts, and played an important part in the movement that some have called neo-Hinduism. Apart from many articles, his opus consists of thirty-three books (and collections) in Bengali and one in English. Many of his Bengali books were translated into English in his lifetime. Since then they have also been translated into Swedish and German.

CHAUDHURI, NIRAD CHANDRA

(1897–1999), Indian critic and writer. Nirad Chaudhuri, who for the first half of his life was a civil servant, was one of India's foremost critics and writers who opposed the withdrawal of the British empire from the Subcontinent. He was born in Kishorganj, a small town in East Bengal, and moved to Calcutta at the time of Indian independence. He then rose to prominence with the first of two autobiographical books, *The Autobiography of an Unknown Indian* (1951). The second, written toward the end of an extremely long life, was *Thy Hand, Great Anarch! India 1921–1952* (1987), in which he showed himself as a "scholar gypsy" living only for literature. In between these two masterly volumes, there were several others, all of which received the acclaim of Western critics. Most notable—although controversial for many Indian critics—were his overviews of Indian society entitled *The Continent of Circe: Being an Essay on the Peoples of India* (1965) and *Hinduism, a Religion to Live By* (1979). From 1953 to 1965, he was attached as a

writer to the French Embassy in New Delhi, but late in his life he moved to Oxford where he died in 1999.

CHAVALIT, YONGCHAIYUDH (b. 1932), Thai general and politician. Chavalit Yongchaiyudh was a career military officer, graduating from the Royal Military Academy in 1953 and from the Command and General Staff College in the United States in 1964. He served as army commander in chief in 1986 before his appointment as Supreme Commander of the Armed Forces, the position he held from 1987 to 1990. Chavalit was a member of a group of politically oriented soldiers who sought to address social injustices and alleviate rural poverty while ensuring the military's dominant role in Thai politics. Under Chavalit's command, the military also became involved in business ventures.

He resigned from the army in 1990, having achieved the rank of general, and entered politics. He was appointed by Prime Minister Chatichai Choonhavan to be deputy prime minister and minister of defense in March 1990, positions he only held for ten weeks before the coalition lost a no-confidence vote. Chavalit went on to form the New Aspiration Party (NAP), which has been a coalition member in several governments since 1992. Chavalit served in a number of cabinet positions: minister of interior (September 1992– December 1994), minister of labor (September 1993– January 1994), deputy prime minister (July 1994–October 1994), and deputy prime minister and minister of defense (July 1995–November 1996). Following the vote of no confidence that forced Prime Minister Banharn Silpa-Archa from office, the NAP won the November 1996 election and Chavalit became prime minister, a position he held from November 1996 to November 1997. But his government was unable to effectively respond to the 1997 Asian economic crisis. Following the vote of no confidence that forced Prime Minister Banharn Silpa-Archa from office, the NAP won the November 1996 election and Chavalit became prime minister, a position he held from November 1996 to November 1997. He was initially thought of as a reformer, and he advocated drafting a new constitution that he hoped would codify the military's leading role in politics. Chavalit's political support came from the rural northeast where he engaged in rampant vote buying, at the expense of the urban mid-

dle class. Yet, as the economy fell into recession, he was unable to support rural development projects. As the economy worsened, Chavalit's varied policy responses led to a deepening crisis. Fiscal mismanagement, a growing debt crisis, and the protection of several major financial corporations led to the collapse of the baht. Chavalit contended that only by centralizing power further could the economy be restored, and he tried to block the passage of a new constitution in 1997 that shifted political and fiscal control to the provinces. Both the military and his rural constituency, however, supported the new constitution, and he was forced to accept it.

He called for emergency powers so that he could restore political and economic order, but the military withdrew their support for him. Under intense pressure from the king and the military, Chavalit was forced to resign and call early elections in November 1997, based on the new constitution approved that October, which was the most democratic constitution in Thai history. He reentered the government in February 2001 as minister of defense and deputy prime minister in a coalition government headed by Prime Minister Thaksin Shinawatra.

CHEJU PROVINCE (2000 pop. 543,000). Cheju Island is the largest island in and a province of South Korea, located about 140 kilometers south of Mokp'o in the East China Sea (Namhae, or South Sea, in Korean). The product of Mount Halla, the tallest mountain in South Korea at 1,950 meters, the rugged island is composed of unique volcanic rock formations and maintains a subtropical climate. Originally known as the isolated island kingdom of T'amna, it first came under the control of the Koryo kingdom (918–1392) in 938 and was later conquered by the Mongols and used to raise cattle and horses during the fourteenth century. The island was governed as part of Cholla province from the thirteenth to the twentieth centuries. In 1925, it fell under Japanese colonial rule. Finally, after the withdrawal of Japanese forces from Korea, it was declared a province in 1946.

The people of Cheju have developed a distinct dialect and lifestyle, focused on two major cities: Cheju

on the north side of the island and Sogwip'ŏ on the south. Agriculture, fishing, and tourism are the main industries. Besides ancient guardians made from volcanic rocks called "stone grandfathers" (*tol harubang*), Cheju is famous for its subtropical fruits, such as tangerines, pineapples, and bananas. Successful demonstrations by the islanders have kept modern industrial factories from being built, which has contributed to the preservation of many beautiful beaches.

CHEN DUXIU (1879–1942), Chinese politician. Born on 8 October 1879 in Anqing, Anhui, Chen Duxiu was famous for his role in the iconoclastic intellectual and revolutionary political movements in China. Chen's experience in studying for and passing the lowest level of the traditional imperial examination (*xiucai*) convinced him that the dynastic government of China was corrupt and disastrous for the Chinese people. In 1901 he studied in Japan and began his lifelong commitment to political organizing, founding the reformist *Chinese Youth Society*. From 1903 to 1907, he established and wrote for revolutionary journals in Shanghai and Anhui. In 1907 he fled in exile to Japan.

After the 1911 revolution, Chen held a minor government position and then took up teaching. During the 1913 "Second Revolution" he fled again to Japan. These early life experiences and defeats influenced him to become a critic of Chinese civilization and society. In 1915 Chen founded *Youth* magazine. This magazine, which changed its name a year later to *New Youth*, became the most important liberal and revolutionary magazine in China. It was a forum to propagate science and human rights under the famous slogan "Support Mr. Science and Mr. Democracy." Chen was influenced by the reformist ideas in Japan and the political philosophies of eighteenth-century France and nineteenth-century America. He layered his political criticism of China's feudalism with a scathing attack on Confucianism. He blamed Chinese culture for destroying human dignity, oppressing women, and suppressing individuality and creativity. His withering attacks provided a generation with the ammunition to criticize Chinese tradition.

In 1917 Chen was named dean of Beijing University's School of Letters. In this capacity he befriended Chinese student leaders and intellectuals. He formed study groups and journals that discussed the cause of China's deterioration. In 1919 he resigned his deanship to join the students who were protesting the Beijing government's domestic and foreign policies, and became a leader in the May 4th movement of that year. Initiated in Beijing, violence, massive protests, and arrests became nationwide. Chen, too, was a prisoner for three months. Upon his release from jail, he became a Marxist, and within two years, in 1921, he was established as Secretary General of the Chinese Communist Party. He held this post until 1927.

Chen's leadership of the Communist Party is still highly debated. He favored a traditional Marxist revolutionary program that relied on the working class, established an independent political organization, placed social reform as a priority before military uprisings, and sought equality with Moscow in determining the world revolutionary movement. Chen was accused of deviating from the party line in all these areas. He opposed Mao Zedong's strategy of placing the rural areas in command and of relying on armed force; he criticized Moscow's plan to ally with the Guomindang; and he failed to respect Stalin's leadership. In 1928 he refused a summons to travel to Moscow for an evaluation of his failures. The following year he became attracted to the writings of Stalin's major rival, Leon Trotsky. As a result, Chen was expelled from the party. His negative experience in the party was further exacerbated by the execution of his two sons by the Nationalist Chinese in 1927 and 1928.

Chen led the Chinese Trotskyist Party from 1930 until his arrest by the Nationalists in 1932. In 1933 he was sentenced to thirteen years in prison but was released in 1937. He began to organize against the Japanese invasion of China. The Communists, however, attacked him for his Trotskyist position and accused him of being a spy for the Japanese. He retreated into private life and wrote his autobiography, along with letters to friends expressing his faith in democracy and science. Some claim he was still a socialist in the Trotskyist tradition, and others claim he returned to his old May 4th views, but without the denunciation of Confucianism and Chinese culture. He died of a heart attack on 27 May 1942 in Jiangjin, a remote area of Sichuan Province.

After decades of abuse, the Chinese government allowed Chen to be reburied in his home town, and, beginning in the late 1980s, allowed for extensive and

objective research of his life and political views. Independent societies were established for the study of Chen Duxiu. His influence as a democrat, socialist, iconoclast, and promoter of human rights was gradually recognized.

CHEN KAIGE (b. 1952), Chinese film director. With his film *Yellow Earth* (1984), Chen Kaige was the first member of the acclaimed Fifth Generation of Chinese film directors to achieve international success. The Fifth Generation, who were graduates of the first class of the reopened Beijing Film Academy following the Cultural Revolution (1966–1976), came of age after the death of Mao Zedong (1893–1976) and reacted against the melodrama and didacticism of the Chinese film tradition. *Yellow Earth* contains gorgeous visuals similar to Chinese paintings. Deceptively simple with minimal dialogue and action, it is a multilayered examination of the impact of China's feudal culture and modern revolution on the peasants. Chen's next film to make a big international splash was *Farewell My Concubine* (1993), a lavish production set in the Beijing Opera of the twentieth century and dealing with the betrayal of art and love. It garnered the Palm d'Or prize at the Cannes Film Festival and other prizes. Chen's most recent film, *The Emperor and the Assassin* (1999), is a historical epic about Qin Shi Huangdi or Ying Zheng, the emperor who unified China in the third century BCE.

With the collapse of the state film industry in the 1990s, Chen and other filmmakers had to seek overseas financing for their projects. Domestic critics have accused them of pandering to Western taste and distorting Chinese realities. Chen, however, is an intensely personal artist who believes that the redemption of China lies in its cultural tradition.

CHEN SHUI-BIAN (b. 1951), president of the Republic of China. Chen Shui-bian became the president of the Republic of China (Taiwan) on 20 May 2000 in only the second direct popular presidential election held in that country. He ran as an opposition pro-Taiwan independence candidate against Lien Chan, the Guomindang (Nationalist) candidate and James Soong, the Independent candidate. His accession to the presidency was heavily criticized by the officials in Beijing, because they feared he would declare Taiwan an independent and sovereign state.

Chen was born on 18 February 1951 in a poor Taiwanese family in Tainan county in southern Taiwan. In June 1969 he attained the highest possible score on the university entrance examination and entered the prestigious National Taiwan University, where he majored in commercial law. In law school, Chen met his wife, Wu Shu-jen, a woman with a strong sense of Taiwanese nationalism. Soon after graduation, Chen joined the Formosan International Marine and Commercial Law Office, where he worked until 1989, rising to the position of chief lawyer. This position gave him the financial independence to engage in politics.

In 1980, encouraged by his wife and his loyalties to his friends, Chen became a defense lawyer for the leaders of the Tang-wai (Opposition) Party, who had been charged with sedition in the famous "Kaohsiung" incident of 1979. His participation in this lengthy trial aroused him to enter politics on a mission of promoting human rights, democracy, and social justice. During the 1990s, he served on the Taipei City Council and in the Legislative Yuan. He became a leading figure in the opposition party, renamed the Democratic Progressive Party in 1987. His popularity made him and his family the focus of political attacks. His wife was crippled when a truck ran her over in a clearly politically motivated accident. Chen himself served six months in jail on the charge of libel.

In 1994 Chen ran successfully for Taipei mayor. In this position, he attacked corruption, lowered the crime rate, and opened relationships with other countries by establishing sister city programs and hosting international conferences. His improvements earned Taipei a place in *Asiaweek's* top five best cities in Asia.

CHEN YUN (1905–1995), Chinese political figure. Chen Yun was noteworthy for his continuous place in the inner group of Chinese leaders and long service on the Central Committee and Politburo of the Chinese Communist Party (CCP), yet was never a contender for top leader from the 1930s until his death in 1995. Born in Qingpu near Shanghai 13 June 1905, he worked as a typesetter in Shanghai before joining the CCP in 1925. He later served as a union organizer, guerrilla soldier, and secret agent. He participated in the Long March and emerged as a key party economic thinker and ideological theorist, especially during the 1942 Rectification Campaign. In 1949, he became the head economic planner, responsible for stabilization and reconstruction.

Close to Zhou Enlai (1898–1976) and Deng Xiaoping (1904–1997) in outlook, Chen agreed with Zhou on the need for incentives to spur agricultural production. At the critical Lushan conference to review the results of the Great Leap Forward in 1959, he remained silent and did not criticize Mao Zedong (1893–1976). Following the Great Leap, he toured the countryside to assess its failures, and later supported the moderate policies of Deng and Liu Shaoqi. Nonetheless, his efforts to reduce the costs of grain shipments to urban areas laid the ground for the later internal deportation of youth. "Set aside" but not punished for his moderation during the Cultural Revolution (1966–1976), Chen began to formulate many of the ideas that later formed the core of the Deng era reforms. He disagreed with Deng only over timing of the early reforms, but from the mid-1980s criticized the reform process for going too far.

Chen supported Deng's second return to power in 1977, and was rewarded with chairmanship of the Central Disciplinary Inspection Committee in 1978. As Deng's reforms got underway, Chen described them as a caged bird, that is, the economy could fly freely, but within the limits of state planning. Chen held no high positions during the 1980s, except for his membership on the Central Committee; due to his prestige and influence, however, he was considered fifth in the hierarchy. Though he resigned from the Central Committee in 1987, Chen was a crucial supporter of Deng's hard line during the Tiananmen Incident of 1989. Nevertheless, he aided efforts to sideline Deng after 1989, and fought Deng's last reform campaign in 1992. He died on 10 April 1995.

CHENAB RIVER The Chenab River, one of the five great rivers that give Punjab its name (in Persian *panj* means "five" and *ab* means "river"), has a total length of 1,087 kilometers. It rises in Lahul, Kashmir, south of Ladakh, and then flows through Kashmir, and south into Pakistan. In the upper reaches it is called the Chandra. After leaving the mountains it follows a southwesterly course, and becomes navigable at Aknur. It joins with the Jhelum near Jhang Maghiana, and here the Emerson (or Trimmu) Barrage has been built. Further downstream to the west of Bahawalpur the Chenab joins with the Sutlej River at the Panjnad Barrage, the two then forming the Panjnad River. This soon joins with the Indus River to the northeast of Chachran. Ancient names for the Chenab were Asikni and Chandrabhaga. Classical Greek writers rendered these names as Akelines, and Sandabaga or Sandabal.

The Chenab Canal, opened in 1887, is the largest canal in Pakistan. It irrigates extensive lands lying just to the south of the Chenab River. In 1892 the Chenab Colony was formed, an irrigated tract of land that quickly became a rich and thickly populated agricultural area of over a million hectares.

CHENGDE (2002 pop. 166,000). Chengde is a middle-size city in northern Hebei Province, China. It developed around the hill station of Bishu Shan-zhuang (Mountain Hamlet to Flee Summer Heat), where the Qing court used to stay several months a year between 1703 and 1820. Designed in 1703 by the Kangxi emperor (reigned 1662–1722) and enlarged by his grandson, the Qianlong emperor (reigned 1736–1795), the summer residence of Chengde forms a unique ensemble of mighty hills, natural parks, artificial lakes, and palatial complexes that provides refer-

The Temple of Universal Peace in Chengde. (PIERRE COLOMBEL/CORBIS)

ences to the architectural landmarks of the Qing dynasty (1644–1912). The landscape of the hill station was indeed conceived to represent a microcosm of China and Central Asia. The Waiba Miao monasteries, a series of Buddhist temples with a Tibetan appearance, surround Bishu Shanzhuang on two sides. The Potala Temple and the Sumeru Temple are the best-known samples of Sino-Tibetan architecture. The residence's most prominent temple is the Taoist Jinshan pagoda at the center of the garden district. The temples, palaces, and forests suffered extensive damage from the warlords of the republican period (1912–1949) and the Red Guards of the Cultural Revolution (1966–1976). Restored during the 1980s, Bishu Shanzhuang and Waiba Miao are now on the UNESCO World Heritage List.

CHENGDU (2002 est. pop. 1.9 million). Chengdu is the capital of China's Sichuan Province and is situated in the center of the province on a fertile but dry plain. Chengdu was founded in the third century BCE by the ancient state of Qin, and benefited from one of the oldest and best Chinese irrigation systems, con-

structed in the same century with water from the Min River, which is still in effective use today. It has remained a prosperous city through the centuries and gained a position as one of the most important trade centers of the empire; traders in Chengdu were the first to use paper money, in the tenth century. Chengdu also became the center of the silk brocade manufacturing industry. The 1937–1945 Japanese occupation of eastern China gave Chengdu an unexpected boost, because the Chinese Nationalist Party (Guomindang) established its capital in Sichuan and moved important industries to the city.

Chengdu has a wide variety of industries. Heavy machinery, aluminum plants, chemical plants, and electronics are important. In addition to that, the textile industry, manufacturing cotton, wool, silk, and satin products, is a major part of the economy. The city has a number of universities and other higher education institutions, including a college of traditional Chinese medicine.

CHENNAI. See **Madras.**

CHERA Chera (or Kerala) is the name of a Tamil dynasty that for over eleven centuries ruled most of the area of the modern state of Kerala as well as western districts of what is now the state of Tamil Nadu in southern India. During that era the Tamilagam or Tamil-speaking territory extended to the west coast of India, and a separate Malayalam language had not yet developed. The Chera capital was originally Vanji, on the Periyar River near Cochin; later Tiru-vanjikkalam near the mouth of that river became the capital. The kings were said to be of the Vanavar tribe and were Tamil speakers.

Around the beginning of the Common Era the Chera king Nedunjeraladan went to war with Perunarkilli, king of the neighboring Chola dynasty, and both perished. Subsequent generations of the two royal families fought with each other, but in the second century CE the two dynasties were united by a marriage. When the Chola capital of Puhar was de-

stroyed by floods, its king was aided by the Chera king Cenguttuvan, a grandson of the Chola king Karikkal. Under him the Cheras were the dominant power in the south. For a while there seem to have been two royal lines among the Cheras. However Karikkal's successor Cey was conquered by the neighboring Pandya dynasty, which assumed the ascendancy until it was overcome in turn by the Pallava dynasty. Nonetheless the royal line lingered on until Chera rule finally disintegrated in the twelfth century CE. As late as the eighteenth and nineteenth centuries the rajas of Cochin claimed descent from the Chera line.

Chera history is known mostly from epic poetry. In addition an Alexandrian Greek mariner's handbook, *The Periplus of the Erythraean Sea*, mentions five thriving seaports on the Kerala coast in the first century CE. In later centuries Jews and Christians moved to this coast from the Middle East. Roman and Alexandrian traders came here, and an as yet undiscovered temple of Augustus was reported to exist in the city of Kuran-ganur. Today the modern population in the area of the former Chera kingdom is probably ethnically similar to the ancient inhabitants, and the Dravidian languages of Tamil and Malayalam are spoken in the region.

CHHATTISGARH (2001 pop. of new state 20.8 million). Chhattisgarh, a region of central India with an area of 97,612 square kilometers, is noted for its distinct tribal populations. It has also been called Gondavana, "the land of the Gonds," who form the largest tribal entity. Other important groups include the Baiga, Birhor, Kamar, Kanwar, Oraon, and Saura. In very early times the region was known as South Kosala; the name "Chhattisgarh" is scarcely two centuries old. The region was ruled by the Kalchuries of Ratanpur until the mid-1800s and then occupied by the Bhonsales of Nagpur. After the fall of the Delhi sultanate in 1857, the region came under British rule, and with the British administration came railways and substantial population growth. The region was known as the Chhattisgarh division in a greater administrative unit known as the Central Provinces.

Chhattisgarh today is also the name of a new state created in 2000 from the eastern third of the state of Madhya Pradesh; it lies exactly in the Chhattisgarh region and has an area of 169,452 square kilometers. This state consists of sixteen districts taken from the older Madhya Pradesh state, with Raipur as the capital. Totally landlocked, Chhattisgarh is surrounded by the states of Jharkhand, Orissa, Andhra Pradesh, Maharashtra, Madhya Pradesh, and Uttar Pradesh. Probably India's richest state in terms of its natural and mineral resources, in 1998–1999 Chhattisgarh's net domestic product was nevertheless in the range of only \$210–\$299.

CHIANG KAI-SHEK (1887–1975), Chinese Nationalist general and president. A major twentieth-century Chinese leader, Chiang Kai-shek headed China's first modern government after 1928 and led the country against Japan in World War II. Chiang Kai-shek (in pinyin romanization, Jiang Jieshi) came from a gentry family in Fenghua county in Zhejiang province. He

studied at military academies in China and Japan in preparation for a military career.

In Japan, Chiang joined Sun Yat-sen's revolutionary society, the Tongmenghui, which later evolved into the Guomindang, or Nationalist Party. Chiang returned to China in 1911 and participated in various campaigns with Nationalist units against the Manchu Qing dynasty, which had ruled China since 1644. The last Qing emperor abdicated in 1912, and the Nationalists took control of China. In 1922 Sun summoned Chiang to Canton to work for his reorganized Nationalist party. Chiang traveled to the Soviet Union in 1923 to observe the Red Army and became chief of staff of the Nationalist army and commandant of its military academy (called the Whampoa Military Academy, later the Central Military Academy).

In July 1926 Chiang was appointed commander-in-chief of the National Revolutionary Army and launched the Northern Expedition to unify China (the north at that time being under the control of various warlords). Rapid successes against larger warlord forces resulted in intense competition between the left wing of the Nationalist party and its allies (the Soviet Union and the Chinese Communists) and the anti-Communist forces led by Chiang. He ended the coalition with the Soviet Union and purged the Chinese Communists from the Nationalist party. The Northern Expedition completed the nominal unification of China in 1928 and established its capital at Nanjing.

Chiang led the Nationalist government and its military forces during the Nanjing decade (1928–1937), defeating rivals within the party and making many reforms. But his government was trapped between Japan's rising imperialism, which sought to conquer China before it could modernize and truly unite, and the Chinese Communists, with their vision of a Marxist China. Japanese aggression culminated in the July 1937 Marco Polo Bridge Incident. The result was an eight-year Sino-Japanese war, which merged to become part of World War II in Asia in 1941.

China emerged as one of the victorious Big Four allied powers in 1945, but the war had shattered China's economy and the morale of the Nationalists. Mao Zedong won the ensuing civil war and established the Communist People's Republic of China in 1949. Chiang's defeated Nationalists retreated to Taiwan. Elected president of the Republic of China in 1948, Chiang continued to serve on Taiwan until his death in 1975.

The United States, which withdrew its support for the Nationalists in the civil war, resumed its alliance with Chiang's government after the outbreak of the Korean War in 1950. U.S. military and economic aid

and reforms instituted by the Nationalist government turned Taiwan into an economic powerhouse, and later a democratic nation.

CHIANG MAI (2000 est. pop. 170,000). Chiang Mai is Thailand's second biggest city, located approximately 700 kilometers (440 miles) northwest of the capital Bangkok. Chiang Mai is roughly twenty times smaller than Bangkok, but in many ways it rivals the capital as Thailand's cultural and historic heart. Chiang Mai is an ancient city dating back to the thirteenth century (in 1996, it celebrated its 700th birthday), when it served as the capital of Lan Na ("a million rice fields")—one of the Tai peoples' earliest kingdoms.

Chiang Mai is also a province, the fifth largest in Thailand, with a population of approximately 1.5 million (1999). Thailand's administrative system is organized by province, not by region. Therefore, Chiang Mai, known as the "Rose of the North," is the provincial capital.

Built within a series of moats, the old city of Chiang Mai covers only about 4 square kilometers (2.5 square miles) yet is packed with markets, temples, and narrow streets. More modern development and construction, prohibited in the old city, has focused on the growing suburbs. The result is a city that represents Thailand's colorful and rich past, while at the same time providing the best that a modern metropolis can offer.

With over three hundred temples—nearly as many as Bangkok—Chiang Mai is one of the most important religious centers in Thailand. The oldest temple in the area, the spectacular Wat Prathat, is situated near the summit of Doi Suthep mountain, around which Chiang Mai was built. The temple, which contains relics of the Lord Buddha, attracts Buddhist pilgrims from all over the world.

Alongside this history, Chiang Mai is also rapidly modernizing and developing into a major commercial center. Tourists use the city as a base for jungle trekking in Northern Thailand, and to visit the re-

gion's various hill tribes. Chiang Mai offers a wide array of tour operators and business services for those wanting to explore the more remote parts of the north. Renowned for its night bazaar, Chiang Mai is a vital hub for silks, lacquerware, teak, silver, stoneware, and jewelry. Craft shops can be found throughout the city and local area. Less flattering, Chiang Mai has also become a base for narcotics, as well as the government's war on the drug trade. Located close to the infamous "Golden Triangle" border region between Thailand, Laos, and Myanmar (Burma), the city is considered by some to be the unofficial capital of the opium trade's distribution. At the end of the twentieth century, the Thai government had some success in reducing opium production in the north of Thailand.

Chiang Mai is widely considered to be more "relaxed" than Bangkok and other cities in Thailand. Life generally has a slower pace there, and the residents are famous for their easygoing attitude and good sense of humor. With a unique combination of old and new, Chiang Mai is one of the more fascinating cities in Asia.

CHIBA (2000 est. pop. 5.9 million). Chiba Prefecture is situated in the central region of Japan's island of Honshu. A residential and industrial satellite of Tokyo, Chiba occupies an area of 5,150 square kilometers, with its population mostly concentrated in the northwest. Its main geographical features are the Kanto Plain in the north, which meets the hilly Boso Peninsula in the south. The main rivers are the Tonegawa and the Edogawa. The prefecture is bordered by the Pacific Ocean and Tokyo Bay and by Tokyo, Saitama, and Ibaraki Prefectures. In earlier centuries the prefecture comprised Shimosa, Kazusa, and Awa provinces. It assumed its present name and borders in 1875.

The capital of the prefecture is Chiba City, some 34 kilometers southeast of Tokyo. A military base during World War II, the city later was reconstructed to make it a core of the Keiyo industrial region with its thermal power and steel plants. Chiba is one of Japan's main international ports. It is home to Chiba University, and land reclaimed from Tokyo Bay provides housing for Tokyo commuters. In feudal times, as a castle town it

was ruled by the Chiba family, and in the Edo period (1600/1603–1868) it was a post station for several highways. The other important cities of the prefecture are Funabashi, Ichikawa, Matsudo, and Choshi.

Industrial pollution ended fishing in Tokyo Bay. In prewar days, weaving and soy sauce production were traditional occupations. The northwest is the site of heavy industry, such as petrochemical processing, electrical and steel industries, and shipbuilding. Elsewhere are intensive rice growing and dairy farming. Narita is the site of the new Tokyo International Airport and thus the center of the nation's air transport. The cultural and recreational amenities include Narita's Buddhist temple Shinshoji, excellent ocean beaches in the Kujukurihama area, the national parks in Suigo-Tsukuba and southern Boso, and Tokyo Disneyland, which opened in 1983.

CHICKEN According to ancient Chinese texts, the chicken or common fowl came to China around 1400 BCE; it is one of the first domesticated animals mentioned in writing. Most geneticists think that the ancestor of domestic chickens (*Gallus gallus*), the red jungle fowl (also *Gallus gallus*), was first domesticated in South Asia, in present-day Vietnam and Thailand, perhaps as early as the sixth millennium BCE. Red jungle fowl still flourish in the wild in southern Asia from Kashmir east to Sumatra, living in the teak forests and in the Himalayas as high as 2,000 meters; thus they are a rare example of a domesticated animal's wild ancestor still being alive today. Red jungle fowl are about 65 centimeters long and are often seen feeding in forest clearings, usually one cock with several hens; each hen may have five to six chicks.

In Southeast Asia, domestic chickens are valued not only for their flesh and eggs, but for the fighting proclivities of cocks. In Indonesia and nearby lands, fighting cocks provide a major sport for the inhabitants.

Chickens were probably not seen in Greece until around 600 BCE; nowadays, the animals are common around the world. In Roman religion, the bird was sacred to Mars, the god of war, and to many ancient peoples cocks symbolized courage. In Christianity, the cock's crow signifies the resurrection of Christ.

CHILDREN'S DAY-JAPAN Children's Day (*kodomo no bi*) is a national holiday in Japan, celebrated

on the fifth of May. The day was formerly named *tango no sekku* (Boys' Day) and honored only boys, and it retains a strong male emphasis. Girls participate in various group activities to mark the day, but they do not have special rituals of their own.

Boys are reminded of the virtues of strength, courage, and perseverance, and wishes are made that they will grow up healthy, strong, and successful. The carp fish, admired for its strength and determination in swimming upstream against powerful currents, is a favorite symbol, and huge carp flags (*koi nobori*) fly from house rooftops in honor of each of a family's sons. Boys display their collections of miniature suits of armor, helmets, weapons and traditional warrior and hero dolls (*musba ningyo*). Popular characters include Shoki (a celebrated general) and Kintaro (a Herculean boy). Boys invite their friends and relatives to share sweet rice cakes wrapped in bamboo, and iris or oak leaves, which symbolize strength and the overcoming of obstacles. Long sword-shaped iris leaves are considered particularly auspicious, for their Japanese name *shobu* has the same pronunciation as the word meaning striving for success. Iris leaves are added to hot baths on this day as a charm against illness and bad luck. In many areas children give public performances and events highlighting children are held.

CHILDREN'S DAY-TURKEY In 1935, Mustafa Kemal Ataturk, founder of the Turkish Republic, dedicated National Sovereignty and Children's Day to Turkey's children. This holiday is celebrated in Turkey each year on 23 April. During Turkey's Independence War, the provisional Grand National Assembly met in Ankara for the first time on 23 April 1920 and laid down the foundations for the national republic that replaced the Ottoman empire. This event became Turkey's National Sovereignty Day and remained the only official holiday—besides religious holidays—until 1925, when the anniversary of the republic's 1923 establishment became another holiday. In 1929, the Association for the Protection of Children sought to establish a special state holiday devoted to making less fortunate children happy and joyful. The government thus declared the last week of every April to be Children's Week and 23 April to be Children's Day. The association encouraged holding a na-

tionwide series of celebrations for children, and in subsequent years Children's Day was incorporated into National Sovereignty Day celebrations. In 1935, the two holidays were combined and named National Sovereignty and Children's Day.

During celebrations children perform on the fields of most stadiums throughout the country, with many spectators in attendance. As part of their activities, children send representatives to substitute for high governmental officials, including the president, prime minister, governors, and mayors. Children also replace deputies in the Grand National Assembly and hold a session to discuss children's issues. For the past several decades, Turkish officials have sought ways to internationalize Children's Day. As part of these efforts in 1986, the Turkish National Assembly decided to invite children of other nations to celebrate this holiday. Each year groups of children from other nations travel to Turkey to join the festivities held for them and to stay with Turkish families. Foreign children's groups also participate in the special session of the Grand National Assembly and pledge to foster world peace. UNICEF thus recognized Children's Day as International Children's Day.

CHILUNG Chilung (Keelung, Jilong) is situated on the northeast coast of Taiwan and is the seaport of the capital Taipei, 27 kilometers to the southwest. Chilung is built at a natural harbor sheltered by mountains. The harbor is not located near the mouth of a river, so there is no problem with silting. A fort was built during the Spanish occupation in 1626. Later, the harbor came under Dutch occupation, but the town was not founded until 1723 when Chinese settlers brought it under Chinese jurisdiction. In 1862, Chilung became one of the treaty ports, and during the Japanese occupation of Taiwan (1895–1945), the harbor was enlarged and developed. When the Japanese retreated, the harbor was totally devastated and clogged with more than 150 sunk vessels.

The harbor has been renovated and connected with the city by a highway and railway tunnel, and it is one of the most important deep-water harbors in the re-

gion. Chilung has a large modern fleet of fishing boats and a substantial fishing industry. Important industries are shipyards, manufacture of fertilizers and cement, and computer hardware and accessories.

CHIN The Chin are a Tibeto-Burmese people who predominate in the great range of hills that run up western Myanmar (Burma) from the Arakan Yoma into Mizoram in northeast India. More than forty different subgroups have been categorized among the Chin inhabitants of Myanmar, including the Kuki, Chinbok, Tashon, and Asho. There are also related subgroups in neighboring India, but, in general, the Chin of Myanmar are known by the collective name of *Zomi*, whereas their ethnic cousins in India are known as *Mizo*.

There are few records of early Chin history. Chin settlers are believed to have lived in the lowlands of central Myanmar from around the middle of the first millennium CE, but Chin communities were gradually forced westward into the mountains by ethnic Burmans and other migrants during the next thousand years. Several Chin subgroups maintain the traditional custom of wearing facial tattoos, which is believed to date back to these times since, according to folklore, it prevented slave-raiding by Burman men or other incomers who found Chin women attractive.

In modern times, the socioeconomic development of the Chin peoples has been held back by the rugged terrain, which has made communications difficult. Of all the ethnic minority regions in Myanmar, the Chin hills have always been the most dependent on lowland areas for food and supplies.

The development of modern Chin political movements has also lagged behind, partly due to the diversity of subgroups. Like the Karens and Kachins, many Chins converted to Christianity under British rule and also served in the British colonial army. But under the colonial system of administration there was little advancement of Chin peoples in national representation or government.

After Burmese independence in 1948, although a special division was created from the former Chin hills

territory under the British, the Chin region continued to be characterized by its isolation, with many villagers continuing to pursue traditional methods of swidden (slash-and-burn) cultivation in the hills. Many young Chin men also joined the Burmese armed forces as a way to escape the continuing poverty.

Eventually, a Chin state was refashioned in 1974 from the special division. However, many Chin people also live in the adjoining Rakhine State, as well as Sagaing, Magwe (Magway), and Pegu (Bago) divisions. As a result, during the twentieth century Chin nationalists advocated creating a "pan-Chin" state to combine all these populations (estimated at more than 1 million), with some leaders even wanting to include their Mizo cousins in India. This was an idea that the British also briefly considered before their departure from the two countries in 1947–1948, but any substantial restructuring of boundaries is likely to remain a pipe dream.

Nevertheless, during the 1990s Chin nationalism appeared to be on the rise, with an insurgent Chin National Front movement active in the Indian borderlands and Chin representatives winning seats in the 1990 election. Christian evangelism was also resurgent, leading to restrictions by local Burmese army commanders who, it was alleged, gave preference to the Buddhist faith.

CH'IN DYNASTY. See **Qin Dynasty**.

CHIN STATE (2000 pop. 532,000). The Chin State in northwestern Myanmar (Burma) comprises some of the least developed hill regions in the country. Formerly governed under the British Frontier Areas Administration, a Chin Special Division was created from these mostly forested highlands at independence (1948). In 1974 the division was politically upgraded into a Chin State, measuring 36,019 square

kilometers (13,907 square miles) in area. Consisting of 9 townships and 505 wards or village-tracts, the capital is located at Haka in the northern part of the state. Other towns include Falam, Tiddim, and Paletwa.

With an estimated population of only 410,000 people (1990), Chin State's population density is one of the lowest in Myanmar. Most of the inhabitants are ethnic Chins, although there are ten thousand Rakhines, who mainly inhabit the Kaladan River valley in the west of the state. Other ethnic groups include Nagas and Burmans.

The difficult geography of the state historically has played a dominating role in political and economic life. Many communities live at subsistence level. Despite its borderland location, there are few road or communication links with either central Myanmar or its international neighbors. To the west lies Bangladesh, to the north the Mizoram and Manipur states of India, to the east the Sagaing and Magwe (Magway) Divisions, while to the south is the modern-day Rakhine State. The highest peak is Mount Victoria (3,053 meters [10,200 feet]), which is situated in the southeast near the Magwe (Magway) Division border.

Timber—teak, cane, pine, and other woods—is the state's most valuable natural resource. Economic modernization, however, has largely bypassed the territory. Farming, including swidden (slash-and-burn) cultivation, is the main economic activity for most inhabitants. The principal crops are rice, maize, and millet, as well as local planting of wheat, chilies, groundnuts, cotton, sugarcane, apples, oranges, and other garden fruits. During the twentieth century, attempts were made to increase agricultural production through methods such as irrigation, terraced farming, and the use of fertilizers and insecticides, but the total acreage under cultivation remained low.

In the first decades after independence from Britain in 1948, the Chin State was infrequently disrupted by insurgencies. From the late 1980s, however, ethnic discontent increased, manifested by the formation in 1987 of the Chin National Front—which carried out guerrilla strikes in the Indo-Bangladesh border region—as well as the victory of Chin opposition candidates in the 1990 general election. Demands included calls for greater autonomy as well as the right to develop closer economic and cultural linkages with Chin communities living outside the state's borders.

revolution in 1949, China has been known as the People's Republic of China (PRC). For the most part, its borders have been unchanged since then. However, there is some disputed territory on the high Himalayan borders between Tibet, which is under PRC control, and India. In a remarkably peaceful transition, Hong Kong (a port on China's southern coast) returned to PRC sovereignty from British colonial control in 1997, and nearby Macao from Portuguese colonial control in 1999. The thriving island economy of Taiwan, off the coast of the China mainland, is populated by Chinese people; whether or not it is a part of China is in dispute.

At the start of the twenty-first century, China, with 21 percent of the total global population, is the world's most populous nation. Its vast territory covers an extreme range of altitudes, climates, landforms, and natural resources. The PRC is a poor country that is developing rapidly. Its economy is one of the fastest growing on earth. Its government is one of the world's few remaining Communist regimes. The political system is struggling to remain viable by transforming China from a command economy to a successful socialist market economy. The social transformation of China's people is also breathtaking. To understand what is going on in Asia during the early twenty-first century, it is essential to comprehend the rapid changes taking place in China.

Geography

China is similar in size and latitude to the lower forty-eight states of the United States. It is mostly in

the temperate zone of the northern hemisphere, with its southernmost areas in the subtropical zone. Most of China experiences strong annual extremes in temperature and rainfall because of its location on the huge Eurasian continental landmass. On the east and south, China is bordered by seas that facilitate ocean commerce. Moving from east to west, China rises from sea level to high plateaus and mountains, including the Himalayas, the world's highest mountains, in Tibet. Therefore, most of China's major rivers flow from west to east.

Where people live in China is determined largely by climate and topography. The half of China's territory that is located in the west, northwest, and north is mostly deserts, arid grasslands, high plateaus, and mountains. About 6 percent of the population lives there. In contrast, 94 percent of the population lives

in the half of China's land area that includes the warm, moist, southern, southeastern, and central provinces, the densely populated eastern and coastal provinces, and the northeast.

Politics

During the PRC's first twenty-seven years, during which the nation was led by Chairman Mao Zedong (1893–1976), China's totalitarian government established and maintained tight control of the population, right down into families. A U.S.-led embargo isolated China starting in the early 1950s; at the same time, China closed off its borders and defended itself from any perceived colonial or imperialist threats. Especially from the late 1950s through the subsequent decade, China heightened its own isolation, suppressing most information about what was happening in the country and focusing inward. The Communist government attempted to overcome the past and transform the beliefs and ideas of China's people, using a succession of disruptive and even catastrophic ideological movements, including the Great Leap Forward from 1958 to 1961 and the Cultural Revolution of the late 1960s and the 1970s. Arbitrary imprisonment, murder, maiming, and other forms of political harassment and physical harm were commonplace during the Maoist decades.

After Mao's death in 1976, his successors Deng Xiaoping (1904–1997) and then Jiang Zemin (b. 1926) instituted some political changes. As a result, the Communist Party greatly reduced its intrusion into people's personal and family lives. Other improvements include experiments with local village elections and attempts to establish and strengthen a legal system to replace arbitrary rule. But the whole political and economic system is riddled with corruption. Political rights in China are still very limited and human rights are frequently violated. Since troops massacred demonstrators in and around Beijing's Tiananmen Square in 1989, the government has cracked down on democratic movements and unofficial religious groups. Because capitalist and democratic ideas from abroad have eroded the perceived legitimacy of the Communist government in the eyes of the people, the government is now using nationalism to rally its citizens. By Western and advanced Asian standards, the people of China today do not yet have a free press or independent media, freedom of association, freedom of religion, or free speech.

Population

China's first modern census in 1953 counted 583 million people, a far larger number than expected. In the 1950s, the government equalized access to food-

growing land in its rural land reform and widely introduced public health measures to improve health and reduce mortality. By 1957, in comparison to the late 1940s, the country's death rate had been approximately halved. However, Mao Zedong's ill-conceived Great Leap Forward brought about agricultural disasters and famine, causing 30 million excess deaths in the period 1958–1961. Thereafter, the government moderated its rural policies and the death rate dropped again. Mortality has remained low ever since. China's low death rate, combined with continuing high birth rates, caused rapid population growth from the 1950s into the 1970s. China's compulsory family-planning program was implemented in rural areas in the 1970s, reducing the birth rate and population growth rate to low levels beginning in the late 1970s. China's population is growing at one percent per year, which is low for a developing country. By the year 2000, China's population had reached approximately 1.3 billion, well over twice the 1953 count.

Economy

In 1949, almost the entire Chinese population was engaged in subsistence agriculture. Only 11 percent of the people lived in urban areas. Modern industry had been brought in by foreign colonial powers only to the coastal city of Shanghai and the northeast provinces (Manchuria). China's Communist government used the Soviet Union as its model of economic development: Starting in the mid-1950s, China's leadership collectivized agricultural land and siphoned off surplus rural production for investment in heavy industry in the cities. This system successfully promoted China's rapid heavy industrialization, but the distortions it introduced into the economy were serious and long-lasting. For example, laborers were prevented from leaving the countryside even if they could be more productive in a town or city. Further, the rural and urban structures of compensation were remarkably flat, and incomes were kept extremely low. The minimal or nonexistent rewards for educational attainment, efficiency, creativity, or work effectiveness in urban and rural areas suppressed incentives to work hard and to excel.

By the 1970s, it was clear to many of China's leaders that certain parts of the economy were not succeeding. Collective agriculture was barely able to keep grain production ahead of China's rapid population growth, and per capita production of other essential foods had declined since the 1950s. In 1978, Deng Xiaoping launched the economic reform period, which began with the abandonment of collectivized agriculture and the return of agricultural land-use rights to each rural family. The government also raised the official purchase prices of

grain and other agricultural commodities, and greatly increased the supply of chemical fertilizer. In response, agricultural production increased rapidly in the early 1980s. Simultaneously, the government began to allow rural industries (called "township and village enterprises," or TVEs), light industries, provision of services, village and street markets, and private companies. With this partial introduction of a market economy, growth of the gross domestic product has averaged 8 percent a year since 1978. On the whole, the piecemeal dismantling of China's command economy and gradual introduction of market forces has been a success.

One factor in this success has been the invigoration of rural and urban work incentives in a liberalized policy environment. Another element has been China's opening to the outside world during the economic reform. The booming economy has been based partly on export-led growth, as foreign investors have set up companies and joint ventures in the coastal provinces to make light industrial products for the global market. A third element has been a belated and ongoing shift of laborers from agriculture to industry and services, accompanied by a policy change allowing some migration out of rural areas for work in towns, cities, and other parts of the country. Surplus rural laborers can now more easily go where their work is in greater demand.

Education and Human Capital

Part of China's economic success is traceable to the fact that the human capital embodied in China's working-age population increased dramatically in the second half of the twentieth century. The PRC began with a huge population that was very poor and agrarian, illiterate and uneducated, frequently ill, and traumatized by civil war, Japanese invasion, and high mortality. In contrast, by the 1990s the average life expectancy was around seventy years. Most diseases that plagued the people in the mid-twentieth century were gone or controlled fifty years later.

China's government promotes universal literacy and attainment of at least a primary education. Of the working-age population (arbitrarily defined as between ages fifteen and sixty-five for international comparison) at the beginning of the twenty-first century, only 6 percent of men and 17 percent of women are illiterate. Success in achieving basic literacy is more pronounced in urban areas than rural, and in eastern and coastal provinces compared to most of the provinces in the western half of China.

Environment

China has an unusual variety in its ecological systems and a rich natural resource base, but its enormous

population places huge demands on its environment. Continuing population growth and rapidly rising living standards are combining to pollute China's air, water, and soil, and to strain the country's food-growing capacity, deplete forests, and exacerbate water scarcity in north and west China. Amidst great natural diversity of animals and plants, many species are threatened or have become extinct. In arid regions, the deserts are expanding, taking over existing grasslands and arable land. China's national government is aware of environmental problems and pollution, and is implementing some policies to reverse or slow ecological deterioration. However, a high priority of China's leaders is the fastest possible economic development. When economic goals and environmental goals conflict, the economy tends to take precedence.

Peoples and Ethnicity

China has a largely homogeneous population based on its officially designated ethnic categories. The Han Chinese nationality comprises 92 percent of the population, though there are some intragroup differences among the category defined as Han Chinese. The fifty-five minority nationalities are unevenly distributed throughout the country. In most of China's populous provinces, only from 1 to 2 percent of the population is non-Han. In general, each minority group is concentrated in one province or several contiguous ones. In only two provinces are Han Chinese in the minority: Tibet in the west and Xinjiang in the northwest. Most of China's land border regions are inhabited by minority nationalities with ethnic kin across the border, which, from the government's perspective, causes major security problems.

Most of China's minority nationalities have been strongly influenced by the Chinese language, historical Chinese culture, and powerful intrusions during the Communist period. Many of the minority groups are highly assimilated. Others remain distinctive in their religion, clothing, housing, language, food, lifestyle, economic life, arts, or customs. Most of the minorities appear to have adapted to overwhelming Han numerical dominance, but some members of certain minority nationalities (Tibetans, along with Uighurs and some other Muslim minorities) are particularly restive. Policies toward the minorities have varied over time. At the beginning of the twenty-first century, some of the minority groups are allowed to have one (or more than one) additional child per couple above the quota for Han Chinese. Other preferential policies are financial subsidies, health and economic assistance, and some affirmative action programs to give the minorities political representation

or educational advantages. At the same time, China's government suppresses minority individuals or groups campaigning for freedom of expression and religion, genuine autonomy within the PRC, or independence.

Culture and Language

China has a rich ancient culture. For more than a century, Chinese thinkers and leaders have struggled to determine what aspects of that culture should be preserved and which aspects should be discarded so that China may become a modern, developed, great power. Mao's Cultural Revolution (1966–1976), during which traditional culture came under attack for its perceived elitism, represented an extreme of intentional destruction, but even today the government attempts to discredit cultural forms that it feels do not sit well with its Communist ideology. Much of China's cultural heritage has also been lost or destroyed through invasion from abroad, civil war, neglect, and globalization. Elements of Chinese traditional culture that remain today are near-universal marriage, close family life, Chinese cuisines and special foods, Chinese traditional medicine, intensive agricultural production, traditional walled-courtyard housing, great respect for education, patrilineal family structure, son preference, male dominance in the workplace, a China-centered perspective, disdain for most other cultures, deference to individuals of higher status, ability to function in hierarchical systems, traditional arts and handicrafts, spoken Chinese dialects, and China's written language.

Society

For a century, the experiences of each new generation in China have differed vastly from the experiences of the previous generation. A series of cataclysmic events—collapse of the last dynasty, civil war, the Japanese invasion, Communist social transformation, attacks on certain social groups, famine, the Cultural Revolution—traumatized tens or hundreds of millions of people at vulnerable stages in their life cycle. At the same time, Chinese society was permanently transformed in many positive ways as well. China's brutal traditional custom of binding and breaking the feet of girls and women completely ceased in the twentieth century, saving hundreds of millions of girls from this crippling disfigurement. The social position of China's girls and women rose sharply in that century, a wrenching cultural shift in any society. There has been vast, generally positive change in male-female relationships. Quality of life for almost all China's people has improved to a stunning degree, especially with regard to survival and health, quantity and variety of food, education, and living standards.

Though China remains primarily rural, the urban proportion of the population increased from 11 percent in 1949 to 36 percent at the end of the twentieth century. Communist policies have set up an economic, political, and social structure that gives extreme advantages to the urban population at the expense of rural people. The World Bank reports that rural incomes are less than one-third of urban incomes, a difference much higher than in most countries. Barriers to geographic and social mobility instituted or strengthened in the Maoist period continue to hold down rural incomes. However, the economic reform period has lifted the great majority of the population out of absolute poverty; remaining pockets of poverty tend to be in mountainous and remote areas.

China in the Twenty-First Century

At the beginning of the twenty-first century, China's people and government wish for the nation to take its rightful place of leadership in global affairs. In many ways, the PRC does function as a responsible, sometimes forward-looking international leading nation. It is an active member of most United Nations organizations, the World Bank system, and many Asian regional organizations. Other Asian nations tend to treat China with caution and respect, in part because of its huge population and territory and rising economic clout, and in part out of fear of possible Chinese aggression. For example, China claims vast reaches of the South China Sea and East China Sea in areas much closer to other countries and claimed by them also. China's unilateral occupation of islands in the disputed regions has raised widespread concern.

Compared with most other developing countries and with other countries in transition from command economies to market or capitalist economies, the PRC is succeeding extraordinarily well. China's biggest economic problem today is employment. The age structure is greatly concentrated in the working-age groups, and the population of working age is still increasing rapidly. As a legacy of China's traditional economy and of Maoist economics, China has one or two hundred million surplus laborers in agriculture, plus tens of millions of surplus workers in industry and government. About one-third of the state-owned enterprises are reported to be losing money, including many of the larger ones. The banking system that has been propping them up is crippled by nonperforming loans to the state sector. Transforming the economy to increase efficiency and productivity means at least temporarily laying off surplus rural and urban workers. The biggest economic challenge is to generate new employment opportunities for those adults who are

unemployed, laid off, underemployed, or looking for more productive employment.

China's government is trying to prove that a Communist one-party political system is still viable in the modern world, even though most such governments have now collapsed. The pervasiveness of corruption at all levels weakens the government's claims to popular legitimacy. The government is trying to confront the corruption problem and shrink the bloated bureaucracy, but the perceived necessity of keeping the Communist Party in power at all costs continues to mean denying democratic freedom to China's people, imprisoning those who speak out against autocracy, arresting and suppressing journalists, preventing people from forming non-governmental organizations, and biasing the content of education. As China's people become wealthier, more educated, and in greater contact with international norms, the PRC political system becomes less viable over time.

Chinese society and culture have been weakened and transformed in myriad ways both by the Communist government from within and by foreign influences from without. Change has been so fast and confusing that many Chinese people are experiencing a spiritual and cultural vacuum. One of China's big issues in the twenty-first century is to build a modern, stable society that satisfies the needs of China's own people as they perceive them.

China's historic demographic transition from traditional high death and birth rates to modern low death and birth rates is nearly complete. The process occurred very quickly. This implies that in the coming decades, China will experience rapid and extreme aging of its population structure. Elderly dependency will place great burdens on China's families and on society because of the escalating needs of the aged for health care, personal care, and financial support.

The cumulative harm to China's environment caused by population growth, rising affluence, industrialization, and the low priority given to addressing this environmental destruction is another concern. Annual economic losses from pollution, deforestation, erosion, desertification, and other ecological disasters are estimated to equal 5–10 percent of China's gross domestic product. Many of China's leaders would like to postpone cleaning up China's environmental problems until China is a rich country more easily able to afford the cost, but others argue that the losses are too massive and the country must reverse the deterioration immediately.

The Future

China has just experienced a century of instability and rapid change in most aspects of life. Almost every

part of Chinese society is still in flux. Economic transformation continues unabated. Living standards are rising and lifestyles are changing fast. Politics is shifting more slowly. China may follow the pattern already seen in many other Asian societies, in which economic development has preceded political development, with democratization lagging a decade or two behind the achievement of fairly high incomes and educational attainment. The achievement of full equality between males and females will take decades more. Continuing urbanization will tilt the balance away from conservative rural customs and attitudes. As China continues to modernize, it may come to resemble more closely Taiwan or Hong Kong, places where Chinese culture has adapted to the interconnected global system without losing its distinctive characteristics. Nevertheless China, by virtue of its huge geographic and population size, will remain unique in many respects.

CHINA—ECONOMIC SYSTEM In the last two decades of the twentieth century, the Chinese economic system changed from a command economy, which dated from shortly after the Communists took control in 1949, to a mixed economy.

The Command Economy before Reform

A command economy is an economic system in which the means of production are publicly owned and economic activity is controlled by a central authority that assigns quantitative production targets and allots raw materials to production units. It involves comprehensive economic planning on the basis of targets and balancing of materials.

China's command economy was first established in 1950–1951 and was followed by the introduction of a Soviet-style five-year plan, the First Five-Year Plan, for the period of 1953 to 1957. The Soviet model was

ideologically sound in that it was supported by Marxist theory, but more important, it seemed to the Chinese a necessity when they had to face the deterioration of the economy following a century of wars and turmoil. With the ability to mobilize resources quickly on a national scale, this administrative approach was effective in its initial phase.

From the early 1950s, the Chinese central industrial ministries and administrative regions were required to assign production targets to the enterprises under their jurisdiction. Each group of enterprises was then required to formulate annual production, cost, and labor plans and to submit them to the higher echelons—that is, the industrial ministries or bureaus—for approval. During the same period, procedures for making annual plans "from the bottom to the top" and "from the top to the bottom" were introduced and standardized. There were frequent consultations and exchanges of information at various levels of the hierarchy. Moreover, a centralized system of supplying raw materials was established.

The central bureaucracy played a predominant role in the economy. In the industrial sector, for example, the state owned outright enterprises that produced more than 60 percent of the gross value of industrial output, and all but a small portion of the remainder was owned collectively. In the urban sector, the government not only prescribed output targets and allocated energy resources, it also set the prices for key commodities, determined the level and general distribution of investment funds, set wage levels and employment targets, ran the wholesale and retail networks, and controlled financial policy and the banking system. The foreign-trade system became a government monopoly in the early 1950s as well. Similarly, in the countryside, from the mid-1950s, the government prescribed cropping patterns, set the level of prices, and fixed output targets for all major crops. Most rural commercial transactions were carried out by the Supply and Marketing Cooperatives—nominally an organization of farming cooperatives but in fact a heavily bureaucratized organization that functioned as the rural wing of the Ministry of Commerce.

In order to run the command economy, the chief organ of planning, the State Planning Commission, was established in 1952 and placed under the State Council when the latter was made supreme executive body by the 1954 constitution. At the same time, the State Construction Commission was organized to oversee capital investment under the five-year plans in 1956; the State Economic Commission was established to take over short-term—up to annual—plan responsibilities, leaving the State Planning Commission to concentrate on long-term and perspective planning. created in 1956 were the General Bureau for Supply of Raw Materials, to handle material allocation, and the State Technological Commission, to plan long-term technical development. The State Statistical Bureau was established in 1952, its provincial and municipal statistical departments in 1953, and below them administrative and special district officers in 1954.

Centralization and Decentralization The organization of planning grew more centralized, reaching a peak in 1955–1956. China had nearly 200,000 separate enterprises, operating with widely varying technologies, product assortments, and levels of efficiency, even within the same industry. Yet, the data gathered, transmitted, and processed for central planning were irregular, sometimes incomplete, and often overestimated. As both the number of commodities and the number of enterprises for which the central planning bodies assumed responsibility grew rapidly, the maintenance of such a high degree of centralization of both planning and management became increasingly cumbersome. In 1957 and 1958, the government adopted a series of decentralization measures to shift some responsibilities onto the localities, increase the scope for local initiative, and strengthen central control of the most important plan targets and enterprises.

In this round of decentralization, most planning tasks were transferred to officials closer to the scene of production in an effort to shorten lines of communication and reduce absentee management. This took place when the ministries passed most of the enter-

prises they had controlled to regional authorities, which gained more rights to allocate scarce resources. Most planning tasks then fell on the shoulders of regional and local authorities. This move was also a regionalization of planning, in which several industrial ministries were abolished after losing a majority of their enterprises. Subsequently, the sixty thousand communes received an administrative and planning role in rural areas. They replaced the *xiang*, or township governments, in 1958. In principle, only the most important enterprises remained under direct ministerial control. Even many of these were supposed to come under dual subordination to ministries and regional authorities, although in practice ministerial control came to dominate. The 1957–1958 decentralization was never entirely reversed.

The Chinese command economy traditionally operated with a strong centralized monopoly over commerce. Monopoly purchase of grain actually preceded agricultural collectivization in China, and even during the Cultural Revolution (1966–1976), when much of the industrial management system was being decentralized, central control of agricultural procurement and distribution of key consumer goods continued. Although there were around thirty thousand rural and suburban periodic markets (that is, markets that opened periodically), they were tightly controlled, and it was forbidden to transact goods such as grain and cotton, over which the Ministry of Commerce had a monopoly.

Shortages in China's Command Economy All command economies have followed development strategies that stress high levels of investment in, and give priority to, heavy industry. China was no exception. As might be expected, the focus on heavy industry was

A major development in the Chinese economy in the last half of the twentieth century was increasing industrialization. Here, workers on an assembly line assemble electronic boards in a factory in Dong Guna, Guangdong Province. (BOHEMIAN NOMAD PICTUREMAKERS/CORBIS)

accompanied by severe shortages of consumer goods as well as, ironically, producer goods.

The shortages seemed to arise from three sources. First, the government simply channeled so many resources into investment and heavy industry that there was little left for households. Second, shortages resulted from the soft budget constraints of enterprises. Most enterprises were quite profitable, and they faced no risk of bankruptcy. As a result, enterprises pursued unrestrained growth and had an almost unlimited desire for investment. Typically, each planning unit of an enterprise tried to make sure it would have the inputs it needed to fulfill its plan targets, plus a margin for insurance. Each therefore tended to overstate its needs and to treat the requirements of other planning jurisdictions as residual. Third, and related to the second, when managers were promoted based on their ability to fulfill the state-set output volume, their demand for inputs tended to expand until total demand ran up against the total available supply of resources. The overdemand for production inputs, without much concern about efficiency or quality of output, resulted in constant shortage of the supply of resources. Command economies have thus a built-in tendency to become "shortage economies."

Other Features of China's Command Economy In addition to the characteristics mentioned above, China's command economy adopted an urban-biased social-welfare policy to encourage industrial development. The policy provided not only lifetime full employment but also virtually free housing, free health care, and free retirement benefits. Excluded were nonurban residents, however, and the government controlled obtaining permits for urban residence.

The government also controlled internal migration and job assignment in the urban sector through a house-registration system, which largely replaced the free labor market after 1957, although the post-Mao reforms have attempted to revive it.

The Post-Mao Economic Reforms and a Mixed Economy

Since the death of Mao Zedong in 1976, China has been trying to reform its economy, with gradual but somewhat parallel changes in the rural and urban sectors. The reforms of Deng Xiaoping (1904–1997) have been accompanied by a flurry of complaints about the inefficiency of Soviet-style central planning and, in particular, about China's unwieldy, overlapping, and inefficient administrative bureaucracy, along with the excessive dependence of enterprises on their planning apparatus. To end the latter, post-Mao leaders have

sought to institute a system of managerial and production responsibility, under which producers become more responsible for marketing their output, procuring supplies, operating in a cost-effective manner, and financing their investments from their own earnings or repayable bank loans. In these post-Mao reforms, the government has emphasized raising personal income and consumption and introducing new management systems to help increase productivity. It has also focused on foreign trade as a major vehicle for economic growth.

In the late 1970s, China started to pursue agricultural reforms, dismantling the commune system and introducing the household-responsibility system, which gave peasants greater decision making in agricultural activities. The development of the household-responsibility system itself can be roughly divided into three phases: the work-quota contract phase, the output-quota contract phase, and the responsibility contract phase. In the work-quota contract phase, the household was responsible for the hours of work contracted on the collective land with the production input from the collective. In the output-quota contract phase, the household was responsible for the quantity of output contracted given the production input from the collective. In the responsibility contract phase, the household was responsible for everything from input to output. The government has also encouraged non-agricultural activities, such as township and village enterprises, in rural areas. Agriculture thus has been decollectivized, small-scale private trade and workshops have been legalized, and the role of market forces has been substantially increased.

In the urban sector, the goal of enterprise reform grows ever loftier. Its original goal was to solve the problem of low incentive and inefficiency in state enterprises. As the reform has progressed, the goal has become changing the managerial mechanism to make state enterprises competitive in the market.

The Four Phases of China's Economic Reform Reform of China's state-owned enterprises has gone through four phases. The first phase (1979–1984) focused on giving a certain amount of autonomy to enterprises in exchange for their improved efficiency. The second phase (1984–1986) focused on ways to enhance the vitality of state enterprises. The third phase (1987–1996) focused on the reconstruction of state enterprises' managerial mechanisms. The fourth phase, beginning in 1997, has tried to get rid of money-losing enterprises, hence starting a period of much-delayed privatization.

As in other socialist countries, Chinese reformers have followed a dual approach. In addition to the state sector, they have allowed the more marketized sector—consisting mainly of small- to mid-sized private and collective firms—to expand explosively in both rural and urban areas. In some cases, the enterprise capital is still state owned, but the facilities are leased to individuals or groups that operate them on a profit-or-loss basis. Since the mid-1990s, stock and bond markets have also sprung up, and over 400,000 enterprises have incorporated themselves.

Within the planning network, many large enterprises still have a primary obligation to meet plan targets, but the latter are supposed to be set low enough to allow a margin of overfulfillment. Production that is beyond state targets or not covered by targets is to be sold in competitive markets, and enterprises that do this successfully are supposed to be able to keep part of the resulting profit for bonuses and investment under their control. Prices have also been gradually deregulated and are now largely free of controls for output not subject to mandatory planning, although subsidies and production quotas in agriculture still hold down grain prices.

CAN CHINA'S ECONOMIC INDICATORS BE TRUSTED?

Some experts argue that some of basic economic indicators published by the Chinese government are less than accurate. Among these are an economic growth rate of an average of nearly 10% per year from 1980 to 1999, which some experts believe is at least 2% too high and suspect figures about the amount of cultivated land in China. China once claimed only 95 million hectares of cultivated land and then claimed 130 million hectares in 2000. Experts believe that 150 million hectares is more accurate. The difference has important policy implications as China can feed itself on 150 million but not on 95 million and with more difficulty on 130 million.

FOR CHINA'S BANKING SECTOR, SMALL MAY BE BETTER

China's banking sector is dominated by the four large state-owned banks: The Industrial and Commercial Bank of China, Bank of China, Agricultural Bank of China, and China Construction of China. Experts agree that all are badly in need of reform to end chronic problems caused by mismanagement, ties to the government bureaucracy, and poorly performing loans. One source of overall reform might be the over 100 smaller banks that have emerged across China since 1996 when new policies allowed their formation. Many of these semi-independent, cooperatively owned banks have been more successful than the larger banks over the last five years. Their success is based on better customer service, more modern facilities, better management of loans, and a profit orientation. It is expected that they will also prove more able to compete in the global banking marketplace as China joins the World Trade Organization.

Source: Allen T. Cheng. (2000) "The Advantage of Being Small." *Asia Week* (16 November): 35.

Historically, price ceilings for consumer goods were supported by formal rationing of some staple foodstuffs and other daily necessities, as well as of a number of consumer durables. This system has been virtually replaced by market allocation, together with far higher prices, although housing may still be purchased through work units at a much lower price.

In recent years, a dual market for urban housing has sprung up, in which some apartments of relatively high quality are leased through the market at some of the world's highest rents. Shanghai, for example, has rents much higher than those in New York City and nearly as high as those in Tokyo.

Reform of Large-Scale Industry Although larger-scale industry has remained subject to central planning controls, similar market-type reforms have long been implemented. Reformers have worked to expand market links within the state-planning network while reducing control by government agencies. In 1982, the number of ministries and commissions directly under

the State Council was cut from ninety-eight to fifty-two and subsequently to forty-one, and their total staff was reduced from 49,000 to 32,000. As their decision-making rights grow, enterprises are supposed to become more profit oriented in order to be stimulated to reduce waste, raise quality and labor productivity, better tailor their products to user needs, and upgrade production. They are to move away from the one-sided emphasis on output volume—a hallmark of a command economy. In addition, provincial governments and over nine hundred enterprises now have rights to conduct foreign trade on their own.

By the late 1980s, the economy had become overheated with increasing rates of inflation. China's economy regained momentum in the early 1990s, after Deng Xiaoping's Chinese New Year's visit to southern China in 1992 gave economic reforms new impetus. The Fourteenth Party Congress later in the year backed up Deng's renewed push for market reforms, stating that China's key task in the 1990s was to create a "socialist market economy," an economy that would accommodate a variety of forms of ownership and permit coexistence of government planning and market mechanisms. Continuity in the political system but bolder reforms in the economic system were announced as the hallmarks of the ten-year development plan for the 1990s.

Challenges for the Twenty-First Century

Despite China's impressive economic development during the past two decades, reforming the state-enterprises sector, modernizing the banking system, and creating a social-welfare system remain major hurdles. Many small loss-making enterprises have now been closed or sold, but larger losing enterprises are usually merged with viable state enterprises or simply continue to be subsidized. Most discharged workers have continued to receive minimum compensation, including early retirement and opportunities to go into business for themselves. However, the rising unemployment rates are expected to be further pumped up after China joins the World Trade Organization.

There are three types of economic activities in China: those stipulated by mandatory planning, those done according to indicative planning (in which central planning of economic outcomes is indirectly implemented), and those governed by market forces. The second and third types have grown at the expense of the first, but goods of national importance and almost all large-scale construction come under the mandatory planning system. Operational supervision over economic projects has devolved primarily to provincial, municipal, and county governments. The market econ-

omy generally involves small-scale or highly perishable items that circulate within local market areas only. In addition, enterprises themselves are gaining increased independence in a range of activities. Almost every year brings additional changes in the lists of goods that fall under each of the three types of planning. Overall, the Chinese economic system contains a complex mixture of relationships: state ownership, shareholding, collective ownership, private ownership, foreign direct investment, and public ownership through shareholding. Indeed, the nonstate investment in fixed assets in China at the beginning of the twenty-first century reached 47 percent of its total, and it has continued to grow. The search continues for an optimal balance between plan and market, although the Communist Party reserves the right to make broad decisions on economic priorities and policies.

CHINA—EDUCATION SYSTEM China's education system, the world's largest, serves over 200 million primary and secondary school pupils. It achieved remarkable gains from 1949 to 2000 despite political upheaval and low levels of funding. When the People's Republic was founded in 1949, 20 percent of school-age children attended primary school. Fifty years later the net enrollment ratio was 99 percent, and the proportion of China's population that was illiterate had dropped from 80 to 14 percent.

The Cultural and Political Economy of Schooling

China's massive educational project is anchored by her citizens' belief in the power of schooling. Surveys indicate that educational expenses get first priority in

family budgets, followed by health and housing. Education reforms throughout the 1990s have resulted in a shift of financial responsibility from the central government to local communities. Funding comes from all levels of government, from enterprise taxes, from surcharges on rural households, and from tuition, fees, and private contributions. The government decreased its funding of education from 84.5 percent in 1991 to 68.9 in 1998, while tuition as a source of funding for education rose from 4.42 to 12.5 percent. Decrease in national funding has forced schools to generate income from school businesses, services, and fee-paying students, exacerbating educational disparities between rich and poor counties.

Such disparities hinder China's education "action plan," which calls for universal senior secondary schooling, a 15 percent matriculation rate to higher education, national systems of lifelong learning and knowledge innovation, and the elimination of illiteracy by the year 2010. However, the government's own officers criticize its disproportionately low investments in education. In 1999 China ranked 145th out of 153 nations in terms of per-capita education spending. Although national policy prescribes government educational expenditures of 4 percent of GDP, the current figure is 2.5 percent, virtually unchanged since the 1950s.

Beyond Access to Quality Primary Education

A majority of urban children have attended preschool since the 1980s, reflecting the mobilization of women outside the household and the one-child family policy. By the early 2000s, the government hopes to achieve a gross preschool enrollment rate of 45 percent for three- to five-year-olds, and 60 percent for children in their last year of kindergarten.

Nearly all children attend and graduate from primary school. In 1997 net enrollment rates of 98.9 percent and promotion rates of 93.7 percent represented an impressive increase over 1980 figures of 93 and 75.9 percent respectively. In 1999 China's 582,300 primary schools enrolled 134.7 million pupils. As China's baby-boom echo generation matriculates into secondary school, declining primary-school enrollments in cities like Shanghai and Nanjing have allowed officials to close poor schools, reduce class size, and raise teaching standards. Changed standards for the primary school curriculum, implemented on a trial basis in 2001, are designed to facilitate well-rounded training in language arts, social studies, mathematics and sciences, physical education, and art and music. English-language and information-technology instruction begin in grade three in schools with adequate resources.

Continuous media attention on funding irregularities and student workload indicates how competition for educational resources extends to the lowest levels of schooling. Shanghai's regulations on tuition and fees are typical in prohibiting donations linked to entrance, mid-year tuition increases, and extra fees for supplementary courses for all students. The Ministry of Education has made lightening the oppressive workload of school children its urgent educational goal for the new millennium. Yet, measures promoting that end (including restrictions on homework) can prove unpopular with parents who fear jeopardizing their children's educational future.

Universalizing and Diversifying Secondary Schooling

China's gross enrollment rate for pupils in junior secondary school (grades 7–9), part of the compulsory education system since 1985, was 88.6 percent in 1998. Coastal cities that have universalized junior secondary schooling have abolished selective entrance examinations in favor of neighborhood schooling. Nationally, junior secondary schools enrolled approximately 77 million pupils in 2000 and will operate for several more years under the strain of increased enrollments, with class sizes regularly exceeding fifty-five pupils.

Graduation from junior secondary school marks the transition of adolescents to stratified senior secondary schools, work, or unemployment. While junior secondary school dropout rates, 3.23 percent in 1998, remain a concern, promotion rates to senior secondary school increased from 40.6 to 57.5 percent between 1990 and 1997. Senior secondary schooling is nearly universalized in metropolitan areas like Shanghai, where 95 percent of junior secondary graduates continued their education in 2000.

Senior secondary-school reforms have included the introduction of new textbooks, elective courses, credit systems, information technology, and an approach to moral education that emphasizes community participation, discovery learning, and "healthy leisure." New curricular standards implemented in 2001 give individual schools more flexibility in deciding how their teachers can best engage students in a well-rounded course of study in Chinese, English, mathematics, computer sciences, social studies, biology, chemistry, physics, geography, music, arts, and physical sciences. College preparatory courses, criticized as too difficult, have been streamlined to offer students time for co-curricular pursuits. Systems of accreditation are being developed for advanced teachers and private schools, and increased educational qualifications and in-service training are mandated for teachers and principals.

The content, structure, and guidelines for competency and matriculation examinations are also changing to conform to changing curricular standards. Many cities and provinces have adopted a college entrance examination system that requires examinations in Chinese, English, and mathematics, plus one or two optional subjects, usually chosen from politics, history, physics, and chemistry. High-achieving students are sometimes exempted from exams. Expanding college enrollment fuels such reforms. The chances for students in metropolitan centers to enter college have never been greater (and college has never cost more). Of Beijing senior secondary graduates, 70 percent entered higher education in 2000. Living in educational centers drastically improves a student's opportunity for higher education; those areas have more resources to spend on education and consequently have more seats available in high schools, colleges, and universities. China's first Spring College Entrance Examination was held in 2000. Only 1,100 examinees sat for Beijing's 1,755 college places. In contrast, 35,000 examinees in Anhui province vied for 6,190 places, making it harder for qualified students to advance to the upper levels of schooling.

Expanding and "Commercializing" Tertiary Education

Relative to other developing countries, the base of China's educational pyramid is very broad while the top is very narrow. In 1990, 3 percent of Chinese eighteen- through twenty-two-year-olds were studying in tertiary institutions, compared to 8 percent in India, and fewer than one out of every 100 citizens was a college graduate. Since China's integration into the global economy, higher education has entered a period of unprecedented expansion. In 1999, enrollment in nearly 1,100 regular tertiary institutions was 4.13 million, an increase in one year of 770,000 students. Enrollment in adult higher education was 3.05 million, an increase of almost 250,000. In the first decade of the twenty-first century, the proportion of eighteen- through twenty-two-year-olds in higher education is expected to expand from 9 to 15 percent.

Reforms in higher education are directed toward decentralized funding, ending state-supported higher education, institutional accountability, and quality. Generally, institutions are increasing in size due to expanded recruitment and consolidation. Disciplines and majors are being redefined. Some universities allow early graduation for qualified students. At the same time, housing, education, and health services for university staff and faculty have been cut as universities contract out services. While the number of university

students more than tripled from 1992 to 1999, the number of support staff fell 35.3 percent.

Student services and financial aid are at the forefront of change. National, provincial, city, and institutional measures to help students afford college have accompanied dramatic increases in tuition, which in Beijing ranged in 2000 from 4,200 *yuan* for ordinary majors at second tier institutions to 6,000 *yuan* for medical and foreign language courses at premier institutions. Universities offer teaching and research assistantships, and the banking industry along with the Ministries of Education and Finance are supporting national student loan programs.

Raising Teaching Standards in the Face of Teacher Shortages

Efforts are underway to require primary and secondary school teachers to have four-year college degrees, and a national continuing education mandate requires extensive in-service training of between 240 and 520 hours every five years. Coupled with expansion in secondary and tertiary education, efforts to raise standards have created a shortfall of qualified teachers. The teacher-student ratio in universities increased sharply in 1999; at the same time, a record number of faculty are on the verge of retirement. Universities are now compelled to attract faculty by increasing pay and opportunities for travel abroad. Competition has also developed among universities in the training of teachers. Comprehensive universities are encouraged to establish teacher-training programs, and normal universities are responding with more specialized and flexible training options.

Enhancing the quality and stability of the teaching force is urgent in rural areas where primary school teachers are not state employees but rather hired by local communities as *minban* (community managed) teachers. *Minban* teachers work in public and community schools but are paid by subsidies and nonbudgetary allocations from villages and townships. Because these teachers receive no regular salary from the government, it has been difficult for them to maintain an adequate standard of living. In response, several ministries recently issued a joint announcement to recognize qualified *minban* teachers as state employees. Regional variation in the quality of the teaching force has also inspired distance education programs for female and ethnic minority teachers in impoverished counties in rural and western China.

Private Schooling: Filling the Gap in Capacity and Funding

Private schooling reemerged at all levels of the system in the 1990s. In 2000 there were over 50,000 non-

state educational institutions, reflecting a diversity of programs and administrative and fiscal autonomy. Nonstate preschools and kindergartens made up 20 percent of the total. In addition, there were over 2000 nonstate primary and secondary schools, 37 nationally accredited nonstate colleges, and over 300 pilot nonstate colleges offering diploma courses.

Lack of state funding, rigidity in the public sector, and restricted entrance to public schools are among the reasons for the rise of private schools. The state's policy of actively encouraging, supporting, and guiding and effectively administering private schools is also designed to boost the economy by prompting families to use their savings on the one "commodity" they consistently desire—education for their children.

Private education has become a major force in reform. Many private schools are short-term or proprietary institutions; others provide a forum for experimentation in teaching and community-government relations. Private girls' schools, for example, experiment with a wide array of curricula—in music, drawing, driver's training, martial arts, information technology, and psychology—designed to meet the "special" needs of healthy female development. They fill educational gaps left by a state unable or unwilling to provide sufficient schooling to meet public demand. Because private schools face opposition from local authorities protective of scarce funds, many are embroiled in community-level conflicts.

Educating China's Margins

Disparities in access to quality education are a product of complex patterns of historical regional, ethnic, and gender discrimination. China's best and worst educated regions reflect the economic inequities that exist between the coastal and interior regions. Census data from 1993 indicate that Beijing and Shanghai are China's educational centers, with 5.5 and 3.2 university graduates and 14.3 and 15.3 senior secondary school graduates per 100 residents. By contrast, Shandong province and the Guangxi-Zhuang autonomous region counted only .3 university graduates and 5.7 and 5.3 senior secondary school graduates per 100 residents.

China has been a high-profile player in international initiatives to end illiteracy and exploitative child labor and to universalize basic schooling. External aid from organizations like the World Bank and the United Nations, and domestic support from programs like Project Hope, the China Youth Development Foundation's social welfare program, have been directed toward these ends, especially in regions inhab-

ited by the poorest 20 percent of China's population. Efforts in the 1990s have targeted the two-thirds of illiterates and school dropouts who are poor, minority, rural, females. China has reintroduced all-girls' schools and classrooms in rural and urban communities.

Females make up an increasing proportion of non-compulsory schooling. However, their location within the system (disproportionately weighted in the humanities, foreign languages, and teacher education) is still heavily determined by gender. Nationally as of 1997, 37.32 percent of students in regular higher education institutions were female. Female full-time college teachers made up 35.21 of the teaching staff, 38.16 and 48.28 percent of the general secondary and primary staff respectively, and 94.57 percent of kindergarten teachers. Female enrollment accounted for 63.17 percent of students in secondary technical schools, 45.56 percent of students in general secondary schools, 48.53 percent of students in vocational schools, 47.63 percent of students in primary school, 46.58 percent of students in kindergarten, and 36.2 percent of students in special education programs.

The push to universalize basic education has also thrown a spotlight on the ethnic minority regions, which span 60 percent of China's territory and generally lag behind on economic and education indicators. Although minority students on average attend primary schools at Han Chinese levels, literacy rates for 28 of the 55 minority groups are below that of the Han majority, and minority students are significantly underrepresented in secondary and higher education. A widespread system of two-track schools that teach in either Mandarin or the local minority language perpetuates discrimination. Originally designed to protect minority cultures, the system places minority students at a disadvantage in competing for jobs in government and business, which require Chinese-language skills.

Arguably, China's disabled population is the group most marginalized by the structures and practices of formal and nonformal education. In 1990 the government adopted legislation to protect the rights of China's 60 million disabled citizens, one-quarter of whom live in extreme poverty. The same year, the Ministry of Education signed a Special Education Project Task Agreement with 21 provinces to universalize compulsory education among disabled children. At that time 358,372 disabled children were enrolled in all types of schools, almost exclusively outside the mainstream system. The agreement provides for building and reconstructing special-education schools and training thousands of new special education teachers.

Chinese Education and Globalization

In 1999 China's State Council endorsed an "Action Plan for Vitalizing Education for the Twenty-First Century." The plan outlines the challenges facing Chinese education, including improving quality; enhancing teacher, vocational, moral, distance, and adult education; simultaneously expanding and improving tertiary education; and rationalizing educational law. China's leaders hope these initiatives will make high-quality, student-centered education more widely accessible, that they will encourage lifelong learning, and, ultimately, revitalize China.

How China handles its education challenges matters well beyond its national boundaries. Scholars and teachers worldwide look to China's educational system for inspiration. Students emerging from Chinese schools are shaping global patterns of the production of knowledge, especially in science and technology. Finally, collaborative scholarly networks, enhanced as increasing numbers of Chinese intellectuals participate in international scholarly and professional organizations, have led to an explosion of research on Chinese education. These trends indicate that China will be a leader in educational reform in the twenty-first century.

CHINA—HUMAN RIGHTS The history of human rights in China divides into three parts: the rallying cries of human rights activists, the political and academic arguments of the government and foreign scholars, and Beijing's suppression of human rights. The activists do not concern themselves with the intellectual or historical origins of human rights, or with their "Western" relationship to China. They are engaged in the application, not in the historical legitimacy of the rights. The cultural theorists argue whether China is exceptional and thus not part of the universal code of human rights, or whether China has a historical background that fostered human rights ideas. Beijing's actions have created a vast response of critics both inside and outside China.

Political Leaders and Movements

The earliest known discussions of human rights in China's context began in the late 1890s. Since the Chinese terminology was not standardized for several decades, the terms "natural law" (*tianfu*) and "human rights" (*renquan*) were used arbitrarily, just as they were in the West when Tom Paine introduced the term in 1791 in *The Rights of Man*. Revolutionaries such as Zou Jung (1885–1905) used a call to human rights to drive out the Manchu rulers and bring political freedom to the Chinese. Others changed their name to announce their new allegiance: Feng Zi-you means Freedom Feng; Liu Yazhi, a lifelong advocate of human and women's rights and constitutionalism, became so infatuated with Rousseau's views that he changed his name to Liu Jenquan, or Human Rights Liu, when he was only sixteen in 1902.

The acceptance of human rights for China was not universal. Radicals and reformers like Liang Qichao (1873–1927) adopted a Darwinian and Spenserian view that denied the existence of human rights because all rights were considered to be created by the powerful. From this point of view, only the strongest survived. It was necessary for the state to become strong in order to protect the people, even if the people's rights were denied. What is significant in the criticism of human rights doctrine is that the argument is not based on Chinese values, but on Western criticism of human rights theory. The debate within China about human rights was a pragmatic one—would they strengthen or weaken China; not whether they were foreign or domestic.

The collapse of the Qing dynasty in 1911 ushered in a period of domestic and international chaos: warlords, Japanese intervention, the rise of nationalist reformers, and Communist revolutionaries. Sun Yat-sen, the founder of the Guomindang, disparaged the con-

cept of human rights. All rights and power came from the political party or the state. People's rights were valid as long as they supported the state. Citizens who opposed the state lost their rights. These ideas were shared by the leaders of both the Nationalist government under Chiang Kai-shek, and the current Communist leadership.

Conversely, many early Nationalists and Communists supported the rights of the individual. Gao Yihan (1885–1968), a GMD leader, advocated for political and civil rights—freedom of speech, freedom of conscience, freedom of assembly, and rule by law. Chen Duxiu (1879–1942), one of the founders of the Communist Party, initially argued for civil and political rights in the tradition of the American and French revolutions. Li Dazhao (1888–1927), another founder of the Communist Party, stressed the socialist rights of economic and labor rights over the civil and political rights of the individual. But he did not renounce the traditional nineteenth-century definition of individual rights. His stress on people's rights (*min ben*) was related more to the ideas of socialism than to the Confucian stress on the people's livelihood.

During and after the May Fourth Movement of 1919, many journals debated the nature and the pros and cons of human rights. The most vigorous debates were published in *New Youth*, *New Tide*, and *Human Rights*. Freedom of thought and of publication clearly and naturally dominated the concerns of these editors. Human rights were not only necessary to protect the individual from the state, but even more important, were also necessary to provide for the dignity of the individual. Without rights, people would lose their human dignity and collapse into a state of slavery. It was the duty of both the citizen and the state to provide for the common good of all people.

The trend toward social utility was reinforced by the visits of John Dewey (1859–1952) and Bertrand Russell (1872–1970) to China and the writings of English idealists such as T. H. Green (1836–1882) and David George Ritchie (1853–1903), social liberals such as L. T. Hobhouse (1864–1929), and socialists such as Harold Laski (1893–1950). The popularization of terms such as freedom, democracy, and human rights made them part of the rhetorical framework of the 1920s. They were not always defined in academic terms because they were familiar and considered to be norms that were applicable to China's crisis.

The May Fourth Movement was not monolithic in its analysis of why human rights did not exist in China. The *New Tide* group felt that the tradition of Confucianism had caused the Chinese to repress their feelings

THE AMERICAN VIEW ON HUMAN RIGHTS IN CHINA

Criticism of Chinese human rights policies and practices by the United States is a continuing source of conflict in relations between the two nations. U.S. criticism is provided each year in the Country Reports on Human Rights published by the Bureau of Democracy, Human Rights, and Labor of the U.S. Department of State. The extract below is from the 1999 report on China released on 25 February 2000.

Section 2. Respect for Civil Liberties, Including:

a. Freedom of Speech and Press

The Constitution states that freedom of speech and of the press are fundamental rights to be enjoyed by all citizens; however, the Government restricts these rights in practice. The Government interprets the Communist Party's "leading role," as mandated in the preamble to the Constitution, as circumscribing these rights. The Government does not permit citizens to publish or broadcast criticisms of senior leaders or opinions that directly challenge Communist Party rule. The Party and Government continue to control many—and, on occasion, all—print and broadcast media tightly and use them to propagate the current ideological line. There are more than 10,000 openly distributed publications, including 2,500 newspapers. All media employees are under explicit, public orders to follow CCP directives, and "guide public opinion" as directed by political authorities. Both formal and informal guidelines continue to require journalists to avoid coverage of many politically sensitive topics. Journalists also must not divulge "state secrets" in accordance with the State Security Law. These public orders, guidelines, and statutes greatly restrict the freedom of broadcast journalists and newspapers to report the news and lead to a high de-

gree of self-censorship. Overall, during the year press freedom deteriorated further. During the early part of the year, newspaper closures or suspensions increased; efforts by the authorities to block the reception of foreign news also increased during the year, particularly prior to sensitive anniversaries.

More than in recent years, the press was exploited by the Government as an effective propaganda tool to disseminate an official line. For example, in its press coverage of NATO's action against Serbia, NATO was depicted as bent on using the conflict in Kosovo as an excuse to expand its influence. Casualties caused by NATO attacks on Serb forces received prominent coverage, but there was almost no mention of the plight of ethnic Albanian Kosovars. The Government's manipulation of the press to mold public opinion had violent results when demonstrators targeted foreign diplomatic facilities in Beijing after NATO's mistaken bombing of the Chinese embassy in Belgrade.

Journalists were given explicit instructions during the year to minimize coverage of negative issues and emphasize positive achievement in preparation for the October 1 celebration of the 50th anniversary of the founding of the PRC. The general worsening of the political atmosphere greatly increased the tendency of journalists, writers, and publishers to censor themselves.

and their sense of dignity. The *New Youth* writers, Chen Duxiu, Li Dazhao, and Gao Yihan blamed the government and the warlords for violating what they claimed were their rights of freedom of thought, assembly, and representation in government.

During the Nanjing Decade, 1927–1937, and the war against Japan, 1937–1945, many of these debates became moot. The commitment to national salvation against the Japanese and the civil war between the Nationalists and Communists created a military campaign

mentality. The debate transformed to questions of dictatorship versus democracy. Nonetheless, liberals and scholars such as Hu Shi (1891–1962), Luo Longji (c. 1898–1965), Zhang Junmai (1886–1969), and Zhang Pengqun (1892–1957), also known as P. C. Chang, and organizations such as the *Xinyue* Group, the China League for Civil Rights, and the China Democratic League vigorously argued for the adoption of human rights, though from very different, and often contradictory, perspectives. Hu Shi argued for both civil and economic rights. For him, human rights were universal and were to be established in the legal and constitutional system of the Republic of China, a stance that created a backlash in the GMD, which attacked him for his views and passed laws that were even more authoritarian.

Luo's views were directly related to Harold Laski's argument that human rights were historical and contextual. Rights and laws reflected the needs of the social and economic system. They should be used functionally to create a safer and more wholesome society. At times, the individual's freedom may need to be curtailed. Zhang Junmai attempted to synthesize the humanism of neo-Confucianism with the philosophical perspective of human rights. He believed that China's traditional ethics, which were based on conscious and promoted human dignity, were not only the best approach to legitimizing human rights and democracy, but that, in fact, China may also have been the real source for the West's views of human rights.

P. C. Chang was China's chief representative to the Commission on Human Rights, which created the Universal Declaration of Human Rights. He is given credit for Article 1, which refused to claim that rights were based on natural law or divine inspiration. Faintly, echoing Zhang Junmai, Chang stressed the innateness of dignity and conscience.

Human Rights with Chinese Characteristics

The establishment of the People's Republic of China in 1949 resulted in a total rejection of the legitimacy of human rights arguments. Human rights were a product of the bourgeoisie and were thus used to maintain the rule of the capitalist and imperialist class. With a few but startling exceptions in 1957 and 1978, any mention of human rights was taboo and resulted in imprisonment.

However, just before and after the massacre of pro-democracy students in Tiananmen Square (4 June 1989), the Communist authorities began to engage in the human rights debate to justify their authority and their rule. In 1991 a white paper on human rights de-

claimed that: "Since the very day of its founding, the Communist Party of China has been holding high the banner of democracy and human rights." This stunning declaration was followed up with academic conferences on human rights and the creation of several institutes especially devoted to human rights, such as the China Society for Study on Human Rights. From 1995 to 1998 the Confucius Foundation in Beijing sponsored a series of international forums with the purpose of discussing Confucius and Human Rights. By the late 1990s, Beijing signed the two covenants on economic, social, and cultural rights.

The study of human rights in China is initiated and managed by the Communist Party and the government. It has not included meetings with Chinese citizens or with local nongovernmental organizations active in human rights. The official position is that China has developed a socialist system of human rights with Chinese characteristics. Stages of economic and industrial development determine the scope and quality of human rights. Liu Huaqiu, head of the Chinese delegation at the Vienna World Conference on Human rights in 1993 defined the Chinese view succinctly:

The concept of human rights is a product of historical development. It is closely associated with specific social, political and economic conditions and the specific history, culture and values of a particular country. Different historical development stages have different human rights requirements. Countries at different development stages or with different historical traditions and cultural backgrounds also have different understanding and practice of human rights.

From this point of view, the most basic rights are those of subsistence and shelter. These "economic" rights are considered superior to, and of greater priority than, political and civil rights.

There is more to the definition than a mere enunciation of domestic policy. China argues that America and the West use the invasive argument that human rights are universal to force China to peacefully evolve into a colony of Western economic and political control. Beijing does not argue that Chinese cultural (e.g., Confucianism) values prevent it from accepting Westernization. Rather, it is China's anti-imperialist stand and its desire to create its own national identity in the twenty-first century that makes it refuse to accept standards that serve the interests of Washington, D.C.

Beijing's Repression of Human Rights

The Chinese government has maintained that its sovereignty excludes foreign powers from interfering

in its affairs. It has adamantly refused to allow independent agencies to investigate openly and report on its alleged human rights abuses. According to its critics, China has engaged in massive abuse of human rights. With regard to political and civil rights, it has tortured and executed prisoners of conscience, repressed religious organizations, prohibited democratic organizations and meetings, arrested and detained people without trial, and engaged in widespread abuse and repression of women, the unemployed, minorities, and the poor. The Chinese leadership has been accused of long-term genocidal practices against the Tibetan people. Contrary to the Beijing's claim that it favors economic and social rights, it has been accused of destroying the environment, censoring the educational system, exploiting workers, and engaging in organized official corruption.

The Tiananmen Square Massacre resulted in a massive amount of attention to human rights conditions in China. The call for human rights became widespread, though underground, in China, and was openly publicized by Chinese groups abroad. Wang Dan, Wuer Kaixi, and other leaders of the student movement found exile in America and Europe, where they organized resistance groups and published journals such as *China Spring*. American human rights organizations joined forces: Amnesty International and Asia Watch were joined by online sources—Tibet On Line Resource Gathering, and Asia Observer. The U.S. government's pressure on China to adhere to human rights standards was most visible in the arguments surrounding the congressional review of China's Most-Favored-Nation status and the arguments over entry to the World Trade Organization. The most sensational and informative moment for the Chinese citizenry came on 30 June 1998, when President Bill Clinton spoke on the "Shanghai Radio 990" call-in show. Broadcasting to China's largest city, the president declared, "whatever differences of opinion we have about what human rights policy ought to be . . . we still have a lot in common . . . I believe that the forces of history will bring about more convergence in our societies going forward."

Beijing's response to these overtures has been negative. A diatribe entitled *The China That Can Say No* best expresses the voluminous official reactions to the human rights movement. It counters the arguments by exposing America's human rights abuses and the hypocrisy of the leadership. In the United Nations Commission on Human Rights, Beijing's diplomats claim their right of sovereignty and denounce what they depict as fallaciousness of the attacks on their integrity. Human rights activities in China are consid-

ered to be antigovernment in nature and result in harsh punishment. China also considers America's campaigns and support of human rights to be an extension of America's imperialistic attitudes. Thus, the creation and development of human rights remains primarily a political, not a cultural, response to repressive regimes. In the early twenty-first century, the struggle for human rights continues.

CHINA-INTERNAL MIGRATION From the 1950s to late 1978, strict controls limited population mobility in China. Even by the time of the 1982 census, China still had a very low level of migration to urban areas for a country at its level of development.

Pre-Reform Migration

In the early 1950s, rural migrants moved to the cities in large numbers. Estimates suggest that from 1949 to 1953 the urban population grew by twenty million, 70 percent of which was attributable to migration. To combat the growing pressure on housing, transportation, education, and health facilities, a system designed to monitor population movement was introduced in 1951. Through a series of regulations culminating in the "Regulations of Household Registration in the People's Republic of China" issued in 1958, the Chinese government developed perhaps the strictest set of controls over the movement of population in the modern world. The basis of control was the *bukou*, or household registration system. Deriving from China's traditional household registration system, it also incorporated elements of the labor registration system of the Soviet Union. Under the system

each household possessed a registration book listing its members and categorizing the household as "agricultural" or "nonagricultural." This division has become a fundamental social divide in China, producing what has been called "a castelike system of social stratification" that keeps the peasants on the land and reinforces a spatial hierarchy in which Beijing, Shanghai, and the other big cities are considered the most desirable places to live and therefore the most difficult to move to.

Under the planned economy with overwhelming state control, people were supposed to reside and work only where they had their *hukou*; any stay in other places over three days needed to be registered at the police station. Transfer of *hukou* was granted only under such circumstances as an assignment to a job in another area or a marriage across administrative boundaries. The *hukou* was the passport to employment and the rations that were issued only locally.

Despite the severe restrictions, considerable rural-to-urban migration still existed. According to official estimates, between 25 and 30 million people obtained *hukou* transfers from one province to another between 1949 and 1978. This figure does not include *hukou* migration within provinces, which would have been of a greater magnitude, or unsanctioned, non-*hukou* migration.

The government organized both economic and political oriented migrations during this period. Economic migrations primarily involved skilled workers in large-scale development projects and students pursuing higher education. In the 1950s peasants were officially recruited into the urban labor force and given nonagricultural status. Later they would be recruited as contract workers for the urban labor force. At the same time, more than 1 million people were moved from heavily populated areas of Shandong Province to open up sparsely populated areas elsewhere between 1955 and 1960, while in January 1959 it was announced that Zhejiang Province was to send 300,000 young people to help develop Ningxia Province. Large public-works projects also forced significant migrations; by the mid-1980s, more than 5 million people had been moved to make way for reservoir construction.

Political migrations included job assignments to frontier areas such as Xinjiang, Inner Mongolia, and Tibet; punishment or political exile; and conscription. Punishment and political exile produced some of the most substantial urban-to-rural migration of the period. It is estimated that between 400,000 and 700,000 rightists were exiled to the rural areas in 1957, where some were to stay for more than twenty years. Dur-

ing the Cultural Revolution urban areas sustained a net loss of almost five million people to rural exile. Individuals who had been politically disgraced were sent for particularly long periods, but ordinary intellectuals and cadres were also sent to the countryside to undergo months or even years of labor reform. In the early 1970s, some 20 million Red Guards were directed to go to the villages for reeducation.

Apart from those organized migrations, spontaneous permanent migrations are estimated to have involved at least 10 million people from 1949 to the mid-1980s. Most spontaneous migrants were peasants continuing migration patterns established before restrictions were imposed. However, before the economic reforms of the late 1970s institutional barriers to migration imposed by the government made movement from a village to an urban area as difficult as movement across national borders elsewhere in the world.

Internal Migration since 1978

The scale of internal migration in China increased enormously with the advent of economic reforms. Figures commonly given for the migrant population vary from 40 to as high as 100 million. Migrants are generally divided into three categories: those who have crossed an administrative border with official permission (*qianyi renkou*), the floating population (*liudong renkou*) or "blind migrants" (*mangliu*) without official permission, and temporary contractual laborers from the rural areas (*mingong*). The floating population in the biggest cities is estimated to form between one-fifth and one-third of their total population. Big cities everywhere have attracted very large numbers, but migrants also go to rapidly industrializing areas such as the Pearl River Delta in Guangdong Province and the towns of southern Jiangsu.

The majority of migrations in China are within the same province. According to the 1990 census, between 1985 and 1990 there were more than 23 million movements within provinces, compared to more than 11 million between provinces. Available data indicate that approximately one-third of migration was interprovincial in 1990, representing rapid change from 1988, when less than one-fifth of migration had been interprovincial. Migrants from the eastern region tend to stay closer to their native areas, whereas migrants from the less developed central and western regions are more likely to travel to the more developed seaboard provinces, especially those of southeastern China.

Four major reasons have been commonly identified in migration during the reform era: urban-rural

disparity, rural surplus labor, development of township and village enterprises (TVEs) and urbanization of rural towns, and business opportunities. Indeed, rapid economic development has offered tremendous job opportunities to migrant workers.

Although it became much easier to move from one area to another after 1978, household registration has remained extremely difficult to change. In 1985 the Ministry of Public Security issued a new regulation on temporary residence certificates for the urban areas. Migrant workers who have obtained these are allowed to live in the urban areas but do not enjoy the social benefits to which permanent urban residents are entitled.

The impact of migration is varied. It has given some people the chance to lift themselves out of poverty and to acquire new skills. At the same time, the influx of rural migrants has caused the urban infrastructure considerable strain. Many migrants lead difficult lives in overcrowded and unsanitary conditions. While migrant earnings have brought new wealth to the countryside, some fear that the departure of so many young, educated residents will be to the detriment of rural society. However, there is no doubt that by providing cheap labor and filling in economic vacuums, migrants have made major contributions to China's economic success.

CHINA—POLITICAL SYSTEM China lags far behind other world powers in official government interest in democracy. This curious state of affairs cannot be fully explained historically. After all, every contemporary democracy has a nondemocratic past. But in China the past weighs unusually heavily.

A Tradition That Scorned Politics

Since before 500 BCE, politics in China were more social than institutional. In the past, various philosophical schools had contended, and something of a feudal structure had been evident, with healthy competition among aristocratic clans, emperor, and officialdom. But long before the People's Republic of China (PRC) was

founded in 1949, Confucianism overwhelmed other schools of thought, aristocracy faded, and emperor and officialdom fused into a unitary, though decentralized, overwhelmingly Confucian state. Ideas of popular sovereignty, rule of law, separation of powers, federalism, and checks and balances never blossomed under this stiflingly rigid tradition. Rather than favoring limited government achieved through fragmenting authority, the ideal was to achieve good government through a state with a virtuous ruler, resembling a family with a benevolent, protective father.

New Politics That Scorned Tradition

Twentieth-century Chinese political movements felt the need to look abroad for fresh ideas. European Marxism appealed more than European democracy, probably because although it was "modern" it differed less dramatically from traditional Chinese notions of power. Chinese tradition mixed with Marxism to create a hybrid ideology known as the political thought of Mao Zedong (1893–1976), which seemed to fit social revolution, a new intellectual orthodoxy, and a new centralized and unitary state better than did chaotic competitive democracy. Political-reform debates still turn on how global standards of democracy, human rights, markets, and private property with Chinese characteristics might be adopted. The weakness of old forms is criticized more sharply than the old forms themselves, inviting revivalist themes. Today, one official view (no longer limited to Mao's thought), one core leader, a single pyramid of state power, and a single Communist Party remain stronger ideals than do institutions that might divide and restrain state power.

From Scorn to Halting Reform

Having rejected almost every state form at one time or another, the PRC today faces the problem of what form to accept. China has rejected democracy in favor of Marxism, Marxism in favor of Mao's thought, and Mao's thought in favor of a less coherent "practical" approach to orthodoxy. China has rejected a constitutional state in favor of a Stalinist state, the familiar Stalin model in favor of a mobilizational Maoist variant (emphasizing ideological themes, political education meetings, mass rallies to demonstrate loyalty), and the Maoist variant in favor of a state more insulated from its ruling party. China has rejected liberal political parties in favor of a Leninist Communist party and now is deeply ambivalent about that move. In fact, even while strongly rejecting the idea of private factions, China has rejected any firm institutional direction in favor of more personal rule by factional elders. China today is more certain of what it does not want

than of what it does want. After several disruptive, occasionally violent spasms of experimentation, political change at the PRC's half-century mark proceeds cautiously, incrementally, and practically.

China's political system, far from a static structure, has evolved through a sequence of momentous cycles and continues to evolve, if less tumultuously. Each phase has added to the accomplishments of the previous one.

1949-1954

The phase from 1949 to 1954 opened with the Communist takeover of China and with land redistribution, party building, and struggle against U.N. intervention in Korea. It ended with the proclamation of a new state constitution. Characteristically, the new constitution was not a vigorously bargained popular grant of authority. Rather, as China's leader put it, "This Draft Constitution of ours is chiefly a summing-up of our experience in revolution and construction, but at the same time it is a synthesis of domestic and international experience" (Mao Zedong 1954: 141-147).

The PRC's first five years witnessed China's assertion of autonomy. China was no longer a territory occupied by a foreign army, a semicolony with its commerce dominated by foreign companies, or a divided society with a weak center—the one that served tea at meetings of international powers. The strong appeal of the new order was that a new China had stood up. Chinese abroad yearned to return and contribute to the glorious national project of building the new China.

The party-army that finally mounted a victorious military campaign after twenty years of rural guerrilla warfare abruptly faced the task of governing. And surprisingly quickly, images of wide-eyed peasants marching into cosmopolitan Shanghai were replaced with images of confidence. The Communists' patriotic credentials, hard won during years of resistance to Japanese occupation, were enhanced as they sent foreigners packing, confiscated foreign property, closed foreign missions, and within a year were fighting U.N. and American troops to a standstill in Korea.

In urban areas, with demonstrative political campaigns and draconian tactics, the Chinese Communist Party (CCP) took charge of seaports, swiftly clamped down on coastal smuggling, opium dens, and prostitution rings, and established effective control of banking, national security, and foreign policy. Not only was the party patriotic, it was also strong. Elites of the old regime were assured that patriotic service to the new

CHAIRMAN MAO ON THE BASIS OF THE CHINESE POLITICAL SYSTEM

"Wherever our comrades go, they must build good relations with the masses, be concerned for them and help them overcome their difficulties. We must unite with the masses; the more of the masses we unite with, the better."

order would be welcome. In rural areas, where the party presence was thinner, mobile work teams led sometimes-violent public rebuke of landlords and redistribution of property. For the first time in over a century, the nation was not embroiled in civil or foreign war. The new regime's standing would never be higher.

Nonetheless, after five years, despite political successes and despite aggressive party building, the first national census, a formal state constitution, and borrowed Soviet-style enterprises and civilian and military bureaucracies, the shape of the new political system had yet to be drawn.

1955-1961

The phase from 1955 to 1961 opened with a stepped-up pace of agricultural collectivization and early moves by Chairman Mao to stem loss of personal power to party leaders with factional networks. It passed through a bizarre attempt to reorganize rural China into radical "people's communes." It ended with Mao recovering from the visible failure of his "Great Leap Forward" experiment.

Yearning to perpetuate the politics that allowed his movement to rise to power, Mao felt he had to motivate succeeding generations to carry on the spirit of revolution. He maneuvered to establish a "correct" view of the political world, encourage universal study of it, and mobilize popular support directly without having to filter his message through channels controlled by CCP factions and bureaucracies.

An early battleground was rural property. Concerned that small landholders could not go it alone and that a controlling landlord class might revive, Mao

PREAMBLE TO THE CONSTITUTION OF CHINA

Adopted on 4 Dec 1982

China is a country with one of the longest histories in the world. The people of all of China's nationalities have jointly created a culture of grandeur and have a glorious revolutionary tradition.

After 1840, feudal China was gradually turned into a semi-colonial and semi-feudal country. The Chinese people waged many successive heroic struggles for national independence and liberation and for democracy and freedom.

Great and earthshaking historical changes have taken place in China in the 20th century.

The Revolution of 1911, led by Dr. Sun Yat-sen, abolished the feudal monarchy and gave birth to the Republic of China. But the historic mission of the Chinese people to overthrow imperialism and feudalism remained unaccomplished.

After waging protracted and arduous struggles, armed and otherwise, along a zigzag course, the Chinese people of all nationalities led by the Communist Party of China with Chairman Mao Zedong as its leader ultimately, in 1949, overthrew the rule of imperialism, feudalism and bureaucrat-capitalism, won a great victory in the New-Democratic Revolution and founded the People's Republic of China. Since then the Chinese people have taken control of state power and become masters of the country.

After founding the People's Republic, China gradually achieved its transition from a New-Democratic to a socialist society. The socialist transformation of the private ownership of the means of production has been completed, the system of exploitation of man by man abolished and the socialist system established. The people's democratic dictatorship held by the working class and based on the alliance of workers and peasants, which is in essence the dictatorship of the proletariat, has been consolidated and developed. The Chinese people and the Chinese People's Liberation Army have defeated imperialist and hegemonist aggression, sabotage and armed provocations and have

thereby safeguarded China's national independence and security and strengthened its national defense. Major successes have been achieved in economic development. An independent and relatively comprehensive socialist system of industry has basically been established. There has been a marked increase in agricultural production. Significant advances have been made in educational, scientific and cultural undertakings, while education in socialist ideology has produced noteworthy results. The life of the people has improved considerably.

Both the victory in China's New-Democratic Revolution and the successes in its socialist cause have been achieved by the Chinese people of all nationalities, under the leadership of the Communist Party of China and the guidance of Marxism and Leninism and Mao Zedong Thought, by upholding truth, correcting errors and surmounting numerous difficulties and hardships. The basic task of the nation in the years to come is to concentrate its effort on socialist modernization. Under the leadership of the Communist Party of China and the guidance of Marxism-Leninism and Mao Zedong Thought, the Chinese people of all nationalities will continue to adhere to the people's democratic dictatorship and the socialist road, steadily improve socialist institutions, develop socialist democracy, improve the socialist legal system, and work hard and self-reliantly to modernize the country's industry, agriculture, national defense and science and technology step by step to turn China into a socialist country with a high level of culture and democracy.

The exploiting classes as such have been abolished in our country. However, class struggle will continue to exist within certain bounds for a long time to come. The Chinese people must fight against those forces and elements, both at home and abroad, that are hostile to China's socialist system and try to undermine it.

Taiwan is part of the sacred territory of the People's Republic of China. It is the inviolable duty of all Chinese people, including our com-

CONTINUED ON NEXT PAGE

CONTINUED FROM PREVIOUS PAGE

patriots in Taiwan, to accomplish the great task of reunifying the motherland.

In building socialism it is essential to rely on workers, peasants and intellectuals and to unite all forces that can be united. In the long years of revolution and construction, there has been formed under the leadership of the Communist Party of China a broad patriotic united front which is composed of the democratic parties and people's organizations and which embraces all socialist working people, all patriots who support socialism and all patriots who stand for the reunification of the motherland. This united front will continue to be consolidated and developed. The Chinese People's Political Consultative Conference, a broadly based representative organization of the united front which has played a significant historical role, will play a still more important role in the country's political and social life, in promoting friendship with other countries and in the struggle for socialist modernization and for the reunification and unity of the country.

The People's Republic of China is a unitary multi-national state created jointly by the people of all its nationalities. Socialist relations of equality, unity and mutual assistance have been established among the nationalities and will continue to be strengthened. In the struggle to safeguard the unity of the nationalities, it is necessary to combat big-nation chauvinism, mainly Han chauvinism, and to combat local national chauvinism. The state will do its utmost to promote the common prosperity of all the nationalities.

China's achievements in revolution and construction are inseparable from the support of the people of the world. The future of China is closely linked to the future of the world. China consistently carries out an independent foreign policy and adheres to the five principles of mutual respect for sovereignty and territorial integrity, mutual non-aggression, non-interference in each other's internal affairs, equality and mutual benefit, and peaceful coexistence in developing diplomatic relations and economic and cultural exchanges with other countries. China consistently opposes imperialism, hegemonism and colonialism, works to strengthen unity with people of other countries, supports the oppressed nations and the developing countries in their just struggle to win and preserve national independence and develop national economies, and strives to safeguard world peace and promote the cause of human progress.

This Constitution, in legal form, affirms the achievements of the struggles of the Chinese people of all nationalities and defines the basic system and basic tasks of the state; it is the fundamental law of the state and has supreme legal authority. The people of all nationalities, all state organs, the armed forces, all political parties and public organizations and all enterprises and institutions in the country must take the Constitution as the basic standard of conduct, and they have the duty to uphold the dignity of the Constitution and ensure its implementation.

advocated collective ownership. He pressed against mounting opposition for higher and higher levels of collectivization, from small Mutual Aid Teams to various forms of collective farm and finally giant People's Communes, some embracing thousands of families. At their zenith, the communes were a vehicle for Mao's Great Leap Forward (1958–1960), which assumed that peasants with proper political motivation could sharply raise production of everything from food to steel. Twenty-five thousand communes were hastily organized in four months. Approaching truly communist social organization, this experiment was the biggest, most radical in history.

The political system changed dramatically, to put the leader in direct communication with the public, bypassing established organizations. When Mao's opponents tried to use his failed Great Leap Forward program against him, he parried with renewed radicalism. Considering the CCP unsympathetic now, he promoted a political style designed to weaken the CCP in favor of dominance by the chairman. He began a campaign to emulate ideological study as practiced in the army, tighter censorship (by a central office not run by the party), purges of commune leaders (by central work teams not controlled by the party), and an open break with "revisionist" (no longer really Marx-

ist) Moscow. Cumulatively these initiatives weakened institution building in favor of personal leadership.

1962-1969

The phase from 1962 to 1969 opened with the unfolding of Mao's counterattack, passed through the first three chaotic and often-violent years of the Great Proletarian Cultural Revolution (1966–1969), during which the party actually ceased to function, and ended with the party's first National Congress in thirteen years. None of the specific political innovations of those three years lasted. Rather, their extremes afterward made possible a lurch in the opposite direction.

In contrast to the Great Leap Forward, the Cultural Revolution—especially during its first three years—was urban more than rural and was aimed at political organization more than economics. While party, army, and government were told to stand by passively, student and worker groups with militant names formed, arrested Mao's opponents, humiliated them with public parades and trials, and even commandeered weapons from army barracks to fight opposing groups in the streets. China recalled its foreign diplomats, withdrew from foreign trade, and shut out foreign culture. In addition to being ideological, the Cultural Revolution was strongly nativist.

Mao was seventy-five and suffering from Parkinson's disease when the CCP revived in 1969. At the end, his stature and reputation were as important as his program and strategic maneuvers. The political system almost froze as the chairman of thirty-five years withdrew from day-to-day leadership, but his authority remained uncontested. The pendulum swung left for the last time.

1970-1978

The 1970s continued the tumult with an attempt on Mao's life, followed by reopening of diplomatic relations with the United States. It progressed through Mao's last moves to keep his revolutionary vision alive, his death in 1976, and a two-year "moment" of controlled succession under Chairman Hua Guofeng. It ended with the rise of a leading target of the Cultural Revolution, Deng Xiaoping, in 1978. So heavily personal was Mao's regime that it could not survive him for more than two years.

Under Deng and his supporters, the pendulum swung dramatically to the right. But while locking arms to reject Mao's legacy, Deng and his supporters differed on what to put in its place. Some advocated a return to the Stalinist 1950s before the Great Leap Forward. Others advocated forward-looking experi-

ments with markets and democracy. Popular sentiments reinforced each side. Many people, fearing unemployment and chaos, yearned for effective government, whatever its form. Many others, fearing old-style corruption and privilege, favored legal, market, and democratic reforms. Underneath it all was spreading economic and social complexity that would gradually tilt the balance toward government with expanding individual and associational autonomy.

1979-1989

The 1980s opened with a multipronged reform program to undo Mao's style. Out went ideological study, political campaigns, communes, and party control of every organization (except the army, a hierarchy of its own). In came a private sector, foreign investment, Chinese study abroad, and private hiring of labor (Marx's bedrock objection to capitalism because it treated people as commodities). Only politics were slow to change. Limited proposals for more democracy, freedom, and rule of law were voiced but stifled. A two-month occupation of Tiananmen Square in Beijing, outside the top leaders' compound, by student demonstrators campaigning for these proposals ended violently. The shooting of hundreds of demonstrators near the square on 4 June 1989 silenced the immediate protest but made reform of such authority a virtual necessity for the next generation.

1990-2002

At the twentieth century's end, China's political system was pushed by necessity more than it was pulled by design. Although the leaders remained unchallenged for office, their hold on power was in danger of eroding. China's authoritarian state had entered a period of gridlock and reactive evolution. The possibility of decisive restructuring toward any form of democracy seemed remote.

Today elite figures who prefer the pre-Great Leap Forward era are a voice for control, order, and planning. They have succeeded at that style of politics, trust it, and feel secure as long as it prevails. Their public is unemployed, economically insecure, or simply most comfortable with socialism and a paternalistic state.

Elite figures who prefer more law, markets, and democracy are a voice for reform. They mostly want China to grow strong and prosperous, and they observe the strongest and most prosperous nations to be capitalist democracies. Their public finds opportunity in the expanding private sector and a more narrowly defined role for government.

Lifting prospects of the reform side are trends that naturally make Chinese society more complex and hence less amenable to political interference. Markets rely on one another and on private banking, insurance, and law. Foreign investors expect internationally agreed commercial rules to apply. China's thriving private firms far outperform state-owned firms; a government wary of high unemployment and attendant crime and social unrest badly needs these private contributions. Young Chinese educated abroad introduce competitive innovations that their elders only dimly comprehend. Satellite communications and the Internet, both mushrooming all over China, bring information that no official censor can delete.

Eerily like the empire of old, authoritarian one-party rule in China may continue only insofar as it learns to live with these irrepressible social developments. If it tries to stifle them, most likely it will be discarded.

Institutions: Shrinking Scope, Growing Importance

The Chinese political system still has a leader, although he is less dominant than previously. The CCP continues to dominate, although a challenging party probably is not far away, given China's growing freedom. A few senior factional leaders still control the dominant party. The system remains hierarchical and formally centralized, although it is losing some control to increasingly active provinces. Actual federalism, though, as with other limits on central authority, remains elusive. State ideology is all but dead. The formerly rubber-stamp National People's Congress is beginning to assert a more standard, autonomous legislative role. And leaders are beginning to accept constitutional term limits.

The People's Liberation Army (PLA)—embracing air, land, naval, and strategic forces totaling at least 2.5 million, the world's largest military—seems destined to fall into line, although it remains unusually free of civilian authority and even has its own stake in the new economy. The leadership has made it a priority to ease the PLA out of the civilian economy. The stage is set for younger leaders to replace retiring senior generals by 2003. And public discussion of military doctrine is increasingly focused on high-tech modernization. Reining in the military may prove to be the most enduring legacy of Jiang Zemin—general secretary of the CCP (1992–2002), president (1993–2003), and chairman of the Central Military Commission (1992–present). How China evolves is actually part of a much larger story that matches relative political values deriving from various national cultures'

own historical experiences against political values stemming from the universal philosophical appeal of democracy.

CHINA POPULATION RESETTLEMENT

Compared with Westerners, the Chinese are relatively immobile. China's 1990 census and sample surveys during the 1990s estimated that on average less than 1 percent of the Chinese population move to another city or county each year. Even after taking into account migrants missed by the criteria used in these sources, the mobility of the Chinese is still far lower than that in Western societies. Until the 1980s, China was an overwhelmingly agricultural nation whose sedentary, family-centered production system discouraged mobility; when large-scale population movements did occur, they were usually caused by natural disasters or wars. The varieties, processes, and outcomes of population relocations that have occurred since the 1980s are useful lenses through which one can gauge the tremendous political, social, and economic transformations China has experienced.

Historical Population Relocations

For thousands of years the dominant form of population movement in China was that of peasants searching for new arable land. As they left the middle region and delta of the Yellow River—the cradles and

origins of Chinese civilization—they shifted the nation's political and economic center of gravity toward the south. During the Han dynasty (202 BCE–220 CE), the vast majority of the Chinese population resided north of the Chang (Yangtze) River. By the Tang dynasty (618–907 CE), the Chang River Delta and Sichuan (in western China) had emerged as new centers of settlement; by the Ming dynasty (1368–1644) the Chang River Delta had become the most densely populated area in.

The southward movements of population were further accelerated by political turmoil and invasions from the north. Invasions by the Xiongnu and other "barbarians" during the Wei, Jin, and Northern and Southern dynasties (220–581), rebellions at the end of the Tang dynasty, and invasions by the Jin at the end of the Northern Song dynasty (960–1126), for example, all triggered large-scale population relocations toward southern China.

Government-Initiated Population Relocations Since 1949

The government of the People's Republic of China that was founded in 1949 has repeatedly initiated "planned" population relocations to achieve specific policy objectives. In the early 1950s, the government sent troops, farmers, and youths to northwestern and northeastern border areas such as Xinjiang and Heilongjiang, where they were to reclaim so-called wastelands and set up state farms. That would achieve the dual objectives of consolidating ethnic Han Chinese control over border areas and accelerating the economic development of those regions. Similarly, national security concerns motivated the government to relocate industries and personnel to "Third Front" inland regions during the 1950s and 1960s, driven by the rationale that coastal areas were too vulnerable during times of war.

Between the late 1960s and mid-1970s millions of educated youths were forced to leave urban areas and go "up to the mountains and down to the countryside" (*xiangshan xiaxiang*) to be reeducated by farmers. This rustication movement was a product of the Cultural Revolution; the young people were joined out in the countryside by the politically persecuted and counterrevolutionaries. After the end of the Cultural Revolution in 1976, however, the majority of these victims of forced relocation were able to return to where they had come from.

Government-initiated relocations since the 1980s have been mainly oriented toward economic development objectives. For example, poverty-alleviation pro-

grams have relocated hundreds of thousands of people from resource-poor areas to locations in more favorable environments. In addition, the construction of the Three Gorges Dam that began in the late 1990s necessitates the relocation of over a million people, mostly to newly constructed towns and communities near their original homes.

Household Registration, Mobility Control, and Self-Initiated Migrations

A hallmark of the Chinese centrally planned economy is the household registration (*hukou*) system, established in the late 1950s and still functioning as a means of state control in the late 1990s. Every person in China has a *hukou* that indicates where he/she legitimately dwells. During the 1960s and 1970s, *hukou* entitled individuals to rationed food and clothing. Three decades later, a local *hukou* is still essential for obtaining subsidized benefits such as housing, schooling, and health care. It is extremely difficult for peasants to obtain urban *hukou* or to transfer their *hukou* to urban areas, thus making their survival in urban areas almost impossible. For decades, then, the *hukou* system served as an effective damper on self-initiated, rural-urban migrations and divided China into two separate entities, one rural and one urban. At the same time, until the 1990s the government was the main agent of labor allocation, via job assignments to graduates and job transfers for state employees. Government-sponsored work-related relocations are typically accompanied by *hukou* transfers that legitimize the migrants' residence in the new location.

From the 1980s, strong push forces in the countryside and new pull forces in urban areas have compelled the government to relax migration control. The mammoth rural labor surplus, estimated as up to one-sixth of the population, urgently needed to be absorbed outside of agriculture. At the same time, economic reforms induced foreign investment and encouraged urban consumption and services, both demanding cheap labor. In response, the government invented a variety of new permits and *hukou* statuses to facilitate the temporary migration of peasants, unleashing a floating population estimated to be anywhere between 20 million and 100 million by the mid-1990s. Marketization, decollectivization, and decentralization further undermined the state's role in labor allocation and engendered the emergence of labor markets in China. But the labor market is highly gendered and segmented. Young single peasant women are sought after, but upon marriage and childbirth most women stay in the villages to farm while their husbands may continue to engage in migrant

work. In urban areas, peasant migrants are relegated to the bottom rungs and are generally blocked from prestigious and high-paying jobs.

Unlike the first three decades of the People's Republic, post-Mao China is marked by population relocations primarily from inland to coastal regions, high rates of rural-urban migration, increasing prominence of self-initiated moves that rely heavily on social networks, and in general a greater heterogeneity of migration types. But rural-rural migration continues to be important, especially since marriage migration remains the leading reason for female migration in China. The enormity of the population relocations, in conjunction with the legacies of social institutions such as the *hukou* system, have fostered new thoughts and debates on the social and economic implications of migration. Topics under discussion include the emergence of new social classes in Chinese cities, segmentation of the labor market, the impact of migrants on urban services, gendered division of labor in peasant households, and the feminization of agriculture.

Survey of Asia's Regions and Nations

The *Encyclopedia of Modern Asia* covers thirty-three nations in depth and also the Caucasus and Siberia. We have divided Asia into five major subregions and assigned the thirty-three nations to each.

West and Southwest Asia

The West Asian nations covered in detail here are Turkey, Iran, and Iraq. Afghanistan and Pakistan form Southwest Asia, although in some classifications they are placed in Central and South Asia, respectively. Afghanistan, on the crossroads of civilizations for thousands of years, is especially difficult to classify and displays features typical of Central, West, and South Asia.

Despite diversity in language (Persian in Iran, Arabic in Iraq, Turkish in Turkey) form of government (theocracy in Iran, dictatorship in Iraq, and unstable democracy in Turkey) and international ties (Iran to the Islamic world, Iraq to the Arab Middle East, Turkey to the West), there are several sources of unity across West Asia. Perhaps the oldest is geographical location as the site of transportation routes between Europe and Central, East, and South Asia. Since ancient times, people, goods, wealth, and ideas have flowed across the region. In 2002 the flow of oil was most important, from the wells of Iran and Iraq through the pipelines of Turkey. Another source of unity is Sunni Islam, a major feature of life since the seventh century, although Iran is mainly the minority Shi'a tradition and there have long been Zoroastrian, Jewish, Christian, and Baha'i minorities in the region. Diversity is also evident in the fact that Turkey is a "secular" state while Iran is a theocracy, and in the conflict between fundamentalist and mainstream Islam in all the nations.

Another important common thread is the shared historical experience of being part of the Ottoman Empire and having to cope with British and Russian designs on their territory and, more recently, American influence. And, in the twentieth century, all three nations have sought to deal with the Kurdish minority and its demands for a Kurdish state to be established on land taken from all three nations.

Unity across Afghanistan and Pakistan is created by adherence to Sunni Islam (although there is a Shi'ite minority in Afghanistan) and the prominence of the Pash-tun ethnic group in each nation. Both nations also experienced British colonialism, although the long-term British influence is more notable in Pakistan, which had been

tied to India under British rule. West Asia is the only region in the world never colonized by Britain, although some experts argue that it did experience significant British cultural influence. In all nations resistance to external control—British, Russian, or United States—is another common historical experience.

Across the region (although less so in Afghanistan) is the stark contrast between the traditional culture and the modernity of liberation from imperial rule, still not complete across the region. This contrast is apparent in clothing styles, manners, architecture, recreation, marriage practices, and many elements of daily life.

In 2002 all the nations faced a water crisis of both too little water and water pollution. They all also faced issues of economic and social development, including reducing external debt, controlling inflation, reducing unemployment, improving education and health care, and continually reacting to the ongoing Arab-Israeli conflict, which exacerbates many of these problems. The governments also faced the difficult task of solving these problems while resisting Americanization and also while controlling internal political unrest. Political unrest is often tied to efforts at creating democratic governments and the persistence of elite collaboration with tyrannical governments.

Central Asia

Central Asia is known by many names, including Eurasia, Middle Asia, and Inner Asia. At its core, the region is composed of five states that became independent nations following the collapse of the Soviet Union in 1991: Kazakhstan, Kyrgyzstan, Tajikistan, Turkmenistan, and Uzbekistan. Scholars sometimes include Afghanistan, Mongolia and the Xinjiang province of China within the label Central Asia. For this project, Central Asia is restricted to the five former Soviet countries, while Afghanistan is classified in Southwest Asia, and Mongolia and Xinjiang as part of East Asia. These states have a shared landmass of 1.5 million square miles, about one-half the size of the United States.

The region's unity comes from a shared history and religion. Central Asia saw two cultural and economic traditions blossom and intermix along the famed Silk Road: nomadic and sedentary. Nomadic herdsman, organized into kinship groupings of clans, lived beside sedentary farmers and oasis city dwellers. Four of the countries share Turkic roots, while the Tajiks are of Indo-European descent, linguistically related to the Iranians. While still recognizable today, this shared heritage has developed into distinct ethnic communities.

The peoples of Central Asia have seen centuries of invasion, notably the legendary Mongol leader Genghis Khan in the thirteenth century, the Russians in the nineteenth and the Soviets in the twentieth century. For better or worse, each invader left behind markers of their presence: the Arabs introduced Islam in the seventh century. Today Islam is the predominant religion in the region, and most Central Asians are Sunni Muslims. The Russians brought the mixed legacy of modernism, including an educated populace, alarming infant mortality rates, strong economic and political participation by women, high agricultural development, and environmental disasters such as the shrinking of the Aral Sea. It was under Russian colonialism that distinct ethno-national boundaries were created to divide the people of the region. These divisions largely shape the contemporary Central Asian landscape.

Today the five Central Asian nations face similar challenges: building robust economies, developing stable, democratic governments, and integrating themselves into the regional and international communities as independent states. They come to these challenges with varied resources: Kazakhstan and Turkmenistan have rich oil reserves; several countries have extensive mineral deposits; and the Fergana Valley is but one example of the region's rich agricultural regions.

Finally, the tragic events of September 11, 2001, cast world attention on Afghanistan's neighbors in Central Asia. The "war on terrorism" forged new alliances and offered a mix of political pressure and economic support for the nations' leaders to suppress their countries' internal fundamentalist Muslim movements.

Southeast Asia

Southeast Asia is conventionally defined as that subregion of Asia consisting of the eleven nation-states of Brunei, Cambodia, East Timor, Indonesia, Laos, Malaysia, Myanmar, Philippines, Singapore, Thailand, and Vietnam. Myanmar is sometimes alternatively classified as part of South Asia and Vietnam as in East Asia. The region may be subdivided into Mainland Southeast Asia (Cambodia, Laos, Myanmar, Thailand, and Vietnam) and Insular Southeast Asia (Brunei, East Timor, Indonesia, Philippines, and Singapore). Malaysia is the one nation in the region that is located both on the mainland and islands, though ethnically it is more linked to the island nations of Indonesia, Brunei, and the Philippines.

Perhaps the key defining features for the region and those that are most widespread are the tropical monsoon climate, rich natural resources, and a way of life in rural areas based on cooperative wet-rice agriculture that goes back several thousand years. In the past unity was also created in various places by major civilizations, including those of Funan, Angkor, Pagan, Sukhothai, Majapahit, Srivijaya, Champa, Ayutthaya, and Melaka. Monarchies continue to be significant in several nation—Brunei, Cambodia, Malaysia, and Thailand—today. Subregional unity has also been created since ancient times by the continued use of written languages, including Vietnamese, Thai, Lao, Khmer and the rich literary traditions associated with those languages.

The region can also be defined as being located between China and India and has been influenced by both, with Indian influence generally broader, deeper, and longer lasting, especially on the mainland, except for Vietnam and Singapore, where influences from China have been more important. Islamic influence is also present in all eleven of the Southeast Asian nations. Culturally, Southeast Asia is notable for the central importance of the family, religion (mainly Buddhism and Islam), and aesthetics in daily life and national consciousness.

In the post–World War II Cold War era, there was a lack of regional unity. Some nations, such as Indonesia under Sukarno, were leaders of the nonaligned nations. Countries such as Thailand and the Philippines joined the U.S. side in the Cold War by being part of the Southeast Asia Treaty Organization (SEATO). A move toward greater unity was achieved with the establishment of the Association of Southeast Asian Nations (ASEAN) in 1967, with the founding members being Indonesia, Malaysia, the Philippines, Singapore, and Thailand. Subsequently other Southeast Asian nations joined ASEAN (Brunei, 1984; Laos, Myanmar, and Vietnam 1997; Cambodia 1999). As of 2002, communism was still the system in Laos and Vietnam and capitalism in Brunei, Cambodia, East Timor, the Philippines Thailand, Indonesia, Malaysia and Singapore. Political, economic, and cultural cooperation is fostered by the Association of Southeast Asian Nations (ASEAN), with headquarters in Jakarta, Indonesia. Economically, all the nations have attempted to move, although at different speeds and with different results, from a reliance on agriculture to an industrial or service-based economy. All nations also suffered in the Asian economic crisis beginning in July 1997.

Alongside these sources of similarity or unity that allow us to speak of Southeast Asia as a region is also considerable diversity. In the past religion, ethnicity, and diverse colonial experience (British, Dutch, French, American) were major sources of diversity. Today, the three major sources of diversity are religion, form of government, and level of economic development. Three nations (Indonesia, Malaysia,

Brunei) are predominately Islamic, five are mainly Buddhist (Vietnam, Laos, Cambodia, Thailand, Myanmar), two are mainly Christian (Philippines and East Timor), and Singapore is religiously heterogeneous. In addition, there is religious diversity within nations, as all these nations have sizeable and visible religious minorities and indigenous religions, in both traditional and syncretic forms, also remain important.

In terms of government, there is considerable variation: communism in Vietnam and Laos; state socialism in Myanmar; absolute monarchy in Brunei; evolving democracy in the Philippines, Thailand, Cambodia, and Indonesia; and authoritarian democracy in Malaysia and Singapore. The economic variation that exists among the nations and also across regions within nations is reflected in different levels of urbanization and economic development, with Singapore and Malaysia at one end of the spectrum and Laos and Cambodia at the other. Myanmar is economically underdeveloped, although it is urbanized, while Brunei is one of the wealthiest nations in the world but not very urbanized.

In 2002, Southeast Asia faced major environmental, political, economic, and health issues. All Southeast Asian nations suffer from serious environmental degradation, including water pollution, soil erosion, air pollution in and around cities, traffic congestion, and species extinctions. To a significant extent all these problems are the result of rapid industrial expansion and overexploitation of natural resources for international trade. The economic crisis has hampered efforts to address these issues and has threatened the economies of some nations, making them more dependent on international loans and assistance from nations such as Japan, Australia, and China. The persisting economic disparities between the rich and the poor are actually exacerbated by rapid economic growth. Related to poverty is the AIDS epidemic, which is especially serious in Cambodia, Myanmar, and Thailand and becoming more serious in Vietnam; in all these nations it associated with the commercial sex industry.

Politically, many Southeast Asian nations faced one or more threats to their stability. Political corruption, lack of transparency, and weak civic institutions are a problem to varying degrees in all the nations but are most severe in Indonesia, which faces threats to its sovereignty. Cambodia and Thailand face problems involving monarch succession, and several nations have had difficulty finding effective leaders. Myanmar's authoritarian rulers face a continual threat from the political opposition and from ethnic and religious separatists.

In addition, several nations faced continuing religious or ethnic-based conflicts that disrupt political stability and economic growth in some provinces. The major conflicts involve Muslim separatists in the southern Philippines, Muslims and Christians in some Indonesian islands and Aceh separatists in northern Sumatra, and Muslims and the Karen and other ethnic groups against the Burman government in Myanmar. Since the economic crisis of 1997, ethnic and religion-based conflict has intensified, as wealthier ethnic or religious minorities have increasingly been attacked by members of the dominant ethnic group. A related issue is the cultural and political future of indigenous peoples, including the so-called hill tribes of the mainland and horticulturalists and former hunter-gatherers of the islands.

In looking to the future, among the region's positive features are the following. First, there is Southeast Asia's strategic location between India and China, between Japan and Europe, and between Europe and Oceania. It stands in close proximity to the world's two most populous countries, China and India. Singapore, the centrally located port in Southeast Asia, is one of two major gateways to the dynamic Pacific Basin (the other is the Panama Canal). Second, there is the region's huge population and related economic market, with a total population approaching that of one half of China's. Indonesia is the world's fourth most populous nation. Third, there is enor-

mous tourist potential in sites and recreational locales such as Angkor Wat, Bali, Borobudur, Phuket, and Ha Long Bay. Fourth, there is the region's notable eclecticism in borrowing from the outside and resiliency in transcending tragedies such as experienced by Cambodia and Vietnam. Fifth, there is the region's significant economic potential: Southeast Asia may well have the world's highest-quality labor force relative to cost. And, sixth, there is the region's openness to new technologies and ideas, an important feature in the modern global community.

South Asia

South Asia is the easiest region to demarcate, as it is bounded by the Hindu Kush and Himalayan ranges to the north and the Bay of Bengal and Arabian Sea to the south. It contains the nation-states of Bangladesh, Bhutan, India, Nepal, and Sri Lanka and the more distant island nations of the Maldives and Mauritius. Myanmar and Pakistan, which are considered part of South Asia in some schemes, are here classified in Southeast Asia and Southwest Asia, respectively.

While the region is diverse economically, culturally, linguistically, and religiously, there is unity that, in some form, has existed for several thousand years. One source of unity is the historical influence of two major civilizations (Indus and Dravidian) and three major religions (Hinduism, Buddhism, and Islam). Regionally, Sikhism and Jainism have been of great importance. There is also considerable economic unity, as the majority of people continue to live by farming, with rice and especially wet-rice the primary crop. In addition, three-quarters of the people continue to live in rural, agricultural villages, although this has now become an important source of diversity, with clear distinctions between urban and rural life. A third source of unity is the caste system, which continues to define life for most people in the three mainland nations. Another source of unity is the nature and structure of society, which was heavily influenced by the several centuries of British rule. A final source of political unity in the twentieth century—although sometimes weakened by ethnic and religious differences—has been nationalism in each nation.

South Asia is diverse linguistically, ethnically, religiously, and economically. This diversity is most obvious in India, but exists in various forms in other nations, except for the isolated Maldives, which is the home of one ethnic group, the Divehi, who are Muslims and who have an economy based largely on tourism and fishing.

The dozens of languages of South Asia fall into four major families: Indo-European, Austroasiatic, Dravidian, and Tibeto-Burman and several cannot be classified at all. Because of its linguistic diversity, India is divided into "linguistic" states with Hindi and English serving as the national languages.

Hinduism is the dominant religion in South Asia, but India is the home also to Buddhism, Jainism, and Sikhism. India also has over 120 million Muslims and the world's largest Zoroastrian population (known in India as Parsis) and Bangladesh is a predominately Muslim nation. India also has about twenty-five million Christians and until recently India had several small but thriving Jewish communities. Nepal is mainly Hindu with a Buddhist minority, and Bhutan the reverse. Sri Lanka is mainly Theravada Buddhist with Hindu, Muslim, and Christian minorities. Mauritius, which has no indigenous population, is about 50 percent Hindu, with a large Christian and smaller Muslim and Buddhist minorities.

Linguistic and religious diversity is more than matched by social diversity. One classification suggests that the sociocultural groups of South Asia can be divided into four general and several subcategories: (1) castes (Hindu and Muslim); (2) modern urban classes (including laborers, non-Hindus, and the Westernized elite); (3) hill tribes of at least six types; and (4) peripatetics.

Economically, there are major distinctions between the rural poor and the urban middle class and elite, and also between the urban poor and urban middle class and elite. There are also significant wealth distinctions based on caste and gender, and a sizeable and wealthy Indian diaspora. There is political diversity as well, with India and Sri Lanka being democracies, Bangladesh shifting back and forth between Islamic democracy and military rule, the Maldives being an Islamic state, and Nepal and Bhutan being constitutional monarchies.

In 2002, South Asia faced several categories of issues. Among the most serious are the ongoing ethnic and religious conflicts between Muslims and Hindus in India, the conflict between the nations of Pakistan and India; the ethnic conflict between the Sinhalese and Sri Lankan Tamils in Sri Lanka; and the conflict between the Nepalese and Bhutanese in both nations. There are also various ethnic separatist movements in the region, as involving some Sikhs in India. The most threatening to order in the region and beyond is the conflict between India and Pakistan over the Kashmir region, as both have nuclear weapons and armies gathered at their respective borders.

A second serious issue is the host of related environmental problems, including pollution; limited water resources; overexploitation of natural resources; destruction and death caused by typhoons, flooding, and earthquakes; famine (less of a problem today), and epidemics of tropical and other diseases. The Maldives faces the unique problem of disappearing into the sea as global warming melts glaciers and raises the sea level. Coastal regions of Bangladesh could also suffer from this.

There are pressing social, economic, and political issues as well. Socially, there are wide and growing gaps between the rich and middle classes and the poor, who are disproportionately women and children and rural. Tribal peoples and untouchables still do not enjoy full civil rights, and women are often discriminated against, although India, Sri Lanka, and Bangladesh have all had women prime ministers. Economically, all the nations continue to wrestle with the issues involved in transforming themselves from mainly rural, agricultural nations to ones with strong industrial and service sectors. Politically, all still also struggle with the task of establishing strong, central governments that can control ethnic, religious, and region variation and provide services to the entire population. Despite these difficulties, there are also positive developments. India continues to benefit from the inflow of wealth earned by Indians outside India and is emerging as a major technological center. And, in Sri Lanka, an early 2002 cease-fire has led to the prospect of a series of peace negotiations in the near future..

East Asia

East Asia is defined here as the nations of Japan, South Korea, North Korea, China, Taiwan, and Mongolia. It should be noted that Taiwan is part of China although the People's Republic of China and the Republic of China (Taiwan) differ over whether it is a province or not. The inclusion of China in East Asia is not entirely geographically and culturally valid, as parts of southern China could be classified as Southeast Asian from a geographical and cultural standpoint, while western China could be classified as Central Asian. However, there is a long tradition of classifying China as part of East Asia, and that is the approach taken here. Likewise, Mongolia is sometimes classified in Central Asia. As noted above, Siberia can be considered as forming North and Northeast Asia.

Economic, political, ideological, and social similarity across China, Korea (North and South), and Japan is the result of several thousand years of Chinese influence (at times strong, at other times weak), which has created considerable similarity on a base of pre-existing Japanese and Korean cultures and civilizations. China's influence was

greatest before the modern period and Chinese culture thus in some ways forms the core of East Asian culture and society. At the same time, it must be stressed that Chinese cultural elements merged with existing and new Korean and Japanese ones in ways that produced the unique Japanese and Korean cultures and civilizations, which deserve consideration in their own right.

Among the major cultural elements brought from China were Buddhism and Confucianism, the written language, government bureaucracy, various techniques of rice agriculture, and a patrilineal kinship system based on male dominance and male control of family resources. All of these were shaped over the centuries to fit with existing or developing forms in Korea and Japan. For example, Buddhism coexists with Shinto in Japan. In Korea, it coexists with the indigenous shamanistic religion. In China and Korea traditional folk religion remains strong, while Japan has been the home to dozens of new indigenous religions over the past 150 years.

Diversity in the region has been largely a product of continuing efforts by the Japanese and Koreans to resist Chinese influence and develop and stress Japanese and Korean culture and civilization. In the twentieth century diversity was mainly political and economic. Japanese invasions and conquests of parts of China and all of Korea beginning in the late nineteenth century led to hostile relations that had not been completely overcome in 2002.

In the post-World War II era and after, Taiwan, Japan, and South Korea have been closely allied with the United States and the West; they have all developed powerful industrial and postindustrial economies. During the same period, China became a Communist state; significant ties to the West and economic development did not begin until the late 1980s. North Korea is also a Communist state; it lags behind the other nations in economic development and in recent years has not been able to produce enough food to feed its population. In 2002 China was the emerging economic power in the region, while Taiwan and South Korea hold on and Japan shows signs of serious and long-term economic decline, although it remains the second-largest (after the United States) economy in the world. Mongolia, freed from Soviet rule, is attempting to build its economy following a capitalist model.

Politically, China remains a Communist state despite significant moves toward market capitalism, North Korea is a Communist dictatorship, Japan a democracy, and South Korea and Taiwan in 1990s seem to have become relatively stable democracies following periods of authoritarian rule. Significant contact among the nations is mainly economic, as efforts at forging closer political ties remain stalled over past grievances. For example, in 2001, people in China and South Korea protested publicly about a new Japanese high school history textbook that they believed did not fully describe Japanese atrocities committed toward Chinese and Koreans before and during World War II. Japan has refused to revise the textbook. Similarly, tension remains between Mongolia and China over Mongolian fears about Chinese designs on Mongolian territory. Inner Mongolia is a province of China.

Major issues with regional and broader implications are the reunification of Taiwan and China and North and South Korea, and threat of war should reunification efforts go awry. Other major regional issues include environmental pollution, including air pollution from China that spreads east, and pollution of the Yellow Sea, Taiwan Strait, and South China Sea. A third issue is economic development and stability, and the role of each nation, and the region as a unit, in the growing global economy. A final major issue is the emergence of China as a major world political, economic, and military power at the expense of Taiwan, South Korea, and Japan, and the consequences for regional political relations and stability.

Overview

As the above survey indicates, Asia is a varied and dynamic construct. To some extent the notion of Asia, as well as regions within Asia, are artificial constructs imposed by outside observers to provide some structure to a place and subject matter that might otherwise be incomprehensible. The nations of Asia have rich and deep pasts that continue to inform and shape the present—and that play a significant role in relations with other nations and regions. The nations of Asia also face considerable issues—some unique to the region, others shared by nations around the world—as well as enormous potential for future growth and development. We expect that the next edition of this encyclopedia will portray a very different Asia than does this one, but still an Asia that is in many ways in harmony with its pasts.

David Levinson (with contributions from Virginia Aksan, Edward Beauchamp, Anthony and Rebecca Bichel, Linsun Cheng, Gerald Fry, Bruce Fulton, and Paul Hockings)

CHINA–INDIA RELATIONS As ancient civilizations, China and India coexisted in peace and harmony for millennia. However, as postcolonial modern nation-states, with the exception of a very short period of bonhomie in the early 1950s, relations between the two Asian giants have been marked by conflict, containment, mutual suspicion, distrust, and rivalry. Just as the Indian subcontinental plate has a tendency to constantly rub and push against the Eurasian tectonic plate, causing friction and volatility in the entire Himalayan mountain range, India’s bilateral relationship with China also remains volatile and friction- and tension-ridden.

Past Perfect: Ancient Civilizations

China and India are two of the world’s oldest civilizations, each with the quality of resilience that has enabled it to survive and prosper through the ages and against the odds. During the past three thousand years, every one of the Asian countries—some situated on the continental landmass, others being islands off the Asia mainland—has at some stage been directly influenced by one or both of these two great civilizations.

Both have long, rich strategic traditions: Kautilya’s *Arthashastra*—a treatise on war, diplomacy, statecraft and empire—in India and Sunzi’s (Sun Tzu’s) fourth-century BCE treatise, *Sunzi bingfa* (The Art of War) in China were written over two thousand years ago. The traditional Chinese concept of international relations was based on concentric circles from the imperial capital outward through variously dependent states to the barbarians. It bears remarkable resemblance to the Indian concept of *mandala*, or circles, as outlined in

Arthashastra, which postulated that a king’s neighbor is his natural enemy, while the king beyond his neighbor is his natural ally. The Chinese dynasties followed a similar policy of encircling and attacking nearby neighbors and maintaining friendly relations with more distant kingdoms (*yuan jiao jin gong*). Much like imperial China, tribute, homage, subservience, and not annexation were the rightful fruits of victory in ancient India.

Political contacts between ancient China and India were few and far between. In the cultural sphere, it was mostly a one-way street—from India to China: Hindu and Buddhist religious and cultural influence spread to China through Central Asia, and Chinese scholars were sent to Indian universities at Nalanda and Taxilla. Though Chinese and Indian civilizations reacted to one another during the first few centuries of the Christian era, the process of religious-cultural interaction on any significant scale ceased after about the tenth century CE. Since then, the two countries lived as if they were oblivious to each other’s existence for over a thousand years, until about the advent of the nineteenth century, when both came under the influence of European powers.

Before the age of European colonization, China accounted for about 33 percent of the world’s manufactured goods and India for about 25 percent. China under the Song dynasty (960–1267) was the world’s superpower. Under the Mughals (1526–1857), India’s economic, military, and cultural prowess also was an object of envy. Then in a complete reversal of fortune, the mighty Asian civilizations declined, decayed, and disintegrated and were eventually conquered by European powers.

Present Imperfect: From Civilizations to Nation-States

The gradual westward expansion over the centuries extended China's influence over Tibet and parts of Central Asia (now Xinjiang Province). In contrast, India's boundaries shrank following the 1947 partition that broke up the strategic unity of the subcontinent going back two thousand years to the first Mauryan empire. Then came the Chinese occupation of Tibet in 1950, as a result of which the two nations for the first time came in close physical contact and clashed. India's partition in 1947 and the Chinese occupation of Tibet in 1950 have allowed China to extend its reach and influence into a region where it had, in terms of history and civilization, previously exercised no influence at all.

China-India relations have been tense ever since a border dispute became a full-scale war in 1962. Several rounds of talks since 1981 have failed to resolve the disputed claims. Agreements on maintaining peace and tranquility on the disputed border were signed in 1993 and 1996. However, the prospects of a negotiated settlement of the Sino-Indian border dispute in the near future seem as remote as ever for the simple reason that China cannot brush aside its ally Pakistan's interests in such a settlement. This was not the case with the settlement of China's territorial boundaries with Russia or Vietnam. A resolution of the Sino-Indian border dispute would lead to the deployment of India's mountain divisions and other military assets on the India-Pakistan border, thereby tilting the military balance decisively in India's favor and much to Pakistan's disadvantage. This would deprive Beijing of powerful leverage in its relations with Pakistan and undermine its old strategy of keeping India under strategic pressure on two fronts.

Even if the territorial dispute were resolved, China and India would still retain a competitive relationship in the Asia-Pacific region. Other factors, apart from the territorial dispute, contribute to the fractious and uneasy relationship. These include the nature of China's ties with India's smaller South Asian neighbors (including its arming of them), the legacy of Cold War alignments (Beijing-Islamabad-Washington versus Moscow-New Delhi axis), unrest in Tibet and Kashmir, Chinese encroachments into what India sees as its sphere of influence, Beijing's plans for a naval presence in the Indian Ocean, power asymmetry and a rivalry for the leadership of the developing world, and, more recently, the nuclear and missile proliferation issues.

Since the days of Jawaharlal Nehru (1889-1964), independent India has entertained hopes of a joint Sino-Indian leadership of Asia as a counter to West-

ern influence, but the Chinese have shown no enthusiasm for sharing leadership of Asia with anyone, least of all India. After all, the main objective of China's Asia policy is to prevent the rise of a peer competitor to challenge its status as the Asia-Pacific's sole "Middle Kingdom." As an old Chinese saying goes, "one mountain cannot accommodate two tigers." Checkmated in East Asia by three great powers—Russia, Japan, and the United States—Beijing has long seen South and Southeast Asia as its spheres of influence and India as the main obstacle to achieving its strategic objective of regional supremacy in Asia. Chinese policymakers' preference for a balance of power approach in interstate relations has led them to provide military and political support to those countries that can serve as counterweights to Beijing's perceived enemies and rivals. Recognizing that India has the size, might, numbers, and, above all, the intention to match China, Beijing has long regarded New Delhi as one of its major strategic rivals and has aligned itself with Pakistan to contain the common enemy.

For its part, India has always perceived the Sino-Pakistani nexus as hostile and threatening in nature. As the pivotal power in South Asia, India perceives itself much as China has traditionally perceived itself in relation to East Asia. That the "strategic space" in which India traditionally operated has become increasingly constricted due to Chinese penetration became further evident from Beijing's forays into Myanmar (Burma) and the Bay of Bengal in the 1990s.

India's defense policy has always been based on the principle of "keeping one step ahead of Pakistan and at par with China." Seeing China as the reference point of India's economic, security, and diplomatic policies, India's strategic analysts have long emphasized the need to keep up with China militarily. Initially, India's nuclear capability was aimed solely at deterring China, not Pakistan. It is the adversarial nature of the Sino-Indian relationship that has driven India's and, in turn, Pakistan's nuclear weapons programs. The 1998 Indian nuclear tests were preceded by the Indian defense minister's statements calling China a "bigger potential threat" than Pakistan and describing how his country was being "encircled" by Chinese military activities in Tibet and alliances with Pakistan and Myanmar.

At the heart of Sino-Indian antagonism is the familiar Indian suspicion, which seems to have now matured into a certainty, that China is seeking to deny India its proper stakes in the game of international politics. That China does not want India to emerge as an equal is evident from its opposition to India's membership in the P-5 (UN Security Council), N-5 (Nu-

clear Club), ASEM (Asia-Europe Summit), APEC (Asia-Pacific Economic Cooperation), and G-8 (Group of Eight). Both remain suspicious of each other's long-term agenda and intentions. Interestingly, both are courting the United States to help balance their relationships with each other until they are strong enough to do so on their own. From New Delhi's perspective, Beijing's gradual but subtle penetration deep into the South Asian region in the second half of the twentieth century was primarily at India's expense.

In terms of history and civilization, India never played a second fiddle to China. Therein lies the root cause of volatile and strained relationship. Both China after a century and India after a millennium of decline are keen to assume the great power roles they believe have been made their right in view of their histories and civilizations. When Chinese and Indian elites speak of restoring their country's rightful place in the world, they give expression to a concept of "preeminence" in Asia and the wider world. This concept reflects their perception that as the foundation of regional cultural patterns, their rightful place is at the apex of world hierarchy. Both want a new international status that is commensurate with their size, strength, and potential. They oppose the economic and political dominance of the United States in world affairs. Both yearn for a truly multipolar world that will provide them the space for growth and freedom of action that befits great powers. Each wants to avoid entangling alliance so as to maximize its options and freedom of action. Both have practiced "tilted nonalignment" while preaching independent, nonaligned foreign policies. China and India have already attained the regional power status.

The similarities between the two countries' outlooks, aspirations, policies, and interests are indeed striking, despite their differing political systems. Both identify the present pattern of international relations with a world order designed to perpetuate the world domination of Western powers. Both oppose the status quo: China in terms of territory, power, and influence; India in terms of status, power, and influence. Furthermore, the Chinese Communist Party's national goal of "rich country, strong military" (*fuguo qiangbing*) bears remarkable resemblance to India's ruling Bharatiya Janata Party's slogan of "prosperous and powerful country." Both are focusing on increasing comprehensive national strength on a solid economic-technological base. Both are major competitors for foreign investment, capital, trade, and markets. Both see themselves as newly rising great Asian powers whose time has finally come. Both have attempted to establish a sort of Monroe Doctrine in their neigh-

borhoods without much success. Both are unable to reassert their traditional suzerainty over their smaller neighbors, as any attempt to do so encounters resistance from regional and extraregional powers.

Both China and India claim that their attitude toward their neighbors is essentially benevolent, while making it clear that those neighbors must not make policies or take actions, or allow other nations to take measures in their countries, that each deems to be against its own interest and security. If they do so, China and India are willing to apply pressure in one fashion or another to bring about desired changes. The two also share remarkable similarity in economic outlooks and policies. Both suffer from a siege mentality borne out of their elites' acute consciousness of the divisive tendencies that make their countries' present political unity so fragile. After all, much of Chinese and Indian history is made up of long periods of internal disunity and turmoil, when centrifugal forces brought down even the most powerful empires.

Future Tense

Obviously, China and India's strategic cultures require both to regain the power and status their leaders consider appropriate to their country's size, population, geographical position, and historical heritage. In the power competition game, while China has surged ahead by acquiring economic and military capabilities underpinned by a clear policy to achieve broader strategic objectives, India has been impeded in its power quest by its incessant political instability and economic weakness. The existing asymmetry in international status and power serves Beijing's interests very well; any attempt by India to challenge or undermine China's power and influence or to achieve strategic parity is going to be strongly resisted through a combination of military and diplomatic means.

The traditional Sino-Indian rivalry is now set to acquire a maritime dimension as China seeks to secure the country's oil supply and trade routes through the Indian Ocean to the Strait of Malacca and the South China Sea and thereby further challenge India's power pretensions in the Indian Ocean in the twenty-first century. Beijing is investing heavily in developing the Bandarabbas base in Iran, the Gwadar deep-sea port in Pakistan, and naval bases in Myanmar. This adds to strains generated by differences over Pakistan, Tibet, and nuclear and missile proliferation. Furthermore, Beijing is now concerned that the logic and pull of geopolitics is pushing India, much like Japan, to a strategic alliance with the United States so as to contain China, even though U.S. relations with China have been much warmer in recent years.

For its part, Beijing is also watching with interest economic developments in India, especially its growing prowess in information technology, as the country could emerge as a potential competitor for foreign investment, technology, and markets. If the twenty-first century's first decade indeed turns out to be India's decade (in terms of a rapid increase in its economic and military might), just as the 1990s belonged to China and the 1980s belonged to Japan, Beijing will have to devise new strategies to keep India in check. Rapid power transitions have always been a major cause of instability and conflict in history, particularly when they are accompanied by arms buildups and sudden changes in regional military balances.

Indications are that bilateral relations are likely to remain adversarial for a long time to come. In the short to medium term, neither New Delhi nor Beijing will do anything that destabilizes their bilateral relationship or arouses the suspicions of their smaller Asian neighbors. Their efforts will be aimed at consolidating their power and position while striving to resolve more pressing domestic problems. However, instability in Tibet, coupled with China's military links with Pakistan and Myanmar, will pose a continuing complication in Sino-Indian relations. At the same time, both will continue to monitor closely each other's activities to expand influence and gain advantage in the wider Asian region and will attempt to fill any perceived power vacuum or block the other from doing so. In other words, China-India relations will be marked more by rivalry and competition than cooperation. However, both sides would want to keep the competition as muted as possible for as long as possible.

In the long term, neither Indian nor Chinese defense planners can rule out the possibility of a renewed confrontation over Tibet, Kashmir, Myanmar, or in the Indian Ocean. A Sino-Indian rivalry in southern Asia and the northern Indian Ocean (especially the Malacca Strait) may well be a dominant feature of future Asian geopolitics of the twenty-first century, which could force their neighbors to choose sides. The nature of the rivalry will be determined by how domestic political and economic developments in these two countries affect their power, their outlook on the region and the world, and their foreign and security policies.

There have been numerous occasions in history when China and India were simultaneously weak; there have been occasional moments of simultaneous cultural blossoming. But for more than half a millennium, Asia has not seen the two giants economically and militarily powerful at the same time. That time now seems to be approaching fast, and it is likely to result in significant new geopolitical realignments in

the region. The emergence of China and India as economic giants undoubtedly will throw a huge new weight onto the world's geopolitical balance. New economic prosperity and military strength would reawaken nationalist pride in India, which could bring about a clash with Chinese nationalism.

While they are potential competitors for power and influence in Asia, China and India also share interests in maintaining regional stability (for example, combating the growing Islamic fundamentalist menace), exploiting economic opportunities, maintaining access to energy sources, and enhancing regional cooperation. Cooperation could allow them to balance U.S. influence and increase their negotiating positions with the sole superpower. From only a few hundred million dollars a decade ago, China-India trade has already reached \$3 billion and is poised for a quantum jump as both economies further open up. On economic, environmental, and cultural issues, they may have far more reason to cooperate than to collide. It is possible that economically prosperous and militarily confident China and India will come to terms with each other eventually as their mutual containment policies start yielding diminishing returns. There is little doubt that future relations between the world's two most populous nations are critical to Asian—and global—security. A lasting global and regional security structure cannot be built without finding a place for both China and India.

CHINA–JAPAN PEACE AND FRIENDSHIP TREATY After forty years of antagonism, China and Japan signed the China–Japan Peace and Friendship Treaty in Beijing on 12 August 1978. This treaty represented the turning point of Sino–Japanese relations and the cornerstone of Chinese foreign policy.

The path to the signing was not smooth. After the signing of the 1972 Sino–Japanese Joint Communiqué, in which Japan acknowledged the government in Beijing as China's legitimate government and diplomatic relations were reestablished, the path was opened for a treaty reflecting greater rapprochement. In November 1974, negotiations started, but the treaty was not signed until 1978.

Although it is called a peace treaty, it actually deals with political and economic relations. It reflects the principle of the Sino–Japanese Joint Communiqué and the essential principles of Chinese foreign policy. Article I of the peace treaty contains China's Five Principles of Peaceful Coexistence: mutual respect for sovereignty and territorial integrity, mutual nonaggression, noninterference in each other's internal affairs, equality and mutual benefit, and peaceful coexistence. It does not address the Sino–Japanese territorial dispute over the Diaoyu/Senkaku Islands in the East China Sea. When the China–Japan Peace and Friendship Treaty took effect on 23 October 1978, to celebrate the event, Chinese leader Deng Xiaoping (1904–1997) visited Tokyo and said that the territorial dispute would be left for posterity to settle. It has not been settled.

CHINA–JAPAN RELATIONS Geographically, the distance separating Japan from mainland Asia is 144 kilometers from Korea and almost 770 kilometers from China, a distance sometimes referred to poetically as "a narrow strip of water." In prehistoric times, migrants flowed into Japan across that strip of water, particularly from northeastern Asia and the Korean Peninsula. Recurrent flows via Korea explain why

Japanese and Korean languages are closely related, whereas neither is related linguistically to Chinese. By the seventh and eighth centuries, when Japan's own written records appear, Korea and China had long been culturally sophisticated, settled, and nonexpansionist. The two nations offered Japan rich materials for borrowing, without risk of invasion or interference—a marvelous advantage for island Japan.

Before 600 CE, local Japanese leaders sought relations with Korea and China for access to raw materials (iron for weapons, copper and tin for bronze) and for other benefits. Then, in 645 CE, a wholly Japanese initiative known as the Taika Reforms, modeled on imperial China, catapulted Japan from a regionally fragmented, often warring, and illiterate society to a rapidly centralizing, nonwarring, and literate society. Determined not to fall behind again, Japan maintained trade and other ties with China for most of its later history.

From this point onward, China–Japan relations fundamentally involved the flow of culture and knowledge to Japan from China, at Japanese initiative. In the late nineteenth and early twentieth centuries, that flow was suddenly reversed—to China and from Japan. This was the result of Japan's successful Meiji-period (1868–1912) transformation to defend against threats from the West. By mutual consent at the turn of the century, Japan served as a model and sympathetic helpmate for China. But rather quickly, Japan became entangled in military actions that, at their height from 1931 to 1945, turned Japan into China's deadly enemy. Japan's defeat in World War II and its postwar economic recovery under its 1947 antiwar constitution, along with China's Communist "liberation" after 1949, set the stage for a more balanced and mutually respectful relationship after diplomatic ties were restored in 1972.

Early Relations to 1200 CE

The only extant written records relating to Japan before 600 CE are Chinese records, because Japan lacked a writing system of its own. The *Shiji* (Records of the Grand Historian) by Sima Qian (145?–86? BCE) alludes to a Taoist mystic reportedly sent by China's first emperor, Qin Shi Huangdi (d. 215 BCE), across the "Eastern Sea" to Japan; brief treatments of Japan appear also in histories of the kingdom of Wei (writing completed c. 297 CE), the latter Han dynasty (completed c. 445 CE), the Liu–Song dynasty (completed c. 513 CE), the Sui dynasty (completed c. 630 CE), and the Tang dynasty (completed in the eleventh century). The first native Japanese accounts of early Japan appeared only in 712 and 720 CE, in the landmark volumes *Kojiki* (Records of Ancient Matters) and

Nibongi (Chronicles of Japan). Thereafter, Japan maintained public records employing China's ideographic writing system, the only writing system in East Asia at the time.

Writing, it could be said, was China's first great gift to Japan. Along with writing came Chinese political, social, and economic thought, public administration, literature and poetry, Buddhism, and much more. In all these arenas, Japan proved an eager and tireless student.

China's histories all report that tribal chieftains or "kings" of Wa ("Wa" was the name used for Japan, written using a Chinese character meaning "dwarf") sought relations with Chinese courts and confirmation of their rulership. Such Japanese efforts quickened in the fifth century as regional rulers sought ascendancy over rivals at home. As China itself neared political reunification under the Sui dynasty (581–618) after nearly four hundred years of political division, the now-dominant Yamato court of Japan in 587 came under the sway of the Soga family of pro-Buddhist and procontinental advocates of reforms. Prince Shotoku (574–622) is credited in 603 with adopting China's twelve-rank court system and, in 604, with promulgating the Seventeen-Article Constitution, a landmark set of principles of government infused with Chinese Confucian ideals. He is also credited with adopting the Chinese calendar, a radical step because it altered native notions of time.

The most encompassing of Japan's borrowings and adaptations from China involved reforms initiated in 645, around the new imperial era known as Taika, meaning "Great Transformation." These brought to full form a Chinese-style centralized state system. Used generically for the larger series of reforms culminating in the Taiho Code of 702, the Taika Reforms concentrated on practical matters of state: land nationalization and redistribution—upon which was based a complex system of taxation (all taken directly from Sui and Tang China)—and division of the nation into Chinese-style provinces, districts, and townships. Underlying this radical restructuring were Chinese political principles and ideals. Chinese-style military conscription was also adopted (but was abolished in 792). The Taiho Code of 702 formalized a fully Chinese-style central governmental structure around the Chinese Tang dynasty system of penal laws and administrative and household guidelines, which served as basic elements of Japanese law until after the Meiji Restoration of 1868, when Western models of governance were embraced.

These self-initiated measures were revolutionary in their consequences in the sense that Japan's public life

was radically and permanently restructured. No other large nation in world history has ever so thoroughly transformed itself through voluntary borrowing without the pressure of military threats or actual conquest. On the other hand, it is necessary to point out that elements of China's "core" were rejected by Japan. First, Japan rejected China's worldview of Heaven, Earth, and Man (or human being), a triad interacting to achieve a harmonious whole, in favor of its own primitive founding mythology, which said that the Japanese islands and people were created by sacred spirits, or *kami*. By this claim, Japan privileged itself over its culturally more sophisticated neighbors. Second, Japan rejected China's belief that a Son of Heaven (who acted as intermediary between Heaven, Earth, and Man) earned the Mandate of Heaven, or right to rule (which could be revoked and transferred to a more worthy claimant), through "rule by virtue," or benevolent and morally upright rule. Japan insisted that its imperial line, the Yamato (Sun) line, was divine, eternal, and nontransferable. Third, Japan rejected China's belief in an imperial administration by an "aristocracy of merit," selected increasingly by civil-service examination and open to commoners. Japan held to its idea of a titled and hereditary aristocracy of blood, who alone qualified for appointment to high office. For reasons like these, Japan remained distinctively Japanese despite massive borrowings of Chinese forms.

The intense Japanese interest in China from about 600 to 900 CE is celebrated by Chinese and Japanese alike as a kind of golden age of China-Japan relations. Between 600 and 614, the Japanese court dispatched as many as five diplomatic missions to the Sui court, consisting of scholars, Buddhist monks, and others with orders to report back about Chinese knowledge and institutions. China's short-lived Sui dynasty was followed by the glorious Tang dynasty (618–907). From 630 to 894, the Japanese court sent at least nineteen diplomatic missions to the Tang court.

Courtiers, scholars, and monks featured prominently in the missions, accompanied by physicians, diviners, archers, musicians, craftsmen, and artists. Kibi no Makibi (693–775), a Japanese court official, went to China in 717 as a student, stayed for nineteen years, and brought back texts on Confucianism, Buddhism, astronomy, divination, civil administration, and military organization. During the period 752–754, he went back to China as deputy head of a mission that, on its return, helped the blind Chinese monk Jianzhen (called Ganjin in Japan; 689–763) to reach Japan after having experienced five shipwrecks and other mishaps. Ganjin founded the Japanese Ritsu branch of Buddhism at Nara (imperial capital from 710 to 784) in

754. The Japanese monk Saicho (767–822), of Chinese descent and active at court, was dispatched to China by Emperor Kammu (737–806) in 804 to gain spiritual sanction for a new Buddhist complex on Mount Hiei, near the new imperial capital of Heian (capital from 794 to 1185 and today's Kyoto). In China, Saicho was drawn to Tiantai ("Heaven's Pedestal," called Tendai in Japanese), a syncretic school of Buddhism emphasizing the *Lotus Sutra*, and after returning to Japan in 806 obtained imperial sanction to establish the sect on Mount Hiei, where it flourished.

Fellow monk Kukai (774–835) traveled with Saicho to China in 804 aboard a separate ship. Drawn to the Buddhist master Huiguo (746–805) of the Chinese Zhenyan ("True Words," called Shingon in Japanese) esoteric school of Buddhism, Kukai so impressed Huiguo that Huiguo transmitted his secret teachings to this foreigner rather than to a Chinese disciple. Kukai returned to Japan in 806, held various religious posts, wrote compellingly about Buddhism, and after 823 (as abbot of the great Buddhist temple Toji in the imperial capital of Heian) laid the foundations for Shingon Buddhism, which emerged as the most influential Buddhist school of the Heian period. Partly because of Huiguo's choice of Kukai for his transmission, Zhenyan Buddhism disappeared as a separate sect in China.

The Japanese writing system was an important outcome of this cultural interchange. In China, Kukai had studied Sanskrit, the Indian script in which Buddhist scriptures were sometimes written. Kukai encountered in Sanskrit a syllable-based writing system suitable to the Japanese language, which, like Sanskrit, is multisyllabic with inflected verbs. Chinese, by contrast, is monosyllabic and not inflected. According to tradition, Kukai used the principle of written Sanskrit to invent the Japanese syllabary known as kana, which is still used today.

In 894, the refusal of eminent scholar Sugawara no Michizane (845–903) to lead an embassy to China because of turmoil there brought an end to Japanese diplomatic missions until 1404, more than five hundred years later. The Japanese court continued nonetheless to use Chinese writing for public records; interest remained high in Chinese classical studies, poetry, and the arts; Japanese Buddhist monks traveled to China; and Chinese trading vessels sometimes called at Japanese ports. The truly important story after 900, however, is that Japanese elites used this interlude to digest earlier cultural imports and to find their own path in such areas as women's literature of the court, the warrior tales that followed, and fine arts and crafts, all distinctively Japanese.

Japan's Medieval Period, 1200–1600

The Heian period (794–1185) ended as a result of fighting between factions at court in alliance with provincial military forces. Real power progressively shifted to those military authorities around an emerging system often labeled "feudal." From 1192 to 1868, a series of military governments ruled Japan, sanctioned by the imperial court. Japanese, observing post-Heian developments, looked to Chinese history for precedents and found a comparable Chinese "feudal" system that had existed prior to political unification under the Qin dynasty (221–206 BCE). Japanese proceeded to apply pre-Qin Chinese terminology to post-Heian Japan: The head of the new military government was called shogun (Japanese pronunciation of the Chinese term "*jiangjun*," meaning "general"); the shogunal government was called *bakufu* (Japanese pronunciation of the Chinese term "*mufu*," meaning "tent headquarters" or "field headquarters"); and, later, after 1467, when Japan entered into more than a century of civil war, Japanese called the period Warring States, or Sengoku (1457–1568), the Japanese pronunciation of the Chinese period of history known as Zhan'guo (403–221 BCE).

Although China–Japan relations omitted further diplomatic exchanges until after 1404, China was very much alive in Japanese minds. Japan's first military government, the Kamakura *bakufu* (1192–1333), encouraged private trade with China, which made possible the importation of large quantities of Song-dynasty (960–1279) copper coins that fueled Japan's economy and commerce. Kamakura authorities also patronized a school of Buddhism that appealed strongly to Japan's new class of warriors, the samurai or *bushi*. This was Zen Buddhism—"Zen" being the Japanese pronunciation of the Chinese "Chan" (from the Sanskrit *dhyana*, meaning meditation). As in the past, key Buddhist monks went to China and returned with new teachings. The monk Eisai (1141–1215) went to China twice, first in 1168 and again from 1187 to 1191, where his enlightenment within the Linji (in Japanese, Rinzai) school of Zen Buddhism was certified by Linji master Xu'an. Along with Rinzai Buddhism, Eisai brought back Song China's enthusiasm for tea. He successfully urged both Zen and tea upon the new military government at Kamakura, which sought to distinguish itself from Nara and Heian Buddhism and culture. The monk Dogen (1200–1253), who traced his ancestry back to Heian-period emperors and aristocrats, in 1223 went to China, where he visited numerous monasteries and Buddhist masters in search of new teachings, and returned to Japan five years later to introduce Caodong (in Japanese, Soto), the other major branch of Zen Buddhism. Zen

flourished and fundamentally enriched all aspects of Japanese culture, including the tea ceremony and Zen gardens, minimalist poetry known as haiku, painting, and martial-arts disciplines. Zen's pervasive influence on Japanese culture far surpassed the influence of Chan Buddhism on Chinese culture.

After Kamakura, Japan established its second *bakufu*, or shogunal government, the Ashikaga shogunate (1338–1573). This period coincided with a vigorous Japanese interest in China under the Mongol Yuan (1279–1368) and the Ming (1368–1644) dynasties and a brief Ming interest in the outside world as expressed through its seven maritime expeditions (1405–1433), some of which reached Arab ports and the east coast of Africa. The third Ashikaga shogun, Yoshimitsu (1358–1408), had interests in China going well beyond trade, and it was he who reinstated embassies to China in 1404, followed by five more embassies up to 1410. These were received by China under its paternalistic system of foreign relations known as the tribute system. Japan dispatched eleven more embassies to Ming China between 1433 and 1547.

During the momentous sixteenth century, characterized by civil war and the arrival of Westerners and their guns in the 1540s, Japanese adventurers led ruinous pirate raids on the coasts of Korea and China. In 1592 and 1597, military unifier Toyotomi Hideyoshi (1536–1598) led two devastating campaigns against Korea, the first step of an ambitious plan to conquer China. Chinese recall the Japan of this unhappy era as a precursor to the militaristic Japan of the twentieth century.

Japan's Tokugawa Period (1600/1603–1868)

After full political reunification under the new Tokugawa shogunal government (1600/1603–1868), Japanese authorities gave top priority to imposing social and political controls on all of Japan. To this end, the new government borrowed China's open social-class system of scholar-official, peasant, artisan, and merchant and enforced it upon Japanese society as a closed, castelike, and hereditary system, consisting of samurai-official, peasant, artisan, and merchant. Buddhism was also subjected to strict state control. Replacing Buddhism at the heart of Japanese intellectual life was Chinese Confucianism, a secular system devoted to ideals of social harmony and to the training of loyal administrators for the state. Confucianism for the first time formed Japan's true unifying ideological core and served as the content of education for samurai-officials throughout the Tokugawa period.

During Japan's Warring States period, unregulated foreign trade had been a source of danger and dis-

ruption to the nation, and it, too, was brought under control by two measures. First, in 1639, the Tokugawa authorities forbade the construction of oceangoing vessels and prohibited Japanese to travel abroad on penalty of death. Simultaneously, the government enforced a national policy of restricted foreign access to Japan, referred to by later historians as *sakoku*, or "closed nation," a form of self-isolation. Foreigners themselves were expelled, with the important exception of those Dutch, Chinese, and Koreans having government authorization. Confined to designated living quarters, these foreigners were allowed entry because they transported precious goods to Japan, like books on Confucianism, medical texts, agricultural manuals, and treatises on astronomy and technology. In this way, China—or at least the China of books and of Japanese imaginings—remained very much on Japanese minds. Japan in Chinese minds, by contrast, became increasingly peripheral, in the absence of pirate raids and military aggression. What shattered this system of regulated and limited contact was Britain's Opium War against China, 1839–1842, which alerted Japan to the rise of an outside enemy that demanded a concerted effort at resistance.

Rapid Transformations after 1840

After the Opium War, four major developments framed and conditioned China–Japan relations: Western imperialism of the nineteenth and early twentieth centuries, China's rapid decline in the nineteenth century, Japan's rapid rise after 1868, and the wars, revolutions, and transformations of the twentieth century. The nineteenth century after 1840 was one of the worst periods of China's history. Faced with serious internal problems, China was diverted from these by relentless imperialist pressures, which led to a series of foreign wars: the Opium War, the Arrow Wars of 1856–1858, the Yili War with Russia of 1871–1872, and the Sino-French War over the Indochinese kingdom of Annam in 1884–1885. Japan watched in growing horror as China, the civilization it had long idealized, lost war after war, all the while proclaiming its own moral and cultural superiority. Alarmed further by instability in Korea, a magnet for Chinese, Russian, and Western intervention, Japan finally went to war with China over Korea. China's defeat in the Sino-Japanese War of 1894–1895 was excruciatingly humiliating for China, robbing even the blindest Chinese of any pretense of superiority. Responsible Chinese became consumed with fears for survival in an imperialist world that, alas, would not go away.

It was to Japan that China then turned for the secrets of wealth and power, cautiously at first but after

EXTRACT FROM THE TREATY OF TIENTSIN

The Treaty of Tientsin was signed by China and Japan on 13 September 1871, a time when China's power was declining and Japan's increasing. It was only 24 years later that Japan would defeat China and establish a dominance that would last into World War II.

Article I. Relations of amity shall henceforth be maintained in redoubled force between China and Japan, in measure as boundless as the heaven and the earth. In all that regards the territorial possessions of either country the two Governments shall treat each other with proper courtesy, without the slightest infringement or encroachment on either side, to the end that there may be forevermore peace between them undisturbed.

Article II. Friendly intercourse thus existing between the two Governments, it is the duty of each to sympathise with the other, and in the event of any other nation acting unjustly or treating either of the two Powers with contempt, on notice being given [by the one to the other], mutual assistance shall be rendered or mediation offered for the arrangement of the difficulty, in fulfilment of the duty imposed by relations of friendship.

Article III. The system of government and the penal enactments of the two Governments being different from each other, each shall be allowed to act in entire independence. There shall be no interference offered, nor shall requests for innovations be obtruded. Each shall aid the other in enforcement of the laws, nor shall either allow its subjects to entice the people of the other country to commit acts in violation of the laws.

Article IV. It will be competent for either Government to send Plenipotentiary Ministers, with their families and suites, to reside in the capital of the other, either permanently or from time to time. Their traveling expenses as they pass through the country will be defrayed

by themselves. In the matter of their hiring ground or buildings to serve as Legations, of the passage of their baggage to and fro, of the conveyance of their correspondence by special couriers, and the like, due assistance shall be rendered on either side.

Article V. Although the functionaries of the two Governments have fixed grades, the nature of the offices conferred are different on either side. Officers of equivalent rank will meet and correspond with each other on a footing of equality. When an officer visits a superior, the intercourse between them will be such as is prescribed by the rites of hospitality. For the transaction of public business, the officials of the two countries will address communications to officers of their own rank, who will report in turn to their respective superiors; they will not address the superior officer directly. In visits, cards with the official title of the visitor shall be sent on either side. All officials sent on the part of either Government to the other shall present for inspection a letter bearing an official stamp, in order to guard against false personation.

Article VI. In official correspondence, China will use the Chinese language, and Japan will either use the Japanese language accompanied by a Chinese version, or a Chinese version alone, as may be found on her side preferable.

Article VII. Friendly intercourse having been established between the two Governments, it will behoove them both to appoint certain ports on the seaboard which their merchants will be authorized to frequent for purposes of trade, and to lay down, separately, Regulations of Trade that their respective mercantile communities may abide by in perpetuity.

1901 in a flood. Japan responded generously, out of a sense of cultural indebtedness to China and of new national pride, but also out of a sense of common threat in the face of Western imperialism. For the first time

in its long history, China adopted a policy of sending Chinese students to Japan, to bring back advanced learning. Between 1898 and 1911, 25,000 Chinese students traveled to Japan for all levels of modern

THE TREATY OF SHIMONOSEKI

The Treaty of Peace between China and Japan of 17 April 1895 ended the Sino-Japanese War of 1894–1895. The defeat in the war and the conditions set forth in the treaty extracted below were a humiliation for China and contributed to the long-term mistrust between the two nations.

His Majesty the Emperor of China and His Majesty the Emperor of Japan desiring to restore the blessings of peace to their countries and subjects and to remove all cause for future complications, have named as their Plenipotentiaries for the purpose of concluding a Treaty of peace; that is to say, His Majesty the Emperor of China, Li Hung-chang, Senior Tutor to the Heir Apparent, Senior Grand Secretary of State, Minister Superintendent of Trade for the Northern Ports of China, Viceroy of the Province of Chihli, and Earl of the First Rank, and Li Cing-Long, Ex-Minister to the Diplomatic Service, of the Second Official Rank; and His Majesty the Emperor of Japan, Count Iro Hirobumi, Junii, Grand Cross of the Imperial Order of Paullownia, Minister President of State, and Viscount Mutsu Munemitsu, Junii, First Class of the Imperial Order of the Sacred Treasure, Minister of State for Foreign Affairs; who, after having exchanged their full powers, which were found to be in good and proper form, have agreed to the following Articles:—

Article I. Independence of Korea. China recognizes definitely the full and complete independence and autonomy of Korea, and in consequence the payment of tribute and the performance of ceremonies and formalities by Korea to China, in derogation of such independence and autonomy, shall wholly cease for the future.

Article II. Cession of part of Fengtien Province. China cedes to Japan in perpetuity and full sovereignty the following territories, together with all fortifications, arsenals, and public property thereon:

(a) The southern portion of the province of Fengtien, within the following boundaries:—

The line of demarcation begins at the mouth of the River Yalu and ascends that stream to the mouth of the River An-ping; from thence

the line runs to Feng-huang; from thence to Haicheng; from thence to Ying-kow, forming a line which describes the southern portion of the territory. The places above named are included in the ceded territory. When the line reaches the River Liao at Ying-kow, it follows the course of that stream to its mouth where it terminates. The mid-channel of the River Liao shall be taken as the line of demarcation.

This cession also includes all islands appertaining or belonging to the province of Fengtien, situated in the eastern portion of the Bay of Liao-tung and in the northern part of the Yellow Sea.

(b) The island of Formosa, together with all islands appertaining or belonging to said island of Formosa.

(c) The Pescadores Group, that is to say, all islands lying between the 119th and 120th degrees of longitude east of Greenwich and the 23rd and 24th degrees of north latitude.

Article III. Delimitation of ceded territory. The alignments of the Frontiers described in the preceding Article and shown on the annexed map, shall be subject to the verification and demarcation on the spot, by a Joint Commission of Delimitation consisting of two or more Chinese and two or more Japanese Delegates to be appointed immediately after the exchange of the ratifications of this Act. In case the boundaries laid down in this act are found to be defective at any point, either on account of topography or in consideration of good administration, it shall also be the duty of the Delimitation Commission to rectify the same.

The Delimitation Commission will enter upon its duties as soon as possible and will bring its labors to a conclusion within the period of one year after appointment.

The alignments laid down in this Act shall, however, be maintained until the rectifications of the Delimitation Commission, if any are made, shall have received the approval of the Governments of China and Japan.

Article IV. War Indemnity to Japan. China agrees to pay to Japan as a war indemnity the sum of 200,000,000 Kuping Taels. The said sum is to be paid in eight installments, The first installment of 50,000,000 Taels to be paid within six months and the second installment of 50,000,000 Taels to be paid within twelve months after the exchange of the ratifications of this Act. The remaining sum to be paid in six equal installments as follows: The first of such equal installments to be paid within two

years; the second within three years; the third within four years; the fourth within five years; the fifth within six years; and the sixth within seven years, after the exchange of the ratifications of this Act. Interest at the rate of 5 per centum per annum shall begin to run on all unpaid portions of the said Indemnity from the date the first installment falls due.

schooling. Some of these students turned against their Manchu-ruled Qing dynasty (1644–1912) and, working with Sun Yat-sen (1866–1925) and other revolutionaries, succeeded in bringing down the dynasty. This brief interlude of good relations was brought to a halt by the Russo-Japanese War of 1904–1905. By this war, Japan acquired vast interests in Manchuria (northeastern China), which shifted Japan's stance from cooperation and support of China to self-serving actions that brought the two into conflict after conflict.

In 1915, Japan presented to the Chinese government of Yuan Shikai (1859–1916) its Twenty-One Demands, which called for the appointment of Japanese advisers to top civilian and military positions. Leaked to the press, these demands triggered an outburst of Chinese nationalist outrage and anti-Japanese sentiment. Under Chinese and international pressure, the most objectionable demands were withdrawn, but Chinese suspicions of Japan persisted.

World War I, which tied down European powers in the West, gave Japan the opportunity to accelerate its trade and involvement in China. China's so-called warlord era of 1917 to 1927 invited even more foreign interference. Growing Japanese militarism at home, accelerated by the world depression of 1929, set Japan on a course of escalating aggression in China: Japanese aggression triggered Chinese resistance, which in turn heightened Japanese demands, which further inflamed Chinese nationalism, until Japan launched its total war against this obstinate nation. More specifically, the Japanese assassination of warlord Zhang Zuolin (1872–1928) of Manchuria in 1928 served as a prelude to the Manchurian Incident of 1931, followed by formation of the puppet state of Manchukuo in 1932; the demilitarization of North China under Japanese pressure in 1933; Japanese-orchestrated efforts to separate the five northern provinces of Hebei,

Chahar, Suiyuan, Shanxi, and Shandong from China in 1935; and finally, on 7 July 1937, the Marco Polo Bridge military clash outside Beijing that precipitated seven years of Japanese military rampage in China. Japan's actions in no small way contributed to undermining the Nationalist government of Chiang Kai-shek (1887–1975), which fell in 1949—a parallel to the years after 1550, when Japanese piracy along the China coast and Hideyoshi's invasions of Korea helped to bring down the Ming dynasty in 1644. The intensity and destructiveness of Japanese aggression of the 1930s and 1940s far exceeded that of the earlier period, however, and in Chinese minds brought China-Japan relations to an all-time low.

Japan lost its war against China and its allies. The Allied Occupation (1945–1952) that followed, under U.S. leadership, was the first foreign occupation of Japan in its entire history. Ironically, China accomplished the reverse of foreign occupation less than five years later: In 1949, China "liberated" itself from foreign control and intervention and expelled most foreigners other than its Soviet Russian allies. Relations between China and Japan after 1949 followed the lead of the United States. Japan established diplomatic relations with the Republic of China on Taiwan under Chiang Kai-shek. Then, in 1972, the surprise visit to China of U.S. president Richard Nixon (1913–1994) and Secretary of State Henry Kissinger cleared the way for Japan to restore diplomatic ties with the People's Republic of China (PRC) under Mao Zedong (1893–1976) in September 1972.

China–Japan Relations since 1972

Since 1972, China has made major shifts in policy, bringing itself increasingly in line with international standards and agreements. The death of Mao Zedong in 1976 brought to an end the Cultural Revolution

Soldiers in China's People's Liberation Army carry wreaths at a memorial ceremony for the 300,000 victims of the 1937 Nanjing massacre by Japanese troops. The ceremony on 14 December 1998 followed a Japanese refusal to provide a written apology for Japanese atrocities. (AFP/CORBIS)

(1966–1976). New policies from 1978 under Deng Xiaoping (1904–1997) emphasized the "four modernizations" in agriculture, industry, science, and defense, accompanied by a commitment to *kaifang*—the policy of opening and reform. In this atmosphere, China-Japan relations have become more balanced and equal than ever before, marked by a resolve to maintain constructive relationships and to work out disagreements.

Providing the framework for relations since 1972 are the Joint Communiqué of the government of Japan and the government of the PRC of 29 September 1972, which affirmed that the government of the PRC is the sole legal government of China, that Taiwan is an inalienable part of China (calling for a peaceful settlement of the Taiwan issue through discussions), and that China-Japan diplomatic relations would be restored as of 29 September 1972, and the Treaty of Peace and Friendship between Japan and the People's Republic of China, signed on 12 August 1978, endorsing economic cooperation and political understanding. On 15 August 1995, Japanese prime minister Murayama Tomiichi (b. 1924) went beyond economics and politics to address officially the touchy subject of Japanese aggression against China, making a personal apology for the actions of Japan during the Sino-Japanese war of the 1930s and 1940s. His 1995 statement has been reaffirmed regularly by subsequent leaders.

Time will tell what effect these repeated apologies have. More notable has been Chinese distrust of Japanese apologies, even as Chinese demand more Japanese bowing and scraping. China plays the "war guilt" card against Japan and has utilized its controlled press to sensationalize outlandish statements by fringe right-wing Japanese elements, while denying any error or shortcoming of its own. Sustained healthy relations are handicapped by such circumstances.

The fact remains that China needs Japan and Japan needs China. Reaffirmation of this truth finds expression in two top-level agreements of 26 November 1998: the Japan-China Joint Declaration on Building a Partnership of Friendship and Cooperation for Peace and Development and the Joint Press Announcement on Strengthening Cooperation between Japan and China toward the Twenty-first Century. Even at low points since 1972, China-Japan relations have been substantial, with Japan usually taking the lead for reasons such as economic gain, security concerns, sense of cultural affinity, curiosity and adventure, war guilt, and feelings of public and international responsibility.

Economic relations have been at the forefront of China-Japan relations since 1949. Before 1978, such relations were surprisingly complex, multilayered, and pluralistic. Trade was relatively substantial and constant as nongovernmental and pro-China trade interests in

Japan found ways to deal directly with China, bypassing official channels constrained by U.S. policies. As a percentage of Japan's world trade, it constituted a modest 2.5 to 3.5 percent, which, however, grew steadily after 1972. By 1985, Japan's exports to China (modern plant and technology, machinery, and petrochemicals) had climbed to about 7 percent of Japan's global export trade, whereas its imports from China (mainly crude oil and coal and, later, textiles) amounted to about 5 percent of Japan's total imports. Japan now ranks as China's largest trading partner, and China as Japan's second-largest, after the United States. To encourage trade liberalization, help manage bilateral economic relations, and resolve trade disputes with China, Japan since 1996 supported China's entry into the World Trade Organization. China achieved full membership in WTO, after fifteen years of negotiations, on 11 December 2001.

Political relations at an official level were meager before the restoration of diplomatic ties in September 1972. Thereafter, Japanese prime ministers (the head of state of Japan) and other high officials have visited China, and Chinese premiers (not the head of state of China, a position held by China's president) and other high officials have visited Japan. In October 1992, no less personages than the emperor and empress of Japan visited China, a first. In early 1993, Jiang Zemin (b. 1926), Chinese president and general secretary of the Communist Party of China, reciprocated in a visit to Japan, also a first for a Chinese head of state. In 1997, when Japanese prime minister Hashimoto Ryutaro (b. 1937) visited China, followed by Chinese premier Li Peng's (b. 1928) visit to Japan, the two nations agreed that every year one of their top leaders should visit the other nation. Annual exchange visits by top leaders of both nations have indeed materialized.

Cultural ties are an arena where attitudes find full expression. Complex sentiments of superiority and inferiority coexist, as assessed by Japanese scholar Ijiri Hidenori:

The Chinese have a superiority complex deriving from their cultural influence in pre-modern history and hatred stemming from Japanese military aggression against China in the modern period, while having an inferiority complex based upon Japan's co-operation in their modernization, and admiration for Japan's advanced economy. On the other hand, the Japanese have an inferiority complex due to their cultural debt to China and the sense of original sin stemming from their past aggression against China, while having a superiority complex based upon their assistance to China's modernization and contempt for China's backwardness.

Howe 1996: 60

These attitudes are part of the cultural baggage of Chinese and Japanese, whose numbers as travelers have exploded. In 1972 only nine thousand Chinese and Japanese traveled between China and Japan; in 1997 that number had risen to well over 1 million—a greater exchange than ever before. Among those were 23,000 Chinese studying in Japan, a figure representing more than 40 percent of all foreign students in Japan. (China began authorizing study and research abroad in 1979.) In the arena of religion, a dynamic Japanese Buddhism is assisting historic centers of Chinese Buddhism, like the home temples of Ganjin and Huiguo, to help Buddhism recover from the hardships, neglect, and attacks of the recent past. Japan is further assisting China at national and local levels to refine modern methods of law and administration and other areas of public life.

Thus, significantly, in matters of trade, diplomacy, study, law and administration, religion, industry, and technology—all areas of importance dating back to Sui and Tang times—relations are very much alive between China and Japan as they enter the new millennium.

CHINA–KOREA RELATIONS It is difficult to overstate the comprehensive influence of traditional China on Korea's cultural development and social

institutions. That influence remained the single dominating feature of Korean culture until as late as the nineteenth century. Four elements of traditional Korean culture have manifested Chinese influence: political culture, popular and court artistic culture, language, and literature.

The long and continuous history of Chinese influence on Korean culture is said to have begun with the Lo-lang Commandery in northwestern Korea (modern P'yongyang province), which was established by the Chinese Han dynasty (206 BCE–220 CE) in 108 BCE. The flourishing commandery led to the sinicization of Korea. Through Lo-lang, the accouterments of the superior Chinese civilization, including advanced techniques in pottery making and iron smelting and an ideographic writing system, were transmitted to the loosely knit Korean tribes. With the Chinese writing system were introduced Chinese notions about statecraft and religion, and with the introduction of iron and bronze tools, the development of agriculture.

Political Culture

It is impossible to understand the traditional cultural affinity between China and Korea without referring to the political culture of Confucianism. The fermentation and development of Confucian ideas and institutions were sustained over the course of Korean dynastic history. Culturally, the Unified Shilla kingdom (668–935) in Korea borrowed extensively from Tang China (618–907) by organizing its central and provincial government administrations, its land and taxation systems, national university, and civil-service examinations along Confucian-Chinese lines.

During the Koryo kingdom (918–1392), Korean social, political, educational, and administrative systems were even more sinicized. The Koryo aristocracy embraced Confucianism for its political precepts and ethical principles and accepted Buddhism for spiritual fulfillment. The later Koryo period saw the decline of Buddhism and the increasing stature of Neo-Confucianism, with a renewed emphasis on the civil-service examination system. Under the Mongol Yuan dynasty (1279–1368) in China, Korea was subject to occasional Mongol political interference but retained its political and cultural identity. Nor did the switch to Manchu Qing vassalage (1644–1912) change the Confucian character of Korean political and civil society. The Manchus themselves relied on the Chinese-run Confucian bureaucracy in China, which they had subjugated politically and militarily but not culturally. Meanwhile, the Choson kingdom (1392–1910) in Korea replaced Buddhism with the Neo-Confucianism of Zhu Xi (Chu Hsi) as the state creed. The essential na-

ture and structure of Sino-Korean cultural relations thus remained intact.

Popular and Court Artistic Culture

From the first major period of Korean art, the Three Kingdoms (c. 57 BCE–668 CE), until the fifteenth century, Buddhism, introduced from China in 372 CE, remained the major source of inspiration in Korean visual art. Architecture, sculpture, and painting of the Koryo dynasty were largely influenced by the style of the Chinese Song dynasty (960–1279). Porcelain making, introduced in the late eleventh century from Zhejiang, China, was transformed by native artisans into a Korean form—kingfisher-colored celadons, which even the Chinese held in high regard.

During the Choson dynasty, Korean arts were influenced by Confucian culture. White porcelain was popular among Koreans for Confucian rites and ancestor worship. In architecture, the Choson court constructed grand buildings in the capital of Seoul, such as the fifteenth-century Kyongbok palace, designed after the Ming dynasty (1368–1644) Chinese prototypes in present-day Beijing. Paintings largely imitated northern Chinese style; professional court artists as well as scholar-gentry painters relied on Chinese themes and conventions. Not until the eighteenth century did distinctively Korean styles emerge.

Chinese music and instruments entered Korea at an early date, and over time Korea developed an extensive repertoire of Chinese-style court music and ritual dance, characterized by slow movements of the shoulders, hands, and neck.

Language

Although Korea has had its own language for several thousand years, its writing system dates only from the mid-fifteenth century; the indigenous Korean script, hangul, was invented in 1443 by King Sejong (1397–1450) during the early Choson dynasty. Most of what is known about the Korean language comes from that period. Information on earlier vocabulary is partly available in vocabularies compiled by the Chinese.

The Korean language borrowed many words from classical Chinese, including most of its technical terms and about 10 percent of its basic nouns, such as *san* (mountain) and *kang* (river). The borrowed words are sometimes written in Chinese characters. It is not known when the Chinese writing system came into widespread use in Korea, but the inscription on a great stele erected to honor the Koguryo king Kwanggaet'o in the early fifth century is the earliest extant historical record written with Chinese characters by Koreans.

Literature

Korean literature was written at first in classical Chinese, then in various transcription (*idu*, *byangch'al*, or *kugyol*) systems using Chinese characters, and finally in hangul. Korean scholars were writing poetry in classical Chinese style by at least the fourth century CE. The introduction of Buddhism and of Chinese characters during the Three Kingdoms period enriched Korean literature and changed the Korean worldview. The Unified Shilla court sent many students to study in Tang China (618–907), and a great body of prose narratives written in classical Chinese resulted from these contacts.

From the institutionalization of civil-service examinations in the mid-tenth century until their abolition in 1894, every educated Korean read Confucian classics and Chinese histories and literature. The Korean upper classes (the *yangban*) were bilingual in a special sense: They spoke Korean but wrote in Chinese. Many of their prose works were set in China, while those written by commoners were set in Korea. The most important literary works often belonged to the Confucianist tradition. Extant literary works indicate that despite the transcription systems, before the twentieth century much Korean literature was written in Chinese rather than in Korean even after the invention of hangul. The prestige of Chinese letters was so great that hangul was scorned by most educated people.

China–Korea Relations Today

Although the number of adherents to Confucianism is small in Korea today, most Korean families still follow its principles, including ancestor worship. In North Korea, ideology and philosophy, along with other forms of religion (shamanism, Buddhism, Taoism, and Ch'ondogyo), have been officially repressed since 1945. In South Korea, however, freedom of religion is constitutionally guaranteed. Although there is no national religion in the south, a significant proportion of the population still adheres to Buddhist beliefs.

Because of the predominance of Confucian culture and institutions, the economic aspect of Sino-Korean relations has not traditionally been most important. This is changing, however, as South Korea in particular and post-Mao China have both been striving to achieve higher levels of economic development. As for North Korea, the dissolution of the Soviet Union in 1991 left China as its only major ally. Yet since 1992, China has been cultivating friendly relations with South Korea as well. This is a far cry from the dictates of Communist ideology and from the days of the Korean War (1950–1953), when the People's Republic of China intervened on the side of North Korea.

That China now seeks good relations with both North and South Korea augurs well for Sino-Korean relations in the twenty-first century.

CHINA–RUSSIA RELATIONS Political and ideological differences deeply embedded in a long history of conflict and territorial disputes have complicated China–Soviet/Russian relations, long before Communist regimes came to power in either China or Russia. Russian Cossacks pushed into Siberia in the seventeenth century as hunters and trappers. In the later 1600s these settlers moved into the Amur River basin to establish agricultural settlements. This expansion of czarist Russia into regions claimed by China's Qing dynasty (1644–1912) eventually resulted in confrontation along the Far Eastern frontier. The two powers concluded the Treaty of Nerchinsk in August 1689, delimiting the Far Eastern sector of the China-Russia boundary in an effort to avoid further conflict. The 1727 Treaty of Burinsk delimited the middle sector (roughly the current Mongolian–Russian boundary).

During China's decline in the nineteenth century, Russia continued to advance into the Far East. Concluded in 1858, the Treaty of Aigun redrew the boundary between the two countries along the Amur and

ESTABLISHING BOUNDARIES

The Treaty of Nipchu (Nerchinsk) of 27 August 1689 sought to establish and maintain peace on the border between China and Russia.

Article I. The river Gorbitza, which joins the Schilka from its left side near the river Tchernaya, is to form the boundary between the two Empires. The boundary from the source of that river to the sea will run along the top of the mountain chain [in which the river rises]. The jurisdiction of the two Empires will be divided in such a way that [the valleys of] all the rivers or streams flowing from the southern slope of these mountains to join the Amur shall belong to the Empire of China, while [the valleys of] all the rivers flowing down from the other [or northern] side of these mountains shall be similarly under the rule of His Majesty the Czar of the Russian Empire. As to [the valleys of] the other rivers which lie between the Russian river Oud and the aforesaid mountains—running near the Amur and extending to the sea—which are now under Chinese rule, the question of the jurisdiction over them is to remain open. On this point the [Russian] Ambassadors are [at present] without explicit instructions from the Czar. Hereafter, when the Ambassadors on both sides shall have returned [? to their respective countries], the Czar and the Emperor of China will decide the question on terms of amity, either by sending Plenipotentiaries or by written correspondence.

Article II. Similarly, the river Argun, which flows into the Amur, will form the frontier along its whole length. All territory on the left bank is to be under the rule of the Emperor of China; all on the right bank will be included in the Empire of the Czar. All habitations on the south side will be transferred to the other.

Article III. The fortified town of Albazin, built by His Majesty the Czar, is to be completely demolished, and the people residing there, with all military and other stores and equipment, are to be moved into Russian territory. Those moved can take all their property with them, and they are not allowed to suffer loss [by detention of any of it].

Article IV. Fugitives [lit., runaways] from either side who may have settled in the other's

country previous to the date of this Treaty may remain. No claims for their rendition will be made on either side. But those who may take refuge in either country after the date of this Treaty of Amity are to be sent without delay to the frontier and at once handed over to the chief local officials.

Article V. It is to be understood by both Governments that from the time when this Treaty of Amity is made, the subjects of either nation, being provided with proper passports, may come and go [across the frontier] on their private business and may carry on commerce [lit., buy and sell].

Article VI. All the differences [lit., quarrels] which may have occurred between the subjects [of each nation] on the frontier up to the date of this Treaty will be forgotten and [claims arising out of them will] not be entertained. But if hereafter any of the subjects [lit., traders or craftsmen] of either nationality pass the frontier [as if] for private [and legitimate] business and [while in the foreign territory] commit crimes of violence to property and life, they are at once to be arrested and sent to the frontier of their own country and handed over to the chief local authority [military], who will inflict on them the death penalty as a punishment of their crimes. Crimes and excesses committed by private people on the frontier must not be made the cause of war and bloodshed by either side. When cases of this kind arise, they are to be reported by [the officers of] the side on which they occur to the Sovereigns of both Powers, for settlement by diplomatic negotiation in an amicable manner.

If the Emperor of China desires to engrave [on stone] the Articles of the above Treaty agreed upon by the Envoys for the determination of the frontier, and to place the same [at certain positions] on the frontier as a record, he is at liberty to do so. Whether this is to be done or not is left entirely to the discretion of His Majesty the Emperor of China.

Ussuri Rivers, but left territory east of the rivers in "joint possession" for future negotiations to settle. Two years later Russia prevailed on China to negotiate the Treaty of Peking (Beijing). This treaty granted the territory between the Amur and Ussuri Rivers and the Sea of Japan to Russia.

Russia also advanced into Central Asia, where China claimed control over the area that is today China's autonomous region of Xinjiang. The 1864 Chuguchak Protocol and the 1881 Treaty of Saint Petersburg (Treaty of Ili) defined generally the boundary between Russian Central Asia and Chinese Central Asia. Following the 1881 treaty, many boundary commissions worked to demarcate precisely the China–Russia boundary in Central Asia. This work was completed, except for one sector in the Pamir Mountains that was delineated by the 1884 Protocol on the Sino–Russian Boundary in Kashgaria (modern Chinese Turkestan, in Xinjiang) but was never demarcated. Russian troops occupied the area in the early 1890s, and the Qing court protested by sending Russia a note stating that it retained its claim to the region even if it did not maintain a garrison there.

Following the Japanese defeat of China in the Sino–Japanese War of 1894–1895, Russia prevailed on a weakened China to grant it the right to build a railroad across Manchuria to Vladivostok, with a southern spur running southward through Manchuria to the Chinese port city of Lushun (Port Arthur), which eventually became Russia's principal naval base in East Asia. Just days before the fall of the Qing dynasty, Russia compelled China to sign the 1911 Qiqihar Treaty, which ceded to Russia several hundred square kilometers near the eastern trijunction of Russia, Mongolia, and China. This legacy of Russian encroachment into regions that the Chinese consider their territory continued to plague China–Russia/Soviet relations until the final decade of the twentieth century.

The Sino–Soviet Alliance of the 1950s

Following the establishment of the People's Republic of China in 1949, China and Russia signed a treaty of friendship and alliance. For the next decade, China followed the Soviet development model, adopting a centrally planned economy with state-owned factories emphasizing heavy industry. Thousands of Russian advisers went to China to train Chinese technicians, and Chinese students were sent to the Soviet Union to study. With time, however, China's growing resentment of Soviet domination, ideological differences between the two countries, and boundary disputes left over from the past sowed the seeds of con-

flict that led to the Sino–Soviet split in 1960, and eventually a border war in 1969.

Territorial Issues in China–Soviet Relations

Following the 1917 October Revolution, the new Soviet government issued the Karakhan Manifestos of 1919 and 1920, which renounced all the treaties concluded by the czarist government with China. However, new boundary treaties were not a high priority in subsequent negotiations, which dealt with the issues of Outer Mongolia and the Chinese Eastern Railway controlled by Russia.

Mao Zedong raised territorial issues in early 1950, while he was in Moscow negotiating the Sino–Soviet alliance. The two nations discussed the status of the Mongolian People's Republic (MPR) during this first Sino–Soviet summit. Mao stated his desire for the eventual reunion of Mongolia with China and raised the boundary issues as well. That the MPR and the Soviet Union were apprehensive about China's ambitions in Mongolia was made clear by Stalin's insistence on a Chinese declaration acknowledging the MPR's independence. Several times during the next ten years China raised the boundary question with the Soviet Union, but in 1960, with the open split in the Sino–Soviet alliance, the boundary dispute became a major source of tension.

As ideological and political tensions escalated between the Soviet Union and China, the Soviets grew concerned that the boundary question had become so salient an issue in Sino–Soviet relations. In May 1963 the Soviet Union proposed holding boundary consultations. At the talks, which began in February 1964, Mao prevented progress toward an agreement when he raised historical issues. He contended that during the czarist period, China had ceded more territory to Russia than to any other imperialist country and that czarist Russia had expanded its borders at the expense of China. Mao stated that the list of "lost" Chinese territory was too long, and the Chinese had not yet "presented their bill" for it. Russia accused China of betraying socialist internationalism, fostering a Maoist personality cult, and adopting radical Maoism. China accused Russia of Soviet imperialism and abandoning Marxism. After this polemical exchange, the two powers made no progress on boundary questions.

During China's Cultural Revolution (1966–1976), the boundary dispute flared up again. In March 1969 a military confrontation at Zhenbao (Damansky) Island in the Ussuri River proved that the boundary dispute could very well be the cause of a larger military conflict. In the wake of the March clashes, tensions

CHINA AND RUSSIA BECOME ALLIES

The Treaty of Friendship, Alliance, and Mutual Assistance between the Union of Soviet Socialist Republics and the People's Republic of China signed on 14 February 1950 formalized cooperative relations between the two nations.

The Presidium of the Supreme Soviet of the Union of Soviet Socialist Republics and the Central People's Government of the People's Republic of China;

Filled with determination jointly to prevent, by the consolidation of friendship and cooperation between the Union of Soviet Socialist Republics and the People's Republic of China, the rebirth of Japanese imperialism and a repetition of aggression on the part of Japan or any other state, which should unite in any form with Japan in acts of aggression;

Imbued with the desire to consolidate lasting peace and universal security in the Far East and throughout the world in conformity with the aims and principles of the United Nations Organization;

Profoundly convinced that the consolidation of good neighborly relations and friendship between the Union of Soviet Socialist Republics and the People's Republic of China meets the fundamental interests of the peoples of the Soviet Union and China;

Resolved for this purpose to conclude the present Treaty and appointed as their plenipotentiary representatives;

The Presidium of the Supreme Soviet of the Union of Soviet Socialist Republics—Andrei Yanuaryevich Vyshinsky, Minister of Foreign Affairs of the Union of Soviet Socialist Republics;

The Central People's Government of the People's Republic of China—Chou En-lai, Prime Minister of the State Administrative Council and Minister of Foreign Affairs of China;

Who, after exchange of their credentials, found in due form and good order, agreed upon the following:

Article I. Both High Contracting Parties undertake jointly to take all the necessary mea-

asures at their disposal for the purpose of preventing a repetition of aggression and violation of peace on the part of Japan or any other state which should unite with Japan, directly or indirectly, in acts of aggression. In the event of one of the High Contracting Parties being attacked by Japan or states allied with it, and thus being involved in a state of war, the other High Contracting Party will immediately render military and other assistance with all the means at its disposal.

The High Contracting Parties also declare their readiness in the spirit of sincere cooperation to participate in all international actions aimed at ensuring peace and security throughout the world, and will do all in their power to achieve the speediest implementation of these tasks.

Article II. Both the High Contracting Parties undertake by means of mutual agreement to strive for the earliest conclusion of a peace treaty with Japan, jointly with the other Powers which were allies during the Second World War.

Article III. Both High Contracting Parties undertake not to conclude any alliance directed against the other High Contracting Party, and not to take part in any coalition or in actions or measures directed against the other High Contracting Party.

Article IV. Both High Contracting Parties will consult each other in regard to all important international problems affecting the common interests of the Soviet Union and China, being guided by the interests of the consolidation of peace and universal security.

Article V. Both the High Contracting Parties undertake, in the spirit of friendship and cooperation and in conformity with the principles of equality, mutual interests, and also mutual respect for the state sovereignty and territorial integrity and non-interference in internal affairs of the other High Contracting Party—to develop and consolidate economic and cultural ties between the Soviet Union and

China, to render each other every possible economic assistance, and to carry out the necessary economic co-operation.

Article VI. The present Treaty comes into force immediately upon its ratification; the exchange of instruments of ratification will take place in Peking.

The present Treaty will be valid for 30 years. If neither of the High Contracting Par-

ties gives notice one year before the expiration of this term of its desire to denounce the Treaty, it shall remain in force for another five years and will be extended in compliance with this rule.

Done in Moscow on February 14, 1950, in two copies, each in the Russian and Chinese languages, both texts having equal force.

also rose along the border in Xinjiang, and during the summer of 1969 several other military incidents occurred. Moscow became increasingly alarmed and even contemplated a preemptive strike against China's nuclear facilities. Both China and the Soviet Union understood the real possibility of escalation and agreed to renew boundary negotiations.

Boundary Settlement

During the 1970s and early 1980s the two countries made no progress toward a boundary settlement. However, with the rise of Mikhail Gorbachev in the mid-1980s, Chinese-Soviet relations began to improve. A significant breakthrough came when Gorbachev, speaking in July 1986 in Vladivostok, showed a clear willingness to improve China-Soviet relations and publicly stated that Russia was willing to adopt the international standard and draw its eastern boundary with China by using the main channel of the Amur and Ussuri rivers rather than China's shoreline, as it had previously insisted. This significant leadership change, and Russia's new position on a boundary settlement, resulted in renewed negotiations.

Coupled with Gorbachev's Vladivostok initiative was the Soviet Union's growing willingness to withdraw its military from Afghanistan, which it had invaded in 1979, end its support for Vietnam's occupation of Cambodia, and dramatically reduce its troop strength along the Chinese-Russia border and in Mongolia. Progress in satisfying these three Chinese preconditions for normalization of relations resulted in the first Sino-Soviet summit in twenty years in May 1989, when Gorbachev and Deng Xiaoping met in Beijing, formally ending the thirty-year-old Sino-Soviet split.

Mutual interest in improving bilateral relations as both Russia and China pursued economic and political reform led to quick resolution of the boundary dis-

pute. At the outset of new negotiations, both sides agreed to use the old treaties as the basis for determining the border and to delimit the boundary according to internationally accepted principles of international law. Following Gorbachev's May 1989 trip to Beijing, negotiations moved forward rapidly, and in June 1990 China and the Soviet Union agreed to sign a treaty covering areas on which they had reached a compromise. They signed the boundary treaty when the Chinese president Jiang Zemin traveled to Moscow in May 1991. The newly established Supreme Soviet of the Russian Federation ratified the accord on 3 February 1992, and the Standing Committee of the Chinese National Peoples Congress ratified it on 25 February. Russia and China concluded a treaty delimiting the short fifty-three-kilometer boundary to the west of Mongolia in September 1994. The following month China, Mongolia, and Russia jointly drafted a protocol and map of the eastern and western boundary junctures. In April 1999 demarcation of the entire Chinese-Russian boundary was finally completed; the detailed maps and comprehensive documentation weighed more than thirty kilograms.

The only area that remained unsettled was a never-before-demarcated region in the Pamir Mountains of Central Asia. By the late 1980s, Moscow was willing to accept the watershed principle in establishing the boundary; that is, it was willing to draw the boundary along the highest peaks of the mountains. Nevertheless the issues remained complex, and both sides agreed to postpone a final settlement until after negotiations were completed for the eastern sector of the boundary. However, with the breakup of the Soviet Union in 1990, China was faced with negotiating boundary settlements with the newly independent Central Asian states of Kazakstan, Kyrgyzstan, and Tajikistan. China has negotiated boundary settlements with Kazakstan and Kyrgyzstan, but the Pamir Mountain boundary with Tajikistan remains unsettled.

Post-Cold War Relations

With the collapse of the Soviet Union and the end of the Cold War, China-Russia relations entered a new phase. This sudden and fundamental shift in the global balance of power made it imperative for China and Russia to develop closer relations. In the mid-1990s, Chinese and Russian leaders formed a Sino-Russian "strategic partnership" to counterbalance American unilateralism in world affairs. These closer military and strategic relations between China and Russia are due in part to both countries' intensely nationalistic response to American power in the post-Cold War world. China and Russia, both undergoing a difficult transition from Communism to a market economy, have bruised national identities that make them natural allies against America's global cultural, economic, and military influence.

In 1992 President Boris Yeltsin of Russia and President Jiang Zemin of China both began promoting a strategic partnership between China and Russia. This new focus on China-Russia cooperation resulted in several high-level meetings and agreements. The two leaders formally announced the strategic partnership during a summit meeting held in April 1996 in Shanghai. The two countries now have a thriving military relationship, with Russia's cash-strapped military industries supplying China's technologically backward military with sophisticated jet fighters and naval vessels. In 1998 China ranked second, after India, as the major purchaser of Russian military equipment. Besides military hardware, Russia has also sold China production technologies and has helped China develop new weapons systems by sending Russian scientists to work in China's defense industries.

The present China-Russia strategic partnership is unlike the Sino-Soviet alliance of the 1950s. China and Russia are not attempting to establish a formal military alliance. Nevertheless they are cooperating closely to improve military-to-military relations and to develop confidence-building measures. Both nations hope to further reduce tensions over borders, as well as over nuclear weapons, and to make themselves more secure in the face of the threat both countries feel from the United States.

Economic relations have improved more slowly than the military relationship. Trade over the past several years has stagnated at 5 to 6 billion dollars annually, only 2 percent of China's total foreign trade in 1997. However, a robust border trade has developed over the past decade, and several border towns have become "open cities" to facilitate this dynamic local trade. The slow development of economic and trade relations is due largely to the problems both countries

are experiencing with the transition from a centrally planned command economy to a market economy.

The greatest potential for cooperation is in developing the energy sector. China's rapid economic development during the past several decades has increased its demand for imported oil and gas. Estimates are that China will import 1.3 million barrels of oil a day in 2000 and 3.6 million by 2010. The Russian Far East has vast undeveloped oil and gas fields. However, Russians living in the Russian Far East are reluctant to develop closer relations with China because of their apprehension about the socioeconomic consequences of a stronger Chinese presence in the region. This apprehension is rooted in the deep historical differences and the history of conflict along the long mutual boundary. The demographic imbalance in the Far Eastern regions of Russia and northeastern China is also a point of concern. The Russian Far East has a population of roughly 8 million, while northeastern China has a population of approximately 100 million; the Russians fear Chinese in-migration will cause them to become a minority in their own country. Regional leaders in the Russian Far East have been more skeptical than leaders in Moscow about developing closer economic relations with China. They would rather develop closer relations with Japan, South Korea, and the United States.

Future Concerns

Although in the post-Cold War world China and Russia share common strategic concerns and some complementary economic interests, they will not easily overcome the deeply rooted historical and geopolitical legacy of conflict. Many inherent tensions are simply due to the fact that China and Russia share a long border. More fundamental causes of friction are the result of China's dynamic economic growth and Russia's precipitous economic decline, resulting in a shift in the balance of power between the two countries over the long term. Russian anxiety, especially in the Russian Far East, over what is perceived as a demographic time bomb just across the border in northeastern China will stymie economic cooperation and integration for the foreseeable future. Nonetheless, if China and Russia effectively manage the inherent tensions in their bilateral relations, closer military and economic cooperation is possible. One factor that will determine the closeness of Russia-China relations is the relationship between the United States and China and between the United States and Russia. Certainly for economic reasons, both countries would value a better relationship with the United States more than a closer relationship with each other. However, con-

cern over American "hegemony" or unilateralism could cause a closer China-Russia strategic relationship that may form the cornerstone of an anti-American coalition seeking to undermine U.S. influence in important regions of the world, including the Middle East and Northeast Asia

CHINA-TAIWAN RELATIONS Taiwan's first residents, who make up the island's aboriginal tribes, migrated to the island about six thousand years ago and are related to ethnic groups from southern China, Southeast Asia, and the Philippines. They now constitute just over 1 percent of the total population. Although Taiwan appeared in Chinese historical records before the Han dynasty (206 BCE-220 CE), the colonization of Taiwan by Chinese settlers began only in 610 CE, during the Sui dynasty (581-618 CE). The next large migration of Chinese to Taiwan started in the twelfth century. During the Ming dynasty (1368-1644), many Chinese settlers in Taiwan were

ordered to return to the Chinese mainland by imperial edicts. However, Chinese pioneers managed to continue to migrate to Taiwan in spite of the imperial prohibition. Soon Taiwan became a base from which Japanese and Taiwanese pirates attacked shipping in the South China seas.

Europeans also began to arrive on Taiwan. In 1590 Portuguese sailors landed on the main island and named it "ilha Formosa," meaning "beautiful island." Formosa remained the name by which Europeans knew Taiwan for centuries. In 1624 the Dutch invaded and occupied the main island. Two years later, the Spanish landed at Keelung, a northern port; they controlled Taiwan's coastal areas for two years. They were finally driven out by the Dutch in 1641.

In 1661, the Ming-dynasty general Zheng Cheng-gong (1624-1662), known to the West as Koxinga, took Taiwan from the Dutch and established an exiled Ming government in Anping (Tainan) in southern Taiwan. The Ming dynasty was overthrown by the Manchus on the Chinese mainland, but Zheng's son ruled Taiwan with a large number of Chinese followers until the Manchus finally took Taiwan in 1683. By then, Taiwan's population had exceeded 2.5 million, most of them from China's Fujian and Guangdong provinces.

By the nineteenth century, China was experiencing economic difficulties and political chaos. Western countries controlled territory along the eastern seaboard. At the end of the first Sino-Japanese War in 1895, Taiwan was ceded to Japan. Japan began its colonization of Taiwan and used it as a major military base for fifty years until the end of World War II.

Relations under the Two Chiangs

In 1911, the Manchu empire on the Chinese mainland was overthrown by a nationalist revolution spearheaded by the Guomindang (on Taiwan, Kuomintang) under the leadership of Sun Yat-sen (1866-1925) and Chiang Kai-shek (1887-1975). They established the Republic of China (ROC), which became an ally of the United States during World War II. On 26 November 1943 Chiang met with U.S. president Franklin D. Roosevelt and British prime minister Winston Churchill at Cairo, Egypt. They agreed that at the end of the war, Japan must return Taiwan to China. Taiwan was returned to Chiang's government on 25 October 1945.

A civil war in China erupted in 1945, pitting the Communist forces led by Mao Zedong (1893-1976) against Chiang Kai-shek's ROC government. Chiang

was defeated, and Mao established the People's Republic of China (PRC) in Beijing on 1 October 1949. Chiang fled to Taiwan with more than 2 million mainlanders and reestablished his government there on 1 March 1950. It was widely expected within the United States that Mao's forces would soon invade Taiwan.

The outbreak of the Korean War on 25 June 1950 proved to be the saving grace for Taiwan. Fearing the spread of Communism across Asia, U.S. president Harry Truman immediately ordered the U.S. Seventh Fleet to defend Taiwan. Mao's troops on the mainland, virtually without a modern navy and air force, were in no position to challenge the U.S. Seventh Fleet.

In May 1951, the United States established its official Military Assistance Advisory Group in Taiwan to train Chiang's refugee troops. By 1954, Taiwan received a total of \$4.2 billion in military aid and \$1.7 billion in economic aid from the United States. These assistance programs, plus a 1954 Mutual Defense Treaty with the United States, helped Chiang Kai-shek to build up Taiwan from an impoverished and threatened island into a strong modern state.

During his twenty-five years of authoritarian rule, Chiang Kai-shek focused on preventing the spread of the Chinese Communists' power to Taiwan. He was not in favor of an independent Taiwan but rather considered the island as a base from which to fight Mao's Communism and to recover the mainland by any means at his disposal. He staged commando-style raids on the mainland, often with training and cooperation from the United States. He also forbade all forms of contact with the Communist-controlled mainland, including such seemingly trivial activities as reading mainland newspapers, listening to mainland radio broadcasts, or even receiving mail from friends or relatives still living on the mainland.

After the death of Chiang Kai-shek on 5 April 1975, the real power in Taiwan fell into the hands of his son, Chiang Ching-kuo (1910–1988), who was formally elected to the presidency in May 1978. Like his father, he absolutely opposed any demand for Taiwan's independence. Both Chiangs believed that Taiwan was a base from which the Kuomintang, and thus the ROC, could regain control of the mainland. To the two Chiangs, Taiwan was part of China, period.

However, Chiang Ching-kuo took significant steps to relax tensions with the Communist mainland government. For example, he permitted indirect trade and contacts with the mainland by Taiwan's residents. He was prepared to begin negotiations with the Communist government shortly after lifting the travel ban in October 1987, but before direct negotiations could be-

gin, he died of cardiac and pulmonary failure on 13 January 1988.

Relations under the Native Taiwanese Leaders

The death of Chiang Ching-kuo opened a new era in Taiwanese politics. A native-born Taiwanese, Lee Teng-hui, succeeded him in 1988. Since then Taiwan has become a more democratic and pluralistic society. In addition to the Kuomintang, another major political party, the DPP (Democratic Progressive Party) is gaining considerable support among Taiwanese voters.

At first Lee Teng-hui continued his predecessor's open-door policy toward the Chinese mainland. Lee established the National Unification Council under the auspices of the President's Office (the White House of Taiwan). In February 1991 the council adopted "Guidelines for National Unification," which outlines three phases of unification: short term (exchange and reciprocity), middle term (trust and cooperation), and long term (consultation and unification). However, Lee refused to set a timetable for the implementation of the guidelines.

Lee Teng-hui also authorized the establishment of a semiofficial "Strait Exchange Foundation" (SEF) to make direct contact with the Chinese mainland's counterpart organization, the "Association for Relations across the Taiwan Straits" (ARATS).

The Chinese Communists have always maintained that Taiwan is a Chinese province and must be reunited with the mainland. Their plans to achieve that goal have varied. Before 1978, the official policy was to use military force. In 1978 the third plenum of the Eleventh Chinese Communist Party Congress adopted a new resolution calling for "peaceful reunification" with Taiwan. Beginning in 1983, the late Chinese leader Deng Xiaoping (1904–1997) made a number of concessions to Taiwan, and in early 1984 China offered a proposal that would take into account Taiwan's political and economic concerns: the "one country, two systems" proposal. "One country, two systems" continued to be China's official policy under Jiang Zemin (b. 1926).

Lee Teng-hui visited the United States in 1995 to give a speech at his alma mater, Cornell University. No Taiwanese top official had set foot on U.S. soil since the United States recognized the PRC in 1979. China feared Lee's visit indicated a move toward independence and would lead to recognition of Taiwan as a state by the world community. As a result, China conducted military exercises across the Taiwan Strait involving 400,000 troops. By 1996 four Chinese missiles had been fired within approximately fifty-one

kilometers of the island state. During that tense period, the United States dispatched two nuclear-armed aircraft carrier groups into the area. Ultimately, China concluded its military exercises.

Relations between China and Taiwan have become extremely tense again since July 1999. At that time Lee Teng-hui introduced a new element by insisting that negotiations must be based on a "special state-to-state" relationship. As a result, China published a White Paper, "The One-China Principle and the Taiwan Issue" on 21 February 2000, in which it declared that they "cannot allow the resolution of Taiwan issue to be postponed indefinitely."

A political earthquake erupted in Taiwan on 18 March 2000, when Taiwanese voters elected a pro-independence DPP candidate, Chen Shui-bian (1951–), as president of Taiwan with 39 percent of the votes in a three-way race. China immediately demanded that Chen accept the "one-China" principle before any negotiations between China and Taiwan could be resumed. As of 2001, Chen continued to reject the one-China principle.

Future Prospects

If economics is the key to world politics in the twenty-first century, the future of China-Taiwan relations appears bright despite political upsets. Since the opening of trade relations between the two sides in 1979, trade across the Taiwan Strait has become a significant portion of total trade for both China and Taiwan. Taiwan's trade with China via Hong Kong rose from \$1.5 billion in 1987 to more than \$11 billion in 1997 and continues to rise higher. The Chinese mainland is now Taiwan's fourth-largest trading partner. Taiwan's investment on the mainland from 1979 to 1995, for example, exceeded \$11 billion, making Taiwan China's second-largest investor after Hong Kong. Furthermore, Taiwan has enjoyed a handsome trade surplus every year since 1980. Therefore, despite their rocky history, there is hope for better relations to come between China and Taiwan.

CHINA–UNITED STATES RELATIONS

Two centuries of relations between China and the United States have included conflict and cooperation in the diplomatic, economic, and social spheres. This relationship has been plagued by cycles of unrealistic expectations on each side of the Pacific, followed by deep disappointment. A common enemy, such as the Japanese during World War II or the Soviets in the latter stages of the Cold War, proved to be the single most important factor in building strong ties.

The Treaty Port Era

Trade formed the basis for the first Sino-U.S. contact. In 1784 the U.S. ship *Empress of China* carried silver and ginseng to the southeast coast of China, then returned to the United States with tea, silk, and porcelain. The *Empress* venture spurred in the United States an interest in goods from East Asia and dreams of prosperity through a limitless China market. The Chinese, then under the Qing dynasty (1644–1912), had little interest in the outside world and saw Americans as no different, albeit weaker, than other "barbarians" such as the British and French. Chinese purchased few Western products, and Americans quickly followed the British lead by selling opium to resolve a persistent trade deficit. Opium smuggling and demands for expanded trade sparked the 1840–1842 Opium War between Great Britain and China. The victorious British forced the Qing to sign the 1842 Treaty of Nanjing, which began a series of unequal treaties that required opening ports to foreign trade ("treaty ports"), limits on tariffs, and extraterritoriality. In 1844 the Qing signed the Treaty of Wangxia with American representatives. This agreement included a provision for most-favored-nation (MFN) status—thus enabling the United States to gain privileges the British enjoyed without firing a shot.

In the mid-1800s, humanitarian interests entered into the relationship, because Americans hoped to change China through Christianity. After France and Great Britain combined to defeat China in the Second Opium War, the resulting unequal treaty expanded trade rights in China, permitted diplomats to reside in the capital, and required that the Qing accept the presence of Christian missionaries. This enabled a growing number of American missionaries, primarily Protestants, to move freely about China.

Each side disappointed the other. Americans discovered that the China market was limited due to poverty and cultural differences, missionaries found the Chinese relatively uninterested in Christianity, and the Qing government showed no inclination to imitate Western political, economic, or social models. The U.S. role in the China trade declined relative to that of the British, Japanese, and Russians after 1900, and by the 1920s, Japan's share of U.S. imports and exports was more than twice that of China's. The most enduring legacy of missionaries was schools, orphanages, and hospitals, not converts. The Chinese became frustrated, because U.S. claims of benevolence did not bring changes to the unequal treaties.

Chinese immigration became another contentious topic. The 1868 Burlingame Treaty encouraged immigration to the United States, though ethnic Chinese had come to the United States earlier to work as miners or railroad workers. Many Chinese were contract laborers whose passage was deducted from their wages in what became known as the "coolie" trade. Growing racial discrimination and violence against the approximately 160,000 Chinese in the United States led to criticism on both sides of the Pacific. In 1882 the U.S. Congress, bowing to union concerns over jobs and cruder racist sentiments, forbade almost all Chinese immigration.

A Special Relationship?

Around the beginning of the twentieth century, U.S. leaders concluded that a unified China was central to long-term U.S. commercial interests and humanitarian endeavors. As the Western powers and Japan appeared poised to divide China into mutually exclusive spheres of interest, in 1899 Secretary of State John Hay issued the first of the Open Door notes, which requested that all nations respect China's territorial integrity. Most recipients were politely non-committal. During the Boxer Movement (1898–1900), violent antiforeign mobs attacked missionaries and other foreigners in Northeast China, creating a crisis that climaxed with the Qing alliance with the Boxers and declaration of war against the West in 1900. As a

multinational expeditionary force prepared to invade China, the United States issued a second note to deter other nations from taking spheres of influence. Following the occupation of Beijing, a coalition of Western powers (including the United States) and Japan forced the Qing to sign the Boxer Protocol, which required a huge indemnity from China. The United States, eager to differentiate itself from other imperialists, devoted its portion of the funds to education in China.

Increasingly, however, nationalistic Chinese rejected the idea of a special relationship, even as it became more deeply entrenched in the minds of U.S. officials and public. The Chinese attacked U.S. treaty privileges. Immigration policies and the treatment of Chinese in the United States spurred a boycott of U.S. goods in the coastal cities of China in 1905. Although the boycott died out after one year, the immigration policies remained unchanged.

Even after the overthrow of the Qing in the Revolution of 1911, many Chinese felt that the United States did not live up to the ideal of a special relationship. The United States supported a former Qing general, Yuan Shikai (1859–1916), rather than the revolutionary nationalists led by Sun Yat-sen (or Sun Zhongshan, 1866–1925). Also, in the Lansing-Ishii Agreement of November 1917, the United States acknowledged Japan's "special interests" in North China and Manchuria, while the Japanese offered lip service to support China's territorial integrity. Nor did American leaders support China's attempt to restore its national sovereignty at the Versailles Peace Conference of 1919.

Treaty revision remained a contentious issue. Western powers, the United States included, used the excuse of instability in China to avoid the issue even after the Nationalists, led by Chiang Kai-shek (or Jiang Jieshi, 1887–1975), unified China through the Northern Expedition of 1926–1928. Chiang carried on Sun's legacy of the Three Principles of the People (nationalism, democracy, and people's livelihood) by emphasizing that the unequal treaties had to be revised. However, Chiang's need for foreign loans and recognition of the Republic of China (ROC) limited his ability to press the issue.

Japanese aggression raised Chinese hopes for closer ties to the United States. In 1931 the Japanese Army plotted an incident as an excuse to occupy Manchuria. Although novels like Pearl Buck's *The Good Earth* built sympathy by portraying China as a nation of poor but hardworking and honest farmers, the United States took few concrete actions to support the republic. Secretary of State Henry Stimson's Nonrecognition Doc-

trine merely declared the unwillingness of the United States to acknowledge what the Japanese had taken by force. All-out war between the China and Japan in 1937 initially elicited little more than American sympathy.

From Allies to Enemies

In public, the period from Pearl Harbor to Japan's surrender was a golden era in Sino-U.S. relations, because the two peoples faced a common enemy and shared similar dreams of a strong, democratic China in the postwar world. The U.S. government supplied military and financial aid, and the American public, influenced by Chiang's propaganda efforts and the idealization of China offered by publications such as *Time* magazine, almost uniformly supported the Nationalists. Chiang appeared to elevate China to great power status by participating in the Cairo Conference of November 1943, where President Franklin Delano Roosevelt, Prime Minister Winston Churchill, and Chiang discussed the restoration of Chinese territory taken by the Japanese, such as Taiwan. Further, the United States and Britain surrendered extraterritorial privileges.

The reality of Sino-U.S. ties was more complex. The Nationalists often found themselves ignored, because Washington's first priority was defeating Germany, and few Americans perceived any vital interests at stake in China. Americans assumed that Chinese manpower would fight Japan and that aid was a lever to reform Chiang's authoritarian regime. These hopes clashed with the reality of a weak China, led by a regime more concerned with eradicating the Chinese Communist Party (CCP) than confronting the Japanese occupation. The Nationalists expressed dissatisfaction with the volume of U.S. aid and wanted to stockpile war materials in anticipation of a postwar struggle against the CCP. U.S. criticism of Chiang's war effort began within China, with U.S. diplomats and U.S. military adviser General Joseph Stilwell, but it gradually spread to Washington.

Communist leaders, such as Mao Zedong (1893–1976) and Zhou Enlai (1898–1976), wanted closer ties to the United States to balance the Soviets, to weaken the Nationalists, and to obtain military equipment, while Americans hoped that the CCP would serve as a more effective force against the Japanese. Roosevelt accepted the need for contact with the CCP, then based in Yan'an, and in 1944 authorized the Dixie Missions. These missions, conducted over Chiang's objections, led to discussions concerning cooperation against the Japanese. Other than allowing Mao and Zhou an opportunity to portray themselves as moderate agrarian reformers, these delegations accomplished little.

At war's end, the United States continued to support the Nationalists, even as it sought to mediate between Chiang and Mao. Efforts to create a coalition government failed, because the Nationalists assumed they would receive aid regardless of their actions, and the Communists lost faith in the ability of the United States to serve as a neutral arbiter. Civil war began in early 1947, and Chiang's forces, poorly led and overextended into Manchuria, were retreating southward by 1948.

The Nationalists' impending defeat spurred Chiang to request more United States aid, as he attempted to make the civil war part of the global Cold War. President Harry S. Truman, however, sought to distance the United States from its wartime ally. In August 1949, the Department of State released a white paper that signaled the end of support for Chiang, whose corruption and ineptitude were blamed for the Communists' victory. The Nationalists retreated to Taiwan, where they claimed to remain the sole legal government of China.

On 1 October 1949 Mao Zedong proclaimed the establishment of the People's Republic of China (PRC). An uneasy waiting period ensued as Beijing and Washington sought to find a modus vivendi to build a relationship. The PRC's growing ties to the Soviet Union and America's hostility toward Communism made immediate recognition impossible.

Cold War and the Dilemmas of a Divided China

Uncertainty turned to conflict when the Korean War began in 1950. President Truman dispatched the Seventh Fleet to the Taiwan Strait, thus signaling the U.S. determination to protect the Nationalists and contain the Communists. By the end of the year, United States troops and Communist "volunteers" were fighting on the peninsula. The leaders of the People's Republic perceived recognition of Chiang's government as a violation of China's national sovereignty. The mainland gave propaganda, if not material, support to anticolonial and anti-American revolutionary movements around the world, while Washington sought to isolate the PRC through diplomatic, military, and economic means.

To most Americans, Taiwan became China. Chiang offered the United States a staunch Cold War ally and valuable outpost for containing Communist power. U.S. aid and trade proved vital to the initial survival and later "economic miracle" of the ROC. Chiang also received military aid and support in international forums such as the United Nations. The December 1954 Sino-U.S. Mutual Defense Treaty marked the high point of Cold War cooperation between the two. But President Dwight D. Eisen-

FIGHTING A UNITED STATES INVASION

During the Cold War era, the United States was concerned about Chinese expansion while the Chinese were concerned about an American invasion. The following text is Marshall Lin Piao's advice to Chinese generals in 1966 on how to combat an American invasion.

In order to annihilate the enemy, we must adopt the policy of luring him in deep and abandoning some cities and districts of our own accord in a planned way, so as to let him in. It is only after letting the enemy in that the people can take part in the war in various ways and that the power of a people's war can be fully exerted. It is only after letting the enemy in that he can be compelled to divide up his forces, take on heavy burdens, and commit mistakes. In other words, we must let the enemy become elated, stretch out all his ten fingers and become hopelessly bogged down.

hower emphasized that the treaty obliged the United States to defend the ROC from attack but did not include support for Nationalist raids on the mainland. Nevertheless, the United States did threaten military action against the mainland during military clashes between the PRC and the ROC in 1954–1955 and 1958.

In reality, the United States and the PRC showed restraint, because neither side sought direct military confrontation after the Korean War. Official contact between the two Cold War antagonists was limited. After the 1954 Geneva Conference (devoted to discussions of Korea and Indochina), U.S. and Chinese diplomats held a series of 130 meetings in Geneva, then in Warsaw. These talks accomplished little of substance, but they would offer an avenue for rapprochement in the early 1970s.

Neither President John F. Kennedy nor his successor, Lyndon B. Johnson, showed imagination in their policy toward China, as domestic politics and international alliances made rapprochement seem impossible. In the PRC, the Great Proletarian Cultural Revolution increased the rhetoric attacking the United States and U.S. involvement in Vietnam spurred Chinese support of the Communist Democratic Republic of Vietnam (DRV).

Rapprochement and Beyond

By the late 1960s, Mao Zedong and Zhou Enlai became convinced that the Soviet Union represented a

greater threat to China than did the United States. The Soviet invasion of Czechoslovakia in 1968 and border clashes between the PRC and Soviet Union in 1969 heightened fears of an attack from the north. The PRC also sought improved relations with the United States as part of a larger drive to end its international isolation. In the United States, President Richard M. Nixon reasoned that closer ties to the PRC would be a counterweight to the Soviet Union, improve his domestic political standing, and demoralize North Vietnam. This effort began by relaxing restrictions on trade and travel—measures considered but rejected during the final year of the Johnson administration.

At Warsaw talks of January and February 1970, the Chinese offered to arrange a high-level meeting. This opened the door to secret contacts through Pakistan, which, in turn, facilitated National Security Adviser Henry A. Kissinger's trip to Beijing on 9–11 July 1971. Nixon's historic visit to China from 20 to 27 February 1972 marked a huge shift in Sino-U.S. relations. The trip concluded with the Shanghai Communiqué, which made clear that each nation shared concern over Soviet power. One sensitive issue was Taiwan. The United States professed hope that Taiwan's status be resolved peacefully, but acknowledged that both the PRC and ROC claimed Taiwan as part of China (the "one China" policy). Both parties also pledged to work toward normalized relations.

Although each nation opened liaison offices in 1973 in the other's capital, Nixon's domestic political travails delayed progress toward full normalization—much to the chagrin of Mao and Zhou. President Jimmy Carter came into office determined to move ahead. In December 1978 a joint communiqué announced the establishment of diplomatic relations and the termination of official U.S.-ROC ties and the Mutual Defense Treaty.

Normalization with the PRC left a delicate problem—the fate of U.S. ties to the Republic of China on Taiwan. In April 1979 Carter signed the Taiwan Relations Act, which set the rules for unofficial relations through the American Institute on Taiwan (AIT). The U.S. Congress reaffirmed the one China policy but pledged to sell defensive weapons to Taiwan and emphasized its interest in the peaceful settlement of the Taiwan issue. Under pressure from the PRC, in 1982 President Ronald Reagan promised to reduce the level of arms sales to the island. The ROC, however, maintained an effective lobbying effort in the United States, which limited the U.S. government's ability to distance itself from its former ally. PRC leaders such as Deng Xiaoping complained that U.S. arms sales and unofficial ties to Taiwan impeded progress toward reunification. Taiwan's economic success and democratic reform sparked further conflict. In 1987 Chiang Ching-kuo (Chiang Kai-shek's son and successor) lifted martial law on Taiwan, marking an important step toward peaceful democratic change on the island.

After Chiang's death in 1988, Lee Teng-hui, a native Taiwanese, assumed the presidency. His rejection of the one-China formula highlighted the problem of Taiwan's relationship with the mainland, even as his promotion of democracy drew praise in the U.S. media, Congress, and public. Lee's ambivalence over reunification drew threats from the PRC, which, despite U.S. wishes, refused to commit itself to a peaceful solution.

Overall, however, Sino-U.S. relations during the 1980s were strong, because the two nations shared economic interests and antipathy toward the Soviet Union. Under Deng's leadership, the PRC sought contact with the West in order to obtain technology and spur economic development, while the United States saw an opportunity to expand exports and reshape China in the U.S. image of capitalism and democracy. Trade spawned a powerful coalition of business interests in the United States that sought good relations with China. However, the violent suppression of pro-democracy demonstrators in Beijing's Tiananmen Square in June 1989 marked a major turning point. Deng blamed Western influence for the demonstrations, and President George Bush an-

nounced sanctions against the Chinese government. U.S. criticism of China's political system and human rights violations became a constant irritant to the PRC. Further, the collapse of the Soviet Union removed a key strategic motivation for rapprochement.

China–U.S. relations became more contentious after the Cold War. Beijing frequently criticized American "hegemony," and objected to the lack of U.S. pressure upon Taiwan to reunify with the mainland, missile defense schemes, the accidental bombing of the Chinese embassy in Yugoslavia, continued intelligence gathering (such as the Hainan island incident of 2001), sympathy for Tibetan dissidents, and U.S. military intervention in the Balkans and the Middle East. Washington complained of Chinese sales of nuclear and missile technology to Iran and Pakistan, trade barriers, human rights violations, and threats against Taiwan. President George W. Bush's public support of a one China policy even as he approved arms sales to Taiwan satisfied neither the PRC nor the ROC. Nevertheless, the United States supported China's integration into the international economic order through institutions such as the World Trade Organization. By the beginning of the twenty-first century, the world's most populous nation and its most powerful nation were increasingly bound together through trade, investment, education exchanges, and immigration.

CHINA-VIETNAM RELATIONS China and Vietnam share a long history of relations marked by extended periods of collaboration and shorter periods of military conflict. Vietnam was for more than a thousand years a part of the Chinese empire before gaining independence in the tenth century CE. The independent Vietnam remained under Chinese cultural and political influence and a tributary relationship developed. This close relationship was ended by the period of French colonial rule in Vietnam during the second half of the nineteenth century and the first half of the twentieth.

After Vietnam regained independence from France in 1954, relations between China and Vietnam were officially very close up to the end of the War in Vietnam in 1975. Thereafter, relations deteriorated into open hostilities in early 1979, and tension remained high for most of the 1980s. From the late 1980s relations started to improve, leading to full normalization in November 1991. The 1990s have been characterized by two contradictory trends: expanding and improving relations in most fields on the one hand, and recurring periods of tension relating to border disputes on the other. Both countries are making considerable efforts to manage and eventually settle the border disputes.

Background

Relations between the countries were very close in the 1950s, and for two decades China provided the Democratic Republic of Vietnam (DRV) with extensive economic and military assistance. China sent thousands of advisers to assist in various fields. China also provided considerable assistance during the Vietnam War. However, irritants developed during the 1960s and into the first half of the 1970s due to different perceptions of the Soviet Union and divergent views on relations with the United States. After the 1973 Paris agreement, which led to the withdrawal of American troops from Vietnam and established a cease-fire in the Vietnam War, the Vietnamese claimed that Chinese leaders had advised them to diminish the level of the fighting in the south for a few

years, advice perceived as aiming at keeping Vietnam divided. China rejected this claim.

Sino-Vietnamese Relations, 1975-1991

Following the end of the war in April 1975 relations between China and Vietnam began to deteriorate over China's uneasiness about Vietnam's relations with the Soviet Union and China's increasing support for Cambodia in the conflict between Vietnam and Cambodia. The Vietnamese military intervention in Cambodia in late December 1978 caused further tension. There were also territorial disputes along the land border, in the Gulf of Tonkin, and in the South China Sea. The clashes that occurred along the border had more significance as an indication of deteriorating relations and of divergence on other issues than as conflicts in their own right. Finally, there was the issue of how the ethnic Chinese in Vietnam were treated by Vietnamese authorities. The mass migration of ethnic Chinese from Vietnam to China in the spring of 1978 led to the open and public deterioration of bilateral relations between the two countries. Vietnam's intervention in Cambodia in December 1978 eventually led to China's attack on Vietnam in February and March 1979.

The normalization process began with low-level contacts in the mid-1980s and expanded to high-level meetings from early 1989. In early September 1990 a secret Vietnamese high-level visit to China took place. Despite this meeting, political normalization did not gain momentum until mid-1991. Increased diplomatic interaction paved the way for a high-level summit on 5-10 November 1991, during which bilateral relations were officially fully normalized.

Relations since 1991

Since full normalization, the relationship between China and Vietnam has been characterized by two contradictory trends: expanding contacts and cooperation in many fields, and continued territorial disputes. The positive trend in bilateral relations can be seen through the expanding political, cultural, economic, and military contacts between the two countries. Official delegations from one country regularly visit the other country to discuss ways of expanding relations in various fields. Increased economic ties since 1991 can be seen through bilateral trade, which grew from \$32 million in 1991 to \$1 billion in 1996 and was expected to reach \$2.8 billion in 2001. China also provides loans and assistance to upgrade Chinese-built factories in northern Vietnam. In the political field the close relationship between the two ruling parties—the Chinese Communist Party (CCP) and the Communist Party of

Vietnam (CPV)—has expanded through a steady stream of exchange visits at various levels. The contacts between the armed forces of the two countries have also expanded through regular exchange visits.

Reverting back to the territorial disputes as a source of tension, it can be noted that since late 1991 sharp differences relating to all the disputes (i.e., overlapping claims to the Paracel and Spratly archipelagos, to water and continental shelf areas in the South China Sea and in the Gulf of Tonkin, and to areas along the land border) were prevalent from May to November 1992. Differences relating to oil exploration in the South China Sea and the signing of contracts with foreign companies for exploration were prevalent during parts of 1994, 1996, and 1997. During 1998 there were shorter periods of tension relating to the disputes. During 1999 the focus was on reaching a settlement of the land border dispute and no significant tension was caused by any of the border disputes. During 2000 the focus was on resolving the Gulf of Tonkin dispute and no significant tension was caused by the remaining border disputes. The major achievements thus far are the signing of the Land Border Treaty on 30 December 1999 and the Agreement on the Demarcation of Waters, Exclusive Economic Zones, and Continental Shelves in the Gulf of Tonkin on 25 December 2000.

The progress in managing the territorial disputes in recent years contributes positively to the prospect of a long-term stability in the Sino-Vietnamese relationship. However, the lack of progress in the talks on the disputes in the South China Sea area remains a potential threat to a stable relationship.

CHINESE CIVIL WAR OF 1945–1949 Although the Chinese Nationalist and Communist movements had pledged to unite against Japanese ag-

gression in 1936, conflict between them actually grew during the war against Japan (1937–1945), setting the stage for a civil war. The approaches the Chinese Nationalists and Communists employed during the war against Japan basically determined the outcome of the civil war. From 1941 through 1945 the Nationalist government held back from major offenses against the Japanese while it grew in international stature and acquired a powerful and generous ally in the United States. Nevertheless, the Nationalists suffered from a variety of internal weaknesses, including loss of its economically advanced territories to Japan, serious inflation, and deteriorating popular support. For their part, the Chinese Communists made simple living and self-reliance into a patriotic virtue while winning widespread admiration for their aggressive anti-Japanese nationalism. Most important, they increased their territorial control across North China, where Communist military units, supported by local militias, knitted together popularly based regional governments behind Japanese lines. Operating largely without outside support, the Communists forces grew tremendously and developed a bold confidence in their newfound abilities.

U.S. Attempt at Intervention

The United States, fully aware by early 1945 of the looming Nationalist-Communist conflict, intervened in the hope of creating a single Chinese government as its chief ally in East Asia. When initial efforts by Ambassador Patrick Hurley stumbled, President Harry Truman dispatched General George C. Marshall to China. But Marshall failed to achieve compromises between the two sides during his fourteen-month mission from December 1945 to January 1947.

Full Civil War

As Japan's collapse loomed in early August 1945, both the Communists and the Nationalists set in motion hastily made plans to expand their territorial control. The Nationalists held Sichuan and the southwest as well as some parts of central China, but they needed to reestablish their pre-1937 control over East and South China, especially the rich and fertile coastal provinces of Jiangsu, Zhejiang, Fujian, and Guangdong. Chiang Kai-shek (1887–1975), the leader of the Nationalists, also intended to gain control of huge areas of China where his Nationalist government had never governed before 1937, including North China, Manchuria, Inner Mongolia, the northwest, and the huge but sparsely populated Xinjiang. Yet only two regions, North China under Communist control and Manchuria occupied by the Soviet Union, became the civil war's major battlegrounds.

Chiang rushed his forces to principal cities all around China, typically using U.S. air and naval units to transport his armies while demanding that defeated Japanese units hand over control only to his forces. Consequently, the Nationalists wound up with their armies in important cities throughout China, but their military and political strength was often thinly spread.

Communist strategy called for building on their present strength by surrounding and taking over the cities of North China. In a bold and ultimately decisive move, Communist leader Mao Zedong (1893–1976) dispatched General Lin Biao (1908–1971) with a large army to Manchuria, where he hoped the occupying Soviet forces might aid their fellow Communists.

Lin Biao's forces entering Manchuria received some assistance from the Soviet armies, but primarily in the form of letting Japanese arms fall into their hands. The Soviet Union still recognized Chiang's Nationalist government and so acceded to Nationalist occupation of the region's cities, ports, and railways. Before withdrawing in May 1946, the Soviets concentrated on looting Japanese factory equipment to rebuild their own war-ravaged economy.

On the U.S. side, doubts increased about the long-term prospects of its ally, the Chinese Nationalists. Chiang's problems were compounded in late 1945 as inflation continued, public confidence in the Nationalists did not revive, and relations between Chiang's armies and the recently liberated Chinese in the large coastal cities were uneasy. The Nationalists hoped for massive U.S. intervention on their behalf, but in the United States the postwar atmosphere demanded a return to normalcy. President Truman and General Marshall concluded that the Congress and American people would not be willing to commit the amounts of money, material, and fighting men needed to ensure a Chinese Nationalist victory. Nevertheless, the United States continued to give extensive economic and military support to the Nationalists.

American efforts in 1945 and 1946 to forge a compromise between the Nationalists and the Communists were unsuccessful because Chiang would not enter a coalition with the Communists, while the Communists insisted on maintaining independent control of the territory they administered. As Marshall prepared to return to Washington in mid-1946, he arranged the appointment of an American missionary educator, John Leighton Stuart, as the new U.S. ambassador. Although Stuart knew both the Nationalist and Communist leaderships in China, he was new to diplomacy and lacked Marshall's close connections in Washington, so his appointment indicated the shifting of U.S.

attention away from China. After his return from China in January 1947, Marshall became U.S. secretary of state and gave his name to a plan to revive the European economy, signaling that again Europe would be foremost in U.S. foreign policy concerns.

Even during Marshall's mission, Nationalist-Communist armed conflict increased. Overall, Nationalist armies fared well in these battles, and by late 1946 Chiang, certain of victory, reorganized his government with a new constitution followed by national elections. Taking Yan'an, the Communists' wartime capital, in March 1947, buoyed the Chinese Nationalist's military fortunes.

Turning of the Tide against the Nationalists

After July 1947 the Nationalist cause began to sputter. Reconciliation with Chinese who had been under Japanese occupation often proved difficult. The serious wartime inflation deepened, making it difficult to restart the modern sector of the Chinese economy. Fear of Communist influence led the Nationalists into general suppression of freedom of expression.

In the summer and fall of 1947, Communist armies began to win victories in North China. Then from December 1947 to March 1948, Lin Biao's armies won a series of major battles in Manchuria. By early November 1948, Lin had destroyed some of the Nationalist's best armies and taken over Manchuria. In these engagements, the Communist military adopted a new pattern that departed from its preference for guerrilla warfare by moving to regular battlefield formations composed of large infantry armies supported by some tanks, artillery, and aircraft. Nationalist divisions began to surrender to the Communists and then to reappear on the Communist side under new leadership with their modern American equipment.

In North China, Communist commanders used similar tactics with great success. As Manchuria slipped from the Nationalists' grasp, the Communists in October 1948 opened a general offensive in southern Shandong known as the Huaihai campaign. Chiang threw his best remaining divisions into the fray only to lose them by January 1949. As the full enormity of the Nationalist defeat emerged, the Nationalist general in command of the Beijing-Tianjin region surrendered with 200,000 soldiers.

Economic collapse compounded these battlefield disasters. Runaway inflation tore through the Nationalist economy like a great typhoon, leaving ruin everywhere in its wake. Opposition elements within the Nationalist Party forced Chiang to resign in January 1949, and General Li Zongren (1890–1969) became

acting president. In April 1949, Communist armies crossed the Chang (Yangtze) River and began the task of mopping up resistance in the huge areas under real or nominal Nationalist control. Chiang directed evacuation of the loyal remnants of his civil and military machines to Taiwan.

Stalemate

In the summer of 1950, with the outbreak of the Korean War, the struggle between the Communists and Nationalists became folded into the Cold War. Small-scale military incidents continued for several years, and then both sides entered a stalemate. By the beginning of the twenty-first century, even though the economies of the People's Republic of China (mainland China) and the Republic of China (Taiwan) have become closely interwoven, the Chinese civil war never has been formally ended.

CHINESE COMMUNIST PARTY The Chinese Communist Party (CCP) emerged out of the infiltration of Western ideas into China at the end of the nineteenth and beginning of the twentieth century in the environment of the May Fourth Movement (1917–1921), in which Chinese students and intellectuals protested the injustices of the Treaty of Versailles. (The treaty ceded Chinese territory to Japan despite China's having participated in the war on the side of the allies; the actual demonstrations against it took place on 4 May 1919.) The founders of the CCP, Chen Duxiu (1879–1942), and Li Dazhao (1888–1927), were both then at Peking (Beijing) University.

Chen left the university after his arrest for leading street demonstrations. Like many others, he became in-

creasingly radicalized. During this period, Li, the more active Marxist, organized various study groups that included later leaders of the CCP, including Mao Zedong (1893–1976). By this time agents of Comintern, the international Communist organization dominated by the Soviet Union, were actively agitating for the formation of a Chinese Communist Party.

This step was finally taken in July 1921. The first party congress was held in secret at a girls' boarding house in Shanghai. Chen and Li were not among the twelve organizing delegates, but their views dominated. Chen favored revolution based upon urban workers, while Li wished to establish a more popular base for revolution, an idea later taken up by Mao.

The CCP prior to the Long March

The period between 1921 and 1927 was traumatic for the CCP. The Comintern was willing to sacrifice CCP interests to those of Chiang Kai-shek's Nationalist Party (Guomindang), with whom the Comintern compelled the CCP to work. The CCP also found it difficult to foment the urban, workers' revolution desired by Chen in China, as the vast majority of China's population was engaged in agriculture.

In 1927, the Nationalists, who leaned more to the right after the Northern Expedition (a campaign against regional warlords), turned against their CCP allies, more or less destroying its urban base. The CCP had no choice but to regroup in rural areas in south and central China.

Between 1927 and 1934, the CCP fought a losing battle against the well-armed Nationalist army. By 1934, its very survival was at stake, and surviving CCP armies began the trek to the north, then outside direct Nationalist influence, known as the Long March. It was completed in 1936. CCP forces regrouped in a stronghold in Shaanxi. By this time, Mao, by no means dominant before, had emerged as the CCP's leader.

War with Japan, Civil War, and the First Decades of the People's Republic

By 1936 the political situation in China had changed dramatically. Japanese aggression had become overt after the Manchurian Incident of 1931, in which the Japanese created an excuse to attack Chinese troops in Manchuria. Chiang Kai-shek (1887–1975) would have preferred to consolidate his regime and to suppress enemies, including the CCP, but he was propelled into a war with Japan by an outraged public. It was disaster. He lost their capital and most other important Chinese cities, and had to retreat to impotence and isolation in Sichuan.

The CCP, by contrast, safely out of the main line of Japanese advance, could nurture its strength. When the Allied victory in World War II came, the CCP quickly expanded its influence in the chaos following the Japanese surrender. It acquired large stocks of arms through its own efforts and with the help of the Soviets.

The United States wanted the Nationalists to negotiate with their CCP enemies, but the Nationalists trusted in their own power to win any civil war. They proved surprisingly inept militarily, while mismanagement of the economy lost them support. In 1949 they retreated to Taiwan and by 1950 held little else.

The People's Republic of China was proclaimed on 1 October 1949, under Mao's control. The next two decades were a period of national recovery and experimentation. Mao remained true to his populist roots, and radical policy was often the result. The most important of Mao's initiatives were the Great Leap Forward (1958–1960), a failed effort to industrialize China on the village level, and the Cultural Revolution (1966–1976), in which gangs of youth terrorized their elders and those in positions of authority, armed with the words of Mao. Only the behind-the-scenes guidance of Premier Zhou Enlai (1898–1976) prevented a total meltdown. The Great Leap Forward actually set China's industrial production back; it also caused widespread famine. During the same period, China broke with its Soviet ally.

The Era of Reform

In the waning years of the Cultural Revolution, the CCP had to reinvent itself, to become less radical, less isolated internationally, and more approachable to the majority of Chinese. As part of this change, the CCP allowed a normalization of relations with the United States after 1971. That same year, party insiders eliminated Mao's chosen successor, Lin Biao (1908–1971). Although radical leaders of the Cultural Revolution, led by Mao's wife, Jiang Qing (1914–1991), staged a comeback in 1973, the tide turned decisively against them after Mao's death. In 1977, the Gang of Four (as the leaders were known) was ousted and brought to trial. As their influence declined, Deng Xiaoping (1904–1997), previously purged for his perceived capitalist tendencies by Mao's faction, reemerged as the dominant force in the party.

After 1977 the CCP decisively rejected radicalism and pushed economic liberalization. This has resulted in rapid growth and the emergence of a new class of wealthy Chinese, whose interests are now intertwined with those of the party. Most important, the party has survived the collapse of Soviet Communism, although at the cost of a frightful massacre of "democratic" el-

ements in 1989. Successions are now orderly rather than through power struggle, and there has been no repetition of the kind of events surrounding the downfall of Lin Biao or the trial of the Gang of Four.

In addition to its success with the economy, the party has achieved a number of foreign-policy successes. They include the 1997 return of Hong Kong to China, followed by that of Macao, and China's assertiveness, against the United States in particular, based upon a rapidly modernizing military.

The CCP in the Twenty-First Century

Nonetheless, the future is clouded. The party remains a geriatry, staid, conservative, and northern based. That the future may lie elsewhere, with the maritime region of the southwest, and an associated Taiwan and Singapore, and their wider economic community, may not be clear to those in power. Nor is the party actively considering the costs of militarism, perhaps because it is not in the interests of those driving the economy. Although the CCP has changed its spots repeatedly, it may lack the ability to respond to the new world of the twenty-first century. Some old ideas may be too thoroughly engrained within it.

CHINESE IN JAPAN Extending as far back as 219 BCE when alchemist Xu Fu is said to have come to Japan with a shipload of Chinese youth, the presence, through the nineteenth century, of the Chinese in Japan has been characterized by flows from different regions in China. As a result of this diversity, the changing nature of Sino-Japanese relations, labor requirements, and immigration policies, the Chinese in Japan, unlike those in other parts of Asia, have established their own unique history.

Pre-Tokugawa Period

Japanese chronicles make numerous references to migration from the Asian continent from the first century CE. According to the *Shinsen shoji roku* (Newly Compiled Record of Names, 815 CE), 162 naturalized families of Chinese origin lived in the central

A Chinese shrine at the Kiyumiza-Dera Temple in Japan in 1989. (CARL & ANN PURCELL/CORBIS)

provinces during this period. Trade between China and Japan became significant from the late twelfth century and grew steadily until the fifteenth and sixteenth centuries, when it became a large factor in the economic life of Japan. Records indicate the presence of many Chinese enclaves in Satsuma, the fief of the Shimadzu clan in southern Kyushu.

Tokugawa Period (1600/1603–1868)

Although Japan's relations with China were severed as a result of the invasions of Korea (1592, 1597) by the Japanese warlord and statesman Toyotomi Hideyoshi (1536–1596), unofficial trade with China and other countries was encouraged by the first Tokugawa shogun, Ieyasu (1542–1616), and resulted in a flourishing Chinese community in Nagasaki in the seventeenth century. Kyofukuji, Sofukuji, and Fukuza-iji, Chinese temples built in the 1620s, were recognized as Japanese national treasures and attest to the wealth of Chinese merchants of the period. The number of Chinese dropped dramatically after 1688 due to more stringent isolation policies. Many naturalized Chinese took Japanese names, while others used the names of their particular homeland in China.

Meiji Period (1868–1912)

When Japan was opened again in the 1850s, Chinese began to arrive at the various port cities in limited numbers, generally in the service of Western firms and individuals. The Sino-Japanese Commercial Treaty of

1871 granted Chinese port, residence, and trading rights, with residence limited to specified areas in Tokyo, Yokohama, Osaka, Kobe, Nagasaki, and Sakai. In 1899 Chinese and Koreans were granted the same privileges of travel and residence that were extended to Europeans and Americans. During the Meiji period the three pillars of overseas Chinese economy developed: trade with Shanghai, Hong Kong, Southeast Asia, the Americas, and other parts of the British empire; the "three-blades trades" (the cook's knife, the tailor's shears, and the barber's razor); and peddling, which permitted Chinese to travel and reside in areas other than the trade ports. Posts established along peddling routes eventually developed into small communities.

After Japan's victories in the Sino-Japanese War (1895–1896) and the Russo-Japanese War (1904–1905), Chinese students began to flood into Tokyo to learn from Japan's adaptation of Western theories and developments. In 1905 there were as many as eight thousand Chinese students within a mile radius of Tokyo's student quarters. Tokyo also became a haven for many Chinese political refugees and a training ground for political activists. Although most of these students and refugees returned to China, their influence endured in the overseas Chinese community.

The 1930s, World War II, and the Postwar Period

Japan's aggression in China during the 1930s led to dramatic drops in the resident Chinese population in

Japan, a trend that was countered by the importation of approximately forty thousand Chinese for slave labor primarily in Japanese mines. Following Japan's defeat in World War II, Manchurians and Taiwanese, formerly considered subjects of Japan, became Chinese citizens. The American Occupation government reported that there were then 14,941 Chinese of mainland origin and 15,906 Taiwanese in Japan.

When Japan signed a peace treaty with the Republic of China in 1952, many Chinese residents in Japan doubted whether the republic truly represented China and were irritated when the Guomindang tried to exercise authority over all Chinese nationals in Japan. In 1972, with Japan's normalization of relations with the People's Republic of China, there was an increase in the number of Chinese seeking Japanese citizenship.

The Chinese migration to Japan between 1988 and 1998 involved mostly young, unmarried Chinese from the mainland who concentrated in the inner city and subsequently sent for family members and friends to join them. Inner-city ethnic communities began to spill over into adjoining suburbs, leading to increasing diversification in a nation usually thought of as remarkably homogeneous.

CHINESE IN MYANMAR The Chinese in Myanmar (Burma) consist of several communities of different origins. In Upper Myanmar, overland inter-

action with the province of Yunnan in China has produced Myanmar's oldest Chinese community, drawn from interior China. In Lower Myanmar, immigrants from the Chinese provinces of Fujian, Guangdong, and Hainan, speaking Hokkien, Hakka, Guangdong, and other dialects, have settled in Burma chiefly from the late eighteenth and late nineteenth centuries. Hence the Chinese in Burma are sometimes divided into overland or "mountain" Chinese and overseas or "maritime" Chinese. Other Chinese immigrants included Baba Chinese (Straits-born Chinese) from the British colonial ports of Penang, Melaka, and Singapore in the nineteenth and twentieth centuries, and the remnants of Nationalist Chinese armies cut off from flight to Taiwan during the Chinese Civil War.

Many Chinese in Burma maintained their cultural identity, for example with language schools. During the World War II occupation of Burma by the Japanese, many Chinese fled to China and elsewhere. Between 1945 and the early 1960s, the Chinese in Burma attempted to rebuild their prewar communities and lives. The establishment of military rule in 1962 and actions by the military regime from 1964, however, led to the forcible closure of Chinese language schools, the prohibition of "Chinese" community activities (although Chinese were still allowed to congregate within dialect groups), and the closure of Chinese-language newspapers. As a result, two generations of Chinese have not had formal instruction in Mandarin and rely chiefly upon Burmese or a combination of Burmese and one of several traditional dialects (Hokkien, Guangdong, etc.).

Since the introduction of new citizenship laws in 1982 by the military regime, Chinese have been considered as foreigners and treated as second-class citizens. Carpenters, largely of Guangdong ancestry, for example, are not legally allowed to work without the full citizenship that they are denied, and are thus heavily represented among Chinese emigrants from Myanmar (many to the United States, Australia, and Taiwan). It is partly for this reason that the Chinese population of Burma has dropped from a high of about 350,000 (1.6 percent of Burma's population in 1961) to about 230,000 (0.6 percent of Burma's population in 1983) in the 1980s. Some estimates, however, suggest that the Chinese population in Myanmar in the 1990s is about 400,000 or higher.

and Twentieth-century Straits and Burma." *Journal of the South Seas Society* 54: 93–106.

Mya Than. (1997) "The Ethnic Chinese in Myanmar and Their Identity." In *Ethnic Chinese as Southeast Asians*, edited by Leo Suryadinata. Singapore: Institute of Southeast Asian Studies, 115–157.

CHINESE IN SOUTHEAST ASIA Since emigration from China began at least a thousand years ago, most migrants have settled in Southeast Asia. At least three-quarters of the world's Chinese outside China reside in the region. However, Southeast Asian Chinese comprise under 5 percent of the region's total population.

Assimilation of Southeast Asian Chinese to indigenous cultures prevents precise measurement of their numbers. Many are more proficient in local languages than Chinese, and most have adopted the citizenship of the countries where they reside. The extent to which Southeast Asian Chinese are considered to belong where they live varies. In Indonesia, for example, a large locally born Chinese community remains distinct from indigenous populations. In Thailand, Chinese descent is a source of pride among the political elite and even in the royal family. In British Malaya, a sizeable Chinese elite became thoroughly Anglicized through business and social interactions with their colonial rulers. In the Philippines, in contrast, an elite group of mixed Chinese-Filipino families become prominent in the anticolonial nationalist movement of the late nineteenth century

Distinctions exist among Southeast Asian Chinese according to ancestral origins within China. Distinct dialects are spoken in the three southeastern coastal regions where most emigrants were born in Guangdong and Fujian Provinces. Dialects and associated occupational differences and loyalties have set Chinese groups apart from each other in Singapore and elsewhere.

Southeast Asian Chinese tend to be urban. They are concentrated in the largest cities of the region, particularly Singapore, where about 70 percent of the population was Chinese in 2000. Because Southeast Asian Chinese are also concentrated in commercial and professional occupations, their economic success has been a sensitive issue. In Indonesia, the Chinese minority, believed to control most of the nation's aggregate wealth, is resented. The apparent dominance of Chinese entrepreneurs in Southeast Asian economies is partly a lasting effect of European colonial policies favoring the employment of Chinese merchants as government revenue agents. Moreover, groups fostering business connections with China and Chinese-owned firms elsewhere in the region have tended to maintain

A dragon in the Chinese New Year parade in Singapore in February 1987. (TED STRESHINSKY/CORBIS)

cultural ties as well, strengthening the association of business success with Chinese ethnicity.

The official view of China's imperial government toward emigration linked it to piracy and illicit overseas trade; only in 1893 was an official ban on emigration lifted and protection provided to Chinese nationals sojourning abroad. Although Southeast Asian Chinese strengthened ties to their ancestral homeland in patriotic solidarity during the Sino-Japanese War (1937–1945), during the Cold War most reacted to suspicions of Communist affiliation by emphasizing local loyalties. With economic liberalization of the People's Republic of China (PRC) since the late 1970s, Southeast Asian Chinese investments in the PRC have become significant.

CHINESE IN VIETNAM According to the 1989 census, there are 900,185 ethnic Chinese, or "Hoa," in Vietnam. This corresponds to only 1.4 percent of the total Vietnamese population. Nevertheless, as with other Chinese minorities in Southeast Asia, they play a very important role in the economic life of Vietnam. This has been the case since Vietnam gained independence from France in the mid-1950s and was particularly true in the former Republic of Vietnam (RVN) up to 1975. Ethnic Chinese have played a different but still important role in the socialist economy of the Democratic Republic of Vietnam (DRV).

After the end of the Vietnam War and the demise of the RVN, the new Vietnamese authorities opted to pursue economic policies that were characterized by the gradual implementation of socialist transformation and that had a considerable detrimental impact on the economic interests of the ethnic Chinese. Relations between China and Vietnam also gradually deteriorated, and as this occurred, increasingly discriminatory policies were implemented against the ethnic Chinese in Vietnam. These factors caused a large-scale exodus of ethnic Chinese from Vietnam in 1978 and 1979. An estimated 430,000 to 466,000 ethnic Chinese left Vietnam between the end of the war in 1975 and the end of September 1979.

The 1980s and 1990s have been characterized by a slow process of reintegration of ethnic Chinese into Vietnamese society. This has been spearheaded by developments in Ho Chi Minh City, where about half of the ethnic Chinese live. Decrees of the Communist Party of Vietnam and government in 1995 and 1996, respectively, signaled the full reintegration of the ethnic Chinese. Apart from changes in the policies implemented at the local, government, and party levels directed at the ethnic Chinese, the overall policies of *doi moi* ("renovation") and economic liberalization have contributed to reintegration.

Given the overall situation today, the future of the ethnic Chinese in Vietnam looks brighter than at any time since 1978. A pertinent question is whether the process of reintegration will continue or if there are potential pitfalls that could lead to the reemergence of past problems and possibly a new mass migration of Chinese. To a certain degree, the future development will depend on economic policies. As long as the policies of

economic renovation and reform are pursued, such a situation will not recur. Another important factor is the impact of China-Vietnam relations. In principle, as long as the bilateral relations are good and there is a willingness to maintain these relations, they will have a positive impact on the ethnic Chinese in Vietnam.

CHINESE INFLUENCE IN EAST ASIA In the seventeenth century, European scholars presented their latest maps to the Chinese court. Although the Chinese were impressed with the cartographers' skills and technological sophistication, the court officials were offended that China was not pictured at the center of the world. Historically, China viewed itself as the Middle Kingdom. Their centrist worldview was based on objective criteria. As late as the Ming dynasty (1368–1644), China continued to be the world's most powerful nation in terms of size, population, commerce, wealth, technology, learning, fine arts, and literature. China's dominance in East Asia (Korea and Japan) for most of this region's recorded history was based on China's supremacy. It was the source rather than the recipient of culture.

Like the waxing and waning of the moon, there were periods when Japan and Korea resembled "little Chinas," because of their conscious imitation of China, while there were other periods of minimal interaction between these states. It is significant that the greatest influence China had on East Asian states occurred during the early centuries of their recorded histories. Consequently, Chinese culture is at the root of East Asian society. As humans are more profoundly influenced by experiences in their early years, Korea and Japan's formative years were marked by their acceptance of the Chinese economic, political, ideological, and social patterns. What Japan and Korea adopted in their early civilizations became the foundation for their more mature states.

Migrants from northern China were among the earliest inhabitants of Korea and Japan. During the first millennium BCE, these migrants developed a hunter-gatherer culture in Japan and Korea. The religion of the area was animistic with an apparent reverence for ancestors and nature. Because Korea was geographically attached to the continent, it was more directly influenced by the political machinations of China. During China's Han dynasty (206 BCE–220 CE), China directly ruled the peninsula. Yet, a recurring theme between China and East Asia is seen early on in that when China faced internal crisis, its political influence in Korea and Japan diminished. Thus, the fall of the Han dynasty coincided with the increased strength of the indigenous Korean kingdoms of Koguryo (37 BCE–668 CE), Paekche (18 BCE–663 CE), and Shilla (57 BCE–935 CE).

Economic stability, brought about by the advent of rice agriculture, shifted the social structure of East Asia from a nomadic existence to a sedentary one with defined geographical boundaries. In battling for supremacy over a particular state, East Asian clans sought legitimacy for their positions by their affiliation with China. The political tug-of-war in the three native states in Korea and the emerging state of Yamato Japan (300–552 CE) produced centralized powers and definite political hierarchies. The rise of dominant states in East Asia coincided with the golden age of China—the period of the Sui (581–618 CE) and Tang (618–907 CE) dynasties. It was during this era that Korea and Japan adopted Chinese patterns in religion, philosophy, political structure, and literature.

Buddhism Spreads

India is the homeland of the Buddha, yet by the Han dynasty this world religion was beginning to flourish in the Middle Kingdom, while its influence waned in India. Buddhism continued to move east. In 372 CE, Buddhism was introduced to the Koguryo court. The religion spread throughout the peninsula as Chinese monks proselytized their faith throughout the Korean states. Concomitantly, Koreans traveled to China to study at influential monasteries. The implications of the Korean states' acceptance of Buddhism as the metaphysical explanation to reality were profound. The ties between Korea and China were now cemented by a common religion. The sacred Buddhist scriptures were written in Chinese characters, and the desire for the Koreans to understand Buddhism solidified the use of Chinese as the mode of written communication throughout Korea. In addition to adopting the Chinese written language, which is a significant gauge of Chinese influence, the Korean states adopted

the art and architecture that accompanied Buddhism. Korean dominant art forms mirrored Chinese works—temples and palaces were built according to the popular styles in China.

During the fifth century, elements of Buddhism crossed over from Korea to Japan, but its official introduction did not take place until 552. Chroniclers note that during the first half of the sixth century, the state of Paekche was at war with Shilla and Koguryo and, in an effort to bring Japan into the fray, Paekche offered to introduce a glorious new truth to the islands should Japan offer its assistance. Thus, it was officially through Korea that Buddhism was introduced to the Japanese court. It was adopted by the most powerful families at the court, who were relatively recent emigrants from the peninsula, and, like Korea, Japan's adoption of Buddhism affected language, art, and architecture in Japan. Chinese written language was the means of written communication throughout the islands, and Japanese art was barely distinguishable from the Chinese art of the day.

The influence of Buddhism on East Asia was from the top down. It was the elite families who first embraced it, though it eventually moved into all social classes. The leading states sponsored the propagation of Buddhism by building monasteries and providing economic relief to those tending the temples. Artisans were paid by the state to create Chinese-style Buddhist art pieces and this media filtered down to the general population. It might also be said that Buddhism spread throughout East Asia because indigenous religions were still evolving and they lacked the sophistication of Buddhism. The elaborate rituals, scriptures, mantras, and art that Buddhism offered was accompanied by other cultural influences from China.

Just decades after Buddhism was officially introduced to Japan, China was united under the glorious Tang dynasty. The political and economic splendor of Tang China was copied by the states of East Asia. In the political realm, the Tang concept of the state's supremacy and the emperor's complete authority was adopted in Korea and Japan. In Japan, this firmly established the still-extant imperial throne. Japan and the Korean states also copied the Tang pattern of taxation, which meant that a more sophisticated manner of assessing the land's resources was needed. The rulers of Korea and Japan partitioned their land into provinces, prefectures, and districts, with the assumption that all land belonged to the state, and taxes were required from those who worked the land. In Korea and Japan, as in China, rice was the currency of the day, and a certain percentage of the harvest,

CHINESE INFLUENCE IN EAST ASIA— A TWO-WAY STREET

China influenced Korea and Japan through travels to these nations by Chinese and travels by Koreans and Japanese to China. The following account describes some of the efforts of Korean scholars in bringing Buddhism to Korea.

Shortly after Buddhism was first introduced into Korea, Koreans began to make pilgrimages to the great temples and teachers of the law in China. A well known Chinese book on Buddhism gives the names of six Koreans who, in the latter part of the seventh century, found their way through China to India. In 583, the son of the King went. In 596, Payak of Kogoryu went to Mt. Tendai in South China and brought back the tenets of the Tendai Sect. In 600, Wunkwang brought back the teachings of the Sinin sect, and, in 634, Myungnang brought more of its rules. Wunkwang also brought copies of the Sungil, Non and the Nirvana Book, the sacred writings most used by this sect. In 617, Wunhyo, and, in 669, Wisang went to the land of Tang in China and brought back many books and relics. These last two were founders of the Pumusa monastery near Fusan, now one of the five largest in the country. Heikwan, in 625, brought back the teachings of the Samnon Sect from the land of Sul in China. By 625, there were five Buddhist sects in Korea.

approximately 40 percent of the crop, was paid to the state. The adoption of the Chinese political and economic patterns increased the political stability in East Asia. The increasingly sinicized states of Japan and Korea continued to look to China for legitimacy, learning, and culture.

The extent of China's influence during this era is exemplified in Japan's so-called seventeen-point constitution that was developed in the seventh century. It began with the Confucian injunction that the goal of the state is to establish harmony above and friendliness below. This was followed by the second point, which asserted that conversion to Buddhism would straighten everything crooked. In Korea, "universities" were established for the exclusive purpose of teaching the Confucian classics, and similar academies were founded in Japan. The Confucian principles of filial piety and rigid rules that govern relationships were propagated through these learning institutions.

Political Institutions Transformed

Political institutions were transformed in Japan and Korea during the Tang dynasty. In Korea, the government adapted the six ministries of the Tang government. In Japan, the ministries of a central secretariat and the imperial household were added to the conventional six of Tang. The most cosmopolitan city of the eighth century was Chang'an, the capital of China. Japan and Korea sent ambassadors to Chang'an. Not only did they borrow the architecture and art of Chang'an, but also they laid out their capitals in the checkerboard fashion that characterized the Tang capital. During the eighth century, Japan established Nara in the fashion of Chang'an. In 794, on the northern end of the Kyoto plain, the city of Heian was founded with dimensions of just over 5 by 5 kilometers, a bit more modest than the Chang'an measurement of approximately 9.5 by 8 kilometers.

Korea and Japan also sought to create a bureaucracy based on merit, as was the case in China. Positions were

set up in the government structures with the understanding that they would be filled by men of rank. In 958, the Korean civil-service exam was based on the Confucian classics, and one advanced through knowledge of these Chinese works. Yet, by the tenth century, there was a definite atrophy of Chinese influence in Korea and Japan. This was due to the hard times that faced China following the collapse of the Tang as well as a fundamental shift in China's state revenue system.

While Japan and Korea sought to emulate Tang China, there were aspects of the Chinese world that did not quite fit the Japanese and Korean models. China's neighbors never fully integrated the merit-based bureaucracy system, for example. Aristocratic families dominated the political and economic worlds of Korea and Japan, and an exam to level the playing field did erase the continued dominant role of the elite. The true breakdown of the Chinese system in East Asia, however, was due to the increase of tax-free lands. In Korea and Japan, portions of land were given to monasteries and families to whom the court owed favors. At the outset, these tax-free lands were minimal in size. These small parcels of land, however, grew into enormous tax-free estates. The state could do nothing about its declining tax revenue because the estate owners were either in under the patronage of the elite families or were from the elite families themselves. By the twelfth century, it is estimated that tax-free religious or estate zones accounted for more than 50 percent of the land in Korea and Japan. With the steady diminution of revenue, the states found it difficult to respond to internal crises—particularly in trying to maintain peace in an age in which marauding gangs preyed on farming villages. Estate owners and villagers turned away from the impotent state and to the warrior class for protection. Thus, the pattern of state-control and a scholar-led bureaucracy subtly underwent a change. In Japan, true power moved away from the imperial family to the *bakufu* (tent government), or military government led by the *sei taishogun* (barbarian-suppressing generalissimo, commonly called simply shogun) was headquartered with his retainers and advisors.

Korea and Japan's departure from the Chinese model in the political realm coincided with their adoption of indigenous written languages. Chinese character-based written language was always a difficult fit in the Korean and Japanese polysyllabic and inflected languages. One compromise was to use the Chinese characters to represent sounds rather than words. During the tenth century in Korea, a system called *Idu*—wherein Chinese characters represented sounds—became the mode of written communication. By the

fifteenth century, a Korean phonetic system known today as *hangul* replaced the Chinese character-based written language on the peninsula. In Japan, it was the women in the eleventh-century court that led the way in writing Japanese, while the men continued to use Chinese characters. Moreover, the literature the men produced was inferior to the more adaptable, but new, Japanese written language.

During the Yuan (1279–1368), Ming (1368–1644), and Qing (1644–1912) dynasties, Japan and Korea continued to acknowledge the supremacy of China in East Asia. It is true that Toyotomi Hideyoshi (1537–1598) of Japan had visions of invading China at the end of the sixteenth century, but Hideyoshi's irreverent approach to China was the exception, not the rule. Buddhism, particularly the Chan sect from China (called Son in Korean and Zen in Japanese), profoundly influenced society in art, architecture, and philosophy during the premodern era of Japan and Korea. During Japan's Tokugawa period (1600/1603–1868), the prevailing ideology was Neo-Confucian thought, as this validated the division between the elite, farmers, artisans, and merchants. In Korea, the Choson era (1392–1910) was one of continued deference to China. The "little brother" sent tributary missions to the "elder brother" three times a year. Confucian ideology was more thoroughly integrated into Korean society during this period than it was in China.

China's Weakness Confirmed

It did not go unnoticed by the East Asian nations, however, that during two of its last three dynasties, China was ruled by outsiders, first the Mongols (1279–1368) and then the Manchus (1644–1912). China's vulnerability and weakness were confirmed by humiliating defeats in its wars against the British during the nineteenth century. Concessions were made to foreigners, and China's undisputed leadership of East Asia was soon to be a memory. During the last half of the nineteenth century, both Japan and China sought to strengthen themselves. China wished to stave off the Western imperial countries, while Japan coveted a first-class-nation status. Japan's lack of respect for the once-proud leader in East Asia was demonstrated in the 1984–1895 Sino-Japanese War and subsequent harsh Treaty of Shimonoseki (1895). Korea, the pawn in the game, was forced to recognize Japanese suzerainty.

The first Sino-Japanese conflict was a precursor to a much more bloody affair between these nations. Between 1937 and 1945, Japan and China were locked in mortal combat. The tragedy at Nanjing—often referred to as the Rape of Nanjing, where Japanese

soldiers butchered Chinese civilians—demonstrated the animosity Japan felt toward its old tutor. Some speculate that the anger the Japanese had against the Chinese was rooted in the Japanese embarrassment and disgust that the source of their culture had sunk so low. Korea, by contrast, was made part of the Japanese empire (1910–1945), and the Koreans, too, were treated harshly by their new colonial ruler.

Post–World War II East Asia can be understood only in the light of the Cold War. Sino-Japanese relations remained sour because of the memory of the Japanese war brutality and because the United States insisted for decades that Japan should not have relations with Communist China. The Korean peninsula was split in to two countries, with North Korea experiencing warmer relations with China. As China emerged as a free-market state, however, its relations with South Korea improved, while North Korea continued to flounder because of its large military budget and the collapse of its once-powerful ally, the Soviet Union.

Japan and Korea have experienced a sweet-and-sour relationship with China. China's influence in these two countries, however, is beyond estimation, because of the adoption of the Chinese pattern in the early civilizations of East Asian states.

CHINESE INFLUENCE IN SOUTHEAST ASIA

In November 1367, the Chinese, led by its first peasant-emperor, Zhu Yuanzhang (1328–1398), continued to wage war against the retreating Mongols. In calling up fresh troops, the emperor wrote to his subjects that since time immemorial the Chinese emperors ruled everything under heaven and that the outside "barbarians" were privileged to pay homage to China. Indeed, China believed that the world revolved around it, and the Chinese selectively spread their culture to "barbarian" states. Consequently, China's economic, cultural, and political influences in East Asian countries were profound. Moreover, China's prestige extended beyond its immediate neighbors; over the past two millennia its influence on the Southeast Asia has been as varied and complex as the region itself.

China and Vietnam

China's historical relationship with Vietnam did not follow the general principles that governed China's relations with the rest of Southeast Asia. Historically, Vietnam has experienced a deeper and longer-lasting influence from China than any other Southeast Asia country. The Vietnamese state was founded in the third century BCE by a Chinese military governor. Two hundred years later, in 111 BCE, China made much of modern Vietnam into a province in the expanding Han Empire (206 BCE–220 CE). Vietnam remained a part of China for one thousand years. Much like the early inhabitants on the Korean peninsula, urban Vietnamese took on Chinese culture in virtually every sphere of life, including politics, literature, ideology, written language, and religion. It is significant that while Theravada Buddhism came directly from South Asia to Burma, Laos, Cambodia, and Thailand, where it became the established form of Buddhism, Mahayana Buddhism—the form of Buddhism practiced in China—took hold in Vietnam.

It must be noted that despite China's thousand-year-long political domination of Vietnam, the Vietnamese tenaciously held on to some indigenous aspects of culture, including the Vietnamese spoken language and their higher view of women. Scholars note that the more the Vietnamese accepted the culture of the

Chinese, the less likely it was that they would accept China's political suzerainty over their land.

Early Relations Between China and Southeast Asia

Economic opportunities rather than political interests dominated China's early relations with the rest of Southeast Asia. The early state of Funan (c. 50–550 CE) on the Mekong Delta River in modern-day Vietnam was a catalyst for Chinese-Southeast Asian relations. In Funan, Southeast Asians became the intermediaries between Chinese-Indian and Chinese-Middle Eastern traders during the first four centuries CE. By the fifth century, however, Southeast Asian entrepreneurs began substituting indigenous products, such as Sumatra pine resins and sandalwood, for the frankincense and myrrh from further west. With the rise of the Chinese Nan Qi state (479–502), trade between China and Southeast Asia dramatically increased as China was an insatiable market for nutmeg, cloves, and mace from the Moluccas, and for rhinoceros horn—which the Chinese prized as an aphrodisiac—from Borneo.

Between the seventh and thirteenth centuries China's influence in Southeast Asia turned political as more powerful states emerged in the region. Champa in present-day Vietnam, Angkor in present-day Cambodia, Pagan in present-day Myanmar (Burma), and Srivijaya and Majapahit in present-day Indonesia all had some type of political relationship with China though these states were more deeply influenced by India. India's prestige in Southeast Asia was due to the world religions it exported to its eastern neighbors. Buddhism, Hinduism, and Islam took hold of Southeast Asian states, and the missionaries from these religions came mostly from India. It is said that India's influence in Southeast Asia was greater than that of China because India had no political agenda in the region.

The relationship between China and Srivijaya, the dominant state in maritime Southeast Asia between the eighth and fourteenth centuries, showcases China's influence in this region. Located close to the modern city of Palembang in southeastern Sumatra, Srivijaya was able to dominate the area due to its strategic location and its political savvy. The political acumen of its rulers included the decision to pay annual tribute to the greatest power in all of Asia—China. Like most early states in Southeast Asia, Srivijaya sought legitimacy and protection based on its tributary relationship with China. Paying homage to China proved to be a tricky game for Southeast Asian states, however. China promised protection to tributary states, but the bigger fish in Southeast Asia could swallow the smaller ones before

China could respond. Again, Srivijaya is a case in point. Majapahit, which was based in Java, gradually increased in wealth, influence, and strength, and was able to defeat Srivijaya before China could come to the latter's rescue. In 1397, twenty years after the fall of Srivijaya, the Chinese emperor wrote a letter to this defunct kingdom castigating it for the breakdown in the tributary relationship, apparently unaware that its client state had fallen.

The Ming-Dynasty Period

Three events led to China's increased economic importance to Southeast Asia during the Ming dynasty (1368–1644). First, China was once again in the hands of the Chinese. The Mongol-dominated Yuan dynasty (1279–1368) had fallen, and under the Ming a series of capable emperors sought to extend their influence over Asia. Second, under the third Ming emperor, Yongle (1360–1424), the Chinese built enormous sailing ships that traveled as far as Mogadishu in western Africa. These impressive ships were more than 130 meters long (by comparison, Columbus's *Santa Maria* was only about 26 meters long that would appear and was built a hundred years later). For three decades these impressive transports traveled throughout Southeast Asia, demanding that each state pay proper tribute to China. Ambassadors from these states were ordered to appear before the Ming emperor and demonstrate the respect due to the Son of Heaven. This gunboat diplomacy not only increased interaction between China and its southern neighbors, it also increased the prestige and political dominance of China throughout East and Southeast Asia.

The third catalyst for China's economic growth in Southeast Asia was the arrival of the Europeans in Asia. The Chinese were able to keep the Western powers on the periphery until the nineteenth century. But when the Portuguese were able to set up a small colony in Macao, just off the major trading port of Guangzhou (Canton) in southern China, China's role in Southeast Asia changed forever. The Portuguese priests and Spanish friars set up a network of trade from Nagasaki to Macao to Melaka and Manila. The key to the entire trading network was the market and materials of China. A case study of the Manila galleon trade demonstrates the power China came to hold in Southeast Asian economics. Silver from Mexico and Peru made its way to China by way of the Philippines; the ship then returned to Acapulco with Chinese goods. Chinese porcelain ware and textiles were coveted in South America and Europe, and the payment for these goods was the silver from across the Pacific Ocean. Manila was where these ships to Acapulco were

loaded with Chinese products. This brought a greater number of Chinese into Manila and other parts of Southeast Asia, where global trading was directed by a growing network of colonial powers. Despite the increased presence of Chinese in Southeast Asia during the Ming period, the ethnocentric tendencies of many Chinese prevented their integration into cultures and societies that were unfamiliar to them. Rather, the Chinese in Southeast Asia produced a subculture of exclusive Chinese neighborhoods and schools.

Chinese Migration

The nineteenth century saw unprecedented Chinese migration to Southeast Asia. The internal factors that drove Chinese from their homeland were economic and political. During the first half of the Qing dynasty (1644–1912), China experienced a dramatic increase in its population, so there was not enough land to pass down to the new generations because of the practice of dividing land among all heirs. At the same time, the price of silver—specie used to pay taxes—rose, and farmers weren't able to pay their taxes. Later in the nineteenth century, the Taiping rebellion (1850–1864)—a civil war that was responsible for some 20 million deaths—added to the misery of the Chinese. Revolution was one option to internal crises; migration was another.

Western colonization of Southeast Asia was another stimulus in bringing Chinese south. In the nineteenth-century British Straits Settlements of Singapore, Penang, and Melaka, the English found that the Chinese were willing to do work that the indigenous population found loathsome. In particular, the backbreaking labor in the mines of Malaya was mostly accomplished by Chinese rather than indigenous labor. By the 1860s, Chinese made up more than 50 percent of the population in Singapore, and Chinese businessmen moved to the Malaya Peninsula and helped the British administer the tin mines and rubber plantations. As Malays were reluctant to work for the British or Chinese, an economic opportunity for Chinese opened in the south, and thousands of Chinese, mainly from China's southeastern provinces, flocked to Malaya. Nineteenth-century colonial governments also encouraged Chinese businesspeople to set up shop in Indonesia and the Philippines. These overseas Chinese remained in Southeast Asia. At the beginning of the twenty-first century, the Chinese remain the dominant ethnic group in Singapore, and some 35 percent of Malaysia is ethnically Chinese. Chinese influence is apparent in the region's business communities, and ethnic tension between the Chinese and Southeast Asia's indigenous populations is blamed

on the inordinate economic power the Chinese enjoy in the region.

The People's Republic of China

The People's Republic of China (PRC) was formed on 1 October 1949. The PRC, with its Communist ideology, had a pronounced effect on Southeast Asia during the Cold War. Visionaries throughout the region, tired of corrupt governments and the continued presence of imperialist powers, looked to China as an example of a socialist revolution. Vietnam, Indonesia, and the Philippines all looked to China for inspiration.

In the Philippines, landless peasants caught in a cycle of perpetual debt to rich landlords believed that socialism, as expressed in the PRC land reform movement, would bring economic equity to their country. Such Filipino organizations as the New People's Army and the Philippine Communist Party looked to China and its leader, Mao Zedong (1893–1976), for ideological direction. In the 1960s a small minority of disgruntled Indonesians also promoted the PRC ideology as an alternative to the government of President Sukarno (1901–1970). But perhaps the greatest impact of the PRC on these nations is that established leaders used the threat of supposed revolutionary Chinese influence in their countries to impose harsh and authoritarian rule. In Indonesia, thousands of Sino-Indonesians were killed to crush an alleged Chinese Communist coup in 1965. In the Philippines, President Ferdinand Marcos (1917–1989) declared martial law in 1972 in response to the threat of a Communist takeover of the archipelago.

In post-World War II Indochina (Cambodia, Vietnam, and Laos), neutrality between China, the Soviet Union, and the United States proved impossible. The Chinese aided the Communist leaders and movements in each of these countries. During the 1954 Geneva Conference, which ended the conflict between France and its former Indochinese colonies, the enormous prestige China had in the region was demonstrated as China's representative to the conference, Zhou Enlai (1898–1976), helped to bring the various fighting sides into an agreement. While North Vietnam and various Communist elements in Cambodia felt betrayed by the PRC at Geneva, it is instructive to note that they signed the agreement. Chinese advisers continued to make their way into Laos, Vietnam, and Cambodia following the 1954 conference, and war material was sent south to aid North Vietnam.

China's influence in Vietnam declined in the late 1960s, and the U.S. belief that North Vietnam and its leader, Ho Chi Minh (1890–1969), were PRC puppets

was false. Indeed, by the early 1970s relations between North Vietnam and China were acrimonious at best. The increasingly strained relationship between North Vietnam and China was due to the growing partnership between North Vietnam and the PRC's enemy, the Soviet Union. The PRC felt North Vietnam's friendship with the USSR was a slap in the face from a nation that had historic and cultural ties with China.

China took its revenge on Vietnam by supporting the Communist Khmer Rouge, who took over in Cambodia in 1975 and whom the Vietnamese opposed. The PRC recognized the Khmer Rouge government and sent high-level personnel to demonstrate its support of the new Communist state. When Vietnam intervened in Cambodia on 25 December 1978, China responded by sending troops into Vietnam to punish its wayward son two months later. Vietnam held its own in the battles with China and for the next decade the two countries sank into a military quagmire as Vietnam continued its military presence in Cambodia while China sent supplies to the Khmer Rouge guerrillas on the Thai border.

Analysts believe that China's influence will continue to grow in Southeast Asia. United, economically vibrant, and accustomed to political primacy, China has increased its hegemony in the potentially oil-rich islands and atolls in the South China Sea. The growing frustration felt in Southeast Asian nations is explained by Indonesia's leading maritime expert, Hashim Djalal who noted that when Southeast Asians try to stem China's increasing presence in the South China Sea, the Chinese respond by talking about dynasties and they bring out old maps. Understanding China's past influence in Southeast Asia may be the key to future relations between these two regions.

CHINESE NEW YEAR Chinese New Year (*Chun Jie*) is the most important festival in the Chinese lunar calendar. *Chun Jie* means the "spring festival," and based on the almanac of the emperor Han Wu Di (140-87 BCE), it falls on the first day of the first month, which does not correspond to January first of the Western, Gregorian calendar. It is celebrated for fifteen days and culminates at the first full moon of the new year.

Before the New Year, Chinese families customarily conduct a thorough spring cleaning of their homes. Examples of auspicious Chinese calligraphy, such as *chun* (spring), *fu* (luck or happiness), and *shou* (longevity), as well as red-colored materials, are hung as decorative pieces in the home. In Chinese, the word for "red" sounds the same as the word for "prosperity." Festive delicacies (for example, biscuits and cakes) are prepared and new clothes purchased. On New Year's eve, family members gather for an annual reunion dinner. They offer food to the ancestral tablets, which are believed to embody the spirits of individuals who have produced sons capable of performing ancestral rites. In return for this attention, the ancestors ensure the fertility and prosperity of the lineage. This ritual renews and reaffirms filial ties. After dinner, many people visit local temples to offer prayers.

Throughout the period of the New Year celebrations, relatives and friends visit one another to offer felicitations. Gifts symbolizing tokens of good fortune, such as oranges and *bon poa* or *hong bao* ("red packets") containing money, are exchanged. In multiethnic nations in Southeast Asia, like Malaysia and Singapore, the practice of open houses has sprung up. Friends and acquaintances of other ethnic and religious back-

DEBTS AND NEW YEAR'S

The Chinese New Year celebration is far more than a public festival, as it also marks important social, political, and economic relations among people in the community. The following text points to one important function—the settling of debts.

But there is another, more serious reason for excitement in this last week of the year; it is the time when one must settle all debts. Western usages spread quickly in China; our business techniques are accepted by the big firms in Tientsin, Shanghai, and Canton, but the small shopkeeper as well as the ordinary citizen still feels obliged to follow this old custom of settling debts three times a year—just before the three great "festivals of living." It is, if one looks for a noneconomical explanation, another of these rites of "cleaning up," of chasing away the bad spirits. Before we enter a new year, everything should be clean—our hearts, our relations with our neighbors. An obligation of the dying year should not be carried over into the new one, just as the old dust in the rooms should not stay there over the New Year.

It is never more difficult to find cash than in these days, and there is no better opportunity for the foreign visitor than now, when someone may be forced to sell an old family piece to get some. Our "January sales" thus take place the week before New Year's in China, with the same "drastic reductions."

grounds pay visits to Chinese homes as a gesture of goodwill. Localized practices like these may be less in evidence in other parts of Asia.

CHINESE, CLASSICAL Classical Chinese refers to the language of canonical literature and formal documents in China before the twentieth century. In the early twentieth century, language reforms were instituted so that writing was no longer carried out in the classical language, which was understood only by an educated elite, but instead was rendered in an approximation of the modern northern vernacular.

When trying to give a formal definition of classical Chinese, linguists tend to resort to one of two strategies: the first is to treat classical Chinese as all that is not in the vernacular—definition by default; the second is to try to pinpoint the historical period out of which classical Chinese developed and to state that classical Chinese consists of literary traditions that grew out of the speech habits of a particular time and place.

The Classical/Vernacular Divide

When stating that classical Chinese (*wenyanwen*) is the logical complement of vernacular Chinese (*baihuawen*), it is natural to ask where we draw the line and what criteria we are using. Criteria that have traditionally been used to distinguish classical and vernacular Chinese include:

1. Intelligibility: Is it readily understood by the average native speaker? Or is it language that only the educated elite can understand?
2. Spoken versus written mode: Is it more like natural speech or more like stylized writing?
3. Time depth: When we talk about "natural speech" and "average native speaker," are we using contemporary people as a point of reference (modern audience), or are we referring to people at the time the work was written (historical audience)?

Let us first look at the intelligibility criterion. By "intelligible," what is meant is that the language is comprehensible to a general audience; if it cannot be understood by the average native speaker without further training, it is considered "unintelligible." The intelligibility criterion cleverly captures the lay view of the vernacular/classical divide: Vernacular Chinese is Chinese written in language the layperson can understand; everything else is relegated to classical Chinese regardless of the source of the difficulty. This view is often reflected in popular comments about writing styles: certain styles are difficult to understand because they are too *wenyan* (classical/literary), as if classical Chinese stands for all that is obscure or arcane.

There are problems with this approach, however. The first is that intelligibility judgments are necessarily limited to the here and now, for we have no way of determining whether people in ancient times can

understand a particular style of writing or not. That is to say, we are tied to the judgments of a modern audience. If we were to do this, we run into a second problem, which is that we would have to exclude from our definition of vernacular Chinese the language of historical popular novels such as *All Men Are Brothers* (*Shuibu Zhuan*) and *Dream of the Red Chamber* (*Honglou Meng*), which are traditionally considered vernacular literature (*baibua xiaoshuo*), but which in modern times are not readily comprehensible to the uneducated reader.

An alternative to the intelligibility criterion is that of spoken language versus written language. Most of the world's languages maintain a difference between spoken and written varieties: the spoken variety is usually more informal and involved, employing more first and second person pronouns ("I," "you"), conjunctions ("and," "but"), and situation-dependent references ("last night," "over here"), whereas the written variety tends to be more informational, abstract, and explicit, often containing learned or technical vocabulary. Relying on such universal tendencies, we can determine whether the text at hand is closer to typical spoken language or written language. Texts that bear closer resemblance to spoken language are then labeled vernacular Chinese; those with attributes of written language are relegated to classical Chinese.

Note that the intelligible/unintelligible divide is not the same as the spoken/written divide. The reason for this is that most uneducated speakers can understand *some* formal language. It is not the case that uneducated speakers can only understand language in the spoken mode and that they find formal writing totally unintelligible. There is an in-between stage in which language can have characteristics of the written register and is yet comprehensible to the uneducated reader.

Whether we use intelligibility or spoken/written language as criterion, however, an additional variable is the historical period of the intended audience. Writing that is intelligible to or characteristic of the population of one historical period may be unintelligible to or uncharacteristic of the speech of another stage in history. For this reason, it is important to specify the period on which we are to base our definition.

A spoken-language, historical-audience-based definition of classical Chinese was given by the scholar Hu Shi (1891–1962), who was one of the chief proponents of language reform and vernacular writing in early Republican China. In his seminal work, *Baibua wenxue shi* (*A History of Vernacular Literature*), Hu implied a dichotomy in which vernacular litera-

ture is literature written in the spoken language of the day (which may be far removed the spoken language of *today*), and classical literature is that which is excluded from this scope by default. By this definition, what is vernacular and what is classical is not a fixed notion, but rather varies with each historical period. This dichotomy, however, while similar to the European notion of vernacular and mainstream literature, is foreign to the Chinese tradition. Hu's definition is often criticized for framing a definition of vernacular language that is too broad. His definition would necessarily include as vernacular obscure works of oral literature from remote periods, which speakers of modern Chinese have great trouble understanding.

A more widely accepted definition of vernacular and classical Chinese is that of Lü Shuxiang: The vernacular language is written text that corresponds to spoken language from the Tang dynasty (618–907) onward; all else is relegated to classical Chinese. Lü's treatment avoids the shortcomings of both Hu's working definition and the lay notion of the vernacular: It includes as vernacular drama and popular writing from the Ming (1368–1644) and Qing (1644–1912) dynasties while excluding obscure pre-Tang works of oral literature. Lü's definition is sometimes criticized for its arbitrary choice of the Tang dynasty as a divide, but it is worth noting that intermingling of Sinitic and Altaic-speaking populations in cosmopolitan Tang society accounts for the considerable linguistic gap between Middle Chinese (265–1269) and Premodern Chinese (1269–1795). It is also during this period that basic Chinese word order began to shift from Subject-Verb-Object (SVO) to Subject-Object-Verb (SOV)—a change often taken to be an important distinction between classical Chinese and modern Chinese.

Classical Chinese throughout the Ages

Having defined the classical language as writing several degrees removed from the spoken language, it is natural to ask whether this writing style may have been derived from the spoken language of an earlier period. Linguists have found considerable overlap between classical Chinese grammar and the syntax of Old Chinese oracle-bone inscriptions and bronze inscriptions of the Shang (1766–1045 BCE) and Western Zhou (1045–771 BCE) dynasties. The inscriptions are for the most part short sentences describing ceremonies and divinations and are considered a more or less faithful record of the spoken language of the day in the Huang (Yellow) River basin.

With the breakup of the Zhou empire (256 BCE), however, a new culture of pluralism demanded a more stylized form of writing suited to political oratory. This

is reflected in the language of works such as Confucius's *Analects* (*Lunyu*) and *Mencius* (*Mengzi*), which is more concise and structured, is richer in rhetorical devices, and shows obvious imitations of earlier classics.

The later Warring States period (402–221 BCE) and the Qin (221–206 BCE) and Han (206 BCE–ce 220) dynasties saw a further move toward allegory and ornamentation, resulting in writing that is stylistically distinct from the vernacular language of the day. It was during this period that classical Chinese forged an identity as a literary language separate from vernacular speech, and it is the conventions of this period that later authors sought to emulate when writing in the "classical style." For this reason, some sinologists reserve the term "classical Chinese" for the writings of the Qin and Han dynasties and refer to the language of later imitations as "literary Chinese."

Following the Han dynasty, worship of form was taken to an extreme at the expense of substance, giving rise to the belletrist "parallel prose" (*pianwen*) of the South dynasties (420–589), in which balance of rhythm, imagery, and tonal patterns reigned supreme. This worship of formal elements created a backlash in the Tang dynasty, in which neoclassicists such as Han Yu (768–824) and Liu Zongyuan (773–819) called for a return to substance and the rhetorical styles of the Qin and the Han. From the Tang onward, different schools of writing offered different takes on the classical language, and literary aesthetics oscillated between form and substance and between arch conservatism and the adoption of new grammar and lexicon.

The dominance of classical Chinese came to an end after the first Opium War (1840–1842) as intellectuals began to see the classical/vernacular gap as a hindrance to greater literacy and called for the replacement of classical Chinese with the modern spoken language in education and media as part and parcel of the modernization of China. In the New Culture Movement of the late 1910s, promotion of Vernacular Chinese gathered momentum through the efforts of noted scholars such as Hu Shi, Chen Duxiu (1879–1942), Qian Xuantong (1887–1939), and Fu Sinian (1896–1950), culminating in the Vernacular Language Movement of 1917–1919. As a result of this movement, vernacular Chinese was adopted as the standard language of textbooks, and influential new works of literature by authors such as Lu Xun (1881–1936) began appearing in the vernacular.

To this day, however, the classical language lives on in government missives and legal documents and in all manner of writing deemed formal. Classical pat-

terns and set expressions appear frequently in vernacular prose—more so in Taiwan than in mainland China. Despite the efforts of early twentieth-century language reformers to make a clean break with *wenyan*, it does look as if it will be some time before the new writing born of the Vernacular Language Movement can forge an identity fully distinct from that of the classical language that has been standard for much of Chinese history.

CHINESE, OVERSEAS At the end of the twentieth century, an estimated thirty-eight million ethnic Chinese lived outside China in almost every country on the face of the earth, including places as unexpected as Iceland and Panama. This geographic dispersion suggests the difficulties of counting exactly how many Chinese there are outside China. Chinese have moved within and beyond the borders of China for several millennia. Where they have both sojourned and settled among non-Chinese, they have experienced varying degrees of assimilation and acculturation, depending on local reception and opportunities. They have remigrated or returned to China as demanded by necessity and common sense. After multiple generations of life abroad, separate Chinese ethnic communities have become difficult to define, with some fading into local populations in appearance and culture, as in Thailand, and others remaining ethnically distinct but practicing a hybridized culture combining both Chinese and local elements, as in the case of the Babas of Malaya or the Peranakans of Indonesia.

History

People of Chinese origin have been crossing borders since prehistoric times, when the Thai and Burmese languages originated in what is now Chinese territory. Until the late eighteenth century, the small number of Chinese who ventured abroad were mostly

RESTRICTING CHINESE IMMIGRATION TO THE UNITED STATES

Chinese laborers played a major role in opening the western United States to settlement. Nonetheless, when they were no longer needed and thought to be too numerous, the United States enacted laws designed to restrict immigration. This Convention Regulating Chinese Immigration was enacted on 17 March 1894.

Article I. The High Contracting Parties agree that for a period of ten years, beginning with the date of the exchange of the ratifications of this Convention, the coming, except under the conditions hereinafter specified, of Chinese laborers to the United States shall be absolutely prohibited.

Article III. The provisions of this Convention shall not affect the right at present enjoyed of Chinese subjects, being officials, teachers, students, merchants or travellers for curiosity or pleasure, but not laborers, of coming to the United States and residing therein . . .

Article IV. In pursuance of Article III of the Immigration Treaty between the United States and China, signed at Peking on the 17th day of November, 1880, . . . it is hereby understood and agreed that Chinese laborers or Chinese of any other class, either permanently or temporarily residing in the United States, shall have for the protection of their persons and property all rights that are given by the laws of the United States to citizens of the most favored nation, excepting the right to become naturalized citizens. And the Government of the United States reaffirms its obligation, as stated in said Article III, to exert all its power to secure protection to the persons and property of all Chinese subjects in the United States.

merchants, pirates, and government agents. Chinese soldiers arrived on Borneo and Java in the twelfth century as part of an attempted Mongol conquest. Between 1405 and 1433, the Ming eunuch Zheng He (1371?–1435) commanded a flotilla of ships that traversed Southeast Asia, edged around India, and reached the eastern shores of Africa. The pirate Zheng Chenggong (1624–1662), or Koxinga, ruled a naval empire headquartered in Taiwan that stretched from Japan throughout the South China Sea. From this offshore stronghold, Zheng eluded Qing-dynasty (1644–1912) capture for seventeen years while advocating the cause of the fallen Ming dynasty (1368–1644). Fear of

such traitors mustering resources to the south led both the Ming and Qing dynasties to forbid emigration, a sporadically enforced ban that did not prevent a steady trickle of enterprising merchants from seeking their fortunes across the ocean for several centuries.

The number and nature of Chinese emigrating changed with European expansion into Asia. Colonial exploitation of land and natural resources provided a wealth of economic opportunity for those willing to work hard and contribute to commercial and industrial growth. Working-class Chinese joined wealthy merchants in the search for prosperity overseas. Growing networks of trade and technological advancements

improved communications, and travel became increasingly accessible through innovations such as credit tickets and steamship lines. To fill the insatiable needs of industry for cheap labor, hundreds of thousands of Chinese ventured overseas both willingly and under duress, as contract workers and as coolies. By 1900 an estimated 3 million Chinese lived abroad, 2.4 million of whom traveled between 1840 and 1900. Economic and political turmoil fueled continued migration throughout the twentieth century, a pattern cut short only by the first thirty years of communist rule. However, migration resumed in the late 1970s. Southeast Asia is still home to the majority of overseas Chinese, about 80 percent, although Australia, Canada, and the United States have become the destinations of choice because of their relatively liberal immigration policies.

Economic Roles

Although widely labeled "the Jews of Asia" for their appearance of disproportionate wealth and economic dominance in countries like Malaysia and Indonesia, overseas Chinese pursue a wide variety of occupations at all levels of society. In the nineteenth and early twentieth centuries, colonial and local modernizing elites nurtured the fortunes of the overseas Chinese by employing Chinese as middlemen—local agents greasing the wheels of economic development who were permitted to become rich even though, as racial

outsiders, they had limited access political power. Because a highly visible handful gained wealth through intrinsically unpopular activities such as money lending and tax farming, Chinese in general served as scapegoats during times of economic depression, deflecting public attention from abusive governments. The majority of overseas Chinese, however, lived and continue to live humbly as petty store owners, farmers, miners, artisans, laborers, and service providers. Although they operate on the same business principles as others do, overseas Chinese appear to enjoy higher levels of success because access to a widely dispersed network of fellow Chinese aids their trading activities. Since the late 1970s, Chinese with professional degrees and entrepreneurial skills have become valued cogs in the wheels of global economic markets.

Social Organizations

Like other mobile peoples, Chinese rely heavily on ethnic networks and cooperation for support and survival. Chain migration is commonly practiced, and family remains the primary organizational unit. Continuing the family line through male descendants and advancing family fortunes remain key goals. Family and clan reliably provide future employees, business partners, and capital. In the past, the widely accepted practice of polygyny enabled Chinese men overseas to maintain multiple connections to China and to their places of settlement through the stability and accul-

turation represented by wives and children in key sites of business contact.

Principles of fictive kinship and native-place loyalty also provide crucial support and resources. The overseas Chinese communities established *buiguan*, or clan and native-place associations, as soon as a critical number of men from a particular place or of a particular surname had arrived. Adapted from migrant practices in Chinese cities, *buiguan* further evolved overseas to include umbrella organizations that combated anti-Chinese discrimination. During the early twentieth century, Chinese organizations emulated Western models in the form of Chinese chambers of commerce and service clubs. Late twentieth-century globalization has produced native-place, kinship, and business associations that are international in scope.

After emigrating, Chinese continued to practice their own religion, worshipping ancestors and a varying pantheon of gods. They established local temples and household altars but also proved fairly syncretic, adapting elements of or converting to local religions, as in the case of Chinese Catholics in the Philippines.

Political Orientation

Until the late nineteenth century, China's rulers usually ignored the overseas Chinese and only intermittently enforced bans on emigration. The status of overseas Chinese improved with imperial recognition of their economic successes, as reported by China's first diplomats during the 1880s. Sun Yat-sen, acknowledged by both the People's Republic of China (PRC) and Taiwan as the "Father of Modern China," enshrined the overseas Chinese in modern conceptions of the Chinese nation by calling them "mother of the Chinese revolution" for their support while he campaigned abroad. During the 1920s and 1930s, Sun's political party, the Guomindang (GMD), courted overseas support through newspapers, schools, and government policies. Facing discrimination abroad and inspired by visions of a modern, strong China, many overseas Chinese responded to GMD appeals by sending money to China and traveling there themselves. And so evolved the concept of *huaqiao*, usually translated as "Overseas Chinese" but meaning Chinese sojourners who remain politically loyal to China despite long-term residence abroad. Although still used by the Chinese government, the term *huaqiao* generated many problems for overseas Chinese, because it carried the implication that Chinese settlers, who in fact were simply interested in economic gain and social stability, maintained loyalty to a foreign government. Fearful of the numerous Chinese in their midst who seemingly were not being assimilated, some host governments imposed harsh

restrictions and sanctioned anti-Chinese violence. The rise of the PRC exacerbated fears of overseas Chinese as a colonizing force and led to violence and expulsions from Malaysia and Indonesia during the 1950s and 1960s. Since the 1960s, the term *huaqiao* has been unpopular among most overseas Chinese, who prefer the more neutral *huaren*, or ethnic Chinese. From the late 1970s, in recognition of both the economic potential and the political risks of claiming overseas Chinese, the PRC has promoted business investments and visits in China while encouraging naturalization overseas.

CHINESE-LANGUAGE NEWSPAPERS—SINGAPORE

Singapore's first Chinese-language daily was *Lat Pau*, which went into circulation in 1881. Modeled on Chinese newspapers in Hong Kong and Shanghai, its coverage aimed to satisfy the interests of the immigrant population by focusing on political and cultural developments in China.

The other two major Chinese newspapers were *Nanyang Siang Pau*, founded by Tan Kah Kee in 1923, and *Sin Chew Jit Poh*, founded by Aw Boon Haw and Aw Boon Par in 1929. *Nanyang Siang Pau* was intended to serve the unorganized Chinese business community and promote Chinese vernacular education. In 1971, the government of Singapore detained its editorial staff for allegedly stirring up communal sentiments. *Sin Chew Jit Poh* was an innovative newspaper and enjoyed high circulation in the 1960s and 1970s.

In 1982 these two papers merged, creating Singapore News and Publications Limited, and *Lianhe Zaobao* and *Lianhe Wanbao* were launched to take their places. Another newspaper, *Shin Min Daily News*, came onto the scene in 1967. The combined circulation of these three Chinese-language newspapers is approximately 500,000.

CHINTANAKAN MAI By 1985, the Lao People's Revolutionary Party, which controlled the government of Laos, recognized the need to adjust the nation's transition to socialism, primarily because of a lack of incentives to improve economic productivity. A new policy was introduced at the Fourth Party Congress in 1986 by party leader Kaysone Phomvihane. The new policy was called *chintanakan mai*, which literally means "new imagination" but is commonly translated as "New Economic Mechanism."

This new policy to move away from a state-planned economy to one emphasizing free-market mechanisms paralleled similar trends in Vietnam (introduction of *doi moi*, or renovation) and the former Soviet Union (perestroika, or openness). Among key structural re-

forms of *chintanakan mai* were deregulating prices; establishing a single floating exchange rate determined by market forces; privatizing state enterprises; opening the financial sector to foreign banks; liberalizing trade; and developing an explicit foreign investment code to facilitate increased international investments in Laos.

The government has implemented these reforms gradually. For example, it has been unwilling to adopt draconian measures to reduce the size of the public sector. Nevertheless, since 1989, Laos has divested itself of a large proportion of its state enterprises. Rather remarkably, even the national telecommunications company is now a foreign joint-venture company. Some privatization has also occurred in the education sector.

At the Fifth Party Congress in 1991, further elaboration of the economic reforms was articulated and specific national goals specified. Among these goals were export expansion, promotion of tourism, and further administrative and legal reforms to enhance the transparency (that is, making the rules of trade more apparent) of the Laotian economic and investment climate. Also in 1991, the hammer and sickle were removed from the state symbol of Laos and replaced by the most revered Laotian Buddhist temple, That Luang.

During the 1990s, Laos also became much more open internationally, with a significant increase in technical and economic assistance from both multilateral (World Bank, Asian Development Bank, and European Union, for example) and bilateral (Japan, Australia, Nordic nations, and Switzerland, for example) donors. Also, in 1997, Laos became the eighth member of the Association of Southeast Asian Nations (ASEAN).

Reflecting the success of the New Economic Mechanism, Laos in the early and mid-1990s had impressive macroeconomic performance with annual economic growth averaging 7 percent, much higher than the 1 percent average of the twenty years before 1985. Initially, it appeared that Laos might not be adversely affected by the Asian economic crisis of 1997, since its currency was not internationally traded and since it did not have a stock market. Unfortunately, in a delayed impact, the Lao economy suffered severely from the crisis, and its currency dropped dramatically, losing 87 percent of its value in only two years, with resulting serious inflation. In the early 2000s, the economy stabilized with real GDP economic growth estimated to be 4 percent in 2000.

In more recent years, some in the international community have expressed concern about the slowing of the reform process because of the political power

AN ECONOMIC MOTTO FOR LAOS

CHISHTIYA The Chistis are an important Sufi (Islamic mystic) *silsilah* (order). Each order consists of *murids* (disciples) of a particular sheikh or *pir* (spiritual master). Khwaja Abu Ishaq of Syria (d. 940) started the order in Chist village, Syria. The founder of the order in India, Khwaja Muinuddin Chisti, came from Sajistan in eastern Iran in 1190 CE and set up a *khanqah* (hospice) at Ajmer, India. Known as the Garib Nawaz (Showing Kindness to the Poor), he attracted many followers, and his disciples, such as Qutbuddin Bakhtiar Khaki and Shaikh Fariduddin, further popularized the Chisti order. Sheikh Nizamuddin Auliya (1236–1325) of Delhi, who witnessed the reigns of seven sultans, attracted both Muslims and non-Muslims to the order. The Chistis further expanded to areas of South Asia such as Sind, Punjab, Rajasthan, Bengal, Bihar, and Deccan.

The early Chisti saints were revered because of their religious tolerance, adoption of indigenous traditions, use of local languages, and egalitarianism. The miracles that were attributed to them strongly appealed to the common people. Although there was no digression from the *shari'a* or Islamic holy law, these saints allowed certain deviations. For example, there were *sama* or musical gatherings for personal union with God. A strong dislike for any form of political patronage and a dependence on God for livelihood were hallmarks of the Chisti saints. There was an emphasis on *wahdat al-wujud* (unity of being). The name

of God was recited both aloud and in silence (*dbikr jabri*, *dbikr khafi*).

The proliferation of Chisti branches such as Na-gauriya, Sabiriya, Nizamiya, Gaudri Shahi, and Zahuri began in the sixteenth century and continues today. There have been obvious changes in Chisti doctrine, and some of the earlier traditions like noninvolvement in politics and nonpossession of property have been given up. Nizami Chisti Hazarat Inayat Khan (d. 1927) established centers in the United States and Britain to propagate the message of universalism. Sayed Khwaja Habib Ali Shah of Hyderabad, India, inspired the South African branch. The Gaudri Shahi/Zahuri branch, established by Zahurul Hasan Sharib Gudri Shah Baba (1914–1996) of Ajmer and presently headed by Inam Hasan, has centers in Britain and the United States. Websites for the orders feature discussions, online discourses, *qawwalis* (a form of musical chorus, where one singer begins the songs and the followers recite), and so forth. The *urs*, a festival celebrating the anniversary of a saint's death, is held where the saint is buried, and the *dargah* (saint's tomb) attracts both Muslims and non-Muslims in the Indian subcontinent.

CHITRA/ARDHACHITRA/CHITRABHASHA Standardized aesthetic norms appeared in South Asian art from about the fifth century CE, coinciding with the Gupta hegemony of the subcontinent (c. 320–c. 520 CE). The consequent canonization of art spawned a rich descriptive and normative vocabulary for identifying the scope of Indian artistic representation. The terms *chitra*, *ardbachitra*, and *chitrabhasha* are used in this context to differentiate broadly between sculpture, relief, and painting, respectively.

Distinctions among *Chitra*, *Ardbachitra*, and *Chitrabhasha*

Although in the earliest theoretical texts on South Asian art, the term *chitra* is used to mean "sculpture" or "painting," in certain texts of the medieval period,

A 2nd century BCE statue of Yakshi, a female earth spirit. The statue is of terracotta and is housed in the National Museum in New Delhi, India. (ANGELO HORNAK/CORBIS)

chitra means "sculpture in the round," and a distinction is made between *chitra* (sculpture), *ardhachitra* (relief), and *chitrabhasha* (painting). Perhaps the most important of these texts is the late sixteenth-century *Shilparatna* attributed to Srikumara of Kerala. The earliest-known text dealing with *chitra* in general is the *Vishnudharmottara*, generally dated as contemporaneous with the flowering of classical South Asian art (fourth–sixth centuries).

Little of ancient South Asian stone sculpture is cut completely in the round. Among the earliest examples of South Asian sculpture in the historic period are the massive *yakshas* and *yakshis* (supernatural elementals) from Mauryan times (third century BCE), chiseled out of sandstone and given the high surface polish characteristic of this period. These figures stand out frontally from the stone base out of which they are carved, giving an impression of sculpture in the round but being, in fact, "flat-backed" stelae (stone slabs). Among the rare examples of true sculpture in the round are animals, such as lions or bulls, standing on

Asokan pillar capitals, also from this period. The gates (*toranas*) of the Great Stupa (50 BCE) at Sanchi, near present-day Bhopal in central India, carry what appear to be free-standing sculptures connecting architectural elements, but these, in fact, are slabs of stone rendered on both sides with back-to-back fronts, giving the impression of two reliefs brought together. Later (post-fourth-century) sculpture of India, occurring in temple settings, also features individual stelae, placed in niches or enshrined in a sanctum. A rare example of a popular image sculpted in the round from the early temple period is that of the theriomorphic representation of Varaha, the boar incarnation of Vishnu. Free standing and often colossal in scale, Varaha was evidently meant to be viewed from all sides during circumambulation. After the sixth century, Nandi, the bull-mount of Shiva, situated on an axis with the sanctum to enable a direct view of the shrine-image, is invariably carved in the round. But these are the exception rather than the rule, and it may be safely assumed that the predominant tradition in South Asian sculpture was relief.

The distinction among *chitra*, *ardhachitra*, and *chitrabhasha*, then, should be seen less as a clear separation of distinct modes of expression similar to sculpture, relief, and painting in the Western sense and more as a gradation in solid representation, painting being thought of as a constricted mode of sculpture, with relief occupying an intermediate zone. Several early texts describe painting as a form of illusionary relief, although actually flat. These include fifth-century literary texts, such as *Shakuntala*, where the eyes are said to stumble over the elevations and depressions of the picture surface, the reference being to the representations of landscape backgrounds, the voluptuous female form, or both. However, this illusion of depth is not to be confused with naturalistic illusionism in the Western sense, where the image is objectified through the systematic use of single-point perspective and chiaroscuro based on an external light source. In the South Asian case, the viewer is denied the experience of a privileged spatial inclusion in the three-dimensional reality of the image, an ontology (theory of the nature of being) of universal emergence, subsistence, and disappearance from or into a spaceless, timeless transcendental reality reinforced through the emphatic flatness of the background against which the play of relative depth occurs.

Sculpture

The history of relief sculpture (*ardhachitra*) in South Asia shows an interesting movement, especially when related to painting. Although sculpture in Mau-

ryan times (c. 324–c. 200 BCE) expresses the strongest feeling for plastic volume and, especially in the massive *yaksha* or *yakshini* stelae, comes close to sculpture in the round, relief proper appeared only from the second century BCE, with the establishment of an architectural context for images. Ananda Coomaraswamy pointed out that the early reliefs on the *vedika* (railing enclosure) walls of stupas, as, for example, at Bharhut (second century BCE), south of present-day Allahabad, in central India, approximate painting (*chitrabhasha*) more than solid sculpture (*chitra*), being closely compressed between the two planes of the wrought surface. On the *toranas* at Sanchi (first century BCE), there is a more heightened relief and a consequent movement in the direction of full sculpture from painting. This tendency continues through the Kushana (first century CE) and later Andhra (second century CE) periods, reaching its fullest expression of realistic emergent figural mass against the flat stone backdrop in the Gupta period and its aftermath (late fourth–sixth centuries). Subsequently, although the quality of the volume represented becomes more fluid and in some respects facile, relief continues to express a fullness of figural depth, the flat expanse of stone wall gradually replaced for its backdrop effect by the massive soaring temple structure, as in the medieval temples (tenth–twelfth centuries) of Khajuraho, Orissa, or the Hoysala kingdom.

In comparison with the shallow beginnings of relief sculpture, South Asian painting, in its earliest phases (i.e., in Caves 9 and 10 at Ajanta, second century BCE), is marked by an emphatic modeling, demonstrating its closeness to sculpture in the round. A similar impression of volume appears in relief much later, although in medieval times (eleventh–fifteenth centuries) a reversal of effect occurs in these two modes of expression. Now temple sculpture persists initially in its maintenance of high relief, whereas painting, particularly in the regions of Gujarat and Rajasthan, survives sculpture but becomes flattened. Coomaraswamy ascribed this flattening to psychological changes at the social level, relating to a shift of focus from a heroic will to a more reflective or contemplative intellect. In an article on *abbasa* (presentation), although Coomaraswamy equated this at first with a slackening of concentration (*shithila samadhi*), on further exploration, he advised a refusal of comparative judgment, treating the stylistic symptoms of an age phenomenologically in terms of the development of its own aesthetic.

Aesthetics of Sculpture Media used for sculpture included stucco, terra cotta, wood, stone, and metal. Of these the most significant surviving monumental

Detail of a stone relief sculpture at the Great Stupa of Sanchi built by Asoka. (ADAM WOOLFITT/CORBIS)

sculpture, occurring invariably in religious contexts, is that made in stone. By the late fourth century (Gupta period), a standardized aesthetic begins to become codified, and sculpture follows an elaborate set of technical and aesthetic guidelines. Figure sculpture predominates from this period, and prescriptive proportions and poetic metaphors, rather than live models, are used for translation into stone. Some of these visual metaphors are as follows: the facial outline should be like a hen's egg (*kukkutandavat*); the brows should resemble the arc of a bow (*caapaakaaram*); a variety of analogues could contextually shape the eyes, such as a bow (*caapaakaaram*), a lotus leaf or bud (*padmapatra*), the petal of the blue lotus (*nilotpala*), the eyes of a deer (*mrigaakriti*), or the belly of a fish (*matyodaram*). The neck should be shaped after the conch shell (*kambugriva*); the chin should resemble a mango seed (*aamra-vijam*); the nose should look like a parrot's beak (*shukanasa*); the pendant of the arm like an elephant's trunk (*gajatundaakriti*); the forearm should look like a young plantain tree (*baala kadali kaandam*); the male waist shaped after a lion's waist (*simbakati*);

the woman's waist after the middle of an hourglass-shaped drum (*damaru-madhyam*); the kneecap like the contour of a crab (*karkataakriti*); and the calf of the foot after a fish (*matsyaakriti*).

The *Visnudharmottara* also classifies a set of arrested stances in a rotational scheme of views for figures, ranging from a full frontal view, through a three-quarter view, a one-quarter view, a profile, and several fractional views, until it reaches a complete back view. Foreshortening, related to the preceding stances, is elaborated, as is a classification for feet stances. For each figural type, proportional measures are supplied, as are postures and gestures related to the subject of depiction.

In place of the frontality of Mauryan images, a variety of pleasing figural flexions were prescribed. These included the *samabhanga* or equipoise, with the plumb line passing through the middle of the body; the *abhanga* or gentle flexion, with a single break or bend in the plumb line; the popular *tribhanga* or triple flexion, which gave a sense of relaxed and rhythmic ease to the figure; and the extreme pliancy of *atibhanga*, with its maximum deviation from the plumb line. Similarly, sitting postures were also codified. For deep meditation, the *vajraparyanka* sitting posture was prescribed; for a more relaxed contemplation, the *ardhaparyankasana* was preferred; further relaxation while seated was depicted using the *mahaaraajaalilasana*. An attitude of comfort was designated by the *sukhasana* posture. A vocabulary of hieratic hand gestures, shared equally by art and dance, was also codified. Popular gestures included the *abhaya mudra*, made usually with the open right hand raised, palm outward, and signifying the gift of fearlessness; the *varada mudra*, made with an open right hand turned downward, palm outward, offering boons; the *dhyana mudra*, signifying meditation; and a number of more specialized gestures corresponding to iconographic context. The powers of gestures (*mudra*) were extolled as devices evoking special states of aesthetic emotion. According to aesthetic texts, where the hand goes, the eye follows; where the eye goes, the mind follows; where the mind goes, the mood follows; where the mood goes, there arises aesthetic mood (*rasa*).

The theory of *rasa*, or aesthetic mood, comes to be fused with the religious consciousness in these sculptural prescriptions. Thus, a classification of the range of emotional states that the sculptor needs to portray effectively is central to this systematization. These emotional states also make their first appearance in the *Visnudharmottara* and can be enumerated as the erotic (*srngaara*), the comic (*haasya*), the pathetic (*karunaa*), the heroic (*vira*), the intense (*raudra*), the terrible

(*bhayanaka*), the grotesque or odious (*bibhatsa*), the wonderful or mysterious (*adbhuta*), and the tranquil (*shaanta*).

In the depiction of deities, youth is glorified. Gods are ideally shown to be eternally sixteen years of age and are generally without a beard. A god or goddess may be occasionally shown as a child but never as old or infirm. Emaciated or obese images were avoided because, apart from aesthetic reasons, there were prevailing beliefs that worship of emaciated images would bring famine and that disease would strike on invocation of gross or obese images. Body, life, and mind controlled by spiritual power is the ideal portrayed in images of deities and heroes. Even in the midst of violent action or in erotic scenes, celestials and heroes are shown with an air of detached serenity and self-contained delight. Such an ideal is based on the practice of yoga, leading to a dynamic spiritual union. The features most expressive of this inward power and poise are the eyes, which undergo a development from wide open in the period preceding the fourth century to a half-closed state subsequently, signifying deep meditative concentration. Women, particularly goddesses (*yakshis*) and heroines (*nayikas*), are shown as voluptuous, with large hips and breasts, signifying creative fecundity, although here, too, tranquillity predominates, and the full maturity of young motherhood is preferred. Corresponding to the postural prescriptions, an elaborate iconography was prescribed for the depiction of supernatural beings. Particularly in Hindu sculpture, this included multiple hands, heads, and eyes to express superhuman omnipresence, omnipotence, and omniscience.

Depiction of Commoners In the depiction of commoners or lesser celestials, various activities with their characteristic postures are expressed. Among the activities most often shown are attendance upon kings and deities and performance of dance and music. The adversarial powers (*asuras*, *rakshasas*) are shown as powerful and grotesque, although in some cases human likeness is bestowed on them.

Painting

Chitrabhasha literally means the "appearance" or "semblance" of *chitra* and thus prioritizes sculpture as a form of visual expression whose semblance is caught in two dimensions through painting. However, the importance of painting in ancient South Asia is attested to by the fact that the *Kamasutra* lists painting as the fourth of its sixty-four courtly arts and by the references in literary and theoretical texts to the presence of *chitrashalas*, or art galleries, for the pleasure of royalty or urban citizens.

A fresco in Ajanta Cave, Maharashtra, with detail of a yaksha couple. (LINDSAY HEBBERD/CORBIS)

Most texts speak of three surfaces on which painting may be done. These are wall surfaces for murals, wooden board, and cloth. Of these, although a tradition in cloth painting (*pata-chitra*) is alive to this day (for example, in Orissa), only a few surviving murals (as at Ajanta) can be dated to an antiquity contemporary with textual sources such as the *Visnudharmottara*.

Painting Techniques Several theoretical texts provide glimpses of the techniques in use for painting. Of these, the *Samaraangana Sutradhara*, a text from the first half of the eleventh century, carries one of the most elaborate and comprehensive accounts of the techniques of painting, codified as the eight limbs (*ashta-angaani*) of painting. These are:

1. *Vartikaa*, or preparation of the "crayon" with which initial outlining of the figures to be painted will be done.

2. *Bhumibandhanam*, or preparation of the ground, enumerated as mentioned into the three surfaces—wall surface, wooden board, and cloth. In the case of murals, where texts imply a use of both tempera and *fresco-secco* (lime medium) techniques, this preparation is usually a mud plaster, sometimes followed by a lime plaster, both reinforced with vegetable fibers.

3. *Lepyakarma*, or priming, where the prepared ground is smoothed and made ready for holding paint.

4. *Rekhakarma*, or the process of making the first line sketch. In discussing this step, most texts

emphasize the need for the artist to visualize first the image in detail and with clarity. This act, equated with yogic concentration, is often made the expressive basis for the quality of pictorial realization, a deficient image being attributed to slack meditation. The first outline is drawn with the *var-tikaa*, or "crayon"; a second outline is then with a medium-sized brush carrying a pigment derived from ocher.

5. *Karsakarma* (also called *varnakarma*), or the preparation of colors. There is some variation in texts (sometimes in the same text) on the primary colors to be used. For example, the *Visnudharmottara* mentions white, yellow, red, black, and blue and, elsewhere, white, red, yellow, black, and green. The *Chitralakshana* section of the *Shilparatna* mentions white, yellow, red, black, and blue. Because, as the *Visnudharmottara* acknowledges, blue and yellow may be mixed to make green, most scholars take the five primary colors to include blue but not green. The *Visnudharmottara* mentions the minerals used for paints as gold, silver, copper, mica, lapis lazuli, tin, yellow orpiment, lime, red lake, cinnabar, and indigo. The metal colors are said to be laid on as foil or liquefied. The twelfth-century *Manosollasa* is more explicit about the relationship of color to source. Thus white is derived from conch shell, crimson from cinnabar, red from Asian sumac (*Rhus verniciflua*), blood red from ocher, yellow from orpiment, and black from lampblack.

6. *Vartanaa*, or modeling. This is among the most important aspects of *chitrabbasha* because it provides the illusion of three-dimensionality that makes the painting a "semblance of sculpture." The effect of depth is obtained through three devices: *patraka*, or cross-hatching, *binduka*, or stippling, and *hairika*, which Sivaramamurti interpreted as a corruption of *raikbika* and which means either fine lines or modulated outline. Mention is made of the use of brighter shades to depict higher grounds and darker shades to depict lower. Indian painting does not use single-point perspective or light and shade to create a consistent naturalistic illusion.

7. *Lekbakarma*, or brushwork. The brush is known as *lekbani* and is differentiated into five types according to thickness. The finest brushes are made from bark fibers and the rest from hair taken from a bull's ear or a mule's mane. Bamboo sticks, attached to the hair with lac resin, are used for handles. In tempera painting, the color is bound by using animal media derived from buffalo hide or elephant hide. In case of *fresco-secco*, lime is used as the binding medium. In the *Vishnudharmottara*, the brushed line is also strongly related to inner concentration. The ideal line is characterized as tranquil (*susnigdha*), distinct (*vispashta*), and uncrooked (*ajibma*).

8. *Dvichakarma* (*dvi cha karma*), or retouching. This is the final stage of painting, when highlights are added, particularly for surfaces, ornamentation, expression of depth, or final outlining.

Painting shares with sculpture elaborate classifications for types of figures relating to physiognomy and social differentiation. For each figural type, proportional measures are supplied, as are postures and gestures related to the subject of depiction. A vocabulary of metaphors related to body parts is also developed. All of these classifications and visual similitudes are prescriptive in nature and meant both to standardize figurative expression in a collective context of practice and to guide visualization and execution in a culture that, avoiding live models, turns the artistic gaze within. It is for this reason that these measures are termed *pramanani* (evidentiary standards or guidelines).

CHITTAGONG (1991 pop. 1.4 million). Chittagong is the primary port and second largest manufacturing city in Bangladesh. It is located on coast of the Bay of Bengal, 164 miles southeast of Dhaka. Previously a center of Buddhism, Chittagong came under the rule of the Hindu kings of the Sena dynasty in the twelfth century CE. In 1299, it was occupied by Muslim invaders, and by the early fourteenth century it had been incorporated into the Delhi sultanate (1192–1526). It was subsequently controlled by Portuguese pirates and Arakanese conquerors before passing under the Mughal rule in 1666 and British rule a century later. In 1947, after Indian independence, Chittagong became part of the newly created Pakistan. It has been part of Bangladesh since December 1971, when Bangladesh won its liberation struggle against West Pakistan.

Chittagong today has several distinct regions: the Old City, the British City, and the Modern City. The oldest part of the city is the Sadarghat on the banks of the Karnaphuli River. Near the Old City is the British City, now the business center of Chittagaong. The Modern City consists of contemporary buildings, as well as steel mills, an oil refinery, and cigarette factories. Chittagong also has several mosques, the most famous of which is Qadam Mubarak, dating from 1336.

CH'OE NAMSON (1890–1957), Korean writer, publisher, historian. A leading intellectual of the early twentieth century, Ch'oe Namson introduced modern free-verse poetry, worked to educate Korea's youth and edited numerous classical Korean works, and outlined a nationalistic view on Korean history. Born in Seoul in 1890, he first received a traditional education and later studied history and geography in Japan. Returning to Korea in 1906, he established himself as a publisher and in 1908 published Korea's first popular modern magazine *Sonyon* (Youth, 1908–1911), a monthly magazine that introduced the Western world to Korean youth. The first issues contained his most famous literary piece, the poem "From the Sea to the Young."

Ch'oe Namson drafted the Declaration of Independence on 1 March 1919, for which he was arrested by the Japanese colonial government but later released in 1921. He published several influential articles on Korean culture, among which the most famous are "A Treatise on Tan'gun" (1926) and "A Treatise on Purham Culture" (1927). His reputation as a nationalist was tarnished, however, when he later collaborated with the colonial government and published pro-Japanese articles and speeches. In 1949 he was arrested for his pro-Japanese activities but was soon released due to illness. He continued to edit classical Korean works until his death in 1957 of a cerebral hemorrhage.

CHOLA Chola (or Cola) was one of three prominent medieval kingdoms in southern India, the others being Chera and Pandya. The realm of the Cholas (Cholamandalam in the Tamil language) centered on the Coromandel coast, the east coast of the modern state of Tamil Nadu, and the lower valley of the Kaveri River. Already in the emperor Asoka's time (c. 265–238 BCE) Chola was mentioned in an inscription as an independent kingdom to which Buddhist missionaries were sent. The earliest historically known king was Karikkal (ruled c. 100 CE), who laid the foun-

datations of the great coastal emporium of Puhar (Kaveripattinam), fought a protracted war with Sri Lanka, and used Ceylonese laborers to build a 160-kilometer embankment along the Kaveri.

When the Chinese traveler Xien Qang visited the area in the seventh century, the dynasty had faded into obscurity, and the kingdom had shrunk. A powerful Chola dynasty reemerged, however, in the reign of Rajaditya I (947–949). Earlier in the tenth century several Chola kings had defeated the Pallava dynasty as well as the combined Pandyan and Sinhalese armies at Vellore. Later Chola rulers incorporated northern Sri Lanka into the kingdom; in 1025 King Rajendra's navy conquered the Andaman and Nicobar Islands. Although toward the end of Kulottunga I's reign (1070–1120) the Hoysalas took some Chola territory, the king maintained trade contacts overseas with Srivijaya, perhaps even with China and the Khmers. The resurgence of the Pandyan dynasty threatened the Cholas, however, and Kulottunga III (reigned 1178–1218) found himself in a complex struggle with the Pandyas, Cheras, and Sri Lankans. At the end of his reign the Pandyas gained a notable victory. In 1279 during the reign of the last Chola ruler, Rajendra IV (reigned 1246–1279), the Pandyas' defeat of both the Cholas and the Hoysalas marked the end of the Chola kingdom. In 1310 Malik Kafur—a eunuch slave who had become the most trusted general of Sultan Ala-ud-din Khalji—overran these former Chola territories, which were absorbed into the Vijayanagar empire.

CH'ONDOGYO Ch'ondogyo (Religion of the Heavenly Way) is the oldest organized indigenous religion of Korea. Founded in 1860 by Ch'oe Che-u (1824–1864) as Tonghak (Eastern Learning), it changed its name to Ch'ondogyo in 1905.

The god of Ch'ondogyo is usually referred to as Hanullim, a vernacular Korean term for "Lord of Heaven." Hanullim is not depicted as a deity residing in Heaven above, however. In fact, he is not depicted at all. There are no statues or paintings of God in Ch'ondogyo worship halls. That is because Ch'ondogyo perceives Hanullim as dwelling within the human heart.

The founder is said to have conversed with God and may have conceived of God as a transcendental personality. He emphasized the moral obligation of

men and women to serve God. However, Ch'oe Che-u's disciple and successor, Ch'oe Si-hyong (1827–1898), added that just as people should serve God, they should also serve their fellow human beings. Son Pyong-hui (1861–1921), the third man to head the religion, amplified that statement with the phrase "God dwells within each and every human being." This focus on the immanence of God has become a core tenet of Ch'ondogyo doctrine.

Because of this focus on God within, Ch'ondogyo worship services include moments of silent prayer in addition to hymns, sermons, and chants. Silent prayer is the norm because, since God dwells within the human heart, he is best addressed internally.

Ch'ondogyo teachings are summed up in a twenty-one-syllable formula that believers are enjoined to chant daily. That formula reminds men and women that they are filled with the animating presence of the Lord of Heaven and that they should always be mindful of his presence within, a presence that helps them become one not only with God but also with all creation. The doctrines of Ch'ondogyo are expounded upon further in *Ch'ondogyo kyongjon* (Sacred Writings of Ch'ondogyo). It contains the poems, essays, and sermons of the three founding patriarchs of Ch'ondogyo: Ch'oe Che-u, Ch'oe Si-hyong, and Son Pyong-hui.

At the end of the twentieth century, Ch'ondogyo claimed to have over 1 million followers in Korea and close to three hundred worship halls, although a government census found fewer than thirty thousand South Koreans who reported that they were members of Ch'ondogyo.

CH'ONGJIN (2000 est. pop. 1 million). Ch'ongjin is the capital of North Hamgyong Province in North Korea (Democratic People's Republic of Korea). Ch'ongjin is a port city of approximately 275 square kilometers, located on the Sea of Japan (East Sea) about 100 kilometers south of the border between North Korea and Russia. The city became prominent with the establishment of its port in 1908. Ch'ongjin

grew in importance with the opening of the Hamgyong rail line connecting Pyongyang and the nearby city of Rajin. Ch'ongjin has been the provincial capital since 1944.

The port of Ch'ongjin accounts for much of the region's commerce. It provides a convenient port for trade between China and Japan. The port is connected by rail to the Musan iron mine, which exports 8 million tons of ore annually. The nearby Rajin-Sonbong Free Trade Zone also benefits from its close proximity to the port.

The region also hosts industries producing metals, machinery, pharmaceuticals, and chemicals. Ch'ongjin and North Hamgyong Province are also noted for their fisheries. Ch'ongjin is home as well to Ch'ongam Mountain, three hot springs, a fortress dating to the fifteenth and sixteenth centuries, and prehistoric artifacts dating to before 3000 BCE.

CHONGQING (1992 est. pop. 3.8 million). Chongqing, which is the largest city in China's Sichuan Province, is situated where the Jialing River flows into the Chang (Yangtze) River in the southeastern part of Sichuan. The old city, which was the main city in the ancient state of Ba, was originally built on a promontory between the two rivers. Chongqing remained on the fringe of the Chinese empire until the fourteenth century. During the Japanese occupation of eastern China (1937–1945), the Chinese Nationalist Party (Guomindang) moved China's capital to Chongqing, and important industries followed. From the 1950s, Chongqing became a center for trade and transportation, and bridges and railways were built, making the city an important river port for transshipments from railways to the far cheaper transport via the Chang River to the east. Chongqing is also one of the main industrial centers in southwestern China, with such heavy industries as iron works and steel mills, and the city manufactures motorcycles, cars, and heavy machinery. Chemical and electronic industries as well as textile and food processing industries are also located there. In the 1980s Chongqing was chosen as model city for market economics to attract foreign invest-

ments, and in 1997 the city became an independent municipality directly under the central government.

CH'ONMIN *Ch'onmin* was the lowest social class in Korean society from the seventh to the nineteenth centuries. As with the three other social classes (the *yangban*, or elite; the *nongmin*, or farmers; and the *sangmin*, or freeborn commoners), membership in the *ch'onmin* marked one permanently. The *ch'onmin* class included all people doing dishonorable work; slaves, actors, entertainers, shamans, and butchers were all *ch'onmin*. Class governed the dress, language, and marriage and funeral ceremonies of the people, and relations between the classes were restricted. The people who belonged to the *ch'onmin* class were restricted in where they could live to areas assigned by the government.

Among the *ch'onmin* groups, slaves were treated the worst. They were registered as personal property and were owned entirely by the master, who had the right to trade and inherit them. During the latter years of the Choson dynasty (1392–1910), there were several emancipation movements that resulted in freeing *ch'onmin* to live wherever they pleased. In 1894 the *Kabo* reform policy was launched to prohibit the registration and trading of slaves; this policy finally proclaimed the release of all slaves. Social discrimination against the ex-slaves continued for a long time, but is today no longer an issue.

CHORMAQAN, NOYAN (1200–1240), Mongolian general. Chormaqan Noyan led the armies of the Mongol empire across the Amu Dar'ya River and into the area of present-day Iran in 1230, conquering much of what would later be the Il-Khanate (a Mongol dynasty that ruled in Persia from 1256 to 1353). Genghis Khan (1165–1227) originally delivered the

orders for this invasion in 1221 during the war against the Khwarizm empire, which lay on the lower Amu Dar'ya River, but a rebellion delayed the campaign. Chormaqan served in this earlier campaign as a *qorchi* (quiver bearer) for Genghis Khan's bodyguard.

Ogodei (1185–1241), the son and successor of Genghis Khan, renewed the command in 1229. Chormaqan's orders were to expand the Mongol empire and hunt down Jalal al-Din Khwarazmshah (d.1230–1231), the last sultan of the Khwarizm empire. While a subordinate commander, Taimaz, pursued Jalal al-Din, Chormaqan efficiently secured the conquest of Iran through force and diplomacy. By 1232, Iran was firmly under Mongol control.

In 1234, Chormaqan turned his attention to the region of Transcaucasia, the region of modern Georgia, Armenia, Azerbaijan, and parts of Turkey. After a five-year campaign, Chormaqan successfully conquered Transcaucasia. He ruled as the military governor for two years until he died. His wife Altan Khatun (flourished 1220–1245) succeeded him as regent until one of his lieutenants, Baiju (flourished 1230–1260), was named his successor.

CHOSHU EXPEDITIONS Punitive expeditions were launched by the Tokugawa shogunate against the domain of Choshu (located in present-day Yamaguchi Prefecture) in 1864 and 1865. The first was a limited success, the second a bitter failure—and a major factor in the fall of the shogunate in the Meiji Restoration of 1867–1868.

Choshu, a domain long hostile to the Tokugawa government, initially drew the ire of the shogunate in the early 1860s when pro-imperial reformers took

control of the domain's capital, Kyoto. In 1863 troops from the domains of Satsuma and Aizu carried out a coup d'état at the court, driving Choshu forces out of the city. Choshu troops marched on Kyoto the following year and were roundly defeated. Spurred to action, the shogunate, by November 1864, had amassed a punitive force of 150,000 samurai from several domains around Choshu's borders. After scattered fighting, Choshu agreed to a limited surrender the following January. Conservative Choshu power holders ordered the execution of three "house elders" and the dissolution of the mixed samurai/peasant rifle troops that had attacked Kyoto. But the radical leaders of the mixed units refused to disband and instead fought the domain government in the Choshu Civil War of 1865. The war brought to power a reformist government committed to the shogunate's overthrow. It was staffed by many lower-ranking samurai who would play prominent roles in national government after 1868, such as Ito Hirobumi and Yamagata Aritomo.

In 1865 Shogun Tokugawa Iemochi led a second expedition to topple the new Choshu government but found circumstances quite different from those of two years earlier. Several domains that had participated in the first expedition refused to contribute troops to the second, and Choshu completed a secret alliance with the powerful Satsuma domain before the shogunate forces arrived to fight. Buoyed by this alliance, as well as the purchase of some 10,000 Western rifles (some from the recently ended American Civil War), the outnumbered Choshu forces easily defeated the shogun's troops. The defeat made it clear that the Tokugawa family's hegemony was over. In 1867–1868 Choshu and Satsuma installed the boy emperor Mutsuhito as the head of a new national government in what is called the Meiji Restoration.

CHOSON KINGDOM Governing the Korean peninsula for over five hundred years (1392–1910), the Choson kingdom was the final stage of dynastic rule in Korea. Also known as the Choson dynasty or Yi dynasty, this era differed from that of its predecessor, the Koryo kingdom (918–1392), in that it formed a highly centralized government under royal authority with the influence of aristocrat-bureaucrats. The Choson king-

Choson dynasty or Yi dynasty (1392–1910)

dom established Confucian rule that continued throughout the entirety of the reign of its twenty-seven kings. During the course of more than five centuries, Choson experienced periods of great development, foreign invasion, factional infighting, and self-isolation from the outside world.

Early Choson (1392–1592)

The Choson kingdom began with a Koryo general, Yi Song-gye (1335–1408), seizing military and political power and eventually placing himself on the throne. Neo-Confucian ideology and land reforms, which controlled land accumulation by the *yangban* (office-holding aristocrats) and improved the livelihood of the peasants, were instituted. From the beginning, the *yangban* had the right to intervene in the governmental decision making of the monarchy. Confucian classics were printed with movable metal type to further Confucian learning for the well-being of the newly founded state.

King Sejong the Great (1397–1450), the son of Yi Song-gye and the most renowned of Choson's kings, ruled during a period of marked advancement in numerous fields. He showed great concern for the peasant farmers, providing them with flood and drought relief as well as tax relief. Marked development in science, agriculture, administration, economics, medicine, music, and the humanities also took place. The most noted of his achievements was the creation of the phonetic alphabet for the Korean language, hangul, which enabled the illiterate peasantry to learn to read. Prior to this, all writing was in Chinese characters, which were inaccessible to the uneducated masses. It wasn't until the twentieth century, though, that the popularity of hangul overtook that of Chinese characters.

The century to follow was marked by instability and a decline in prosperity due to power struggles between the monarchy and the *yangban* bureaucrats. To offset *yangban* power gains, royal favor was shown to-

ward Buddhist and Taoist religious orders, and the literati *yangban* were suppressed; as the throne changed hands, however, there was a resurgence of Neo-Confucian rule and *yangban* influence in the royal court and administrative affairs. During this time, the plight of the peasant worsened and the power of the kingdom weakened.

Choson maintained almost no international trade or political ties, but was drawn into international affairs when Japanese warlord Toyotomi Hideyoshi (1536–1598) requested Choson's aid in attacking Ming China to consolidate his power at home. Choson refused and for this was brutally and repeatedly attacked during by Hideyoshi from 1592 through 1598. The Japanese invaders attained initial success in occupying strategic land areas but met stiffer resistance on the seas. Choson's most renowned military leader, Yi Sin-sin (1545–1598), devastated the Japanese fleet and its supply lines, eventually forcing a Japanese withdrawal. If it had not been for the ingenious warfare strategies of Commander Yi and his ironclad *kobukson* (turtle ships), Japan would almost assuredly have wrested control of the peninsula from Choson.

The war took a heavy toll on Choson—heavy loss of life, the abduction of artisans and technicians, the devastation of farming land, and the destruction of government records and cultural artifacts. Taking advantage of Choson's weakened state, the Manchus to the north, who had gained control of China, demanded that Choson acknowledge his suzerainty. When Choson refused, the Manchus attacked and overwhelmed Choson in a relatively short war; Chinese suzerainty was acknowledged, as it had been before the Manchu invasions.

Later Choson (1592–1910)

The destruction caused by the wars with the Japanese and the Manchus brought great social and economic upheaval. The cost of reconstruction was high and government financial difficulty led to repeated tax increases and the sale of aristocratic titles. The plight of the peasantry worsened, while the rise of a wealthy merchant class led to a new notion of wealth—mercantile wealth—as well as to the decline of the *yangban* society. All of these factors contributed to the rise of a new generation of scholars critical of the traditional Neo-Confucian order. This reformist school started the Sirhak (Practical Learning) movement in the seventeenth century and advocated the promotion of utilitarian knowledge, as well as political, economic, and educational reforms to promote political integrity, economic stability, and social accord. They had a true concern for the well-being of the common people.

The schism led to fierce factional strife among the *yangban* during the latter half of the seventeenth century. Realizing the seriousness of the situation, King Yongjo (1694–1776) effected a series of reforms. These reforms were intended to end factional feuding, improve the life of the peasants and commoners, and reassert the Confucian monarchy; it enjoyed, however, only limited success. Mercantile activities increased rapidly, with the *yangban* also becoming involved in activities that they once had disdained. The economy and social conditions improved, and, in the early nineteenth century, Western ideas of finance reform were seriously considered, though never implemented due to factional strife.

During first half of the nineteenth century, drought and flood fiercely undermined agricultural productivity, causing widespread famine. Excessive taxes were levied by a chronically debt-ridden government, exploiting the destitute farmers. These intolerable natural and social conditions led to peasant revolts in the northern part of the kingdom in 1812 and in the southern part in 1862. The adverse social conditions also gave rise in the mid-nineteenth century to a new ideology, Tonghak (Eastern Learning), which appealed to the farming class. It sought to rescue the peasantry from poverty and social unrest and to restore political and social stability throughout the kingdom. To succeed in this, it opposed government corruption, the privileged *yangban* class, social injustice, and Sohak (Western Learning), which manifested itself mainly in Catholicism, which had entered Korea in 1593 and had begun to take root among the populace in the late eighteenth century.

Attempts by American and French naval vessels to open Choson to commerce led to the adoption of a policy of isolation in 1871. In 1876, backed by naval force, Japan coerced the signing of a treaty establish-

HWASEONG—WORLD HERITAGE SITE

Hwaseong—an eighteenth-century fort built around Suwon, the capital of Korea's Choson kingdom—was designated a UNESCO World Heritage Site in 1997. Six kilometers of wall, artillery towers, and gates still remain.

ing diplomatic and commercial relations between the two countries. In order to offset the Japanese influence in militarily weak Choson, similar treaties were soon signed with the United States and other Western nations. Choson sent diplomatic missions to Japan and the United States, and an influx of North American Protestant missionaries began.

This newfound knowledge of the outside world led to a progressive movement by young scholars to modernize the government and bring about social reforms. As efforts at modernization were blocked by government officials, the progressives, with Japanese support, resorted in 1884 to a coup, which was put down only with Chinese assistance. Ten years later, the Tonghak rebellion spread throughout the country and brought both Japanese and Chinese troops to Choson.

Japan, China, and Russia were now all vying for influence on the peninsula. Chinese influence was quickly removed by Japan's victory in the Sino-Japanese war (1894–1895). In 1895, the Japanese instigated the assassination of the influential queen consort, Queen Min (1851–1895), the real power behind the throne, to increase their influence. With victory in the Russo-Japanese war (1904–1905), Japan was now unrivaled on the peninsula, and Choson had no choice but to become a Japanese protectorate. Annexation by Japan in 1910 brought an end to the kingdom of Choson and the beginning of thirty-five years of colonial rule.

CHOU DYNASTY. See **Zhou Dynasty**.

CHOU EN-LAI. See **Zhou Enlai**.

CHOYBALSAN, HORLOOGIYN (1895–1952), Prime minister of Mongolia. Choybalsan was born in Achit Beysiyn (now the city of Choybalsan) in the Tsetsen Khan aymag (now Dornod province) of Mongolia. After running away from a Buddhist monastery at age seventeen, Choybalsan worked a variety of jobs while attending the Russian School for Translators in Nisfel Khuree, as Ulaanbaatar was then called. While attending school in Russia, he became one of the founding members of the Mongolian Peoples Revolutionary Party, which established contact with the Bolsheviks.

After the successful Mongolian Communist revolution in 1921, Choybalsan attended a military academy in Moscow and eventually became the commander in chief of the Mongolian army. He then held several posts in the Mongolian government, ranging from foreign minister to minister of war. In 1939, however, Choybalsan obtained the position of prime minister and held it until his death in 1952.

Choybalsan was a close friend of Josef Stalin and is often referred to as Mongolia's Stalin. Like Stalin, he developed a cult of personality and purged thousands of dissidents. The death toll is still uncertain. In 1962, ten years after Choybalsan's death, the MPRP Central Committee admitted that many innocent people died as a result of his misconduct.

CHRISTIANITY. See **Belo, Bishop Carlos; Catholicism, Roman—Philippines; Catholicism,**

Roman—Vietnam; Eastern Orthodox Church—Asia; Endo Shusaku; Jesuits—India; Ricci, Matteo; Oriental Orthodox Church; Protestant Fundamentalism—Southeast Asia; Saint Paul

CHRISTIANITY—CENTRAL ASIA In numbers of adherents, Christianity is Central Asia's second major religion after Islam. Missionaries, merchants, scholars, and diplomatic envoys traveling from Europe to the Far East all contributed to the penetration of Christianity to Central Asia. Over time, Christianity grew and consolidated itself to reach the present state of acceptance and coexistence with Islam. After the fall of the Soviet Union in 1991, the newly independent states of Central Asia guaranteed their populations religious freedom. Nevertheless, recently a new wave of religious regulation has appeared in a number of those states. Some fear that for security reasons new restrictions on religion may be imposed in the fight against Islamic fundamentalism.

The Early Years of Central Asian Christianity

The earliest Christian community in Central Asia emerged in what is now Iran in about 200 CE. Between the fourth and sixth century Christians were also found in China and Mongolia and in the seventh century in the present Central Asian Region. Many of the Turks who in the 1800s served in the army of the Governor of Bukhara (now in Uzbekistan) bore the sign of the cross on their foreheads. Coins and ornaments of the period also bore this cross-like image.

New information has come to light since the 1990s concerning the earlier stages of Christianity in Central Asia, and concerning a Christian community in the city of Merv in Turkmenistan in particular. At the Council of Constantinople (381 CE), the community was the first one granted metropolitan status (that is, it became an episcopal center). This was thanks to Bar Shaba (third century CE), one of the first active promoters of the Eastern Church, which appeared soon after the Roman Empire split in the fourth century. Exiled with his wife from Iran to Merv for his faith, Bar Shaba converted many people to Christianity. He constructed several churches in and near the city, and assigned them preachers, so that they could care for the people and perform religious services.

Churches and monasteries were built and ecclesiastical centers functioned. In Asia, Christians were regarded as excellent doctors, scribes, scholars, diplomats, and theologians, and often included top government officials. The Sogdian period from the sixth to the tenth centuries was the golden age of the Nesto-

rian Christians (Christians who emphasized the independence of Christ's human nature and his divine nature), who left traces of their presence all over Central Asia.

Another important historical site is the Armenian abbey on the shore of lake Issyk-Kul in Kyrgyzstan. According to legend, this is the location of the grave of Saint Matthew. On a hill to the south of Samarqand in Uzbekistan, along with various Christian symbols, a chancel of fire was found. As this is a Zoroastrian symbol, it shows that the two religions mingled.

Roman Catholic Forays into Central Asia and the Rise of Islam

An apostolic nuncio to the Tartars was appointed in April 1245 by Pope Innocent IV and made a long journey through Central Asia. His was probably one of the first Catholic diplomatic missions to the Far East. The Franciscan friar Giovanni da Pian del Carmine, a contemporary and disciple of Saint Francis of Assisi, reached the court of the Great Khan Guyuk in 1246, nearly thirty years before Marco Polo. But Venetians and Genoese merchants were already in Central Asia with their goods and their Catholic faith, and records indicate that Christianity was already current there. During his journey, the friar learned that Prince Michael of Tchernigov, a fervent Christian (later made Saint Michael of Russia) and his assistant Theodore (later Saint Theodore of Russia) had been executed for refusing to recognize the divinity of Genghis Khan. Another Franciscan, the German friar William of Rubruck, visited the area in 1253.

By the thirteenth century, Asia was conquered by the Mongolian Tartars, and Islam started to displace all other religions. But Muslims respected Christians and other "people of the book" and never interfered with their rites; they simply taxed them as foreigners. By the sixteenth century, Christianity in Central Asia came almost to a standstill, and visits by Roman Catholic missionaries became rare.

Eastern Orthodox Christianity in Central Asia

At the end of the seventeenth century, the first Russian settlers appeared in eastern Kazakhstan. In their new land, Russian peasants found an escape from serfdom, and Old Believers (those who refused to accept mid-seventeenth-century reforms to the Russian Orthodox Church) found a break from religious oppression. From the mid-nineteenth century, a new era of Christianity began in Central Asia, arising from the political interest of the Russian Empire in its southern borders. Unusual churches appeared—army

garrison churches, mobile vans that serviced the railway builders, and later, the first permanent church—in Kazakhstan, in 1847.

Poor migrants, most of them orthodox Christians, rushed to Asia in the hope of finding free land, jobs, and markets. The officialdom, military officers, and craftspeople included many Germans, Poles, and Lithuanians, who were Catholics and Lutherans. A Mennonite group established three different settlements in today's Kyrgyzstan. In addition, a community of Armenian Christians was engaged in winemaking, silkworm breeding, and trade. The inflow of Christians increased when prisoners and clergymen of World War I—Hungarians, Czechs, Poles, and Austrians—were brought here.

In 1871, the Holy Synod of the Russian Orthodox Church and the State Council of Russia established the Turkestan eparchy with headquarters in Vernyi (now Almaty), and after 1916, in Tashkent. In order to survive, the eparchy—situated in predominantly Is-

Kazakh women pray during a mass celebrated by Pope John Paul II during his visit to Kazakhstan in September 2001. (AFP/CORBIS)

lamic territory and uniting a diverse community—had to find its own path. The picture was further confused a few years later by the problems of regulating the different religions' relations with the Soviet authorities. The Orthodox communities, whose numbers decreased sharply, were not allowed to keep their property, which was declared the common property of the people. Soviet authorities disbanded the Catholic and Lutheran communities. Religious celebrations were replaced by revolutionary holidays. A wave of terror was launched against the clergy.

The Communist attitude toward the Russian Orthodox Church changed somewhat during the World War II, when the Church played a big propaganda role in defending the motherland. But the negative view of any type of religion persisted until the late 1980s and early 1990s, when the collapse of the Soviet system finally removed the trammels of atheism.

Christianity in Central Asia in the Twenty-First Century

Today Christians of different denominations—Russian Orthodox, Roman Catholic, Lutheran, Adventist, Baptist, evangelical, and others—are all actively involved in their pastoral activity and most of them are officially registered in the nations of Central Asia. Islam and Christianity coexist peacefully. Relative stability was achieved at the cost of compromises that the official church had to make with the state during the Soviet period and afterward. Today Christian festivities are celebrated not only by Central Asian Christians but also by people of other faiths.

In autumn 1996, in the presence of the holy patriarch of Moscow and all Russia, Aleksei II, Christians celebrated the 125th anniversary of the Tashkent-Central Asian eparchy. In the same period the Vatican also established a general nunciature (papal diplomatic mission) in Almaty (Kazakhstan), in charge of all Central Asian states and with missions in Kyrgyzstan, Tajikistan, Uzbekistan, and Turkmenistan.

On a darker note, a new wave of religious restrictions has appeared in various Central Asian countries. The secular governments are trying to protect themselves against a wave of Islamic fundamentalism, fearing terrorism and calls for an Islamic state in Central Asia. This new trend is being carefully watched by the democratic institutions in the West and may represent a sad new page in the history of Christianity's development in Central Asia.

CHRISTIANITY—CHINA Christians have been trying to convert the Chinese for over a thousand years. Although Christians make up only a small percentage of the Chinese population, Christianity is an established minority religion in China, and Chinese and foreign Christians have had a great impact on China's modern history.

The Jesuits in China

Christianity first came to China in the Tang dynasty (618–907 CE) when Nestorians established churches in Changan, but the first major attempt at Christianizing China came from the Jesuits. The most important early Jesuit was Matteo Ricci (1552–1610), who arrived in China in 1582. The Jesuits hoped to convert China beginning with the elite, and they managed to establish themselves at court and served the Ming and Qing emperors as astronomers, painters, and weapons makers. The Jesuits won some converts, as did their rivals the Franciscans, who concentrated on the lower classes, but their work was undermined by growing Confucian hostility to Christian philosophy and the long-running Rites Controversy, which ended with a papal decree that Chinese Christians could no longer participate in ancestor worship. In 1724, the emperor declared Catholicism a perverse sect, similar to the White Lotus, a Buddhist sect that was often at odds with the imperial government. The prohibitions against Catholicism were usually not rigorously enforced, but the numbers of Catholics fell. Catholicism remained a viable minority religion in a number of areas, but the greatest significance of the Jesuit interlude was the intellectual exchanges between China and Europe it facilitated.

Nineteenth-Century Missionary Activity in China

The next great attempt at the conversion of China began in the nineteenth century and involved both Catholics and Protestants. The attempts to convert China were only one part of a larger Euro-American drive to evangelize the non-Christian world, and the missionaries were also only part of a larger effort to control and transform China. For at least some of the missionaries the task of making China a modern nation was at least as important as making it a Christian

one. Missionaries played a significant role in helping build a new nation, but their connection to foreign imperialism loomed large in the eyes of many Chinese.

In the early nineteenth century, there was a revival of interest in missionary work that led to the creation of bodies like the French Catholic Society for the Propagation of the Faith and the London Missionary Society. Under the Canton system, which restricted where foreign traders could live, foreign missionaries could reside only in Macao and Canton, and until the Treaty of Tientsin (Tianjin) their efforts were mostly confined to translating and publishing Christian works. By 1900, however, there were 886 Catholic priests in China, and in 1905, there were over 3,000 Protestant missionaries, members of 63 missionary societies.

Problems of Acceptance

The presence of missionaries often created trouble at the local level. The gentry resented the political privileges that the treaty system gave the missionaries and saw them as agents of their governments, a charge that was sometimes true. The Christians were also associated in the popular mind with the opium trade and the Taiping Rebellion (1850–1864). Anti-Christian violence was not uncommon. Although missionaries could sometimes reside in China for years without trouble, incidents like the Tianjin Massacre of 1870, which was sparked by rumors that Christian missionaries were using the blood of Chinese infants in their rituals, were also possible. The greatest anti-Christian outbreak was the Boxer Rebellion of 1899–1900, which tied together anti-Christian and anti-Imperialist sentiments.

In addition to problems simply maintaining their presence in China, the missions had far less success in converting the Chinese than had been hoped. Most of the missionaries could count only a handful of converts after years of work, and almost all the financial support for their efforts came from their home countries. At the beginning of the twentieth century there were 700,000 Chinese Catholics and 100,000 Protestants. For most Chinese the foreign religion was simply too foreign, requiring an end to ancestor worship and withdrawal from the religious rituals that defined local communities.

Christians and Education

Like the Jesuits before them, the nineteenth-century missionaries were important cultural conduits between China and the West. In addition to producing religious tracts, they were responsible for translations of many Western books into Chinese, bilingual

RELIGION IN CHINA FROM THE PERSPECTIVE OF A PROTESTANT MISSIONARY

"But whether a Chinaman is a Confucian, Taoist, or a Buddhist, he considers it to be his first duty to sacrifice to his ancestors. This Ancestral Worship, as it is called, is dearer to hearts of Chinese than any other kind of worship. They say that the idols belong to everybody, but their ancestors are their own, therefore they worship them. Of course it is only a dead ancestor who is worshipped; he is in the spirit-world and is supposed to have power over his living relatives, who think that he will cause some evil to fall upon them unless they please him by offering him sacrifices and worship. The relatives also think the departed spirit will in some way be better for these sacrifices. The worship is carried out at the graves and before the ancestral tablets which are put up to the memory of the departed in almost every house.

"In the face of all this the missionaries are bravely advancing, carrying the message of the Gospel into the strongholds of superstition and idolatry. They have made such progress during the last fifty years, that whereas just before the accession of Queen Victoria there were scarcely a dozen Protestant Christians in the land, to-day there are upwards of a hundred thousand."

Source: Mary Isabella Bryson. (1890) *Child Life in China*. London: William Clowes and Sons, Limited, 21–22.

dictionaries, and translation of the Chinese classics into English. James Legge, one of the first to undertake translations of the Chinese classics into English, justified his work on the ground that it was only by understanding the Chinese that missionaries could convert them; he and his compatriots also laid the foundations for the study of China in the West. It was through education and medicine that Christians first began to find a role for themselves in China. Christian-run hospitals were the first to introduce modern medicine to China and Christian schools provided education in Western subjects to a growing number of Chinese. For the many missionaries, especially Protestants, who were influenced by the doctrine of the social gospel, modernizing Chinese culture was as important a mission as evangelism. Missionaries were at the center of early efforts to eliminate opium smoking and improve the position of women.

Revolution

Christian education in China culminated with the founding of universities, perhaps the best-known being St. John's, founded in Shanghai in 1879. The goal of the universities was to create a Chinese Christian

elite, and partly because of the universities such an elite came to exist. Like most of the Christian universities, St. John's came to enroll more non-Christian than Christian students. Although the total numbers of Chinese Christians remained small, by the 1920s members of the urban elite were quite likely to have attended a Christian school. Two of China's most famous leaders, Sun Yat-sen (1866–1925) and Chiang Kai-shek (1887–1975), were Christians. Despite this, and in part because of it, there was a considerable amount of anti-Christian feeling among educated Chinese. The May Fourth Movement, which began in 1919, was critical of Confucianism in particular and religion in general and of foreign control of important Chinese institutions, such as universities. This led to a rising tide of criticism of Christianity among the elite in the 1920s.

At the same time members of the elite were attacking the foreign nature of Christianity, more Chinese forms of Christianity were beginning to develop. Making Christianity into an indigenous Chinese religion had been a goal of most missionaries from the beginning, but the mainline missionary organizations made little progress in this direction. In addition to small independent congregations of Chinese Chris-

tians, groups like the True Jesus Church and the Little Flock emerged. These movements owed much to the Chinese sectarian tradition and the Pentecostal movement in the West. They were led by charismatic Chinese and often had contentious relationships with foreign-led Christian organizations.

Communism

The Communist victory in 1949 was not good for Chinese Christianity. Many organizations were banned and some individuals arrested. The fact that so many Christians had overseas ties was also a problem. Although official sanctioned churches continued to function, the religion was regarded with great suspicion by the authorities, especially during the Cultural Revolution. Since the death of Mao there has been a great increase of interest in religions of all sorts, and Christianity has grown rapidly. Although the state is not formally opposed to Christianity, it is very much opposed to groups that are not approved by the government.

CHRISTIANITY—JAPAN Christianity arrived in Japan with Catholic missionaries in the mid-sixteenth century and flourished for approximately a century before being brutally suppressed. After that, isolated underground communities attempted to maintain Christian teachings without benefit of priests. With the reopening of Japan in the mid-nineteenth century, a new wave of missionaries arrived, and during this period the Japanese people alternated between interest in and rejection of what they saw as foreign to Japanese sensibilities.

First Encounter with Christianity

The history of Christianity in Japan began with the arrival of Portuguese traders, but formal instruction began in 1549 with the arrival of Francis Xavier in Kagoshima, the southernmost city of Kyushu. Xavier and those who followed were generally received amiably by local rulers, partly because the foreigners were obviously educated and partly because they were as-

sociated with profitable Portuguese trade. The Jesuits were successful in Kyushu and western Honshu, converting as many as thirty thousand Japanese by 1570, partly as a result of mass conversions under varying degrees of pressure from the local lords. Another factor in their success was an emphasis on conforming as much as possible with Japanese forms and customs and developing a native clergy. By 1614 there were an estimated 300,000 Christians out of a total Japanese population of 20 million.

The early mission activities took place during a nationwide power struggle, in which Oda Nobunaga (1534–1582), the first of the Three Unifiers of Japan, made the first steps toward broad centralized control. Out of hatred for the Buddhist hierarchy and interest in learning about European civilization from men of culture, Nobunaga was friendly toward the Jesuits and tolerant of their activities. Amiable relations continued when Toyotomi Hideyoshi (1536/7–1598), the second Unifier, succeeded to power, culminating in his granting an interview to Vice-Provincial Gaspar Coelho in 1586 at Osaka. The following year, however, saw a radical change. Hideyoshi became incensed at the undue deference paid to the Jesuit fathers by the converted daimyo (regional lords) of Kyushu and at the forcible conversions of people within certain domains. The result was a sudden reversal of the favorable reception of the Jesuits.

Aggravating an already tenuous situation, rivalry between Portuguese and Spaniards and between the Jesuits and the Franciscans, Augustinians, and Dominicans, who arrived in Japan between 1593 and 1602, showed itself as mutual defamation. Things were brought to a head when a Spanish ship, the *San Felipe*, was driven ashore in Shikoku in 1596. The ship was confiscated, and the captain appealed to the representative in charge of negotiations. During the proceedings, the captain showed a map indicating the colonial possessions of the king of Spain, and when asked whether missionaries had played a part in acquiring the colonies, the captain replied that they had. Hideyoshi immediately adopted a policy of complete intolerance toward the missionaries and their Japanese followers.

In 1597 Hideyoshi had foreign and Japanese Franciscans active in the Kyoto area arrested. They were eventually executed by crucifixion as a warning that Christian missionaries and converted Japanese would no longer be tolerated. In 1614 an edict of persecution was issued charging Christians with intent to take charge of the government and the country. Churches were destroyed or closed, missionaries were forbidden to enter the country, and Japanese converts were forced to recant.

THE "ACCEPTANCE" OF CHRISTIANITY IN PREWAR JAPAN

The following description of women's interest in Christianity as depicted by characters in pre-World War II novels by Japanese scholar M. Kawaguchi suggests that Christianity had not taken hold.

None of the characters in these works has any clear religion. But the women are all "interested in" Christianity. Michiko in *Tsuki yori no Shisha* (Kume) becomes a nurse at the Fujimi Convalescent Home because, she says, "it is only fitting that we should bear all bear the suffering of the cross." Keiko in *San-Katei*, who can no longer bear to live with her unfaithful husband and goes home to her mother, tries to assuage her despair as she waits to bear that husband's child by reading the Bible. Emiko, whose mother is a Christian, sometimes reads the Bible, but in her case it is generally enforced reading as a punishment for coming home late. She reads the Old Testament stories—as literature. But interest in Christianity does not develop into Christian faith. The Christian Madame Isago is said to be "pompous in everything, prejudiced, lacking in understanding and unable to make allowances; her judgment of sin is swift and cunningly ruthless." Christianity is even held to be narrow and oppressive.

Source: R. P. Dore (1967). *City Life in Japan: A Study of a Tokyo Ward*. Berkeley and Los Angeles: University of California Press, 360.

When suppression intensified, there was little choice but to apostatize or go underground. The strength of the conviction of Japanese Christians is witnessed by the estimated forty or fifty thousand who were martyred for their faith. Resistance effectively came to a close with the end of the Shimabara Rebellion (1637–1638). When peasants rose up in rebellion against extortionate taxation, religious persecution, and chronic poverty in Shimabara domain (current Nagasaki prefecture), the government viewed it as inspired by Christians. The rebellion ended with the slaughter of some thirty-seven thousand men, women, and children. The next year the entire country was closed to outside intercourse, with the exception of Dutch trade at Dejima, an island off Nagasaki, and by 1643 Christianity was ostensibly eradicated.

The Second Encounter

When Japan opened to the West in the 1860s, it was discovered that communities of *kakure kirishitan* ("hidden Christians") had survived for two centuries.

C. R. Boxer quotes a contemporary estimate that there were some forty thousand Christian believers at the end of the Edo or Tokugawa period (1600/1603–1868). The greatest concentration was in present-day Nagasaki prefecture, primarily in rural areas on islands isolated from the mainland and from each other.

The first Protestant mission to Japan began in 1859, but given Japan's continued hostility toward Christianity, open activity was virtually impossible. In 1873 the proscription against Christianity was lifted and small-scale American and European missions—Catholic, Protestant, and Russian Orthodox—entered Japan. The early years of these missions were taken up with mastering the Japanese language and making the Scriptures available in Japanese translation. The New Testament was published in 1880 and the Old Testament appeared in 1888.

Not every Japanese Christian welcomed the new missionary movement. Among these Christian believers was Uchimura Kanzo (1861–1930), who advocated

a return to the simplicity of the gospel and the early church, spurning the divisive denominationalism and stubborn institutionalism of the Christianity that had come in. In response, he sought to make Christian belief more congenial to the Japanese through the *mukyokai* (no-church) movement.

Renewed missionary activity had considerable impact in the field of education. A network of Catholic schools throughout the country led to the establishment of Jochi Daigaku (Sophia University), University of the Sacred Heart, and Nanzan University. The combined Protestant denominations established Doshisha University, Aoyama Gakuin University, Rikkyo University, and, much later, International Christian University. Schools were established also for women and for the physically challenged, both largely ignored by the national government of the day.

With the outbreak of World War II, foreign missionaries were either repatriated or interned, and Japanese Christians once again found themselves forced to keep their beliefs to themselves as nationalism promoted worship of the Shinto deities as an indication of national loyalty.

Contemporary Christian Activity

During the Allied Occupation (1945–1952) interest in Christianity was rekindled, but as Japan recovered and society stabilized, its appeal decreased. However, in the postwar period indigenous groups have founded new organizations such as *Iesu no Mitama Kyokai* ("Spirit of Jesus Church"), founded in 1941 by Murai Jun, and *Iesu no Hakobune* ("The Ark of Jesus"), formed in 1960. Like Uchimura, these groups share the conviction that their Japanese cultural expressions of Christian faith are truer to the spirit of New Testament Christianity than the distortions of the Western churches.

Today mainstream Christian activity in Japan remains unassuming and the Christian population is estimated at less than 1 percent of the total Japanese population. Primary activities include support of medical, social, and educational organizations.

Summary

When the first Christian missionaries arrived in Japan in the late sixteenth century, there was a spiritual and social openness resulting from a long civil war and increasing dissatisfaction with the political and social conditions that war created. The subsequent rejection of Christianity can be partially attributed to that religion's exclusivist nature. Requiring singular obedience to one religion was at odds with Japanese tolerance of multiple

People pray for victims of the 1945 atomic bombing of Nagasaki in August 2000 at the Urugami Cathedral in Nagasaki. (AFP/CORBIS)

beliefs. Second, the political ramifications of the foreign creed led to a conflict of interests. Loyalty to the deity and its foreign missionaries stood in the way of unchallenged subservience to their lord. For Japan's leaders, the risk of tolerating Christianity was just too great and the religion was suppressed. A similar pattern of acceptance during social instability and rejection as society returned to order followed both the Meiji period (1868–1912) and the years following World War II. It remains to be seen whether Christianity will become more accessible to a broader element of society or remain appealing to only a small segment.

CHRISTIANITY—KOREA Christianity is a major religious force in Korea. Its influence began in the late eighteenth century with small communities of Korean Catholics who had learned the doctrines during encounters with Christians in China. For a century, the highly Confucian Korean royal government viewed Christianity as a dangerous heterodoxy, and there were frequent persecutions. This changed after Korea was "opened" to contact with the West in the 1880s and Korea's Protestant and Catholic Churches began to grow, first under the guidance of foreign missionaries and then under the leadership of Korean clergy. The growth continued under Japanese colonial rule and during the postwar ordeal of national division. By the 1980s in South Korea, where Christianity flourished after the Korean War, fully one-quarter of the population had come to identify itself as Christian.

Development

The success of Christianity in Korea is unique in East Asia, where in most countries the Christian population does not exceed 5 percent of the total. The reasons for this success have to do with Korea's modern history and the things Christianity has represented in the minds of Koreans. Though the traditional ruling elites of Korea disdained it in the beginning, Christianity was associated in the minds of commoners with advancement and better living. The early missionaries started schools that offered education to ordinary people. They promoted the use of the Korean hangul alphabet to boost literacy, which formerly had been reserved for the elite. Under Japanese colonial rule (1910–1945), adopting Western Christianity seemed to be an alternative to adopting the Japanese value system. Churches were among the very few organizational structures not controlled by the Japanese, so Christianity also came to be associated with nationalism.

World War II was a time of persecution for Christians, and their numbers dropped off. After the Allied victory, however, Korea was divided into northern and southern zones. Christianity had actually been stronger in the north than in the south before 1940, but after Korea's division, a Soviet-backed leftist government came to power in the north. Christians opposed the new government's ideology and thus were targeted for new kinds of political persecution. Many of North Korea's Christians moved to South Korea as refugees, starting new churches as centers for mutual

support as well as worship. Those who remained in the north were grudgingly tolerated until the Korean War, after which Christianity was officially persecuted as an enemy ideology.

In South Korea, by contrast, Christianity was associated with Western-style prosperity and American power. Koreans looking to the United States for support in their beleaguered situation found Christianity attractive for a combination of reasons. There were those who became Christians as a way of looking modern, of course; but there was also an authentic religious response to the comforts of Christian faith in a country that was undergoing multiple ordeals of reconstruction, urbanization, and revolutionary economic development. Korea's urban churches functioned as networking organizations for people arriving from the countryside, as ready-made communities of supportive cobelievers, and as affirming religious centers that helped maintain human and moral values in a world being turned upside down.

The theological traditions of Korean Christianity, whether Protestant or Catholic, are conservative, emphasizing personal morality, community, and the sovereignty of God. Korea's Christians believe that prayer and piety are keys to winning divine favor and that perseverance in the faith brings blessings in daily life. At times they have seen themselves as a people chosen by God to undergo unique trials that have purified them and empowered them to claim a leading role in society. During the Japanese colonial period especially, they often likened themselves to the children of Israel in the Old Testament. The ideological war between Christianity and communism contributed to this line of thinking, creating a tacit claim that Christians are uniquely suited to be national leaders. While some non-Christians regard this as arrogant, it helps explain the visibility of Christianity as a phenomenon on the contemporary Korean landscape.

South Korea's churches long ago became free of foreign missionary control and have developed into completely "Korean" organizations, being self-financed and self-directed. As a Korean religion, Christianity manifests traditional traits. One such trait is a strong Confucian authority pattern, notably patriarchal despite the fact that a majority of the members of all churches are women. Another is the tendency of Korean pastors to assume charismatic identities that recall Korea's shamanist tradition. The cherished practice of worship in natural settings, long a part of Buddhist practice, is reflected in the penchant for long sessions of prayer and fasting in mountain retreats. The health emphases of traditional Korean religions are reflected in the popularity of healing services, and the expectation of ma-

Worshippers at the Youido Full Gospel Church in Seoul in 1990. (BOHEMIAN NOMAD PICTURE-MAKERS/CORBIS)

terial benefit from religious practice is reflected in prayers for blessings. Indeed, some of Korea's fastest-growing churches emphasize the idea that God wants his people to be prosperous. Many churches (and their pastors) are conspicuously wealthy.

South Korea's biggest churches have members numbering in the tens and even hundreds of thousands, making them congregations that are actually denominations in themselves. They often spin off daughter churches and branch churches for immigrant communities overseas. Some of them engage in missionary activity, deploying members to countries in Asia and Africa as doctors, teachers, and evangelistic workers, exercising the same impulse that brought missionaries to Korea a century and more ago.

The first Protestant communities in Korea date from the mid-1880s; a small village church was founded in a house in the 1860s, but the first formal congregation, still extant, was founded in 1885. Protestants far outnumber Catholics in Korea, but the Catholic Church has also grown proportionately since the end of World War II. It was led by foreign priests before that and did not become free of missionary direction until 1962. In the 1960s and 1970s, Catholics were prominent in South Korea's democracy movement, opposing military dictatorship and identifying the Catholic Church with the struggle for political and economic justice. This stance attracted many youth, especially university students. In 1984 Korea's Catholic

bicentennial brought Pope John Paul II to celebrate a special mass, attended by many thousands, in which he presided over the canonization of 103 martyrs from the anti-Catholic persecutions of the nineteenth century.

Church and State

The division of Korea has played a major role in shaping the Korean Christian Church. In South Korea, Christian refugees from the north have helped make the Protestant movement strongly anticommunist and therefore inclined to support the South Korean government even during its worst periods of military rule and human-rights abuses. When the Seoul government used the memory of the Korean War and the evil personified in Kim Il Sung and his oligarchy in the north as an excuse to clamp down on dissent and free expression, Korea's conservative Christians tended to go along.

However, the manifest injustices of political life in South Korea under military rule between 1961 and 1992—the suppression of dissent, the use of torture in police interrogations, the low-wage strategy of Korean economic development, the abuse of police power to seek political advantage, and many other obvious violations of human rights—led many Christians in all denominations to demand democratic reforms. As was once the case under colonial rule, Christian leaders found that their institutions constituted platforms from which to speak out against dictatorship. Though they

were often blacklisted, arrested, and even tortured, Christians led the human-rights struggle. Prominent among them was Kim Dae Jung (b. 1925), a Catholic, who was once the archenemy of the regime but persevered in politics to be elected president in 1997.

The Future

As South Korea experiences material prosperity for the first time in its history, the church finds itself facing new challenges. Having grown under adversity and having been disciplined by colonialism, war, and political repression, it risks becoming complacent and fractious. Moreover, with national reunification remaining the top item for national discussion and the number-one problem to be solved in the future, Korea's Christians find it oddly difficult to agree on a role in the process. Many rallied to help alleviate the 1990s famine in North Korea, stressing their brotherhood with fellow Koreans in the north. Others, however, have tried to position themselves for an anticipated victory over North Korea. The "Christian reoccupation" of North Korea is unlikely to succeed if it is undertaken as a crusade. For Korea's Christians, reunification may well turn out to be the greatest test of all.

CHRISTIANITY—MYANMAR Christians are estimated to constitute only 5 percent of the population of Myanmar (Burma), but the religion is dominant in a number of communities, especially among the ethnic minority Chin, Kachin, Karen, and Karenni peoples. The first Western Christian missionaries were Roman Catholics who arrived with the Portuguese in the sixteenth century. Subsequently, missions were established by Italian and French Catholics. However, it was only during British rule of Burma in the nineteenth century that the spread of Christianity began to accelerate.

The first large-scale conversions were among the Karens in the Tenasserim and Irrawaddy River delta

regions of southern Burma. Here, the pioneering Baptist missionary Adoniram Judson arrived in 1813. A key element in the spread of Christianity was the promotion of education among animist or spirit-worshipping communities. Many previously nonliterate languages, such as Karen and Kachin, were transcribed into writing.

The establishment of indigenous churches quickly followed, and in 1881 the Karen National Association was formed by Christian Karens to promote the advancement of the Karen people. Many Christians from ethnic minority communities also joined the government service and armed forces. Although perhaps only one-sixth of modern-day Karens are Christians, such cooperation with the British authorities led Burma's leaders to allege that Christianity was a key element in what they described as the colonial armory of the "Three M's": missionaries, merchants, and military. In response, in 1906 the Young Men's Buddhist Association was formed parallel to the Young Men's Christian Association, signaling the revival of the Burmese nationalist movement.

Further allegations of the divisive role of Christianity were made after the British departure in 1948 when Karen and Karenni leaders, the majority of whom were Christians, took up arms against the central government. In 1961, insurrection also began in Kachin State when Prime Minister U Nu (1907–1995) attempted to make Buddhism the nation's official state religion.

Under General Ne Win's Burma Socialist Program Party (1962–1988), a more secular policy was pursued by the government. All foreign missionaries were expelled from the country during a quarter-century of isolationism. Nevertheless, a diversity of Christian churches survived.

At the end of the twentieth century, the two strongest Christian religious groups were the Baptists (the largest denomination) and Roman Catholics, both of which have more than one-half million members. Other significant groups include Anglicans and Seventh-Day Adventists. Most of these Christian groups continue to work together through two umbrella organizations: the Myanmar Council of Churches, which links Protestant groups, and the Catholic Bishops Conference.

Under the State Law and Order Restoration Council, which assumed control of the country in 1988, church groups became more visibly active again in religion and community development. Although incidents of discrimination against Christians were reported (especially in Chin State), in other areas

church leaders acted as intermediaries in peace talks between armed opposition groups and the government, notably in Kachin, Kayah, and Karen States.

CHRISTIANITY—SOUTH ASIA Christianity has been an important force in South Asian history. During the period of British rule in India (c. 1757–1947) British Christians were influential in securing social reforms such as the suppression of *sati* (suttee). Protestant and Catholic missionaries established widespread and influential mission school systems, which influenced the attitudes and outlooks those educated there. While some locals welcomed Christian missionary activity, others were hostile and feared conversion. This fear, together with a desire to adopt some teachings of Christianity, encouraged the emergence of Hindu and Buddhist reform and revival movements.

Origin and Character of Precolonial Christian Communities

Christians have been living in the Indian subcontinent since ancient times. A persistent tradition, reflected in the apocryphal Acts of Thomas (probably written in the Syriac language in the fourth century CE) that Saint Thomas preached and died in India, is echoed in Hindu and Christian belief that he founded the community of Saint Thomas Christians on the Kerala coast and was martyred at Mailapur, south of Madras City. The first evidence of Christian commu-

nities in Kerala dates from the sixth century. This evidence and subsequent material relating to the period until the arrival of the Portuguese in 1498 show that Saint Thomas Christians maintained close ecclesiastical, commercial, and family links with Syria and the Middle East.

The community's numbers were constantly augmented by settlers from Western Asia. The Christians pledged allegiance to the Syrian Patriarch of the East (whose seat was in present-day Iraq), who was the recognized leader of churches independent of the Church of the Roman Empire. The liturgy was in Syriac and the doctrine influenced by the Nestorians, who taught that Christ had two distinct natures, divine and human. While reflecting Middle Eastern influences, Saint Thomas Christians were also affected by their Hindu environment. Conscious of their high status as warriors and merchants in the caste system, they avoided contact with the lower castes. They enjoyed honored positions as donors or benefactors of Hindu shrines all over Kerala. The management of church affairs, the hereditary nature of the all-male priesthood, the use of torches, umbrellas, and banners in procession, and the performance of some minor Hindu-type rituals, all reflected the Hindu context in which the community developed.

Continuing Spread of Christianity, 1498–2000

In 1503 a West Asian prelate reported some 30,000 Saint Thomas Christian families in Kerala; the census of 1901 estimated the number of individuals in that community at nearly half a million. During the period of Portuguese and British rule the number of Protestant and Catholic Christians (those whose origin is associated with European missions) also steadily grew. In 1991 there were nearly 20 million Christians in India, mostly in the south and northeast, representing 2.34 percent of the total population. Christians represent about 8 percent of the population in Sri Lanka, 2 percent or less in Pakistan, and less than 1 percent in Bangladesh. In 1990 there were an estimated 50,000 Christians in Nepal.

Religious Inquiry and Conversion Movements

Historians place varying emphasis on the political, economic, religious, social, or other factors involved in the rapid expansion of Christianity during colonial rule. Less in dispute is evidence that those who wished to join Christian churches usually acted together rather than as individuals—representatives of caste, family, or other groups approached Christian leaders asking for information or requesting baptism. Some churches welcomed all who came irrespective of motive, hoping

Indian Roman Catholics leave the Sacred Heart Cathedral in New Delhi, India's largest, in September 1998. (AFP/CORBIS)

"inquirers" would grow in faith and practice in the church. Others were more selective, insisting on the application of strict criteria, which varied in different missions and which involved either rejection of the candidate or evidence of changes in belief or behavior before individuals or groups were admitted to full membership.

Issues Still Confronting Christian Communities

Since the development of Christian communities in Kerala and elsewhere, Christians have faced many of the same questions. What ought to be the relationship between Christians and the state or between indigenous Christians and the wider ecclesiastical and Christian movement? What does it mean to express one's faith in and through a South Asian culture as distinct from a Syrian or European culture? How does one preach the Gospel, teach, and heal effectively in the local multireligious environment?

Christians and Politics

One of the most sensitive issues in Christianity is the varying relationship between Christians and political authorities. While Saint Thomas Christians were integrated in the indigenous state system before the arrival of the Portuguese, most Christians in South Asia trace their origins to conversion movements occurring in the context of European missionary activity and colonial rule. European missionary paternalism, which often included a policy of keeping Indian Christians in subordinate positions within the church, created resentment especially among Western-educated Christians. That feeling heightened their awareness of the "evils" of foreign rule and encouraged Christian participation in the early stages of the Indian nationalist movement. However the rise of strident forms of Hindu nationalism soon raised fears among Christians of their eventual fate in a state dominated by the Hindu majority. After a period of considerable anxiety, Protestant and Catholic leaders threw their weight increasingly behind the Gandhian movement and the idea of an independent India as a secular state. Confidence in the new government of India was enhanced by acceptance of a Catholic proposal that minorities' rights be guaranteed in a new constitution.

The Present Pattern of Contrast

While churches operating in postcolonial South Asia continue to face political problems, there are opportunities for growth and participation in nation building. The sense of belonging to a persecuted minority in Pakistan, Bangladesh, and parts of India (where militant anti-Christian forms of Hindu nationalism have been increasing) contrasts with a sense of confidence and optimism associated with the continued rapid expansion of Christianity in northeastern India and Nepal.

The priorities, lifestyles, and forms of worship among Christians also vary. A preoccupation with internal issues such as power, property, and social standing (especially in the Church of South India) contrasts with other church programs of change and reform and increasing involvement in outward-looking welfare projects in rural areas and slums. Traditional forms of Christian worship are maintained alongside experiments in further indigenization and increasingly popular charismatic-type meetings throughout the region. The establishment of interdenominational national Christian councils in most South Asian countries, the formation of the Church of South India (1947), Church of North India, and Church of Pakistan (1970), which bring together Protestant denominations, and increasing Protestant and Catholic collab-

oration in educational and other programs, reflect both the practical needs of small but growing Christian communities and the new spirit of the global ecumenical movement.

CHRISTIANITY—SOUTHEAST ASIA With the exception of the Philippines, Christianity in Southeast Asia is statistically a minority religion. Nevertheless, because of its missionary convictions, organizational strength, and transnational connections, institutional Christianity generally has a high profile and exerts an influence far beyond its numbers. But like other religions in the region, it also has to "reinvent" itself in order to compete with powerful secularizing forces, and to maintain its appeal both for its own adherents and for the unevangelized. The Christian intelligentsia in Southeast Asia, as elsewhere in the Third World church, play active roles in theologically delineating the shape and direction of their faith. Christianity in Southeast Asia is not monolithic; it ranges from the hierarchical Roman Catholic, Orthodox, and Anglican churches, through established Protestant denominations—Lutheran, Reformed, Brethren, Methodist, Baptist, Presbyterian, and the Pentecostalist Assembly of God among others—to schismatic churches and fundamentalist, charismatic, and indigenized Christian sects.

History

Christianity in Southeast Asia has a long legacy that predates the arrival of Roman Catholicism in the fifteenth century and Protestant Christianity in the centuries following. Extant archaeological and literary evidence, although sparse, indicates that trading contacts between Persia and countries farther West were already known by the fifth and sixth centuries. Persia

itself had been exposed to Nestorian Christianity since the early centuries of the first millennium, when many Aramaic- and Syriac-speaking Jewish and Christian communities fled eastward after the destruction of Jerusalem in 70 CE. Through trading contacts with the region, Nestorian settlements were probably set up in the northwestern part of peninsular Malaysia and in northern Sumatra. As elsewhere, however, their traces have long disappeared because of displacement and persecution.

By the time Roman Catholicism arrived with Portuguese, Spanish, and French adventurers during the European age of exploration, commerce, and conquest in the sixteenth century, the region had long been under the sway of other world religions. At the beginning of the Christian era, Indian kingdoms and their civilizing influences were being established in various parts of Southeast Asia. By the fourteenth century, Theravada Buddhism had assumed dominance in mainland Southeast Asia (except Vietnam), and much of maritime Southeast Asia was Islamicized. Moreover, these religions had been culturally assimilated and translated into local idioms. Conversion to Roman Catholicism, particularly in the Philippines and Vietnam, followed similar processes despite periodic prohibitions and persecutions because of religious rivalry and political intrigue. Protestant Christianity, in comparison, spurred on by evangelical piety, arrived during the high colonial period of the nineteenth century. Adult literacy, modern education, the translation of the Christian Scriptures into the vernacular, and medical services were among the key strategies used to entice "pagans" into the Christian fold. Nevertheless, on the whole the numbers converting to Protestant Christianity are not phenomenal.

In most cases, though colonial governments generally did not openly favor Christianity, indirectly they created conditions that enhanced a degree of openness to the new faith. Christianity and Christian institutions were perceived as the legitimate religion and expressions of colonial power and also as means to escape the constraints of traditional social and economic burdens. In some instances, missionaries adopted a policy of nonintervention with the members of the dominant religion (for example, with Muslim Malays in British Malaya) to stave off political unrest for the sake of lucrative commercial interests. In comparison, post-World War II Southeast Asia and the postindependence milieu have seen the democratic principle of religious liberty enshrined in the constitutions of most countries. By and large, however, the influence of institutional Christianity has been undermined and circumscribed by nationalist forces and the exigencies of

CHRISTIANITY MEETS BUDDHISM

The following conversation between a Buddhist nobleman in Thailand and a Christian missionary in about 1850 makes clear the basic beliefs of each faith and suggests some of the difficulties faced by unsuccessful Christian missionaries in Thailand.

Nobleman. After all, my religion is a better religion than yours.

Missionary. Convince me of that and Your Excellency shall be *my* teacher.

N. This is my religion: To be so little tied to the world that I can leave it without regret; to keep my heart sound; to live doing no injustice to any, but deeds of compassion to all.

M. This is excellent: this accords with my teaching; but will Your Excellency tell me what those must do who have already committed sin?

N. Why should they commit sin?

M. Who has not sinned: We should own we have sinned; we Christians have One who has removed our sins from us, and taken them upon himself; but you—

N. Where have I sinned? I do not acknowledge sin.

M. But it is not enough that men should be honest and kind to one another. They owe allegiance to God, their great Sovereign. To disobey Him, to forget Him, to avoid His presence, to be indifferent to His favor—this is sin.

N. And so you think God is censorious and jealous of His creatures, and wants their services and their praises? No! Let us treat all men justly. God is absorbed, gone into annihilation. We need not be troubled or think about Him.

M. No! He lives above! He is *our* Master. It is not enough that servants should be honest towards their fellows, kind to their wives and children; they owe to *their* Master service and gratitude, and will be punished if they do not render them.

N. Who is to punish? You call sin what is no sin.

M. But does not Your Excellency flog your servants when they disobey? Do you pardon them solely because they have not wronged their fellow servants?

N. (Much excited). What service does God want of us? He is not envious and covetous, as you fancy Him to be.

M. Suppose I told Your Excellency's servants that nothing was required of them but to live honestly and pleasantly together; to care nothing about you—neither to seek to please, nor obey, nor serve you, nor be thankful for Your Excellency's kindness: will you allow this? . . .

N. Now I will tell you of your heavy sins.

M. Show it to me and I will confess.

N. Why don't you take a wife?— Why don't you provide successors to teach your religion when you are gone? Christ had thirty disciples, had he not? and his disciples had wives and children; and they multiplied, and have overrun the world; but your religion and your name would perish together if others followed your example.

M. Others will take care of this.

N. No! Each man has a duty for himself.

M. Your Excellency is right. I am beaten here; but your Buddhist priests enjoin celibacy.

N. Battle it then with the Buddhist priests and not with me. . . . Now how long have you American missionaries been here?

M. Nineteen years.

N. Have you made a single convert?

M. Not among the Siamese; and we acknowledge our disappointment but are not discouraged. If a merchant sent out his agents and they failed, he would recall them; but those who sent us would think their sacrifices well repaid if a single soul were saved; for a soul is not extinguished by death, but lives forever; and we know that Siam will become a Christian country.

CONTINUED ON NEXT PAGE

CONTINUED FROM PREVIOUS PAGE

N. But the Siamese are not savages of the woods, having no religion and therefore ready to receive one. We have our religion, in which we have been brought up from our childhood; it will not easily be rooted out. Has

it been in any single instance? The work would be difficult.

Source: John Bowring. (1857) *The Kingdom and People of Siam*. London: John W. Parker and Son, vol. I: 378–380.

nation-building, given Christianity's negative association with colonialism. Since the 1980s, aided by modern technology, enterprising Christian fundamentalist groups, particularly from the United States and South Korea, have been successful in appealing to the peripheral and urban populace, as well as in drawing adherents from more well-established Christian denominations.

Brief Survey

Partly because of the longevity of Christianity in the country, the Philippines is the only country in the region where Christians constitute the majority, including some 94 percent of the population in 1999. Roman Catholicism is overwhelmingly dominant and deeply embedded in Filipino everyday life, as well as in religious and political culture.

Vietnam has the largest Catholic population (about 6 million in 1988) after the Philippines, and a long tradition of native clergy and catechists. Traces of Catholic missionary activity as far back as the fourteenth century exist. Having undergone periodic Confucianist persecution in the mid-nineteenth century and having borne restrictive controls imposed by the Communists in the twentieth century, Vietnam is now experiencing a period of religious liberalization and consolidation.

In expansive Indonesia, the Portuguese Roman Catholic mission to the Moluccas in the 1530s was one of the earliest in the region. The arrival of the celebrated Jesuit priest, Francis Xavier (1506–1552), was the highlight of that mission. He laid the foundation for subsequent missionary work by other Catholic orders. Nevertheless, in present-day Indonesia Protestant Christians, belonging to a diverse array of denominations and conciliar groups, exceed Roman Catholics in numbers.

Thailand is the only country in the region that escaped European colonial subjugation, and, despite the efforts of French and Spanish Catholic missionaries since the seventeenth century and Protestant missionaries beginning two centuries later, there are relatively

few Christians in the country (totaling less than 1 percent of the population). Myanmar (Burma), like Thailand, is steeped in Theravada Buddhism. Protestant missionary bodies have had more success than their Catholic counterparts in Myanmar. Work among the animist Karen and Kachin hill peoples by the American Baptists, in particular, has yielded one of the well-known missionary success stories of the region.

As elsewhere, Roman Catholicism arrived first in Malaysia with the Portuguese, who captured the important entrepôt of Melaka in 1511. Later, from the nineteenth century onwards, both Protestant and Roman Catholic missions concentrated on the urban non-Malay populations of the British-created Straits Settlements, comprising Melaka (or Malacca), Penang, and Singapore. In East Malaysia (comprising the states of Sabah and Sarawak), conversions among the numerous animist indigenous groups have been notable. Meanwhile, the number of Christian converts in Singapore has increased dramatically in the last decades of the twentieth century. According to a government report, the proportion of Christian adherents jumped from 10 percent in 1980 to 13 percent in 1990 to 15 percent in 1990. Most are young, educated adults with Taoist or Confucianist backgrounds. In March 1992,

A Khmer woman teaches a Thai woman the Khmer language for missionary work in Cambodia in 1994. (BOHEMIAN NOMAD PICTUREMAKERS/CORBIS)

Christian demonstrators occupying the grounds of police headquarters in Ambon, Indonesia, in February 2001. They are protesting the killing of Christians by Muslims on the island. (AFP/CORBIS)

the "Maintenance of Religious Harmony" bill was passed by the Singapore government, which, inter alia, allows the authorities to restrain any priest, pastor, imam, or other individual in a position of authority who is believed to have committed or attempted to commit "feelings of enmity, ill-will or hostility between religious groups" or to "promote a political cause under the guise of religious belief."

Transnational Christianity

Southeast Asian Christianity is anything but monolithic, and long-established doctrinal and ideological positions are further polarized by newer evangelical, ecumenical, charismatic, and fundamentalist nuances. These, in turn, are further shaped by the host cultures and political contexts, giving rise to varieties of indigenous theologies and localized practices.

Transnational Christian institutions in Southeast Asia do not adhere strictly to the boundaries of nation-states or regional blocs; they are linked to wider-based entities in the Asia and Pacific region. Institutionally, Roman Catholics have been organized through their respective parochial bishops. In 1970, a landmark decision was made to form the Federation of Asian Bishops Conference (FABC) as a network of Asian Catholic bishops. Programs and position papers emanating from the FABC bear the hallmarks of the reforming spirit of Vatican II, held in Rome during the early 1960s. Generally, the focus has been to evolve a church imbued with what are seen as the Asian values of harmony, holism, and inclusiveness.

The Christian Conference of Asia (formerly East Asia Christian Conference) is the major regional ecumenical body for Protestant Christians. Although its

origins can be traced back to the International Missionary Council meeting held in Tambaram, India, in 1938, it was only officially formed in 1957 at Prapat, Indonesia. Currently, it brings together 119 different churches from 16 Asian countries, and the total membership of these churches exceeds 50 million. Ideologically, the CCA leadership has opted to play an avant-garde role, rethinking traditional Christian doctrines, biblical exegeses, missiology, and ecclesiology in the light of nation-building and contemporary political and economic realities. Particular stress is given to evolving a contextualized theology that addresses the complex realities of unfettered capitalist development, poverty, democracy, and the religious and cultural plurality of the region. Like the FABC, the CCA also gives attention to evolving an Asian ecclesial identity that accords with the ethos of the region.

In the 1980s and 1990s, a number of ecumenical organizations addressing specific regional problems and concerns have also sprung up. They address such issues as human rights, child prostitution, migrant labor, tourism, people's movements, interfaith dialogue and cooperation, and feminism. By comparison, regional evangelical and fundamentalist Christian institutions have shied away from these kinds of Christian activism, contending that while social concerns should be high on the church's agenda, they are not central to the identity and mission of the church.

Future Directions

As Christianity in Southeast Asia develops in the twenty-first century, we can expect to see interchurch understanding and cooperation broaden, deepen, and mature. Additionally, with Southeast Asia's strategic position in the world taking on renewed importance, Christianity in the region is presented with intriguing possibilities as it becomes more localized in a region in which most of the world's major religions thrive.

CHRYSANTHEMUM The chrysanthemum (Japanese: *kiku*) is a revered flower in Japan, favored for its beauty and fragrance; its cultivation is considered an art form. Reflecting its significance, the Japanese word for chrysanthemum appears in several Japanese names, including *kiku* (chrysanthemum), *kikuko* (chrysanthemum child), and *kikumi* (beautiful chrysanthemum) for women, *kikuo* (chrysanthemum male), *kikuji* (chrysanthemum, second son), and *kikuta* (bold chrysanthemum) for men. The word *kiku* has also been used in place names, such as Kikuchi (chrysanthemum ground) in Kumamoto Prefecture, as well as for businesses. Until 1940, the prominent Kikuya Department Store (chrysanthemum store) operated in the Ikebukuro district of Tokyo, until it was purchased by Seibu Department Store. The Chrysanthemum Festival, held September ninth (the ninth day

of the ninth month), is one of five Japanese linked festivals (*gosekku*), including New Year's Day, involving odd prime numbers in which the number of the month and date coincide. One custom during this festival is drinking *kikuzake*, or sake flavored with bits of chrysanthemum flowers.

Chrysanthemums were used in homemade toiletries since at least the Heian period (794–1185). Cotton was placed over chrysanthemums at night; by morning, it was damp with a dew-like substance extracted from the flowers. These pieces of cotton, rich with the fragrance of chrysanthemums, were then used to wipe one's body, particularly on hot and humid late summer days. Symbolizing purity, chrysanthemums were historically used for funeral and temple displays to ward off negative spirits, while their fragrance helped mask other smells. Chrysanthemums symbolize long life, but are also associated with death because of their funeral usage. The famed *fugu* (globefish), parts of whose internal organs are poisonous, is often presented as *sashimi* slices of raw fish shaped like a chrysanthemum, evoking the deathly possibilities of mistaken preparation.

The chrysanthemum has been the Imperial family's emblem since the Kamakura period (1185–1333). During part of the Meiji period (1868–1912), laws banned its use by anyone outside the Imperial family. Now the chrysanthemum motif is used as a state symbol and appears on Japanese passports.

Japan's Imperial chrysanthemum crest at the Koishikawa Botanical Garden in Tokyo in the 1980s. (MICHAEL S. YAMASHITA/CORBIS)

The chrysanthemum is notably featured in foreign literary depictions and cultural analyses of Japan. Pierre Loti's nineteenth-century novel *Madame Chrysanthemum*, the basis of Puccini's opera *Madame Butterfly*, fascinated the European imagination. Ruth Benedict's classic mid-twentieth century anthropological analysis of Japanese culture (*The Chrysanthemum and the Sword*) highlighted the chrysanthemum as a symbol of Japan. This text was the inspiration for titles of later works on Japanese culture and society. One of these, Mamoru Iga's *The Thorn in the Chrysanthemum*, analyzes the issue of suicide in Japan. Another example is Robert Whiting's *The Chrysanthemum and the Bat*, a tribute to the importance of baseball in contemporary Japanese popular culture.

CHU HIS. See **Zhu Xi**.

CHU NOM *Chu Nom* or *Nom* is Vietnam's only indigenous writing system. The etymology of the term *Chu Nom* is obscure. *Chu* unambiguously means "character," but *Nom* has been interpreted as "southern," "demotic," or "popular/native speech." Native *Chu Nom* should not be confused with imported *Chu Han* (Chinese characters), though the two scripts look similar to the untrained eye. The latter script was also known as *Chu Nho* (Confucian characters) due to its use in Confucian texts.

Although the precise origins of *Chu Nom* are unknown, it was clearly an offshoot of *Chu Nho*. *Chu Nho* and the Chinese language were imposed upon Vietnam during a millennium of Chinese rule (111 BCE–939 CE). After liberation from China, however,

the Vietnamese had no script of their own. The only script they knew was *Chu Nho*, which was specifically designed to write the syllables of Chinese. Hence the Vietnamese modified *Chu Nho* in a number of ways in order to adapt it to their own language. This process probably occurred over several centuries and cannot be attributed to any single person or group.

The resulting *Nom* script that emerged around the twelfth century consisted of three major types of characters: phonetic loans, semanto-phonetic compounds, and semantic compounds. Phonetic loans were *Chu Nho* graphs used as phonetic symbols, that is, the *Chu Nho* graph *da* "many" was used as a phonetic loan for the unrelated but homophonous native words *da* "banyan" and *da* "rice pancake."

Semanto-phonetic compounds each consist of a *Chu Nho* graph or graph element (radical) that hints at the meaning of the word and a *Chu Nho* graph representing the sound of the word. For example, the *Chu Nho* radical *trung* "insect" and the *Chu Nho* graph *de* "emperor" were combined into a semanto-phonetic compound representing the native word *de* "cricket."

Semantic compounds each consist of combinations of two *Chu Nho* graphs that hint at the meaning of the word. For example, the *Chu Nho* graphs *thien* "heaven" and *thuong* "above" were combined to form a semantic compound representing the native word *gioi* "sky." This final class of *Nom* graphs is the rarest.

In spite of the heavily phonetic nature of *Nom*, its thousands of graphs were never standardized and hence were difficult to learn. Nevertheless, *Nom* was in use among educated Vietnamese until the early twentieth century, when it was eclipsed by the *Quoc Ngu* (national language) alphabet devised in the seventeenth century by Catholic missionaries. *Nom* is virtually extinct today.

CHU TEH. See **Zhu De**.

CHUAH THEAN TENG (b. 1914), Malaysian painter. Chuah Thean Teng, a Malaysian painter of Chinese descent, achieved an international reputation during the 1950s by developing a new art form that adapted the wax-resist techniques of batik textile production to create a painting medium. Chuah captured traditional Malayan ways of life on canvas in colorful scenes rendered in a semiabstract style.

During the decade following Malaya's establishment as an independent nation in 1957, Chuah was credited with giving artistic expression to a distinctively Malayan visual consciousness. Together with two sons, Chuah Seow Keng and Chuah Siew Tang, who have followed their father as painters in batik, Chuah established the Yahong Gallery in Penang. As well as serving as an exhibition space for the family's work, the gallery has become a well-known emporium for antiques and locally crafted jewelry and curios.

CHUAN LEEKPAI (b. 1936), **Thai prime minister**. Chuan Leekpai served as Thailand's prime minister twice: in 1992–1995, Thailand's fiftieth government, and again in 1997–2001, Thailand's fifty-third government. He was Thailand's twenty-second prime minister. He served longer as prime minister than any other civilian in the history of Thai politics. He is one of the few Thai prime ministers who had neither top-level military experience nor royal blood. He is of humble background from Trang in Thailand's South.

After a brief legal career, Chuan entered politics in 1969 under the banner of the Democratic Party, Thailand's oldest. At age thirty-three, he became one of the youngest Members of Parliament. In the subsequent twelve national elections, Chuan was elected to Parliament each time. Before serving as prime minister in 1992, he had served in nine different cabinet positions under various governments, handling such portfolios as justice, commerce, public health, education, and agriculture.

In terms of political style, Chuan has a humble, polite demeanor, with impressive interpersonal and public speaking abilities. He is perhaps the smoothest Thai politician since Pibulsongkram and is gifted at crafting

complex political compromises. He also has a reputation for being a politician with high personal integrity. He and his party lost the 6 January 2001 national election to the new Thai Rak Thai Party, primarily because of Thailand's persistent economic problems related to the Asian economic crisis. Basically, Chuan was perceived as being honest but weak in dealing with persisting economic problems and issues.

CHUBU (1990 pop. 21 million). Chubu region of Japan is formed of nine prefectures: Niigata, Toyama, Ishikawa, Fukui, Gifu, Nagano, Yamanashi, Shizuoka, and Aichi. It is geographically divided into three areas: the Hokuriku region on the Sea of Japan side, the Central Highlands, and the Tokai region on the Pacific Coast—totaling 67,000 square kilometers. The region is mountainous, dominated by the Japanese Alps, and contains volcanoes such as Mount Fuji (3,800 meters). Some of Japan's longest rivers, the Shinanogawa (367 kilometers), the Kisogawa (227 kilometers), and the Tenryugawa (213 kilometers), flow through the region. The northern part of the region is characterized by heavy snowfalls, two to four meters in the mountain areas. The snow is a major natural resource. The water stored in the form of snow is important for generating electricity, irrigation, and industrial use. The Niigata Plain along the Sea of Japan is one of the major rice growing areas in Japan. Agricultural products include tea and mandarin oranges. Fishing is important all along the coast. The Nobi Plain, densely populated in and around Nagoya on the Pacific Coast, is a highly industrialized area. Chubu region includes three significant industrial areas: Chukyo, Tokai, and Hokuriku. The major industries are textile, ceramics, precision machinery, and automotive.

CHUCHE. See **Juche**.

CHUCI CHUCI (Verse of the Chu State) is regarded as the ancestor of anthologies in Chinese literature. The earliest known edition of the anthology, in sixteen *juan* ("fascicles" or "volumes"), was recompiled by Liu Xiang (c. 77–6 BCE) from earlier sources; this edition was subsequently augmented to 17 *juan* with commentary by Wang Yi (c. 89–ca. 158). The *Chuci buzhu* (Subcommentary on Chuci) of Hong Xingzu (1019–1155), which incorporates Wang's commentary, is the most important edition.

Most of the *Chuci* poems were written during the Warring States period (475–221 BCE) in the style of folk songs of the southern state of Chu (in modern Hubei and Hunan Provinces). Performed in the Chu dialect and recording Chu culture and history, it presents a distinctive Chu style.

The anthology consists of individual poems and suites. The first and most representative work in the collection is the "Lisao" (Encountering Sorrow). This first-person, politically oriented poem in 187 couplets is one of the greatest, and longest, poems in Chinese literature; the *Chuci* style is often simply named, after this monumental poem, the "Sao" style. The anthology also includes shorter lyrical and narrative poems, dialogues, and hymns to local deities, most of which have traditionally been interpreted as allegories for the poet's frustrations.

The attribution of the Chuci poems is problematic. Qu Yuan (c. 343–290 BCE), a high official of Chu who was later slandered, estranged, and finally exiled, was long considered the author of "Lisao" and of most of the *Chuci*, and these works accordingly were read against the story of his political fortunes. Although this view is not clearly proven by the evidence, it has found sympathy from readers who see in Qu Yuan a patriotic hero, who, thwarted in his efforts to serve his king, ended his life by throwing himself into the Miluo River in northeast part of modern Hunan Province.

CHUGEN *Chugen* is the traditional period of mid-summer gift giving in Japan. Households, businesses, and work associates offer gifts to those they are obligated to, often superiors or customers. The tradition is maintained today in two forms: gifts and bonuses. Gifts, normally costing between 1,000 and 5,000 yen (\$8 to \$40), are offered, usually from those in subordinate positions to those in higher ones. These gifts are comprised of preserves, cakes, cleaning materials, cooking staples such as oils, and so on. In rural Japan it is still possible to receive homemade *chugen* gifts such as pickles, dried fruit, or tea. Most *chugen* gifts, however, are bought, often as a packed box of several items. Supermarkets, department stores, and mail-order catalogs market a variety of prepackaged items that need only be addressed and delivered. Related to the *chugen* tradition is that of the bonus. Successful firms will normally provide their employees with bonuses of one month's salary. This gift is the formal recognition of the debt the firm owes its employees for their efforts. *O-chugen* (the honorific *o* is normally added) is matched by *o-seibo*, the gift-giving season at the end of December that begins the New Year. *Chugen* is not a religious event, but falls into the category of civil-cultural rituals that are a common part of Japanese heritage.

CHUGHTAI, ISMAT (1911–1992), Indian novelist. Chughtai started writing in the fourth decade of the twentieth century when Urdu fiction was still a fledgling enterprise. She and her contemporaries—Saadat Hasan Manto, Rajinder Singh Bedi, and Krishan Chander—freed Urdu fiction from a preoccupation with romance and fantasy and gave it a realistic conviction. Chughtai's contribution lies in her exploration of feminine sensibility and female sexual-

ity. Despite belonging to a movement of progressive writers that had great impact on Urdu literature in the 1940s and 1950s, Chughtai was fiercely independent and crusaded against any orthodoxy, religious or ideological. She wrote about eight novels and novellas—most notably *Terhi Lakeer* (Crooked Line, 1942), an autobiographical novel. Her fame rests chiefly on her short stories, which depict the lives of middle-class Muslims, particularly women, in northern India in the early decades of the twentieth century. Chughtai was a storyteller par excellence; stylistic directness, sparkling dialogue, brilliant turn of phrase, and scintillating humor are hallmarks of her style.

CHUGOKU (2000 est. pop. 7.8 million). Chugoku region, with an area of 32,000 square kilometers, encompasses the entire western tip of Honshu and comprises five prefectures: Hiroshima, Okayama, Shimane, Tottori, and Yamaguchi. With the Chugoku Mountains as the dividing lines, the Inland Sea side is called the Sanyo region, and the Sea of Japan side, the Sanin region. It is a mountainous region with many small basins and coastal plains. The natural features of Shimane are characterized by the Oki Kuniga coastline with tall cliffs, as well as Shinji-ko, the sixth-largest lake in Japan. The Tottori Sand Dunes, located in Fukube Village, measure sixteen kilometers from east to west and two kilometers from north to south. Forestry is an important industry with a high quality lumber production. The Okayama Plain and the coastal plains are important areas for the production of rice. Other agricultural products are citrus fruits, melons, and grapes. Industry and commerce characterize the Inland Sea coast. The most heavily populated areas are along the Inland Sea coast, around the cities of Hiroshima, Kurashiki, and Okayama. Coastal waters are among Japan's richest fishing grounds; however, catches of sea bream, prawn, and abalone have been declining due to increasing industrial pollution.

CHULALONGKORN, KING (RAMA V) (1853–1910), Siamese monarch. King Chulalongkorn, also known as Rama V, was the fifth king of the Chakri dynasty and ruled from 1868 until his death in 1910. He succeeded his father, King Mongkut, who had begun to modernize Siam in an attempt to stave off European colonial aggression. Educated in part by Anna Leonowens (featured with King Mongkut in the Rodgers and Hammerstein musical *The King and I*), Chulalongkorn was the first Siamese monarch to study abroad and, like his father, he surrounded himself with European advisers. An advocate of Western education, science, and technology, he sent all of his sons abroad to study. At home, Chulalongkorn implemented a Western-style educational system and founded the country's first university (later named Chulalongkorn University) in order to train a modern governmental bureaucracy.

Chulalongkorn implemented sweeping political and economic reforms that radically transformed

CHULALONGKORN'S PHILOSOPHY OF THE KINGSHIP

Chulalongkorn set forth his philosophy of the kingship in letters he wrote to his son Crown Prince Caofa Maha Vajirunhis, who died before he could succeed his father on the throne.

To live easily, first is to be a priest and second is to be rich. To be a king, there are duties to be performed. You must be restrained in love and conquer hatred, anger, flattery, and laziness. The result of your merit will appear when you die. You will leave a good name as preserver of the family and protector of the people. These are two principles which you must have in mind more than anything else. If you cannot keep them in mind, you cannot rule and take care of the country. . . . It is a blessing that you have everything to make you ready to acquire knowledge, behave well and follow the path of merit.

Source: King Chulalongkorn. (1950) *Letters, Miscellaneous*. Part I: 17. Bangkok, Thailand: n.p.

Siamese society. In 1874 he abolished slavery. Beginning in 1885, he began reforming the government, establishing ministries structured on functional lines. He stripped power from the old nobility, provincial elites, and hereditary court officials. He established a professional military armed with modern weaponry. Chulalongkorn reformed the tax system and established the country's first modern bank, the Siam Commercial Bank. Despite his reforms and attempts to modernize Siam, he resisted establishing a European-style constitutional monarchy, arguing that the people were not ready for it. Chulalongkorn was known for adroit diplomacy that preserved Siam's independence, though he had to accommodate most European demands.

Chulalongkorn died at the age of fifty-seven, having reigned for forty-two years, a period of dramatic change that saw Siam emerge as a modern state. He was succeeded by his eldest son, Vajiravudh (Rama VI), one of his seventy-six children from ninety-two wives.

CHULALONGKORN UNIVERSITY Chulalongkorn University was Thailand's first institution of higher learning and remains the nation's most prestigious academic institution. Though founded in March 1917, the school's roots date back to the reign of King Chulalongkorn (1853–1910), who in 1871 established a school that in 1902 became the Royal Pages School. The school's original mission was to train students for the civil service, but other disciplines, including international relations, commerce, agriculture, engineering, medicine, and teacher training, were added to the curriculum. On 1 January 1911, the school was renamed the Civil Service College and on 26 March 1917 was renamed Chulalongkorn University by King Vajiravudh (1881–1925). The original funding for the school came primarily from the royal family, who donated a large parcel of land where the university still resides. The five-hundred-acre campus is in the heart of Bangkok, and the university derives considerable income by renting some of its properties to commercial interests.

The university came under the supervision of the University Affairs Department, Ministry of Education.

When it was founded, the university had 380 students taking classes under four faculties: the faculty of medicine located at Siriraj Hospital and the faculties of law and political science, engineering, and arts and sciences. In 1927, the first female students were enrolled. The undergraduate school grew substantially, and, in 1961, the university set up the graduate school. The university currently has over 27,000 students, including 9,000 graduate students, in 351 study programs and 16 specialized institutes and colleges with 19 faculties. It is Thailand's preeminent research institution.

CHUN DOO HWAN (b. 1932). Chun Doo Hwan was the president of South Korea from 1980 until 1987, when his handpicked successor Roh Tae Woo succeeded him. Born in 1932, Chun was raised in North Kyongsang Province, where he was a student at Taegu Middle School. Before he could finish, Chun transferred to the Korean Military Academy, from which he graduated in 1955.

After graduating from the Korean Military Academy, Chun quickly moved up the ranks, holding various army appointments before being named to the Supreme Council for National Reconstruction. Shortly thereafter, Chun was named the chief of the newly formed Korean Central Intelligence Agency before being named Commander of the Capital Garrison. Like his successor, Roh Tae Woo, Chun saw action in Vietnam as a member of the South Korean forces fighting with the Americans.

In 1979, Chun was named the Commander of the Defense Security Command. Following the assassina-

President Chun Doo Hwan and U.S. President Ronald Reagan at the White House on 26 April 1985. (BETTMANN/CORBIS)

tion of President Park Chung Hee (1917–1979) in October 1979, Chun and a group of coconspirators seized control of the military. He was responsible for the brutal suppression of the Kwangju Uprising, a reaction against the military's control of politics in Korea, in May 1980. In August 1980, Chun eased out acting president Ch'oe Kyu-ha and took over the position; he was formally elected president in February 1981.

Chun's term in office can best be characterized by his attempt to open negotiations with North Korea—with little success. Domestically, Chun is best known for his relaxation of the restrictions imposed by the Yushin Constitution.

CH'USOK The Harvest Moon Festival, known in Korea as *Ch'usok* and sometimes as *Han-gawi*, has been observed for more than two millennia. Along with the Lunar New Year's Day (*Sol*), it is one of the two most important of Korea's holidays. *Ch'usok* is observed on the fifteenth of the eighth lunar month, which is always a full-moon day. This date is the beginning of the autumn harvest season, in September or early October, and the harvest moon appears as the biggest and brightest of the year's full moons.

Although harvest celebrations by different ethnic groups occurred on or around this date for centuries before, the first nationwide celebrations on this day were held in the Shilla kingdom (57 BCE–935 CE) in the first century CE, originating in the culmination of a month-long hemp-weaving contest among the women of the capital.

As on *Sol*, ancestral rites are the most important events of *Ch'usok*. *Charye*, the early-morning offering of tables of foods, as well as full ceremonial bows, is held in the home of the oldest male of the family, where the extended family has gathered for the occasion. The second rite, *Songmyo*, is held at the tombs of the immediate ancestors. Here, too, foods are prepared as offerings, and ceremonial bows are made.

Because it is harvest time, foods are an important part of the celebration. Boiled rice is made from early-harvested rice from the year's new crop. From this rice is also made the holiday's specialty rice cakes (*song-*

p'yon). These round or half-moon-shaped rice cakes are filled with sesame seeds, boiled chestnuts, red *azuki* beans, or jujubes and are steamed over pine needles to give them a distinctive fragrance. Apples, pears, persimmons, chestnuts, and jujubes are also feasted on throughout the day.

Various games and entertainments are associated with *Ch'usok* festivities. Korean bullfights pitted two bulls against each other. The head butting, ramming, and goring continued until one bull overpowered the other. The tortoise dance (*kobuk-nori*) was among the most eye-catching of entertainments. The tortoise, actually two men covered with a shell-like mat, danced at village houses and then collapsed, feigning hunger until offered food. Food collected in this manner was distributed to the needy. A tug-of-war employing a gigantic, specially woven straw rope was held between teams from neighboring villages. Good fortune was believed to come to the village of the winning team.

The evening was the time for the women to gaze at the rising full moon, good fortune coming to the one who saw it first. While waiting for moonrise, the women would join in the circle dance (*kanggangsullae*). As the harvest moon rose in the evening sky, supplications were made to the brilliant orb, giving thanks for the harvest and asking for good fortune until the next harvest moon.

CI *Ci* ("words to be sung") was a type of lyric poetry that originated during the Tang dynasty in China (618–907 CE) and became the most popular style during the Song dynasty (960–1279). Many foreign tunes had made their way into China with foreign travelers, and many of the tunes became popular but needed Chinese words. Although originally associated with singing girls and prostitutes, the new form earned the favor of Emperor Xuanzong (reigned 713–755), who had the court music school add them to its training. Thus *ci* found their way into the repertoire of courtly music. The first anthology of *ci* poetry, *Hua jianji* (Among the Flowers), appeared in the tenth century. When northern China fell in 1127 to the Jin, the court musicians and singers moved south with the rest of the

court, taking with them the *ci* form, and its popularity increased.

Ci had lines of uneven length (unlike *shi*, classic Chinese lyric verse, which always had lines of the same length) and were composed to fit with existing popular folk tunes and their rhythmic and rhyme schemes as well as tonal patterns. As *ci* evolved into pure poetry, they eventually became difficult to sing. Theoretically, *ci* usually could be divided into two sections, one section focusing on human feelings the other section on the scene. Zhang Yan of the Ming dynasty (1368–1644) broke *ci* poetry into two distinct categories: the first being Wan Yue (graceful and restrained) and the second Hao Fang (heroic and free).

CI XI, EMPRESS DOWAGER (1835–1908), Dowager empress of China and regent. Nee Yehonala of the Manchu Blue Banner, also known as Ci Xi, held power over China's political life for almost half a century. She was a consort of Emperor Xian Feng (1831–1861, ruled 1850–1861) and bore his successor, Tong Zhi (1856–1875, ruled 1862–1874). After Emperor Xian Feng's death in 1861, Ci Xi seized power by removing eight conservative regents from the court and setting up her own regent over the boy emperor. In 1875, after Emperor Tong Zhi died with no heir, Ci Xi named her three-year-old nephew Guang Xu (1871–1908, ruled 1875–1908) to the throne.

In 1898, Ci Xi resumed the regency as a result of a coup in which she succeeded in crushing the emperor's effort to push through a number of radical proposals designed to renovate and modernize the Chinese government. In 1900, Ci Xi supported officials who encouraged the antiforeign secret society Boxer movement. A coalition of foreign troops soon captured the capital and Ci Xi was forced to flee from Peking to northwestern China, where she accepted the humiliating treaty, the Boxer Protocol, in 1901. Re-

turning to Peking in 1902, she finally began to implement a number of innovations that the reformers had sought in 1898, including the inception of China's constitutional establishment. Ci Xi died on 15 November 1908, one day after the emperor's death.

CILICIAN GATES The Cilician Gates (Gulek Bogaz) is the key pass leading from the central Anatolian plateau to the Cilician plain and gives access from the cities of Konya and Ankara to Adana and the Mediterranean at Iskenderun and Antakya. Running between the Bolkarlar and Aladag Mountains, the road descends along the course of the Cakir Cay, a tributary of the Seyhan River, to Gulek Bogaz, the narrowest point of the pass, at an altitude of 1,050 meters (3,400 feet). The original passage was cut through rock from gorge to gorge and was so narrow that two caravan camels could barely pass; the cut is now bypassed by the main E90 road. The total length of the narrows, where railway, main road, and river run squeezed together between rock walls, is seventy kilometers from Ulukisla in the north to Gulek in the south.

The pass assumed importance when Asia Minor was a province of the Persian Empire; the Royal Road that supposedly connected Sardis in ancient Lydia with Susa in ancient Persia ran through the gates, and one branch of the Silk Road went from there to Istanbul. It was a key obstacle to the invasion of Persia from the west, and Alexander of Macedon described the desertion of the gates by the Persian defenders (333 BCE) as the most amazing piece of luck in his entire career. The Cilician Gates has remained a major trade route ever since; the Byzantine fortress of Loulon defended approaches from the north, and a chain of ruined Seljuk caravansaries or inns is still visible along the road. The first Crusaders under Baldwin of Boulogne used the pass in 1097, but subsequent Crusaders, aware of the possibilities of ambush, used sea passage or alternative passes. Today the railway is little used, but the multilane highway is continuously and heavily employed by commercial traffic carrying goods from the refineries and steelworks at Iskenderun, the factories at Adana, and the free port at Mersin to the interior.

CINEMA—CHINA The history of modern Chinese cinema began on 11 August 1896, when a film by the French production studio Lumière Brothers was shown in Yu Gardens in Shanghai. The first Chinese production, the opera *Dingjun shan* (Dingjun Mountain) was filmed in 1903. In 1916, twenty years after the introduction of Western films into China, the first Chinese-owned film production company was established. From then on, China was able to address topics related to its changing political, economic, social, and international situation through its own lens.

The intended audience of these films, largely Chinese mainlanders, enjoyed the markedly different films made during the various eras of Chinese cinematic history. These included martial arts and romance films in the 1920s, leftist films in the 1930s (the first sound film, *Genu hongmudan* [Singsong Girl Red Peony], was produced in 1931), antiwar films in the 1940s, Soviet-style social realism in the 1950s, a mixture of revolutionary realism and romanticism (spearheaded by Mao Zedong's wife Jiang Qing) in the 1960s, and films of ideological correction and relaxation in the 1970s and early 1980s.

The first generation of Chinese film directors aimed to borrow Western techniques while building a national cinema resistant to Western influences. The second generation of film directors attempted to assist socialist nation-building after the founding of People's Republic of China. The third generation, represented by Xie Jin (*Tianyunshan chuanqi* [The Legend of Tianyun Mountain]), emerged after the Cultural Revolution (1966–1976) and tried to forge Chinese film production with socialist Chinese characteristics. Before Xie chose to reflect the concerns of the majority of the Chinese at the time, film production had been either liable to excessive foreign influences or revolutionary romanticism. The fourth generation, represented by Teng Wenji, pushed Xie Jin's paradigm to its limits. The fifth generation, revolting against the previous schools, aimed at transforming Chinese culture through cinema. The sixth generation is now pushing the fifth generation's approach to its limit in a new historical context.

Censorship and Cinema

Censorship has been omnipresent throughout much of the history of Chinese cinema: against com-

munist by the republican government (1912–1927), and against Soviet revisionism (1958–1978) and "bourgeois liberalization" (1978–present) by the Chinese Communist government. Worthy of special mention is the impact on film production of Mao Zedong's policy of art for the sake of ideology. The policy aimed to maintain political correctness in every film. Mobile film projection teams presented these politically correct films to agricultural production teams and work and military units, helping to disseminate official ideology and policies to the masses in hopes of maintaining its legitimacy and political dominance.

Contemporary Cinema

Dissatisfied with the sterilization and wholesale politicization of the cinema, a younger generation of film directors, trained at the Beijing Film Academy after the Cultural Revolution, forged a new cinematic school characterized by cultural critique and reflection and bold artistic experimentation. These directors include Zhang Yimou (*Red Sorghum*, *Judou*, *Raise the Red Lantern*, *The Story of Qiu Ju*), Chen Kaige (*Yellow Earth*, *Farewell My Concubine*, *The King of Children*), and Tian Zhuangzhuang (*The Blue Kite*, *The Horse Thief*). Their films have not only drawn a large and diverse audience but have also attracted the attention of international film scholars. Many of these films have won international awards despite state censorship and are available in video stores throughout the world. These films have been acclaimed both for their exploration of the Chinese cultural psyche and their artistic innovation. In many ways this generation has renounced Mao's policy of art for the sake of ideology. As Zhang Yimou said: "Chinese filmmaking has to remain an open art, free" (Semel 1987: 140). This not only best sums up the aesthetic vision of the new school of filmmakers, but also applies to China's newest generation of film directors, as they seek to negotiate the forces of localism and globalism in constructing cinematic representations of the deeper flows of Chinese culture.

CINEMA—INDIA Cinema was introduced in India on 7 July 1896 when the Lumière brothers invited the residents of Mumbai (Bombay) to see their movies brought from France. In the next few years, Indian entrepreneurs flooded India with foreign motion pictures, which were actually of little interest to the Indian masses. It was Dhundhiraj Phalke, a young Brahman student of drawing, painting, and photography, who pawned his wife's ornaments to make the first Indian feature film, *Raja Harishchandra*, a mythological tale with titles in Hindi and English, which opened in Mumbai on 12 April 1913. In the next few years, Phalke made other mythological films, as well as animated films, travelogues, and documentaries. Indian tycoons such as J. F. Madan in Calcutta were responsible for a prodigious output of both social and mythological films in the following years. In spite of the popularity of Indian films, because of higher production values and a superior distribution system, about 85 percent of the movies shown in India by the late 1920s were American, a fact that dismayed both Indian filmmakers and British rulers.

Talking pictures came to India on 14 March 1931 with the showing of Ardeshir Irani's *Alam Ara*, a drama based on a stage play. Another important force in the 1930s was the Prabhat Film Company and its leader, V. Shantaram, who showed a Hindi film, *Amar jyoti* (Eternal Light), about the vengeance of women, at the Venice Film Festival in 1936 and won an award at that festival for his Marathi film *Sant tukaram* (Saint Tukaram) a year later. From the beginning, however, Hindi emerged as the dominant language of Indian cinema, although films in other languages of more limited reach, such as Bengali and Tamil, were also made. Building on the indigenous entertainment of India, every film included a multitude of songs, which rapidly evolved from folk music to a distinctive film song genre with its own emotional identity. The film song gradually became a separate source of entertainment, and the popularity of the songs, which were often released before the movie, determined the success of the movie. Given the importance of the film song and the difficulty of finding actors who were also good singers, by the 1940s the "playback" system had become universal, and the actors mouthing the songs on screen

were not the actual singers. The most famous of these playback singers is Lata Mangeshkar, who became the world's most recorded singer in her fifty-year career, which began in 1948.

Indian Cinema since Independence

With the independence of India and the partition of the subcontinent in August 1947, Indian cinema continued its development free of British censorship but subject to the censors and taxation rules of the new Indian government. The 1950s in Mumbai were marked by the filmmaker Raj Kapoor (1924–1988), whose films were mostly scripted by the famous film journalist K. A. Abbas (1914–1987). Kapoor, through his depiction of the lovable vagabond in films, such as *Awara* (Vagabond) and *Sabri 420*, became famous not only in India, but also in the Soviet Union and the Middle East. In 1957, ten years after independence, another famous director, Mehboob Khan (1906–1964), made *Mother India*, one of the most popular films ever made in India, in which the Indian woman as mother becomes a symbol for the nation. It was nominated for an Academy Award as best foreign film.

More than half of all the cinema halls in India were in South India, however, and therefore Madras soon became the film capital of India. Most of the films in Madras were made in Tamil, but many were made in Hindi also, such as the 1948 blockbuster, *Chandralakha*. The Tamil cinema also had a strong connection with South Indian politics because the famous Tamil film actor M. G. Ramachandran (1917–1987, known as MGR) became chief minister of the state of Tamil Nadu and was succeeded in that position by the actress Jayalitha.

The New Cinema

Although K. A. Abbas in 1954 made the Hindi film *Munna*, the first Hindi film without any songs or dances, it was in Calcutta that a new kind of Indian cinema arose. There Satyajit Ray (1921–1992), a young advertising man who had been active in the Calcutta Film Society, determined to make a film that would deserve worldwide acclaim. With a small subsidy from the state of Bengal, Ray made a film based on a famous Bengali novel about a boy named Apu who grew up in a small village. The film *Pather panchali* (Song of the Road) was shown at the Museum of Modern Art in New York and became the first Indian film to achieve extensive U.S. distribution. Ray completed the Apu trilogy with *Aparajito* (The Unvanquished) in 1957 and *Apur sansar* (The World of Apu) in 1959. During the centennial of the birth of Rabindranath Tagore, India's only Nobel Prize winner

Large movie billboards such as this one in Madras are a common way of advertising films in India. (HANS GEORG ROTH/ CORBIS)

in literature, Ray made a documentary on Tagore in 1961 and followed that with two films based on Tagore's literary works, *Charulata*, about a lonely wife in nineteenth-century Bengal; and *Two Daughters*, a film based on Tagore's short stories. Another Ray trilogy in the early 1970s dealt with the Calcutta middle class in the turbulent 1960s: *Days and Nights in the Forest* (*Aranyer Din Raatri*, 1969), *The Adversary* (*Pratidwandi*, 1970), and *Company Limited* (*Seemabaddha*, 1971). Ray stayed far away from the Mumbai stereotypes: no songs and dances, careful scripting, strong emphasis on authenticity, shooting on location, and careful selection of actors, who were often inexperienced. But Ray also worked with master actors, whom he had mainly discovered himself. Soumitra Chatterjee, who played the adult Apu in *Apur sansar*, worked with Ray for more than three decades, and Sharmila Tagore, Apu's wife in that film, appeared in Ray films throughout the 1960s. Except for *Shatranj ke khilari* (*The Chess Players*), which he made in Hindi-Urdu, all of Ray's films were in his native Bengali. Ray's prodigious output continued until his death in 1992, soon after receiving an honorary Academy Award in his Calcutta hospital bed.

The first Hindi movie of the new Indian cinema was made by another famous Bengali director, Mrinal Sen (b. 1923). The film was *Bhuvan Shome* (1969), and its moderate success was a harbinger of a new cinema

movement that was vigorous for more than two decades. Actors and directors graduated from the Film Institute in Pune and with the help of state subsidies made some good movies, such as *27 Down* in 1973, which, like *Bhuvan Shome*, had a railroad theme. The most prominent director of the new Indian cinema was probably Shyam Benegal (b. 1934), whose 1973 film *Ankur* (*The Seedling*), about the cruelty of landlords, was followed by *Mandhan* (*The Churning*), a film about exploitation of farmers by a dairy owner that was financed by Gujarati farmers.

In the last two decades of the twentieth century, in spite of vigorous production in regional centers like Madras, Mumbai continued its dominance and became universally known as Bollywood, a contraction of Bombay (Mumbai's former name) and Hollywood. After the often violent films starring superheroes such as Amitabh Bachchan, Bollywood in the late 1980s saw the rise of romantic musical films. The trend in musicals culminated with the hugely popular 1994 film *Hum aap ke hain kaun* (*Who Are We to You?*), which chronicles typical family events instead of including the typical movie plots and subplots. Emigrants from South Asia all over the world—via Indian movie theaters, VCRs, DVDs, and Indian cable channels—have made Indian cinema a world cinema.

CINEMA—JAPAN Developing an art form that had originated in the West, Japanese cinema emerged after Japan's victory in the Sino-Japanese War of 1895. As with the later golden age of Japanese film, film art came into its own in the wake of upheaval. The predominance of ideas, of speculation and introspection, so common in Japanese cinema, began with the *banshi*, the narrator of Japanese silent films. The *banshi* explained, with flourishes, what was happening, with the premise that there was something of moment to communicate beyond what visual images provided.

Japanese cinema of the late 1940s, 1950s, and 1960s owed much to the new drama of Shingeki, the social drama born in the early 1900s and influenced by the works of Henrik Ibsen (1828–1906) and George Bernard Shaw (1856–1950). Film, like theater, would be an arena of social assessment, a means of examining and exploring the fate of society. Kaoru Osanai, a founder of the Shingeki movement, had studied at the Moscow Art Theater, where Sergey Eisenstein (1898–1948) was also a presence. (In this article, Japanese names are presented surname first.) Crucial to the history of Japanese film are Osanai's films and Minoru Murata's landmark *Rojo no Rekion* (Souls on the Road), made in 1921 and based partly on Maxim Gorky's *The Lower Depths*, a work that Akira Kurosawa would adapt as well.

By the late 1920s, the first great Japanese director, Teinosuke Kinugasa, had arrived on the scene. His masterpiece, *Kurutta Ippaiji* (1927; A Crazy Page, also known as A Page of Madness), brought Japanese film a world dimension. Combining German expressionism with Soviet montage (he had studied with Eisenstein), Kinugasa created Japanese film art. The work of Daisuke Ito and Masahiro Makino in the late 1920s prefigured the later golden age of the period film. This work attacked feudal society and, by implication, the

current social system. "Tendency" pictures, focusing on social problems and themselves influenced by the Russian Revolution, were a dominant trend when, with Heinosuke Gosho's *Madamu to Nyobo* (The Neighbor's Wife and Mine) in 1931, talking pictures came to Japan.

Just as American cinema distinguished itself in the early years of the twentieth century with the films of D. W. Griffith, and Soviet cinema reached its high point in the 1920s, Japanese cinema truly came into its own at the moment of Japan's defeat in World War II. It is at moments of transition in the social history of a culture that great art flourishes. After Japan's defeat in World War II, the country turned to a political and social reexamination of its national identity. This reexamination was assumed in the arts with the greatest verve and imagination, not by poets and novelists, but by film directors.

Some of the directors, like Ozu Yasujiro (1903–1963), had been making films since silent days. Others, like Kurosawa Akira (1910–1998), came into their own during the war. All explored in their films the theme of what it means to be Japanese. Some of their works, particularly those of Ozu, were set in the present. Other directors, like Kurosawa and Kobayashi Masaki, created their greatest art through period films: stories set as far back as medieval times, but mostly depicting another period of transition—the nineteenth century, which saw the fall of the Tokugawa dynasty and Japan's tentative and then thunderous entrance into modernism.

Kurosawa Akira

Kurosawa's subject, the passing of the samurai class from the stage of history in the sixteenth century, is the theme of the greatest Japanese film ever made, his *Seven Samurai* (1954). In the tragedy of the decline of the samurai, Kurosawa discovered a quality of being Japanese lost in the era in which he himself lived and worked. "Again we've survived—again we're defeated," says Kambei, played by Shimura Takashi, the humane leader of the *ronin*, those disenfranchised samurai who have come to save the peasant village.

The winners are the peasants who will live on in history, not the samurai, whose nobility has been tainted by corruption and upheaval. As Kurosawa revealed, the peasants are able to enlist only six wandering *ronin* to work for them, with no payment but the satisfaction of helping a community survive. Kurosawa depicted the subsequent ascendance of the merchant class in his searing satire *Yojimbo* (1960), a film that despite its historical setting speaks to this director's perception of the corruption of modern-day mer-

cantile Japan: its press, its industry, and its inequitable system of justice.

Ozu's *Tokyo Story*

The very rhythms of Kurosawa's films, from *Rashomon* (1950) to *Red Beard* (1965), trumpeted the inevitability of change, but Kurosawa's later films, from *Dodeskaden* (1970) on, do not share this optimism and belief in the possibility of social and human transformation. Even the Soviet co-production *Dersu Uzala* (1975), which followed *Dodeskaden*, is nostalgic and pictorial rather than full of the dynamic tension and implicit optimism that the world may be transformed, so characteristic of Kurosawa's greatest works.

Ozu's efforts to define being Japanese expressed in the postwar moral chaos a nostalgic appreciation for traditions of graciousness that were being lost as Japan modernized and embraced the values and culture of the West. The most telling moment in all his films may well occur at the climax of *Tokyo Story* (1953). The mother dies at the end of the film, allowing Ozu to offer a dialogue between daughter-in-law and youngest daughter that rises above the plot to speak to Ozu's worldview.

Most of the children have been selfish and mercenary. Appalled by her older sister Shige's selfishness—the materialism that allowed Shige at the moment of the mother's death to demand her best kimono as a "keepsake"—the youngest child, Kyoko, cries out in anger. Her siblings and indeed, for Ozu, people in general were all so selfish, she complains. Her sister-in-law, Noriko, who has lost her husband in the war, demands a more measured response. "At your age I thought so, too," she gently reminds Kyoko. Even Shige "meant no harm."

"Isn't life disappointing!" Kyoko concludes. It is Noriko, however, who speaks for Ozu with the spirit of *mu*, the peace that passeth understanding.

"Yes, it is," she smiles. There is no doubt that Ozu admires Noriko for attempting to retain her Japanese spirit, even as she suffers premature widowhood and is herself uneasy and discontented. "I'm quite selfish," Noriko had admitted to her mother-in-law. "I'm not always thinking of your son."

New Views of Women

Mizoguchi Kenji (1898–1956), following one of the edicts of the Allied Occupation that the efforts of women to assume their independence should be paramount among film subjects, created great works of cinema by depicting women of the past. In *The Life of*

A large billboard advertises a movie in Japan. (EYE UBIQUITOUS/CORBIS)

Oharu (1952) and *A Story from Chikamatsu* (1954), Mizoguchi spoke to the needs of the modern Japanese woman by exploring her subjection to patriarchal domination in the past.

Another director who concentrated on the social restrictions that thwart women was Naruse Mikio, whose greatest film, *A Wandering Life* (1962), depicts the struggle for fulfillment of a woman who became one of Japan's leading writers, Hayashi Fumiko. In 1960, Naruse remarked that people did not write about strong, independent women and that audiences preferred stories about weak women's torment and abuse. In film after film, Naruse transcended that perception. "I shared none of their feelings that untraditional women are unattractive," he confessed to an interviewer for the Japanese film magazine *Kinema Jumpo*, or "that strong-hearted women are despicable and disgusting."

Antiwar Films

Antiwar films flourished in the postwar period under the encouragement of the supreme commander of

the Allied powers, General Douglas MacArthur. From the edict that postwar Japanese films reject the values that led to the war came masterpieces of film art revealing the cruelty of the Japanese in China, such as Kobayashi Masaki's three-part epic, *Ningen no Joken* (1959; *The Human Condition*). Other films depicted how the war brought suffering to the ordinary Japanese who wanted no part of militarism.

The most moving of these films was *Twenty-Four Eyes* (1954), by Kinoshita Keisuke. It is the biography of a teacher on Sado Island in the Inland Sea. Miss Oishi must instruct a child, defying the previously prevailing ideology, that the emperor is not "in the cupboard" and that his portrait is no more than a portrait. The emperor is not omnipotent and omnipresent, but rather a man like any other—a view that was sacrilegious until 1945.

Culture Criticized

That Japanese directors were ready to make films critical of the culture that nurtured the war was revealed in Kurosawa's *No Regrets for Our Youth* (1946), a film about a woman who achieves liberation by marrying an antiwar activist who is murdered by the Japanese secret police. Yukie, played by the greatest actress of her day, Hara Setsuko, goes on to reject traditional Japanese views of femininity in exchange for becoming an assertive citizen of the society that has destroyed her possibility of personal happiness.

The generation of directors who followed Kurosawa, Mizoguchi, Ozu, and Naruse was no less obsessed by the theme of its unique Japanese identity. With passion and urgency, Shinoda Masahiro, Hani Susamu, Oshima Nagisa, and the most talented of them all, Imamura Shohei, explored the turmoil of postwar society. In *Pigs and Battleships* (1961), Imamura created a brilliant protest against the continuing military occupation of Japan; the marauding Americans are the "pigs" of the title, but so are the Japanese gangsters, the *yakuza*, who profit from their presence. Oshima challenged the inability of the older generation to face its responsibility for Japan's moral demise in *Ceremonies* (1971). A groom goes through with his wedding despite the fact that his bride has run away; Japan persists in meaningless traditions that have lost all purpose, even as the nation has lost its moral direction.

Oshima's masterpiece, *In the Realm of the Senses* (1976), located a uniquely Japanese appreciation of sexuality in characters who defy the conventions of the wartime moment, the late 1930s, to devote themselves exclusively to the joy and sensuality that belong to a Japan where sex was not associated with shame. Os-

hima's Sada and Kichizo invoked the aristocratic culture of tenth-century Japan, when people dedicated themselves to an appreciation of lovemaking, a mood reinvented for the last time in the flurry of pleasure seeking of late-Tokugawa Japan just prior to the opening of Japan to the West. As did the great generation of filmmakers who preceded him, Oshima used the past as a vehicle into the present.

In that ancient and more beautiful Japan, where sex was divorced from psychopathology and repression, Oshima located the heart of the unique Japanese identity. In that past, women were the equals of men in their mutual abandon. The need to make war was countered by the natural, physical fulfillment of lovemaking, a freedom that came to an end, Oshima suggested, in 1936 with the Officers' Coup that made Japan's participation in World War II inevitable. *In the Realm of the Senses* may indeed itself be seen as the punctuating moment of the great era of Japanese filmmaking. Subsequent directors have been content to revel in satire, outlandish action, and broad humor. Like that of other nations, France and Italy included, the Japanese cinema awaits its next resurgence.

CINEMA—WEST ASIA Film production in Iraq, Turkey, and Iran has struggled in the face of censorship, lack of government support, and competition from the U.S. film industry. Nevertheless, in the past few decades, Iranian and Turkish films have made their way onto the international scene, where they have garnered awards. Iraqi cinema faces more obstacles than Turkish or Iranian cinema and is rarely seen in the West.

Iraqi Cinema

Documentary films are the most common type of film produced in Iraq because of the prohibitive technical requirements and expenses associated with the production of feature films, and documentary film production is dominated by the state. High costs and lack of state support, combined with a history of domestic unrest, have prevented the emergence of a strong and independent private sector; currently only a limited number of films are privately produced each year. The most successful company is the Babil Corporation, which is partly owned by the government. The primary film producer in Iraq is the state-owned and -operated Cinema and Theatre Administration.

Not surprisingly, most Iraqi films are either complimentary narratives of Iraq's history and development or critical assessments of the impact of United Nations sanctions and military operations against Iraq. Although such films can be seen as mere legitimization exercises by the government, they also represent a viewpoint that is rarely given credence in the West.

Sanctions and Iraq's difficult political and economic situation have meant that few Iraqi films ever reach Western audiences. Furthermore, the future of both public and private sectors has been severely affected by the banning of raw film imports into Iraq under the U.N. sanctions. In light of the nature of Iraq's film industry and the failure of its films to have a presence in the Western market, it is not surprising that Iraqi films have been little studied. Whatever analysis there is has been published exclusively in Arabic.

Turkish Cinema

For many years, Turkish cinema was dominated by cheaply made films produced for a wide audience. Collectively referred to as *Yesilcam* (the Turkish version of Hollywood), such films were Turkey's answer to Hollywood, replete with swooning, blond-tressed falsetto-voiced women and hirsute men with handlebar mustaches. Most were simplistic depictions of life, often based on popular Turkish novels or American films.

However, Turkey's film industry has also been a medium through which the country's various domestic

A billboard advertising an Iranian movie in 1995. (DAVID & PETER TURNLEY/CORBIS)

conflicts are examined. For example, Halit Refig's *Sebirdeki Yavanci* (Stranger in the City, 1963) explored the conflict between Islamic and secular values in Turkey. *Karanlıkta Uyananlar* (Those Awakening in Darkness, 1964), directed by Ertem Gorec, dealt with the social consequences of a workers' strike. The conflict over Turkey's ethnic and religious identity has been expressed in various and often differing efforts to develop a national film culture. One example was the Milli Sinema, a national film movement that emerged in the 1970s as a promoter of Turkey's Islamic identity, producing several films with strong religious contents, including *Birlesen Yollar* (Joining Roads, 1970) and *Memleketin* (My Country, 1974).

The long and often bloody history of Turkey's Kurdish minority has also been reflected in the effort to develop a Kurdish film industry. The Kurdish film industry has struggled to survive, severely hampered at various stages by the efforts of Turkey, Iran, Syria, and Iraq to prevent the realization of a Kurdish identity. The technological revolution in the late twentieth century, which saw the introduction of videos and satellite television, has made it easier for Kurdish filmmakers to produce independent films. Perhaps the best-known Kurdish movie is *Yol* (The Road, 1982). It won the Cannes Film Festival's highest award, the Palme d'Or, in 1982 but was not allowed to be seen in Turkey until 1992.

Although films such as *Yol* (The Road, 1982), *Etikiya* (Bandit, 1996), and *Hamman* (Turkish Bath, 1997) have drawn significant international audiences and won rave reviews at European film festivals, the growing international presence of Turkish films has been paralleled by the mounting obstacles that filmmakers face at home. Most filmmakers struggle to make films on limited budgets, with inadequate government support and in the face of the country's often volatile political and economic situation. Turkish films must also compete with American films, which, with the latest filmmaking technology and internationally recognized actors, are very popular in Turkey.

Iranian Cinema

The cinema industry has become one of Iran's best-known exports. During recent decades, Iranian films have won favorable reviews from Western filmgoers and critics alike and have gained numerous awards at international festivals. Two prominent examples are Abbas Kiarostami's *Ta'm-i Gilas* (Taste of Cherry, 1997), which won the Palme d'Or at the Cannes Film Festival in 1997, and Majid Majidi's *Bachchab'ba-yi Aseman* (Children of Heaven, 1997), which received

an Oscar nomination in 1998. Aside from their popularity, Iranian films present an alternative view of Iranians, who have traditionally been seen in the West as fanatical and intolerant. However, while displacing one negative image of Iran, the films have to a certain extent been popular because they depict other stereotypical images, of Iran's idealized past or of a sentimental view of children. Consequently, such films have been criticized for seeking popular acceptance by pandering to the Orientalism of the West by exoticizing and patronizing Iranian life.

Iranian filmmakers, however, have emphasized such content because it can easily pass strict government censorship requirements. Under these requirements, there can be no violence, no affection between men and women who are unrelated, no dancing, no female singers or alluring music. The story must not offend the clerical establishment or disagree with Islamic tenets. As a result, Iranian filmmakers have developed ingenious ways to surmount the censorship barriers. Mohsen Makhmalbaf overcame the ban on depicting a woman giving birth by donning a skirt and playing the role himself in his 1996 film *Gabbeh* (Gabbeh, 1997). Other directors have cast female and male actors who are related, thereby skirting the rule against characters demonstrating affection. Filmmakers have often resorted to allegory, satire, and symbolism to get their message across—hence the frequent use of small children.

Some filmmakers, however, have willingly dealt frankly with sensitive issues. Ibrahim Hatamikia's *Azbans Shishab'yi* (The Glass Agency, 1998) portrayed the plight of disabled war veterans in the aftermath of the Iran-Iraq war. Davoud Mirbaqeri's *Adambarfi* (The Snowman, 1995) has come under strong criticism from conservative elements in Iran for its depiction of male cross-dressing.

Like the press, television, and universities in Iran, the cinema has become a battleground where a war is waged between opposing ideological views—between those who want to reform Iran's conservative Islamic system and those who campaign for its continuation. Recently reformist politicians, in an effort to liberalize the arts, have encouraged the film industry by attempting to loosen cultural restrictions.

CINEMA, CONTEMPORARY — JAPAN

Japanese cinema began in 1897 with the importation of motion picture cameras from France. By 1900 the Japanese were manufacturing their own equipment. The earliest Japanese films were actualities along the lines of the Lumiere Brothers in France, brief vignettes of street life or glimpses of landscapes. The Russo-Japanese War, beginning in 1904, was actually a boon to Japanese filmmaking, which catered to a seemingly inexhaustible demand for newsreel footage of the fighting—real or staged. The fiction film came into its own when it was integrated into stage plays to form a unique dramatic presentation known as *rensa-geki* (chain drama). Film sequences shot on location or scenes of dramatic chases became part of live theatrical performances. As the fiction film developed and increased in popularity over the documentary mode, theater, especially kabuki and *shimpa*, became the dominant model for Japanese cinema. Directors like Itami Mansaku (1900–1946), the father of Itami Juzo, and Makino Shozo (1878–1929) pioneered modern cinematic storytelling techniques, often in the *jidai-geki* (period film) mode, paving the way for masters like Mizoguchi Kenji (1898–1956), Yamanaka Sadao (1909–1938), and Ozu Yasujiro (1902–1963) to create a golden age of film in the 1930s. Wartime censorship and the exigencies of war soon put an end to this remarkable period of creativity and commercial success, which would be equaled and perhaps surpassed in the 1950s.

Decline, Fall, and Resurgence

By the 1950s, Japanese cinema was the envy of the world. Filmmakers produced critical favorites at festivals and commercial successes at home year after year. As U.S. cinema went into a decline because of judicially mandated changes in the film industry and increased competition from television, Japan's film industry entered another golden age. The decade came to a close with a record 547 films released in 1960. But this was the beginning of an end. Production levels, attendance, and number of movie screens all went into a gradual decline in Japan, until by 1978 only 350 or so films were released each year, the majority of which were low-budget exploitation films, termed, however

unfittingly, *roman-poruno* ("romantic-pornography"). By the end of the 1990s, production of *roman-poruno* declined, as liberalized censorship laws and cheap video production put an end to the genre for all intents and purposes. Production levels fell to around 250 films per year.

That number is deceiving, however, in terms of Japanese cinema as a whole. If one discounts *roman-poruno* from the production numbers of the 1970s, in the 1990s Japanese filmmaking experienced a noticeable increase, not only in quantity but, more important, in quality. While in the minds of many critics Japanese cinema of the 1980s had precious little to offer the serious film fan and even less to offer the national box office, the situation changed in the mid-1990s. With a host of new directors and talented stars, Japanese cinema again found itself the object of critical acclaim and commercial success.

Japanese Cinema in the 1970s and 1980s

One of the structural features of the Japanese cinema that prevented its resurgence amid the decline in the 1970s was the fact that major Japanese production studios were also major distribution outlets for foreign and domestic films, as well as in control of important theater chains. When domestic film production declined, the studios could turn to foreign films for distribution and exhibition. Thus, it is no surprise that the resurgent Hollywood cinema of the 1970s contributed to the declining Japanese cinema of that era. Similarly, the film studios also turned to television production to maintain a steady flow of income. Toei, for instance, reaped the rewards of its animation subsidiary during the *anime* (animation) boom of the 1980s and its live-action offshoots known as *sentai*, or five-hero shows, such as *The Mighty Morphin Power Rangers*. Mostly, however, the major studios kept themselves afloat with big-budget prestige films or middle-budget formula films guaranteed to turn a modest profit through advance ticket sales and blockbooking (forcing a theater to book a whole slate of a company's films, often sight unseen, rather than picking and choosing) practices. Toho, for instance, which scored a surprising hit in 1954 with *Gojira* (*Godzilla*) and then its numerous sequels, had put the venerable monster on hiatus in the mid-1970s. But in the mid-1980s the studio trotted him out again, and during the 1990s he reappeared with startling regularity. And, like Toei, Toho reaped the rewards of its *anime* connection, in particular with the films of Miyazaki Hayao: *Kaze no tani no Naushikaa* (*Nausicaä of the Valley of Wind*, 1984), *Tonari no Totoro* (*My Neighbor Totoro*, 1988) and *Majo no takkyubin* (*Kiki's Delivery Service*,

1989). More impressive was the case of the film studio Shochiku, which had a substantial hit with a light comedy called *Otoko wa tsurai yo (It's Tough Being a Man)* in 1969. From then on, the studio churned out two films per year detailing the romantic misadventures of the lovable Tora-san until the star, Atsumi Kiyoshi, died in 1996.

Serious Japanese cinema was kept alive in the 1980s through independent productions, mostly comedy films which tended to have more critical respect abroad than commercial clout at home. Directors such as Itami Juzo with *Ososhiki (The Funeral)*, 1985) and *Tampopo* (1986) and Morita Yoshimitsu with *Kazoku Geemu (The Family Game)*, 1984) appealed to overseas audiences with satire and dark humor by showing the Japanese family system under stress. Meanwhile, younger directors like Kurosawa Kiyoshi and Suo Masayuki were cutting their teeth on comic variations of *roman-poruno* and classical Japanese cinema with films such as Kurosawa's *Do-re-mi-fa-musume no chi wa sawagu (The Excitement of the Do-Re-Mi Fa Girl)*, 1985) and Suo's *Hentai kazoku: Aniki no yomesan (Crazy Family)*, 1983). Though often distributed by a major studio, these works owed nothing in style and spirit to the often plodding, formulaic films that passed for mainstream Japanese cinema at the time.

Japanese Cinema in the 1990s

One man deserves much of the credit for returning Japanese cinema to the limelight in the 1990s: Kitano Takeshi, better known as "Beat" Takeshi. A popular television personality, "Beat" Takeshi made his film debut in Oshima Nagisa's *Merry Christmas, Mr. Lawrence* (1983) and continues to act in numerous films, including Oshima's more recent, *Gohatto* (2000). It is, however, the films that he directs that demonstrated the possibility of an original and major voice emerging in Japanese cinema. Violent police or *yakuza* (gangster) films dominate his output (*Sonatine*, 1993; *Hana-bi*, 1997), but he is also capable of dealing sensitively with young people (*Kids Return*, 1996; *Kikujiro*, 1999). If he—along with Imamura Shohei, the 1960s director who has maintained his importance—is a major figure in Japanese cinema today, he is not alone in his impressive output or his interest in violence, loss, and youthful alienation.

A sense of extreme alienation, whether manifested in schizophrenia, murder, or in the death of a young person by disease or suicide, permeates much of the best Japanese cinema of the 1990s and early years of the twenty-first century. This thematic link is also manifested by stylistic similarities primarily revolving around the long take, an uninterrupted, unedited run

of the camera, creating single shots. In films as seemingly diverse as *Maborosi* (Koreeda Hirokazu, 1995), *Suzaku* (Kawase Naomi, 1997), *Okaeri* (Shinozaki Makoto, 1996), *Unagi (The Eel)*, Imamura Shohei, 1997), *Tokyo Yakyoku* (Ichikawa Jun, 1997), *M/Other* (Suwa Nobuhiro, 1999), *Charisma* (Kurosawa Kiyoshi, 1999), and *Eureka* (Aoyoma Shinji, 2000), the canny use of long takes lends emotional depth and stylistic beauty to recent Japanese films dealing with loss, betrayal, and incomprehensible grief.

To counterbalance the long-shot, long-take style, another group of young Japanese directors has appeared with crime films and thrillers in the pulp-fiction mode, creating stylish bullet-ballets that compare with films made by the likes of Quentin Tarantino and John Woo. These directors, including Takashi Miike (*Audition*, 1999; *City of Lost Souls*, 2000), Tsukamoto Shinya (*Tokyo Fist*, 1995; *Bullet Ballet*, 1998), and Tanaka Hiroyuki, working under the pen name of Sabu (*Dangan Runner*, 1996; *Postman Blues*, 1999), have pushed Japanese aesthetics into the MTV-age.

Films with styles somewhere between the austere and the frenetic, such as Suo's *Shall We Dance* (1996), or the veteran director Fukasaku Kinji's controversial *Battle Royale* (2000), have also helped to return Japanese cinema to box office success at home and abroad and to achieve the kind of critical acclaim that films of the 1950s and 1960s received. *Anime* films like *Akira* (1988) and *Mononoke hime (Princess Mononoke)*, 1997) draw domestic box office numbers unseen in a generation and appeal to worldwide audiences, as well.

In short, the range of subjects, themes, and styles apparent in Japanese cinema of the 1990s and beyond indicates that Japan's cinema continues to reveal the complexity and artistry of Japanese culture as a whole. Youthful alienation and Japan's increasingly multicultural society are likely to remain potent subjects for a newly vibrant Japanese cinema.

CIRCASSIANS The Circassians (Cerkes in Russian and the Turkic languages or Adygea in the Circassian language) are a people of the northwestern Caucasus and northeastern Black Sea region whose languages belong to the Northwest Caucasian family, a non-Indo-European group. Beginning in the thirteenth century, the Circassians were under the nominal control of the Golden Horde and were a major source of slaves for the armies and households of the Islamic world. This trade was a principal source of wealth for the khanate of the Golden Horde and later for the khanate of the Crimea through the eighteenth century. With the expansion of the Russian empire in the eighteenth century, Circassian independence became more circumscribed; as a defense against Russian expansion, the Circassians fostered closer ties with the Ottoman empire. This move was no more than a temporary impediment to Russian expansion, but the Ottoman association did encourage a major change in

Circassian society: the majority of Circassians accepted Islam. With the Treaty of Adrianople in 1829, the Ottomans ceded control of the region to the Russians; resistance to Russian imperial control assumed a more local color and persisted fiercely until about 1864.

Beginning in the 1850s and dramatically increasing after about 1862, many Circassians left the Caucasus for the Ottoman empire. Some one and one-half million Circassians are estimated to have fled to Ottoman territory before 1914. Most originally settled in the Balkans. Eventually, however, they settled mainly in Anatolia and the Ottoman province of Syria.

Today sizable Circassian populations are found in Syria, Jordan, Israel, and Turkey as well as in the republic of Georgia and the Russian Federation. Although the population figures offered here are only rough estimates, more than half of all Circassians presently live outside their homeland. Approximately 500,000 live in Georgia and Russia combined; up to one million live in Turkey, approximately 50,000 in Syria, 30,000 in Jordan, and 2,000 in Israel. These diaspora populations exhibit significant diversity. In Turkey, they largely assimilated into the general population, while the Circassians in Jordan play a notable role in public affairs and commerce and maintain a distinct sense of Circassian identity.

Howard Eissenstat

This illustration shows Circassians migrating to Turkey from Russia to escape persecution in the nineteenth century. (BETTMANN/CORBIS)

CITIZEN'S MOVEMENT The Japanese citizen's movement (*shimin undo*) was mobilized in the 1950s and early 1960s to oppose nuclear weapons, the United States-Japan security treaty, and the Vietnam War. At this time, citizens' groups joined left-wing students, labor, and socialist organizations to combat the conservative ruling party's decisions on social and political issues. Later in the 1960s, people's concerns turned to the industrial pollution and environmental destruction caused by economic development. Industrial poisoning incidents, such as the Minamata (mid-1950s) and Niigata (1964–1965) mercury poisonings, the Toyama cadmium pollution (1955), and the Yokkaichi asthma outbreaks (1961), led to lawsuits, which in turn forced the government to introduce victims' compensation. Movements organized by ordinary people such as fishermen, farmers, and peasants (*jumin undo*) also dealt with such issues and attempted to prevent the establishment of new polluting industrial plants. In 1964, these actions stopped a planned heavy chemical complex in Mishima and Numazu on the Pacific coast.

Many more such legal actions occurred from 1967 to 1973. By this time, the term *jumin undo* was used interchangeably with *shimin undo* throughout Japan. Citizen-action groups played a decisive role in changing Japan's environmental policy and were responsible for the Basic Law for Pollution Control in 1967, its revision in 1970, and the 1971 establishment of the Environmental Agency. In the 1970s, farmers protested the construction of Narita Airport in Chiba prefecture, and citizens opposed the development of the *shinkansen* (bullet train), because of its environment impact, such as noise and vibration. In the 1980s, housewives demonstrated about consumer issues such as prices and product quality.

The antinuclear movement in Japan had developed rapidly after the end of the U.S. occupation, and it was reinforced in the 1980s by the strong antinuclear and nuclear-freeze protests that spread throughout Europe, the United States, and the South Pacific. Since the 1990s, protests in Japan have concerned such issues as the construction of industrial waste dumpsites, nuclear power plants, and dams and the relocation of U.S. military bases.

CIVIL-SERVICE EXAMINATION—CHINA

China's examination system started during the Han dynasty (206 BCE–220 CE) and continued until it was abolished by the dowager empress Cixi (1835–1908) in 1905. By the Qing dynasty (1644–1912), the civil-service examination had become the traditional method for recruiting civil servants in China, and this practice was eventually adopted by numerous countries throughout the world.

In traditional China, the concept of a state ruled by people of ability and virtue was an outgrowth of Confucian philosophy, which was concerned with benevolent rulers and rulership. The civil-service examination was an attempt to recruit people on the basis of merit rather than of family or political connections. Since success in the examination system was the basis of people's social status, education became highly regarded as the key to success. The Confucian classics were the texts studied for the examinations.

During the Tang dynasty (618–907), the system was reorganized in an effort to promote efficiency. In the Song dynasty (960–1279), the system again underwent changes, this time to address concerns that the examinations emphasized memorization rather than practical application. Wang Anshi (1021–1086), the prime minister responsible for the reform, stressed the importance of understanding the underlying ideas and being able to apply classical insights to contemporary issues.

Although only a small percentage of those who studied for the examinations could gain office, students spent twenty to thirty years memorizing orthodox commentaries in preparation for a series of as many as eight examinations for the highest degree of civil-service rank.

By the end of the nineteenth century, the examination system had come to be regarded as outdated and inadequate training for officials who faced the task of modernizing China. In addition, students who dropped out often became figures of rebellion in Chinese society. For instance, Hong Xiuquan (1814–1864), who took the examination many times, became

a key figure in the disastrous Taiping Rebellion (1850–1864) directed against the Qing government, which Hong hoped to replace with his heavenly kingdom (Taiping); the rebellion failed, and more than 20 million people may have lost their lives in the fighting.

Despite these facts, the examination system has some strong points. Chinese rulers found that the system provided them with an objective and institutionalized method of recruiting loyal government officials. Theoretically, almost all Chinese, regardless of social background, could take the examinations. Today, civil-service examinations in Japan, the United States, and European countries are strongly influenced by the Chinese examination model.

CIVIL WAR OF 1956–1975—LAOS Laos's civil war of 1956–1975 was a struggle for power among three factions: the leftist Pathet Lao, the neutralists,

and the U.S.-backed right wing. Moderate Souvanna Phouma (1901–1984) was elected premier in the post-independence election of 1956. Souvanna initiated negotiations with the Pathet Lao to reach a peaceful resolution to the conflict. The outcome was the formation of a coalition government installed in 1957. The United States halted its aid to Laos, finding the Communists in the government intolerable. The right retaliated by removing Souvanna from office and arresting Prince Souphanouvong (1909–1995), the leader of the Pathet Lao, and other Pathet Lao members in 1959, dissolving the coalition government. U.S. aid increased, and agencies such as the U.S. Central Intelligence Agency began covert activities in Laos, including the mobilization of the Hmong and other ethnic minorities as a secret army. At the same time, the guerrilla-warfare activities of the Pathet Lao, headquartered in northeastern Laos, grew with the help of North Vietnam.

In 1960, an army captain named Kong Le seized control of the capital, demanding neutrality and returning Souvanna Phouma to power. However, the right quickly overthrew Kong Le, forcing him, Souvanna, and their supporters to flee the capital. The United States backed Prince Boun Oum as the new leader of Laos.

In an attempt to find a peaceful resolution to the war, a second Geneva conference was convened in

A parade in Vientiane in December 1980 marks the fifth anniversary of the end of the civil war and the establishment of the People's Democratic Republic of Laos. (TIM PAGE/CORBIS)

1961. The outcome was the second coalition government of 1962, which had failed by 1964. Souvanna continued as prime minister but held no real power due to U.S. interference. Fighting continued with neither side making any real gains until 1970. The United States began to withdraw its aid, which supported the right wing and thus prolonged the war, in the early 1970s under pressure from U.S. public sentiment.

Both sides began talks to resolve their differences and signed the Agreement on the Restoration of Peace and Reconciliation in Laos, calling for a cease-fire and removal of foreign troops, in 1973. Souvanna remained prime minister in the third coalition government, while Souphanouvong led the National Political Consultative Council. After the Communist takeovers in Saigon and Phnom Penh in 1975, anti-U.S. and anti-rightist demonstrations were held in Vientiane. King Sisa Vattana abdicated, and Souvanna Phouma resigned. On 2 December 1975, the Pathet Lao gained complete control of the government through the use of military force and established the People's Democratic Republic of Laos. Souphanouvong became president, while the king and the former prime minister served for a time as political advisers to the socialist regime, thus ending the Communist thirty-year struggle.

CLIFFORD, HUGH (1866–1941), colonial administrator of Malaya. Hugh Charles Clifford, one of the most outstanding colonial administrators of Malaya, had a deep understanding and affection for the Malays. Born in England and educated at Woburn Park, in 1883 he qualified for Sandhurst with a Queen's cadetship, but instead joined the administration of the western peninsular Malay state of Perak.

Clifford became British Agent (1887–1888) and was Resident from 1896 to 1899, and again in 1901. He also held high colonial posts in North Borneo, Trinidad, Ceylon, Ghana, and Nigeria before returning to Malaya as Governor and High Commissioner (1927–1929). But the country was suffering the collapse of rubber and tin prices and the onset of the Great Depression, and Clifford himself was gravely

tired. He later suffered a mental breakdown and had to retire in 1930.

Clifford was forthright and impetuous, sympathetic to the peasantry but highly critical of the traditional Malay political structure that he felt victimized the lower classes. He was a prolific writer, and his novel *A Prince of Malaya* (1926) was reprinted in 1989 as *Saleb: A Prince of Malaya*.

CLIMATOLOGY—SOUTH ASIA In South Asia climate is governed by the tropical monsoon system. The monsoons occur in summer and winter and are variable over space and time.

Monsoons

Because of atmospheric circulation, the monsoon over South Asia alternates seasonally between equatorial westerlies in summer and trade winds (tropical easterlies) in winter, which are mostly deflected to southwesterlies and northeasterlies at ground level. Both flows vary in rain capacity. The southwesterlies are associated with moist and unstable air masses of great rain-carrying capacity; the northeasterlies are comparably dry, stable, continental airflows with little rain-carrying capacity. In most areas the summer monsoon defines the rainy season and the winter monsoon the dry season. The duration of either season varies

depending on the region, as do rainfall totals. The summer monsoon is the major agricultural season; winter agriculture depends on irrigation, which is widely used throughout South Asia.

For South Asia the monsoon climate system defines on average four seasons: summer, from June through September; winter, from December through February; and two transition seasons, March through May (premonsoon) and October through November (postmonsoon). The onset of the summer monsoon may vary by several weeks or may even fail, upsetting the agricultural calendar and causing famine. It generally starts between late May in the south to early July in the north, and withdraws between mid-September and early December from north to south, varying in length, therefore, from six to three months. It affects rainfall throughout South Asia. The winter monsoon is a continental flow that establishes a dry season.

Rainfall

The striking seasonal nature of rainfall over South Asia is illustrated by computing the monthly distribution of rainfall through the year for 306 representative stations throughout India for a 120-year recording period (1871–1990). The monthly and seasonal rainfall totals are as follows, given in millimeters:

Dec.	Jan.	Feb.	Mar.	Apr.	May
12	11	13	15	26	52
winter		36		pre- monsoon	
93					
June	July	Aug.	Sept.	Oct.	Nov.
163	275	243	171	77	31
summer			852		post- monsoon
					108

Seventy-eight percent of the annual total of 1,089 millimeters of rain falls during summer, and only 3 percent during winter; the transition seasons have 8.5 percent (premonsoon) and 10 percent (postmonsoon). Hence rainfall other than during the four months of summer is negligible.

In practice, however, rainfall varies to a hazardous degree over South Asia. The world's record rainfall total, at Cherrapunji (located in the Shillong Hills of Assam), averages an annual 10,798 millimeters, with the wettest year being 24,000 millimeters. In extreme contrast, desert conditions occur over most of the Indus plain and Tharr Desert (where in some locations annual rainfall is less than 100 millimeters). The overall distribution of rainfall shows the wettest parts over the western coastal lowlands on the Indian peninsula and its eastern provinces on the Deccan plateau, the

Ganges plains, Brahmaputra lowlands, and surrounding parts of northeastern India and the Bengali lowlands. The driest regions are northwestern India and Pakistan. In most parts of South Asia annual rainfalls vary between 750 and 1,500 millimeters, enough to support abundant crop cultivation in the rainy season.

The high interannual variability of rainfall makes monsoon rains unreliable for agriculture. Interannual variability is largest in dry regions, with a coefficient above 30 percent, and lowest in the wettest parts, with less than 15 percent variability.

Rainfall annual totals have changed over the years on a small scale. The maximum annual rainfall increase during the past one hundred years (588 millimeters) occurred at Bombay; the maximum decrease (679 millimeters) occurred at Nuwara Eliya, Sri Lanka. In South Asia low rainfall occurs during El Niño years and high rainfall during La Niña years.

Under the prevailing hot and warm conditions large amounts of water are evaporating at all times. Only during the summer monsoon is a rain surplus observed; that is, more water falls as rain than is evaporated. In all other seasons evaporation exceeds rainfall.

Temperatures

Temperatures also vary greatly over South Asia, though tropical temperatures principally prevail. Shown by a cross section from north to south, mean annual temperatures are high. The mean hottest (summer) month shows only slight variation across South Asia, while there is considerable difference in the temperature mean for the coldest (winter) month. The annual temperature range (the difference in temperature between the hottest and coldest month) increases with latitude. Winter and summer are therefore defined only over the northern parts of South Asia, while the southern parts have only slight annual temperature variation. Synchronously, as one moves south, the daily range of temperature also decreases, yet the daily temperature range surpasses the annual temperature range, a characteristic of tropical conditions. Temperature drops with increasing altitude, leading to freezing temperatures in the highlands (above 2,000 meters) of Sri Lanka and South India. The altitudinal decrease of temperature most strikingly affects the Himalayas and Karakoram mountains above 1,500 meters, where precipitation occurs as snow and ice. The affect of global temperature change on South Asia is discussed in the final paragraph.

Rainfall and temperature variabilities over space and time are summarized by climate diagrams in which annual variations in both elements are plotted month

to month. Changes in rainfall and temperature in most cases occur synchronously, such that summer is both wet and hot, while winter is dry and cold.

Floods and Cyclones

South Asia suffers from floods and droughts that originate from heavy rainfalls and failure of monsoon rains, respectively. The worst hazards are tropical cyclones, which originate in the Andaman Sea, move in a western direction, and three to five times a year visit the lowlands on the east coasts of India and Bangladesh. Tropical cyclones develop extremely heavy storms moving at over 200 kilometers per hour; they are accompanied by torrential rainfalls and high sea waves, which wreak havoc on the coast and in the hinterlands.

Resulting mostly from the rainfall conditions and to a smaller extent from snow precipitation on the northern fringe of South Asia and the Himalayas, river runoff is subject to extreme variations. The maximum flow is mainly in summer, the minimum in winter. The contrasting discharges of the Himalayan rivers are illustrated by the Brahmaputra at Pandu, with a maximum flood discharge over 70,000 cubic millimeters per second and a minimum at 3,000 cubic millimeters per second. The rivers of peninsular India also show great variation, with the Mahanadi having a maximum of 46,000 cubic millimeters per second and a minimum of only 6 cubic millimeters per second. In summer the rivers regularly inundate the land along their lower stretches, particularly the deltaic regions. Control of river discharge, by dikes and dams, is a major task on all rivers.

Global Temperature Change

Observations during the past one hundred years identify a warming trend over the northern, eastern, central, and southern parts of South Asia, which partly exceeds the global trend (0.55° C per 100 years), whereas a cooling trend prevails over the western and northwestern parts. Both trends show maximum values of 1.2° C. Both temperature increase and decrease are determined by the temperature trend during winter.

CLOISONNÉ Cloisonné is a technique employed in the decorative arts whereby pulverized multicolored

glass or enamel is fused onto a metal surface; the enamel is held in wire cells (from the French, *cloisons*). The technique came to China from the West in the fourteenth century (or earlier) and reached its height in the early Ming dynasty (1368–1644) under the rule of the Jingtai emperor (1428–1457). In fact, one of the terms by which cloisonné is known in China is *Jingtai lan*. Other names for cloisonné tell of the technique's foreign origins: a Ming text states that cloisonné came to China from Da Shi (Arabia) and Folang (Byzantium), thus yielding the names *dasbi yao*, Arabian ware, and *falan* or *falang*, likely a corruption of the Chinese name for Byzantium.

Cloisonné enameling uses cells formed from slender metal wires to hold the enamel paste. These wires become part of the overall design of the piece and are soldered onto a metal foundation. The enamel paste is added to the cells, and the piece is fired at a temperature high enough to fuse the paste without destroying the metal cells or the foundation. Pieces often need to be fired a second time to correct any flaws in the enamel and to fill up the cells. The piece is then polished with a pumice stone to smooth the surface and increase its luster.

The earliest pieces carrying a reign mark date from the fifteenth-century reign of the Xuande emperor (1399–1435). The usual colors of these early pieces are a distinctive turquoise blue, a lapis lazuli blue, deep brown-red, yellow, green, black, and white. (A true pink was not seen until the famille rose palette was developed for porcelains in the early eighteenth century.) The pieces are strikingly simple in both shape and decoration. One characteristic of Ming cloisonné is the presence in the enamels of the solder used to hold the metal wires to the base. This was remedied in the late seventeenth or early eighteenth century by the use of vegetable glues, which burned away in the heat of the firing.

During the Qing dynasty (1644–1912), production of cloisonné wares increased due to the establishment under the Kangxi emperor (1654–1722) in 1680 of imperial palace workshops. It has been said that the aesthetic quality of pieces during this time suffered in the quest for technical perfection. This was especially true during the reign of the Qianlong emperor (1711–1799), when the wires were gilded, designs were complex and busy, and frequent firings dulled the finish. Despite the technical achievements of the eighteenth century, fifteenth-century pieces remain a high point of the enameler's art.

CLOTHING, TRADITIONAL—AFGHANISTAN Traditionally, Afghan dress reflects ethnic diversity and the socio-cultural, historical, and geopolitical dynamics of the region. The country and its people are positioned at the crossroads between the Arab, Persian, Turkish, and Asian empires. Consequently, Afghan dress shows strong aesthetic connections to areas contiguous to its borders: the Arab and Islamic Middle East and Persia, the Turkish Ottoman Empire, and, to a lesser degree, Mughal India.

Since the 1920s, Afghanistan's leaders, in an effort to maintain control of both human and natural resources, have struggled with the definition of women's rights and independence as exemplified in the propriety of dress. Afghan dress also reflects other aspects of identity in a variety of inseparable yet interrelated ways: gendered and generational status; religious affiliation; rural and urban differences; stages of the life cycle; and everyday or special occasions.

Afghan dress first and foremost distinguishes gender. Women customarily wear four items of dress: the pants (*tombaani*), an overdress (*parabaan*), a head covering (*chaadar*), and footwear (*payzaar*). This ensemble is referred to as *kalaa Afghani*, or Afghan women's dress. Men wear *tombaani*, an overshirt (*payraan*), a hat or cap (*kullaa*), and footwear or boots. In addition to this basic ensemble, Afghan men wear a vest (*waaskaat*), another hat (*pokool*), and a shawl (*shaal*) during colder seasons.

Women's *tombaani* are made of approximately two yards of cotton or silk-like rayon or acetate fabric. They are usually solid white, gathered drawstring pants with full legs. Frequently the pant cuffs are decorated with white machine- or hand-embroidered patterns. The *parabaan* are typically made from five yards of cotton, silk (or silk-like acetate), and plain or satin woven fabrics in bright colors (for young women) and darker colors (for older women), usually in tone-on-tone or floral patterns. Necklines vary but usually are rounded; occasionally pointed collars are added, as are gathered set-in sleeves with fitted or buttoned cuffs. Dress skirts are full and gathered at the waist and worn mid-calf length. *Chaadars* are made of similar fabrics—usually rectangular pieces of lightweight cotton or silk-like crepe, woven with machine- or hand-embroidered edges. Men's *tombaani* and *payraan* feature fewer dec-

orative details and are typically in natural-colored cotton fabric. *Kullaa* exhibit the most variety in shapes, colors, and embroidered patterns.

Dress also differentiates the age and generational status of the wearer. For example, though all females wear pants, overdress, and head and foot coverings, aesthetic characteristics vary according to age throughout women's lives. More costly materials and surface design embellishments are added to women's dowries. The decorative focus is on pants cuffs, dress bodices, and head covering borders as females age and gain more status when they become engaged, marry, and become mothers. These differences are evident to a lesser degree in men's dress as well. Shirt-sleeves, bodice shirtfronts, and hats are embroidered in regional and ethnic patterns by either their betrothed or wife.

Two items of dress are worth mentioning since they are the most visible to non-Afghans and are the most politically recognizable dress that Afghans wear. The *pokool* hat worn by Afghan men is a symbol of the Afghan freedom fighters, or the *Mujabideen*. It is a naturally colored wool hat with the characteristic versatile rolled edge. The second distinctive item of dress worn by Afghans is the woman's full body covering known as the *chaadaree*. The *chaadaree*, constructed of nine to ten yards of fabric with an embroidered face piece, conceals the entire women's dress ensemble of pants, overdress, and head covering. The original *chaadaree* is of Persian origins but over time became associated with the urban dress of middle and upper class Afghan women. The *chaadaree* has been incorrectly attributed as Afghan women's traditional dress; it only became mandated women's wear after dress sanctions were imposed by the Taliban in 1996.

Afghan dress also suggests religious affiliation. The majority of Afghans are Muslim, and presumed Islamic prescriptions of propriety and observance govern the manner in which items of dress are worn. For example, Islamic prescriptions govern the fit, transparency, and drape of dress. In general, the everyday dress for both males and females fit loosely so that the contours of the body are less noticeable. Prescriptions also determine the patterns embroidered on men's shirts and hats and women's pants, over dresses, and head coverings. The majority of these embroidered designs are floral, geometric, and abstract shapes, presumably because of Islamic prohibitions on representational art and aesthetics.

Afghan dress is also notable for its embroidery. Embroidery styles tend to be associated with geographic regions and ethnic groups. Whether from

Herat, Kandahar, or Kabul, regional associations are made. Styles generally are distinguishable by the fiber content of the fabric (plain weave cottons, pile woven velvets, or synthetic satin weaves) as well as the kind of thread (cotton, silk or gold metallic threads); a variety of embroidery techniques and the complexity of their execution; the floral and geometric motifs; and the design placement of the embroidery. Three such embroidery styles are the gold stitched embroidery or *chirma dozi*, known for the unique kind of metallic thread and braid used; *tashamaar dozi*, recognizable by the intricate counted stitch technique; and silk stitched flower embroidery or *gul dozi*, distinctive because of the rich use of colored threads.

Afghan dress observed in the context of daily life and during special occasions of secular and religious contexts distinguishes gender and generational, ethnic and regional, and religious identity. Dress serves to unify and maintain a sense of Afghan identity not only among Afghans living in Afghanistan, but also as Afghans differentiate themselves from other Middle Eastern and Central and South Asian populations in the Afghan diaspora.

CLOTHING, TRADITIONAL—BHUTAN

In 1989 the Tshogdu, or National Assembly, of Bhutan announced that all Bhutanese citizens must wear the appropriate national dress in all public areas. For men in Bhutan, the traditional dress is a robe known as the *go*; women's traditional costume is a wraparound garment called the *kira*. Accounts, both written and pictorial, suggest that until around the seventeenth century the prevalent male dress was different from the current dress. The popularization of the *go* is attributed to Shabdrung Ngawang Namgyal (1594–1651), the creator of a unified Bhutan.

History of the National Costume

In 1616 Shabdrung Ngawang Namgyal fled to Bhutan to escape from conflicts in Tibet and by the time of his death in 1651 had not only set the stage for the creation of a unified Bhutan, but also made sweeping changes in the laws and customs. One such change attributed to him is the *go*, which in most respects resembles the Tibetan dress for males. In time the *go* achieved almost universal usage in Bhutan and even came to be recognized as an important element of Bhutan's distinct identity in the region. In contrast, it is believed that the women's dress, the *kira*, has been in use in Bhutan almost unchanged for centuries.

The national costumes of Bhutan have remained the principal choice of attire in Bhutan. By the end of the twentieth century, with the effects of modernization finally being felt, the national costumes gained even more prominence. For a small country surrounded by giant neighbors, the costumes were seen to be attributes that clearly set Bhutan apart from the rest of the region and gave the inhabitants a Bhutanese identity. Concern that such a symbol would inadvertently be discarded along Bhutan's path toward modernization led to considerable debate in the National Assembly of Bhutan as well as among private citizens in the 1980s and continues today. Thus, according to this pronouncement, the *go* and *kira* were formally declared the national costumes of Bhutan for men and women, respectively. This law ignored the existence of several ethnic minorities, each with a unique dress style, inside Bhutan's borders. Fortunately the seemingly radical move of ordering people to wear national costume was mitigated during its implementation and did not lead to the prosecution of ethnic minorities who wore their own dress in public. The affected minorities were mostly the Westernized Bhutanese youth, who preferred to follow the latest Western trends, and the ethnic Nepalese, who preferred to wear their own traditional costume. Western attire and Nepalese costumes were both considered foreign. The vast majority of Bhutanese were largely unaffected by this law since they already wore the national costumes. Strong calls for continuing the dress code have persisted unabated in the National Assembly.

Women's Dress

Traditional dress for women consists of the *kira*, *kera*, *koma*, *wonju*, *toego*, and petticoat. The *kira* is a large piece of woven cloth that is wrapped around the body in a series of folds. It is worn over a blouse, or *wonju*, and a cotton petticoat. Body-length petticoats are known as *gutsum*, and petticoats from the waist down to the ankle are called *meyo*. Wrapping the *kira*

is a complex process: with the *kira* behind the woman, she brings one corner from behind her left shoulder. Wrapping the other end from her right side, she hooks it with the corner by using a *koma*, a two-part brooch with a connecting chain. She then turns the *kira* around until the edges reach her right side, loops it back to her left, and draws it behind to her right shoulder. The two ends are again hooked together with the other end of the *koma*. The resulting pleats are adjusted until they are even, and the dress is fastened at the waist with a belt known as a *kera*. A jacket or *toego* is worn over this. Cuffs are formed by folding the *wonju*'s sleeves back over the sleeves of the *toego*. Tying the *kera* creates a pouch in the fabric above it, which is used as an ample pocket to keep anything from money to snacks. Ordinary women and villagers were expected to wear their *kira* ankle length; the nobility and wives of senior officials wore it to the ground, a practice that continues in rural areas.

Men's Dress

For men, the traditional *go* is a robelike dress that extends down to the toes. It is worn over a simple inner shirt known as a *toego* (not to be confused with the women's *toego*). The right half of the *go* is tucked inside the left, and then both ends are raised to around knee level, from where they are folded back to form symmetrical pleats. The garment is fastened by tying the *kera* around the waist. As with the women's dress, folding back the sleeves of the *toego* over the sleeves of the *go* forms the cuffs.

Three aspects of wearing a *go* traditionally reflected the wearer's station in society: the height of the *go*, the length of the cuffs, and the extent of exposure of the *toego* at the collar. Nobility, senior government officials, and members of the religious order generally wore their *go* below the knees. Everyone else wore a *go* that fell above the knee. Similarly, only the elite were permitted to display long cuffs and expose a considerable amount of the *toego* at the collar. By the 1990s however, through social custom, the increasing number of wealthy "commoners" made this distinguishing feature disappear.

Accessories

Most Bhutanese men carry a dagger known as a *dozom* in their *go*. It is a multiutility item whose use ranges from peeling betel nuts, to cooking, to self-defense. Other accessories are used for formal occasions, however. A *kabne* is a long scarf worn when visiting government offices and temples and when meeting senior officials. It is the traditional mark of rank, with the color determining rank. Ordinary people wear a

white *kabne*; senior officials wear red, which can be awarded only by the king. Ministers wear an orange *kabne*, and those of the king and the head of the religious body, the Je Khempo, are saffron. People in the military, when wearing the national costume, wear a shoulder sash for the same purpose. Women wear a *rachbu*, a woven sash worn on the shoulder, though here there is no distinction of colors to mark rank. On formal occasions, the attire for men requires the traditional boot known as *dalham*, a knee-high boot made of cloth and embroidered with decorations. Senior officials who wear a red scarf and higher must wear the traditional sword known as the *pata* on the right hip.

The textiles with which the *go* and *kira* are made are an important aspect of the national costumes. The different patterns, each with distinctive names, bring the *kira* to life and set the *go* significantly apart from its original form in Tibet. Bhutanese textiles are artistic and cultural assets that are also quickly finding markets outside Bhutan.

Other Ethnic Costumes

In addition to the national dress, other ethnic costumes are worn in Bhutan. The Doya men of southwestern Bhutan wear a dress known as the *pakhi*, a simple wrapped, sleeveless, knee-length garment belted at the waist. Women wear a similar garment that is closer to ankle length. European travelers to Bhutan in the eighteenth century reported that a dress similar to the *pakhi* was in use at the time.

Among the pastoral communities of the northeastern parts of Merak and Sakteng, the men wear thick jackets of yak wool with rawhide jackets over them. The lower garments are leather trousers belted at the waist, over which thick woolen shorts known as *kango* are worn. The women are dressed similarly, except that instead of shorts they wear a sleeveless tunic or *shinkha*, which extends to the knees and is belted at the waist. The pastoralists of Laya wear tunics and garments made of woven yak wool as well, which distinguish them considerably from the rest of the country. Among the Nepali-speaking minorities in the south of Bhutan, the dress is the same as is worn in Nepal. Similarly, the ethnic Tibetans settled in Bhutan wear traditional Tibetan dresses.

CLOTHING, TRADITIONAL—CAMBODIA The intricately patterned ikat silks (silks that whose threads are tie-dyed before being woven) created by the Khmer and Cham ethnic groups may come to mind when thinking of Cambodian textiles, but the peoples of Cambodia have produced many other cotton and silk textiles. Cambodians traditionally considered both domestic and imported textiles to be markers of identity, prestige, and wealth, and quantity and quality of textiles possessed by an individual or family contributed to their status within society.

Traditional dress in Cambodia is similar to traditional dress in neighboring Laos and Thailand. *Sampot* is the lower garment worn by either sex. The *sampot* for urban lower class and peasant women is a tube-skirt (sarong) approximately one and a half meters in length with both ends sewn together and is worn wrapped around the waist and secured with a cloth belt. Women of the middle and upper classes preferred to wear the *sampot chang kben* on a daily basis until the beginning of the twentieth century. This rectangular piece of cloth is approximately three meters long and one meter wide and is worn by first wrapping the cloth around the waist and stretching the ends away from the body. The outstretched ends are then twisted together and pulled between the legs and toward the back. The ends are tucked into the waist at the back, and the *sampot chang kben* is lastly fastened with a cloth or metal belt. Women of all social strata wear the *sampot chang kben* on special occasions such as religious ceremonies and weddings. Men also wear the *sampot chang kben*, but the traditional textile patterns worn by males differ from those worn by females. Traditionally, neither women nor men wore an upper garment. However, when the French colonial presence grew in Cambodia in the late nineteenth century, both men and women began to wear upper garments.

Even after the French presence in Cambodia from the 1860s onwards, Cambodians continued to wear traditional clothing. The Cambodian royalty and government officials combined the shot silk *sampot chang kben* (in the appropriate color for the day of the week) with a formal jacket. In the beginning of the twentieth century, Cambodians adopted forms of western style clothing such as a blouse or shirt. Men more readily adopted trousers as the lower garment for daily use, and both sexes continue to wear the *sampot chang kben* for formal occasions. Lower class and particularly rural women still wear a tube-skirt, but the material may be

printed batik-patterned cloth bought at the market rather than hand-woven silk or cotton.

Silk Textiles

The most important silk textiles of Cambodia are the ikat silks (*bol*), twill-patterned, weft ikat textiles. The pattern is made by tying vegetable or synthetic fibers on sections of the weft threads before the threads are dyed. This process is repeated for different colored dye baths until the patterns are formed and the cloth is woven. The two types of *bol* textiles have five traditional colors: red, yellow, green, blue, and black. The *sampot bol* is the lower garment mentioned earlier, made from *bol* cloth (*bol* cloth can also be used for *sampot chang kben*). The *pidan bol* is a ceremonial hanging reserved for religious or sacred purposes.

The *pidan bol* is an example of excellent craftsmanship. It may be presented to a Buddhist temple or hung in homes to create sacred space around the family's personal shrine. In a temple this textile is hung behind, above, or around the base of, a Buddha image. The narrative motifs of a *pidan bol* often depict tales of the previous lives of the Buddha.

Cotton Textiles

The various ethnic groups of Cambodia also produce cotton material for religious clothing and other purposes, such as for bedding and for various household textiles. The royal courts also imported Indian chintz with patterns especially for the Southeast Asian market.

The *kroma* is the all-purpose utility cotton cloth used by either men or women throughout the country as a head or neck scarf, belt, or towel. It is also used as a bag to carry things. This rectangular textile has a checkered pattern, usually blue and white or red and white, with striped ends. Political groups such as the Khmer Rouge have used the *kroma* to symbolize membership.

The Cham, an Austronesian group, are highly skilled silk weavers who produce cotton tube-skirts or sarongs for both men and women. Three or four hundred years ago, the Cham reportedly used to produce batiks (wax resist-dyed fabrics) in cotton similar to that of their kin in insular Southeast Asia. Cham women weave a checked or plaid cotton sarong for men. Natural or white cotton is important in Cham religious activities; it is worn by Cham priests and used as a sacred object during religious ceremonies.

Other Mon-Khmer and Austronesian minorities living in the northeastern region of Cambodia weave

cotton cloth on back strap looms for clothing and domestic use. The groups of both of these linguistic families weave similar textiles by attaching the warp beam of the back strap loom to a tree or part of a house in order to achieve the lengths of woven material needed for their loincloths.

The male loincloth is approximately 20 to 25 centimeters wide and 3 to 7 meters long. It is indigo blue or black with large red warp stripes and smaller yellow and white warp stripes. Supplementary patterns also decorate the stripes. The ends of the loincloth are patterned with red bands with supplementary patterns of animal or plant motifs. Red tassels and lead, glass, or plastic beading sometimes decorate the edges and ends of the loincloth. Men of the various Mon-Khmer linguistic groups sometimes wear a blanket over a shoulder during rituals, but otherwise do not wear an upper garment. Occasionally, men wear a simple tunic made from plant fibers such as bark cloth or banana leaves. These plant-fiber tunics are reported to have been more common when the technology to weave cotton was not familiar to these groups. It is now rare to find clothing made from these fibers. Men of the Jarai and Ede Austronesian minorities wear a collarless shirt of indigo or black cotton adorned with red yarn or metal beads on special occasions.

Women of the different ethnic minorities wear tube skirts. The long tube-skirt is worn tucked in around the breasts and is made from two pieces of material sewn together to form a tube. The shorter version is made from one piece of cloth sewn into a tube and is worn tucked in at the waist. The color scheme of the women's tube-skirts is similar to that of the men's loincloth. Women either do not wear an upper garment or wear a simple tunic made from a single piece of cloth with a hole cut in the middle of the textile for the head and the sides sewn together leaving open spaces for the arms. Ede women add sleeves to the tunic and decorate them with red yarn and metal beading.

As with other Khmer and Cham ethnicities, the minority groups of northeast Cambodia presently reserve traditional dress for special occasions. Textile production in Cambodia has experienced disruption because of political conflict, particularly during the Khmer Rouge regime of the late 1970s. Textile production increased in the calmer conditions at the beginning of the twenty-first century, encouraged by renewed local and foreign interest in hand-woven textiles, particularly in mastering the dyeing and weaving of the *pidan hol* produced prior to the twentieth century.

CLOTHING, TRADITIONAL—CHINA

Prehistoric clothing in China was constructed from animal skins, furs, and the natural plant fibers hemp, wisteria, and ramie. Shell, bone, and stone ornaments have been discovered in caves and ancient tombs. Bone needles and awls have also been discovered; the discovery of the awl suggests the use of leather for clothing.

Characteristics of Clothing Before Manchu Rule

By the Shang dynasty (1766–1045 BCE), trade and tribute with neighboring regions were well established. Tribute goods included cloth; weaving and dyeing were common during the Shang. The sericulture industry developed, and Chinese silk fabrics were highly prized trade goods. Simple cut-and-sewn garments such as straight, narrow robes, skirts, and trousers were worn during this period. Robes closed to the right, and sleeves were long and covered the hands to show respect. Hair was braided; hairpins were symbols of distinction and rank. Clothing was used to distinguish the stratified social classes.

Clothing continued to be used to maintain a stratified class system in the Zhou dynasty (1045–256 BCE). The *Zhou li* (Book of the Rites of Zhou) included sumptuary laws regulating the use of dress to show rank; the designation of special robes with special symbols worn by the emperor; and the dictate that all garments must close to the right. The usual clothing worn was the long, slim, narrow-sleeved embroidered robe and trousers or skirt. Hats and shoes were symbols of distinction and rank. As Taoism was incorporated into Chinese life, the symbols for the Taoist immortals were frequently embroidered on clothing. These symbols include the fan (life infused into the dead), the bamboo tube (longevity), the magic saber (magic), the pair of castanets (music), the magic gourd (medicine),

the flute (harmony), the basket of flowers (longevity), and the lotus flower (purity).

Minority clothing influenced Chinese dress during the Warring States period (475–221 BCE). The *hu fu*, a short jacket and long trousers, was introduced. The *hu fu* was widely adopted throughout China by men and women, particularly those from rural areas. Robe sleeves began widening near the end of this period.

During the Qin (221–206 BCE) and Han dynasties (206 BCE–220 CE), color symbolism was defined and became an important characteristic of ceremonial and ritual robes. Black denoted darkness, dawn, or evening; green or blue was considered the color of creation or life; red meant burning brightly and was the color of the sun and happiness; white was associated with opening, clearing, and cracked ice; and yellow denoted sparkling light and sunshine. These colors also symbolized the universe and the elements: black signified North or water; green or blue indicated East or wood; red symbolized South or fire; white meant West or metal; yellow indicated center or earth. From the *Yi jing* (or *I ching*), red became associated with the masculine concept (*yang*) and blue became associated with the feminine concept (*yin*). During this period, the one-piece robe was the most popular garment. It was characterized by a straight cut silhouette and large, wide, curved sleeves. Wealth was displayed by type and amount of embellishment and amount of fabric used in the robe. Hats and ribbons continued to denote rank; the texture, color, and size of the silk ribbons were used to distinguish between social classes.

Buddhism reached China by the end of the Han dynasty, and Buddhist symbols were used as embroidery motifs on clothing; these symbols included the parasol (charity), fish (tenacity), the sacred vase (ceremonial), the lotus (purity and marriage), the seashell (appeal to wisdom), the canopy (spiritual authority), and the Wheel of the Law (infinite changing). Toward the end of the Han dynasty, women began to favor a two-piece ensemble consisting of a long, pleated, wraparound skirt and short jacket.

Sui dynasty (581–618 BCE) clothing featured a narrow silhouette. Women continued to wear the jacket and skirt; red became the most popular skirt color. Sleeves could be narrow or wide. A popular nonceremonial robe style that was worn by men was the "band robe." This robe featured a round neckline and a section of fabric sewn to the lower half of the front and back of the robe in a wide, horizontal band. Colors and fabrics continued to be used to indicate the rank of the wearer.

During the Tang dynasty (618–907 CE) Chinese envoys spread Chinese costume throughout Asia, partic-

ularly affecting court dress in Japan and Korea. Tang-dynasty dress became fuller and more elaborate than the dress of previous eras. High-ranking men wore a stiff leather hoop belt with decorative plaques, often of jade, gold, or silver.

In the Song dynasty (960–1267 CE) cotton was introduced from India. It became an important textile crop in China for domestic use and foreign export and started to replace indigenous cellulosic fibers used in Chinese clothing. In particular, cotton became widely used in the clothing of the lower classes. Elements of Song dress included large, full robes, with large, wide sleeves. Robes opened down center front or closed to the right. Hoop belts with decorated plaques were also worn.

The tradition of foot binding, which was practiced in China before the Tang, was well established by the Song dynasty. Foot binding was usually characteristic of Han Chinese women (that is, women of the dominant Chinese ethnic group as opposed to women of ethnic minorities) only. Tiny, intricately embroidered shoes, called "lotus slippers" or "lily slippers" became important dress and cultural items.

Under the Mongol Yuan dynasty (1267–1368 CE), trade with other countries was encouraged. The cotton industries were well established. The Mongols considered the Han Chinese inferior but borrowed many Han Chinese dress traditions, such as color symbolism and items denoting rank. Mongols reduced the width of the robe, and introduced the finial, an ornament worn on the top of hats to designate rank.

The Ming dynasty (1368–1644 BCE) was the last Han Chinese dynasty to rule China. Ming means "brilliant" or "glorious," and red was its dynastic color. Sumptuary laws from the Han, Tang, and Song dynasties were reestablished and clothing regulations for all social classes were strictly codified in such documents as the *Ming Hui Dian*. For the upper classes, Ming dress was characterized by extreme width and very long, wide sleeves.

Changes Brought by the Qing

China's final dynasty was ruled by a conquering group of horsemen from the north, the Manchu (1644–1912 CE). The Manchu dynasty took the Chinese name Qing, which means "pure" or "clear." The Manchu instituted new sumptuary laws, many designed to assimilate the Han Chinese into Manchu culture. All Han Chinese men were forced shave their forehead and wear their hair in a long queue (braid) in the Manchu style; those in government positions had to wear Manchu-style garments, namely, one-

ADMIRATION FOR CLOTHING IN THE *BOOK OF SONGS*

The following short poem is from the *Book of Songs*, one of the Five Classics of Chinese literature, compiled about 600 BC.

How well your black coat fits!
Where it is worn I will turn it for you.
Let us go to where you lodge,
And there I will hand your food to you.

How nice your black coat looks!
Where it is worn I shall mend it for you.
Let us go to where you lodge,
And there I will hand your food to you.

How broad your black coat is!
Where it is torn I shall alter it for you.
Let us go to where you lodge,
And there I will hand your food to you.

Mifflin Company, 75.

piece robes with no pleats, sleeves ending in the distinctive horse-hoof cuffs. Horse-hoof cuffs were distinctive features of Manchu robes and derived their name from their resemblance to the hoof of a horse. They were wide, flaring cuffs that, when turned-down, extended over the hands of the wearer. The cuffs were turned down to protect the back of the hand, to help keep hands warm in cold weather, or to show respect when saluting high-ranking military, civil, or imperial officials. The Qing dynasty was also responsible for many regulations that controlled the use and the possession of the dragon robe as a court and official costume. Robes with dragons as the main design appear to have been in existence since at least the Tang dynasty and were worn by imperial and high-ranking officials of each successive dynasty; there are also records that robes with dragon motifs were also given as gifts to foreign heads of state. However, it was not until the Qing that the dragon robe became part of the Chinese official costume; in 1759, an imperial edict codified the use of dragon robes according to rank.

The styles characteristic of dragon robes worn by the emperor were regulated to set him apart from any other official. Qing imperial dragon robes had nine dragons embroidered on them and only the emperor could have five clawed *long* dragons. The emperor was the only person who could have all Twelve Auspicious symbols embroidered on his robe. These symbols, whose use dates back to the Han dynasty, represented the qualities desirable in an emperor: the sun, moon and stars (or constellations), enlightenment; the mountain as the ability of the emperor to protect his people; the dragon as adaptability; the pheasant as literary refinement; the water weed, purity; two sacrificial cups as filial piety (family devotion and loyalty); a plate of millet as the ability of the emperor to empathize with his people; fire or the flame as the brilliance of the emperor; the axe as the emperor's power to punish; and the *fu* symbol to represent the power of the emperor to discriminate between right and wrong. Groupings and placement of these symbols also had meaning. The sun and moon placed at the shoulder and the stars and mountains at the chest and back represented four important annual sacrifices that only the emperor could make. The *fu* symbol and axe groupings represented the emperor's authority over the natural world. The five elements of the natural world were also represented with a grouping of the mountain (earth), waterweed (water), flame (fire), sacrificial cups (metal), and plate of millet (wood or plant life).

Rank or insignia badges that indicated the rank of military and civil officials were also costume items that were regulated by Qing sumptuary laws. These

badges, known as mandarin squares in the West, had been used at least as early as the Ming dynasty to embellish robes; not until the Qing were regulations for their use formally structured. Qing rank badges were square-shaped and were sewn to the upper back and chest areas of robes. Animals were embroidered on badges awarded to military officials; birds were embroidered on badges awarded to civil officials.

Three basic types of robes were worn by men in the Qing court. The most formal was the *qao fu*, a one-piece dragon robe with a pleated skirt attached at the waist and horse-hoof cuffs on the sleeves. The heavily embroidered *pi-ling*, or cloud collar, was worn with this robe. The *qi fu* was a semi-formal dragon robe worn for festive occasions. It was in the typical Manchu style, having no pleats, horse-hoof cuffs, and side and center front and back slits (women's robes had only side slits). The *pu fu*, a plain surcoat, was often worn over the *qi fu*. The third robe was the *qang fu*, an ordinary robe worn for informal occasions. This robe was generally not embroidered, and was often worn with the *ma gua* or short jacket.

For women, the rules of dress were more relaxed, particularly for Han Chinese women, and there were distinct visual differences between Han Chinese and Manchu women's dress. Han Chinese women typically

had bound feet, wore a two-piece garment (a jacket and long pleated skirt or trousers), maintained regional hairstyles, and continued using embroidered sleeve band cuffs instead of the horse-hoof cuff. Manchu women did not bind their feet, usually wore the one-piece *qi pao*, and wore the distinctive Manchu black cloud headdress or *liang pa tou erb*, the "two handle headdress." This headdress consisted of a wire framework covered with black thread or yarn and with a black-satin-covered T-shaped projection rising from the framework. The black satin was draped over the T-shaped projection for an effect of wings spread out on each side. Hair, either real or false, could be draped over this framework and then decorated with various hair ornaments. Han Chinese women were also allowed to wear their husband's mandarin square on their outer jacket. Han Chinese women did not appear to borrow many Manchu dress traditions; Manchu women, however, frequently borrowed Han Chinese dress elements, such as the embroidered sleeve bands.

Everyday dress worn by the lower classes in the Qing Dynasty was simply cut and decorated. The *shan ku (sam fu)*, a two-piece ensemble, was worn by men, women, and children. The *sham sam* was a long- or short-sleeved, hip-length jacket that closed to the right, and the *ku (fu)* was a pair of trousers. These were usually made from wool, hemp, or cotton fabrics, and could be lined, quilted, or padded for warmth. These garments were cut to be comfortable, and to allow the wearer to work efficiently. By the end of the Qing, *sham* for men used a center front closure. Men who were wealthier wore a long robe, the cheongsam, with a center-opening hip-length jacket. A variety of sleeveless jackets could also be worn over the cheongsam. After 1912 the cheongsam was usually worn with a short jacket, the *ma gua*.

Western Influence After the Qing

After the overthrow of the Qing dynasty, Western influence became strong, especially in the coastal urban areas. Men who dealt with Westerners on a daily basis, such as bankers or businessmen, were the first to cut their queue and adopt total Western dress. More typical was the incorporation of Western dress with traditional clothing, such as wearing the *qiang pao* and cheongsam with Western hats, shoes, and a suit coat. Men in rural areas were less likely to adopt Western clothing.

Urban women in China embraced Western dress quickly, especially hairstyles and shoes, and many totally abandoned traditional clothing. Most urban women wore modernized versions of the jacket and

skirt, and also adapted the Manchu *qi pao* to Western design and style lines. Western trousers were not considered acceptable women's attire for social occasions. Peasant or lower-class women in urban and rural areas continued to wear the *shan ku*.

Changes During the Regime of Mao

Under Mao Zedong's regime, many restrictions on apparel were instituted, and people were allowed to own only a small quantity of clothing. The *qi pao* for women was not considered representative of the Communist regime, and after 1949, disappeared from mainland China. Mao favored a jacket and trouser combination for men and women, the *chieh fang i fu* or "liberation dress"; although originally the uniform of the Nationalist army, which opposed the Communists during China's civil war of the 1930s and 1940s, this suit became known as the "Mao suit." Under Mao, this was the only approved apparel and was usually made of blue cotton twill fabric. A uniform look was believed to be in keeping with the Communist precepts of universal comradeship and equality; wealthy Chinese, however, often had hand-tailored Mao suits of luxury wools.

During the last three decades of the twentieth century, clothing restrictions in China gradually relaxed as the result of changes in government policies. The Mao suit continued to be worn, especially by older people and those who lived in rural areas. Western clothing is nevertheless quite prevalent throughout the Chinese mainland. China plays an important role in apparel manufacturing for Western companies, and the high-fashion industry in China is experiencing a period of rapid growth. Historical Chinese costume also plays an important role for Western fashion designers, providing inspiration and new avenues to express creativity.

CLOTHING, TRADITIONAL — HONG KONG

During the Qing dynasty (1644–1912), the local Hong Kong population wore the same garments, made of silk or cotton, as the rest of the Han Chinese (ethnic Chinese majority) mainlanders. The *changshan*, or long gowns, for men, had a curved front opening on the right side, fastened with buttons and loops, and an upright collar. Silk was often used for summer garments; winter garments were wadded or lined with fur. Women wore the *ao*, a knee-length dress styled like the *changshan*, with a full-length skirt consisting of front and back panels with pleats or godets (cloth inserts) at the sides to allow movement. The portion of the skirt that showed below the *ao* was originally heavily embroidered but later was made in plain black or other dark, undecorated fabric. Originally, loose baggy trousers, or *ku*, were worn under the *ao*, and these continued to be worn by women who performed physical labor. For middle- and upper-class women, accessories included an embroidered headband that concealed the plucked forehead, bound-foot shoes, and ankle covers.

A version of these garments continued to be worn through the latter part of the twentieth century as part of traditional ceremonial dress. *Changshan* for men and *qun gua*, skirts and jackets, for women, and *dajinshan*, blouses with large lapels that fastened with *huaniu* (buttons and loops) to the right, had their origins in everyday dress of previous decades. As heavily embroidered versions of earlier clothing, they were most fashionable between the 1960s and 1970s. Shops sold or rented traditional ceremonial costumes, the *changshan magua* (long gowns and short jackets) for men and *qun gua* (*gua*, a red front-opening jacket; *qun*, a long black skirt) for women. These garments were worn by upper- and middle-class people for birthday banquets or other formal occasions. Later the *qun gua*, made in red and embroidered with *longfeng*, the dragon-and-phoenix motif, became the ceremonial costume for brides. Other embroidered motifs included mandarin ducks, flowers, and plants. Traditionally, two decorative sashes are embroidered at the center of the lapel, *zisundai*, or offspring bands. Today, a version of the Western white wedding dress—theatrically styled with a padded bust, off-the-shoulder straps, tight waist, and hooped skirt—has replaced the red wedding dress, although a red dress may be worn for part of the wedding ceremony.

Styles after the Qing Dynasty

Qipao or *cheung sam*, literally meaning "long dress" or "Manchu gown," and *magua* (horse jacket), a man's

short jacket, were worn after the overthrow of the Qing dynasty. The jacket was slimmer-fitting than previously, had side slits, tight-fitting sleeves, and a high collar. Unusual for Asia, the *cheung sam* developed into a tailored garment; the front of the garment was constructed using bias-cut fabric to fit the chest area of the wearer in much the same way that a Western tailored jacket is molded to the body shape of its wearer. Later, the addition of darts allowed for an even closer fit. The fastened edge usually has a contrasting satin binding stiffened by glue. The *cheung sam* is characterized by its right-front fastening, standing collar, and side slits.

Originally worn by urban Chinese as a signifier of modernity in the early decades of the twentieth century, the *cheung sam* was worn with Western hairstyles, makeup, stockings, and high-heeled shoes. The depiction of girls wearing tight-fitting *cheung sam* in advertisements and in the prewar Shanghai film industry associated the *cheung sam* with fashion, overseas Chinese, and Hong Kong, where it became something of a national dress. It was considered a symbol of decadence in China after the Communist Revolution (1949) and was banned on the mainland during the Cultural Revolution (1966–1976). The link with alluring theatrical costume continued as the *cheung sam* became tighter and shorter, reflecting both Western fashion from the 1940s through the 1960s and the uniformity prevalent beyond the Hong Kong border in China during this period. The garment was worn by all of the local female population, and its tightness varied depending on the wearer's position and role in society, conforming to traditional Chinese ideas of modesty by concealing the neck, arms, and legs. Variations included sleeveless *cheung sam*, the use of shoulder pads, and zippers set in the slits at the hem that could be decorously lowered en route to work and raised after work in a club or bar. It was worn as a full-length garment for evening wear, and knee-length—reflecting Western fashion—for everyday use. Fabrics used included silks, rayon brocade, and, for everyday, printed cottons. The tailor was responsible for selecting the *huaniu*—the choice being an indication of his taste. The *cheung sam* continues to exist today as a theatrical dress-up item, worn by actresses, movie stars, and some local people at Chinese New Year. A small number of older women in prominent professional, social, or political positions wear the *cheung sam* on a daily basis, and many elderly women wear it on special occasions. Made of a plain woven cotton, the *cheung sam* is a much disliked school uniform at a number of Protestant girls' schools in Hong Kong.

The buttons and loops used on the *cheung sam* are made from bias-cut strips of glue-stiffened satin

reinforced with an iron wire. They were most in demand when fashions for the *qipao* were at their zenith in the late 1950s, early 1960s. In Hong Kong two styles seem to have been used; *luosiniu* for men's and *huaniu* for women's wear. They may include one, two, or three colors matched to the garment and its trimmings. Patterns include flowers, birds, fish, or insects, symbolizing Chinese characters with auspicious meanings. Each *huaniu* is part of a pair; the knotted end, *gong*, is male, and the part with the eye, *na*, is female. *Huanu* of the same size are used on women's gowns, while men's gowns have a larger *gong* and a smaller *na* stitched nearer the shoulder.

Bound-Foot Shoemaking

Bound-foot shoes were usually made by the women who needed them. In the past, the practice of binding women's feet was common among wealthy families, but women with bound feet are now very rare in Hong Kong. Having learned embroidery, women would start to learn how to make shoes for themselves at the age of eleven or twelve. The cutout parts of the shoe were embroidered before assembly. The sole was made from bamboo culm, washed, straightened, bound with layers of cloth, and stitched together with a thin linen rope. Winter shoes were lined with cotton wool. Heels were made from carved pomegranate or lychee tree wood wrapped in fabric. These were either self-made or purchased from vendors of string and wool. Fake bound-foot shoes, designed at first glance to mistake the heel for the ankle, also existed for women who had not had their feet bound but wished to look as though they had.

Clothing among Minority Peoples

The Hoklo people, of Fujian or Hokkien origin, make and continue to use a number of traditional items of clothing for festive occasions. Their everyday clothing is dark, but festive clothing is brightly colored. Children's garments and accessories, such as baby carriers, are elaborately decorated with beads, bells, decorative trim, and embroidery; small boys' hats are made in the shape of animals to confuse the evil spirits so that the child may grow up safely. Cotton purses are appliquéd with brightly colored thread and worn around the waist. Another minority group, the Tanka, who fish the waters around Hong Kong, also make brightly colored items such as baby carriers.

Hemp weaving was practiced in the early part of the twentieth century by the Hakka women. They wove narrow braids, *huadai*, on looms tied around their waists. These were used as straps to keep their *liang-mao*, a flat, circular bamboo brimmed hat with a blue

or black cloth fringe, in place. Hemp, handspun onto a bamboo pole, would also be woven by local weavers for use as blouses and dyed—usually dark colors—by boiling yam and dyer's weed in water or in commercial dyehouses in Kowloon.

Contemporary Styles

In Hong Kong today, the *cheung sam* is regularly revived by local fashion designers attempting to capitalize on Hong Kong's fashion past to create new collections, and by local design students attempting to find a new way to wear clothing that is now only associated with old people. Occasionally, international fashion adopts the *cheung sam* as a look, as most recently in 1997, when the fashionably dressed women of Hong Kong wore Christian Dior versions of the *cheung sam*. The most successful use of elements of traditional clothing are seen in the collections of New York designer Vivienne Tam, who references her origins in her collections, which are very popular in Hong Kong. The process of reappropriation via New York appears to be a critical element in her commercial success. Although a simplified phoenix-and-dragon robe is still worn at many weddings, more generally the use of traditional clothing is declining, both among the Cantonese and minority peoples of Hong Kong.

CLOTHING, TRADITIONAL—INDIA Archaeological finds four millennia old mark the beginning of information on Indian dress, though sufficient information to develop a costume history is only available from the Mauryan dynasty, beginning 324 BCE. Study of Indian dress is further complicated by the high degree of social stratification, cultural diversity, and climate variation within the subcontinent. Similar garments, too, have different names by region. Moreover, India has always provided textiles and other components of dress to the world through trade, thereby in-

fluencing and being influenced by the dress of other societies as its industries negotiated the aesthetic requirements of its world markets. Thus Indian dress has never been a closed, unified, or rigid cultural tradition.

Wrapped Garments

Of all the countries in the world, India is most closely associated with wrapped cloth garments, the ephemeral form of folds, pleats, tucks, rolls, and knots which disappears as soon as the garment is taken off. The woman's sari; wrapped forms of men's dress such as the *dboti* and *lungi*; and the unisex *veshti* of south-western India are the primary garments worn by the adult population. They vary slightly in width but generally cover the distance between ankle and waist and range from 2 1/2 to 11 yards in length. They are wrapped to cover the lower torso in styles—from simple to complex—specific to region, caste, religion, or ethnicity. Women wear longer saris that cover both the lower and upper torso. The end of the sari, or the edge of any wrapped garment lying next to the waist, can be used to secure small objects such as money or tobacco. A wrapped garment easily accommodates changes in body size from aging, illness, diet, or pregnancy since fit is redetermined each time the garment is donned. Simple wrapping adjustments further adapt the garment to changes of temperature or activity through the day.

Head coverings, most commonly worn in the north and west, also consist of wrapped or draped cloth. The head wraps of men of specific communities, such as the Sikhs, or of high-ranking men, consist of a 12–22-foot-long cloth arranged in styles determined by sociocultural factors. Manual laborers casually wrap a much shorter cloth around the head. This informal 1 1/2-yard garment can also be used for incidental tasks such as wiping a seat or wrapping a small bundle around the waist.

Many married women in the north use part of the sari to cover their heads. Where the sari is not worn, the head covering consists of a cloth, the *dupatta* or *orbni*, for instance, 2 or 3 yards long, draped from the top of the head. Its ends dangle behind, are tucked into the waistline or neckline of other garments, or are drawn around the body to provide protection from cold or the unwanted gaze of others, according to customs of respect and avoidance.

Wrapped garments are surface designed or woven to size in decorative patterns. Decorations include woven or applied borders or more extensive designs in printing, tie dye, or embroidery. Border designs emphasize the style of wrapping.

Preshaped Garments

Through the ninth century CE, the wrapped garment remained the primary and often sole garment worn by men and women, though soldiers always wore preshaped garments and the many foreigners in residence or traveling through early India wore a variety of stitched garments. Over the next thousand years a variety of stitched and, much later, knit garments were broadly incorporated during the periods of Muslim influence and subsequent rule (beginning with raiding parties in 997 CE) and then European ascendancy (beginning with Portuguese capture of Goa in 1510). The history of particular garments that now comprise Indian dress is a complex intertwining of broad regional trends and court fashions. For example, the women's *coli*, a bodice front and sleeves secured by back ties, probably appeared in pre-Muslim Gujarat in the tenth century, yet only became widespread in the north as Muslim power spread. The modern sari developed from the ensembles of *veshti* and *mumdnai*, upper body cloth, and *ghaghra*, a gathered skirt reaching to the lower calf, and *orbni*.

While men's dress has evolved, women largely have adhered to wrapped garments, merely adding stitched accessories. In the twentieth century, a tight blouse, complete with back but baring midriff, became the common accessory to the sari or *veshti*. A petticoat was also incorporated, although some pant-like styles of wrapping the sari precluded it. Primarily stitched ensembles of *salwar* (loose-legged pants that narrow at the ankles) and *qamiz* (a knee-length tunic) with *dupatta*, or *ghaghra* and *coli* with *orbni* are characteristic of women's dress in specific communities in the north and west.

Men adhering to the wrapped *dboti*, *lungi*, or *veshti* in the early 2000s commonly accessorized it with preshaped tunics including *kurta* and Western-inspired shirts, including cotton knit shirts. Fully stitched male ensembles extended this variety of tunics to include the *achkan*, a knee-length jacket closed with buttons down the front, and paired them with a variety of pant types to create ensembles that marked the social occasion and identity of the wearer. Pajama, *curidar* pajama (pants that are skintight below the knee with extra length gathered at the ankles), trousers, shorts, and *salwar* were popular pants for men.

Gender Differentiation

A woman's marital and reproductive status is marked by elements of her head covering, such as specific items of jewelry, garment colors, body markings, or a veiling garment. Among orthodox Hindu women, the absence of decorative elements in a woman's dress

indicates that she is currently menstruating or that her husband is out of town or deceased. Motherhood, especially the birth of sons, is marked in some subgroups by small changes in dress. In veiling practices, characteristic of the north, arrangement of a woman's dress can further communicate that she is in the presence of her husband's senior relatives, before whom she always covers her head. In her natal family village or far from her husband's village she need not do so. Similar information is conveyed by the way a Muslim woman adjusts the several layers of face veils of her *burqa*, a preshaped garment donned over normal dress when outside the home to cover the body from head to toe.

Gender differences are apparent in the use of world dress in India. Men drawn away from the agriculture-based economy incorporate items or don complete ensembles of world dress. Cultural authentication of originally foreign garments makes them Indian; businessmen, for example, wear sandals, trousers, and a front-buttoning shirt with sleeves and European collar, with the straight hem of the shirt worn hanging out over the hips. The specific form and use of such garments follow the dictates of local environmental and non-verbal communication requirements, as well as Indian fashions in cut, fit, color, surface design, and ensemble building. Such localized forms represent Indian participation in the globalization of dress, and would be deemed foreign if worn in business contexts outside India.

Diversity in Dress

Because India contains one-sixth of the world's population and incorporates diverse cultural groups, dress quite distinct from that described above often constitutes the norm within specific groups or regions. The distinctive modes of dress worn by hundreds of millions of people in remote regions or among minority groups is nevertheless sometimes unfamiliar to members of mainstream Indian society. The Bondo, for example, are easily mistaken for residents of other continents. Women crop their hair close to the head, barely cover their hips with a narrow piece of cloth, and let their many necklaces suffice to dress the upper torso. Bondo men grow their hair long and wear a brief loincloth. The dress of some Assamese tribes indicates ancient connections to peoples in highland Southeast Asia. The dress of still other Assamese communities, and some central Indian tribes, mirrors ancient Indian dress, but with the addition of the modern sari blouse.

A 1993 government study of tattoo, jewelry, and headdress revealed that designs communicate the caste, religion, and regional or ethnic identity of much of the population. Such distinctions are also often

made in the cut, surface design, color, or wrapping style of garments. Indian dress is thus characteristically diverse. Anonymity regarding caste, religion, and ethnicity are more characteristic of the less than 30 percent of the population residing in cities. There, the *nivi* wrapping style for sari and Indian fashions in tradition-based and world dress garments create relative homogeneity.

Politics and Dress

Politics play a significant role in the design of Indian dress. Throughout history the political elite have enjoyed greater access to foreign dress and traders' wares. Muslim rule of the north, from 1192 to 1857 CE, radically influenced men's dress. Similarly, during European rule, ending in 1947, high-ranking men donned garments or complete ensembles fashioned on European lines. Eventually, various redesigned European garments were broadly culturally authenticated into Indian practice through all social ranks. The redesigned garments, no longer appropriate to European dress, became truly Indian in character. Common examples in the early 2000s included the sari blouse and man's shirt. Simultaneously, colonial rulers participated in the development of Indian dress traditions, such as the codification of Sikh headdress, still worn worldwide by Sikh men.

During the independence struggle, culminating in 1947, industrially produced cloth and overtly European or luxurious forms of dress were rejected. Nationalists donned plainer and tradition-based dress in sympathy with the most exploited members of colonial society. The fervent wore *khadi*, a cloth handwoven from handspun yarn. *Khadi* was woven into saris and sewn into the garments of an ensemble developed by Mahatma Gandhi. His design communicated a unified national identity, in contrast to conventional dress, which revealed the wearer's distinctive social identity. This chiefly male ensemble included pajama, *kurta*, and Gandhian cap. *Khadi* and the cap were also incorporated into other ensembles.

India's postindependence economic planning profoundly influenced dress. The government supported the handloom industry to maintain employment levels, and discouraged imports or the mechanization of weaving. Cotton fiber agriculture was encouraged until population increases demanded conversion of land to food production in the 1980s. Synthetic fiber production and blends with cotton are now encouraged. Thus, handwoven cotton wrapped garments remained a dress staple from ancient times until the mid 1980s. Handwoven synthetic blends have subsequently become popular. In contrast, luxury garments through-

out the twentieth century consisted of handwoven silk or industrially loomed synthetics, especially the discouraged imports from Europe and, later, Japan.

Fashion

Traditional forms of dress for the elite have undergone fashion changes well documented through two thousand years of artwork in stone, metal, and paint. Strong documentation for the dress of lower and middle ranks of society exists from the nineteenth century. Until the advent of Muslim influence in the north, fashionability in dress consisted largely in developments in wrapping style, garment dimensions, woven or surface design, color, and border widths. The addition of preshaped garments, with the associated possibilities of design through garment cut, and the covering up of the female upper torso, constitute the major cumulative changes in dress from 1000 CE to the present, though innumerable fashions in wrap or cut of garment have come and gone. Still, topless female dress sporadically occurs in minority communities in central and southern India and among the elder population in parts of the east and south.

The urban elite and youth led twentieth century women's fashion, which involved a movement toward gold jewelry and away from silver, experiments in surface design of fabrics, developments in the cut of commonly worn stitched garments, and increasing abandonment of caste-specific wrapping styles. Participation in broad fashion trends of the West also occurred, as in the rising and falling of *qamiz* and sari *pallav* (end-border design) lengths with Western skirt lengths. Yet women's dress generally maintained traditional silhouettes.

Two current trends mark urban professionals' and young educated women's dress practice. Ethnic Chic, beginning in the 1980s, consists in historic revivals and commodified ethnic traditions in dress spreading across the nation and its worldwide diaspora. Styles include a Gujarati way of wrapping the sari, *ghaghra-coli* ensembles, regional traditions in surface embellishment applied to saris and other garments, and most popularly the *salwar qamiz* ensemble. Ethnic Chic also affects menswear, primarily producing luxurious ensembles for urban elite and diaspora bridegrooms.

Indian forms of world dress are now appearing among urban upper class young women. As promulgated by Indian films serving both diaspora and national audiences, world dress is restyled to an Indian aesthetic in Bombay film industry costume workshops. Male youth, constituting the primary film audience, have long worn world dress, but increasingly young

elite women are donning jeans and shirts, too. Indian dress norms require that the shirt hang outside the jeans to obscure definition of a woman's hips and crotch. Despite this trend, the more than 70 percent of the Indian population residing in rural areas will continue to anchor women's dress for some time to come in the tradition of wrapping elegant saris.

CLOTHING, TRADITIONAL—INDONESIA Indonesia has three hundred ethnic groups, each with their own costume variations. The majority of the population, the Javanese, wear Indonesian national dress. Western dress arrived in Indonesia in the sixteenth century and has been one of many sources of

Performers in traditional costume performing the Batak dance at Lake Toba, Sumatra, Indonesia, in 1996. (STEPHEN G. DONLADSON PHOTOGRAPHY)

tension between indigenous groups and colonizers. Dress is an indicator of cultural change in Indonesia; indeed, history can be divided into three eras categorized by dress terms: sarong (local dress), *jubbah* (Islamic influences), and trousers (Western influences).

The function of dress in Indonesia, with a population that is primarily Muslim, is complex. Although Islam had an impact on Indonesia prior to that of the Europeans, after centuries of Dutch domination, dress in Indonesia has become a way to express attitudes toward foreign, cultural, political, and religious influences. Although Western dress is most commonly worn today, traditional dress continues to be important in Indonesia, where varied forms of traditional dress testify to the wide variety of cultural subgroups in the nation.

Textiles

Indonesia has a long history of fine textile production; this traditional art is still considered important, despite Westernization. Indonesia is particularly noted for its textiles made with complex resist-dyed techniques. Batik is a patterned fabric produced by using wax as a resist agent. Where the wax has been applied, it prevents the dye from penetrating.

Another resist-dyed technique is *ikat*, in which the dye is applied to the warp yarns prior to weaving. The design is seen in the finished yarn goods, and is a re-

sult of the dyed warp yarns being woven with plain weft yarns, a process known as single *ikat*. When the warp and weft yarns are both resist dyed, an extremely complex form of double *ikat* results; these *geringsing* cloths are rare and are made only in Tenganan on Bali. These cloths are the most highly prized Indonesian textiles.

Other fine textiles produced in Indonesia include *songket*, a heavy silk handwoven fabric with gold- or silver-wire-wrapped thread used as a supplementary weft to form the pattern. *Pelangi* is a tie-dyed fabric, common in Bali. *Prada* cloth is a fine cotton fabric in vivid colors with floral motifs printed in gold dust or applied with gold foil and is often worn by Balinese dancers.

Traditional Dress

Traditional dress is still commonly seen in rural areas and is especially important throughout Indonesia for national ceremonial occasions. For both men and women, traditional dress in Indonesia includes a wrap-around lower-body cover—a *kain* (a rectangular length of fabric, generally in batik) or a sarong (a length of fabric with ends sewn together, more often in *ikat*). Women in Java and Bali wear sarongs and *kain*, held in place with a *stagen*, a narrow sash. The *kebaya* is a tight, often sheer, long-sleeved blouse worn on the upper body. It is often made of lace, but can also be made

of lightweight, sheer, elaborately embroidered cottons. In addition, women generally have a large rectangle of cloth called a *selendang* (*ikat* or *batik*) draped over the shoulder (on less formal occasions a large *selendang* is used to carry babies or objects); on Bali the *pelangi* (a sash) is worn over the *kebaya* around the waist when going to temple.

Indonesian men generally wear *kain* or sarongs only in the home or on informal occasions. A black felt cap, or *peci*, is occasionally worn; although it was once associated with Islam, it has acquired a more secular, national meaning since Indonesia's independence. These ensembles have become national dress in Indonesia because the vast majority of the population lives on Java and Bali. *Kebaya* and batik *kain* are considered Indonesia's national dress for women, and *teluk beskap*, a combination of the Javanese jacket and *kain*, are national dress for Indonesian men.

CLOTHING, TRADITIONAL—IRAQ Artifacts found in Sumerian tombs suggest that the early inhabitants of Mesopotamia (c. 3500–2500 BCE) wore a wrapped sheepskin skirt, called *kaunakes*, with one end of the garment passed under a wide belt in front and over the left shoulder. After woven cloth was available, the garment was fringed at the hem to simulate the effect of fleece. Cloaks covered the upper body, and royal women wore elaborate gold jewelry. Later Babylonian and Assyrian (c. 1000–600 BCE) costume shifted from draped garments to tunics. Assyrian law codes prescribed veiling for free, married women and prohibited it for prostitutes and slaves. Mesopotamia was the land of wool production and weaving, and wool was the primary fiber for clothes, tapestries, and curtains, although linen, cotton, and even silk are mentioned. The industry was technologically sophisticated enough to produce elaborate woven and embroidered

figural motifs. Evidence of weaving guilds and apprenticeships, plus textile trade with other countries, attests to the importance of the textile industry.

The traditional dress of Iraq is a reflection of Iraqi technical skills, aesthetic and political ideals, moral standards, and religious values. Members of Iraqi society are deeply immersed in Islamic fundamentalism; consequently, costume reflects these ideals and values. Traditional dress is less prevalent in urban centers such as Baghdad and Basra than in rural areas. All social classes wear the same clothing, with only subtle differences. Arabs and Kurds exhibit distinct differences in their clothing, though both are predominantly Muslim.

The traditional dress of Arab Iraqi men includes the *dishdashba*, an ankle-length, typically white, loose-fitting, shirtlike garment allowing free air circulation over the body; the *aba*, a long cloak, tan or neutral in color, for cool weather; the *kaffiyeh*, a white or checked square scarf folded into a triangle and sometimes worn over a small white cap with the *agal*, a circular black rope or plaited-cord device to hold the *kaffiyeh* in place; and sandals. Men also wear undershirts and

Iraqi women at Friday prayers in a mosque in Baghdad on 1 January 1999. (AFP/CORBIS)

drawers, loose trousers, and a cotton or wool coat. The *disbdasha* may be hoisted up and secured for greater freedom of movement, and the *aba* may be doubled up over the head. To further protect against the elements, the ends of the headdress may be wrapped loosely around the neck, across the ears and lower face, or around the top of the head.

The Arab Iraqi woman's traditional costume is designed to conceal the woman and achieves this through *bijab*, or veiling, the practice of covering the woman's hair and body for the sake of modesty and adherence to socioreligious requirements. Veiling is believed to prevent men from falling into temptation and to protect women from unwanted sexual advances. The traditional costume includes the *abayah*, a long black cloak worn over a dress and covering the wearer from head to foot; the *asha*, a black head scarf; the *foota*, a black chin scarf; sandals or clogs; and gold or silver jewelry (for example, ankle bracelets, earrings, or pendants, valued not only as ornament but as insurance in case a woman's husband dies, leaves, or divorces her). The dress under the *abayah* is traditionally a black long-sleeved, ankle-length shift or yoke-style, but may be other colors. Younger women may wear the *abayah* and veil only when they leave the house but indoors wear dresses of printed cotton (during the summer) and flannelette (during the winter). In winter women may wear four or five layers of clothing—heavy black sweaters and black imitation caracul jackets—under the *abayah*. The *hashmiya* is a wide-sleeved full net or sheer black ceremonial gown that women wear for certain religious ceremonies.

The traditional costume of Kurdish men includes baggy pantaloons, a shirt, a cummerbund (in which valuables are kept, as well as a dagger or two), peaked leather slippers, a close-fitting cap or turbanlike head wrap, and, in winter, a quilted jacket and long cloak in bright colors. Kurdish women have never practiced veiling and enjoy considerable latitude in community activities. The traditional costume is modest but colorful, and it includes a loose-fitting dress or kirtle, a short collarless jacket, a headscarf or turban, and several pieces of jewelry. At times they wear a bifurcated garment similar to Turkish trousers.

An Islamic man may have up to four wives, and a large family is highly desirable, since the greater the number of children, especially sons, the greater the prestige of the father. Young girls are dressed in brightly colored print dresses, and boys are clothed in candy-striped *disbdashas*, or trousers. Typical footwear is sandals or tennis shoes. Children often wear sweaters, wool scarves, and caps in winter. Boys and girls are traditionally separated at puberty, and girls

are excluded from male society outside the family circle. Parents generally arrange marriages, preferably between relatives, and part of preparation for the ceremony includes decorative painting of the bride's hands and feet with henna, a natural red dye.

Westernization of traditional costume is prevalent throughout Iraq, and increasing educational levels and opportunities in the workforce encourage the abandoning of all or parts of traditional dress. Wealthy professionals in urban centers have adopted Western dress to a greater extent than other components of the population. Most men who have visited the city own at least one Western-style business suit, and women may wear highly fashionable Western dresses or suits with or without the *abayah*. Many women who discarded traditional dress after the revolution, however, have reverted to traditional dress as an expression of national pride.

CLOTHING, TRADITIONAL — JAPAN

The basis of Japanese traditional costume is the kimono, a loose-fitting cloth garment constructed only of various sizes of flat rectangles, wrapped around the body and held in place with strings or sashes. Throughout its historical development, the structure of the kimono has remained basically the same.

Early Period to Premodern Period

Clay figurines and wall paintings found in prehistoric tombs show that the clothing of ancient Japan was similar to that of China and Korea, attesting to its cultural attachment to continental civilization. In 603, Prince Shotoku (574–622) established the first dress code in Japan and, following a Chinese model, fixed twelve court ranks distinguished by the color of their headgear. During the Nara period (710–794), intensive assimilation of continental culture continued. The oldest-surviving Japanese textiles were brought to Japan along the Silk Road through China and Korea from remote areas as far away as the Middle East.

During the Heian period (794–1192), Japanese native styles emerged. Male aristocrats wore *sokutai*, a combination of a cloak with a long tail and wide trousers, at official court ceremonies, and *ikan*, *noshi*, or *kariginu*, round-necked broad-sleeved cloaks, for less formal occasions. The most formal attire for female aristocrats was *karaginu-mo*, the so-called *juni-bitoe* (twelve-layered gown), which consisted of many layers of undergarments, a long-sleeved jacket (*karaginu*), a long, pleated divided skirt (*bakama*), and a long train (*mo*). When layering garments, the aesthetics of color combinations were particularly important. Color schemes were formulated, and sets of different colors were linked to specific flowers, seasons, or weather conditions.

In the Kamakura period (1192–1333), as the military class came to power, the ruling class adapted a more practical and restrained style of clothing based on warrior garments. *Hitatare*, a tailored suit with a broad-sleeved cloak and *bakama* trousers became the standard for men's clothing. Family crests often appeared as dyed motifs on fabrics. Meanwhile, a narrow-sleeved kimono called a *kosode*, originally an undergarment, became an outer garment. From this period through the Muromachi period (1336–1573), the *kosode* continued evolving and became the common dress for almost all classes of women. As it came to be worn alone without *bakama*, its full-length flat surface provided larger continuous spaces for two-dimensional decoration and encouraged new designs with striking colors and patterns.

The Momoyama period (1573–1603) was generally characterized by its bold extremes of taste initiated by dynamic social changes and economic growth. Costumes of this period displayed flamboyant designs. *Tsujigahana* dyeing, a method of exquisite surface decoration produced by a combination of stitched tie-dyeing, hand painting, and embroidery, was popular. Surviving cloaks (*dofuku*) decorated with *tsujigahana* worn by military leaders exhibit their extravagant taste.

During the Edo period (1603–1868), the urban population exhibited a passion for fresh textile designs. Some of the most celebrated painters of the time were involved in the textile industry, including Ogata Korin (1658–1716), a celebrated Kyoto painter. *Yuzen* dyeing, a technique of rendering detailed images on fabrics by defining outlines with rice-paste resist, was perfected by Miyazaki Yuzensai. Wealthy people sported garments dyed in the *yuzen* style, often combined with other embellishments such as tie-dyeing and embroidery, despite sumptuary laws set by the government. From the late eighteenth century, a more

understated style became popular around Edo (present-day Tokyo). This style employed simple patterns such as stripes or tiny repeated patterns in neutral or grayish colors, following the fashions of famous actors or smart customers of the pleasure quarters.

Modern Period

In 1854, Japan fully opened to the outside world after more than two hundred years of relative seclusion, and rapid Westernization began. The government adapted Western clothing styles for the official uniforms of national institutions and formal occasions, and Western costume became a sign of authority. A few decades later, however, intense reaction against rapid Westernization resulted in nationalistic movements aimed at preserving traditional Japanese culture. From then until the end of World War II in 1945, when Western-style clothing finally became the norm in everyday life, Western and Japanese styles coexisted and often were mixed according to individual needs. For example, Western dress tended to be worn more often by men than by women in formal settings, and Japanese dress continued to be worn in domestic settings by older women.

In the late twentieth and early twenty-first centuries, the kimono has survived mainly as a representation of or as a means to communicate Japan's cultural heritage. Many textiles and costumes have been designated as National Treasures or Important Cultural Properties to be exhibited at museums, and skilled textile craftspeople have been appointed as Living National Treasures for the preservation of traditional techniques. At the same time, many people still prefer traditional costumes for formal occasions such as wedding ceremonies, funerals, and coming-of-age celebrations. The kimono also plays an important role in other traditional activities such as performances of music and dance and in the tea ceremony. In addition to luxury kimonos worn at those formal occasions, *yukata*, an informal cotton kimono, is often seen at summer festivals and hot-spring resorts.

Augmenting the efforts to conserve the tradition as it is, a group of Japanese designers started to incorporate kimono designs into contemporary international fashions in the 1970s and 1980s. The kimono, with its delicate surface decorations and its flexible sizing, provided designers with new approaches to the body and clothing. Meanwhile, with the recently revived interest in the kimono, the kimono industry is promoting a new type that can be worn and laundered more easily.

CLOTHING, TRADITIONAL — KOREA

Hanbok, the Korean traditional costume, is characterized by a keen appreciation and consciousness of the seasons, a sensitivity to color, symbolic motifs from myth and legend, and individual taste, value, and style. *Hanbok* offers a glimpse of Korea's past, representing hundreds of years of colorful history before modernization. Korean costume also reflects the lifestyles of aristocrats, nobility, and commoners in very distinct ways.

Hanbok consists of a jacket called *jubgori* and trousers called *baji* for men, and *jubgori* and skirts called *chima* for women. For men, a hat is essential for all occasions, as is a sash at the waist and high- or low-

cut shoes. These are the basic attributes of dress in cold countries and are especially suitable for farming and hunting. Laces (*daenim*) are tied around the ankles of men's baggy trousers to facilitate movement. Headdresses are important for presenting a refined appearance.

The textiles used for costume include *sambae* (hemp), *mosi* (ramie), *sa* and *ra* (stiffened silk gauze), *myungju* (soft silk pongee), and *dan* (opaque silk). A variety of accessories, such as highly ornamented royal crowns, elaborate earrings, necklaces, bracelets, hairpins, belts, and bronze shoes, adorned dress. Under the influence of Chinese culture, from the seventh century CE onward the sleeves of Korean jackets and robes became larger and trousers wider. Headdresses and robes were similarly modified.

Shilla Period

During the Unified Shilla dynasty (668–935 CE), which maintained close ties with Tang China, China's influence on Korean costume became more evident. Korean figurines unearthed from a mid-eighth century tomb in Kyongju, the capital city of the Shilla kingdom, were depicted in Chinese-style dress. In earlier tomb mural paintings, long jackets with belts at the waist were worn over long, pleated skirts, but the figurines from the Unified Shilla wore skirts over their jackets, a distinctively Tang Chinese style.

Korean girls in traditional dress in 1989. (DAVID & PETER TURNLEY/CORBIS)

Koryo Period

Extravagant style prevailed during the succeeding Koryo period (918–1392), until the Chinese styles of the Yuan dynasty (1267–1368) became popular in the declining years of Koryo. The Yuan Chinese influence dictated tighter sleeves and shorter jackets. (Previously, jackets were long enough to cover the hip line, with a sash tied around the waist.) The wearing of a *dae* (a belt or girdle) of jade, leather, or cloth, which indicated the rank of the wearer, ended with the advent of the Koryo period. Instead of the *dae*, the palace adopted the Chinese clothing and hat system to indicate rank. The *jogdoori* (today's women's wedding crown) and *doturak-daenggi* (doubled-long hair ribbon with embroidery and ornaments) were Yuan Chinese features adopted by Korea and were worn until the Choson dynasty (1392–1910). Commoner women wore white *gubn* (head scarves) and white clothes, but did not cover their face. Noblewomen wore *nubwool* (a veil) made from a foot or more of black, soft silk or *sa* (stiffened silk) over a small, umbrella-like cover worn on the head. The material and size of a woman's *nubwool* indicated her social status.

Official court attire was worn with *hwa* (boots). From the time of the Koryo dynasty's King Wu (c. thirteenth century CE), when a new dress system was decided, until the end of the Choson dynasty, black leather *hwa* were worn with official attire. On the other hand, commoners were absolutely prohibited from wearing *hwa*. They generally wore white clothes and straw sandals.

Choson Period

Clothing during the Choson dynasty was influenced by China's Ming dynasty (1368–1644); influences are apparent in the official and unofficial costumes of the royal court, where the Chinese ceremonial robe was adopted. For traditional ceremonies, a specific dress for a particular occasion was stipulated. A dress style intended for a certain ceremonial occasion could never be worn at another time. Under the ceremonial robe, however, women always wore the traditional *chima-jubgori* and men wore the *baji-jubgori*. Costume materials varied with seasonal change; cut and length of the *jubgori* went up and down with fashion and social standing; an individual's rank, class, sex, and age were distinguished by specific colors, lengths, and styles. Muted colors for the everyday wear of commoners persisted, as did the splendid, vibrant colors of the royal household, a statement of their absolute authority.

Twenty-First Century

Traditional *hanbok* are worn by men and women of all ages only as ceremonial dress on special occasions,

such as for traditional festivals, wedding ceremonies, and so on. Numerous prohibitions and sumptuary laws were decreed by almost every new king, leading to a gradual simplification of the clothing and the eventual evolution of the *hanbok* of today. The simplified version of *hanbok* remains a very common sight in the busy streets of modern Seoul.

CLOTHING, TRADITIONAL—KYRGYZSTAN

Dress in Kyrgyzstan developed as a part of Central Asian costume, with clothing styles that were adapted to either a sedentary or nomadic lifestyle. In general, the styles and design of Kyrgyz costume were similar to those found in Uzbekistan and Tajikistan and reflect the old traditions of textile manufacture and design that developed along the Silk Road. Political conquests brought in new techniques, such as felting, weaving, and quilting, that were adopted for clothing and textiles in the region. It is difficult to estimate origins of any kind of ethnic dress, but it is safe to say that traditional Kyrgyz dress developed over a few centuries and only began to show significant change in the mid-twentieth century after Westernization began.

As in much of Asia, men in Kyrgyzstan rapidly adopted Western dress and today few wear the traditional costume except for the hat (*kolpok*). For festivals, men may wear a traditional jacket (*jelek*) made of blue, black, or brown velvet, with a belt at the waist. Men's jackets have very little decoration, but may have trim around the neckline, at the sleeve edges, and down the center front. Pants are velvet and cut like Western pants, but might have decorations at the hem, like the *sakwar* of India.

Women's dress is much more complex. Traditional dress is worn more frequently by women and is commonly seen at weddings, rituals, festivals, and other cultural events. There are three categories of female dress, based on age.

Girls' Dress

Girls up to age seventeen wear long dresses (*koinok*). These dresses are semi-sheer, have high necklines, and have many layers of flounces or frills at the neck, sleeves, and skirt. White, red, yellow, and other bright

colors indicating youth are preferred for girls. A sleeveless jacket (*kamzol*) is worn with the dress. These vests come in different lengths, but girls usually wear the shortest vests. The *kamzol* is made from heavy fabrics, usually velvet, and can be many colors; it is decorated with embellishments referred to as *saïma*. The decorations are most extensive on the center front corners of the *kamzol*.

Girls' hair is traditionally arranged in about forty braids (*besh koku*) and is covered by headdresses such as a cone-shaped hat (*tebeti*) that may have feathers and silver or gold coins, precious stones, pearls, threads, and beads.

Young Married Women

For their weddings, brides wear more elaborate versions of the traditional dress; the wedding dress is long and white, and the *kamzol* is richly decorated. The special bridal headdress, or *shokulo*, is very high and cone-shaped, with a veil falling down the back; the veil may be used to cover the bride's face. Once a girl marries, her attire becomes a visible symbol of her married status. Dresses are longer and have fewer frills. For married women, *kamzols* are longer and plainer. In the winter, velvet wrap skirts (*beldemchi*) with appliqué designs decorating the edges and hem can be worn over the *koinok*. They are sometimes lined with fur.

Hair and headdresses also change with marriage, in deference to values of female modesty. Hair must be kept covered after marriage and is worn parted into two plaits (symbolizing the couple). If a woman's husband were to die, she would braid her hair into only one plait, indicating her solitary status.

Older Married Women

As women age, their entire ensembles continually become simpler, plainer, longer, and duller in color. Middle-aged and elderly women wear big white headdresses called *elechek*. Approximately ten meters of fabric are needed to make this turbanlike headdress with a drape under the chin, similar to a wimple from the European Middle Ages. In winter, shawls are worn for warmth, as are jackets (called *chapan*), often made of velvet or fur.

CLOTHING, TRADITIONAL—LAOS The geographical distributions of most Lao ethnic groups extend beyond Lao national borders into the surrounding countries of China, Vietnam, Cambodia, Thailand, and Myanmar (Burma). Across national borders as well as within nations, a group's costumes may differ. Additionally, costume components—from yarn, weaving techniques, and cloth to design, decorative elements, and jewelry—manufactured by one group may be used or adopted by another. This results in the complicated interdependence for which mainland Southeast Asia interethnic relations are famous.

Tai-Kadai Linguistic Groups

Tai-Kadai populations (approximately 66 percent of the population) came into Laos from what is now northern Vietnam, probably originating in southern China, during the last millennium and a half. Tai women brought with them the freestanding frame loom, silkworm cultivation and yarn preparation, and a three-part design for women's sarongs or wrap-around skirts (*sin*).

The adoption of Theravada Buddhism by many Tai speakers had a major impact on textile production and meanings. Theravada Buddhist monks may neither weave nor cook. Thus women's work includes not only the preparation of cloth for secular and ritual purposes but also the provision of textiles to members outside the family. Tai women provide white cloth to monks, who cut, sew, and dye it for the robes (*sirwon*) they will wear.

Women's *sin* display traditional designs abstracted from the natural and mythological worlds; men wear sarongs with blocked or checked patterns. The man's sarong is an elegant garment. Woven in plaid two-ply silk heavier than that used in a woman's skirt, or in cotton, it produces a shimmering color. The man's longer wraparound skirt (*yao* or *bang*), with its ends twisted together in front, pulled between the legs, and fixed into the waist band at the small of the back, is the product of many months of labor, with heavy plied silk forming both warp and weft. Utilitarian textiles, such as blankets and shawls, are usually without design, but can be checkered or have subdued patterns.

During the nineteenth century, European travelers recorded that everyday men's clothing was skimpy at best, and women were often bare breasted, wearing drab skirts. The *biang* (shoulder cloth) was a common woman's garment, draped over the shoulder and often used on ritual occasions. These long, narrow pieces often served to display a woman's aptitude for design as well as her command of weaving technology and dyes. In addition, explorers remarked that the blanket or shawl

(*hom*), made of two or more two-meter warp lengths sewn along the selvage, which could be draped around the shoulders to keep warm during chilly nights and mornings, was a major garment well known even in early colonial Cambodia and Saigon. In the early nineteenth century, large quantities of English textiles began appearing in Lao markets. Royalty was usually clothed, at least for state occasions, in Chinese imported textiles.

Austroasiatic Linguistic Groups

Documentation of Lao Austroasiatic-speaking groups (23 percent of the population) is sparse, particularly regarding costume history. Some have sought better lives by moving to lower elevations and assimilating into other ethnic groups through marriage. In the 1950s and 1960s, Khmu women wore a cotton sarong with simple horizontal stripes or with designs influenced by weavers of the Tai-Lue ethnic group. Their upper garment, a long-sleeved black blouse with a slight flare at the waist, had a center diagonal closure fastened at the side and sometimes decorated with sequins, appliqué, embroidery, or silver coins.

Austroasiatic speakers in southern Laos include a cluster of ethnic groups that historically had close trade relations. Some of these included the Katu, Nha Heun, Ta-Oi, and Alak. The Alak in the Attoupeu and Saravane provinces were known as fine weavers. In addition to weaving for themselves, they traded long lengths of cloth for making loincloths (*katiao*), sarongs, and blouses. A particular pattern was woven exclusively for the use of one ethnic group.

Men wore loincloths of varying degrees of elaboration according to their status within their village. Some were heavily beaded, the beads being strung on the weft before weaving. Women wore sarongs with horizontal stripes and sleeveless blouses made of two strips of cloth joined by side and center seams. Silver coins sometimes decorated the bottom edges. Brass and silver necklaces, anklets, and bracelets were also common. Most men wore loincloths until the 1960s. By 1970, only a few village elders wore them, and then only for special ceremonies. Because of heavy conscription during the war, many men switched to wearing army fatigues on an almost regular basis. In the 1990s, there seemed to be a revival of beaded weaving among the Katu in Champassak province, possibly stimulated by tourism.

Hmong-Mien and Sino-Tibetan Linguistic Groups

Lao highland groups (11 percent of the population) include the Hmong, Mien, Lahu, Akha, and Lisu, and

Hmong women in Laos in traditional costume. (BOHEMIAN NOMAD PICTUREMAKERS/CORBIS)

their traditional dress is basically the same as in Thailand. During the war in Indochina in the 1960s and 1970s, the lives of many of these groups were disrupted. Many Hmong and Mien were resettled internally in camps at lower elevations, and others eventually fled the country as refugees to camps in Thailand and then to third countries. Ethnic dress was largely exchanged for lowland sarongs, partly due to the hotter climate and partly to disguise identity in a strange environment where their ethnicity might cause problems. Life in the camps brought more free time, commercial marketing of textiles, and exposure to new designs and styles. Hmong and Mien who fled as refugees to other countries such as the United States and France began ordering traditional clothing from refugee camps in Thailand or from relatives in Laos. These costume components ordered from abroad were executed in much finer stitches and with more elaboration of appliqué, silver, and other ornamentation than had previously occurred in Laos.

Current Trends

Copious quantities of beautiful Tai textiles from Laos appeared in world markets in the 1980s and 1990s. These elegant pieces ably demonstrate Tai women's exemplary command of a technology for producing artistic masterpieces.

The Lao People's Revolutionary Party, which has had control of the country since 1975, imposed a standardized women's costume focused on the *sin* and *biang*, displacing more ethnic costume except in tourist contexts. However, commercialization, interest from abroad, and refugees nostalgic for their homeland have brought about a revival of indigenous production.

Today, Lao costume provides myriad meanings for a diverse clientele of ethnic groups and outside observers.

CLOTHING, TRADITIONAL—MALAYSIA

Malays, the majority population in Malaysia, are a Muslim people indigenous to villages (*kampung*) in Southeast Asia. Village dress is situational and reflects relationships and contexts. Traditional dress for women is the *sarung kebaya*. The *kebaya* (blouse) may be diaphanous to near transparent and is commonly pleated significantly above and below the part of the garment covering the breasts. The *sarung*, a cotton skirt hemmed into a cylindrical shape, is stepped into, folded right to left, and tucked at the waist. It is commonly of a floral pattern. Although normally worn with a blouse or pullover top, it can also be worn alone; this is commonly done when sleeping or bathing. The final piece of traditional women's dress is a head scarf (*selendang*); although often serving as a veil, it can be worn in a number of ways.

The male shirt (*baju*) and small black hat (*songkok*) are usually reserved for formal occasions, such as Friday prayers or certain feasts. Men often wear *sarung*, differentiated from women's by the fold (left to right, below the navel) and the pattern (plaid, rather than floral).

In the distant past, both men and women used the *sarung* as the primary and often sole garment. However, varieties of dress have risen with increased trade and contact with other cultural groups. Even so, women are careful to conform to public forms of dress in the market, the mosque, and village celebrations. The more accepted contemporary form of public village dress is the *tudung*. Commonly, this consists of a matching long sleeved tunic and floor length skirt (*baju*

A Malay bride and groom in traditional wedding attire in Singapore. (EARL & NAZIMA KOWALL/CORBIS)

kurung), accompanied by a head scarf (*anak tudung*). It is not uncommon for women to mix and match long skirts and tunics, even substituting short-sleeved blouses or tee-shirts. The *baju kurung* is often made from very colorful cloth, and may also be patterned. In recent times, the *sarung kebaya* has fallen into disrepute as a public garment and been replaced by more modest clothing, usually a variation of the *baju kurung* ensemble. The *sarung* itself, however, continues to be a staple of the *kampung*.

CLOTHING, TRADITIONAL—MONGOLIA Mongolian costume shares many characteristics with Chinese, Tibetan, and Manchurian costume forms and its manufacture and styling reflect a nomadic lifestyle. Because the climate is often very cold, costume pieces are worn layered and may be padded and quilted. Many of the long robes worn in Mongolia also have side or front and back slits to accommodate horse riding. Garments are cut and sewn with as little waste as possible, and are not closely tailored to the body. They are cut to hang loosely and comfortably on the body. Garments can be folded easily for storage and transport.

Fabrics used for Mongolian garments include imported cotton, silk, and velvet, indigenous wool fabrics, and animal skins and furs. Chinese silk fabrics are prized, especially silver and gold silk brocade fabrics. Cotton is used for the everyday dress of the common people and as a lining for silk garments. Chinese color symbolism is used in Mongolian costume, and yellow and red are considered to be sacred colors. Colors used in Mongolian costume are stronger in value and hue, however, than those used in Chinese costume. The use of animal skins with the fur worn towards the body is common, and is necessary for warmth in the winter season.

Garment details and embellishments vary depending on the tribe, but basic costume forms are similar for men and women throughout Mongolia. The *debel* is a long caftan-type robe, fastened at the throat, right shoulder, and down the right side with a variety of knot-and-loop closures. This basic garment is constructed from silk fabrics, cotton fabrics, wool felt, or animal skins. Often fur-lined, the *debel* has long sleeves that end in horse-hoof cuffs or in wide striped cuffs. (Horse-hoof cuffs resemble the hoof of a horse: they are wide, flaring cuffs that, when turned down, extend over the hands of the wearer.) The *debel* is seldom completely hidden by other garments layered over it.

Garments worn over the *debel* may fasten down center front or to the right. The *uudji* is a long, sleeveless, collarless robe that often has center back slits; those that close to the right have side slits. The *olba* is a sleeved garment that ends just below the waist; it may be collarless or have a stand-up or shawl collar. The sleeveless *khargilchi* is a vest that is collarless or has a stand-up collar.

Omudun are pants worn by men and women and constructed by sewing two leggings together with a

crotch gusset. Men and women may also wear *kboshiya*, or wraparound petticoats; when worn by men, these may be hunting and dancing skirts. The *kboshiya* is also part of lama dress. Mongolian footwear includes shoes and boots made from materials such as black cotton, silk, velvet, and black or brown leather; the surfaces of shoes or boots are usually highly decorated with embroidery. Mongolian shoes may be similar to the flat-soled Chinese shoe, or may have a wooden platform sole in the style common in the Manchu court of China's Qing dynasty (1644–1912). Boots, or *grotal*, have flat leather soles that cover the bottom and sides of the foot and that turn up at the toes. Stockings are cloth or felt and may be padded and quilted.

Diverse headwear is worn in Mongolia, not only for protection, but also to designate rank, status, and tribal or regional affiliation. Headwear includes conical hats, broad brimmed and upturned brim hats, bonnets, and hoods made from a variety of materials; headwear is often lined with fur. A popular soft hat has a helmet-like crown, with front and back brims and fur-lined

Mongolian men in traditional dress in Ulan Ude. (WOLFGANG KAEHLER/CORBIS)

earflaps; this hat may be fabricated from velvet, cloth, cotton, or fur and the brims may be turned up.

Although men and women share general costume, there are differences that distinguish the sexes. Women are more likely to wear the *uudji*. Women's *omudun* are never visible. Women may also wear a highly decorated separate neckpiece, the *ningdjala*, which is worn so that only its stand-up collar is visible. Waistsashes or *bous* are worn with *debel* by men and unmarried women; married women wear unbelted *debel*. Other costume is used to signify marital status and varies tribe to tribe. One special costume piece is often called the "elephant ears" or "mountain-goat horn" headdress. Sleeves on a married woman's *debel* have a tall, stiffly padded sleeve cap; married women also wear embroidered boots with felt uppers, and a red dot on each cheek. Married women wear much jewelry, including earrings, bracelets, pendants, necklaces, and hair ornaments; the jewelry is part of the wealth of the family.

Special costumes also exist for lamas, shamans, and wrestlers. Lama costumes are usually red or yellow, and many items are deliberately pieced or patched together. The *orkimdzi* is a toga-like garment draped asymmetrically around the body leaving the right shoulder bare. Other lama costumes include a leather *debel*, a *kboshiya* or petticoat, a shawl-collared patchwork jacket, and a *dagham*, a full-length, pleated cloak with a red collar; a helmet with a red or yellow plume is also worn for certain ceremonies. Ritual costumes include the skeleton dress, a two-piece red and white costume representing a stylized skeleton; this is worn with a mask. Other ritual lama robes are similar to Qing court costume and include a dragon robe; many of these robes do not have closures and slip on over the head. Masks are worn for many ritual dances.

Shaman costumes include leather tunics and pants; the tunics have no closures and slip on over the head. They are embellished with a number of materials, including metal objects, shells, beads, animal fur, horn, and stuffed animals. Shaman costumes also include stylized animal masks. Wrestling matches are an important part of Mongolian festivals, and wrestlers accordingly have a costume that is very different from standard male costume. Wrestling costume includes a short-sleeved jacket that exposes the breast, very full trousers; embroidered leggings, a loincloth of embellished silk, and leather boots with upturned toes.

CLOTHING, TRADITIONAL—SOUTHEAST ASIA, TRIBAL Six colorful tribal groups in Thailand are the Karen, Hmong, Mien, Lahu, Akha, and Lisu. All have migrated from southwest and south-central China and have been mountain dwellers for many generations. All but the Karen can still be found in southern China, as well as in bordering countries. These groups have remarkable artistic skills, which the women express in the production of beautiful clothing for themselves and their families, providing their only relief from the rigors of subsistence agriculture. Although these six tribal groups live as neighbors, the techniques and skills they use in producing their clothing are unique for each group.

Karen

Karen girls and unmarried women typically wear simple white shifts with red trim. Married women typically wear red skirts and indigo-dyed blouses. Young boys typically wear red-striped shirts that hang down below their knees. Men wear red hip-length shirts that resemble those of boys', along with loose black pants. The upper garments for men, women, and children are basically of the same style: two strips of material folded lengthwise and stitched together with openings for the head and arms. Various lengths and embellishment indicate age, gender, and marital status.

While little girls' simple shifts have only a minimum of red at the waist, seams, and hemline, teenaged girls, who weave their own clothing, add color and attractive designs to their dresses. When they are betrothed, they weave their married woman's two-piece costume. The upper part of the blouse will be plain, but the lower third will either be beautifully embroidered or have an intricate woven design if the girl is a Sgaw Karen. If the girl is a Pwo Karen, the woven design will be in the upper part.

Karen women reign supreme among the tribes as skilled weavers. Skirts of the oldest style are woven of homespun thread. Some of the thread is tied with jungle grass, and then dyed with a rust-colored vegetable dye. When woven, this results in ikat patterns that are alternated with stripes of rust-colored thread. Some skirts are woven of commercial thread into very intricate colorful designs, with red predominant. Their distinctive embroidery is mainly created using the satin stitch, tastefully embellished with white rice-shaped Job's-tear seeds.

Sgaw women wear many colorful waist-length strands of beads around their necks and silver bangles on their wrist. Pwo Karen women, on the other hand, wear large quantities of beads wrapped layer upon

layer around their necks and tiered down to their waists. Their arms, both above and below their elbows, are lined with metal bracelets. Both Sgaw and Pwo women wear cup-shaped earrings with a cylindrical post that is inserted into large holes in their earlobes.

Hmong (Meo)

Unique among Blue Hmong women are their indigo-colored batiked skirts with bright cross-stitched and appliquéd borders. This full, accordion-pleated skirt swings gracefully from the waist. Women's jackets, with bold patterns of red appliqué and embroidery, large showy collars that hang in the back, and batiked and embroidered aprons with magenta tassels, are among the spectacular tribal costumes in Thailand. Although the white pleated skirts of the White Hmong women are not as spectacular as those of the Blue Hmong, the delicate embroidery, appliqué, and reverse appliqué that grace their jackets reveal unexcelled artistry.

The clothing worn by Blue and White Hmong men and children on special occasions is particularly splendid. At the New Year's festival, all the splendor of Hmong costumes can be seen. Family members, including the smallest children, don their finest clothing, enhancing it with the family's silver jewelry and ornamentation. Heavy chains with pendants of various shapes, four or five-tiered neck rings, finger rings, and earrings are worn, with the most elaborate pieces going to young men and women of marriageable age. The New Year's celebration is of utmost importance in each young person's life, since it is the time for courtship.

While everyday garb is less spectacular, most village Hmong people wear their traditional garb all the time. Little children nearly always wear beautiful caps, such as the rooster cap, bird cap, or flower cap, that showcase their mothers' finest skills.

Mien (Yao)

Mien women typically wear solidly embroidered pants and black tunics with red ruffs. While women of all tribes embroider, the Mien are most noted for their embroidery skills. Mien girls are taught to embroider from the age of five or six; by the time a girl enters her teens she can embroider a large assortment of designs, perhaps even inventing new ones. After her betrothal, she will use her finest embroidery skills to make her own wedding garments, as well as embroidered pants for her groom's mother.

Spectacular appliqué work is another skill of Mien women. Elaborate patterns of symmetrical shapes with many lobes and curlicues in red, black, and blue are

edged with white braid and appliquéd to women's aprons (also used as baby-carrying cloths), boys' caps, and saddlebags for horseback riders.

Elaborate caps are made for small children. The black or indigo homespun material of girls' caps is covered with beautiful embroidery. A large red, doughnut-shaped pompon circles the top, and ball-shaped pompons are sewn over each ear and in front. Other decorations may include silver buttons or coins, silk tassels, and small black and white beads. These caps are designed to make the little girls look like flowers. Boys' caps may boast bold appliquéd designs on panels of red and black cloth, an embroidered border, red pompons, and silver buttons.

Lahu

The Chinese-style Lahu woman's ankle-length black tunic opens on the sides, which are split to the waist. The edges of the split sides are embellished with neat bands of cut fold-and-stitch geometric piecework in primary colors, with red predominating. Around the neck and crossing the chest to the fastening under the right arm is a band encrusted with small silver buttons and dangles, some of which may be in the form of fish. Red and blue bands add a touch of color on the sleeves. The Lahu woman's sarong-style skirt is made of black homespun cotton or commercial cloth. The modern-style sarong is often brightened with strips of red and other colors appliquéd to the lower part of the skirt in decorative patterns. Each woman devises her own pattern, such as flowers, scallops, and zigzag designs. The short Chinese-style jacket of the Lahu man's black or indigo suit will have lines of red embroidery edging the jacket. Clusters of silver ball-shaped buttons will be inserted into loops to close the jacket. Very wide pant legs have lines of red embroidery on the cuffs.

Both men and women carry shoulder bags of the same appliquéd design that is on the woman's tunic. At New Year's, men carry bags that are decorated with an abundance of wool tufting and pompons to augment the gaiety of New Year's dancing. There are three other subtribes of Lahu in Thailand, but the Lahu Na, described above, are considered to be the group from which the others have branched out, both genealogically and fashion-wise.

Akha

Akha women are distinguished by their short dark skirts and ornate headdresses. Several styles of headdresses are lavishly decorated with silver ornaments, beads, Job's-tear seeds, buttons, feathers, and coins. Their dark jackets and colorful leggings are resplendent

with embroidery and intricate appliqué in bright colors and are edged with Job's-tear seeds or white beads. Quantities of glass beads hang around their necks and are slung from one shoulder to the waist on the opposite side. Men's indigo-dyed jackets are of a smart cut and are brightened with colored embroidery and appliqué. Silver medallion buttons or silver balls fasten them. A young man going courting wears a turban at a rakish angle, with silver rings threaded into it; he also wears heavy silver chains with dangles in the forms of fish, butterflies, and wheels. Children wear a miniature version of adult clothing, except for their close-fitting caps that have been embroidered and appliquéd by their mothers and studded with coins, silver ornaments, feathers, and pompons.

Lisu

Young Lisu women are characterized by their colorful blue or green tunics, full black pants, and bright red leggings. Their tunics have a wide yoke that consists of numerous narrow strips of bright-colored cloth. Similar multicolored bands are sewn to the red sleeves at the shoulders. They wear a wide black sash tightly wound around their waists, with two long tassels hanging in the back. These extraordinary tassels consist of a bundle of long strands made of tightly rolled cloth in bright colors with small pompons at the ends.

At New Year's the young women wear neatly wound turbans with red and yellow wool yarn attached at the front to fall over the crown and down to the shoulders in back. They wear velvet vests encrusted with silver buttons and ornaments over their tunics, and rings with a multitude of dangles around their necks. Young men wear velvet jackets studded with silver buttons, blue knee-length pants, and white turbans. They also wear black sashes with tassels like the women, but they wear them in front. Some young men wear "courting bags" over their shoulders. These bags are covered with a network of small beads, and silver dangles hang from the top border.

Most of the tribal people continue to wear their traditional clothing with some modern adaptations, but may wear them only at festive occasions. For convenience sake, many have adopted Thai or Western dress for daily wear, although there are those who still wear their own distinctive dress all the time.

CLOTHING, TRADITIONAL—TAIWAN

The clothing worn by indigenous Taiwanese people was traditionally manufactured from locally available materials derived from plants and animals, and was of crude construction when compared with the garments of the mainland Han Chinese. Later, when Taiwan was incorporated into China during the Qing dynasty (1644–1912), Taiwan was subjected to the same dress regulations as the rest of China, and Taiwanese aboriginal groups were largely assimilated into the society of the mainland emigrants. Taiwanese dress began to diverge from mainland dress when Taiwan was occupied by Japan between 1895–1945.

Some traditional dress of the Paiwan and Puyama aboriginal tribes of southwest Taiwan has survived and can be seen at the Musée de l'Homme, Paris. A man's black cotton top made of rectangles of fabric with brightly colored embroidered edges, fastened with frog fastenings and silver buttons, was worn with a narrow, indigo-dyed, double ikat waist tie. Multicolor leg coverings made of strips of red, yellow, and green fabric, with insets of indigo-dyed double ikat around the crotch, were tied tightly with black braids around the knee and calf. The front thigh and calf area of the machine-stitched leg coverings were decorated with lozenges of geometric-patterned embroidery in red, yellow, blue, white, and black. A narrow, braided linen waist tie with embroidered ends and fringing was attached to the top of the leg coverings and tied twice around the waist; a second waist tie held an eighteen-inch-long dagger in place. A rectangular weft-faced linen cape—probably a woman's mourning cape—is also exhibited. Made in three sections, the cape has a cream background with red double stripes and edging, and is embellished with navy blue geometric embroidery. The cape ties with a thin braid around the neck. It is displayed with a padded, geometrically embroidered headband that resembles a simple turban and has an overlap allowing for size adjustment at the back.

Women wore a *zhanpao*, a long robe that fastened on the right and left and was decorated with a line of embroidery on both arms and brass bells. The *zhanpao* was worn with geometrically embroidered hand covers tied with cerise braids. Leg covers, similar to those worn by men, were made of indigo-dyed fabric with a double ikat spot motif. The below-knee length apron/skirt had an ikat spot motif, indigo-dyed edging, vertical bands of royal blue, and a central panel of geometric and stylized plant motif embroidery in black, red, and blue on an un-dyed linen ground. An older band in brown, red, and blue (possibly using natural dyes) was set in nearer the waist. Strands of conch

shells were worn around the neck but may also have been used to decorate garments.

During the Qing period, Taiwanese men wore the *zhanpao* and a *magua*, an outer jacket, or *gua*, a vest, worn outside the long gown. The horse jacket, shorter than the *gua* and reaching only to the mid-abdomen, was worn with skullcaps called "melon rind." Officials wore long "python gowns" and a short gown over it called *guazi* (longer than the *gua*), which resembled a modern windbreaker jacket. The garments were of plain colors and were worn in contrasting color combinations: dark or light green, blue, gray, white, or red. *Shan*, a shirt, and trousers, together known as *dangshan*, were worn with a bamboo hat by those engaged in manual work. Women wore *tadaoshan*, a tight-fitting, wide-sleeved jacket trimmed with ribbon, with *mamian chun*, a long skirt, for formal wear. *Gu*, trousers made of silk, were worn for formal occasions, and a cotton version was worn for everyday use. These were worn with bound-foot shoes and a headband. Shades of red were popular for women's dress, including carmine, peach, and pink. The upper and lower garments were often in contrasting shades.

Western Influences

When the Japanese took over Taiwan in 1895, they made little effort to introduce changes in dress, apart from banning the practice of foot binding. Residents of Taiwan soon began to combine Western dress with traditional Chinese dress. In the late nineteenth and early twentieth centuries, Han Chinese men in Taiwan wore the *zhangshan* with Western leather shoes and hats. In Japan at this time, Western dress was embraced as a manifestation of a forward-looking ideology. In 1911 men in Taiwan cut their queues, as did those on the mainland, and women adopted Western style leather shoes worn with a traditional jacket and pants. In the 1920s women wore silk stockings and knee-length skirts with traditional style short-sleeved velvet jackets, and carried a parasol and handkerchief. By the 1920s Western dress had largely replaced traditional Taiwanese dress, but differences between Han Chinese women who originated from the Fujian or Guangdong (Hakka) provinces were visible in their dress; Fujian styles were more lavish and intricate, while the Hakka preferred simple, decorative but durable materials.

Chinese and Japanese Influences

Under Chinese rule, imported Chinese cloth was used to make clothes, as there was no sericulture and little cotton or hemp grown. That which was grown was dyed locally, with chemical dyes gradually replac-

ing plant dyes. Pineapple fiber, taro flax, jute, and banana fiber were also used for textiles. Pineapple fiber was the most successful as it did not cling to the body in Taiwan's humid climate. After 1918, Japanese spinning and weaving technology was imported and large-scale production developed using Japanese cotton, which became the fabric of everyday wear, replacing Chinese imports by the middle or end of the Japanese occupation. After two to three decades of occupation, Japanese fabric patterns and the pale "refined" colors favored by the Japanese (pink, baby-blue, lake-green, grayish blue, and beige), became standard, replacing the patterns and bright colors favored during the Qing dynasty and earlier.

Only after Japan declared war on China in 1937 did the Japanese attempt to weaken Taiwanese cultural links with China and discourage adoption of Chinese fashion. While older men continued to wear traditional dress, many young men adopted military uniforms, *muge* (Japanese wooden clogs), and "duck's tongue" hats—a wider version of the cloth cap traditionally worn by working class men in northern British cities. Women adopted the kimono and both genders adopted Japanese-style names.

As on the mainland, children were dressed like small adults: hats and cloaks had decorated hems, tassels, and embroidery for special occasions. Like mainland garments, pants had split seats. Western-style school uniforms were introduced in 1925.

The *qipao*, or cheongsam (as it became more widely known internationally), that is, the asymmetrically fastened dress worn by women, was worn in Taiwan during the twentieth century, peaking in popularity the 1940s, 1950s, and 1960s. The Sun Yat-sen suit went out of fashion after Communist rule was established on the mainland, but continued to be worn by a few older officials of Taiwan's republican government on formal occasions. Tailored in khaki colored woven wool cloth, it featured breast pockets with military style flaps, brass buttons, and a high collar.

In the mid-twentieth century, the *hong gua*, which consisted of a red embroidered jacket and a black embroidered skirt featuring phoenix and dragon motifs, was worn for special occasions with an elaborate head-dress. In rural areas, for special occasions, men wore a traditional blue gown with a red sash worn diagonally, and gilt hat sprays on each side of a trilby hat or skullcap. There was a gradual discontinuance of traditional styles during the 1960s and 1970s as fashions from the West were adopted.

CLOTHING, TRADITIONAL — TAJIKISTAN

Traditional Tajik costume developed as a part of Central Asian costume, and had common style and design features with other countries in the region. Until the twentieth century, both men and women wore bulky pants and long tunic shirts with no opening down the center front. The only difference between shirts for males and females was in the neckline shape: men's shirts had horizontal necklines, while women's had vertical necklines, designed for breastfeeding. In some ethnic groups young women's tunic shirts had the horizontal neckline shape until they were married or had their first child. Tunics for men and women had the same cut. The body of the garment, front and back, was made of one rectangular piece folded at the shoulders with underarm panels. The sleeves usually had a rectangular shape as well, or were slightly narrowed to the wrists. This design did not require scissors to cut; often the fabric was torn by hand. The center and side panels were cut with the fabric grain going lengthwise, while the grain in the sleeves went across, creating interesting pattern with the stripes in the men's coat, called *khalat*. The coat had no fastener, but could be tied with a sash or big colorful handkerchief folded diagonally. Money, tobacco, and other personal effects were kept in the folds of the sash.

In common with all Central Asian men, Tajik men had a large variety of headwear. They wore fur hats, turbans, and stiff squared little black caps, called *tubeteika*, with a white stylized pepper or cucumber embroidered on them. Men wore their hair closely cropped.

As in many Asian countries, women wore pants under their tunics, which were made in white or other light colors; to wear only a tunic was considered sin-

ful. Pants were very wide at the waist and hips, tight at the ankle, and had a decorative trim at the bottom. Pants were an important part of the costume—women kept them on, even while sleeping. It was common to make the pants of two fabrics: plain white cotton for the upper part, and a colorful patterned silk or fine calico for the legs, which could be seen from under the dress. This tradition was developed not only to save expensive fabric, but also because they believed in the magical power of the color white, which was supposed to provide a woman with fertility and happiness.

A Tajik woman was not allowed to put her arms into the sleeves of a coat or wear any tops with a center front opening. A well-known proverb of the time explained this rule: "God told men to wear coats, but not women." Although women had a special kind of coat, called a *parandja*, they could wear it only with the a high neckline. In the winter females wore a little padded shirt under the long tunic. In the cities during the nineteenth century, women were required to cover entire their body, including the face. They used a specially designed scarf or net made of horsehair. A big white square scarf made of high-quality cotton or silk was used to cover the head. The typical jewelry was silver earrings, rings, and necklaces of coral or coins. Women braided their hair into thirty or forty tiny long plaits: the number marked the degree of beauty.

When this region of Asia was joined to czarist Russia at the end of the nineteenth century, traditional costume began to respond to Western culture, trade, and fashion. These changes were new for a Muslim country, where traditions and stability in the costume had been strictly protected by religion and prejudices. Mass-produced, inexpensive fabrics from Russian mills began to predominate over domestic home-woven textiles, making clothing cheaper and more affordable for everybody. The greatest transformation in traditional costume, however, occurred after the October Revolution (1917). The transformation continued during the building of the Asian Soviet republics over the following decades.

Modifications in traditional costume started with reforming the basic tunic cut. A more flattering shoulder line and a round armhole and sleeve cap made the garment more comfortable. In the late 1920s women started to wear *tubeteika*, which usually were made of black velvet or wool, embroidered with silver and colored threads, and decorated with hanging silver coins. Later, Tajik women adopted Western style for outerwear: the *parandja* was transformed into a fairly tight-fitting jacket. Some elements of the traditional costume—such as the *tubeteika*—are still widely used in Tajikistan. The men's coat is still tied with a sash,

especially by old men or in the villages. Tajiks often wear contemporary fashion but made from textiles with traditional patterns and hues.

CLOTHING, TRADITIONAL — THAILAND The numerous ethnic groups of Thailand traditionally have produced a wide array of cotton and silk textiles. Each ethnic group wove textiles in distinctive patterns for clothing, domestic, and ceremonial purposes, thus transforming textiles into markers of identity. The various Thai linguistic groups, as well as the Khmer, Kui, and Malay ethnic minority groups living in the lowland areas of Thailand used cotton and silk fibers to create their textiles. A combination of fiber, color, and technique distinguishes a textile of one group from that of another, but the structure of textiles made throughout Thailand is similar.

Women's Traditional Dress

The *pha sin*, or tube skirt, is the traditional lower garment for women of the various ethnic groups of lowland Thailand. The *pha sin* consists of three sections: *bua sin* (head or top), *tua sin* (body or midsection), and *tin sin* (foot or border). The three sections of the *pha sin* are either woven in one piece of cloth with patterns differentiating the three sections or are made from two or more pieces of cloth sewn together.

The top section is made from plain-woven cotton cloth of various colors. The Tai Lue of northern Thailand and the Lao Song Dam of central Thailand use indigo cotton for the top section, while the Tai Yuan living in the north prefer natural or white cotton, sometimes with a strip of red cotton, for this section. The Tai Lao and Khmer use a single piece of material for all three sections of the *pha sin*; they distinguish the top section by the absence of motifs.

The midsection is the largest section of the tube skirt. Weavers of the various ethnic groups use a variety of techniques to decorate the midsection, including ikat (tye-dyeing the thread before weaving it), tapestry, and supplementary warp and weft patterning. The Tai Lao, Lao Khrang, Khmer, and Kui weavers favor weft ikat or *mat mii* technique, while the Tai Lue

employ tapestry and other techniques to create complex patterns. The Lao Phuan of Sukothai and Utaradit provinces weave an overall supplementary warp pattern for the midsection and attach a complicated patterned border to their tube skirt.

The skirt border is either plainly woven or very elaborate. The most intricately patterned border is the *tin chok*, a border pattern with decorated *chok*, or discontinuous supplementary weft motifs. The skirt border is highly valued, and many women of various ethnic groups possess a *pha sin tin chok* (a *pha sin*, or tube skirt, decorated with a discontinuous supplementary weft border) for special occasions. The Tai Lue prefer a simple border of plain indigo cotton, while the Phu Tai and Lao Song Dam weave a thicker border, approximately five centimeters wide, decorated with supplementary patterns or stripes. Some women dress in tube skirts or sarongs with an overall pattern. Mature Khmer women of northeast Thailand often wear tube skirts with a checked or plaid pattern. Malay women in the south favor batik or wax-resist-dyed sarongs similar to Malay dress of neighboring countries.

The *chong kraben* was the lower garment traditionally worn by women of central Thailand and Cambodia. Central Thai women used a variety of textiles for the *chong kraben* including Indian chintz; they also used different types of silk textiles such as silver and gold brocades on silk made locally or from India; local weft ikat silk; and imported Chinese and Cambodian silk. The use of an upper garment by women varied until the beginning of the twentieth century. Most women did not wear an upper garment, but wrapped a rectangular cloth, *pha sabai*, around the breasts or across a shoulder when attending religious or ceremonial functions. Prior to the twentieth century, women belonging to ethnic groups originating in colder climates (for example, the Tai Lue, Lao Song Dam, and Phu

Costumed lakorn dancers perform at the Lak Muang shrine in Bangkok in 1995. (KEVIN R. MORRIS/CORBIS)

Tai) wore blouses or shirts of indigo or black cotton decorated with silver buttons, embroidery, or appliqué. For special occasions, an elaborately patterned shoulder or breast cloth was added to complete the outfit. The Phu Tai *pha phrae wa* was an outstanding example of a shoulder cloth; this red silk textile is decorated with bands of complex patterns and is approximately three meters long. Women began to wear European-style blouses in the 1900s.

Men's Traditional Dress

Unlike women, men no longer commonly wear traditional clothing. The traditional clothing of men was not as elaborate as women's dress and did not vary much among the different ethnic groups. Men wore a short version of the *chong kraben* as a loincloth, made of plain or plaid patterned cotton. This shortened version of the *chong kraben* exposed the wearer's thighs, which were usually tattooed. Men reserved a silk *chong kraben* for special occasions such as weddings and ordination ceremonies into the Buddhist monkhood. A plaid or checked cotton sarong was another lower garment favored by Malay men in the southern region of Thailand.

Men did not wear an upper garment on a daily basis, and draped a cloth over one or a both shoulders for special events. Men of ethnicities from colder climates dressed in cotton shirts with a shoulder cloth for ceremonies and religious activities. Men also used a plaid cotton cloth or *pha khao ma* as a sash, bag, belt, head cloth, scarf, and towel. Both sexes carried a shoulder bag that could be plainly or elaborately patterned. A young woman might create an intricate bag to give to a man as a token of her affection.

Household Textiles

Women produce an array of textiles used for such purposes as mattresses, blankets and covers, pillows, and mosquito nets. These items are made from cotton, but items reserved for a wedding may be silk or decorated with silk and often contain elaborate motifs. The Tai Lue favor black and red geometric motifs on a natural cotton background. The Lao Song Dam adorn their special household textiles with green, red, orange, and white silk appliqué. The Lao Khrang prefer a natural cotton blanket with elaborate supplementary patterns at the ends, bordered with red cotton.

Religious or Ceremonial Textiles

Women also weave textiles for religious or ceremonial purposes. Laywomen provide dyed cotton cloth for Buddhist monks' robes, as well as household

textiles. Family members usually donate these items to monks at ordination ceremonies and at subsequent religious festivals. Ceremonial textiles are also donated to hang inside and outside a temple and to cover palm-leaf manuscripts.

Textiles for the Royalty

Until the beginning of the twentieth century, Thai royalty consumed textiles that were similar in design and structure to villagers' textiles but were of higher quality. Court weavers produced gold and silver supplementary-patterned silks for the royal family and aristocracy. The elite also commissioned highly skilled weavers throughout the kingdom to supply finely woven silk and cotton textiles. The royalty imported specially designed textiles from India, China, and Cambodia; their laws restricted the use of the imported fabrics to the higher strata of society. Thai kings wore the finest materials when their dress mimicked the deities.

The adoption of Western-style clothing among the Thai elite began in the mid-nineteenth century. Western missionaries also introduced and persuaded women to wear blouses with the traditional lower garment in the late 1800s. Men more readily adopted Western clothing (such as trousers) during the first quarter of the twentieth century. The *pha sin* continues to be worn in rural areas on a daily basis by some women, and the elite are returning to modernized versions of traditional dress inspired by Her Majesty Queen Sirikit of Thailand for special events. Local and foreign interests alike currently sustain traditional textile production, and perhaps will continue to do so into the near future.

CLOTHING, TRADITIONAL — TIBET

Tibetan costume reflects the environment and nomadic lifestyle of many of Tibet's people. A long his-

TIBET DRESS IN THE 1840s

The dress of the Thibetan women closely resembles that of the men; the main difference is, that over the robe they add a short, many-coloured tunic, and that they divide their hair into two braids, one hanging down each shoulder. The women of the humbler classes wear a small yellow cap, like the cap of liberty that was in fashion in France at the time of our first republic.

Source: Huc Evariste-Regis and Joseph Gabet. ([1851] 1987) *Travels in Tartary, Thibet and China, 1844–1846*. New York: Dover Publications, 174.

tory of intermarriage between Chinese and Tibetan nobility, resulting in exchanges of material culture, has also influenced Tibetan dress. Fabrics used for Tibetan clothing include hemp, Chinese cottons and silks, rayon, indigenous animal furs, felted fabric derived from the hair of the yak, and *pulu*, a traditional woolen cloth. Chinese silks are believed to have been brought to Tibet when a Chinese princess married a Tibetan noble during the Tang dynasty (618–907). *Pulu* became a popular tribute item given to China. Other Chinese costume characteristics, such as color symbolism and the right-over-left closure method, are also reflected in Tibetan costume. Tibetan and Mongolian traditional costumes also share characteristics; in particular, lamas of both countries share similar costumes, among them the *zi xia* (crested helmets). Although basic garments worn throughout central and northern Asia may be similar, distinctions exist not only between countries, but also between regions and tribes within each nation.

Tibetan garments are worn layered, and many basic pieces are worn by men and women alike. Most garments close to the right and are fastened with a variety of closures. The *anju* is a full-length, long-sleeved garment made of silk, cotton, or rayon, worn close to the body. Over the *anju* is worn the *andub*, a full-length, sleeveless garment usually made of black *pulu* and lined with blue fabric. Men and women also wear leggings tied to a waist girdle. The basic Tibetan outer garment is the *giuba*, a long-sleeved, round-collared, loose-fitting robe of *pulu*; it closes to the right and is tied at the waist with a sash or belt. The *giuba* may be as long as seven feet, with the upper part bloused over the waist tie to adjust the length to knee level for men

and ankle level for women and priests. Waist ties—leather belts or silk or cotton sashes—keep the *giuba* in place and allow the wearer to pull out his or her arms for cooling. This garment can also be used as a blanket or sleeping bag.

Other robes include the *giuiu*, a sleeveless, broad-shouldered robe made of black *pulu* or animal skins, and the *giubjialo*, a lined *pulu* robe with a floral design on the collar. The *cha* is a fur-lined robe worn by men and is made either from jacquard silk fabric (for special occasions) or plain-colored leather (for everyday wear). Waist-length jackets, both sleeved and sleeveless, may also be worn over the *giuba*. Square-toed *sunpa* (boots) are a popular type of footwear. *Sunpa* have soles of thick yak hide and fabric foot and leg sections. They are secured with cloth ties and often have embroidery at the ankle area.

Headwear is also an important part of Tibetan costume, and the shape and quality of the hat indicate rank, status, and regional and tribal affiliation. The *xi-*

A woman in Lanmdakh wearing a *peyrak*, the traditional headwear for married women in Tibet and northern India. (RIC ERGENBRIGHT/CORBIS)

amou jiasi (golden flower) hat is worn in winter by men, women, and children. The *xianmou jiasi* has a tall crown of fabric, felt, or leather, four fur flaps, and is often trimmed with gold rickrack imported from India or China.

Costume indicates a woman's marriage status. Married women wear the *bangdian*, an apron-like garment made from three widths of hand-woven, horizontally striped fabric in shades of red. Different hairstyles and hair ornaments are also important marital indicators and vary by region and tribe. A basic married woman's hairstyle is a Y-shaped style, or *peyrak*, with the hair curving into two ram-shaped horns that encircle the head. Women's hair is also embellished with many hair ornaments of precious metals and materials.

Accessories are important to Tibetan costume, serving decorative and practical purposes. Silver belt buckles and belts are common for both sexes. Many accessories hang from the waist ties. Males typically hang Buddhist boxes, cartridge clips and belts, and *bagu* (metal wallets) from their waist ties or belts. Women often hang needle cases from their waist ties. Men and women wear jewelry such as earrings, bracelets, and necklaces; men may wear only one large dangling earring. Coral, jade, silver, and gold are highly prized jewelry materials. Women wear more jewelry than men; part of the wealth of the family is kept in women's jewelry. One of the most important accessories worn by women is the *kou*, a square metal box with a diamond shape on it. The *kou* is worn around the neck on a chain so that it rests on the woman's chest and contains a Buddhist religious artifact.

The *kba-btags* or *kata* is an important Tibetan textile material artifact. It is a white scarf symbolizing purity that is offered as a gift when greeting people. The *kba-btags* are also used as offerings when visiting shrines and during other rituals such as wedding and funeral rites. This tradition is believed to have evolved from an ancient custom of clothing statues of deities.

CLOTHING, TRADITIONAL—TURKEY

In Turkish costume, highly ornate ensembles are composed of many layers of textile and nontextile items. Older forms of Turkish traditional dress do not include Western-style dress, which exhibits rapid change

and is available through a system of mass production and distribution. Traditional dress was once the everyday dress of people living in the rural areas of Turkey; today it is worn daily only by a few rural women, by others for ceremonial use, and by Turkish folk-dance groups.

The traditional dress of Turkey has changed slowly; this is important historically because it informs us about the people who produced it. Surface decoration and the way costume elements are arranged on the body serve as a means of communication, indicating membership in tribal or village groups, and myriad other anthropological messages.

Turkish traditional dress exhibits tribal and village distinctions while sharing features with Central Asian dress, the dress of the Ottoman Court, and Middle Eastern dress. The common features can be attributed to the cultural contacts of the Turkic peoples over the centuries. The Turkish people are believed to have migrated south and west from the Altai Mountain regions south of Lake Baikal, entering Persia, Iraq, Central Asia and Eastern Europe. By the eleventh century they penetrated the Anatolian plateau, the landmass forming the peninsula in western Asia that comprises the bulk of the modern Republic of Turkey. By the fifteenth and sixteenth centuries Turkic groups formed many villages, some of which remain intact today. This stability of geographic location coupled with relative isolation in inner Anatolia, away from the waterways on the periphery, allowed for stability and slow change in traditions of dress.

Turkic peoples influenced and were influenced by cultural contact with civilizations along their migration routes, by the earlier inhabitants of Anatolia, and by the remains of Anatolia's ancient civilizations. The vast Ottoman empire (fourteenth–nineteenth centuries), which eventually encompassed the Balkan Peninsula, Greece, Transylvania, Moldavia, Wallachia, most of Hungary, Podolia, the entire north coast of the Black Sea, Crete, Cyprus and the Aegean isles, Armenia, most of the Caucasus, the Tigris and Euphrates valleys to the Persian Gulf, the eastern Mediterranean coast, a strip along the Arabian peninsula, Egypt, Tripoli, Tunisia, Algeria, and the Anatolian peninsula, brought the Turks in contact with people from other lands. Those contacts also had an effect on the dress and textiles of Turkey.

Forms of Turkish Traditional Dress

Characteristic features of Turkish traditional dress include the layering of garments, distinctive surface or woven-in decoration on the fabrics, and a geometric

Men in traditional dress at the festival of Edirne in 1954. (STUDIO PATELLANI/CORBIS)

cut. Wool, silk, and cotton, fibers indigenous to Turkey, are commonly used for apparel. Separate garments are layered to accommodate the need for adjustments according to climate; to create storage areas for coins and other small items in fabric folds; and to create a system for holding garments onto the body. Careful cutting exposes portions of garments underneath the top layers. Surface design is achieved by embroidering, dyeing, or weaving.

Common items are the *salvar* (baggy trouser), *gomlek* (chemise), *ucetek* (three-skirted cloak), and elaborate headgear that always includes one or more headscarves for women. Sleeveless vests and waist-length jackets are also common, as are aprons for women. The layers are held together by a girdle or belt, or by a shawl (*sal kusak*) that is folded and wrapped around the waist. With the exception of the face, the body completely covered. Portions of the men's body are left exposed, such as the head, face, and neck, with the exception of a headdress. In the traditional dress of some areas of Turkey, portions of the legs are exposed. Turkish traditional dress was relatively unisex, but certain distinguishing features clearly indicated gender. Primary among these was the style of headdress. In the Ottoman court, male headdress distinguished social and economic positions. Headdresses such as the turban, used throughout the Ottoman empire from before the Turks' capture of Constantinople in 1453 to the early nineteenth century, and the fez, used for about 100 years after the demise of the turban, became symbols of identity for

Turkish men during their respective periods of use. Both were outlawed: the turban in 1829 when the fez was adopted, and the fez in 1925—in favor of the Western-style brimmed hat. The headscarf for women remains an important article of dress among segments of the population in modern Turkey.

Recent Changes

Over 60 percent of the inhabitants of modern Turkey live in urban areas. Forces of the global economy have created changes in lifestyles, particularly since 1970. Traditional dress and textile production is disappearing at an astounding rate. Fabrics formerly were produced in villages, but now changing markets and improved infrastructure have made it possible for women to purchase fabrics and trims, produced throughout Turkey and the world, in their local markets. Women in some villages continue to wear all or parts of their traditional dress, especially for ceremonial events such as weddings. Common in most villages is the baggy trouser (*salvar*) worn sometimes with a skirt over the top, a long-sleeved blouse or T-shirt, a sweater-vest, and a headscarf. Turkish folk dance groups have kept some of the elaborate dress ensemble traditions alive. In the urban areas of Turkey, men and women wear typical Western clothing, although some Muslim women cover this dress with a coat and wear a headscarf, or cover themselves completely with a black cloak.

CLOTHING, TRADITIONAL — TURKMENISTAN Dress in Turkmenistan developed as a part of Central Asian costume, and the styles and design of clothing were similar to those in Uzbekistan and Tajikistan. Until the 1880s, traditional clothing

had the same basic form—a long, loose, simple tunic style. Styles were similar for all social classes, often differentiated only by the quality of the cloth and accessories, and the quantity of clothing in a wardrobe. The costume, however, was visibly different depending on the individual's age and social status.

The modern Turkmen women's costume includes a colorful, three-quarter-length jacket, or caftan, over a fairly tight-fitting dress with narrow sleeves and a little stand-up collar. The front panel, center front edges, and neckline of the dress are outlined in white embroidery. The jacket's front edge, hem, and bottom of the sleeves are decorated with velvet bands, metal disks, and beads. The cap, or *tubeteika*, in a bright color matching the jacket, is covered with silver jewelry and hanging coins.

The famous Karakul sheep are bred in Turkmenistan, and their gray, black, or brown wool has always been used extensively in clothing. Cotton and heavy silk were used in traditional clothing for the summer season. Women's costume was usually made from plain fabrics. All colors were used, but yellow, red, green, and blue were especially popular. The most popular color was red, in all its shades.

Everyday clothing was simple and consisted of a long tunic shirt and pants. The upper part of pants was wide, gathered with a lace. Pants were worn very low, almost at the hip level, leaving the belly bared. Pants' legs narrowed from knee level down. Women wore scarves and little woolen dome-shaped caps on their heads. Women's flat, soft, leather shoes or boots had pointed, slightly upturned toes.

An important part of the Turkmen women's costume was silver jewelry with semiprecious stones, which were necessary elements of everyday attire. Women wore rings, earrings, necklaces, and special decorations for forehead, temples, overcap and dress. The jewelry was often heavy with hanging coins. Even women from the poorest families had to have some jewelry—at least a ring—because the Turkmen believed that food cooked by a woman with no ring was bad. Children, both girls and boys, began to wear silver decorations at the age of five. Girls from nine to twelve years old, who were ready for marriage, and married women who had not yet had their first baby, had many more decorations than middle-aged women (thirty to thirty-five years of age).

Until the middle of the twentieth century, basic dress for men included a cotton or woolen shirt in dark colors and black or brown pants tucked into leather boots. The shirt had a rounded neckline with an opening on the right side and was worn over the pants and tied with

a brightly colored sash; men would keep little necessities and tools in the pleats of the sash. For outerwear, men wore a three-quarter-length cotton robe or long sheepskin coat. The robe had dolman sleeves (wide at the shoulders but coming to a tight cuff), was decorated with a braid on the outer edges, and could be padded. Every Turkmen man carried arms, which was a part of the costume. A high, sheepskin bonnet, or *papakha*, was worn during summer and winter.

Today in Turkmenistan people wear a mixture of modern Western dress and traditional costume. The most complete version of the traditional costume can be seen during national holidays or special occasions, such as wedding ceremonies. However, some elements of the traditional costume, such as the *tubeteika*, and specific textile colors and patterns in the cloth, can be seen every day in the streets of big cities and tiny villages. Women still wear pants under their dresses, and older females always cover their heads with scarves. During the last decade of the twentieth century, after Turkmenistan became independent from the former Soviet Union (1991), the country began to revive its native culture, and interest in the history and style of the traditional costume increased.

CLOTHING, TRADITIONAL — UZBEKISTAN Traditional Uzbek costume remained unchanged until the end of the nineteenth century. As in all Muslim countries, Islamic values in Uzbekistan were reflected in the style of dress. Men and women alike had limited items in their wardrobe; these included a long tunic shirt, pants, and a coat. The style of a garment was not subject to change and was similar for both sexes and all social classes. For example, the only difference in a tunic shirt for men and women was in the neckline openings—horizontal for men, vertical for women. Wealthy people could be distinguished from the poor by the superior quality of their fabrics, their more expensive jewelry, and the presence of decorative elements in their costume, such as embroidery, studded stones, and beads.

Despite similarities in costume style, each ethnic group created a unique look, artistically combining the elements of design, color palettes, textile patterns, and trims. Within an ethnic group or region, costume differed because each family had to spin, weave, and dye

its own fabrics to make clothing. This led to the colorful variety in Uzbek traditional dress.

Men's Clothing

The most important part of Uzbek men's costume was the loose-fitting cotton coat, called the *khalat*. The *khalat* was long-sleeved, knee length or longer, and made from fabric with a variety of colorful stripes. The bottom of the sleeves, center edges, hem, and neckline of the coat were sewn round with a decorative braid, which was believed to protect a person from evil powers. The side seams were slit for ease when walking, riding a horse, or sitting down. Wearing two or more coats at the same time was common in both winter and summer, and gave a man a certain prestige while showing the prosperity of the family. The outer coat could be padded with batting. A white tunic shirt was worn under the coat. The coat or shirt was tied with a big folded handkerchief or a band. This band was an important accessory, and could be made of fine fabrics, decorated with complicated silver embroidery, studded with stones and silver coins, and hung with little bags for tobacco and keys. Pants were loosely cut but narrowed to the bottom and were tucked into soft leather boots with pointed toes. Skullcaps were popular all over Central Asia. The *tubeteika* is an Uzbek cap made of velvet or wool, beautifully embroidered with silk or silver threads. Over the cap men could drape a turban, or *chalma*, in different colors. Fur hats were also worn.

Women's Clothing

Women's traditional dress consisted of a tunic, pants, a scarf, and a coat. The long, loose tunic had wide sleeves reaching to the wrists. Loose-cut pants were often made of the same fabric as the tunic, or out of complementary fabric. The bottom of the pants was gathered and decorated with embroidered braid. Women's coats were similar to men's *khalat*.

For centuries cotton has been used extensively for clothing in Uzbekistan. Home-woven striped and white cotton were the most common fabrics for everyday wear. Textile patterns often included up to six or seven different colors in the typical geometrical or stylized floral design. Fabrics were brightly colored, in shades of red, yellow, blue, green, violet, and orange. The color of the costume was an important signal of a person's age or social status. Red and pink were common for girls and young women; middle-aged women were supposed to wear shades of light blue and gray. White was the most popular color and appropriate for all ages, especially for the elderly. Black, dark blue, and violet were colors of mourning.

It was not appropriate for a woman to be seen bare-headed, even by family members. The scarf was tied round the head, leaving long ends hanging down the back. Similarly, a woman was required to cover herself with a cloak when outside of the house. In different ethnic groups a big scarf or a special kind of stylized coat, or *parandja*, was used. *Parandja* was worn with the neckline resting on the top of the head, partially covering the woman's face and draping around the entire body. In many Muslim countries females are not allowed to show their faces in public, and one common cover in Central Asia was a black net made of horsehair. The length of the net varied, depending on the region, from waist-level to the hip-level, or sometimes longer. Only in large Central Asian cities such as Tashkent, Farghona, and Bukhoro was the veil a necessary part of a woman's wardrobe at the end of the nineteenth century. In villages, women used the hanging ends of the scarf tied round the head to cover their faces when in public.

Women's long, black hair was braided into two or more plaits. In addition to common Central Asian jewelry, it was popular among young Uzbek women to pierce the nose and decorate it with a ring set with stones. Shoes were made of felt or colored leathers and had low heels.

Clothing in the Twentieth Century

Russian influence was seen in the early twentieth century. Shirts and coats became more comfortable and closer fitting with the introduction of shoulder seams, cut armholes, and rounded sleeve caps. The traditional tunic shirt evolved into a dress with a waist seam and, later, a front yoke. Today the dress with a yoke is considered the traditional Uzbek women's costume.

In the 1920s, during the Civil War and the creation of the Asian Soviet Republics, Western clothing began to appear in Central Asian wardrobes. This trend first developed in larger cities. Men added pieces from military uniforms as well as civil Western dress to their everyday attire. Although women were more conservative and slow in reshaping their wardrobe than men were, they started to appear in public with uncovered faces.

The modern version of traditional women's costume consists of the dress, pants, and headwear. Dress length varies from the knee to calf level. Pants, which are still an irreplaceable part of an Uzbek woman's wardrobe, can be very long, draping over shoes, or shortened for young women. A hip-length jacket or a waist-length vest can be worn over the dress. The skullcap, or *tubeteika*, is now extremely common. A tassel is placed on the top of a woman's cap for festive occasions.

At the end of the twentieth century, Western fashion dominated, but fashionable styles are still produced with native design elements and in traditional multi-colored textile patterns and hues. Since the disintegration of the Soviet Union and the creation of an independent Uzbekistan in 1991, the culture as well as the economy has been in transition, influencing modern Uzbek appearance.

CLOTHING, TRADITIONAL — VIETNAM

Most Vietnamese men now wear Western clothing but most Vietnamese women wear the *ao dai*, a front opening, knee-length, coat-like garment with a stand collar and splits from hem to waist level at each side. The *ao dai* is tailor-made from plain or printed cotton for summer use, or from silk for special occasions; these fabrics often are mixed with polyester to reduce creasing. The *ao dai*, worn in winter, is made from wool, or a wool/polyester mix. The *ao dai* is always worn over *quan*, zip-fronted pants with two buttons at the waist. *Quan* may be black or white depending on the *ao dai*; women wear matching *ao dai* and *quan* if wealthy or for special occasions. Schoolgirls and students often wear *ao dai* with a white ground with white pants, but blue and lavender are also popular. Elderly women prefer brown and navy blue, worn with black pants. Black is not worn much in the hot southern summers. The *ao dai* may also be embroidered. The length of the *ao dai* varies, depending on fashion and occasion, from a few inches above the ankle (for evening wear) to just below the knee. The collar may also be round necked or V-necked, depending on fashion. Sleeve lengths are long or three-quarter length.

Although it has not been commonly worn since the 1930s, men's traditional dress displayed features similar to women's dress. It comprised a long-sleeved, indigo-dyed tunic with silver button fastenings. As with women's dress, the tunic sometimes had contrast edging on the collar, cuffs, and lower hem, and was worn with either a woven, skirtlike garment to mid-calf, or with simple pants. Tunics were worn loose, tied with a sash, or worn with a tabard. Headdresses varied from plain wrapped fabric to tassel-decorated caps.

Tribal Clothing

As recently as the 1930s and 1940s tribal women wore elaborately decorated, woven traditional dress;

this has largely been replaced by a simplified version of dress worn everyday in rural areas. In the north, women wear a loose-fitting shirt with a skirt and headscarf, while women in the south may wear a loose-fitting shirt and pants with a headscarf. Among tribal groups, fabrics are woven on back strap or simple looms, using homegrown cotton, hemp, or ramie, to make striped waistcloths and warp-faced ikat. Embroidery includes motifs of trees, flowers, eight-pointed stars, and sugarcane leaves. Brocade fabric is produced using up to 150 supplementary threads in cotton or silk. Dress is worn with pride as a marker of ethnic identity among hill tribes and subgroups. Each group has local nuances in spoken dialect and in women's clothing.

In the North The Tai people form eight subgroups totaling over three million people in northern Vietnam. Other tribal groups living in northern Vietnam are the Jarai, the Phen, the Lao, the Lu, the Nung, and the Pa Di, while the Hmong, Yao, and Pathern spread from the north to the northwest. Women's garments are distinctive to each group, and permutations of indigo-dyed cotton, embroidery, and silver decoration signify tribe membership, gender, and status.

Many Tai women wear long black tunics, while those worn by the Nung (Ngan) are shorter. The Tai also wear a wrapped, sarong-style waistcloth with bands of decoration. Pants or leggings are worn under the skirt, a waist tie holds the waistcloth in place, and pendants on chains of silver links complete the ensemble. The Jarai decorate loincloths and waistcloths with geometric bands of supplementary weft decoration. The Phen wear brown-colored clothing; the Lao wrap their heads in cone-shaped headdresses; the Pa Di women wear a headdress shaped like a house roof and trimmed with silver balls.

The garments of some groups are similar to those of other groups; for example, Nung and Pa Di women both wear a short black tunic that opens on the right, with a decorated stand collar, and contrasting blue and white cuffs. The fabric seam at the sleeve join is embroidered and the front fastening is decorated and fastened with silver balls. The Lu wear a short black cotton tunic with a peplum (a short overskirt attached at the waist). The tunic is decorated at all seam joins with embroidery, and adorned with silver coins at the front. The waistcloth has a vertically embroidered and appliquéd central panel, and an outer waistcloth with an embroidered panel is worn around the hips. The Hmong batik the central panel of their distinctive circular skirts using bamboo pens and beeswax. Made from hemp, cotton, and silk, and now stitched by ma-

Vietnamese women in *ao dais* on the street in Hanoi in 1993. (OWEN FRANKEN/CORBIS)

chine, women's circular pleated skirts are indigo dyed, batiked, embroidered, and appliquéd. Additional Yao decoration includes tassels, beading, fringing, and silver lozenges used as fastenings. The linear-patterned batik is applied using different sized pens for eight-pointed stars, spirals, flowers, and gourds. The Yao use larger motifs, and the Pathern, use red as a ground color rather than black. The Lisu, Akha, Hmong and Micu all use Chinese methods in the construction of their garments, especially jackets, trousers, pleated skirts, aprons, and kaftans. Indigo dye on cotton cloth is decorated with colorful bands of appliqué, cross-stitch embroidery, and the inclusion of tufts of wool, seeds, silver bosses, and club-shaped pendants. Motifs are mostly geometric or record the natural environment. Weaving and needlework are prized skills; a prospective bride's work may be examined by future in-laws as a means to determine character. The Muong live in an intermediate area between the mountains and the coastal plains; here they grow cotton used for white, front buttoning, women's tunics and folded headdresses, similar to the caps of Western nurses. These are worn with plain green or patterned waist sashes and long waistcloths.

In Central and Southern Vietnam The Mon-Khmer of Truong Son Cordillera and the Central Highlands are spread throughout the central and southern areas of Vietnam. Other groups in this area include the Bahnar, the Ta Oi, the Cotu, and the Gie-Trieng. The Mon-Khmer has a population of three-quarters of a

million people, and includes fifteen subgroups. The Khmer people have rich textile traditions, producing belted aprons, vests, skirts, waist ties, scarves, blankets, bags, and baby carriers. The Bahnar weave cotton on an Indonesian-style loom on which the warp threads are held stretched between beams six feet above the ground and tensioned by a wooden back rest. This kind of loom is used to produce supplementary weft cloth up to a meter wide. Fabric is indigo and may combine pre-dyed threads. The Mon-Khmer use predominantly black, dark red, and ochre colors. The fabric of the Ta Oi, the Cotu, and some Gie-Trieng has glass or lead beads strung on the horizontal weft threads before weaving the decorative motifs.

Outlook for Traditional Clothing

As education and economic opportunities become increasingly available to the tribes of Vietnam, all aspects of women's dress is evolving, including the fabrics and dyes used, types of decoration, and construction (generally moving to simpler construction). The future of Vietnamese dress seems intimately bound up with the country's future economic prosperity: If industrialization continues at its current pace, with increased communications and logistics, the availability and affordability of Western goods will bring a multitude of fashion choices to people of Vietnam, and it is likely that the popularity of traditional Vietnamese women's dress will decline as men's dress has already done. Alternatively, a sense of cultural

identity and nationalism—strongly felt in Vietnam—may help retain the use of Vietnamese dress in the same way that the Indonesian sarong has remained part of the Balinese dress.

CO LOA THANH Co Loa Thanh (Co Loa Citadel) is located approximately 20 kilometers north of Hanoi, Vietnam, in the Dong Anh district. The citadel and the city were built around 257 BCE by King An Duong Vuong (Thuc Phan, reigned c. 257–c. 207 BCE) to enhance defense of the area from Chinese invasion. An Duong Vuong made Co Loa Thanh the capital of his Au Lac kingdom.

The shape of the citadel gives it its name, Loa Thanh, which means "snail-shaped citadel." The three principal mud walls of the citadel were constructed in a pattern of concentric circles resembling the shell of a snail. The first, outer wall had a perimeter of 7.6 kilometers; the second, 6 kilometers; and the third, 1.6 kilometers. The walls rose from 4 to 12 meters in height and were from 8 to 30 meters thick.

Following King An Duong Vuong's military defeat and subsequent suicide in 207 BCE, Co Loa Thanh was pillaged and abandoned throughout the period of Chinese rule in Vietnam (111 BCE–939 CE). After Chinese rule ended in 939 CE, Prince Ngo Quyen (897–944) made Co Loa Thanh the capital city of his new Vietnamese administration. It remained the capital city until 944.

COASTAL MALAYS The origins of the modern Deutero-Malay or Coastal Malay people are the subject of much debate. Some believe they came to the coastal regions of the Malay Peninsula from mainland

Southeast Asia around 2000 BCE. The Malay settlers who first came to the peninsula kept to the rivers, and earlier races were driven inland to the mountains and swamps. These Malays intermarried with the indigenous peoples but failed to absorb them.

Folklore recorded in the Malay Annals has it that the founder of the Malay dynasties in much of insular Southeast Asia from the Malay Peninsula through the archipelago was a prince named Sang Sapurba. He was the son of Raja Suran, the "Ruler of the East and the West," by his marriage to a mermaid who was the daughter of the Kings of the Sea. This prince was believed to have revealed himself on the hill of Si-guntang, near Mount Mahameru, in the hinterland of Palembang, a port city near the east coast of Sumatra.

The legendary Sang Sapurba was said to have crossed the central range of Sumatra into the mountains of Minangkabau, where he slew the dragon Si-katimuna and became king and founded the line of princes of Minangkabau, the noblest Malay dynasty. His relative, Nila Utama from Palembang, had meanwhile crossed the sea, first reaching the island of Bintan and then the island of Temasik, on which he founded Singapore.

The modern or Deutero-Malay of Southeast Asia are believed to be descended from Proto-Malays who lived in the southern states of the Malay Peninsula, the Riau-Lingga Archipelago, Bangka Island, and certain districts in eastern Sumatra. Anthropologists caution against inferring that every modern Malay is descended from Proto-Malay tribe members. The modern Malay are a mixed race and differ among themselves considerably. They developed from intermarriage with Chinese (as early as the Chou period), Indians from Bengal and Deccan, Arabs, and Thais.

The earliest immigrants to the Malay Peninsula from the Indonesian archipelago were Minangkabaus from Sumatra. Attracted by the wealth and commerce of Melaka, they moved into what are now the Malaysian states of Negri Sembilan and Melaka. Their legacy of matriarchal social structures remains visible in Malay culture today. In the early eighteenth century, the Bugis of Celebes established themselves in what is now the state of Selangor, later becoming politically dominant in the Riau-Johor empire.

This migration from the archipelago differentiates southern Malays from those in north of the Peninsula in Kedah and Kelantan. These differ from other groups, such as the Patani Malays of northern Perak (another state in modern peninsular Malaysia). These Malays were driven south from Thailand in the mid-nineteenth century and retain aspects of Thai culture.

Southern Malay communities generally spoke Malayan dialects or a language from which Malay has developed. In British Malaya they were known as Biduanda, while in the south and on the islands they were called Orang Laut, or people of the sea. Many of these people were unacquainted with agriculture and lived by fishing. The coastal Malays did well by the sea, as the coasts and rivers of Southeast Asia where they settled were rich in marine life, and the waters yielded more than did the inland jungles. The Orang Laut in their coastal villages had specific indigenous customs, but few of these are left to the Malay.

Coastal Malays appear to have settled along the coasts of Malaya and surrounding areas and intermarried with Chinese and Indians who migrated to and traded in the region, giving rise to the Deutero-Malay. The Malay spoken today is thought to have originated in a language from the archipelago. In the remote past, it is believed that the two great language groups—the language spoken on the archipelago and that spoken by the Indo-Chinese—were connected.

Historians agree that prior to recorded history in the Malay Peninsula and archipelago, there was already a substantial population with a fairly well-developed culture. Early Malays knew how to navigate by the stars on the open ocean and maintained some sort of political and social organization.

Unlike their predecessors, modern Malays are pre-eminently an agricultural people, and wet rice cultivation and fishing have been traditionally their main occupations wherever they settled. In the Melaka and Kelantan-Trengganu regions, fishing was revived as the main occupation because of better transportation in the eastern coastal region and the substitution of money for barter, which allowed for the division of labor and specialization in fishing by the coastal Malays.

The Malays today number over 200 million people in the Philippines, Indonesia, and Malaysia who share similarities in religion, language, general culture, and even political identity. Islam has proven to be a unifying force whose extranational character links the most remote mountain farmers to the townspeople of other Muslim communities in Southeast Asia.

COCKFIGHTING Cockfighting, which pits two male chickens against each other, is a blood sport indigenous to Asia. The chicken, or common fowl, is most likely a native of the Indian subcontinent, where both a red jungle fowl (*Gallus gallus*, 65 centimeters long) and a gray one (*G. sonneratii*, 80 centimeters long) are found. Chickens were domesticated in the forests of mainland Southeast Asia perhaps as long as six thousand years ago. Over the years, a variety of domestic fowl was bred for culinary and ritual purposes, and some were bred for their fighting ability as well. When cockfighting first appeared is unknown, but sculptures found at Angkor Wat in Cambodia indicate cockfighting took place there one thousand years ago. As the chicken spread around the world, cockfighting followed, and it became a worldwide activity.

In Asia, cockfighting remains popular in Indonesia, Malaysia, Thailand, Vietnam, and the Philippines. In all places, the basic elements of the fight are the same. The key players are the cocks, the breeder-owners, and the audience. Betting is a vital component, and various rules and structures are in place that ensure that bets are collected and paid quickly and fairly. Fights take place in cockfighting pits and are attended almost exclusively by men. The goal of the fight might be for one bird to be killed or for one bird to be judged victorious without necessarily killing the other. Cocks may fight with their spurs, with attached blades, or with their spurs covered with padded gloves.

COEN, JAN PIETERSZOOM (c. 1586–1629), governor-general of the Dutch East Indies Company in Indonesia. Born to a burgher family in Hoorn, the Netherlands, Jan Pieterszoon Coen learned bookkeeping in Rome before joining the Dutch East Indies Company (VOC, Verenigd Oostindische Compagnie, United East Indies Company) at the age of twenty.

After his first visit to Indonesia in 1607, Coen rose in the ranks of the VOC. In 1614 he wrote an influential analysis of the company's strategic position, arguing for monopolization of the spice trade, the establishment of strong bases in the Indies, and the expulsion of other Europeans and introduction of Dutch settlers. Coen was appointed fourth governor-general in 1617, taking up his post in 1619. He was convinced of the need to establish a central headquarters for the company in Asia, both for military and administrative reasons, and for this headquarters to become the hub of a network of Asian trade routes. In 1618 Coen established a fort at Jayakarta (now Jakarta) in western Java for this purpose, later naming it Batavia.

Coen ruthlessly enforced the VOC's spice monopoly in eastern Indonesia, attacking the nutmeg-producing Banda Islands in 1621 and slaughtering or deporting the entire indigenous population. Coen left for Holland in 1623, but returned for a second term as governor-general in 1627 and died in Batavia during a siege by Javanese forces.

COIMBATORE (2001 est. pop. 923,000). Coimbatore is situated on the banks of the Noyil River on the Coimbatore Plain 425 kilometers southwest of Madras City (now Chennai). It is an industrial city of the northwestern Tamil Nadu state and the headquarters of Coimbatore District. It was an important site along a trade route between the east coast and the west coast even in Roman times; numerous Roman coins have been found in the district. Several medieval kingdoms maintained a fortified stronghold there. Coimbatore was developed as an administrative and industrial center under the British administration, and during the twentieth century, it has had varied industries: hides, glass, photographic goods, coffee, sugar, cotton cloth, electrical goods, tea, fertilizer, and other agricultural products. Coimbatore is the site of the Tamil Nadu Agricultural University, Bharatiar University, and several others institutions of higher learning. It has an airport and a military airfield.

The extensive Coimbatore District (7,469 square kilometers) was under British rule from 1799 until Independence in 1947. Bordered on its northern edge by the Nilgiri and Periyar districts (and the Bavani

River, which forms the border of these two districts), the Coimbatore District has rich farmland that is irrigated in several areas. The Bavani Sagar dam is an important part of the irrigation system, but many farmers who are unable to get water from the dam system use wells instead.

COLOMBO (2001 est. pop. 770,000). The commercial and business center of Sri Lanka, Colombo is a multifunctional and multicultural cosmopolitan city. Colombo city is merely the core of the Greater Colombo agglomeration that sprawls over 60 kilometers in a narrow band along the west coast of Sri Lanka near the Indian Ocean. Greater Colombo, with a total population of approximately 1.5 million, suffers from burgeoning social, traffic, and environmental problems resulting from high population and insufficient urban planning. As one of the major harbors in Asia, Colombo is the overseas port of call for Sri Lanka, and it lies at the crossroads of all domestic road and rail traffic. The international airport of Colombo (the only international airport in Sri Lanka) is located at Katunayake, at the northern edge of the Greater Colombo agglomeration, 38 kilometers from the city center, next to the biggest free-trade zone in Sri Lanka.

Greater Colombo has a decentralized structure, with light industry and working-class quarters at the peripheries, and the city center, called Fort (as a reminder of the old colonial fortification), accommodating the commercial district. The bustling traditional bazaar quarter (Pettah) and the fashionable residential quarter (Cinnamon Gardens) are adjacent to the center. Mount Lavinia (in the south) and Negombo (in the north), also part of greater Colombo, are home to many tourist resorts. Despite its great cultural and religious diversity, Colombo's many ethnic and religious groups enjoy peaceful coexistence. Colombo's religious diversity is evident from its many Buddhist and Hindu temples as well as its churches and mosques. Present-day Colombo proudly preserves the impressive colonial buildings of its colonial past, but it is also well stocked with modern hotels and futuristic shopping centers, suggesting that Colombo is forward-looking. Colombo is still regarded as the capital of Sri Lanka, although in 1982 Sri Jayawardenapura Kotte (located on the west-

ern outskirts of Colombo), which houses a modern parliament complex, officially became the nation's capital.

COLOMBO PLAN The Colombo Plan for Co-operative Economic Development in South and Southeast Asia was proposed at the Colombo, Sri Lanka, meeting of the foreign ministers of the British Commonwealth nations—Australia, Ceylon, India, New Zealand, Pakistan, and the United Kingdom—in January 1950. Later these nations were joined by Cambodia, Laos, and Vietnam and still later by Myanmar (Burma), Nepal, and Indonesia.

The meeting was intended to discuss international affairs, but the ministers realized that unless there was economic stability in Asia, there would be revolutionary disturbances, most often of the community sort. They understood that progress depended on economic improvement. It was decided that to promote development in Southeast Asia, they would give financial and technical assistance to their Asian counterparts.

The Consultative Committee, representing British Commonwealth governments, met in Sydney at the behest of the Australian government. At the meeting, nations planning development were asked to submit a "reliable" scheme for the next six years to act as a draft on their own future economic progress.

Next came the scheme for technical assistance and expertise necessary to practicalize large development programs. Governments providing aid were to bear the cost of basic salaries of experts they made available, and governments receiving aid were to bear the local costs of the experts. To aid in the preparation of the details of the scheme, a council for technical cooperation was proposed to meet at Colombo to aid in the economic development of Southeast Asia by providing technical assistance. This also required experts to participate directly in the process of development in Asia.

But this did not mean that there was a general Colombo Plan fund, although at the Sydney meeting the British Commonwealth governments had promised to provide 8 million pounds for the ensuing three years.

Every offer of assistance would be subjected to bilateral negotiation between the nations concerned, and

the progress reports would be discussed at periodic meetings. This was stipulated as a necessary caveat.

Finally, in September and October 1950, there was a further meeting of ministers in London, during which several development schemes were cleared and the need for "financial support of outside agencies" was approved. The Colombo Plan was originally proposed to run for six years, but at the Singapore meeting in 1956, its tenure was extended to 1961.

COMFORT WOMEN From 1938 until its surrender at the end of World War II in 1945, Japan forced women from regions captured or otherwise occupied to serve as prostitutes for its military forces. The terms "comfort women" and "comfort stations" (the brothels set up by the Japanese military forces) are euphemisms for these women and the facilities set up for them. The Japanese word for comfort women, *ianfu*, is equivalent to the Korean *chongshindae* and the Tagalog *lola* (grandmother).

Japan's System of Military Prostitution

The establishment of a system of military prostitutes began with use of Japanese professional prostitutes who would be sent to overseas locations. These women were provided to Japanese military forces beginning in the 1920s, but often had high levels of venereal diseases. It was later decided to use foreign women, who, not being prostitutes to start out with, were relatively free of disease. An estimated 200,000 women from Korea, the Philippines, Indonesia, Thailand, China, Taiwan, and to a lesser degree Burma (now Myanmar), Malaya (now part of Malaysia), and Vietnam, as well as some British and Dutch women were used as comfort women. As the war drew to a close, many of these women were abandoned or killed, or claims were made by the Japanese that they had been nurses. Discussion of forced military prostitution was avoided during the American military occupation of Japan because of cultural sensitivities; women who had been forced into sexual slavery were unlikely to admit to the experience in the decades following the

Two elderly Korean women at a rally in Seoul, in May 2001. Both were forced to serve as comfort women to Japanese soldiers during World War II. They are protesting a new Japanese history textbook which Koreans feel downplays Japanese atrocities. (REUTERS NEWMEDIA INC./CORBIS)

war, due in part to the psychological pressures which had resulted from the experience.

The Positions of the Japanese Government

The involvement of the Japanese army was denied by the government of Japan until 1992, when documents implicating the imperial government were discovered by a Japanese historian. Since that time the Japanese government has held that the "comfort women issue" is not one to be resolved through official channels, since war reparations had been agreed upon with its wartime enemies years before.

To be more precise, the government of Japan has adopted a series of official positions that acknowledge varying degrees of complicity, while maintaining that it holds no blame for any wrongdoing that may have occurred. The positions range from absolute denial that comfort women ever existed to an acknowledgment that the current government should accept historical evidence and apologize to the few who are still alive.

The Japanese educational system has also been hesitant to include discussions of comfort women. In 1997, for the first time, middle school social studies texts included references to *ianfu* (without explaining what they were). This drew criticism from politicians who criticized what they characterized as the "masochistic" inclusion of such material. The Japanese Ministry of Education was required to review all proposed school texts before they could be used, and could require publishers to change or delete passages that did not comply with official policy.

Two sets of feelings were apparent by the mid-1990s: members of the wartime generation, who were by that time in their sixties or older, saw themselves as victims and felt little remorse for other, non-Japanese victims. Members of the postwar generation, for their part, have been educated to believe in personal accountability for actions, not collective accountability, and therefore feel no sense of responsibility for acts carried out by the army before they were even born.

The Controversy Surrounding the Asian Women's Fund

To deal with public pressure to acknowledge past wrongdoing while still avoiding a public apology, in 1995 the Asian Peace and Friendship Fund for Women (commonly known as the Asian Women's Fund, or AWF) was established. As first proposed, the AWF was to be a nongovernmental means to make amends to former comfort women. This, it was thought, would settle the issue of reparations without involving formal channels. Payments of approximately \$20,000 from the fund (which would be created from private and government contributions) would be accompanied by a letter of apology from the Japanese prime minister. This approach was widely criticized by former comfort women, and led to refusal to accept the payments. Former comfort women from South Korea, the Philippines, Taiwan, and the Netherlands asked Japanese legal and labor organizations to end support for the AWF, saying that the fund ignored the victims, who had declared they would not accept payments from it. Lila-Pilipina, a Philippines-based Filipina support group for former comfort women, announced its members would reject the offer from the AWF since it did not constitute a formal apology. The AWF's ability to make payments was complicated by an unwillingness on the part of those to be compensated to accept payments from an organization perceived as a smokescreen for the Japanese government.

The AWF attempted to defuse the issue by pledging to give 380 million yen over a ten-year period to the Indonesian government for distribution to private social institutions. This backfired when the Indonesian Legal Aid Foundation criticized the government plan to accept the AWF payments without an official apology from the Japanese government. The South Korean government asked Japan to cease payments because the AWF was seen as an attempt to avoid an official admission of responsibility, and interfered with South Korea's own support programs, since payments to former comfort women are made in secret.

The Japanese stance has also been criticized by the United Nations. In 1998, the United Nations Sub-

commission on Human Rights denounced the AWF for its failure to provide legal compensation to former comfort women. In 1999, the special investigator for the United Nations Commission on Human Rights commented that the AWF would be viewed with suspicion as long as Japan attempted to avoid responsibility.

The comfort women issue will not likely be forgotten. South of Seoul, the Historical Museum of Japanese Military Sexual Slavery depicts the sufferings of those Korean girls who were taken from their homes to be used as *ianfu*.

COMMUNISM—CENTRAL ASIA The application of Communist ideology to the Central Asian environment was always a difficult undertaking. Throughout much of the Soviet Union's history, efforts were made to revise, adapt, or forcibly introduce Communist thought in the region, with mixed results. As was often the case, local leaders made use of the structure of the Soviet state and the rhetoric of Communism, but maintained their traditional views on power relations and society. Thus, when the Soviet Union collapsed in 1991, it was no surprise that Communism, as an ideological force, dissipated.

The Introduction of Communism to Central Asia

According to Marxist thought, the Socialist-cum-Communist revolution was to take place first in industrialized countries and only then proceed to the feudal (that is, less-developed) states. Imperial Russia was in the process of industrialization when Vladimir Ilyich Lenin (1870–1924) sparked the Bolshevik Revolution. In that empire, the Central Asian region was largely agrarian or pastoral. The small communities of industrial workers that existed were overwhelmingly ethnic Slavs. Thus, one of the more significant problems for the Bolshevik leadership and theoreticians was how to introduce Communism to a region that had

recently been under either feudal or precapitalist forms of government and society. (The Bolsheviks sometimes called Czarist Russia "precapitalist," suggesting that the basic elements of capitalism were present in the industrial sector, but that other parts of the economy and the mentality of the population were still lagging behind.)

During the Bolshevik Revolution, the local population in Central Asia generally viewed the new ideology as a foreign import and stayed away from much of the political wrangling that took place in 1917 and 1918. However, the collapse of the Russian empire did prompt members of indigenous elites to call for independence and for new states in Central Asia, and during the Civil War, a myriad of conflicting organizations and groups vied for power.

Many in Central Asia viewed Communism not necessarily as an ideology, but as a political and military force that would ensure continued Russian domination of the region. Some opposition groups of native inhabitants became part of the Basmachi revolt, a movement of Central Asians of all ethnicities who sought to create an independent political entity in the region. The weakness of the Basmachi was the varying views of participants—from Jadidist ("New School") thinkers who wanted to emulate the Young Turk movement in Turkey (Ottoman military officers who sought to reform what they saw as a corrupt political system in the late 1800s and early 1900s) to Islamic fundamentalists who wanted to recreate a caliphate in the region and base the new society on precepts of Islamic law. The divergence of views ensured that the Basmachi would not be able to cooperate successfully, and by 1922, the Bolshevik Red Army controlled much of the region.

In contrast, the reformist elite in Central Asia, particularly those living in the principalities of Bukhara and Khiva, saw the Bolsheviks as potential allies in their efforts to modernize the region. By enlisting the support of the Red Army, it was argued, the reformists could overthrow the repressive and conservative regimes in the respective states (ruled by executive councils modeled somewhat after the Bolshevik leadership structure in Russia) and create new, progressive entities. However, instead of being able to create their own independent states, these leaders found themselves beholden to the Bolshevik victors. By 1924–1925, Central Asia was delimited along ethnic- or national-republic borders—in spite of the fact that Lenin had originally rejected the notion of national republics and had adhered to the classic Marxist belief that ethnic identities would disappear in the new state.

Communism and the Stalinist State

During the 1920s, Joseph Stalin (1879–1953), as the Commissar for Nationalities, developed the policy for minority groups in the Soviet Union. In theory, minorities were to be given rights in the areas of language and cultural policies, but the eventual goal—according to Marxist theory—was for these groups to merge into one Soviet people. Relics (*perezhitki*), such as religious practices and certain backward aspects of a society, were discouraged, with the thought that they would finally disappear.

This theory required some creative explanation of Marxist thought when it was applied to the Central Asian region. Even Lenin thought that this area would be difficult to incorporate, and he reluctantly tolerated the national Communism exhibited by Central Asians, who followed the example of the Tatar, Mir Said Sultangaliev (1880–1939?). In the 1910s and 1920s, this activist presented to the Muslim peoples of the Soviet Union a form of Communism that underscored how one could blend Communist ideology with nationalist sentiments. He suggested that national differences would continue for some time but that, at some point, different nationalities would start to band together to work for larger, transnational ideals, assisting in the spread of Communism to other countries. The notion of combining national liberation with Communism was expressed in such places as the University of the Toilers of the East, an institution located in Tashkent (in present-day Uzbekistan), which was devoted to educating anticolonial revolutionaries.

Communism became the dominant, and then sole, ideology of the region, as it was an integral part of the Soviet Union's ideology. Leadership changes that took place in the 1920s and 1930s focused on the removal of nationalist and feudal leaders in favor of a young, pro-Communist elite. However, even these fell victim to the Stalinist purges of the 1930s.

In particular, the Communist ideology required that the local elite focus on education, improved social conditions, and women's rights—all sectors in which progress was demonstrated in the Soviet period. The Communists decided on women's liberation as a vehicle through which the basic tenets of Marxism-Leninism could take hold in the region of Central Asia. Families were largely patriarchal, and women were traditionally not afforded educational and career opportunities. In the 1920s, universities, gymnasiums, and primary schools were opened to women and girls in Central Asia.

One of the more dramatic liberation campaigns was the 1926 unveiling (*bujum*) campaign. Women, par-

ticularly wives, daughters, and sisters of Communist Party officials, were encouraged not to wear veils and even to remove and burn them in public ceremonies. Reactions to the campaign were mixed, with some fathers murdering daughters who disgraced themselves by unveiling.

Islam became another key target for Communism in Central Asia. By definition, the inherent atheism of Communist thought gave theoretical credence to any effort to curtail religious activity. The state policies on religion dictated in 1918 and 1928 clearly reduced the formal role of religion in Central Asia. Through the 1920s and 1930s, thousands of mosques and *madrasas* were closed, and religious leaders were persecuted. In the campaign against religion, Communism was an atheist ideology with its own principles, in opposition to all religions. Yet although official mosques and religious institutions were limited, Islam still survived during this period. What was often called parallel Islam began to emerge as a powerful force in Central Asia, particularly the Sufi orders that had existed in the region in centuries past. Studies today note that Muslims were able to adapt to the repressive environment, and Islamic customs were practiced during the entire Soviet period, albeit often in secret.

In 1942, while the outcome of the Great Patriotic War (World War II) was uncertain, the Soviet leadership decided to enlist the support of religious leaders throughout the Soviet Union to boost morale and offer yet other legitimizing reasons for supporting the war effort. In the following year, 1943, the Spiritual Directorate system was introduced, creating a structure through which Islam could be practiced and controlled. Mullahs and other religious figures were limited in their activity, but as long as they were state sanctioned, they could legally carry out their responsibilities.

Postwar Communism in Central Asia

From 1945 to 1991, the force and importance of Communist ideology went through several cycles. As an ideology, it was laying the groundwork for the eventual movement to a pure socialist and then Communist state. As the Central Asian region was considered backward, massive industrialization campaigns took place there in the 1950s and 1960s. In particular, major cities such as Tashkent and Alma-Ata (now Almaty), as well as the belt of cities in northern Kazakhstan, experienced significant developments.

Leadership policies saw a softening during this period. While the Stalinist years were typified by regional leaders who were devout Communists first and then national figures, during the post-Stalinist years

leaders thrived who paid proper fealty and loyalty to Moscow while maintaining more traditional forms of power in their respective republics. For example, Dinmukhamed Kunaev (1911–1991) of Kazakhstan and Sharaf Rashidov (1917–1983) of Uzbekistan were first secretaries of their respective republics for almost twenty-five years each. They, as well as their contemporaries in the other Central Asian republics, maintained intricate networks of authority in their republics that resembled the pre-Soviet period rather than the organizations that the regime in Moscow would have preferred. Both Kunaev and Rashidov rose to the ranks of the Politburo of the Communist Party of the Soviet Union (CPSU), although neither was viewed as a top decision maker in that elite body, which was dominated by ethnic Slavs.

Communist thought with respect to national merging was also softened. Indeed, under the administration of Leonid Brezhnev (1906–1982), the official ideology favored the flowering (*rasvet*) of nationalities. It was declared that in the future Soviet state, national and cultural distinctions would remain and would actually compliment each other. For the Central Asians, this cultural relativism meant that they were now encouraged to demonstrate and hone their "national music," "national costume," and "national traditions." Not surprisingly, the Russian culture remained supreme in the country vis-à-vis the Central Asian cultures.

It was still difficult to discuss fully the early nationalists, and, in classic Communist verbiage, most histories of Central Asia continued to focus on the overall forces of social development in the region, led by Russians. In the 1970s and early 1980s, several Central Asian authors, including Chingiz Aitmatov (b. 1928) and Mamadali Makhmudov (b.1943), wrote on nationalist themes, but couched them sufficiently in the language of Socialist Realism (realistic style and content prescribed for Soviet arts) to have them published. These efforts, and the push to increase the study of local languages in schools, were the early forms of national awakening in Central Asia.

However, it should be noted that most Central Asians seemed to like the social and economic benefits derived from being part of the Soviet Union. The Communist social contract, in which the state maintained authority and the population received extensive social-welfare benefits as justified in Communist thought, was maintained throughout much of the later Soviet period. Indeed, Central Asia was often presented as a success story to the developing world, especially to those states in Africa, South and Southeast Asia, and Latin America that were allies to or sympathetic of the Soviet Union.

Communism and the Gorbachev Reforms in Central Asia

During the years of Mikhail Gorbachev (b. 1931), as the Communist Party attempted to reevaluate itself and become more efficient, interest in Communism as an ideology and as a form of political power waned in Central Asia. According to the Gorbachev leadership, Communism, as a belief system, could exist in the Soviet Union, with its diverse societies and cultures. However, it was essential that the old guard, who were continuing to take advantage of the spoils system of Communist Party leadership, be removed. The general populations took such sackings of old party bosses as signs of national crackdowns and actually protested the removal of co-ethnic figures, even if they were corrupt. Gorbachev ousted Kunaev because he felt that this long-time office-holder in Kazakhstan was simply too corrupt and extremely nepotistic. However, when Kunaev was replaced by an ethnic Russian, Gennadi Kolbin, riots erupted in the Kazakh capital of Alma-Ata. This ouster was considered an affront by Central Asians, who saw Gorbachev as more of a Russian chauvinist than a modernizer.

The Central Asian people had a similar reaction to Gorbachev's condemnation of Rashidov regime and the infamous Uzbek cotton scandal. Although the investigation of financial improprieties in Uzbekistan took place during the years of Yuri Andropov (1914–1984), the case became a national issue in the late 1980s. In the so-called scandal, over three hundred top Uzbek officials were arrested and imprisoned for long-term falsification of cotton-harvest records and the resulting overpayment by Moscow of countless millions of rubles to local economic units. The Uzbek Communist Party was decimated as key personnel were implicated in the crime. The culprits were often described in Communist terms as closet capitalists and even feudal warlords, and stories of regional bosses amassing great fortunes appeared in the Soviet press. From the Central Asian perspective, these were not criminal investigations at all, but rather assaults on local cultures and leaders.

At this time, Communism as such was equated with Russia or Russians. In the Central Asian states, the non-Russian peoples began to assert themselves in the areas of political and cultural rights. In Uzbekistan, demonstrations with over twenty thousand participants took place in the late 1980s over the issues of language rights and primacy of the Uzbek language in the republic. Such sentiments were expressed in the other Central Asian states as well, although not at the level of protest seen in the Baltic republics and Ukraine.

Past leaders who had been declared nationalists were reexamined, and a number of victims of the Great Purge (the Stalinist campaign of 1934–1939 to eliminate opponents within the Communist Party apparatus and the Soviet military) were rehabilitated. Communist excesses were highlighted, much to the discredit of the official ideology that was being challenged throughout the Soviet Union. Thus, by the time of the Soviet collapse, the Central Asian view of Communist ideology was already low. However, this discrediting of Communism was not equated with a drive for independence, as the Central Asian peoples still saw the benefits of staying within the union.

The Collapse of Communism in Central Asia

In 1990, requests to join the Communist Party were decreasing as people no longer seemed to believe in the ideology. The politically savvy first secretaries in each of the Central Asian republics followed the examples of their counterparts in other republics of the Soviet Union and focused on their political offices, often being elected president of the respective republics. In a sense, their legitimacy was now derived from constitutional or institutional sources and not from being part of the Communist system.

In the last year of Gorbachev's tenure as General Secretary of the CPSU, the Politburo was reconstructed to include the first secretary of each of the republics of the Soviet Union. In theory, the goal was to diversify the leadership and elevate the position of the marginal republics. The Central Asian leaders appear to have been supportive of this and, in contrast to the other republics, maintained fairly strong support for remaining in the USSR. The Communist system's centrally planned economy, in general, benefited the Central Asian states in that they received more state subsidies than they paid to the central planners, in contrast to, say, the Baltic states, which paid more than they received. While the region was weaker relative to the European republics, conditions in Central Asia had improved considerably over time. Compared to the situation prior to the Russian/Soviet period, levels of education, health care, women's rights, industry, and transportation all improved. There were also costs—loss of sovereignty and many casualties during the collectivization campaign and the Great Purge. But die-hard supporters of the regime equated Communism with social and economic success, contrasting conditions in the Central Asian states with the conditions in war-torn Afghanistan to the south.

The collapse of the Soviet Union was soon followed by the gutting of Communism as a force in Central Asia. Quickly, the ideological veneer of Communism

and the hierarchy of the Communist Party structure were replaced by new forms of regionally based nationalism and political authority founded in the presidential apparatuses of the respective countries. Within months, the Communist Parties of each of the Central Asian republics were renamed, and the notion of having a Communist Party was challenged. Tajikistan was an exception in that its Communist Party did not change its name until three years after independence.

Attitudes toward Communism in Central Asia in the Twenty-First Century

All five Central Asian states are in the process of rewriting their histories, attempting to purge them of Communist ideology and Soviet political correctness. Unfortunately, these past portrayals are being replaced by similarly dogmatic nationalist concepts, often using the same techniques of their Communist predecessors. Communism as an ideology never quite took hold in Central Asia but remained a force in opposition to strong local values and belief systems. That Central Asian leaders were able to work within the Communist system and perpetuated their own power relationships underscores this failure.

COMMUNISM—CHINA The decay and fall of the Qing dynasty (1644–1912) produced a China racked by sociopolitical instability and unable to prevent foreign military attacks and political interference, including the imposition of concessions over which foreign powers had control and under which foreigners were not subject to Chinese law (extraterritoriality). These problems caused many Chinese to search widely for explanations; traditional thought systems

such as Confucianism offered inadequate answers. The New Culture Movement of 1915 spurred students to investigate competing foreign ideas, including the ideologies of socialism and anarchism, but anarchist and socialist initiatives failed.

Early Days

In early 1920, the Communist International (Comintern) sent the young revolutionary organizer, Gregori Voitinsky (1893–1953), to China to establish a Chinese Communist party. Before he arrived, the Soviet Union issued the Karakhan Declaration renouncing imperial Russia's claims on China. This declaration set the Soviet Union apart from the West, which continued its exploitation, passing Germany's concessions in China to Japan in the 1919 Treaty of Versailles, despite China's having been an ally in World War I. As a consequence, many Chinese lost faith in Western ideals, and Voitinsky found a warm welcome.

Voitinsky helped Chinese intellectuals such as Li Dazhao (1889–1927) and Chen Duxiu (1880–1942) form Marxist study groups in Beijing, Shanghai, Changsha, Guangzhou (Canton), and Jinan. In mid-1921, delegates representing about sixty members became the core of the Chinese Communist Party (CCP), committed to ending exploitation based on private ownership. Yet the CCP was tiny, while the Guomindang (GMD), or Nationalists, led by Sun Yat-sen (1866–1925) was a growing revolutionary anti-imperialist party with an army. To promote revolution, the Comintern pressed the CCP into an alliance with the Nationalists. The aim was for the CCP to help the GMD develop while simultaneously extending Communist influence to eventually make the Nationalist Party a Communist one.

The first period of GMD-CCP cooperation (The First United Front) ended in April 1927, when Chiang Kai-shek (1887–1975), the commander of the GMD forces, turned on the Communists. Communist membership fell from 58,000 to 4,000 active members, now experienced in organization, activism, and military and political affairs. While its urban influence evaporated, the CCP survived in the countryside, where, under Comintern direction, it instigated a series of failed uprisings, established worker-peasant-soldier soviets (councils), and implemented radical agrarian revolution, violently confiscating and redistributing land to the poor.

In October 1934, encirclement and attacks by GMD and local elite forces forced the CCP to flee the Chinese Soviet Republic it had established in Jiangxi, southeastern China, in November 1927. During this

retreat, known as the Long March, Mao Zedong (1893–1976) rose to prominence. The threat of war with Japan allowed the Communists to portray themselves as patriots heroically advancing to fight Japan despite GMD resistance.

From the Second United Front to Civil War

In 1937, popular opinion and pressure from the Soviet Union forced the GMD and CCP into their second period of cooperation, this time against Japan. This alliance formed half of the CCP's Second United Front. The other half consisted of winning as many allies as possible among intellectuals, warlords, landlords, and others by making concessions in Communist ideology and practice. Mao justified these concessions by invoking the idea of "New Democracy," a period of transition from the allegedly old "semi-feudal, semi-colonial" society to a socialist one. This transition would entail the long-term coexistence of different classes and forms of property ownership until the forces for the final transition to a classless socialism were strong enough. During this time, all classes allied to the CCP would be represented in the political system. This policy was reflected in moderate policies including rent and interest-rate reductions rather than radical land confiscation and redistribution.

Inside its rural bases, the CCP experimented with policies determined by local class structures and attitudes, GMD responses, rural conditions, attitudes of local elites, and international conditions. There was no overarching revolutionary theme of nationalism or land revolution that would guarantee success for any one policy throughout China, although the CCP made much of its patriotism and worked extremely hard to win support from the poor and landless in particular.

After the end of World War II in 1945, the CCP delayed civil war as long possible, building military and political strength. Meanwhile, the GMD, racked by infighting and corruption, rapidly deteriorated. The GMD lacked a strong political and social base, while the economy suffered hyperinflation, further undermining the GMD's legitimacy. Reviving the anti-CCP civil war cost the Guomindang more support, and its political weakness became increasingly obvious. The GMD was eventually defeated by CCP armies of rural soldiers won over by the promise of land, GMD deserters, disaffected students, and others who were promised a New China. The GMD fled to Taiwan.

The People's Republic of China

On 1 October 1949, Mao declared the founding of the People's Republic of China. The CCP quickly

CHAIRMAN MAO ON COMMUNISM

A well disciplined Party armed with the theory of Marxism-Leninism, using the method of self-criticism and linked with the masses of the people; an army under the leadership of such a people; a united front of all revolutionary classes and all revolutionary groups under the leadership of such a Party—these are the three main weapons with which we have defeated the enemy.

Source: Mao Zedong (1976). Quotations from Chairman Mao Tsetung. Beijing, China: Foreign Language Press, 3.

moved to eliminate potential enemies, institute thought reform, confiscate many businesses, and implement land reform. The CCP subjected private businesses to repeated campaigns aimed at delegitimizing them and forcing them into state or cooperative ownership. Soviet-model rapid industrialization using central planning to develop state-owned enterprises was implemented according to five-year plans. Despite the Korean War (1950–1953), in which China was involved, the economy grew quickly. In 1956, Mao declared the transition to socialism complete and ended New Democracy.

Maoism

Despite the apparent success, Mao also saw increasing bureaucratism, dogmatism, and sectarianism in the CCP. Mao's methods for rectifying these problems included allowing intellectuals to criticize government. Mao's 1957 speech, "On the Correct Handling of Contradictions," implied there was no more need for class struggle and reassured many that it was safe to speak up. However, Mao was shocked when his Hundred Flowers Movement, intended to encourage constructive criticism of CCP shortcomings, including criticism from the CCP's united front allies, also elicited severe criticisms of both the party and himself. In response he launched the Anti-Rightist Campaign. This campaign reemphasized class struggle and encouraged anti-intellectualism. Mao promoted the use of big character posters, public meetings, and debates to force criticism and self-criticism, so-called big democracy. These methods often involved public humiliation and even torture of critics. Accusations of rightism could refer to denying the centrality of class

struggle, advocating markets in economics, or opposing central planning or party control over politics and culture. Hundreds of thousands were labeled, exiled, imprisoned, demoted, and sidelined. These features of Maoism also marked the Great Leap Forward (1958–1960) and the Cultural Revolution (1966–1976).

The Great Leap Forward was an experiment by Mao to overcome the problems of central planning and to speed up industrialization. These goals were to be achieved by emphasizing mass mobilization, native ingenuity, and correct ideological viewpoint. Moral incentives rather than financial rewards were stressed, and distinctions between politics and technical knowledge were to be eliminated to make individuals both "red and expert." Relying on surpluses from agriculture to fund industrialization, the Great Leap accelerated the socialization and industrialization of agriculture by creating communes of up to five thousand households, where private plots, markets, and sideline businesses such as selling homemade pickled vegetables were eliminated. Decentralization and self-sufficiency were also key goals. The most famous Great Leap initiative was the building of backyard furnaces to raise steel output, but instead created large amounts of unusable pig iron at enormous cost in labor, raw materials, and wasted resources. The CCP mobilized the masses to build rural infrastructure such as dams and irrigation projects. Unfortunately, poor planning, excessive state extraction of grain taxes, shortcomings in communes, and other problems, together with bad weather, resulted in an estimated 20 million deaths from starvation in rural areas.

After 1959, stung by the failure of the Great Leap, Mao retreated from leadership. Pragmatic leaders, including Liu Shaoqi (1898–1969) and Deng Xiaoping (1904–1997), then instituted moderate policies, allowed private plots and sidelines, and rehabilitated some alleged rightists. Mao saw this moderation as revisionism and betrayal of revolutionary ideals. He began building support in China's army (the People's Liberation Army) and in September 1962 asked everyone never to forget the class struggle. In 1964, Mao began to reimpose his will and ultimately created the Cultural Revolution.

Through the Great Proletarian Cultural Revolution, as it was officially named, Mao encouraged the army and students in particular to criticize those like Liu and Deng whom he saw as taking the capitalist road. Mao told students that rebellion is justified and that they should fight selfishness and criticize revisionism. CCP leaders and intellectuals such as teachers became targets of student Red Guards, who had prepared themselves by memorizing *Mao zhuxi yulu*

(*Quotations from Chairman Mao Zedong*), nicknamed the Little Red Book. Many people, including Liu Shaoqi, were tortured and died as a result. In line with Mao's calls, students also worked to destroy old ideology, culture, customs, and habits (the "four olds"). However, Mao's egalitarianism also spurred the development of basic health care and education and attacked traditional elitism.

China and the CCP since Mao

The CCP now describes the Cultural Revolution as ten years of chaos and waste. After Mao's death in September 1976, there was an interregnum under Chairman Hua Guofeng (b. 1921), during which the so-called Gang of Four (including Mao's wife, Jiang Qing, 1914–1991) and others were arrested and blamed for the Cultural Revolution. In 1978, Zhao Ziyang (b. 1919) replaced Hua as China's premier, but it was Deng Xiaoping who came to wield the most power. The new leaders began rebuilding support among non-"Red" classes, especially intellectuals, former business people, and those with overseas connections. The goals were the four modernizations (agriculture, industry, science and technology, defense) and a dramatic increase in economic growth. Farmers benefited first when the communes were replaced with the Household Responsibility System, under which individual families again had responsibility for many decisions in the management of agriculture and rewards related directly to their success in production. The state increased produce prices and allowed the revival of private markets.

In 1980, Special Economic Zones (SEZs) were established in China's south, where foreigners, overseas Chinese especially, could invest in manufacturing for export. After the SEZs proved successful, efforts to attract foreign investors spread widely. The state also began gradually relaxing controls on private business. Rural industries built by communes for self-reliance assisted rapid rural industrialization, because their products could be sold at the revived rural markets or exported. Township and village enterprises (both village and privately owned) are now a major feature of the Chinese economy. State-owned enterprises have dramatically declined in importance and efficiency, and most are now heavily indebted and a drag on the economy. The CCP's reform and opening-up policy marked a shift from autarky. The intent was not to abandon Communist ideals but to create a socialism with Chinese characteristics, which proved itself by building national strength and raising living standards.

The changes created by reform have created major dilemmas for the CCP and its ideology. China is now

a major economic power, but only after abandoning most tenets of its original ideology and retreating from full socialization of ownership to mixed ownership and markets. In 1987, Zhao Ziyang justified the CCP's return to a New Democracy-type economy by declaring that China was in the initial stage of socialism and that full socialism could be achieved only when all the productive forces were fully developed and modernized. This formulation was reinforced by the 1992 promulgation of the concept of the socialist market economy, under which the declining state-owned sector coexists with cooperatives and foreign-owned and joint-venture businesses as well as, increasingly, Chinese privately owned enterprises.

In 1980, Deng Xiaoping had mooted major political reforms after blaming feudal and undemocratic traditions for the overconcentration of power in one person, which resulted in excesses like the Cultural Revolution. Deng advocated a separation of the roles and powers of the CCP and government and called for more people's democracy and debate in the party itself. A party theorist, Liao Gailong (b. 1919), promoted reforms, including direct elections at all levels and a two-house national parliament—one for regions and one representing economic interests—but with the CCP maintaining overall power. Deng's ideas and Liao's corporatist proposal were forgotten after the rise of Poland's Solidarity trade-union movement highlighted the threat of relaxing controls over mass movements by demonstrating how such movements could easily become dangerously politicized and threaten CCP rule.

A similar fate befell Zhao Ziyang's modest late-1980s proposals to build socialist democracy, a broadening of representation and participation in the political system by new groups and experts in particular areas, by developing the national and lower-level People's Congresses and by expanding united-front work and its public face, the Chinese People's Political Consultative Conference. While the congresses are elected and have nominal power to make decisions, conference representatives are appointed. They can only review laws and policies and can only make recommendations to the government, the CCP, and public organizations. The student movement of April–June 1989, during which student demands for better living conditions, jobs, and less corruption, escalated to calls for an undefined democracy; the army violently suppressed the protests on 4 June 1989. Zhao was sacked for his sympathy for the students' demands, and his reforms were dropped.

The current leader, President Jiang Zemin (b. 1926), endorses Deng Xiaoping's four cardinal principles:

upholding the socialist path, proletarian dictatorship, leadership of the CCP, and Marxism-Leninism-Mao Zedong thought. While maintaining CCP dominance, these principles leave little room for democratization. The party repeatedly campaigns against bourgeois liberalization (any calls for Western-style political reforms) and spiritual pollution while promoting construction of an ill-defined socialist spiritual civilization and nationalism as counterweights.

The Future

Since 1987, there have been incremental improvements in village elections, and in 2000 there were indications that this experiment would be extended to towns. There have also been steady improvements in China's legal system, but toward establishing rule-by-law rather than a rule-of-law that would better guarantee the rights of Chinese citizens as written in the Chinese constitution. This development and China's accession to the World Trade Organization will promote rule-based decision making over arbitrary fiat.

Among possible indications of the direction of future change are experiments in Hainan Island and Shenzhen to develop a "small state, big society" in which groups themselves, rather than the state, police their own members. In February 2000, President Jiang Zemin began promoting the CCP as being the representative of advanced forces of production, of the fundamental interests of the broad masses, and of advanced culture. These three forces could all be used to advance radical change, including fundamentally altering the political system and the CCP itself. Only the future will tell whether the CCP can attempt such change and succeed.

COMMUNISM—NORTH KOREA The core of the original North Korean communists consisted primarily of Koreans who lived out the Japanese occupation in either the Soviet Far East or in various parts of China. Upon Japan's defeat they returned to Korea and organized into the Korean Workers' Party (KWP); factions grew among KWP members based on their colonial-era locations as refugees. The party served as the nucleus of the communist state since its inception in 1948. Following the Korean War, in 1955 Kim Il Sung (1912–1994) unified the factions through successfully purging his opposition. Throughout the remainder of his life he strengthened his power base through building a near-religious cult, his name appearing on everything from flowers to universities. His "on-the-spot guidance" and that of his son Kim Jong Il (b. 1942), it was reported, helped strengthen North Korea's industrial, educational, and military sectors. He initiated mobilization campaigns, similar to China's Great Leap Forward, to stimulate labor toward increased production. Kim Jong Il officially inherited the elder Kim's titles in 1994 following Kim Il Sung's death; the son (and the North Korean people) had been preparing for this transition from the 1980s.

Bruce Cumings describes this form of communism as "socialist corporatism," a political system built around a social family (Cumings 1998, 398). The glue holding this corporate family together is the ideology of *chuch'e* (or *juch'e*), a term that has most often been translated as "self-reliance" but behaves closer to the idea of "self-determination." This thinking was obvious in the 1960s with the Democratic People's Republic of Korea's (DPRK's) success in playing off the two communist giants, the USSR and China. It is seen in the dynamics of the DPRK in its negotiations with the United States. The KWP remains to this day the central organizing body of North Korean communism.

COMMUNISM—VIETNAM Communism in Vietnam developed in the context of Vietnam's anti-colonial struggle against France, the growing Sino-Soviet ideological and military conflict, and Vietnam's localization of foreign influences.

The political memorial billboard at Reunification Palace in Ho Chi Minh City in 1996. (STEPHEN G. DONALDSON PHOTOGRAPHY)

Communism was adopted in Vietnam as an anti-colonial solution. Ho Chi Minh (1890–1969), founder of the Vietnamese Communist Party and father of Vietnam’s independence, noted that it was patriotism rather than communism that led him the ideas of Lenin. This approach remained valid into the 1950s during Vietnam’s war with France and into the 1960s and 1970s during Vietnam’s war with the United States. Although Leninism was often cited in Vietnamese Communist writings, the Communist system that developed in Vietnam was mainly shaped by Stalinism and Maoism. The Vietnamese Communist movement adhered to the Moscow line in the 1930s, adopted the Maoist model of guerrilla warfare in the late 1930s, and executed Stalin’s suggestion of, and the Maoist model of, land reform in the 1950s. The government in Hanoi vacillated between Moscow and Beijing in the 1960s, culminating in an internal conflict that is called the “revisionist” incident. Hanoi clashed with Beijing between 1979 and 1991 over Cambodia and moved closer to the Soviet bloc.

Tensions in Vietnamese Communism

Throughout the history of the Communist period, however, there was not only conflict between the Stalinist and Maoist models of socialist development but also between Communism as a foreign ideology and Vietnamese political tradition, three salient elements of which were patriotism, Confucianism, and village

culture. This conflict with Vietnamese political tradition can be seen in several examples: (1) Ho Chi Minh’s conflict with the Moscow-led Comintern in 1930, when he named the Communist party he founded the Vietnamese Communist Party instead of the Indochinese Communist Party (though the name was later changed); (2) his drafting a political thesis that did not advocate the Moscow line of class struggle; (3) the founding of a united front organization known as the Vietnam Independence League, or Viet Minh, that incorporated every sector of society; (4) the dissolution of the Indochinese Communist Party in 1945 after the revolution; (5) the public apology for the mishandling of land reform in the mid-1950s; and (6) the absence of the use of brutal force as a means to develop socialism or to deal with political opponents.

Confucianism and Communism

Ho Chi Minh relied on Confucian concepts and terms in introducing, recasting, and propagating Communist ideological concepts, making the latter more compatible with Vietnam’s Confucian-based tradition. Presented in Confucian terms, Ho’s revolutionary ethics consisted of the five principles of *nhân* (humanity), *ngĩa* (duty), *tri* (knowledge), *dũng* (courage), and *liêm* (integrity). Selected elements of village culture were incorporated into the new socialist discourse. One aspect of village culture selected was the image of the peasant family as a stable social unit

engaged in agricultural activities. Internal family relations were marked by equality, reciprocity, and mutual sacrifice, and family work was characterized by equal distribution of responsibilities. These aspects of family relations were extended to govern relationships among friends and in society at large.

The Development of Vietnamese Communism

The Vietnamese Communist movement was founded in 1930 by Ho, then known as Nguyen Ai Quoc. Since then, the movement has assumed several names: the Vietnamese Communist Party (February–October 1930), the Indochinese Communist Party (1930–1945), the Vietnam Worker Party (1951–1976), and the Communist Party of Vietnam (1976–present). The revolution that broke out in August 1945 can be considered a war for independence. It was not until the years 1949–1950 that the war became a socialist revolution. This development unfolded in the context of intensified military conflict with France in the 1940s and 1950s, the crystallization of the Cold War in the 1940s and 1950s, and the victory of the Communists in China's civil war in 1949. Politically, signs of a socialist revolution were seen through the revival of the Indochinese Communist Party under the name Vietnam Worker Party in 1951 and a rise of absolute party control over the state apparatus. Economically, socialist development can be seen in the land reform of 1954–1956, in the collectivization of agriculture and nationalization of domestic industries beginning in the late 1950s, and in the imposition of central planning in the 1960s. In the intellectual realm, Maoist practices of ideological rectification were imported into Vietnam in 1949–1950, and the period between 1953 and 1956 was one in which peasant-based political and economic ethics penetrated the content of every type of writing. This intellectual trend led to conflicts between the party-state and intellectuals known as the Nhan Van Giai Pham Affairs in the mid-1950s.

Communism in South Vietnam

Until 1975, Communism developed only in Vietnam north of the seventeenth parallel, in the area known as the Democratic Republic of Vietnam, or North Vietnam. Communism was imposed on the South only after reunification in 1975. The Hanoi regime moved to collectivize agriculture, nationalize industries, and control wholesale and retail trade. In the south, agricultural collectivization did not succeed because by the mid-1970s the distribution of land ownership had already become fairly egalitarian; the Hanoi government's agricultural collectivization turned out to be an attack on the interests of the mid-

dle-income and rich peasants who had benefited from the land distribution policy of the National Liberation Front for South Vietnam in the 1960s. The government's move to nationalize industries and control retail and wholesale trade disrupted production and supply in the south. Severe economic crises resulted and led to the practice of "fence breaking," whereby production units spontaneously violated rules and regulations. The party-state responded by endorsing policies to reform the socialist system.

The reform process can be divided into two phases. The first phase lasted from 1979 to 1985, when reforms were carried out within the framework of central planning. Measures adopted included the endorsement of the concept of a multisectoral economy in 1979 and subsequent reform policies in the areas of foreign trade, agriculture, industry, and the pricing system in the early 1980s. The second phase lasted from 1986 to 1989. In 1986, the Sixth Party Congress endorsed a policy of reform known as *doi moi* (renewal), calling for abolition of the central planning system. Major policies put forth during this period included the promulgation of a law dealing with foreign investment in 1987, the call for withdrawal of troops from Cambodia in 1987, the decollectivization of agriculture in 1988, and abolition of the two-price system in 1989.

Vietnamese Communism's contribution to the process of national liberation and its localized nature helped legitimize the authority of the Vietnamese Communist Party in the face of the collapse of Communism in the Soviet Union and Eastern Europe and the challenge to Communism in China between 1989 and 1991.

COMMUNIST PARTY OF BURMA Despite failing to gain power, the Communist Party of Burma (CPB) was a major influence on political life in Myanmar (Burma) during the twentieth century. Marxist ideology played an important role in the national liberation struggle, leading to the formation of the CPB by a cell meeting of underground leaders in 1939. The most famous of these, Aung San (1915–1947), subsequently left the party over political differences, but CPB membership grew rapidly during resistance to the Japanese occupation (1941–1945). At one stage, the CPB was reputedly the strongest organization within the coalition Anti-Fascist People's Freedom League (AFPFL) that later led the country to independence.

Ideological differences, however, caused the CPB to walk out from the AFPFL in 1946, and, in March 1948, the party began armed insurrection. Inspired by communist victories elsewhere in Asia, CPB militia seized control of vast central areas of the country with the aid of several senior commanders in the Burmese army who deserted with their troops. In the Chin-Arakan borderlands, a smaller "Red Flag" faction, headed by Thakin Soe (1905–1989), gradually dwindled in strength, but the mainstream "White Flag" party, led by Thakin Than Tun (1911–1968), remained a considerable thorn in the government side for many years in central and southern regions of the country. Staging frequent guerrilla raids, it also enjoyed the support of both trade union and student activists in the towns.

In the mid-1960s, an internecine "Cultural Revolution" saw the party take a dogmatic turn towards Maoism, which was modeled on developments in China. This precipitated the deaths of Than Tun and other key leaders in a series of violent incidents. However, following anti-Chinese riots in Yangon (Rangoon), the CPB was able to open a major new front along the Chinese border in 1968 with full-scale military backing from the People's Republic of China. In the following decade, the CPB's Northeast Command built up significant "liberated zones" in the Shan and Kachin States, with its own radio station and 15,000-strong People's Army. The scale of this new front compensated, in part, for the loss of the party's remaining base areas in the Pegu Yoma highlands during the mid-1970s.

The CPB's Northeast Command, however, was never able to break out from its strongholds along the China border. Here the CPB, which was mostly led by ethnic Burmans, clashed as often with ethnic insurgent forces as with government troops. Eventually, it was ethnic dissatisfaction that led to mass mutinies from the CPB's People's Army and the party's virtual

collapse in 1989. Thakin Ba Thein Tin (b. 1914) and the party's veteran leaders retired into China, and during the 1990s only a few loyal cadres were occasionally reported to be still active inside Myanmar.

CON DAO ISLANDS The Con Dao Islands consist of fourteen islands located southeast of Vinh Loi off the coast of southern Vietnam. Until the eighteenth century, there were no permanent settlements or inhabitants on the islands. In 1702, Britain's East India Company established a base on Con Son (Poulo Condore), the largest island on the archipelago. The British ultimately left following a rebellion, and France took possession of the islands in 1861. On Poulo Condore, the French found a prison with 119 inmates of Vietnam's Hue government. The French continued to use the island as a prison, which they expanded on over the course of their rule in Vietnam.

A great number of Vietnamese patriots and revolutionaries, such as Phan Chu Trinh, Luong Van Can, and Le Duan, served time on Poulo Condore, earning the prison the reputation of being a "revolutionary training ground." By 1934, there were at least 2,700 Vietnamese prisoners on the island.

Following France's defeat in 1954, Poulo Condore continued to be used as a prison by the government of the Republic of Vietnam. In 1993, Poulo Condore became a national park and the archipelago now boasts a population of about 1,500 residents. There are plans to further develop the area for tourism.

CONFUCIAN ETHICS Confucian ethics is best understood as a contextualistic virtue ethics based on self-cultivation. There are three general categories that are used to classify moral systems: absolutism, relativism, and contextualism. Ethical contextualism means that there are no absolute moral rules and that cultural customs or feelings cannot be blindly followed; alleged absolute codes or customs and feelings can serve only as guidelines. Each person must decide what is the best that she or he can do in that particular context to complete in action a higher value such as authenticity, love, or virtue. The philosophies of Aristotle, Confucius, and the existentialists and modern situation ethics are examples of ethical contextualism. Confucian ethics can be summarized as the art of contextualizing the practice of virtue.

Confucian ethics bears some similarity to Aristotelian ethics. Both are virtue-based systems (virtue ethics refers to the moral quality of one's character or personality as opposed to merely obeying moral rules), which acknowledge that there are no fixed and binding rules to govern the moral life. Rather a person must be well trained and habituated to weighing the relative value of actions in specific situations in regard to particular persons.

Confucians and Aristotelians soon part company, however. Aristotle held what has been called the doctrine of the golden mean, namely, that most of the virtues are at the midpoint between the extremes of deficiency and excess. Regrettably, *Zhongyong* ("centrality and commonality") was misleadingly translated as the Doctrine of the Mean, allowing for superficial comparisons. The Confucian concept of "centrality" refers to the condition before feelings of pleasure, anger, sorrow, and joy are expressed; clearly it is not the mean between extremes.

Confucius and Before

Confucian ethics began long before the time of Confucius (551–479 BCE). It was rooted in the clan values of the early Zhou dynasty (1045–256 BCE) aristocracy. Confucius was both a traditional and an innovative thinker; he breathed new life into the traditional aristocratic clan ethics of the Zhou. Confucius's innovation was that he sought to transform aristocratic values and practices into everyday practices and values for com-

mon people. Thus, he reinterpreted the label for "prince" (*junzi*, "the son of the ruler") to mean any person who achieves the status of being a noble and moral example for others, that is, a "prince of virtue."

Although Confucius had his gender biases, the content and practice of his moral teachings are similar to those of the feminists who advocate a contextual care ethic. Speaking very generally, Confucius, like the feminists of care, was concerned about interpersonal relationships founded on love and affection; his known writings contain nothing of an ethics based on impersonal duty. In the writings of both Confucius and certain feminists, moral values are learned at home by participating in a morally healthy parent-child relationship. The writings of Confucius emphasized the father-son relationship rather than the feminist mother-child relationship, but both advance the importance of proper child rearing for the cultivation of a moral personality that learns to contextualize values and actions in particular situations in relation with unique persons.

All Confucians agree that moral education begins at home. Only after a child learns filial respect for parents and brotherly love for siblings can he or she be expected to extend respect and love beyond the family. Methodologically, filial piety (*xiao*) is primary; ontologically, person-to-person care (*ren*, usually rendered as "benevolence" or "humanity") is the significant trait of being human. To be a caring person is to be a moral example or moral authority for others to follow. After proper rearing, a person needs instruction from a Confucian teacher to develop his or her practice of caring. This instruction focuses primarily on literary achievement (*wen*); memorizing the Four Books (four ancient and venerated Confucian texts), large sections of the Five Classics (also important Confucian texts), and other important Confucian works; and learning Confucian rituals and music so as to habituate the student in the practice of being virtuous.

The Confucian virtues are best understood in terms of actual human behavior, rather than intellectual beliefs. Confucians, both past and present-day, are concerned with the practice of taking care of others, not the abstract idea of care. The five constant virtues are person-to-person care (*ren*), ritual action (*li*), rightness (*yi*), trustworthiness (*xin*), and moral wisdom (*zhi*). Person-to-person care is defined as "love" in the *Analects*. Confucians do not advocate random acts of love; all of the virtues must be practiced according to the requirements of ritual action. Confucian society is one of ritual order, not legal order.

The art of contextualizing the virtues in practice is clearly expressed in being a person of rightness (*yi*).

Although the examples of the ancient sages serve as a guide, there are no absolute standards of rightness. Rightness entails doing the right thing to the right people at the right time in the most appropriate manner. Confucius invested a lot in trustworthiness (*xin*); exemplars of the moral must stand by their words. They must practice before they teach others, and they must teach only what they themselves have practiced.

Even moral wisdom (*zhi*) should be understood in terms of practice, or doing the right thing, rather than merely knowing what should be done. It is bolstered by the virtues of literary accomplishment (*wen*) and studiousness (*xue*). Any virtue may have to be practiced with bravery (*yong*). The virtues of reverence (*jing*) and sincerity (*cheng*), only briefly mentioned by Confucius, were developed by later Confucians and were understood to be part of the structure of the universe.

Mencius and Later Philosophers

Where the writings attributed to Confucius were primarily concerned with the practice of moral behavior, those attributed to Mencius (372?–289? BCE) understood the cardinal virtues to constitute the operations of the human heart-mind. While the writings of Mencius and Xunzi (c. 310–213? BCE) disagreed on the natural goodness of humans, with Mencius claiming that people are basically good and Xunzi that they are basically deviant, both emphasized the importance of proper rearing, education, and ritual action for the correct expression of moral virtues. It was not until Zhou Dunyi (1017–1073) and Zhang Zai (1020–1077) revitalized the study of Confucianism that all the Confucian virtues came to take on a cosmological as well as a social moral role. To the extent that Korean, Japanese, Vietnamese, and other Southeast Asian cultures adopted and adapted Confucianism, they also accepted and transformed Confucian ethics to meet their social and moral needs.

CONFUCIANISM—CHINA The system of thought known as Confucianism derives its name from the highly esteemed teacher and sage Confucius (551–479 BCE), or Kong Fuzi (Grand Master Kong). Confucianism includes the complete literature, practices, and teachings of the traditions which align themselves with Confucius. It is interesting to note that in the Chinese language there is no equivalent expression for Confucianism. The Chinese refer to specific thinkers or trends; for example, they refer to the *Kong-meng shi xue* (teachings of Confucius and Mencius) or to the Song- and Ming-dynasty study of principle (*Song Ming lixue*), which is called "Neo-Confucianism" in English. When bibliographers of the Han dynasty (206 BCE–220 CE) codified the books in the imperial library, they classified the works of Confucius and his followers under the heading "Literati."

The basic teachings of Confucianism stress the importance of education for moral development of the individual so that the state can be governed by moral virtue rather than by the use of coercive laws.

Syncretism in Confucianism

It is often said that traditional China was a Confucian society or that Confucianism was the official state religion and philosophy of China before the twentieth century. Such claims are misleading overgeneralizations. First, the syncretic nature of both early and later Confucian thought must be understood. Second, the hybrid syncretic character of later state-sanctioned Confucianism must be explained.

Generally speaking, East Asian cultures, philosophies, and religions are syncretic or composite in nature. Because of their practical orientation, they do not place great store in exclusive ideas or practices, but rather prefer to absorb and integrate whatever proves useful or satisfying. This is especially true of Chinese culture and philosophy, and is in large part the reason why the dynastic system was effective and long lasting.

What made the teachings of Confucius so compelling and attractive to so many thinkers for over 2,500 years is their syncretic amalgamated content and character. Confucius, his disciples, and most of the later followers celebrated and incorporated various forms of literature. They emphasized poetry, history and legend, divination, music, and ritual. They integrated

self-cultivation and virtue with the notions of harmony and a political philosophy of rulership. The Confucian curriculum was well rounded and eclectic, consisting of the six arts: ritual, music, archery, charioteering, calligraphy, and mathematics. Confucius also advocated that any serious student, even a commoner, should have some training in military arts. The Confucians assumed that the masses would be vigorously engaged in agriculture and related industry. In this regard, the Confucians incorporated agricultural skills into their social program, though they did not place great emphasis on these because they were far more concerned with moral cultivation.

Given the number of shared values found in the *Analects* (*Lunyu*) of Confucius (one of the basic texts of Confucianism) and the *Daodejing* (one of the basic texts of Taoism) it is likely that those who later generations labeled as Confucians and Taoists originally shared a common ground. Both stressed the significance of self-cultivation, acknowledging the need for special training that would make one a true and better person. Although the Confucians emphasized the human-to-human relationships and the Taoists underscored the human-to-nature affinity, nevertheless the writers of the *Zhongyong* (Centrality and Commonality, another basic text of Confucianism) reasserted the importance of the relationship between humans and nature in Confucianism. In their emphasis on the mutual complementarity of opposites (such as yin and yang), Confucianism and Taoism have borrowed and absorbed ideas and practices from each other, increasing their respective longevity and profundity.

Borrowing from the statesmen who debated and were concerned about properly naming job titles and evaluating job performance, Confucius and others, especially Mencius (372?–289? BCE) and Xunzi (310–213? BCE), delineated the meaning of the "rectification or attunement of names" (*zhengming*). This was important because knowing the precise name for one's position in the world (as prince, for instance, or father, or son) let one know one's duties and responsibilities.

Superficially speaking, the Confucians appear to have been most at odds with the Legalists (*fajia*), who advocated a rigorous notion of the rule of law—as opposed to the Confucian notion of rule by example. Although Confucius, Mencius, and Xunzi advocated ruling the people with virtue by setting a moral example, they certainly recognized the need for law. Tradition has it that when Confucius was the chief of police, even he had to authorize the execution of a criminal. The Confucians, like the Legalists, wanted to standardize a code of human conduct, but the Legalists sought to do so by instituting public law,

whereas the Confucians placed greater emphasis on instituting a homogeneous system of ethics to govern human interactions, holding the law in reserve for when egregious behavior occurred.

It is clear, then, that Confucius did not create a pure philosophical system; he borrowed from various approaches. The followers of Confucius likewise absorbed elements from the other schools of philosophy to bolster their interpretation of Confucius.

Mencius and Xunzi

Mencius is noted for advancing Confucius' teachings. Confucius was concerned with the details of proper moral behavior; Mencius advocated a more abstract philosophy, focusing on goodness of human nature (*xing*) and the development of the mind (*xin*). Although Mencius had syncretic tendencies, he also vehemently attacked other philosophers, including the early Taoist Yang Zhu (c. late fourth century BCE); Mozi (479–438 BCE), the founder of Mohism, a philosophy that stressed universal love; and Xu Xing (c. late fourth century BCE), who argued that a king should labor in the field alongside his subjects. (Mencius answered that the king should concentrate on ruling and leave agriculture to the farmer.)

A century later, Xunzi revitalized Confucian teachings by invigorating them with practical political measures such as economic means to enrich the state and placing greater emphasis on public law. Xunzi is noted for soundly attacking Mencius' idea that human nature is basically good; on the contrary, Xunzi argued that people are basically selfish given limited resources, but that they can be trained to be good through the practice of ritual action and education. Xunzi's approach dominated Confucian thinking from the Han dynasty to the Song dynasty (960–1279). During the Song dynasty, Mencius' philosophy was used to develop Neo-Confucianism.

Syncretism and State-Sponsored Confucianism

The syncretic approach to philosophy and the arts of rulership became especially popular toward the end of the Warring States period (475–221 BCE) and during the first portion of the Han dynasty (the so-called Western Han; 206 BCE–8 CE).

After the short-lived Qin dynasty (221–206 BCE), the Han emperors continued to grapple with the problem of systematizing political philosophy and the arts of rulership. During the reign of Emperor Wu of the Han (156–87 BCE) Dong Zhongshu (c. 179–104 BCE) constructed a composite syncretic form of Confucianism that became the state-sanctioned philosophy. Dong

was a Confucian in that he praised Confucius and generally adhered to the Confucian ideas of self-cultivation and rule by virtue, but he effectively integrated aspects of the Five Phases philosophy (a philosophy of the mystical composition of the universe out of five elements), Taoism, and Legalism into Confucianism. Dong established his philosophy on a temporal order, and explained history and dynastic succession in terms reminiscent of the Five Phases, although he delineated only three stages. The authoritarian structure of his sociopolitical philosophy made it attractive to Han rulers. Dong advocated the "three bonds" in which the king rules the people, the father disciplines the son, and the husband provides for the wife.

After the Han dynasty, the intellectual life of Confucianism stagnated, becoming a lifeless dogma for nearly seven hundred years. In the Tang dynasty (618–907), Han Yu (768–824) reawakened Confucianism with his study of the moral way (*daoxue*), claiming that he had received the correct transmission of the teachings via Mencius; he rejected Xunzi and emphasized the goodness of human nature.

Zhou Dunyi, the Cheng Brothers, and Zhu Xi

A Tang-dynasty Taoist alchemical document called the Diagram of the Great Ultimate (*Taijitu*) was transmitted to Zhou Dunyi (1017–1073) in the Song dynasty. Zhou Dunyi wrote a short but profound work on that document, in which he linked the moral nature of human beings with the nature of the universe, putting forward the notion that the goodness of human nature is part and parcel of the moral goodness of the universe. Zhou was also influenced by Buddhism, especially Zen. He also taught the Cheng brothers.

Cheng Hao (1032–1085) and his younger brother Cheng Yi (1033–1107) developed Zhuo's idea of a universal principle (*li*) inherent in all things, making it the cornerstone of their respective philosophies and the main concept of Song-dynasty Neo-Confucianism. They proposed that the proper subjects for study were principle (*li*) and human nature (*xing*) and that ultimately human nature was identical to principle. For them, the investigation of things is crucial for self-cultivation. They asserted that the universe is a process of giving life and that the life-giving principle is goodness. They influenced the Neo-Confucian scholar Zhu Xi (1130–1200).

Zhu Xi systematized the teachings of Zhou Dunyi and the Cheng brothers. Zhu Xi argued that reality consists of two components: principle (*li*) and material force (*qi*). Principle is the form of all that exists,

while material force fills and activates things. Zhu said that human nature is basically good because it is endowed with the principle (*li*) that is goodness. People learn to be bad, and so the purpose of education is to retain the good principle in one's original nature and remove acquired pollutants. Zhu Xi sided with the rationalistic tendencies in Cheng Yi's philosophy, and what is called the Cheng-Zhu school of Neo-Confucianism dominated China for several hundred years. Zhu Xi debated with Lu Xiangshan (1139–1193) who supported the idealistic tendencies in Cheng Hao's philosophy. Lu did not emphasize human nature the way Zhu did. Instead, Lu focused on the human mind, advocating that it is one with principle. For Lu, the investigation of things meant the study of the mind. Lu argued for the unity of the Way (*tao*), opposing Zhu's distinction between principle and material force.

Confucianism in the Ming and Qing Dynasties

In the Ming dynasty (1368–1644), Wang Yangming (1472–1529) developed the idealism of Lu Xiangshan. The reader should note that in philosophy "idealism" means that reality is in the mind, or in the ideas of the mind; it does not denote a perfect (ideal) world. Wang championed the School of Mind (*xinxue*), in contradistinction to Zhu's School of Principle (*lixue*). Wang argued that anyone could become a sage because everyone possesses a mind that contains innate knowledge of the good. This innate goodness extends outward, starting with a natural love for oneself and one's family, extending to one's community, and then outward to all other people, creatures, and things. Wang is also well known for advocating that knowledge and action form a unity. The purposeful character of his philosophy influenced later thinkers such as Tan Sitong (1865–1898) and Sun Yat-sen (1866–1925).

In 1644, the Manchus conquered China, establishing the Qing dynasty (1644–1912). Under foreign occupation, Chinese government officials were marginalized, and many turned to scholarship and the study of Confucian philosophy to avoid criticism or punishment by the Manchus. Dai Zhen (1724–1777) and Kang Youwei (1858–1927) are two important Confucians of the Qing. Dai Zhen dedicated his life to studying the *Mencius* (the text associated with the philosopher of the same name). The rationalism of the Cheng-Zhu school was still popular in his day, but Dai Zhen boldly rejected it. Dai proposed that human morality had its origin in blood-and-material force and the knowing mind. He argued that principle only exists when the feelings are not mistaken. Kang Youwei accepted a basic tenant of the Lu-Wang school that book learning must be complemented with profound

action. He was a learned scholar, and he also advocated social and political reform. Kang understood Confucius to be an innovative institutional reformer. He also proposed that Confucius was a divine being or god, and the founder of a great religion. Borrowing an expression from the Mencius, Kang argued that the core of human nature was the mind that cannot bear to see the suffering of others. Kang adapted Dong Zhongshu's idea of the three ages and modified it into a theory of historical evolution, proposing that human history begins with an Age of Disorder, followed by an Age of Small Peace, and culminating in an Age of Great Peace. In the Age of Great Peace, everyone and everything will be treated exactly the same; there will be one humanity, one world order, one great unity (*datong*).

Confucianism in the Twentieth Century

In the twentieth century, Feng Youlan (1895–1990) revitalized rationalistic Neo-Confucianism. He argued that everything that exists is undergoing a continuous process of realizing principle (*li*) by means of material force (*qi*). He proposed that humans live in one of four spheres of life: the innocent sphere, the utilitarian or practical sphere, the moral sphere, and the transcendent sphere. Philosophy, he contended, assists people to live in the last two higher spheres of life. Xiong Shili (1883–1968) reconstructed idealistic Neo-Confucianism. Xiong advocates that reality is change, a perpetual process of production and reproduction, or closing and opening. By closing, Xiong means that reality has the tendency to integrate, to momentarily be what we call matter. By opening, he means that reality has the tendency to maintain its own nature, to be its own master, what we can temporarily call mind.

When Mao Zedong (1893–1976) and his Communist followers won the civil war in 1949, Confucianism and Confucius were strongly attacked. Feng, Xiong, and all other scholars were forced to denounce Confucius and their own decadent views. The Communist Party became far more tolerant of Confucianism after the Mao's death, such that by the 1990 party propaganda began to cite the ideas of Confucius or his followers. In addition, there are still in both Taiwan and the West practicing Confucianists.

CONFUCIANISM—JAPAN The ideas of the great Zhou-dynasty Chinese philosopher Kong Qiu (551–479 BCE), or Confucius, as he is known in the West, diffused to the Korean kingdoms nearly a millennium later, in the early fourth century CE. A century after that, in 405, these ideas were brought to Japan by scholars from Paekche, the southernmost of the Korean kingdoms. It was not until the latter part of the next century, however, as the Yamato state began to solidify its rule, that Confucianism really took hold in Japan. Confucian scholars accompanied the Buddhist missionaries sent by the king of Paekche to the Yamato court, and by the reign of Empress Suiko (593–628), the Confucian classics, in combination with Mahayana Buddhist theology preached by the Korean missionaries, had become the foundation of the nascent imperial regime. The man who accomplished

this synthesis was one of the most important figures in Japanese history, Suiko's regent and kinsman, Shotoku Taishi. Prince Shotoku's famous "Seventeen-Article Constitution," the goal of which was to provide the basis for a harmonious and hierarchical political system centered on the imperial monarchy, was in large measure based on Confucian precepts.

The *Junzi* and the Ideal of *Ren*

The essential idea of Kong Qiu's teachings is that the source of all morality is filial piety, that is, a child's absolute respect for and loyalty to his parents. This, in turn, is reflected in the relationship between the ruler and his subjects, with the ruler the equivalent of the morally upright father. One must cultivate virtue at all times so as to become a "superior man," or *junzi*. The most important component of the "superior man" was *ren* (or *jin* in Japanese), which can be defined as benevolent altruism. The virtuous ruler is one whose behavior is suffused with *ren* and who commands the loyalty and obedience of his subjects, not by terror, but by example and by enlightened benevolence. Moral training was to be exclusively the province of the father/male ruler; indeed, women play hardly any role in traditional Confucianism.

These ideas are contained in a series of classical texts, including the *Yi jing* (Book of Changes), an ancient divinatory manual that Confucius was believed to have edited; the *Shu jing* (Book of Documents); the *Shi jing* (Book of Songs); the *Chun qiu* (Spring and Autumn Annals); and, most importantly, the *Lun yu* (Analects), a collection of sayings by Confucius and his disciples. Until modern times, when they were finally translated into the vernacular, these texts were studied by Japanese scholars in classical Chinese.

Confucianism in Ancient Japan

In addition to contributing to the Seventeen Article Constitution, Confucian ideas influenced the Taika Reform (646), which abolished all private ownership of rice lands and called for the establishment of a permanent capital and an elaborate administrative bureaucracy on the Chinese model. Indeed, several of the scholar monks who engineered the coup d'état of 645 had spent time in China studying Confucianism, as well as Buddhism, and the resulting *ritsuryo* system, in which land was periodically redistributed according to need, was based on Confucian principles. So was the Taiho Code of 701, which set up a bureau that was charged with performing divinatory rituals according to the Confucian model. Another manifestation of Confucianism in ancient Japan was the appearance of

historical chronicles, such as the *Kojiki* (Record of Ancient Matters, 712) and *Nihonshoki* (Chronicle of Japan, 720). Chinese Confucianism placed great value on historical scholarship, as it could provide lessons on proper statecraft and the moral behavior of rulers. By ordering the compilation of national histories, Japan's newly established Nara regime (710–794) sought to establish its authority and legitimacy.

Neither China's intensely patriarchal family structure nor the Chinese model of a bureaucratic elite steeped in the Confucian classics ever took firm root in Japan; however, filial piety and a profound respect for education and the teacher (*sensei*) became integral elements of Japanese culture and have continued to shape the Japanese worldview.

Medieval Japan and the Tokugawa Period

During China's Song dynasty (960–1279) Confucianism underwent a radical reformation. The chief figures were the Cheng brothers: Cheng Hao (1032–1085), Cheng Yi (1033–1107), as well as Zhu Xi (1130–1200) and Wang Yangming (1472–1529), who shifted the focus of Confucianism from ritualism and virtuous rulers to individual ethical and spiritual enlightenment and, in the process, added a mystical, quasi-religious aspect to the tradition. This reformed Neo-Confucian tradition was transmitted to Japan in the late twelfth and early thirteenth centuries, primarily by Zen monks who had studied in China, and it soon came to play a role in the samurai-based society that took shape during the Kamakura (1185–1333) and Muromachi (1333–1573) periods. The spiritual aspect of Neo-Confucianism helped reinforce the warrior mystique, as well as the ideal of absolute loyalty to one's master.

After the establishment of the Tokugawa shogunate in 1603, Neo-Confucianism received state sponsorship and became the official ideology of the *bakufu* (shogunal government). The Neo-Confucian emphasis on spiritual discipline, hierarchy, and social harmony was ideally suited to Tokugawa policy, the cornerstone of which was to rebuild Japanese unity under the benevolent but absolute authority of the *bakufu*, after centuries of internal strife. The Tokugawa also drew heavily on the concept of *ren*, as prolonged peace caused the samurai to evolve into a class of gentlemen bureaucrats broadly analogous to those who traditionally managed affairs in China and Korea. The Confucian ideal of the scholar-administrator led the regime to subsidize schools in each of Japan's feudal domains; there local samurai could study the Confucian classics. In 1632, the third Tokugawa shogun,

Iemitsu, established a shrine to Confucius in the capital, and in 1704, the *bakufu* constructed the only Confucian temple in Japan in what is now the Hongo district of modern Tokyo.

The Confucian Legacy

After the Meiji Restoration in 1868, when the center of power in Japan shifted once again to the imperial monarchy and Japan began to absorb Western philosophical, religious, and ethical ideas, the importance of Confucianism waned briefly. However, as the new regime crystalized, especially after the Imperial Rescript on Education (1890), Confucianism once again came to play an important role by defining the filial relationship between the emperor and the nation. Indeed, in the early 2000s it still permeates almost every aspect of Japanese culture, at least to some degree, from the persistence of filial piety and respect for teachers to the way corporations are organized and business conducted. Together with people in China, Korea, and Vietnam, the Japanese continue to be inspired by the teaching of Kong Qiu and his disciples.

CONFUCIANISM—KOREA Koreans are fond of bragging that Korea is the most Confucian country on earth. They note that over 230 Confucian academies are still open south of the border that divides North Korea from South Korea. They also boast that Confucianism has been an important part of Korean culture for at least 1,600 years. However, the Confucianism found in South Korea in the twenty-first century differs from the Confucianism that existed on the Korean peninsula a millennium and a half ago. Moreover, both forms of Confucianism differ from the Confucianism that dominated Korea during the five centuries of the Choson dynasty (1392–1910).

Early Confucianism in Korea

Confucianism originally entered Korea from China as an administrative tool. In the fourth century, two of the three kingdoms on the Korean peninsula at that time, Koguryo (37 BCE–668 CE) and Paekche (18 BCE–663 CE), established Confucian academies to teach lower-level government officials how to keep historical records and write diplomatic documents in the format and language used by Confucian government officials in China. The third kingdom, Shilla (57 BCE–935 CE), did the same in the seventh century.

This Confucianism was for government clerks. High government officials were not expected to have a Confucian education until the Koryo dynasty (918–1392). A substantial percentage of upper-echelon Koryo officials passed the Confucian civil-service examination after they had embarked on their careers in government. This suggests that a Confucian education had become an aid to promotion, although it was not yet required for an initial appointment.

The Koryo civil-service examination system was a modified version of the civil-service examination sys-

JONGMYO—WORLD HERITAGE SITE

A UNESCO World Heritage Site since 1995, Jongmyo in South Korea is the oldest remaining Confucian royal shrine in existence. Unchanged since the sixteenth century, sacrificial song, dance, and music rituals are still performed at Jongmyo.

Women musicians in traditional Korean Confucian costume perform at the Grand Ceremony at Chongmyo, the Royal Ancestral Shrine in Seoul. (NATHAN BENN/CORBIS)

tem of Tang-dynasty China (618–907). The men who took the Koryo examinations could choose to be tested either on their ability to analyze classical Confucian texts or on their ability to write essays and poems in the style of revered Chinese Confucian writers. Because most who sat for the examinations chose the composition track, Confucianism remained primarily a guide to good writing.

Neo-Confucianism in the Choson Dynasty

This approach changed in the Choson dynasty, which replaced the Koryo at the end of the fourteenth century. The Choson dynasty was Korea's first and only Confucian dynasty, and most entry-level government officials were required to pass a Confucian civil-service examination. This examination focused on policy and morality more than on literary style. In the preceding periods, Buddhism had dominated court ritual and ethical discourse. Confucianism was confined primarily to defining how official histories, government documents, and literary compositions should be written.

Confucian influence on Korean moral thinking before the fourteenth century, however, was not insignificant. Confucian moral rhetoric, particularly terms such as loyalty and filial piety, had penetrated Korea via the texts taught to government clerks in earlier periods. Confucian virtues had become an inextricable part of the Korean ethical discourse, but they

existed alongside, and often as a supplement to, the ethical principles of the official state religion, Buddhism.

During the Choson dynasty, Neo-Confucianism replaced Buddhism both inside and outside government as the principal arbitrator of how human beings should live. Neo-Confucianism, which Koreans called "the learning of human nature and principle," insisted that Confucian moral principles not only defined how human beings should interact with one another, but also defined what human beings were when they realized their full human potential. In other words, moral principles constituted human nature.

In order to help human beings realize that full potential, Neo-Confucianism offered two tools to replace the sutra study, chanting, and meditation Buddhism had offered. The first was ritual and etiquette, detailed prescriptions of how to behave in specific situations. The second was practical moral psychology, techniques for cultivating a moral character that could follow those prescriptions.

One of the more important guides to proper behavior during the Choson dynasty was *House Rules of Master Zhu*, a guide to household ritual and etiquette by the great Chinese Neo-Confucian Zhu Xi (1130–1200). Koreans became aware of this work near the end of the Koryo dynasty, but only in the Choson dynasty did it assume so much importance that family relationships were restructured to bring them more in

line with its prescriptions. According to Zhu Xi, only eldest sons could host ancestral memorial services. This contradicted the Koryo practice of letting younger sons and even daughters lead rituals honoring their parents and of letting younger sons and daughters inherit the property that provided enough income to host such rituals. In order to bring Korean ritual practices in line with Neo-Confucian ritual prescriptions, the Choson dynasty redefined the family to give priority to the eldest son, reducing the inheritance rights of younger sons and depriving daughters of any inheritance rights whatsoever.

Korean Neo-Confucians accorded as much importance to the cultivation of a proper mental attitude for such rituals as they did to the rituals themselves. The most effective approach to such character cultivation became a hotly debated issue in the sixteenth century. For the next three centuries, Koreans argued about whether to follow the advice of Yi Hwang (1510–1570, pen name T'oegye) or Yi I (1536–1584, pen name Yulgok). T'oegye recommended sitting in quiet concentration to rid the mind of disturbing self-centered emotions. Yulgok, on the other hand, encouraged his followers to cultivate an attitude of sincerity so that they always acted appropriately in whatever situation they found themselves, whether hosting an ancestral memorial service or advising their king.

Confucianism in Korea Today

When the Choson dynasty fell in 1910, Neo-Confucianism lost its institutional base and could not maintain its hegemony over government, ritual, philosophy, and ethics. Nevertheless, a century later, Korea still shows traces of its Confucian past. Koreans continue to mourn their ancestors with Confucian ritual, albeit modernized and simplified. And they continue to wield Confucian terminology in debates over ethical issues. Sixteen hundred years after Confucianism became established in Korea, Korea remains in many ways a Confucian country.

CONFUCIUS (551–479 BCE), Chinese philosopher. Confucius, whose family name was Kong and personal name was Qiu (stylized as Zhongni), is recognized as China's greatest teacher. He was eventually given the title "Kong the Grand Master" (Kong Fuzi), which has been Latinized as Confucius. He was born in the state of Lu (in Shandong Province), during the Zhou dynasty (1045–256 BCE). His father died when he was three; by seventeen, he supported his mother. Confucius married at nineteen, had two daughters and a son, and held a minor office in Lu. He dedicated his life to teaching, but believed he was called to reform the decaying Zhou culture. At the age of fifty-one, Confucius was promoted to magistrate and subsequently to minister of justice. Discouraged by conditions in Lu, at the age of fifty-six, Confucius and his closest disciples traveled to other states in search of a worthy ruler to implement his teachings. After almost thirteen years, Confucius returned to Lu to teach. Tradition claims that he wrote or edited the Five Classics (*Shujing*, *Shijing*, *Yijing*, *Chunqiu*, and *Liji*) and the now-lost classic of Music. Of the traditional three thousand students, only seventy-two mastered his teachings, and only twenty-two were close disciples.

After his death, Confucius's reputation underwent a process of apotheosis. By the time of Mencius (371–289 BCE), he was called a sage. Emperors of the Han dynasty (206 BCE–220 CE) made offerings at his tomb, which became a shrine and later a temple. He was given the imperial title "duke" in 1 CE, "foremost teacher" in 637, "king" in 739, and "perfect sage" in 1013. By 1906, the ritual for the "emperor on high" was performed in the name of Kong Fuzi.

Details of Confucius's life and teachings are found in the Four Books; among them, the *Analects* is most important. With typical "Chinese" humility, Confucius claims in the *Analects* to be a transmitter, not an innovator. This is certainly not the case, but it displays the importance of maintaining historical precedent, namely, following the example of the ancient sages for self-cultivation, to sacrifice personal needs and wealth for the good of the community and to rule by virtue rather than law.

Confucius was an innovative teacher. His school was open to all serious students, even commoners, transforming aristocratic values into collective moral values. His methods went beyond vocational training, emphasizing moral cultivation, which institutionalized the literati class and influenced Chinese history.

An undated portrait of Confucius. (BETTMANN/CORBIS)

Confucius emphasized literacy (*wen*) and demanded that his students be enthusiastic, serious, and self-reflective. His teachings are of a practical nature. He held that all persons, but especially the ruling class, must develop their moral integrity by practicing ritual action (*li*) to express person-to-person-care or humanity (*ren*) to become a consummate person (*junzi*). Empathy (*shu*), defined in the *Analects* as "never do to another what you do not desire," summarizes his teachings in one word. With the renewed interest in Confucius even in the People's Republic of China, his teachings continue to influence Chinese and Asian cultures.

CONNECTIONS. See **Guanxi**.

CONSTITUTION—INDIA One of the longest and most comprehensive documents in the history of modern Asian legislature, the Indian constitution has twenty-two parts, 395 articles, and twelve schedules that provide an enormous body of instructions and provisions that affect almost every aspect of Indian life.

Most of the framers of the Indian constitution had extensive experience in constitutional law during the British rule in India. Soon after India gained independence on 15 August 1947, its Constituent Assembly started working on constructing a constitution for a country beset by the centuries-old socioeconomic inequities of the caste system and the unsatisfactory postcolonial sharing of political powers between the central and provincial authorities. Ironically, the committee that wrote the constitution worked under an untouchable leader of India, Dr. Bhimrao Ramji Ambedkar (1893–1956), a law graduate from Columbia University, New York. The first draft constitution was published in February 1948. Its final version was officially adopted on 26 November 1949 but went into effect on 26 January 1950. Mohandas K. Gandhi (1869–1948) was not there to guide the framers of India's constitution while it was being written, but the ideals for which he had struggled were enshrined in it: liberty, equality, justice, and fraternity.

The Contents of the Constitution

The preamble states the solemn resolution of the people of India: that of turning the country into a sovereign socialist secular democratic republic that will secure social, economic, and political justice for all its citizens. It guarantees liberty of thought, expression, belief, faith, and worship; equality of status and of opportunity; and promotion of fraternity, securing the dignity of the individual, and the unity and integrity of the nation.

Articles in the twenty-two parts of the constitution mainly deal with the Indian union and its territories; citizenship; fundamental rights; principles of state policy; fundamental duties; the union government; the state governments; the *panchayat* (village council) system; city municipalities; tribal areas; relations between the central and state governments; finance, property, contracts, and suits; trade; commercial dealings within the territory of India; services under the union and the states; tribunals; elections; special provisions relating to certain classes; official languages; emergency provisions; miscellaneous matters; amendments to the

constitution; temporary, transitional, and special provisions. The authoritative text of the constitution is in Hindi.

Redressing Historical Inequity

India's constitution provides equal opportunity for all citizens regardless of their creed or color. Article 16 promises equal opportunity in matters related to employment or appointment for any office under the state. No citizen, therefore, shall be considered ineligible or discriminated on the bases of religion, race, caste, sex, descent, place of birth, or residence. Since the government of India, through its military and bureaucracy, is the largest economic provider in the country, Article 16 opened public positions to lower-caste members of the society who had hitherto been excluded from pursuing economic and political opportunities.

Abolition of untouchability was the crowning achievement of the Indian constitution. India's vast majority of untouchables—whom Gandhi called Harijan, or "children of God"—were among the most oppressed people in the world. Article 17 declares the practice or enforcement of untouchability in any form as an offense punishable in accordance with the law. The constitution not only did away with special powers for the privileged social and economic classes such as the feudal lords but also provided special protection and quotas for the historically oppressed castes and tribes. With these leveling measures, the constitution changed for the better the social, political, and economic conditions of India's 1 billion people. Reservation of seats and quotas for depressed classes in union and state governments—and especially in educational institutions—brought about revolutionary changes in India. And even though there were calls to end such reservations, they were extended in 1952.

Although discrimination against women is unconstitutional, it has been rampant in every aspect of Indian life. Thanks to the growing women's rights movement and the rise in female education in India, politicians are now more responsive to women's needs. Although the socioeconomic and political conditions of women in rural India are far from satisfactory, the status of the educated and liberated women in cities and urban centers is a spectacular success story. India is a signatory to the worldwide women's resolution to set aside 33 percent of national and state legislative assembly seats for women, and in Indira Gandhi (1917–1984) has already had a powerful female prime minister.

National and Local Government

Central and state powers are balanced by organizing India into a federal democratic republic of twenty-

five states headed by governors and seven union territories administered by ministers, all appointed by the president. India has a bicameral parliament composed of two bodies: the Rajya Sabha, or Council of States; and the Lok Sabha, or House of the People. The Rajya Sabha has 250 members, of which 238 are elected by their state legislative assemblies every second year. The president nominates the other twelve members, who are known nationally for their sound knowledge and experience in the fields of arts, literature, social sciences, and natural sciences. The Lok Sabha has 550 seats, with 530 members from the states and twenty members from the union territories.

Amendments

With more than eighty amendments as of 2000, India's constitution stands as one of the most frequently amended documents. Jawaharlal Nehru (1889–1964), the first prime minister of India, insisted that India's constitution must be flexible and responsive to new changes in the country. There are three ways to pass amendments to the constitution. First, a simple majority of both houses of the legislature can amend only those articles that are related to matters in the schedules—those parts in the constitution that deal with states and union territories, state governors, allocation of seats in the state councils, administration of tribal areas, and state languages, and so forth. Second, a two-thirds majority in both houses of the parliament is required for amending articles that deal with important matters, such as fundamental rights, citizenship, state policies, duties of the executive, constitution of parliament and state legislatures, legislative powers of the president, state governors, relations between the union and the state, and elections under the union and the states. Third, in addition to the two-thirds majority in each house of parliament, an amendment related to the distribution of legislative authority between the central and state government also must be passed by 50 percent of the state legislatures.

Checks and Balances

The Indian Supreme Court and Election Commission are recognized as the bedrock of Indian democracy; these two bodies stand up to the enormous powers that the constitution invests in the central government in general and to the unbridled powers of the Indian prime minister in particular. The checks and balances that are provided by the constitution also smooth out the strained relations between the central government and the states by limiting the central government's ability to interfere in the states' affairs. Usually, either the state government or a political party may file an appeal

or a writ petition in the Supreme Court against a policy or practice of the union or a state.

Although India's constitution follows the British parliamentary system, it is the constitution and not the parliament of India that reigns supreme. As in the United States, the Indian courts interpret the constitution and adjudicate the laws passed by the parliament. Although the parliament has the authority to amend the constitution, India's courts have made sure that the parliament does not change its fundamental structure, which guarantees economic opportunities, social justice, and religious and political freedom to all its citizens. Although political corruption and coercion are rampant in India—as they are in other developing countries—the courts are judiciary guarantors of India's freedom from oppression.

CONSTITUTION, IRAN—ISLAMIC The Iranian Islamic Constitution was approved by a national referendum in December 1979. The concept of *vilayat-i faqih* (rule of religious jurisprudence) is at the core of this constitution.

Soon after Ayatollah Khomeini (1900–1989) rose to power in Iran in January 1979, he gave the task of drafting a new constitution to the provisional government. The latter prepared a draft constitution, which was ready for national referendum in June of that year. However, several prominent figures insisted that an expert panel should review the draft constitution before it was put to a vote. Ayatollah Khomeini agreed and appointed an Assembly of Experts to review the draft constitution. The Assembly of Experts, made up of seventy-three members, was heavily weighted in favor of religious leaders and supporters of Ayatollah Khomeini's vision. The result was a substantially modified constitution, which institutionalized the role of clerics in the government. Reportedly, it was approved with over 98 percent of the vote.

The Islamic Constitution established the role and functions of the *faqih* (spiritual leader) as well as the executive, legislative, and judiciary branches of the government. The *faqih* is given oversight responsibil-

ity over the other three segments of the government in order to make sure they are operating within the tenets of Islam. He or she has the right to declare war or peace based on the recommendation of the Supreme Defense Council, over half of whose members the *faqih* nominates. He or she can depose the president if either the Supreme Court or the *majlis* (parliament) considers it appropriate. In addition, the *faqih* is responsible for selecting the supreme judge, the chief of the general staff, and half of the members of the Guardian Council. Ayatollah Khomeini was named the first *faqih* of the Islamic Republic and was given this position for life. The Islamic Constitution makes provisions for an Assembly of Experts, which is composed entirely of clerics, in order to choose successive *faqih*s based on constitutional criteria.

The executive branch of the government is composed of the president and cabinet. The president is elected for a four-year term. The legislative branch is represented by the *majlis*, 270 members who are also elected for four-year terms. The *majlis* handles the budget, general policy matters, and the introduction and passage of bills. However, any bill passed by the *majlis* must be reviewed by the Guardians Council, a group of six lawyers and six judges who verify that all new legislation and laws do not contradict Islamic principles.

CONSTITUTION, JAPAN—POSTWAR

Drafted by the staff of General Douglas MacArthur (1880–1964) in 1946, Japan's constitution created a democratic, pacifist nation. Japan gives more per capita support to the United Nations than any other nation but cannot use military force to defend the U.N. Charter. Despite North Korean missile threats,

growing Chinese dominance in East Asia, and nuclear bombs in South Asia, Japan still depends on American forces for its national security.

On 15 August 1945, Japan surrendered to the Allies. American occupation forces under General MacArthur, the supreme commander of the Allied powers, ordered Japan's demilitarization and democratization. To Americans, revising the Japanese constitution was the best assurance of democracy. The Japanese favored limited constitutional change preserving the imperial institution. Government proposals in September and October 1945 seemed promising but never reached the cabinet; a committee led by Prince Konoe Fumimaro (1891–1945), which MacArthur initially encouraged and then denounced, ended in Konoe's suicide in December; the cabinet's conservative effort led by the state minister Matsumoto Joji (1877–1954) failed in January 1946, partly because of lack of support and advice from MacArthur.

By early February 1946, several developments had convinced MacArthur of the need to draft a "model" constitution for Japan. Emperor Hirohito (1899–1989), fearing Allied retribution, sought MacArthur's protection by cooperating and revealing an interest in Christianity, which MacArthur saw as the foundation of democracy. The Allied powers attempted to gain control over Japan's constitutional reform, and Australia and the Soviet Union wished to try the emperor as a war criminal. On 25 January 1946, MacArthur warned the U.S. government of the dangers of this course of action. On 1 February, the Japanese press leaked the Matsumoto committee's conservative proposals for revising the constitution.

Two days later, MacArthur ordered his government section, under General Courtney Whitney (1899–1969), to draft a new constitution for Japan in one week, making the emperor the head of state without power and prohibiting Japan from having military forces or war potential, even for self-defense. Whitney presented the draft to Matsumoto and to the foreign minister Yoshida Shigeru (1878–1967) on 13 February. The stunned Japanese ministers had only an hour to look over the draft in English. Whitney said MacArthur wanted the cabinet to produce a Japanese draft, quickly, using this model.

The cabinet reluctantly accepted the draft constitution on 26 February and rushed an unfinished Japanese draft to Whitney's office on 4 March. Thirty hours of nonstop debate, translating, and redrafting ensued, ending shortly before MacArthur published the document on 6 March as a draft produced by the Japanese government and approved by himself and the

emperor. An election was scheduled for 10 April to elect representatives to adopt Japan's new constitution. Thirty-one days had passed since MacArthur's order to write a model constitution for Japan.

The liberal provisions of the draft surprised many Japanese: the antiwar article: a powerless emperor as a symbol of the state; guarantees of basic freedoms, universal education, and equality of women with men; a true parliamentary system; and a powerful supreme court. The cabinet independently rewrote the document in vernacular Japanese. Prime Minister Yoshida, eager to end the military occupation, urged a quick approval.

Historians have understated the role of Japanese constitutionalists and politicians in the debate. Despite vigilant American monitoring, members of the national diet (created in 1889) engaged in spirited debate, refashioning a distinctly Japanese understanding of the draft, particularly about the role of the emperor; reshaping the peace clause; expanding the bill of rights; elevating the supreme court; and generally developing a sense of proprietorship over the text. Approved by both houses of the diet, the new constitution was promulgated on 3 November 1946 and took effect on 3 May 1947.

Movements for constitutional revision have roiled Japanese politics since the end of the American occupation in 1952. Again in 2000 Japan was engaged in a public debate over the relevance of the antiwar article. According to Article 9 and court rulings, Japan can use its self-defense forces, which are never called the army, navy, or air force, only to defend itself. So far, however, Japan has not felt that it can legally commit these forces to take part in U.N. peacekeeping missions or to help the United States in its self-proclaimed war on terrorism.

CONSTITUTION—TURKEY Since the Turkish Republic was founded in 1923, it has adopted three different constitutions and a series of constitutional revisions. A common characteristic of Turkish constitutions is that all of them were developed in reaction to the political problems of a previous period, and each successive constitution tried to prevent recurrences of these problems through constitutional restrictions.

The First Constitution of 1920

The first constitutional document of modern Turkey was created by the Turkish Grand National Assembly (TGNA) during the war for independence. The Law of Constitution, dated 20 January 1920, designated the TGNA as the supreme organ of the state. It was given executive, legislative, and judicial powers. The executive power was exercised by a council of ministers, or cabinet, which the TGNA elected from among its members through direct vote. The ministers of the council were individually responsible to the TGNA, which also resolved executive disagreements in the council.

The First Constitution of the Republican Era of 1924

Problems associated with the concentration of power in the hands of the TGNA led to a change in the Law of Constitution. In 1924, the newly elected members of the TGNA, then dominated by the Republican People's Party (RPP) under the strict control of Mustafa Kemal (later Atatürk), developed the first constitution of the Republican era. The 1924 constitution maintained the supreme status of the TGNA by vesting the sovereignty fully and unconditionally in the nation; the TGNA was empowered to exercise its sovereignty on behalf of the nation (Article 5). The constitution did, however, transfer the exercise of executive power to the president and the Council of Ministers, so-called after 1924. The Council of Ministers was accountable to the TGNA under the principle of "collective responsibility." The president, however, was kept out of the principle and was not vested with political responsibility.

The Constitutional Amendments of 1934

The 1924 constitution was amended in 1934, and the six principles of the ruling RPP's program—republicanism, nationalism, populism, secularism, etatism, and reformism—were included in it as the defining charac-

teristics of the state. Although the 1924 constitution had recognized civil liberties and social and political rights, it failed to put them under constitutional protection. The constitution had also lacked effective check-and-balance mechanisms over the legislative and executive bodies, which became extremely damaging after the transition to the multiparty period in 1950. The unlimited rule of the majority party, the Democrat Party (DP), finally led to the collapse of the first Turkish Republic in 1960.

The Second Republican Constitution of 1961

A military coup was carried out in 1960 by a group of junior officers, who declared their intention to create a democratic constitution and to transfer power to civilian rule. Unlike the 1924 constitution, which had been developed by the popularly elected TGNA, the 1961 constitution was prepared by a bicameral Constituent Assembly. The junta, which called itself the National Unity Committee, constituted the first chamber. Members of the second chamber included representatives of various social groups and political parties, chosen either by indirect election or by appointment. Exclusion of the supporters of the banned DP from the Constituent Assembly clouded the legitimacy of the 1961 constitution for the coming decades.

The 1961 constitution, which was approved by 60.4 percent of the popular vote, was a reaction to the problems of the DP era of the 1950s. It aimed to prevent the hegemony of an elected parliamentarian majority over the political system. The constitution foresaw a complete separation of powers and implemented a strong mechanism of checks and balances over government and parliament. The new system had a strong bicameral legislature, a weak executive, and an autonomous and strengthened judiciary.

Distrust of political bodies led to the establishment of the Constitutional Court, empowered to review the constitutionality of legislation. The 1961 constitution also renamed the National Unity Committee; it became the National Security Council—a permanent advisory body to assist the cabinet in issues related to national security, which legitimized the role of the military in government. The 1961 constitution was considered progressive because it expanded civil liberties and social rights and put them under constitutional protection. The constitution also granted administrative autonomy to various public organizations and civil-society institutions (nongovernmental, nonmilitary institutions). Although the 1961 constitution was liberal in tone, it still restricted participation of certain political groups and ideologies in the political arena. Progressive aspects of the constitution were later

blamed for the country's woes and were curtailed by the 1971 and 1973 constitutional amendments. These amendments also strengthened the executive body by granting it power to use government edicts and increased the institutional autonomy of the military.

The Third Republican Constitution of 1982

The third constitution was developed after the 1980 military coup. The new constitution created in 1982 restricted civil rights, freedoms, and political expression even further. It was prepared by a bicameral Constituent Assembly established for the purpose, but even less representative than the previous one. The National Security Council was given more power than it had been granted in 1961; it now constituted the first chamber. The second chamber, handpicked by the National Security Council, excluded members of all political parties and all social groups of the previous period. Unlike the 1961 constitutional referendum, which allowed the expression of opposing views, the 1982 referendum campaign did not allow any debate on the draft constitution.

Identifying weakness of the executive as the root of the problem with the 1961 constitution, the 1982 constitution aimed to provide a strong executive and a weak unicameral legislature. Distrust of elected politicians and civilian institutions led to strengthening the powers of the presidency and the National Security Council. The president was given substantive powers in appointing heads of public organizations and could also dismiss the prime minister and other cabinet members, dissolve parliament and call for a general election, and declare a state of emergency. Under the 1982 constitution, individual rights and freedoms were limited; freedoms of association and of political participation were restricted; the privileges and autonomy of civil-society institutions were reduced; and the powers of the judiciary were limited.

The 1982 constitution has been criticized for its undemocratic nature. Although constitutional change has been on the agenda of every political party in the 1990s, political dynamics in the country have delayed any amendment of the constitution. Since 1995, some articles of the constitution, related mostly to freedom of association and freedom of political participation, have been amended. These amendments, however, have brought little improvement in the protection of civil rights and liberties in Turkey.

The Constitutional Court

The Constitutional Court was introduced in the 1961 constitution as a body to review the constitu-

tionality of legislation and to prevent arbitrary and partisan rule by the elected bodies and governments and domination of the political system by the majority party. The Court was empowered as a high council to try senior members of the state, to prevent the abuse of political power, and to outlaw political parties that acted outside constitutional limitations. The rulings of the Court were final and binding on all the organs of the state.

A wide range of political and social institutions were given the right to request review of the constitutionality of laws by the Court. The president, the parliamentary groups of political parties, political parties that had won at least 10 percent of the popular vote in a general election, or one-sixth of the members of the TGNA, as well as civil and public organizations as long as the matters submitted for review dealt with these groups' functions, could exercise this right.

The Constitutional Court consisted of fifteen regular and five substitute members. Two members of the court were appointed by the president. The remaining members were chosen by the Court of Account (one regular), the TGNA (five regular and two substitute), the High Court of Cassation (four regular and two substitute), and the Council of State (three regular and one substitute) from among their members.

The Court was under constant attack by political parties in the 1961 constitutional era. It was accused of usurping the prerogatives of parliament and obstructing the government's performance of its executive duties. The Court was also criticized for closing down the Turkish Workers' Party and the National Order Party because of their ideologies.

Under the 1982 constitutional regulations, the function and scope of the Constitutional Court have been remarkably restricted. Review of the constitutionality of laws and decrees issued by the National Security Council during the interim period is no longer under the Court's authority. Its membership is reduced to eleven regular and four substitute members, and all members are appointed by the president. Only the president, the parliamentary group of the governing party or the main opposition party, or one-fifth of the members of the TGNA may request review of the constitutionality of laws. Presidential decrees are kept out of the Court's jurisdiction. The Court's status as a high council to try senior members of the state and to outlaw political parties acting outside constitutional limitations remains intact.

CONSTITUTIONAL CRISIS OF 1881 The revolutionary changes introduced by government leaders during the Meiji period (1868–1912) provoked a great deal of uncertainty and unrest throughout Japan. For a variety of different reasons—from unfair taxation to reduced incomes and loss of political status—the samurai and farmers were extremely dissatisfied with the direction in which the new government was headed. Amid such growing turmoil, the Popular Rights movement (*minken*) evolved, one of whose leaders was Itagaki Taisuke (1836–1919). In 1874, Itagaki and other like-minded political leaders gained enough influence to submit a proposal to the government calling for the establishment of a national assembly. Cronyism and despotism were rotting the country, they complained. If Japan had any hope of keeping pace with the West, free public discussion must be permitted, and the best way to do that was to establish a national assembly.

In mid-1878, the home minister Okubo Toshimichi (1830–1878) was assassinated. Okubo had singled out a politician, Ito Hirobumi (1841–1909), to succeed him, but another Okubo favorite, Okuma Shigenobu (1838–1922), had also developed a strong following. Meanwhile, the Popular Rights movement was sweeping the country, and pressure to establish a national assembly intensified. Various councilors and politicians submitted proposals favoring a gradual movement toward a constitutional government, but in March 1881 Okuma startled them by presenting a paper calling for the speedy drafting of a constitution on the English model. This threw the principal parties into immediate conflict.

The political upheaval reached a boiling point in summer 1881, when Okuma and his followers refused to approve a proposal to sell at a huge discount the government's holdings in a Hokkaido project (Hokkaido Colonization Commission) to a business consortium headed by a former official, calling it the most blatant form of favoritism. Angered by Okuma's condemnation, not to mention his attempt to bypass their constitutional proposals, the councilors insisted in August that he and his followers be expelled from the government. Okuma and his cohorts resigned their official posts shortly afterward.

In an effort to calm the political agitation that the government knew would come with Okuma's ouster, the councilors agreed that a constitution would be granted by the emperor within the next decade. Ito was given the task of drafting it, but took Prussia as his model rather than England or the United States. Eight years later, on 11 February 1889, the Meiji Constitution was proclaimed.

CONVEYANCE ARTS The tradition in South Asia of conveyance arts—decorating vehicles of all kinds—can be traced to the classical periods of Indian history. This article focuses mainly on conveyance arts in Bangladesh and Pakistan, with a brief discussion of the phenomenon in India and Afghanistan.

Bangladesh

Contemporary artisans in Bangladesh who decorate the three-wheeled cycle rickshas or pedicabs with elaborate pictures, scrollwork, calligraphy, and fancy machine-sewn, appliquéd, and painted plastic hoods are drawing on a long tradition. In past centuries, palanquins and pleasure boats were beautifully ornamented, often with gilt and colorful designs; animal transports were also lavishly decorated. Cycle rickshas became popular modes of transport by the mid-twentieth century. Ricksha art began to appear in Bangladesh a few years later, by the mid-1950s.

Today's rickshas are designed and hand-painted by special ricksha artists (*shilpakars*), or decorations are handmade by ricksha artisans (*mistris*) who assemble rickshas to order for customers. Many of the artists speak and read some English; they often designate themselves as "artist" or "painter," adopting the English terms. Most ricksha artists either learn by working under an artist master or are self-taught. The main image on a ricksha is the backboard picture panel (*chobi*). It is separately painted and hangs behind the ricksha, at the base of the cab between the rear wheels. Since the 1990s, commercial mass-produced photo prints have appeared as decoration on some ricksha backboard panels, possibly indicating a future trend toward the decline or even the elimination of hand-painted art.

A man with his decorated ricksha in Dhaka, Bangladesh. (EYE UBIQUITOUS/CORBIS)

The range of content of conveyance arts is both exuberant and varied. The artists denote certain picture themes by special names: for example, *jongler shin* (jungle scene), *shoborer shin* (city scene), *posbu shin* (animal scene), *filmi shin* (movie scene), *goromer shin* (village scene), and *mukti joddha shin* (liberation war scene), to name the most common selections. Movie scenes (or *manusher chitra*—people pictures) are mainly drawn from foreign, Indian, or local films. These may feature Tarzans, Rambos, and Bengali heroes or danger women sporting weapons, such as the real-life bandit queen Phulan Devi of India, who inspired popular films in India and Bangladesh. Glamorous actresses and actors from Dhaka and Calcutta films often are depicted, as well as political heroes—for example, the Bengali schoolboy Khudiram Bose, of Indian independence fame; Saddam Hussein, of Gulf War vintage; or the Awami League Prime Minister Sheikh Hasina. In the 1970s, jungle scenes of animals congregating at a waterhole, animal-human impersonations, and fantastic courting birds were predominant.

Overall decor on a costly ricksha includes intricately handsewn appliquéed hoods, which fold or unfold like umbrellas. These are decked with medallions in which

they place shiny gold, silver, black, or pink peacock cutouts applied to a central white, red, or yellow field. Sometimes hand-painted red roses, butterflies, candles set within lotuses, or flowers are inserted in the medallions instead of peacocks. Hood designs, together with certain other features, can usually identify the city or region from which a ricksha originates. The seat base, ornamented by variably shaped recessed niches and bordered by gleaming nail heads, was filled with painted paired birds—peacocks or pigeons—signifying love or sexual fulfillment, or inserted view cards of movie stars. The footboard bore geometric or curvilinear designs (hearts pierced by arrows were popular). Painted conventional floral designs covered the ricksha's metal frame. Hand-painted designs on plastic, artfully cut and installed, upholstered the seatbacks and arm rests. The passenger's seat cover bore a conventional lotus design, suggesting (ironically, perhaps) that the rider is a petty deity, since deities are seated on lotuses.

The driver's seat was dotted with colored plastic flower cutouts. Handlebars sported small brass flower vases containing plastic flowers and colored plastic streamers. In Bangladesh, a nation with a Muslim majority, undecorated rickshas or imagery featuring only scenery or birds were favored by pious owners who observed the traditional Islamic prohibition on graven images, a practice based on several *hadith* (traditions of the Prophet). Birds are messengers of Allah in the Qur'an, and emblems of the soul in Sufi thought. They are thus not offensive to piety, although they might subversively suggest the motif of male desire, which is a foundation of this popular art form.

Ricksha arts are part of the male public culture. In the late twentieth century, a few women ricksha artists emerged, but women usually participated as family members in some artist's or ricksha maker's shop. Made to be seen "at a glance," the significations of ricksha art seems to be male desire in its major forms: for sex, competitive power and wealth, for one's home village, for the blessings of religious devotion, for new things. After the United States put a man on the moon in 1969, a few rickshas featured a man, in a spacesuit, planting a Bangladesh flag on the moon. In the late 1990s, auto taxis featured travel-poster images of far-flung places such as Sydney Harbor, Mt. Fuji, European-style palatial mansions with red sports cars in the driveway, and Tower Bridge in London, a prime emigration goal of many Bangladeshis.

India

In India, various conveyances, such as auto taxis and trucks, also tend to be decorated. The auto taxis, however, are usually not as fully decorated as they are in

Bangladesh, nor are the trucks as flamboyant as those found in Pakistan. In Rajasthan during the 1998 Diwali festival, trucks sported multiple glittering tinsel streamers and garlands in gold and colors, but hand-painted décor on the sides or on truck bodies was sparse. The state of Kerala boasts some of India's most outstanding conveyance art; the décor seems to reflect a regional style. Colorful boards with carved edges that suggest painted garlands of flowers and birds, surmounted by a rectangular name board, are installed above the cab. The names on the name board may be women's names (such as Sajna), inspirational names (Sunrise, for example), or Muslim names, (Nizamol, for example). Painted in blocky calligraphy, the truck names are spelled out either in English or romanized Malayam. The hood often sports apotropaic eyes; a demon mask may be hung below the front bumper—both intended to ward off evil. The sides of the cab are built up to the headboard above the cab door, and painted with dense millefleur designs interest with small, conventional landscape cameos. Here one might find slogans amidst the posies: "Do for India; Die for India," for example. Behind the cab (at the cab end of the truck bed) is a large square picture; common themes are the Taj Mahal or Lord Ganesa, the Hindu god who is the remover of obstacles; also popular are parrots or a gigantic red rose, all popular images throughout the subcontinent. Floral styles surrounding the truck door resemble those found in other Keralan fold arts in their large scale and sculptural-

mimesis painting technique, especially as compared to floral representations on trucks in other parts of the subcontinent.

Pakistan

The decoration of trucks in Pakistan resembles the decoration of rickshas in Bangladesh in many ways, although the artists tend more assiduously to avoid depicting people, favoring instead scenic landscapes, complicated geometric designs, fantastic gardens, pillared mansions, rockets, airplanes, wild animals and birds, and calligraphy. Pakistani trucks began to be decorated with flamboyant art design in the mid-twentieth century, a period when interprovincial transport began to expand, truck owners were getting rich, and display became competitive. As in the rest of the subcontinent, royalty traditionally decorated both human-carried palanquins and animal transports, including camels, which still today sometimes sport elaborate necklaces of bells and colored plush tassels. Truck art today is a fulsome elaboration from earlier conventional geometric and floral designs as well as from banners (now devolved into plastic streamers) and camel or donkey necklaces with pendants, which have evolved into ornamental chain pendants that hang below a truck's front and rear bumpers. Since approximately the 1970s Pakistani motorized three wheeler transports (auto taxis) have also been decorated with designs and movie material, but their overall impression is not as outstanding as that made by the trucks.

A decorated truck hauling ice in Karachi, Pakistan. (NIK WHEELER/CORBIS)

Pakistan truck art—most of which originally was produced in Rawalpindi but now is made in other cities as well—is also handmade. Like the ricksha artists, Pakistan truck artists may use cheap printed calendars and illustrated paper books from the bazaar as reference material for their designs. They do not copy these but redesign them to suit their own taste or the truck's structure. Several men, the master artist and helpers, work on one truck.

Pakistan truck designs since the 1950s have become increasingly more elaborate geometrically, such that almost the entire surface is decorated, an old tradition in Islamic arts. The style at beginning of the twenty-first century emphasized vertically stacked horizontal friezes of fish, birds, and geometric designs, on which contrasting designs or framed picture scenes, and pious calligraphy are superimposed. As with the Bangladesh ricksha arts, in gender-segregated Pakistan all the artists are men. The pious inscriptions include such wisdom as "Before going on this journey, pray for forgiveness for your sins. This might be your last trip." Pakistan trucks—commonly, English Bed-fords—show architectural propensities in the built-out decorated crown (*taj*) towering above the cab and projecting forward over the motor hood. In addition to the *taj*, gigantic pictures applied to the back slats of the truck bed or to the round rear end of a tanker truck and multiple panel or scenic medallion designs on the sides are central decorative features, imposing in size and astonishing in overall lavishness.

The truck crown is built up to twice the height of the truck below the cab, providing a grand billboard for colors and designs. Every color in the usual palette is used, with red, gold, silver, and green (the heraldic color of Islam) being favorites. Sculpted and painted fish or peacock framing devices might overlay bands of repeated geometric figures, or square boards bearing calligraphic proverbs or Qur'anic verses might be placed front and center on the *taj* and draped with cloth scarves.

Motorbuses are also elaborately painted and decorated, often with flat or three-dimensional multicolored scenic medallions, peacocks, hearts, and birds. One motif found repeated on the side of panels (under the windows) of a bus was a delicate woman's hand with polished fingernails holding up pearl necklaces and flower garlands, juxtaposed with a flower vase holding a lighted candle.

Afghanistan

Decorated trucks have been found in Afghanistan for several decades. Most of them were painted in Rawalpindi, Pakistan, once the only site of truck art

decoration in the general area and a city on a main route between Afghanistan and Pakistan. These trucks originally resembled Pakistani trucks in style and picture themes; at that time, the crown over the Afghan truck cab was not built up as high as it now is in Pakistan. Under the Taliban, in power in Afghanistan from 1996 through late 2001, truck decorations were most likely restricted to purely geometric and calligraphic designs, in compliance with the Taliban's prohibition against representations, in home or in public, of humans or animals.

COOMARASWAMY, ANANDA KENTISH

(1877–1947), Sri Lankan art historian. Ananda Kentish Coomaraswamy was an art historian who, in a series of influential books, greatly advanced the understanding of Hindu and Buddhist iconography. Originally trained as a geologist, he gained a Doctorate of Science in that subject from London University (1905). On returning to Ceylon, he felt that the traditional culture had been corroded by Western influences and was in need of a spokesman, which he then became. After about a decade in Ceylon, he left for the United States, where he founded the first museum department of Indian art at the Boston Museum of Fine Arts in 1917.

In his writings, Coomaraswamy presented South Asian art as a form of knowledge strongly imbued with a religious feeling. He was strongly influenced by mystics and metaphysicians, considering art "an effective expression of metaphysical theses." He was thus profoundly concerned with the communicative characteristics of art, viewing traditional art not from an aesthetic so much as an inspirational position, in which technical function was fused with symbolic meaning. He discovered the Rajput school of painting, and related it to Indian literary forms. Perhaps his most re-

markable achievement was his demonstration of the way in which the Hindu temple represented the body and house of God. He was a pioneer in presenting South Asian art within a similar intellectual framework to that which had long been applied to Western art. In this, he set his thinking in opposition to the conventional dismissals of Indian art that had come from European critics such as Hegel (1835) and Ruskin (1859), who had considered it irrational and unnatural.

CORDILLERA CENTRAL The Cordillera Central is the centrally located mountain range on Luzon island in the Philippines. It consists of three parallel mountain ranges. These ranges are the Malayan, Central, and Polis. Mount Pulog, which is the highest peak on Luzon and the second highest in the country, is within the Polis range. These mountains vary greatly in width—from 58 kilometers to 86 kilometers (36 miles to 54 miles). The average height of its peaks is about 1,800 meters (5,900 feet). The Philippine mountain ranges typically are oriented in the same direction as the islands on which they are located. This is approximately north to south for the Cordilleras.

This mountain range connects with the Sierra Madre Range and the Caraballo Mountains. Located between these ranges is the Cagayan Valley. Several rivers' headwaters begin on the slopes of Mount Data, which is located within this mountain range. The Abra and Agno rivers in particular are controlled by the massive Cordillera Central mountains until they reach the sea. The metamorphic rocks that form these mountains are exposed. For this reason, much of the Philippine metals mining (for ores such as copper and gold) is concentrated in the Cordillera Central.

CORMORANT Cormorant, or shag, refers to any of about thirty species of the family Phalacrocoracidae, a family of dark-colored water birds. The large

cormorant (*Phalacrocorax carbo*) is one of the most widespread of birds, occurring near rivers, lakes, cliffs, and seashores throughout Eurasia, as well as in eastern Canada and Iceland to the west, parts of Africa to the south, and Australia and New Zealand. In the Himalayas it is found in Ladakh, a region of Jammu and Kashmir, up to 3,000 meters. Friar Odoric (c. 1265–1331; a Franciscan monk who traveled from Italy to the East) reported seeing cormorant fishing from boats in China.

The young are easily trained to fish. The large cormorant and the slightly smaller Japanese cormorant (*Phalacrocorax capillatus*) are the two species that have been domesticated in eastern Asia for fishing, mainly in China, Vietnam, and Japan; the large shag was once used in France and England in the same way.

A speedy swimmer, the cormorant catches a fish underwater and brings it to the surface in its gular (throat) pouch. It then tosses the fish in the air and swallows it—unless a fisherman-owner has put a strap round the bird's neck. In one day it can eat up to half a kilogram of fish. The birds nest communally in great colonies with other water birds. The body of the adult bird may be 80 centimeters or even one meter long. Its remarkable agility underwater depends on the webs between the four toes, the long, stiff tail, and in adults the absence of external nostrils. The cormorant numbers over half a million in Europe alone (2001), where it is now seen as a threat to inland fisheries. In Asia, its numbers are probably much greater.

Paul Hockings

CORRUPTION Corruption, a serious problem in many Asian countries today, refers to "the misuse of public power, office, or authority for private benefit—through bribery, extortion, influence peddling, nepotism, fraud, speed money, or embezzlement" (United Nations Development Programme 1999: 7). (See Table 1.)

In Table 1, the higher the rank, the worse the corruption. The table shows that, except for the city-states of Singapore and Hong Kong, corruption is rampant in many Asian countries, with Pakistan and Indonesia being perceived as among the most corrupt nations in the world. Why has corruption been minimized in Singapore and Hong Kong on the one hand, and why is it rampant in Indonesia and Pakistan on the other hand?

The extent of corruption in Asian countries depends on two factors: the causes of corruption and the

degree to which government anticorruption measures are effective. Governments that have correctly diagnosed the causes of corruption and taken appropriate measures to eliminate them are more effective than governments that do not observe the same logic of corruption control.

There are three patterns of corruption control in Asian countries, depending on the types of anticorruption agencies and laws employed. The first pattern is adopted in Mongolia, which introduced the Law of Anti-Corruption in April 1996, but has no independent anticorruption agency. The task of controlling corruption is shared among the police, the general prosecutor's office, and the courts. The second pattern of corruption control can be found in China, India, and the Philippines, which employ many anticorruption laws and rely on multiple anticorruption agencies.

The third and most effective pattern of fighting corruption is the combination of comprehensive anticorruption laws impartially implemented by an independent anticorruption agency. Singapore and Hong Kong demonstrate this pattern, and it is not surprising that they are both perceived to be the least corrupt countries in Asia.

Causes of Corruption

In his comparative study of bureaucratic corruption in Hong Kong, India, and Indonesia, Leslie Palmier identified three important causes of corruption: opportunities for corruption, which depend on the degree of involvement of civil servants in administering or controlling lucrative activities; salaries; and policing or the probability of detection and punishment. He contended that the combination of these factors

accounts for the level of corruption in a country. When there are few opportunities, good salaries, and effective policing, there is little corruption, and when there are many opportunities, poor salaries, and weak policing, there is considerable corruption.

Low Salaries Political leaders and civil servants who are poorly paid are more vulnerable to corruption, as they are more likely to succumb to temptation by making use of their position or authority for their personal benefit. Singapore's former prime minister, Lee Kuan Yew (b. 1923), justified raising the salaries of political leaders in March 1985 when he noted that political leaders and civil servants should be paid the top salaries that they deserve to ensure a clean and honest government. If they were underpaid, they would succumb to temptation and be corrupt.

In Indonesia and the Philippines, corruption was a serious problem during the colonial period under the Dutch and Spanish, respectively, as civil servants were poorly paid and had many opportunities for corruption. In 1971, the salaries and allowances of Indonesian civil servants constituted about one-third of their monthly income. In the Philippines, civil servants are paid starvation wages and are forced to sell goods in the office, hold a second job, teach part time, practice their profession after office hours, work as researchers and consultants, and resort to petty corrupt practices. Finally, in contemporary Mongolia, which has a per capita gross domestic product of \$390, the major cause of corruption is the low salaries of civil servants and politicians; the highest monthly salary is \$71, and the lowest monthly salary is \$35.

Ample Opportunities for Corruption David J. Gould and Jose A. Amaro-Reyes observed that the expansion

of the government's role in developing countries contributed to the bureaucracy's monopolistic position and increased the opportunities for administrative discretion. Red tape and enhanced bureaucratic discretion provide ample opportunities for corruption, as civil servants extract bribes from individuals or groups competing for access to such goods and services. Thus, Hong Kong's experience shows that when the government must control certain activities, there is ample room for corruption.

According to Donald Warwick, the opportunities for corruption in Indonesia depend on whether an agency is "wet" or "dry": "Wet" agencies, such as the police, customs, immigration, and internal revenue, provide more opportunities for corruption than "dry" agencies, such as research and administrative departments, which do not interact with the public. Ratus Prawiro, the Indonesian coordinating economics minister from 1989 to 1993, identified the tax office and customs service as the most lucrative "wet" government agencies in Indonesia.

Low Risk of Detection and Punishment As corruption is illegal in all countries, individuals convicted of corruption should be punished. However, in reality, the probability of detection and punishment of corrupt offenses varies in Asia. Corruption thrives in those Asian countries where the public perceives it to be a low-risk, high-reward activity and is not a serious problem in countries where it is perceived as a high-risk, low-reward activity.

For the population in a country to perceive corruption as a high-risk, low-reward activity, the government must publicize through the mass media the detection of corrupt behavior among civil servants and politicians and their punishment according to the law if they are found guilty. Such adverse publicity serves as an effective deterrent against corruption. Conversely, those governments that muzzle the media, such as Indonesia under President Suharto (b. 1921) or India during the emergency of the 1970s, actually encourage corruption.

Pattern 1: Anticorruption Laws without an Independent Agency

Mongolia became the first Communist state in Asia in July 1921 and was dependent on the former Soviet Union for foreign aid, technical assistance, and a large market for its exports until the departure of the Soviet advisers in 1991. Corruption existed in Mongolia during its seven decades of Communist rule. However, the transition from a Soviet-style command economy to a market economy since 1991 has increased the op-

portunities for corruption and made the environment conducive for corruption for three reasons: the poverty of the population, the low salaries of public officials, and the lack of enforcement of the anticorruption laws.

The Law of Anti-Corruption (LAC) requires all Mongolian public officials to declare their incomes and assets and those of their families within a month of assuming their positions and thereafter to submit their annual declarations during the first two weeks of February. Failure to submit such declarations results in fines of between \$6 and \$29. Officials who do not monitor the declarations are fined between \$24 and \$35. Failure to declare gifts or foreign bank accounts results in fines of between \$35 and \$47. Finally, corrupt officials are discharged or displaced according to the procedure provided in the law.

The LAC is ineffective; only three members of Parliament have so far been convicted of corruption since its enactment in April 1996. The LAC's first weakness is that no specific agency is responsible for its implementation; Article 5 indicates that all state organizations are required to perform four common duties to prevent corruption. Second, the penalties imposed on officials for their failure to submit or monitor their annual income and assets declarations are too low to be effective deterrents, and there is no imprisonment.

Corruption offenses are first handled by the Criminal Police Department, which investigates and refers the cases to the Investigation Department. Both departments investigate complaints of corruption against public officials, and if there is evidence to substantiate these complaints, the cases are handed over to the General Prosecutor's Office (GPO). From the GPO, the cases are processed by three levels of courts.

This lengthy procedure for dealing with corruption offenses itself provides opportunities for corruption among the officials involved as each can interpret the law differently. For example, a bribery case by the police can be interpreted as a smuggling offense by the GPO and as illegal crossing of borders by the courts. As judicial salaries are low, individuals can pay the poorly paid judges to make decisions in their favor.

Pattern 2: Anticorruption Laws with Many Agencies

China, India, and the Philippines are examples of this pattern. China's battle against corruption has intensified as economic reform presented more opportunities for corruption; India has battled corruption since its independence in 1947, and the Philippines began fighting corruption in the 1950s.

China As corruption was endemic in China during the post-1978 reform period, the regime of Deng Xiaoping (1904–1997) relied on the Criminal Law of 1979 as the major law for curbing corruption. This law was amended twice: in 1982, to impose heavier penalties for corruption; and in 1997, to link the penalty for corruption to the amount involved. For example, a person found guilty of corruption involving more than 100,000 yuan (\$12,000) is punished by ten years' imprisonment or the death penalty.

The various anticorruption agencies in China are organized along three sectors. The Supreme People's Procuratorate (SPP) was formed in 1978 to combat corruption in the judicial sector. Below the SPP, the Bureau for Embezzlement and Bribery of the People's Procuratorate handles and prevents cases of embezzlement and bribery. Given China's vast domain, it is not surprising that there are 3,563 agencies for embezzlement and bribery. In December 1986, the Ministry of Supervision (MOS) was reorganized to curb corruption and maladministration in the civil service. Finally, the Central Disciplinary Inspection Committee (CDIC) was created in 1978 to check corruption among the Chinese Communist Party (CCP) members.

Even though the MOS had received more than 700,000 reports in 1993, both the CDIC and MOS failed to reduce corruption because of the lack of political will to deal with corruption among senior party members. Until recently, few senior party officials have been convicted of corruption because they can seek help from their protectors in the CCP hierarchy. However, since 1999, Premier Zhu Rongji (b. 1928) has waged a crusade against corrupt officials; in March 2000, Hu Changqing, the deputy governor of Jiangxi province, became the highest-ranking public official to be executed. One month later, the deputy mayor of Guigang city, Li Chenglong, was executed for taking \$478,000 worth of bribes.

India The Prevention of Corruption Act of 1947 is implemented by the Central Bureau of Investigation (CBI), the Central Vigilance Commission (CVC), the state anticorruption bureaus, and the state vigilance commissions. The CBI was created in April 1963 to investigate cases of bribery and corruption, but it could do so in a state only with the consent of the local government. This requirement became a problem after the decline of the Congress Party, as some state governments withdrew the consent given by their predecessors. The CVC was formed in February 1964 to investigate complaints of corruption against civil servants. Apart from requesting reports from ministries, departments, and public enterprises to check and su-

pervise their vigilance and anticorruption efforts, the CVC can also request the CBI to investigate a case.

The CBI, however, is perceived by the public as ineffective; only 300 of the 1,349 cases (22.2 percent) in 1972 and 164 of the 1,231 cases (13.3 percent) in 1992 resulted in conviction. The CBI tends to concentrate on minor wrongdoers; its record in investigating more important cases is dismal: There have been no convictions.

The Philippines The Philippines has relied on seven laws and thirteen antigraft agencies since its fight against corruption began in the 1950s. The Forfeiture Law of 1955 authorizes the state to acquire property illegally obtained by corrupt officials, but there were no convictions after four years. The most important law is the Anti-Graft and Corrupt Practices Act of 1960, which identifies eleven types of corrupt acts among public officials and requires them to file every two years a detailed and sworn statement of their assets and liabilities. The other laws are the presidential decrees (PD) issued by President Ferdinand Marcos (1917–1989) after the establishment of martial law in September 1972. For example, PD No. 6, which identifies twenty-nine administrative offenses and empowers heads of departments to dismiss guilty officials immediately, has resulted in the termination of nearly 8,000 public officials.

The large number of anticorruption agencies in the Philippines can be attributed to the frequent changes in political leadership; such agencies are either created or abolished by the president. During May 1950 and January 1966, five anticorruption agencies were formed and dissolved, during five changes in political leadership. President Marcos created another five anticorruption agencies, the most important of which were the Sandiganbayan (Special Anti-Graft Court) and the Tanodbayan (Ombudsman), which were established in July 1979.

Similarly, President Corazon Aquino (b. 1933) created the Presidential Commission on Good Government (PCGG) and the Presidential Committee on Public Ethics and Accountability (PCPEA) during her term of office. However, both agencies were ineffective. The PCGG itself was accused of favoritism and incompetence as five of its agents faced graft charges and thirteen more were under investigation, and the PCPEA lacked staff and funds. Aquino's anticorruption stance was honest, but she lacked the political will to punish corrupt officials.

In 1994, President Fidel Ramos (b. 1928) formed the Presidential Commission against Graft and Cor-

ruption (PCAGC). In June 1997, the Inter-Agency Anti-Graft Coordinating Council was set up to control graft in government through the sharing of information and resources among the Commission on Audit, the Civil Service Commission, the National Bureau of Investigation, and the PCAGC. However, the Philippines' sixty-fifth ranking on Transparency International's 2001 Corruption Perceptions Index reflects the ineffectiveness of its anticorruption strategy. Eufemio Domingo, the head of the PCAGC, concluded that the anticorruption agencies in the Philippines were not working because the anticorruption laws were not implemented.

Pattern 3: Anticorruption Laws with an Independent Agency

Singapore and Hong Kong, the two Asian countries that show relatively low levels of corruption, are examples of this pattern. In both cases, severe corruption was overcome through the implementation of this pattern.

Singapore The Prevention of Corruption Ordinance (POCO) was Singapore's first anticorruption law, introduced in December 1937, and it was implemented by the Anti-Corruption Branch (ACB) of the Criminal Investigation Department (CID) within the police force. The ACB was ineffective as it did not have sufficient staff and resources, and it failed to deal impartially with police corruption. The discovery by the British colonial government that police officers were involved in the theft of S\$400,000 of opium in October 1951 demonstrated clearly the ACB's inability to curb corruption. The British authorities realized the importance of creating an independent anticorruption agency that was separate from the police. Accordingly, the ACB was dissolved and replaced by the Corrupt Practices Investigation Bureau (CPIB) in October 1952.

When the People's Action Party (PAP) government assumed office in June 1959, corruption was a way of life in Singapore and was perceived to be a low-risk, high-reward activity. To minimize corruption and change the public perception of corruption to a high-risk, low-reward activity, the PAP leaders initiated a comprehensive anticorruption strategy in 1960 by enacting the Prevention of Corruption Act (POCA) and strengthening the CPIB. As Singapore was a poor country with a per capita gross domestic product of S\$1,330 (\$443) in 1960, the PAP government could not afford to raise the salaries of civil servants. Accordingly, it was left with the alternative of strengthening the existing anticorruption laws to reduce the opportunities for corruption and to enhance the penalty for corruption.

The POCA of 1960 removed the POCO's weaknesses, increased the penalty for corruption to five years' imprisonment and/or a fine of S\$10,000, and gave the CPIB more powers to perform its duties. The penalty for corruption was increased to S\$100,000 in 1989. The CPIB has grown from eight officers in 1960 to its current size of seventy-seven staff. While the CPIB investigates corruption complaints in both the public and private sectors, its emphasis is on misconduct by public officials; it also examines the practices and procedures in the civil service to reduce opportunities for corruption. The CPIB can perform its duties without a large staff as its location within the prime minister's office and its legal powers enable it to obtain the required cooperation from both public and private organizations.

Hong Kong Following Singapore, the POCO was introduced in Hong Kong in 1948 and implemented by the ACB of the CID of the Royal Hong Kong Police Force. The ACB was separated from the CID in 1952, but it kept its name and remained within the police. In 1968, the ACB reviewed the POCO and recommended a scrutiny of the anticorruption laws of Singapore and Ceylon (now Sri Lanka). A study team visited the two countries during 1968 to examine how their anticorruption laws worked in practice. The study team was impressed with the independence of the anticorruption agencies in these countries and attributed Singapore's success in minimizing corruption to the CPIB's independence from the police. The knowledge gained from the study tour contributed to the enactment of the Prevention of Bribery Ordinance (POBO) on 15 May 1971.

The introduction of the POBO in May 1971 led to the upgrading of the ACB into an Anti-Corruption Office (ACO). The escape to England of a corruption suspect, Chief Superintendent P. F. Godber, on 8 June 1973, angered the public and undermined the ACO's credibility. The governor, Sir Murray MacLehose, decided to form a new anticorruption agency that was independent of the police.

The Independent Commission Against Corruption (ICAC) was formed on 15 February 1974 with the enactment of the ICAC Ordinance and was entrusted with two tasks: to stop corruption and to increase public confidence. The ICAC is independent in terms of structure, personnel, finance, and power. Before the handover of Hong Kong to China in July 1997, the ICAC was directly responsible to the governor, and its commissioner reported directly to him and had easy access. Since July 1997, the ICAC reports directly to the chief executive of Hong Kong Special Administrative Region and is directly responsible to him.

Corruption in Asia Today

For anticorruption measures to be effective, they must be properly designed to attack the causes of corruption and must be supported by the political leadership. This explains why the third pattern is more effective than the first two; the experiences of Singapore and Hong Kong have shown the critical importance of political will in curbing corruption. The political leaders in a country must be sincerely committed to the elimination of corruption by demonstrating exemplary conduct and adopting a modest lifestyle themselves. Those found guilty of corruption must be punished, regardless of their position or status in society. Political will is absent when the rich and famous are protected from prosecution for corruption, and only ordinary people are caught.

Political will is the most important prerequisite for implementing a comprehensive anticorruption strategy. It ensures the allocation of adequate personnel and resources and the impartial enforcement of the anticorruption laws by the anticorruption agency. Thus, even though the Philippines has the most anticorruption laws and agencies in Asia, it has been ineffective in curbing corruption because of the lack of political will among the political leaders. Similarly, the anticorruption strategies in China, India, and Mongolia are ineffective because of the absence of political will in those countries.

In addition to political will, Pattern 3 is also more effective because the anticorruption agency is a specialized agency dedicated to the task of minimizing corruption. The agency is not distracted by other competing priorities. For example, India's CBI is not only concerned with fighting corruption but also with organized crime and terrorism. In contrast, Singapore's CPIB and Hong Kong's ICAC focus their resources on curbing corruption.

CORRUPTION—CHINA The Chinese term *tanwu* is similar to the Western term "corruption," meaning the abuse of a public position to line one's own pocket. Opinion polls in the 1980s and 1990s show that the population regards corruption as the most important social problem. Even the party leadership realized that the phenomenon was seriously threatening its legitimacy, and has repeatedly started anticorruption campaigns. China is now accused of being one of the most corrupt countries in Asia.

Corruption has a long history. Even in early classical documents, affairs covered by the current meaning were regarded as moral depravity on the part of the government (and consequently also of society), as errors that violated the prevailing moral code. An emperor who was "corrupt" in this sense of the word had betrayed his Mandate of Heaven. Excessive public corruption was often the cause of rebellions and uprisings such as the Taiping rebellion in the nineteenth century. In this early period there were already criminal punishments for what is today referred to as corruption. The criminal code of the Qin dynasty (221–206 BCE) included a catalog of strict punishments for all offenses related to "dereliction of duty in office."

In the People's Republic, corruption has been defined differently in each period according to the political aims. In politically radical times it was identified as ideological deviation, supposedly antisocialist or bureaucratic behavior. In public, however, the topic was mainly taboo. Only at the end of the 1970s, as reform policies began to emerge, was the press permitted to report cases of corruption again. To begin with, the

"Gang of Four" were held responsible, but the dramatic increase in corruption in the 1980s made new explanations necessary.

There are factors embedded in the system that favor corruption, for example overcentralization of the economy, the Chinese Communist Party's (CCP) monopoly position, lack of a clear division between public and private spheres, bureaucratic planning, and state control of resources. In addition, there are psychological factors such as the failure of the revolutionary model, changes in values, and development deficiencies such as shortages of goods and resources, and the town-country divide. The introduction of reforms (decentralization, openings to the outside world, extension of market mechanisms, migration, and diversification of property structures) has led to increases in corruption in some areas. Since the CCP's monopoly on power has not been affected, and since no instruments to control cadres have been introduced, functionaries can use the CCP's monopoly on power and their right to distribute goods and resources quite freely to line their own pockets. Some officials, however, have been accused of corruption and subsequently punished—including Chen Xitong, the former party secretary and member of the Political Bureau of the CCP, who was sentenced to many years in prison in 1998; and Chen Xitong, the vice-chairman of the National People's Congress, who was executed in August 2000.

CORRUPTION—KOREA Known as the "Korean disease," corruption pervades South Korean society and has manifested itself in many forms in everyday life. Widespread corruption, such as influence peddling, cronyism, and bribery, has long been a part of Korean culture and has served as a catalyst for change in Korean history as far back as the Koryo dynasty (918–1392 CE), when corruption among Buddhist monks eventually led to the downfall of the

dynasty and the adoption of neo-Confucianism in the following Yi dynasty (1392–1910). More recently, the April Students' Revolution of 1960 was a revolt against Republic of Korea President Syngman Rhee's corrupt administration.

Although corruption occurs worldwide, corruption in Korea has exhibited unique characteristics. The centralization of power and the abuse of power within the governmental and bureaucratic structure of South Korea have provided opportunities for individuals to accrue power and influence.

Interestingly enough, preventing widespread corruption has been the focus of successive presidential administrations as the lethal effects of corruption have created a public backlash. During the 1990s, a series of accidents was blamed on corrupt bureaucrats and inspectors. Yet changing the entrenched culture where gift-giving and kickbacks are routine has proved difficult as corruption and graft have been tied to the highest levels of government, with many of the politicians and bureaucrats charged with curbing corruption having themselves become corrupt. Moreover, governmental agencies charged with investigating corruption have often failed to investigate wrongdoing and indict those responsible in criminal corruption cases.

Things may change in the Republic of Korea with the passage in 2001 of legislation that tightens anti-corruption laws by protecting whistle-blowers, requiring civil servants to report wrongdoing, and allowing for the confiscation of bribes.

COURTYARDS The courtyard house is the archetypal form of traditional Chinese dwelling. Its basic design of a central courtyard surrounded on four sides by buildings or pavilions parallels the basic model of traditional Chinese-built environments, including cities and gardens: a central open space enclosed by buildings. The buildings face the courtyard, which

provides outdoor space for leisure activities, work, air circulation and ventilation, water drainage, and storage. Access to the enclosed courtyard house is provided through a south or east entrance. Carved arches or ornate door lintels signify the class and trade of the resident, and many entrances are flanked by stone lions. A courtyard complex may be expanded by adding more courtyards in front, in back, or on either wing. Different regional variations cater to local environmental conditions. In Beijing and other northern cities, courtyards are large in area to admit more sunlight, while in southern cities they are smaller so that more shade and better ventilation are provided.

During the chaotic Cultural Revolution of 1966–1976, many families were evicted from their courtyard homes in Beijing because of their "bad class backgrounds." Following the Tangshan earthquake of 1976, refugees poured into the city and took shelter in the courtyard gardens, and many stayed. With the current economic boom in China, land prices have skyrocketed, and urban renewal programs to clear neighborhoods of one-story courtyard houses to make room for multistory buildings are under way. Courtyard houses are becoming mere memories.

CRAM SCHOOLS "Cram school" is the English translation for *juku*, the Japanese word for a wide range of private, after-school schools. During the Edo period, *juku* included the highly academic private academies organized around one scholar who was renowned in a particular field. Some offered instruction in Japanese musical instruments, abacus, calligraphy, martial arts, and tea ceremony. When the modern education system was introduced into Japan at the end of the nineteenth century, academic *juku* almost disappeared.

In the latter half of the twentieth century, *juku* has meant private classes, usually intended as preparation for entrance exams to high school and university, or a type of remedial education. Nonacademic *juku*, also known as *okeiko*, provide instruction in traditional arts and defensive skills, as well as enrichment classes such as music lessons. *Juku* range in size from home-based operations to large nationwide corporations.

Education in Japan has been described as having a dual structure. The cram-school industry is the informal side, and public and private schools comprise the formal side. In public schools all students must learn at the same pace, but it is widely acknowledged that entrance exams to the best high schools, and therefore the top universities, require more advanced instruction. Students from both public and private schools, therefore, attend *juku* to maximize their chances in the examination competition. If students fail the entrance exam to the university of their choice, then they may also attend an intensive one-year exam preparatory school known as *yobiko*.

In 1998, the Education Ministry reported that 37 percent of public elementary students, 72 percent of public junior high, and 35 percent of high school students were attending cram schools. The increasing role of *juku* as a supplement to the formal education system in Japan was acknowledged for the first time in the early 2000s by the Education Ministry. On a final note, while the *juku* phenomenon is sometimes seen as typically Japanese, similar cram schools exist in Korea and Taiwan, where they fulfill similar functions.

CRANGANUR (2002 est. pop. 36,000). Cranganur (Cranganore, Kadungalloor) is a small city on the Alwaye river estuary in northern Kerala state, India, lying 26 kilometers to the north of Cochin. While of minor economic importance, exporting some timber and peppers, in ancient times it was the site of one of the great entrepôt centers of the East, the Roman emporium of Muziris (its Greek name).

Muziris was the best harbor on the Kerala coast (before silting occurred). Saint Thomas is thought to have

founded a church there in 52 CE. Muziris in 341 CE was the seat of government of Cheraman Perumal, a king of the early ninth century, who sanctioned the first settlement of Jews and Christians on this coast. The town has a synagogue three centuries old, and a Portuguese tomb dating to 1551.

In classical times the port exported tropical lumber, pearls, ivory, silk, diamonds, sapphires, and pepper. The town was so important to the Romans that they maintained a legion of soldiers here, around five hundred to one thousand men, and the city boasted a temple to Augustus (undiscovered, but probably submerged in the estuary). An ancient Tamil poem captures the bustle of the ancient port: "Agitating the white foam of the Periyaru [River] the beautifully built ships of the Yavanas [Ionians] come with gold and return with pepper, and Muziris resounds with the noise."

CRICKET A sport originating in a small Hampshire village in seventeenth-century England, cricket was introduced to South Asia by the British in the early eighteenth century. The first recorded cricket match in South Asia took place in 1721 in Cambai, western India, between the officers and men of a British ship. Although at first played only by the British, cricket eventually gained a following among local populations. Indians formed their first cricket club, the Orient Cricket Club, in Bombay in 1848. Today cricket is immensely popular throughout the subcontinent and is regarded as a national sport in several South Asian countries.

Cricket is a bat-and-ball game played between two teams of eleven players each. Each side takes turns at bat, while the fielding and bowling side attempts to get the opposing batsmen out for the least number of runs. The team with the highest number of runs wins. Most cricket matches are concluded in one day, but games at higher levels of competition may last longer. For example, Test matches (international matches between the top ten cricket-playing nations) are played over five days.

The subcontinent has produced world-famous cricketers, such as Ranjitsinhji (1872–1933), after whom India's Ranji trophy is named, and the Nawab

CRICKET

As this notice in a Bombay newspaper of 1825 illustrates, it was important to find "amusements" for "the ladies" who would not be among the cricket players.

There will be tents for the ladies, and as the cricketers are all to be dressed in an appropriate uniform, we anticipate one of the most gay and animated scenes that has ever graced our island.

We feel infinite pleasure in announcing amusements which tend to counteract the effects of this enervating climate, by raising the spirits from apathy, and the physical powers from that feminine indolence which is generally rewarded by premature old age, skin hanging in drapery, and muscles reduced to pack thread.

Source: Hilton Brown. (1948) *The Sabibs*. London: William Hodge & Co, 184–185.

of Pataudi (1910–1952). Both of these players represented England before India was accorded Test status.

In the modern era, India and Pakistan have been the traditional cricketing powers of Asia. In 1983, with stars such as Kapil Dev and Sunil Gavaskar, India won the Cricket World Cup, becoming the first country from South Asia to win this major international competition. Current players such as Sachin Tendulkar are national heroes in India. Pakistan, too, has fielded some excellent national teams, especially in the early 1990s under its legendary captain Imran Khan. Waqar Younis, Shoaib Akhtar, and Wasim Akram are among the current Pakistani stars. In recent years Sri Lanka has performed well in international competition, while Bangladesh attained full Test status in the summer of 2000 (the International Cricket Council determines which countries compete at this highest level of cricket). India, Pakistan, Sri Lanka, and Bangladesh play regular series against other Test nations (England, the West Indies, South Africa, Zimbabwe, Australia, and New Zealand). These games create intense interest among fans of cricket in South Asia and are widely regarded as highlights of the sporting calendar.

CUI JIAN (b. 1961), Chinese singer and musician. Cui Jian is China's first rock and roll star. Born to musician parents of Korean descent, Cui was raised in Beijing during the Cultural Revolution (1966–1976). He began learning trumpet at age fourteen and in 1981, joined the Beijing Philharmonic Orchestra as a trumpet player. In his spare time he explored popular music.

While Cui's first album was a largely unnoticed collection of pop music covers (*Lanzigui*, 1984), he soon began writing his own music and lyrics and developing his trademark gravel-voice style, drawing inspiration from Western rock bands like the Beatles, the Rolling Stones, and the Police. In Beijing in May 1985, Cui performed one of his first rock songs, "Nothing to My Name," a disconsolate ballad melding western rock with traditional Chinese melodies and instrumentation. The performance rocketed him to stardom and the song remains his signature hit and an anthem of loss for the Tiananmen generation, the youth who witnessed the bloody crackdown on student democracy activists on 4 June 1989.

Cui's albums include *Rock and Roll on the New Long March* (1987), *Solution* (1991), *Balls Under the Red Flag* (1994), and *Power of the Powerless* (1998).

CUISINE—AFGHANISTAN Afghani cuisine blends the flavors and ingredients of Central Asia, the Middle East, South Asia, and China. Afghanistan's lo-

An Afghani girl carrying bread on a street of damaged buildings in Kabul. (BACI/CORBIS)

SAMOOS-I-YIRAKOT

Samoos (or samosas) are a popular dish in Afghanistan and South Asia. Samoos are fun to make and are a good appetizer or hors d'oeuvre.

1 tbs. corn oil
 1 medium onion; chopped
 1 garlic clove; chopped
 1 potato; peeled and cut into small pieces
 ½ cup cauliflower; chopped
 ½ cup carrot; chopped
 ½ cup green peas, fresh or frozen
 ½ cup thin-sliced green beans
 ¼ tbs. salt
 ¼ tbs. freshly ground black pepper
 1 cup corn oil, for deep-frying

Mix the meal, egg and salt together, adding just enough water to make a moist dough that holds together. Set aside. Heat the oil in a skillet, add the onion and garlic, and stir-fry over moderate heat until light brown, about 3 minutes. Set aside. Take the potato and ½ cup each of any other 3 vegetables and blanch in boiling water for 5 minutes. Drain well. Add these to the pan with the onion and garlic and stir-fry over moderate heat for 3 minutes, to mix well. Add salt and pepper. Cool. Take 1 heaping tablespoon of the dough and press it out on a flat surface into a 2½-inch square. Put 1 tablespoon of the vegetable mixture on the bottom half of the square and fold it over into a triangle. Prepare all the samoosi this way. Heat the oil in a wok or skillet and brown the turnovers over moderate heat for about 3 minutes. Drain on paper towels. Serve warm. Makes about 20 turnovers.

cation at the hub of the Silk Road accounts for the wide range of culinary influences on the country, with typical dishes ranging from traditional Indian breads to meat kabobs that are the staples of Middle Eastern cuisine.

Breads (such as nan and chapattis) and noodles are central to meals. Short-grain rice is used for *bata* (sticky rice), and long-grain rice is the basis for a wide variety of flavorful pilafs. Fried turnovers stuffed with potatoes (*boulanee*) or vegetables (*samoosi*) are popular

THE TRADITIONAL AFGHAN DIET

"Necessity compels the Afghans to live soberly and frugally, and they subsist on fruit nearly half the year. Meat, unless swimming in grease, is not approved; and no meat may be eaten unless it is *halal*, that is to say the animal must have had its face turned towards Mecca and its throat cut in a particular part, to the accompaniment of certain words of prayer. Rice and wheaten bread are consumed by the well-to-do, the former generally cooked with meat and fat in the shape of *pilao*. The principal food of the villagers and nomads, out of the fruit season is *krut*, a kind of porridge made of boiled Indian corn, bruised between two stones, or simply unleavened bread, with which rancid grease is eaten."

appetizers. Spices such as saffron, cumin, mint, cardamom, orange peel, cinnamon, and Chinese chives are part of many dishes; yogurt, nuts, and raisins are often-used ingredients as well.

Vegetables are more widely available than meat. Pumpkin is used as the main ingredient for turnovers and soups, and eggplant and spinach figure prominently in many dishes. Lamb is the most popular meat and is used in curries, kabobs, and stews (*korma*). Recipes also include ground beef, chicken, and goat. Although spices in these dishes are wide ranging and exotic, Afghan cooking is considered to be somewhat mild compared to other Asian cuisines.

Seasonal fresh fruits such as melons and grapes are often served at the conclusion of a meal. Sweet treats are considered an extravagance and are not routinely served, but such foods as *firmee* (a milky pudding flavored with rose water and pistachios), baklavah, and halvah would be among the dessert items for special occasions.

CUISINE—CENTRAL ASIA Central Asian cuisine encompasses the traditional culinary practices of the region's five countries, whose methods of food preparation can be divided into two groups. Historically, Kazakhstan and Kyrgyzstan were populated primarily by nomadic peoples, who for centuries herded sheep, camels, and horses. Their constant movement left no time for agriculture or complex cooking; the people of these countries relied mainly on the meat and milk provided by their herds, with very little else to diversify their diet. In contrast, inhabitants of the more settled regions of Uzbekistan, Tajikistan, and Turkmenistan cultivated crops and developed sophisticated cooking techniques, thanks to greater availability of produce as well as their ability to spend time at the hearth.

Central Asia's largely harsh and arid climate meant that even in the agricultural regions people relied heavily on meat and cultured dairy products, with relatively few vegetables beyond hardy root crops. Beginning in the late nineteenth century, however, many new crops were introduced, and as the traditional nomadic way of life began to disappear, more garden crops were sown, a process accelerated by the use of widespread irrigation during the Soviet period. Today, after more than a century of change and outside influence, the differences among the Central Asian countries are far less pronounced than they once were, and it is possible to make certain generalizations about the foods of the region.

Meats and Meat Dishes

Meat remains an important food source throughout Central Asia. Lamb is the most popular, although the Turkmens favor mountain goat or kid, while Kazakhs are partial to organ meats. The Kyrgyz consider horsemeat sausage a delicacy. The two most wide-

Two women in Old Town, Khiva, Uzbekistan, make flatbread in an outdoor oven. (WOLFGANG KAEHLER/CORBIS)

spread methods for preparing meat are grilling and boiling (or steaming). Uzbekistan is renowned for its many varieties of kabob (skewered grilled meat, either in whole pieces or ground). The excellent *kiyma* kabob is made by shaping seasoned ground lamb around a skewer.

Turkmen and Tajik meat cookery also depends on the grill, but in Kazakhstan and Kyrgyzstan boiled meats are more common. An ancient dish still eaten today is *kavurdak*, meat that has been stewed in its own fat and then stored in vessels for long keeping. Meat is also preserved by drying it on tall poles in the sun. Both methods reflect the necessities of itinerant life.

Meat is used to flavor a variety of soups; especially prized is the *lagman* found throughout Central Asia, a hearty soup of lamb, carrots, and noodles. Unlike many clear European and Asian soups, the soups of Central Asia are nearly always stew-like, enriched with thickeners like potatoes, chickpeas, or mung beans. These soups tend to be rich and filling from the addition of the prized fat from fat-tailed sheep.

Domestic fowl is not as popular as red meat; more highly appreciated are wild fowl such as pheasant and quail. Since pork is proscribed under Islamic law, it is consumed solely by the minority non-Muslim population. Fish is regularly eaten only in regions that have a significant water source, such as western Turkmenistan and Kazakhstan bordering on the Caspian Sea.

Dairy Products

The second most important component of Central Asian cuisine is the wide array of cultured dairy products made from the milk of sheep and camels and, to a lesser extent, goats and cows. These include *koumiss* (slightly fermented milk), *ayran* (yogurt mixed with water), *kaymak* (clotted cream), and *suzma* (yogurt cheese). Uzbek cuisine in particular boasts numerous milk-based soups, one of the best being *shirkovok* (milk soup with pumpkin and rice). Eggs are not significant in Central Asian cookery.

Grains, Legumes, and Breads

Central Asian cuisine is perhaps best known for its extensive variety of rice pilafs (*palov*). Uzbekistan alone is said to have one hundred different types, and their proper preparation is considered an art. Often legumes such as chickpeas (*nut*) and mung beans (*masb*) are mixed with the rice for extra protein. Pilafs are also made from other grains including millet, barley, and sorgho. All of the Central Asian countries enjoy tasty flatbreads, dumplings, and pies made with wheat-flour dough. *Manty* (large steamed dumplings filled with

meat or vegetables), *chuchvara* (small boiled dumplings), and *samsa* (baked or fried pies filled with meat or vegetables) are encountered throughout the region. Kazakhstan is also known for its *beliashi* (open-faced pies fried in a skillet). Central Asian flatbreads are baked in a *tandyr*, a clay oven similar to the Indian tandoor. *Non*, a large, flat round bread pricked in a decorative pattern with a special instrument, is the most popular. These round breads were originally baked to mimic the shape of the sun. They are eaten out of hand or used as a plate to hold meat or vegetable stews.

Seasonings

Although different regions favor different spices and seasonings, certain flavors characterize Central Asian cuisine as a whole. Onion is used abundantly, as is the fat of the fat-tailed sheep, which lends intense flavor to meat and vegetable dishes. Hot red pepper and black pepper add heat to a wide variety of dishes. *Zira* (cumin), sesame seed, nigella, basil, dill, cilantro, parsley, and mint are all used to enliven foods from soups to salads to pilafs. Cinnamon and saffron are used less widely. Garlic adds intensity to many dishes, while dried barberries contribute a sour tang.

Beverages

Tea, either black or green, is the most popular beverage of Central Asia; the preference for one type over the other depends on the locale. Kazakhs tend to drink more black tea, while the Kyrgyz enjoy green tea served with milk or cream and slightly salted. In Uzbekistan black tea is drunk more often than green. Black tea, often in traditional pressed brick form rather than loose leaf, is boiled with milk and served as a rich beverage. Central Asians drink tea from a *pialy*, a bowl-like cup without a handle, and serve it as a ritual part of their hospitality. Other beverages include the aforementioned *koumiss* and *ayran* as well as a variety of refreshing fruit drinks with sugar (*sherbet*).

Fruits and Vegetables

Kazakhstan is the birthplace of the apple (the name of the capital city, Almaty, means "father of apples"), and Uzbekistan and Tajikistan produce exceptionally sweet melons. Other fruits include apricots, peaches, cherries, quince, persimmons, and pomegranates; Central Asian raisins and dried apricots are among the best in the world. The most frequently encountered vegetables are root crops such as carrots, turnips, radishes, onions, and garlic. Carrots alone come in a surprising variety of shapes and colors and have a rich, sweet flavor. Pumpkins and squash are frequently used

in soups and as fillings for dumplings and pies. Typically, vegetables are not served alone but are added to soups or paired with meats or pilafs.

Sweets

Traditional Central Asian sweets consist of fruits or nuts simmered in a sugar- or honey-based syrup, served either as a compote or allowed to dry and crystallize. Often fruits are boiled down to make *bekmes*, a concentrated syrup. Other desserts include halvah, made from ground sesame seeds, and dough fried in coils or balls and sweetened with syrup. Although European-style cookies and cakes were introduced under Russian rule, they never displaced the traditional Eastern sweets that still constitute the best ending to a Central Asian meal. Ice cream, however, is extremely popular.

Two centuries of Russian domination did little to change the traditional foodways of the region, and Central Asian cuisine today still reflects a historical reliance on meats and cultured dairy products. The local foods also reveal the influence of centuries of trade, from Chinese noodles to tandoor-baked flatbreads to Persian-style pilafs. Central Asian cuisine is much more diverse now than it was in the past, with vegetables and fruits making up a larger part of the diet. One thing that has remained constant over the centuries, however, is Central Asia's great tradition of hospitality, which is still very much alive in the region's many *chai-khanas* (tea houses) as well as in private homes.

CUISINE—CHINA China's cuisine has spread to all corners of the earth, and the lavishness and variety of Chinese meals is legendary. Yet, through most of history, the vast majority of Chinese have eaten very simple fare, and have considered themselves lucky if they had enough of that. Dense population, unpredictable weather, poverty, and progressive environmental damage combined to give the country a reputation in literature as a land of famine. Only since about 1970 has China been free of major food shortages. The cuisine developed its sophistication partly

through the constant need to use every possible resource with maximum efficiency.

History

Early humans populated East Asia approximately one million years ago. They lived by hunting, fishing, and gathering plants and shellfish. Agriculture began before 8000 BCE in China. Recent finds have shown that by this time rice agriculture was well established along the Chang (Yangtze) River and agriculture based on foxtail millet (*Setaria italica*) was established in the drier, cooler drainage basin of the Huang (Yellow) River. By 4000 BCE, cultivation or domestication of many of the basic elements of Chinese food was already widespread: rice, Chinese cabbages, pigs, chickens, sheep, cattle, and various fruits and nuts. Hunting and fishing were still important, however. Archeological finds have revealed that by 3000 BCE a wealth of sophisticated cooking implements and eating utensils existed. Inequalities in wealth were also well established by this time. Perhaps wheat and barley had also arrived from the Near East. They appear by 2000 BCE, but were rare until later.

Chinese cuisine enters the written record in the Zhou dynasty (1045–256 BCE), when recipes begin to appear in ritual texts. Supernatural beings and human elders had to have food prepared according to specific rules. The *Book of Songs* (*Shi Jing*), a collection of folk and popular songs from about 1000–500 BCE, includes the names of most of the commonly eaten plants and animals. Although the record of ritual cooking runs primarily to meat—always a luxury and feast food—and grain, with liberal amounts of *jiu*, mildly alcoholic drinks brewed from fermented grains (usually translated "wine," but technically beer or ale), the *Book of Songs* gives a wider perspective, with mentions of vegetables, fruits, nuts, herbs, fish, and game. Grain was the staple food, with vegetables a very long second in importance. The basic distinction between *fan* (cooked grain) and *ts'ai* (vegetables, or any dish eaten with grain) was already being made. It continues to be basic in Chinese food. Soybeans were known, but not much used.

In the Han dynasty (206 BCE–220 CE), contacts with West and South Asia brought new things, including grapes and wine, but, more important, advanced milling technology. This enabled the Chinese to do far more with wheat and soybeans, both of which need to be ground to be useful. It is probable that China's enormous wealth of wheat products—noodles, dumplings, breads, steamed buns, fermented pastes, sauces, gluten products, and more—began its evolution at this time. Soybeans were used for soy sauce and

pastes, and probably for tofu (bean curd), though the evidence is thin.

In the next several centuries, Chinese cooking became more elaborate. In the Song dynasty (960–1267), growing prosperity and the arrival of new foodstuffs led to the development of the complex, sophisticated cuisine we know today. Crucial to this, according to modern scholars, was the development of a middle class. Unable to afford the sheer quantity of game and domestic meat that dominated the tables of the nobility, the middle class developed complex culinary techniques, making small amounts of ordinary ingredients into refined, elegant fare. Buddhism, which values simplicity, contributed to this development. In the northwest, Persian and Central Asian influences were particularly strong, due to trade along the Silk Road.

When the Mongols conquered China and founded the Yuan dynasty (1267–1368), influences from western Asia flowed into China, profoundly shaping court cuisine. Dishes from Baghdad and Kashmir were served along with Mongol and Chinese foods. Such influences remained primarily in the north and west. The east developed a highly complex cuisine that made much use of fish, shellfish, and vegetables.

The Ming dynasty (1368–1644), a native Chinese dynasty, reasserted Chinese traditions, partly because of new nationalism. Cuisine perceived as central Asian became steadily less popular. Dairy products, for instance, were popular in west and north China during the entire period of Asian influence but lost ground during the Ming dynasty. Animal herding was displaced by grain agriculture in many areas as the population rose. Most East Asian adults cannot digest lactose (milk sugar) and get indigestion from fresh milk, but they once consumed much yogurt and similar products in which the lactose is destroyed by fermentation.

The Ming dynasty saw the arrival of new foreign influences. Portuguese and Spanish traders introduced New World crops domesticated by Native American peoples. China's economy was radically transformed by maize, sweet potatoes, peanuts, tomatoes, chili peppers, tobacco, and minor crops from pineapples to guavas. Maize and sweet potatoes (and, later, white potatoes) became famine staples and animal feeds; peanuts were a new source of protein and oil.

The Qing dynasty (1644–1912), China's last imperial dynasty, saw a steady increase in European influence on China. The expansion of the tea trade integrated China into the expanding world trade in foodstuffs. After the fall of the Qing dynasty, the incorporation of China into the global economy pro-

CHA XIAO BAO (ROAST PORK DUMPLINGS)

Dim sum or yum cha dates back to the tenth century when little dumplings began to be served with tea. These treats have evolved considerably since then and are one of the most delicate and complex Chinese dishes.

Dough

20 oz. flour
1 cup sugar
6 tsp. baking powder
1½ tsp. white vinegar
2 tbsp. lard
6 oz. lukewarm water
wax paper
2 egg whites

Filling

10 oz. roast pork
1 clove garlic
1 sprig scallion
5 tbsp. cornstarch
6 tbsp. water

Sauce

4 tbsp. sugar
4 tbsp. light soy sauce
1 tbsp. dark soy sauce
2 tbsp. oyster sauce
1 tsp. sesame oil
dash of pepper
⅔ cup water

For the filling, start by frying the garlic and scallion in 2 tbsp oil. Add the sauce ingredients and the roast pork. Thicken with the starch and water.

For the dough, sift the flour with the baking powder. Heap the flour, making a crater in the middle. Add sugar, beaten egg white, vinegar, lard, and water. Mix the ingredients together and knead into a ball. Leave dough to rest for half an hour. Then roll the dough between your palms into a long cylinder about 1½-inches wide. Cut into 20 pieces.

Flatten each piece of dough into a disk and add the filling. Bring the edges up and gather at the center. Put each dumpling on a piece of wax paper and put into a steamer. Bring the water to a rolling boil. Put the steamer over the boiling water, cover and let steam for 10 minutes over high heat.

Source: "John Sui's Recipes by Request." Retrieved March 15 2002, from <http://www.galaxylink.com.hk/~john/food/cooking/canton/chaxiaobao.htm>.

ceeded apace. China has taken advantage of the global economy to spread Chinese cuisine worldwide. Such items as soy sauce and tea are known and used throughout the world.

Current Changes

Chinese food continues to evolve and change. One change—deplored by traditional gourmets—is the coming of monosodium glutamate, which was isolated from seaweed in Japan in the early twentieth century and only since 1960s spread into Chinese cooking. Another addition is the "fortune cookie," invented by a Chinese bakery in California in the late nineteenth century; it reached East Asia in the mid-twentieth century. Western food, including the fast food offered at McDonald's, has come to China. Another recent development has been the spread of the Cantonese cus-

tom of making a leisurely breakfast of dim sum. The Cantonese phrase *dim sam* (Mandarin *dienxin*) literally means "dot the heart" but may more idiomatically be translated "hits the spot." Dim sum are small, savory, high-calorie snacks, most often various kinds of stuffed and steamed dumplings and buns. They are eaten with endless cups of tea. Traditionally a breakfast for workers or for weekend outings, dim sum have become exceedingly popular in urban China, and in many distant urban centers to which Chinese have migrated.

General Characteristics

Chinese cuisine shows similarities with other cuisines of East Asia, partly because of China's influence in the region. Throughout East Asia, meals are typically boiled grain with some form of mixed topping involving vegetables, spices, and soy products. Soup is

BOK CHOY SOUP

This recipe is adapted from Ken Hom's *Easy Family Recipes from a Chinese-American Childhood*. Hom recalls that his neighbors would grow bok choy and other traditional Chinese vegetables in small garden plots in Chicago's Chinatown.

- 4 cups chicken stock or reduced-salt canned broth
- 1 cup bok choy, cut up
- 1 egg
- 2 tsp. sesame oil
- 1 tsp. sugar
- 1 tsp. salt
- ¼ tsp. freshly ground white pepper
- 1 tbs. light soy sauce
- 3 tbs. finely chopped scallions, white part only
- 3 tbs. finely chopped green scallion tops (for garnish)
- 1 cup shredded iceberg lettuce

Put the chicken stock in a pot and bring it to a simmer. Separate the leaves and stalks of the bok choy, and cut the leaves into 2-inch pieces. Peel the stems, cut them into diagonal slices, and wash them well in several changes of water.

Lightly beat the egg and then mix with the sesame oil in a small bowl. Toss the sugar into the simmering stock, taste, then add salt, pepper, and soy sauce and give the stock several good stirs. Next toss in the bok choy and scallions and then drizzle in the egg mixture in a very slow thin stream. Using a chopstick or fork pull the egg slowly into strands.

Remove the soup from the heat and toss in the shredded lettuce, stirring all the while. Garnish with the finely chopped scallion tops and serve at once.

Source: Ken Hom (1997). *Easy Family Recipes from a Chinese-American Childhood*. New York: Alfred E. Knopf, 51–52.

abundant and important. The grain is most often rice, simply boiled (often miscalled "steamed"). Boiled rice (or a substitute such as millet or cracked maize) is topped with a mixed dish, usually involving a good deal of highly flavored sauce that can soak into the rice. Next most common, especially in China itself, are noodles—usually made of wheat, often of rice or other grains. These are most often cooked in soup, but they are frequently boiled and then fried with vegetables and flavorings (the familiar "chow mein"—more correctly *chao mien*—and its relatives). Steamed buns, small breads, dumplings, and other products, usually made of wheat but often of maize, buckwheat, or other grains, are common. These are usually eaten by themselves, as snacks or quick meals. In some of the poorest parts of China, heavy flat cakes of maize or buckwheat were

staples. They have since been replaced by wheat and rice products over the last thirty years.

Within China, pork is the commonest meat. China is home to two-thirds of the world's domesticated pigs. Chickens—native to China—come second. Fish and shellfish abound wherever there is water. Thousands of species of marine life are used. Most fish are now supplied by pond farming. This practice was invented in China at least 2,000 years ago and continues to increase. Hundreds of species of vegetables and fruits are eaten.

Traditionally, oils were most often made from cabbage seeds (rapeseed oil). Later came unrefined sesame, maize, and peanut oils, whose marked tastes added much to the cuisine. Today, rapeseed and soy

oils are common; maize and peanut oils continue to flourish; all are refined and essentially tasteless.

Food is usually boiled, steamed, or fried. Soup is traditionally present at virtually every meal, and often is the entire meal. Water was (and still often is) highly polluted, and had to be boiled; making it into soup or tea thus made good sense. Frying usually involves the famous process called *chao* in Chinese and "stir-frying" in English: Food is cut into small pieces and stirred in a small amount of extremely hot oil. This process spares oil and fuel. The custom of eating with chopsticks (*kuayzi*) was already established by the Zhou dynasty (1045–256 BCE).

The mix of spices and flavorings distinguishes Chinese food from other cuisines of East Asia. Flavorings in a Chinese meal almost always contain at least some of the following: Soy sauce, fermented soybean paste (or whole beans), garlic, onions (often small green onions), chili peppers, fresh ginger, Chinese "wine," and Chinese vinegar. The latter two are made by fermentation of grain, using special strains of fungi and bacteria that yield complex and distinctive flavors. In impoverished or climatically stressed areas, food flavorings may be little more than garlic and onions and a bit of soy sauce. In overseas restaurants that cater to non-Chinese, the flavorings are usually reduced.

Chinese cooking evolved as a cooking of scarcity. Several characteristics of the cuisine follow from this. First, food, especially meat, is cut into small pieces. This allows it to cook more quickly and go farther in serving, and to make it manageable by chopsticks. Second, dishes and stoves are designed to use little fuel. This, with the thin slicing, allows ordinary people to cook a meal on a handful of grass or splinters; until recently, this was all the fuel available for many or most families. Third, by putting small dishes of cut-up vegetables and meat on the rice, in a closed pot, cooks can produce a three- or four-course meal in one pot, cutting back still further on fuel use. These are only a few of many tricks for saving fuel and food.

Another type of efficiency is gained by using almost everything edible. Tough leaves can be boiled for soup. Frogs, small shellfish, and minnows are consumed. Wild herbs and berries are sought out. Many crops are grown, the choice governed by what grows best in each local habitat—streamsides, rice paddy banks, groves, pots, even roofs. The result is an enormous variety of foodstuffs and of dishes. Restaurants often have 400 dishes on their menus and can make many more on request.

Most important of all, Chinese cuisine is based on foods that produce an adequate diet on a minimum of

land. Rice is the highest yielding of all grains. Sweet potatoes and other root crops extend the range of cultivation. Soybeans are high in protein that complements rice protein in the diet. Chinese cabbages and other popular vegetables are high in vitamins and minerals.

Many foods are eaten solely for their high nutrient value. An example is *kou ji cai* (*Lycium chinense*), "the poor people's vitamin pill," whose leaves and berries are among the richest sources of vitamins known. Long before anyone analyzed vitamins, the leaves and dried fruits of this plant were known to be nutritious and strengthening. Handfuls of the fruits (*kou ji zi*) are used in soups for women recovering from childbirth or for persons convalescing from sickness.

Regional Variations

Within these general guidelines, Chinese cuisine varies greatly by region. The basic divide is between north and south. The north is dominated by wheat, with maize, sorghum, millet, and rice playing minor parts. The south is dominated by rice. The northern limit of the Jiang River basin is the approximate dividing line; the Jiang drainage basin grows both rice and wheat (and now a great deal of maize). Maize is produced in large amounts almost everywhere in China, but it is usually used for animal feed and is not popular with humans.

In the north, distinctive subtypes have evolved in the major geographic divisions. Particularly famous are the cuisines of Shaanxi (centered on Xi'an), Hebei (centered on Beijing and Tianjin), and Shandong. All are characterized by the dominance of noodles, dumplings, and steamed breads. All use a great deal of onions and garlic. Lamb, very rare southward, is used in the northwest. Shaanxi food is simple and often flavored with local vinegar. Beijing is more elaborate and has its own elite tradition in the form of the cuisine of the Forbidden City; the disappearance of the imperial court led to great reduction of this cuisine, but it survives in a few restaurants and banquet halls. Shandong food uses many vegetables, soybean products, seafoods, and dumpling varieties.

The classic centers of the south are Hunan-Sichuan, the Chang delta, and Guangdong. Hunan and Sichuan have always had a spicy cuisine. Until chilies arrived from the Americas, the "heat" came from smartweed (*Polygonum* spp.), Sichuan "pepper" (actually a prickly ash or fagara, *Xanthoxylum* spp.), and black pepper and relatives (*Piper* spp.). Chilies gave local cooks a chance to escalate the heat level. This spicy style has spread to, or has influenced, most of southwest China.

Life in the Chang delta originally centered around several great cities: Hangzhou, Suzhou, Ningpo, Shanghai (recently), and others. Each city has its own variant of a general style characterized by sweet-sour dishes, much oil, a smooth and mellow texture, and very heavy use of vegetables and seafoods.

Guangdong (Cantonese) cuisine is marked by its enormous variety of ingredients (even by Chinese standards) and its heavy use of various fermented soy-bean products, including the distinctive fermented "black beans" (Mandarin *dou shi*, Cantonese *tausi*). Seafoods are intensively used, and are often made into salty pastes and sauces; these resemble similar South-east Asian products.

Several other important southern styles exist, including Chaozhou (Teochiu, Chiuchow), Fuzhou, and others. Distinctive cuisines also characterize the many minority groups that speak non-Chinese languages. The largest of these, the Zhuang minority (speaking languages very close to Thai), is noted for heavy vegetable use and for certain fermented products. Some Zhuang villages are characterized by high life expectancies, due in large part to their healthy diet of relatively unprocessed grains and varied local vegetables.

Issues for the Twenty-First Century

Overuse of wild foods, especially rare animals (with the distinction between medicine and cuisine blurred), is now a serious problem. Erosion, deforestation, spread of cities and roads onto farmland, and other processes are destroying much of the landscape. Unless conservation is taken far more seriously, China will again be the land of famine.

CUISINE—INDONESIA Indonesian cuisine is as distinct and diverse as the many thousands of islands that make up the archipelago. On the routes of commerce between India, China, and the Middle East, Indonesia developed a cuisine that reflects these foreign influences in its curries and stir-fries. In the ba-

GADO-GADO (INDONESIAN VEGETABLE SALAD)

2 cups sliced lettuce
2 cups sliced steamed cabbage or cauliflower florets
2 cups steamed bean sprouts
1 boiled potato, thinly sliced
½ cucumber, thinly sliced
1 large tomato, thinly sliced
Arrange the vegetables in a platter

For garnish:

1 hard boiled egg, sliced
crushed *krupuk* (prawn crackers)

Peanut Sauce

1 cup crunchy peanut butter
2 tbs. sweet soy sauce
1 tbs. fried onions
2 tbs. brown sugar
1 tbs. lime/lemon juice
1 cube chicken bouillon
1 cup boiling water
salt to taste

Simmer ingredients for the sauce over low heat. Cool and pour over salad, garnish with sliced egg and prawn crackers.

sic Indonesian staples of rice (*nasi*) and vegetable dishes, fish, and occasionally beef or pork, the cuisine also reflects local products. Rice is grown in places with rich volcanic soil, either by terraced, wetland cultivation or by dry cultivation in eastern Indonesia.

The Wallace line divides the Indonesian archipelago into two parts with distinctly different fauna and flora. The west consists of the larger islands of Sumatra, Java, Bali, and Kalimantan, while the east consists of Sulawesi, Maluku, the Lesser Sunda Islands, and West Papua. The differences in produce and cuisine roughly follow this biological division. Another dividing factor is the proximity to coastal areas, which are known for many fish and coconut dishes combined with spices and vegetables and complemented with tropical fruits.

Javanese, Sumatran, and Balinese cuisine represent the dominant Indonesian cuisines and are widely available across the archipelago because of interisland migration. Beef *rendang* is well known internationally.

SAMBAL DENDENG **(SPICY SHREDDED BEEF)**

This spicy, deep-fried shredded beef dish is typical of Indonesian cuisine. A blend of Chinese and Southeast Asian influences, sambal dendeng is a good dish for entertaining or for exploring the culinary pleasures of Southeast Asia

- 1 lb. beef round, cut into ¼-inch-thick pieces
- salt as needed
- oil as needed
- 4 Holland red peppers (fresh cayenne may be substituted)
- 8 garlic cloves
- ½ tsp. shrimp paste
- 1 tsp. minced zedoary (ginger can be substituted)
- 2 thinly sliced galangal (ginger can be substituted)
- 2 tbs. lime peel
- ½ tsp. tamarind (the pulp from a lemon or lime can be substituted)
- ½ cup coconut milk
- 1 cup water

Sprinkle some salt on beef pieces then deep fry them in oil for 7 minutes. Drain on a paper towel then let cool. Shred beef into small pieces. If they are too tough or rubbery, pound them with a meat tenderizer before shredding.

Grind Holland red peppers, garlic cloves, shrimp paste, zedoary, and galangal to a fine paste. Heat a deep frying pan, add 2 tablespoons of oil. Sauté spice paste for about 5 minutes then add lime peel, tamarind, coconut milk, and water. Bring sauce to a boil then lower heat to simmer. Add beef to the sauce, then simmer, covered, until beef is tender and sauce is almost dry. Season with salt. Serve with steamed rice.

From West Sumatra, this dish is a beef curry cooked in spices, chilies, and coconut, simmered until dry. It is purchased in tiny stalls (*warung* Padang) in remote regions of the eastern islands of Indonesia and together with *nasi goreng* (fried rice) has become a café-style take-out food all over the world and in upmarket Asian restaurants in the Netherlands, United States, and Australia. During the centuries before air travel, the mainly Muslim inhabitants of West Sumatra brought *rendang* with chilies and spices as preservatives on their long pilgrimages to Mecca.

Javanese *tempe* (tempeh) and *tabu* (tofu), both made from soybeans, are the basis of many Javanese dishes. In the West, they are often sold in health shops and Asian groceries. They have become popular daily

foods throughout Indonesia because of their high nutrition, low cost, easy storage, and delicious taste. Eastern Indonesia, which is partly non-Muslim, offers pork-based dishes.

Meals

In prosperous times, people expect to eat rice three times a day, accompanied by a main dish and side dishes. In Java, it is customary to offer to share food with others, and this practice has been adopted throughout Indonesia as a social gesture of inclusion: *selamat makan* or *bon appétit*. Guests arriving around mealtime are invited to share the meal. The food is placed on the table or floor mat where the diners serve themselves. In a middle-class home, a plate, spoon, and

fork are used, while others use banana leaves as plates and eat with their right fingers.

Rice and a variety of dishes based on vegetables, fish, poultry, beef, pork, and pulses (beans) are cooked in a wok or a pot. The main ingredient is mixed, marinated, broiled, fried, or simmered with spices. Spices include pepper, nutmeg, coriander, lesser galangal, turmeric, candlenuts, garlic, onions, and chilies, which are crushed using pestle and mortar. During feasts, such as weddings and *Lebaran* (the Muslim celebration at the end of the fasting month of Ramadan), a variety of dishes are served: for instance, yellow (turmeric) rice accompanied by fried chicken, fried fish, chicken curry, or prawn curry and garnished with thinly sliced omelettes and greens. This combination is the basis of the internationally acclaimed rijstafel (rice and a set of special dishes), a Dutch colonial's gastronomic adaptation of the typical East Indies (as Indonesia used to be known) feast.

Everyday cooking relies on vegetables, such as cabbages, *kang-kung* (a kind of watercress), Chinese cabbages, snake beans, a variety of bean sprouts, and summer squash, available daily in the market. *Gado-gado*, a famous Indonesian vegetarian dish, consists of vegetables, including tomatoes, garnished with thinly sliced boiled eggs and crushed *krupuk* (prawn crackers), and complemented with peanut sauce as a dressing. This low-cost but healthy dish is popularly eaten as a snack or main meal during midday, competing with chicken *satays* (cubed meat on a skewer), both of which are available in street food stalls or from hawkers and restaurants.

Sweets and Beverages

Indonesians eat sweets as snacks, not as desserts. Dessert is commonly a selection of tropical fruits in season, particularly bananas, which are available all year. Cakes, puddings, biscuits, and pastries have been much influenced by the Dutch, while traditional sweets are made of cassavas, sweet potatoes, glutinous rice, palm sugar, or grated coconut or a combination of these. The mainly Muslim population does not drink alcohol with meals; however for feasts and special occasions in some areas, people may drink a locally produced fermented palm wine, known as *tuak*, *moke* (palm wine or *lontar* palm), *arak* (distilled liquor from sugar palm), or *brem* (fermented rice). People usually drink hot or iced tea or water with their meals.

Today Indonesian cuisine also reflects the Western influence of fast foods such as breads and hamburgers and the Chinese influence of noodles, along with the traditional foods based on fresh tropical produce with

various tastes: spicy, sweet, savory, sour, pungent. The home of a wide range of spices, Indonesia became famous during three and a half centuries of colonial rule for these condiments and since then for its cuisine.

CUISINE—IRAN Because of its relatively large size and diverse climates (from the Persian Gulf in the south to the Caspian Sea in the north), a history of several thousand years, and the many ethnic groups that populate it, Iran has a rich variety of foods that differ from region to region and sometimes even season to season. The national cuisine of Iran, however, which has spread to and influenced the cuisines of other cultures and countries in South and Central Asia and the Middle East, consists of ethnic and regional foods that have been refined and perfected over the course of many centuries, particularly by the master chefs of the royal courts. To Western tastes, Iranian food seems both exotic and familiar: exotic because the many combinations of vegetables, herbs, spices, and fruits are new; familiar because almost all the ingredients are commonly used in the West. What characterizes this cuisine is essentially its emphasis on flavors.

Based on the ingredients used and methods of preparation, Iranian foods are categorized in a dozen or so main groups, some of which are *polo* (rice mixed with other ingredients such as legumes, meats, vegetables, and herbs), *kboresh* (stew-type dishes that are usually served over *chelo*, plain rice), *kabab* (skewered meats), *ash* (thick pottage-like dishes), *abgusht* (soups), *dolmeh* (stuffed vegetables and grape leaves), *kufteh* (meat and/or rice balls), and *kuku* (vegetable or other soufflé-type dishes). Rice is one of the most important staples in the Iranian diet and is often the main dish. The most popular way of making rice in Iran, which is quite different from that of most other cuisines, results in fluffy, separated grains of rice. For this kind of dish, a high quality, long grain rice such as basmati is used, which has a unique flavor and aroma. Rice dishes are usually

DOLMEH-YEH FELFEL

An Iranian classic, the flavor-infused rice and dense but delicate taste and textures characteristic of Iranian foods are wonderfully presented in this recipe. Adapted from the Iranian culinary "bible," Rosa Montazemi's *Honar-e Ashpazi* or *Art of Cooking*, dolmeh-yeh felfel or stuffed peppers are relatively simple to make and absolutely delicious.

2 medium onions, finely chopped
 cooking oil
 ½ lb. ground lamb or beef
 salt
 black pepper
 3–4 tsp. tomato paste
 ⅓ cup parsley, finely chopped
 ⅓ cup mint, finely chopped
 ½ cup spring onions, finely chopped
 ⅓ cup garlic chives, finely chopped
 ⅓ cup tarragon, finely chopped (optional)
 3½ oz. of long-grain or basmati rice
 4 large green or red peppers
 2–3 tsp. sugar
 3–4 tbs. fresh lime juice

Fry onions in cooking oil over medium heat until golden. Add ground meat and fry further until meat changes color. Add ½ cup water, salt, pepper and most of tomato paste. Mix and cook further until water boils off.

Fry prepared herbs and spring onions in cooking oil over medium heat until wilted. Boil 2 cups of water in a small pot. Add 1 teaspoon of salt and rice and boil further until rice softens. Drain the water and let cool slightly.

Cut a circle at the top of the peppers and remove seeds. Boil 2 cups of water in a large pot. Add 1 teaspoon of salt and the peppers. They should be placed side by side (make sure not to stack them). Cook until they soften slightly. Take care not to overcook or they might fall apart later on. Drain the water and let cool.

Mix well-prepared meat, vegetables, most of the lime juice, most of the sugar, and rice. Sprinkle some salt inside peppers, fill them with the mix and close the tops. Again place the peppers side by side (avoid stacking them) in a large pot. Prepare sauce by mixing ½ cup of hot water with the rest of sugar, lime juice and tomato paste. Pour the sauce in over the peppers and simmer for 5–10 minutes. Serve this dolmeh hot with the sauce. Makes four servings.

Source: Iranian/Persian Recipes. Retrieved 17 March 2002, from: <http://www.ee.surrey.ac.uk/Personal/F.Mokhtarian/recipes>.

decorated with saffron-flavored grains of rice. Traditionally, red meat (usually mutton) and poultry are not consumed in the quantities that are customary in the West. Meats are often used to flavor dishes, as are other ingredients. Iranian foods are by no means bland, which

is not to say that they are spicy, as is Indian cuisine. What distinguishes an Iranian table is the subtlety of the combination of flavors. A typical Iranian meal may consist of a rice dish with a meat sauce; yogurt; fresh herbs such as mint, basil, and tarragon; and freshly

baked bread, of which there are many varieties available on every street corner.

CUISINE—IRAQ Iraq's rich and varied cuisine reflects the nation's long history. Located at the geographic center of the Middle East, modern-day Iraq also encompasses ancient Mesopotamia, the so-called land between the rivers. On the rich soils between the Tigris and Euphrates Rivers, some of the world's first agriculturalists started domesticating livestock and raising crops ten to twelve thousand years ago. From these earliest origins came a number of the staples of modern Iraqi cuisine: dates from palms that dotted the oases; wheat, rice, and barley from lush, intensively cultivated fields; and meat from lambs, sheep, goats, cattle, and camels that served as the basis of nomadic Iraqi life.

Iraq's location has also made it a crossover point for cuisines. Along the Silk Road from China came ingredients such as peas and apricots, as well as techniques for combining sweet and sour flavors. Mongol invaders brought tea, a drink popular to this day. Periods of rule by the Sumerians, Babylonians, Assyrians, Persians, Greeks, Romans, Arabs, Ottomans, and the British also left their marks.

Baghdad served as a center for culinary mixing as well as a center for gastronomic extravagance. Medieval Islamic caliphs, for instance, threw lavish banquets in which their guests feasted for days and wrote poetry exalting their food bounty.

From the neighboring Persians, Iraqi cooks learned to create sweet and savory dishes combining meats with dried and fresh fruits. Like their Turkish neighbors, Iraqis enjoy stuffed vegetable dishes, including stuffed grape leaves (dolma). Well-traveled Jewish chefs also left their mark, introducing French and Italian influences in the eighteenth century, notably a pizza-like dish consisting of flat yeast bread coated with a tomato sauce and ground meat.

Formal meals consist of multiple courses, starting with appetizers that might include kebabs (skewered

OVEN BARBECUED FISH WITH TRADITIONAL STUFFING

A traditional Iraqi method for preparing fish with a pungent but delicious stuffing.

- 1 whole fish (approx. 3 lbs.), cut open lengthwise head to tail through the back
- 4 tbs. vegetable oil
- 8 chopped onions
- 12 garlic cloves, minced or pressed
- 2 tsp. curry powder
- 2 tsp. salt
- 2 tbs. tamarind paste (can substitute pulp of lemon or lime)
- 1 cup warm water

Place the open fish skin down on a cookie sheet. Broil for 3–4 minutes until partially cooked. Heat oil in a saucepan, and sauté the onion and the garlic, stirring until the onions are tender. Add curry powder and salt. Stir. Dissolve the tamarind in the warm water, then add it to the onion mix. Let cook on medium heat until the mixture is a thick paste (about 30 minutes). Spread the onion mixture on the broiled fish.

Bake the fish in a 350° oven for 15–30 minutes or until done. Place the fish under the broiler for few minutes until a thin crust has formed on the stuffing. Serve with rice and green salad.

Source: Saleh's Iraq. Retrieved 15 March 2002, from: http://www.mecookbook.com/Book_Maklooba.html.

grilled meats) or yogurt dishes. Flavored rice dishes serve as the foundation of meals and also mark a cook's skill. The most common meats include lamb and mutton, but the meat of cows, goats, chickens, and even camels is still used. Pork is prohibited by Muslim law throughout the region. Fish, however, forms the basis for perhaps the country's most famous dish, *mas-goof*, a skewered river fish barbecued and spiced with salt, pepper, and tamarind. Pickled vegetables (*turshi*) link Iraqi cuisine to that throughout northeast Africa and the Middle East.

Abroad and at home, Iraqi cooks continue to adapt their cooking techniques, responding to new influences while retaining millennia of traditions.

CUISINE—JAPAN The basic characteristics of Japanese foodways may be traced to its ecological and historical contexts, above all, to the conditions related to island life and to the periods of isolation and borrowing from Asia and European culinary influences. Reliance on the products of the sea made fish, shellfish, and sea vegetables preeminent in the Japanese diet, and the suitability of Japanese soil to rice growing made rice the staple carbohydrate. Rice is the center of any meal; in fact, most older Japanese would not consider a meal complete without rice. Other dishes, such as pickles, cooked vegetables, and small amounts of salted fish and egg are flavor accompaniments to the main dish of rice. Before modern transportation permitted a more varied diet, people ate whatever their regions afforded.

Legendary Times Through the Nara Period

Prehistoric evidence from archaeological sites demonstrates the dominance of seafoods, especially shellfish—*asari* (short-necked clam), *hotategai* (scallop), and *awani* (abalone)—as represented in ancient shell mounds. It is probable that fish such as *tai* (sea bream), *suzuki* (sea bass), *koi* (carp), and *umagi* (eel) were also central to the diet during the Jomon culture (10,000–300 BCE). In addition, the diet may have included deer, crane, duck, boar, and rabbit. There is evidence too of other foods such as nuts and melons. Pottery and tools indicate that boiling and grilling were the main cooking methods. By the third century BCE, mainland Asian rice, millet, and wheat had come to Japan. Salt extraction from seawater permitted the pickling, preserving, and fermenting of foods; it is in this period that the standard meal evolved, consisting of a central grain dish accompanied by small portions of pickles and vegetables.

Rice growing depends on the cooperation of many people and the coordination of irrigation systems. By the seventh century, reliance on rice cultivation helped to create a political and social system in which mutual dependency for labor and irrigation was managed and controlled by a landlord class that gained economic and political power. Taxation of agricultural production was managed by a bureaucracy that could reach every farm worker and tie local organizations and authorities to the imperial capital, which by the eighth century was established in Nara. The court at Nara

received the bounty of the outlying regions, and a more diversified and elite cuisine became the object of courtier connoisseurship. Along with the refinement of taste, preparation methods were codified. Artisan tableware developed and an aesthetics of dining manners was created for courtiers. Class distinctions in diet and manners were apparent. Chopsticks (*hashi*) were used by aristocrats, while common people ate with their fingers. Peasants, agricultural producers of the aristocratic rice, ate less refined grains such as millet.

Heian and Kamakura Periods

During the Heian period (794–1185), court life featured elaborate presentations based on Chinese cooking methods. At the same time, the variety of foodstuffs declined under the influence of Chinese Buddhism, which prohibited the use of animal products. Japanese culinary historians look to this period as a time when the ubiquitous soup stock, *dashi*, was developed. Literature of the time includes details of dining. While rice was clearly the staple food, noodles were also prepared. A banquet might include raw fish, a soup, boiled foods, grilled and fried foods, followed by more boiled and steamed foods and ending with pickles and rice. Murasaki Shikibu, author of the Heian-period novel *The Tale of Genji*, records that the meals were taken at midmorning and midafternoon, supplemented by snack foods during the day and evening.

In the Kamakura period (1185–1333), the dominance of the warrior class spread a culture of simplicity and tough frugality, in which it became a virtue to simplify one's meals. Indeed, going without a meal was seen as a sign of good character. The need for foods transportable to battle sites and campgrounds may have been the origin of the *bento*, prepared foods that would keep longer. The *umeboshi* or pickled plum is said to have been created in this period; it became a necessary accompaniment to rice and other grains. In the court and in temples, however, refinements were based on Zen Buddhist simplicity, rather than warrior sensibilities, and on the tea ceremony, which was developed and practiced by Buddhist priests. The development of a Zen Buddhist cuisine elevated frugality and vegetarianism to an art in which "eating with the eyes" (*me de taberu*) was a value, and the aesthetics of food preparation and presentation became a tenet of Buddhist culinary practice.

The Tokugawa Period

The influences of European foodways began in Japan in the 1500s, when traders and missionaries from Spain, Portugal, and Holland brought methods of preparation such as breading and deep frying, as well

as new foodstuffs such as leavened bread. Most of these *namban ryori* (southern barbarian cooking) foods, however, did not influence local diets beyond the more cosmopolitan samurai and official classes. Moreover, there were as yet no routes to disseminate these novelties, and most people's diets were still determined by locally available foodstuffs.

By the Edo or Tokugawa period (1600/1603–1868), the elaborate cuisine attached to the tea ceremony (*chakaiseki ryori*) defined an order of service and mode of eating. *Kaiseki* cuisine emerged as the most refined eating, and evolved as a formal meal independent of the tea ceremony from which it derived. Seasonal fresh foods were emphasized, and the quality of ingredients was highly regarded. *Kaiseki* service stipulated that each element in the meal be prepared separately to ensure freshness and that it be prepared according to its own nature. The idea of separate courses in a meal was established by this principle. As a correlate, the appearance of each dish became very important and serving ware and implements had to be designed to reflect color and taste, as well as to present each element of the meal to its best advantage. The order of service, as established and elaborated from the Heian period banquet, began with *sakizuke* (appetizers), tiny portions of elegantly prepared fish. Second was *chinmi*, a kind of salad, tofu, or wheat gluten. Third was a soup, often a simple and elegant clear broth with a tiny vegetable, fish or clam decorating the bottom of a dark lacquer bowl, perhaps suggesting a miniature landscape. Next was *mukozuke*, a portion of sashimi or raw fish, followed by *takiawase* (a vegetarian simmered dish). There followed *mushimono*, steamed items flavored with a sauce based on soy sauce and garnished with grated *tororoimo* (mountain potato), a *yakimono* or grilled dish, a vinegar *sunomono* (salad), and finally rice with *miso* soup and pickle. Variations on these themes

A Japanese woman assists a man who is eating a sashimi meal of *fugu* in Fukuoka in 1995. (JAMES MARSHALL/CORBIS).

abound, and *kaiseki* came to include a wide variety of ingredients and preparations, combining the virtues of Buddhist simplicity with elaborate aesthetics.

During the Edo period, peace and bureaucratic centralization allowed for the flowering of arts and the development of an urban culture. The rise of the merchant class and a money economy meant the creation of a new urban consumer culture, which included an emphasis on entertainment and eating. Restaurants such as noodle shops, tempura shops, and grill houses became popular in the entertainment section of the cities. There were also *yatai*, stalls where workers could stop for a stand-up or sit-down meal. New foodstuffs continued to diversify the diet of the townspeople, and foreign ingredients and modes of preparation were introduced. Chinese tradition also continued to influence the diet. The bureaucratic centralization of the nation included compulsory sojourns in Edo (present-day Tokyo) for local *daimyo* (feudal lords); the frequent travel this system demanded helped to establish regular routes to the capital along which restaurants and teahouses sprang up. As ever, social class distinctions were reflected in food consumption patterns. Elaborate entertainment focusing on food were popular among the aristocracy and some members of the merchant class. Among commoners and peasants, a much simpler diet prevailed.

Meiji and Taisho Periods

Western food traditions continued to influence Japan even in the *sakoku jidai* (closed country) of the Tokugawa period. It was in the Meiji period (1868–1912), however, that full exposure to foodstuffs and cultures of the West occurred. At first many people were reluctant to try exotic substances, but the diffusion of a sophisticated cosmopolitan urban culture through media such as women's magazines that included recipes for roast meats and dairy-based dishes like custards, puddings, and butter cakes spread the fashion of eating foreign foods. Many older people, however, rejected the meals based on bread, potatoes, and starches other than rice. Meat eating had arrived in Japan much earlier, when Spanish and Portuguese missionaries had made beef eating part of the Christian conversion experiences of nobles in the sixteenth century. Ordinary people, however, did not eat beef until the Meiji era. Some Meiji leaders encouraged beef eating as a means for strengthening Japanese physically. The Meiji Emperor proclaimed the suitability of beef for the Japanese diet, and dishes like *sukiyaki* became popular. Western dining habits began to influence home meals. A dining table and chairs took the place of a traditional low *kotatsu* table and sitting on the floor. Using Western cutlery was also a novelty, and etiquette books be-

PORK CUTLET ON RICE (*KATSUDON*)

This dish, adapted from a recipe by master chef Shizuo Tzujii, is a staple in homes and restaurants throughout Japan.

6–8 cups hot cooked short-grain white rice
 4 6-ounce pork loin cutlets (pork tenderloin steaks or chops without bone)
 salt and pepper

Breading

6 tbs. flour
 2 eggs, beaten
 2 cups breadcrumbs
 vegetable oil for frying (peanut or corn oil works well)

Onion-and-Egg Topping

1 small onion
 2½ cups *dashi* (Japanese soup stock; vegetable broth can be substituted)
 7 tbs. *mirin* (rice wine or sake)
 6 tbs. soy sauce
 4 green onions, cut into 1½-inch lengths
 6 eggs, beaten

Pound cutlets with a mallet or bottle to flatten slightly. Remove fat at the edge of the cutlets to keep the meat from curling during frying. Salt and pepper both sides.

Dust with flour, dip in beaten egg, and coat both sides thickly with dry or fresh breadcrumbs. Let stand 2 or 3 minutes before frying. Note: Alternatively, the frying can be done in ¾ inch of oil in an ordinary skillet

Heat a generous amount of oil in a heavy-bottomed pot or deep-fryer to a medium temperature (340°F/170°C), and deep-fry cutlets one at a time, turning once, till golden brown, about 6 minutes each. Remove and drain on absorbent paper, and cut crosswise into ½-inch slices. Keep hot.

Meanwhile slice onion into rounds or half moons and, in a large frying pan in a scant amount of oil, sauté onion over high heat till transparent and soft. Add the *dashi*, *mirin*, and soy sauce to the pan. Simmer, and add the green onion lengths.

Finally, pour the beaten egg over the simmering onions. Stir when the egg begins to set. The egg is done when it is a little runny and juicy.

To serve, put a single portion of hot rice, 1½ to 2 cups, into a *domburi*-type bowl. Arrange one of the cutlets so it covers half the rice. Use the fried onion-and-egg topping to cover part of the cutlet and the rest of the rice. Use all the liquid. Serve immediately. Makes 4 servings.

came popular describing the precise fork and spoon to use with a course or dish.

In the Taisho period (1912–1926), the Japanese began to create uniquely Japanese versions of adopted foodstuffs, as with the Japanese versions of British versions of Indian curries (*kare raisu*). Pork dishes like *tonkatsu*, using the Portuguese method of deep frying

the meat and serving it with shredded cabbage salad, became ordinary urban restaurant food, as did *korokke* (croquettes), torpedo-shaped fried mixtures of potato, chicken, and other foods, derived from French and other European dishes.

Food technology also changed since the beginning of the Meiji period. Industrialization involved changes

FRIED *FUGU* WITH POTATO SALAD

Oddly enough, the potentially poisonous effects of *fugu*—the ovaries and liver are toxic and require removal by a licensed chef before the fish can be prepared—make it a rare delicacy. This recipe allows you to substitute other fish, chicken, or pork for *fugu*, which can cost up to \$200 when served in a fine restaurant in Japan.

Thinly sliced *fugu* (or any other white fish, chicken, or pork)
Thinly sliced potatoes
Watercress
Red pepper or soy sauce

Fry *fugu* slices. In place of *fugu*, you can use any white fish, chicken, or pork.

Slice potatoes very thinly and place in water. Take potatoes out of water and spread on a plate. Place *fugu* on top, and decorate with cress. Season lightly with red pepper. If you prefer, serve with Chinese-style dressing or soy sauce.

in household technology, as well as changes in agricultural and food processing technologies. Refrigeration in food locations, as well as in transport vehicles for fresh foods, meant a greater distribution of fresh foodstuffs and better preservation without salting, pickling, drying, and fermenting. In the post-World War II era, more people had refrigerators at home, allowing the purchase of foods for several days' use, and daily shopping was no longer necessary. Home ovens also began to appear after World War II, but only became popular after 1970. Other domestic equipment began to appear such as electric mixers, toasters, and later, food processors have become popular as well.

Globalization produced new influences on the daily diet of most Japanese people. Fresh and frozen seafood and produce can be transported to Japan from anywhere in the world within twenty-four hours. In the early twenty-first century, Japan became the buyer of about 55 percent of the tuna caught in the world. At dockside in many small harbors along the Maine Coast, lobster buyers from Japan are ready to purchase catches as they come in, and local fishermen know the rigid

specifications they must adhere to if the lobsters and fish they catch are to be acceptable to Japanese buyers.

Conversely, foods from Japan also have penetrated the foreign markets, and sushi is eaten in every major city in the world by people who have never been to Japan, but who now know words like *maguro*, *toro*, *uni*, and *unagi*. Instant ramen is recognizable in most of the world too, though it is not seen as a Japanese product. In fact, it is a modern version of a Chinese food that was thoroughly assimilated in Japan and then sold as a convenience food everywhere.

Fast foods and family restaurants are everywhere in Japan. There were local fast food places in Japan before the advent of hamburgers, fried chicken, and donuts, but these tended to be unique operations, run by a family who lived above the shop and catered to a local clientele that might drop by after work to pick up prepared food such as yakitori, sushi, and soba.

The extraordinary period of economic boom demonstrated the full diversification and spread of the Japanese diet, as restaurants of high quality prospered and food trends became more elaborate. Eating as entertainment of clients, family, and friends became expensive propositions, and meals of delicacies such as *fugu* (the poisonous blowfish that requires preparation by a licensed chef) could cost as much as \$300 per person. Indeed, single cups of coffee at one Ginza coffee shop could cost that much—because of the pure gold leaf that was served in them.

The bursting of the bubble economy did not slow development of new food trends. In the 1990s, restaurant eating continued to be popular, although the business expense account for dining significantly diminished. Consumers continued to explore new cuisines and ethnic restaurants became popular. The leading new cuisine in the early twentieth century has been Italian, but other trends include Thai, Vietnamese, African, Indian, and Sri Lankan foods, American regional cuisine, and refinements of regional French and Spanish dishes. There is almost no food that cannot be obtained in Japan. Food-related television programs such as the hit show "Ryori no Tetsujin" (Iron Chef) became popular in the 1990s, along with food and cooking-related magazines. These included not only women's magazines, but also magazines for men, young people, and the elderly, who have joined women in taking cooking classes. Food tourism also has become a prominent travel industry, with small groups of connoisseurs visiting vineyards, restaurants, food-preparation establishments, and cooking schools all over the world.

CUISINE—KOREA As was the case with other aspects of Korean culture, Korean cuisine developed under the strong influence of its powerful neighbor, China. Rice and fermented soybean products (soy sauce, soybean paste, and soybean curd, or tofu) occupy a prominent place in the diet of the Korean people. The use of chopsticks is another indicator of

Chinese influence. The emphasis on five elements in Korean cuisine, for example, five flavors (salt, sweet, sour, hot, bitter) and five colors (red, green, yellow, white, black) has Chinese origins as well.

Rice and Meat

The technology of rice cultivation was brought to the northern parts of the Korean peninsula from China probably late in the second millennium BCE, but rice became a staple of the Korean diet only in the Shilla period (668–935). Earlier staples had been buckwheat, millet, and barley. Before the late twentieth century, furthermore, rice was not the staple for everyone, but was rather a symbol of wealth. The old phrase "White rice with meat soup," for example, connotes the good life, while tacitly acknowledging that not everyone could afford either rice or meat.

Buddhist influences in Korea did not have much impact on meat eating. (According to Buddhist principles, Buddhists should be vegetarians, although nowadays this is not always the case. Buddhism forbids the eating of animal flesh, which is closely connected to killing

SPICY PORK STIR-FRY (*JAE YOOK BOKUM*)

This hefty Korean side dish goes well with kimchi.

- | | |
|---------------------------|----------------------------------------|
| 20 oz. thin cut pork meat | 3 tbs. sugar |
| 1 onion | 2 tbs. chopped green onion |
| ½ carrot | 1 tbs. chopped garlic |
| 2 thick green onions | 1 tbs. ginger juice (or ginger powder) |
| 3 smaller green onions | 2 tbs. rice wine |
| 2 tbs. red bean paste | 1 tbs. sesame oil |
| 1 tbs. ground red pepper | ground black pepper |
| 2 tbs. soy sauce | oil |

Pork meat should be as thin as possible, about 1 inch. Use meat tenderizer and lightly beat the meat. Cut onion and carrot into thin strips and cut green onions diagonally. In a large bowl, mix red bean paste, red pepper, soy sauce, sugar, chopped green onion, chopped garlic, ginger juice, rice wine, sesame oil, and black pepper. If your pork meat is too big, cut them the way you want.

Marinate pork meat and vegetables with the seasoning mixture for about 30 minutes. Coat a large skillet with oil, and stir fry meat and vegetables until meat is completely cooked. Serve over rice.

a living organism; some vegetarians exclude milk and eggs as well.) Beef, pork, lamb, chicken, and various types of game were regularly consumed by the Korean upper classes. Still, before the economic growth of the 1970s, for common people in Korea, the eating of meat was a luxury. Farmers, who formed the majority of the Korean population, rarely ate meat apart from the three days in summer when dog stew was served and a special day in winter when sparrows, wild boar, or wild rabbit was prepared. In both cases, the eating of meat, which was not part of the daily fare, was intended to strengthen physical resistance against extreme weather conditions.

Fermented and Pickled Products

The techniques of wine making and *chang* (a semi-liquid predecessor of soy sauce and soybean paste) making were also introduced from China and by the seventh century were already highly advanced. This was also the time when fermented seafood (*chotkal*) developed, along with vegetables preserved in salt. The latter eventually evolved into kimchi—the spicy pickled cabbage that is nowadays a symbol of Korea and Korean culture.

Kimchi is considered to be quintessentially Korean by Koreans and foreigners alike. Yet, in the form we know it today, it matured only a hundred years ago, after chili pepper and *chotkal* were added to the fer-

mentation process. The addition of chili pepper took place in the mid-eighteenth century and gave kimchi its characteristic red color and pungent taste. *Chotkal*, which has been included in the pickling from the late nineteenth century onward, not only enriched the taste of kimchi, but also increased its regional diversity. While at the end of the seventeenth century only eleven types of kimchi were classified, the regional varieties of *chotkal* (some regions use shellfish, others anchovies or other fish), which is now one of kimchi's vital ingredients, contributed to the development of several hundred varieties of kimchi. The vegetables that are pickled have also changed. Gourd melon and cucumber have been used since ancient times, followed by eggplant and Chinese radish. The Chinese cabbage that is most commonly used for making the popular *paech'u* kimchi was introduced only about a hundred years ago.

Chili pepper was brought to Korea at the end of the sixteenth century, most probably via Japan. It began to be widely cultivated a century later and by the twentieth century had become an integral part of Korean cuisine. In addition to being an indispensable component in kimchi, chili pepper contributes to the flavoring of the majority of Korean dishes through chili pepper powder and chili pepper paste (*koch'u-jang*). Both are not only used extensively in the kitchen, but often appear as a relish at the table.

Street vendors prepare a batch of kimchi on a sidewalk in Kyoonggi-do, South Korea. (MICHAEL FREEMAN/CORBIS)

KIMCHI

This powerful smelling, fiery dish provides much of the vegetable content of Korean cuisine. Most recipes require at least a week of fermentation for the lactic acids to break down the cabbage or radish, but this recipe only needs about a day. Kimchi may be a bit of an acquired taste for some, but its enormous nutritional content and purported anticancer properties make it a good addition to any diet, even if you don't eat the half pound a day the average Korean does.

1 lb. Napa or Peking cabbage	½ tbsp. chili flakes
½ tbsp. salt	¼ cup light soy sauce
1 tbsp. chopped spring onions	¼ cup white vinegar
½ tbsp. minced ginger	¾ tsp. sugar
½ tbsp. minced garlic	sesame oil

Coarsely chop the cabbage and place in a glass dish (metallic dishes can discolor and contaminate the kimchi). Sprinkle the cabbage with salt and let stand for 3–4 hours, or until the cabbage is thoroughly wilted (the high salt content breaks down the cell walls of the cabbage and makes it easier for the bacteria to digest). Remove the cabbage from the brine and squeeze out the excess liquid, and then add the next 7 ingredients. Transfer the mixture to sterilized jars to ferment, seal, and leave in a cool place for at least 24 hours. The kimchi should keep for a few weeks in the refrigerator, but will be best if eaten within a few days. Sprinkle the kimchi with sesame oil before serving. Yields 1 pound.

The Typical Korean Meal

Throughout the ages, Korean cuisine developed two distinct types of cooking: home cooking of the common people, matured within the family and the province of the housewife, and the more refined cuisine of the royal court, with its intricate cooking methods and elegant presentation. With the economic and social modernization that took place during the twentieth century, the distinction between the two became increasingly blurred. The twentieth century was also the time of Westernization of Korean cuisine. This process was initiated during the Japanese occupation (1910–1945), when Western food and drink, such as bread, confectionery, and beer, became popular in Korean cities, and a Western-style food processing industry in Korea began. Some Japanese food items were also adopted into Korean cuisine at that time, such as *tosirak* (the assorted lunch box) and sushi rolled in sheets of seaweed, which was popular in Korea under the name of *kimbap*.

A contemporary Korean meal is structured around plain boiled rice, accompanied by soup (*kuk*) and side dishes (*panch'an*). The number of side dishes varies, from three at ordinary meals to as many as twelve at more elaborate occasions. Stews (*tchigae*) and greens (blanched or sautéed and then mixed with a dressing) constitute the majority of *panch'an*. A variety of seafood and a wide selection of vegetables, along with beef, pork, and chicken, are the major foodstuffs. Seaweed is also used, but less extensively than in Japan. Chili pepper, soy sauce, soybean paste (*toenjang*), sesame oil, garlic, and green onions in various combinations give Korean dishes their characteristic flavor.

Eating Utensils and Eating Habits

A spoon and metal chopsticks are used while eating. Rice, soup, and other liquids are eaten with the former, side dishes generally with the latter. Soup and rice are served in individual bowls, but side dishes can

often be shared by more than one diner. Nowadays, bowls are usually made of stoneware, steel, or plastic, but for special occasions white porcelain is used. In the past, the tableware of the upper classes changed depending on the season: brass bowls were used in the winter and white porcelain ones in the summer. It is considered inelegant to lift bowls from the table (contrary to the rest of East Asia, where it is customary to lift bowls up to the mouth).

The majority of eating-out facilities in Korea have two dining areas: one with Western-style tables and chairs and one with an elevated floor where customers, seated on cushions, dine at low tables. Similarly, most Korean households use Western-style tables with chairs on a daily basis (with the table usually in the kitchen) but share meals seated on cushions on the floor, at a low table with short legs, when guests are entertained. The most traditional dining device is a small table designed for one or two persons. In upper-class households, such tables were once laid in the kitchen and then carried to different parts of the house where family members dined, divided according to age, gender, and position.

Fast Food

In recent decades, dairy products, confectionery, and a variety of Western-style dishes that are available at restaurants and fast-food outlets have become increasingly important items in the diet of the Korean population. Various noodles (*kuksu*) and stuffed dumplings (*mandu*) are popular and quick lunch dishes. Noodles are usually served in soupy liquids; stuffed dumplings are steamed, fried, or simmered in soups (*manduguk*).

Although Korean family meals still remain relatively uncontaminated, the share of commercially prepared foods is rising, as opposed to the pattern of home processing that prevailed before the 1970s. It may be surmised that further changes will take place in the decades to come. However, change rather than stability characterizes Korean cuisine, as any other.

CUISINE—MALAYSIA Malaysian cuisine reflects the rich multicultural heritage of the nation. When the port sultanate of Malacca (1400–1511) was founded, it attracted traders from both the East and West. Later culinary traditions were brought by Portuguese (1511–1641), Dutch (1641–1876), and English (1876–1957) colonists, as well as merchants from China, India, Saudi Arabia, and the Indonesian archipelago.

The dietary staples of rice and noodles reflect in part geography and native plant life, while the spice trade left an indelible impression on present-day tastes. The cuisines of Malaysia's three main ethnic groups, the Malays, Chinese, and Indians, form the core of Malaysian cuisine.

Various manifestations of rice dishes abound, and accompanying dishes are highly spiced in traditional Malay cuisine. Coconut cream features prominently. Malay food is ever evolving as old recipes for curries, *sambals* (spicy chili-pepper-based paste), and chutneys (spicy fruit- or vegetable-based paste) reappear. The best-known forms of Malay cuisine are *satay*, meat kebabs served with a spicy peanut sauce, cucumbers, onions, and rice cooked in coconut fronds; and *nasi lemak*, rice cooked in coconut cream and served with various condiments.

Malaysian Chinese cuisine can be categorized as Cantonese, Hainanese, Hakka, or Hokkien. Again,

A Malaysian steamed fish dish served in Penang in 2001. (MACDUFF EVERTON/CORBIS)

SOTO AYAM (CHICKEN SOUP)

Chicken soup is a Malaysian classic. This particular recipe makes heavy use of some of the Malaysia's more Indian culinary influences, such as cumin, turmeric, and fennel and stirs it up into something uniquely Malaysian.

1 packet compressed rice (or noodles)
 4 cloves
 1 stick cinnamon
 several tbsp. ghee (unsalted butter may be substituted)
 2 liters chicken stock (either from bones or cubes)
 pandan leaves (also known as screw pine leaves)
 1 chicken cut into big pieces
 salt
 MSG
 bean sprouts

Grind the following:

10 shallots or 1 red onion
 ½ inch ginger
 3 cloves garlic
 1 tsp. fennel seeds
 1 tsp. cumin seeds
 1 tbs. coriander seeds
 1 tsp. black pepper
 3 candlenuts (Be sure to cook them well as they are toxic when raw. Macadamia nuts may be substituted.)
 ½ tsps turmeric powder

Boil compressed rice packet in water till cooked, take out and leave to cool.

Fry ground ingredients, cloves, and cinnamon in a little ghee till fragrant, add stock, pandan, and chicken. Cook till chicken is done. Remove chicken and shred. Strain soup, season with salt and MSG. (Reduce the stock if necessary)

To serve, pour hot soup over rice, bean sprouts, and chicken in a large bowl.

Source: Thian's Mom. Retrieved 15 March 2002, from: <http://www.makantime.com>

rice and noodles are staples in the offerings of one-dish meals. Seafood and vegetables as well as meats are served with rice, and noodles are prepared in many different ways. Notables include hawker fare from the northern island-state of Penang and Cantonese offerings in the Klang Valley situated in the state of Selangor, and the city of Ipoh in the state of Perak.

Indian food, contrary to popular belief, is not always spicy. Vegetarian offerings are plentiful in Malaysian Indian cuisine, and the most popular dishes include rice with various curries served on a section of banana leaf, in south-Indian style. Indian-style breads are numer-

ous, among them *roti canai* (local name for *paratha*, a crispy bread with several thin layers), chapati (a thicker whole-wheat bread), nan (a thick bread of northern Indian origin), and *thosai* (a thin pancake made from the paste of ground lentils). Styles of preparations of accompanying dishes differ according to India's various regions and states, and there are distinctions between Indian Muslim and South Indian cuisines.

Overall, with constant exposure to cuisine from around the world, Malaysia's cuisine goes through a continual process of metamorphosis. The rise in "self-consciousness" about Malaysian cuisine also plays a large role

in its evolution, exemplified by the plethora of Malaysian cookbooks and the mushrooming of Malaysian restaurants in Western cities during the last decade.

CUISINE—MONGOLIA Traditional Mongolian foods have been and remain whatever the Mongols can obtain from their flocks (above all, milk, usually consumed fermented; more rarely, meat, generally boiled) and by hunting or gathering (or today, by importing). In general, these foods are monotonous, and access is highly seasonal and uneven. The Mongols also eat a number of bread foods when they can get access to flour. These foods are often in forms borrowed from a larger Eurasian world, e.g., the varieties of *boov* (from the Chinese *baozi*, meaning bread or bread food) that range from pastry to steamed dumplings

A woman cooking in a large pot in her yurt in Hovd Province, Mongolia, in 1996. (STEPHEN G. DONALDSON PHOTOGRAPHY)

HORSHOOR

Mutton and beef should taste just fine in this traditional Mongolian recipe, since goat, camel, and horse tend to be a little stringy—not to mention being difficult to find in supermarkets.

- 2 lbs. meat (mutton or beef; camel, horse, or goat for the true Mongolian dish)
- chopped cabbage and onion
- vegetable oil
- water
- 3 cloves minced garlic
- 1 tsp. salt
- 2 cups flour

Partially fry meat, vegetables, and garlic and set them aside. Make a pastry dough of flour, the salt, and enough water to make a pie-like dough. Mix the pastry ingredients together and knead until well blended. Let the dough sit for 10 minutes, roll out into little circles and fill with the meat mixture. Either place another circle atop the first and seal the edges or bring the sides together and pinch closed.

Fry the *horsboor* in about an inch of oil on medium-high until golden brown.

Source: Chicago Area Peace Corps Association Newsletter. Retrieved 15 March 2002, from: <http://www.capca.org>.

MONGOLIAN BEEF

A slightly Westernized version of Mongolian beef, this fairly easy recipe evokes notes reminiscent of true nomadic Mongolian cuisine.

4 cups peanut oil	½ tsp. salt
15 green onion tops	1 tsp. chili paste with garlic
1 tbs. minced ginger	¼ cup chicken stock
2 lbs. flank or sirloin steak	2 tbs. soy sauce
1½ tbs. water chestnut flour	¼ tsp. sugar
2 egg whites	1½ tbs. of dry sherry
cornstarch paste	

Cut tops of green onions into 2-inch-long pieces. Combine sauce ingredients (at right) in small bowl and stir thoroughly. Cut steak across the grain into thin slices, about ½-inch deep by 2-inch long. In a large bowl, combine egg whites, salt, and water chestnut flour. Beat with chopstick until frothy. Add steak and use fingers to coat each slice.

In a wok, heat oil to moderately hot. Fry meat in small batches; drop in 1 slice at a time to avoid sticking. Cook until lightly brown, about 1 minute. Drain on a paper bag.

Next, remove all but 2 tablespoons of oil from wok. With wok at medium heat, quickly stir-fry green onions and ginger for about 20 seconds. Add sauce; bring to boil on high heat while stirring. Add beef all at once, and toss with sauce until beef is hot and coated. Push beef out of sauce, dribble in cornstarch paste to lightly thicken. Recombine. Serves 4.

Source: Food Down Under. Retrieved 15 March 2002, from: <http://fooddownunder.com/cgi-bin/recipe.cgi?r=34250>.

similar to those eaten in China. Mongols also directly use grain, ground or semiground, in such dishes as *tsampa* (battered grain). Tea is now ubiquitous, most popularly as *suutei tsay* (Mongolian tea), made by long boiling of compressed bricks of tea in milk, with various additives, including butter or cream. Elites living a more completely sedentary life have often assimilated the foods of neighboring Russians and Chinese. In Inner Mongolia, for example, urban Mongols and the best-educated often serve foods that are more North Chinese than Mongolian, strictly speaking, but these North Chinese foods themselves have been heavily assimilated from central Eurasia by centuries of contact.

Mongolian cuisine was not always so dull as this description implies; the Mongols were once briefly arbiters of international taste, as is evidenced by the rich cuisine of the *Yinshan zhengyao* (Proper and Essential

Things for the Emperor's Food and Drink), presented to the Mongolian court in China in 1330 by its author, the Sino-Uighur dietary physician Hu Sihui. In this work, whose recipes for traditional foods run the gamut from roast wolf to a Kashmiri curry eaten with a fennel yeasted bread, there is an underlying foundation of *shulen* (banquet soups). These are exquisite blends of lamb, spices, and ingredients from one end of Asia to the other, melded in an attempt to create a cuisine that has a little something for everyone but is, at the same time, firmly based in a Mongolian love of boiling.

CUISINE—PHILIPPINES The cuisine of the Philippines reflects its complex history of colonialism and its geographic location. Beginning in 1521, three hundred years of Spanish colonization were followed by fifty years of American rule. These events have left their indelible marks on the foodways of the Philippines, making it one of the "centers for gastronomic change" (Sokolov 1991, 14–25). Combined with these influences is a history of commerce with Chinese and Malay neighbors, and the result is a dynamic cuisine where no one dish can properly represent the country. *Sinigang*, a broth of fish or shrimp paired with vegetables and flavored with tamarind, guava, or citrus fruits, may be the most indigenous dish, which best symbolizes the sour-salty combination preferred by Filipinos. *Adobo*, made with chicken or pork cooked in vinegar and garlic, originates in Mexican-Spanish in-

Lunchtime at a Jollibee fast-food restaurant in Manila in April 2000. The company controls 46 percent of the fast-food business in the Philippines. (REUTERS NEWMEDIA INC./CORBIS)

fluences, while *pancit* (noodles crowned with meat, vegetables, or local ingredients) and *lumpia*, a spring roll fried or served fresh, derive from Chinese cuisine.

Composed of 7,000 islands, the Philippines is surrounded by the sea. Fresh seafood is a must, especially in *kinilaw*, where fresh fish is marinated in vinegar and immediately eaten. Fish and a jar of palm wine were the first gifts to greet Magellan and his party. Today, fish served with rice is a Filipino meal boiled down to its essence. There are at least 160 words relating to rice and its prominent role as the staple grain, although in some areas corn or sweet potatoes are preferred. Beloved for its versatility, rice not only makes a meal but is used for rice cakes called *puto* as well as numerous sweets. The coconut is a close second to rice; its juice and meat are consumed fresh or used to flavor cooking, while the heart of the tree is enjoyed as a delicacy. Reliance on nature is another trademark of Filipino cuisine, seen in the use of cooking utensils that flavor food. The hollow of a bamboo pole can be made to boil rice while banana leaves steam fish or meat as well as flavor *bibingka* (rice cakes topped with sugar and native cheese).

Each province or region is known for its specialties. In Pampanga, a province reputed to harbor good cooks, cured meats are among the specialties. *Tocino* is made from thin slices of seasoned pork and served with eggs over fried rice for breakfast, or sometimes it is *longanisa*, a slightly spicy and sweet pork sausage. *Pinakbet*, a vegetable dish of bitter melon, eggplant, and *bagoong*, a popular condiment made from fermented tiny shrimp or anchovies, typifies Ilocano foodways. Down south, in Muslim Mindanao and Sulu, pork is avoided. Instead, goat, beef, and seafood cooked with coconut milk and spicy red chilies are favored.

SINIGANG SHRIMP

- 5–7 cups water
- 1 onion, sliced
- 2 jalapeño peppers or 2 whole chilies (optional)
- long string beans, cut into bite-size pieces
- 1–2 taro root, peeled and sliced into chunks.
- 1 packet Sinigang tamarind mix (if unavailable, use a few teaspoons tamarind paste)
- 1 pound whole raw prawns, unshelled (fish or pork can be used)
- 2 tomatoes
- kangkong (swamp cabbage) or substitute spinach or other leafy vegetable

Boil water with onion. Add peppers, string beans, taro root, and tamarind mix. Simmer until taro root is done. Add shrimp and tomatoes; cook for a few minutes. Add kangkong or leafy vegetable. When vegetables are barely cooked, just before serving, smash the tomatoes. Serve with hot rice and fish sauce.

Source: Margaret Magat

TINOLA (CHICKEN WITH GREEN PAPAYA)

2–4 garlic cloves
 1 tbs. minced ginger
 1 medium onion, sliced
 1 green papaya, sliced into chunks
 chicken pieces, skinless and defatted
 6–7 cups water
 chili pepper leaves (if unavailable, whole chilies)

In a deep pot, sauté garlic, ginger and onions. Add chicken, sauté until the outside is barely cooked. Add water and boil until chicken is tender, then add papaya and simmer. Minutes before serving, add chili leaves. Serve with hot rice and fish sauce.

Source: Margaret Magat

Fiestas and special occasions like Christmas call for rich Spanish-based dishes, such as *lechon* (roasted pig), *paella* (saffron-flavored rice seasoned with tomatoes and garlic and topped with meats and seafood), and chicken or fish *relleno* (stuffed chicken or fish), with *leche flan* (an egg custard) for dessert. For everyday meals, lower and middle classes prefer Malay- and Chinese-influenced dishes. *Merienda* is the afternoon snack, as simple as a mango or as elaborate as *puto* and *dinuguan* (pork blood stew). Favorite *pulutan* or snacks like fertilized duck eggs called *balut* are both street food as well as snacks eaten during drinking sessions, and are believed to be an aphrodisiac for men. Despite foreign influences, the liberal use of flavoring condiments like *bagoong*, chilies, crushed garlic, and vinegar can be said to indigenize Filipino cuisine, making dishes unique to that country.

CUISINE—SOUTH ASIA Like Europe, South Asia has a variety of sophisticated local, regional, and ethnic cuisines. The most familiar and recognizable cuisine of the subcontinent is Indian cuisine, but some of what passes for Indian food is actually Bangladeshi or Pakistani cuisine. The cuisine of each locality and ethnic group in the subcontinent was usually inspired by local ingredients, and each region boasts distinct specialties and recipes handed down from generation to generation.

However, until the Green Revolution of the 1970s, certain regions in India and Bangladesh regularly suffered from overpopulation, which, along with drought and floods, led to pronounced and repeated food scarcity. Today India is self-sufficient in food grains and suffers no major shortages, but the same is not true for all of South Asia.

Some of the distinctive culinary regions of South Asia are the Punjab area in the central Indo-Gangetic plain, including parts of Pakistan, dominated by spicy baked meats (such as tandoori chicken) and flat breads made of wheat flour; the Bengal region to the east, including Bangladesh, known for mustard-spiced fish dishes and *rossogollas* (cottage-cheese sweets); the Tamil/Kerala area in the south, including Sri Lanka, known for rice-based meals, snacks such as *idli* (steamed rice cakes), and meat and vegetables cooked in rich coconut sauces (*sambhal*); and the Kashmiri region in the Himalayas, influenced by Afghani cuisine, with meat and rice cooked Persian fashion with raisins and nuts.

The use of spices and sauces is the unifying thread of an otherwise diverse cuisine, as is the variety of unleavened flat breads made with wheat flour, rice, and ground legumes. Dairy products, such as ghee (clarified butter), buttermilk, curds (yogurt), along with dals (dried peas and beans) and vegetables, are dietary staples. Vegetables are generally fried to make curry (Tamil *kari*) or are served with gravies or in legume-based soups.

A traditional meal (*thali*) for lunch or dinner is eaten with the fingers. Originally served on a leaf, now commonly served on a stainless-steel platter, a typical meal includes several vegetable dishes, rice, puris or chapatis (fried unleavened bread), pickles, *papads* (lentil wafers), salads, dessert, and yogurt. The *thali* can be vegetarian or can include meat dishes. The meal is usually accompanied by tea, coffee, or hot water and followed by a *paan* (betel leaf and nut, eaten as a digestive).

South Asian cuisine also offers much in the way of vegetarian and nonvegetarian snack foods. These are

usually savory dishes served with chutneys and pickles and eaten at any time of day.

Cooking in the subcontinent was traditionally associated with religious practices and moral beliefs. For example, India has a centuries-old tradition of cooking highly sophisticated and elaborate ritual food (*prasadam*) for sacred offerings to temple deities and for life-cycle rituals of devotees. This tradition is still alive today, and there is a vast resource of indigenous cooking knowledge and expertise in the subcontinent.

Diets and dietary restrictions in the subcontinent are closely linked to religion. India is predominantly Hindu, and while it is believed that all Hindus are vegetarian, the practice is usually confined to the Hindu upper castes; lower castes eat meat such as poultry and mutton, but no beef. Muslims of India, Pakistan, and Bangladesh eat mutton, beef, poultry, and seafood, but no pork. Christians of the subcontinent eat poultry, fish, pork, mutton, and beef on a regular basis.

Historical Influences

South Asia was a destination of spice traders from the second through fourteenth centuries, so that foreign elements inevitably seeped into the culinary culture and modified local cuisines. The major influences were the Mughals, the Portuguese, and the British.

In 1527 the Mongol emperor Zahir-ud-Din Muhammad (Babur) invaded India and established the Mughal dynasty (1526–1857). The Mughals created the "Mughlai" court cuisine, heavily influenced by Afghani and Central Asian cuisine. Spices were added to cream and butter, rice was cooked with meat, and dishes were garnished with nuts. India was also introduced to kebabs and pilafs, as well as a variety of sweets made of wheat, cream, honey, and nuts. Today Mughlai cuisine is the core of the cuisines of India, Pakistan, and Bangladesh.

The Portuguese had traded in Goa on the southwestern coast of India as early as 1510, and Portuguese rule in Goa lasted for 450 years. Portuguese traders introduced such New World crops to Goa as potatoes, tomatoes, chilies, pineapples, yams, tobacco, and guavas, transforming the cuisine of the entire subcontinent.

In 1600 the British East India Company was established under a royal charter of Queen Elizabeth I for a fifteen-year period of spice trading. That event marked the beginning of the British empire's rule, which lasted three centuries on the subcontinent. With the British came a new cuisine called Raj—a compromise between British cuisine and that of the subcontinent. Bombay duck (native dried fish) replaced kippers at the colonial British breakfast table, and Bengali breakfast foods such as kedgeree (steamed rice and pulses) were exported from the subcontinent to the British table.

MASALA DOSAI

The *masala dosai* is the traditional south Indian lunch dish. The *dosai* is a large rice flour pancake often filled with the rich but refreshing spicy coconut chutney and spicy potato curry described here. *Dosai* are very versatile and can be filled with a variety of different foodstuffs, although these by far the most common.

2 cups par boiled rice
 2 cups raw rice - 1 cup *urud dal* (yellow lentils)
 1 tsp. fenugreek seeds

Rinse the above ingredients in water for about 2–3 hours. Then grind in a blender (with adding water in steps) into a very fine flour. Add salt and keep it aside (to get sour) for 12 hours.

Heat the pan and spread a drop of oil on it. When the pan is fully heated, take some flour and spread it on the pan into a round shape. Turn it over so that both sides are cooked well. When it is almost cooked spread a teaspoon of coconut chutney over it. Place some potato curry and roll the *dosai* on both sides and move it to a plate.

Coconut Chutney

1 cup grated coconut
 2 green chilies
 ¼ tsp. salt
 pinch of *asafetida* (garlic or onion powder may be substituted)
 pinch of tamarind (lemon or lime pulp may be substituted)

To the coconut, chilis, and salt, add a pinch of tamarind and grind everything into a thick paste. Splatter with mustard seeds and *urud dal*.

Potato curry

1 lb. potatoes
 3 ½ oz. onions
 3 ½ oz. green peas
 1 tsp. mustard seeds
 1 tsp. *urud dal* (lentils)
 3 small green chilies
 1 twig of curry leaves
 ½ tsp. of salt

Boil the potatoes fully, peel and mash them. Heat some oil and add mustard seeds and *urud dal*. Add finely cut onions, fresh green peas and fry until the onions turn transparent. Add some fine pieces of green chillies and add the mashed potatoes, salt and fry. Add some curry leaves.

Source: India Tastes—South Indian Recipes—Masala Dosai. Retrieved 15 March, 2002, from: <http://www.indiatastes.com/categories/22.html>.

The British also introduced the word "curry," which people today associate with food from the sub-continent. British cooks ground spice powders to season meats and vegetables and cooked them into a kari,

a stir-fried preparation with gravy. The British called the ground spices "curry powder" and took it back to Britain, where it became popular. In 1997 Britain declared curry Britain's national dish, and in a

THE COLONIAL DIET

"You ask what shops we have. None at all; the butler buys everything in the bazaar in his bill every day. One of the Court native writers translates it into English, and very queer articles they concoct together! Such as, 'one beef of rump for biled;'—'one mutton of line beef for *alamoor estoo*,' meaning *à-la-mode stew*;—'mutton for curry pups' (puffs);—'eggs for saps, snobs, tips, and pups' (chops, snipes, tipsy cake, and puffs);—'medication (medicine) for ducks;'—and at the end 'ghirand totell' (grand total, and 'howl balance')."

Source: Julia C. Maitland. (1846) *Letters from Madras during the Years 1836–39*. London: Wm. Clowes & Sons.

countrywide survey 51 percent of people claimed they were "curryaholics," a word that may soon be listed in the Oxford English dictionary.

Vegetarianism

Toward the end of the Vedic period (1500–500 BCE), the concept of vegetarianism arose in the subcontinent primarily as a reaction to the dissolute upper castes who ate meat and drank liquor. The Buddhist notion of ahimsa (nonviolence) forbade the killing of animals as food, and this idea further influenced the Hindus not to eat meat. Asoka (d. 238 or 232 BCE), the Buddhist ruler of three-fourths of the subcontinent, further contributed to the development of vegetarianism by banning meat eating in his empire. Upper castes adopted vegetarianism soon afterward, and today vegetarianism is linked with upper-caste diet and behavior. Lower castes adopted vegetarianism as part of the process of Sanskritization (emulation of higher castes). Many vegetarian dishes of contemporary South Asia, especially of India, have been exported to the West, especially for those cultivating a healthful alternative lifestyle.

Contemporary South Asian Food

Today in South Asian cities like Delhi and Dacca, multinational companies such as McDonald's, KFC, Wimpys, and Pizza Hut offer pizzas, hamburgers, fried chicken, and other American and European foods. However, the indigenous food industries on the subcontinent compete with multinational interests in anticipating the needs of South Asian consumers.

In the indigenous food industry, Indian, Pakistani, Bengali, and other regional recipes are simplified for fast production, which decreases preparation time and costs for consumers. Food products include those for immediate consumption, as well as prepared foods such as snacks, spice powders, lentil wafers, pickles, and chutneys. Many of these prepared foods are exported to Britain and the United States for consumption by the South Asian diaspora, and today foods from various parts of the subcontinent are popular all over the globe.

CUISINE—THAILAND Thai cuisine is defined by its balance of four flavors: spicy, salty, sweet, and sour. Preserved fish or seafood generally provides the

Bowls with an assortment of spices to make Thai curry. (MAC-DUFF EVERTON/CORBIS)

***LAAP KAI* (MINCED CHICKEN SALAD)**

2 chicken breasts (approximately 1 pound)
 2 cloves garlic, minced
 2 ½ tbs. fish sauce
 3 tbs. lime juice
 1 tsp ground cayenne pepper
 1 tbs. roasted rice powder*
 2 tbs. chopped scallions, ends only
 ½ cup fresh mint leaves, roughly chopped
 lettuce leaves
 1 cucumber peeled and sliced

Cook chicken in a covered skillet over medium heat until done, about 20 minutes. Add 1–2 tablespoons of water to prevent chicken from sticking to the pan while cooking if needed. Let the chicken cool and then chop it by hand or in a food processor into small chunks.

Transfer the meat into a mixing bowl. Add garlic, fish sauce, and 2 tablespoons of lime juice and mix well. Add more lime juice according to taste. Mix in ground pepper and rice powder, and then toss in chopped scallions and mint leaves.

Transfer mixture to serving plate lined with lettuce and arrange cucumber slices. Serve with steamed sticky rice.

*Roasted rice powder may be purchased at Asian grocery stores or made at home. Roast 1 tablespoon of uncooked sticky rice in a dry pan. When the rice granules turn brown, remove from heat and pound in a mortar and pestle.

Source: Linda McIntosh

salty flavor, while the spiciness originates from chilies and peppercorns. Palm sugar and coconut milk lend sweetness, and the sour or citrus flavor comes from sources such as lemon grass, kaffir lime, and tamarind. Indian, Chinese, and Western cooking has influenced Thai cuisine, which also shares similarities with the cuisine of Thailand's neighboring countries—Malaysia, Myanmar (Burma), Laos, and Cambodia. Despite these external influences, Thai cuisine is distinguished by its combination of fresh ingredients and its relatively short cooking time.

The foundation of Thai food is rice. Jasmine rice is the staple in central Thailand, while people living in the north and northeast prefer a glutinous or sticky rice. Various Thai noodle dishes were adopted from the Chinese. Abundant rivers and coastal areas make fish and seafood, either fresh or in a preserved form

such as fish sauce, shrimp paste, or fermented fish, another staple of Thai diets.

Thailand's four regions offer distinct cuisines. Central Thai food, the regional cuisine most commonly found in Thai restaurants, is known for its coconut-based curries. The people of north and northeast Thailand eat sticky rice and *laap*, a salad dish made from minced raw or cooked meat, including that of water buffalo and catfish, flavored with garlic, chilies, lime juice, and mint. In the northeast, Thailand's poorest region, exotic foods such as ant eggs are frequently eaten. Southern Thai cuisine, heavily influenced by Malay and Indian cooking, uses many spices. The majority of the south's population is Muslim and of Malay descent, so the influence from these countries comes naturally. Seafood is a common dish in the south, where the primary occupation is fishing.

KHAO NIEO MAMUANG **(MANGO AND STICKY RICE)**

8 oz. (1 cup) sticky rice
6 oz. coconut milk
1½ tbs. sugar
pinch of salt
2 ripe mangoes
4 tbs. coconut cream

Soak sticky rice in water for at least 4 hours. Drain rice and steam for 20 minutes or until tender, stirring occasionally while cooking. Transfer steamed rice to a bowl.

In a small mixing bowl, combine coconut milk, sugar, and salt. Combine the coconut milk mixture with the rice. Mix well and let rice sit for 30 minutes or until the milk mixture is absorbed.

Peel and slice the mangoes. Slice the two halves of the mango alongside its pit. Slice each half into diagonal, ½-inch-wide slices.

To serve, divide the rice and mango slices among four plates. Dribble 1 tablespoon of coconut cream onto the rice on each plate.

Source: Linda McIntosh

A typical Thai meal consists of several dishes, including a soup, a curry, a fried dish, and a spicy salad accompanied by rice. A fork and spoon are the usual Thai eating utensils; chopsticks are reserved for noodles. Fresh fruit to cleanse the palate typically follows the meal. Sweets are generally eaten as snacks throughout the day. Traditional Thai sweets include sweetened sticky rice with mango or durian and a custard called *sangkbaya*. Thai cuisine has received international attention as Thai restaurants have spread across North America and Europe. Thai ingredients are now found on the shelves of Western supermarkets. Thai cuisine is likewise thriving in its homeland with endless food stalls, markets, and restaurants, despite the popularity of foreign—especially Western “fast food”—restaurants.

CUISINE—TURKEY Turkey, the unique Muslim Republic with a democratic and secular regime, located in the eastern Mediterranean where it bridges Europe and Asia, has always been a bridge between European and Middle Eastern cultures with its historic and contemporary customs and traditional cuisine.

The richness and diversity of Turkish cuisine is a result of the Ottoman empire (453–1922), which reigned for centuries over a varied geography and landscape combining characteristics of Europe, Africa, and Asia, and which interacted with different cultures throughout the centuries. Thus Turkish cuisine has many specialties and variations, and it is understandable that people from Greece or Lebanon can claim that moussaka, for instance, is a Greek or Lebanese dish.

Meals at Home and in Restaurants

Turkish cuisine generally consists of soups; salads; sauced dishes prepared with cereals, vegetables, and meat; pastries with meat and vegetable fillings; cold vegetable dishes cooked in olive oil; and flour- and semolina-based desserts.

A typical Turkish breakfast consists of white cheese, fresh tomatoes, black or green olives or both, honey and jam, boiled eggs, fresh bread from the bakery, and tea. New healthy eating habits imported from Europe and the United States, such as consuming cereals and fruits, are welcomed by Turkish families. However, consumption of meat products such as ham or sausage is still not popular.

Families and working people who lack the time to get together tend to skip lunch. However, in restaurants, the lunch served includes soup, seasoned lamb or chicken with vegetables, a rice- or bulgur- (cracked and boiled wheat) pilaf dish, and salad. Milk desserts are preferred for lunch.

Most Turkish dinners start with appetizers called meze. Mezes are a category of food, consumed in small quantities, at the start of a meal and traditionally intended to accompany alcoholic drinks, especially raki, an anise-flavored liqueur. White-bean salad, smoked eggplant puree, green salads, pickles, feta cheese, fresh vegetables drenched in yogurt sauce and garlic, pastrami (dried tenderloin or sirloin), *tarama* (fish puree), humus (chickpea puree), and fava (broad-bean puree) are served as mezes. The main course that follows is grilled or fried fish or meat with fried tomatoes, green pepper, and sautéed potatoes. Fruits and desserts are served before enjoying Turkish coffee.

SHISH KEBABS

A classic Turkish dish, shish kebabs are basically meats on a stick. These barbecued meats are gently marinated and, while cooking, infuse with flavors from the peppers and onions.

Marinade

1 whole squeezed lemon
1 tsp. coarse sea salt
6 cloves garlic
1 tsp. mint
1 tsp. oregano
Dash olive oil

Kebabs

1½ lbs. lamb (or beef) cut into 1½-inch pieces
button mushrooms
cherry tomatoes
yellow bell pepper cut in 2-inch pieces
red bell pepper cut into 2-inch pieces

To make the marinade, add together squeezed lemon, garlic, coarse sea salt, mint, oregano, and olive oil. Coat the lamb chunks and refrigerate for about 2 to 3 hours. Thread the meat onto one set of skewers and the vegetables on a separate set of skewers. Cook the lamb over medium-high fire until done (about 6 minutes). Cook the vegetables until slightly charred (about 8 minutes). Serve with tahini, pita, and lemon.

Source: Adapted from *Food and Wine*. Retrieved 25 March 2002, from: <http://www.foodandwine.com>.

Vegetables

Vegetables are consumed in large quantities. Generally they are not boiled in water or used as garniture. It is customary to cook vegetables with meat, onions, tomatoes, or tomato paste. Vegetables are also cooked in olive oil. A specialty of Turkish cuisine is the *zeytinyagli* or olive-oil course. Oil is important in Turkish cuisine: Vegetables, such as root celery, green string beans, artichokes, leeks, eggplants, or zucchini can be cooked in olive oil and served at room temperature. Vegetables such as peppers, eggplants, carrots, or zucchinis can also be fried and served with a tomato-garlic or yogurt-garlic sauce.

Onions and tomatoes are the main ingredients of almost all dishes. Chopped onions fried in oil and fresh tomatoes (or tomato paste) are added to dishes and are also chopped into most salads.

"Dolma" is the term for stuffed vegetables. There are two kinds of dolmas: those filled with ground meat and eaten with a yogurt sauce, and those with seasoned rice mix and cooked in olive oil. The former is a frequent main-course dish. Any vegetable that can be filled with or wrapped around these mixes can be used to prepare dolma: zucchini, pepper, tomato, cabbage,

grape leaf, and eggplant are examples of such vegetables. Eggplant (or aubergine) has a special place in Turkish cuisine.

Meat

Sheep, lamb, beef, and veal meat are generally consumed with vegetables in dishes served hot at home. However the real taste and flavor of meat can be best appreciated by tasting kebabs at restaurants. Kebab is widespread in many Mid-Eastern countries, but is originally Turkish. Shish kebab is grilled cubes of skewered lamb or veal. *Doner* kebab is made by stacking layers of ground meat and sliced leg of lamb on a large upright skewer, which is slowly rotated in front of a vertical charcoal fire. As the outer layer of the meat is roasted, thin slices can be cut and served with rice pilaf. Southern and southeastern cities of Turkey are famous for the variety of their kebabs.

Pilaf

Pilaf is another specialty of Turkish cuisine. The most common types are cracked-wheat pilaf and rice pilaf. Pilaf is made of rice boiled in beef stock with cubed onions and tomatoes and green peppers

ALMOND BAKLAVA

This Turkish delight is sticky, crisp, and rich, yet surprisingly easy to make. Be warned, though, that baklava is very rich and dense, so unprepared diners may need a jolt of mud-thick Turkish coffee to keep them from napping after eating it.

Pastry

¼ cup sugar
2 tsp. cinnamon
4 cups almond slivers
filo dough
¼ cups butter, melted

Syrup

4 cups sugar
3 cups water
½ cup honey
1 stick cinnamon
6 whole cloves

Mix together ¼ cup of sugar, the cinnamon, and the almond slivers. On a medium-size buttered pan lay out one of the sheets of filo dough, butter it, and layer on another five or six buttered sheets of filo. Try and keep the dough covered for as long as possible, as the paper-thin pastry tends to dry out.

Lay out another sheet of filo dough, without buttering it this time. Spread on some of the almond mix, enough to cover it evenly, about a sixteenth of an inch. Keep doing almond layers until all the mix is gone.

Fold in the dough that hangs from the side of the pan. Some of the edges will be dry, so just cut them and discard them. Continue layering the remainder of the filo dough (about 5 sheets), making sure to butter each one and fold in the edges before adding the next one. Butter the top sheet very well, and sprinkle a little bit of water on it so the top doesn't burn in the oven.

Bake at 375° for about 20 minutes or until golden. Remove from oven, slice into small rectangles and serve dripping with syrup. To make the syrup, combine the remaining sugar, water, honey, cinnamon and, cloves in a small sauce pan and heat, stirring frequently over medium heat until the mixture is thick and syrupy. Remove cloves before serving.

Source: Botherless Baklava. Retrieved March 21, 2002, from:
<http://www.geocities.com/NapaValley/2267/baklava.html>

sautéed in butter and usually served with vegetable and meat dishes.

Bread and Pastries

Accompanying the main dishes is a variety of bread made of wheat and corn flour. Pita, a flatbread with various toppings, *simit*, ring bread with sesame seed, and *manti* (Turkish ravioli) are some examples of breads and pastries. But the true specialty is the *borek*, a special pastry of thin sheets of homemade dough (*yufka*). The pastry sheets are layered or folded into various shapes after being filled with cheese, vegetable, meat, or other mixes, and then are baked or fried.

Spices and Seasonings

Various spices are used in Turkish cooking, the most common being red pepper, cinnamon, thyme, and cumin. Widely used seasonings are dill, mint, parsley, and garlic. Fresh or dried mint is also consumed.

Yogurt and Ayran

Yogurt, a contribution of Turkish cuisine to the world, is a popular food and a staple in the Turkish diet. Turkish chefs can cite at least hundred recipes in which yogurt is used as an ingredient or a sauce. *Ayran*, a widely consumed national nonalcoholic drink, is a

diluted and salted sour yogurt, served with meals or with snacks.

Desserts and Beverages

The best-known sweets associated with Turkish cuisine are Turkish delight (*lokum*) and baklava. *Lokum* is a jelly sweet often mixed with walnuts or pistachios, cut into cubes, and rolled in powdered sugar. Baklava is the paper-thin pastry sheets that are brushed with butter and folded, layered, or rolled after being filled with ground pistachios, walnuts or heavy cream, baked, then soaked with a thick syrup.

Muhallebi, made with milk, sugar, and rice flour, is a traditional dessert in Turkish cuisine, as is halvah, made by pan-sautéing semolina and pine nuts in butter before adding sugar, milk, or water and briefly cooking until these are absorbed.

Turkish traditional drinks include Turkish coffee, preferred after meals, and Turkish tea, with its deep red color and unique taste. *Çay*, Turkish tea, is brewed over boiling water; it is served in special small, thin-walled glasses.

Among alcoholic drinks, raki is usually mixed with water at the table; in everyday language, it is called lion's milk. *Şerefe* (cheers) is a common toast.

Eating is taken seriously in Turkey. It is inconceivable for family members to eat alone, or eat and run, while others are at home. The concept of having a potluck meal at someone's house is also entirely foreign to the Turks. Despite the increasing presence of frozen and canned foods and fast-food chains in the big cities, Turkish cuisine is resisting the new habits of eating, both in domestic settings and in restaurants.

CUISINE—VIETNAM The most common Vietnamese word for food has the basic meaning of "cooked rice" (*com*). Vietnamese has many words for rice, depending on whether it is husked or unhusked, cooked or uncooked, plain white rice or sticky (glutinous) rice. At most Vietnamese meals, a bowl filled with white rice sits in front of everyone present. Plat-

ters of food, sauces, and condiments are shared family style, with small helpings added on top of the rice. If enough rice is available, several bowls of steamed white rice form the foundation of almost every meal. Fish, meat, and even vegetables are used mainly as condiments to be eaten with the rice. Without adequate rice, many people feel they are hungry, even if other food is available.

When rice is scarce, people add substantial amounts of corn, manioc, yams, or sweet potatoes to their diet to make their rice supply last longer. These foods are sometimes boiled and eaten separately and sometimes mixed in with the rice. But rice is almost always preferred. With certain dishes or for ceremonial offerings, glutinous rice is preferred. There are many kinds of both regular and sticky rice, depending on whether the grain is short or long, heavy or light. Ordinary rice is also pounded into powder to make different kinds of noodles and cakes, while glutinous rice is used for certain pastries.

Meat and Fish

Most Vietnamese eat little meat; the meat eaten is mainly pork and chicken. Beef is not often eaten; it is scarce, expensive, and poor in quality. Almost all parts of slaughtered animals are eaten, including organs and intestines. Bones are used to make soup. Most people eat more fish than meat. Fish come from rice fields, ponds, rivers, lakes, streams, and the sea. People also eat meat from goats, ducks, and geese. Crab, shrimp, snail, and eel are also eaten where available. In the north, some people eat field rats and dogs, the latter dish being usually preferred by older men. A few restaurants in and around major cities and resort areas specialize in snake meat; others serve exotic game dishes.

TET ROAST BEEF SALAD WITH SPRING ONION OIL

This special dish is one of the foods often served during Tet, the Vietnamese New Year.

Salad

1 large cucumber, peeled
 1 large carrot, peeled
 2 limes
 ½ tsp. sugar
 ½ tsp. crushed red pepper flakes
 ½ tsp. toasted sesame oil
 1 clove garlic, minced
 1 piece ginger, ½ inch in length, peeled and minced
 ½ lb. spinach, washed, trimmed, and dried
 ½ lb. roast beef, thinly sliced
 3 tbs. crushed toasted peanuts
 cilantro sprigs
 fresh cracked pepper

Spring Onion Oil

¼ cup canola oil
 4 large chopped green onions, including green part
 ¼ tsp. salt

Slice the cucumber into thin rounds. Lightly salt the rounds and leave in a colander to drain for at least 15 minutes. Slice the carrot into thin rounds and set aside. When the cucumbers have drained, squeeze out the excess water with your hands.

Cut 1 lime into wedges and set aside. In a small bowl, mix together the juice of the remaining lime, sugar, red pepper flakes, sesame oil, garlic and ginger. Toss the cucumbers and carrots with this sauce and let them sit 5 minutes.

Toss the spinach with 2 tablespoons of the spring onion oil, or amount to taste. Arrange on a platter. Pour the cucumber and carrot mixture, with the dressing, on top of the spinach. Arrange the roast beef slices around the edges of the salad. Spoon 1 to 2 tablespoons of the remaining spring onion oil (with toasted onion bits) on top of the roast beef. Serve topped with the toasted peanuts, sprigs of cilantro, fresh cracked pepper and the reserved wedges of lime on the side.

To make the spring onion oil, heat the oil in a saucepan on high until very hot. Add the onions and salt. Fry the onions until they become crisp and the edges begin to brown. Turn off the heat and let the onions continue to cook in the hot oil until they become very brown. Drizzle sparingly on salads, cooked chicken, noodles, soups, and other dishes, sprinkling a bit of the onion bits on top.

Sauces and Garnishes

Dipping sauces and garnishes are important parts of Vietnamese cuisine. Meat and vegetable dishes are often highly seasoned (with garlic, chili peppers, lemon grass, ginger, or any of a number of herbs) and heavily garnished with mint, basil, dill, slices of chili pep-

pers, bean sprouts, or crushed peanuts. Most meat dishes, even whole chickens, are chopped (bones and all) into bite-size pieces that are dipped into one or another of half a dozen common dipping sauces. The most prevalent of these is a sauce made from fermented fish (*nuoc mam*), which is also used in cooking. For dip-

ping, the fish sauce is mixed with crushed garlic, lime juice, sugar, and chili pepper, then slightly diluted with water. It is often served in individual dipping bowls, to which chili peppers can be added to taste.

Vegetables and Fruits

Vegetables include a spinach-like green grown in water (*rau muong*) and many different kinds of beans, squash, pumpkins, cabbages, lettuce, eggplant, turnips, cucumbers, both regular and green onions, carrots, and tomatoes. These are eaten fresh, boiled, sautéed, or fried. Some are pickled, and some are dried for use in cooking. There are also many varieties of corn, yams, sweet potatoes, Western white potatoes, manioc, and other tuber crops.

Fruits are abundant, and most Vietnamese eat a lot of fruit. Common fruits include papaya, mango, orange, lime, pomelo, tangerine, watermelon, jackfruit, litchi, rambutan, custard apple, jujube, persimmon, plum, dragon fruit, milk apple, star fruit, and mangosteen. Some Vietnamese like durian very much; others, not at all.

Beverages and Soups

Most Vietnamese drink large quantities of tea, usually warm green tea with nothing added. A thermos of hot water is often kept at the ready in homes and offices for making a pot of tea or topping up a pot that has been sitting and has got cold. Many varieties of tea are available: black, green, lotus, and jasmine. Tea bags can now be found in quite a few urban homes. Most Vietnamese do not drink much coffee, and they tend to drink it very strong with a generous dollop of sweetened condensed milk in it. Limeade is popular, and vendors sell drinks of juice from crushed sugarcane in the streets.

Most Vietnamese drink alcoholic beverages only moderately and mainly at social and ritual occasions, although some men are heavy drinkers. Locally distilled rice whiskey (*ruou de*) is a common and affordable drink throughout Vietnam, and beer is very popular. Inexpensive, locally produced draft beer of variable quality is readily available in all cities and most towns. Canned and bottled beer, both imported and domestic, has recently become popular, but is expensive for many people. Western-style wine made from grapes was once largely imported and expensive, but the quality of domestic wines has been improving. A growing but still small number of Vietnamese can now afford to buy an occasional bottle of wine or champagne. Many ethnic minority groups make wine from fermented rice or sometimes from manioc. Brandy is

popular among those who drink hard liquor. Some people have developed a taste for imported scotch, bourbon, or blended whiskey. Gin and vodka are less popular but are readily available in shops and stalls in major urban centers.

Soup and noodle dishes are also important parts of Vietnamese cuisine. The most popular Vietnamese soup is *pho*, which contains flat rice noodles in either beef broth or chicken broth, with small amounts of meat. Another popular soup is made with a different kind of flat rice noodle (*bun*). Often this noodle is served in a bowl of broth containing grilled and seasoned meat (*bun cha*) or with snails (*bun oc*). Another common soup is rice porridge (*chao*), a rice gruel to which may be added chicken, fish, pork, shrimp, organ meat (heart, liver), or even eel. Other soups are made with Chinese wheat noodles (*mi*), which are also sometimes served sautéed with vegetables, meat, or seafood. Most of these soups are commonly eaten in small restaurants or soup stands or purchased from sidewalk vendors. Soup is eaten at all hours of the day, as a meal or a snack. Clear, light soups (*canh*) are often served with meals both in homes and in restaurants. In cities, one can find wonton soup, eel soup, crab and asparagus soup, and many others.

Desserts

Vietnamese normally do not eat much dessert. A meal may end with tea and perhaps a little fruit. Sometimes a kind of pudding or custard (*che*) may be served. These desserts usually contain glutinous rice, soy beans, black beans, green beans, tapioca, or lotus seeds. They usually contain no milk products, but are made with plenty of sugar and one of a variety of flavorings (ginger, sesame, or others). Such dishes may be called dessert dishes, but they are commonly eaten as snacks.

Regional Specialties

There are hundreds of regional specialties, but some are common all over Vietnam. One of the best-known Vietnamese dishes is the distinctive Vietnamese version of a spring roll, known as *nem* or *cha gio*. Another dish, *chao tom*, is made by pounding shrimp, garlic, and other ingredients into a paste and wrapping the paste around a thick stick of the inner portion of a sugarcane and then grilling it. Another dish (*banh xeo*) is something between a pancake and an omelet. Ingredients include eggs, rice flour, coconut milk, green onions, beans, and bean sprouts, fried in a hot skillet.

There are hundreds of special dishes associated with a region, a city, or even a particular street. In Hanoi, a famous fish dish (*cha ca*) is associated with one small

street, and shrimp cakes (*banh tom*) are sold mainly in a short strip along West Lake. Ho Chi Minh City cuisine features a sumptuous meal of "seven kinds of beef" (*thit bo bay mon*). Hue cuisine includes many varieties of distinctive cakes and dumplings and an astonishing variety of vegetarian dishes.

In Vietnam, what people eat and how they prepare it depend on social class, region, and the seasons. In winter in the north, people eat more meat and more fried dishes, and they season the food more. In summer, people eat more fruit and vegetables and more soups and puddings. Throughout the year, people take advantage of whatever produce is fresh and at the peak of its season.

Food and the Theory of Yin and Yang

Vietnamese cuisine was influenced by the ancient East Asian model of yin and yang, the two primordial forces from which everything in the world was created. A balance between yin and yang was necessary in all things. Illness was thought to be caused by a lack of balance between yin and yang, either within a person or between a person and the environment. It was believed that diet could disrupt or restore harmony. All foods were thought to have an essential nature, to be hot, warm, cool, or cold. Hot and warm foods were yang; cool and cold foods, yin. Depending on weather, environment, and symptoms of illness, one would eat certain foods and avoid others to preserve or regain good health.

CUKONG Derived from the Chinese word *hokkien* (master), *cukong* is a pejorative term in the Indonesian language for a clever Chinese businessman who plays a role as a middleman with connections and cooperation with those in power. The figure is not unique to Indonesia but occurs in other Southeast Asian countries as well.

The concept of the Chinese businessman as *cukong* arose from the nature of Dutch colonial policies in the

eighteenth and nineteenth centuries in Indonesia. These policies estranged the Chinese minority from the rest of the population. Forbidden government jobs, the Chinese were forced into roles as traders. As traders, they established networks and developed their management skills.

A broadening of the concept of *cukong* began in 1965 when the army took over political power in Indonesia and asserted control over the country's economic resources. Lacking skills, experience, and trading networks, some army officers authorized Chinese businessmen to run the army's businesses and manage their economic interests.

These army officers believed that their collaboration with the Chinese businessmen, coupled with discriminatory laws and the weak political base of the Chinese minority in Indonesia, would maintain the army's political and economic power more effectively than it would be maintained if the officers collaborated with indigenous, or *pribumi*, businessmen. This system has developed into what is known in Indonesia today as the "*cukong* system," a web of collusion and corruption among Chinese businessmen, bureaucrats, and military officers. The *cukong* specialize in administering business affairs while the bureaucrats and military officers provide them with government funds, facilities, and security protection.

CULT OF MAITREYA The cult of Maitreya (Mile) in China was originally associated with the vows of monk-scholars to be reborn in what they called Tusita heaven. The goal was that they might hear the dharma directly from the mouth of the future Buddha Maitreya and thus attain Buddhahood. These elite monks, and the aristocrats and royalty who patronized them, commissioned images of Maitreya, both standing and seated in meditation, as objects of worship and as aids for visualization and contemplation. Standing images of Maitreya were indicative of his preaching in Ketumati, and seated images portrayed Maitreya's waiting in Tusita. Both styles are found closely con-

nected in the art of the Northern dynasties (220–589 CE) and the Tang dynasty (618–907 CE) and demonstrate that these two aspects of the cult of Maitreya were interrelated in early medieval China.

The origins of the monastic aspect of the cult of Maitreya in China may be traced to the exegete Daoan (312–385), whose worship was focused around his desire to be reborn in Tusita heaven in the presence of Maitreya so that his doubts concerning the scriptures could be resolved. The famous Buddhist pilgrim Xuanzang (Hsuan-tsang, c. 596–664) was a fervent devotee of Maitreya who desired rebirth in Tusita, so the cult became closely associated with his school of Chinese Yogacara.

The Maitreya cult was an important focus of Buddhist belief in early medieval China. Since the sutras about Maitreya suggested that he would descend from Tusita to inaugurate a peaceful Buddhist millennium after years of warfare and the decline of the Buddhist teaching (*mofa*), worship of Maitreya spread throughout Chinese society. During the chaos that ensued at the end of the Sui dynasty (581–618 CE) and rise of the Tang, a few Buddhist monks and laymen justified their rebellions by claiming to be Maitreya, thus drawing upon the imagery and beliefs common to the cult. Later, Empress Wu Zetian (624–705) justified her usurpation of the Tang throne and declaration of her short-lived Zhou dynasty (690–705) by identifying herself with Maitreya. Followers of Maitreya rebelled frequently through the Song (Sung) period (960–1279), and rebels drew upon Maitreya cult imagery to lend authority and religious fervor to their uprisings.

The image of Maitreya and his cult have gone through many transformations in Chinese society. Maitreya was eventually reinterpreted iconographically, going from the slim and sleek figure of the Northern dynasties period to the roly-poly figure of Budai (Pu-tai) during the Song. The "Laughing Buddha," as he is commonly known, spread throughout Chinese popular culture during the late imperial Chinese period (1368–1912) and is a staple image of traditional Chinese culture that has been exported to the West through immigrant Chinese communities.

CULTURAL REVOLUTION—CHINA The Chinese Cultural Revolution (CR), the full title of which was the Great Proletarian Cultural Revolution, was the largest and most important of the ideological campaigns of Mao Zedong (1893–1976). Because of the political movement's length, scale, and destabilizing effects, its significance for the history of China under Mao and the Chinese Communist Party (CCP) he led was enormous. There is general agreement that Mao was by far the single most important figure in the campaign and that the Cultural Revolution gave rise to a massive personality cult surrounding him. Yet it was also a mass movement, involving many millions of people and considerable struggle between different sectors of Chinese society over the movement's control and direction. There was consequently much violence and even periods of localized civil war. However, Mao and his followers presented the CR to the people in Marxist ideological terms, the central feature being an extreme emphasis on class struggle, dubbed "the key link."

What Caused the Cultural Revolution?

Mao, the CCP chairman from the early 1940s until his death, had both ideological and political reasons for initiating the CR. He opposed the moderate economic policies that his former comrades in the CCP leadership had implemented following the failure of his own radical Great Leap Forward economic campaign, begun in 1958. He regarded the CCP as beginning to display the characteristics of a new ruling class and feared that the growing elitism and bureaucratization of the CCP would, if left unchecked, spell the end of his radical notions of revolution and result in a "capitalist restoration." The CR was thus both an ideological campaign and a struggle for power. Mao was supported by Lin Biao (1908–1971), Mao's chief deputy until 1971, and by his own wife, Jiang Qing (1913–1991). Their opponents in the CCP hierarchy were led by Liu Shaoqi (1898–1969), who in April 1959 had replaced Mao as China's president, and by Liu's chief supporter, Deng Xiaoping (1904–1997).

For Mao, the outcome of the CR would determine fundamental questions of policy regarding China's

economic and political direction. He believed in the need for an increasing socialization of China's economy and society and for continual revitalization of the revolution through a campaign-style of politics that both mobilized the masses and prevented the party and its cadres from becoming elitist. Liu, conversely, believed in the importance of careful economic planning under the control of the CCP. He also believed a retreat from the radical economic policies of the Great Leap Forward was necessary, and he reintroduced measures, such as rural markets and private farm plots for the peasants, which encouraged production through offering material incentives to the Chinese people. Mao believed Liu's policies facilitated the emergence of a new bourgeoisie, and it was consequently those "persons in authority taking the capi-

talist road" such as Liu and his supporters who were to become the main targets during the CR.

The Early Stages of the Cultural Revolution

Opposed by most of the party leadership, Mao turned to China's students and the People's Liberation Army under the control of Lin Biao for support in his struggle against the "capitalist roaders" within the CCP. Frustrated by attempts by the mayor of Beijing, Peng Zhen (1902–1997), to limit the CR's scope to strictly cultural affairs (Peng was initially put in charge of the movement), Mao had Peng purged and established a Cultural Revolution Group under the control of Jiang Qing and Chen Boda (1904–1989). This group encouraged and directed much of the radical activity over the next few years. In late May 1966, secondary and university students began to organize themselves into groups called Red Guards, which were central to the mass struggles and violence that characterized the CR. The first official party document on the CR was the sixteen-point "Decision" adopted by the Eleventh Plenum of the Eighth Central Committee (August 1966). The "Decision," which set the intensely ideological tone of the CR and provided guidelines to run it, declared the CR to be a new stage in China's revolution, one that "touches people to their very souls." It emphasized the need to struggle against and overthrow those in authority taking the capitalist road and endorsed the struggle in education against "bourgeois" academic authorities. The "Decision" did, however, caution against violence as a means of resolving contradictions or differences among the people. It also declared that the "great majority" of cadres—party administrators and professionals—were "good" or "comparatively good," suggesting that Red Guards should not attack them without good reason. In the event, the commands against both violence and attacking "good" cadres were frequently disregarded, as Red Guard factions attempted to outdo one another in demonstrating their devotion to Chairman Mao.

On 18 August 1966, Mao, Lin Biao, and other CR leaders reviewed a mass rally of over 1 million Red Guards in Tiananmen Square in central Beijing. Some half-dozen such mass rallies were held in the square from then until late November. Rallies were also held in other cities. These helped to spawn a one-sided revolutionary atmosphere that brooked no view on any topic but the one supposedly authorized by Mao, with the result that fanaticism became commonplace.

The Red Guard organizations spread through society and across China, believing they had a duty to destroy old culture and habits, including anything traditional, and to establish new, supposedly socialist,

CHAIRMAN MAO ON IDEOLOGICAL AND POLITICAL PURITY

"Recently there has been a falling off in ideological and political work among students and intellectuals, and some unhealthy tendencies have appeared. Some people seem to think that there is no longer a need to concern oneself with politics or the future of the motherland and the ideals of mankind. It seems as if Marxism was once all the rage but it is currently not so much in fashion. To counter these tendencies, we must strengthen our ideological and political work. Both students and intellectuals should study hard. In addition to the study of their specialized subjects, they must make progress both ideologically and politically, which means that they should study Marxism, current events and politics. Not to have a correct political point of view is like having no soul . . .

"All departments and organizations should shoulder their responsibilities in ideological and political work. This applies to the Communist Party, the Youth League, government departments in charge of this work, especially to heads of educational institutions and teachers."

Source: Mao Zedong. (1966) *Quotations from Chairman Mao Tsetung*. Beijing: Foreign Language Press, 142–143.

things in their place. The Red Guards subjected teachers to often-violent criticism and effectively closed down the education system. They frequently spearheaded the attack against the "capitalist roaders" within the CCP, ransacking party offices, parading cadres through the streets wearing dunce hats, and subjecting these persons to humiliating criticism sessions that often ended in violence. The ideological orientation of the Red Guard organizations was variable, and in the hothouse atmosphere of the CR, fueled by the cult of personality surrounding Mao, these ideological differences often ended in pitched battles between rival Red Guards, resulting in numerous casualties. From August 1966, Red Guards also destroyed or damaged religious buildings and attacked and humiliated their clergy.

In September 1966, *Mao zhuxi yulu* (Sayings of Chairman Mao Zedong), usually described as The Little Red Book, was published. This book, which became an icon for Mao's followers, especially the Red Guards, contained the nucleus of his thought. According to official figures, 350 million copies had been printed by the end of 1967. The obsession with following Mao's thought saw an emphasis on class struggle and "serving the people" (the title of Mao's most popular article) rather than on oneself or one's family, and on demanding sacrifices from ordinary people on behalf of socialism and the revolution. Meanwhile, the attacks on "old culture" created an extraordinarily narrow and restrictive cultural environment. Very few books were published other than those expressing Mao's thought or the CCP or revolutionary history. Many literary figures were humiliated and even persecuted to death, notably the famous fiction writer and playwright Lao She, who died 24 August 1966. All traditional theater was banned, and Jiang Qing imposed a theory of "model" dramas, based on a forum held in February 1966, which insisted that all literature and art should reflect and propagate the class struggle and revolutionary heroism.

Developments to the Ninth CCP Congress

The Red Guards' failure to observe the injunction against violence as well as the heightened radicalism and fanaticism of late 1966 and early 1967 led the CR leaders, in January 1967, to command the People's Liberation Army to restore order, extending its control to many civilian institutions. "Revolutionary committees" were then set up in the whole country from every province down to every factory, school, and people's commune to take over the power of old administrative authorities. These committees were a new administrative model regarded as appropriate for a mass revolutionary movement like the CR. They con-

tained representatives of the military, the Red Guards (the masses), and experienced cadres who had survived the CR relatively unscathed. However, the military soon occupied a prominent leadership role in these revolutionary committees.

A mid-1967 resurgence of radical Red Guard activity led to violent conflict between the Red Guards and the military in several areas. The most serious was a three-week civil war in July and early August in and around Wuhan, the capital of Hubei province central China. Fanned by Jiang Qing, this war ended in a victory for Mao and the Red Guard forces when the commander of the Wuhan military region, Chen Zaidao, was dismissed. In the international arena, Red Guard-inspired disturbances flared in Hong Kong, and there was a savage attack on the British chargé d'affaires office in Beijing on 22 August.

After another period of relative order, a further resurgence of fighting occurred from April to July 1968, with many small-scale civil wars in southern China, especially in the Guangxi Autonomous Region, bordering Vietnam. A war in April and early May in Wuzhou, in far-eastern Guangxi, brought about large-scale destruction in the city and the torture and deaths of several thousand Red Guards. Ultra-leftist groups plundered trains taking weapons to Vietnam, where the Vietnam War was raging.

Seeing that a continuation of this situation would throw the country into civil war, Mao moved to end the chaos. Early in the morning of 28 July 1968, Mao, Lin Biao, Jiang Qing, and other leaders interviewed several Red Guard leaders, condemned them, and began the process of sending large numbers of Red Guards to the countryside. This was carried out supposedly to broaden the revolutionary experience of the Red Guards, but the real motive was to get them out of the cities, thereby reducing the level of conflict and violence.

In October 1968, a CCP Central Committee plenum condemned Liu Shaoqi as a traitor and sent him to prison, where he died on 12 November 1969. Not until February 1980 was his death revealed to the world. After this revelation, he was rehabilitated by the post-Mao leadership of Deng Xiaoping, which adopted an extremely hostile view of the CR.

The Ninth Party Congress, held in April 1969, ended the most important and radical phase of the CR and stressed unity and the need to rebuild the CCP. Appearing as a total victory for Mao, it even declared Lin Biao his "close comrade-in-arms and successor" as well as the sole CCP vice-chairman. However, challenges to the CR's line were far from over.

The Lin Biao Affair and the Later Stages of the Cultural Revolution

The years from the Ninth Party Congress to Mao's death were characterized by a retreat from the radicalism of the early years of the CR, as the party rebuilt itself and reasserted its authority. Victims of this process were often those who had most ardently supported Mao's radical line. A campaign against Mao's erstwhile ally Chen Boda was initiated in September 1970, and the following year saw the Lin Biao affair, probably the most unusual example of intra-elite political conflict during the CR. According to official accounts, Lin and his main followers, including his son and wife, had concocted a plot to assassinate Mao but were killed in an air crash in September 1971 while fleeing from China after their attempt was exposed. Lin's death in the air crash is not in doubt, but there

have been many explanations of his fate, and Western scholars are generally skeptical that he had tried to assassinate Mao. What is clear is that to have Mao's "close comrade-in-arms and successor" condemned as the chairman's would-be assassin severely undercut the power of the Left. It also raised serious doubts among many Chinese about the validity of the CR and whether Mao's judgment was as reliable as the almost godlike status accorded him implied.

At the same time as the Lin Biao affair, enormous changes were taking shape in the field of China's foreign relations. Following the largely self-imposed isolation of the early phase of the CR, China moved to rejoin the international community. In October 1971, China was admitted into the United Nations, and in February 1972, the U.S. president Richard Nixon visited China. The first half of the 1970s saw China establish full diplomatic relations with numerous countries, including several major Western countries.

Signs of the relatively relaxed atmosphere continued in 1973, although factional struggles within the CCP leadership persisted. Deng Xiaoping was again referred to as vice-premier in April, after seven years in disgrace. The Tenth CCP Congress of August 1973 saw the trusted premier Zhou Enlai (1898–1976) replace Lin Biao as Mao's first deputy and CCP vice-chairman. On the other hand, Wang Hongwen, a radical young worker (and later a member of the Gang of Four) from Shanghai, emerged among the other vice-chairmen, showing that the influence of the CR was still alive. A series of ideological campaigns, initiated by either Mao or his radical supporters, followed. These were aimed at keeping alive enthusiasm for the CR. The last of these, beginning in February 1976, saw Deng Xiaoping condemned as an "arch unrepentant capitalist roader still on the capitalist road" and ousted once again from his leadership positions.

With Mao's death in September 1976, the CR lost its major source of inspiration. According to the Resolution of the 1981 Sixth Plenum of the Eleventh Central Committee of the CCP, the arrest the next month of the Gang of Four (Mao's widow Jiang Qing and three of her influential radical supporters, including Wang Hongwen) signaled the end of the CR.

The Cultural Revolution Assessed as a Setback to Development

The 1981 Resolution was unequivocal in its judgment, roundly condemning the CR and claiming that the CR had "led to domestic turmoil and brought catastrophe to the Party, the state, and the whole people." However, despite the authoritative status of the

Resolution, there are numerous divergent views, from both Western scholars and Chinese commentators, of the causes, course and consequences, and even the dates, of the CR. Yet most agree that the CR caused much suffering to millions of people and set back China's development for several years.

Deng Xiaoping returned to power in July 1977 and, from December 1978, was able to dictate an economic policy that was hostile to the spirit of the CR in nearly all respects. The condemnation of "old culture" gave way to a major revival of traditional arts. The revolutionary committees were dismantled, along with almost every other idea and practice spawned by the CR. It is thus evident that the CR failed to achieve the radical socialist objectives Mao had set for it. The CR nevertheless provided one of the most important chapters in the political and economic history of contemporary China, and it is only against its backdrop that the increasingly pro-market economic reforms introduced by Deng Xiaoping after 1978 can be understood.

CURZON, GEORGE NATHANIEL (1859–1925), Viceroy of India. After brilliant undergraduate years at Oxford, George Nathaniel Curzon prepared himself for a grand political career. He traveled through most of the countries of North America and Asia, including Russia, China, and Afghanistan, and produced three solid books on contemporary Asian political affairs. He was elected to Parliament in 1885 and later served as undersecretary for India (1891–1892), undersecretary for foreign affairs (1895–1898), and ultimately as viceroy of India (1899–1905). In this position he behaved more like the president of a republic than the queen's representative in Calcutta. Ever fearful of Russian expansion, he dealt with the Dalai Lama in Lhasa, and the Amir Abdur Rahman in Kabul, and reorganized military operations in the new Northwest Frontier Province so as to maximize British influence along India's northern borders. He even sent an unsuccessful commercial mission into Tibet.

Within India, Curzon did much to rectify previous administrative errors, setting up commissions to deal with irrigation, railways, agricultural banks, and police. He even succeeded at currency reform and at reducing the amount of governmental paper flow. While much of this was quite popular in India and rather less so in London, his decision to split Bengal Province in two in 1905 was universally condemned, and the two parts had to be reunited in 1911—only to be split permanently in 1947.

Curzon made no attempt to involve the Indian public in his reforms. He clashed with Lord Kitchener, then commander-in-chief of the Indian army, and repeatedly clashed with statesmen in London. The disfavor he brought upon himself affected the positions he held after his return to Britain: chancellor of the University of Oxford, Lord Privy Seal, and president of the Air Board (1916); but then he became foreign secretary (1919–1924). He was elevated to the House of Lords, but was shattered when, in 1924, his old dream of becoming prime minister ended with the selection of Stanley Baldwin, and he died within a year.

DA NANG (2002 pop. 446,000). Da Nang is a large city located on the central coast of Vietnam 973 kilometers (603 miles) north of Ho Chi Minh City and 30 kilometers (17 miles) north of Hoi An. It became an important port city at the end of the nineteenth century after Hoi An's access to the ocean, via the Thu Bon river, was filled in by silt runoff. In 1888, the French seized control of Da Nang, which they called Tourane, from Vietnamese emperor Gia Long after he reneged on a promise to assist them in Vietnam. During the first part of the twentieth century, the city was second only to Saigon as Vietnam's busiest port and most cosmopolitan city. Da Nang received much attention from both France and the United States during the ensuing wars in Vietnam. Da Nang, only 200 kilometers (124 miles) south of the Demilitarized Zone, was the first place U.S. military forces landed in Vietnam in 1965 and was the home of a large U.S. Air Force base from which bombing missions were launched against the Democratic Republic of Vietnam (DRV). The influx of thousands of military personnel brought about rapid growth to the city both in population and in various businesses. Many South Vietnamese refugees used Da Nang as a staging area for escape from the country when the DRV took over the surrounding areas in 1975. Today Da Nang, still with its French and American vestiges in the form of wide avenues, old villas, and diverse entertainment, is only a remnant of its former bustling self.

DADRA AND NAGAR HAVELI UNION TERRITORY

(2001 pop. 220,000). The Union Territory of Dadra and Nagar Haveli, located in western India, is surrounded by the states of Gujarat and Maharashtra. It is a predominantly rural area and has seventy-two villages. Its capital city is Silvassa, and the principal languages spoken are Gujarati and Hindi.

Originally a part of the Maratha Confederacy, Dadra and Nagar Haveli became the scene of prolonged skirmishes between the Portuguese and the Marathas in the eighteenth century. In December 1779, the Maratha government, in an effort to ensure the friendship of the Portuguese, assigned to them the revenue of a few villages of the region. Since then the Portuguese ruled over the territory until its liberation on 2 August 1954. Subsequently it merged with the Indian Union on 11 August 1961 as a Union Territory.

Agriculture is the major occupation of the people of the region, paddy rice and millet being the most important crops cultivated. Fruits, especially mango and banana, are also produced. Nearly 40 percent of the total geographical area of Dadra and Nagar Haveli is under forest cover, which provides a livelihood to the tribal population.

Traditional crafts of the region include pottery, bamboo, and leather goods. The establishment of a cooperative industrial estate by Dan Udyog Sahakari

Sangh Limited introduced industrialization in 1967–1968. Since then, modern industries have sprung up in the cities like Silvassa, Masat, and Khadoli. At present, the region boasts 988 cottage, village, and small-scale industries and 312 medium-scale industries in textiles, engineering goods, plastics, chemicals, and pharmaceuticals. A multiple-development project, the Damanganga Irrigation Project, a joint venture of the Union Territories of Dadra and Nagar Haveli and Daman and Diu and the state of Gujarat, is nearing completion. Despite its advantages, it has also caused hardship and displacement to some. The village of Kothar has been submerged, and four others partly submerged due to its construction.

Tourism is well developed in the region. Sites include the Tadkeshwar Siva temple, the Vanganga Lake, Dadra, Bindrabin, and the Tribal Cultural Museum and Hirvavan garden at Silvassa. Usually all Hindu, Muslim, and Christian festivals are celebrated in the territory. Members of the significant tribal population celebrate their own festivals. The Dhodia and Varli tribes celebrate Diwaso; Varlis and Koli celebrate Bhawada. Almost all the tribes perform Khali Puja after harvesting crops and Gram Devi before the harvest.

DAENDELS, HERMAN WILLEM (1762–1818), Dutch colonial governor. Herman Willem Daendels's brief term as governor-general of the Dutch East Indies marked the beginning of a new era of direct colonial intervention and ambitious social and political engineering in the colony. After commanding the revolutionary "Patriots" who overthrew the oligarchic Dutch Republic in 1795, Daendels, who was born in Hattem, the Netherlands, rose to become commander of Dutch military forces under King Louis Napoleon (1778–1846). He took office as governor-general of the Dutch East Indies in 1808, after the Dutch government had dissolved the Dutch East Indies Company (VOC) and placed the colony under metropolitan authority. His rule was energetic and autocratic. He incorporated Javanese "regents" (*bupati*) into the colonial bureaucracy, annexed new territories

in Java, and reduced sultans to the rank of vassals. He banned officials from receiving private income and moved the center of administration from old Batavia to a new suburb, Weltevreden. Daendels reformed the judicial system, establishing different courts for different population groups. He conscripted laborers to construct fortifications against an expected British attack and, at the cost of many lives, to lay down a postal road running the length of Java. To fund his reforms and defense works, he sold vast areas of land to Chinese and European investors and speculators. He was recalled to the Netherlands in 1811 and the following year served as marshal in the Napoleonic invasion of Russia. He was governor of the small Dutch colonies in West Africa from 1815 to 1818.

DAGESTAN (2002 est. pop. 2.2 million). A southern Russian republic, Dagestan is bordered by Azerbaijan to the south, Georgia to the west, and the Caspian Sea to the east. Although Dagestan translates as "land of the mountains," the republic actually consists of three general geographic zones. First, there is an elevated southern region situated in the northeastern Caucasus that descends to foothills and mixed forests in the north. Second, there is an arid and sparsely vegetated northern region located in the Nogai Steppe. Third, there are narrow coastal lowlands in the east that run along the Caspian Sea, which include saline wetlands in their northernmost extreme. Although increasingly endangered, Dagestan is one of the leading hearths of biodiversity within the Russian realm.

Renamed after the revolutionary Dagestani leader Makhach, Makhachkala is the capital of Dagestan; the port city, on the site of a nineteenth-century Russian fortress, is located roughly in the middle of the republic's coastal zone. The city's chief industries are related to oil and gas refineries and pipelines, chemical factories, and manufacturing. Although there are considerable oil and gas resources in the republic, they remain relatively unexploited due to inaccessibility. Derbent, the other major city, dating to a fifth-century fortress, lies in the south at a narrow point on the coast between the Caspian Sea and the Caucasus

Mountains; Derbent translates as "gateway." However, the majority of Dagestanis (about 60 percent) live in rural areas.

The Dagestani population is characterized by extreme ethnic diversity. Although in the late 1990s the republic's population was estimated at fewer than 2.2 million, it includes many different national groups—between twenty and forty (although some sources put it as high as eighty). The largest of these, the Avars, constitute roughly 30 percent of the total population. Although Russian is employed as a common language, Avar is the most common local language, and is also the common medium for communication between those indigenous to the republic. The majority of the population is Islamic, and the Dagestanis are world-renowned for their carpet weaving and colorful, geometric designs.

Long before becoming a Russian republic Dagestan was legendary for its resistance to external powers (e.g., Arab/Islamic, Seljuk Turk, Mongol-Turkic, Ottoman Turk, and Persian armies). This image is personified in the histories and legends of Shamil, the nineteenth-century Imam of Dagestan. Reportedly an Avar, he established a Dagestani state and led Dagestanis and Chechens against the czarist empire, preventing pacification of the region by the Russians for over twenty-five years. Dagestan was designated an autonomous republic of the Soviet Union in 1921; it became a Russian republic in 1991. The stability of the republic is tenuous due to extreme instability in neighboring Chechnya, with Chechen rebels entering the republic in an attempt to unite with Dagestanis in a larger separatist movement, and Russian troops entering Dagestan to prevent such an escalation. There is also increasing activism among Islamists (both homegrown variations of Sufism and Wahhabism as fostered in the Middle East), Chechen rebels, cleavages between ethnic groups, and separatist movements, especially among the Lezgin peoples living on both sides of the Azeri-Dagestani border.

DAI QING (b. 1941), Chinese journalist and environmental activist. Dai Qing is the adopted daughter of Ye Jianying, who was a high-ranking government official. Raised in a privileged revolutionary family, she was trained as a missile engineer and worked in military intelligence before starting her career in journalism. She came to prominence in the early 1980s for a series of investigative reports, written for the *Guangming Daily*, about persecution within the Chinese Communist Party in the early days of the revolution.

Dai went on to become the most outspoken critic in China of the Three Gorges Hydroelectric Dam. In 1989 she published a collection of essays condemning the \$30 billion project titled *Yangtze! Yangtze!* Later that year, Dai publicly denounced the 4 June 1989 Tiananmen Square massacre and on 5 June 1989 quit the Chinese Communist Party. As a result, she was fired from the *Guangming Daily*, jailed for ten months, and her writing was banned in China.

Dai was awarded the Harvard University Nieman Fellowship for journalists in 1991, the Golden Pen for Freedom Given by the Paris-based International Federation of Newspaper Publishers in 1992, and the Goldman Environmental Award in 1993. In 1997 Dai published a second volume of critical essays on the Three Gorges project titled *The River Dragon Has Come!*

DAI VIET SU KY *Dai Viet Su Ky*, also known as *Dai Viet Su Ky Toan Thu*, designates a collection of historical chronicles written by several different authors over a period extending from the thirteenth to the fifteenth centuries. Le Van Huu (1230–1322), considered the father of Vietnamese history, wrote the first narrative, relating events occurring between the years 207 BCE and 1225 CE. Phan Phu Tien (fifteenth century) continued Le Van Huu's account to 1446. Both of these works no longer exist as independent works. Ngo Si Lien, an official historian of the court of emperor Le Thanh Tong (1460–1497), reproduced

them while comparing them with Chinese official histories, Vietnamese nonofficial accounts, as well as other historical material such as biographies, genealogies, and eyewitness reports. He also added his own commentaries. In the presentation of his work to the emperor, Ngo Si Lien informs us about his conception of history: "History records events; whether good or bad, they can serve as examples for posterity." As for his method, he followed the footsteps of Sima Qian in his *Shi Ji* and Confucius in his *Qun Qiu*, which means that events are recorded year by year—earning for these histories the common title of annals—listed under the names of successive rulers.

DAIGAKU *Daigaku*, the Japanese word for universities and colleges, has its origins in the earliest academic institutions of higher learning in Japan, centers of scholarship that developed at influential temples not only in Kyoto but in the Kanto region (eastern Japan) as well. The curriculum of these primarily secular institutions, which took their name from the Chinese term for schools that trained government officials, was centered primarily on Confucian texts and Chinese histories and literary anthologies that were transmitted to Japan beginning in the sixth century CE. Two types of schools of higher learning were established for the nobility: the Daigakuryo, a Confucian college for nobility in the capital, and branch schools for nobility in the provinces.

During his stay in Japan in the mid-sixteenth century, Francis Xavier noted that in addition to the university in the capital city of Kyoto there were five other significant universities with enrollments of over 3,500. Of these, the largest and most representative was the Ashikaga Gakko (Ashikaga School), located in the Kanto region.

After completing basic education at one of the numerous local temple schools, students would set out to further their education at centers of higher learning where they could gain the training that would lead to a successful career. Many students completed their training at the Ashikaga School, studying both Buddhist and Confucian texts.

During the Sengoku period (c. 467–1568), when rival clans were continually in a state of war, the university offered a curriculum that came to include medicine, military science, and astronomy, along with the ancient study of divination—all subjects essential to medieval warfare. During the Edo period (1600/1603–1868), there were *ban* (domain) schools for the samurai, as well as private schools that provided advanced instruction to both commoners and samurai in a variety of disciplines, notably "Western" studies. Prior to and immediately following the Meiji Restoration of 1868, desire for knowledge about the West grew rapidly, and institutions of higher education flourished.

In 1872 the Fundamental Code of Education delineated standards for a modern educational system. The first of the modern universities to be established was Tokyo Daigaku in 1877, a merging of two existing shogunal schools. National universities were later founded in Kyoto (1897), Tohoku (1907), and Kyushu (1910). Institutions such as Keio University (founded as a private academy by Fukuzawa Yukichi in 1858) and Waseda University (founded by Okuma Shigenobu in 1882) went through several transformations before becoming full-fledged universities. Several of the most prestigious universities were founded as Christian missionary schools; these include Doshisha, Sophia, and International Christian University. Today there are about 450 public and private four-year universities.

DALAI LAMA The Dalai Lama is the spiritual and temporal leader of the Tibetan Buddhist peoples, by whom he is regarded as the earthly manifestation of Chenrezi, the bodhisattva ("incarnating deity") of compassion. Each Dalai Lama is regarded as being the reincarnation of his predecessor, and after the death of a Dalai Lama, a search is made for the young boy in whom he is considered to have taken rebirth. Tenzin Gyatso (b. 1935), the present Dalai Lama, is the

THE PALACE OF THE DALAI LAMA

The following text written by two French missionaries in the mid-nineteenth century provides a positive impression of the home of the Dalai Lama in Tibet, despite mainly critical comments about Buddhism in general found throughout their report.

The palace of the Talé-Lama merits, in every respect, the celebrity which it enjoys throughout the world. North of the town, at the distance of about a mile, there rises a rugged mountain, of slight elevation and of conical form, which, amid the plain, resembles an islet on the bosom of a lake. This mountain is entitled Buddha-La (mountain of Buddha, divine mountain), which upon this grand pedestal, the work of nature, the Talé-Lama have raised the magnificent palace wherein their Living Divinity resides in the flesh. The palace is an aggregation of several temples; that which occupies the centre is four stories high, and overlooks the rest; it terminates in a dome, entirely covered with plates of gold, and surrounded with a peristyle, the columns of which are, in like manner, all covered in gold. It is here that the Talé-Lama has set up his abode. From the summit of this lofty sanctuary he can contemplate, at the great solemnities, his innumerable adorers advancing along the plain or prostrate at the foot of the divine mountain.

Source: Huc Evariste-Regis and Joseph Gabet. ([1851] 1987) *Travels in Tartary, Thibet and China, 1844–1846*. New York: Dover Publications, 171.

fourteenth in a line of succession originating in a fourteenth-century disciple of the founder of the Gelugpa sect, the leading school of Tibetan Buddhism.

Commonly referred to in English by the title "His Holiness," the fourteenth Dalai Lama was born into a peasant family in the village of Takster, in the north-eastern Amdo Province of Tibet (now part of China's Qinghai Province). His predecessor had "passed to the heavenly fields" in 1933, and Tenzin Gyatso was recognized as his reincarnation in 1937. He was taken to Lhasa, the Tibetan capital, in 1939 and was enthroned in the Potala Palace in February 1940. While a regent ruled Tibet in his name, he began the lengthy course of studies that culminated in his being awarded the *Lharampa Geshe* degree (roughly equivalent to a doctorate in Buddhist studies) in 1959.

Due to the crisis caused by the Communist Chinese invasion of Tibet in October 1950, the sixteen-year-old Tenzin Gyatso assumed temporal power in

Tibet on 17 November 1950. He remained there under Chinese authority until the excesses of the Communist regime prompted him to flee Lhasa in March 1959. Although closely pursued by Chinese forces, he succeeded in reaching India. There, with around one hundred thousand of his followers, the Dalai Lama established a Tibetan government-in-exile in Dharamsala, in the Himalayan foothills of north India. He has since become the primary ambassador of the Tibetan cause as well as a world-renowned spokesman for non-violence and for the Buddhist ideal of "universal compassion." In October 1989 he was awarded the Nobel Peace Prize.

The fourteenth Dalai Lama remains the focus of Tibetan identity in the world. A charming and modest, yet charismatic figure, with a great appeal in the West, he prefers to be known as "a simple Buddhist monk." His leadership has been characterized by an openness to change, the promotion of dialogue be-

The Dalai Lama at a news conference in New Delhi, India, in May 1999 at which he announced a series of concerts entitled the "World Festival of Sacred Music." (AFP/CORBIS)

tween religions and science, and a steadfast belief in the principles of nonviolence.

DALAT (2002 pop 125,000). Dalat is a small city located in the central highlands of Vietnam 205 kilometers (127 miles) southwest of Nha Trang and 308 kilometers (191 miles) north of Ho Chi Minh City. Named for the "River of the Lat Tribe" after the native Lat ethnic group who live in the area, Dalat, with its cool climate, has been used by the Vietnamese and eventually the Europeans in Vietnam as a vacation spot that allowed an escape from the extreme heat of the cities and the Mekong Delta area. The Frenchman Dr.

Alexander Yersin (1863–1943), a protégé of Louis Pasteur, is credited with "discovering" Dalat for such purposes. During Vietnam's war with the United States, high-ranking North and South Vietnamese officials used Dalat as a nonpartisan resting locale before it was captured officially by the North Vietnamese on 3 April 1975. Dalat's most famous former resident was the last Nguyen emperor, Bao Dai, whose summer palace exists today as a tourist attraction. Today Dalat is used by Vietnamese as a favorite honeymoon destination and, with its many former colonial villas as guest houses, nice restaurants, and eighteen-hole golf course, is in the process of being transformed by the Vietnamese government into an international tourist destination.

DAMAN AND DIU UNION TERRITORY

(2001 est. pop. 200,000). Daman and Diu Union Territory, comprising two separate districts, lies within the Gujarat state of western India. It was a part of Goa Union Territory until Goa achieved statehood in 1987. Goa, along with Daman and Diu, had made up Portuguese India (*Estado da India*) until it became part of the India in December 1961. The Portuguese acquired Daman and Diu from Bahadur Shah (1506–1537) of Gujarat in 1534.

Daman (formerly Damao), 170 kilometers north of Mumbai (Bombay), is on the east side of the Gulf of Cambay (Khambhat), while Diu, 270 kilometers northwest of Mumbai, lies at the southern tip of the Kathiawar Peninsula. Both districts—Daman and Diu—are coastal enclaves on the Arabian Sea. Fishing and shipping are common activities for both, but a water depth of only one or two fathoms is insufficient to accommodate large vessels. Both Daman and Diu have small airports. The Gujarati language is common to both settlements. Their crops include rice, groundnuts, pulse, beans, wheat, banana, mango, coconut, and sugarcane.

Daman

Daman has two forts: Little Daman, with a picturesque main gate in an aquatic motif, inside which is

the church, Nossa Senhora do Mar ("Our Lady of the Sea"); and Big Daman, which has a small park, houses, shops, and the remains of a seventeenth-century church and convent. The Damanganga River separates the two forts. The population of Daman in 1991 was 62,101. The area covers 78 square kilometers.

Diu

The coastal city of Ghoghla (formerly Gogolá) faces an island 11 kilometers long that contains the Fortaleza, the largest Portuguese fortress in Asia. In the channel between Ghoghla and the island is a "water fort" or *panikota* in Gujarati, *fortim do mar* in Portuguese. Built in 1536, the Fortaleza was besieged by Turks in 1538 and 1546. Today it holds a small garrison and is a local tourist attraction. Another tourist attraction is Nagoá Beach. On the island are several ancient homes, about 150 Hindu temples, and several mosques and churches, including the Sé Matriz Cathedral, which was built in 1601 and was formerly a Jesuit college.

East of Ghoghla is Simbor, where there is another *panikota*, S. António, in the estuary of a river. It was at S. António that in December 1961 the last European flag to fly over Indian territory was finally lowered. In addition to tourism, industries include salt processing and fishing. The population of Diu in 1991 was 39,485. The area covers 52 square kilometers.

DAMDINSUREN, TSENDIYN (1908–1986), Mongolian writer. Tsendiyn Damdinsuren, one of Mongolia's most distinguished writers, was born in what is now Dornod Province and grew up in the era of Mongolian autonomy and early Communism and became politically active in the Mongolian Revolutionary Youth League. He gained election to its Central Committee in 1926 and later became editor of its publications. Subsequently Damdinsuren became chairman of the Council of Mongolian Trade Unions and later was involved in the forced collectivizations and seizures that brought Mongolia close to civil war. Young Damdinsuren had to tread carefully to avoid being purged or executed. In 1932, he joined the Communist Party while continuing his editorial work but

in 1933 went to Leningrad to further his education, returning only in 1938.

Once back in Mongolia, Damdinsuren became increasingly allied with Yumjaagiyn Tsendenbel, Mongolia's future premier and president, and his circle. Damdinsuren became involved in efforts to adapt the Cyrillic script to write Mongolian. Prior to that time Mongolian had been written with the Uighur script, which was both difficult to learn and use and divorced from spoken Mongolian. The new script and orthography, on the other hand, closely reflected living usage and were a common element in the rest of the Soviet world. According to some sources, it was Damdinsuren who proposed the change in the first place, and he later became one of its most active proponents. In connection with his linguistic work, Damdinsuren later worked on the first large Russian-Mongolian dictionary and between 1942 and 1946 was editor of the party newspaper *Unen*. In 1950, he served as chairman of the Committee of Sciences and between 1953 and 1955 as chairman of the Writers Union. By this time Damdinsuren was becoming increasingly famous for his literary works, above all his poetry, but also his prose, including literary studies and a translation of the *Secret History of the Mongols* into modern Mongolian.

Damdinsuren's style is lucid and readable, and he was a master of writing in the new Khalkha literary language that he helped create. He was a vivid storyteller, particularly when his stories focus on everyday Mongol life. Although he did not suffer as much as his contemporary B. Rinchen, Damdinsuren fell afoul of party authorities more than once. Unlike the academician Bazaryn Shirendev, he did not live long enough to see the triumph of the new Mongolia after the decline and collapse of Communism. His works remain in demand and have been frequently reprinted after his death.

DAMKOENG, AKAT (1905–1932), Thai prose writer. M. C. Akat Damkoeng Raphiphatna was born in 1905 at Rajaburi Palace as the sixth of eleven

children of Phra-ong Chao Raphiphatnasak Kromluang Rajaburi-direkruethi. The royal title M. C. (*Mom Chao*) was given to Akat Damkoeng as a relative of the king.

Though in poor health from his early childhood on, Akat Damkoeng was an extraordinarily good pupil, who—together with Kulap Saypratisth and Ja-eam Antrasen—engaged in writing and publishing as editor of the "Srithep Journal" of the Thep Sirindra High School in Bangkok. In 1924 he went to London to study legal science, but failed the examinations because of being more interested in literature and his own writing. Then he matriculated at Georgetown University, Washington, D.C., for foreign studies. However, due to a serious ophthalmic disease he had to go back to Thailand in 1928 without a degree.

In Bangkok, Akat Damkoeng began to work at the Ministry of Interior, Department of Public Health, where he met his former fellow student Ja-eam Antrasen, who encouraged Akat to write.

In 1929, the first novel of Akat Damkoeng, *The Circus of Life*, was published and became a best-seller at once. A sequel to this novel, *Yellow Skin or White Skin*, was published in 1930. Only one year later, a collection of short stories and the manuscript of the novel *East or West* (in English) were finished. Permanently in poor health—physically as well as mentally—Akat Damkoeng died in 1932 of malaria. His short stories were published after his death in Thailand and Hong Kong, but *East and West* remains unpublished.

DANCE—BALI Dance is integral to Bali's cultural life, and includes sacred temple dances that are indispensable to religious rituals, adaptations of old temple or court dances now chiefly performed for tourists, and social folk dances. Balinese dance is rooted in the Hindu-Javanese culture that predates the coming of Islam in the fourteenth and fifteenth centuries, but the repertory has been continually augmented and developed. After Java's conversion to Islam, Balinese dance continued to develop in a sa-

cred, temple setting, while Javanese dance was centered in the royal courts. Balinese choreography generally tended to be more dynamic than Javanese choreography. Balinese choreography emphasizes controlled animation of the entire body, with stance, and leg, arm, hand, and eye movements all carefully defined and positioned.

Visitors to Bali can easily become confused by the plethora of regional variations and dance styles. The following descriptions are generic; details of costume, repertory, and performance vary widely among regions and villages. In Bali, it is customary to classify the dance repertory according to the division of the Balinese temple into three courtyards. The main dance repertory is thus divided between sacred dances traditionally performed in the *jeroan* (inner temple), less sacred dances performed in the *jaba tengah* (middle courtyard), and secular dances which belong in the *jaba*, or outer courtyard.

Jeroan Dances

The main *jeroan* dances are the *pendet*, *rejang*, and *baris gede*. The *pendet* is a dance of welcome for the gods, and is danced by a group of girls or women, each wearing ordinary traditional dress (as opposed to a special dance costume) and carrying an offering in her right hand. *Pendet* is widely taught to girls in Bali today, and has a more or less standardized form. The *pendet* is accompanied by a gamelan gong ensemble. The *rejang* is a stylized procession to entertain visiting spirits. *Rejang* is danced by a group of women and girls of all ages, wearing traditional temple dress along with a gold headdress decorated with flowers. *Baris gede* is a stylized warrior dance performed by a group of men, who form the personal guard of the visiting spirits. The dancers carry weapons—usually pikes, but sometimes *kris* (traditional daggers) or even firearms—and wear distinctive helmets decorated with pieces of shell. The dance represents military actions, including a mock battle. The *sanghyang* dance also belongs to the inner temple group, as does, by extension, the *kecak*. *Sanghyang* is a ritual trance dance accompanied by gamelan gong or chanting, performed to repel evil influences. The dancers are young girls of around eight to ten years old. *Kecak* is a modern offshoot of *sanghyang* developed in the 1930s, which uses the chanting of traditional *sanghyang* as an accompaniment to theatrical dance using stories from the *Ramayana* epic.

Jaba Tengah Dances

The *jaba tengah* dances are mostly narrative. The most important is the *gambuh*, which, like the *jeroan* dances, functions to welcome the spirits. The *gambuh*

has pre-Islamic Javanese court origins, and is generally held to be the source of all Balinese narrative dance forms in terms of movement vocabulary, character types, costume, plot development, dramatic conventions, and musical accompaniment. *Gambuh* performances originally lasted for several days, though today they rarely exceed an hour or two. Most *gambuh* performances tell stories from the early Javanese *Panji* romance cycle, often placing the central character in Bali rather than Java. Dialogue is in *Kawi* (Old Javanese), though the comic characters keep up a running commentary in Balinese.

The *topeng pajegan* and *wayang wong*—both masked dramatic forms—also take place in the *jaba tengah*. In *topeng pajegan*, a single dancer performs the entire story, changing masks and voices to represent the various characters, while in *wayang wong* a number of dancers present an episode from the Ramayana epic, again with dialogue in *Kawi*. There is also an outer courtyard masked dance known as *topeng panca* (masked dance of five), in which five dancers represent different characters.

Jaba Dances

Jaba (outer courtyard) dances can be performed outside the context of religious ceremony as purely secular, artistic events. Some of these are dramatic forms, while others, like the *legong* and *baris* dances, are choreographic character studies. *Legong* is performed by three young girls, and has a dramatic structure when performed in its entirety. Today, however, it is usually excerpted, the point being the grace and elegance of the choreography. *Legong* is normally the first dance taught to young girls when they start to study dance. *Baris*, in contrast, is a vigorous male dance style representing a warrior preparing for and engaging in combat. *Baris* is normally taught to all male dance students in Bali, as it contains all the fundamentals of Balinese male choreography. A modern development of the *legong* is the *kebyar duduk*, in which the dancer sits at an instrument of the gamelan gong *kebyar* (modern-style gamelan) ensemble, and the choreography, while based on *legong* style, incorporates playing the instrument.

Outside the temple are a number of genres of social dance, such as *joged bungbung* and *janger*. *Joged bungbung* is similar to the Javanese *tayuban*, and features a number of young female dancers paid to dance flirtatiously with male guests, usually inviting the man to dance by placing a sash around his waist. *Janger* resembles a secular version of the *sanghyang*, and features a group of performers split evenly between the

sexes. They sit facing each other in lines and sway rhythmically to their own chanting.

Balinese dance has been widely admired by foreign artists and scholars as a vibrant and vital strand of Balinese culture. Some of these, like German artist Walter Spies, contributed to the development of dance in Bali itself. The continued popularity of traditional dance with Balinese performers themselves should ensure the survival of the tradition even as Indonesian society changes around it.

DANCE—BANGLADESH Folk dancing in Bangladesh has to be viewed in the context of the history of the Indian subcontinent. Bangladesh is among the youngest nations of the world; it became a nation in 1971, following its independence from Pakistan, which itself became a nation in 1947. Bangladesh, as former East Pakistan, was far removed socially and culturally from West Pakistan and was closer in every respect to the neighboring Indian province of West Bengal. With its very strong emphasis on cultural preservation, Bangladesh has retained the majority of folk dances that were practiced in Bengal, drawing also from other Indian states such as Orissa and Bihar, with which there have been strong interactions for centuries. It is to be noted that even though a large number of folk dances have been inspired by Hindu rituals, they have been well preserved in Bangladesh, even though since 1947 that region has been predominantly Muslim. If some of the traditional folk dances have gone out fashion, then it is more due to the constraints of urbanized living than to any religious censure.

Mask Dances

The most prominent among the folk dances are mask dances, originally from the Mymensingh district but later performed in various other parts of Bangladesh as well. These dances, usually held after the harvest in March–April, are enactments of myths of the cult of the Hindu god Siva and the goddess Kali.

The wooden masks for the dancers are made by the village carpenter and painted by the potter. All the roles—male and female—are played by village boys. The local drum, the *dbaka*, is played dexterously, and the audience usually joins the performer in singing the chorus of the songs. In these dances, Siva is always shown as a bare-bodied ascetic. The dancer performing as Siva enters and dances; the songs begin in a slow rhythm, progressing toward a faster beat. In the second part of the performance, Kali, the consort of Siva, represented in a terrible form causing destruction, enters and circles around, while Siva lies prostrate on the ground. Kali stands for a while with one foot on the chest of Siva and then proceeds to perform the main section of the dance. These dances are largely improvised, and the songs are composed locally.

The Bara-buri ("old couple") dance also uses masks, but it is very different from the religious dances. The songs and demeanor of the masks depict a good-humored celebration of married life in old age. This dance is performed for fun at social and family functions. The actors are usually males and amateurs.

Other Popular Folk Dances

The most popular form of dancing associated with all Bengali territory is the Kirtana dance. This is a purely devotional dance for the worship of Krishna, started four centuries ago by the saint Caitanya (1485–1583). The movements of this dance are very simple, consisting of raising the hands above the head and clapping to the beat of the *khol*, an elongated wooden drum. Part of the dancing company vigorously plays the *khol*, and everybody sings "Hare Krishna" ("Hare" is the vocative case for "Hari," the name of Vishnu as Krishna). This dance has become known all over the world since the 1960s as part of the Hare Krishna movement.

A spectacular activity is the incense dance, held at the end of the Bengali year during dark, moonless nights. The dancers hold earthen incense pots containing glowing charcoal and throw incense at the end of the refrain while singing, creating a shower of sparks and smoke.

Because smallpox was a major threat in the subcontinent before the advent of modern medicine, regular worship was held for the goddess Sheetala, who was believed to prevent the disease or at least mitigate its fury; she was also believed to cure infertility in women. This worship, which is still used for curing infertility along with modern medicine, is a community effort in which the ritual lead is taken by one woman at whose house other village women gather be-

fore proceeding through the village to the riverbank. The leader carries a pitcher of water placed on a winnowing fan on her head, and all the women make loud ululations, a sound that marks many sacred activities in this region. After a ritual bath in the river, the company returns to the house of the leader, where songs and dances are held around the pitcher and fan. The next day, the pitcher and the winnowing fan are taken to various homes in the village, and dances are held in each house around these objects. A drummer of the lower caste plays the *dbak*, a small drum, and women perform ring dances accompanied by simple chants.

The Rayibeshe dances preserve the memory of a past martial tradition. They are no longer very common. Features include a gong called *kansi*, the *khol* drum, and dancing bells worn only on one foot. Rayibeshe dances were manly and vigorous, full of war cries, acrobatics, swordsmanship, and duels with knives and spears. They required long and special training. A similarly martial dance was the Dhali, albeit different in style.

The Shi'a sect of the Muslims holds a period of mourning, called the *Mubarram*, in memory of the death of Hussain and Hassan, the sons of Ali (the Prophet Muhammad's son-in-law) at the battlefield of Karbala. During this period, when Shi'ite Muslims avoid most song and dance, mourning songs—*marsiya* and *jari*—are sung with deep emotion and great finesse during nights in community gatherings. A special dance performed by men is held, in which they hold one end of their white undergarments (dhoti) in one hand and a piece of scarlet cloth in the other. Slow and mournful movements are made to the chiming of bell-anklets used to create sad rhythms.

Professionally Performed Dances

Khemta, another form of dance, is performed by professionals (for example, courtesans or prostitutes) in family and community gatherings and in religious processions. As most celebrations, including birth, child naming, marriage, and initiation of males, are occasions for dancing, the courtesan class are invited to add to the gaiety. The dance also serves the purpose of providing some extra income to courtesans. Family members, however, only watch; they do not dance along with the courtesans. These dances are usually accompanied by songs on the love dalliance of the god Krishna and his beloved Radha. Intricate footwork and certain features of refined dancing such as complex eye movements are also used. A typical feature of the costume of the main courtesan is a big necklace called *sinthi*. The supporting instruments are tabla

(small hand drums) and *sarangi* (an instrument similar to a violin). These are not folk instruments but are used by classical singers only, indicating a close connection with formal dance.

The professional dance that is best known is the Baul, performed by male, rarely by female, members of the Baul community. Simple but full of abandon, this dance has distinctive music and can be performed at any time for recreation. The Bauls are usually traveling mendicants.

Dance in the Twenty-First Century

Folk dances in Bangladesh, as in the rest of the subcontinent, are threatened in the twenty-first century, as the social climate in which they once flourished has changed with the modernization of society. Reduction of community activity such as harvest festivals, extended marriage feasts, lengthy personal and family rituals and loss of patronage from rich landowners and merchants have diminished their frequency. Amateur performers have migrated to big cities, so that training in the village communities is difficult. The new patronage given by academies and art centers is located in the cities and does not promote dances as part of the social fabric of everyday life but only as cultural entertainment. As a result, the folk dances are not only withering, they are becoming more contrived under city patronage, far removed from their native vitality.

DANCE—CENTRAL ASIA Located at the heart of the great Silk Road, Central Asia is crossed by an ancient network of caravan routes that linked China with the Mediterranean. The dances of the region reflect the rich legacy of many cultures, both indigenous and foreign. Through commerce and conquest, Iranian, Turkic, Indian, Arabic, Chinese, and Mongolian elements entered dance styles of the region. The spiritual traditions of Zoroastrianism, shamanism, Hinduism, Buddhism, Christianity, and Islam had an impact on dance. The great division between steppe and oasis that characterizes Central Asian geography influenced cultural development; as a result, the music and dances of nomadic people were less

elaborate and varied than those of the settled oasis dwellers.

Dance has long been integral to Central Asian peoples. On the territories of present-day Uzbekistan, Kazakhstan and Azerbaijan, rock paintings known as petroglyphs depict dancing figures and date back to as early as the Bronze Age. Later objects, such as sculptures, frescoes, ornaments, ossuaries, and serving vessels, also portray dancing figures.

General Characteristics

Central Asian dance is often of a solo, improvisational nature, although line and circle dance also exist. Women, or young boys imitating them, usually perform the most celebrated dances. Men and women do not typically dance together and, if they do, they rarely touch.

Typical characteristics encountered in Central Asian dance include head slides and circles. Hands and arms are especially expressive. Wrist circles, hand undulations, and shifting arm patterns create intricate spatial designs around the body and above the head. Shoulder isolations can include up and down lifts, back and forth pushes, and sustained shimmies. The relatively uncomplicated footwork patterns create constant traveling steps over which intricate movements of the upper body are layered. Rhythmic accents occasionally punctuate some dances with stylized hand clapping, finger snapping, and foot stomping by the performer.

Traditionally, many dances were performed almost completely in place because they were done within a household, with guests seated around the perimeter of a room. In Persia, temporary wooden stages covered with carpets were created on top of the decorative ponds that were the central feature of courtyard gardens—another factor that limited performance space. Portions of the dance often took place with the performer kneeling on the floor, requiring a graceful ascent and descent. Spins and turns, ranging from simple to complex, have long been identified with the dance of the area. Folk dances sometimes included hops but rarely high leaps. Unlike Arabic dance, Central Asian dance has virtually no true pelvic isolations, although Persian and Azeri dance sometimes has simple hip twists. Acrobatic components, such as deep backbends or spins ending in a sudden drop to the floor, are usually encountered only in the dance of professionals.

Facial expressions of great emotional range play a central role in the dance performances of women and girls. In the *yalla* dance genre, which is accompanied

by song, the dancer must mirror the content of the lyrics in her movements and gestures.

With the exception of some ritual dances, performers wore traditional clothing from the region of a dance's origin. Professional dancers favored more opulent fabrics and jewelry, which were sometimes bestowed by a patron. (This practice continues even today.) Contemporary costumes frequently consist of stylized garments, sometimes from synthetic textiles, which more tightly fit a dancer's body than the voluminous robes of the past.

Ritual, Spiritual, and Healing Dances

Ritual, spiritual, and healing dances reflect a close spiritual relationship with the yearly cycle of nature and the animal world. The Iranian and Turkic peoples of Central Asia celebrated the New Year at the spring equinox with a pre-Islamic festival known as No Ruz (New Day). In ancient times it represented the sacred marriage between Innana, the queen of heaven, and her consort Tammuz, the shepherd god who represented the creative powers of spring. This ritual promoted the fertility of crops, animals, and humans for the coming year. Women still engage in the all-night ritual of making *sumalak*, a special dish of seven grains, singing and dancing while they take turns stirring a large cauldron. No Ruz continues to be celebrated and has enjoyed a revival in the Central Asian republics that were once part of the Soviet Union.

Vestiges of Central Asian shamanism can be linked to the incantational dances of medicine men and fortune-tellers that were still common at the beginning of the twentieth century but that largely died out under the Stalinist persecutions of the 1930s. Traces of the shaman's dance can be discerned in *lazgi*, a traditional healing dance from the Khorezm region that contains trembling movements common to trance dances, as well as gestures imitating animals such as birds or fish.

Some of the earliest references to dance reveal links to religious and spiritual practices. The cult of Mithra, widespread throughout Central Asia, included ritual dance. Zoroastrianism had a fire dance. The so-called whirling dervish traditional dance may have derived from the Tocharian spinning dance and was possibly brought to Asia Minor by Jalal ad-Din ar-Rumi (c. 1207–1273), who was born in the city of Balkh in present-day Afghanistan.

Another ritual was *suskbotin*, a dance entreating "the Lady of Waters" for rain. In the *zikr*, a ritual from the Sufi tradition of Islamic mysticism, dancers travel in a

circle with repetitive movements accompanied by chanting and percussion. The dance is still performed. Other folk dances depict daily chores, seasonal work, or important events. Some dances relate to ceremonies such as weddings and funerals.

Combat or War Dances

Martial dances not only developed agility but also aided warriors in achieving a frenzied state that banished fear. The Greek historian Xenophon (430–c. 355 BCE) in his work *Anabasis* described a Persian war dance in which the performer clashed shields together, crouched on one knee, and sprang up again—all accompanied by flute. Afghan men, before going into battle, traditionally performed the *atan milie*. The *atan* still figures in Afghan holidays and wedding festivities. The dancers hold swords and scarves, executing vigorous turns and twisting jumps, as they travel in circles around the musicians, who play the *dobl* (a drum) and *bajakhana* (double-reed oboe).

Court and Professional Dance

From the fourth to the eighth century, the professional dancers of the Samarqand, Bukhara, and Tashkent region enjoyed popularity at the court of the Chinese emperor. During the Tang dynasty (618–907 CE), the celebrated Chinese poet Bo Juyi (772–846 CE) compared the movements of these dancing girls to the whirling of snowflakes. Silver and gilt ewers (pitchers or jugs) dating from the eighth century and discovered in Iran and Uzbekistan depict nude or thinly garbed females, adorned with jewelry, dancing with veils and finger cymbals.

The adoption of Islam subsequent to the Arab invasion of Central Asia in the seventh century promoted sexual segregation and the practice of veiling. Public entertainers suffered from a low social status; female dancers were often linked with prostitution. Respectable women danced for each other in the *ich kari* or *andaroon*—the women's quarters—away from the eyes of strange men.

Generally, public performance of dance became the domain of the *batcha* (dancing boy), who dressed in women's clothing, wore makeup, and danced in a decidedly effeminate style. Rulers and well-to-do merchants kept troupes of these dancing boys. Sometimes several men pooled resources to become patrons of a troupe, which then would entertain at parties.

In the rarefied setting of the court, female dancers entertained, as depicted in the miniature paintings that illustrated manuscripts produced in Central Asia and

Persia from the Middle Ages until the nineteenth century. Many of these dancers came from the non-Muslim population, such as Greek and Armenian Christians and Bukharan Jews.

The clownlike *maskbaraboz* were traveling players who performed in bazaars, wearing white-face makeup, tall hats, and patched coats. They developed a humorous dance form known as *gul ufari*, in which the mannerisms associated with various elements of society (wealthy aristocrats, for example) were lampooned.

In Bukhara, a tradition of female wedding performers known as *sozanda* developed. These women sang and danced while wittily improvising poetic verses in praise of the guests.

Social Dances

Important Central Asian festivals and celebrations have long featured dance. When Alexander of Macedon (356 BCE–323 BCE) visited Sogdiana, he was entertained by dancers at a wedding banquet. Line dances, common in the Caucasus and Asia Minor, especially among Kurdish and Azeri populations, are encountered less frequently than circle dances in Central Asia. Turkmen women and men dance in circle formation together in the *kush-depte*. Generally, dancers do not touch each other as they travel in a circular pattern. Solo improvisational dance is more typical, with several persons sharing the performance space but dancing as individuals.

Musical Accompaniment

Music for dance ranges from a purely rhythmic accompaniment to simple folk tunes and songs. Classical art dances are performed to intricate compositions, or *maqams*, played by ensembles of traditional instruments with singers. At times the dancers themselves create the rhythm by snapping their fingers or clapping their hands. Rhythm can also be provided by *zang* (wrist bells), worn by female dancers, and *kairok* (smooth river stones played somewhat in the manner of castanets). Dances in which the dancers provide their own rhythm range from simple folk dances to sophisticated art dances in which the performer moves to complex and constantly changing rhythm patterns. Even everyday objects of domestic life, such as saucers, thimbles, teacups, and teapots, become potential percussion instruments.

Traditional instruments include the *nai* (reed flute), *zurnai* (double-reed oboe) and *karnai* (long trumpet), *chang* (hammer dulcimer), *gidzbak* (spike fiddle) and

kemanche (three-string fiddle), *doire* (frame drum), and *davul* (double-headed drum.)

Western Influences

The Russian empire expanded into portions of Central Asia and the Caucasus in the nineteenth century. Although it made some effort to convert the local populations to Russian Orthodox Christianity, the government left most traditions and customs undisturbed. In the early twentieth century, pan-Turkist ideas of the Young Turks, led by Mustafa Kemal (later Atatürk; 1881–1938), reached Central Asia. Another important intellectual current was the Jadid movement of Crimean Tatar educational reformer Ismail Bey Gaspirali (1851–1914), which encouraged the merging of Western advances with traditional Islamic values. The Bolshevik Revolution of 1917 and the subsequent creation of the Soviet Central Asian republics introduced additional Western influences. Perhaps of greatest impact were universal education for both genders and the *khujum* campaign to eliminate the custom of veiling.

With the increased freedom brought about by unveiling, public performances of dance by women and girls followed. In the 1920s, Tamara Khanum (1906–1990) became one of the first women to defy tradition and perform unveiled, often courting death at the hands of reactionaries. The brother of another dancer, Nurkhon, murdered her for dishonoring the family by dancing in public.

The Soviet government promoted the establishment of "national" dance ensembles in each republic and the creation of ballet companies. With state support, Soviet Central Asian republics developed professional folk-dance and ballet ensembles. If indigenous people did not have a significantly developed dance culture, specialists were sent to the area to create one. Elizavetta Petrosian, sister of Tamara Khanum, developed Karakalpak dance, inventing movements based on traditional carpet designs. These state folk-dance companies, following the Soviet dictum of "national in form, socialist in content," adopted Western staging techniques, creating choreographies based on politically approved themes. Some Central Asian performers and choreographers trained in Moscow.

Huge Soviet-style celebrations with mass dance presentations in large public spaces, popular from the 1930s to the end of the Soviet period, robbed dances of delicate, nuanced gestures. The advent of television brought back the intimacy of traditional performance settings; close-ups could reveal the subtle facial expressions and small movements that had been the hall-

mark of traditional styling. Televised dance concerts became prominent in Central Asia in the 1960s, and increased in popularity in the following decades. Special dance programming bestowed celebrity status on leading female dancers. Expanded contact with the outside world, especially in the 1980s, encouraged Western dance forms to flourish in Central Asia, including ballroom dance, break dance, aerobics, and hip-hop.

After the collapse of the Soviet Union in 1991, the Central Asian republics embraced dance as an expression of national identity and included it in Independence Day celebrations. Nonindigenous forms were sometimes seen as unwelcome foreign imports. In March 2001, Turkmen President Saparmurat Niyazov announced that he would abolish the National Ballet of his country because the Turkmen people "have no ballet in their blood."

Contemporary Western influence continues through the media of television and movies and the incursion of foreign business people and tourism. Traditional dance has become more commercial in nature, abandoning many of the older classical dances in favor of more lively numbers performed to ethno-pop-style music on stages replete with fog machines and laser lights. Arabic and Turkish style dances, with pelvic movements and more revealing costumes, have also been incorporated into popular concerts and nightclub performances.

Central Asian dance continues to gain popularity with Western audiences; some foreign dancers have even mastered folk and classical repertoires. Uzbekistan, and specifically the capital Tashkent, continues to serve as the unofficial cultural center for the Central Asian republics. Leading performers such as Qizlarhon Dustmuhamedova, proclaimed the "People's Artist of Uzbekistan," instruct at dance seminars and work with professional Western dance companies, and similar developments are occurring throughout the Central Asian republics.

DANCE, EAST ASIA—MODERN Modern dance in East Asia—Japan, Korea, China, and Taiwan—has a complex and varied history in the twentieth century. It is characterized by four main directions: (1) the work of pioneers who were influenced by the West, (2) the transformation of indigenous dance forms, (3) the introduction of foreign styles of modern dance, and (4) the introduction, assimilation, and creation of new works in the classical ballet genre. In addition, many traditional forms have been maintained and continued in new contexts.

Modern Dance in Japan

Modern dance pioneers in Japan were Ishii Baku (1886–1962), Eguchi Takaya (1895–1929), and Ito Michio (1892–1961). Ishii studied with Mary Wigman (1887–1973), a German modern dance pioneer. He then toured in East Asia and influenced dance there. Eguchi also studied with Mary Wigman and was influenced by Èthe eurythmics teacher Émile Jaques-Dalcroze (1865–1950). Ito worked in the United States and Europe. He also assisted the Irish poet and dramatist W. B. Yeats (1865–1939) with his work on Noh theater.

In 1948, Nihon Geijutsu Byoka Kyokai (NGKB, Japan Dancing Artists Association) was founded with Ito Michio as president. In 1958, ballet members of this society joined the then-established Japan Ballet Association. In 1971, NGBK renamed itself Gendai Buyo Kyokai (Modern Dance Association). In the late

1990s, a National Modern Dance Company was established at the new National Theater for Opera and Dance in Tokyo, which became a focal point to bring modern dancers together in a culture where cooperation among groups has been elusive.

Creative expression was curtailed by the military in Japan during the 1930s, but modern dance developed rapidly after World War II. Whereas the pioneers were influenced primarily by the German school, the postwar dancers looked to Martha Graham, musical theater, and later Merce Cunningham for inspiration. Major artists of this period included Fuji Mieko and Wakamatsu Miki. Orita Katsuko, Kanai Fumie, and Takeya Keiko are also notable. In 1985, Teshigawara Saburo founded a group called Karas. He was trained as a visual artist, and set design is an important part of his creations. Butoh, an indigenous Japanese genre, has influenced the development of dance artists worldwide. After its defeat in World War II and the devastation of the atomic bomb, Japan entered a period of social unrest; neo-Dada art was in fashion. Butoh artists rejected Western influences and expressed the spirit of postwar Japan in a way that was sometimes provocative and violent. There was an interest in the old, the ill, and criminals, and in how body memory can be reflected in postures and movements. The result has been called grotesque, shocking, humorous, poetic, and hypnotic. Training for Butoh dancers involves various strenuous activities, discipline, and a lifestyle similar to that of monks. Movement style became increasingly slow, focusing on basic emotional gestures. Often, the general atmosphere is one of chaos.

Three dancers influential in developing the Butoh style are Hijikata Tatsumi, Kasai Akira, and Ohno Kazuo. The dances of all three were characterized by an androgynous quality.

Ohno (b. 1906), the best-known Butoh dancer today, studied with Japanese pioneers Ishii and Eguchi. Ohno's signature work, "Admiring La Argentina," was first performed in 1977 when he was seventy years old. It has since been performed all over the world and is typical of the delicate and transient nature of Ohno's fragile and ascetic art. Ohno has also starred in films and is a writer.

Hijikata, who began to work in the 1950s, was endorsed by the writer Mishima Yukio. Hijikata's work started the trend of naked shaved-head dancers covered in white body paint. In 1963, he called his dances "Ankoku (dark) Butoh (dance)," and the word Butoh has been used since to refer to this style.

Kasai, a follower of Ohno, founded a group called Tenshi-kan in 1971. He came from a Christian background, but also studied Shintoism and Rudolph Steiner's mysticism; some of his works had a spiritual intensity. There was also an erotic element arising from his interest in the writers Jean Genet and the Marquis de Sade.

The two major Butoh companies are Dairakudakan and Sankaijuku. Dairakudakan, founded by Maro Akaji in the early 1970s, uses large-scale sets and huge casts to create spectacular effects. The basically male group works in a comic and exaggerated style borrowed from cabaret theater. Sankaijuku, founded by Amagatsu Ushio in the late 1970s, is known for its solemn reflective atmospheres. Both companies have toured extensively and are credited with making this uniquely Japanese art form known abroad. Major solo Butoh artists include Tanaka Min, Goi Teru, Ashikawa Yoko, and Ono Man. Butoh is now being seen and appreciated more in Japan after having gained recognition abroad, and many young artists are experimenting with this genre.

Two recent trends in dance in Japan can be seen in the work of Condors, an all-male group dressed in school uniforms, which satirizes Japanese pop culture and integrates film, speech, and visual gags into its format. The second trend is to look to Europe for new directions. Japan and its artists are known for continually searching for new trends in the arts and public culture.

Modern Dance in Korea

In 1922, Japan's Ishii Baku visited Seoul and performed a work titled "Dance Poem." After this, several Korean students went to Tokyo to study with Ishii. One of these was Choi Seung-hee (1910–?), a dance pioneer who returned to work on a new dance style for Korea. She later toured the West under the management of Sol Hurok, then spent her later years in North Korea, though little is known of her work there.

In 1962, a modern dance course was introduced at Ewha Women's University by Yuk Wan-sun, who trained in the United States with Martha Graham and is called the godmother of Korean modern dance. Ewha's is considered the top university dance program in Korea, and the university continues to graduate dancers who become leaders in the modern dance world there. Modern dance is taught in about forty universities in Korea, and many small companies have been established in recent years.

After World War II and the end of the Japanese occupation, many Koreans began to look to their own

cultural history for inspiration. One of the major artists in this effort was Kim Mae-ja, a master teacher of traditional Korean dance, who creates modern works based on that tradition. She teaches and performs frequently in China and has established the Chang Mu Arts Center in Seoul where her company performs along with other Korean and international dance groups. Kim Myong-sook, a professor in dance at Ewha University, also creates contemporary works based on traditional Korean genres and organized the Nuri Dance Company in 1996.

Many outstanding modern dance choreographers are active in Korea: Choi Chung-ja expresses the emotional intensity of pain and spirituality in her work; Park Myung-sook works with women's issues and inner feelings; Ahn Ae-soon deals with the Asian idea of opposites and suggestion in movement and in life; Nam Jeong-ho studied in France, and her works are called fresh and innovative; and Ahn Song-soo worked in New York and London and creates technically demanding choreography. Working in a more avant-garde style, Hong Shin-ja creates work that stems from a natural outdoor environment and traditional spirituality.

Modern Dance in China

Dance pioneers in mainland China were Wu Xi-aobang (1906–1995) and Dai Ailien (b. 1916). Wu trained in Japan and returned to China to establish his own school in Shanghai in 1931. In the 1930s his dance creations expressed his patriotism, and after World War II he worked in many institutes in the new China and wrote about theories and methods for his adaptations of Western modern dance to create a new Chinese dance tradition. Dai was born in Trinidad, studied ballet in London, and went to China in the 1940s to take part in the building of a new China. She helped to establish the Beijing Dance Academy, the Central Ballet Company, and after 1949 was one of the first dancers to go into the villages and study the dances of minority peoples. She was made to do hard labor during the Cultural Revolution, but after that traveled abroad as an ambassador for dance in China.

Around 1949, with the help of Russian ballet artists, a new classical Chinese dance was created that is a hybrid of classical ballet and Chinese opera movement. This newly created classical Chinese dance is taught at all the major dance academies in mainland China and in Hong Kong. In recent years this style has been expanded, with many new choreographic works in a contemporary style.

In 1987, Yang Meiqi led the establishment in Guangdong of the first school and company for mod-

ern dance in China. Choreographers and teachers from the United States have contributed to the development of the Guangdong Modern Dance Company, which tours internationally and has received glowing press reviews. One of the first choreographers for this company was Wang Mei, head of the Modern Dance Program at the Beijing Dance Academy. Resident choreographers Liang Xing and Sang Jija create works that illumine an experimental aspect of the spirit of the modern China.

In Hong Kong, City Contemporary Dance Company (CCDC), founded by Willy Tsao in 1979, is the major voice for modern dance. Tsao has been a major figure in Chinese circles as a producer and promoter of contemporary dance and is now working in Beijing as director of the Modern Dance Company. Other important Hong Kong choreographers, all connected with CCDC, are Helen Lai, who choreographs for many groups in Asia; Mui Cheuk-yin, best known for her innovative solos stemming from Chinese tradition; Poon Siu-fai, creating avant-garde pieces; and Yuri Ng, who works in a modern ballet style. CCDC has a strong education and outreach program that contributes to the growth of interest in dance as a career and to the raising of dance standards in Hong Kong. Since 1980, CCDC has made fifty-one international tours to over thirty major cities in Asia and the West. Also in Hong Kong, the School of Dance at the Academy for Performing Arts, founded in 1984, has become a major training center for modern dance (and for ballet and Chinese dance), and its graduates have established many small groups in Hong Kong and overseas.

Modern Dance in Taiwan

Modern dance in Taiwan was first introduced during the Japanese occupation by touring companies in the early 1930s. A young dancer, Tsai Ryueh, then went to Japan to study with Ishii Baku after the latter visited Taiwan, and Tsai returned to Taiwan to pioneer modern dance. In 1966, Al Huang Chung-liang came to Taiwan to conduct modern dance workshops at the Chinese Dance Arts Institute founded by Tsai. In 1967, Liu Feng-shueh began a modern dance center.

The best-known dance artist in Taiwan is Lin Hwai-min, who founded the Cloud Gate Dance Theatre in 1973. Cloud Gate, with Lin's choreography, draws heavily on Chinese culture, its legends, and its folklore. In the early years, his work was a synthesis of Chinese opera movement, ballet, and Graham technique; in recent years, however, the primary source of movement inspiration and training has been tai chi and improvisation. Lin was also instrumental in 1983 in

establishing the Dance Department at the National Institute of Arts in Taipei, now the main training center for modern dance in Taiwan. Cloud Gate tours internationally and is the best-known Asian modern dance company. Before his dance career, Lin was famous as a writer in Taiwan and was known for his astute political sense and deep concern for the Taiwanese people.

Taiwan's many modern dance artists include Henry Yu, former member of the Graham company; Heng Ping, who established a dance center and the Taipei Dance Forum with resident choreographer Sunny Pang of Hong Kong; and Liou Shaw-lu, a former Cloud Gate member who directs the Taipei Dance Circle, which tours extensively and performs Liou's unique art of oiled bodies sliding around and over each other on large plastic floor cloths. Two others of note are Lo Man-fei, who formed a company of mature dancers, many of whom had danced with Cloud Gate, and Lin Hsiu-wei, who developed a modern theatrical dance style that draws heavily on Chinese opera tradition.

General Trends

For many years, East Asia has been exporting modern dancers and choreographers who have had successful careers around the world. A notable example from China is Chiang Ching, who worked in the United States and Europe in the 1970s. H. T. Chen of Taiwan has worked in New York's Chinatown for the past twenty years. From the 1960s through the 1980s, several dance artists from Japan came to the United States to pursue their careers. Kanda Akiko, Takako Asakawa, and Yuriko Kimura were soloists with the Martha Graham Company. In 1969, Takei Kei did her first group work, "Light," which began a life-long journey exploring the theme of an imaginary family of man in his ceremonies though time and nature.

The development of modern dance in East Asia is expanding at a phenomenal rate. Modern dance programs have been established in many secondary and tertiary educational institutions, and graduates are participating in a variety of ways in their local dance worlds. Moreover, many excellent new choreographers and companies are emerging and making important contributions to dance communities in Asia and around the world. In the near future, there is likely to be continued growth and exciting new trends in the modern dance of East Asia.

DANCE—INDIA Dance in India is as diverse as the multiethnic society from which it stems. Each region, with its own language, literature, customs, costume, and cuisine, has its own dance forms, some of which are traced through wall paintings, ancient manuscripts, and temple sculptures to well over three thousand years ago. There are dances in which everyone participates, at religious festivals or private celebrations, and those performed only by specialists who undergo rigorous training from childhood. Some forms are considered classical, while others are classified as folk; each is part of larger theater, music, religious, and even cinema traditions.

Indian dancers gesture with the eyes, head, neck, and hands. With wrists bent and arms flowing, the dancer interprets the lyrics of accompanying songs, telling stories through facial expression and hand gesture; with bare feet, rhythms are beat on the ground to complement percussion instruments like drums, sticks, and cymbals. Indian classical dances have influenced court and temple dance in most of Southeast Asia—Myanmar (Burma), Thailand, Indonesia, and Cambodia. Dance sequences in modern Indian films, choreographed to extremely popular songs, have captivated peoples all over the world.

Ancient and Classical Dance

Detailed descriptions of ancient Indian theater and dance are found in Sanskrit texts like the *Natya Sastra* (Treatise on Dramaturgy, second century BCE) and the *Abhinaya Darpana* (Mirror of Gesture, thirteenth century CE), which present the theory and technique of a highly developed art. Elaborate lists of eye, neck, head, and hand movements, and of walks and turns, include the various meanings that can be conveyed. Sections are devoted to the performers, music, costume, and stage, as well as to the sacred and aesthetic purposes of dance performance.

THE ESSENCE OF DANCE IN INDIA

"Wherever the hand moves, there the glances follow; where the glances go, the mind follows; where the mind goes, the mood follows; where the mood goes, there is the flavor."

Source: Ananda Coomaraswamy and Gopala K. Duggirala, trans. ([1917] 1970) *The Mirror of Gesture: Being the Abhinaya Darpana of Nandikesvara*. Reprint ed. New Delhi: Munshiram Manoharlal.

By the end of the nineteenth century, both the texts and the dances they described had fallen into obscurity due to lack of patronage and also to attitudes introduced by the British about the immorality of dance. Dance was associated with *nauch* (dancing) girls, many of them *devadasis* (female servants of gods) attached to temples who performed at temple festivals and palace parties. Regarding them as prostitutes, some outraged British women led an anti-*nauch* movement and sought to ban dance.

The rediscovery and translation of ancient manuscripts, the birth of Indian nationalism, and growing pride in indigenous art forms led to a revival of many dance forms. The first dance form to be revived in the 1930s, that of the *devadasis* from temples in south India, was renamed *Bharata Natyam* (Theater of Bharata) after the legendary author of the *Natya Sastra*.

With the ascendance of other forms like *Kathak*, *Odissi*, *Kathakali* and *Kuchipudi*, dances performed by men, and dances originating in royal courts, *Bharata Natyam* remains the paradigm of Indian classical dance. Traditionally taught by hereditary male gurus (maestros), who rarely performed, classical dance training includes the study of ancient texts on theater, aesthetics, mythology, and music. Many universities offer academically rigorous degrees in dance.

Folk and Popular Dance

While classical dances are presented by specialists and associated with elite social groups (the ideal spectator is learned, noble, and refined), everyone can participate in folk dances. Like one's mother tongue, these are learned while growing up in a community. Each region and ethnic group has its own dances, as various as the dances of warriors carrying spears and

the dances of women in swirling skirts with several water pitchers balanced on their heads. When dancers from all over India come to the nation's capital to participate in the annual Republic Day parade, their nationally televised performances require a sports stadium.

People dance at village fairs, street festivals, and in homes during marriages. They carry their dances with them when they emigrate to other provinces, or even abroad. Folk dances from different regions are now taught in high schools, and in many cities, when one ethnic group dances during its festivals, members of other ethnic groups join in. Traditional dances to a disco beat are popular among young and old, from Mumbai (Bombay) to London. Dance dramas or ballets, modeled on Western and indigenous forms in which a story is enacted through dance, are also popular among professional and amateur dance groups.

Most popular of all are *filmi* dances that accompany the many songs that characterize Indian cinema. Clips of these dance sequences, in which stars lip-sync the lyrics while performing hip-jerking movements in an array of romantic settings and while wearing a range of form-revealing costumes, are a major part of television programming. Street children in many countries break into the more famous routines the minute they see an Indian tourist. Commercially produced extravaganzas, at which cinema icons perform live, are extremely successful in India.

Music and Costume

Musical accompaniment for dance is as varied as the dances. In general, dances from the south are allied to the Carnatic musical tradition, and those of the north to the Hindustani system and so follow their distinctive musical modes (ragas) and rhythmic cycles (talas). Beyond that, each dance form—folk, popular, or classical—has its own melodies, rhythms, and instruments. A *chenda* double-headed drum signals an all-night dance theater from Kerala, whereas a *pungi* double clarinet with a gourd reservoir accompanies a gypsy dancer from Rajasthan. As with the rest of Indian music, the leading instrument is the human voice, and, even within a single form, individual dances are defined by specific songs.

Apart from percussion instruments and feet with bells, rhythms are also expressed by vocalized syllables, like *tat*, *dbit*, *gadbi gheba dbaa*. In classical dance these syllables are chanted by the leader of the musical ensemble and accompany sequences of rhythmic dance. Songs can be set just to Indian musical syllables—sa, re, ga (the Indian do, re mi)—or to poetic

texts or both. Poetic texts are interpreted with mimed as well as abstract movement. Lyrics usually refer to deities and characters from Hindu scriptures who, particularly in female temple-dance forms, are directly addressed in passionate love songs through which the dancer expresses a human's yearning for union with the divine soul.

Dancers' costumes are usually the festive wear of the communities from which they stem, characterized by colorful fabrics and elaborate ornaments. In keeping with their earlier ritual status as "brides of a deity," temple dancers are dressed as brides; actor-dancers of theatrical forms sometimes wear masks or masklike makeup, especially in Kathakali dance. Traditional dance and theater rarely employ scenery or props.

Dance in the Early 2000s

As India modernizes, becomes more urban, and is influenced by a world economy, the traditional dance ethos is changing. Dance festivals, organized by the government or supported by businesses, are held at ancient ruins and in foreign countries. Dance is becoming increasingly prestigious and performers are highly valued; they win national awards and receive government land to start academies. A new generation of spectators is encouraging dancers to update the form and style of dances and to experiment with non-traditional themes.

Indian dancers travel widely; many live, choreograph, and teach abroad. Each artist subtly adds to and even changes the traditional forms, whether working within those forms or breaking away to find a more contemporary idiom. Fusion is a growing trend—Kathak and Flamenco, Bharata Natyam and jazz, Kathakali and ballet, filmi dance and Western disco. Yet the fount remains the traditional, particularly the classical, forms with which most dancers, including film stars, are familiar. Indeed, it is this interplay between popular and classical that has characterized Indian dance throughout the ages and makes it a vibrant expression of Indian culture.

DANCE—KOREA Traditional dance in Korea can be divided into two categories, folk dance and court dance. Ritual folk dance is performed by women and men, although originally only men performed the sacred dances within Confucian shrines. Ritual dance in North Korea tends to be more athletic, with jumps and quicker tempos, while South Korean ritual dance is more meditative and slow. Also known as "shaman dancing," ritual dance is used in some cases to exorcise bad spirits. The *Salp'uri* is a slow/fast, joyful, often bewitching and entrancing style of dance. Ritual dances honoring various deities as well as the folk dances celebrating the various agricultural seasons of the earth and the farmer's festivals were also used in the training of peasant militia groups during ancient times.

Music and dance associated with the agricultural aspects of Korean life are called *nongak*. *Nongak* is one of the oldest traditional forms of Korean dance, tracing its roots back to the period of tribal states (first century BCE) and before. Although *nongak* was performed during the course of everyday farm work as well as festivals, professional musicians and dancers also performed the style for entertainment. These performers also wore masks. *T'al'ch'um* is the Korean form of a masked dance drama. The masks themselves represent the five geographic directions: Yellow = center, red = south, blue = east, white = west, and black = north. *T'al'ch'um* was originally a style of Buddhist morality plays from China. The Korean style of the form evolved a comic sense, making light of everyday situations, and at times could be quite racy with theme and dialogue.

Court dance in Korea is much more reserved than folk dance. This style is often described as *chong'joong'dong* or "motion within stillness." The movements are elegant, graceful, flowing, and restrained, with the movement controlled by the dancer's inhalation and exhalation. The costumes cover the entire body: long full skirts and tops with extended sleeves that help to augment the small delicate movements of the hand and forearm, making the dancer appear to float weightless during performance.

Dance continues to evolve in Korea through contemporary modern styles. Young dance artists such as

Dancers participate in a folk dancing competition in Aanyan, South Korea, in 1989. (STEPHANIE MAZE/CORBIS)

Hong Sin-cha, Nam Jeong-ho, Lee Kyung-ok, Kim Hyon-ok, Kim Mae-ja, and Ch'ang Mu Hoe explore both the traditional spirituality, breaking the boundaries established by their predecessors, while finding their own unique movement vocabularies.

DANCE—MALAYSIA Dances in Malaysia are categorized into court-classical dances, folk dances, ethnic-tribe dances, and dances from immigrant communities such as Chinese, Indian, and Portuguese, as well as modern dance. Although Malaysia is a Malay-dominated nation, it is multiethnic.

Court and folk dances are mainly Malay. Even though Malaysia has thirteen states plus the federal territory of Kuala Lumpur and Labuan, Sabah, only nine sultanates survived—Perlis, Kedah, Perak, Kelantan, Terengganu, Pahang, Selangor, Negeri Sembilan, and Johor. Melaka, regarded as the beginning of Malay civilization in the fifteenth century, was captured by the Portuguese in 1511. The fall of Melaka resulted in the birth of other sultanates such as Johor

and Perak. The Malay court dances originated from these courts. The courts of the northern Malay states of peninsular Malaysia are perceived as culturally richer. The best-known court dance is Asyik from Kelantan.

Other dances include *inai* of Perlis, *gamelan* of Terengganu, and *mak yong* of Kelantan, the latter being dance theater that encompasses many dances within it, such as Mengadap Rebab and Belan-belan Bejalan. Some of the Malay folk dances were also performed at court for special social functions, either as presentation or as social dance, such as *joget*. The word *joget* could actually be translated as "dance" but is commonly translated as "folk dance." The court-classical dances are normally much slower and performed by women, which is one of the reasons why the court dances disappeared after these courts became more Islamic. The folk dances are normally performed as social dance in villages for special occasions such as weddings and engagements. The ethnic-tribe dances are common among ethnic groups in Sabah and Sarawak as well as among the Orang Asli (Original People) of peninsular Malaysia. Most of the ethnic-tribe dances are related to rituals of tribes, such as the harvest festival.

Other dances include ballet, modern, and contemporary dance. Contemporary dance in Malaysia is not restricted to Western modern and contemporary dance, but includes contemporary Malaysian dances

Dayak women performing in a costumed dance drama in Sarawak, Borneo, Malaysia. (CHARLES & JOSETTE LENARS/CORBIS)

that include Chinese, Indian, Malay, and ethnic issues. Perhaps the early contemporary dances could be traced to dances created for films in the 1950s and 1960s. In the 1970s, contemporary dances developed further when dance and theater groups collaborated for new works. Today, the contemporary dances continue to be developed by incorporating Malaysian issues (that is, issues that affect all citizens of Malaysia, not just ethnically Malay citizens) rather than Malay issues, especially with new performance venues and the Malaysia Dance Society and National Arts Academy teaching both traditional and contemporary dances. Traditional Malay and ethnic dances continue to be performed for tourists.

DANCE, SRI LANKA—KANDYAN Kandyan dance is a style of classical dancing that flourished under the patronage of the rulers of the kingdom of Kandy (1597–1815), in central Sri Lanka. Kandyan dance is known as *uda rata natam*; it is one of three distinct styles of traditional dance in Sri Lanka. (The other two are *pabatha rata natum* and *sabaragamuwuwa* dance.) Kandyan dance is characterized by very elaborate costumes and by a highly developed rhythmic system (*tala*), which is carried by drums and tiny cymbals (*thalampataa*).

Drumming is such an integral part of Kandyan dance that the very act is surrounded by sanctity. The basic drum scale is made up of the drum syllables *tha - ji - tho - nun*, and these individual notes are considered a salutation to, respectively, the Buddha, the gods, the master or teacher, and the audience. Of several drums that are used, the most important for dance is the *gete-bere*, which is played on all festive occasions in Sri Lanka. It consists of a single piece of wood hollowed out to form a cylinder, with a drumhead on each end: one is made of monkey skin, the other of oxhide. The drum is slung round the drummer's waist so that he can play it with both hands.

The term "Kandyan dance" actually embraces five distinct types. *Ves* dance is derived from an ancient purification rite and is still performed as propitiation, by

Kandyan dancers performing at the Esala Perahera festival in Kandy, Sri Lanka, in 1981. (TIM PAGE/CORBIS)

male dancers only. The elaborate dance costume is thought sacred, as belonging to the deity Kohomba, and it has only been a century since the dancers were first permitted to perform outside the Kankariya Temple in Kandy.

Another of the dance types is *uDekki* dance. This uses a small, lacquered, hand-held drum called *uDekki*, the parts of which are believed to have been given to humankind by various gods. It has strings that can be tightened to change its pitch. It is difficult to play, especially as the dancer is singing while playing it.

Pantheru dance employs an instrument called *pantheruwa*, which resembles a tambourine but without a skin. This dance is believed to have come down from the time of the Buddha (c. 566–486 BCE). The gods are said to use this particular instrument to celebrate their victories in battle, and Sinhalese kings used to use *pantheru* dances in the same way.

The *naiyaaNDi* dance is performed during preparations for the Kohomba Kankariya festival and other religious festivals. It is characterized by a special dance dress.

Vannam dance derives from the Sinhalese word *var-Nana* ("descriptive praise"). Originally these *vannams* were only sung, but later they were adapted for solo dancing, each one expressing a single dominant idea. There are eighteen principal *vannams*, and the songs are said to have been composed by the sage Ganithalankara. They take their inspiration from many different themes, and bear titles like "elephant," "precious stone," "lion," "arrow," and "peacock."

DANCE DRAMA, MASK—KOREA Korean mask dance drama, *t'alch'um* (*sandaenori*), dates back to prehistoric Korean shaman rituals. Mask dance dramas were performed to propitiate the spirits during the agricultural year, repel evil, honor ancestors, and ensure bountiful harvests. With the introduction of Buddhism to Korea, influences from India via China were adopted, as noted in the lion dance. Performed at New Year's, Buddha's birthday, and the Tano and Ch'usok festivals, the dramas were a lively folk tradition. Today, the dance dramas, in reality short skits, are a combination of music, dance, song, and narrative combined with humor.

The dramas, handed down as part of an oral tradition, were always performed outdoors at night by firelight. The performers were exclusively men, usually farmers, until recently, when women began to participate. Drumming and music were a crucial component, with a different rhythm introducing each new character. The characters included humans, gods, spirits, and animals. The masks (made of wood, gourds, or paper) were exaggerated and brightly colored to compensate for the low light. Colors have special significance; black is used for the faces of the elderly, red for a young man, and white for a young woman. Most of the masks are backed with black cloth to signify hair and to secure the mask. Some masks have movable parts, such as the eyes or lower jaw. Some of the roles are acted in pantomime and dance alone. Performances can last the entire night or only a few hours. Improvisation often is used. The artistic masks used in traditional dance dramas were often destroyed after performances.

Performances are often opened with a ritual ceremony to ensure the success of the play. The most common theme of dance dramas is social satire. Many of the satires ridicule the ruling classes, wayward Buddhist monks, and shrewish women. Broad humor is a strong component. The *Kosong ogwangdae*, a mask dance drama from southeastern Korea, has five scenes including a leper, a disreputable Buddhist monk, and a ruined aristocrat. Complicated love triangles between a man, his proper wife, and his courtesan abound. Traditionally, masks depicting the *yangban* (ruling classes) usually were given unattractive features such as a harelip or lopsided leer. Such entertainment enabled the common people to voice social criticisms and rebellious sentiments safely.

In the 1980s, interest was revived in this folk art form, and many small troupes were formed. Modern *t'alch'um* performances can be seen in Seoul at the Chong-dong Theater.

DANCHI During the Meiji period (1868–1912), Japanese cities rapidly industrialized, bringing large numbers of people from rural areas to urban centers. Some neighborhoods in Tokyo became virtual tenements, with almost 200 percent occupancy in some dwellings. However, the situation in Japan never ap-

proximated the slum conditions of industrializing urban areas in America and Europe due to the nature of labor migration. Most early factory workers lived in dormitory-like accommodations, established by factories for *dekasegi rodo*—young people (especially women) brought for a contracted term to live in the cities but to return to the rural areas after a fixed period, with their wages sent home to the countryside, and their housing and food provided by the employers. Thus a permanent urban working class was slow to form in Japan, compared to the earlier industrializing nations. However, with the devastation of the 1923 Tokyo earthquake, many workers needed housing, and *danchi*—large-scale apartment dwellings—were constructed to meet these needs. Some of these complexes were envisioned by their developers as communities, with a central plaza or square in the center of the surrounding buildings, and with facilities for residents held in common. In general, these large buildings were relatively clean and hygienic and provided reasonable accommodations in close quarters. Construction was suspended in wartime, when bombings and fire destroyed many homes.

In postwar Japan, the remaining housing was overcrowded and lacked amenities. Many families doubled or tripled up, sleeping took places in shifts, and workers sometimes stayed at their place of employment rather than return "home." The enormous apartment complexes built on city fringes since the war also create bedroom towns in suburban areas. These *danchi* may contain as many as 400 or more units. They were first built in the late 1950s to accommodate workers migrating to urban industrial areas, and workers displaced from war industries or from former colonies. Soon, burgeoning white-collar workplaces brought more educated young people from the countryside and provincial cities to the capital. The residents of *danchi* were often young couples living on their own, away from their rural or provincial extended households. During this period very few of these young wives worked outside the home, though some older wives and mothers did *naishoku* (take-home employment) as piecemeal work for small-scale enterprises contracting out light manufacturing or assembly work. Because of the isolation from their natal families, young women with small children and little contact with adults during the day, sometimes fell victim to *danchibyoo*, or "apartment complex sickness," a syndrome characterized by depression and neurasthenic symptoms—similar to suburban housewives' depression-related symptoms in postwar America.

Some *danchi* are private apartments and some are rented at highly subsidized rents to workers, with most

of the cost covered by the employer. *Danchi* continue to be built, some resembling small towns, with community services, shopping, and day-care centers included. Some *danchi* now are specially built to accommodate the increasing number of elderly, who living alone or in couples, away from caregiving children or other relatives, are provided with some assistance, such as visiting home aides, meals on wheels, and telephone chain contact.

A typical *danchi* apartment is known as a "2LDK," because it has two "living areas" and a kitchen-dining room, along with a separate toilet and a bathroom. It is also likely to have a small balcony with a washing machine and clothes drying lines. Such an apartment may have one large Western style room with a carpeted floor. Frequently, the other "living" area will be tatami matted. New buildings may have no tatami-matted rooms at all. These two large rooms will have large closets on one side where futons (sleeping mats, mattresses, etc.) are kept during the day, and brought out at night. Most families with young children tend now to have a designated "children's room" once the children are of kindergarten age (before that age, children tend to sleep next to their parents on futons), and there may be bunk beds or fixed furnishings, less flexible than the older style of mobile bedding.

DANGREK RANGE The Dangrek Mountains, known in Khmer as the Chuor Phnum Dangrek, divide Thailand and Cambodia along an east-west axis. The range is located along the northern Tonlé Sap Basin and is primarily a steep escarpment. The average elevation of the escarpment is about 500 meters. Its peaks range from 450 to 700 meters in height.

The Dangrek escarpment is located on the southern edge of the Khorat Plateau. The mountains extend west from the Mekong River to approximately San Kamphaeng, Thailand. This watershed serves as the boundary between Thailand and Cambodia, run-

ning about 800 kilometers in length. Although there is a main road in the area connecting these two nations, travel and communications are difficult. The Mekong valley, located at the eastern end of the range, and the Mekong Delta, in the southeast, provide land and water access between Cambodia and Laos.

Because this geographic feature has served as a border between nations, it has also been a region in which military activity has taken place during periods of civil unrest and war. The Dangrek Mountains have a place in history as having been where Pol Pot (1925–1998), the leader of the Khmer Rouge, died.

DAOISM. See **Taoism**.

DARDANELLES The Dardanelles is a 61-kilometer-long strait separating European and Asian Turkey, linking the Aegean Sea with the Sea of Marmara. Its widest point is 7 kilometers, its narrowest only 1,600 meters. During classical antiquity the strait was known as the Hellespont, and its modern Turk-

ish name is Canakkale Bogazi. The Dardanelles, together with the Bosphorus Strait farther north, has been a major crossing point between Europe and Asia and also controls navigation between the Black and Mediterranean Seas.

The ancient city of Troy was located near the Dardanelles, and both Xerxes I of Persia (c. 519–465 BCE) and Alexander of Macedon (356–323 BCE) crossed the strait during their military campaigns. During the Byzantine and Ottoman empires, the strait was used in the defense of Constantinople (now Istanbul) and was fortified for this purpose. In World War I, the Allied powers attempted to pass through the strait, but two early attempts, in 1915, were unsuccessful. The second of these, the Gallipoli campaign, resulted in great loss of life. In 1918, the Allies passed through the strait and took Constantinople. Following the war, several international treaties demilitarized and internationalized the Dardanelles, but the Montreux Convention of 1936 allowed Turkish remilitarization while guaranteeing access to foreign vessels. The strait remains important as a shipping lane for Black Sea nations.

DARHAN (2000 pop. 66,000). The city of Darhan (elevation 700 meters) located some 219 kilometers north of Ulaanbaatar, Mongolia, on the Trans-Mongolian Railway, is the third largest city in Mongolia. Before 1961 the site where Darhan now stands was nothing but rolling pastureland in Selenge Province. What sets this site apart from other regions of Mongolia, however, is its proximity to the country's only transnational rail line and a surplus of raw materials, including coal, marble, and limestone. For these reasons, the Mongolian government and its former economic partner, the Union of Soviet Socialist Republics, envisioned locating a fledgling industrial complex here and in 1961 began building the city from the ground up. Beginning with the building of a reinforced concrete factory, which contributed to further development, the city grew quickly and by 1990 had reached a population of 70,000. The population is as young as the city, with 90 percent of all inhabitants under the age of thirty-five (in 1990). Construction workers and specialists from other socialist countries—as far away as Czechoslovakia, the German Democratic Republic, Poland, Bulgaria, and Hungary—played a large part in the city's rapid growth. For this reason, Darhan is known as the "town of international friendship."

DARI Dari, a language of Indo-Iranian origin, is one of the official languages spoken in Afghanistan (Pashto is the other official language of Afghanistan). Dari is a dialect of Farsi (or Persian), the official language of Iran, and the two languages are so similar in their structure, syntax, and lexicon that Iranians and Afghans can communicate with each other with little difficulty. Nevertheless, there are some distinctive differences between the two. The accent in Dari is not quite as stressed as in Farsi; the vowel systems of the two languages differ; and Dari employs more consonants than Farsi. Finally, when a designation is specified, Dari adds a suffix, *ra*.

Dari uses a modified Arabic script with thirty-two alphabetic characters, and the language has many loanwords from Arabic as well as Persian. There is a for-

mal and more proper version of the language as well as an informal one. In fact, the word "Dari" originates from the word "*dar*," or "*darbari*," which means "court language." Dari, like Pahlavi Middle Persian, is thought to have been spoken in the eastern Iranian royal courts. The language, however, may have originated as common people's speech, which later became formalized to bring it to the level required for use in the royal courts. Today the language has evolved to a stage where the formal style is more closely associated with Farsi, while the informal one resembles more the language spoken in Tajikistan.

Dari is spoken by approximately 5 million people in Afghanistan. Several ethnic groups, including the Chahar Aimak, Hazara, and Tajik, speak Dari as their main language. In Afghanistan Dari is spoken when people who speak different languages come together.

Dari has a rich literary tradition and history. It was the language chosen by several prominent ancient and modern literary figures to weave an epic tale or compose a touching poem. Poets who wrote in the Dari language include Abu Hafs-I Sughdi, Abu al-Abbas-I Marvarzi, and Yazid Ibn-I Mifraq. A modern Afghani poet, Ustad Khalilullah Khalili, also writes in Dari, and many critics consider his use of the Dari language to be brilliant. Khalili has written almost fifty literary works, which include poems, fiction, history, and Sufi studies, all representing some of the finest literary points of the Dari language.

DARJEELING (2002 est. pop. 110,000). Celebrated as a hill resort and tea-producing center, Darjeeling is a city in India situated along a ridge in the Himalayan foothills of northern West Bengal State, 500 kilometers north of Calcutta. Its name is derived from the Tibetan Dorje-Ling, "place of the thunderbolt," and much about the city is Tibetan in sensibility. It has three parts, joined by flights of steps and steep narrow streets; highest are hotels, shops, private schools, and entertainment for visitors and the wealthy, near the ridge line; lower, homes of residents, smaller hotels, and shops; at the bottom, the main market and bazaars. The rajas of Sikkim controlled Darjeeling intermittently until 1816, when the British

DARJEELING HIMALAYAN RAILWAY—WORLD HERITAGE SITE

The Darjeeling Himalayan Railway was designated a UNESCO World Heritage Site in 1999 for its singular demonstration of the profound sociological and economic impact railroads had on the nineteenth-century world. The railroad still provides transportation to and from the hill-top tea-producing city of Darjeeling.

gained use of the area. In 1835, the British established a sanatorium in Darjeeling. Tea arrived in 1856, and within twenty years 113 estates were producing 4 million pounds of tea per year. By the early 1900s, Darjeeling was considered among the most glamorous outposts of the British empire. After World War I, it became a staging ground for expeditions to Mount Everest. From the 1980s through the 1990s, the local population called for political autonomy from West Bengal. Attractions are the "toy train" (a narrow-gauge extension of the North Bengal State Railway); Tiger Hill, with its magnificent view of Kanchenjunga and, occasionally, Mount Everest; botanical gardens; Buddhist monasteries; and museums.

DARUL ISLAM Darul Islam (House of Islam) was a revolutionary Islamic movement that fought between 1948 and 1963 to make Indonesia an Islamic republic. The Darul Islam arose from Muslim militias formed to fight the Dutch during Indonesia's independence war (1945–1949). It was founded in West Java by S. M. Kartosuwiryo (1905–1962) in May 1948, after the Indonesian Republic agreed to surrender that region to the Dutch. Kartosuwiryo proclaimed himself imam of an Islamic State of Indonesia, which was to replace the Republic. The Darul Islam continued its struggle after the Dutch were defeated and the movement was loosely allied with Islamic rebels in South Sulawesi from 1952 under Kahar Muzakkar (1921–1965) and in Aceh from 1953 under Daud Beureueh (1899–1987).

The movement controlled only rural areas, but its operations extended to the fringes of many towns and cities, including Jakarta. The movement's administration was based on Islamic law as interpreted by Islamic teachers (*kyai*), but in many areas its forces were little more than rural bandits. In 1957 the Indonesian authorities pacified Aceh with an offer of special status for Islamic law in the region, but the Java and Sulawesi movements were suppressed by the army, which captured and executed Kartosuwiryo in 1962 and killed Kahar Muzakkar in battle in 1965.

DASHT-E MARGO Dasht-e Margo (Desert of Death) is located in the southwestern part of Afghanistan. Sometimes referred to as the Western Stony Desert, it is dry, dusty, and full of sharp, wind-blasted pebbles. The Iranian border with Afghanistan and the Iranian desert are in the western part of Dasht-e Margo. To the north lies the base of the Hindu Kush (killer of the Hindus). It is approximately 900 meters above sea level, very hot during the day, and freezing at night. The only plants to be found are deep rooted and generally have very sharp thorns. The only possible food source comes from the sap of the razor-sharp camel grass found in certain parts of the cracked earth.

The harsh climate, barren landscape, and waterless earth have left this region relatively unexplored. However, Afghanistan is home to a hardy group of pastoral nomads called the Kuchis. The Kuchi nomads have been crossing the Dasht-e Margo two times a year for generations during their migration seasons as they search for water for their flocks.

DASTAN, TURKIC Traditionally, there are three epic genres in Asia: Altaic, Persian, and subcon-

tinental (of the Indian subcontinent). While the latter two have been studied to a certain extent, the Altaic genre, the origin of Turkic *dastans*, has been largely inaccessible until recently.

The term "*dastan*" is relatively new to the Turkic epic genre and was first recorded in the twelfth century. Some six to eight centuries earlier, oral composers, reciters, and owners of this genre among the Turks either used only the name of the work, which intrinsically referenced the genre, or employed specific autonomous terms such as *chorchok*, *jir*, and *sav*. Though in various dialects, all refer to the same concept, that is, the words of the forefathers.

Performers of and Occasions for *Dastans*

Therefore, a *dastan* is thought to contain the words of the forefathers, embellishing the story of how a particular Altaic lineage and polity gained independence. The reciter, called an *ozan*, or, depending on geographic location, an *akin*, *ashik*, *bahshi*, or *kam*, performs the work, while accompanying him- or herself on a traditional stringed instrument. The occasion of such a performance is an event itself. Apart from that, the recitation is a standard requirement for momentous anniversaries: births, burial ceremonies of rulers, annual festivals, marriages.

The Epic Hero

The main character of the epic is an *alp*, or epic hero, who endures the worst possible scenarios in life to save his or her people from military defeat and slavery. The work is usually known by the *alp*'s name. He or she is fully supported by a sizable cast of characters and is opposed by powerful and treacherous foes and villains. Regardless of the hopelessness of the circumstances, the *alp* can never be subjugated and can never abandon the fight. In the end, under appalling conditions, the *alp* and his followers triumph.

The villains are generally punished lightly. Usually their shame is made public, but they are allowed to wander the earth searching for forgiveness. The victorious ending is celebrated by a grand feast, during which, of course, the *chorchok*, *jir*, *sav*, or *dastan* is joyfully recited by the *ozan*.

Cultural Values in *Dastans*

Apart from the messages of independence, the genre is also a repository of identity. As such, *dastans* are carriers of early cultural values, including ancient spiritual values, such as the Tengri belief system— one of the earliest monotheistic religions. Because the

genre contains immutable linkages to the past, it is common to quote from older *dastans*. This assures and reminds the audience and owners of the works that they are the same people, sharing common goals. The genre is alive and well across Asia, with dozens of original plots, each replete with several dozen variants.

DAUD, MUHAMMAD (1909–1978), Afghan political figure. Muhammad Daud belonged to the royal family of Afghanistan. Educated in Europe (1921–1930) while his father was in temporary exile, he joined the army on his return to Afghanistan. In 1934 he married the sister of the new Afghan king (and his cousin), Zahir Shah.

A resolute supporter of the modernization of Afghanistan, though not of its democratization, and a tough Pashtun nationalist, Daud became minister of defense in 1946, but in 1948, after a disagreement with the prime minister, he was sent to Paris as ambassador. A year later, he became minister of the interior and,

in 1953, prime minister, holding that position until 1963.

During this period (the so-called Daud decade), he exacerbated the question of Pashtunistan—the creation of a single state for all the Pashtun—which poisoned relations with Pakistan, since that state had a strong Pashtun minority. For his policy of modernization, he looked for military aid and economic assistance from both the U.S.S.R. and the United States, cunningly playing on their rivalry.

In 1963 he was forced to resign in order to prevent a serious confrontation with Pakistan and was excluded from active political life. Nevertheless, Daud maintained strong ties with the army and the communist activists. In 1973 he seized power with a bloodless coup, declaring Afghanistan a republic and becoming its president. The worsening of his relations with the Afghan communist activists and with Moscow weakened his position. In April 1978 he was killed, along with his family, during the communist coup, which paved the way for the Soviet invasion of 1979.

DAUYLPAZ The *dauylpaz* is a small kettledrum used by the Kazakhs in falconry. Falconry was one of most popular and entertaining forms of hunting in Kazakhstan and other parts of Central Asia from the earliest times. For fowling they used sparrow hawks and goshawks; for hunting wolves, foxes, and mountain goats, the *berkut* (golden eagle) was irreplaceable. The *dauylpaz* has similar names among the Turkic peoples: The Kyrgyz call it *doolbas*, the Uighur *tevilvaz*, and the Azerbaijanis *tebl-baas*, which all derive from the Arabo-Persian *tabl-baz* (where *tabl* stands for drum, and *baz* for falcon). Falconry scenes were often depicted in the Islamic miniatures of the sixteenth and seventeenth centuries.

The *dauylpaz* had a helmet-shaped body with a leather head (diameter about 300 millimeters, height 160 millimeters) and was often beautifully ornamented. A flat leather strap, a beater, or sometimes a hand was used to produce sound. The instrument was attached to the saddle under the left hand of a horseman, while the falcon rested on his other hand. The *dauylpaz* could also be held in the hands. The *dauyl-*

paz was used as a signaling instrument in military activities as well.

Another term in Kazakh used for this instrument is *shyndaulyl* (similar to the Uzbek *chindaulyl*). Some experts believe the only difference between a *dauylpaz* and a *shyndaulyl* is that the body of the latter was of metal (copper), while the body of the *dauylpaz* was of wood. Both these kinds of kettledrums have not been used since the end of the nineteenth century. Modified forms of the *dauylpaz* are used in the Kazakh folk instrument orchestras.

DAVAO (2000 est. pop. 1.1 million). Davao, an important commercial, educational, and cultural center of the southern Mindanao region, is one of the largest seaports in the Philippines. Davao lies on the southeast side of Mindanao Island, occupying a total area of 2,440 square kilometers, with an average population density of 491 persons per square kilometer. Davao port services interisland and international shipments. The city is situated 974 kilometers south of Manila, on the shore of Davao Gulf. "Davao" also refers to three provinces: Davao del Norte, Davao del Sur, and Davao Oriental. Davao City is located in Davao del Sur but is politically and administratively independent of the province.

When Spaniards first visited Davao in 1528, they found thriving communities of various ethnic groups, such as Bagobos, Mandayas, B'laans, and Manobos. Some of these later embraced Islam and were called Moros or Moors by the Spanish. The modern history of Davao began in the mid-nineteenth century, when Spanish colonizers defeated a rebellion of Moros and established a Roman Catholic settlement on the strategically important bank of the Davao River. Thus the Spanish gained leverage over the flourishing and lucrative regional trade, yet they were unable to establish full control over many parts of Mindanao Island.

A community of buildings on stilts in Davao. (YANN-ARTHUS-BERTRAND/CORBIS)

The American occupation of Davao began after the Spanish were defeated in the Spanish-American War (1898). Davao grew further in the twentieth century. In addition to the rich agriculture on Mindanao Island, mining flourished, and international trade grew to supply a strong worldwide demand (especially from the United States) for abaca hemp (from the banana leafstalk), cotton, coffee, and rubber. During this time, a large Japanese community settled in Davao and became one of the most influential communities in the city. In 1937, Davao was formally inaugurated as a city.

World War II arrived to Davao in 1941; the Japanese made Davao the regional headquarters of the imperial army. The city was heavily damaged in heavy fighting between Japanese and American troops in 1945.

Davao was extensively rebuilt after the war, with its economy now based on food processing, textiles, mining, and regional and international trade. During this era, most of the forest in and around Davao was destroyed, damaging Davao's status as a city in a jungle. Between the 1960s and 1990s, Davao experienced a new wave of industrialization and population growth, although in the early 1980s its business environment was heavily damaged by kidnappings and attacks by guerrillas and leftist groups such as the Communist New People's Army.

In response, citizens of Davao formed *Alsa Masa*, a vigilante group organized with the support of the

Philippine military. Some view this organization as exacerbating the already-volatile situation in Davao by focusing its vigilante justice on the New People's Army and Muslim separatists. The political situation in Davao is still unstable, although after the fall of the regime of Ferdinand Marcos (1917–1989) in 1986 most guerrillas ceased their operations in the city. Public officials still tolerate the existence of self-defense groups that engage in extrajudicial killings, ostensibly to fight crime, drug trafficking, and Communists and Muslim extremists, but Davao City is more peaceful than it was during the height of *Alsa Masa* activity. At the turn of the century, Davao had become one of the fastest-growing cities in the Philippines, with a population growth of 3.23 percent; its population doubled between 1980 and 1999. If the city maintains peace and order through the rule of law, its economy will become even more successful.

DAVID, COLLIN (b. 1937), Pakistani painter. Born in Karachi, Pakistan, Collin David produces

minimalist paintings that are complex studies of line and structure, which question the very humanity of the women who inhabit them. David first attended the National College of Art and then the Fine Arts Department, Punjab University, from which he graduated with a master's degree in 1960. David studied under the tutelage of the landscape artist Khalid Iqbal, but found his own forte in portraiture and figurative art. After attending the Slade School of Art in London for one year, he joined the faculty of the National College of Art, Lahore, in 1964, where he has continued to teach.

David's art focuses primarily on women, but he is unconcerned about the social or psychological dimension of his subjects. The bodies, nude or clothed, form part of the spatial composition of his canvases. Artistic trends of the 1960s like op art influenced his early work to some degree, as in the 1970 painting *Ghazala*, which depicts a woman in the center of a concentric grid, her striped clothes interacting and colliding with the background in an optical pas de deux.

DAWAI, ABDUL HADI (1894–1982), Afghan poet and diplomat. A native of Kabul, Afghanistan, Abdul Hadi Dawai belonged to the Pashtun tribe, a group that predominates in southern Afghanistan.

In 1912, at the age of eighteen, he graduated from Habibia High School and became the assistant editor of the magazine *Seraj*, a Persian-language journal, where he published his first poems and articles. In 1920, he moved on to edit *Aman-e-Afghan*, another Persian-language journal. In his writings, he critiqued society and politics from a socialist point of view and expounded on the beauties and strengths of Afghan culture. He published his poems in Dari (Persian as spoken in Afghanistan) under the pen name Pareshan, meaning "perplexed."

In addition to his writing career, Abdul Hadi Dawai became a diplomat and was present at the peace conferences held in Rawalpindi, modern Pakistan (1919), and Mussoorie, India (1920), when Britain and Afghanistan formally signed a peace accord that ended years of hostility between the two nations. Thereafter, from 1922 to 1933, he served in various diplomatic posts in London, Berlin, and Afghanistan.

From 1933 to 1946, he was imprisoned for his support of the former Afghan king Amir Amanullah Khan (1892–1960), who had been forced into exile because of his policy of modernization. After Abdul Hadi Dawai's release, he again entered Afghan politics, was elected to parliament, and became speaker of the house. He also served as secretary to King Muhammad Zahir (b. 1914) and tutored the crown prince, Mohammad Akbar Khan, from 1933 to 1942. After 1958, he retired from political life and devoted himself to writing. He died in Kabul in 1982.

DAZAI OSAMU (1909–1948), Japanese writer. Born into a wealthy family in Tsugaru, Aomori prefecture, Dazai Osamu showed a strong interest in writing as a student. Feeling alienated from his family, which had political connections at the national level, and attracted to a bohemian lifestyle and left-wing politics, he failed in his studies. Nonetheless, in 1929, following the first of several attempted suicides, he gained admittance to Tokyo Imperial University. In Dazai's seminal work, "Omoide" (Recollections), published in 1933, he employed his characteristic method of autobiographical storytelling; in "Omoide" the narrator struggles to find some worth in his existence. Plunging into the literary life, he failed to graduate from university, attempted suicide two more times, suffered from peritonitis, became addicted to painkillers, and failed to win the first Akutagawa Prize (a prestigious literary award), which he desperately craved. Encouraged by his mentor Ibuse Masuji (b. 1898), he married and achieved a new stability that allowed him to write short stories and gain recognition. Commissioned to write a travel book about his home province, he published *Tsugaru*, a masterpiece of reminiscence and anecdote, in 1944. Gradually, he slipped back into his self-destructive ways, and this provided him with the stimulation for his great novel *Shayo* (The Setting Sun, 1947), which depicts a determined heroine struggling to survive in postwar Japan. In the following year, he published *Ningen shikkaku* (No Longer Human), a reworking of earlier themes. Only a few weeks later he committed suicide with Yamazaki Tomie, one of his disciples.

DAZU ROCK CARVINGS Dazu County, located 160 kilometers (100 miles) west of Chongqing, Sichuan Province, in central China, contains an exceptional series of rock carvings, most dating from the ninth to the thirteenth centuries CE. Construction of the Dazu carvings began during the early period of the Tang dynasty (618–907 CE) and continued until the late Song dynasty (960–1279). Buddhist, Daoist, and Confucian influences are evident in the fifty thousand individual statues found in grottoes and shrines at seventy-five major sites across the mountainous county. The largest and most spectacular grottoes are found at Beishan and Baodingshan. Built during the Song dynasty, the Baodingshan Grotto is carved beneath the overhang of a horse-shoe-shaped cliff. The grotto, known as the "Great Buddha Bend," stretches for 500 meters (1,640 feet) and houses over ten thousand sculptures. The Dazu sculptures depict religious and secular life in China and are noted for their diverse subject matter. Many bear inscriptions asking people to embrace moral and religious principles. Dazu County has attracted pilgrims and other travelers for over a thousand years. The rock carvings were inscribed on the World Heritage List in 1999.

DEFENSE INDUSTRY—CHINA Upon its establishment in 1949, the People's Republic of China was faced with a hostile Western world and came to rely on the Soviet Union for military and technological assistance. This resulted in the adoption of the Soviet organizational model, compelling each factory and industrial sector to be as self-sufficient as possible, even at the expense of efficiency. In 1960, the abrupt end of Soviet assistance forced China's defense research and production to

stand alone, adversely affecting the country's overall industrial development.

Perceived threats from abroad between 1965 and 1971 led to a massive "third-front" (or third-line) construction model, an effort to build a huge self-sufficient industrial base in the remote southwestern and western regions. (The "first front" usually refers to coastal areas, which would be hard to defend; the "second front," inland from the first front, might have to give way to the third front, still farther inland and thus more suitably defended in a protracted war.) Approximately 50 to 55 percent of China's defense industry was located in provinces such as Sichuan, Shanxi, Hubei, Yunnan, and Guizhou. By 1975, the percentage of domestically manufactured weapons was 71, 75, 89, and 97 percent, respectively, for tanks, aircraft, naval ships, and cannons.

In 1977, after the Cultural Revolution, the defense industry adopted the policy of "combining the military with the civilian" and "using the civilian to support the military" to fulfill the overall goal of economic reform and modernization. Under the joint supervision of the Central Military Commission and the State Council, the Commission of Science, Technology, and Industry for National Defense (COSTIND) was established in 1982 to ensure better coordination in defense-industry leadership. In that year as well, the machine-building ministries were renamed to indicate their functional responsibilities. For example, the Second Machine Building Ministry became the Ministry of Nuclear Industry. The 1980s also witnessed the production of some civilian goods by the defense industry, thus involving it in dual functions and profit-making activities.

The significance of high-tech weapons during the Persian Gulf War (1990–1991) renewed China's interest in technological development. In March 1998, COSTIND was headed for the first time by a civilian bureaucrat, a change regarded as an attempt to avoid the military's heavy-handed interference in China's defense industry's operation. While the General Armaments Department, newly created within the People's Liberation Army, now oversees weapons research, the military is expected to pay more for weapons and equipment from COSTIND's defense factories, due to further involvement in the nuclear economy. On 1 July 1999, corporations in the main defense industrial sectors were split for further specialization. For example, the nuclear industry was divided into the China National Nuclear Corporation and the China Nuclear Engineering and Construction Group Corporation.

CHINA'S NATIONAL DEFENSE IN 2000

On 16 October 2000, the State Council of the People's Republic of China issued a white paper, "China's National Defense in 2000." The foreword to that paper, which follows, stresses China's commitment to peace even as it pursues a strong national defense.

"The turn of the century has opened a new chapter in the development of human society.

"When we look back on the twentieth century we notice that mankind created enormous material and spiritual wealth never seen before. We also experienced two world wars, hundreds of local wars and the Cold War that lasted for nearly half a century, suffering tremendously from the scourge of wars or the menace of wars. The Chinese nation has gone through many hardships. The Chinese people have fought bravely for their national independence, liberation, democracy and freedom. They have finally brought the country onto the road toward modernization. The Chinese people know full well the value of peace.

"Humanity is facing a rare chance for development as well as tough challenges in the new century. To safeguard world peace and promote the development of all are the themes of the times and the common aspirations of people all over the world. China is engaged wholeheartedly in its modernization drive. A peaceful international environment and a favorable surrounding environment serve China's fundamental interests. China steadfastly follows an independent foreign policy of peace and is committed to a new world of peace, stability, prosperity and development. China firmly pursues a defensive national defense policy and is determined to safeguard its state sovereignty, national unity, territorial integrity and security. The Chinese people are ready to work together with other peace-loving people of the world and contribute their wisdom and strength to world peace and development, and a more beautiful future for mankind.

"At this important point in history—the turn of the century—we publish this white paper, China's National Defense in 2000, to express the Chinese people's sincere aspirations for peace and to help the rest of the world better understand China's national defense policy and its efforts for the modernization of its national defense."

Achievements

China claims that its military-industrial complex, which is composed of thirty thousand state-owned entities engaged in the aerospace, aviation, ordnance, shipbuilding, and nuclear industries and which builds everything from warships to washing machines, produced and exported \$7 billion worth of goods in 1997.

The Chinese defense industry's nearly unrivaled access to supplies and its rarely challenged methods of marketing have gradually been forced to change, however, and to respond to market trends. In the 1980s, a shift in emphasis from preparation for war to preservation of peace necessitated the reorganization of the defense industry. Conversion to civilian production

mitigated the pain caused by the cuts in military spending and symbolically showed China's willingness to contribute to global peace. While data vary for different sectors, civilian goods in the late 1990s approached 80 percent of the gross output value of China's defense industry. In 1997, for example, China's defense industry claimed credit for producing 50 percent of motorcycles and 30 percent of color televisions in the domestic market. The goal is for the defense industry to be increasingly self-sustaining, efficient, and innovative. In addition, loosening state control has given defense factories flexibility in interaction with foreign business communities.

Another phenomenon of the 1990s was the formation of big-business conglomerates to link firms vertically and horizontally so that they could participate in economies of scale. One such conglomerate is the China North Industries Corporation, reported in 1997 to have more than three hundred affiliated units with fixed assets of at least \$7.5 billion.

Indigenous efforts and access to foreign know-how may enable the defense industry to close technological gaps between China and the world's other major powers. China's defense industry has been working on advanced weapons systems such as cruise missiles and satellite-positioning systems. In 1999, China successfully launched and recovered an unmanned spacecraft. As long as China's economic boom continues and the government increases the budget for military procurement, the defense industry has great potential for growth.

Challenges

The legacy of central planning has hurt the economic vitality of China's defense factories. Many defense plants have found themselves with duplicate production, oversupply, and brain drain to lucrative private enterprises. For the "third-front" defense factories, inconvenient sites and worn-out infrastructure have scared off new investors. Although defense factories have been successful in joint-venture deals with companies like Mercedes-Benz (now Daimler Chrysler), Suzuki, and McDonnell Douglas, by 1998 fewer than six hundred joint ventures had been forged, despite years of courtship.

Overall, the viability of China's defense industry relies as much on public-policy design, the political will of leaders, and military circumstances as on economic development. Problems like a bloated labor force and ever-increasing costs for technological innovation must be solved. Most important, a defense industry long accustomed to government planning must make

a difficult shift to a market mentality in consolidating and rationalizing its industrial layout and operation.

With recipients like Armenia, Iran, Pakistan, Turkey, and Brazil, China's aggressive arms-transfer policy made China the sixth largest supplier for the 1993–1997 period. Although China had a new arms-export statute in place in 1998, its nontransparent practices have occasionally violated certain international agreements and norms governing global arms transfers. Even with the 1999 structural separation of COSTIND from the military, the image of the defense industry's symbiotic association with China's military persists. This mammoth military-industrial complex poses a hindrance to the central authority. Eventual loosening of military control over the defense industry and more transparent arms-transfer procedures seem to be the main task for the healthy development of the defense industry. The detachment of COSTIND from military control was just the first step.

DEFORESTATION For millennia people have known the importance of trees. The Sumerians described in their tablets how the forest canopy shades the earth and moderates the climate. The authors of the Old Testament realized that trees were necessary for year-round springs and rivers. Plato told how forests prevented flooding and runoff, thereby preserving the earth's fertility. Today it is known that forests and their soils absorb great quantities of car-

A dirt road cuts into the rain forest in remote West Kalimantan, Indonesia, to provide access for loggers. When the land is cleared, it will be occupied by migrants from Java. (ECOSCENE/CORBIS)

bon dioxide, and that the forest canopy exudes oxygen and provides living space for a myriad of creatures.

Throughout history people have plundered forests to obtain the wood needed for construction and fuel. Until the late nineteenth century, all ships were built from hull to mast of timber. The spokes, wheels, and chassis of almost every cart, chariot, or wagon were made of wood, as were the bridges they crossed. Transportation would have been impossible without wood. Timbered beams and rafters held up ancient palaces and propped up the world's mines. Wherever trees have abounded, people invariably build their homes of wood, and wood has been used for uncountable tools and domestic items; more trees have been lost to fuel than have been lost to lumber.

When civilization first arose in Asia, so too did large-scale deforestation. Today, Asia still leads the world in the aggregate amount and percentage of forestland lost. Since the rise of the first great civilizations, the continent had a little over 15 million square kilometers of forest; today, only around 4 million square kilometers of forested land remain.

The first accounts of humanity's attack on forests come from ancient Mesopotamia, China, and India. The *Epic of Gilgamesh*, the world's first written saga, tells of Mesopotamia's founding king and his entourage stripping the mountains of their forests. Mesopotamian kings of the third millennium BCE

boast in cuneiform script preserved on clay tablets how they made paths in cedar mountains and cut its cedars with their great axes.

Likewise, deforestation dominates the founding legend of historical China. According to the ancient Chinese philosopher Mencius (c. 372–289 BCE), the legendary emperor Yao (c. twenty-fourth century BCE) felt great anguish to see the land overgrown by vegetation and crowded by swarming birds and beasts. Yao's handpicked successor, Shun, acted to rid the landscape of what had so offended his mentor. He ordered his forester, Yi, to set fire to the forests and vegetation on the mountains and in the marshes so that the birds and beasts fled away and grain could be planted. Over the centuries the mountains and plains of China underwent a similar transformation.

The policies of Mao Zedong (1893–1976), the leader of China's Communist revolution, continued the destruction of forests. His Great Leap Forward resulted in tens of thousands of villages cutting down nearby timber stands to fuel their backyard iron furnaces. A loss of over 100,000 square kilometers of forest resulted from Mao's other initiative: "Taking Grain as the Key Link." That program converted 700,000 square kilometers of forestland to agricultural uses.

The topic of forest destruction also comes up in the *Mahabharata*, the national epic of India. The ancient Aryan heroes Krishna Vasudeva and Arjuna help the

fire god devour the great Khandava Forest in northern India and make sure none of the fleeing creatures survive. They want the forest cleared so that the new kingdom they have fought for will be assured of sufficient farmland. In India's other ancient epic, the *Ramayana*, the hero Rama shows no compunction in ordering the felling of whole forests to build a great causeway for his troops to cross. Thousands of years later, the British continued the destruction of India's woodlands. Independence did nothing to ameliorate what the British had done to India's forests; in fact, deforestation accelerated. Taken together, only 20 percent of China and India's original forests remain.

The accelerated deforestation of China and India's neighbors to the east and south has more recent origins. As late as 1919, almost 70 percent of the original forests in the Philippines were intact, but as of 1989, that figure had dropped to 20 percent. Other recent deforestation flash points include eastern Myanmar (Burma), northern and northeastern Thailand, Vietnam, the state of Sarawak in eastern Malaysia, and Sumatra and East and South Kalimantan in Indonesia. This rapid loss of forests coincides with an almost twelve-fold increase in logging in the region since 1950 and the population explosion that began in the 1960s. Loggers cull hardwoods from among other trees in the forest. To gain access to these trees and to haul the logs overland for export, they build roads that allow the landless masses to enter the forests. Once there, the landless burn down what trees are left, and plant what crops they can. When that patch inevitably gives out, they move deeper into the forests and continue to slash and burn. In this fashion, more and more forested land turns barren.

Deforestation in Asia follows a world pattern. Between 1990 and 1995, the developing world has cleared 65 million hectares of forestland. Deforestation in Asia as well as in the rest of the developing world ranks along with global warming among the world's gravest environmental problems faced in the new millennium.

DEHRA DUN (2001 est. population 448,000). A city in northwestern Uttar Pradesh state, India, Dehra Dun is a popular retirement area in the Himalayan foothills, known for elite private schools and long-grain Basmati rice. It was founded in 1699 when the heretical Sikh Guru Ram Rai, driven out of the Punjab, built a temple there. During the eighteenth century it was occupied by successive invaders, culminating in the Gurkhas. At the end of the Gurkha War in 1816, it was ceded to the British.

Tea processing is the main industry, along with wheat, millet, and timber. Dehra Dun is home to the Forest Research Institute and headquarters of the Survey of India, which has produced maps of Indian cities, states, and regions since 1767. It is an important railroad on the Northern Railway. The city was once known for its exquisite climate, lush green forests, and clean environment. Building and mining have denuded the hillsides and wrought other unwelcome changes. Since 1988, however, Supreme Court rulings have sought to restore the environment, and the government plans to develop a technology center to encourage Dehra Dun's emergence as a major center for higher education, including medicine and engineering.

DEKKAN The Dekkan (or Deccan) Plateau, in Sanskrit Dakshin (meaning "south"), is a triangular plateau covering central India, at an average elevation of 450 to 600 meters, with a gentle sloping toward the east, which drains several major rivers in that direction. The northern boundary is the Vindhya range or the Narmada Valley, while to the south it reaches to the Kaveri River, the Malabar Coast, and the Coromandel Coast, tapering off in the plains of Tamil

Nadu. A more restricted use of the term Dekkan applies to the land between the Narmada and the Kistna rivers. In its broad usage Dekkan has been contrasted with Hindustan, an old term for the Indo-Gangetic Plain to the north. In the Puranas and other Sanskrit texts the region was referred to as Dakshinapathi or Dakshinatya.

Between the mid-fourteenth and the late-seventeenth centuries, six Indo-Islamic sultanates were established in several parts of the region, each evolving a distinctive art style and culture, and all known collectively as the Deccan Sultanates. Otherwise the Dekkan has historically been a Hindu preserve for the most part. Today the region encompasses most of the states of Maharashtra, Madhya Pradesh, Andhra Pradesh, Chhattisgarh, and Karnataka. Three major inland cities are Hyderabad, Pune, and Bangalore; and the main agricultural produce includes cotton, sugarcane, and food grains.

DELHI UNION TERRITORY (2002 est. pop. 14 million). India's third-largest city (after Calcutta and Mumbai) and a union territory, Delhi has served as the capital of various regimes for over ten centuries. Jawaharlal Nehru (1889–1964), India's first prime minister after achieving independence, called it "the symbol of old India and new." The union territory (federal district) includes the area known as Old Delhi, the population center, with many mosques, museums, and forts, and New Delhi, built as the imperial capital by the British, with wide avenues, many embassies, government buildings, and research centers. The population of the city of Delhi (Old and New) was approximately 10 million in 2002.

Situated in north-central India at the intersection of the route from the Khyber Pass to the Ganges-Yamuna valley, the Aravalli hills, and the south-flowing Yamuna River, Delhi has always been a transportation, trade, and communications center. It was the central place for regimes aspiring to hold the Punjab, Afghanistan, Rajasthan, and the Gangetic plains east of the Yamuna. The area survived much rebuilding and much devastation. The earliest settlement Indraprastha (est. 1400 BCE) is featured in the epic poem *Mahabharata*, though none of its archaeological remains have been found. From the twelfth to

HUMAYUN'S TOMB— WORLD HERITAGE SITE

Humayun's Tomb—the Mughal empire's first garden tomb and precursor to the Taj Mahal—was designated a UNESCO World Heritage Site in 1993 for the profound effect its beautiful geometric style had on Mughal architecture.

the fourteenth century CE, royal enclaves were located ten miles west of the river. Rainwater tanks were then supplemented by elaborate canals. The Tomar Rajputs built Lal Kot, the core of the first of Delhi's eight successive cities, in 736. Qutb-ud-Din-Aibak made Delhi his capital in 1206 and built the Quwwat ul Islam mosque and the towering Qutb Minar. After the sack of Baghdad in 1258, Delhi's court and *madrasabs* (Islamic seminaries) made it the most important cultural center of the Muslim east.

Allaudin Khilji established Siri, the second city, in 1304. The third Delhi was Tughlagabad (1321); the fourth, Jahanpanah (1325); the fifth, Firozabad, was famous for its Ashokan pillar; and Purana Qila was the sixth. Shajahanabad was the seventh Delhi, serving as the Mughal capital from 1639 to 1771, when Hindu Maratha princes held it off and on until 1803—after which time Delhi came under British rule. The Red Fort remains as a reminder of the Mughal period. The writings of Delhi's Persian and Urdu poets from the fourteenth to the nineteenth century—Amir Khusrau, Mir, Ghalib—became widely known.

Delhi was a center of the Indian Mutiny. In 1857 revolting Indian soldiers (sepoys) seized Delhi for several months where fighting ensued between the British army and mutineers. The imperial capital New Delhi was completed by 1931. Delhi became a union territory in 1956. With twenty-five daily newspapers and 125 weeklies, Delhi continues to be both daunting and alluring, an intellectual and tourist center as well as a political and administrative one. Besides its stunning architectural backdrop and overall scale, attractions include Delhi University; Delhi Zoo; many religious celebrations and secular festivals; and the National Museum, with paintings, sculptures, manuscripts, weapons, jewelry, pottery, and relics dating back four thousand years.

DEMIREL, SULEYMAN (b. 1924), Turkish political leader. Suleyman Demirel is a major political figure in contemporary Turkey. He was born in a modest peasant family in the village of Islamkoy, located in the Isparta province of central Anatolia. Benefiting from government scholarships, he obtained a degree in civil engineering from Istanbul Technical University in 1949 and went to the United States for further study on a Eisenhower Exchange Fellowship. In return for the scholarships, Demirel completed his obligatory service in the Turkish State Statistical Institute and the State Hydraulic Works. The prime minister, Adnan Menderes (1899–1961), appointed him the director-general of the State Hydraulic Works, in 1955, when Demirel was thirty-one.

After the 1960 military coup, he joined the newly founded Adalet Partisi (Justice Party). In 1964 following the death of the party's first chairman Ragip Gumuspalala (1897–1964), Demirel was elected chairman, and he held this post until the dissolution of the party in 1980, when all political parties were dissolved following another military coup. His first cabinet post was as the deputy prime minister in the 1965 cabinet of Prime Minister Suat Hayri Urganlı (1903–1981). Following the victory of the Justice Party in the 1965 general elections, he was appointed the prime minister at the age of thirty-nine. He held the post for seven different terms, from October 1965 to April 1993.

Demirel was largely blamed for the unstable political coalitions of the Turkish government during his tenure as prime minister in the 1970s, which pushed Turkey into economic crises and urban violence. His reign was interrupted by military intervention in 1971 and again in 1980. Following the 1980 coup, he was banned from politics together with other political leaders of the pre-1980 era. He returned to active politics as the chairman of the Dogru Yol Partisi (True Path Party) after a 1987 referendum, which removed the political ban. His party won 27 percent of the popular vote in the 1991 general elections, and Demirel was appointed the prime minister for a seventh time.

In 1993, after the death of President Turgut Ozal (1927–1993), Demirel was elected as the ninth president of the Turkish Republic. His term of office ended

in May 2000. During his presidency, he played a pivotal role as an arbiter between the army and the politicians, especially through the Refah Partisi (Welfare Party) crisis.

DEMOCRAT PARTY—TURKEY The Democrat Party (Demokrat Parti; DP) was the first party in Turkey to challenge successfully the rule of the Republican People's Party (RPP). The DP ruled the nation from May 1950 to May 1960, when it was overthrown and shut down by the Turkish military.

During the single-party period of the RPP (1923–1945), some members of the RPP increasingly opposed a political system that was seen as inflexible, unresponsive to the people, and undemocratic; they also opposed the power of the party leader, Ismet Inonu. In late 1945 Celal Bayar (1884–1987), Adnan Menderes (1899–1961), Fuat Koprulu (1890–1966), and Refik Koraltan (1889–1974) were expelled from the RPP for criticizing the leadership and calling for changes. In May 1946 the four joined to form the DP. As the new party's leaders recruited members and began to set up a national organization, the party immediately attracted widespread support from businesspeople, merchants, and manufacturers, among others. Despite calls to boycott early elections set for 1946, the DP issued a platform supporting a program of liberalism, including lowering taxes, shrinking the public sector in favor of private enterprise, having less state control of cultural matters, and showing greater respect for Islam. In 1946 the DP gained 65 of the 465 seats in the Turkish Grand National Assembly (the RPP won 390 seats), where members continued to demand reform of the electoral system.

In 1950 the Democrat Party won 53 percent of the vote and took control of the National Assembly. President Bayar named Menderes prime minister. During the 1950s the DP encouraged growth of the private sector and development of agriculture, as well as close relations with the United States. In 1954 and again in 1957, the DP was returned to power. By the end of the 1950s, however, the party's popularity was wan-

ing, and Menderes began to adopt more authoritarian policies in a bid to retain power. In May 1960 a group of officers overthrew the DP government. The DP was shut down, and Bayar and Menderes were both tried for charges ranging from corruption to crimes against the nation. Menderes was convicted and executed; Bayar served six years in prison. The DP's agenda was adopted by the Justice Party, which held power in the late 1960s and 1970s.

DEMOCRATIC SOCIALIST PARTY—JAPAN In 1960 the right wing of the Japan Socialist Party (JSP) split off, and the Democratic Socialist Party (DSP) was formed. Three issues divided the left and right wings of the JSP. One was the far-left faction's continued adherence to the goals and tactics of Marxism, such as the elimination of capitalism and the establishment of a workers' state by means of violent revolution. The second issue was the right's support for the existence of the Japanese military (the Self-Defense Force), and the third was its interest in an expanded security role for Japan in international affairs by being a more active partner with the United States and by taking a more visible role in international organizations.

The DSP moved away from doctrinaire socialism and toward centrism, accepting private enterprise instead of public ownership of the means of production and emphasizing welfare issues. It saw its role primarily as a coalition partner with other moderate parties such as the Clean Government Party. The DSP drew support from labor and in particular the federation of unions representing industrial and trade workers mostly from the private sector.

In several elections, the DSP tried to present itself to voters as an alternative to the Liberal Democratic Party. The strategy worked in that LDP losses translated into DSP gains and vice versa. In the party realignments of the 1990s, the DSP was unable to make headway. Smaller parties were joining with each other to form new parties and the DSP was no exception. In 1993, the party disbanded and its members joined the New Frontier Party.

DEMOCRATIZATION—SOUTH KOREA

South Korea's movement from authoritarian rule toward a more democratic form of government has been a record of irregular progress since the nation developed political independence in 1948. The movement toward democracy has been interrupted by the involvement of high-ranking military officers who have seized power in times of crisis, but a central group of opposition candidates have, over time, led the nation from authoritarian rule to a more democratic system.

Korea's First Elections

Korea's first elections were held in 1948. In that year, United Nations-sponsored elections were to be held in all of Korea, but the election was not permitted to be carried out in the Soviet-controlled north. The election, held in the U.S.-controlled south, chose a National Assembly that wrote a constitution and appointed Korea's first president, Yi Seung-man, known in the West as Syngman Rhee (1875–1965). While the president was indirectly chosen in this first election, he governed, according to the constitution, at the will of the National Assembly. When the Assembly sought to remove Rhee from office in 1952, however, he declared martial law and forced into effect a revision to the constitution that called for direct election of the president.

Rhee was elected by popular vote in 1952, and in 1954 the constitution was revised to permit him to run for an unlimited number of terms. He was reelected in 1956 (after his opponent died of a heart attack ten days before the election) and again in 1960 (when another opponent died just before the election); however, because of widespread suspicion over balloting, Rhee resigned, and a new constitution, placing executive power in the hands of a prime minister, was drafted. In July 1960, Chang Myon (John Myon Chang) was chosen as the prime minister of the Second Republic.

Political Difficulties in the 1960s and 1970s

Economic difficulties in 1960 led to political difficulties for the new regime, and in May 1961 General Park Chung Hee (1917–1979) seized power in a coup organized by Colonel Kim Jong-pil (b. 1926). A new constitution approved in late 1962 returned power to the president (who was to be elected by popular vote) and diminished the power of the National Assembly.

Park left the military to seek election in 1963 and was elected that year and subsequently reelected in 1967 and 1971. In the 1971 election, Park was nearly defeated by the opposition leader Kim Dae Jung (b. 1925), who received 45 percent of the vote. Kim Dae Jung lost votes to another opposition candidate, Kim Young-sam (b. 1927). President Park named Kim Jong-pil as his prime minister.

President Park subsequently declared martial law in South Korea and in October 1972 instituted the Yushin (Revitalization) constitution, which provided for election of the president through an electoral college, ending direct election of the president.

During this period of martial law, Kim Dae Jung was in Japan; in 1973, he was kidnapped from a Tokyo hotel by agents of the South Korean government and smuggled back to South Korea, where he was placed under house arrest. He was arrested for subversive activities in 1976 and sentenced to five years in prison but was released in 1978 for health reasons.

President Park was elected by an electoral college in 1978 for a six-year term, but was assassinated by the head of his own Korea Central Intelligence Agency in 1979. In accordance with the Korean constitution, Prime Minister Choe Kyu-ha (b. 1919) became acting president and declared martial law. Within a few days, President Choe began the release of political prisoners (including Kim Dae Jung) from house arrest and prison and subsequently pardoned hundreds.

Political Repression in the 1980s and the Beginning of Democracy

The officer in charge of the investigation of Park's assassination, Lieutenant General Chun Doo Hwan (b. 1931), began to consolidate his power within the military and seized power from Choe in May 1980; Choe retained his position as president, but Chun held actual power, leading to massive protests in the city of Kwangju. Chun authorized the use of the military to put down the riots and retake control of the city. Hundreds of citizens were killed in the fighting, and Kim Dae Jung was arrested and sentenced to death as a protest leader (his sentence was later commuted to twenty years, and he was released in exile to the United States). Chun rose to four-star rank, retired from the military, and was named president by the electoral college in August 1980.

Under a new constitution, President Chun was reelected to a single seven-year term in February 1981. Kim Young-sam, was placed under house arrest for two years. Kim Dae Jung returned to Korea in 1985 and was placed under house arrest with his civil rights

suspended. As this political repression was taking place, South Korea hosted the 1986 Asian Games and prepared for the 1988 Olympic Games.

South Korea's democratization is often said to have started with the election of President Roh Tae Woo (b. 1932) in 1987. A new constitution that year provided for the first direct election of a president since 1971, the others having been conducted with an electoral college similar to that in the United States. However, Roh was a former army general, a classmate of Chun Doo Hwan at the Korean Military Academy, class of 1955, and had been in charge of the military forces that had put down the protests in Kwangju in 1980.

The 1987 electoral campaign was hotly contested, and the primary opposition candidate, Kim Young-sam, led in some polls late in the campaign. In what was claimed to be an act of good will, President Chun restored Kim Dae Jung's civil rights late in the campaign. Kim Dae Jung declared himself a candidate for the election, which split the opposition vote between himself, Kim Young-sam, and Kim Jong-pil. This division of the opposition vote allowed Roh to win the election with 8.2 million votes. Kim Young-sam received 6.3 million, while Kim Dae Jung received 6.11 million. Once again, a former general had come to power, although this time by more democratic means. During Roh's administration, his former political rival Kim Young-sam brought his political party into a coalition with Roh's.

South Korea's Government in the 1990s

In 1992, South Korea elected its first president since Syngman Rhee who had not been in the military, and Kim Young-sam won with 42 percent of the

vote. Kim's main competitors were Kim Dae Jung, who received 34 percent of the vote, and Chung Ju-young, the founder of the Hyundai Group, an industrial conglomerate. President Kim initiated a campaign against corruption in government, asserting that no official should profit from his or her position. To this end, in 1995, the former presidents Chun and Roh were tried and convicted of mutiny, treason, and corruption. Chun was sentenced to death (later reduced to life in prison) and Roh to twenty-two years in prison (later reduced to seventeen years).

In the national elections of 1997, Kim Dae Jung was elected president, winning over 40 percent of the popular vote. Kim's popularity was based largely on his continued role in opposition to past administrations, despite accusations of his being pro-North Korea. One of his first actions was to pardon the former presidents Chun and Roh, who were present at his inauguration.

Kim Dae Jung held a summit meeting with North Korea's leader, Kim Jong Il (b. 1941) in June 2000, the first summit ever between the leaders of North and South Korea, and reestablished cross-border family reunions. Advances in public welfare, human rights, and the economy were primary goals of his administration. However, he has been criticized for his government's hard line on labor issues.

DENG XIAOPING (1904–1997), leader of the Chinese Communist Party. Deng Xiaoping, head of the Chinese Communist Party (CCP) during the 1980s, survived the purges of the Cultural Revolution of 1966–1976 to assume the party leadership. The eldest son of a prosperous landlord, he was born on 22 August 1904 in Paifang Village, Sichuan Province. Like many of his contemporaries, Deng went to France through the work-study program, where he became involved with what would be the future leadership of the CCP. Following his time in France, Deng went to Moscow, where he trained as a political activist and organizer. After working briefly as Communist Party organizer in Southwest China, Deng moved to the Kiangsi Soviet to be with party leader Mao Zedong (1893–1976). From 1938 to 1952, Deng served in the forerunner of what would later be the People's Liberation Army, where he led forces against

A billboard in Shenzhen features Deng Xiaoping and reads: "Uphold the party's fundamental line—we will not waver in a hundred years." (EYE UBIQUITOUS/CORBIS)

the Japanese and later against nationalist forces during the Chinese civil war.

Following the Chinese civil war, Deng's loyalty to the CCP was rewarded when he was named vice premier. Deng primarily worked in the ministry of finance, where he would formulate economic policy. He later was appointed to the Politburo, where he eventually became general secretary. He held that post until 1966, when he was denounced for his opposition to Mao's Socialist Education Movement (1962–1965) and removed from his post by Mao, Lin Bao, and Chen Boda. In 1973 Deng was rehabilitated and returned to office. In 1975 he once again was denounced and removed from office, this time by the Gang of Four, a group of radical leaders who sought to seize control of the CCP. Following Mao's death and the arrest of the Gang of Four, Deng again assumed the mantle of leadership within the Communist Party and maintained this position until his death on 19 February 1997.

DENKI ROREN Denki Roren, or the Japanese Federation of Electric Machine Workers' Unions, was the sector-level labor-union federation for Japan's workers in the electrical machinery, electrical appliance, and electronics industries between its May 1953 formation and its July 1992 conversion into Denki Rengo (Japanese Electrical, Electronic, and Information Union).

Formed out of remnant enterprise unions in the electrical sector following the late 1940s purge of Communists and other militant elements, Denki Roren pursued a "neutral" brand of unionism that steered clear of the political rivalry between Sohyo (General Council of Trade Unions of Japan) and Domei Japanese Confederation of Labor) and was the leading industrial federation in Churitsu Roren, or the Federation of Independent Unions (formed September 1956). While actively participating in Sohyo's annual wage offensive (*shunto*) and sharing with Sohyo

support of "unarmed neutralism" in foreign policy, Denki Roren simultaneously championed an enterprise-oriented cooperative approach to labor-management relations that overlapped with that of Domei unions and the International Metalworkers Federation Japan Council (IMF-JC), in which it took an active part. It was thus quite fitting that when the Japanese labor movement began to move toward consolidation during the late 1970s, Denki Roren was at the forefront of the efforts to merge Sohyo and Domei, and that Denki Roren's president, Tateyama Toshifumi, was selected as the Rengo's first president in 1987.

DEPARTMENT STORES—EAST ASIA In East Asia, department stores are more than just glittering showplaces for merchandise. They have reflected and helped propel urban development, the growing middle classes, and the transition to consumer lifestyles. Pivotal in the transition to a Westernized and internationalized lifestyle, East Asian department stores have introduced foreign goods, customs, and holidays. Conversely, they have also helped preserve traditional customs and activities. They have mediated historic transitions, addressing issues these changes have brought for consumers. Further, they have provided education and entertainment and have been primary promoters of art and culture.

Japan

Japan's department stores boast a four-hundred-year history. These stores stem from two traditions. The older historic tradition is the development of department stores from *gofukuya*, clothing and drapery stores, which originated as large merchant houses during the Edo or Tokugawa period (1600/1603–1868). These accompanied the rise of Japan's early cities and the new middle classes that emerged from the formerly lowly ranks of artisans and merchants. Early in the twentieth century, some decades after Japan opened to the outside world, these stores expanded into *byakkaten*, "one-hundred-things stores," or department stores. The second tradition for the development of department stores in Japan is with railroad companies, which built department stores at stations at urban intersections and in outlying suburban areas as railroads became prominent in commuting within

Ornate light fixtures in Lotte department store in Seoul, South Korea, in 1998. (CATHERINE KARNOW/CORBIS)

cities and in connecting cities to the outlying areas where many urban employees lived. These stores were called *tetsudo depaato* ("railroad department stores"). Over time both types of department stores came to be referred to as either *hyakkaten* or *depaato*. *Depaato* is more common in colloquial speech, while *hyakkaten* is used more in official store titles.

Japanese department stores played a major role in introducing the West to Japan. One of the earliest department stores, Mitsukoshi, established ties to British stores and British royalty while also promoting American connections. Department stores brought in Western goods and taught people how to use them. Specialized employees taught the Japanese how to put on Western-style clothing with buttons, which were very unfamiliar to a populace who daily wore kimonos wrapped or tied into place. Department stores also promoted foreign holidays, such as Christmas, Valentine's Day, Mother's Day, and Father's Day. After a fire at the Mitsukoshi department store in Tokyo, several shoes went missing in the rush to exit the store, and the store began requiring its employees and customers to wear shoes in the store, ending the previous Japanese business custom of removing outside footwear and wearing slippers in shops. Several kimono-clad women died in another fire at the Shirokiya department store because they would neither jump nor slide down chutes for fear their clothing might become

disarrayed and embarrassingly revealing. The store joined the Tokyo municipal fire department in promoting the adoption of Western-style underpants so both lives and honor could be saved in a fire.

Japanese department stores proffered entertainment with concerts, craft fairs, and recreational facilities inside stores and on rooftops. They offered education in the form of seminars, health and medical guidance for new parents, and in-store science fairs and educational contests for children. Typically, such seminars and other free information services did not involve the expectation that customers would buy anything on that occasion, but were geared toward developing loyal patronage through an ongoing relationship with the store. Stores also sent educational specialists into schools. Tokyo's Seibu department store started a "community college" (requiring course fees) with over four hundred course offerings, a major innovation in personal-interest education in Japan. Most department stores have exhibit and gallery spaces for art and folk craft displays. Isetan and Seibu department stores inaugurated legally designated museums of art within their stores. These museums, galleries, and exhibit halls have been pivotal in circulating Japanese and foreign art. In the last few decades of the twentieth century in Japan more international art circulated through department store museums than through government and private museums. These

stores also responded to Japanese nostalgia for lost Japan by sponsoring Japanese traditional crafts and hosting calendrical festivals associated with a rural agrarian past.

South Korea

Department stores in the Republic of Korea (South Korea) have also been pivotal in introducing foreign culture by popularizing Western customs and trends from Japan. Seoul department stores became focal arenas of fashion couture, while department stores in other areas disseminated these new trends to smaller cities. In Seoul the rise of a middle-class consciousness was strongly associated with frequenting the city's glistening new department stores as opposed to shopping in traditional market districts like Namdaemun (South Market) or Tongdaemun (East Market). Among status-oriented female consumers, shopping for daily family goods at department stores rather than at open markets became a sign of rising family status.

South Korean department stores have hosted entertainment and educational offerings within stores and in addition have established other amusement centers. The department store conglomerate Lotte built the entertainment theme park Lotte World, an amusement park similar to Disneyland in concept but featuring Lotte's own characters, in a Lotte department store on the outskirts of Seoul.

China

Chinese department stores also mirror historical changes, further development of urban centers, and the rising middle class. The immense early-twentieth-century entrepreneurial development in China's main cities was reflected in the rise of department stores. Shanghai in particular became a major industrial and commercial center after the end of the Sino-Japanese war in 1895. Nanjing Road, Shanghai's version of New York's Fifth Avenue, saw the birth of glamorous department stores that offered the increasing numbers of middle-class customers a different shopping experience from traditional shops and markets. Along with the visible array of a wide spectrum of goods, fixed prices, and extensive services, these Chinese department stores provided rooftop tea gardens, music recitals, and dancing parties. Sincere department store had an attached hotel, showing that a trip to Shanghai for shopping had itself become a vacation objective. Chinese department stores mediated the transition to Westernization and modernization, tutoring customers on issues of style and essentials of modern life. As in Japan, department stores were linked to the development of railroads and

involved a reinterpretation of the merchant classes. Whereas traditionally merchants had been seen as unproductive to society, merchants were increasingly seen as entrepreneurs whose economic activity could be advantageous to society, partly because of the rising prominence of department stores.

Regional Trends

East Asian department stores have influenced women's employment and domestic roles. In 1900 Sincere department store caused a sensation with the opening of a Hong Kong branch with female shop clerks; previously women were employed only in family shops. Due to the public outcry over this public employment of women at that time, these women were laid off, but by the late 1930s female sales clerks were an accepted part of Chinese department stores. In Japan, even before the Equal Employment Opportunity Law of 1985, department stores promoted more women to managerial positions than did other private or government concerns because the overwhelming proportion of both department-store employees and walk-in customers were women.

Another trend has involved the establishment of large Japanese and Chinese retailing concerns in Europe, North America, and Australia. Some of these stores, such as Yaohan, were considered extended supermarkets in their home countries but have been perceived as department stores in the foreign context. These stores primarily cater to Asian customers abroad and to Asian-descent populations, but they also appeal to non-Asian Westerners. Where East Asian department stores have long introduced Western goods and culture to Asian countries, now the reverse is also true. Stores originate in East Asia, and they transmit food, styles, fashions, culture, and trends from their Asian countries of origin to the Western countries where they do business, thereby acting as mediators between culture and consumption.

DEV, NANAK GURU (1469–1539), founder of Sikhism. Nanak Dev, who laid the foundation of Sikhism, endeavored to synthesize both Hinduism and Islam in the new religion and combat social inequality. Born in the village of Talwandi in western Punjab to Kalyan Das Meheta and Tripta Mahal, Nanak was attracted to spiritualism from childhood and contributed monetarily to charitable works. His marriage at the age of eighteen to Sulakhani Devi did not deter him from spiritual pursuits, and he traveled throughout India and even to Mecca, Medina, Tibet, and Sri Lanka.

Nanak rejected the prevailing social system based on caste and class. Identifying with the downtrodden, he declared, "I am lowliest of the low." He was also averse to rituals and idol worship. Holding woman in high esteem, he asked, "Why denounce her form [of] whom even kings and great men are born?" One of the important aspects of Nanak's teaching was monotheism, and to him God was timeless and everlasting. He advocated an honest livelihood and shared earnings. His simple and universal message had widespread appeal. Nanak's followers were known as Sikhs, and after his death in 1539, Sikhism became an important religion.

DEVELOPMENT ZONES—CHINA The creation of development zones in China since 1984 marked the intensification of an open-door policy and

a wider engagement of China with the outside world. By 1988 China had designated fourteen development zones: Dalian, Qinhuangdao, Ningbo, Qingdao, Yantai, Zhanjiang, Guangzhou, Tianjin, Nantong, Lianyungang, Fuzhou, Minxing, Hongqiao, and Caohejing. These development zones were located in close proximity to coastal cities and placed major emphasis on export processing, technology development, and foreign investment. With tax incentives and preferential policies, development zones function as new growth poles of the economy. This in turn results in their quick development and diversification.

Concept and Characteristics of Development Zones

The idea of development zones did not originate in China. Development zones became popular following World War II in such forms as free ports, free trade zones, export-processing zones, science and industry parks, and border trade zones. China modeled its own development zones on this international experience, treating them as new means to open China to the outside world. It aimed to create an attractive business and investment environment to encourage foreign investment, joint ventures, and technology development and transfer and to learn advanced management skills.

China's development zones are similar in many respects to special economic zones (SEZs) but they have some distinct features. First, SEZs are relatively independent in administration; their administrative rank is equivalent to that of a province. Development zones, by contrast, are managed by local governments through a development zone committee. Second, SEZs are encouraged to develop into a cross-sector comprehensive economic structure; development zones focus on export-led industry and technology or other special sectors. Third, all types of investment enjoy tax incentives in SEZs, while development zones are only intended to offer tax incentives for investment in industry and technology or in other designated sectors.

Development zones have advantageous locations. Economic and technological development zones and tax-free zones are normally located in coastal cities and ports. Border cooperative zones are located in inland border trade areas. High-tech development zones are located in large or medium-size cities across the country. In short, they have easy access to transport networks. They are often in or close to areas with well-developed industrial foundations or an advanced economy. Development zones are provided modern infrastructure and high standard services.

History of China's Development Zones

In 1983 China opened up fourteen coastal cities to the outside world, and in late 1984 and early 1985, the government designated eleven development zones in eleven coastal cities. Shanghai was approved to establish two development zones in 1986 and a further one in 1988. The main work during this initial period (1984–1988) included: (1) the establishment of an administrative committee to oversee the development zones, as well as the establishment of the Economic and Technological Development Corporation; (2) the planning of the development zones; (3) the preparation and creation of regulations and policies relating to the development zones; and (4) the construction of physical infrastructure.

The forms of development zones have been diversified since 1988. The first high-tech development zone was established in Beijing in 1988, and tax-free zones were created in 1990. Development zones have received unprecedented rapid development since 1992, when paramount leader Deng Xiaoping (1904–1997) toured south China and called for further opening up of China's economy. After that, even small cities, counties, and townships began to create their own development zones.

Achievements and Problems of the Development Zones

Although development zones only account for 0.004 percent of China's land, they account for about 10 percent of the total national foreign investment. More than two hundred giant international corporations have invested in China's development zones, which are particularly effective in advancing technology development and in facilitating national economic restructuring. In most of the development zones, more than 60 percent of the industrial projects are high-tech or new technology projects.

Development zones have created extremely rapid growth and high productivity. The gross industrial product in the first thirteen development zones increased about 450 times within ten years and had grown to 135 billion yuan (China's currency) in 1996. The per capita productivity in Minxing, Tianjin, Dalian, Hongqiao, Beijing, and Kunshan exceeded 200,000 yuan in 1996; Minxing, in particular, recorded a high of 419,000 yuan. Problems include a lack of strategic coordination and effective control in the development of development zones. For example, 1992 saw the sudden creation of more than two thousand new development zones, which were more than twenty times the total number created before 1992. Among

these, only 1.1 percent were approved by state, province, or city governments. Counties, small cities, and townships were also striving to establish development zones. This led to uncontrolled expansion of such zones to occupy 33.34 billion square meters of land, of which 80 percent was arable land. This resulted in the wasteful use of land resources and the abuse of preferential policies by local authorities.

The Future

After more than two decades of open-door policies, China is turning its attention to establishing a fair competition environment throughout the country. This will result in the gradual reduction and eventual abolition of tax incentives and preferential policies enjoyed by development zones.

DEVI, PHOOLAN (1964?–2001), Indian political figure. In contemporary India, Phoolan Devi's name is intimately connected to the country's history of caste and class animosities. Born in a north Indian village, Devi grew up amid extreme poverty. At a young age, she was abducted, repeatedly assaulted, and raped. Although a great deal of controversy surrounds the exact details of her early life, it is generally believed that she reacted to her harrowing upbringing by participating in the "Valentine's Day Massacre" in 1981, in which twenty people of an upper caste background were killed. After leading life as a bandit for three years, she surrendered in 1983, and was incarcerated for the next eleven years.

Following the release of her biography by Mala Sen in 1991 and the film *Bandit Queen*, directed by Shekhar Kapoor and released in 1994, Phoolan Devi became a well-known public figure. She was released from prison in 1994 and subsequently went on to become a successful politician. With support from lower caste

groups and women, she was elected twice to the Indian parliament. In 1995 she converted to Buddhism, an act viewed by many as a political move. In July 2001 she was shot dead by unidentified assailants outside her Delhi home on her way back from Parliament.

DEVIL DANCING. See **Possession**.

DHAKA (2002 est. pop. 8.5 million). Located in central Bangladesh, Dhaka (formerly Dacca) lies on an alluvial terrace above the northern bank of the Buriganga River, which offers access to several of the major regional rivers, including the Brahmaputra, the Meghna, and the Padma. Dhaka's early history is linked to the prominence of the nearby administrative urban center of Sonargaon, which lay to the east along the Buriganga. Dhaka grew as a result of the commercial and political prominence of Sonargaon from the late thirteenth to the sixteenth centuries, as indicated by the names of neighborhoods in the old town,

which point to a pre-Mughal Hindu presence there. The old town is bounded by the Dulai River, a waterway coming from the north and curving eastward as it joins the Buriganga.

In 1610, the Mughal governor Islam Khan (ruled 1608–1613) chose Dhaka as the regional capital. He built an artificial canal joining the Dulai to the Buriganga, thus forming a western boundary for the old town. The Mughals expanded Dhaka to the west and north along the Buriganga, building two large forts and several major mosques. Dhaka was the center of the eastern Mughal empire, hosting diplomatic and commercial visitors from around the globe, including Sebastian Manrique, Jean Baptiste Tavernier, and Thomas Bowrey, each of whom published an account of his visit. During the late seventeenth and early eighteenth centuries, the Mughals allowed Europeans to build factories along the river; these structures were still extant when James Rennell's *Bengal Atlas* was published in 1780. An Armenian community grew in the old town, and the Portuguese built a small church and community in the northern suburb of Tejgaon. Dhaka remained the regional capital until 1717, when the Mughal prince Azim Shah (1697–1712) shifted the capital to Murshidabad.

During the eighteenth century, Dhaka's population and urban infrastructure declined; paintings of the city emphasize its decay, as evidenced by Charles D'Oyly's *Antiquities of Dacca* series, done between 1814 and 1827. In the nineteenth century, the British East In-

A crowded ferryboat in Dhaka in 1996. (TIZIANA AND GIANNI BALDIZZONE/CORBIS)

dia Company built the residential area of Wari in the old town and cleared Ramna Park to the north. Between 1905 and 1911, Dhaka was the capital of the short-lived province of East Bengal and Assam. After Independence and the partition of British India into Pakistan and India in 1947, Dhaka served as the capital of the East Pakistan province. In 1971, a bloody civil war led to the creation of the independent state of Bangladesh, with Dhaka as its capital. The American architect Louis Kahn (1901–1974) designed its striking parliament building (completed 1974). Dhaka has preserved its pre-Mughal, Mughal, and European histories in its contemporary urban fabric.

DHAMMAYUT SECT Founded by King Mongkut (1804–1868) of Siam during his twenty-six years of monkhood, the Dhammayut sect (Thammayut or Dhammayuttikanikaya, those attached to the dharma, or Buddhist teachings/doctrines) is distinguished from the other order of Theravada Buddhism in Thailand: Mahanikaya (the great congregation). Both sects cooperate in some ways and for some rituals and are united in Thailand under the nationwide Council of Elders, or Sangha Supreme Council. While the laity rarely pay attention to the differences between the two sects, each sect has its own rituals and emphases, and the Dhammayut sect is known for its greater orthodoxy and closer relationship with royalty and the aristocracy.

After Mongkut was ordained in 1824, he became the principal religious figure in Siam at the time. Studying the Pali (the language of the Theravada Buddhist canon) scriptures and the strict discipline of Monks, he became convinced that Siamese Buddhism had gone astray and came to demand from his followers more serious study of Pali and the Vinaya (the Buddhist scriptures pertaining to monastic rules) and more dedication to and proficiency in meditation. He sought to put aside superstitions and tried to discern the most accurate pronunciation of Pali, demanding monks learn this. He also insisted that laypeople perform tasks such as cleaning, robe-washing, and distributing monk's food so the monks could adhere more strictly to their discipline. The most visible sign of the difference in Mongkut's order at its founding was the

style in which monks wore their robes. At the founding of the order, Mongkut insisted that the robes cover both shoulders, allowing the right arm freedom. (Later, when he became king, Mongkut would allow monks to choose for themselves what style of robe they preferred.) Other changes in monastic practice included ordination rituals, daily routines, and observance of different religious days. When Mongkut left Wat Bowonniwet, the center of the sect, in April to be crowned king in May 1851, he vowed to support both Dhammayut and Mahanikaya.

During the reign of Mongkut's son Chulalongkorn (1853–1910; reigned 1868–1910), Prince Vajiravudh (1881–1925), who was another of Mongkut's sons and a half brother of Chulalongkorn, led the Dhammayut sect to a period of particular influence. Prince Vajiravudh eventually headed the entire *sangha*. Chulalongkorn unified Siamese Buddhists into a national organization, and monks throughout the country helped determine its policies and programs. While originally the Dhammayut sect made up an elite group, the demand for rigor and study led to standardization of discipline, education, and rituals throughout the country. A standard monastic curriculum was established and a state-sponsored Buddhist nationalism arose without the diversity found previously in customs, practices, and emphases. In 1864 a Khmer monk who had studied in Siam brought the sect to Cambodia, leading to a similar division between Mahanikaya and Dhammayuttikanikaya devotees in that country.

DIKIR BARAT *Dikir barat* is a form of popular Islamic-oriented musical entertainment particularly associated with the northern Malaysian state of Kelantan. It may be derived from the Arabic *zikir*, which generally refers to a form of Islamic chanting in which the various names of Allah are repeated, leading the

reciter into a state of trance. In Malaysia, however, this practice has evolved into a popular form of poetic debate, *dikir barat*. Originating among the Malays of the northern state of Kelantan, it is usually sung by teams in a responsorial (solo-chorus) fashion.

A team consists of a chorus (*awok-awok*) of ten to fifteen singers, who sit cross-legged on the floor and sing in unison; a lead singer (*tok juara*); and a second solo singer (*tukang karut*), who spontaneously creates and sings lyrics. The *tok juara* begins the performance by chanting a *pantun* (four-line quatrain of Malay origin) in free rhythm, while the chorus repeats a fixed verse, interjecting syncopated shouts, clapping their hands, and making dancelike movements with their hands, arms, and upper torsos. The *tok juara* and chorus alternate until the final chorus, when the *tukang karut* takes the lead, spontaneously creating new lines of text and singing in a responsorial style with the chorus.

The vocalists are accompanied by a small ensemble of frame drums (*rebana*), a bossed gong (*tetawak*), a pair of small knobbed gongs suspended over a wooden resonator (*canang*), and maracas. The *rebana* and maracas establish a recurring rhythmic pattern, while the *tetawak* and *canang* mark larger two- or four-beat units.

Contemporary *dikir barat* texts often have heavy religious or political content. Competitions are common, and performances are frequently broadcast on television to increase public awareness of social issues. Originally performed only by male vocalists, female *dikir barat* choruses have become popular.

DILI (1999 pop. 250,000). Dili is the largest town and capital of East Timor, with a premier seaport located on the northern coast of the island of Timor on Ombai Strait. Dili was once the capital of Portuguese Timor where Portuguese traders arrived as early as 1512. The population is mostly Timorese and Atonese with minorities of Eurasians and Arab Muslims. The importance of Dili as a trading post has been in decline since the 1920s, as the sandalwood trade declined and Portugal fell into depression. Dili's modest prosperity is derived from the production and export of coffee.

An East Timorese woman and her child stand in front of a destroyed home in Dili in October 1999. (REUTERS NEWMEDIA INC./CORBIS)

After the end of the dictatorship in Portugal and fighting in East Timor between groups favoring integration with Indonesia and proindependence groups, the last Portuguese soldiers left Dili in 1975. With Indonesia's invasion and East Timor's formal integration into Indonesia on 17 July 1976, Dili became the capital of Indonesia's twenty-seventh province. After the announcement of the United Nations-sponsored public consultation on the future of East Timor in September 1999, Dili was rampaged and destroyed by pro-Indonesian militia forces, and most of its inhabitants fled. Since 1999, Dili has been rebuilt and as of 2001 is the administrative center of an independent East Timor.

DILI MASSACRE The Dili Massacre, also known as the Santa Cruz Massacre, took place on 12 November 1991 in East Timor. This event became a turning point in the search for a final political status for the territory. Since Indonesia's military invasion in December 1975, the military's behavior was characterized by a pattern of human-rights violations. However, this became a major international news issue only in 1991.

On 12 November, a memorial mass was held for Sebastião Gomes, a proindependence East Timorese,

killed on 28 October by the Indonesian military. In the procession from the Church of Motael to the Santa Cruz cemetery, there was a small clash between the participants in the mourning and Indonesian soldiers. Later, when the crowd had reached the cemetery, the military opened fire against the crowd, began beating them, and bayoneted those inside the cemetery.

Contrary to other human-rights violations committed before in the territory, this time there were seven foreigners present—one of them was killed—at the cemetery when the events took place. The English cameraman Max Stahl recorded what happened and was able to smuggle the videotape showing the events out of East Timor. On 13 November, the European community condemned Indonesia's behavior, and in the next few days several governments suspended their aid programs to Indonesia.

A first official Indonesian version of what happened admitted only nineteen deaths. The East Timorese estimated that the true number was at least five times higher. Owing to the international criticism, Indonesia was compelled to form a national commission to investigate the facts. On 26 December, the commission admitted the occurrence of fifty deaths. Two days later, President Suharto replaced the East Timor military commander Brigadier General Rudolf Warouw and his immediate superior based in the Bali Udayana Command, Major General Sintong Panjaitan. Moreover, he also ordered the army chief of staff Edi Sudrajat to form a military tribunal—a Council of Military Honor—to recommend whether any officers should face court-martial. The Council operated from 2 January to 20 February 1992. On 27 February, it became public that six officers had been disciplined, but their names were never made public.

The Dili Massacre triggered a rare instance of public criticism of the Indonesian military, the need for an allegedly independent report, and, especially, a response by Suharto. It was the first time that Indonesia was compelled to appease international criticism since its invasion of East Timor. In fact, the Indonesian foreign affairs minister Ali Alatas would later describe those events as a turning point in Jakarta's international support.

DIN MOHAMMAD, MUSHK-E-ALAM

(1790–1886), Afghan hero. Din Mohammad is a national hero of Afghanistan, renowned for his undying enmity to the British. He was a mullah (Islamic cleric), whose grandfather came from India and settled in Ghazni, a city southwest of Kabul.

Din Mohammad studied with various religious teachers, one of whom gave him the name Mushk-e-Alam ("Musk of the World"), because of his erudition. He was a militant mullah and in time opened his own religious school where he propounded his aggressive views. This ensured him a following of like-minded mullahs, many trained by him, and he became a man of considerable influence among the Ghilzais, the clan that inhabited Ghazni and the surrounding area. He was given an allowance by Shir 'Ali Khan (1825–1879), the amir of Afghanistan from 1863 to 1879.

Din Mohammad openly preached jihad or holy war against the British during the Second Anglo-Afghan War (1878–1881). When 'Abdorrahman Khan (c. 1844–1901), the ruler of Afghanistan from 1880 to 1901, tried to limit his influence and his rhetoric, Din Mohammad incited the Margul and Ghilzai tribes to open rebellion in 1886. Din Mohammad died during this revolt, but his son, the mullah Abdul Karim, took up his father's cause and led the Margul and Ghilzai uprising; it was only with great difficulty that the amir 'Abdorrahman suppressed the rebellion.

DING LING (1904–1986), Chinese novelist. Born in Hunan Province, Ding Ling studied at several schools in Shanghai and Beijing. She began to publish short stories in 1927 and quickly emerged as the country's foremost woman writer. After she joined the Chinese Communist Party in 1932, she was arrested by the Guomintang government and held in detention for three years. Her husband Hu Yepin was killed secretly by the Guomintang.

In 1936 she went to Yanan, the capital of the Soviet government of China. There she published the well-known essay "Thoughts on the March 8 Festival (Women's Day)," in which she examined women's situation and sharply criticized discrimination against them. This made her a target of the Yanan Forum in 1942. Though she held senior official positions for several years after the establishment of the People's Republic of China, she was once again criticized in 1955. From that time on, she was either in jail or in labor camps in north China until the end of the Cultural Revolution. She died in 1986.

Ding Ling always maintained a sincere interest in Chinese women. She was the first writer to portray women liberating themselves in Chinese society. From her maiden effort, "Mengke," to such representative works as "Miss Sophie's Diary" and "Mother," she described how the first generation of new women struggled to get free from the yoke of feudalism.

DISEASE, TROPICAL Tropical diseases are those found in the tropics, which is the climatic region that lies between 30 degrees north latitude and 30 degrees south latitude. People living in the tropics are prone to the same infections that are found in other parts of the world, but tropical diseases are more prevalent in the tropics. Tropical diseases vary in time and space. Factors such as population distributions, cultural patterns, political circumstances, economic situations, and the physical environment determine the spatial and temporal distribution of these diseases. The countries of Asia that are in the tropics include India, Pakistan, Bangladesh, Sri Lanka, Nepal, Myanmar (Burma), Laos, Vietnam, Cambodia, Thailand, Taiwan, Philippines, Brunei, Malaysia, Indonesia, Singapore, and parts of Japan and China. Most tropical countries have high average temperatures and humidity, and these conditions are conducive to the prevalence of many tropical disease vectors. Some diseases, such as African sleeping sickness, are confined to tropical areas because the transmission of these diseases can occur only in tropical climates.

Most of the tropical countries of Asia are poor and therefore diseases caused by nutritional deficiencies are common. Many tropical countries have inadequate

SURVIVING IN THE TROPICS

This account indicates the horrors that awaited many Europeans who traveled to tropical regions of Asia. In India, there was the two-season rule: if one survived two tropical seasons, the chances were good that one would survive in the future.

The Common Distemper that destroys the most in *India*, is Feavers, which the *Europeans* with difficulty escape, especially if they have boild up their Spirits by solemn Repast, and been in-gag'd in a strong Debauch. Besides this, the Mordechine is another Disease of which some die, which is a violent Vomiting and Looseness, and is caus'd most frequently by an Excess in Eating, particularly of Fish and Flesh together. It has been Cur'd by Red-hot Iron clapt to the Heel of him that is sick, so close that it renders him uneasie by its nearness, whereby it leaves a Scar behind it.

Source: John Ovington. (1690) *A Voyage to Suratt in the Year 1689* (1690), as quoted in *The Sabibs*, edited by Hilton Brown (1948). London: William Hodge & Co., 37.

public health systems and a poorly educated population, two factors that contribute to the spread of disease. Increased international travel has facilitated a rapid increase in the spread of tropical diseases into temperate countries by refugees, immigrants, tourists, and business people. Development itself may also introduce new health problems. The construction of dams and irrigation canals may create breeding sites for the vectors of malaria, yellow fever, and schistosomiasis.

Factors Contributing to Tropical Diseases

A hot, wet, tropical climate is an ideal habitat for many microbial agents, parasites, insects, and rodents. Insects and other arthropods serve as vectors for disease agents. Numerous species of animals, especially rodents, live near humans and are reservoirs for diseases. Close contact with animals exposes humans to a wide range of zoonotic diseases (diseases that are transmissible from animals to humans). Genetic factors also contribute to the spread of tropical diseases. For instance, leprosy is more prevalent in Caucasian and East Asian populations than in Africans because of genetic predispositions. While natural immunity can explain why some people do not suffer from certain infections, immunity acquired during childhood by being exposed to a disease or by getting a vaccine against it is a more usual explanation. Vaccines control the spread of diseases that were once highly prevalent worldwide. Efficient vaccines exist for many diseases, including yellow fever, polio, measles, and tetanus. However, they have made little impact in many developing countries of the tropics because vaccine programs are expensive and difficult to administer. Exposure to certain tropical diseases, such as onchocerciasis does not lead to meaningful immunity against them, and therefore vaccines for these diseases do not exist.

Diseases of malnutrition are related to the availability and cost of food, which are dependent on the economic and political circumstances in a particular region. Malnutrition is also associated with the prevalence of gastrointestinal infections as well as traditional practices and taboos that may limit the use of available food. Acute infectious diseases, especially respiratory infections, measles, and gastroenteritis, still account for the high infant mortality in some parts of the tropics, where up to 40 percent of children die before five years of age. Acute infections such as measles may cause specific forms of malnutrition including protein deficiency (kwashiorkor). The absence of a clean water supply and sewage disposal system, especially in the urban slums of the tropics, leads to a high

The *Plasmodium falciparum* parasite, which causes malaria, one of the most common and most deadly diseases in the tropics. (LESTER V. BERGMAN/CORBIS)

prevalence of gastrointestinal infections. Poor sanitary conditions contribute to the spread of diarrheal diseases, especially among children.

Prevalent Tropical Diseases in Asia

Tropical diseases that lead to the highest number of deaths in tropical Asia include respiratory infections and diarrheal diseases. Other diseases that lead to a high number of deaths include measles, nutritional deficiencies, tetanus, pertussis, AIDS, sexually transmitted diseases, leishmaniasis, and dengue fever. Acute respiratory infection is the most common cause of childhood death in the world. Bacterial pneumonia and tuberculosis are the most common respiratory infections in Asia. Chronic bronchitis is rare in most rural areas of Asia, although it is common in North and Central India, where it is attributed to smoke from wood fires in dwellings.

Worldwide, 10 million people die each year from diarrheal diseases, and children who live in the tropics are at highest risk. Many different disease agents are responsible for diarrheal diseases; common agents are cholera, rotavirus, *Escherichia coli*, salmonella, shigellosis, and giardia. Diarrhea is often associated with bottle-feeding when baby formula is mixed with contaminated water. Most diarrhea attacks are self-limiting within several days, but if diarrhea is severe and treatment is not available, severe dehydration and death may result, as is common with cholera. Infantile diarrhea is also the single most important cause of malnutrition in infants in the tropics. The most important treatment for diarrhea is rehydration, which can be accomplished

THE EPIDEMIC GHOST

In many Asian cultures, indigenous beliefs about disease exist alongside Western scientific medicine. In Central Thailand, rural villagers often attribute serious outbreaks of disease to a supernatural force—the epidemic ghost.

Until the Twentieth Century, Thailand was visited by terrifying epidemics of cholera, smallpox, and other devastating diseases. The physiological and psychological consequences of these sudden epidemics were shattering, and it is not at all surprising that the culture has evolved a specialized ghost that is considered peculiarly responsible for these visitations. Since buffaloes and other farm animals are also of vital importance in the livelihood of the Bang Chan farmer, this same ghost is considered responsible for epidemics of rinderpest and other economically disastrous animal diseases.

One frequently hears the word *haa* (epidemic) in everyday speech, usually of a rough sort. *Taaj haa* means to die of an epidemic disease. *Aaj haa* is an insulting term implying that the person spoken about derives from, or is associated with, the hated and feared *haa* ghosts.

The sole effect of Epidemic Ghost is to inflict sickness in the form of epidemic diseases. Conversely, diseases of epidemic proportions are caused only by Epidemic Ghosts, among all the *S-s* found in the culture. If a person is stricken by a disease which, at the time, is endemic rather than epidemic or nearly so, then the diagnosis will invariably be rendered in terms of other *S* other than Epidemic Ghost.

Although there are no standardized notions as to the derivation of Epidemic Ghost, it is not surprising that idiosyncratic notions tend to define this *S* as deriving from an out-group. Thus, Monk Doctor Marvin told me that Epidemic Ghost derives from a dead Muslim or Lao—explaining that those ethnic groups like to eat fresh raw meat. The Laos do in fact like raw meat prepared in certain ways. Nai Sin, on the other hand, believes that this *S* derives from a Muslim who, before death, specialized in slaughtering buffaloes and chickens, and who now, as a ghost, continued to indulge in killing those animals. Muslims around Bang Chan do in fact engage disproportionately in slaughtering, a service which they render commercially to their Buddhist neighbors, whose Merit-Moral system includes a firm prohibition against the taking of animal life.

Source: Robert B. Textor. (1973) *Roster of the Gods: An Ethnography of the Supernatural in a Thai Village*. New Haven, CT: HRAFLEX Books, 391–392.

by drinking oral rehydration solution or through the administration of intravenous fluids.

Several diseases can be caused by nutritional deficiencies of total calories, protein, iodine, vitamin A, vitamin C, and iron. Calorie deficiency, or marasmus, causes emaciation and can lead to death. Protein de-

ciency, or kwashiorkor, makes its victims more susceptible to other infections and can cause mental deficiency. Iodine deficiency may lead to enlargement of the thyroid gland, or goiter, which leads to various complications. Vitamin A deficiency leads to blindness, and vitamin C deficiency, or scurvy, leads to ane-

mia, bleeding of the gums, and bleeding under the skin. Iron deficiency also leads to anemia, which causes weakness and other complications.

Two especially deadly tropical diseases are visceral leishmaniasis and dengue fever. They are both diseases that are transmitted by insects. Visceral leishmaniasis is caused by a protozoan and is transmitted to humans by the bite of a sand fly. It causes damage to the spleen, liver, and bone marrow of its victims and has a high fatality rate. Prevention of leishmaniasis includes both control of the sand fly vector and control in humans through treatment. The sand fly vector has been successfully controlled by spraying insecticides on the walls of homes. Dengue fever is a viral disease that is transmitted by mosquitoes. It causes severe fever, headache, muscle pain, and a rash. Severe cases of dengue fever result in a syndrome called dengue hemorrhagic fever, which can lead to death. The only way to control the disease is to control the mosquito population.

Another tropical disease that is not responsible for large numbers of deaths in Asia but is a serious health problem is schistosomiasis. Schistosomiasis is a parasitic disease that is caused by blood flukes belonging to the genus *Schistosoma*. Infection occurs when a person wades or bathes in water that is infested with snails that transmit the blood flukes. The parasite infects an individual's blood vessels and is characterized by blood in the urine. The disease is associated with irrigation development schemes in many parts of the tropical world.

Fighting Tropical Diseases

Fighting tropical diseases involves not only diagnosis and treatment but also health education, environmental management, provision of a clean water supply, and development of a health-care infrastructure. However, many tropical countries in Asia have limited health budgets, making a comprehensive approach difficult.

DIWALI Although the religious practices of India are numerous and diverse, the festival of Diwali (array of light) is celebrated in most parts of India, primarily by Hindus. Diwali occurs on the new moon day of Kartik (a month during October and November).

The festival is celebrated by putting oil or ghee (clarified butter) lamps (*diyas*), wax candles, and sometimes colored electric bulbs around the house and setting off firecrackers during the night. The goddess of wealth, Lakshmi, is worshiped at night. Houses are cleaned and painted, and colored decorations (*rangoli*) adorn the doorways and courtyards to welcome the goddess. The trader community (*Banya*) begins the new financial year after Diwali.

According to popular stories about the origins of this ancient festival, *diyas* are lit to welcome Lord Rama, his wife Sita, and his brother Lakshmana to their kingdom of Ajodhya (former city in northern India) after a fourteen-year exile. Another story is that Diwali is observed to commemorate Krishna's killing of the demon Narakasura and the rescue of 16,000 women held captive by him. In southern India, Diwali celebrates the killing of the demon Hiranyakashipu by Vishnu in the form of a man-lion.

DIYARBAKIR (2002 pop. of province 1.4 million). Diyarbakir (formerly Diyarbekir, ancient Amida, capital of the province of Diyarbakir) is located in south-eastern Turkey on a basaltic plateau on the right bank of the Tigris River. Its old name, Black Amida, came from the black basalt walls surrounding the city. Diyarbakir is a very ancient city, dating back 5,000 years. Assyrians and Persians ruled there until Alexander of Macedon's conquests. The city walls, originally Roman (297 BCE), were rebuilt by the Byzantines. Arabs arrived around 638 CE and renamed the city Doyarbakir, "abode of [the tribe of] Bakr."

The collapse of the Byzantine empire in 1071 enabled the Seljuks to annex the city. Many nomadic pastoral tribes, especially Turkmens and Kurds, then settled in the area. The city was conquered by the Kara-Koyunlus in the fifteenth century, was occupied by the Safavids in 1507, and finally fell into Ottoman hands in 1515. The Ottomans organized the newly conquered territories into the province of Doyarbakir, centered on the city of Amida. One of the largest provinces of the Ottoman empire, it had special importance because of its position near the Persian frontier. In 1923 the city was officially named Diyarbakir under the new Turkish Republic. Today Diyarbakir is a largely Kurdish town and is the major center of trade, industry, culture, and education in southeast Anatolia.

T. Isikozlu-E.F. Isikozlu

DOAN THI DIEM (1705–1748), Vietnamese poet. A brilliant exponent of the Vietnamese *nom* (demotic script) verses, Doan Thi Diem was born in 1705 in the village of Gia Pham in Hai Hung Province, northern Vietnam, into a family of teachers. When she was twenty-five years old, her father died, and, as she was unmarried, she went to live with her brother, who held a doctor's degree. It was under his tutelage that Doan Thi Diem continued her education and writing career. Tragedy struck a few years later when her brother died. She then had to shoulder the responsibility of providing for her mother and her brother's family by engaging in two professions unprecedented for a Vietnamese woman: she practiced medicine and taught. She excelled in both while also pursuing her writing. She published collections of poems, but she was most famous for her translation into *nom* of a long poem, *Chinh Phu Ngam* (Lament of the Soldier's

Wife). The original version of this poem was written in classical Chinese by a Vietnamese scholar, Dang Tran Con (1710–1745), a contemporary of Doan Thi Diem. Her translation equaled its Chinese version in grace and elegance but surpassed it in sensitivity, as it was able to communicate to its audience in their own tongue the pain, distress, and anguish of a wife whose husband has gone to war. Doan Thi Diem died of a severe cold, contracted while accompanying her husband, an official, to his new post in the province of Nghe An, south of Hanoi.

DOGRA DYNASTY The Dogra dynasty (1820–1947) was a lineage of Rajputs who ruled much of Kashmir and adjacent valleys. Dogra was in fact the name given to the country surrounding the small state of Jamma; the word meant "two lakes," in reference to the inhabitants' ancestral home between the lakes Siroensar and Mansar. During the First Sikh War (1845–1846) the Dogras won a high reputation as soldiers fighting on the British side, and during their later service in the Indian Army, they distinguished themselves in several operations late in the nineteenth century. Dogras were of mixed culture: Hindus, Muslims, and even Sikhs, all claiming Rajput status. They still have a dominating position in the state of Jammu and Kashmir.

The first ruler of the Dogra line, Gulab Singh (1792–1857), was appointed raja of Jammu in 1820 by the Sikh ruler of the region. He became a mediator rather than a participant in the First Sikh War, and was rewarded by the British with the province of Kashmir. It was in this way that a largely Muslim state came to have a Hindu ruler, down to independence in 1947. In that year Hari Singh, the great-grandson of Gulab Singh, acceded to the union of Kashmir with India.

DOI INTHANON Doi Inthanon (known as the Roof of Thailand) is the highest mountain peak in Thailand at 2,565 meters. The mountain is located in northwestern Thailand near the upper Ping River in the Chiang Mai province. On its summit rests the pagoda built by King Kue-Na in the fourteenth century that is said to house relics of Buddha.

Doi Inthanon, also designated a national park, covers more than 48,000 hectares. The park is splendid with mountains from the Shan Hills range, waterfalls and limestone rock formations and caves in the eastern end of the park. Forest floras include plants that grow in the park's temperate climate, such as rhododendron, pine, and laurel. Epiphytes can be found here, mainly orchids. Lichens, lianas, and fern are also abundant. The park has the largest number of bird species in Thailand. The Center for Wildlife Research at Mahidol University has recorded more than 360 species, making the park a popular destination among birdwatchers from around the globe.

"Doi Inthanon National Park: 'The Roof of Thailand.'" (2002) *Welcome to Chiangrai & Chiangmai* magazine. Retrieved 14 January 2002, from: <http://www.welcome-to-chiangmai-chiangrai.com/int-park.htm>.

DOI MOI *Doi moi*, which means "renovation" in Vietnamese, is a set of political and economic reforms that were instituted in Vietnam by the Central Committee of the Vietnamese Communist Party (VCP) during the Sixth Party Congress in December 1986 in response to severe economic problems and a lack of confidence in the government.

Economic Crisis

After Vietnamese reunification in 1975, an economic crisis and serious food shortages became increasingly problematic for the VCP. This was mainly due the U.S.-imposed trade and aid embargo and the difficulties that the government had converting the agricultural sector in the south to socialist collectivism. In response, the Vietnamese government instituted a series of economic reforms which can best be described as a trial-and-error process. Initially, the government recognized contracts signed without a legal basis by some state enterprises with other state enterprises and private entrepreneurs to address the insufficient supply of production tools and fertilizer. The agricultural contract system and the industrial three-

plan system (a three-fold production plan: Plan A was the general state plan with highest priority, Plan B authorized the purchase of production means and their autonomous use, and Plan C authorized the sale of products of lower value) were intended to increase private initiative, strengthen market functions, and intensify material production incentives. Between 1981 and 1985, low productivity, insufficient quality standards, and energy and material shortages, as well as inefficient management, further paralyzed economic development. Although policy papers recognized the important role agriculture played in the development of the country, state subsidies were allocated primarily to heavy industries. Despite this, in 1983 family agricultural production already accounted for 50–60 percent of the income and 90 percent of foodstuffs available in agricultural areas. It also provided 30–50 percent of the entire foodstuffs of the country.

Instituting *Doi Moi*

Initial discussion of the *doi moi* program occurred at the Eighth Plenary Session of the Vietnamese Central Committee in June 1985. At this session, members agreed that the main cause for the further deterioration of living standards were two basic concepts of the DRV model: bureaucratic centralism and the state subsidies system. These, they argued, led to large disparities between public and private prices. Further, the agricultural contract system was still inefficient because the state was not able to fulfil the provision of seeds, crops, and fertilizer. Consequently the Central Committee decided on currency, price, and salary reforms, as well as increased autonomy for the state enterprises and the abolition of the state subsidies system and the twofold price system (the official state prices and the free prices of the private market). When these reform measures resulted in a further decline of living standards, popular confidence in the VCP's economic competence began to suffer. Inflation, corruption, and smuggling only worsened the situation. During the Sixth Party Congress in December 1986, liberal reformers such as Nguyen Van Linh, Vo Chi Cong, and Vo Van Kiet gained decisive influence within the Party.

The rather vaguely formulated *doi moi* program also resulted in a restructuring of the government, which was publicly announced in February 1987. Twenty-two ministries were filled with new personnel and the National Assembly developed a more debate-oriented approach. In addition to making these personnel changes, the Party cited bureaucratic centralism, state subsidies, and international isolation as the major reasons for economic deterioration. Consequently the

Party's ideologically derived foreign policy changed, and in May 1988 the Politburo Resolution No. 13 codified the need for a "multidirectional foreign policy orientation." After the end of the Cambodian conflict, Vietnam succeeded not only in reestablishing relationships with member countries of the Association of Southeast Asian nations (ASEAN), but also in reestablishing diplomatic and economic relations with the United States and Europe. Vietnam became a member of ASEAN and the United States removed its trade and aid embargo.

Despite these efforts, however, the economic sector was affected by further decline and confusion for various reasons, including the national budget deficit, a patchwork of reform measures, tremendously high inflation rates, and the lack of a clearly defined *doi moi* policy. Controversy about the future role of the private sector led to ongoing discussions among the leadership and in the media. Then, in 1988, the reforms seemed to succeed partially. Substantial cuts of subsidies for state enterprises, the abolition of the central state price system, and a further devaluation of the Vietnamese currency resulted in a short-term economic recovery. The short-term nature of this recovery was due to the fact that financial reallocation from the industrial sector to the agricultural sector could not be effectively organized, even after the Sixth Party Congress. Although agricultural production increased in 1986, it decreased again in 1987 and the state-owned media admitted that about ten million people in the northern provinces suffered severely from starvation.

In April 1988, two new laws, one addressing agricultural management renovation and another dealing with land disputes, led to various reactions among the population. South Vietnamese peasants publicly argued about their right to take back confiscated parts of land. Early in 1988 a new contract system guaranteed peasants at least 40 percent of their harvest. During the second half of 1988 foodstuff production increased considerably and Vietnam even became one of the world's leading rice-exporting countries. According to Gerd Trogemann, this was not only due to the new contract system but also to better energy supplies and favorable weather conditions. As before, however, economic achievement did not prove to be sustainable. Cuts in subsidy programs and bad weather conditions were responsible for low productivity in 1991. Decentralization measures and the promulgation of efforts to develop a multicomponent economy accompanied an overall reform of state enterprises and efforts to reallocate budgets from heavy to light industries.

While *doi moi* was easily understood as renovation of the economic structure, political reforms still lagged behind societal development. Since the introduction of *doi moi*, however, political liberalization has gained a certain dynamism, especially among the mass media, which have shown more willingness to publish criticism and openly unveil cases of severe corruption among state officials. When intellectuals and artists have contributed to this political criticism, however, the government has reacted with political repression. Because civil society is still underdeveloped in Vietnam and an overall public consensus about the necessity of smooth and uninterrupted economic development prevails even among the opponents of the VCP, political reforms are still limited.

The Future

By the early 2000s, it has become clear that the renovation program is irreversible and that economic development is inevitably accompanied by certain structural changes within society. More freedom to participate in privately financed foreign exchange programs, as well as the increasing access to information from the Internet will certainly contribute to more open-mindedness in Vietnam. Time will tell how important a role the emerging middle class and private entrepreneurs will play in the future political liberalization process of the country.

DOKMAI SOT (1905–1963), Thai novelist. Dokmai Sot ("Fresh Flower") is the pen name of M. L. Buppha Kunjara Nimmanhemmin. Born into an aristocratic family, she began writing in her early twenties. Her first four novels were published in installments in one of the major literary magazines of the day, but thereafter she published her novels herself, producing eleven novels between 1929 and 1940. Of these, the most famous is *Phu di* (A Person of Quality), first published in 1938, in which she intended to demonstrate that a person of quality was defined not by social status or wealth but rather by Buddhist qualities of patience, wisdom, and self-sacrifice.

Dokmai Sot's novels are mostly domestic dramas, admired for both their use of language and their content. Her novels were among the first to be accepted in literature syllabi at secondary- and tertiary-education level in Thailand. The author's penchant for including Buddhist epithets at the beginning of each chapter led the writer and critic Nilawan Pinthong to describe her as a preacher.

At the age of forty-nine, Dokmai Sot married Sukit Nimmanhemmin, a former minister of industry who later briefly held the position of deputy prime minister; she accompanied him to India when he was appointed ambassador in 1959. Her health was never robust, and she died of a heart attack in Delhi, India, in 1963.

DOMBRA The *dombra* belongs to the family of two-stringed lutes that are widespread in Central Asia and especially associated with pastoral nomadic peoples. They include the Kazakh *dombura*, the *dambura* of Turkestan and Badakhstan, and the Uzbek and Uighur *dutar*. The instrument consists of a rectangular or oval body usually hewn out of a single piece of wood, covered by a wooden soundboard, with a long, slender neck. It is usually unfretted, although modern versions of the instrument have added frets set at chromatic intervals. The *dombra* is strung by a single gut, or nylon string, which passes from a wooden tuning peg at the end of the neck, looped around a pin at the base of the body and up to a second peg to make two tunable strings. The strings are most commonly tuned a fourth apart—the higher string is physically below the other when the instrument is played—and they are plucked with the thumb and two fingers and held together with a sweeping back-and-forth movement.

The *dombra* is commonly used to play dance tunes, solo programmatic pieces, or to accompany songs and epic tales. Typically *dombra* music alternates between double and triple rhythms and has a general emphasis on fourths and fifths as basic structural intervals, with the widespread use of melody plus drone.

DOST MUHAMMAD (1793–1863), founder of the Pashtun Barakzai dynasty in Afghanistan. Dost Muhammad, the twentieth son of the chief of the Pashtun Barakzai clan, spent his early years living with his mother's relatives, part of a Turkish nomadic tribe. After 1810, thanks to the favor of his powerful eldest brother, Fath Khan, he held important political and military offices in Kuhistan, Kashmir, and Herat, at that time part of the Afghan kingdom. Dost Muhammad demonstrated his military skills by capturing the Afghan cities of Kabul, Ghazna, and Jalalabad in 1818, after the king of Afghanistan, Mahmud Shah, had blinded his eldest brother. In 1826 Dost Muhammad became the effective ruler of Afghanistan, although he formally took the title of emir (king) only in 1834.

During the first years of his reign Dost Muhammad tried to secure the position of his ethnic confed-

eration, the Durrani, against the rival Pashtun group of the Ghilzay, and to recover lost Afghan territories. However, he was hindered by a Persian attack against the city of Herat in 1837 and the British invasion of Afghanistan in 1839. Dost Muhammad escaped toward Central Asia, where he was arrested and deported to India with part of his family.

The British crowned Shah Shuja (d. 1842) as the new puppet emir of Afghanistan. Ethnic outbreaks, however, continually challenged the British army, which was forced to retreat in the winter of 1841–1842 and was almost entirely slaughtered by Ghilzay tribes. Dost Muhammad returned to Kabul in 1843 and was restored as emir by the new British governor-general of India, Lord Ellenborough, who had decided to quit the country. Dost Muhammad dedicated the last twenty years of his life to consolidating Durrani authority, recovering the northern territories and the cities of Qandahar, Balkh, and Herat.

DOUMER, PAUL (1857–1932), governor-general of Indochina. Paul Doumer was governor-general of French Indochina from 1897 to 1902. Born in Aurillac, France, Doumer worked as a journalist before embarking on a political career. He was first elected to the French National Assembly in 1888 and served as minister of finance (1895–1896) just before his appointment as governor-general of Indochina.

During his five-year mandate in Indochina, Doumer instituted a number of reforms. He created a general budget for Indochina and established monopolies on salt, opium, and alcohol to finance colonial development projects. He promoted the construction of a railway line from Saigon to Yunnan (the Yunnan Railway project), and sanctioned public works projects, such as the building of roads, bridges, canals, and communications lines. Doumer also systematized the colonial civil service by creating departments of public works, customs, and agriculture and commerce. In 1898 he founded the *Ecole Française D'extrême Orient*, whose purpose was the study of East Asia.

Doumer returned to France in 1902 and was elected senator of Corsica (1912–1931). He eventually was

elected president of France in 1931 but was assassinated one year later by a Russian immigrant who accused him of siding with Bolsheviks.

DRAGON BOAT FESTIVAL The annual Dragon Boat Festival, commemorating the dead, is observed primarily in central and southern China. It occurs on the fifth day of the fifth lunar month and falls between 28 May and 25 June in the Western calendar. During this festival, people along the seacoasts and major rivers compete in races in boats made from wooden planks and carved with dragon heads and tails.

A team of young adult males rows the boats, directed by a team leader who synchronizes their action with a big drum. While racing dragon boats in competition, the competitors occasionally toss triangular-shaped rice cakes, typically made from glutinous rice with meat or sweet bean paste stuffing and wrapped in bamboo leaves, into the water. Popular folktale attributes this festival to the patriotic poet Qu Yuan, who lived in the third and second centuries BCE in the southern kingdom of Chu during late Zhou dynasty (1045–246 BCE). According to legend, Qu was dissatisfied with the ineptness of the Chu king. When the king spurned his repeated advice, Qu threw himself into a river in today's Hunan Province. The boat racing is said to have originated from the attempt to recover his body. Throwing rice cakes symbolizes a sacrificial offering to Qu.

DRAMA—CHINA Chinese drama has a long tradition. Generally, the highly developed structure of dramatic text created in the Yuan dynasty (1279–1368) is considered to have influenced later traditional theater literature, and therefore the Yuan dynasty often cited as the age in which Chinese drama began. Dramatic influences on Yuan drama, however, go back many centuries, beginning in the earliest courts of record—the Zhou (1045–256 BCE).

Drama during the Zhou Dynasty

One of the most important elements of Chinese drama, the performance synthesis of song, dance, and music, first appeared in the Zhou courts. The *Liji* (Book of Rites) describes performance synthesis as the inherent, correlative relationship between music, movement, emotion, and other aspects of performance wherein the sum of the parts creates a greater whole. Throughout Chinese theatrical history, the aesthetic of melding into a singular totality the skills of singing, dancing, acrobatics, special speaking techniques, and use of costuming, props, and dramatic storytelling has been an identifying feature. Both the Zhou court ritual dance-dramas and some of the acts staged by court jesters featured performance synthesis as an inherent element of the dramatic basis of their presentations.

Drama during the Qin and Han Dynasties

In the Qin (221–206 BCE) and Han (206 BCE–220 CE) eras, the court ritual of the Zhou was assumed for

new purposes, although quite likely revised, and new forms of dramatic entertainment arose in both the countryside and urban areas. Two of the most important forms were based on popular stories; in the dramatically enacted combat scenario of *chiyouxi*, or Chi You theater, one finds the epic myth of the cosmic battle between the demonic rogue Chi You and the Yellow Emperor (the legendary founder of the Chinese empire). In the second skit, *Donghai Huanggong* (Duke Huang of the Eastern Sea), a drunken shaman is overpowered by a tiger and killed after displaying a series of magical acts. These dramatic pieces, as well as others, were often performed as part of enormous variety shows (*baixi*, "hundred acts") staged by the courts as part of expensive displays intended to impress foreign envoys; they took the form of circus-like entertainments with costumed performers singing, dancing, and playing musical instruments among equestrian, acrobatic, and magic acts.

Drama during the Tang Dynasty

During the Tang dynasty (618–907 CE), such skits as *Donghai Huanggong* continued to be popular presentations in the marketplaces, at court, and in temples, as well as in the homes of patrons. Other favored dramatic sketches of the Tang included *Tayaoniang* (Singing-Stepping Woman), in which male and female actors employed song and dance to comically portray the plight of a battered woman married to a drunken, egotistical official. In another favorite, *Botou* (Setting Matters Right), a son mourns his father, killed by a

tiger while journeying through some mountains, using a mixture of monologue and conventionalized movement patterns to portray the father's ill-fated trip. Similar to these entertainments was *canjunxi* ("adjutant theater"), wherein two actors enacted a comic scenario about a corrupt official who steals bolts of silk.

Also during the Tang period, Buddhist monks began to dramatize sermons with the aid of scrolls illustrating Buddhist teachings; this form was called *bianwen*, or transformational tales, and exhibited not only religious but also historical and social or political contemporary themes. All topics were presented through a mix of literary and vernacular styles, using song, prose, verse, and idiomatic speech. Additionally, *chuanqi*, or marvel tales, a more literary form composed of short stories with dialogue, originated during the Tang dynasty and initiated a greater interest in using literary stylization in the dramas of developing theatrical forms. Puppet performances may have also played a significant role in the evolution of drama at this time.

Drama during the Song Dynasty

During the Song dynasty (960–1279), dramatic developments began to take place that would distinguish northern from southern forms until the present day. Song *zaju* ("miscellaneous theater"), popular in both the north and south, included on a much smaller scale some of the variety-show characteristics found previously in Han *baixi*, but the primary focus of the presentation was on a central play or sketch. By the Southern Song dynasty (1126–1279), Song *zaju* was composed of three parts: (1) a curtain raiser, (2) the main comedy, and (3) a comic or variety-show act. A variation of early *zaju*, known as southern theater (*nanxi*), also developed at this time, as did ballad forms such as *daqu* ("great song set") and *zhugongdiao* ("various palace tones"), which, using direct speech rather than description, alternated song and speech. The Mongol Jin dynasty, operating in the north while the Southern Song continued in the south, developed *yuanben* ("courtyard literature"), instigating a tradition of crafting texts through writing guilds that collectively worked to craft their scripts of words, song, and music.

Drama during the Yuan Dynasty

During the Yuan dynasty, drama flourished. Some theorize that this resulted when the many unemployed literati, ousted from court office in the Mongol conquest and the subsequent political shift against Confucianism, used their free time to write drama to attack

the new government. *Yuanben* continued in the northern courts, but the most important form to evolve was that of Yuan *zaju*. The writing guilds of the court infused tremendous literary breadth into *zaju*, and the compositional form encouraged further development of actor technique, especially in singing. Yuan *zaju* was divided into four acts, each featuring a soloist. Every act contained several songs, all in a single key, giving the acts a musical unity. Metrical rules were set for the alternation of prose and poetry, with over 80 percent of the ends of lines rhyming. Each act, however, had a rhyme scheme differing from that of the other acts in the play. Additionally, a "wedge" (a simple song of one or two stanzas) could be placed between acts. Although the song sets (*qu*) were a primary element, the plots and dramatic dialogue were also rich; plays often contained forty or more acts and could have been staged in their entirety only over several days. The length of such scripts has strongly influenced presentation until this day; most modern performances stage only highlights of a drama instead of performing the whole story. In the south, *nanxi* continued to develop, employing duets and trios to present the alternating lines of sung and spoken dialogue.

Drama during the Ming and Qing Dynasties

In the Ming dynasty (1368–1644), various forms of music were combined with dramatic features of pronunciation, rhyming patterns, and regional singing fashions (alternating song and speech was a common trait), producing new forms. The dramatic texts for these forms included song and musical scores; some plays were shared, but altered, between forms. *Kunqu* (Kunshan opera) evolved in this age and is still performed by five major troupes located in both the north and south of modern China.

In the Qing dynasty (1644–1912), musical systems continued to be melded with regional songs and stories to produce forms such as Beijing Opera, now performed by hundreds of professional and amateur troupes. Between 1895 and 1905, plays using Western themes and traditional Chinese performance form were introduced and called New Theater (*xinju* or *xinqu*); an example is Liang Qichao's *Xin Luoma* (New Rome) staged in *kunqu* form with a theme relating the contemporary government to that of the Italian risorgimento (the nineteenth-century political movement toward Italian unity and the formation of a nation-state), with the characters of Dante and Cavour quoting Confucius and Tang poetry. *Huaju* (spoken drama), essentially Western nonmusical drama, was then imported and translated into Chinese, with favorites being works of Brecht, Shakespeare, and

Chekhov. Chinese authors, such as Cao Yu and Lao She, wrote their own plays using this dramatic style.

Drama in the People's Republic of China

During much of the Cultural Revolution (1966–1976), all theater was banished except for eight plays and one ballet. The plays, focused on concerns of workers, were performed in the style of traditional opera but without its elegant costuming. In 1972, the ban on theater was lifted, with traditional and new performances again becoming significant aspects of Chinese culture.

After the 1976 fall of the Gang of Four (the four people held responsible for implementing the Cultural Revolution), the "model" operas of the Cultural Revolution were no longer performed. During the next ten years, an open-door policy initiated an influx of foreign drama and theatrical personnel into China as well as an opportunity for Chinese artists to bring Chinese opera to America and Europe; Arthur Miller directed *Death of a Salesman* in Beijing in 1983, and the Shanghai Kunqu Troupe toured Europe with a *Kunqu*-styled production of *Macbeth* in 1988. Dramatic developments focused on experimental and social-problem plays. A Jia and other theorists began to elaborate on the result of combining Western schools of acting, especially the Stanislavsky method, with traditional Chinese drama form and with artistic elements taken from ancient Chinese poetics and painting. The result is an evolving style of drama, uniquely Chinese, combining realism and well-defined characters with performative techniques that focus on the actor's presence.

Although many of China's new works have developed under the auspices of major institutions, such as the Beijing People's Art Theater, China's minority groups have also actively produced works of their own. Two well-recognized productions are *The Battle of Potala Palace* by the Tibet Autonomous Regional Drama Troupe and *Hello, Standard-Bearer* by the Inner Mongolia Autonomous Drama Troupe. In 2000, the Nobel Prize for Literature was awarded to Chinese dissident Gao Xingjian, author of *Chezhan* (The Bus Stop) and *Bi An* (The Other Shore).

DRAMA—INDIA India has a long tradition of dramatic forms dating as early as Mauryan times (c. 324–c. 200 BCE). The *Natya Sastra* of Bharata (flourished second century CE), a treatise on dance and acting, became the bible of Indian performers. Regional folk traditions like *kathakali*, *yatra*, and *yakshagana* enriched Indian drama. Indian theater as it exists today, however, appeared in India in the nineteenth century, as did European drama.

During the nineteenth century traditional Indian plays were written and acted to highlight the evils of society and the consequences of British rule. There were also dramatic presentations of plays translated from Western sources, particularly Shakespeare. The National Theatre of Calcutta, the first public theater in India, was created in 1872. Itinerant Parsi drama companies also attracted large crowds due to the plays' humor and grand spectacle. The *Krishnakumari* (1861) of Madhusudan Dutt, the *Niladarpan* (1860) of Dinabandhu Mitra, the *Kanchi Kaveri* (1880) of Ramshankar Ray, and the *Lalita Dukh Darsak* (1864) of Ranchodhbhai Udayram were some notable nineteenth-century plays.

In the beginning of the twentieth century, powerful dramatic literature began to appear not only in English, but in many Indian languages. The playwrights Sri Aurobindo, T. P. Kailasham, and Harindranath Chattopadhyay wrote in English. Iswar Chandra Nanda wrote plays in the Panjabi tongue, highlighting social problems. Imtiaz Ali's *Anarkali* was much acclaimed. P. Sambandha Mudaliyar brought new direction to the Tamil-language stage. Annapurna Theater kept the Oriya-language dramas alive. The *Gayopakhyaana* of Chilakamarti Lakshminarasimgha was well received by Telugu-speaking audiences. K. M. Munshi, Jayashankar Prasad, and D. L. Ray wrote plays in Gujarati, Hindi, and Bengali, respectively. The *Rakta Karabi* of Rabindranath Tagore is a landmark in Indian theater.

In 1943, the Indian People's Theatre Association began a progressive trend encompassing all of India. In the 1950s, new names came on the scene. Badal Sircar earned fame by introducing new forms. Instead of writing in regional languages, Girish Karnad, Vijay Tendulkar, Mohan Rakesh, and Adya Rangachari became all-India figures. *Ghashiram Kotwal* by Vijay Tendulkar was acclaimed throughout the country.

The Kendirya Sangeet Natak Academy and National School of Drama gave new direction to Indian drama. B. V. Karnath, Habib Tanvir, and Rattan Thiyam directed many modern plays. The *Bitter Harvest* by Manjula Padmanvan received international acclaim. By then there was a strong interplay between drama and film; many well-known film actors got their start on the stage.

DRAMA—JAPAN *This article deals with Western drama in Japan; traditional dramatic forms, such as Kabuki, are covered under their own names.*

Modern theater in Japan began as an attempt to import wholesale Western drama and theater of the late nineteenth and early twentieth centuries. Its development occurred in three stages, characterized first by adaptation, then borrowing, and finally rejection of Euro-American models. When Japan was forcibly opened to foreign commerce and diplomacy in the early Meiji period (1868–1912), the arts of Europe, and later America, flooded into Japan along with political, social, and economic ideas. Learning from Ibsen, Chekhov, Shaw, and Stanislavsky, young playwrights and directors staged Japanese versions of contemporary European drama that represented the present world in contrast to the ancient and feudal worlds dramatized by Noh, Kabuki, and Bunraku. Many producing companies emerged in the 1920s and 1930s, only to be suppressed during World War II for being too Western in orientation. In the half-century following Japan's wartime defeat, modern drama flourished, and in the early 2000s hundreds of troupes perform in newly built, state-of-the-art theaters.

Shinpa

In 1899, the young politically active actor-director Kawakami Otojiro (1864–1911) and his wife, Sa-

dayakko (1871–1946), embarked on the first of four trips to the United States and Europe, where they performed before elite Western intellectuals. Sadayakko received ecstatic reviews. More important than their success in bringing Japanese theater to the West was the opportunity their travels gave them to see Henry Irving, Ellen Terry, and Sarah Bernhardt onstage. Returning home, they performed *Hamlet* and *Othello* with contemporary Japanese settings. The style of performance, in which Western and Japanese theaters and cultures melded, was called Shinpa (new school) to contrast it with old-school Kabuki, which was rooted in the feudal age. Through the 1920s several Shinpa troupes staged newly written plays that dramatized urban life in Japan, mixing actresses and *onnagata* (men playing women's roles). The major Shinpa star before and after the war was the actress Mizutani Yaeko (1905–1979). Today a single Shinpa troupe continues under the management of the Shochiku Theater Company.

Shingeki

In contrast to diluting European art through adaptations, directors and actors of the Shingeki (new theater) movement attempted to replicate European plays as authentically as possible. In 1906, scholar Tsubouchi Shoyo (1859–1935) formed the Literary Arts Society (Bungei Kyokai) at Waseda University in Tokyo; it was dedicated to training students in Western realistic acting. The group's star, Matsui Sumako (1886–1919), was Japan's first modern actress. Director Osanai Kaoru (1881–1928) and Kabuki actor Ichikawa Sadanji II (1880–1940) founded the Free Theater (Jiyu Gekijo), in which professional Kabuki actors and young amateur actresses joined in epochal productions of Ibsen and Gorky. Kabuki actors, especially *onnagata*, found it difficult to abandon stylized acting, and the Free Theater was able to take only a few steps toward a genuinely modern theater. Authors in their twenties, such as Kikuchi Kan (1888–1948), Yamamoto Yuzo (1887–1974), and Tanizaki Junichiro (1886–1965), who went on to become famous novelists and playwrights, were stimulated to write plays in the style of Ibsen, Shaw, and Chekhov.

The construction of the 500-seat Tsukiji Little Theater (Tsukiji Shogekijo) in 1924 marked a major step in breaking away from traditional theater. The first theater in Japan expressly designed for modern drama, it was the brainchild of Hijikata Yoshi (1898–1959) and Osanai Kaoru. Hijikata and Osanai directed more than one hundred recent plays by O'Neill, Strindberg, Capek, Pirandello, and other Western playwrights, largely ignoring newly written

Japanese plays. Osanai's sudden death in 1928 precipitated a breakup of the theater into progressive and artistic factions; Hijikata became a leader of the progressive camp and later established the New Tsukiji Troupe (Shin Tsukiji Gekidan).

Shingeki was severely suppressed during World War II. In August 1940, the police arrested more than one hundred Shingeki artists, and thereafter most troupes were ordered to disband. Following Japan's defeat in the war, the American Occupation supported Shingeki as a means of conveying democracy and liberal ideas. During the 1950s, Shingeki was a major cultural force, and scores of troupes contributed to its reinvigoration. Socially concerned theater artists formed the People's Art Theater (Gekidan Mingei) to bring serious drama to village audiences and workers. Members of the Advance Theater (Zenshinza), who joined the Communist Party en masse, brought both Kabuki and modern drama to youth audiences throughout the country. Postwar playwrights whose works can be read in English include Mishima Yukio (1925–1970), Kinoshita Junji (b. 1914), Tanaka Chikao (b. 1905), and Abe Kobo (1924–1990).

The 1960s saw an abrupt rejection of the values of Western-based, realistic Shingeki and an explosion of experimentation in new theatrical and dramatic forms, known variously as *angura* (underground), *han-Shingeki* (anti-Shingeki), or *shogekijo* (little theater). Ohta Shogo (b. 1939) exposed the existential nature of human life in wordless dumb shows in his "theater of silence." Hijikata Tatsumi (1928–1986) and Ohno Kazuo (b. 1906) created a profoundly unsettling "dance of darkness," *Ankoku Butoh*, in which naked performers appear as tortured ghosts from another world.

During Japan's bubble economy of the 1980s, more than forty high-tech theater complexes were built throughout the country, and theater companies found generous subsidies. Despite a severe economic slowdown in the 1990s, the modern theater scene is diverse and active. On any given day in Tokyo, more than 150 performances of modern drama and theater are staged. Performance art, high-tech staging, and video art reflect Japan's digital age. Collaborations among contemporary and traditional performers are increasingly common. The latest teen idols of the music industry crossing over into theater compete with old-line Shingeki troupes; new productions by Suzuki, Ohta, and Ninagawa; and explorations in *Butoh*. Each holds a segment of a diverse audience for contemporary theater.

DRAMA—KOREA Although scores of court and folk dances and dance-dramas are known in Korea, no forms using dramatic scripts evolved until the twentieth century. Masked-dance dramas (dramas or farces featuring masked performers) are especially characteristic of Korea and were performed throughout the Three Kingdoms era (37 BCE–935 CE), which includes the kingdoms of Koguryo, Paekche, and Shilla. The earliest records mention annual or biennial festivals honoring heaven; people danced and sang at these events to cement their tribal identities and may have used specific themes or stories to dramatize the dances.

Early Forms

In the later years of the Koguryo kingdom (37 BCE–668 CE), an influx of music and dance entered the central courts from the foreign courts of the Sui (581–618) and Tang (618–907) dynasties of China and from Central Asian sources, profoundly affecting the development of elite entertainment. In the neighboring kingdom of Paekche (18 BCE–663 CE), a presentation developed called *kiak* ("skill performance"). *Kiak* seems to have been a pantomime consisting of ten scenes with Buddhist ceremonial characteristics. It was probably performed by a masked dancer and no doubt aimed to promote Buddhism.

While essentially no evidence of drama survives from the Shilla kingdom (57 BCE–935 CE), theatrical presentations in the Unified Shilla (668–935) had probably existed, perhaps in a simpler form, in earlier times as well. One such form, *choyong kamu* ("to-tolerate-punishment song and dance") evolved through stages from the worship of mountain and dragon deities to entertainments that became a verse-drama form by the Koryo (918–1392) and Choson dynasties (1392–1910). In the courts of these dynasties, skits satirizing corrupt officials were often presented; one skit concerned a loyal soldier of the twelfth century, Ho Kong Jin.

Masked Drama and the Rise of Professional Organizations

In the Koryo and Choson eras, an important genre of dance-drama featuring masked performers began to be performed on upper-level stages, a practice that gave the name of the stages, *sandae* ("mountain platform"), to the presentations. Also in these eras, professional associations of performers, assembling to perform various specialties, aided dramatic development. New political ideas, and especially the dictate to reject Buddhism and respect Confucianism, influenced writings.

Furthermore, as a result of the schism between the aristocratic and common classes beginning in the Koryo period and continuing through the Choson era, performers began to specialize in particular skills. The *p'ansori*, or narrative song, became a popular entertainment under this continuing evolution of dramatic song and dance forms. Puppet plays staged by traveling performers were also a favorite attraction in the countryside. The dramas staged in many of the puppet plays are like those of the masked dance-dramas, and the same characters found in the *sandae* forms appear again as puppets.

Modern Korean Drama

In the twentieth century, Korea adopted Western realistic drama forms. Yi In-jik, returning from studying in Japan, wrote and staged the so-called New Dramas at the Wongaksa Theater in Seoul beginning in 1908. He was followed in 1911 by Im Song-gu, who focused on popular romantic sentiments in what became known as New-School Plays. The Drama Arts Society was organized in 1921, mostly by students returning from Japan, and the T'owolhoe (Earth-Moon Society) was formed in 1923 by students then studying in Japan. Though an amateur society, the T'owolhoe was consistently acclaimed for its high artistic standards and for introducing realistic themes. Its repertoire consisted mostly of original works written by its membership, but it also included translations and adaptations of world masterpieces. In 1931, the Society for the Study of Dramatic Arts was organized by the elite of Korea's theatrical and literary circles. This group presented great works of world drama as well as original scripts by its members.

Japanese authorities closed theater after theater during its rule over Korea (1910–1945), but the establishment of the Republic of Korea (1948) paved the way for a National Theater in 1950. The Drama Center of the Seoul Institute of Arts was established in 1962 by the dramatist Yu Chi-jin. Numerous young

writers in the 1970s adapted traditional theatrical forms such as the masked dance-dramas, shamanic rituals, and *p'ansori* into new works, a trend that influences theatrical practice to this day. O T'ae-sok is the most celebrated of the playwrights who have achieved national prominence. Drama in the 1990s has continued to flourish in Seoul with a growing interest in staging musicals.

DRAMA—SOUTH ASIA Dance-dramas, both classical and folk or popular, have long been a part of South Asian culture. Many of these forms draw on the epics of the *Ramayana* (c. 300 BCE) and the *Mahabharata* (c. fifth century BCE) for their story lines. Performance styles of folk forms vary greatly, often reflecting the diverse religious traditions of each region. Classical forms evolved out of the system of dramatic theory and practice found first in the Sanskrit theater and are still present in the South Asian region.

Sanskrit Theater (c. 1000 BCE–Twelfth Century CE)

The oldest dramatic form, Sanskrit theater, is often considered to have had its origin in the dialogues of the Vedic hymns of the Rig Veda (c. 1000 BCE); the Vedic ritual performances featuring song, dance, chant, and impersonation that were staged for various deities; or to have developed from epic recitations. The earliest extant critical work on Sanskrit drama, the *Natya Sastra* (attributed to Bharata; flourished second century CE), reflects a highly sophisticated tradition of dramaturgy and theatrical activity already in practice by this time.

Although scholars disagree, the *Natya Sastra* is generally held to reflect a theatrical tradition that began in the ancient Gandhara region, covering areas now located in Afghanistan, northern India, and Pakistan. A prescriptive work, it describes a rigidly fixed system of theatrical presentation, according to which staging

was crafted and plays constructed throughout the lengthy history of Sanskrit drama. At its base are four styles of performance—the Verbal, the Grand, the Energetic, and the Graceful—which are further divided into specific varieties of action. According to the *Natya Sastra*, from out of these styles derive ten dramatic classifications ranging from elaborate multiact plots of the *nataka* (concerned with stories and characters out of legends) and *prakarana* (requiring an "original" plot from the author) to simple balladlike forms performed by a single performer. All classifications work toward an aesthetic sharing of emotions (categorized into eight primary *rasa*, or "flavors") between the actor and audience. The remarkably persistent use of these presentational guidelines continued until the decline of Sanskrit drama, which began in the tenth century CE and was complete by the twelfth century CE.

On reading a Sanskrit drama for the first time, a reader is most immediately impressed by the melding of prose and poetry in the language of the play. The remarkably descriptive passages lead the audience to imagine the environment and, therefore, stage settings—necessary in traditional Western theater—can be dispensed with. The extant scripts were only a part of the complicated performance activity; because the staging of a play was considered in its totality a visual sacrifice in the *Natya Sastra*, ritual acts of dance, chant, and song were integral to the performance.

According to Bharata, a Sanskrit drama performance began with eighteen preliminary actions, the first nine involving various prescriptive means of tuning instruments and preparations for dancers and singers. A curtain was removed and the presentation began, according to the *Natya Sastra*, with a series of songs, ritual actions, and recitations. The ritual preliminaries continued with a short scene played between the stage manager, a clown, and an attendant. Finally, a brief synopsis of the play and an appeal for the success of the presentation were made by the stage manager.

The major Sanskrit playwrights include Asvaghosa (80?–150 CE), Bhasa (c. third century CE), King Sudraka (c. fifth century), Kalidasa (c. fifth century), Bhavabhuti (flourished 700), Harsa (c. 590–647), and Visakadatta. It is important to note that of the primary authors of Sanskrit drama, all except Bhasa (of whom the least is known) were members of court environments (two, Harsa and Sudraka, were kings). Sanskrit drama was written and performed by professional troupes for court audiences, and their authors, at least, were members of the highest social class. The royal patronage of Sanskrit drama certainly contributed to

its lengthy history, providing a sheltered environment for its traditions of highly codified activity to develop. The essence of Sanskrit performance, as dictated by the *Natya Sastra*, is still alive in the tradition of classical forms of South Asia.

Classical Theater Forms

The *kuttiyatam* of Kerala, the oldest extant theatrical form in India (and, quite possibly, in the world), probably began as a regional derivation of Sanskrit theater and became well-developed in its own terms prior to the tenth century. Performed by male actors born into a special caste of performers, *kuttiyatam* presentations originally took place only in theaters constructed in temple compounds, but they now may be seen occasionally in more commercial venues. Performances still include extensive preliminary ritual preparations and require a lifetime of training to achieve a level of virtuosity in various verbal and physical techniques that closely resemble those discussed in the *Natya Sastra*.

Classical Indian forms such as *bharata natyam* and *kathakali*, among others, owe much to the traditions formed in Sanskrit theater. *Bharata natyam*, while often classified as a dance form of South India, requires an increasingly dramatic portrayal from the solo performer throughout the course of an evening's performance. *Kathakali*, perhaps the most internationally known theater form of India, dramatizes the epics using a particularly vivacious style of acting melded with singing and dancing. *Chau*, a dance-drama form (masked in two of its three forms), is found only in three districts of western India and is considered a classical form by the elite of one district who once served as patrons. The *yaksa gana* of Mysore is a dance-drama form featuring not only actor-dancers but also a narrator who uses both song and recitation to establish elements of the story. The *kandyan* dramatic dance of Sri Lanka also demonstrates many Sanskrit features.

Folk and Popular Forms

While many of the numerous folk and popular dramatic forms of the South Asian region are related, most are specifically associated with a single region and, in many cases, linked to a particular urban or rural area. It has been argued that the sophisticated presentation of the Sanskrit theater developed out of popular forms, and, with its decline, various forms of popular theater reemerged from the remnants. While this may be true for some folk and popular theater forms, many others developed out of tribal practices.

The Bengali *jatra* originally focused on stories of Krishna but now characteristically presents social and political commentaries to enthusiastic audiences in Bangladesh and the Indian states of West Bengal, Orissa, and Bihar. *Svang*, a narrative, operatic form of North India, has influenced variant forms, such as the northern *nautanki*, the *khyal* of Rajasthan, and the *maach* of Madhya Pradesh. Amateur rural theater, performed in regional languages and focusing on social issues, has become especially important in Bangladesh, Kashmir, and Pakistan in recent years. Parsi theater, dating to the second half of the nineteenth century and featuring large-budgeted productions, toured the subcontinent—beginning in the 1870s, peaking in the 1890s, and dwindling after 1925—influencing the growth of similar theatrical enterprises.

The urban theater of Mumbai (Bombay) and Calcutta is well developed; over three thousand troupes are registered in Calcutta and over five hundred in Mumbai, while only a few dozen exist in each of the other major urban areas of Delhi, Colombo, and Dhaka. Most plays presented in the urban areas are realistic. The generally middle- and upper-middle-class audiences see Western plays in translation as well as farces, social dramas, and experimental productions in regional languages. Few actors or directors are able to sustain a living on the salaries earned for stage per-

formances; many (especially young actors in Mumbai) hope to secure passage into the more lucrative Hindi film industry through their participation in plays.

DRAMA—SOUTHEAST ASIA Numerous theatrical genres developed in Southeast Asia as a result of influences coming from India, the Islamic nations, and China. Additionally, as indigenous theater practices crossed national borders in the Southeast Asian region, they influenced new developments in adjoining countries. Finally, in many of the individual nations that collectively compose the region of

A man operates shadow puppets in a shadow theater in Wayang Kulit, Java, Indonesia, in 1992. (CHARLES & JOSETTE LENARS/CORBIS)

Southeast Asia, local forms evolved as specific responses to political and social conditions.

While primary elements of form differ between theater genres from area to area, certain dramatic elements are shared by most types of plays. Epic stories, often featuring the fall of kingdoms or great battles involving kings and gods, make up the dramatic text of performances throughout the region. Comic, serious, and farcical sentiments are collectively present in most plays, and most drama serves a didactic purpose, demonstrating the victory of good over evil.

Indonesia

Many ancient forms of theater are still popular in the Javanese-speaking area of the island of Java. *Wayang kulit* (leather shadow-puppet theater), the most popular form of theater in Southeast Asia, was well established by the time of its inclusion in twelfth-century court literature. Rulers patronized performances that took place during religious events. In *wayang kulit*, a *dalang* (a person functioning as a puppeteer, orchestral conductor, priest, and narrator combined) manipulates up to two hundred puppets in a drama beginning at dusk and continuing until dawn. A gamelan orchestra, composed of multiple chimelike instruments struck in repetitive rhythms, accompanies the action. The elegant puppets, intricately incised with cutout designs and subsequently coated with colored paint and gold, developed their current form between the thirteenth and seventeenth centuries. The movable arms of the puppets, especially effective in the display of battle actions, were added during the final period of this development. During the eighteenth century, puppet sets included up to 400 puppets. By the nineteenth century, puppet shapes and coloring had become fixed.

During the performance, the *dalang* sits on one side of a white screen (*kelir*), originally lit by the flickers of an oil lamp but today usually by electric light. Audiences may sit on either side of the *kelir*, the side opposite where the *dalang* sits being favored to see the shadows on the screen. By sitting on the *dalang's* side, however, his skilled puppet manipulation and his tour-de-force vocal performance can be more clearly observed. The cycles of plays performed in *wayang kulit*, collectively known as the *purwa* (old) cycle, feature Java's most ancient myths, including those borrowed from the *Ramayana* and the *Mahabharata*.

Several forms developed out of *wayang kulit*, each practiced almost exclusively in court environments. A derivative known as *wayang madja* (middle theater) employs leather puppets to tell stories of legendary Ja-

A Thai dancer performing traditional costumed dance. (CORBIS)

vanese kings. The shadow-puppet form of *wayang gedog*, created in the sixteenth century, dramatizes stories of the Javanese prince Panji. *Wayang klitik* uses wooden puppets enacting the rise of Damarwulan from village youth to national hero during the Majapahit era (1293–c. 1520). *Wayang dupara* depicts historic events from the central Javanese trade and cultural center of Surakarta. The Java War of the early nineteenth century provides the leather-puppet dramas of the *wayang Djawa*, and the period of Dutch rule is portrayed in the *wayang wabana*. *Wayang beber*, a puppetless form originally performed as a religious ritual, features a *dalang* punctuating his presentation by referring to illustrations painted on long scrolls, which he unwinds to musical accompaniment.

Wayang orang (literally, "human theater") also sprang up in the courts at some time prior to the fourteenth century. Stories taken from the mythology of early kingdoms were enacted by an unmasked human cast using dance and song, which was at times impro-

vised by the actors. Another form featuring human performers is *wayang topeng* (masked theater), which probably developed as a result of the influence of Indian dance dramas on indigenous animistic rituals. The *wayang Menak*, also known as *wayang tengul*, which uses leather puppets, depicts stories of the Islamic hero Amir Hamzah of the late sixth–early seventh century.

Developed in the twentieth century, *ketoprak* and *ludruk* are popular attractions. *Ketoprak* originated in central Java as a dramatic form based on stamping rhythms from rice-planting activities and uses dance-acting to dramatize Javanese legends. Performances today are fairly naturalistic and exclude dance, although both song and dance may precede the central play. Improvised dialogue is used by both male and female performers, and wing-and-drop scenery is conventionally employed. *Ludruk*, commonly associated with the city of Surabaya, developed in eastern Java. Although it traces its origins to an animistic form called *ludruk lerog*, today it is a realistic, spoken entertainment concerned with modern life; domestic comedies are particularly popular. Song and dance may be performed in the intervals between scenes, and a traditional dance known as *ngremo* precedes every *ludruk*. An unusual feature of *ludruk* is the appearance of female impersonators, rarely found in realistic theater forms in which women are included as cast members.

The western Sundanese region of Java developed a doll-puppet form called *wayang golek*. Because daytime performances were more popular than evening ones in this region, the doll-puppets supplanted the newly introduced *wayang kulit* during the nineteenth century. While Islamic themes with a proselytizing function initially supplied the dramatic content of *wayang golek*, present-day stories are intended primarily to entertain. The *dalang* has been replaced in most presentations by a female singer who performs popular songs. Sundanese theater also includes theatrical stagings called *sandiwara*, which may include dramatizations of scenes from the *Ramayana* and the *Mababharata* in the style of *wayang orang*, history plays presented in the style of *ketoprak*, or more realistic dramas depicting contemporary life.

Balinese *wayang kulit* is similar to its Javanese model, but simpler: the performance lasts only four hours, the puppet designs are less intricately patterned, and there are only sixty or seventy puppets in a set. Plots continue to be taken from the *Ramayana* and the *Mababharata*, but significant legends of the Balinese are also dramatized. In *wayang wong*, a Balinese derivative of *wayang orang*, characters often wear masks.

Since *wayang wong* was developed in the villages, the overall environment of a presentation contrasts greatly with the sophisticated court atmosphere of a *wayang orang* production. Only stories from the *Ramayana* are staged in *wayang wong*. Most important, where in *wayang orang* dance is featured, in *wayang wong* performers emphasize poetic recitation.

Wayang topeng is also popular in Bali, its masked performers remaining silent throughout the dance-drama in contrast to the presentation of Javanese *topeng*, in which characters may employ dialogue. A theatrical ritual known as the *barong* dance-drama presents a cosmic story relating the balance between good and evil. Chaos is magically ousted from the community through the reenactment of a fight between the lion-like figure of the *barong* and a witch named Rangda. Villagers, wielding sharp knives in a state of trance, join in the fight but neither Rangda nor the *barong* can be destroyed: the play's conclusion is a balance demonstrated between the forces of good and evil.

Thailand

Traditional Thai theater consists of several performance genres. The two most important classical forms are the *khon*, a masked court dance-drama in which scenes are staged from the *Ramayana* (called *Ramakien* in Thailand), and the *lakon*, a term covering various forms of dance-dramas. In addition, there is *likay*, a rural folk play in which actors boisterously improvise comic or melodramatic dialogue interspersed with dance and music, as well as *nang yai* or *nang talung* shadow-plays, found in southern Thailand.

The *khon* masked drama adopted movements from Indian temple dancing. During the Ayutthaya period (1350–1767), the *khon* was enacted by male court retainers playing both male and female roles. By the mid-1800s, men and women were performing together. *Khon* performances are characterized by their combination of song, dance, and acting. Actors and actresses are masked, and only clown characters speak onstage; narrative verses are usually recited and sung by a chorus sitting with the accompanying woodwind and percussion musical ensemble.

Generally in *lakon* and *khon*, little scenery is used, but costumes and props can be very elaborate. The oldest form of *lakon*, and indeed of all Thai theater, is the *lakon jatri* or "sorcerer theater." Beginning as an animistic ritual, *lakon jatri* developed into a dramatic form after Indian dance traditions were introduced into the telling of the Buddhist *jataka* tale of Manora; the theatrical form itself came to be known as *manora*. During the fourteenth century, *lakon jatri* arrived in

the central capital and evolved into *lakon nok* (also called *manora*), which relies less on dance and more on contemporary dialogue and bawdy humor.

Likay, a popular theater genre, developed at the beginning of the twentieth century. *Likay* is found primarily only in Bangkok today, but during the 1920s and 1930s hundreds of *likay* troupes attracted audiences throughout Thailand. A solo singer initiates the performance; then an actor engages the singer in a dialogue and introduces the drama. Common stories are taken from literature or history.

The puppet theaters of Thailand include both doll and shadow-theater forms. The *nang yai* shadow-theater is an ancient form that influenced the development of *khon*. Scenes from the *Ramakien* are performed to musical accompaniment.

Under King Chulalongkorn, Western forms of drama began to be popular. Shakespeare's *Romeo and Juliet*, *As You Like It*, and *The Merchant of Venice*, as well as a number of English, French, and classical Sanskrit plays were translated by King Vajiravadh. Today many playwrights produce dramas written in the form of Western spoken drama or in a fusion of Western spoken drama and traditional Thai forms. One of the most widely produced playwrights is Supa Devakul, a writer of popular novels and of plays for stage and screen.

Laos

While few, the theater forms of Laos are diverse. *Mob lam* (literally, "singer of *lam*") is a folksinging performance originally involving a duet composed of a singer and a *khene* (reed organ) player. Developing out of the Buddhist melodic storytelling popular since the first millennium CE, early forms of *mob lam* included topics such as accounts of local and court news, bawdy ditties, and epic stories from the *Rama Jataka* (the Laotian *Ramayana*, containing strong Buddhist elements). Today, the popular presentations feature two singers competitively improvising love poems, according to strict traditional formulas.

In another form of *lam*, *lam luong*, the *mob lam* originally enacted all the roles, changing costume and movement with each character. Now, influenced by Thai *likay*, as many as thirty people perform the various roles.

Modeled after Khmer court performance in the fourteenth century, Laotian court theater (*lakon phrarak phraram*) included female dance, masked male dance, shadow-theater, and musical presentations. Patronized by the court, the elegant presentations were

refashioned to favor Thai stylistic elements after the Thai conquest of the Khmer kingdom. Remnants of *lakon phrarak phraram* are now occasionally staged in Laos and in overseas areas to demonstrate traditional culture.

Modern spoken drama (*lakon wau*) was introduced to Laos during the early 1980s. Today the National Drama Company presents works derived mainly from improvisations or adapted from Laotian legends, as well as translations of Western classics.

Cambodia

Thirteenth-century reliefs found at Angkor Wat testify that a form resembling Indian dance existed in the Khmer courts. Indian dance, and possibly dance-drama, probably accompanied Buddhism into Cambodia between the fourth and ninth centuries. Javanese dance-drama was also brought into the Khmer court by its Javanese founder, Jayavarman II (802–869). The court asserted its cultural identity by evolving an elegant classical dance-drama tradition maintained until the fall of Angkor in 1431. At this time, Siamese (Thai) forces transplanted the Khmer court along with its theatrical forms to Siam. During the nineteenth century, Thai classical dance, modeled after the transplanted Khmer dance-drama, was carried back into Cambodian courts; further developments created a repertoire of dance-dramas performed until the Pol Pot massacre of court performers. The government of Cambodia now cultivates this traditional dance, previously restricted to the court, at the National Theater Company, which also features Khmer shadow-puppetry and circus. Her Royal Highness Bopha Devi, a former classical dancer and the daughter of King Sihanouk, is now the minister of culture and is actively seeking to restore the vitality of Cambodian arts, including drama.

Popular twentieth-century theater forms include *lakon yike* and *lakon bassac*. *Lakon yike* resembles Thai *likay* in that both mix classical and contemporary choreography and instrumentation. *Lakon bassac*, featuring traits found in classical Vietnamese theater, Khmer theater, and even Hindi and Western movies, developed as traveling performers of different styles stopped at villages along the Bassac River. Modern spoken drama, originally in French, entered Cambodia in the 1940s. Plays focus on Khmer society.

Myanmar (Burma)

Sixteenth-century traveling entertainers performed Burmese spirit-plays, wherein a clown played the primary role. The existing *nat pwe*, in which a medium

performs Indian-like dance movements, descends from this form.

Captured Thai prisoners brought Thai classical dance-drama into the Burmese courts in 1767. At first presenting the Thai *Ramayana*, Burmese dramatists soon crafted their own adaptations and wrote new plays based on Burmese stories, until the demise of the court dance-drama with the British conquest a century later. Musical and dance characteristics of the Burmese courts continue, however, in the classical *zat pwe* musical plays found in central and southern Burma.

Vietnam

From the thirteenth through the early twentieth centuries, Chinese opera was reconfigured to please Vietnamese courtiers. While the new plays reflected Vietnamese concerns, performance elements continued to use costuming and makeup, conventionalized action, and symbolic use of scenery found in traditional Chinese opera. Popular throughout central Vietnam until the end of the nineteenth century, *bat boi* has practically disappeared since losing its court support. In the twentieth century, two popular variations of *bat boi* evolved: *tuong tau* and *cai luong*. Each adopted Vietnamese melodies, replacing the Chinese musical system of *bat boi*. Both added scenery and sought new dramas from Vietnamese history and love stories. The *tuong tau* repertoire was eventually subsumed into *cai luong*, effectively combining the two forms into one.

Modern spoken drama (*kich*) began in the cities with the introduction of French plays. It developed a variety-show format in which a half-hour play follows two hours of musical entertainment.

One of the most unusual forms of puppetry in the world is also found in Vietnam. Puppeteers stand on one side of a body of water and by using long strings operate puppets located on an island or a boat between the operators and their audiences. The spectators gather on the banks of the opposite shore to watch.

Malaysia

Javanese *wayang kulit* was introduced into Malaysia prior to the sixteenth century. Presented in Malay, stories came from Hindu and Islamic sources. An ensemble of Malaysian instruments replaced the Javanese gamelan. Some regional dance-dramas resemble Thai *likay* in their combination of dance, drama, opera, and comedy.

Bangsawan originated in Penang in the late nineteenth century. An operatic theater form, it combines

improvised dialogue, singing, dancing, martial combat, music, poetry, and comedy. Chinese opera is also popular with the Chinese community, although it is now in danger of losing its audiences since many younger Malaysian Chinese do not speak Chinese.

The Philippines

Epic recitations, brought by early Malay and Indonesian settlers and possibly also emerging from the early Negrito culture of the indigenous population, date to the pre-Hispanic era in the Philippines. In the seventeenth century, Spanish missionaries created the *moro-moro* play, or *komedya*, dramatizing through marches, stage combat, and music the Christian conquest of the Moors. A passion play, known as *sinakulo*, is still enacted during Lent.

During the period of U.S. colonization (1898–1945), the operetta form of the *zarzuela* was played before officials and traders. Anti-American sentiments and other social concerns fueled new dramas. Subsequently, companies turned primarily to Western drama, staging Shakespeare and musicals. Noted modern Filipino playwrights include Wilfrido Ma, Guerrero, Severino Montano, and Bienvenido Noriega.

Singapore

Reflecting its ethnically diverse population, Singaporean theater includes nonprofessional Chinese opera, called *wayang* by the Singaporeans; *bharata natyam* and *kathakali* (Indian classical dance forms), danced by committed amateurs in the Indian community; and Western dramas, musicals, and experimental forms staged by young directors. Singapore is home to Southeast Asia's largest performing arts complex, the Esplanade-on-the-Bay, and interest in theater has steadily grown since the early 1990s, when the government reversed its previous stance opposing theater and acknowledged theater as economically important to the community.

Brunei

Since the nation of Brunei Darussalam achieved independence from Britain in 1983, both government and nongovernment organizations have been established to support the preservation of traditional theater forms and the development of new dramas and musicals. Primary producing groups include the Senandung Badaya Groups (KKBS), Rusilia, Darah Kedayan, Putera Seni, Kastea, and Astrawani. Traditional performances are generally dramatic pieces featuring various combinations of song, dance, humorous banter, trance, and martial arts display. The most pop-

ular forms are performed on special occasions such as marriages (*alus jua dindang*, song-dance), harvests (*aduk-aduk*, dance and the martial art form of *silat*), coronations (*alai sekap*, dance), festivals (*henari*, dance and humorous banter), or as cures for sicknesses (*anding*, trance dance).

DRAMA—THAILAND The principal traditional dramatic genres of Thailand are *khon* (masked drama), *lakhon* (dance-drama), *likay* (folk opera), *nang* (shadow theater) and *hun* (puppet theater). While there is a secondary school that specializes in training children to become classical performers, opportunities to pursue a career in traditional theater are extremely limited, for public performances are few and far between. Thai scholars writing in the 1930s often lamented the decline of traditional theatrical genres. Attempts to revive and revitalize the traditions have had limited success, although drama continues to be widely promoted as a symbol of national identity. Images of Thai classical drama are represented widely in advertisements and greeting cards in the form of souvenir dolls, ornamental *khon* masks, and miniature shadow puppets, while much-abbreviated performances are staged in restaurants for the benefit of foreign tourists.

Khon

The origins of *khon* are uncertain, but the prototype is generally believed to have existed in the fourteenth century CE. The most distinctive feature of *khon* performances is that nearly all the actors, with the exception of those taking female roles, wear elaborately painted masks. Performances are based on episodes in the *Ramakien* (the Thai retelling of the Hindu epic the *Ramayana*), with battle scenes in which the hero Phra Ram vanquishes the villain Thotsakan particularly popular. It is a convention of Thai theater, however, not to portray Thotsakan's death onstage, as it is be-

A Buddhist puppet used in Thai drama. (WERNER FORMAN/CORBIS)

lieved to bring misfortune. The story is narrated in verse by a chorus and there is an accompanying musical ensemble. The style of dancing and martial posturing, unlike the *lakhon* style mentioned below, puts emphasis on leg and body movements rather than refined hand gestures. Until the 1930s all parts were taken by male actors.

Lakhon

Lakhon emerged during the Ayutthaya period (1351–1767). It is subdivided into *lakhon nok* (dance-drama of the outside), performed outside the royal court, and *lakhon nai* (dance-drama of the inside), performed within the royal court. The differences between the two lie in the stories performed, style of dancing, musical accompaniment, and costume. The

stories performed in *lakbon nai* are taken from the epic poems known as the *Ramakien*, *Inao*, and *Unarut*. Traditionally, and as still practiced, women took both male and female parts, with men confined to playing the part of clowns. Performers do not wear masks unless taking the part of monkeys or demons; graceful arm movements and elaborate hand gestures are the outstanding characteristics of the dance movements, which are accompanied by an offstage chorus and a small orchestra. By contrast, *lakbon nok* is a folk dance-drama that employs faster dance movements, more action, and scenes of comedy and melodrama; its repertoire is drawn from the *jataka* tales (tales of the past lives of the Buddha). *Lakbon nok* was traditionally performed by an all-male cast but later by mixed casts.

Likay

Likay is a part of traditional popular "low culture." It appeared toward the end of the reign of Rama V (1868–1910), blending elements of *lakbon nok* with music, singing, and dancing of Indian or Malay origin. A *likay* troupe traditionally consisted of a mixed cast of between twelve and forty players and musicians. It would normally perform on a makeshift stage at temple fairs, markets, and other public gatherings, using garishly painted backdrops for scenery. Its repertoire was drawn from well-known historical tales, folktales, and literary works, featuring an array of kings, clowns, and star-crossed lovers. The *likay* audience, which tended to be made up largely of lower-class women, did not expect highly stylized and polished performances from the comically overdressed and gaudily made-up cast. *Likay's* charm came from its brashness, its vulgarity, the amateurishness of the untrained performers' movements, and the often-bawdy improvised dialogue; and at the same time it provided a relaxed backdrop for gossiping, eating, drinking, and chewing betel. Today *likay* is a rapidly dying art form; although it could still be seen and heard regularly on the television and radio in the 1980s, it faces ever increasing difficulty in competing to attract young audiences away from newer, more sophisticated forms of entertainment.

Nang

Nang is the traditional Thai shadow play, developed during the Ayutthaya period; it employed large, elaborately drawn figures or scenes, usually taken from the *Ramakien*, which were embossed on dried buffalo hide and painted. They were then mounted on two sticks so that they could be held up, either in front of or behind an illuminated white sheet, which served as background. A chorus narrated the story while the shadow puppets

were moved across the screen by men who adopted dancing postures and steps to fit in with the story. It has been speculated that the shadow theater was a possible precursor of the *khon* masked drama, which was likewise originally performed before a screen, and in which the masked characters still try to present a side profile to the audience rather than a full face. Another kind of shadow theater, *nang talung*, which originated in southern Thailand, employed much smaller figures, each of which had one arm that moved. The first surviving references to *nang talung* are during the reign of Rama V, when it was introduced to Bangkok, but its origin was doubtless much earlier.

Hun

Now resurrected only occasionally, this traditional puppet theater, which dates from the nineteenth century, was confined to the royal elite. The string puppets were beautifully crafted and dressed in elaborate costumes; unlike Western puppets, their legs and arms were manipulated from below. Plays were taken from classical tales. A new form of puppet theater, *hun krabok*, emerged during the reign of Chulalongkorn (Rama V; reigned 1868–1910) in which the puppets' arms and legs were manipulated by bamboo rods; plays performed in this style usually offered scope for slapstick humor and the genre continued to enjoy some popularity up to the late 1940s. In recent years university drama departments have played an important role in trying to preserve the dying art of *hun krabok*.

During the reign of Chulalongkorn there was an attempt to introduce a "sung drama," *lakbon rong*, imitating Western operetta, while Rama VI (reigned 1910–1925) actively wrote and promoted Western-style plays, termed *lakbon phut*, as a means of promoting patriotism. In the 1930s the nationalistic plays of Luang Wichitwathakan were given government support, while less didactic plays began to appear during the 1940s when the import of foreign films was banned. Today, live Western-style plays are produced almost exclusively in university drama departments and reach only a very limited audience.

DRAVIDIAN LANGUAGES In terms of the number of speakers the Dravidian language family is the fourth or fifth largest in the world. It consists of at least twenty-three languages spoken primarily in South Asia by about 230 million people. Zvelebil's 1997 survey enumerated eighty-eight languages, most of which are unwritten (nonliterary, preliterate), and many of which are probably dialects of other known languages. Some of these languages are reportedly spoken by 350 speakers (Allar or Chatan in Kerala) or even fewer (Wishavan or Malarkuti, 150 speakers, in Kerala; Cholanaickan of Nilambur forest, Kerala, 20 speakers).

The Indian Constitution (1951) established the creation of states in the Indian Union along linguistic lines. Four Dravidian languages, Telugu (55 million) in the state of Andhra Pradesh, Tamil (48 million) in Tamil Nadu, Kannada (27 million) in Karnataka, and Malayalam (27 million) in Kerala, were recognized as official languages. All of them have written literature of high quality and great antiquity, with early inscriptions in all four dating to between the third century BCE and the ninth century CE. In each language literary composition began one or two centuries after the first inscriptions. Each of these four literary languages developed a distinctive writing system (so-called alphasyllabic scripts), which can be traced back to southern varieties of the Asokan Brahmi script (used in India from around 250 BCE). A number of Dravidian words have made their way into English (e.g., rice, pepper, ginger, mango, coir, curry, cheroot, catamaran, carborundum).

Languages of the Family

The Dravidian linguistic family is usually described in terms of four subgroups: South Dravidian, South-Central Dravidian, Central Dravidian, and North Dravidian. These subgroups were established according to typological similarities and diachronic or historical reconstructions.

Apart from the three great literary languages of Tamil, Malayalam, and Kannada, South Dravidian encompasses a number of nonliterary or preliterate languages, including Kota, Toda, Irula, Kurumba, Kodagu, and Tulu. Tamil is one of India's two classical languages, alongside Sanskrit, and the only one of the two with continuity between classical and modern forms. Tamil has a number of regional and social dialects and is also spoken outside India, in Sri Lanka, Malaysia, South Africa, and elsewhere.

Between 800 and 1200 the western dialects of Tamil developed into Malayalam, spoken mostly in Kerala; Malayalam speakers boast the highest literacy rate in

the Indian Union. The Nilgiri Mountains are home to a number of nonliterary languages such as Badaga, Kota, Toda, Irula, and Kurumba. Despite the small number of speakers, these languages have attracted linguistic, anthropological, and cultural interest. Kodagu is spoken only in the Coorg district of Karnataka. Tulu is probably the first language to have branched off from proto-South Dravidian; traditionally described as a nonliterary language, it has been written down for about the last 250 years in Malayalam and Kannada scripts.

South-Central Dravidian includes a great literary language, Telugu, and six nonliterary languages spoken in parts of central India: Gondi with numerous dialects, Koya, Konda, Kui, Kuvi, Pengo, and Manda. Telugu is the Dravidian language spoken by the greatest number of speakers (more than 60 million) and has four regional dialects and important ancient and modern literature. Among the other languages, Konda seems to be the most phonologically conservative of the group. Kui, Kuvi, Pengo, and Manda, are closely related and, unlike other Dravidian languages, have devised a system of object-verb agreement.

Central Dravidian includes five nonliterary languages, Gadaba, Kolami, Naiki, Ollari, and Parji, spoken in central India. Whereas South Dravidian languages developed the use of the auxiliary verb *iru* "be," Central Dravidian has not lost the ancient perfect tense auxiliary verb *man* "be."

North Dravidian languages include Brahui, spoken in Baluchistan, a province of Pakistan, and considered the first to branch off from the Dravidian protolanguage. Kurux (alias Oraon) is spoken in northeastern India and Bangladesh. It is also spoken in Nepal, where it is known as Dhangar or Jhangar. Striking in its grammar is a distinction between men's and women's speech, found also in the third language of the group, Malto (northeastern India, Bangladesh).

The count of the number of Dravidian languages and their speakers has steadily increased. The "father" of Dravidian linguistics, Robert Caldwell (1814–1891), listed nine languages in 1856, while a 1997 survey listed about ninety. Because of the absence of adequate description, it is impossible to decide whether all these languages are new or merely various forms of known languages. However, new Dravidian languages are likely to be discovered, particularly in central India and the mountains and forests of southwestern India.

Historical Dimension

Nothing definite is known about the ancient domain of the Dravidian ancestral speech. Dravidian

speakers must have been widespread throughout India because numerous features of Dravidian vocabulary and grammar appear in the Rig Veda, the earliest known Indo-Aryan literary composition. Proto-Dravidian probably existed as a single language as late as 4000 BCE, when the linguistic unity of Dravidian began to disintegrate, and distinct branches and individual languages began to develop.

The divergence of the last major branch, South Dravidian, might have taken place around 1500 BCE. The arrival of Dravidian speakers in India is shrouded in mystery, but linguistic evidence suggests that the present locations of Dravidian languages resulted from several distinct movements. Brahui, Kurux, and Malto may represent surviving islands of a speech once extant all over northern India and Pakistan. A widely accepted hypothesis proposes that ancient Dravidian speakers traveled from the mountains of eastern Iran to south India and ultimately to Sri Lanka, "dropping off" groups of languages along their way. This movement might have taken place between c. 4000 and 1500 BCE. Along the route various Dravidian speech-forms peeled off the main stock, and some of them may have played an important role in the ethnolinguistic composition of the Indus Valley (Harappan culture).

Dravidians continued to move until the southernmost part of the peninsula was reached by the proto-Tamils, who, between c. 600 and 400 BCE, established the first historically recognizable literate and cultured Dravidian-speaking civilization, with the adaptation of Emperor Asoka's (reigned c. 265–238 BCE) Southern Brahmi script to preliterary Tamil.

Characteristics of Dravidian Languages

The morphology of Dravidian languages is agglutinating and exclusively suffixal. An agglutinative language incorporates separate formal units of distinct meaning into a single word, but Dravidian morphology also distinguishes between so-called free and bound forms. Free forms are "words," and bound forms are "clitics." There are some elements of internal flexion (the alternation of short and long vowels in derived words) as well as regular alternation in vowel and consonant qualities in the root. Relatively low receptivity to change resulted in a slower rate of diachronic (historical) development than in Indo-European languages. The degree of phonetic divergence among the Dravidian languages is not very great; hence etymologies are not too difficult to discover. Proto-Dravidian seemed to have had just two parts of speech, noun and verb, identified by their characteristic inflectional morphology. The reconstruction of further parts of speech such as adjectives and adverbs in the pro-

tolanguage is controversial, but the daughter languages originated other parts of speech (word classes). In any study of Dravidian both evolution and diffusion must be taken into account.

The Sounds of Dravidian

The two most striking features of the proto-Dravidian sound-system are the surprising number of apical stop (plosive, obstruent) phonemes (perhaps the world's maximum) and the total absence of sibilants. The protolanguage contained five pairs of vowels, both short and long: *a, ā, i, ī, u, ū, e, ē, o, ō*.

There is no evidence for the reconstruction of diphthongs. The most important vowel developments are the gradual elimination of the contrast between short and long *ē* and *ō* in Brahui and the merger of proto-Dravidian *ī* and *ū* with *ē* and *ō* in South Dravidian before a consonant plus *ā*). The proto-Dravidian set of stops exhibits a six-way contrast: voiced stops are allophones of their voiceless counterparts in the protolanguage. Most consonant clusters appear only at morpheme boundaries; hence no consonant clusters occur in root morphemes, which are essentially monosyllabic. The prosodic structure of Dravidian is quantitative rather than qualitative. Only a limited number of syllabic structures can occur in the protolanguage. Several important and regular prosodic alternations have been reconstructed for the protolanguage. Stress occurs in many Dravidian languages but is not distinctive. It typically falls on the first syllable of a word. Some languages developed, after the loss of vocalic peaks, long consonant clusters: for instance the Kota *anzrčgčgvdk* "because of the fact that (someone) will cause (someone) to frighten (someone)."

Grammatical Features

Dravidian words consist of two or more morphemes strung together in the agglutinating process in a linear fashion from left to right with minimum morphophonemic intervention. Morphemes appear in the order (lexical root [+ derivative suffix] + inflectional suffix). Nouns are inflected for case and number and secondarily for person and gender. There are two numbers, unmarked singular and marked plural. The proto-Dravidian gender system apparently distinguished between human (animate) and nonhuman (inanimate) nouns. Animate nouns were often further divided into masculine and feminine. First person plural of pronouns distinguished between inclusive plural "we and you" and exclusive plural "we but not you."

Proto-Dravidian verbs distinguished two tenses, past and nonpast. The present tense developed inde-

pendently in various languages. Verbs also distinguished between affirmative and negative forms. All verbs were either finite or nonfinite (these last do not mark subject-verb agreement). A characteristic derivation is that of "pronominalized" (alias "personalized") nouns, for example, Tamil *īlai* "youth": *īlai-y-am* "young-we."

In a sentence, however complex, only one finite verb occurs (normally at the end), preceded (if necessary) by a number of nonfinite forms: for instance Tamil *rāmaṇ vantu eṇṇai-p pārttu ōṭi-p pōṇāṇ* "Raman came, saw me, and ran away." The determining member always precedes the determined: Tamil *pon* "gold" + *nakaram* "town": *ponnakaram* "golden town." Word order follows certain basic rules but is relatively free; however, the most frequent normal word order is subject-object-verb.

Vocabulary

Different Dravidian languages were receptive to loanwords in differing degrees. The existence of many cognate words of Dravidian origin (i.e., exhibiting no "outside" etymological relationships) and systematic correspondences among them enabled scholars to establish a Dravidian linguistic family, based on a comparative lexicon.

Among the literary languages Tamil has the lowest number of Indo-Aryan loanwords (18–25 percent, according to the style), although the modern spoken language adopts loanwords from English and other non-Indian languages. In Malayalam, Kannada, and Telugu the percentage of loanwords is higher. The most important sources of loanwords have been Sanskrit, Pali, Prakrits, and later Urdu, Portuguese, and English. There was not much lexical borrowing from one Dravidian language to another. Brahui was obviously most influenced by borrowing, mainly from Indo-Aryan and Iranian. In contrast Toda of the Nilgiris was probably least influenced by any other language.

At the beginning of the twentieth century a movement called "Tamil Only" was initiated to remove Sanskritic elements from the Tamil vocabulary and replace them with Tamil ones. This linguistic purism is still active, but similar movements have not occurred in the other cultivated languages.

Writing

Tamil, Malayalam, Telugu, and Kannada have phonologically based writing systems and are written from left to right. All these scripts are derived from South Indian Brahmi, used from around 250 BCE as

the medium of Buddhist inscriptions, carved at the orders of Emperor Asoka (reigned c. 265–238 BCE). In the script each consonant is represented by a consonantal symbol; a following short vowel *a* is considered inherent in each consonantal symbol. All other vowels are written as obligatory diacritics; a vowel in an initial position has an independent symbol. Consonants may also occur in sequences, particularly in words borrowed from Sanskrit (e.g., *str*). Writing systems of this Indic type, which indicate consonant-vowel combinations by vowel diacritics obligatorily attached (above, below, in front, or behind) to the consonants, are rather rare in the world. Such systems are usually called alphasyllabic, suggesting similarities with both alphabets and syllabic systems. The traditional order of symbols in all South Indian scripts is based on articulatory phonetics as developed from Sanskrit (i.e., *a ā ī ū e ē o ō . . .* etc.).

External Links of Dravidian

The Dravidian linguistic family is what is usually called an isolate; that is, no external (non-Indian) linguistic genetic kinship has so far been convincingly proved. As soon as Dravidian became known to Western scholarship and recognized as an independent linguistic family, the question arose of its origin and possible genetic kinship with other languages and language families. Among the possible candidates for such genetic relations were Scythian, Nubian, Finno-Ugric, and Japanese. The most plausible candidates are Elamite and Ural-Altaic. A few scholars explain Ural-Altaic and Dravidian affinities by actual genetic relations; however, although the typological and even material similarities may be striking, they can probably be explained by widespread diffusion and borrowing due to multilingualism, ethnic mixture, conquests, dominance movements, or accidental events somewhere in Central Asia—an area of prolonged and ancient contacts—rather than by genetic relations. Several scholars, particularly archaeologists, have accepted the Elamo-Dravidian hypothesis as almost a fact, but it too seems dubious for several valid reasons. Even less convincing is the Japanese connection. The most provocative hypothesis is the Indus Valley (Harappan) connection, which maintains that the language on the (as yet undeciphered) Harappan seals was an early form of Dravidian. None of the hypotheses of genetic relations is to be rejected without further rigorous study. There are still no adequate descriptive studies of most Dravidian languages, particularly their historical development, and no critical editions of the earliest texts in Dravidian. The reconstruction of proto-Dravidian itself is fragmentary and provisional.

As long as it remains so, the external links and possible genetic affiliations remain in the realm of typological and etymological speculations. This presents Dravidianists with a great challenge and opportunity. Among the tasks ahead is, above all, the full descriptive study of the various languages (including their dialects); a full diachronic, historical treatment of their development; and a new, revised etymological analysis and description of their respective lexica.

DRUG TRADE Asia has a long history of dealing with psychoactive substances. Many of them have existed from time immemorial all over the continent. Various places established traditional uses for some drugs and even integrated them into social codes. However, today's drug trade in Asia threatens the health and safety of its population as well as the stability of its countries. The drug trade is shaped and spurred by mercantilism and grows on the fertile and complex terrain of poverty and armed conflicts. In fact a direct relation between drug production, poverty, and war appears to exist. Thus drug production and trafficking can be perceived as the outcomes of economic as well as political events.

History

The first stage in the Asian commerce in drugs was probably the opium trade along the numerous and far-reaching precursors of the Silk Road and the early Chinese maritime trade that reached Africa by the first century BCE. However, the opium poppy, *Papaver somniferum L.*, most likely a European plant, was spread throughout Asia mainly by the Arab traders who transmitted it to the Indians in the seventh century and to

the Chinese a century later. It is questionable whether the Arabs themselves actually introduced the opium poppy into these areas, since early Indian traders or Buddhist pilgrims may have done it, but Arab traders undoubtedly were the main contributors to its commercial spread as a cash crop.

The next stage in the opium commerce was taken by European maritime colonial powers, who used it to balance their trade in spices and tea with Southeast Asia and China: first by the Venetians (in the fourteenth century), then by the Portuguese and the Dutch in the sixteenth century, and finally by the British from the seventeenth century and on. Through their powerful East India Company (founded 1600), the British brought to China opium originating in the poppy fields of India, where it had long been produced by the Mughal rulers. This led, in the mid-nineteenth century, to China's two Opium Wars, first with the British and second with a British-French coalition. The treaty of Nanjing (1842), which ended the first war, gave Hong Kong to the British; it went on to become the world's heroin hub. China, confronted with exploding opium consumption, eventually fostered local poppy production as a way to balance its growing trade deficit.

After the southern migration of some opium growers from Yunnan, pressured by imperial political repression and, later, by the enforcement of communist prohibition, opium production spread from China into Southeast Asia, which became the Golden Triangle (Burma, Laos, and Thailand), a precursor to the Southwest Asian Golden Crescent (Afghanistan, Iran, and Pakistan). Opium was integrated as a trade commodity, but it needed improvements to increase its global marketability. Consequently, after heroin was synthesized from opium in 1898, producers were able to transform opium into heroin, a product with a greater efficacy that was easier to trade than the bulky opium.

The Twentieth Century

Opium poppy production expanded to almost everywhere in Asia, from Turkey in the Near East to Japan in the Far East, along the succession of mountain ranges that stretch across Iran, Afghanistan, Pakistan, India, Burma (Myanmar), Laos, Thailand, Vietnam, and China, as well as in Russia and the Central Asian republics. Nonetheless, the opium poppy is of course not the only psychoactive plant thriving in Asia. *Cannabis sativa L.*, consumed as either marijuana or hashish, is prevalent as well. In fact Lebanon, Turkey, Afghanistan, Pakistan, India, Nepal, Thai-

THE TREATY OF NANJING

The Treaty of Nanjing between China and Great Britain marked the conclusion of the Opium War and the opening of trading ports to Britain. The Treaty heavily favored Britain.

Victoria, by the Grace of God, Queen of the United Kingdom of Great Britain and Ireland, Defender of the Faith, etc., etc., etc. To All and Singular to whom these Presents shall come, Greeting! Whereas a Treaty between Us and Our Good Brother The Emperor of China, was concluded and signed in the English and Chinese Languages, on board Our Ship the Cornwallis, at Nanking, on the Twenty-ninth day of August, in the Year of Our Lord One Thousand Eight Hundred and Forty Two, by the Plenipotentiaries of Us and Our said Good Brother, duly and respectively authorized for that purpose; which Treaty is hereunto annexed in Original:

Article I. There shall henceforward be Peace and Friendship between Her Majesty the Queen of the United Kingdom of Great Britain and Ireland, and His Majesty the Emperor of China, and between their respective Subjects, who shall enjoy full security and protection for their persons and property within the Dominions of the other.

Article II. His Majesty the Emperor of China agrees, that British Subjects, with their families and establishments, shall be allowed to reside, for the purpose of carrying on their Mercantile pursuits, without molestation or restraint at the Cities and Towns of Canton, Amoy, Foochow-fu, Ningpo and Shanghai, and Her Majesty the Queen of Great Britain, etc., will appoint Superintendents or Consular Officers, to reside at each of the above-named Cities of Towns, to be the medium of communication between the Chinese Authorities and the said Merchants, and to see that the just Duties and other Dues of the Chinese Government as hereafter provided for, are duly discharged by Her Britannic Majesty's Subjects.

Article III. It being obviously necessary and desirable, that British Subjects should have some Port whereat they may careen and refit their Ships, when required, and keep Stores for that purpose, His Majesty the Emperor of China cedes to Her Majesty the Queen of Great Britain, etc., the Island of Hongkong, to be

possessed in perpetuity by Her Britannic Majesty, Her Heirs and Successors, and to be governed by such Laws and Regulations as Her Majesty the Queen of Great Britain, etc., shall see fit to direct.

Article IV. The Emperor of China agrees to pay the sum of Six Millions of Dollars as the value of Opium which was delivered up at Canton in the month of March 1839, as a Ransom for the lives of Her Britannic Majesty's Superintendent and Subjects, who had been imprisoned and threatened with death by the Chinese High Officers.

Article V. The Government of China having compelled the British Merchants trading at Canton to deal exclusively with certain Chinese Merchants called Hong Merchants (or Cohong) who had been licensed by the Chinese Government for that purpose, the Emperor of China agrees to abolish that practice in future at all Ports where British Merchants may reside, and to permit them to carry on their mercantile transactions with whatever persons they please, and His Imperial Majesty further agrees to pay to the British Government the sum of Three Millions of Dollars, on account of debts due to British Subjects by some of the said Hong Merchants (or Cohong), who have become insolvent, and who owe very large sums of money to Subjects of Her Britannic Majesty.

Article VI. The Government of Her Britannic Majesty having been obliged to send out an Expedition to demand and obtain redress for the violent and unjust proceedings of the Chinese High Authorities towards Her Britannic Majesty's Officers and Subjects, the Emperor of China agrees to pay the sum of Twelve Millions of Dollars on account of the Expenses incurred, and Her Britannic Majesty's Plenipotentiary voluntarily agrees, on behalf of Her Majesty, to deduct from the said amount of Twelve Millions of Dollars, any sums which may have been received by Her Majesty's combined Forces as Ransom for Cities and Towns in China, subsequent to the 1st day of August 1841.

land, and Cambodia are among the most internationally renowned producers and exporters of cannabis. Kazakhstan for its part boasts the world's largest area of wild cannabis.

In Asia the production, trade, and consumption of opiates always have combined national and international issues and stakes. In fact the spread of drug trafficking in Asia and elsewhere is linked to its international prohibition. The 1955 Persian prohibition stimulated production in Afghanistan and Pakistan and affected even the distant Golden Triangle. In another example, Turkey began a long legal and power struggle with the United States in the early 1960s. In Turkey, poppies were grown legally for pharmaceutical purposes, and a large quantity of illicit opium was smuggled to France, where it was processed into heroin and subsequently shipped to the U.S. drug market. The United States pressured Turkey to institute a national prohibition against opium production, which, after many setbacks, Turkey instituted in 1972. The 1960s were bounded by two significant events that shaped the way all narcotic phenomena were addressed. In 1961 the United Nations Single Convention on Narcotic Drugs reinforced the previous multilateral agreements that had followed the 1909 Shanghai Convention. The main international concern then was heroin. In 1971 the administration of U.S. President Richard Nixon declared a "war on drugs," setting up the "carrot and stick" system that conditioned U.S. financial aid on drug eradication and thus favoring a bilateral, biased approach over the multilateral approach of the United Nations. Turkey's compliance in 1972 had deep repercussions in Asian trade, spurring the Golden Crescent's production and further linking Asia's various poppy-growing areas.

These pressures on the drug trade were nevertheless counteracted by the U.S. Central Intelligence Agency (CIA), which played a significant role in the drug trade in both Southeast Asia and Southwest Asia. Its anti-Communist covert actions benefited from the participation of some drug-related combat units who, to finance their own struggle, were directly or indirectly involved in drug production and trade. Considering the involvement of different groups in the drug trade (for example, the Hmong in Laos, the Nationalist Chinese [Guomindang] in northern Burma, and the Islamic mujahideen resistance [the party of Gulbuddin Hekmatyar, notably] in Afghanistan), their backing by the CIA implied that the agency condoned the use of drug proceeds and considerably increased opiate production in Asia. Hence the Golden Triangle and the Golden Crescent remain the world's two major opium production areas. The Golden Triangle

led world production until 1991, with Myanmar ranking at the top. After that date the Golden Crescent took the lead, with Afghanistan breaking previous records in 1999. (In 2001 the Taliban government forbade opium growing, and production plunged.) Opium production in these two areas can be attributed to the protracted civil wars that have plagued Myanmar since 1948 and Afghanistan since 1979. The atmosphere of conflict during the Cold War also contributed. In the late twentieth century Thailand, Iran, and Pakistan, former important opium producers, coped with growing narcotics trafficking and, even more disrupting, local epidemics of narcotic addiction. Conservative estimates in Iran and Pakistan show 2 million opiate addicts in each country, and the number continues to grow. Afghanistan, mainly a producer, is likely to become an important consumer, as indicated by the spillover in Central Asia. In fact Iran, previously the primary trading route, has succeeded in partially diverting Afghan smuggling toward Central Asia.

Thailand, Myanmar's neighbor, faces the same problems and has reoriented trading routes toward China, Laos, and Vietnam. Thailand is now emerging as a pioneer in new drug consumption patterns as amphetamine-type stimulants overtake heroin in the kingdom, with Myanmar massively producing such synthetic drugs in its Shan states.

Drug production and trade in Asia thus evolve and adapt to the market, be it opium, heroin, amphetamines, or ecstasy. These types of trade and consumption, ancient phenomena, have benefited from world globalization and conflicts. Rooted in poverty, the drug trade quickly grows on the ruins of development and its related political conflicts. Wars have proven to nurture the drug trade, and drug profits prolong wars.

DU FU (712–760), Chinese poet. Du Fu, who was also known as Zimei, is commonly recognized as the greatest poet in Chinese history and is referred to as the "Poet-Historian" or "Poet-Sage." The Tang dynasty (618–907 CE) was beset by the An Lushan rebellion just as Du Fu was seeking advancement as an official, so he experienced firsthand the decline of China's greatest dynasty. His own failures and frustrations in official life, criticism of the wrongdoings of those in power, praise of good officials, and sympathy for the common people became the main themes of his poetry, which presents a vivid picture of his troubled times. A prolific writer, with over 1,400 surviving poems, Du Fu was proficient in various poetic forms. He rigidly complied with the rules for regulated verse, but he also composed in various "ancient style" formal types, as well as creating new forms. Seen as exemplary in both prosody and morality, with his poems the focus of the attentions of generations of scholars and commentators, Du Fu became a paragon in traditional China for readers and poets alike.

DUCK AND GOOSE, DOMESTICATED

Along with swans, ducks and geese belong to the Anatidae family of large waterbirds characterized by webbed feet. Ducks differ from geese in having shorter necks and legs, but both are at home on lakes and ponds; geese commonly graze on grassland even at some distance from water.

The mallard (*Anas platyrhynchos*, about 60 centimeters long) was domesticated in Eurasia and was the ancestor of most domestic breeds of duck worldwide; today wild mallards live throughout the Northern Hemisphere. Ducks were domesticated in China probably as early as the seventh millennium BCE; there are ten native species in that country. From northern China and Japan came the small Mandarin ducks (*Querquedula mandchurica*), first introduced to Europe in 1830. The goose was also domesticated in China from the Chinese, or swan, goose (*Cygnopsis cygnoides*), the largest living goose, today native to Siberia and eastern Mongolia.

Both ducks and geese are farmed for their meat and eggs, and sometimes their down. Centuries ago, the Chinese had invented incubators made of pottery that were capable of hatching a thousand eggs.

Paul Hockings

DUJIANGYAN Dujiangyan is one of the world's greatest water engineering operations, dating from the Qin dynasty. For over 2,000 years the Dujiangyan complex has provided water to millions of Chinese citizens while protecting them and their farms from flooding, a situation rarely if ever achieved anywhere else. The complex is located near the city of Guanxian, 56 kilometers (35 miles) from Chengdu in Sichuan Province, central China. The name Dujiangyan means "the dam on the capital's river." Construction of the project began in 256 BCE and was directed by the engineer Li Bing and his son Li Erlang. Dujiangyan incorporates a dike of piled stones that divides the Min River, a tributary of the Chang (Yangtze) River, into inner and outer channels. The inner channel is diverted for irrigation, allowing, at the time of its construction, about 1 million hectares of the Chengdu Plain to be irrigated without danger of flooding, supporting a population of 5 million. The complex has been in continual use since its construction, and expansion of the project in later years, along with annual silt removal, allows about 3 million hectares to be irrigated today. The role of the two engineers is commemorated in the Fulong Guan, or Temple of the Harnessed Dragon (referring to the river), a place of veneration for Li Bing, and the Erwang Miao, or Two Kings Temple, memorializing Li Erlang. Dujiangyan was inscribed on the World Heritage List in 2000.

DULATOV, MIRZHAQYP (1885–1935), Kazakh writer, poet, dramatist, social activist. Mirzhaqyp Dulatov was born in 1885 in Turgai province to a poor family. His father and mother died while he was still young. His education started with a local mullah, and when he was twelve years old he enrolled in the

second class of the Russian-Kazakh school in Turgai. The education regime included studies in mathematics, history, geography, physics, philosophy, and other subjects. He quickly demonstrated talents as a skilled debater and musician. After graduating, he moved to Omsk to teach at a local school. He joined an underground Kazakh political organization and quickly established himself in local social movements. He became a staunch critic of the czarist government's policies and actively pursued reform that would alleviate the suffering among those Kazakhs who were forced to settle and give up their former nomadic way of life. In 1909 he published a book that was among the most important influences on the development of Kazakh national identity and consciousness. *Oian, Qazaq!* (Awake, Kazakh!) was a small collection of poems that attempted to rally Kazakhs to oppose the increased Russian migration to the steppe while identifying the internal disintegration of Kazakh society. For Dulatov and many other Kazakhs, the seizure of land came to symbolize colonial oppression and national humiliation. The work was criticized by czarist authorities and Dulatov was arrested several times for illegal political activities. In 1912 he published *Baqyt-syz Zhamal* (Unhappy Zhamal), the story of a poor Kazakh girl forced to marry against her will. It is regarded by many scholars to be the first novel in the Kazakh language. In 1913 he joined Akhmet Baitursynov on the editorial board of the Kazakh-language newspaper *Kazak*, contributing many articles during the next five years. In 1917 he became an essential leader of the Kazakh national movement Alash Orda (The Horde of Alash). Following the Bolshevik victory in the Russian Civil War, he joined the Communist Party and vigorously worked for Kazakh cultural autonomy, particularly in education. During the 1920s he published many more works about Kazakh history and culture and worked for the Soviet-Kazakh newspaper *Engbekshi Kazak* (Kazak Worker). In 1928 he was arrested for bourgeois nationalism and spent the next several years under constant surveillance. In 1935 he was arrested again and incarcerated in Solovetsk prison, dying of an illness while imprisoned.

DUNGANS Dungan is the Turkic name for Chinese-speaking Muslims living in various parts of Central Asia. Significant Dungan communities in the Central Asian republics of Kyrgyzstan, Kazakhstan, and Uzbekistan came to Central Asia from China in the nineteenth century. A Dungan population living along the Myanmar (Burma)-China border is known as Pathay, their Burmese name.

Dungans are descended from communities of Muslim merchants, soldiers, artisans, and scholars who established themselves in China under the Tang dynasty (618–907) and later under the Yuan dynasty (1206–1368). These groups intermarried with Han Chinese and adopted the Chinese language, and today they are physically indistinguishable from the rest of the Han population.

The Dungan communities of Kyrgyzstan, Kazakhstan, and Uzbekistan arrived in two waves in the late nineteenth century. The first group crossed the Tian Shan range in the winter of 1877–1878, fleeing to the Russian empire after the suppression of a Muslim revolt in southwest China. The second group was invited to resettle in the Russian empire after the Treaty of Peking adjusted the Russo-Chinese border in 1881. Many Dungans who had been Russian subjects chose to remain part of the Russian empire rather than pass under the authority of the Manchu emperors of China.

DUONG VAN MINH (1916–2001), last president of the Republic of Vietnam. Duong Van Minh was born in 1916 in My Tho in the Mekong Delta. He received military training in France and in 1955 became an army officer in the Republic of Vietnam. Known as "Big Minh" because of his size (he was over six feet tall), he gained notoriety in 1956 when he captured Hoa Hao sect leader Ba Cut and had him publicly guillotined. Later that year, President Ngo Dinh Diem stripped him of military power by making him a "special adviser."

On 1 November 1963, Duong Van Minh headed the Revolutionary Military Council that ousted Ngo Dinh Diem (1901–1963) from power. The following day, Diem and his brother Nhu were assassinated, re-

portedly on Minh's orders. In January 1964, Minh was overthrown in a coup led by General Nguyen Kahn. In 1971, Minh ran for the presidency of the Republic of Vietnam but withdrew because he could not seriously challenge Nguyen Van Thieu (1923–2001).

In April 1975, President Thieu resigned and Vice President Tran Van Huong appointed Minh president. He was the Republic of Vietnam's last president. On 30 April 1975, he was arrested when North Vietnamese army forces marched into the presidential palace. In 1983, he immigrated to France.

DURRANI Durrani was the dynasty that ruled Afghanistan from 1747 to 1842. It was founded by Ahmad Shah Abdali (1722?–1773), who gained his power and prestige through successful raids on India. He was elected king by a tribal council in Kandahar and adopted the title Durr-e-Durran (the pearl of pearls); from the title the dynasty acquired its name "Durrani."

It was during Ahmad Shah's rule that Afghanistan became an empire. By uniting the various warring factions, he was able to extend Afghan rule from Delhi, Kashmir, and the Punjab to Meshed and from the Amu Dar'ya River to the Arabian Sea. Thus, Afghanistan became the second-largest Muslim empire, surpassed in size only by the Ottoman empire to the west.

After Ahmad Shah's death in 1773, rule passed to his son Timur Shah (reigned 1773–1793), who spent most his reign suppressing uprisings. The fifth and last ruler of the dynasty, Shah Shoja (1780–1842), concluded a treaty with the British in India by which he agreed to oppose any passage of foreign troops through Afghanistan. This move was to negate Napoleon's plan to invade India with the help of Russia from the north. Eventually, Shah Shoja was overthrown by the Barakzai brothers, who in 1826 founded their own dynasty, which lasted until 1973, when Zahir Shah (b. 1914) abdicated. The Barakzai dynasty may once again play a role in Afghanistan, now that Zahir Shah has returned to Kabul, his old capital.

DUSHANBE (2002 est. pop. 581,000). Formerly named Stalinabad (1929–1961), Dushanbe is the administrative, industrial, and cultural center of Tajikistan, a small republic adjacent to Afghanistan, China, and other Soviet Central Asian successor states. The site appears to be level, but it is actually a series of gently sloping and rocky alluvial fans at the base of the Pamir and Hissar mountains in Southwest Tajikistan. The Varzob and Kofanihon Rivers flow through the city. Rough roads connect it to Tashkent, Uzbekistan (314 kilometers to the north), and the Afghanistan frontier post of Termez (230 kilometers to the south). The city's 690-meter elevation and interior Central Asian location produce a long, hot summer lasting from May until September, where many days exceed 38° C. Mountain breezes ameliorate the intense July and August heat. The cold winter (0° C January mean) lasts from November through February. An average 85 millimeter (3.3 inches) of precipitation arrives during heavy spring rains or sporadic winter snowfall.

Dushanbe began as three small settlements of modest single-story rock and mud structures that served as the eastern administrative center of the Bukhara khanate until 1920 when Soviet troops toppled the emir. The heavy fighting destroyed many buildings. In 1924 the Soviets designated Dushanbe the capital of the new Tajik Autonomous S.S.R. They combined the three settlements and initiated rapid development and population growth that lasted until Tajik independence in 1991. The Transcaspian railroad linked Dushanbe with Turkmenistan in 1929, transforming the Monday bazaar into a daily event that remains its commercial and social heart. The city center offers broad tree-lined streets bounded by multistory Soviet-era government buildings. The many fountains, shaded plazas, and *chaikhanas* (teahouses) invite much bicycle and pedestrian traffic. Elsewhere, high-rise concrete apartment blocks alternate with pre-Soviet mud and brick structures designed to mitigate the severe earthquake hazard.

Dushanbe is also the financial and commercial center of Tajikistan. Aluminum and cement factories, large textile combines, and manufacturing plants for looms, electric cable, and appliances are nearby. It was the primary staging and supply center for the 1979–1989 Soviet-Afghan war. It remains an important military

crossroads. Since independence, Dushanbe has been the center of a prolonged civil war between competing ethnoreligious and political factions. The violence severely damaged the infrastructure and discouraged most foreign investment. The manufacturing sector is facing an uncertain future.

There are many fine parks; a zoo; two live theaters and an opera house; hospitals; medical, teacher-education, agricultural, and polytechnic institutes; the Tajik Academy of Sciences (1951); and the Tajik State University (1948). The Firdowski Library houses an impressive collection of medieval Islamic manuscripts. The abrupt termination of Soviet support is jeopardizing these institutions. The predominantly Tajik and Russian population includes Kirghiz, Kazakh, Uzbek, Tatar, and Ukrainian minorities. Since 1991 *ostravechnio* (outmigration of Russians) and persistent refugee movements inside and outside of Dushanbe have altered the demographic profile.

DUTCH EAST INDIA COMPANY The Dutch East India Company, or Vereenigde Oost-indische Compagnie (VOC), was formed in 1602. VOC consisted of sixty companies aimed at monopolizing the spice trade, expanding Dutch colonial influence, and reducing competition from other commercial powers. The government of the Netherlands supported VOC financially, as well as giving it immense powers, including the right to trade, maintain military forces, take possession of territories, declare war, and make peace. At the height of its power, the company had roughly 150 trading vessels, 40 warships, and 10,000 soldiers.

With such power and authority, VOC dominated the spice industry, especially the cinnamon, clove, and nutmeg trade in the East Indies during the seventeenth and eighteenth centuries. The company's Asian base was in Batavia (modern Jakarta), which came under Dutch control in 1619. In 1650, VOC merchants became the first Europeans settlers in South Africa on the Cape of Good Hope; in 1652, the Cape of Good Hope became a Dutch colony, remaining so until taken over by Great Britain in 1814. The company's influence extended to Cape Town, which emerged as

The insignia of the Dutch East India Company on a building in the Netherlands in 1997. (DAVE BARTRUFF/CORBIS)

a key supply point for provisioning Dutch ships with food, water, and other goods. By 1670, VOC was the richest company in the world, controlling trade from the Cape of Good Hope to the Straits of Magellan.

In the Malay archipelago, VOC controlled the spice trade in Banda, Ternate, Grisek, Patani, Aceh, Johore, and Bantam. After its capture in 1605, Amboina (now Ambon) became the first Dutch possession in the East. Subsequently, VOC controlled and colonized local rulers, and drove the British and Portuguese from the Malay archipelago and Ceylon. The Anglo Dutch Treaty of 1824, which divided the Malay archipelago into British and Dutch spheres of influence, further enabled VOC to establish Dutch rule in Indonesia.

Throughout its existence, however, VOC had trouble maintaining its monopoly, as strong competition came from other European powers; the English, Portuguese, and Spanish challenged the Dutch whenever possible, as they too wanted a share of the spice trade. By the late eighteenth century, Chinese tea and textiles were more in demand than spices, and in 1789 VOC was disbanded, due in part to corruption, rising

debts, and competition from other traders. VOC was not merely a company that monopolized world trade, but was also the sole representative of Dutch political power in the East Indies for nearly 200 years.

DUTCH IN SOUTHEAST ASIA In the early 1600s, two maritime nations, Britain and the Netherlands, were emerging as powerful players in the world economy. Seeking to challenge the network of the Portuguese and the Spanish, who had divided the non-European world between them under the authority of a Papal Bull (edict), the two emerging Protestant nations sought to control the spice trade. In 1602 the Vereenigde Oostindische Compagnie (VOC, or the Dutch East India Company) was formed to gain a share of this lucrative spice trade. Britain and the Netherlands, although rivals in many senses, came to an agreement to divide trade with Asia. The Dutch, notably under Batavia-based governor-general Jan Pieterszoon Coen in the early 1600s, aimed to achieve a stranglehold on the spice trade. In 1641, with the help of the Sultan of Aceh, the Dutch captured Melaka (Malacca) from the Portuguese and at this point the strategic balance shifted in favor of the Netherlands.

Dutch Ascendancy

Like the Portuguese before them, the Dutch initially sought to take control of small strategic ports, while local potentates were left undisturbed to rule over the hinterlands. Initially this involved a series of processing factories scattered around India and what is now Indonesia, as well as the seizure of territory in Taiwan (Formosa), Sri Lanka, the west coast of Malaya (including Melaka), and Batavia, Flores, and Maluku

A Dutch trading building in the former colony of Sulawesi, Indonesia. (JEREMY HORNER/CORBIS)

in the Dutch East Indies (later known as Indonesia). The VOC forced local rulers to deliver spices at fixed prices and banned any trade with other outside powers in order to ensure the Dutch monopoly. Regular patrols were mounted to police these rules. The strategic possessions the VOC held in Southeast Asia were to enable the export of such spices as nutmeg and mace, cloves, and pepper.

Dutch control over Indonesia, from their arrival in the early seventeenth century, took more than three hundred years to complete and largely occurred without resort to large-scale conventional warfare, although rebellions were commonplace. There was no actual strategic decision or plan to assume control over the entire archipelago, but the Dutch found it necessary to control more and more of the hinterlands to prevent rebellions and attacks. After interfering in rivalry and dynastic disputes among the various Javanese kingdoms, the Dutch commercial empire had authority over Java by 1800. The empire of the Netherlands grew as far as possible within the geographical confines of neighboring empires. However, this imperial overstretch, which required funding a growing administration and military campaigns, meant that by 1799 the VOC was bankrupt and was subsequently abolished. In the first half of the nineteenth century the Dutch military fought a series of wars of against local resistance in Sumatra, Java, and Bali.

After 1800, pressure grew in the Netherlands to improve the livelihoods of the people of the Dutch East Indies. Pressure in the Netherlands, coupled with demands for greater self determination inside the Dutch East Indies, led to the development of the "Ethical Policy" to devolve authority to Indonesia, provide health

and education, and develop infrastructure. The Netherlands came to have far greater contact with the Indonesian people, but ultimately failed to keep vague promises of independence. The Ethical Policy helped unify the disparate ethnic groups into a collective consciousness. Significant gains were made in public health, resulting in the biggest population explosion that maritime Southeast Asia had ever seen—Java alone increased from a population of 4.5 million in 1815 to nearly 35 million a century later. One major reason for this exponential increase was the end, under the authority of Dutch overlordship (the so-called *Pax Neerlandica*), of regular warfare between the smaller feudal kingdoms. However, this belated attempt at development could not alter the fact that the rationale for the Dutch presence was the exploitation of natural resources and labor to generate capital for the Netherlands. It did nothing to undermine calls for independence; on the contrary, young Indonesian intellectuals such as independence leaders Sukarno (1901–1970) and Mohammad Hatta (1902–1980) trained in the Netherlands and learned about democracy, nationalism, and self-determination. Powerful nationalist (and religious) movements emerged in the Dutch East Indies from the first half of the nineteenth century until the Japanese invasion, in contrast to the localized rebellions of earlier times in Sumatra and Java.

Japanese Occupation and Its Aftermath

Japanese forces arrived in Indonesia in January 1942, primarily to seize the oilfields of the coastal areas of Sumatra and Kalimantan. Many Indonesians welcomed the Japanese as liberators but soon discovered that their new master was both far more ruthless and not serious about promises of independence. However, it was the Japanese invasion that broke Dutch rule; nationalists, led by Sukarno (later to be the first president of Indonesia) cooperated with the Japanese authorities as a means of gaining independence.

The Japanese left Indonesia in August 1945, and Sukarno and Hatta announced independence and the creation of the Republic of Indonesia. The return of Dutch administrators, initially backed by British troops, sparked a rebellion in Java and Sumatra. Against the advice of the British, who were preparing the Indian subcontinent and Burma (now Myanmar) for independence, in July 1947, the Dutch had marshaled enough forces (after tricking the Indonesian leaders through a peace agreement) to launch a "police action" to retake West and East Java, followed by a second police action in December 1948 to retake the remaining territory. With Sukarno and Hatta imprisoned, the Indonesian army of former Dutch officers and Japanese-trained troops under General Soedirman decided that armed revolution was the only solution and launched a fierce counterattack. This time, the United Nations condemned Dutch actions, while large numbers of Dutch soldiers, themselves former victims of the Nazi occupation, had no will to enforce Dutch imperial rule. The Dutch left Indonesia on 27 December 1949. They left behind a country of more than two hundred ethnic groups that had little in common except the experience of Dutch colonial rule and bonds forged between the intelligentsia as a result of the Ethical Policy, which had done little to prepare for independence. By attempting to recolonize Indonesia after World War II, the Dutch helped enshrine the Indonesian army as the "protector of society" that continues to be the justification for its interference in civil affairs.

EARTHQUAKES Earthquakes are the result of rocks breaking under stress. The constant movement of the tectonic plates that cover the earth's thin outer crust, or lithosphere, causes stress to build up in the rocks beneath the earth's surface. Rocks adjust to this stress over time by folding, but occasionally the stress is released, creating seismic or energy waves that cause the sudden and sometimes disastrous vibrations known as earthquakes. Earthquakes occur throughout the world, but mainly along narrow belts marking the boundaries of the earth's major tectonic plates. Ninety

percent of all earthquakes take place at these plate boundaries, and about two-thirds of all large earthquakes are located in the circum-Pacific belt. This tectonic collision zone is one of the most active in the world and stretches from the Aleutians in the North Pacific through Japan, Taiwan, the Philippines, and Indonesia to the Himalayas in northern India. Although there are hundreds of earthquakes in this belt each year, few are felt by the population. However, there have been more than sixty large earthquakes registering 7.0 or higher on the Richter scale in the last

An elderly woman walks in the ruins of Kobe following the 1995 earthquake which destroyed much of the city and killed over 6,000 people. (REUTERS NEWMEDIA INC./CORBIS)

EXPLAINING EARTHQUAKES IN SOUTH ASIA

Throughout human history and across cultures, earthquakes have been terrifying events that are beyond human control. Numerous explanations have been set for earthquakes. The following is the explanation of the Andaman Islanders, the indigenous people of the islands of the same name in the Bay of Bengal.

The Andaman Islands are occasionally visited by earthquakes. An Aka-Kede account of how earthquakes are caused is that when a man dies he goes to the spirit world which is beneath the earth. The spirits hold a ceremony. My informant spoke of the ceremony as *Kimil*, which is the name of the initiation ceremonies. At this ceremony they have a dance similar to the peace-making dance . . . but instead of erecting a screen such as is used in that ceremony, they make use of the rainbow. As they shake the rainbow in dancing this causes earthquakes. The ceremony which newly-arrived spirits have to undergo in the world after death is a *poroto kimil*, i.e., the initiate eats *poroto* (*Caryota sobolifera*).

Source: A. R. Radcliffe-Brown. (1922) *The Andaman Islanders: A Study in Social Anthropology*. Cambridge, U.K.: University Press, 146–147.

quarter century, the largest of which released twenty times more energy than the annual energy consumption of the United States. Significant property damage and loss of life can result from earthquakes and the secondary hazards associated with these events, especially when they occur near urban centers or areas of high population density.

Earthquakes occurring at weak points in the interior of plates, away from the major plate boundaries, are more difficult to explain. They do not occur according to well-defined patterns like those at plate boundaries. Scientists have not yet been able to model their occurrence so that forecasts of time, place, and size of future earthquakes could be made. China, for example, experiences numerous intraplate earthquakes hundreds of miles toward the interior of the country. Since 1990 eight major intraplate quakes of 5.2 to 7.1 on the Richter scale have been recorded in

Yunnan, Hebei, Sichuan, and Menglian provinces in China.

The vibrations, or seismic waves, from an earthquake travel outward in all directions from the fault and, if the earthquake is large enough, are recorded around the world on special measuring instruments called seismographs. A seismograph measures the amplitude of the energy (or seismic waves) released; the measurement is expressed on the Richter scale. The most severe earthquakes recorded to date have not exceeded 9.0 on this scale, although there may be hundreds of low-magnitude quakes measuring 3 or 4 in Asia alone in a single year. Energy release and earthquake magnitude can be poor guides to the hazardous impact of earthquakes, however, because the duration of ground shaking is not accounted for in this scale. The extent of that hazard depends on many other factors, such as distance from the epicenter, rock and soil conditions, population density, and types of building construction.

Although ground shaking is the primary earthquake hazard and the cause of much structural damage and human injury, there are also important secondary hazards. Liquefaction, which happens when loosely packed, waterlogged sediments lose their strength in response to strong shaking, can damage structural foundations of buildings and highways, cause buildings to settle or tilt, and produce submarine avalanches that can destroy harbor facilities and break underwater telecommunication cables. Landslides and rock and snow avalanches can also result from earthquakes. Landslides triggered by earthquakes often cause more destruction than the quakes themselves. Since 1964 landslides resulting from large-magnitude earthquakes in Japan have accounted for more than half of all earthquake-related deaths. The most characteristic secondary earthquake-related hazard is the seismic sea wave, or tsunami. Most tsunamis result from tectonic displacement of the seabed associated with large shallow-focus earthquakes under the oceans, but can also be caused by exploding volcanic islands. These waves may reach 100 feet or higher and can travel across the ocean at speeds as great as 150 kilometers per hour. The 1883 volcanic eruption of Krakatau Island in Indonesia generated a tsunami that killed more than thirty-six thousand people in nearby Java and Sumatra. More than 370 tsunamis were observed in the Pacific from 1900 to 1980; Japan is particularly vulnerable to these events, especially on the eastern margins of the large island of Honshu.

Twentieth-Century Occurrences

More than one-half of the most destructive earthquakes in the twentieth century, those causing five thousand or more deaths, have taken place in Asia.

The three largest of these occurred in China, each with more than 200,000 deaths. The 1923 Tokyo-Yokohama earthquake resulted in 143,000 deaths. Indonesia, located astride the boundaries of the Indo-Australian and Eurasian plates, records hundreds of quakes each year; between 1994 and 2000 twelve registered 4.7 to 7.6 on the Richter scale. India had at least five major quakes of 6.2 to 8.4 magnitude in the twentieth century, each resulting in tens of thousands dead and injured. When earthquakes take place near urban centers or more densely settled areas, the impact can be catastrophic. The 1995 Kobe, Japan, earthquake, for example, was measured at a relatively moderate level of 6.9 but caused significant damage and loss of life because it took place in a densely populated port and industrial city. More than 5,500 people were killed and more than 300,000 left homeless due to shock waves, fires, and the collapse of housing built to withstand tropical cyclones but not earthquakes. A similarly disastrous earthquake registering 7.6 on the Richter scale hit northwestern Taiwan in June 2000, causing millions of dollars in property damage, killing 2,100 people, and injuring more than 8,000.

Programs for earthquake disaster preparedness and management in countries throughout the Asia Pacific region are quite varied. The 1990s saw a shift away from local disaster relief activities to increased preparedness and preventive strategies in how regional governments and disaster management organizations respond to earthquake hazards. Enhanced preparedness measures should be augmented with preventive strategies to mitigate earthquake hazards, link rehabilitation with sustainable human development, and focus on community-based disaster management (CBDM) approaches. For CBDM approaches to gain wider support and be more effective, however, there must be greater acceptance by national governments throughout the region. A number of international agencies, regional disaster training groups, and private philanthropic and nongovernmental organizations are increasingly engaged in discussing and planning new earthquake and disaster management strategies in this part of the world. Groups that are involved include the Asian Disaster Preparedness Center, the ASEAN Earthquake Information Center, the United Nations Development Program, the United Nations High Commission for Refugees, CARE, and Save the Children, among others. Information and lessons learned from other earthquake-prone areas of the world help to improve earthquake forecasting, disaster preparedness, and mitigation for this region of the world. This level of international collaboration is an encouraging development for the millions of people who are vul-

nerable to the social and economic consequences of earthquakes in Asia.

EAST CHINA SEA The East China Sea (Dong Hai) constitutes part of the Western Pacific. It is 1,296 kilometers long from the north to the south and 740 kilometers wide from the east to the west and covers an area of 790,000 square kilometers. In the north, it borders on the Yellow Sea (Huang Hai), and in the east it borders on Jiangsu, Zhejiang, and Fujian provinces of the Chinese mainland. In the south, the East China Sea is connected to the South China Sea (Nan Hai) through the Taiwan Strait. The southern Japanese archipelago with the Ryukyu Islands constitutes the eastern border. Except for an area around the Ryukyu Islands, where depths up to 2,700 meters have been measured, the East China Sea is on a shallow continental shelf most of which is less than 200 meters deep. The Chang (Yangtze) River flows into the East China Sea, leaving huge deposits of sediment. The climate is subtropical, and monsoon winds with summer rain predominate in the area. The East China Sea is China's most important marine fishing area, and the catches of hairtail, small and large yellow croaker, and cuttlefish account for two-thirds of China's total catch. Shanghai, just south of the mouth of the Chang River, is the largest port bordering the sea and also is the center for food processing.

EAST TIMOR—PROFILE (2001 est. pop. 800,000). On 20 May 2002, the former Portuguese colony of East Timor, occupied by Indonesia in 1976, became the world's newest independent state. East Timor burst into world attention on 30 August 1999, following a flawed U.N.-supervised referendum on independence that left Indonesian armed forces in charge of security. When almost 80 percent of registered voters rejected integration with Indonesia, a full-blown campaign of terror orchestrated by the Indonesian led to the destruction of 70 percent of East Timor's infrastructure. Many Timorese were murdered, kidnapped, or disappeared. As many as 500,000 were displaced from their homes. In response to international outrage, the U.N. Security Council mandated an Australian-led international force (INTERFET) to restore security and supervise the withdrawal of Indonesian occupation forces. Deemed successful, INTERFET was subsequently transformed on 25 October 1999 into a U.N. blue beret force (United Nations Transitional Administration for East Timor) to provide security pending a transition to full independence.

Topography and People

Of recent geological formation, the island of Timor features a mountainous interior, with its highest peak, Tata Mai Lau, rising 3,000 meters above sea level. Situated at the extreme east of the Lesser Sunda chain, Timor island is subject to great climatic contrasts between monsoon seasons, and is ecologically more vulnerable than islands to the west. The southern coast supports an extensive coastal plain, which is more restricted in the north, where mountain spurs extend to

the sea. The diverse landscape is matched by a variety of climatic zones and supports a diversity of vegetation: swamps on the plains, pockets of tropical rain forest, and extensive eucalyptus forests on the mountain slopes.

While anthropologists differ as to specifics, there is broad agreement that eastern Timor was populated by successive waves of Malays and proto-Malays, and also Papuan elements, although none exist today in pure form. The linguistic situation is no less complex: there are sixteen distinct languages in the whole of Timor, thirteen of which are spoken in East Timor. Most of these fall into either the Austronesian or Papuan language families. Tetum, also spoken in parts of West Timor, serves as lingua franca in East Timor.

The Traditional Political System

Sharing cultural and political traditions with other islands and societies in the Lesser Sunda Islands, Timor's traditional political system conforms to what Dutch anthropologist F. A. E. van Wouden calls a "segmented society" (one divided along ethnic lines). Not directly touched by Indian or Islamic influences, Timor never developed a centralized government, aside from a highly mythologized center believed to have been located in Wehale, in West Timor, in what would eventually become Dutch territory. In fact, geography and the complex peopling of the island bequeathed many competing and warring societies, often in conflict with each other and with outsiders who came in search of Timor's coveted sandalwood. Real power was in the hands of the "*liurai*," a Portugalized term meaning "little king." While the traditional lineage of the *liurai* was ruptured by the Portuguese after the Boaventura rebellion of 1911–1912 in order to win and cement new alliances, they continued to wield considerable local influence, surviving even the Indonesian occupation.

The Portuguese Colonial System

First reached by Portuguese traders and missionaries in the early 1500s, the island of Timor was ruled from the early 1700s by Portuguese governors sent first to the enclave of Oecusse, and then, with the transfer of the seat of government in 1776, to Dili, the present capital. Although Timor was distant and neglected within its empire, Portugal nevertheless developed a successful coffee plantation system, as well as bequeathing the Timorese a Catholic and Portuguese heritage.

In the modern period, notably after the 1911–1912 rebellion, the Portuguese introduced new forms of lo-

cal government around military posts centered on districts, but in a classical colonial system that saw little Timorese representation in the upper echelons of colonial administration. The rising tide of anticolonial nationalism in Southeast Asia bypassed eastern Timor. The major threat to the status quo was always Indonesia, as proven by an Indonesian separatist rebellion in the Viqueque district of eastern East Timor in 1959, suppressed with much loss of life.

Treated as part colony, part protectorate, a system that saw metropolitan Portugal subsidize only a meager developmental budget—which left most Timorese outside the coffee economy living in an unmonetized or subsistence economy—there is a sense that Portugal actually conserved rather than dissolved feudal bonds and cultural forms.

Portuguese political life atrophied under the premiership of Antonio de Oliveira Salazar (1932–1968) and his successor, Marcello Caetano (1968–1974), but with Lisbon's "flower revolution" of 25 April 1974, in which reformist soldiers replaced the dictatorship, the independence of Timor was placed squarely on the table, and political parties sanctioned. But just as East Timor's majority Fretilin party prevailed in a short civil war against its adversary, União Democrática Timorenses, and proclaimed a democratic republic on 28 November 1975, Timor was robbed of its short-lived independence by invading Indonesian forces. After successfully waging a guerrilla war of resistance against the Indonesian occupier, the armed wing of Fretilin (Falintil) only grew in stature with the capture and incarceration of its leader, José "Xanana" Gusmão (born 1946 in Manatuto district of East Timor), in 1992. As leader of CNRT, an umbrella front conjoining Fretilin and other parties and personalities, Gusmão, along with countrymen Bishop Carlos Ximenes Belo and José Ramos-Horta (recipients of the 1996 Nobel Peace Prize), became an international symbol of East Timor's struggle for freedom and justice.

The Indonesian Colonial System

Following an invasion on 7 December 1975, East Timor was annexed as the twenty-seventh province of the Republic of Indonesia. The Jakarta government reproduced in East Timor all branches and agencies of its own central and provincial governments. In a classic case of internal colonialism in which most East Timorese were economically and politically marginalized, Indonesian rule was supported not only by a cadre of collaborators, but also by an iron fist. The foremost Indonesian achievement in East Timor was undoubtedly the introduction of a universal education system that saw large numbers of Timorese students

rise through the educational hierarchy, some attending universities in Indonesia. The other tangible achievement of Indonesian rule was the expansion of the infrastructure bequeathed by the Portuguese. Both education and infrastructure served the counterinsurgency aims of the Indonesian military, as did such forms of population control as resettlement villages and the introduction of large numbers of Indonesian settlers. Sustained and repressive military actions, however, not only led to the deaths of up to one-third of the population of East Timor, but also destroyed the fabric of traditional Timorese society.

Rule under the United Nations Transitional Administration

Headed by a Brazilian diplomat, Sergio Vieira de Melo, answering directly to the U.N. secretary-general, and staffed by some one thousand international civil servants, the United Nations Transitional Administration for East Timor (UNTAET) formed the de facto government in East Timor from early 2000 until its dissolution in May 2002. UNTAET was also backed by eight thousand international peacekeepers, along with hundreds of civilian police. UNTAET was empowered to make and enforce laws, to enter into international agreements (such as the renegotiation of the Timor Gap Treaty), and to supervise all aspects of governance. UNTAET decrees covered the establishment of a central banking system, the nomination of the U.S. dollar as official currency, the creation of a police force, the rebuilding of the justice system, the creation of a civil-service commission, and the recruitment of a seven-thousand-member civil service. Nevertheless, in deference to East Timorese opinion, and sometimes frustration owing to disagreement with East Timorese over administrative issues, UNTAET sanctioned the establishment of a transitional National Consultative Council alongside a parallel East Timor Transitional Administration, thereby speeding up the "Timorization" process.

In mid-2001 UNTAET focused on drawing up electoral laws and the norms for the creation of political parties. An election in which sixteen political parties took part was conducted on 30 August 2001 for a second transitional Constitutional Assembly; Fretilin emerged victorious. Fretilin Vice President Mari Alkatiri was appointed the country's first chief minister. The main task of the transitional assembly was to debate and approve the new nation's constitution.

Having adopted both Portuguese and Tetum as official languages, the new Democratic Republic of East Timor remains true to its long history under European colonialism. Under East Timor's new constitu-

tion, East Timor will be governed by a mixed presidential and cabinet system; church and state will be separated. East Timor vows to uphold a democratic system with free institutions, but as a desperately poor country, it will remain dependent upon the goodwill of international donors for years to come. The United Nations maintains a scaled-down presence in East Timor to further assist in capacity building and to guarantee East Timor's security.

EASTERN GHATS The Eastern Ghats are a somewhat fractured mountain range running down much of eastern India and thus forming the eastern border of the Dekkan Plateau. The geological formation is granite, with gneiss and mica slate. The Eastern Ghats rise in the northern part of Orissa and then strike in a south-southwesterly direction, parallel to the coast and at a distance of from 80 to 250 kilometers from it. There is thus a broad and fertile coastal plain, much of it devoted to rice and coconut cultivation. However, in the Ganjam and Visakhapattinam areas, the Ghats nearly abut on the coast; here too are found the highest peaks. With several wide breaks to allow the eastward passage of some major rivers, the Godavari, Kistna, and Kaveri, the chain continues in the same direction until it reaches South Arcot district in Tamil Nadu. Then, adopting a more westerly direction, the Eastern Ghats finally merge with the Western Ghats in the high Nilgiri Plateau. Outliers are found further south in Tiruchirappalli and Tinneveli Districts. The average elevation of the Eastern Ghats is about 450 meters; they are thus considerably lower than the Western Ghats. In Orissa, Chhattisgarh, and Andhra Pradesh, the hills are inhabited mainly by tribal people who have a mixed farming economy supplemented by some hunting and gathering.

EASTERN ORTHODOX CHURCH The Eastern Orthodox (from Greek "right believing") faith is directly descended from the spiritual communities established by the apostles of Jesus Christ in the eastern Mediterranean region; Eastern Orthodox Christianity officially separated from the Western (Roman Catholic) branch of the Christian church in 1054, though the split had begun centuries earlier with the division of the Roman empire. Today Eastern Orthodoxy flourishes in Greece as the Greek Orthodox Church. The Russian, Bulgarian, Romanian, Serbian, and Georgian Orthodox churches have also reemerged following the collapse of Communism in Eastern Europe in the 1980s and 1990s. Sizable Orthodox populations also exist in America and Australia.

The majority of early Christian communities, founded by St. Paul or his followers, shared common beliefs and liturgy, but worship was conducted in different languages. However, Syrian beliefs, originating from St. Thomas, emphasized the humanity of Christ. After the Roman emperor Constantine I (324–337) first adopted Christianity, he assumed the secular leadership of the Church and the patriarch of Constantinople (his capital) laid claim to religious authority over the whole church. Constantinople remained the center of Eastern Orthodoxy until the city fell to the Turks in 1453. Even today the patriarch of Constantinople has authority over the Greek communities in Turkey, the Greek islands, northern Greece, and the rest of the world. The other spiritual leaders of the early Christian church were the patriarchs of Rome, Alexandria, Antioch, and Jerusalem.

THE ORTHODOX CHURCH

"The Church also possesses the great tradition of the Hesychastic and ascetic fathers, the liturgical tradition, the immutable tradition of theological experience and thought, and the cultivation of letters and fine arts, particularly Byzantine iconography and music, as well as the equally important tradition of social philanthropy and conciliatory spirit."

Early Offshoots of Eastern Orthodoxy and the Advent of Islam

Eastern Orthodoxy recognizes the authority of seven ecumenical councils, starting with the first Council of Nicaea (325), which were convened to decide matters of doctrine. Constantine imposed his personality on the council of Nicaea, but subsequently inter-patriarchal rivalry emphasized differences. At the third council (the Council of Ephesus, 431), the Nestorian church diverged, and at the fourth council (the Council of Chalcedon, 451), dispute about the nature of Jesus caused the Armenian, Syrian, and Coptic churches to secede. The other councils were the first, second, and third Councils of Constantinople (381, 553, and 680) and the second Council of Nicaea (787).

From the sixth century many Asian and Mediterranean Christians came under Persian and then Islamic Arab rule. The conquerors divided the Orthodox population into separate self-governing communities led by their own patriarchs. Except during times of war, Arab occupation did not cut cross-border contacts; the three Eastern patriarchs (of Alexandria, Antioch, and Jerusalem) and bishops were able to attend church councils; pilgrims continued to visit the shrines in the Holy Land. The Orthodox church in Asia was at its maximum extent in around 901, with 405 bishops, including fifty-four metropolitans and fifty autocephalous (independent) bishops; Orthodox missionaries also converted the Slavs, Bulgars, and Russians.

The Split between Eastern and Western Christianity

Eastern and Western Christianity diverged gradually. In 800 Pope Leo III anointed Charlemagne as

Holy Roman Emperor, thus placing the Western church under the protection of France; from this time forward Western Christianity regarded the Roman pope as the prime religious authority. The Eastern Church, however, asserted its historical precedence, and differences between East and West eventually led to a complete schism in 1054. Among the doctrinal differences dividing Eastern Orthodox and Western believers is the nature of the relation of elements of the divine trinity (Father, Son, and Holy Spirit.) The Nicene creed adopted by the Western Church says that the Holy Spirit proceeds "from the father and the son," but the Eastern Church believes that the Holy Spirit proceeds from the Father alone. The final insurmountable issue was a dispute over who had jurisdiction where: Pope Leo IX and Michael Cerularius, the patriarch of Constantinople, mutually excommunicated each other. Rome and Byzantium cooperated to some degree during the Crusades, but in 1204, during the Fourth Crusade, Westerners besieged and looted Constantinople.

Eastern Orthodoxy under Ottoman Rule

After the fall of Constantinople Sultan Mehmed II (1432–1481) set fairly generous rules for the surviving fifty thousand members of the Orthodox community and recognized the patriarch as the head of all the Christians in the Turkish empire. Saint Sophia, the central church in Orthodoxy, was immediately dedicated to Islam, but most churches remained in use. (Today, most surviving Orthodox churches in Turkey have become museums.) Superior training and knowledge of languages enabled much of the Orthodox community to monopolize the Turkish diplomatic service. The Orthodox patriarchate thus survived in Constantinople partly by collaboration with the Muslim overlords.

Informal leadership of Orthodoxy in time moved to the Russian church; in 1589 it received its own patriarch, but in 1721 Peter the Great (1672–1725) abolished it (it was reestablished in 1917). In the nineteenth century, when the Orthodox peoples of Asia were freed from Turkish rule, the Balkan states and Greece won church and state independence, and the patriarchate of Constantinople lost whatever religious powers it had enjoyed.

During World War I and the War of Turkish Independence Greco-Turkish animosities led to atrocities. The burning of Izmir is still referred to by Orthodox Greeks as the Catastrophe. In 1923 about 800,000 Greek Christians (Orthodox and Catholic) living in Turkey were exchanged with a population of

1.2 million Muslims living in Greece; about 100,000 Greek Christians, protected by the Treaty of Lausanne, remained in and around Istanbul. Today only an estimated 3,000 Greek Orthodox remain in Turkey.

Distinctions between Eastern Orthodoxy and Roman Catholicism Today

Orthodox doctrines have always lacked precision, partly due to the conviction that it is presumptuous to define God, partly because, in Byzantine times, theology was a universal intellectual hobby. Few doctrinal differences separate Orthodoxy from Catholic Christianity; the dividing issues remain the governance of the church, papal versus conciliar authority, and a married priesthood. The seven sacraments of Catholic Christianity (baptism, confirmation, marriage, holy orders, penance, anointing of the sick, and the Eucharist) are augmented in Eastern Orthodoxy by others for special occasions. Both churches rescinded the mutual excommunications of 1054 in the twentieth century, and following Roman Catholicism's Second Vatican Council (1962–1964), ecumenical dialogue between the Eastern Orthodox Church and the Roman Catholic Church was undertaken.

EBINA DANJO (1856–1937), Japanese Christian leader and educator. Ebina Danjo, a native of Yanagawa in Japan's Chikugo Province (now a part of Fukuoka Prefecture), was a Christian leader and educator of the Meiji (1868–1912), Taisho (1912–1926), and Showa (1926–1989) periods. In 1872 Ebina attended the Kumamoto Yogakko, a school that was established in 1871 for Western studies, where he came under the influence of an American educator, Leroy Lansing Janes (1838–1909). He was then baptized. Thus, in 1876, converted to Christianity, he became a member of the Kumamoto Christian Band. He went to study at Doshisha (Doshisha University since 1920) in Kyoto under Nijima Jo (1843–1890). In 1879 Ebina became a pastor of the Annaka Church in Gumma Prefecture and traveled around Japan to spread Chris-

tianity. He was also engaged as a pastor in Kobe in 1893. It was especially when he was a pastor of the Hongo Church in Tokyo from 1897 to 1920 that he became known as a preacher and evangelist. In 1920 he also founded a Christian journal entitled *Shinjin* (New Man) and educated younger people such as Yoshino Sakuzo (1878–1933) and Suzuki Bunji (1885–1946). At Hongo, and as the head of Doshisha from 1920 to 1928, Ebina was a leading figure in the congregational church in Japan.

ECONOMIC PLANNING AGENCY OF JAPAN

Until January 2001, the Economic Planning Agency (Keizai Kikakucho) of Japan was an agency under the jurisdiction of the prime minister's office. One of its key responsibilities was to act as secretariat to the Economic Council (Keizai Shingikai), an advisory council to the cabinet. While the EPA was not a cabinet ministry, its director-general was officially a cabinet member. In January 2001, its offices and functions were reassigned to the newly organized Cabinet Office (Naikakufu, the successor to the prime minister's office), where they function as secretariat to the Council on Economic and Fiscal Policy (Keizai Zaisei Shimon Kaigi, which replaces the old Economic Council). The title of director-general has changed to minister of state for economic and fiscal policy.

The EPA was established on 20 July 1955, but its direct antecedents date back to 12 August 1946, when the Economic Stabilization Board (Keizai Anteibu) was established at the behest of the Allied Occupation forces. When the occupation ended, the board was officially renamed the Economic Deliberation Agency (Keizai Shingicho) on 1 August 1952 and became the Economic Planning Agency on 20 July 1955.

The EPA was responsible for preparing national economic plans and for compiling a variety of economic statistics and providing projections. In its early years, its planning functions were at the forefront. Based on assessments of potential output in different industries and of the barriers to achieving that poten-

tial, long-term (generally five-year) plans laid out a series of investment, employment, and production targets. These plans were primarily recommendations, since the Japanese government had limited authority to shape private-sector activities. However, private firms would take into account EPA plans and predictions of supply-and-demand conditions in their own planning.

EPA plans also affected government behavior. In the 1950s and 1960s, the lending programs of government financial institutions, such as the Japan Development Bank, were based on EPA plans. Public investment also reflected those plans to some extent. Over time, the plans changed their focus from post-war reconstruction to high-speed growth to social amenities. In the 1990s, many plans tended to focus either on responding to economic stagnation or on economic restructuring.

The most famous of the various EPA economic plans was undoubtedly the Income Doubling Plan (Kokumin Shotoku Baizo Keikaku). Promulgated under Prime Minister Hayato Ikeda in 1960, the plan called for a doubling of Japan's gross national product within a decade. Though widely considered unrealistic at the time, the goal was realized in slightly over seven years. While considerable government investment did result from the Income Doubling Plan, for the most part the plan's writers recognized the latent potential of the Japanese economy: a skilled but still underutilized workforce, rapid capital accumulation, and an ability to gain access to and assimilate technological improvements. Public investment was aimed mainly at transportation and regional development.

The EPA continued to engage in long-term planning, but the practical effects of the plans decreased in importance as the government's role in the economy declined. In the 1980s and 1990s, the most influential documents produced by the EPA were the annual cabinet economic forecasts (*Economic Outlook and Basic Policy Stance on Economic Management*, or *Keizai mitoshi to keizai un'ei kibonteki taido*). The macroeconomic projections in those forecasts provided the basis of budget and tax debates. In the 1990s, these predictions became controversial, outsiders deriding them as overoptimistic. Indeed, the predictions regularly exceeded actual growth rates.

The EPA produced a variety of publications based on statistical analysis and forecasting. Notable publications included the annual *Economic White Paper* (*Keizai hakusho*) and *White Paper on the National Lifestyle* (*Kokumin seikatsu hakusho*). The EPA collected some of the original data itself through surveys, but

relied on other ministries for much of its data. One of its main roles was to produce statistics on the economy and government finance that conformed to the internationally accepted System of National Accounts (SNA). The SNA was introduced by the Organization for Economic Cooperation and Development in 1953. After spending several years investigating how best to meet those standards, the EPA began publishing such figures in 1966 and continues to do so. In the late 1990s, the EPA began to release many of its publications and statistical series in electronic form on the Internet.

While the EPA's responsibilities were important, it was considered to be weak politically. Its subordinate position was reflected in its agency rather than ministry status. Many of its staff were seconded from the powerful Ministry of Finance (MOF) and Ministry of International Trade and Industry (MITI). In the 1960s, the EPA was the site of a well-known turf battle between MOF and MITI; career EPA staffers backed MOF, and the result was that MITI's role was sharply reduced. Subsequently, the Ministry of Finance was seen as particularly influential in the EPA.

The EPA was not in a political or administrative position to control forecasting and planning functions, despite its official mandate to do so. Line ministries such as MITI, the Ministry of Agriculture, Forestry, and Fisheries, and the Ministry of Posts and Telecommunications have had the greatest control over those functions for industries under their jurisdictions. Similarly, while the EPA was the official compiler of economic stimulus packages, these were actually put together largely by the Ministry of Finance, which has responsibility for fiscal policy. The EPA's role was thus mostly technical, although in its early years it did participate in coordinating the various ministries' plans so as to match Japan's limited resources.

Career EPA officials have positioned themselves as technocrats and have worked to improve their expertise in econometrics and measurement. Additionally, the agency's Economic Research Institute was a resource for academic economists investigating public finance and various economic phenomena, and constructed sophisticated computer models such as the EPA World Econometric Model. Despite the EPA's origins as a central planning agency, its officials have been regarded as strong advocates of greater liberalization of the Japanese economy since at least the 1970s.

ECONOMIC STABILIZATION PROGRAM

After World War II, the United States initiated programs to demilitarize and democratize Japan. These were followed by additional initiatives designed to reform the Japanese economy. The main tasks were combating inflation and boosting production, with factions in both Japan and the United States divided over which was more important. In 1949, President Harry Truman appointed Joseph Dodge, president of the Detroit Bank, to spearhead an economic reform package. Dodge reluctantly accepted the position of "Financial Adviser" to the Supreme Commander of Allied Powers (SCAP), but once in Japan he wasted no time drafting the Economic Stabilization Plan.

The "Dodge Line," as the plan is better known, aimed to balance the national budget, establish the U.S. Aid Counterpart Fund, fix a single foreign exchange rate, and decrease government intervention in the economy. Short-term successes were immediate: inflation dropped from 80 percent in 1948 to 24 percent in 1949, and the number of goods on the black market fell. Laid-off workers expressed discontent, however, a likely reason why Douglas MacArthur did not want to lead the economic recovery himself. Scholars debate the extent to which the Dodge Line contributed to Japanese economic recovery in the long run, especially since the Korean War, which began the year after Dodge's arrival, boosted Japanese production.

EDA SABURO (1907–1977), Japanese politician. Born in Okayama Prefecture, Eda Saburo left college to participate in the leftist farmer's movement. Those activities led to his becoming a member of the central executive committee of the National Farmers' Party and service in Okayama Prefecture's prefectural assembly. An activist for socialist causes all his life, he spent time in prison in the 1930s for his activities and worked for the North China Political Council in Beijing in the 1940s. He joined the Japan Socialist Party (JSP) after returning to Japan in 1946 and served several terms as party secretary-general in the 1960s. With Asanuma Inejiro (1898–1960), the head of the JSP, Eda led the movement opposing the renewal of the U.S.-Japan Security Treaty, which let the United States retain military bases in Japan. After Asanuma's assassination in October 1960, Eda took over leadership of the party; he then stood for election as the party head, but lost, despite his platform of structural reform. In 1976 he lost a bid for election to the lower house of Diet, and the following year he left the JSP.

EDIGE The epic *Edige* has as its historical nucleus the emir of the Golden Horde Edige (also called Edigu, Idiga, Idiku, d. 1419) and his wars against Khan Tokhtamysh (d. 1406/1407) and the Russians. The epic is shared by a number of Turkic peoples who trace their origins back to the tribal confederation of the Golden Horde. The earliest known version is a Kazakh text that was written in the nineteenth century by the Kazakh prince Chokan Valikhanov (1835–1865). In the twentieth century the epic was recorded mainly from Kazakh, Karakalpak, Noghay, and Tatar singers. In the epic, Edige is presented as both a wise man and a hero who fights against an unjust khan and helps his tribe to survive and prosper in a hostile environment. The epic is important as a testimony to the transformation of history into heroic poetry and for exemplifying one of the main functions of the heroic epic, the celebration of a glorious tribal past.

EDIRNE (2002 pop. 128,000). Edirne is the capital of the province of Edirne in northwestern Turkey, near the border with Greece and Bulgaria and the confluence of the Tundzha, Maritsa, and Arda rivers. The city is the gateway from the Balkans to the east. The first settlers were most likely Thracian tribes, succeeded by the Macedonians and later by the Romans under the emperor Hadrian (76–138 CE), who named

The Sultan Selim Mosque in Edirne in the 1990s. (CHRIS HELLIER/CORBIS)

the city Hadrianopolis or Adrianopolis. The city was captured by the Ottoman sultan Murad I (1326?–1389) in 1362, after which it became Edirne, the second capital of the Ottoman empire after Bursa. From here Fatih Sultan Mehmed planned his attack on Constantinople in 1453. Due to Edirne's importance as one of the first capitals of the Ottoman empire, many Ottoman monuments, mosques, and palaces adorn the city. Most notable is the Sultan Selim Mosque, commissioned by Sultan Selim II (1524–1574), built between 1568 and 1574 by the distinguished Ottoman architect Mimar Sinan (1489–1588). The mosque's dome has a diameter of 31.5 meters, a few centimeters larger than the Saint Sophia dome in Istanbul, and has the second-highest minarets in the world, surpassed only by those in Mecca.

Edirne was occupied by the Russians during the Russian-Turkish wars in 1829 and 1878–1879, and by the Bulgarians in 1913. After World War I the Greeks laid claim to Edirne from 1920 to 1922. Edirne officially became part of the Turkish Republic in 1923 under the Treaty of Lausanne. Each summer Edirne hosts the popular Kirkpinar Festival, a 600-year-old competition of greased wrestling.

EDOGAWA RAMPO (1894–1965), Japan's first modern mystery writer. Edogawa Rampo (whose real name was Hirai Taro) graduated from Waseda University in 1916. He worked alternately as a clerk, accountant, and editor, but in 1923 found himself unemployed. An avid reader of foreign mystery stories, he penned *Nisen doka* (The Two-Sen Copper Coin) and submitted it to the only mystery magazine in Japan, *Shin seinen*, which published translations of Western mysteries. Edogawa's short mystery was accepted, and it became the first original Japanese mystery story to be published. He chose as his pen name Edogawa Rampo, after the Japanese pronunciation of Edgar Allen Poe.

With the subsequent publication of *Shinri shiken* (The Psychological Test) in 1925 and *Yaneura no samposha* (The Attic Stroller) in 1925, he became the leading Japanese writer in the mystery genre. Gradually turning to longer mysteries, he published *Inju* (Dark Beasts, 1928), *Kumotoko* (Spider Man, 1930), and *Ogon kamen* (Golden Mask, 1931), which found a large

audience. As founder of the Japan Mystery Writers' Club and the Edogawa Rampo Prize, he encouraged young writers and wrote critical essays of works in the mystery genre.

EHIME (2002 est. pop. 1.5 million). Ehime Prefecture is situated in the northwest region of Japan's island of Shikoku. It occupies an area of 5,672 square kilometers. The main geographical features include a mostly mountainous terrain, western Japan's tallest peak, Ishizuchisan, various coastal plains and river valleys, and a rugged shoreline in the south with many small offshore islands. Ehime Prefecture, once the ancient province of Iyo, is bordered by the Inland Sea and by Kochi, Kagawa, and Tokushima Prefectures.

The prefecture's capital is the centrally located port city of Matsumaya, Shikoku Island's largest city. Matsumaya Castle is one of the few feudal fortresses to survive relatively intact. The city's traditional crafts include *iyogasuri* (an indigo-dyed textile) and *tobeyaki* (blue and white porcelain). The larger industries include petrochemicals, soda factories, and wood pulp processing. Nearby is Dogo Onsen, one the nation's oldest hot spring spas. Matsumaya also is the site of eight of Shikoku's eighty-eight pilgrimage temples. The other important cities of Ehime Prefecture are Niihama, Saijo, Yawatahama, and Uwajima.

Ehime's warm temperatures make it the major source of Japan's mandarin oranges and other citrus fruit. Commercial fishing now has given way in part to shellfish fishing, pearl culture, and the production of *nori* (edible seaweed). Along the northeast coast is an industrial zone of plants for processing metals, chemicals, paper, textiles, and petrochemicals. Among the other tourist attractions are the Inland Sea National Park and the Ichizuchisan area.

EKAPHAP *Ekaphap* (unity) is a word found in both Thai and Lao languages. Unity and preservation of a

distinctive national identity have been important priorities of both the Thai and Lao states. *Ekaphap* is one of the five major political slogans of the Lao government. The challenge to unity in both the Thai and Lao cases has been the existence of considerable ethnic diversity. Only 52.5 percent of the Lao nation is ethnically lowland Lao. Thailand also has considerable ethnic diversity, though less than that of Laos.

Thailand's leadership has been remarkably successful in creating national unity, primarily through the institution of the monarchy and a uniform, standardized modern educational system, which has required all to learn and use standard Thai, the national language and a unifying factor. His Majesty King Bhumibol Adulyadej has been brilliant in using the institution of the monarchy to create solidarity and unity among all Thais. The king travels to all regions of the country on a regular basis to help build national unity. With the abolition of the Lao monarchy in 1975, Lao unity has been achieved primarily through the promotion of standard Lao language and the institution of the revolutionary party that led the long Lao struggle for political independence.

ELBURZ Elburz is a mountain range located between the Caspian Sea and the central Iranian plateau. The range serves as a natural border for Iran and its northern neighbors (Azerbaijan, Armenia, and Turkmenistan) in the Caucasus. The extinct volcano of Mount Damavand is the peak of the Elburz Range, rising to about 5,600 meters. Elburz is covered by an ice cap of about 140 square kilometers, with seventy-seven minor and steadily retreating glaciers radiating from it, some reaching 400 meters in thickness. Lakes are mostly of glacial origin, small in area, but deep.

The range consists of steep, narrow, parallel ridges crossed only by the Safid River, whose valley forms the main trans-Elburz route. The northern slope of the Elburz is rainy and forested, and the southern slope is semiarid. Snowcapped water peaks provide seasonal

flow used for irrigation and industry. Elburz is composed of both hard crystalline rocks and magma. In the surrounding valleys, mineral springs are common and in a few places, sulfurous fumes escape through fissures, often deep under the ice cover. Pine forests mingled with birch and mountain ash cover the north of the main ridge valleys and lower mountain slopes of Elburz. In higher elevations, forests have been replaced by alpine meadows rich in flowers. The foothills of Elburz, lying to the north of Tehran, act as a major recreational attraction for both alpinists and nature enthusiasts.

ELECTRONICS INDUSTRY—JAPAN After being opened to the West in the mid-nineteenth century Japan quickly adopted the electrical technologies of the time. By the early decades of the twentieth century the Japanese military and some Japanese researchers had attained world-class levels in many areas of electronics. Japan's electronics industry, however, remained largely dependent on U.S. and European firms for technology and capital throughout the prewar era.

After World War II, Japanese firms effectively used, and often improved, foreign technology to become world leaders in electronics. For some time, the Japanese electronics industry has been second only to that of the United States. At the beginning of the twenty-first century, however, the Japanese electronics firms have been handicapped by the slow growth of the Japanese market.

The Introduction of Electrical/Electronics Technology in Japan

Despite being relatively isolated from the West until the middle of the nineteenth century, the Japanese were aware of important developments in Western science and technology. This was thanks to Japanese scholars who painstakingly translated science books acquired from Dutch traders into Japanese. Information on the telegraph, for example, was translated in 1848, ten years after Samuel Morse had demonstrated the device to the U.S. government.

In 1853 and 1854, a U.S. naval squadron under Commodore Matthew Perry (1794–1858) visited Tokyo Bay. Crew members demonstrated a telegraph and other modern Western technology. Perry's visit demonstrated the inability of the ruling government to protect Japan from the Western powers that had

Women assemble the electronic components of a high-tech toilet at the Toto Toilet Company in Miyazaki, Japan, in the early 1990s. (MICHAEL S. YAMASHITA/CORBIS)

already colonized most of Asia. It also suggested that Japan needed to adopt Western technology to maintain its national sovereignty. After some years of internal conflict, a new government determined to "modernize" Japan was formed in 1868. Just a year later, telegraph service was inaugurated between Tokyo and Yokohama.

In the 1870s, the government started a university-level program in electrical engineering and established electrical research laboratories. Now that Japan was more fully open to information flows from the West, the Japanese were quick to master the new electrical technologies. Japanese made a telephone receiver in 1878, only two years after Alexander Graham Bell. They started producing electric light bulbs in 1884. An electric lighting system was established in Tokyo in 1887, only five years after Edison established his first system in New York. That same year Japan built its first electric power plant and Tokyo Electric Lighting started supplying electricity to factories. General telephone service was introduced in Tokyo and Yokohama in 1890. In 1905 the Japanese Navy used wireless telegraphy to defeat a Russian fleet at the Battle of Tsushima. Radio broadcasting began in 1925, initiating modern electronics engineering in Japan.

The Japanese also made significant original contributions to electronics technology. The Yagi antenna, which became the world's most widely used radio and television antenna, was invented in 1926 by Yagi Hidetsugu and Uda Shintaro. Also in 1926, Takayanagi Kenjiro was one of the first in the world to successfully produce an all-electronic television image. Toshiba demonstrated Japan's first television set in September 1939, only eight months after RCA first demonstrated its television technology.

Origins of Major Private Firms

Japan's first firms in the electrical/electronics industry were established in the late nineteenth century. Many of these firms soon experienced severe difficulties. Electrical technology was advancing rapidly in the West and was becoming increasingly complex. After Japan joined the International Patent Convention in 1899, Japanese firms were less free simply to copy foreign technology. Another problem was that economic conditions in Japan made it difficult for the new electronics firms to get adequate capital.

Foreign firms often provided the solution to both the technology and capital shortages. In 1899, the U.S. company Western Electric established the firm that became NEC. In 1905, another U.S. company, General Electric (GE), acquired 51 percent of Tokyo Electric Lighting, and provided it with light bulb manufacturing technology. With GE's capital and technology, Tokyo Electric soon dominated light bulb production in Japan. In 1910 GE took 24.5 percent of the equity of Shibaura Engineering Works in exchange for technology. This allowed Shibaura to become Japan's largest producer of generators and other heavy electrical equipment. In 1939 Tokyo and Shibaura merged to form Tokyo Shibaura Electric, today's Toshiba. Westinghouse Electric of the United States and Mitsubishi formed Mitsubishi Electric in 1921; Germany's Siemens and Furukawa Electric formed Fuji Electric in 1923 (one of the spin-offs from Fuji Electric is Fujitsu).

A few Japanese electronics firms have always been independent from foreign firms. Hitachi, which started out as a mine repair shop in 1908, became a separate electrical/electronics firm in 1920. The company long prided itself on its independence from Western technology. Matsushita (also known by its Panasonic and National brand names) was founded in 1918. The firm that became Sharp was established as a metal-processing firm in 1912; it grew based on its founder's invention of a mechanical pencil (the Ever Sharp) and began making radios in 1925.

In the late 1930s, the Japanese government restricted the production of home appliances, and the electronics industry concentrated on producing electronics for the military. The foreign firms were increasingly forced to withdraw. Toshiba shared the technology it had gotten from General Electric with Hitachi, NEC, and other companies, but during the war years the Japanese electronics firms suffered from their loss of contacts with the rest of the world. Military electronics research in such areas as radar, however, was nearly equal to that in Western countries.

Postwar Recovery: Radio and Television

The environment facing the Japanese electronics firms changed drastically with the end of World War II. During the postwar occupation of Japan (1945–1952), U.S. authorities banned research in radar and other areas considered to be of military significance. One of Japan's premier centers of electronics research, the Naval Research Institute, was dismantled. And, of course, there was no longer a market for military electronics. One consequence of this was that talented researchers shifted their interest to consumer electronics. Masaru Ibuka (1908–1997) and Akio Morita (1921–1999), for example, left their positions as naval researchers and went on to found Sony in 1946. Other wartime researchers moved into leading positions at the other electronics firms.

The U.S. Occupation authorities regarded the development of commercial radio and television broadcasting as a way to build support for democratic institutions in Japan. High priority was given the establishment of commercial stations and the manufacture of radios. With this encouragement, around two hundred firms of various sizes began producing radios by 1949. Television broadcasting was begun in 1953. Sharp (then called Hayakawa Electric) put the first Japanese-made television receiver on sale in January 1953. By the end of the 1950s, there were 3.3 million television sets in Japan.

Technology Imports

Although Japanese technologies were being developed that might eventually have served as the basis for Japan's television industry, the faster route of using American standards and relying on foreign technology was chosen. Nearly forty Japanese firms quickly entered into license agreements for foreign television technology, most often with the dominant American firm at the time, RCA. Meanwhile Japanese electronics firms, beginning with Sony, quickly signed licensing agreements for the transistor technology developed at Bell Laboratories in the United States. Although U.S. firms were the first to market transistor radios, Sony developed a radio of the right size and price to appeal to a mass market. The production of transistors for transistor radios also established Japanese firms in the new semiconductor industry.

By 1959, more than one hundred Japanese companies were making transistor radios, and Japan was the world-leading producer of transistors. In 1960 transistor radios were Japan's second largest generator of export earnings, after ships. Although Sony and other Japanese firms deserve credit for developing transistor

radios that were popular with consumers, there was another reason for Japan's success with these products. These products were highly labor intensive at the time and Japanese firms were able to hire thousands of female factory workers for about ten cents per hour.

In the late 1960s, the integrated circuit (IC) and the LSI (large-scale integrated circuit) calculator played a role similar to that of the transistor and the transistor radio in the 1950s. While Sony had been the catalyst for the early technology, Sharp was the key early mover with the LSI calculator. In 1969 Sharp introduced a calculator based on U.S.-developed LSIs. Some fifty other Japanese firms quickly brought out versions of this product. Japanese semiconductor firms quickly developed the technical expertise to meet the needs of the calculator producers. This supported Japan's growing strength in the world semiconductor industry throughout the 1980s.

Japan continues to spend \$2 billion a year on imported electronics technology, but Japan's electronics firms are now also leading suppliers of technology, with annual receipts for technology exports of more than \$1.5 billion.

Developing a Japanese Technological Capacity in Electronics

Although imported technology was essential to the Japanese electronics industry, much more was needed. First of all, the Japanese firms needed to build a strong capability to absorb the technology. Secondly, creative adaptations in product design or production methods, as with the transistor radio and LSI calculator, were needed to make the technology a success. In some instances it was necessary to create new markets for products, such as Sony's Walkman, that had not previously existed. Some of these capabilities were developed through heavy spending on research. In some instances government provided funds and coordinated the activities of firms to develop technology and markets.

The Electronics Industry Law of 1958, for example, provided government subsidies for research and development. Special loans and tax policies encouraged investment in efficient new plants and equipment. Another major policy measure encouraged the formation of research associations—groups of firms subsidized by government and exempted from antitrust laws that worked on specific new technologies. The first of these in the electronics industry, the Japan Electronics Industry Promotion Association, was established in 1958 as the first major cooperative research program. Although it is not clear how many of

the research associations can be characterized as successful, the VLSI (Very Large Scale Integration) Consortium is often credited with helping Japan catch up with the United States in this technology and there may have been other successes in the electronics industry.

Evolving Domestic Market

While Japanese electronics exports attracted attention around the world and sometimes have been the subject of heated trade disputes, a major factor in the Japanese electronics industry's growth has been Japan's increasingly affluent and sophisticated domestic market. Black and white television helped propel the rapid growth of the Japanese electronics industry in the 1950s, but it was not long before the market for this product became saturated. By the time of the Tokyo Olympics, in 1964, about 90 percent of Japanese households had black and white television sets. The electronics firms quickly moved to the production of color television sets. In 1970 color televisions accounted for one third of total electronics industry sales. While a similar transition occurred in the United States and Europe, it extended over a much longer period.

As the Japanese market for color televisions neared saturation in the mid and late 1970s the electronics firms began introducing home video recorders. This time the Japanese domestic market received large volumes of a new electronic product ahead of the United States and Europe, giving an added advantage to the Japanese in export markets. By 1985 Japanese firms and their affiliates accounted for some 80 percent of world video recorder production. In 1979 Sony created another hit product, the Walkman. Other consumer products such as room air conditioners and compact disc (CD) players quickly sold in the Japanese market, contributing to the rapid growth of the Japanese firms.

The demand for increasingly sophisticated consumer products, added to that for calculators and computers, also meant lucrative new markets for Japanese semiconductor producers. Through most of the 1980s five and sometimes six of the world's ten largest semiconductor producers were Japanese. In 1987 Japanese firms had more than half the world's semiconductor market.

The 1990s and 2000s

By the beginning of the 1990s, Japan's household market for consumer products was largely saturated. Worse yet for the electronics firms, Japan's economy had entered a long-term period of stagnation at the

end of the 1980s. During the 1990s, although there was some growth in industrial electronics, sales in the consumer electronics segment of the industry dropped almost in half. The weakness in consumer markets also caused problems for Japanese semiconductor producers. At the end of the 1990s, more than a third of the demand in Japan for semiconductor products came from consumer products, compared to about 5 percent in the United States. Often the consumer applications required analog products, so semiconductors designed for these markets could not be used in the faster-growing computer market.

Another problem facing the Japanese electronics firms in the late twentieth century was the high level of Japanese wages. Beginning in the mid-1980s Japanese electronics firms began moving their facilities offshore to reduce their labor costs. In 1998 these firms had about eight hundred production facilities in Asia and another four hundred in other parts of the world. By the late 1990s, Japanese firms were producing about 40 million color television sets per year, but only about 10 percent of these were actually being made in Japan. Offshore production of video recorders was more than double domestic production. Similar patterns were being seen in the production of stereos, car stereos, and other consumer electronics products.

Despite their success in reducing labor costs by moving offshore, in the late 1990s and early 2000s Japan's "big five" industrial-electronics firms, Toshiba, NEC, Hitachi, Fujitsu, and Mitsubishi Electric (together accounting for 5 percent of Japan's GDP and more than a quarter of its exports) and Japan's largest consumer electronics firm, Sony, were all experiencing serious difficulties. Toshiba, for example, was experiencing its first losses in nearly a quarter of a century. The firms were all being widely criticized for a lack of focus and all were announcing moves to restructure their businesses. Vertically integrated single-nation electronics firms seem to be losing competitive advantage to multinational alliances of more specialized firms. In response to this trend, Japanese firms are increasingly entering into international alliances, most often with U.S. partners.

ELEPHANT, ASIAN The Asian elephant (*Elephas maximus*), also known as the Indian elephant, inhabits the forests and grasslands of Southeast Asia, from India and Sri Lanka to Thailand, Malaysia, and Sumatra. Enormously strong, Asian elephants are also intelligent and easily tamed. Asian elephants were first tamed over 5,000 years ago and can be trained to a very high standard. They are usually captured in the wild as young adults and the initial breaking in and taming process takes only a few weeks. Each elephant is assigned a handler known as a mahout who trains the animal according to detailed traditional procedures and may use tame elephants to calm the new captive and to teach by example. An unbreakable, lifelong bond often develops between a mahout and his elephant. They have served people as beasts of burden, as draft animals, in warfare, and for ceremonial purposes for several thousand years.

Males (bulls) stand three to four meters high and weigh up to six tons. Females (cows) are smaller. Their thick gray skin is wrinkled and almost hairless and their

An 1849 illustration of the Asian elephant in South Asia. (MICHAEL MASIAN HISTORIC PHOTOGRAPHS/CORBIS)

trunk, a fleshy, boneless nose, acts as a hand. Bulls have large ivory tusks, used for digging and fighting. Elephants have poor eyesight, but extremely keen hearing and sense of smell. They are herbivores, feeding primarily on leaves, grasses, bark, and roots. They also enjoy bananas and sugarcane. Food is ground down with their four huge molar teeth.

Elephants live and migrate together in herds and are very social animals. They have a lifespan of up to sixty years. Following a twenty-two-month pregnancy, a cow gives birth to a single calf.

Asian elephants are generally gentle, curious, and friendly creatures. However, enraged or stampeding elephants will trample everything in their path and have occasionally been known to kill people, usually those threatening or hunting them.

Asian elephants are seriously endangered due to loss of habitat and poaching, despite a ban on trading ivory. Most remaining wild elephants are in special reserves.

ELEPHANT RANGE The Chuor Phnom Damrei (Elephant Mountain Range) is an extension of the Chuor Phnom Kravanh (Cardamom Mountains) of western Cambodia. Extending 110 kilometers south and southeast from the capital city of Phnom Penh to the Gulf of Thailand, with an average elevation of 500 meters, the name is literally translated as "the mountains around which the clouds turn." The Elephant Range was the principal center of Cambodia's pepper-growing industry until the Khmer Rouge, also referred to as Red Cambodians, took power in 1975. The heavily forested western slopes receive nearly 5,000 millimeters of rain each year from the southwest monsoons. The rainfall in the eastern hills, however, rarely exceeds 1,520 millimeters, because they lie in the rain shadow.

The highest point in the Elephant Range is Mount Bokor (1,081 meters), located near the coast between the towns of Kampot and Kampong Saom (Sihanoukville). Now a national park, the mountain contains the abandoned ruins of the Bokor hill station, once a popular retreat for the French administrators

who sought to escape the summer heat of Phnom Penh. More recently, it was controlled by Khmer Rouge guerrilla soldiers. Today, both visitors and residents seek out the mountain for its forested surroundings and scenic, panoramic views of the sea.

EMAKIMONO *Emakimono* (*emaki*), meaning literally "pictures rolled," is a uniquely Japanese painting format in which a narrative is presented in both words and pictures through a long horizontal handscroll. *Emakimono* illustrate texts that can be either religious or nonreligious; the emphasis is always on the narrative and thus continuous landscape paintings, for example, cannot be considered *emakimono*.

The scroll, made of paper or silk, is attached to a wooden dowel at the far left end so that the picture may be rolled up for storage, secured by a braided silk cord. The *emakimono* is backed by silk to protect it and give it strength. Once rolled, the scroll can be placed on a shelf or in a large box if the work is comprised of several scrolls.

An *emakimono* is best seen by a single viewer who unrolls and rolls the scroll with both hands. The act of touching the scroll creates an intimate relationship between the painting and the viewer, who is able to control the action of the narrative by moving quickly along some parts of the scroll and pausing at others. As both the Chinese and Japanese languages are traditionally read from right to left, these illustrated handscrolls are intended to be viewed by unrolling the scroll from right to left as well. Typically, an *emakimono* begins with a frontispiece of decorated paper, and then proceeds to the main work where passages of text alternate with illustrations. There is no set length for either the illustrations or the text, but in general, the scenes of battle stories are longer because they convey intense drama.

A number of subjects are found in *emakimono* and include romances, famous battles, legends, and Buddhist themes, such as biographies of eminent monks and histories of temples. *Emakimono* were especially

A scene from the *Tale of Genji*. (ARCHIVO ICONOGRAFICO, S.A./CORBIS)

popular from the twelfth to the fourteenth centuries when stories of this nature were enjoyed. Although the subject matter varied considerably, there are in essence only two types of *emakimono*—those composed of small scenes alternating with sections of text, which include Buddhist treatises and courtly romances, and those with long and dramatic scenes that are unbroken by passages of text, such as the fiery stories of military events.

At the end of the fourteenth century, the vogue for *emakimono* declined, largely due to the growing popularity of Zen-inspired ink paintings and later a market for decorative paintings to adorn sixteenth-century castles and palaces.

EMEI, MOUNT Mount Emei is a 3,099-meter mountain located 200 kilometers southeast of Chengdu in Sichuan Province, China. Dramatic cliffs provide excellent views of the Himalayan Plateau to

the west. It is notable for its very diverse vegetation, including a rare plant called the "dove tree." Monkeys heckle pilgrims for food on the trail, and bearded toads, tree frogs, silver pheasants, and a small species of panda inhabit the undisturbed wilderness of the mountain.

The site has been sacred for over 2,000 years. The Taoists practiced on the mountain during the Eastern Han dynasty (25–220 CE). The first Buddhist temple was said to have built there in the first century CE. Mount Emei is one of the four sacred Buddhist mountains in China. Imperial support of Buddhist institutions at Mount Emei came at the end of the Tang dynasty (618–907 CE) and during the Song dynasty (960–1279). The most remarkable was the Giant Buddha of Leshan, carved out of a hillside in the eighth century and looking down on the junction of three rivers. At 71 meters high, it is the largest Buddha in the world. Another famous image on the mountain is an enormous bronze statue cast in 980. This statue was mounted on a white ceramic elephant during the Ming dynasty (1368–1644), which saw a revival of imperial patronage for the mountain's Buddhist monasteries. In the fourteenth century, over one hundred temples and thousands of monks and nuns could be found there; only twenty temples remain today. The mountain (in Tibetan: *Glang chen 'gying ri*), which is located within the sight of the cultural Tibetan border, is currently

a pilgrimage destination for Chinese and Tibetan Buddhists. In 1996 the mountain, including the Leshan Giant Buddha scenic area, was listed as a UNESCO World Heritage site.

EMERALD BUDDHA The Emerald Buddha is the most sacred Buddha image in Thailand, which prior to 1939 was Siam. It rests in its own chapel within the Wat Phra Keo, the royal palace and temple complex in Bangkok. Carved out of green jasper, the image is 66 centimeters (26 inches) high and is in *virasana*

mudra (sitting with hands on the lap). The Emerald Buddha is an object of national veneration and is believed to protect Thailand. Its origins, however, are mysterious. The *Chronicle of the Emerald Buddha*, an anonymous text of unknown date, relates a legend suggesting that the Emerald Buddha was sculpted in India by Nagasena and the god Vishnu. The *Chronicle* tells that the image then traveled to Sri Lanka, Burma, Cambodia, Laos, and Thailand. The Emerald Buddha was discovered, encased in stucco and inside a stupa (dome-shaped Buddhist shrine), in Chiang Rai, Siam, in 1434. The image later traveled to Lampang, Chiang Mai, and Vientiane. It was brought to Siam in 1778, after the Siamese army sacked Vientiane at the command of King Taksin, the expansionist ruler who united Siam. The Emerald Buddha was first brought to Thonburi and then, in 1784, to Bangkok, where it was installed in its current location by King Rama I when he moved the national capital to Bangkok. Rama I used the image to legitimize his reign. Successive members of the Chakri dynasty (1782–present) have used the image in a similar way. The most important ceremony associated with the Emerald Buddha is the dressing of the image, which takes place three times each year, marking the beginning of the hot, rainy, and cool seasons. The king of Thailand cleans the image and changes its headdress, and then prays while a royal attendant changes the image's garments. The Emerald Buddha is Bangkok's most important treasure and is part of the Thai language name of Bangkok.

ENCHI FUMIKO (1905–1986), Japanese novelist. Enchi Fumiko was born Ueda Fumi, daughter of the well-known linguist Ueda Kazutoshi. She received a good education, including private tutoring in English, French, and Chinese classics. From childhood, she absorbed the Kabuki plays and Japanese classics, such as *The Tale of Genji* (eleventh century) and late Edo tales of the supernatural, which, combined with her knowledge of Western literature, formed the foundation for her writings. Her literary debut as a playwright occurred

in the late 1920s. After marrying the journalist Enchi Yoshimatsu in 1930 and having a daughter, she began writing fiction but fell into relative silence. Her unsatisfactory marriage provided her the emotional energy that fueled many of her powerful writings. Her mastectomy (1938) and hysterectomy (1946, from which she nearly died) also deepened her insight into women's psychology and sexuality. Her short story "Himogiji Tsukihi" (Hungry Years, 1953) brought her public recognition. Her masterpiece, *The Waiting Years* (1949–1957), depicts the unhappy marriage of a persevering woman, inspired by the life of Enchi's grandmother. It garnered the Noma Literary Prize (1958). Enchi's works often feature strong, suffering, and tenacious women. Recurrent themes from classical literature, such as spirit possession, shamanism, or blending of the real and the supernatural, also characterize her works. She also translated *The Tale of Genji* into modern Japanese, in ten volumes (1972–1973). In 1985 she received the Order of Culture.

ENDANGERED SPECIES Tropical Asia and Australia appear to have a large number of endangered species and particularly high extinction rates. In the face of this global crisis, international treaties to control trade in wildlife and wildlife products, government education and species protection programs, and efforts by wildlife conservation programs have been developed and expanded.

Asia's Endangered Species

In twenty-six Asian countries stretching from Japan to Afghanistan, a total of 2,022 species of mammals, birds, reptiles, amphibians, fish, and invertebrates

were identified as endangered in 1996 by the International Union for Conservation of Nature and Natural Resources (IUCN). Among these countries, Indonesia, China, India, the Philippines, and Vietnam are among the richest in species and yet have the largest number of endangered species.

The 2000 IUCN Red List of Threatened Species reported that Indonesia harbors the highest number of threatened mammals (135 species), while India (80 species), China (72 species), and Thailand (32 species) rank among the top ten. In the Philippines, which has a large number of endemic species or mammals found nowhere else, 32 percent of those mammals are endangered.

A similarly discouraging profile of endangered bird species is also typical of Asia. Of the twenty countries with the largest number of threatened avian species, 50 percent are from Asia. According to the Red List, the Philippines, a biodiversity hot spot that has lost 97 percent of its original vegetation, has more critically endangered birds than any other country. Endangered species of doves, parrots, and perching birds (passerines) found in Southeast Asia have also shown marked declines due to continued deforestation. Indonesia and China, with some of the largest numbers of bird species in the world, are also countries with large numbers of threatened species. As is the case with the mammals, the countries with the most threatened species also have extremely high human populations. Since 1966, the number of threatened reptiles has grown more slowly, but the populations of freshwater turtles and tortoises are deteriorating rapidly in Southeast Asia. Their decline is due to heavy exploitation for food and medicinal use and to unregulated hunting. As these populations disappear in Southeast Asia, there are signs that this trade is shifting to the Indian subcontinent. Other Asian species, such as snakes and salamanders, are heavily exploited for use in traditional Chinese medicine, but the effects of this and other pressures on most of these species have not yet been assessed.

Various plant species, especially tropical timber trees, are also endangered in large areas of Southeast Asia. Malaysia, for example, has the most threatened number of plant species (681), followed closely by Indonesia with 384.

Preservation and Conservation

In 1975 the CITES treaty, or the Convention on International Trade in Endangered Species of Wildlife Fauna and Flora, was approved to control the trade in wildlife and wildlife products. Over 151 countries have signed this treaty, which identifies species and species

products that are illegal to purchase or sell for profit or whose sale is allowed only if it will not harm their survival. Other actions have been taken to protect endangered species and their habitats from one of the main factors driving their decline: humans. In Nepal, a second home for the endangered greater one-horned rhino was created in Royal Bardia National Park, helping that population grow to over 550 animals. China's giant panda, a universal symbol of endangered wildlife, has benefited in the past two decades by the creation of thirty-two reserves protecting more than 15,540 square kilometers (6,000 square miles) of panda forest habitat from timber harvesting. And similar efforts are under way to provide protected habitats for the endangered Asian elephant in Sumatra, Indonesia. These government efforts are often undertaken in cooperation with such organizations as the World Wildlife Fund (WWF), the World Conservation Society (WCS), and the IUCN to provide training in conservation methods, conduct surveys of endangered species, and develop long-term species conservation and protection programs.

While there has been some success in species conservation over the last twenty years, these have come too infrequently and generally have been achieved through large investments that tackle immediate threats. There have been very few attempts to address the underlying driving forces that contribute to species endangerment or extinction. For this crisis to be addressed effectively, greater action is needed to remove the immediate threats to species and the driving forces causing their decline. These issues will be tackled only if there is much greater support for lifestyle changes, and this involves the political will of governments.
