ter majoring in French literature at Keio University, in 1950 he was selected as the first Japanese to study abroad. Endo spent two and a half years in France, reading especially French Catholic writers. Upon his return to Japan he began writing fiction, publishing in 1955 *Shiroi bito* (White Man), for which he won the Akutagawa Prize, followed by *Kiiroi bito* (Yellow Man). In these works he contrasted the Western and Japanese views of faith, guilt, and sin.

In 1958, Endo published *Umi to dokuyaku* (The Sea and Poison), which dealt with the vivisection of captive American soldiers. In *Ryugaku* (Foreign Studies, 1965) he examined the difficulties that Japanese have in absorbing the essence of Western culture, particularly Christianity. Perhaps his most well-known work is *Chinmoku* (Silence, 1966), concerning the martyrdom of Christians in Japan beginning in the late-sixteenth century. With *Samurai* (The Samurai, 1980), critics began to write of Endo as an eventual candidate for the Nobel Prize. While a devout adherent to Christian faith, to the end of his life he pursued as his subject the human psyche in its sometimes disturbing complexity.

ENERGY—CENTRAL ASIA Among the many regions suddenly opened to the outside world with the end of the Cold War are the five countries of Central Asia—Kazakhstan, Kyrgyzstan, Tajikistan, Turkmenistan, and Uzbekistan. These new nations, home to 55 million people in an area 40 percent the size of the United States, are best known in the West as lands of the ancient Silk Road that connected the European, Islamic, and Asian civilizations. But beneath the steppes, deserts, mountains, and river valleys, abundant energy resources lie waiting for investment and development.

Energy—including oil, natural gas, coal, electricity generated from these and hydroelectric sources, and nontraditional sources—is the most abundant and valuable natural resource of Central Asia. Kazakhstan has large reserves of oil and coal, Turkmenistan and Uzbekistan have significant reserves of gas, and Kyrgyzstan produces important amounts of hydroelectric power. Only Kazakhstan has an operating nuclear power station, but plans to build a new plant were

abandoned in 2000 over safety and cost concerns. All of these energy reserves form a basis for economic growth and development, with energy exports promising to generate foreign-exchange revenues. Central Asia is, in fact, poised to become a major world supplier of energy, especially in the oil and gas sectors.

To develop and restructure the energy sector in the Central Asian republics, energy planners are addressing two key issues: (1) overcoming periodic energy shortages and (2) reducing dependencies on unreliable sources of energy. All governments in the region are trying to develop new international markets that provide stable supplies of foreign exchange as they internationalize and develop ties with countries in the West and with their neighbors.

Oil

Oil is the most valuable commodity traded in the world; billions of dollars' worth of oil are globally traded daily. As such, oil serves as the economic foundation of many countries. Yet in Central Asia oil is only the second most important resource: on an energy-equivalent basis, Central Asia is still a gas-producing region, although this could change in the near future with the tremendous oil potential of places such as Kazakhstan.

Central Asia now produces more oil than it consumes, as a result of a dramatic increase in output during the second half of the 1990s. Production will probably continue to grow in the first decades of the twenty-first century as major projects are developed. Output from the entire region—50 million metric tons—amounts to about one-seventh that of Europe or Central and South America.

Kazakhstan is the main producer of oil in the region (35.3 million metric tons or 745,000 barrels daily in 2000), with proven reserves of 8 million barrels, or 1.1 billion metric tons. Uzbekistan has modest oil reserves (0.6 billion barrels, or 0.1 billion metric tons) and produces 7.5 million metric tons of oil and condensates each year. It could increase output relatively easily if a viable external market were identified. Like Uzbekistan, Turkmenistan has limited oil reserves, totaling 0.5 billion barrels in 2000. Kyrgyzstan and Tajikistan produce only small quantities of oil, with oil balances in these two countries likely to worsen in the immediate future if economic development proceeds briskly and demand for energy increases.

Natural Gas

Central Asia is predominantly a gas-producing region, with proven gas reserves amounting to 6.6 trillion cubic meters—2.9 trillion cubic meters in Turk-

menistan, 1.9 trillion cubic meters in Uzbekistan, and 1.8 trillion cubic meters in Kazakhstan. This represents slightly more than one-tenth of the known gas reserves of the former Soviet Union, which total 56.7 trillion cubic meters. Combined, Central Asia's output—106.7 billion cubic meters or 96.2 million metric tons oil equivalent—represents about half that of the Middle East.

Uzbekistan and Turkmenistan are the two leading gas producers, although Kazakhstan, too, has significant deposits. Until 1991 Turkmenistan produced nearly 80 billion cubic meters of gas per year, but output has fallen dramatically since then because of difficulties in paying for Turkmen gas in the Ukraine and harmful actions by Gazprom, the Russian gas line company. Turkmenistan's production totaled 43.8 billion cubic meters in 2000. Uzbekistan produced 52.2 billion cubic meters in 2000 and estimates it will export between 5 billion and 10 billion cubic meters per year in the future.

Gas from the region is generally high in sulfur, containing corrosive properties, as is also the case with oil from Kazakhstan and other parts of Central Asia. The pipelines therefore have to be well maintained and fuels cleaned before transportation.

As the economies in the region continue to develop, the demand for natural gas as a source of both heat and electricity will increase. Conversion from coal to gas for thermal power production would result in less pollution and reduce the cost of energy. But in spite of significant gas deposits, gas shortages are a continuing problem in some areas because of the inadequate gas pipeline network, inadequate energy policies, payment difficulties, and unstable government structures.

Coal

In spite of the importance of oil and gas in the region's export economy, coal remains the most common source of energy in Central Asia. It is the primary source of electricity in Kazakhstan, for example, and is a major source of heat in both Kazakhstan and Kyrgyzstan. Many thermal power plants in Uzbekistan are fired by coal, although an effort is being made to convert coal-fired power plants to gas in that country.

The biggest coal producer in Central Asia is Kazakhstan, with an estimated 120 billion metric tons of coal in Karaganda and other areas, but the quality is generally poor, and the deposits are far from major industrial locations. The quality can be enhanced, however, if it is mixed with higher-quality coal from other areas, just as oil and gas can be enriched. There is such a tremendous coal base in Kazakhstan that the gov-

ernment is considering converting coal to synthetic oil in the eastern part of the country, where it is economically feasible.

Electricity

Electric power is essential for economic development. The countries of Central Asia generate power by various means. Kyrgyzstan, which has large hydroelectric potential, generates most of its electricity through hydroelectric power stations. Uzbekistan relies primarily on thermal power stations fueled by natural gas, although cheaper energy produced by hydropower electric plants exists. The country also draws significantly on hydropower produced by power stations in Kyrgyzstan and Tajikistan. Kazakhstan depends primarily on coal to generate electricity.

With the exception of Turkmenistan, electricity shortages are a major problem in the region, particularly in Kazakhstan. To alleviate the power shortage, the Kazakh government has implemented a privatization program aimed at rejuvenating the entire electric power industry. Turkmenistan has excess electric generation capacity, and the country has the potential to boost its electricity exports.

Nontraditional Energy Resources

Some of the countries in Central Asia have made substantial commitments to support development of

nontraditional energy sources such as solar energy and wind power. In Kyrgyzstan, for example, the Kyun government agency is entirely devoted to examining alternative energy supplies, including solar, wind, geothermal, and coal-bed methane gas. Kyun is one of four key energy agencies or ministries in Kyrgyzstan directly under the Cabinet of Ministers and has the same level of authority and prestige as the other energy ministries.

In Kazakhstan, government officials have mapped alternative energy resources across the country to determine the feasibility of developing these resources. Kazakhstan's southern and northern tiers annually receive an abundance of sunshine and possess significant potential for solar energy. Potential wind and biogas resources have been identified in the west. Both southern and northeastern Kazakhstan have potential for geothermal energy. Kyrgyzstan, Kazakhstan, and Uzbekistan have formed a joint venture to produce solar batteries and panel components for export to India and the People's Republic of China.

Major Trends in the Energy Sector

After decades of closed economies in Kazakhstan, Kyrgyzstan, Tajikistan, Turkmenistan, and Uzbekistan, local government officials are now encouraging rapid development of their oil, gas, coal, electricity, and nontraditional sectors. To do this, governments in the region are actively restructuring their energy sectors to improve efficiency, streamline operations, and internationalize. In both Kazakhstan and Kyrgyzstan, for instance, privatization is changing the agencies involved in energy production, transportation, and utilization. Government ministries involved in energy exploration, development, and use are being reorganized; large state enterprises are being disaggregated and their component parts converted to joint stock companies. In Kazakhstan, the government ministerial systems, including those engaged in energy development, have been restructured repeatedly over the past several years.

In addition to privatizing state enterprises, countries in Central Asia are soliciting foreign investment to facilitate rapid development of their energy reserves. Central Asian leaders now view their energy resources as a long-term source of revenue, and the nations, especially Kazakhstan, Turkmenistan, and Uzbekistan, are revising investment and taxation codes to woo foreign investors. To date, most private foreign investor interest in Central Asia has focused on providing technology and expertise for the development of the region's potentially huge oil and gas fields. Investment opportunities include refinery and pipeline

AN INTERCONNECTED POWER GRID

A fairly reliable regional electricity grid serving Uzbekistan, Kyrgyzstan, Tajikistan, Turkmenistan, and five districts in the southern territory of Kazakhstan was established in 1960, under Soviet administration. During the first years of independence, there were relatively few problems with the region-wide system. Rainfall was abundant and Kyrgyzstan's Toktogul Reservoir was full. However, between 1992 and 1997 rainfall was less than average, and hydroelectricity generation from Kyrgyzstan became less reliable. As a result, shortages plaguing Central Asia's entire electric power system caused serious disagreements among the countries.

construction, enhanced oil recovery, and development of a regional pipeline system to distribute natural gas resources from wells to surrounding areas and neighboring republics.

ENERGY INDUSTRY—CHINA China is the biggest producer and consumer of coal in the world. Some 1.4 billion metric tons are produced each year. This means that coal industries, rather than petroleum or natural-gas industries, have played the most significant role in energy production and industrial development to date.

The use of coal to heat buildings and smelt metals began in China at least as early as the fourth century, when coal was simply excavated from surface deposits. Coal was a leading fuel by the year 1000, a time when settlements in Europe still preferred to use wood and charcoal (a fuel made from wood). Coal continued to dominate energy use in China for the next thousand years. In the 1960s, however, increasing concerns about the security of the domestic energy supply, as well as market demands for alternatives to coal, led to major initiatives in oil and gas exploration, including the development of the famous Daqing oil field. Proven oil and gas reserves on the mainland and offshore, however, will not meet increasing domestic demand. China has become and will continue to be a net

importer of oil and gas. Other diversification initiatives beyond oil and gas include developing untapped hydroelectric potential and the decision, in particular, to create the Three Gorges hydroelectric dam by blocking the Chang (Yangtze) River, the world's third-largest river after the Amazon and the Nile.

The sources of electricity production provide one key insight into the Chinese energy industry. Of the 1.16 trillion kilowatt-hours of electricity produced in 1998, 80 percent was supplied by coal industries. The balance came from hydroelectric and nuclear-power industries at about 18 percent and 1 percent, respectively. Other sources, including renewable sources, are insignificant. The amount of coal used in electricity production is 24 percent of total coal consumption. Industries such as iron and steel, armaments, cement, and chemical fertilizers also use significant amounts of coal.

Energy use by fuel type provides another key insight into the energy industry. Coal accounts for 74 percent of all energy use in China, ensuring the dominance of coal industries. Oil, at 20 percent of all energy use, is a distant second. Hydroelectric power, natural gas, nuclear, and renewable-energy sources account for 6 percent, 2 percent, 0.1 percent, and 0.1 percent, respectively.

Industrial Restructuring

The shift toward a market economy in energy in China has been fraught with difficulties. National-security concerns over the control of energy policy and the difficulty of separating government and enterprise functions in the energy sector represent two overarching challenges at the domestic level. At the international level, the Asian financial crisis of 1997, combined with low prices for oil and coal in the late 1990s, has made the economic climate for reforms more difficult.

The restructuring of the energy industry varies by sector, with the level of competition significantly less than that in the United States, Canada, and Europe. In January 1994, coal prices were deregulated and gradually allowed to float. This led to the closure of 31,000 unprofitable mines in 1999 and another 18,000 mines in 2000. Some 420,000 miners were laid off in 1998 alone.

The oil and gas industries, like other industries, were centrally controlled by the government. Since the economic reforms of the 1980s, however, state-owned oil and gas companies have been created to increase productive capacity through joint ventures with foreign oil companies. The fact that oil consumption has

outpaced domestic production since 1993 has further spurred efforts to increase domestic production. To this end, exploration licenses are now awarded to state-owned (but slightly privatized) companies on a competitive basis to meet national production targets. The energy reforms also saw the creation of two vertically integrated and publicly traded companies from government-controlled organizations that previously had to serve public-policy and regulatory functions. By creating two "market-based" companies, PetroChina and Sinopec, the Chinese government sought to have greater efficiency in energy production and to prepare the way for the competitive pressures that would arise from greater foreign direct investment in domestic-energy projects.

PetroChina was created from the China National Petroleum Corporation (CNPC) in 1999 with 480,000 of its 1.5 million workers. CNPC allocated the majority of its best assets to PetroChina while retaining the excess workforce and welfare obligations. At the outset, PetroChina ranked fifth in the world in estimated reserves, produced 68 percent of China's total oil, operated 3,400 gas stations, and owned pipelines transporting 84 percent of China's natural gas. A second company, Sinopec, followed in 2000. This company operates more than 20,000 gas stations, 1,100 bulk-storage facilities, and a number of refineries. A significant aspect of this restructuring has been the dismissal of excess staff. PetroChina laid off 38,000 employees by January 2001, and Sinopec is expected to cut its workforce of 500,000 by 20 percent by 2005.

Changes planned in hydropower production are also significant. A number of large hydropower dams are under construction. The Three Gorges dam, the largest of these, is scheduled for completion in 2009, when it will generate 84.7 billion kilowatt-hours a year.

Of the remaining sources of energy—natural gas, nuclear energy, and renewable energy—natural gas will probably be the most significant. China has significant domestic reserves of natural gas and a plan to deliver up to three times the amount currently consumed by 2010. A "West to East" natural-gas pipeline could involve partnership with Western companies. Nuclear-power capacity will also expand. There are currently two nuclear-power facilities, the first in Zhejiang Province south of Shanghai and the second in Guangdong province near Hong Kong. Several new nuclear-power facilities are under construction to expand electricity production from just over 1 percent to 3 percent. Of the renewable-energy sources, only

China relies heavily on coal as a source of energy as with this coal-fired power plant in northern China. (EYE UBIQUITOUS/CORBIS)

hydropower plays a significant role. Other sources of renewable power, such as biomass, wind, solar, geothermal, and tidal power, are minor in China compared with levels of 3 percent in nations such as Denmark and the United States. Their potential for development, however, is considerable.

Eco-efficiency

China's reliance on coal has led to serious energy-efficiency and environmental problems and makes the development of less harmful sources of energy a pressing challenge. Environmental problems created by burning coal include acid rain, smog, and greenhouse gases such as carbon dioxide. Each of these problems has specific impacts on the environment and human health. Acid rain, for example, damages forests, croplands, and lakes. Smog, made up of particulate matter and sulfur dioxide emissions, covers many cities and affects people's health. In certain parts of China, the concentration of total suspended particles is two to three times the level specified as safe under World Health Organization guidelines. Carbon-dioxide emissions (the main cause of greenhouse-effect climate change) in China are second only to emissions in the United States. On a per-person basis, however, the average American creates 7.5 times more carbon dioxide than does the average Chinese.

Energy production is no longer a simple matter of economic efficiency, narrowly defined. Because energy production can have significant impacts on employment and the environment, capital markets are increasingly required to consider environmental, labor, and human-rights ramifications before they make their investment decisions.

Energy industries, whether they are publicly or privately owned, not only have to produce more energy from existing natural resources, they also have to produce it in environmentally responsible ways. Improving energy efficiency while linking energy production to environmental goals is part of a larger challenge China shares with other nations.

ENGLISH IN ASIA English is an Asian language. That may sound strange at first, but the facts are clear. English has been used in various parts of Asia for almost two hundred years. It is the first language of two countries in Asia (Australia and New Zealand), the second language of seven others (Bangladesh, India, Malaysia, Pakistan, the Philippines, Singapore, and Sri Lanka), and the first foreign language in the remaining Asian countries. More fluent users of English can be found in Asia (estimated at 350 million) than on any other continent; English is used predominantly to communicate with fellow Asians. Locally published English newspapers can be found in practically every metropolitan city across Asia. Conferences frequently are conducted in English (and their proceedings published in English) when only a few, if any, of the participants are native English speakers. English is the language of the Association of Southeast Asian Nations (ASEAN), even though it is not the first language of any of the member countries. More students are studying English in this region than in any other part of the world. China alone has 100 million people learning English. Although most people in Asia do not speak English, Asian leaders in many fields (the arts, business and commerce, education, diplomacy, law, the military, space exploration, and tourism) usually do. English sometimes enables different ethnic groups

in the same country to communicate with one another, helping to establish a sense of nationhood.

The Debate on the Use of English

Ongoing articulate debates about English in Asia have continued for some time. One side takes the position that English is an instrument of cultural imperialism and neocolonialism. They argue that linguistic diversity is greatly diminished by the spread of English, which adversely affects minority languages. The other side does not see English as an alien language or as an instrument of Western hegemony. This group maintains that English belongs to those who use it, not only to native speakers, and that it also expresses Asian culture. They point out that leaders such as Mohandas K. Gandhi (1869–1948) and Jawaharlal Nehru (1889–1964) wrote in English to reach a national audience and to promote a national agenda. They make the point that English has no claims to intrinsic superiority but that it has a preeminent role in Asia because it is a medium for science, technology, literature, and law. English has borrowed from the languages of Asia as well. A few examples include "bungalow" from Bengali, "pajama" from Hindi, "sugar" from Sanskrit, "serendipity" from Singhalese, "kowitz" from Mandarin, "ketchup" from Malay, "boondocks" from Tagalog, and "tycoon" from Japanese.

Features of Asian English

There are also national coinages in English, which are familiar primarily to a local population. These include "dirty kitchen" (in the Philippines, the room in a home where the real cooking is done), "minor wife" (in Thailand, a wife who is secondary to the major wife), "lah" (in Singapore and Malaysia, a mark of informality), "field chickens" (in China, frogs), "sayonara home run" (in Japan, the winning run), and "crow and sparrow story" (in India, a "cock and bull" story).

Pronunciations vary across Asia, but intelligibility of the different varieties of English is no more of a problem in Asia than it is in other parts of the world. As in the United States, grammar use across Asia ranges from pidgin to an international standard. Discourse patterns are frequently different in different varieties of Asian English.

Showing politeness is important in every culture, but it is done differently in the various forms of Asian English. Because the Japanese are reluctant to say "No" directly, a person from Osaka may say "I will consider it," or a person from Tokyo may say, "That will be difficult," when they mean "No." Nodding the

head and saying "Yes" do not always mean agreement from an Asian speaker of English; neither do "I'm sorry" and "I apologize" necessarily mean an acceptance of guilt or responsibility for a mistake. Often each of these means "I regret there is some unpleasantness here. I wish it were not so."

One way to learn about the use of English in Asia is to read creative writing by Asians. Talented authors include Anita Desai, Wimal Dissanayake, Ha Jin, Min-fong Ho, F. Sionil Jose, Catherine Lim, Shirley Geok-Lin Lim, R. K. Narayan, Arundhati Roy, Raja Rao, Bienvenido N. Santos, Pira Sudham, and Edwin Thumboo. There are also academic publications devoted to the topic of English in Asia.

The future of English in Asia is one of growth and variation. In almost every Asian country the percentage of the population fluent in English is increasing rapidly, and it is predicted that 30 to 35 percent of the population will use English on a daily basis by the year 2010. English will doubtless continue to be the language Asians use to represent their personal aspirations and public policies in the international workplace, the global media, and for Internet communication.

ENOMOTO TAKEAKI (1836–1908), Japanese government official. Enomoto Takeaki was a naval officer and diplomat who served the Tokugawa shogunate (known then by the name of Kamajiro) and later the Meiji government. Born in Shitaya, Edo prefecture, he studied at the Shoheiko (Shogunal College) and learned navigation from the Dutch in Nagasaki. Appointed director of the Shogunate naval school, in 1862 he went to Rotterdam to study military services and to supervise construction of the warship *Kaiyo Maru*, which was commissioned by the shogunate. After six years in Europe, he became vice commander-in-chief of the shogunate navy. When the rule of the house of Tokugawa was overthrown and power was

restored to the Meiji emperor, Enomoto, with a small army of supporters, took eight ships of the Tokugawa navy to the northern island of Hokkaido to establish an independent republic. He surrendered to imperial forces in 1869, spent three years under house arrest, and was pardoned in 1872. Restored to favor, he later received many important ministerial appointments within the Meiji government, including envoy to Russia (1873–1876). He concluded the Treaty of St. Petersburg (1875), by which Japan abandoned its claim to Sakhalin Island in exchange for the northern Kuril Islands. Enomoto was subsequently appointed navy minister (1876–1882), minister to China (1882–1884), and he held cabinet posts in communications, education, foreign affairs, agriculture, and commerce. He was made a viscount in 1887 and named adviser to the Privy Council in 1890.

ERDENET (2000 pop. 68,000). Erdenet (1,300 meters above sea level), located 240 kilometers northwest of Ulaanbaatar, Mongolia, is the second largest city in the country. Erdenet is also one of Mongolia's youngest cities. Its establishment began with the discovery of massive copper and molybdenum deposits in Erdenet Mountain in the 1960s. By 1974, an ore-processing plant began operating in the area under a Mongolian-Soviet joint venture—the Erdenet Copper and Molybdenum Mining and Concentrating Combine. In 1975, the industrial complex, located in a valley between the Selenge and Orhon Rivers, was officially declared a town.

Although the city has several industries—including a carpet factory, a food-processing plant, and a timber-processing plant—its economy revolves around copper and molybdenum mining. By 1990, the city boasted Asia's largest copper-molybdenum ore-processing plant and accounted for up to 90 percent

of the total output of Mongolia's mining industry. The city also supplies 30 percent of the country's tax income and 60 percent of its exports.

ERSHAD, H. M. (b. 1930), President of Bangladesh. Born in the Rangpur District of modern-day Bangladesh, Hussain Muhammad Ershad became a career officer in the Pakistan army, reaching the rank of lieutenant colonel by 1971. Stationed in Pakistan when Bangladesh and Pakistan split, he was interned there (as an East Pakistani he was believed to be disloyal to a united Pakistan) and did not return to Bangladesh until 1973, when he was included in the Bangladesh army. Ershad succeeded Ziaur Rahman (Zia) as chief of staff in 1978. From that position, he overthrew the Bangladesh Nationalist Party government of Abdus Sattar, who had succeeded to the presidency on the

death of President Zia. He assumed the title of president in December 1984, having earlier ruled as chief martial-law administrator. Although an unpopular and unelected leader (he did win an obviously rigged referendum in 1986), Ershad continued many of the development programs of Zia and was rather successful in reducing the rate of population growth, receiving a citation from the United Nations for this. Opposition, which was endemic, peaked in the last months of 1990, resulting in his resignation in December 1990. He had formed a party, the Jatiya (People's) Party, which contested in the 1991 and June 1996 elections, finishing third each time. In 1996 the Jatiya Party supported an Awami League-led coalition, but the party has since split and the faction led by Ershad has withdrawn support from Sheikh Hasina and joined Khaleda Zia in opposition.

ERZURUM (2002 est. pop 333,000). Erzurum is one of the most important cities in eastern Turkey. The capital of the province of Erzurum, it is located between the Karasu and Aras valleys at an altitude of nearly 2,000 meters. Due to its geographic location, Erzurum has always held military and economic significance. Its strategic location also means it was often fought over in the past, despite the high frequency of earthquakes. The city first became significant in 415 when the Byzantine emperor Theodosius fortified and renamed it Theodosiopolis. For the next 500 years, it was held, alternately, by the Byzantines, Arabs, and Armenians (who called it Karin). The Byzantines reigned until the Battle of Manzikert (1071), which left Erzurum under Seljuk rule. It later fell to the Mongols, after which it was conquered by Sultan Selim I (1467–1520) in 1514 and incorporated into the Ottoman empire. Erzurum became the capital of the new province in 1534 and served as the primary military base for campaigns to Iran and Georgia throughout the sixteenth and seventeenth centuries. During the Ottoman-Russian wars, Erzurum was occupied by the Russians in 1829, 1878, and 1916. On 23 July 1919 Mustafa Kemal Ataturk (1881–1938), founder of the Republic of Turkey, held the first meeting of the National Congress in Erzurum. The city was linked to

the country's rail system in 1939. It is the location of the 3rd Army and Atatürk University, which opened in 1958. Erzurum is often used as a base for outdoor expeditions to nearby Mount Ararat.

ESFAHAN (2002 pop.1.4 million). Esfahan, an ancient city located in central Iran, has played a significant role in Iranian history, as it was often the battleground between warring tribes and dynasties, undoubtedly because of its strategic position. Not much is known about the city before the Sasanid dynasty (224/228–651 CE). Its location, however, at the intersection of several important roads, suggests that it may have been a cultural and financial center. Some believe that Esfahan was the residence of a few Achaemenid royals, who called it either Gaba or Gi. In 642 CE the city was conquered by the Arabs, who made Esfahan the capital of al-Jibal Province. Esfahan was controlled by various rulers over the years and its prosperity depended upon their whims. When the Seljuk dynasty began in the eleventh century, Toghril Beg named Esfahan the capital of his realm. During this time the city flourished, increasing in size and population. With the demise of the Seljuk dynasty, however, Esfahan endured neglect and difficulty.

Esfahan experienced a renewal in the late sixteenth and seventeenth centuries when it was designated the capital city of the Safavid ruler Shah Abbas I the Great, who used his riches to improve the city's sanitary conditions and architectural landscape. After the Safavid dynasty (1501–1722/1736) fell, however, Esfahan once again became the target of various warring factions. Political and economic stability did not return to Esfahan until the Qajar dynasty (1794–1925) rose to power in the eighteenth century. This stability continued through the Pahlavi dynasty. Toward the end of the Pahlavi dynasty (1924–1979), the people of Esfahan were active in their opposition to the shah's policies and instrumental in the establishment of the Islamic Republic of Iran in 1979.

Esfahan is currently home to Esfahan University, which was founded as part of a program to bring higher education to the provinces of Iran. Due to its ancient roots, Esfahan is also home to several famous

architectural sites: Meydan-i Shah (Royal Square), Masjid-i Shah (Royal Mosque), Masjid-i Shaykh Lotfollah (Lotfollah Mosque), A'li Ghapo (Royal Palace), the Great Bazaar, and Sadr Boulevard. These sites make Esfahan a beautiful Iranian city, which also enjoys the greenery that the Zayandeh River and its channel system bring. Esfahan is also an important manufacturing center, home to Iran's modern steel industry, and pipe-building, helicopter assembly, among others.

ESTRADA, JOSEPH (b. 1937), president of the Philippines, 1998–2001. The thirteenth president of the Republic of the Philippines, Joseph Estrada was born José Ejercito. Against his parents' wishes, he became a movie actor, adopting the stage name Joseph Estrada and the nickname "Erap." In his thirty-two-year acting career, Estrada starred in 107 movies,

President Estrada with a baby in a Manila slum neighborhood in October 2000. (REUTERS NEWMEDIA INC./CORBIS)

often portraying Robin Hood-type roles. This endeared him to the masses, and he became a popular and recognizable personality.

His popularity served him well when in 1969 he ran for mayor of the Manila suburb of San Juan and won. During his sixteen years as mayor, he earned a reputation as a champion of poor people. Although he initially ran as an independent, he later became identified with the former president Ferdinand Marcos (1917–1989). In 1986, following the ouster of Marcos through popular demand, Estrada was unseated, along with other local officials, as a result of the massive governmental reorganization that Corazon Aquino (b. 1933) embarked on when she assumed the presidency.

The following year, Estrada successfully campaigned for a senate seat and was one of only two candidates who won under an opposition ticket allied with old Marcos forces. Elected vice president in May 1992, he used that position as a launching pad for his presidential campaign. In May 1998, he was elected president by the largest electoral margin in Philippine history.

Though poor people believed him to be their champion, Estrada did little to mitigate poverty or address land reform, and his presidency was short lived. Amid allegations of rampant corruption, he was criticized for giving lucrative business contracts and concessions to former Marcos cronies. He was later accused of receiving \$80 million in bribes from illegal gambling operators, as well as kickbacks from tobacco excise-tax receipts.

In 2000, as the house of representatives voted to impeach Estrada, the groundswell for his resignation heightened. The Philippine senate then began the impeachment trial, but after a close vote of eleven senators to ten, which in effect suppressed evidence supposed to prove Estrada's guilt, senate president Aquilino Pimentel and the entire house prosecution team resigned. Mass rallies took place, and in January 2001 several cabinet officials and senior military officers withdrew their support for him in favor of the vice president Gloria Macapagal-Arroyo (b. 1947).

When Estrada left Malacanang, the presidential residence, the supreme court regarded him as having resigned from his position and declared the presidency vacant. It then swore in Macapagal-Arroyo as president. Estrada was arrested in May 2001 and continues to be detained at a military hospital. He faces charges of perjury, corruption, and economic plunder and could receive the death penalty for the latter offense.

ETATISM—TURKEY Etatism (statism), derived from the French word *état* (state), was adopted as one of six ideological principles of Kemalism, the founding ideology of the Republic of Turkey, named after Mustafa Kemal (later Atatürk). The others are republicanism, secularism, nationalism, reformism, and populism. The Republican People's Party (RPP), which was founded in 1924 and ruled until 1950 as the single and, therefore, dominant party, incorporated the principle of etatism into its program as the term defining the official economic strategy at its 1931 congress. In 1937 the principle was incorporated into the Turkish constitution.

Definitions of Etatism

Etatism has two interrelated meanings. Broadly, it referred to the state-centric component of Kemalist ideology, which stressed the autonomous role of the state in shaping policy outcomes and societal forces. It reflected the Kemalists' intentions to use the state as a pioneering and active agent of modernization. Etatism gained a more limited meaning after the fourth RPP congress, which was held in 1935. There the term was used to refer specifically to the economic strategy of the ruling RPP, which called for state involvement in the economy to advance the nation's welfare and prosperity. The state's involvement in the economy did not mean the abolishment of private initiative, as was the case of Soviet-style collectivism. Private enterprise was to play a fundamental role in the economy, but coordinated government intervention was considered to be essential to accelerate the accumulation of initial capital necessary for rapid economic development, since the private sector was too weak to undertake this task. Etatism encouraged indigenous capitalist development by shielding the local infant industries through various protectionist policies.

Turkish Economic History

The Republic of Turkey was founded in 1923, the same year in which the Allies recognized Turkey as an independent state with the signing of the Lausanne Treaty. Successive wars since the Ottoman Empire's entry into World War I in 1915 and the War of Independence between 1919 and 1922 had had a devastating impact on the economy of the Anatolian peninsula. The Lausanne Treaty contained some re-

strictive clauses that set the tone for the economic policies of the new republic. Turkey was not required to pay war reparations, but it agreed to pay the debts of the former Ottoman empire—the last installment was paid in 1953. The treaty also prohibited Turkey from adopting a protective customs regime until 1929. The underlying rationale was to protect the rights of the foreign firms operating in Turkey. In exchange for its recognition as an independent state, Turkey agreed to that term, but the state then gave support to Turkey's weak private sector through a complex system of incentives and subsidies in line with the guiding principles adopted at the Izmir Economic Congress of 1923. The passage of the Law for the Encouragement of Industry in 1927 was the first sign of the expansion of state control over industry.

Having faced the aftereffects of the Great Depression of 1929, which signaled a collapse of liberal *laissez-faire* economics in Europe and the United States, republican governments began to formulate conscious etatist policies. Having been influenced by the interventionist trend in Western European economic theory and the practical insights drawn from the successes of the planned industrialization efforts (1928–1933) of the Soviet Union, the Kemalist elites, in search of some alternatives to *laissez-faire* economics, revised their earlier liberal economic policies along etatist lines. One of the first measures they imposed was the nationalization of foreign companies operating in such various sectors as infrastructure and the service sector. The nationalization program, completed in 1939, paved the way for further state control of the economy through expanding public ownership into different branches of the economy. In addition to the failure of *laissez-faire* liberalism in the late 1920s, the lack of initial capital formation and entrepreneurial spirit, as well as the need for protectionism, can be counted as three basic reasons for the state's turn to etatism in the 1930s.

The state took two crucial steps that constituted the backbone of etatist policies: first, large state-owned or -controlled companies, known as state economic enterprises (SEEs), were founded; second, industrial development plans were formulated. The state's active involvement in the economy under the guise of etatism created the earliest patterns of an inward-looking industrialization strategy in which the SEEs such as Sumerbank (1933) and Etibank (1935) would play a leading role. These were giant state companies, specialized in diverse manufacturing industries such textiles, mining, and extraction and founded for the production of intermediate, consumer, and producer goods. The foundation of People's Bank of Turkey

(1935) and the reorganization of Agricultural Bank of Turkey (1937) on etatist principles signaled the state's expansion in the financial sector through a network of credit facilities, grants, and subsidies.

To coordinate public and private industrialization efforts, the state launched comprehensive plans. The First Five-Year Industrial Plan was launched in 1934. The second one, launched in 1938, became obsolete with the outbreak of World War II in 1939. Some minor plans were also designed on a sectoral basis, as in the case of mining. Centrally planned industrialization strengthened etatist control over the economy, since the state began to intervene intensely in industry, commerce, and finance to achieve the objectives set in the plans.

Effects of Etatism on the Turkish Economy

Under etatist policies, the public sector had a pioneering role in the economy; etatism also provided a new basis of political legitimacy for Kemalism by making the state the most active institution, one that would lead the nation to the highest levels of material welfare. Etatist policies in effect from the 1930s until 1980 made the state a significant economic actor in Turkey.

After Turkey's transition to multiparty politics in 1950, all the major parties on both the left and the right supported the etatist policies that the RPP had launched in the 1930s. Therefore, vestiges of etatism survived until the 1980s in the form of central planning, protectionism, and the state's pioneering role in the import-substitution method of industrialization. These vestiges impeded the development of a full market economy. Etatist practices created an economic system that suffered from weak export capacity, chronic trade deficits, shortages of foreign currency, and balance-of-payment deficits.

Influenced by the West's popular supply-side economic policies, the Turkish economy was reoriented at the beginning of the 1980s and moved from a state-led model of industrialization to an export-oriented growth strategy. The etatist policies that the state had followed since the 1930s were severely challenged as the Turkish economy embarked on a journey of restructuring according to liberal principles.

ETHNIC COLONIAL POLICY — INDONESIA For most of the long period of Dutch involvement in Indonesia, colonial authorities made clear administrative distinctions between ethnic groups. The sharpness of these distinctions and the extent to which it was possible to cross the boundaries varied, however, over time.

The Dutch East India Company (VOC) avoided having direct administrative control over non-Europeans, preferring to rule via traditional elites or by appointing other Asians—especially Chinese—to be agents, often called *kapitan*. Because few European women traveled to the Indies, many Europeans married or cohabited with local women, though from time to time laws were introduced to ban such practices. Their descendants were seen as European if they were Christian and recognized by their fathers; consequently, European society in the Indies was very much mestizo (of mixed ancestry) in culture and appearance. Christian Indonesians were close to Europeans in status.

After the end of rule by the VOC in 1795 and the imposition of direct rule by the Netherlands, a formal legal distinction between Europeans and "natives" (*inlanders*) began to harden. This distinction enabled the Dutch to restrict land ownership to natives, and after

about 1830 it was almost impossible for any European to buy land. This was partly to protect the native population, partly to enable natives to be tied to the land for tax purposes, and partly to preserve many elements of traditional law, culture, and social structure. It also allowed discrimination against Indonesians in employment conditions and in civil and political rights (especially in criminal procedure). This discrimination contributed to the eventual emergence of nationalism. As in VOC times, legitimate children produced by marriages of Europeans and natives followed the heritage of their fathers, while illegitimate children followed their mothers'. Those who were neither European nor native were attached to one category or the other for different purposes until a third category, "foreign Orientals" (*vreemde oosterlingen*), was developed in the late nineteenth century. Natives and foreign Orientals could legally acquire European status if they were culturally Europeanized or had legal need of the status, for example, as owners of businesses. In the late nineteenth century, many Dutch policy makers proposed abandoning such classifications to encourage modernization, but they were blocked by conservatives and supporters of traditional law.

In 1899, Japanese diplomatic pressure forced colonial authorities to grant Japanese subjects European status. There was increasing pressure from China to do the same for resident Chinese, especially in the 1930s. This led to a gradual change in emphasis from "racial" categories to various categories of citizenship.

The Dutch also distinguished among native ethnic groups, such as the Javanese, Balinese, and Timorese, particularly in matters of civil law and recruitment into the colonial army. These legal distinctions were, however, never legislatively defined and disappeared with Indonesian independence.

ETHNIC CONFLICT—AFGHANISTAN

Ethnic differences are strongest when other significant differences—religious, ideological, economic, geographic, linguistic—reinforce distinctions between one ethnic group and another. Although Afghanistan

is a complex country in terms of ethnic composition, the importance of ethnicity in explaining conflict has varied significantly throughout its history.

In the original state named Afghanistan, dating back to 1747, the Pashtun ethnic group constituted an overwhelming majority. Until the late nineteenth century, Afghanistan was a fragile confederation of Pashtun tribes, and the word "Afghan" was used as a synonym for Pashtun. As part of a nation-building project early in the twentieth century, it increasingly came to imply "citizen of Afghanistan." The borders of the territory that now form Afghanistan were established toward the end of the nineteenth century, when the British and Russian empires were competing for control of the region. The Pashtun population was split, one part living in British India and the Pashtun majority in Afghanistan being reduced to around half the total population.

During his monarchy, Abdur Rahman Khan (reigned 1880–1901) attempted to build a stronger, more modern state, less dependent on shifting tribal alliances. Trying to establish authority throughout the country, particularly where ethnic minorities were dominant, the king battled several contentious groups, with especially harsh implications for the Hazara and Nuristani peoples. Whereas Afghanistan's majority are Sunni Muslims, the Hazara are Shi'a, and the Nuristani practice their own religion. Religion was used to legitimize warfare and ethnic persecution. Abdur Rahman Khan also forcibly moved large numbers of non-complying Pashtuns to minority-dominated areas in the north, thus forming people who were formerly a threat into an effective instrument for strengthening his rule in non-Pashtun areas. Pashtun nomads were granted privileges such as access to pastures in the Hazara-inhabited central region.

Twentieth-Century Events

Habibullah (reigned 1901–1919) and Amanullah (reigned 1919–1929) introduced constitutional reforms and outlawed slavery and other discriminatory practices that affected primarily minorities. King Amanullah fell in 1929, replaced by the sole non-Pashtun ruler in Afghan history, Bacha-e-Saqao—"son of the water-carrier." A Tajik from the Kohistan region north of Kabul, his position was based less on ethnicity than on support from a religious network.

Nader Shah (reigned 1929–1933), representative of a tribal Pashtun confederation, deposed Bacha-e Saqao after only nine months. After Zaher Shah (reigned 1933–1973) inherited the throne, the country was relatively calm for several decades. A short era of liber-

alization in the late 1940s was strangled by the ruling family in 1953, when Prince Daud Khan, the king's cousin, became prime minister. Daud, a strong proponent of Pashtun nationalism, wanted to expand Afghanistan to include the Pashtun population of Pakistan. This led to tense relations between the two countries and to the eventual ouster of Daud in 1963.

The constitution of 1964 allowed freedom of the press, and political parties were established. The pro-Soviet communist party, the People's Democratic Party of Afghanistan (PDPA), was dominantly Pashtun, but split into the Parcham branch of urban intellectuals with a tendency toward ethnic accommodation and the rural, authoritarian, and nationalist Khalq branch. The major Maoist party, Shula-e Jawid, arose in 1967 from divisions in PDPA. Faced with a variety of parties seeking to place ethnic discrimination squarely on the political agenda, the king responded by unofficially ensuring that minorities were represented in the cabinet, but the basic attitude toward ethnic differences was that economic modernization would lead to their gradual erosion.

When former prime minister Daud Khan regained power in 1973, the "new democracy" of the past ten years came to an end. He established an authoritarian rule that was overturned in a PDPA coup in 1978. PDPA immediately announced a Soviet-style nationality policy that addressed four areas: government participation, education, newspapers, and culture. PDPA's credibility was severely undermined by Pashtun dominance of the party and its attempts to foster Pashtun support by launching ethnic appeals.

With the 1978 coup and the Soviet invasion of 1979, Afghani resistance parties were established in Pakistan and Iran. The Pakistan-based parties were, with the exception of Jamat-i Islami, dominated by Pashtuns, and all had some form of Sunni Islamic orientation. Iran became the major backer of the groups active among the Hazara. The resistance based its legitimacy on various forms of politicized Islam, and ethnicity was low on the political agenda of the exiled parties in the early 1980s. Nonetheless, the fact that the resistance leadership was overwhelmingly Pashtun was problematic from the perspective of the non-Pashtun population. Resistance-based shadow cabinets were notoriously weak and fragmented, mainly because the resistance leaders could not accommodate Afghanistan's ethnic variety.

Once in power, the PDPA went on to announce a Soviet-style nationality policy. In practice, the will to implement such reforms was limited, and PDPA's credibility was severely undermined by its Pashtun

dominance. When President Najib took power in 1986, there was a change of approach. First, Najib's government was designed as a massive project in political accommodation. Second, the government realized that Soviet military presence in Afghanistan was on the wane, and ethnic and tribal loyalties were exploited to establish local militias to fill the gap. The so-called Uzbek militia of General Dostum and the Ismaili militia of Sayyed Mansoor developed into major military units. Ethnicity, for many, became an avenue to privileges. Military groups of different origins opposed or supported one another, as when Uzbek militias were used to reinforce the defense of threatened government garrisons in the Pashtun south.

The ethnic dimension was brought to the limelight as the resistance took power in Kabul in April 1992. Jamat-i Islami and its key commander, Ahmed Shah Massoud, were a major force, but different groups in the resistance soon split Kabul into separate sections, and the ethnic definition of the conflict gained in prominence. Alliances between resistance groups and sections of the old government army that shared ethnic identity emerged as key forces in the battle for controlling the capital. Alliances rapidly shifted; political and military leaders used ethnic arguments to build support, and common people had little alternative but to seek protection with their own group.

The Taliban emerged in late 1994 in reaction to the strife in Kabul and the lawlessness in the rest of the country. Based on traditionalist networks of Islamic scholars and village mullahs, the Taliban found supporters mainly in the Pashtun population. At first the organization avoided ethnic rhetoric, but gradually it began using pro-Pashtun as well as anti-Shi'a arguments. In the aftermath of armed confrontations with other groups, the Taliban often arrested and harassed people only for ethnic reasons. The movement's dominantly Pashtun membership and the frequency of ethnic violence have only contributed to further manifest ethnicity as a central component of the conflict in Afghanistan. It remains to be seen how the Taliban's removal from power in late 2001 will affect the complex ethnic conflicts in the country.

ETHNIC CONFLICT—MYANMAR Ethnic conflict has been a central feature in the political life of Myanmar (Burma) since independence from Great Britain was obtained in 1948. Located on the crossroads between East, South, and Southeast Asia, Myanmar is one of the most ethnically diverse countries in the region. But the failure of successive governments to resolve the issues of insurgency and equitable representation for the various ethnic nationalities is a major factor behind the country's long-standing malaise.

A Land of Diversity

Burma's 1974 constitution (the country did not become Myanmar until 1989) set aside states for the seven largest ethnic minority groups in the country: the Chin, Kachin, Karen, Kayah, Mon, Rakhine, and Shan. The situation, however, is rather more complicated in the field. Minority ethnic groups, speaking a total of over one hundred languages and dialects, make up a third of the total population. These groups range in diversity from the Salum (Moken) sea-gypsies of the subtropical Tenasserim (Tanintharyi) division to the Nung-Rawang crossbow hunters in the mountains of Kachin state.

Under British colonial rule (1826–1948), the different peoples of Myanmar were kept on largely different roads of political and economic development. While minority ethnic groups in the borderlands remained under their traditional rulers in the Frontier Areas Administration, the Burman majority was governed separately under Ministerial Burma, in which a limited form of parliamentary democracy was introduced. Relations became dangerously inflamed during World War II, when many ethnic minority groups remained loyal to the British, while the Burma Independence Army (BIA) initially fought on the Japanese side and changed to the British side only in 1945. As a result, there were disturbing outbreaks of intercommunal violence, including the killing of Karen villagers and, during 1941–1942, the expulsion of ethnic Indians from the country, after BIA members accused them of supporting British colonialism.

In the hasty run-up to Burma's independence, many issues of ethnic social and political rights, territorial divisions, and legacies of the war were never fully re-

solved. A general agreement of principles was established at the Panglong Conference in February 1947, but a number of important groups were missing. As a result, the 1947 constitution was full of anomalies. While the Shan and Karenni (subsequently Kayah) states were granted the right of secession after a ten-year period, many other ethnic groups—such as the Mon, Rakhine, and Pao—went unrecognized. It also was decided to leave the controversial question of the designation of territory for a Karen state until after independence.

A State of Insurgency

Burma gained independence in January 1948 against a backdrop of political violence. This was tragically highlighted by the assassination of Aung San (1915–1947) and most of his cabinet in July 1947 by the gang of a political rival. Aung San was widely regarded as the one Burman leader who had the trust of most ethnic minority peoples. Even before the British departure, ethnic Rakhines and Muslims had begun guerrilla actions in Arakan (present-day Rakhine state). The situation deteriorated rapidly following an attempt to seize power by the Communist Party of Burma (CPB), beginning in March 1948. The CPB's insurrection was supported by widespread desertions from the fledgling armed forces of the new government.

Myanmar's ethnic nationalities were soon pulled into this spiral of conflict. The Karen National Union (KNU) took up arms in January 1949, rapidly followed by various Mon, Karenni, Pao, and Kachin forces. At one stage, as insurrections swept the country, the cabinet of the prime minister U Nu (1907–1995) became known as the "Rangoon six-mile government," as this was the only territory it controlled. A further descent into chaos took place at the end of 1949, when Chinese Guomindang remnants from Yunnan Province seized large areas of territory in Shan state.

In the late 1950s, a number of peace talks were held with different ethnic forces, but these groups failed to gain countrywide momentum. During the "Military Caretaker" administration (1958–1960) of General Ne Win (b. 1911), the rights of the traditional Shan and Karenni rulers were abolished. In 1961, U Nu attempted to make Buddhism the country's official state religion. Such moves only fueled disquiet in the Shan and Kachin states (the latter, especially, is home to many Christians), where a new generation of nationalist movements was now getting under way.

In March 1962, Ne Win seized power, and the former Shan president of Burma, Sao Shwe Thaikie

(1894–1962), and many other minority leaders from the parliamentary era (1948–1962) were arrested. An unsuccessful "peace parley" was then held during 1963–1964, but virtually all opposition groups rejected Ne Win's "Burmese Way to Socialism." Subsequently, Ne Win embarked on a twofold strategy: he conducted intensive counterinsurgency operations in rural areas while seeking to impose a one-party system under the Burma Socialist Programme Party (BSPP), which would radiate out from Rangoon (now Yangon) into the ethnic minority states.

Such tactics endured for a quarter-century, but they did not end armed resistance. As the Burmese economy declined, insurgency became a virtual way of life in many ethnic minority areas. Opposition groups were able to finance their struggles through control of the black-market trade in everything from luxury goods and medicines to teak, opium, and jade. Military supplies were also plentiful, both through illicit purchases in Thailand and also from the insurgent CPB, which was given military backing by China after 1968.

During the BSPP era (1962–1988), two main ethnic coalitions emerged: those allied with the CPB in northeastern Burma, who looked to the "autonomous region" system of China as their political model; and the eleven-party National Democratic Front (NDF), established in 1976, which sought the formation of a federal union of Burma. Together they maintained under arms some fifty thousand troops who controlled substantial "liberated zones" around all of Burma's borders.

Changes after 1988

Ethnic politics then underwent a dramatic reorientation during the epoch-making events of 1988–1990. The collapse of Ne Win's BSPP during the pro-democracy protests in 1988 was followed by mass ethnic mutinies from the fifteen-thousand-strong People's Army in 1989. The atmosphere of impending change was further enhanced by the flight of thousands of democracy activists into NDF territories following the assumption of power by the military State Law and Order Restoration Council (SLORC). This momentum was then maintained by the landslide victory of the National League for Democracy (NLD) and nineteen ethnic parties in the 1990 general election. A fundamental realignment in Myanmar's politics appeared imminent.

Not for the first time, however, events now moved in directions that few observers predicted. Following the CPB mutinies, four new ethnic armies emerged in

northeast Myanmar, spearheaded by the United Wa State Party. These forces quickly agreed to cease-fires with the beleaguered military government, which unexpectedly announced a new peace policy toward all armed ethnic groups. Under these agreements, cease-fire forces would be allowed to administer their territories and join political discussions until Myanmar's new constitution was introduced. Subsequently, the Shan, Pao, Palaung, Kachin, and Mon nationality members of the NDF—as well as the Mong Tai Army of Khun Sa—all made peace deals with the SLORC government.

Underpinning these changes of strategy was a growing war weariness after more than four decades of fighting in which it is estimated that over a million people had died. In the process, many communities had been devastated, and as many as two million people had been displaced from their homes. Also prompting minority leaders was the desire to be on the inside of the political process at a rare moment of reorientation and transition in the country's history.

The importance of the ethnic issue was taken up by the United Nations, which called for "tripartite dialogue" between the military government, the NLD, and the ethnic minority groups as an essential element in the reform process. Differences, however, remained in all political camps. Among ethnic nationality groups, there were disagreements between cease-fire forces, which advocated a "peace through development" strategy, and the remaining non-cease-fire forces, centered around the KNU in southeast Burma, which continued to work with exile groups and underground opposition parties allied in the Democratic Alliance of Burma and the National Council Union of Burma. Following abortive peace talks with the SLORC in 1995–1996, the KNU in 1997 announced support for the NLD and called for "politics first" agreements as the only way forward.

This resulted in intensive Burmese army offensives against remaining KNU bases, the defections of more Karen guerrillas to the government side, and the continuing exodus of refugees into Thailand, where official refugee numbers passed the 100,000 mark. Fighting continued in Shan, Kayah, and also in several other borderland areas.

By the beginning of the twenty-first century, this situation created an ambiguous picture of life in ethnic lands. Whereas peace had returned to many areas for the first time in decades, there were many regions in which conflict continued. All sides agree that only inclusive dialogue and reform will bring about the stable peace that the peoples of Myanmar desire. To help

achieve this, during 2001, efforts were stepped up by Razali Ismail, the special representative of the United Nations secretary-general, to try to bring together representatives of the military government, the NLD, and the ethnic minority groups.

ETHNIC CONFLICT—SOUTH ASIA Until the renewal of violent conflict in Central and Eastern Europe, and more spectacularly in the Balkans, at the end of the twentieth century, postindependence South Asia seemed more prone to violent conflict linked to nationalism and ethnicity than most other parts of the world. The terms "nationalism" and "ethnicity" have eluded the efforts of generations of scholars to define them precisely. The common assumption—stemming largely from the Central and Eastern European and Balkan situations—is that the two terms are so closely intertwined as to be interchangeable. The South Asian record shows that they are often intertwined, but clearly not interchangeable.

"Ethnicity" has many facets; scholars treat groupings as varied as communities, cultures, language groups, and even corporations as ethnic groups, under certain circumstances. The castes in South Asia, particularly

INDIA AND THE TAMIL-SINHALESE CONFLICT IN SRI LANKA

In 2002 the conflict between Sri Lankan Tamils (a people of Indian origin resident in Sri Lanka for centuries) and the dominant Sinhalese remains one of the longest-lasting and bloodiest ethnic conflicts in the world. The resolution which follows was passed by the Indian National Congress party in January 1953. It failed to prevent the conflict and some Sri Lankans place partial blame on India, which has been accused of supporting the Tamils.

This Congress views with grave concern the latest developments in Ceylon in regard to the people of Indian origin, who have long been resident there and who have not been or who are no longer citizens of India. The administrative measures and economic sanctions taken against these people have not only caused them considerable hardship but intend to make them stateless and thus create a grave situation. The Congress is of opinion that these measures of the Ceylon Government are not in conformity with justice or international practice, and appeals to the Government of Ceylon to give further consideration to this question which is not only important because it affects large numbers of people, but comes in the way of friendly and cooperative relations which should exist between such near neighbours as India and Ceylon which have had so much in common from immemorial times.

Hindu India, for example, can be considered ethnic groups. There is no pure form of ethnicity, and definitions of ethnicity are therefore prone to circular reasoning. Scholars generally agree that ethnicity functions as a way to bind individuals to a group. An ethnic group becomes one because and when it successfully presents itself as one and, having secured acceptance of this identity by its own members, gains recognition by others. An essential feature of a mature or maturing ethnicity is an awareness of the common identity. Ethnic identities often carry with them deep-rooted historical memories that link ethnicity and nationalism.

South Asia offers many examples of identities that have withstood the passage of time and form part of the consciousness of people, whether such consciousness is linked to religion, as is the case with the Sikhs in India, or rooted in language and culture, as with the Ahoms of Assam. Nevertheless, despite the remarkable powers of survival that ethnic identities possess, they are not immutable. They are changeable and have

changed through the centuries. The core of most communities' ethnic identity is the traits that set them apart from others, primarily language and culture and often religion; as with castes in Hinduism a distinctive identity may be linked to a ritual status imposed and sustained by religious sanctions.

In the politicization of ethnicity, a process transforms an ethnic group into a political one. The South Asian experience shows that transformation of an ethnic group or community into a nationality or nation can be a dual process, partly cohesive and partly divisive. A new state faces the threat of separatist activity waged by ethnic groups; it often resorts to violence to prevent the separation, as in India, Pakistan, and Sri Lanka.

Language and Ethnicity

In the early years of independence in South Asia, disputes about language policy were a more divisive source of political instability in India, Pakistan, and Sri

Sri Lankan soldiers patrol the outskirts of Jaffna in September 2000 following weeks of fighting that left 160 soldiers and about 600 Tamil Tiger separatists dead. (AFP/CORBIS)

Lanka than were religious tensions. When the terms of the transfer of power were being negotiated in the then-undivided India and in Sri Lanka, the assumption was that English, the official language of colonial rule, would be replaced after independence by indigenous languages or language. The political elite in all these countries, as legatees of colonial powers, viewed the replacement of English by an indigenous language as easily accomplished, but they soon learned how difficult it was.

The first overt threat to the stability of the newly independent Indian state came from linguistic nationalism, or ethnic identity based on language. Like the political leadership in both Pakistan and Sri Lanka, Jawaharlal Nehru (1889–1964), first prime minister of India from 1947, was ill prepared for the challenge posed by the forces of linguistic nationalism, but he handled these problems better than his counterparts in Pakistan and Sri Lanka. In Pakistan the challenge to the integrity of the state from 1947 came from the Bengalis in East Pakistan (now Bangladesh), who resisted the attempt to impose Urdu as the national language in Pakistan.

The partition in 1947 of the British Raj into India and Pakistan had demonstrated that the religious divide between Hindu and Muslim was too deep for accommodation in a single state; twenty-five years later Pakistan was divided, showing that religion alone was not enough to bind a state together when ethnic identities based on language and culture divided it. The state of Bangladesh emerged independent.

Sri Lanka provides a classic example of the destabilizing effects of linguistic nationalism in a multiethnic society. Disputes about language policy were the

focal points of tension between the Sinhalese majority and the Tamil minority in the 1950s and 1960s, each identifying themselves on the basis of language loyalties. Sri Lanka was unique in South Asia in the repudiation of the language settlement that had been agreed on before independence. Substantial progress had been made in the implementation of that policy, which envisaged the replacement of English by Sinhala and Tamil by the mid-1950s. The two languages were to have parity of status. Instead this policy was repudiated in 1956, and Sinhala was elevated to the status of sole official language in the country. Just as the Bengali majority in East Pakistan opposed the imposition of Urdu, so too in Sri Lanka the Tamil minority opposed the elevation of Sinhala. The upshot of this conflict was that the decade of peace and stability that the country had enjoyed since independence was over for many years to come.

Ethnicity and Separatism

In India as in other parts of South Asia, ethnic identities linked to language, culture, and religion, dating from precolonial times and acting separately or in combination, threatened the stability of the postindependence state. India confronts more separatist and autonomy movements than any other state in the world, with the exception of Russia in its present form, and many of these movements originated in the colonial expansion and consolidation under the British Raj. Thus Indian separatism and autonomy movements are rooted in two processes: first, colonial expansion and consolidation in the territories that now constitute India; second, the revitalized precolonial forces with identities linked to language, culture, and religion.

India has kept these latter forces at bay by a number of policies. One was the redemarcation of state boundaries, with the adoption of the recommendations of the Report of States Reorganization Commission in the mid-1950s and 1960s, on the basis of linguistic identities. Another is the creation of new states to meet the pressure of regional forces seeking autonomy in existing states. Thus the number of states in the Indian union has increased since the 1950s and 1960s. In a country as large and populous as India, where some states are larger than many independent countries in other parts of the world, demarcation of new states in response to agitation for regional autonomy can be unending. Another policy was the use of force to crush separatism when the integrity of the Indian state was seen to be threatened.

There have been very few successful separatist movements in the postcolonial societies of the third world. Bangladesh is generally considered the product

of the only successful separatist movement in postindependence South Asia and therefore a unique development. Even in Bangladesh's case the separatist struggle might not have succeeded but for India's intervention on behalf of the separatists.

Having lost its eastern unit to a successful separatist movement, Pakistan faced two other secessionist movements, in the frontier province and in Baluchistan, which reemerged under the government of Zulfikar Ali Bhutto (1928–1979) in the 1970s. The military involvement first in putting down the guerrilla warfare in Baluchistan and later in running the government directly for almost a decade under General Mohammad Zia-ul-Haq (1924–1988) alienated various communities in the smaller provinces—the Baluchis in Baluchistan and the Sindhis in Sind—even if these separatist aspirations were effectively thwarted. Thus ethnolinguistic identity emerged as an important issue in Pakistan's national politics in the 1980s and 1990s. The continuing ascendancy of Punjab in the state system of Pakistan, and the alliance between the Punjabi elite and their preferred partners, whether Urdu-speaking *mohajirs* (immigrants from India) in the past or the Pashtuns now, cause tensions in other provinces and among other communities.

In the mid-1980s the *mohajirs* themselves engaged in a struggle against a political system they had dominated from the time of the establishment of Pakistan in 1947. Their struggle has many peculiar features. The *mohajirs*, as a group, lack a common geographical, historical, or cultural identity; and they are differentiated internally along lines of class and sectarian loyalties, linguistic identities, and areas of origin. Yet they provide an unusual example of the deliberate construction of ethnicity for political purposes, the welding of a heterogeneous mass of people who had chosen to leave India at the time of the partition of the Raj, into a distinctive group. Their transformation into an ethnic group is by no means complete, and their rights to claim such a status do not remain unchallenged by others, especially the Sindhis, among whom a great many *mohajirs* live, especially in the city of Karachi.

Sri Lanka's separatist agitation is postcolonial; its strength, in recent times, owes a great deal to Indian intervention on behalf of the Tamil separatists. Indian intervention failed in most if not all of its objectives, and the Tamil separatist movement ranks as one of the most thwarted in South Asia. Early expressions of separatist sentiments (in the late 1940s and early 1950s) developed into a full-fledged movement over a period of twenty-five or more years. That transformation re-

sulted from several factors: a perceived threat to the ethnic identity of the Tamils from political, economic, and cultural policies; perceived grievances of a political or economic nature or both; and a sense of relative deprivation at the loss or imminent loss of the privileged position the Tamil minority enjoyed under British colonial rule.

Bangladesh is virtually unilingual; between 95 and 98 percent of the population speaks Bengali (or Bangla, as it is called in Bangladesh). Moreover, apart from a small Hindu minority of about 10 percent, almost everybody is Muslim. A tiny minority (about 1 percent) are Buddhists and animists living in the Chittagong Hill Tracts (CHT). Yet this minuscule minority is at the center of international attention as Bangladesh's most persistent minority problem and one that touches on every aspect of ethnic identity, separatism, and separatist agitation reviewed here. The crux of the problem is that the CHT constitutes 9 percent of the land area of Bangladesh but has only 1 percent or less of the population. Bangladesh, the most densely populated country in South Asia, has around twice the land area of Sri Lanka but more than six times Sri Lanka's population. Thus the temptation to disregard the special status conferred on the CHT by the British and the interests of the tribal population has been great, and resistance to that temptation has been little. Separated from the predominantly Bengali Muslim population of Bangladesh by language, culture, religion, and forms of livelihood, the tribal people have had little choice but to fight back.

In its more constructive form the combination of ethnicity and nationalism has been an instrument of national integration in South Asia. Nevertheless the record is somewhat ambiguous. Pakistan, as it was in 1947, lasted just twenty-four years. The Indian polity, on the other hand, has remained intact, with virtually the same territorial boundaries if not the same form, as it had at partition. In every South Asian country the combination of ethnicity and nationalism or the politicization of ethnicity has a historical dimension. Thus while the political establishments and political elites have some justification for their claim that the linkage between ethnicity and nationalism has been, more often than not, a stabilizing influence, they would have to concede that the same combination of forces is also the principal cause of internal disharmony and discord in all the states of South Asia.

ETHNIC RELATIONS—SOUTHEAST ASIA

Southeast Asia consists of the ten nation-states of Brunei, Cambodia, Indonesia, Laos, Malaysia, Myanmar (Burma), the Philippines, Singapore, Thailand, and Vietnam. The people in each are of mixed ethnic backgrounds since they are composed of groups descended from indigenous people as well as migrant Chinese and Indians. These migrant groups settled in the region in large numbers during the colonial administration of many countries in Southeast Asia.

The population in Malaysia, for example, is 58 percent Malay and other indigenous peoples, 26 percent Chinese, 7 percent Indian, and 9 percent other ethnic origins. Similarly, Singapore's 4 million population is

A Chinese student is attacked by Indonesian youths at Republican University in Jakarta in October 1965. (BETTMANN/CORBIS)

77 percent Chinese, 14 percent Malay, 8 percent Indian, and 1 percent people of other ethnic origins. This multiethnic mix is a characteristic of all Southeast Asian countries.

Colonization brought Western political and social influences to Southeast Asia. Western institutions of government and social organization were superimposed on indigenous structures and traditions. With independence from the Western colonial powers, emerging nation-states formed along the lines of the former colonies. The boundaries of these nation-states straddle territories long inhabited by indigenous tribes, migrant groups, and dominant ethnic groups. Even the concept of the nation-state is one derived from the West, and the governments in the Southeast Asian nation-states have faced major challenges in shaping a common national identity among their multiethnic citizenry. Former colonies of European industrialized nations were challenged with what must have seemed like an impossible task on independence—the construction of a national identity that would be simultaneously unitary and racially plural. The birth of the nation-state in Southeast Asia has been associated with ethnic strife and conflicts. These included racial riots in Malaysia, Singapore, and Indonesia.

With the assumption of independence and the end of colonial rule, former colonies such as Singapore basically had to shape nation-states out of what were then considered as immigrant societies—different ethnic groups comprising immigrant groups mixed with indigenous and local groups but sharing relatively little apart from the territory on which they had settled. Indeed, many of the immigrants had continued to maintain strong links with kin and family in their countries

of origin. In a similar manner, the hill tribes and other such groups residing in the mainland Southeast Asian states of Myanmar, Thailand, Laos, Cambodia, and Vietnam have had to adapt to the new territorial identities that the imposition of national boundaries required. What it means to ethnic groups that straddle the borders of several nation-states to be citizens of just one of those states remains in question. Being nationals of several emerging nation-states has meant that ethnic groups such as the Karen, like the earlier immigrant Chinese and Indians, now belong to different nationalities depending on which side of the national borders they are living.

Interethnic differences have been accentuated by the coincidence of social and economic divisions with ethnic groups. In Indonesia as well as Malaysia, the Chinese have been perceived to be economically more successful than the indigenous people. This has led to the imposition of a preferential policy favoring the Malays and other indigenous people in Malaysia. Until the end of the Suharto regime in Indonesia, the Chinese were not allowed the use of their language or to celebrate their festivals.

Interethnic tension runs high in the region, with the Karen waging a separatist war in Myanmar, the Acehese people in northern Sumatra contesting the legitimacy of the government in Indonesia, and Muslim separatists active in southern Philippines and also southern Thailand. Since 1997 and the onset of the Asian economic crisis in the region, there have been armed conflicts between Christians and Muslims in Indonesia as well as between groups indigenous to the outer territories and other ethnic groups who have been resettled in these territories as part of the transmigration program meant to ease population pressures in and around Java. The growing popularity of an Islamic political party in Malaysia has been of concern given the decades of moderate Muslim leadership in both Malaysia and Indonesia, the two countries with the largest Muslim groups in Southeast Asia.

Given the national policies introduced to manage interethnic relations in the countries of Southeast Asia that have tended to favor one ethnic group over others, stability in these relations has been of major concern. With weakening of the unitary state that had earlier brooked no challenge to its policies on interethnic relations, there is great concern that race and religion will once again become the rallying platforms for the people in Southeast Asia who are discontented with the outcome of development.

ETO JUN (1933–1999), Japanese writer and critic. Eto Jun was one of the most outspoken critics of post-war Japanese culture, society, and politics, who over the course of his long career dissented from both right and left wings. Born in Tokyo, he achieved recognition with his debut book in 1956 on novelist Natsume Soseki (1867–1916). The book, which casts Soseki in the light of Meiji period (1868–1912) historical contexts, disputes the critical consensus of Soseki as an individualist. After receiving recognition for his work on writer Kobayashi Hideo (1902–1983), Eto traveled to the United States and taught and researched at Princeton University.

In reflections on his cross-cultural encounters published as *Amerika to watashi* (America and Myself, 1965), Eto critiqued the problematic relationship between Japan and the United States. For the next three decades, Eto developed and sustained the notion that the Japanese defeat in World War II and subsequent U.S. occupation led to an unrecoverable loss of Japan's

autonomy and understanding of history. From 1979, Eto began to consider the long-term effects of the occupation, making his most controversial arguments that the militarists alone, not Japan as a whole, unconditionally surrendered, and that the imported "false" taboos of occupation censorship imprisoned all of postwar literature in a linguistic space closed off from true freedom. In his view, Japanese democracy today carries the taint of its undemocratic inception. Shortly after the death of his wife, Eto took his own life in 1999.

ETOROFU ISLAND (Est. pop. 6,000). Etorofu Island (Russian: Iturup) is the largest of the Kuril Islands. A volcanic island 3,000 square kilometers in size, Etorofu is located 110 kilometers from the northeast of Cape Nosappu-Misaki on the northern extremity of the Nemuro Peninsula in Hokkaido, between the Sea of Okhotsk and the Pacific Ocean. Until the end of the eighteenth century, the population was exclusively autochthonous (Ainu). At the time of the Russian occupation in August 1945, the population, mainly Japanese, was expelled, and Soviet citizens were encouraged to settle on the island.

In 1941, the Japanese sailed from the Gulf of Hitokappu, located in the middle of the island on the Pacific Ocean side, to attack Pearl Harbor. Etorofu is one several islands (Kunashiri, Shikotan, and the Habomai group of islets) of the Northern Territories for which Japan asserted a claim in 1955, when Japan and the Soviet Union began negotiations toward a peace treaty. In 2001, it was still administered by the Russian Federation and the territorial dispute was not yet resolved.

Among the twelve volcanoes on the island, the highest is Chirippu-date (Chiripurupuri, 1,587 meters). The average annual temperature on the island is 4.3°C, and in winter, it drops to minus 5°C. The main products are salmon, trout, codfish, crabs, and seaweed. There was an active mining industry (sulfur) before World War II. Mineral deposits in-

clude tin, zinc, lead, copper, nickel, sulfur, and metallic sulfides.

EUPHRATES RIVER The Euphrates River is the longest river in West Asia, crossing a distance of 2,700 kilometers. (The Euphrates is known in the Bible as Perath, in Arabic as al-Furat, and in Turkish as Firat.) It originates in the Armenian Mountains of eastern Turkey and flows southeast across northern Syria and southern Iraq to merge with the Tigris River

and form the Shatt al-Arab River, which enters the Persian Gulf.

The Euphrates is formed by the confluence of the Karasu stream, rising close to the city of Erzurum, and the Murat stream, rising close to Mount Ararat. The river flows through the Taurus Mountains of southern Turkey and descends to the plains of Syria and Iraq. In Syria, the Euphrates flows south-southeast into Iraq through entrenched valleys and collecting waters from its two main left-bank tributaries.

In its lower course, the Euphrates enters the Mesopotamian alluvial plain. The mainstream meanders slowly in braided channels with waters rapidly decreasing through seepage, evaporation, and irrigation. Depositing sediment along the vast plain, the river raises its bed level and becomes prone to seasonal overflow and spontaneous course changes. Just below the town of al-Fallujah, close to Baghdad, the Euphrates approaches the Tigris River at a distance of approximately 30 kilometers before it divides into two branches. The branches reunite after a distance of 175 kilometers near the town of al-Samawah, and the river continues downstream to join the Tigris and empty into the Persian Gulf.

To control the varied flow of the river and to draw water for irrigation and the generation of power, Iraq has developed a system of diversion and storage, including the drainage canal, the "Third River," 563 kilometers long, flowing between the Tigris and Euphrates. Since the 1970s, however, the construction of a series of large dams in Turkey and Syria has intensified rivalry among the riparian states over water usage.

Flowing almost parallel to the Tigris River, the Euphrates water is the source of life in Mesopotamia giving rise to the most ancient civilizations. On its banks emerged the great civilizations of Sumer, Akkad, and Babylonia, which drew sustenance from its waters through extensive irrigation schemes.

EUROPE-ASIA RELATIONS Relations between Asia and Europe have come a long way since the colonial and postindependence periods in Asia. For the last thirty years, Europe has been building a constructive relationship with the Association of South East Asian Nations (ASEAN). The European Commission-ASEAN (EC-ASEAN) ministerial meetings established in 1980 are a forum for regular dialogue between the two entities. In February 1996, a Europe-Asia Meeting process (ASEM) was launched, thanks to Goh Chok Tong, the president of Singapore. ASEM hopes to promote political, cultural, and people-to-people dialogue along with traditional economic exchange.

The Missing Link

When compared with the involvement of the United States in the Asia-Pacific region, the involvement of Europe has been weaker, despite strong historical links and growing economic interdependence. Strengthening the weak leg of the U.S.-Asia-Europe relationship—that is, the Asia-Europe relationship—provided the major rationale for the creation of ASEM. In July 1994, the EC published a discussion paper entitled "Towards a New Asia Strategy," which shed light on the necessity to upgrade European relations with all Asian countries, while continuing to emphasize ASEAN's centrality to Europe. In the 1980s, there had already been some concern about Japan-U.S. relations. Although Japan and Europe have made significant efforts to enhance their interchange, no formal relation had been established between Europe and East Asia before ASEM. Launched to balance the U.S.-Asia relationship and enhance the Europe-East Asia relationship, the ASEM process had no clear common vision, except the shared principle that regional cooperation and dialogue help regional stability.

The ASEM Process Meetings

The ASEM process brings the leaders of ten countries of East and Southeast Asia together with leaders from the fifteen member states of the European Union (EU). The inaugural meeting at Bangkok (1–2 March 1996) clearly reflected a shared enthusiasm, while the second meeting held in London (3–4 April 1998) stressed the necessity to elaborate materials to give stronger credit to the interregional relationship. The ASEM Trust Fund, established after the London summit, was a useful creation in the context of the Asian financial crisis. The Trust Fund, which became operational in June 1998, for two years, provides technical assistance and financial and social training. In 1997 and 1998, almost all Asian countries faced financial

and economic turmoil, leadership crises, and intraregional tensions. There was strong sentiment in these Asian countries that Europe was not doing enough to help: the London summit, in a sense ASEM's first test, showed that Europe's multilateral and bilateral contributions to the numerous international financial packages to Asian countries ranked second after those of Japan. The European financial and economic commitment to the recovery of Asia was reconfirmed with the ASEM Trust Fund. The launch of the Euro has also changed Asian perceptions of the European Union, since a successful Euro offers the possibility of diversifying Asia's debt structure and debt servicing, reducing vulnerability to major fluctuations in the dollar exchange rate.

Yet at the London meeting, the political and people-to-people dialogues were unsuccessful. At the Seoul meeting (20–21 October 2000), the countries issued the "Asia-Europe Co-operation Framework for the First Decade of the New Millennium"; this framework set the principles, aims, priorities, and mechanisms of the ASEM process for the ten following years and stressed the sociocultural intention of promoting both interregional political dialogues and economic partnerships. Among the mechanisms established were informal human-rights seminars, the last one of which occurred in Denpasar in July 2001, and the trade facilitation action plan, which began in 2001 and aims to remove trade obstacles between the two regions.

The Asia-Europe Foundation (ASEF), based in Singapore, is the body in charge of promoting cultural, intellectual, and people-to-people exchanges. ASEF was created in February 1997, after the Bangkok summit. It organizes workshops on education, human rights, and the position of the individual, and strengthens cultural exchanges. Yet it remains to be seen whether the Foundation, with a staff mainly of career bureaucrats and with limited personnel and financial resources, can meet the challenge.

Problems Facing ASEM

The EU is a highly regulated area with its Commission, Council, and Parliament, while ASEAN is an informal structure based on consensus policy making and noninterference in member states' business. Northeast Asian countries (Japan, China, South Korea) are still trying to solve historical disputes and achieve cooperative interchange. The lack of unity in Asia, and also in a Europe still looking for a common foreign-security policy, makes it difficult to promote basic cooperative schemes.

Obviously, the first pillar of the ASEM process—political dialogue—takes longest to bear fruit, since

cultural sensitivities act as stumbling blocks. The issue of Myanmar (Burma) is a good example: Myanmar challenged the long-established EC-ASEAN relationship when it was admitted as a member of ASEAN in 1997. European criticism of Myanmar's record on human rights made official meetings between the EU and ASEAN virtually impossible for three years. Yet at the thirteenth EU-ASEAN ministerial meeting, held in Vientiane on 11–12 December 2000, with Myanmar attending, all sides showed some willingness to look beyond their differences.

Another problem is that Europe, lacking strategic interest in Asia, finds it difficult to play a significant role in security issues and in promoting regional stability, yet regional stability is probably one of the main concerns of both Europe and Asia. In 1995, ASEAN countries launched the ASEAN Regional Forum, the only structure in Asia in which all the Asian countries, together with the United States, Russia, and Europe, meet to discuss a security agenda. Europe has already showed commitment toward helping resolve such Asian crises as the aftermath of Cambodia's civil war, tensions between North and South Korea, and the struggles of East Timor for independence from Indonesia. Europe's increased interest in the security of the Asia-Pacific region mainly follows the "comprehensive security" theory, which emphasizes, among other concepts, political stability, economic prosperity, and environmental safety. Europe's experience in preventive diplomacy, confidence-building measures, and reconciliation has an appeal to its Asian partners. Learning from European expertise is perhaps preliminary to deeper cooperation on security issues between the two regions.

Although ASEM still lacks a clear vision or a shared philosophy of what the Asia-Europe relationship should be, it has enhanced the regionalization processes in Asia. The launch of ASEM coincided with the enlargement of the ASEAN ministerial meetings in Northeast Asia (Japan, South Korea, and China—a process called the "ASEAN plus three"), and there are signs of a possible dialogue among Northeast Asian countries. Whether the regionalization processes lead to more unified regions will be important for determining ASEM's future relevance. The invisible third party at the table, the United States, will also have a decisive impact.

EUROPEAN UNION AND TURKEY The European Union (EU) is a multinational organization for economic and political integration in Europe, instituted on 7 February 1992 with the signing of the Treaty on European Union (known as the Maastricht Treaty).

History

Since 1870 three increasingly destructive wars were waged in western Europe. To bring stability and prosperity to Europe and to settle the historical feud between France and Germany (major contenders in all three wars), European powers agreed that a cooperation mechanism, including these two countries and other Western European powers, should be created.

In 1946 Winston Churchill called for the United States of Europe, and one year later he fostered the creation of the United European Movement. The French Council for a United Europe was created by Socialist parliamentarian René Courtin on 1 July 1947, and the Socialist United States of Europe was established in the same year. While the Council for a United Europe was absorbed by the United European Movement in 1953, the Socialist United States of Europe was renamed the European Left in 1961.

When the Marshall Plan for European reconstruction was launched in 1947, sixteen European states formed the Organization for European Economic Cooperation to coordinate the distribution of American economic aid. On 7–11 May 1948, the Europe Congress, fostered by the International Coordination of Movements for the Unification of Europe, met in the Hague and agreed to establish a European Deliberative Assembly and a European Special Council. France, Great Britain, Belgium, the Netherlands, Lux-

embourg, Denmark, Ireland, Italy, Norway, and Switzerland then formed the Council of Europe in 1949.

On 25 March 1957, the treaties establishing the European Economic Community (EEC) and the European Atomic Energy Community were signed in Rome by Belgium, France, Germany, Italy, Luxembourg, and the Netherlands. The European Parliament was established in March 1958. The Merger Treaty of 8 April 1965, which came into force on 1 July 1967, brought all these organs and institutions together and established a single executive called the European Community (EC).

In the 1970s and 1980s the EC was enlarged: in 1973 by granting membership to Denmark, Ireland, and the United Kingdom; in 1981 by the addition of Greece; and in 1986 by Spain and Portugal. In 1986 the Single European Act, which planned the institution of a common market no later than 31 December 1992, was signed. The Maastricht Treaty (7 February 1992) produced a clear timetable for further progress on the road to economic and monetary union, including the introduction of a European Central Bank and a single currency no later than 1999. From 7 February 1992, the European Community (EC) became known as the European Union (EU).

Austria, Finland, and Sweden joined the EU in 1995, and the EU started negotiations with thirteen other European countries interested in membership: Hungary, Poland, the Czech Republic, Slovakia, Slovenia, Estonia, Cyprus, Romania, Bulgaria, Latvia, Lithuania, Croatia, and Turkey.

The European Parliament

The European Parliament, the EU's public forum, has 626 members, elected for five-year terms. Parliament members form political rather than national groups. Parliament's main power is to vote for the EU's budget. The distribution of the seats is as follows: Germany ninety-nine; France, Italy, and the United Kingdom eighty-seven each; Spain sixty-four; the Netherlands thirty-one; Belgium, Greece, and Portugal twenty-five each; Sweden twenty-two; Austria, Denmark, and Finland sixteen each; Ireland fifteen; and Luxembourg six.

The European Commission

The Commission, consisting of twenty commissioners, including the president and members who are nominated and appointed by the consensus of EU countries, proposes policies and is the only body al-

lowed to initiate legislation, with exceptions in the fields of common foreign and security policies, justice, and home affairs. It is also responsible for administration and ensures that the provisions of the treaties and the decisions of the institutions are properly implemented.

The European Council

The European Council is the EU's legislative body for a wide range of EU issues. It exercises its legislative power in co-decision with the European Parliament. It also coordinates general economic policies, concludes international agreements on behalf of the EU, with the parliament constitutes a budgetary authority that adopts the EU's budget, takes decisions necessary for defining and implementing common foreign and security policy, coordinates the activities of member states, and adopts measures in the fields of police and economic and judicial cooperation in criminal matters.

The council is composed of ministers representing the national governments of the fifteen member states, with a total of eighty-seven votes distributed according to the size of the countries. The numbers are as follows: Germany, France, Italy, and the United Kingdom ten each; Spain eight; Belgium, Greece, the Netherlands, and Portugal five each; Austria and Sweden four each; Ireland, Denmark, and Finland three each; and Luxembourg two.

The European Court of Justice

The court provides judicial safeguards necessary to ensure that the laws are observed in the interpretation and application of the treaties and in all of the activities of the EU. The Court is composed of fifteen judges, assisted by nine advocates-general. The judges and advocates-general are appointed by common accord of the governments of the member states and hold office for a renewable term of six years. They are chosen from jurists whose independence is "beyond doubt" and who are of recognized competence.

The Ankara Agreement

Turkey first applied to join the EEC in 1959. The EEC's response was to suggest a loose association until Turkey's circumstances permitted it to join. Ensuing negotiations resulted in the signature of the Ankara Agreement on 12 September 1963, which entered into force on 1 December 1964. It aimed at securing Turkey's full membership in the EEC through the three-phase establishment of a customs union that would serve to bring about integration between the

EEC and Turkey. The Ankara Agreement still constitutes the legal basis of the association between Turkey and the EU.

Turkey's Application for Full Membership

Turkey applied for full membership in 1987. The request underwent the normal procedures, and the commission's opinion was completed on 18 December 1989. It underlined Turkey's eligibility for membership, yet deferred the in-depth analysis of Turkey's application until the emergence of a more favorable environment. Although the commission argued that the EU was not ready at the time to accept and digest additional members, refusal of Turkey's application was, in fact, unofficially based on economic and political arguments. Turkey's democratic credentials, its high rates of inflation and unemployment, and the possibility of an influx of population to EU countries were points of concern. On the other hand Greece's resistance to Turkey's membership was also an effective factor in the decision. The commission stressed the need for a comprehensive cooperation program and added that the Customs Union should be completed in 1995 as envisaged.

Customs Union

Talks for the envisaged Customs Union (CU) began in 1994 and were finalized on 6 March 1995 at the Turkey-EU Association Council. Although basic agricultural products were excluded from the initial package, a preferential trade regime for those products was adopted on 1 January 1998.

Apart from technical provisions related to the establishment and proper functioning of the CU, the package also included an Association Council resolution providing for the intensification of cooperation between Turkey and the EU in areas not covered by the CU, such as industrial cooperation, trans-European networks, energy, transport, telecommunications, agriculture, environment, science, statistics, matters relating to justice and home affairs, consumer protection, cultural cooperation, and information. These provisions demonstrated that, despite predictions to the contrary, the Turkish economy was able to withstand EU competition.

The EU Enlargement Process and Turkey

In the Association Council of 29 April 1997, the EU reconfirmed Turkey's eligibility for membership and asked the commission to prepare recommendations to deepen Turkey-EU relations, while claiming that the development of this relationship depended on

factors relating to Greece, Cyprus, and human rights. The commission, however, excluded Turkey in its report entitled "Agenda 2000." While the report conceded that the CU was functioning satisfactorily and that it had demonstrated Turkey's ability to adapt to the EU norms in many areas, it repeated the same political and economic arguments against Turkey and made no reference to Turkey's full membership objective. The commission proposed measures that would reinforce the current relationship and complemented these measures with the idea of inviting Turkey to the European Conference.

After Turkey's rejection of the invitation and EU's various proposals, the Helsinki European Council held on 10–11 December 1999 produced a breakthrough in Turkey-EU relations. At Helsinki Turkey was officially recognized without any precondition as a candidate state on an equal footing with the other candidate states.

EVEREST, MOUNT Mount Everest, known in Tibetan as Chomolungma ("mother goddess of the land") and in Nepali as Sagarmatha ("peak of the heavens"), is located in the Himalayan Range on the border between Nepal and Tibet. It is 8,848 meters high and thus the world's highest mountain. Its English name honors Sir George Everest (1790–1866),

the surveyor-general of India from 1830 to 1843. Although it had been surveyed from a distance and flown over, in 1921 George Mallory was the first European to attempt to climb it. He lost his life there in 1924. Sir Edmund Hillary (b. 1919), a New Zealand mountaineer, and Tenzing Norgay (1914–1986), a Sherpa, finally reached the summit in 1953. Subsequently many adventurers have made the ascent from several directions with the help of modern equipment. Six deaths on the mountain during an ill-fated climb in

CLIMBING MOUNT EVEREST— JUST A JOB

To the Sherpas of Nepal, guiding tourists up and down Mount Everest is just a job and the mountain itself a source of income.

Eight of Khumbu's most experienced and illustrious *sardars* unanimously agreed that virtually the only reason they climb is that they need the high income they cannot earn any other way. As one put it, if he had the education to qualify for a good office job, he would unhesitatingly choose that line of work. Sherpas see no intrinsic point in climbing; neither fame (though that is welcome since it helps them get their next climbing job more easily; it also accounts for the multiple ascents of Everest), nor challenge, nor adventure. Climbing is simply a high-paying job. None of the eight *sardars* expressed much enthusiasm for a hypothetical all-Sherpa expedition because they could not imagine any earnings accruing from it. Even though they enjoy the camaraderie and the scenic views and take pride in a job well done, these reasons alone would never motivate them to move up a mountain. Plans for a "First Sherpa Youth Mt. Everest Expedition 91" indicate contrary sentiments, but if skilled Sherpa climbers are paid on such an expedition, the view of the eight *sardars* will stand unchallenged.

SAGARMATHA NATIONAL PARK— WORLD HERITAGE SITE

Home of Mount Everest, Sagarmatha National Park's deep glacial valleys teem with pandas and snow leopards. The park was designated a UNESCO World Heritage Site in 1979 for its ecological significance and indigenous Sherpa culture.

EXPORT-LED DEVELOPMENT "Export-led development" refers to the experience of nations in which strong export growth has been the leading factor driving strong overall economic growth. Such development has come to characterize the exceptional growth performance of Asian nations, especially Japan, South Korea, Taiwan, and Singapore. Export growth has been credited as the main contributor to their high overall growth rates in the 1970s and 1980s.

Theoretical Considerations

Rigorous theoretical models link economic growth to factor accumulation (labor, capital) and productivity improvements. In these models, exports enter as a source of foreign exchange to finance capital accumulation or as a learning opportunity to assimilate more productive foreign know-how.

Exports as a channel to generate foreign exchange for investment in foreign capital goods has been the focus of the traditional growth literature, which focuses on the limited availability of capital in developing nations. In this way, available resources are channeled from domestic consumption to investment. Exports may also serve as a signal to foreign investors that external debts incurred today can be serviced in the future and thereby allow foreign savings to be tapped for further investments.

Exports as a channel toward rising productivity have been the focus of the new growth literature fo-

cusing on knowledge spillovers. Exports are much less effective for adopting foreign know-how than are imports or inward foreign investment. But a strong export performance can finance imports of advanced foreign goods. It can increase a location's profile as an export platform and thus attract foreign investments that tend to imply knowledge transfer into the economy.

More qualitative concepts, such as Michael Porter's "diamond" framework, incorporate factor conditions, the context for firm strategy and rivalry, demand conditions, and supporting and related industries in order to study factors driving productivity and productivity growth. In these concepts, export-led development affects, for example, the context for firm strategy and rivalry through companies' exposure to competition on international markets and to management practices at foreign business partners, as well as demand conditions through exposure to world-class customer needs.

The theoretical welfare implications of export-led growth are ambiguous. Moving from a closed economy to an open economy with exports unambiguously raises prosperity. Moving further to actively promoting exports in an otherwise undistorted economy, however, creates welfare losses in traditional growth models. In the new growth models and the competitiveness framework, as well as in traditional growth models with distortions, the welfare implications are ambiguous.

Development Policy Implications

The export-led growth performance of Asian nations had a major impact on policy discussions. The apparent success of the export-led model has refuted the earlier import-substitution development model. The role of government in the export-led model has unleashed a vigorous debate on the merits of government intervention. Moreover, the observation that export-led growth was driven by factor accumulation rather than productivity increases has shed doubts on the long-term sustainability of the export-led model.

The export-led growth model was preceded by earlier attempts in many parts of the world to use import substitution as an engine of development. Proponents of import substitution argued that companies from advanced economies had advantages over potential competitors from developing economies based on existing scale and thus would dominate industries with high potential for growth and value creation, absent government intervention. To counter these scale advantages of advanced economy companies, import-substitution policies closed developing nation markets to

imports and encouraged the creation of domestic companies to serve these markets. The experience with this approach—especially in Latin America, where it was pushed in the 1960s and 1970s by the U.N.'s Economic Commission for Latin America—was disappointing. Under the cover of import tariffs local companies remained inefficient and consumers had to put up with high prices and low-quality domestic goods.

The role of the government in export-led development has been debated since the success of Japan. In many nations associated with export-led development the government has played a role through, for example, export targets for individual companies, the allocation of credits for export-oriented investments, or a consciously undervalued currency. But did growth materialize because of government intervention, or in spite of it? Initially, the success of Japan and the other Asian nations that followed in its footsteps was credited to institutions such as Japan's Ministry of International Trade and Industry (MITI). Over time, however, it was pointed out that many of the most successful Japanese export industries had flourished against the advice of MITI, whereas industries that had been targeted, like the aircraft industry, turned out to be failures. Other nations such as Taiwan and Thailand also achieved success based on export-led development but with less interventionist economic policies. An emerging third view argues that government interventions had a positive impact when they encouraged exports and competition on world markets across companies and industries but had a negative impact when they targeted individual companies or industries for export success.

The long-term sustainability of the export-led development model has come into focus more recently. In an influential article, Alwyn Young pointed out that the growth performance of the Asian "tigers" following in Japan's footsteps can be almost exclusively accounted for by the increased use of factor inputs. The productivity of factor input use, however, has stagnated. Low productivity has two effects: It limits the growth potential for catch-up at increasing income levels, and it limits the prosperity that nations can enjoy as a consequence of growth.

Growth at higher income levels is limited because further factor accumulation becomes harder and less effective. In the past, the Asian nations were able to increase their industrial labor force by increasing female labor force participation and moving people from agriculture into industrial jobs. They were also able to increase their capital stock through heavy investment. Now, however, the labor pool is largely exploited, and further capital investments face diminishing returns.

Growth without productivity improvements also limits the level of prosperity that nations can enjoy. As the returns of further capital accumulation diminish, further wage growth can be supported only by productivity improvements. To turn wage growth into prosperity, nations need to have an efficient domestic sector in order not to diminish the real value of wages. High retail, real-estate, and local-service costs have, for example, limited prosperity in Japan despite high wage levels in the 1990s.

Status of the Current Debate

The debate on the implications of export-led growth, especially in Asian nations, continues: On one side of the spectrum export-led development and the Asian experience are seen as evidence for the merits of a more directive government role that sets clear sectoral priorities. On the other side of the spectrum it is argued that the Asian growth experience can be explained by traditional factor accumulation. Export orientation had a role within a procompetition policy agenda that also opened up internal markets and refrained from sectoral interventions. Although the de-

bate is far from over, more recently the majority view seems to shift in the latter direction.

FA NGOUM (1316–1374?), founder of the Lan Xang kingdom of Cambodia. Fa Ngoum or Fa Ngum was born in Muang Sawa, a Lao principality located on the site of present-day Luang Prabang, and founded the Lan Xang Hom Khao (better known as Lan Xang) kingdom in Laos in 1353. Phraya Khampong, ruler of Muang Sawa and Fa Ngoum's grandfather, banished Fa Ngoum and his father, Chao Fa Ngiew, to the Khmer kingdom of Angkor in the 1320s due to his father's indiscretion with one of the grandfather's wives. Fa Ngoum subsequently married a Khmer princess, Keo Keng Nya. With the support of Angkor, Fa Ngoum returned to Muang Sawa with a Khmer army to gain control and consolidate his kingdom, Lan Xang Hom Khao—"land of one million elephants and a white parasol." The elephants symbolized military power since most battles were fought using elephants, and the white parasol symbolized royalty, particularly a Buddhist monarch. Fa Ngoum further legitimized his rule by enshrining the Prabang Buddha image as the spiritual protector of the kingdom in Viang Chan Viang Kham (present-day Vientiane). He made Xiang Dong Xiang Thong (later renamed Luang Prabang) his capital. Fa Ngoum is credited with introducing the Theravada Buddhist sect to the region when the Khmer monks who accompanied the image of the Prabang Buddha established a monastery in Lan Xang. Political turmoil ensued, and Fa Ngoum's son Oun Hueun (Sam Sene Thai, 1356–1417) succeeded the throne in 1368. Fa Ngoum died in Muang Nan in 1374 or 1375.

FAIZ AHMAD FAIZ (1911–1984), modern Urdu poet of Pakistan. Born in Sialkot, Pakistan, Ahmad Faiz symbolizes the heights that progressive poetry reached on the Indian subcontinent. He employed all the devices of classical Urdu lyrical poetry to convey a modern sensibility. The heady combination of ideological commitment and romanticism ensured his wide popularity. A recipient of the Lenin Prize for his work on behalf of the downtrodden and for peace, Faiz wrote eight volumes of poetry and six volumes of prose, as well as other works. His poetry represents the high point of progressive literature in the Urdu language.

Faiz's early poems were concerned with love and were written in the idiom and imagery current in Urdu poetry in the early decades of the twentieth century. His formative phase ended when Urdu poets were divided into three categories, depending on their ideological-artistic inclinations: first, those writing in the orthodox classical tradition who regarded any deviation in matters of style and prosody blasphemous; second, those who styled themselves progressives (whose objective was to work for social uplift rather than for aesthetic reasons) or their sympathizers; and third, the group called "Circle of Men of Good Taste," who claimed to write pure poetry, unencumbered by any social(ist) concerns. These distinctions were drawn in the 1940s and 1950s by the Circle of Men of Good Taste. Faiz belonged to the second group, though he did not share the extreme views of some of its members. The catholicity of taste, lyricism, and perfect blending of tradition and modernity in his poetry made him acceptable to all, encompassing ideological divides.

The first collection of his poems, *Naqsh-i Faryaadi* (Supplicant's Prayer), was published in Urdu in 1941.

His earliest poems, written mostly in the *ghazal* form, speak of love in the traditional vein. However, the poem *Mujh se pabli si muhabbat meri mahboob na maang* (My Beloved, Do Not Ask of Me My Former Kind of Love) marks the beginning of a new consciousness in which love for an earthly beloved is suffused with awareness of suffering humanity.

The poems in his second collection, *Dast-i Saba* (Fingers of the Morning Breeze, 1952), reflect his commitment to the progressive ideology at its height so much so that he characterized Indian independence in 1947 as a "much-stained radiance" in his justly famous poem *Subh-e azad* (Freedom's Dawn), which expresses Faiz's dissatisfaction with mere political freedom unaccompanied by economic freedom. In his inimitable style Faiz gave expression to a feeling of disillusionment with the false dawn of India's freedom from colonial domination, as well as feelings of resolve to continue the struggle against all oppressive regimes. Many of the poems in *Dast-i Saba* and all the poems in his third collection, *Zindan Nama* (Prison Writings; 1956), were composed during his imprisonment from 1952 to 1955 for opposing imposition of martial law in Pakistan and have an urgency about them. They speak of the need to fight against capitalism and dictatorship and to safeguard freedom of speech, the isolation of prison life, and undaunting courage in the face of suffering, imprisonment, even execution. At the same time Faiz also wrote poems about human feelings that are universal in nature, including "Tanhaai" (Solitude) and "Yaas" (Despair).

Faiz's diction is often consciously literary and decorative. He moved from the traditional rhymed verse in his early phase to free verse in his middle and later phases. In matters of style he blended the old with the new; his adherence to the traditional symbols and imagery of the *ghazal* is traditional, whereas his espousal of social themes is new. Innovation and experimentation for their own sake had no appeal for him.

FALUN GONG Founded by Li Hongzhi (b. 1952) in 1992 in China, the Falun Gong, or Falun Dafa, is the fastest-growing religious and social movement in

recent history. The Chinese government estimates the number of Falun Gong followers as between 2 and 10 million in China, but Li claims there are 100 million adherents in thirty countries. The movement first attracted the world's attention with a series of well-organized protests in Beijing in early 1999. Li left China in 1998 for New York City, probably in anticipation of his trouble with Chinese authorities. Alarmed by Falun Gong's organizational prowess and its challenge to the official ideology, the Chinese government declared Falun Gong a "heretical organization" on 23 July 1999 and launched a full-scale propaganda campaign against Li and his followers. Falun Gong has responded to the official ban with more protests and its own publicity crusade carried out mostly through Western news media and on the Internet.

The rapid rise of Falun Gong has as much to do with Li's charisma as with his message. All established religions in China have seen significant growth in their membership, and many new quasi-religious sects associated (like Falun Gong) with *qigong* were established there in the 1980s. *Qigong* is a three-thousand-year-old natural-healing discipline involving exercises and meditation. Like other *qigong* masters, Li emphasizes its spiritual element, but he distinguishes himself by linking *qigong* with Buddhist and Taoist cosmologies.

Falun Gong has spread through Li's many books and lectures and the testimonials of practitioners. Despite its proven capability of mobilizing people, Falun Gong remains a loosely organized movement as determined by Li's teaching. Practitioners can participate at exercise centers or cultivate on their own. Li is the only "teacher," or "master," in the religion.

FAMINE—CHINA Famine is a result of multiple political, economic, social, and ecological disorders that combine to produce an increase in the number of deaths from starvation and epidemic disease. An ex-

A crowd at a government facility providing rice during the famine of 1948. (BETTMANN/CORBIS)

amination of Chinese famines and Chinese official responses to famine conditions reveals universal features that apply to both traditional and modern times. Famine descriptions punctuate China's historical records. One survey noted that eighteen hundred famines were recorded between 108 BCE and 1929 CE. Chinese record keepers were careful to note that, in most cases, actual famine conditions did not result directly from drought, flood, war, or neglected infrastructure, but rather from failures of official intervention in the face of widespread popular distress.

Traditional Relief and Prevention

Famine relief and prevention traditionally formed an inherent part of Chinese official responsibility for popular welfare. Historical literature describes different episodes of famine and explains direct, indirect, and long-term measures for dealing with famine conditions. Lists of precipitating events point to differences between so-called heavenly calamities, such as drought or flood, and calamities linked to human causes, such as political ineptitude, rebellion, or war. Scarcities produced by grain transfers or extractions and failure to maintain irrigation works, dikes, and transport networks are classified as human causes.

A guiding principle for relief efforts called for them to be administered according to circumstances. Local investigators described famine conditions in terms of

degrees of hunger or the amount of food available per person during a given period. Immediate, or direct, relief measures included food and cash distributions to halt starvation. Indirect measures included tax relief, seed distributions to restore agricultural productivity, and work-relief projects to repair famine-related damage. Long-term relief measures included plans for water conservancy and programs to help settle famine refugees on unused land. Officials often planned projects ahead of actual needs so that they could be implemented quickly and without controversy.

An examination of Chinese official responses to famine conditions reveals that, overall, relief efforts succeeded best when China had a strong central order to mobilize physical and economic resources on behalf of popular welfare. When the central order was weak, millions were doomed. A hallmark of Chinese famine intervention called for grain storage to protect against the effects of crop failures. China's "ever normal granaries" served the dual goals of price stabilization and food relief by permitting officials to sell grain at reduced prices and to arrange grain transfers to avert hoarding and price gouging.

Historical data reveal that, by the mid-nineteenth century, the Chinese state could not mobilize resources necessary to carry out effective famine relief and that famine conditions occurred somewhere in China almost every year throughout the first half of the twentieth century.

Foreign Intervention

Foreigners in China during the late nineteenth and first half of the twentieth centuries made repeated attempts to provide famine relief, but they confronted a system in decline, and their efforts never evolved into coherent programs. Foreign efforts did, however, yield themes that were reiterated by a variety of relief agents and agencies in China. One was foreign insistence that China needed long-term physical and economic improvements before the constant threat of famine could be eliminated. A second proposed that the necessary improvements be instituted and run by foreign agencies and personnel. A third theme took form in negative reports that discouraged foreign donors and governments from contributing to Chinese official relief efforts.

Chinese officials regularly accepted foreign food and money for short-term relief and, with equal regularity, rejected long-term relief proposals for projects designed to be owned and run by foreigners. Ultimately, foreign relief efforts emulated Chinese trends. They succeeded best when they had strong external political support. They failed when foreign governments determined that conditions for relief were hopeless and refused to support agents and agencies operating in China.

China and the Great Leap Famine

Establishment of the People's Republic of China in 1949 brought dramatic improvements in medical care, disease prevention, and agricultural production. For a time it seemed as if official priority given to eliminating famine would bring positive results. Food production and distribution came under strict central controls, and the state gave high priority to increasing food supplies and improving transport networks. However, state collectivization policies produced disaster as outside assistance was halted, agriculture became collectivized, demands for huge quotas could not be met, and limited resources could not be distributed equitably. An estimated 30 million people died of starvation and disease during the Great Leap Famine of 1958–1962. It is now referred to as the worst famine in human history. A consensus holds that it was human made and that it resulted primarily from political failures associated with the Great Leap Forward, Mao's abortive effort to encourage rural industrialization at the expense of agriculture.

Since the death of Mao in 1976, China has gradually liberalized its economic policies and allowed for private control of agricultural land while maintaining firm centralized control of the government. It is to be hoped that these measures have put famine firmly in China's past.

FARID, KHWAJA GHULAM (1845–1901), South Asian Sufi poet. Khwaja Ghulam Farid was a great Sufi poet, mystic, and literary figure who remains revered and beloved by millions to this day all over the India-Pakistan subcontinent. Khwaja Ghulam Farid composed in the *kaafi*, the favored poetic genre of his native Multan in present-day Pakistan, to bring spiritual enlightenment to Muslim contemporaries, considered during that period to be in the throes of political, economic, and spiritual decline that manifested itself in widespread drug use, social ills, superstition, and debased religious practices.

Farid's poetry reflects his great love and knowledge of music and his homeland. He chose to compose in the regional language of Siraiiki rather than Persian or Urdu, the courtly and scholarly languages of the time. He added a romantic, ecstatic flavor and new musicality to the more ascetic devotional poetry of his predecessors. Effortlessly he takes the reader/listener through explanations of the highest mystical matters as well as charming depictions of everyday lives of simple folk. As a result, to this day, his mystical expressions of wonderment, love, humility, and gnosis bring delight to both the lover of poetry and the illiterate villager, while edifying the student of theology.

Like other Sufis of the subcontinent, Farid's expansive spirit of tolerance endeared him to Muslim, Hindu, and Sikh alike. Even today, his shrine in Kot Mithan is visited by thousands each year on the occasion of his *urs* (death anniversary).

FARMERS' MOVEMENTS Japanese farmers face demographic and economic challenges. Their political strength of the early post-World War II period has waned due to a demographic shift away from rural areas. Deregulation of the agricultural commodity trade has put further pressure on Japanese farmers.

Comprehensive taxation on farmers was introduced from Tang dynasty China during the seventh century. Farmers faced an additional burden as drafted foot soldiers during the warring states period of the late-fifteenth to mid-sixteenth centuries. Their repeated rebellions against local lords resulted in confiscation of all swords from the farmers in 1588 by Toyotomi Hideyoshi and their complete separation from the warrior class.

Heavy tax burdens, especially during poor harvests, prompted farmers to rebel against domain lords. During the Edo period (1600/1603–1868), the decentralized and more sophisticated taxation on farmers by local domains and the ban on land transactions kept most farmers small-scale and poor. While most rebellions were quickly suppressed by the domain forces, the widespread rebellion by mostly Christian peasants in Shimabara (1637–1638) required intervention by the central government. Frequent famines after the late-eighteenth century and the development of urban commerce and industrial activities prompted informal transfer of land titles, dividing the farmers into a few rich landowners and many poor tenant farmers.

The two-tiered structure of the farmers largely continued throughout the pre-World War II period, despite limited land reforms, and the dual burdens of taxation to fuel state-led industrialization and military draft fell heavily on the tenant farmers. Some Marxist intellectuals, like Kawakami Hajime and his followers, and anarchists insisted on a political alliance of industrial workers and tenant farmers but had limited success due to state suppression. Farmers took part in the prewar proletariat movements in the stream of worker-farmer parties, such as Rodo Nominto, Nihon Ronoto, and Zenkoku Rono Taishuto. However, the military government and its control of agriculture

through the Food Control Law of 1942 tightly incorporated farmers into the war efforts.

More than half the Japanese population was engaged in agriculture at the end of World War II. The American-led occupation forces implemented a major land reform program, breaking large land holdings into small independent farms. The collective support of these small farmers became a backbone of the ruling Liberal Democratic Party. The government used the Food Control Law for encouraging production and orderly distribution of rice under its monopoly during the food shortage following the war. The farmers set up the Central Union of Agricultural Cooperatives and successfully pressured the government into raising its purchase price of rice until the mid-1980s. Government efforts to deregulate the rice distribution system and discourage rice production through crop diversion programs had limited success. In other commodities, such as oranges and beef, quota-based imports started in the 1980s.

In the face of U.S. demands that Japan open its rice market to imports, Japanese farmers launched political campaigns to block imports and promote quality domestic rice. The former campaign delayed the opening of the rice market until 1994, when Japan agreed to institute a quota-based import program. In 1999, a tariff replaced the quota system. Meanwhile, the "quality rice" campaign networked farmers, environmentalists, and quality-conscious consumers and may provide a way for innovative farmers to compete successfully with imported rice. By the late 1990s, less than 10 percent of the Japanese population was engaged in agriculture, and half Japan's farmers produced commodities other than rice. The monolithic political strength of the farmers has vanished.

FARS (2002 pop. 4.2 million). Fars, in southern Iran, is one of the largest Iranian provinces, with an area of 133,294 square kilometers; it is a region with great historical significance. The nucleus of the ancient Persian empire (c. 550–331 BCE), it was called Persis and was the seat of the royal cities of Pasargadae and Persepolis. An evolved version of the ancient Persian tongue (called Farsi or Parsi after the region) is still spoken today in Iran and is the official language of the country.

The Iranian-speaking Aryans first came to northern Fars; later the valleys of the Kur and Pulwar rivers became centers and remained so until the time of the Sasanid dynasty. Darius the Great (reigned 522–486 BCE) built Persepolis where the Pulwar flows into the Kur on the plain of Marwdasht. Another town on the banks of the Pulwar, called Istakhr in the Middle Ages, was the focal point of the Sasanid dynasty. Other cities of Fars later outshone Istakhr in terms of size and activity (namely Shiraz, Fasa, Siraf, and Arrajan).

Throughout history, Fars flourished and waned according to the fortunes of the dynasty in power. Shiraz was the capital of various dynasties, but eventually power, money, and prestige shifted from this area to the northerly cities of Tehran and Isfahan. Fars nevertheless remained a significant commercial and cultural center. Today Shiraz is not only the bustling hub of commerce for the Fars region, but is also one of the

Ruins of the Persian capital of Persepolis in Fars. (CORBIS)

most industrialized cities in Iran. It is a major destination for tourists who appreciate historical sites and art centers and wish to visit the tombs of the poets Sa'di and Hafez.

Several nomadic ethnic groups, including the Qashqais, inhabit Fars as they did in past centuries. Nomads mounted on horses or camels may spend summers on the high plateaus and move south to the Persian Gulf in the winter to search for pastures for their herds; others spend winters in a city. These groups represent not only an economic mode of production, but also a lifestyle that has strong cultural and traditional roots in many parts of Iran.

FARSI-TAJIKI The Farsi-Tajiki or Tajiki language, the name given to one of the Iranian languages spoken in Central Asia, is also called Persian, Tajik, or Tajik Persian. This variety of names reflects the rather complicated history of the language.

Forms of New Persian

Farsi-Tajiki belongs to the Western branch of the Iranian language group (of the Indo-Iranian branch of the Indo-European language family), in which it is usually classified as New Persian. Today there are three standardized forms of New Persian: Farsi-Tajiki, Farsi, and Dari. In their standard forms, these three are to a large extent identical, although there are many regional spoken variants, which may differ considerably from the standard forms. Since 1989, Farsi-Tajiki has been the official language of Tajikistan, but it is also spoken in large parts of the neighboring republic of Uzbekistan and in Afghanistan. Farsi is the official language of Iran, and Dari the official language of Afghanistan.

History of Farsi-Tajiki

Farsi means "Persian," and Tajiki is derived from *Tajik*, a word with an obscure etymology, once implying "Muslim," but nowadays referring to the people of the Central Asian republic of Tajikistan. Farsi-Tajiki evolved from the classical New Persian language that gradually emerged as a new written lan-

guage, replacing Middle Persian and other Iranian languages in the centuries following the Muslim Arabs' conquest of Iran and Central Asia in the seventh century. (Iranian languages had long been spoken in Central Asia.) Classical New Persian, like the modern New Persian (Farsi) of today, is written in an adaptation of the Arabic script and is characterized by a large number of loanwords from Arabic. Farsi-Tajiki also has a relatively large number of Turkic loanwords. With the coming of the Turkic tribes from the tenth century on, Turkic languages, such as Uzbek, gradually superseded the Iranian languages once spoken in the area of Central Asia. More recently, Russian has deeply influenced Farsi-Tajiki.

The term "Tajik" began to be used widely from the sixteenth century onward to refer to speakers of New Persian in the area of the Oxus River (the modern Amu Dar'ya, in central and western Central Asia) basin and present-day northeastern Afghanistan, to distinguish them from speakers of Turkic languages in that area. The expansion of Turkic peoples, mainly Uzbeks and Turkmen, from the north to the south of Central Asia, in combination with the stabilization of national frontiers in the sixteenth century, separated the Iranians of the Iranian plateau from the Iranians to the northeast. From then on, the spoken Persian of the northeast developed separately from that of Iran.

However, the written Persian, in use for administrative and literary purposes in India as well as Central Asia, remained the same as the Persian used in Iran until the first quarter of the twentieth century. This language was called Farsi or Parsi (Persian, or more specifically New Persian) in the whole of the Iranian cultural area, which stretched from India to western modern Iran. The term "Farsi-Tajiki" or "Tajiki" came into use under Soviet influence around 1925.

Emergence of Farsi-Tajiki

The development of standard Farsi-Tajiki was instigated by the poet and novelist Sadriddin Aini (1878–1954), considered the founder of modern Tajik literature. He was trained in the medieval cloisters of a Bukharan *madrasab* (Muslim religious school), but he used his talents in the service of reform and revolution.

When Soviet rule was established in Central Asia in the 1920s, it was decided that the region should be divided into national republics. The republics were named after their dominant ethnic groups, whose languages had to be developed as tools for educating the proletariat. This division into national republics was artificial, not only since there were many more ethnic groups than national republics, but also because dif-

ferent ethnic groups had been living together in the same areas for centuries. A seemingly neat division was nevertheless carried through, and the newly appointed national languages were turned into modern Soviet-era languages by introducing elements from the vernacular to replace classical expressions. Sadriddin Aini was among the intellectuals who created the reformed Persian, which was called Tajiki. Aini apparently invented the term "Farsi-Tajiki," to mark the language's close relationship with the classical Persian heritage and with the Persian spoken in Iran and Afghanistan. Although this language was based on the spoken forms of Persian around Bukhara and Samarqand in present-day Uzbekistan, it was imposed as a new literary language on the inhabitants of the newly founded republic of Tajikistan, which was situated farther east and did not include Bukhara and Samarqand, the Tajik centers of old. Until then the area of Tajikistan had been only sparsely populated, and those who lived there mainly spoke different forms of Tadjiki or other Iranian languages, although Uzbek and Kirghiz were also spoken in western and northern present-day Tajikistan.

One of the first steps in transforming the allegedly old-fashioned and feudal image of the Persian language used in Central Asia was the adoption of a new alphabet. First, around 1930, the Latin alphabet was adopted. In 1940 the introduction of a modified Cyrillic alphabet facilitated the adoption of many Russian loan words, and the Russian language gradually gained importance in Tajikistan, marginalizing and Russianizing Farsi-Tajiki. This process ended in the late 1980s under the influence of glasnost and perestroika.

Since the disintegration of the Soviet Union in 1991, the people of Tajikistan have tried to reintroduce the Arabo-Persian script and to decrease the use of Russian and Russian loan words in Tajiki. However, so far the poor economic situation prohibits an effective reintroduction.

In short, Farsi-Tajiki in its present form is a relatively new language, but it has a long history. Its direct ancestor is classical New Persian, which had been spoken in Central Asia since the emergence of Islam. Whereas the Soviets increasingly tended to isolate Farsi-Tajiki from the Persian (Farsi) of Iran and Afghanistan, since independence Tajiks have tried to emphasize Farsi-Tajiki's similarity to Farsi and Dari. Both Farsi-Tajiki and Farsi have a common heritage, although political and historical circumstances through the centuries have resulted in considerable differences in grammar and vocabulary, particularly in colloquial language.

FAZILET PARTY. See **Refah and Fazilet Parties.**

FAZL, ABU'L (1551–1602), Indian historiographer. Born in Agra in 1550, Abu'l Fazl, the second son of Shaikh Mubarak, was a learned man of north India who became the faithful secretary and adviser of the Mughal emperor Akbar. His great scholarship as a historiographer is evidenced in his famous but adulatory book, the *Akbarnama* (Book of Akbar, 1590s), which chronicles the history of India in the time of Akbar, and in its supplement, the *Ain-i-Akbari* (Institutes of Akbar, 1593), a statistical account of the Mughal empire. The *Akbarnama* is the most important of all Mughal-era documents. Both books were written in an elegant style of Persian, the court language. Abu'l Fazl's brother Faizi was a noted court poet at the time.

After many years of service Abu'l Fazl was murdered at the instigation of Prince Salim while he was returning from a mission to the Dekkan (a plateau in southern India); the killer was a Bundella chief. (The Bundellas were a dominant clan in the region.) That prince, who had become jealous of the minister's influence, afterward became the emperor Aurangzeb.

FEDERAL TERRITORIES—MALAYSIA

Malaysia has a federal system of government that is made up of thirteen states and three federal territories that are under the direct control of the federal government. Wilayah Persekutuan, the national capital region (often called the Kuala Lumpur Federal Territory) was created in February 1974 from part of the state of Selangor and includes the city of Kuala Lumpur and the surrounding area. Putrajaya is the newly built national capital and was declared a federal territory on 1 February 2001. The third federal territory is the island of Labuan, which the government is trying to promote as an international offshore banking center. When the Federation of Malaya was founded in 1957, the federal territories also included Pulau Pinang and the city of Malacca, in addition to Kuala Lumpur. Pulau Pinang and Malacca, however, became states in 1957.

The federal territories have a different political structure from the thirteen other Malaysian states. There is a cabinet-level minister of federal territories, who is assisted by an advisory board for the general administration of each of the three federal territories. The mayors of Kuala Lumpur, Putrajaya, and Labuan are appointed by the king of Malaysia on the advice of the prime minister.

FEDERALLY ADMINISTERED TRIBAL AREAS—PAKISTAN

(2002 est. pop. 3.5 million). Home to Pashtun tribes, the strip of territory along Pakistan's northwestern border with Afghanistan has retained a degree of autonomy since the territories' inception as a buffer zone during British colonial rule (1757–1947). Encompassing seven tribal areas (Khyber, Kurram, Orakzai, Mohmand, Bajaur, North Waziristan and South Waziristan), the region makes up some 27,220 square kilometers of Pakistani territory.

Pakistan's constitutional agreement with the Pashtun tribes, who are the ethnic majority in neighboring Afghanistan, is much more than a mere formality. The Pashtun have successfully resisted occupation for centuries, and until pressure from the United States forced the Pakistani government to mount a helicopter

expedition into the area in 2002 to look for the Saudi terrorist Osama bin Laden, the last national military intrusion was by the British in 1897. That expedition never returned. The disastrous mission put an end to British colonial designs on the area, and instead of seizing and settling it (the British pattern for other problematic provinces), the British officially incorporated it into their North-West Frontier Province, but designated it a tribal area and stayed away from it.

When Pakistan gained its independence in 1947, the tribal areas voluntarily swore allegiance to the new government but stopped short of any actual integration and rejected the imposition of any governmental apparatus that might have threatened their autonomy. The tribes were granted a seat in the parliament, and technically universal suffrage applies to them, but with tribal law forbidding political parties, only the tribal elders vote.

The tribal areas have always been a center of smuggling in the region and refuge for some of Pakistan's worst criminals. The situation worsened in the 1960s, when worldwide demand for heroin increased (the tribal areas are centers of opium production, heroin processing, and distribution), and the Soviet invasion of Afghanistan in 1979 further exacerbated the situation. Always a center of arms production, with tribal law and custom dictating that every man should own a gun, the influx of arms from the Soviet invasion of Afghanistan exponentially increased the availability and sophistication of the arms available to the Pashtun, particularly when the United States began covert sales of arms to the Mujahadeen rebels. The area came to be known as *ilaga ghair* ("the land without laws"), and is a big contributor to instability in the region. With the U.S.-led invasion of Afghanistan in 2001, international pressure to bring the rule of law to the region is growing and will probably succeed, even if only temporarily.

FEDERATED MALAY STATES The Federated Malay States (FMS) was a former federation of the states of Perak, Pahang, Selangor, and Negeri Sembilan on the southern part of the Malay Peninsula. British colonial administrator Frank Swettenham (1850–1946) suggested the idea, and the FMS was established 1 July 1896 and terminated in 1946. With the inclusion of the unfederated Malay States, the Federation of Malaya was formed in 1948.

The British Resident system had previously overseen local administration in the various states. However, Swettenham and other British officers, felt that a central government was needed for greater unity, uniformity, and cooperation between these states. The FMS headquarters were established in Kuala Lumpur, where a Federal Civil Service consisting of departments such as Justice, Communications, Finance, and Public Works was set up. A council of Malay rulers for the FMS was instituted to discuss matters of importance with the British rulers. The first conference of Malay rulers, popularly known as the Durbar (royal display), was held in July 1897 at Istana Negara, Kuala Kangsar, Perak. The Durbar conference was held nine times until the year 1939.

With the formation of the Federation of Malaya in 1948, the Durbar membership increased with the inclusion of the unfederated Malay States of Johor, Kedah, Perlis, Kelantan, and Trengganu. On 18 February 1948 its first conference was held in Kuala Lumpur. The Conference of Rulers was held fifty times from February 1948 until August 1957.

FEDERATION OF MALAYSIA The Federation of Malaysia was the name given to the 1963 political union of several British colonies on the Malay

Peninsula, as well as Singapore and the island of Borneo. In 1946, Britain had separated Singapore, which remained a crown colony, and organized the nine sultanates and two federal territories on the peninsula into the Malay Union. Sarawak and British North Borneo (Sabah) were brought under direct colonial control at that time. There was considerable opposition to the Malay Union, which the local leaders felt consolidated British control. After protracted negotiations with Malay rulers, the British established the Federation of Malaya on 1 February 1948. In this agreement, the British committed themselves to preparing for the Federation's independence. A federal government headed by a British High Commissioner was established in Kuala Lumpur.

Local-level elections were established in 1951, and the first federal elections were held in 1955. Soon after these elections, the coalition government dominated by the United Malays National Organization (UMNO) began negotiations with the British over independence, while Singapore was granted internal autonomy. As a result of an agreement between the British and ethnic Malay, Chinese, and Indian communities, on 31 August 1957, the independent Federation of Malaya was established. This compromise agreement gave ethnic Chinese and Indians citizenship rights but tacitly preserved the leadership role of ethnic Malays in government and constitutionally recognized the "special position and needs of the Malays," creating an affirmative action program. The agreement set up a parliamentary democracy with a bicameral parliament, composed of a nonelected upper house made up of the nine Malay sultans among whom the position of head of state, or paramount ruler, rotated, and an elected lower house.

On 12 May 1961, Prime Minister Tunku Abdul Rahman proposed that the Federation of Malaysia absorb Singapore and the British-controlled territories in northern Borneo, Brunei, Sabah, and Sarawak to create a united Malaysia. The proposal was well accepted in peninsular Malaya and Singapore, but was less popular in the three Borneo territories. The proposal infuriated the Philippines, which asserted a claim over Sabah until 1987, and Indonesia, which viewed it as a neocolonialist plot and began a low-intensity conflict as part of President Sukarno's policy of *Konfrontasi* from 1963 to 1965. Elections were held for the first time in 1962 in Sabah and Brunei, and an Anglo-Malay commission visited the three territories in 1962, where it reported that following a September referendum a majority of the population was in favor of integration. Although Brunei opted to remain outside the Federation, on 16 September 1963, Sabah, Sarawak, and Singapore were constitutionally added

to peninsular Malaya to create the Federation of Malaysia. Under the constitution, the state governments have only limited autonomy and internal security; nation defense, foreign policy, and fiscal policy are prerogatives of the federal government.

Despite the founding of the Federation of Malaysia, there was little attempt to integrate Singapore into the Federation. UMNO extremists feared giving their Singapore counterparts economic advantages and government contracts, yet Kuala Lumpur demanded an increased percentage of Singapore's revenues. The creation of the Federation also radically changed the racial makeup of the country. Though there was a large increase in the number of Chinese, there was a similar rise in the number of indigenous peoples from Sabah and Sarawak. The UMNO campaigned in Singapore's September 1963 elections, and Singapore's ruling party, The People's Action Party (PAP), campaigned in Malaysia's April 1964 elections, causing mistrust. In May 1965, the PAP and four other Chinese-dominated opposition parties founded the Malaysian Solidarity Convention, which convinced many in the UMNO that there was a Chinese plot to take over the country. Communal tensions continued, and on 6 August 1965, the Tunku notified the Singapore chief Lee Kwan Yew that Singapore would be expelled from the Federation. On 9 August 1965, without any Singaporean representatives in attendance, the Malaysian parliament passed a bill favoring separation by 126 to 0. The Republic of Singapore was founded that day. The Federation of Malaysia then adopted the official name Malaysia.

FELTING—CENTRAL ASIA Felt is one of the earliest and most important textiles used by the nomads of Central Asia. For over two thousand years, felt has been used to make tents, furniture, and clothing. Through the influence of the nomads, the textile spread out of Asia and into Europe, where it remains an influence.

Materials and Techniques

Felt is a textile usually made from sheep wool or goat hair, but it can sometimes be made from fur.

The exterior of a traditional yurt in Kyrgyzstan covered by decorated felt siding that can be removed and rolled for storage during travel. (JANET WISHNETSKY/CORBIS)

Throughout Asia, wool is the most common material used for felt. The most prevalent sheep of this region are those of the family called fat tailed, because of their large, fat-filled tails. These sheep produce wool that is coarse and easy to felt. The felt made from this wool is stiff and holds up well under heavy use. The outside walls of the Central Asian *ger* (yurt) are made of thick sheets of this stiff felt. Carpets of felt are folded and rolled to be used as furniture inside the *ger*. In addition, felt is used for cloaks, boots, hats, and saddle blankets. Mohair, from Angora goats, is also used to make felt. (The "whirling dervishes" of Turkey wear tall hats of mohair felt.)

The sheep are shorn twice a year, in the spring and at the end of summer. It is the summer fleece that is used for making felt. (The spring fleece is spun into yarn and used for weaving.) After shearing, the wool is laid onto a large piece of cloth on the ground and is beaten with long, flexible sticks. This causes the clumps of fiber to open up and become fluffy.

The fluffy wool is laid out on reed mats in a pile that is about 35 centimeters deep. Boiling water is sprinkled on top of the wool. A long stick is laid on one end of the reed mat, and the mat is rolled up with the wet wool inside it. Sometimes the roll is covered with a piece of canvas or tarp, and then the whole bundle is tied with strong cord in several places. In Turkmenistan, Kyrgyzstan, and Kazakhstan, a long cord is put around the roll, and it is pulled in such a way that it makes the roll

rotate. Then a group of people walks arm and arm and kicks the top of the roll as it is rotating. In Mongolia and parts of China, the roll is attached to a rope behind a horse or camel. When the animal is guided forward, the mat-roll turns and hits against the ground, causing agitation. The agitation caused by this action, along with the moisture, causes the wool fibers to expand and contract until they are tangled together. This tangled mass of fiber is what we call felt.

With each method, after a half hour or so, the roll is untied, more hot water is added, and the whole thing is rolled up again from the opposite end of the mat. This rolling process can go on for several hours. At this point, because the felt is still not quite hard enough to function well, it is removed from the reed mat, heated with boiling water, and rolled up on itself, without the center rolling bar. The workers roll it back and forth with their forearms for ten to fifteen minutes. The felt is then unrolled and rerolled from another direction; the process is repeated until it has been rolled from all directions and on both sides. When it is finished, the edges are trimmed and it is allowed to dry.

Felt Decorations and Carpets

Asian felt is often used for carpets. These carpets fall into two major categories: decorated single-layered felts and double-layered felts. Single-layered felts are known by various names and have various surface-decoration techniques. In Kashmir, the carpets

are called *numdab*, and the decorations are embroidered onto the finished piece of felt. The edges of these felts have a fleece fringe. In Mongolia, the carpets are usually quilted and sometimes have additional motifs cut from felt and appliquéd onto them. The carpet edges are cut, and a piece of wool rope is sewn to them for added durability. Kyrgyz people make a carpet called *alla kijiz*, in which all the designs are added as the felt is being made. In Europe and North America, this method of creating motifs in felt is called inlay.

Inlay techniques are a common method of decorating felt in Central and Western Asia. The design is created by laying bits of colored fleece either onto a background layer of wool or onto the reed mat before the background layer is placed on it. A variation is to use a sheet of partially made soft felt. Shapes are cut from this soft felt and used like the colored fleece bits mentioned above.

The double-layered felt carpets are among the most prized of Central Asia. Called *shirdak* by the Kyrgyz and *syrmak* by the Kazakhs, these carpets have a patchwork-felt top layer and a solid felt bottom layer, which are quilted together. In English, these types of carpets are called mosaic felts.

Socioeconomic Context

In most parts of Central Asia, the women of nomadic tribes make felt, usually for the family's use. They work together to make the felt, since it is a labor-intensive activity. In some cases, men help by leading the animals that drag the felt rolls. In the non-nomadic community, however, men make felt as a business. These city dwellers work in shops, with master felters doing the layout and design of the felt carpets and apprentices doing the heavy labor. Because felting is so laborious, the master felters find it difficult to find apprentices. This, together with the lack of commercial interest in felt carpets, has caused many felt businesses to close.

During the time of the Soviet Republics (1920s–1991), many nomadic people were relocated onto collective farms and could no longer travel along their nomadic routes. They raised sheep not for their own felting, but so that the wool could be exported to the carpet factories of Russia. As a consequence, people in some areas forgot their traditional methods of making felt. Since the fall of the Soviet Union, there has been a resurgence of felting, and government agencies are sending teachers out to the countryside to help as people try to resume their traditional way of life.

History

Until recently, the earliest known pieces of felt were found in frozen grave mounds (*kurgans*) in Siberia. These felt artifacts included wall hangings, stuffed animals, saddle blankets, and cloaks, dating from 600 to 100 BCE. The Siberian finds were ornately decorated with many of the same inlay techniques used by Asian felters today. The State Hermitage Museum in Saint Petersburg has a wonderful collection of these artifacts. However, in the late 1980s, Western scientists found some very old mummies in western China. These mummies, dating from 2000 to 500 BCE, in many cases were dressed in felt boots and hats. While these objects had simple ornamentation, their shapes were complex, and they were made in a sophisticated three-dimensional felting technique. Also of note are the felt carpets in the Shosoin Repository, in Nara, Japan. Dating from 618 to 906 CE, these items were collected from all over Asia to be part of the Japanese emperor's treasure. Their intricate motifs show a complexity that is unrivaled today.

While felting has been an important part of the culture of Central Asia for over two thousand years, the twentieth century was a troubled time for the craft. With the collectivization of the nomads, many people lost their knowledge of the technique. In the cities, felt carpet businesses shut down. In the early 2000s, however, there has been an effort across the region to help people reconnect with their past and bring this craft back to life.

FEMININE LANGUAGE Sex differentiation in language has long been noted as a feature of some non-Western languages. It was only after the worldwide women's movement gained momentum in the 1960s and 1970s, however, that researchers in the United States, Europe, and other parts of the world seriously investigated various gender-related linguistic phenomena.

Scholars assume that differences exist between the way men and women speak in most languages, reflecting the universality of gender-based role divisions in human societies. Women generally speak in what is characterized as a feminine way, that is, more deferentially and less assertively than men. Although in most contemporary societies feminine language is less conspicuous than it has been in the past, some Asian languages preserve grammatical features strongly associated with feminine language. Japanese, the most well-known example, marks femininity through pitch, excessive politeness, hesitation, deletion of declarative predicates, and avoidance of final particles with strong assertion. Thai and Korean, although not as pronounced as Japanese, also are sensitive to the gender of the speaker.

Studies show that the feminine language is a social stereotype, that is, an idealized version of women's talk represented in literature and mass media (for example, television dramas) and that it is not as consistent in actual interaction as is often implied in existing literature on the subject. Studies also indicate that younger speakers tend to obscure the boundary between men's language and women's language, and some researchers predict that feminine language will gradually become more subtle than it is at present.

FENG SHUI Feng shui is an ancient Chinese art of site orientation based on the belief that the human dwelling or tomb can be situated physically to take advantage of invisible currents of energy within the en-

THE ORIGINS OF THE NAME "FENG SHUI"

"Qi rides the wind (*feng*) and scatters, but is retained when encountering water (*shui*). The ancients collected it to prevent its dissipation, and guided it to assure its retention. Thus it was called *feng shui*. According to the laws of *feng shui*, the site that attracts water is optimum, followed by the site that catches wind.

"Where forces cease and features soar high, with a stream in front and a hill behind, here hides the head of the dragon. The snout and forehead are auspicious; the horns and eyes bring doom. The ears obtain princes and kings; the lips lead to death or injury from weapons. Where terrain winds about and collects at the center, this is called the belly of the dragon. Where the navel is deep and winding, descendants will have good fortune. If the chest and ribs are injured, burial in the morning will bring sobbing that night."

Source: Zangshu, or Book of Burial, attributed to Guo Pu (276–324), translated by Stephen Field.

vironment. This energy, called *qi* (*ch'i*), is the same force that is affected by the pierce of the acupuncture needle. The human body is an analogue of the Earth, such that the blood veins of one correspond to "dragon veins" of the other. When a tomb is excavated or ground is broken for a house, such action taps into these dragon veins. Whereas arteries and veins bring oxygen and nutrients to the cells of the body, the *qi* brings good fortune to those residing in a dwelling.

Seeking the Dragon Veins

The Chinese developed two different procedures for locating *qi*. One approach, first outlined in a fourth-century text, though it undoubtedly originated earlier, was based on the idea that water collects and stores *qi*, while wind captures and scatters it. So the auspicious site would be bordered on three sides by mountains to block the wind and fronted by a pond or nestled in the crook of a stream to attract *qi*. Practitioners of this technique are collectively called the Form School. Another approach, elements of which date back to the second century BCE, was based on the theory of *wu xing* (the five phases), which analyzes *qi* as a force alternating between the poles of yin and yang

FENG SHUI AND ONE'S FATE

In traditional rural Chinese society, the effective use of feng shui was thought to bring prosperity to the family. This account of the use of feng shui by the Miao people of southern China in 1937 before the government repressed the practice indicates its importance in controlling fate.

The Miao believe in feng shui. When I was in Ang-chi village, Lu Tsun-ying, the chiah'ang, told me that the reason the Miao people there were so poor was because the feng shui was not good there. He also pointed out how the feng shui was poor. The mountain peaks were too sharp, there was a lack of springs, and the aspect was too narrow, so that there was nothing from which wealth could issue. His cousin, a pao-ch'ang, also asked whether I knew how to practice feng-shui. I gave him a negative answer. He said he would save more money to enable him to engage a good master of feng shui, who would find for him a place of prosperity.

as it progresses through the five elemental phases of earth, metal, water, wood, and fire. Each year has an elemental designation, as does each direction. Since each of these phases produces one of its fellows and is simultaneously destroyed by another, it is possible to avoid destructive *qi* by orienting dwellings or tombs toward productive directions according to one's year of birth. Practitioners of this technique became the Compass School.

Feng Shui in the West

Feng shui became accessible to the English-speaking world only at the end of the nineteenth century, when the British missionary Ernest Eitel published his landmark study of feng shui in 1873. But only in the last quarter of the twentieth century did the public at large discover this ancient system. One of the earliest proponents in the United States was Thomas Yun Lin, who founded a temple for American Black Sect Tantric Buddhism in 1986. His brand of feng shui dispensed with many of the traditional practices and relied on intuition and mystical knowledge. Subsequently every

major city in the United States attracted its own community of feng shui consultants, many of them trained by Lin or his school. There are now institutes of traditional feng shui—as opposed to the Black Sect variety—all over the Western world. Outside the United States, the practice of feng shui is most popular in England, Brazil, the Netherlands, and Australia.

Ironically, the practice of feng shui is no longer popular in China, where it was labeled a superstition and banned by the Communist Party; its practitioners there work mostly underground. The practice continues in Hong Kong, Taiwan, and Singapore, however, and it is from there that feng shui has spread rapidly to the West.

FERGANA VALLEY The Fergana (Farghona, Farghana) Valley, on the Syr Dar'ya River with an area of 22,000 square kilometers (8,494 square miles), is a fertile, densely populated irrigated valley in the south-eastern part of Central Asia. As a result of the Soviet demarcation (1924), the Fergana Valley is divided between three Central Asian states—Uzbekistan, Tajikistan, and Kyrgyzstan. The largest portion is in Uzbekistan.

The valley, which is 300 kilometers (186 miles) long and 170 kilometers (106 miles) wide, ranges from 330 to 1,000 meters above sea level. The Tian Shan and Pamir ranges enclose the valley on the north, east, and south. The valley is mainly accessible through the western Khudzhand Pass.

The Fergana Valley, as an important center of Central Asia, was first mentioned by Chinese sources in the fourth century BCE. The ancient Great Silk Road linking China with the Mediterranean crossed the valley and contributed substantially to the valley's prosperity. Islam was introduced in the eighth century. Starting from the late sixteenth century, the Fergana Valley was

part of Bukhara and Kokand khanates (principalities) until it was fully incorporated into Russia in 1876.

The Fergana Valley is irrigated by the Syr Dar'ya River, one of the two major Central Asia streams, and a wide network of canals. The major dams in the Fergana Valley are the Nurek dam (constructed in 1980), which at 300 meters is the tallest dam in the world; the Baypaza dam (1968); the Rogun dam (1983), all in Tajikistan; and the Toktagul dam (1974) in Kyrgyzstan.

The Fergana Valley is the most densely populated area in Central Asia. The average density in the central Andizhan Province of Uzbekistan is 465 inhabitants per square kilometer (1,203 per square mile). It is an important regional center of irrigated agriculture, silk production, and industry.

FERTILITY Human fertility is the number of births contributed to a population. Historically, in Asia as a whole, the average levels of births and deaths have been relatively in balance and have been more significant than levels of migration; consequently, population growth has been slow.

Two measures based on annual births are sensitive to year-by-year changes. The first is the crude birthrate (CBR), usually calculated as annual births per thousand midyear population. In 1999 Asian crude birthrates ranged from nine in Hong Kong and ten in Japan to forty-three in Afghanistan and Oman. The second measure is the total fertility rate (TFR), the sum of the birthrates for each single age of women of reproductive age. When fertility is stable for decades, the TFR approximates completed fertility. Even when fertility is changing, the TFR provides a good index, and it also shows what completed fertility would be if the changes ceased. In 1999 Asian total fertility rates ranged from lows of 1.1 in Hong Kong, 1.3 in Georgia, and 1.4 in Japan and Taiwan to highs of 6.7 in Yemen and 7.1 in Oman. Most societies that have not attempted to control the number of births have recorded total fertility rates around six to seven, limited by early widowhood, sterility, and the cessation of sexual activity within marriage. Crude birthrates were rarely higher than forty-five. A total fertility rate of around 2.1 is considered population replacement. In the absence of immigration, sustained periods below this level lead to population decline, even with low mortality levels.

A woman with twin babies in Shanghai, China, in 1996. (STEPHEN G. DONALDSON PHOTOGRAPHY)

TABLE 1

Total fertility rates, 1950–2000				
	1999 population (millions)	TFR immediately before decline	Period of TFR decline	1999 TFR
Asia	3,637	5.9	1970–1975	2.8
Subregions				
East Asia	1,481	5.7	1970–1975	.8
South Central Asia	1,451	6.1	1975–1980	3.6
Southeast Asia	520	6.1	1970–1975	2.7
West Asia	186	6.4	1970–1975	3.9
Largest countries				
China	1,254	6.1	1970–1975	1.8
India	987	6.0	1975–1980	3.0
Indonesia	212	5.7	1970–1975	2.5
Pakistan	147	7.0	1985–1990	4.9
Japan	127	5.7	1930–1935	1.4
Bangladesh	126	7.0	1985–1990	3.0
Vietnam	80	6.1	1980–1985	2.5
Philippines	75	7.3	1965–1970	3.5
Iran	66	7.3	1985–1990	2.9
Turkey	66	6.9	1960–1965	2.4
Myanmar (Burma)	48	6.0	1975–1980	2.7
South Korea	47	6.3	1965–1970	1.7

Note: East Asia includes China, Hong Kong, Japan, Macao, Mongolia, North Korea, and South Korea; South Central Asia includes Afghanistan, Bangladesh, Bhutan, India, Iran, Kazakhstan, Maldives, Nepal, Pakistan, Sri Lanka, Tajikistan, Turkmenistan, and Uzbekistan; Southeast Asia includes Brunei, Cambodia, East Timor, Indonesia, Laos, Malaysia, Myanmar (Burma), Philippines, Singapore, Thailand, and Vietnam; and West Asia includes Armenia, Azerbaijan, Bahrain, Cyprus, Gaza, Georgia, Iraq, Israel, Jordan, Kuwait, Lebanon, Oman, Qatar, Saudi Arabia, Syria, Turkey, United Arab Emirates, and Yemen.

The problems associated with land inheritance and food production during famines forced some agrarian societies to limit the number of children. Between 1500 and 1800, Western Europeans delayed or forwent marriage, and total fertility rates dropped to 5.5 or lower. Without lowering fertility, infanticide produced a similar effect in Japan, China, and northern India. In spite of these checks, economic growth during those centuries produced a considerable population increase in Japan and China, in the latter due to intensified cultivation and the migration of farmers to South China.

Fertility in the Second Half of the Twentieth Century

Table 1 shows the 1999 total fertility rates for Asia, its subregions as defined by the United Nations Population Division, and the area's twelve largest countries, which account for almost 90 percent of Asia's population. Demographers consider a fertility rate drop of 10 percent from a higher stable rate to be a fertility transition. In some countries fertility levels

rose immediately before the fertility transition because modernization brought a decline in widowhood, a shortened breast-feeding period, and possibly increased sexual activity.

Fertility transition in Japan began in the early 1930s, only to stall until after World War II. In the rest of Asia, population growth rates rose as mortality declined with unprecedented steepness, and many governments responded with national family planning programs, but there were no signs of fertility decline until the 1960s.

Fertility began to fall widely in Asia in the mid- to late 1960s following early signs of an incipient fall in Sri Lanka, Singapore, Turkey, and the Philippines in the late 1950s and in South Korea, Taiwan, Malaysia, and Thailand in the early 1960s. The beginning of fertility transition was delayed in Oman, Bhutan, Laos, and, among the larger countries, in Pakistan particularly.

At the end of the twentieth century, fertility in East Asia was below replacement level (TFR 2.1) except in Mongolia. In Southeast Asia fertility was below replacement in Singapore and Thailand; moderate (TFR 2.2–2.9) in Indonesia and Vietnam; moderately high (TFR 3.0–3.9) in Malaysia and the Philippines, where political and religious forces opposed fertility control; and very high in Cambodia and Laos, which were relatively underdeveloped. In South Asia fertility was moderate in Sri Lanka; moderately high in India, Bangladesh, and Iran; and very high elsewhere. In West Asia fertility was very high, except in Turkey, Lebanon, and Bahrain, where it was moderate. In the Asian states of the former Soviet Union fertility rose with the proportion of Muslims, from below replacement level in Armenia and Georgia to very high in Tajikistan, with the exception of Azerbaijan, which was 93 percent Muslim but had replacement-level fertility.

The Asian fertility decline of the late twentieth century was central to control of the global population explosion. Between 1995 and 2000 worldwide births numbered only three-fifths of the births that could have been expected if the fertility levels of 1955 to 1960 had continued. Asia was responsible for 70 percent of the birth decline, and three Asian countries—China, India, and Indonesia—were responsible for 50 percent of the decline.

The Causes of the Asian Fertility Decline

Underlying the Asian fertility decline were profound economic, demographic, and social changes, including rising per capita income, declining mortality, increasing urbanization and nonfarm employment, and dramatically rising educational and literacy levels. As a consequence the average age of female marriage

rose at least two years. While a minor factor in the fertility transitions of most areas, the delay in female marriage, to almost twenty-five years of age by 1981, was largely responsible for the beginning of the fertility transition in Sri Lanka.

The decrease in marital fertility was the major factor in the fertility decline in Asia, the only continent where nearly all fertility occurs within marriage. The decline likely was hastened by national family-planning programs. First initiated in India in 1952, these programs were confined largely to the Asian continent. Combining free or inexpensive access to contraception with information and moral suasion to control family size, they were most effective in Turkey and the arc of countries from South Asia to East Asia, where Brahman, Confucian, military, and communist elites encouraged family planning amid little social or religious opposition. Compared with elsewhere in the world, the resulting fertility declines began at lower per capita income levels and within lower levels of the Human Development Index, a measure of income, literacy, and mortality devised by the United Nations Development Program. The relative importance of socioeconomic changes and family planning programs in lowering fertility have been debated, especially with regard to Bangladesh.

Several individual national experiences are notable. China in the 1970s and India during the emergency of 1975–1977 showed that people could be coerced into adopting fertility control, while Indonesia successfully employed subtler pressures during that period. China reduced its TFR by over two-thirds in twenty-five years, from 6.1 in the late 1960s to 1.9 in the early 1990s. A comprehensive family planning program begun in Bangladesh in the late 1970s halved fertility in two decades. Iran, which experienced a TFR of almost seven after its 1979 revolution, began to facilitate family planning in the 1990s and subsequently halved its fertility level during that decade. Political and religious opposition at times slowed the fertility decline in the Philippines and reversed the decline among the Malay population of Malaysia. A diverse range of contraceptive methods, including sterilization, the intrauterine device (IUD), the birth-control pill, the condom, and traditional methods such as withdrawal and rhythm, effected the Asian fertility declines. Abortion, both legal and illegal, also became more widespread.

United Nations Projections

The United Nations medium-range population projections show Asia reaching the long-term fertility replacement level (TFR 2.1) around 2020 and slow population growth (under 0.5 percent per annum) in

2035. The long-range population projections suggest the Asian population will be stationary, that is, with fertility and mortality equal (TFR 2.1 or a little lower), by 2150, amounting to 6.1 billion people out of a world population of 10.8 billion people. Accordingly, Asia's population would constitute 56 percent of the world's population, a reduction from 61 percent at the end of the twentieth century.

FINANCIAL CRISIS OF 1927 The financial crisis of 1927 in Japan was characterized primarily by a large-scale collapse of banks, both large and small, that resulted in greater financial control of the economy by the biggest banks, which took over the assets of bankrupt firms. The crisis originated in the latter stages of World War I, when companies had to decide whether to reduce commitments in view of an expected slowdown after the war or to expand investments to exploit an anticipated postwar recovery. Many Japanese companies chose the latter option, fueling their expansion with credit. When Japan's stock market crashed in March 1920, the superstructure of this expansion collapsed. Furthermore, now debt-ridden companies lacked the competitive power to engineer a recovery. Their prices had risen more rapidly during the war than those of their Western competitors but had declined more slowly after it due to the

underdeveloped state of Japan's technology and the higher costs faced by Japanese companies seeking to manufacture comparable products.

Initial government countermeasures were undermined by the massive Tokyo earthquake of 1923. The financial aftershock of the earthquake created an insurance crisis and greatly expanded the debt held by banks that took out loans to invest in the stock market and in industrial enterprises during the short-term boom after World War I. The government sought to ameliorate the situation with "earthquake bills," a second round of special credit. A key institutional feature of Japanese finance in this era was the "organ bank." Many banks had lent so much to related industrial firms whose fortunes were so precarious that cutting off credit would bankrupt both the firms and the banks. The largest such linkage, and the one that resulted in the biggest disaster, was between the Bank of Taiwan (which was a Japanese bank), and Suzuki Trading Company. In late March and early April 1927, the Finance Ministry warned the Bank of Taiwan to cut back on its loans to Suzuki. Mitsui Bank then called in some of its loans to the Bank of Taiwan, precipitating the closure of both Suzuki and the Bank of Taiwan, with the latter subsequently being reorganized. As a result of this crisis and the consequent short bank moratorium, many banks and the industrial firms that they had financed went bankrupt. Their assets were then acquired by the large *zaibatsu* (family-owned financial and industrial groups). With their consequent broader control over the banking sector, the top five banks increased their share of national deposits from 24 percent in 1926 to 40 percent in 1930.

The 1927 financial crisis can be placed within the larger patterns of Japan's modern history. At least through the 1980s Japan was credited with dealing exceptionally successfully with economic crises. A frequently cited example is its response to the energy crisis of the 1970s. That, however, was primarily a crisis of inflation. By contrast, the era immediately preceding the 1927 crisis was one of wealth (produced by the wartime boom) and deflation (meaning the decline in prices after the war). There is a striking similarity between that crisis and the prolonged financial crisis beginning in 1990. The latter manifested a similar sequence of boom (generated by inflated asset prices in real estate and stocks) and deflation (the bursting of the financial bubble followed by long-term price decline). This comparison suggests that in the twentieth century Japan has been singularly inept at handling problems of wealth and deflation.

FINE ARTS—CENTRAL ASIA The art of Central Asia has always been the consequence of the contacts of local cultures with neighboring great civilizations. Being at the crossroads of the Persian, Hellenic, Indian, Arabic, Mongol, and Turkic worlds and later influenced by European culture, Central Asia was a melting pot of aesthetic systems, producing local schools that are interesting for more than their own aesthetic discoveries. The interaction of Hellenistic and Buddhist or Persian and Turkic elements, and the later meeting of West and East, brought about unprecedented intercultural penetration.

Prehistory to Middle Ages

The first artifacts known from Central Asia are rock paintings (showing the hunting scenes and magic symbols characteristic of prehistoric cultures) such as those of Zaraut-Sai, Uzbekistan, dating from the Mesolithic period (eleventh–sixth millennia BCE). The Neolithic period and the early Bronze Age (sixth–third millennia BCE) are represented by ornamental paintings preserved in the ruins at Iassydepe, Anau, in Turkmenistan. During the Bronze Age, when two types of civilization (sedentary-agricultural and nomadic-stockbreeding) existed in the region, two trends of artistic metal treatment were defined. The first, connected with early town culture, presented figures of oriental mythology in a local style. The second, the so-called animal style involving the symbolic depiction of animals, originated with the Sako-Scythian nomadic tribes of northern Central Asia. Prior to its conquest by Alexander of Macedon, this region belonged to the Achaemenid empire (559–330 BCE). Little is known of Achaemenid art in Central Asia apart from the scarce artifacts of the so-called Amu Dar'ya hoard, some animal-style artifacts, and a few preserved architectural structures (Kyzyltepa and Kutlugtepe, Uzbekistan). Historians accompanying the campaign of Alexander left accounts of numerous images of epic personages displayed in the homes of the people of Sogdiana (now in Uzbekistan and Tajikistan).

The Greek conquest (330–328 BCE) opened a new and important period in Central Asian art history. According to Galina A. Pugachenkova, this period was initially characterized by the rapid Hellenization of the art of Bactria (the region between the Hindu Kush mountains and the Amu Dar'ya river) between 323 and 140 BCE, evident in temple paintings of the Dioscuri found in Dilberdzhin north of Afghanistan and in the development of Hellenistic sculpture in North Bactria (Ai Khanum, Afghanistan). Between 100 BCE and 100 CE, a diversified Bactrianization of Hellenism took place (seen in artifacts from Dilberdzhin, Afghanistan, and Khalchayan, Uzbekistan). Sculpture of this period was especially distinctive in its synthesis of Greek masterpieces and its tendency to psychological expression in the depiction of local ethnic personages. Similar processes took place in neighboring Parthia (now northeastern Iran), where the Greek style was interpreted on the basis of Persian-Parthian traditions, evident in the statue *Rogoduna* and drinking vessels from Nisa (Turkmenistan, 200 BCE). A final phase known as the Kushanization of Bactrinism (100–300 CE) began with the rise of the Kushan empire (30–370 CE) and was characterized by the interaction of antique and Buddhist elements with local traditions (for example, the sculpture, painting, and architecture of Dalverzintepe, Fayaztepe, and Afrasiab in Uzbekistan).

The early medieval period (500–722 CE) was the height of mural painting of the Sogdian school, whose best-known frescoes are the Red Hall in Varakhsha Palace, Uzbekistan, and the so-called *Procession of Ambassadors* in Afrasiab, Uzbekistan, and especially the frescoes in Pedjikent, Tajikistan. These were characterized not only by an original graphic style that defined oriental miniature painting for several centuries but also by the depiction of figures from Central Asian folklore, later represented in the poetry of Firdawsi (c. 935–c. 1020).

The Arab invasion (late 700s–800 CE) prohibited the creation of sculpture and considerably limited the development of representational painting because of Islamic prohibitions. Visual art was mostly ornamental, and architecture became the dominant art form. Inventive bricklaying was the primary means of expression in the pre-Mongol period. The most interesting buildings in Bukhara are the mausoleum of Ismail Samani (Samanid era, 864–999) and the Kalyan minaret (Karakhanid era, twelfth century); in Merv, the mausoleum of Sultan Sanjar (Seljuk era, 1038–1157) is prominent. During the first half of the thirteenth century, the development of Bukhara and Khorezm as artistic centers was halted by the Mongol invasion (1220).

Much of the fine arts of Central Asia shows an Islamic influence. This tile mosaic of a vase with flowers is from a mosque in Kazakhstan. (BUDDY MAYS/CORBIS)

The high point of the art of Central Asia was reached in the epoch of the Timurids (fourteenth–fifteenth centuries). Historical documents reveal that fresco painting was revived, and architecture, miniature painting, decorative applied arts, and calligraphy all achieved a unity and harmony that have led some scholars to speak of a Timurid Renaissance. The highest achievements in architecture were created in Samarqand, center of the Timurid empire: the Bibi-khanum mosque, the memorial complex Shakh-Zindah, Gur-Emir (Timur's mausoleum), and the *madrasah* observatory of Ulugh Beg. Significant structures were also built in Turkistan (the mausoleum of Khoja Ahnaf Yassavi) and in Shakhriyab (Ak-Sarai, the palace of Timur). Miniature painting was highly developed in Samarqand and especially in Herat, where the renowned schools of Kamal al-Din Behzad (1455?–1536?) and the calligrapher Sultan-Ali Mashhadi (1442–1520) flourished during the reign of Sultan

Hussein (1438–1506). Miniature painting now took many forms: genre painting, portraiture, painted chronicles, and the lyric genre.

Another considerable phase in the development of medieval culture in Central Asia began in the era of the Shaybanid dynasty (sixteenth century) as the center of artistic life gradually shifted to Bukhara. The sixteenth and seventeenth centuries were the height of miniature painting and architecture in Bukhara and Samarqand, where Tajik and Uzbek artistic interaction took place, generating new schools of art and architecture. In this period, the main architectural monuments are Registan Square in Samarqand, the Kalyan mosque, and *madrasah* Abdulaziz Khan in Bukhara. With the nineteenth century a long period of stagnation in the art of this region began.

Modern Period

The modern phase of Central Asian art was initiated with the Russian colonization that began in the second half of the nineteenth century. Central Asia experienced three cultural interventions: European, Russian, and Soviet. Initial imitation of the Russian-European artistic tradition later gave way to transformation, which ultimately led to a regional reaction to Europeanization in the 1970s and 1980s. The art of Europeans resident in Central Asia developed alongside local art, and the two interacted with each other.

Colonial Period to 1917 Russian colonization triggered a wave of Orientalism in the art of Central Asia. This phenomenon was a consequence of the interest of Russian artists in the exoticism and ethnography of the East. Several Russian painters visited Russian Turkistan immediately after its colonization (1865), among them Vasilii Vereshchagin (1842–1904) and Nikolai Karazin (1842–1908), active participants in military campaigns who developed the principles of naturalism and interest in the ethnography of the region. Vereshchagin's works expressed a contradictory aspiration to justify the imperialistic ambitions of Russia and at the same time created symbolic images of the calamities of war (*Apotheosis of War*, 1870–1871). Other Russian artists, such as Rikhard Zommer (1866–1939), Sergei Iudin (1853–1933), Ivan Kazakov (1873–1935), and Lev Bure (1887–1943), adhered to the traditions of the late Wanderers (a Russian artistic group at the end of nineteenth century), painting landscapes and architectural studies. The Orientalism of Central Asia was defined by its descriptive nature and the tendency to cultural realism. In architecture, the colonial style was not aesthetically uniform. In the Caspian region the so-called Russian style predominated,

whereas a provincial modernism predominated in Tashkent and Quqon. Colonial urbanism differed markedly from the traditional dwellings, and traditional and European artistic cultures coexisted in relative independence.

Soviet Period, 1917–1991 The Russian Revolution was both a social and a cultural event with grave consequences for life in Central Asia as an ideologically indifferent czarism gave way to a Communist ideology envisioning radical social reconstruction. The East became one of the main regions of revolutionary transformation in which Soviet Central Asia was eventually divided from a larger cultural and geographical region called the Central East.

After new states came into existence in Central Asia following the disintegration of the Soviet Union in 1991, there were persisting discussions on the significance of the Soviet period in their history. According to popular opinion, characteristic of the official institutions of the new states, the local elite managed to return to the ethnicity-oriented path around the 1970s, and Sovietization did not stop but merely delayed the development of local ethnic cultures; its consequences were predicted to be quickly overcome when independence was achieved. However, the Sovietization of Central Asia meant the radical Europeanization of the local elite's consciousness, and it cannot be overcome by the surface changes in political ideologies. The twentieth-century art of Central Asia has been the arena of broad interaction of European and Asian spiritual paradigms.

Artistic institutions of a European cast emerged in Central Asia from the 1920s through the 1950s. Local institutions were founded to train artists, professional theater groups, philharmonic societies, and researchers in traditional and modern art. Two opposite tendencies followed: the Orientalization of the Russian avant-garde and the Europeanization of Central Asian thought and education. The most significant phenomenon of that period was the development of a moderate Central Asian avant-garde, represented by Ruvim (Il'ya) Mazel (1890–1967), Aleksandr Nikolaev (1897–1957), and Aleksandr Volkov (1886–1957), almost all connected with key members of the Russian avant-garde.

Developing in two principal directions, the Central Asian avant-garde sought to apply to Central Asian material the artistic principles of modern Russian European art (constructivism, decorativism, and primitivism), a trend seen in painters such as Volkov (*Pomegranate Tea-room*, 1925) and the photographer Max Penson. They also sought a synthesis of oriental

painting (mostly miniatures) with the broader European tradition (the Russian icon, the Italian Renaissance, and the twentieth-century European avant-garde), as seen in *Friendship, Love, Eternity* (1929) by Nikolaev (also known as Usto-Mumin).

During the 1920s various artistic groups appeared: the shock school of Eastern art (under Ruvim Mazel and Aleksandr Vladychuk, 1920–1926) was founded in present-day Turkmenistan; a local affiliate of the Association of Revolutionary Russian Artists opened in Turkistan in 1922 and has functioned ever since; and the group called Masters of the New East (Volkov, Nikolaev, Mikhail Kurzin, Vera Markova, Semen Malt, and others) was founded in 1929.

In the critical period of Stalinization (late 1920s through early 1930s), some members of the Central Asian avant-garde turned to new subjects and independently cultivated a style close to the Mexican muralists around Diego Rivera (Volkov, Nikolai Karakhan, and others), whereas others turned to the more stereotypical forms of socialist realism. Numerous members of the avant-garde were persecuted during the Stalinist repression of the 1930s (Kurzin, Nikolaev, and others). At the same time, an official aesthetic doctrine that emphasized the national character of art, promoting works that were ethnic in form and socialist in content, lent significance to folk art. Orientalism could now develop within Socialist realism, and Chingiz Akhmarov cultivated the principles of oriental miniature in monumental paintings from the end of the 1940s.

Constructivist ideas were popular in the architecture of Central Asia of the 1920s and 1930s. New building types were seen in such structures as communal housing. The most significant constructivist structures were government buildings by Moisei Ginzburg (1929) in Alma-Ata (present-day Almaty in Kazakhstan) and by Stepan Polupanov (1931) in Tashkent (the capital of present-day Uzbekistan). When criticized in the mid-1930s for using "bourgeois" and "anti-popular" styles, constructivist architects attempted a synthesis of Stalinist classicism and traditional architecture, chiefly expressed in opera and ballet theaters in Alma-Ata (by Nikolai Prostakov, 1941) and Tashkent (by Alexei Shchusev, 1947), in which buildings were decorated by masters of applied folk art.

The period from the 1960s to the 1980s was characterized by an open confrontation between Europeanism and an aspiration toward ethnic identity. During the 1960s, a European openness prevailed in the so-called strict style in painting and in a post-impressionist style in portraiture and still life (Iurii

Taldykin and Grigorii Zilberman in Uzbekistan; Salikhitdin Aitbaev and Tokbulat Tugusbaev in Kazakhstan; A. T. Amindzhanov, A. Ahunov, V. Boborykin, and K. Zhumagazin in Tajikistan; Chary Amangeldyev, S. Akmuhamedov, S. Babikov, and D. Bairamov in Turkmenistan; and Myrza Omorkulov and Altymysh Usumbaliev in Kyrgyzstan). A new specifically Central Asian international style evolved in architecture (the Public Library in Ashkhabad, Turkmenistan, by Abdula Ahmedov, 1961–1975; the Uzbek Communist Party Central Committee Building and Panoramic Cinema in Tashkent by Sergo Sutiagin, Vladimir Berezin, Dmitrii Shuvaev, and others, 1964). Urban planning showed the influence of European principles, such as the garden city utopia (Navoi, Uzbekistan, 1970; downtown Tashkent, 1966). By the end of the 1960s, however, artists increasingly rejected cosmopolitan doctrines and sought new artistic means among local traditions.

In the 1970s, a search for local specificity prevailed, giving rise to a national romanticism in which artists adapted motifs from ancient and medieval Central Asian art (an influence of active archaeological excavations) to the present. Thus the *pandzhara*, an added sunshade, which was a modernization of the traditional geometrical ornamental lattices, became popular in architecture. Ceramic art was the most developed of the decorative arts and appeared not only in walls but also sculpturally in urban architecture. Painting and sculpture interpreted and used numerous sources: European Orientalist paintings of the early twentieth century, local oriental material, and the adoption of "ethnic" motifs from the Central Asian avant-garde of the 1920s. The influence of Latin American art was also evident.

Postmodernism was the prevailing style of the 1980s and 1990s. The 1980s witnessed the disintegration of official Soviet art and was the first period since the 1920s in which new artistic ideas were spontaneously formed. Postmodernism had two branches: that of the Central Asian Europeans, who turned mostly toward Western art, and that of the ethnic modernists, who turned to traditional art, local folklore, and the mythology of Islam, Buddhism, and Zoroastrianism. The two branches interacted, but whereas the Europeans situated their work in the context of modern and past (Asian) cultures, the traditionalists developed an individual style in which tradition was reflected. Painting dominated over other visual arts, and Central Asian art became known abroad through the work of Maksim Vardanian, Daima Rakhmanbekova, and Gairat Baimatov. Notably, the leaders of European art in Central Asia, after leaving Asia, became new Orientalists (Maksim

Vardanian, Konstantin Titov), whereas former leaders of the traditional movement of the 1980s, after leaving Central Asia in the 1990s, refused to use "oriental" motifs in their work and became "international" artists (Abduhakim Turdyev, Fayzula Shakirov). Thus the cultural preferences of both groups were polyvalent and could be converted reciprocally in other circumstances—one consequence of Europeanization.

Modern Period, 1991 to Present The independence of the Central Asian republics has had an ambivalent influence on the development of art in the region. The developing art market has been a positive consequence and has led to the secularization of artistic life and the formation of local art schools. At the same time, state regulation of art has intensified. In Turkmenistan and Uzbekistan, new official art has returned to the socialist realism of the 1940s and 1950s. By the end of the 1990s, many European artists had left the region, along with some local artists who founded small Central Asian art communities in Russia, Europe, and the United States. The architecture of this period has a clearly expressed Western character, whereas buildings that tried for an Oriental feel have a kitsch quality (Timur Museum, Tashkent, mid-1990s). The number of genres and types of art practiced in Central Asia has diminished, but some maintain the level apparent at the end of the 1980s.

FISH-FIGHTING Thailand is notable for indigenous sports that involve nonhuman competition including cockfighting, kite-flying, and fish-fighting. Fish-fighting is now a mainly rural sport, as it is banned in Bangkok. It involves placing two male Thai or Siamese fighting fish (*Betta splendens*) in a bottle and watching them tear at each other with their mouths until one dies or is severely injured. The spectators, including the owners of the fish, bet on the outcome throughout the match. *Betta*, which are native to Thai canals, are raised and bred by their owners to be ferocious fighters and those who win a match but are injured will be nursed back to health to fight again. Only males, generally no more than 5 centimeters long and 1 centimeter across, are used for fighting. It takes about six or seven months to raise a fish for fighting. Part of the appeal of the sport is the fighting and gambling and another is the bright colors of the *Betta*, one of the most popular tropical fish among fish enthusiasts around the world.

FISHING INDUSTRY—CHINA The Chinese fishing industry has led world production since 1989. It produces primarily for domestic consumption and helps to absorb surplus labor in rural areas. It is divided into four sectors: marine fishing, mariculture, freshwater fishing, and freshwater culture.

The Traditional Fishing Industry

The Chinese have practiced fish culture for over 3,000 years; the first pisciculture manual, by Fan Li, dates from around 475 BCE. Polyculture (the raising of multiple species) was introduced in the Tang dynasty (618–907 CE), when the consumption of common carp was forbidden because its name (*li*) had the same sound as the surname of the imperial family. Farmers responded by moving from monoculture based on common carp to polyculture. Compared to intensive monocultural systems with reliance on carnivorous fish species practiced today in developed countries, polyculture not only requires much less labor but also releases much less waste and is much more efficient in the conversion of biological energy. Up to nine different species of fish (primarily herbivores), each feeding on different resources, are spawned in the artificial and balanced ecosystem of a fishpond.

A distinctive method for pond fishing, integrated culture, was developed in the Pearl River delta in South China around 1400. In a complex dike-pond ecosystem, crops such as mulberry, sugarcane, fruits, and rapeseed are grown on the dike banks. These crops are used for fish feed in the ponds, and the fishes' waste in turn is used to fertilize the plants on the dikes.

The practice of paddy fish farming, first documented in the third century CE, probably evolved from the catching of wild fish in ponds that had been dug in the rice fields for water storage, irrigation, and water control. The most productive species, which can help to control rice weeds and harmful insects as well as provide fertilizer for rice fields, are selected for breeding.

The Modern Fishing Industry

Fisheries took off after the onset of economic reform in 1978. The government gave households greater freedom in managing aquaculture production, deregulated purchase and sales prices in 1985, and provided support through research and extension. Fisheries production rose rapidly: total aquatic production expanded more than eightfold between 1978 and 1998, from 4.7 million to 39.1 million metric tons. Fisheries' share of gross output value of primary food industries in China has risen from 1.6 percent in 1978 to 9.9 percent in 1998.

Marine capture fisheries dominated production until the 1980s, when the government focused on the development of aquaculture in response to the depletion of many major marine fishery resources. In 1978, the share of capture production was 73.9 percent of total aquatic production, but that share declined steadily

thereafter even as total quantity continued to grow. By 1993, aquaculture contributed over 50 percent of total fish production. China became the first major fisheries country with aquacultural production exceeding wild fishing.

Marine fishing has expanded in recent years primarily through the increase in number of motorized vessels, from around 50,000 to 274,000 vessels between 1980 and 1995. China fields over 1,600 ocean-going fishing vessels. The government has supported capture fisheries production through an extensive program of fishing vessel building, modernizing, and purchasing from abroad.

Mariculture, or marine culture in intertidal zones, small bays, and shallow seas, accounted for a negligible 5.8 percent of total catches in 1970. But production increased almost twenty times between 1978 and 1998, from 0.45 to 8.6 million metric tons. Seaweed, fish, crustaceans (especially prawns), and mollusks (particularly scallops) are its major products. Mariculture has benefited recently from the application of the principle of integrated culture. For example, some species of mollusks may be bred in prawn ponds or along with cultivated seaweed.

Varieties of carp continue to be the most important component of freshwater culture. Recently, however, over twenty foreign species, most notably the Nile tilapia, have been introduced into Chinese fish culture. Since the 1950s fish culture has spread from the original core areas of the Chang (Yangtze) and Pearl River deltas to virtually all provinces, and even lakes and reservoirs in remote regions and paddy fields in mountainous areas have been increasingly exploited. Nonetheless, output in freshwater fish culture has expanded primarily through the improvement and popularization of modern and traditional technologies rather than by enlarging the area under cultivation.

Before 1960, fish culture depended on fry (immature fish) originating from the natural reproduction of wild stock. The availability of fry increased greatly with the successful development from 1958 to 1960 of techniques for hormonally induced spawning of the four common species of carp. Subsequently, artificial propagation techniques, including induced breeding and hatching and larval breeding, were further developed and introduced for additional varieties of fish. The expansion of fry production by artificial propagation was especially rapid after 1978. By the 1990s most counties had at least one fingerling (fish up to a year in age) farm to supply local fish farmers, many of whom also reared fingerlings in their ponds and rice paddies.

After a period of rapid growth, the industry has encountered serious resource constraints. Already by 1990 average yields (per units of effort) in capture fisheries had dropped to less than 50 percent of 1950s levels. Some traditional species have been overexploited, and increasingly harvests shifted towards juvenile fish and lower-value species. Uncontrolled industrial effluent and domestic discharge have contaminated many lakes, rivers, and coastal areas. Red tides—massive concentrations of microscopic algae that flower and multiply rapidly—have caused serious losses in maricultural production along the South China coast.

The government first formulated a sustainable development strategy for its marine program in 1996. The revised Marine Environmental Protection Law of 2000 seeks to curb marine pollution and to conserve marine resources. Amendments to the 1986 Fishery Law promulgated in 2000 regulate the number of fishing permits and quantity of fish and strive to protect China's rights in its exclusive economic zones while maintaining stable relations with neighboring countries.

Competition over fishing rights and claims to territorial waters and associated marine resources had become a serious security issue in the western Pacific by the 1990s. China's Territorial Sea Law of 1996 claims sovereignty over islands and reefs also claimed by other countries. However, China also ratified the U.N. Convention on the Law of the Sea in 1996 and signed bilateral fisheries agreements with Japan and South Korea in 2000.

FISHING INDUSTRY—JAPAN Japan's fishing industry is divided into four types: coastal fishing, distant-water fishing, aquaculture, and recreational fishing. Coastal fishing of various species has continued since the country's premodern era, whereas distant-water fishing beyond its present exclusive economic zones (EEZ) started around the 1920s and increased dramatically during the food shortage of the immediate post-World War II period. Aquaculture has long been another feature of the Japanese fishing

industry, the oldest form being the farming of seaweed. Japan's recreational fishing industry is probably the largest in volume of sales and most diverse in the world, including everything from charter boat businesses and equipment and bait production and sales, to various fee-based fishing park operations.

The coastal fishing sector has been characterized mainly by small-scale independent boat owners organized into township fishery cooperatives that collectively deal with wholesale fish dealers. Japan's coastal fishing has suffered since the 1970s from both depletion of resources and the lack of successors. In recent years, the removal of trade barriers on fishery products and the reduction of government subsidies to the fishing industry have also forced coastal fishermen to change careers. Japanese trading companies and supermarket chains have bypassed the wholesale dealers, thereby increasingly challenging the hierarchically organized domestic fish distribution networks of the cooperatives.

Since the late 1970s, distant-water fishing has experienced the twin blows of unilateral proclamations by many coastal states of 200-nautical mile fishery zones and the adoption of the EEZ concept in the United Nations Convention on the Law of the Sea (UNCLOS) in 1982. Coastal states' extended control over fishery resources in adjacent seas reduced Japan's free access to distant-water fish stocks.

UNCLOS also laid the legal foundations for the management of anadromous species (species that travel between fresh water and sea, such as salmon). Jurisdiction for the management of such species was given to the coastal states in whose rivers such species originated. Japan's offshore salmon fishing ceased as negotiations with the then Soviet Union failed. Highly migratory species (such as tuna) were placed under joint management by coastal states, which resulted in the imposition of international catch quotas and regulations on tuna fishing practices. Japan is a member of all such international tuna management bodies. According to the *GGT Newsletter* of 25 March 1999, the number of Japanese tuna boats declined from about 1150 in 1980 to 661 in 1997.

Japan's major fishing companies have transformed themselves into trading companies dealing in fishery products and have invested in the fishing industries of other countries. The high costs of operating Japan-based ships contributed to this trend. Retired tuna boats have been sold to owners in other countries, who in turn have registered their boats in countries such as Taiwan and Korea that do not belong to the international management bodies. The "flag-of-convenience"

Two sea bass fishing boats in Tokyo Bay in 1994. (MICHAEL S. YAMASHITA/CORBIS)

fishing operations by these boat owners continue to supply tuna to the Japanese market through the trading companies. Japan's Fishery Agency and the Fishery Division of the Ministry of Foreign Affairs consider access to distant-water fishery resources a matter of national security, and work jointly to defend the sustainable use of fishery resources in international waters against both unmanaged "pirate" fishing and dogmatic conservationists.

The declining coastal fishing industry is being replaced by aquaculture. Japan has a long history of aquaculture, from the farming of seaweed, pearl, and carp to more modern fish farming of yellowtail, snapper, jack mackerel, flat fish, and eel. In addition, coastal waters have been stocked with farm-raised juvenile snapper, flat fish, crayfish, abalone, and other species, to be later harvested. This has created conflicts between professional and recreational fishermen, the latter being accused of stealing and free riding. The aquaculture industry has suffered from the growth of toxic planktons and algae caused by nutrient-rich household wastewater. The industry has also been accused of destroying reef ecosystems with organic wastes from fish feed. Consumers are increasingly alarmed by the industry's use of antibiotics in fish feed.

The recreational fishing industry is growing fast. While recreational fishing in general has been considered an activity for older males, several developments have gradually altered this perception. American bass

fishing using artificial lures has become popular with a large number of younger Japanese, and increasing social independence and disposable income have contributed to the rising numbers of women in recreational fishing. Charter boat businesses provide exclusive charter, casual booking, and nonbooked individual services, targeting various species of fish. Operators of such businesses have joined environmentalists in opposing various land reclamation projects.

Japanese-made fishing equipment enjoys worldwide popularity. Computer-based high technology (using computer-assisted design techniques as well as microcomputers in fishing reels) and basic composite material are lavishly applied to reels and rods, and countless minor fishing devices have been patented.

Japan's fishing industry, like many other industries, is going through a major transformation to achieve higher added value. The era of fishing as a primary and commodity industry is passing, and the growing industrial aquaculture, manufacture of recreational fishing gear, and fishing-related services characterize the diversifying Japanese fishing industry.

FISHING INDUSTRY—KOREA Korea is among the world's leading fishing countries (sixth in 1995 in terms of gross registered tonnage). Of the many varieties caught, the major ones by tonnage are squid, saury pike, Alaska pollack, shrimp, yellow corvina, sabre fish, mackerel, and anchovy.

Fishing was regarded as a plebeian business during the Yi (Choson) dynasty (1392–1910). Under the Japanese occupation, fishing in Korea started its modernization process, which was made possible by more modern ships, equipment, and technology. The industry was devastated by the Korean War (1950–1953) but has recovered rapidly. Over the long term, the rise in the catch has been closely matched by the tonnage of the fishing fleet, which increased from 262,079 tons in 1967 to 991,955 tons in 1999. During the 1990s the number of fishery workers dropped slightly, from 176,123 in 1995 to 170,590 in 1999, whereas the number of fishing vessels rose in the same period from 76,801 to 94,852. Nonmotorized vessels constituted only 6 percent of the total number in 1999. Of 535 Korean-registered deep-sea fishing vessels, approximately 65 percent were more than sixteen years old in 1999.

Increases in wages and reduced fishing territories created significant problems after the mid-1980s. For example, Korea's deep-sea catch reached a peak in the mid-1970s and then declined sharply due to rising fuel costs and the declaration of 200-mile economic sea zones by many nations. The total production has gone down considerably during the 1990s, from 3,348,184 metric tons in 1995 to 2,190,450 in 1999. Also contributing to this decline are the serious ecological problems affecting the coastal fishing industry and inland

THE SOCIAL ROLE OF FISHING

A major economic activity, fishing also plays a major role in the social interaction in Korean fishing communities. The account below shows how these social responsibilities can be more important than the economic issues.

Fish are an important medium of exchange in many social transactions within the village. "Gifts" of fish expressing the fulfillment of various obligations or an attempt to gain favors are frequent. Sokyp'o fishermen resort to considerable subterfuge in order to safeguard this traditional outlet for their catch from the demands of buyers. On four occasions I spent the entire day out fishing, each time on a different sailing junk. In three cases the boat owner put more than half of the choicest fish in a relatively inaccessible compartment on top of which lines and other heavy gear were piled as we approached the beach. Then when the buyer (or buyers) came scrambling aboard, the owner and crew, bewailing their small catch, showed them only the remainder of the fish that had actually been caught. Not until the dealers had been ferried off to the other shore were the rest brought out. Some were divided among the crew, and I was always given one. The rest was either distributed on the spot to villagers who had been alerted by some mysterious communications network that I never understood, or they were delivered by members of the boat owner's family directly to certain houses. Invariably the supply seemed insufficient to satisfy the demand.

waters that Korea currently experiences as the result of land reclamation projects, industrial water effluents, and waste disposal. The ecosystem surrounding the Republic of Korea is very vulnerable to the coastal activities of adjacent nations. The primary sources of sea-based pollution of the marine environment are oil spills, aquaculture, and dredging. The decline mentioned above encompasses distant waters fisheries, adjacent waters fisheries, shallow-sea cultures, and especially inland waters fisheries. The production of aquaculture from inland waters, for example, dropped

from 20,365 metric tons in 1995 to 11,529 in 1999—that is to say, more than 40 percent. Korea's share in the world's commercial catches of fish, crustaceans, and mollusks dropped from 2.54 percent in 1993 to 2.07 percent in 1999.

The fishing industry remains an important source of revenue. Exports of fish and other seafood stayed stable in the 1990s, whereas imports went up sharply. To a great extent the future of the fishing industry depends upon Korea's success in negotiating fishing rights with other nations and improving processing methods.

FISHING INDUSTRY—SOUTHEAST ASIA

Many Southeast Asian countries have extensive coastlines and river systems. Hence, commercial, local-market, and subsistence fishing have long been important economic activities. The region's total catch was estimated at nearly 86 million metric tons in the

1980s; Indonesia alone accounted for 2.8 percent of the world's total fish production, followed by Thailand (2.5 percent) and the Philippines (2.2 percent).

Southeast Asian waters are believed to be home to more different fish species than any other part of the world. Most of these live in shallow water, and because the coastlines in much of this region are fringed by wetlands, the fishing industry continues inland—in swamps, flooded rice fields and their canals, lakes, lagoons, and rivers. Until the 1960s, nearly three-quarters of Southeast Asian sea fishing was done at depths of less than 3 meters. Deepwater fish in Southeast Asia were only exploited commercially by Japanese trawlers; local fishermen were usually too poor to equip themselves for deepwater trips.

Among the most important commercial fish are anchovy, shrimp, and tuna. The primary tuna fishing grounds are found in the Pacific Ocean east of the Philippines and north of the eastern islands of Indonesia; anchovy fishing grounds are primarily found in the Celebes Sea; shrimp fishing grounds are in the shallow waters of the South China Sea extending into the Gulf of Thailand. In common with fisheries elsewhere, overexploitation is the greatest threat to commercial fisheries in the region. Such overfishing is particularly serious in the Gulf of Thailand and off the coast of peninsular Malaysia.

Fishing boats docked in a lagoon beside the small fishing village of Kuala Paka, Malaysia. (ECOSCENE/CORBIS)

TABLE 1

Marine and freshwater catches and aquaculture						
(in metric tons)						
Country	Average Annual Marine Catch	Average Annual Freshwater Catch	Average Annual Aquaculture 1993–1995			
	1993–1995	1993–1995	Freshwater Fishes	Diadromous Fishes	Marine Fishes	Mollusks and Crustaceans
Indonesia	3,277.5	611.5	292,635	161,268	9,273	139,936
Cambodia	31.8	76.4	7,940	-	-	597

Subsistence fishing is carried out in coastal waters and rivers. It is estimated that 3 million people fish for a living, although that number may be on the conservative side. Much of this catch finds its way to local village markets.

Commercial aquaculture in Southeast Asia has so far been limited, mainly for economic reasons. Such commercial aquaculture has been focused mostly on shrimp ponds and prawn farms in Thailand, Indonesia, the Philippines, and, increasingly, in Vietnam. (See Table 1.) These produce mostly for export to cities, as well as to countries such as the United States and Japan. Southeast Asian countries, however, are far behind industrialized countries in their output for world markets.

A traditional form of aquaculture is still practiced in conjunction with wet rice cultivation in Java, Bali, Thailand, and Vietnam: rice farmers set aside a deep-water area for raising fish, or introduce fish, such as paddy eel, directly into the wet fields. Due to the Green Revolution, when it became common to plant high-yield varieties of rice that required the increased use of pesticides, it became very difficult to continue these traditional aquacultural practices, as the pesticides harmed the fish. In addition, many believe that the heavy exploitation of coastal areas for tourism and the development of other industries is contributing to declining fishing yields and major environmental problems. Both may have a major impact on aquaculture as well as on the region's marine fisheries.

Regional Survey

In Vietnam, investment by the state in the fisheries sector increased fivefold between 1996 and 2000, with additional plans to convert 300,000 hectares of rice

fields into aquaculture breeding farms in an attempt to earn \$3 billion in seafood export revenue over the next four years. This implies a yearly catch of 1.4 million tons, while fish farm stocks could reach 1.5 million tons.

Due to ongoing deforestation in Cambodia, the water quality of Tonle Sap (Cambodia's largest lake) and rivers in some provinces has been affected, and many fish species have been threatened with extinction. Other species are faced with degraded habitats that no longer support spawning and reproduction. This means the potential for fishing is declining in Cambodia.

Commercial fishing in Myanmar is small in scale and takes place in major rivers, as well as off the long Arakan and Tenasserim coasts. Much of the total catch, which amounts to nearly 389 million kilograms a year, is provided by part-time fishermen. Traps are commonly used in standing water and rivers. Farm families may also supplement their diets by fishing with nets or hooks and lines. In 1990, the total catch was 743,818 metric tons, which made Myanmar the twenty-third most productive fishing nation in the world. The catch suggests a per-capita annual consumption of about 17 kilograms, slightly more than in the United States, although a large proportion of this is in the form of a fish paste taken with rice.

As is the case in most Southeast Asian countries, in Indonesia fish remains the single most important source of animal protein. Nearly 75 percent of the catch is taken from marine fisheries off the western coast of Sumatra, the northern coast of Java, and the southern coasts of Kalimantan and Sulawesi, Bali, Nusa Tenggara, the Moluccas, and Irian Jaya. Inland fisheries, however, employ more people. More than 1

million families engage in inland fishing, while fewer than 500,000 families engage in marine fishing. Inland fisheries in Indonesia include open-water fishing in lakes and rivers, as well as the aquacultural cultivation of fish, shrimp, and prawns in freshwater ponds (*kolam*) and bamboo cages placed in streams and rice fields, brackish coastal ponds (*tabak*), and paddy fields. In 1989, Java contributed 44 percent of inland tonnage and 23 percent of marine tonnage. Overfishing in marine waters and a decline in the rate of fish production were sufficiently alarming to lead to a presidential decree banning trawling in marine waters.

Fishing accounts for 5 percent of the gross national product of the Philippine economy and supplies 60 percent of the animal protein in the Filipino diet. The Philippine archipelago has long been known for the availability of a wide variety of fish. Two million metric tons were caught in 1989; of this, inland fishing accounted for about a half million metric tons, and marine fishing the rest. More than half the catch came from subsistence fishing; one-third came from commercial fish ponds. Although production has been steadily increasing over the years, the industry has not been able to cope with the growing demand in the Philippines and the rest of Southeast Asia. Export revenue, mainly from shrimp, tuna, and dried seaweed, amounted to nearly \$500 million in 1990 alone.

FIVE CLASSICS The Five Classics (Wujing) were lengthy collections of prose and poetry that formed the core of the Chinese Confucian canon from the

Western Han dynasty (206 BCE–6 CE) through the Southern Song dynasty (1127–1279), when another collection, the Four Books, began to gain prominence through the influence of Neo-Confucianism. The Five Classics were the following: *Shijing* (Book of Songs; also called Classic of Poetry or Book of Odes), the *Shujing* (Book of Documents), the *Li* (Rites), the *Yijing* (Book of Changes, often known in English under its Wade-Giles romanization: *I-ching*), and the *Chunqiu* (Spring and Autumn Annals). A sixth, the *Yue* (Music), is no longer extant.

Although literate elites in China and elsewhere celebrated the Five Classics as primary expressions of Confucian thought, each of the classics had roots in traditions and practices far older than the era of Confucius (551–479 BCE) himself. The *Shijing* is made up of 305 verse texts of varying length, the earliest dating from the tenth century BCE and the latest from the sixth. Contents range from sacrificial hymns to folk songs. The *Shujing* purported to record key speeches of sage rulers; the earliest chapters dated to the tenth century BCE, and the latest were fourth-century CE forgeries. The *Li*, as codified in three distinct texts (the *Liji* [Record of Rites], the *Yili* [Ceremonies and Rites], and the *Zhouli* [Rites of Zhou]), detailed ritual prescriptions for a range of public events, from governmental entertainments to funerals and mourning, and defended the role of ritual propriety as a tool of social control. The *Yijing*, originally a divination manual constructed around sixty-four hexagrams and associated early Zhou mantic texts, came to include much cosmological and political philosophy in the form of commentaries. The *Chunqiu*, a terse chronicle of the years 722 to 479 BCE, was accompanied by three commentaries containing more extensive historical and exegetical material: the Zuo commentary (*Zuozhuan*) and the commentaries of the Gongyang and Guliang schools (*Gongyangzhuan*, *Guliangzhuan*).

By 136 BCE, when Han Emperor Wu (reigned 141–87 BCE) elevated the five works by appointing official teachers for them at the capital, the texts were strongly associated with Confucius, who was believed to have had edited or written parts of each of them. The Five Classics's canonical status was cemented in later centuries by the frequent appearance of new commentaries and by the court's expectation that most prospective candidates for government office would be able to demonstrate a basic knowledge of the works in their essays for civil service examinations. Confucian courts in Japan, Korea, Vietnam, and elsewhere also promulgated the Five Classics as a basis for moral philosophy and political practice. In contemporary China, debate over the antiquity and importance of

the Five Classics continues to serve as an index of cultural continuity.

FIVE PHASES Zou Yan (c. 305–240 BCE) is traditionally regarded as the systematizer of the philosophy of the yin-yang (bipolar forces of the universe; yin is the dark, passive female force, and yang is the light, active male force) five phases (*wuxing*), namely, wood, fire, earth, metal, and water. Despite the pervasive affect of the five-phases concept on the philosophy of the Han dynasty (206 BCE–220 CE) and on subsequent Chinese science, cosmology, and medicine, little is known of Zou Yan’s teachings.

The *Ying tong* (Responding in Kind) chapter of *Master Lu’s Spring and Autumn Annals* is usually cited as the standard elucidation of Zou’s ideas. In this chapter, the five phases are used to explicate a cos-

mological order to explain historical political change according to the conquest cycle of the five phases. This influenced the justification of the "first emperor" of the Qin dynasty for adopting the symbols of "water" to show he had vanquished the "fire" of the Zhou dynasty (1045–256 BCE). Subsequently, the idea was hotly debated by Han philosophers, some of whom sought to use it to justify Han rule.

The five phases explain the processes of change in terms of conquest and productive cycles. In the conquest cycle, earth is conquered by wood, wood is vanquished by metal, metal is melted by fire, fire is extinguished by water, and water is obstructed by earth—and thus the process continues. In the productive cycle, wood produces fire, fire’s ashes generate earth, earth begets metal, from metal drips water, and water nourishes wood—and thus the cycle continues. The five phases are bound up with the nondual correlative thinking of yin and yang, and they are correlated with the myriad aspects of nature and human experience.

The philosophy and classification system of the five phases left a lasting impression on Chinese science, medicine, and alchemy, on and the art of placement (*feng shui*). Because the five phases are correlated with every aspect of the natural world and human life and are believed to explain and predict change, they became indispensable tools for taxonomy and for un-

THE FIVES PHASES AND THEIR ASSOCIATIONS

In Chinese cosmology, each of the five phases is linked with specific manifestations of different categories of natural phenomenon. Knowledge of these associations is important to diviners who use them in formulas that help them predict and control the future.

Associations	Wood	Fire	Earth	Metal	Water
Seasons	Spring	Summer	Late Summer	Autumn	Winter
Directions	East	South	Center	West	North
Colors	Green	Red	Yellow	White	Black
Tastes	Sour	Bitter	Sweet	Acrid	Salty
Virtues	Benevolence	Wisdom	Faith	Righteousness	Decorum
Disease	Insomnia	Heartache	Stomach	Lungs	Sex Organs

Source: John L. McCreary. (1983) *The Symbolism of Popular Taoist Magic*. Ann Arbor, MI: University Microfilms, 60.

derstanding transformation. Five-phases philosophy is still used in the practice of Chinese medicine and the art of placement. In Chinese medicine, the organs, acupuncture points, and herbs are correlated with the five phases. Thus, a weak heart correlated with the fire phase is treated by administering herbs correlated with fire and stimulating acupuncture points correlated with fire. In placement, the sink should go on the north wall and the stove on the south side of the kitchen, because water is correlated with the North and fire with the South.

FIVE POWER DEFENCE ARRANGEMENTS

The Five Power Defence Arrangements (FPDA), which came into effect 1 November 1971, refer to a collective agreement between Australia, Britain, Singapore, Malaysia, and New Zealand to maintain ongoing consultations and an agreement to consult in the event of external attack against Singapore and Malaysia. A series of exercises evolved from this framework. A tandem arrangement also saw the stationing of ANZUK (Australia, New Zealand, the United Kingdom) forces in Singapore and Malaysia, although in time they were withdrawn. The FPDA replaced the Anglo-Malayan ("Malaysian" from 1963) Defence Agreement (AMDA), which lasted from 1957 to 1971 and contained a far more overt commitment to assist Malaysia and Singapore in the event of a security threat. Thus, forces from Australia, New Zealand, and the United Kingdom had fought, during the Malayan Emergency and *Konfrontasi*, in order to guarantee Malayan/Malaysian and Singaporean security. While the ANZUK forces were gradually withdrawn in phases—Britain by 1976, Australia by 1986, and New Zealand by 1989—FPDA has continued. This loose military alliance has evolved from one that initially intended to give confidence to Malaysia and Singapore to one of interoperability and joint military exercises. By the 1990s major sea and air exercises were held—often involving thirty warships and fifty aircraft in comprehensive exercises including all aspects of land, sea, and air defense and electronic warfare systems (Rolfe 1995: 9).

The FPDA has been criticized by those who view it as a product of either British colonialism or the Cold War, and by those who see it as contrary to greater Southeast Asian multilateralism and self-reliance. Some Indonesian officials and commentators have wondered aloud if the alliance is maintained with Indonesia firmly in mind (Methven 1992:126–130). Malaysia did briefly suspend participation in exercises in the late 1990s, most probably because of bilateral tensions with Singapore, while New Zealand has sometimes scaled back its participation due to budgetary reasons. However, the alliance members seem committed to FPDA, which shows no signs of being shelved. All members seem to view the alliance as useful for the following reasons: (1) all benefit from the utility of defense exercises with historical allies; (2) Malaysia and Singapore have additional assurance; (3) Australia and New Zealand are able to participate in the security of an area seen as important to regional security, as well as being in the last military alliance that includes traditional ally Britain; and (4) Britain is able to continue its presence and influence in Southeast Asia.

FLORES SEA The Flores Sea or Laut Flores, with a surface area of around 240,000 square kilometers (93,000 square miles), is located off the eastern part of the Indonesian archipelago. It is a portion of the western South Pacific Ocean bordered on the south by the Lesser Sunda Islands of Flores and Sumbawa and on the north by the island of Sulawesi (Celebes). Part of Laut Flores is preserved in the Taman Nasional Taka Bonerate, a national park including a series of twenty-one coral atolls that cover a vast area of around 220,000 hectares, the third largest coral atoll network in the world after Maldiva and Kwadifein. Laut Flores is also well known for its beauty and the richness

of its underwater life. It has a greater diversity of submarine life than the other nearby shallow-water sea, the Java Sea (Laut Jawa).

FOLK OPERA—BANGLADESH. See **Jatra**.

FOLKLORE—CENTRAL ASIA Through oral folklore the peoples of Central Asia express their identity in speech and song while renewing and refashioning links with their past. The numerous Central Asian verbal art genres are as diverse as life's varied situations, yet share common features owing to regional cultural contacts and common origins. The forms of folklore expression are intimately tied to language. The Karakalpaks, Kazakhs, Kyrgyz, Turkmen, Uighurs, and Uzbeks all speak Turkic languages and have a shared stock of oral traditions; the Tajiks speak an Iranian language and have distinct traditions, but their Persian cultural heritage has influenced the folklore of their Turkic neighbors, especially the Turkmen, Uighurs, and Uzbeks.

"Oral tradition" refers not only to a body of tales, epics, songs, proverbs, and legends, but also to the ways in which these verbal materials are created and transmitted. Texts are rarely handed down verbatim through the generations; each successive bearer of the tradition, as an active practitioner of oral folk art, recreates an expression by using patterns, styles, and performance situations as traditional as the words themselves. Central Asian peoples have contributed significantly to folklorists' understanding of the worldwide phenomenon of oral composition-in-performance and of oral tradition in general. With the help of various techniques, specialists may even study the oral or oral-derived aspects of written texts hundreds of years old.

Written Records

The oldest records of Central Asian folklore are preserved in a dictionary of the Middle Turkic language, *Diwan Lughat at-Turk*, written around 1075 by Mahmud al-Kashghari. The numerous specimens of popular poetry and songs that Kashghari cited display a range of rhythms, assonances, rhymes, imagery, and word combinations found even today in the oral po-

etry of contemporary Central Asian Turkic peoples. Many of the specimens in the *Diwan Lughat at-Turk* are of heroic poetry, and other records of Turkic folklore from the Middle Ages, such as the *Kitab-i Dede Qorqut* (Book of Grandfather Qorqut), also attest to heroic and epic traditions with links to Central Asian nomadic peoples.

Speakers of a dialect of Persian, the Tajiks carry on Iranian oral traditions known in writings from medieval greater Iran. An early written folklore specimen from the region inhabited by the Tajiks is a partial Arabic translation of a satirical song composed in Balkh in modern Afghanistan in 725 CE. Tajik oral poetry before the twentieth century is discerned mainly through the abundant folk motifs in literary poetry, as in the Persian *Shahname* epic.

The search for national origins, which peaked in Europe in the nineteenth century, stimulated a generation of European and European-trained folklore collectors to study Central Asia, and the work of documenting oral traditions has continued through the czarist and Soviet eras to the present day. Thus there are numerous written records of Central Asian folklore from the last century and a half, including the nineteenth-century collections and translations of Chokan Valikhanov (Kazakh and Kyrgyz), Arminius Vámbéry (Khivan dialect of Uzbek), Wilhelm Radloff (Kazakh, Kyrgyz, and Taranchi), and Abubekir Divaev (Kazakh and Karakalpak). Much early collecting work was done in the name of linguistic investigation.

After 1918 the Soviet government took an active role in preserving certain folk traditions for the sake of their content, and projects to collect folktales, epics, songs, and many other genres went hand in hand with concerted scholarly study and publication. Similar efforts have been carried out among the Uighur, Kazakh, and Kyrgyz populations of the Xinjiang Autonomous Region of China. Today Central Asians themselves are responsible for most of the work being done to document and analyze Central Asian folklore. Western researchers, influenced by theories of verbal art performance, have introduced an emphasis on studying audio and audiovisual recordings of actual folklore events.

Genres and Practitioners

Folklore may be classified into prose and poetic genres. Central Asian legends and tales—folklore in prose—are heard in everyday situations that make up the context of traditional culture. Legends are short narratives in ordinary language about what people believe to be true events of the past, whether mundane

or supernatural. Central Asian legends share material with epic poetry; some feature giants, sprites, and magical feats. Miracles play a prominent part in legends connected with Sufi saints and their shrines. Ethnic groups have legends about their origins, and in some cases these refer to a divine progenitor or an animal such as a dog or doe that suckled the ancestor of the tribe. Numerous Central Asian legends mention local heroes who have a basis in historical fact. One of the oldest of these is Iskandar, or Alexander of Macedon, whose conquests in Bactria and Sogdiana in 329–328 BCE placed part of Central Asia under short-lived Hellenistic dominion.

Tales are stories that the teller and audience know are untrue. Tales about human beings typically have a happy ending. The hero or heroine of a Central Asian tale may be of noble or low birth; if the former, often the character begins poor and in reduced circumstances and only later learns the truth and regains a destined high position. The sovereign (khan or *padishah*) with whom the hero or heroine deals may be good, generous, and a just arbiter, or wicked, greedy, and a jealous antagonist. Some common stories are romantic tales, often about a poor girl who wins her "prince charming" by means of her intelligence or beauty, and animal tales, which usually have a moral lesson. The humorous tales (Tajik and Uzbek *latifa*) of the "wise simpleton" Nasruddin Hoja are enjoyed throughout much of the Islamic world, and Central Asia is no exception. One of the most popular facets of this humble figure is his gift for exposing and subverting the pretensions of the rich, powerful, and vain. The Uzbeks know him as Nasreddin Apendi or Afandi, the Kyrgyz as Apendi, and the Kazakhs as Khoja Nasr. Facetious tales about the deceptive, malicious, and cruel figure *Kose* (Beardless) occur in Uzbek, Kazakh, and Turkmen traditions.

Central Asian folk poetry is sung poetry. Thus, renowned practitioners of this art go by the general terms "singer" (Uzbek *bakhsbi*, Turkmen *bakhsby*, Karakalpak *baqsy*, Kazakh *olengshi* or *zhyrshy*, Kyrgyz *yrchy*, Kazakh and Karakalpak *zhyrau*) or "poet" (Uzbek and Tajik *shoir*). Other terms highlight genre specializations, such as the Turkmen *ozan* (epic bard) or Kyrgyz *manaschy* (singer of the *Manas* epic). Kyrgyz *akyn* means simply a poet, whether literary or oral, but in the context of oral tradition, *akyn* refers to a highly skilled songster who performs with an instrument, usually the lute. Good singers gain fame and enduring reputations, such as the eighteenth-century Kazakh bard Buqar-zhyrau or the Kyrgyz *akyn* Toktogul (1864–1933), who essayed his traditional poetic mastery in the new field of Communist propaganda.

The Central Asian folksinger entertains audiences with a wide variety of poetic genres, including epics, lyrics, complaints, admonitions, didactic verses, even insults and denunciations; in several of the Turkic languages, any improvised song is called *terma* or *terme*. Epic (*dastan*), the art of long narrative poetry (or mixed poetry and prose), is both widespread and diverse in Central Asia and is esteemed as a special repository of the people's identity and culture. Epic singers may perform other genres as well. Kazakh, Karakalpak, and Kyrgyz singers excel at virtuosic song-contests (Kazakh, Karakalpak *aitys*, Kyrgyz *aytysb*) in which two *akyns* match wits in impromptu composition while performing topical songs, with liberal doses of self-praise and jibing at their opponents. Genealogies (Kazakh *shezhere*, Kyrgyz *sanzhyra*) in the form of oral poetry and legends are a feature of the folklore of Central Asian peoples with a nomadic tribal past.

Folk songs are often classified without regard to the professional and specialist performance spheres, in such categories as work, ceremonial, lyrical, and children's genres. Work songs may reflect agricultural or pastoral work or a specific trade. Songs sometimes have ties to a specific socioeconomic group, as in the Tajik *gharibi* genre of plaintive songs about the difficulties of life, sung originally by transient laborers. Professional mourners, usually women, compose and perform long, eulogistic laments at funerals. The Uzbek and Turkmen *yar-yar* (Kazakh *zhar-zhar*) is a sometimes mournful, sometimes playful wedding-lyric sung by the bride, her parents, the groom's friends, and other participants, all linked by a common phrase in the refrains, *yar-yar* or *zhar-zhar* (beloved). Love lyrics are popular. The Tajik and Uzbek *lapar* is a dialogue-song sung by a boy and a girl in a competitive style; the dialogues, sometimes improvised, range from urgent expressions of love to satirical taunting as the singers attempt to outdo each other in witty repartee.

Proverbs, sayings, and riddles are concentrated folk expressions. Their brevity often belies artful structure and profound cultural reference. Proverbs, loosely defined, are distillations of popular wisdom in the form of simple idiomatic sayings or figures of speech ("To pour saltwater over a burn"—Tajik) or observations ("A knife wound will heal; a tongue wound will not heal"—Kazakh) or admonitions ("Don't throw your coat in the fire in annoyance at the fleas"—Karakalpak). Proverbs are highly portable bits of folklore, appearing as embedded elements in lyric and didactic poetry, epics, tales, and many other genres. Central Asian riddles may be no more than a phrase, such as the Kashgari (Uighur) riddle *Isbtin pes attyn igiz* (Lower than a dog, higher than a horse. Answer:

saddle), or they may constitute tiny poems in a symmetrical style, as in this Kashgari example:

<i>Qulagy quiruqynyng qashita,</i>	Its ears on the side of its tail,
<i>Ucheii qosaqynyng tashita (dutar)</i>	Its guts outside its belly (Answer: <i>dutar</i> , a lute with two gut strings)

Poetics

The quantitative meters of Persian oral and literary poetry dominate Tajik folk verse, and Islamized Turkic peoples have used Persian-based verse structures for oral poetry. In quantitative verse, the fundamental linguistic principle used to organize sounds into verse is the length (quantity) of the syllables: a long syllable usually has the same metrical length as two short syllables. The 'arudh system of metrics in Persian literature has had an influence on oral metrics. In turn, two popular literary verse-forms are believed to originate from oral models. The *ghazal*, a lyric miniature somewhat analogous to a sonnet, consists of five to fifteen *beits* (distichs or double lines) in a single rhyme, in which the first line sets the theme of the poem and the final line gives a concluding image or idea. The *ruba'i* is a quatrain of *beits* in an *aaaa* rhyme scheme.

In contrast to the quantitative poetics of Tajik folk poetry, the traditional Iranian meter for epic recitation is syllabic, or organized by the number of syllables in a line. The *Shabname*, *Farhad and Shirin*, and other Tajik epics follow an eleven-syllable verse scheme in rhymed couplets.

Turkic folk verse forms have found particularly rich development in Central Asia. The older Turkic meter is syllabic; this meter is common to the oral poetry of all Central Asian Turkic peoples. In Turkic syllabic poetry the basic poetic form derives from a combination of two fundamental features of Turkic grammar, the "agglutinative" principle of word formation (common to all Turkic languages), where meaning is built by stringing suffixes onto base words; and "vowel harmony," or rules by which the base vowel of a word governs the shape of the vowel in succeeding syllables (these rules are absent in most dialects of Uzbek). In poetic composition these principles of word morphology and phonology produce a class of effects known as rhythmico-syntactic parallelism. Kyrgyz, with clear-cut vowel harmony, affords a rich illustration of these effects in a few lines from the epic *Manas*:

<i>Aryp-darbyp miniship,</i>	Greatly excited, mounting (horses),
------------------------------	-------------------------------------

<i>Aikyryp zholgo kiriship,</i>	Shouting and getting under way,
<i>Toogo chapy toptoshup,</i>	They galloped to the mountains en masse,
<i>Adyrga chapy antalap,</i>	They galloped to the hills in a group,
<i>Boksogo chapy bolunup,</i>	They galloped to the foothills breaking up,
<i>Talaaga chapy dabyrap.</i>	They galloped thunderously to the steppe.

Rhythmico-syntactic parallelism is found in poetic passages as far back as the *Diwan Lughat at-Turk* and subsequently in most oral poetic forms among the Central Asian Turkic peoples. It is also used in proverbs and riddles, as in this Turkmen riddle:

<i>Agbyr baly kakylmaiar</i>	The heavy carpet cannot be shaken;
<i>Kakylsa da dokulmeiar</i>	even if it shakes, they won't fall off
<i>(jildiz)</i>	(Answer: the sky and stars)

In addition to the seven- and eight-syllable lines seen in the examples above, compositions in eleven- and twelve-syllable lines are also common. In the early system, verses were loosely organized with respect to one another. The easygoing feel of the resulting rhythms is exemplified in two Kazakh and Kyrgyz verse-forms named after the gaits of horses: *zhorgo soz* (pacing speech) and *zheldirme* (jog-trot). Strophic structure, or organization of verses into stanzas, was a later development and is found in the folklore of most Central Asian Turkic peoples.

Folklore and Society

People's oral traditions preserve many aspects of their self-images and aspirations. Folklore performers know and exploit this situation by singing and speaking to their specific audiences. For example, a singer performing for a rich and powerful personage may improvise lines alluding to the preeminence of the patron or the patron's ancestors; this may even elicit a material reward from a happy patron. Other audiences may need to be consoled for their lot in life or reminded of their people's proud history or inspired to act for the good of the group.

Because folklore is an ideological phenomenon, Central Asian folklore traditions became the focus of ideological debate and struggles in Soviet society, especially during the 1930s to the 1950s. The Communist Party actively embraced folklore as a means of promoting approved values of the working classes,

such as love of the land and the nation, respect for hard work, and enmity toward religion and the exploitative classes. This emphasis went together with the forcible suppression of other popular traditions, such as religious legends and poetry connected with Sufism. Epic poetry was entwined with the sensitive issue of national identity and tended to espouse religious themes and a positive attitude toward ruling elites. For this reason numerous Central Asian epics were banned by the Soviet authorities around 1951. They were later rehabilitated, but the Soviet period of cultural indoctrination affected Central Asian peoples' views on the nature of folklore in general.

Today Central Asians are taking advantage of national independence and openness to revitalize their folklore traditions. While economic and political transition and globalization create challenges for Central Asians interested in recovering and preserving their cultural memory, folklore traditions may now advance to positions of unprecedented preeminence in society. For example, in 1995 the government of the Kyrgyz Republic recognized the epic *Manas* as the official basis of state ideology, and basic rules of social conduct devised by President Askar Akayev in the name of the hero *Manas* are taught in the schools.

FOOD CRISIS—NORTH KOREA It has been reported that more than 3 million people out of 23 million have died from hunger in North Korea since 1995, the first of two consecutive years during which North Korea suffered floods. The flooding was followed by a serious drought, and the nation was hit by tidal waves in 1997. The succession of misfortunes brought about widespread famine. There have been reports of people surviving by eating the bark of pine trees and grass roots, or by selling items like clothing and furniture to buy food. The condition of the children has been compared to that of the children of Ethiopia during the famines of the mid-1980s. The World Food Program (WFP) continued through 2001 to warn that without food grain aid from outside, the most vulnerable people were still in danger of starvation.

Since North Korean authorities have provided no reliable data on demographics or the nation's criteria

for food rationing, it is difficult to evaluate the food situation in North Korea. According to a report of the North Korean Flood Damage Rehabilitation Committee in March 1998, annual demand for food grain was shown to be as much as 7 million metric tons, while actual production in 1997 was 2.3 million metric tons. However, the Ministry of Unification in South Korea estimates that the north's total demand for grain is 5.5 million metric tons, while grain output was 3.9 million metric tons in 2001. According to these figures, a shortage of 1.6 million metric tons remains. An assessment by the WFP and other U.N. food assistance groups puts North Korea's annual grain demand at 4.8 million metric tons, with 2.9 million metric tons of grain harvested, also leaving a shortage of 1.9 million metric tons in 2000. However, this shortage should be eased by food assistance from the U.N., grain secured through the North Korea's bartering activities, and Chinese relief efforts. While it is hard to judge the accuracy of these figures, the general view is that North Korea suffers a food shortage of 2 million metric tons of grain annually.

Causes of the Food Shortage

The food shortage in North Korea has continued unabated because of the structural deficiencies of its socialist economy, combined with natural disasters and the disappearance of entire markets within the international socialist bloc. North Korea's cooperative farm system reduced farmers' incentive to work and dampened their productivity. Further, the cutting off of North Korea's oil supply, which had been provided largely by the former Soviet Union; a sharp drop in foreign trade; and the collapse of socialist countries, particularly the former Soviet Union, dealt a heavy blow to all sectors of the North Korean economy. Moreover, the government's expansion of farmland to hillside regions through bench-terraced farming was a major factor in the destruction of forestland, which increased the destructive force of the floods. The country's inadequate transportation system also compounded its deepening food crisis by making it difficult to ship food to where it was needed.

As the food crisis has worsened, the North Korean government has tried to minimize its responsibility to supply food grain through the central distribution system. It launched a national campaign, the "Arduous March" (1996–1997), in order to overcome the worsening food crisis. Grain rationing by the central government was curtailed to the minimum level, leaving local authorities and institutions to make up the bulk of the shortage. Although there are regional variations in food shortage due to the regional self-supply system,

food grain rationing by the central government was reduced to 300 grams (half a bowl) per day in most areas of North Korea, except the capital city Pyongyang.

It is not easy to confirm how many people starved to death during the "Arduous March" campaign. Based on interviews with 1,694 North Korean "food refugees" in northeast China, the Buddhist Chapter of the Movement for Mutual Help of Our Nation estimated that 3 million people (27 percent of the entire population of North Korea) died from hunger between August 1995 and March 1998. Before he defected to South Korea, Hwang Jang Yup, the former secretary of international affairs of the North Korean Worker's Party, claimed to have heard from a reliable source that 1.5 million people had starved to death by the end of 1996. The Council on Foreign Relations of the U.S. Congress estimates that the total number of deaths from starvation to date ranges from 1 million to 2 million.

In addition to those who have lost their lives due to food shortages, many people are suffering from malnutrition and a lack of adequate health care. According to a World Vision report of July 1997, out of 547 North Korean children of two years and under in five nursery schools in the cities of P'yongyang, Wonsan, Sariwon, Haeju, and P'yongsan, 85 percent were malnourished and 29 percent were severely malnourished. Although it is hard to forecast how the food crisis is going to be resolved in the near future, there seems no way out without a fundamental reformation of the sluggish economy.

FOOT BINDING A practice that might have originated in the court of a decadent, late-tenth-century emperor with a fetish for small feet, foot binding spread through China from the end of the eleventh century and was a common practice by the time of the Ming dynasty (1368–1644). Girls between the ages of five and seven years were subjected to the practice, in which their toes and heels were bound together with tight bandages, so that their feet would ideally be about eight centimeters long. Originally an emblem of femininity and a marker of social status for upper-class

women, foot binding spread to lower-class women, for whom the possession of feet resembling "golden lotuses" represented opportunities for upward mobility in the marriage and service markets.

By keeping women largely confined to inner chambers (since it was difficult to walk any distance with bound feet), foot binding maintained the chaste roles prescribed for women by Neo-Confucianism, yet at the same time turned them into objects of erotic desire. Foot binding thus became a symbol for feminine beauty, social and sexual hierarchy, and Confucian morality.

By the early twentieth century Chinese reformers campaigned against foot binding and saw it as a source of national shame and weakness. For the reformers, foot binding symbolized China's vulnerability to Western imperialism, as it left a large portion of the population capable only of hobbling. Natural feet became the sign of feminine beauty. The anti-foot binding efforts of Chinese natural-foot societies and Western women and Christian missionaries living in China—combined with the fierce criticism of the May Fourth intellectuals (who favored the adoption of Western science and philosophy for the strengthening of China) and laws prohibiting foot binding and rewarding those who turned in women's binding cloths and lotus shoes—brought about the demise of the 900-year-old custom by the 1920s.

FOREST INDUSTRY—MONGOLIA Forests occupy only 8.1 percent of Mongolia—a total of 17.5 million square hectares. Most forest reserves are pine, birch, and other conifers and are located in the northern uppermost corridor, which borders Siberian Russia. Forests are found mainly in Selenge Aimag (province), but also in the northern provinces of Bulgan, Khubsghul, and Hentii, and even in the Gobi Desert to the south near China. Although small, Mongolian forests provide ecological balance, soil

protection, and water collection. As of 1997, total forest resources were 1.337 billion square meters, with an annual growth rate of 5.6 million square meters.

Mongolia's first forest utilization/preservation law was passed in 1940; from 1970 to 1990, 1.7 million square meters of forest were cut annually; 270,000 hectares of forest were destroyed by fire, and another 70,000 hectares were lost to insects and diseases. At the end of the Socialist era in 1990, there were twenty-three small state-owned wood-processing companies. With the complete privatization of these companies in the past decade, in 2000 there were about fifty shareholding companies, mainly exporting nonprocessed wood to China. This represents about 6 percent of Mongolia's total industrial output. According to the Mongolian Ministry of Nature and Environment, Mongolia's few wood-processing plants have cut down almost half of the national timber resources over the last few decades and, if the pace continues, in seventy years Mongolia will have no forests.

The Mongolian government is concerned about deforestation and believes that the export of nonprocessed wood has an adverse impact on the price of domestic wood products. At the beginning of 1999, the government began limiting nonprocessed wood exports and imposing timber export taxes under the National Program on Forests. Nevertheless, the amount of exported timber in 1999 exceeded the limits set by Ministry of Nature and Environment. The government, to discourage additional logging, imposed a tax of 150,000 tugrik (\$1,500) per cubic meter of export timber. Also, a reforestation plan has been implemented: in 1999, young trees were planted over 6,000 hectares, and projects with foreign export partners are under development. The tax policy on timber has hurt an already-declining local industry. Many workers have lost their jobs, especially in Selenge Province. Wood-processing factories have gone bankrupt because the tax policy on timber has decreased Chinese market demand.

The Mongolian government is promoting development in three areas of the forest industry: (1) production of tincture for medicinal use, powdered vitamins, and oils from conifers and pine resins; (2) production of construction materials, cut board, and tree particle board; and (3) production of furniture and birch floor and construction materials.

FOREST INDUSTRY—SOUTHEAST ASIA

An important source of raw materials and revenues, the forests of Southeast Asia have played a key role in the development of trade and commerce in this region for more than two millennia. Since World War II the forest industry in Southeast Asia has become an increasingly significant player in the international forest-products trade. The effects of many years of overcutting and forest conversion are transforming this sector. Forestry institutions as well as the forest industry are changing as concern for the social and environmental role of forests grows.

Historical Basis

Forest produce, as trade or tribute, has formed the basis of economic and political relationships between neighboring societies in this region since earliest times. Indian, Arab, and Chinese vessels plied southern seas conducting a thriving trade for more than a thousand years before Europeans arrived in Southeast Asia in the late fifteenth century. Historically important trade goods have included spices, aromatics (e.g., sandalwood and aloeswood), medicines, dyes, and decorative woods (e.g., ebony), plus a great variety of gums, resins, fruits, and various wild animals and animal products, all from the forest. Expansion of commerce has been instrumental in the domestication of several forest species, including pepper, cloves, and cinnamon, while products less easily cultivated (e.g., sandalwood) have been pressed to the brink of extinction.

As tropical timber was too heavy and cumbersome to haul long distances, industry tended to establish itself close to the sources, as in the case of teak and shipbuilding. With timber clearly of strategic importance in commercial and military terms, extensive forest clearing for agriculture, construction materials, and fuel in the early 1800s prompted fears of a timber famine and the introduction of "scientific" forest management into first India and later Southeast Asia by midcentury. Well into the twentieth century, however, the so-called "minor," or nontimber, forest products remained a primary source of revenues, and in volume terms nearly 60 percent of total wood removals in Asia ended as fuel.

Development of the Modern Forest Industry

With most countries in Southeast Asia achieving independence soon after World War II, government focus shifted to reconstruction and economic development. Nations looked to their forest reserves to play an important role in providing the resources, both physical and fiscal, for nation building. At the middle of the twentieth century, the area of productive forest

in Asia was about 0.3 hectares per person, approximately the same as Europe. Only about half of this area was accessible. Southeast Asia was generally considered well forested, with Indonesia alone harboring three to four times the forest area of any its neighbors. With extraction costs high, the primary market for tropical wood products was seen to be the richer, industrialized nations.

Technological advances in logging equipment soon brought previously inaccessible forests into production. Led initially by multinational firms, logging contractors advanced through the Philippines, Malaya, Borneo, and Sumatra in the 1960s. Technical and financial aid from bilateral and multilateral development assistance agencies promoted forest-industry development. Enticing foreign investors with low royalty fees, tax holidays, export credits, and tariffs on competing imports, governments promoted the establishment of manufacturing facilities to process rather than export logs. Manufacturers formed industry associations to improve bargaining power in international trade and nations cooperated under the auspices of the Association of Southeast Asian Nations (ASEAN) to develop and share information on economics, silviculture, and other management issues. In 1986 the International Tropical Timber Organization (ITTO) was established to provide a framework for consultation and cooperation between producer and consumer countries on production, trade, and conservation of tropical timber worldwide.

The success of these efforts is seen clearly in the statistics. In 1950 little more than 30 percent of the 93.6 million cubic meters of total wood production in Asia was saw logs, veneer logs, or squared timber. According to the Food and Agriculture Organization's *Yearbook of Forest Products, 1993–1997*, in 1997 Southeast Asia accounted for nearly 41 percent of the 960 million cubic meters of industrial roundwood produced in Asia. A variety of finished products, including furniture, doors, molding, and parquet as well as lumber are produced from tropical hardwoods. Increasingly, industrial roundwood is being processed domestically with greater emphasis on fiber processing, especially for panel products such as particle board. The comparatively higher growth in processed goods indicates significant gains in utilizing raw materials and processing them efficiently. In 1994 Southeast Asia was the Asian leader in the export of sawed wood and wood-based panels. Indonesia remains the clear leader in absolute volume of roundwood produced, with 1997 output of 201.6 million cubic meters at approximately seventy times 1950 levels and more than four times that of any of its neighbors, according to the *Yearbook of*

Forest Products, 1993–1997. The financial crisis beginning in late 1997 severely affected tropical timber trade. Although the weakened Southeast Asian currencies made Southeast Asian timber more competitive, the industry suffered sharp declines in prices—some as much as 50 percent—for logs, sawed wood, and plywood. Global trade in wood pulp fell as well in 1998, reflecting the sharp drop in demand from East and Southeast Asia as well as global oversupply.

The Negative Impact of Industrial Development

The development of Southeast Asia's forest industry has not been an unqualified success. There have been both environmental and social consequences. Low stumpage fees have led to wasteful use of timber, and badly designed timber contracts have undermined sound forest management. Degradation of residual forests has resulted from unregulated harvesting and deliberate fires, as well as from the normal insect, pest, and disease problems. Subsidized factory installation has resulted in excess capacity and poor profitability for some products and inadequate investment in research has handicapped forestry vis-à-vis competing enterprises including plantation crops such as oil palm. Poor coordination of the broad spectrum of government policies has led to conflicts among the various sectors of the forest-products industry, and loss of forest land to often less productive uses. Logging bans instituted to protect forest often shift the burden of demand to neighboring countries where unstable political conditions or economic needs are conducive to overcutting. For example, Thailand's ban on logging teak resulted in increased cutting of teak in Cambodia, Laos, and Myanmar. At home these laws may actually accelerate forest destruction, because they have the effect of devaluing it (since it can no longer be regarded as a source of income).

From a socioeconomic perspective forest industry development in most instances has failed to produce the desired multiplier effects. Rather than training local people, contractors have brought in guest workers to operate the new technology, thus reducing benefits to local communities. Forests traditionally used by local communities to provide a myriad of useful and commercial products were assigned to logging companies who so badly mangled these areas that they became virtually useless and the target for illegal wood cutting and land clearing. Ignoring local community needs has resulted in social conflict detrimental to all. Swidden (slash-and-burn) agriculture, long decried as a threat to forests, reflects the failure of government development policies to deal effectively with a growing rural population. Reorientation of forest adminis-

A boat pulls logs on the Chao Phraya River to Bangkok, Thailand, in 1996. (JAMES MARSHALL/CORBIS)

trations to incorporate local community interests in forest planning and management, a process begun in the 1980s, still has far to go.

Prospects for the Future

Southeast Asia contains approximately 8.4 percent of the world's population. Rapid rates of economic growth, rising incomes, and rising expectations throughout Asia will mean continued strong demand for forest products. China's imports of tropical logs between 1996 and 1998 grew nearly as much as Japan's imports fell between 1997 and 1998. Although tropical-hardwood log and sawed-wood production fell worldwide in 2000, veneer and plywood production increased, led by Malaysia and Indonesia respectively. Malaysia supplied nearly half of the world's tropical log exports for 2000. The gap between recorded exports and imports in 2000 amounted to 3.6 million cubic meters, three times the level in the previous year, reflecting the rising rate of illegal logging in Southeast Asia, especially Indonesia. Thailand contributed

significantly to the increase in sawed-wood exports in 2000, while Indonesia and Malaysia together provided more than 90 percent of the tropical plywood exports. Exports of finished or secondary processed wood products rebounded in 1999, led by exports from Indonesia, Malaysia, and Thailand. Although Japan retains first position as tropical plywood importer, China, now the leading importer of tropical logs, sawed wood, and veneer, the majority of which come from Southeast Asia, is likely to remain the strongest influence on the Southeast Asian forest products market for the foreseeable future (ITTO 2000, Table 2, pp. 115–118).

Southeast Asia contains 65 percent of Asia's remaining tropical forest and is one of richest areas of biological diversity in the world: Indonesia alone is estimated to have a greater variety of animal life than all of Africa. Over the past two decades concern over the fate of tropical forest has transformed it into a global resource. As forests in Southeast Asia are being lost at an estimated rate of 1.5 percent of forest area annually—and more than that in some areas—the services or nontangible benefits derived from forests, such as watershed protection, recreation, preservation of cultural heritage and biological diversity, habitat protection, and climate mitigation (carbon sequestration) are becoming of increasing interest and are expected to play a more important role in shaping future development of the forest industry.

The wave of new wood supplies—largely from plantations in New Zealand, Australia, and Chile—projected to enter Asia-Pacific markets by 2005, possibly meeting 10 to 15 percent of regional demand, will undoubtedly affect the world supply-demand balance. By some estimates this resource could meet some 70 percent of the world's present needs for industrial wood. The implications for industry are significant. The present market for timber and pulpwood-based products is already fiercely competitive; if estimates are correct, from about 2005 onward the tropical timber industry will face an oversupplied and even more intensively competitive market. We may well see production shift to specialty and decorative timbers and nontimber forest products.

With large-diameter logs of the old-growth, natural forests being replaced by smaller materials and plantation output, we are seeing a fundamental change that should affect all levels of the industry. Consumer demands for "certified" wood produced in a sustainable, environmentally friendly system will push up production costs and prices. Greater materials recovery, utilization of more species, and genetically improved stock should mean enhanced productivity per unit area of managed forest.

With the devolution of forest administration to local authorities in many countries in the region, there will be a trend toward community forest management, in which case we may find an increasing number of small-scale sawmills harvesting and preprocessing logs, such as are now seen in Indonesia.

Policy makers struggle with pleas for favoritism from this historically protected sector. Although a significant foreign-exchange earner for many countries (and source of political support for many in this region), the industry is often laced with corruption and is a poor environmental citizen. Issues that governments must deal with include devolution of authority; decentralization and participatory management; recognition of historical claims, traditional-use rights, and indigenous knowledge in the context of changing national priorities; and increasing competition in the global marketplace; as well as an increasing list of international commitments, economic and environmental. The demand for wood products, whose beauty and mechanical and structural qualities are broadly appreciated worldwide, will undoubtedly endure. For the forestry industry the essential challenge remains how to balance the demand for raw materials with the need to preserve and conserve forest areas.

FORSTER, E. M. (1879–1970), British novelist and essayist. A prolific British writer of the twentieth century, Edward Morgan Forster was born in London on New Year's Eve in 1879 to Morgan and Alice Forster. His father died when Forster was near two years old, and his mother raised him. Educated at Tonbridge School and Kings College, Forster had been to Italy, Greece, Germany, the United States, Egypt, and India. He began his literary career with short stories, which he published in *Independent Review*, a literary journal that Forster along with Lowes Dickinson (1862–1932) started in 1903. Forster wrote his first novel, *Where Angels Fear to Tread*, in 1905 and the autobiographical work *The Longest Journey* two years afterwards. *A Room with A View* (1908), *Howards End* (1910), and *A Passage to India* (1924) brought him literary fame. *Maurice*, dealing with homosexuality, was published posthumously in 1971.

Forster's most famous novel, *A Passage to India*, was viewed as an indictment of British colonial rule in India and played an important part in molding Western perceptions of Britain's presence there. Published in 1924, *A Passage to India* is a discourse on the British Raj with a liberal-humanist touch, portraying cross-cultural friendship. Forster has been accused by some critics for succumbing to "Orientalism," the term generally associated with the study of non-Western culture by scholars from the West and their motivations. Although Forster writes about the failure of British rule in India, he also shares certain myths concerning Indian culture and people, which were hallmarks of the "Orientalists" of the nineteenth century.

FOUR BOOKS Zhu Xi (1130–1200 CE), the great synthesizer of neo-Confucianism, was an innovator in

standardizing educational methods by compiling what came to be known as the Four Books. Before Zhu Xi, Confucian education focused on the Five Classics, that is, the books of *History*, *Poetry*, *Changes*, *Rites*, and the *Spring and Autumn Annals*, supplemented by the *Analects*, *Mencius*, *Xunzi*, Dong Zhongshu's (179–104 BCE) *Chunqiu fanlu*, and such other texts as the *Classic on Filial Piety* and *Ceremonies and Rites (Yili)*. Zhu Xi streamlined the educational process with the Four Books, namely, the *Analects*, *Mencius*, *Great Learning (Daxue)*, and *Centrality and Commonality (Zhongyong)*, often rendered as the *Doctrine of the Mean*. The latter two were extracted from the book of *Rites*.

Zhu Xi wrote special commentaries on these four books, reinterpreting their contents in the light of his syncretic approach, and used them as the basis of his moral, social, and political philosophy. His innovation had a lasting impact on Confucian education and Chinese bureaucracy, in that the Four Books were used as the basis of the civil-service examinations from 1313 to 1905. By emphasizing the Four Books, Zhu Xi removed many Buddhist and Taoist tendencies from neo-Confucianism. It is not an overstatement to claim that the Four Books influenced Chinese culture more than any other classics during the last six hundred years of the dynastic period.

The *Analects* contains the teachings of Confucius, which advocate moral self-cultivation and rulership based on virtue. The *Mencius* describes the teachings of Mencius, which expand Confucius's ideas, emphasizing the inner quality of the virtues and advocating humanitarian rulership. The *Great Learning* explicates the chain reaction that begins with the "investigation of things," initiating a process of moral cultivation that regulates the family and brings order to the state and ultimately peace on earth. *Centrality and Commonality* is usually mistakenly translated as the *Doctrine of the Mean*, which wrongly implies that it is similar to Aristotle's Golden Mean or the Buddha's Middle Way. Whereas Aristotle sought a balance between extremes and the Buddha proposed a way to extinguish extremes, the Confucian concept of "centrality" is defined as the natural condition "before the feelings of pleasure, anger, sorrow, and joy come forth."

FRANCO-VIET MINH WAR The Franco-Viet Minh War (1946–1954) began following skirmishes between French and Viet Minh (Vietnamese Liberation League) troops in Haiphong and Hanoi. The war lasted eight years and marked the end of French colonial rule in Indochina (Vietnam, Cambodia, and Laos).

Background

Although the war began in 1946, the conflict between France and Vietnam can be traced back to 1885, when France colonized Vietnam and divided it into three separate administrative areas: Cochin China, Annam, and Tonkin. Vietnamese resistance to French colonial rule was immediate and constant. In 1930 the Vietnamese independence movement reached a decisive turn, when Ho Chi Minh (1890–1969) helped create the Vietnamese Communist Party. The party later changed its name to the Indochinese Communist Party in order to include Laos and Cambodia. The party provided an organizational framework for obtaining independence from France. In 1941, at the suggestion of Ho Chi Minh, the Viet Minh was formed. This was a Communist-led and -dominated alliance of various nationalist groups, Communists and non-Communists alike. Viet Minh strategy called for a struggle for independence on both military and non-military fronts. In 1944 the Viet Minh created its first armed units while also sending some of its members into the Vietnamese countryside to politically "educate" the general population. Most of the Viet Minh's activities were restricted to Vietnam's northern and central areas (Tonkin and Annam), but Viet Minh

units also operated in the southern area (Cochin China). By 1945 the Viet Minh had made significant headway in securing the northern part of Vietnam, and it prepared itself to fill the power vacuum that would follow the end of World War II. Following Japan's unconditional surrender in August 1945, Ho Chi Minh and the Viet Minh mounted a general insurrection (the August Revolution), and on 28 August 1945 Viet Minh general Vo Nguyen Giap and his troops marched into Hanoi. By 2 September Ho Chi Minh had formed his administration and proclaimed the Democratic Republic of Vietnam.

In Paris, one of the postwar aims of the French government was to reestablish a measure of colonial rule in Indochina. The first obstacle was to remove the defeated Japanese troops from Vietnam. An agreement between France and her allies in July 1945 at the Potsdam Conference called on China's nationalist army to supervise the departure of Japanese troops in Tonkin and Annam. In Cochin China, this task was given to British troops. Although Britain's military had been ordered not to allow France to reclaim sovereignty in Vietnam, French troops previously arrested by the Japanese were armed and used to police the area. By October 1945 more French troops poured into Cochin China from France, commanded by General Jacques LeClerc. On 8 February 1946 French troops arrived in Tonkin. On 25 March 1946 French admiral Georges Thierry D'Argenlieu established an autonomous French-ruled republic in Cochin China.

There were numerous French and Viet Minh attempts to negotiate a political settlement. Viet Minh and French representatives met in Dalat, Vietnam, in April and May 1946, but negotiations failed. The two parties were unable to agree to a definition of Vietnamese independence. In addition, no resolution was reached to the problem posed by France's creation of a separate republic in Cochin China. Negotiations failed also at the Fontainebleau Conference of July and August 1946. As in Dalat, an obstacle at Fontainebleau was the question of Vietnamese integrity, of reuniting Tonkin, Annam, and Cochin China into one nation.

The Conflict Heats Up

By the fall of 1946, the autonomous republic established by France in Cochin China had failed. Viet Minh guerrillas had made their way into Cochin China, and the French high command in Vietnam now decided it needed to retake Tonkin and defeat the Viet Minh in order to maintain the colony. On 23 November the French navy bombed the port of Haiphong, killing thousands of Vietnamese. French troops were able to retake the northern port city of

VICTORY AT DIEN BIEN PHU

In the excerpt below, General Vo Nguyen Giap describes the Vietnamese effort that led to victory at Dien Bien Phu in 1954.

Truck convoys valiantly crossed streams, mountains and forests; drivers spent scores of sleepless nights in defiance of difficulties and dangers, to bring food and ammunition to the front. . . .

Thousands of bicycles from the towns also carried food and munitions to the front. Hundreds of sampans of all sizes, hundreds of thousands of bamboo rafts crossed rapids and cascades to supply the front.

Convoys of pack-horses from the Meo highlands or the provinces headed for the front. Day and night, hundreds and thousands of porters and young volunteers crossed passes and forded rivers in spite of enemy planes and delayed-action bombs.

Near the firing line supply operations had to be carried out uninterruptedly and in the shortest possible time. Cooking, medical work, transport, etc., was carried out right in the trenches, under enemy bombing and cross-fire.

Such was the situation at Dien Bien Phu. . . . Never had so many young Vietnamese travelled so far and become acquainted with so many distant regions of the country. From the plains to the mountains, on roads and jungle trails, on rivers and streams—everywhere there was the same animation.

Source: General Vo Nguyen Giap. (1962) *People's War—People's Army*. New York: Praeger: 183–184.

Haiphong and then the northern city of Lang Son. On 19 December Viet Minh troops mounted an attack in Hanoi, killing thousands of French residents there, and officially declared war on France.

The Viet Minh strategy of political mobilization had been effective. In March of 1945 there were approximately 1,000 Viet Minh armed soldiers, but they numbered an estimated 50,000 by the end of 1945, and 100,000 by the end of 1946. In addition to its regular army, the Viet Minh could count on guerrilla and regional and local self-defense forces throughout Tonkin, Annam, and parts of Cochin China. As for the French high command, in 1946 it could count on approximately 67,000 soldiers. Although French forces were able to retake Hanoi shortly after the 19 December Viet Minh insurrection, General Giap and his troops retreated to the northern countryside (the Viet Bac) and enjoyed the support of an estimated

800,000 members of the general Vietnamese population. In the hills of the Viet Bac, the Viet Minh leadership prepared for a prolonged war against France.

China's Role

The war took a decisive turn in 1949 after Mao Zedong's Communist forces won China's protracted civil war. From this point, what had been primarily a colonial war now also became an international Cold War conflict. Once in power, Mao's government soon officially recognized the Democratic Republic of Vietnam. The Soviet Union and the Eastern Bloc countries quickly followed suit. On 1 April 1950 a Sino-Viet Minh aid agreement was reached, and Chinese military matériel and advisers poured into the Viet Bac. Mao's military also contributed by training Viet Minh soldiers in China. Meanwhile, France received substantial financial aid from the United States.

It is estimated that by 1952, 40 percent of France's war effort in Vietnam was funded by the United States.

Chinese aid allowed the Viet Minh to change tactics, and the Viet Minh was able, for the first time, to engage in a direct attack, successfully overrunning a French military post at Pho Lu. In addition, Ho Chi Minh increased the size of the Viet Minh by declaring in May 1950 that all Vietnamese males in Tonkin and Annam between the ages of sixteen and fifty would be conscripted.

In early 1953 General Henri Navarre became commander of French forces in Indochina. Navarre's strategy was first to attack Viet Minh strongholds along the Red River delta in Tonkin. Rather than face French units head on, Giap's troops retreated to the hills. Viet Minh units focused instead on the northwest area of Tonkin and on the Lao border. Navarre decided that in order to counter this Viet Minh initiative, French troops needed to secure and hold a base in the area. He chose Dien Bien Phu, believing that the surrounding mountains made the area impenetrable. Navarre had underestimated the Viet Minh. By November 1953 French paratroopers controlled the garrison, but over the course of the winter, Giap's forces surrounded the area. The Viet Minh managed to position approximately fifty thousand soldiers around the French garrison, while hundreds of thousands of Vietnamese civilians helped by building roads and transporting food and equipment into the mountains.

Viet Minh forces, now known as the People's Army of Vietnam (PAVN), began their attack on Dien Bien Phu on 13 March 1954. They managed to damage the airfield, crippling French supply lines. Their siege of Dien Bien Phu lasted almost two months. French supplies ran out, and PAVN forces dug trenches in order to approach the French garrison. On 7 May 1954 the PAVN, in a horrendous battle, took Dien Bien Phu. An estimated 8,000 Viet Minh soldiers were killed. On the French side, an estimated 2,200 were killed. The fall of Dien Bien Phu was a serious setback for France and resulted in its permanent withdrawal from Indochina. The terms of withdrawal, the Geneva Accords, were drawn up between 8 May and 21 July 1954.

FRENCH EAST INDIA COMPANY Although originally established by a charter that King Henry IV granted in 1604, the French East India Company lacked funds and soon went out of business. In 1664, however, Jean-Baptiste Colbert (1619–1683), the finance minister of Louis XIV, infused new spirit into the company through state funding and the granting of trade monopolies. He also equipped the company with guns and soldiers, so that it could compete with the Dutch and British East India Companies for raw materials and markets in Asia and Africa. To encourage French merchants and aristocrats to support the company, Louis XIV himself started investing in it and gave it his royal patronage. In 1674, headed by François Martin, the company established its headquarters in South India at Pondicherry and set up subsidiary factories at Surat north of Mumbai (Bombay) and at Chandernagar near Calcutta and the Hughli River. In 1722 the company brought the islands of Mauritius and Bourbon in the Indian Ocean under its military control.

The French East India Company gained further military and financial strength in 1742 under Joseph-François Dupleix (1697–1763), the French governor-general of Pondicherry. Dupleix easily captured Madras on the southeast Indian coast in 1746. When challenged by Anwar-ud-Din, the ruler of Carnatic in southern India, for the possession of Madras, Dupleix led 230 French soldiers supported by 700 Indian sepoys (soldiers) to victory over a 10,000-man Indian army and gained control of Carnatic.

With such easy conquests Dupleix came to believe that India was ripe for French imperialism, and he became a de facto ruler in the south of India. To secure the French East India Company's position against the British East India Company, Dupleix acted as a king-maker by aiding pro-French and anti-British Indian rulers. He also interfered in the dynastic problems of contending Indian rulers. When in 1748 the old Nizam (ruler) of Hyderabad died, Dupleix placed his own nominee on the throne against the Nizam's wishes. In the ensuing war Dupleix's French forces defeated the army of Nizam's nominee, whom the British favored. In 1754, however, the British East India Company, under Robert Clive (1725–1774), defeated the French forces of Dupleix, and Dupleix was recalled to France.

Dupleix had gained an enormous knowledge of India. But his expensive warfare against Indian rulers, and the Seven Years' War (1756–1763) between

France and England, led to the company's bankruptcy and ultimately to its complete collapse during the French Revolution in 1789.

FRETILIN Fretilin is an acronym derived from the Portuguese Frente Revolucionária do Timor Leste Independente (the Revolutionary Front for an Independent East Timor). It is the most important political movement in East Timor and enjoys strong support from the local population.

Fretilin was founded on 20 May 1974 in Dili, East Timor, in the wake of the revolutionary armed forces movement in Lisbon, which advocated that Portugal grant independence to its overseas possessions. Established by a seminary-trained elite of intellectuals and civil servants, Fretilin's program called for immediate participation of Timorese in government, an end to racial discrimination, and an offensive against corruption.

Together with the Timorese Democratic Union (UDT) it campaigned for independence from Portugal, but Fretilin's more radical stand attracted a growing number of politicized East Timorese. The radical rhetoric alarmed the leadership of neighboring Indonesia, which governed the western part of Timor. After fighting between Indonesian-sponsored groups and Fretilin ended in 1975 and negotiations failed, Fretilin declared a unilateral independence for East Timor on 28 November 1975.

Following a brutal invasion by Indonesia and East Timor's formal integration into Indonesia on 17 July 1976, Fretilin carried out a sporadic insurgency throughout the 1980s. In 1992 the commander of the Fretilin Armed Forces (Falintil), José "Xanana" Gusmão, was captured and imprisoned in Jakarta. Represented by an observer at the United Nations, which had refused to recognize the annexation of East Timor by Indonesia, Fretilin refrained from retribution against Indonesian troops during the U.N.-sponsored consultation on the future of East Timor in August 1999.

FU BAOSHI (1904–1965), Chinese painter. Fu Baoshi was one of the most influential figures in early-twentieth-century Chinese painting. Born into an impoverished family in Nanchang, Jiangxi, Fu studied art history and sculpture at the prestigious Tokyo Academy of Fine Arts from 1933–1935. Upon his return to China, Fu developed his own distinctive painting style, integrating his studies in Western, Japanese, and Chinese painting. Although most famous as a figure painter, Fu also excelled at landscape painting. He composed his landscapes out of free interweaving broken ink brushstrokes and light washes rather than traditional calligraphic lines. His works are remarkable for their poetic eloquence and mood, and they emphasize a personal response to nature, rather than the physical appearance of the landscape. Fu was also one of the first historians of Chinese painting. His famous works include "Such Is the Beauty of Our Mountains and Streams," the large officially commissioned wall painting in the Great Hall of the People in Beijing, jointly painted by Fu and Guan Shanyue in 1959.

FUGU Fugu is a globefish or blowfish from the family *tetraodontidae*. When these fish swell up, they puff their bodies into a nearly square shape. They are cultivated in cages in the sea off the coast of Japan, where they are a delicacy in the Japanese diet, cited in early records of cuisine. Part of the attraction is that the fugu contains a deadly poison. Since the Meiji Period (1868–1912), prohibitions and restrictions limit its sale, and only licensed chefs can prepare this fish as it is necessary to remove the ovaries and liver wherein the poison resides. A lethal dose, one milligram, can fit on a pinhead, and one typical mature fugu contains thirty times that amount. The poison acts by blocking sodium channels in nerve tissues, paralyzing muscles and causing eventual respiratory arrest. No antidote exists, but fisherman lore says that

burying the victim up to his or her head with sand will reverse the poison's course.

In spite of this hazard, connoisseurs enjoy fugu prepared as sashimi. It is a white fish, usually sliced in paper-thin translucent wafers and eaten in soups or arranged on a platter in the shape of a flying crane, the symbol of longevity. It is frequently served with *ponzu*, a mixture of citrus juice and soy sauce. Some daring (or foolhardy) gourmands like to include a tiny dot of the liver as they eat it, savoring the "high" of the numbness just short of dangerous ingestion—though no licensed chef would prepare it this way.

Winter is the best time to eat fugu, when its flavor is most delicate. The price is the highest between October and March. A fugu meal at a good restaurant will cost about \$200. In Shimonoseki, known as "fugu city," 80 percent of Japan's fugu catch is sold and a fisherman can make up to \$100,000 in an hour's auction. The sales rates of fugu, which decline in times of recession, are said to be an indicator of the economic climate.

FUJI, MOUNT Mount Fuji rises on the border of the Shizuoka and Yamanashi prefectures in central Honshu, Japan, near the Pacific Coast. Identified as a conical stratovolcano, it is the highest peak in Japan at 3,776 meters above sea level. Mount Fuji has a complex history of growth. A group of overlapping volcanoes rather than a single structure, it is composed of Komitake, Ko-Fuji (Older Fuji Volcano), and Shin Fuji (Younger Fuji volcano). Shin Fuji experienced a period of lava flows from 11,000 BCE to 8,000 BCE that account for four-fifths of its current volume. The base of the volcano is about 125 kilometers in circumference with a diameter of roughly 40 to 50 kilometers. The summit is a circular crater about 500 meters across and about 250 meters deep below the highest point.

The volcano has erupted approximately sixteen times since 781 CE. An eruption from 16 December 1707 to 22 January 1708 contributed to the formation of a large, new crater on the east flank. This is known as Mount Hoei. The summit vent released steam between 1780 and 1820, and despite remaining dormant since then, the mountain is classified as an active volcano.

The temperature at the top of Mount Fuji averages -19.2°C in January and 5.9°C in August. At the foot the temperature averages 2.2°C in January and 23.8°C

Mount Fuji in November 1972. (CHARLES E. ROTKIN/CORBIS)

in August. Precipitation is important at the foot, where the annual rainfall reaches 2,000 millimeters. Flora and fauna are abundant. The more than 1,300 plant species include alpine varieties, and more than 130 bird species are native to the region. Many rivers flow through the area, including the Kisegawa, Ayusawagawa, Uruigawa, and Shibagawa. The eruptions of Mount Fuji have formed five small lakes at the mountain's northern foot. From east to west they are Lake Yamanaka, Lake Kawaguchi, Lake Sai, Lake Shoji, and Lake Motosu. The abundance of groundwater and streams around Mount Fuji has encouraged farming and has facilitated the establishment of paper and chemical industries.

A feature of Fuji-Hakone-Izu National Park, Mount Fuji is a popular tourist attraction and climbing site. Since early times the summit has been considered a sacred peak. In 1994 Mount Fuji was considered for registration as a World Natural Heritage site, and subsequent measures toward nature conservation have been significant issues in Japan.

FUJIAN (2002 est. pop. 36.2 million). Located on China's southeastern coast, Fujian Province covers an area of 121,400 square kilometers and is bordered by the Taiwan Strait to the east and the Wuyi Shan mountain range to the west. As of 1996, Fujian's capital, Fuzhou, had a population of 1.4 million. Xiamen is the second largest city of the province, with a population of 600,000.

Fujian has a long history and can trace its origins to the Warring States period (475–221 BCE), when it was a part of the kingdom of Yue. Yue was conquered by the kingdom of Chu, which was then conquered by China's first emperor, Qin Shi Huangdi, who annexed Fujian during his reign (221–210 BCE). Following the overthrow of the Tang dynasty (618–907 CE), a short-lived Yue kingdom was reestablished but lasted only a few years, until 946. Fujian was also the last stronghold of the Ming dynasty (1368–1644 CE) before its

downfall and the emergence of the Qing dynasty (1644–1912 CE).

Owing to its proximity to the sea, Fujian has long been a center of shipbuilding and trade. During the Song and Ming dynasties, shipbuilding and trade were the primary sources of income in Fujian Province, as ships laden with silk, porcelain, and tea sailed for Japan and Korea as well as Southeast Asia and the Middle East and brought back spices and herbal medicines. Foreign traders have also long plied the waters off of Fujian. As far back as the eleventh century, Muslim traders settled in the southern Fujian city of Quanzhou to trade ivory and spices for silk and tea. The sixteenth century saw the arrival of Dutch and Portuguese traders, who exported porcelain, silk, and tea from China.

Today, Fujian has a broad and varied economic base, producing bananas, fish, fruits, pears, rice, rubber, seafood, sugar, and tea. Fujian's nearness to Taiwan has also made it the center of the growing cross-strait trade between China and Taiwan as the two sides seek closer economic ties. Fujian Province is also tied linguistically to Taiwan, because about half of all current Taiwanese hail from Fujian and speak a dialect native to southern Fujian.

FUJIEDA SHIZUO (1908–1993), Japanese novelist. Fujieda Shizuo is the pseudonym of Katsumi Jiro. Born in Shizuoka Prefecture, Fujieda graduated from Chiba Medical College and became an ophthalmologist. He published his first short story at the age of thirty-nine in the magazine *Kindai Bungaku* (Modern Literature). He wrote principally in the genre of autobiographical fiction (*watakushi shosetsu*) favored by Shiga Naoya, whose writing he most admired. Major works include *Iperitto-gan* (Eyes of Mustard-Gas, 1949), based on his experience as a medical doctor; *Inu no chi* (Dog's Blood, 1956); *Kuki atama* (Head of Air, 1967), a detailed account of his wife's recovery from tuberculosis and his own musings on a bizarre medical experiment; *Kyoto Tsuda Sanzo* (Outlaw Tsuda Sanzo, 1961), a nonautobiographical work based on

the attack on the Russian crown prince in 1891; and *Kanashii dake* (Only Sadness, 1979), a requiem for his deceased wife. Beset by senility and self-loathing, he continued writing spare and poignant novels, such as *Kyokai* (Empty Longing, 1983), until his death in 1993.

William Ridgeway

FUJISAWA TAKEO (1904–1989), Japanese novelist. Born in Osaka, Japan, Fujisawa Takeo began writing short stories as a high school student. He published in small *dojin zasshi* (literary coterie magazines) and soon won acclaim from established writers of the Shinkankaku-ha (Neo-Sensationalist School) such as Yokomitsu Riichi (1898–1947) and Kawabata Yasunari (1899–1972). He turned to writing proletarian fiction while a student at Tokyo University; *Kizudarake* (Song of the Bruised and Battered, 1930) is his best known work in that genre. He contributed to the left-wing magazines *Daigaku Saba* (University Left Wing) and *Senki* (Battle Flag, a major leftist literary journal) during the late 1920s.

After being institutionalized for tuberculosis treatment from 1930 to 1933, Fujisawa shifted his focus to popular fiction. His later fiction is characterized not by the autobiographical style favored by the naturalists but by a bright, cosmopolitan flair. As a town native, Fujisawa became the toast of the Osaka literary world. His novel of love and romance, *Shinsetsu* (Fresh Snow, 1941–1942), was made into a film in 1942. His autobiography, *Osaka Fijoden* (Osaka Autobiography), was published in 1974.

William Ridgeway

FUJITA TSUGUHARU (1886–1968), Western-style Japanese painter. A native of Tokyo, Fujita Tsuguharu was also named Fujita, Tsuguji, or Leonard Foujita. After graduation from Tokyo Bijutsu Gakko (now the Tokyo School of Fine Arts and Music) in 1910, Fujita went to France in 1913. He became associated with the École de Paris, developed his own style, and gained a considerable reputation in Parisian artistic circles through works such as *My Studio* (1921), and *Five Nudes* (1923). In 1931 he traveled in the Americas, before going to Japan in 1933. He became a member of the Association of Artists (*Nikakai*) and started to paint several murals such as *Early Events in Akita* (1933), and *The Festival of the Four Seasons in Akita* (1937). World War II brought him back to Japan, and he was appointed to the Imperial Art Academy. He painted war zones in China and Southeast Asia, and received the Asahi Cul-

ture Prize for *The Last Days of Singapore* (1942) and other paintings. He left Japan and went back to France, taking French nationality in 1955. He converted to Catholicism and was christened Leonard, which led him to design the stained glass windows and murals for the chapel of Notre-Dame-de-la-Paix built in Reims.

FUKUCHI GEN'ICHIRO (1841–1906), journalist, politician, and playwright. Fukuchi, who was also known by the pen name Ochi Fukuch, was born in Nagasaki. The son of a doctor, he studied the Dutch language during his youth. When he was eighteen, he went to Edo (now Tokyo) to study English, and in the early 1860s he was a translator for the Tokugawa government and acted as interpreter on Bakufu missions to the United States. In the same year as the Meiji Restoration, 1868, he was jailed for the publication of an antigovernment newspaper, *Koko Shimbun*. In 1870 he joined the new government and accompanied Hirobumi Ito (1841–1909) and Tomomi Iwakura (1825–1883) on missions abroad (1871–1872). From 1874 to 1888 he worked as an editor of the *Tokyo Nichi Nichi* newspaper. Later, he held a short tenure in the Finance Ministry. After becoming a leading journalist in Japan, he founded and led the pro-government *Rikken Teiseito* (Constitutional Imperial Party) in 1881–1883. He started to write novels, historical works, and Kabuki plays, and from 1887, he helped to build the Kabuki Theater. In 1904 he was elected to the Diet (legislature).

FUKUDA HIDEKO (1865–1927), pioneer of Japan's women's liberation and socialist movements. Born Kageyama Hideko in Okayama prefecture, Japan, Fukuda was first inspired to join the women's

liberation and democratic rights movements by a speech made by the women's rights advocate Kishida Toshiko (1864–1901) in 1882. The following year, she took an active part on behalf of the Liberal Party in Okayama by founding a private night school for girls. She ran the school until it was ordered closed in 1884. In 1885, Fukuda was arrested in Tokyo for her involvement with a group of radicals advocating the Korean reformation movement. She was later released from prison under the amnesty of 1889.

Married to a radical socialist for eight years, Fukuda became more deeply involved with well-known socialist groups of the times. She then became a socialist herself, particularly concerned with raising the status of women. In 1907, Fukuda began publishing the feminist journal *Sekai fujin* (Women of the World), which introduced Japanese readers to the activities of the women's suffrage movement around the world. Though Fukuda labored under financial difficulties and political suppression throughout her life, she continued to educate women and to advocate women's political and economic independence. She also supported various social and political movements. In 1904, she wrote an autobiography titled *Warawa no hanseigai* (My Life Thus Far).

FUKUDA TAKEO (1905–1995), prime minister of Japan. Fukuda Takeo was born in Gumma Prefecture and graduated from Tokyo University. A career bureaucrat in the Ministry of Finance and a member of the House of Representatives from 1952 until his death in 1995, Fukuda held cabinet posts under various prime ministers; he served as minister of agriculture, of finance, and of foreign affairs. As foreign minister in the cabinet of Prime Minister Sato Eisaku (1901–1975), Fukuda handled negotiations with the United States during the conclusion and ratification of the 1971 agreement on the return of Okinawa. He successfully challenged Miki Takeo for presidency of the Liberal Democratic Party (LDP), resulting in his becoming president of the LPD and prime minister of

Japan in 1976. Unable to stabilize the economy and faced with declining public trust in his leadership, he was forced to dissolve his cabinet in 1978 when party members were implicated in the Lockheed bribery scandal, in which government and business colluded to purchase aircraft in exchange for kickbacks.

FUKUI (2002 est. pop. 829,000). Fukui Prefecture is situated in the western region of Japan's Honshu Island. Occupying an area of 4,192 square kilometers, it is divided into a more populous northern district of mountain ranges intercut with river valleys and coastal plains and a narrow rocky strip extending southward along Wasaka Bay. Its main rivers are the Kuzuryugawa, Hinogawa, and Asuwagawa. Fukui is bordered by the Sea of Japan and by Ishikawa, Gifu, Shiga, and Kyoto prefectures.

The capital of the prefecture is Fukui City, which grew around a castle built in 1575 by Shibata Katsuei (1522?–1583), the future governor of Echizen Province (subsumed into Fukui Prefecture in 1881). Severely damaged by bombing during World War II and by a 1948 earthquake, the city has since been rebuilt. Traditionally a weaving center, it now produces synthetic fiber as well as foodstuffs and machinery. Among its attractions are the former site of Fukui Castle; the remains of the Asakura family fortress, Ichijodani; and Asuwayama Park. Other important cities of the prefecture are Takefu, Sabae, and Tsuruga, the last near the Hokuriku Tunnel, the second longest in Japan.

Fukui's many archaeological sites are evidence of early human settlement. Rice culture, commercial fishing, and textile mills are the main economic activities. Modern chemical and machinery industries operate alongside more traditional producers of lacquer ware and cutlery. Fukui also supplies the Kansai region, comprising the cities of Osaka, Kyoto, Kobe, and Nara, with nuclear power. Visitors are drawn to Fukui by the ancient Buddhist temple complex of Eiheji and by Haku-san National Park and other parks along the coast.

FUKUMOTO KAZUO (1894–1983), Japanese Marxist intellectual. The most influential ideologue of

Japanese Marxism in the 1930s, Kazuo Fukumoto introduced the question of subjectivity into Marxist thought with his postulate that the class struggle was a matter of self-transformation. He was born in Tottori Prefecture, graduated from Tokyo University in 1920, and taught at Matsue Higher School. In 1922, he went to study Marxism in Germany and France.

After returning to Japan in 1924, Fukumoto joined the Communist Party. With the support of his students, he criticized the theories of established Marxists such as Yamakawa Hitoshi (1880–1958) and Kawakami Hajime (1879–1946), and attempted to reorganize the Communist Party. In 1926 he became the head of the party's political section, but was forced to resign in 1927 due to increasing criticism from the Comintern and other Japanese Communists, who felt his ideas alienated the party from the masses, and that Fukumoto didn't understand the correct role of the party as distinct from the labor unions. This marked an end of Fukumoto's prominence. He was arrested in June 1928 and sentenced to ten years at hard labor but was imprisoned for fourteen.

After the Second World War, he joined the Communist Party again but was expelled in 1958 for disagreeing with other party members. In his sixties, Fukumoto turned to the study of economic history and Japanese culture, focusing on the Edo Period (1600–1868).

FUKUOKA (2002 est. pop. 5 million). Fukuoka Prefecture is situated in the north of Japan's island of Kyushu. Once a conduit for the transmission of culture from ancient China by way of Korea, it occupies an area of 4,963 square kilometers. Its main geographical features are the central Tsukushi Mountains, the river Chikugogawa surrounded by broad plains in the south, and the northwestern Fukuoka Plain. Fukuoka is bordered by Oita, Kumamoto, and Saga Prefectures, and by the Inland, Ariake, Genkai, and Hibiki Seas. The prefecture assumed its present name

and borders in 1876; it subsumed the former provinces of Chikuzen, Chikugo, and Buzen.

The capital of the prefecture is Fukuoka city, situated on Hakata Bay. It is Kyushu Island's largest city as well as its cultural, commercial, and political center. Fukuoka city began as the seventh-century port of Hakata; close by was Dazaifu, the administrative center for all Kyushu. In the thirteenth century the Mongols tried to invade Japan along the Fukuoka coast. Hakata flourished through trade with Ming China (1368–1644). In 1601, a castle was erected in Hakata and named Fukuoka. The city of Fukuoka resulted from the merger of the new castle town and Hakata in 1889. Following destruction in World War II, Fukuoka was rebuilt on a grid plan.

Today its cultural institutions range from Kyushu University to numerous shrines and temples, notably the Shofuku Buddhist temple, founded in 1195 by Eisai (1141–1215), the monk who established the Rinzaï sect of Zen Buddhism in Japan. Kyushu's oldest Shinto shrine, Sumiyoshi Jinja (1623), is also located in Fukuoka. Among the city's traditional crafts are silk weaving and dyeing and the manufacture of dolls. It is noted for one of the largest fish catches in Japan, and its modern industries include chemicals, textiles, electrical equipment, machinery, printing, and food processing. The other important cities of Fukuoka Prefecture are Kita, Kyushu, Kurume, and Omuta.

The prefecture's rich coal deposits fueled Japan's industrialization around the beginning of the twentieth century, although the coal output declined after World War II. Today the prefecture's larger industries include steel, glass, and ceramics. The agriculture of rice, vegetables, fruit, tea, and livestock remains productive. Visitors are drawn to scenic Inland Sea National Park and to the area's quasi-national parks, as well as to the Kofun tombs around the capital.

FUKUSHIMA (2002 est. pop. 2.1 million). Fukushima Prefecture is situated in the northern area of Japan's island of Honshu. A prime agricultural region and the transportation link between northeastern and southwestern Honshu, it occupies an area of 13,784 square kilometers. Its primary geographical features are the Abukuma, Ou, and Echigo mountain

ranges that separate the coastal plains and central river basins. The main rivers are the Abukumagawa, Nip-pashigawa, and Tadamigawa. The region's highest peak is Hiuchigadake, rising 2,356 meters. The prefecture is bordered by the Pacific Ocean and by Yamagata, Miyagi, Ibaraki, Tochigi, Gumma, and Niigata Prefectures. Once part of Mutsu Province, Fukushima assumed its present name and borders in 1876.

The capital of the prefecture is Fukushima city. During the fifteenth century, it grew as a castle town and a post station town. Today it is home to Fukushima University and Iizaka Hot Spring. The prefecture's other important cities are Aizu Wakamatsu, Iwaki, Koriyama, and Sukagawa.

In the late nineteenth century the prefecture was a hotbed of popular resistance against the high taxes and conscript labor of the Meiji government. In the Fukushima Incident of 1882, some one thousand peasants assembled to demand the release of their leaders from jail. The leaders had opposed the public auction of the property of peasants unable to pay taxes, and the event came to symbolize commoners' resistance against unjust rulers.

Today, half of the prefecture's arable land is devoted to rice. Cucumbers, tomatoes, peaches, pears, and apples also are grown, as is tobacco. Nuclear energy powers such industries as the processing and production of chemicals, metal, machinery, and textiles. Visitors are drawn to Bandai-Asahi National Park and to the prefecture's many hot spring resorts.

FUKUZAWA YUKICHI (1835–1901), Japanese intellectual. Of all the intellectuals associated with Japan's late-nineteenth-century transformation, none has earned more scholarly and popular attention than Fukuzawa Yukichi, a man whose name evokes the ideology of "civilization and enlightenment" that engulfed the country during the 1870s. Fukuzawa was born in the city of Osaka but raised in a samurai family of modest standing in the small domain of Nakatsu in Kyushu. Schooled in the Confucian classics, Fukuzawa, at age nineteen, ventured out in pursuit of "Western learning" first in Nagasaki, then Osaka, and finally Edo (Tokyo). The move to Edo in 1858 was precipitated by the request of the local domain offi-

cial that Fukuzawa open his own Dutch (soon to become English) academy. Over the next decade, this school, which eventually evolved into Japan's leading private institution for higher learning (Keio University), served as the institutional foothold for Fukuzawa's career as the nation's preeminent pedagogue of Anglo-American culture and thought. Fukuzawa's credentials were further enhanced when he joined missions to the United States and Europe during the 1860s that were sponsored by the Tokugawa *bakufu* (shogunate). From 1866, when he published the first volume of his famous *Conditions in the West*, until his death in 1901, Fukuzawa's writings on education, economics, government, and social etiquette circulated more widely than those of any other contemporary writer. Fukuzawa Yukichi's legacy, however, remains a subject of controversy. Fukuzawa was a man of striking ambivalence: an egalitarian liberal and iconoclast in some respects, but also a conservative bureaucrat with distinctly aristocratic pretensions. Among scholars of "Western learning," he stood at the progressive forefront in his call for individual freedom and independence, the universal pursuit of utilitarian learning, and the equality, at least in regard to property rights, of wives and husbands within the family. Still, for all of his celebrated disdain for "feudal" privilege and custom, Fukuzawa was himself a *bakufu* employee between 1860 and 1867 and, for the most part, remained an enduring defender of the old regime during its Restoration struggles between 1858 and 1868. Nevertheless, within the context of his times, Fukuzawa stands out as an innovative educator who helped to navigate the nation through its historical transition from the Tokugawa period (1600/1603–1868) to the Meiji period (1868–1912).

FUNAKOSHI GICHIN (1868–1957), father of modern karate. Funakoshi Gichin was born in Shuri, Okinawa, Japan, to a *Shizoku* (gentry) family. He was raised by his grandfather, a Confucian tutor to the Okinawan royal family. Funakoshi also became an educator, but is more popularly known as a master of Okinawan martial arts. He studied with a number of legendary Okinawan teachers such as Matsumura Sokon (1809–1901) and Kanryo Higaonna (1853–1917), but his closest teachers were Azato Yasutsune (1828–1906) and Itosu Yasutsune (1831–1916).

Funakoshi is considered today to be the father of modern karate. He was not the first proponent of the Okinawan martial arts to teach in mainland Japan, but he is remembered as the Okinawan master who popularized karate in Japan. Between 1917 and 1921, he was involved in a number of martial arts demonstrations, including one for Crown Prince Hirohito. In 1922, Funakoshi was selected by his teachers and peers to attend the Ministry of Education's National Athletic Exhibition in Tokyo, where he demonstrated various self-defense techniques and lectured about the health benefits of the Okinawan martial arts. At the request of a number of important Japanese officials, Funakoshi agreed to remain in Tokyo and teach his art.

Before these demonstrations most people in Japan had never heard of Okinawan martial arts. Within a few short years, however, Funakoshi had organized martial arts clubs at all of Tokyo's most prestigious universities and authored a number of books on the martial arts of Okinawa. It was around this time that Funakoshi popularized the name *karatedo* (empty hand way) to describe the practice he was teaching. Before this, the martial arts of Okinawa were usually referred to as "Chinese hand" or "Okinawan hand." By 1936, with the help of his third son Gigo (1907–1945), Funakoshi was able to open a private dojo (training hall), which his students named the Shotokan in honor of the Master's pen name Shoto (pine waves).

The interwar years were a dark time for Funakoshi. Not only did he suffer from dire poverty and hunger, as did most of Japan, but he also lost his wife, his son Gigo, and the Shotokan. In 1949, during the U.S. occupation of Japan, Funakoshi's students helped him to pick up the pieces and formed the Japan Karate Association with Funakoshi as its chief advisor. From this point, he began to teach once again, and karate began to gain popularity around the world.

Funakoshi continued to teach and write until his death in 1957. He dedicated his life to promoting an understanding of what he referred to as "the true meaning of *karatedo*." He felt that karate was grossly misunderstood and misused by most practitioners. He often commented that the practice of karate is best used for combating sickness and old age rather than people and that the highest goal in karate is to diffuse a potentially dangerous situation before it escalates into violence.

FUNCINPEC A Cambodian political party, the National United Front for an Independent, Neutral, Peaceful, and Cooperative Cambodia is known by its French acronym, FUNCINPEC. The party traces its origins to the non-Khmer Rouge political faction associated with King (then Prince) Norodom Sihanouk (b. 1922), which fought for control of the country from a base near the Thai-Cambodian border against the incumbent People's Republic of Kampuchea during the 1980s.

The FUNCINPEC returned to mainstream politics in the aftermath of the 1991 Paris Peace Agreements, when it emerged as one of the dominant parties contesting the 1993 national elections. Capitalizing on its royalist heritage, it won the majority of seats at those elections, with the party's leader, Prince Norodom Ranariddh (b. 1944), a son of Sihanouk, assuming the title of first prime minister. Since the FUNCINPEC's political infrastructure was poorly formed at local levels, its power-sharing coalition with the Cambodian People's Party (CPP) soon became inequitably weighted in favor of the latter, former rulers of the People's Republic of Kampuchea, who controlled much of the country's security forces and administration, and were therefore particularly influential in much of the rural countryside.

In 1997 problems between the coalition partners reached the boiling point, with CPP leader Hun Sen (b. 1952) ousting Ranariddh. Many FUNCINPEC officials fled the country, leaving the party in shambles. Those officials slowly returned to the country in late

1997 and 1998, when the FUNCINPEC again contested the national elections. The party came in second to the CPP in the national vote and assumed the role of junior coalition partner. FUNCINPEC leader Prince Ranariddh became the president of the legislature, the National Assembly.

FURUKAWA ICHIBEI (1832–1903), Japanese entrepreneur. Born in Kyoto, Furukawa was engaged in the silk trade business for the Ono Group, a merchant company based in Kyoto. In 1874, Ono went bankrupt and Furukawa started independently in the same activities. After raw silk exporting became unprofitable, he turned to mining ventures. He went to manage a mining company that was operated by the Soma family in the Tohoku region. In 1877, with a loan and the aid of the financier and entrepreneur Eiichi Shibusawa (1840–1931), Furukawa purchased the Ashio copper mine from the government. His innovations in Ashio produced commercial success. By 1885, Ashio's production reached 4,131 tons annually, which represented 39 percent of Japan's total copper output. Furukawa extended the purchase of mines by acquiring in 1885 the Great Innai and Ani silver mines. He possessed by 1900 eighteen metal mines and four coal mines. In 1897, Furukawa's operations passed to his adopted son, Junkichi. After the death of Furukawa Ichibei in 1903, the enterprise was reorganized, to take the form in 1905 of a *zaibatsu*, one of the pyramid-type business conglomerates that dominated the Japanese economy until their dissolution in 1945.

FUTABATEI SHIMEI (1864–1909), Japanese novelist and translator. Futabatei Shimei (pseudonym of Hasegawa Tatsunosuke) was born in Edo (now Tokyo) to a samurai family. He is the author of Japan's first modern novel, *Ukigumo* (The Drifting Cloud, 1887–1889), which he began while still a student at Tokyo Gaikokugo Gakko (now Tokyo University of Foreign Studies). Futabatei's studies in Russian language and literature resulted in many fine translations, which he continued to produce until his death, including those of Turgenev, Tolstoy, Dostoevsky, Goncharov, and Chekov. He was able to achieve a literary style appropriate to the realistic fiction of contemporary Japan known as *gembun itchi* ("fusion of spoken and written language"). Futabatei also accomplished a psychological realism that his mentor, Tsubouchi Shoyo, had originally proposed in his *Shosetsu shinzui* (Essence of the Novel, 1885–1886) but could not himself realize. Futabatei had little trust in the public reception of his art and, unable to make a living from writing, took up a government post in 1889, withdrawing from literary circles but continuing to devote his time to writing. His ambivalence toward being a novelist is reflected in his choice of a pseudonym that sounds like the profanity *kutabatte shimae*, "go to hell." In the last years of his life, he again received critical attention for a novel on the common Japanese practice of adopting a son-in-law into a family that has no heir, *Sono omokage* (An Adopted Husband, 1906). The author's bitter attitude toward his literary milieu is summed up in his final novel *Heibon* (Mediocrity, 1907), a semiautobiographical study. Hired as a newspaper correspondent in Russia, he took ill soon after arrival and died on his return trip to Japan.

GADJAH MADA UNIVERSITY In December 1949, Gadjah Mada University (Universitas Gadjah Mada, or UGM), in the city of Yogyakarta, located in the quasi-provincial area of Yogyakarta (Daerah Istimewah Yogyakarta, or DIY), became Indonesia's first national university. It superseded the Gadjah Mada Institute of Higher Learning, previously established on 3 March 1946 by, among others, Hamengku Buwono IX, Sultan of Yogyakarta, in the then capital of the newly proclaimed Republic of Indonesia.

To form the university, the Institute merged with the School of Engineering (founded by the Indonesian Department of Education), the staff and students of which were recruited from an engineering institution in Bandung, West Java. Also joining in the merger was the College of Political Science, a training center for bureaucratic and diplomatic staff run by the Department of the Interior. The new university was named after a fourteenth-century Javanese statesman.

The state-run UGM has eighteen faculties, including medicine, law, education, philosophy, engineering, animal husbandry, and forestry. It offers sixty-three undergraduate programs, sixteen diploma programs, and several nondegree programs. Its Graduate Studies Faculty comprises fifty-two programs. UGM has nineteen specialized research centers, five interuniversity centers and six community centers. With over 38,000 students and first-class academic and research facilities, UGM is one of Indonesia's largest universities.

GAFUROV, BOBOJAN GAFUROVICH

(1908–1977), Tajik politician and scholar. Bobojan Gafurovich Gafurov led the Tajikistan Soviet Socialist Republic from 1946 until 1956 as the first secretary of the Communist Party. Born in Ispisar (a remote northern province of the republic) in 1908, he began his career as a journalist and lecturer before joining the Communist Party apparatus and climbing up to the highest political post in the republic under Josef Stalin (1879–1953), then Soviet leader. In 1956 he left the republic to become the director of the Institute of Oriental Studies of the Soviet Academy of Science in Moscow.

However, it was his works on the history of Central Asia, and particularly on the history of Tajikistan and Tajiks, that won him nationwide recognition in Tajikistan and a reputation as one of the founders of the Tajikistani oriental school and Tajikistani nationalism. In his publications, including two versions of *Tarikbi Mukhtasari Halki Tochik* (The History of Tajik People), he put forward the idea that the beginning of the Tajiks could be in ancient civilizations of Central Asia. This interpretation of history was widely used in the consolidation of the Tajik identity in the territory of modern Tajikistan.

GAJAH MADA (d. 1364), Javanese military leader. The Hindu-Javanese kingdom of Majapahit, established in 1293 by the East Javanese king Vijaya (d. 1328), experienced its golden age in the fourteenth century CE, owing to the military prowess and political cunning of Gajah Mada. Born a commoner, Gajah Mada rose to fame when he was still an officer of the royal bodyguard. After he overcame an insurrection against Vijaya's son, King Jayanagara (reigned 1309–1328), he was elevated to the rank of minister. His loyalty, however, waned when Jayanagara laid claim to Gajah Mada's wife. After successfully plotting the death of the king, he ascended to the height of his power under the reign of Jayanagara's daughter Tribhuvana (reigned 1328–1350), who appointed him as prime minister after he quelled another rebellion. True to his oath that he would conquer the whole archipelago, he subjugated Bali in 1343 as well as other smaller kingdoms. These conquests are related in the *Nagarakertagama* (Sacred Book of the Prosperous State), a Javanese epic that was written in 1365 under his sponsorship by the poet Prapancha. Tribhuvana, who abdicated in 1350, was succeeded by her son Hayam Wuruk (reigned 1334–1389). During his reign, Gajah Mada extended Majapahit's influence even further, up to mainland Southeast Asia. Gajah Mada died in 1364 under mysterious circumstances.

GAKUREKI SHAKAI *Gakureki* is the Japanese word for an individual's educational record or history, and *gakureki shakai* describes the characteristics of Japanese society that make such a record crucial to a student's future social status. With the rapid expansion of enrollment in senior high schools and universities between the early 1960s and the late 1970s, not only the level of education obtained but also the rank or status of a person's alma mater became a major factor in determining his or her initial labor-market position.

The Japanese education system is generally considered meritocratic and egalitarian because of the open competition of the entrance exams. However, empirical studies show a consistent link between parents' educational or social status and the level of schooling attained by their offspring. Nevertheless, the Japanese educational selection system is widely regarded as legitimate among students and parents despite the severe academic competition.

Three characteristics of Japanese culture and society may explain this enduring legitimacy. First, no overt link exists between middle-class values and the knowledge tested on entrance exams. Unlike many European nations, which emphasized elite forms of social capital in schools and in interviews for job entry, Japan has historically emphasized Japanese national culture. This continued in modern education. Second, most Japanese do not believe in innate differences in either intelligence or ability. Most people view success as the product of individual effort. This belief is reinforced by the fact that students who do not study hard risk failure in the intense competition for high school or university entrance, even if they are gifted with academic ability. Third, education in high schools and universities and the transition to the job market revolve around competition. Students are faced with the constant possibility of losing or winning, and the status of past winners in future competitions is ambiguous, promoting a cycle of status anxiety and increased aspirations.

In the mid-1980s, concerns about intense academic competition and an eruption of school problems, including bullying, violence, and students refusing to go to school, engendered support for a series of educational reforms focused on individual differences, freedom in education, and creativity. Multiple selection criteria for admission to high schools and universities, including interviews and evaluations of extracurricular

lar activities, were introduced in the 1990s. However, these reforms were implemented without parallel changes in the job market, thereby increasing the popularity of *juku* (cram schools) and private schools that fuel competition. In addition, some argue that the introduction of the new criteria in the selection system creates inequality between students from different social classes, as disadvantaged students will have fewer opportunities to participate in extracurricular activities and may experience discrimination during interviews. *Gakureki shakai* will continue to flourish, even after a series of educational reforms to suppress competition, as long as no dramatic changes occur in the job market and in its legitimacy among participants.

GAMA, VASCO DA (c. 1460–1524), Portuguese explorer. Vasco da Gama discovered the sea route to India from Europe and established a Portuguese presence in India, which lasted until 1961. He was born in Simes, Portugal, around 1460. In 1497 King João II of Portugal sent him on a mission to India; da Gama was to find a route that would circumvent the Middle East, where travel and commerce were difficult for European traders. Da Gama sailed from Lisbon with four ships on 8 July and rounded the Cape of Good Hope in November, arriving in Calicut, in southwest India, on 20 May 1498.

The Zamorin of Calicut welcomed him, but because of Muslim opposition da Gama was unable to conclude a treaty. He returned to Lisbon in 1499 and was granted a triumphal homecoming; King Manuel I granted him the title of Dom (Sir) and named him Admiral of the Indian Ocean. He also received a large pension from the king.

In 1502, he was sent back to India to avenge the destruction of a factory the Portuguese had built in Calicut. He sank a ship sent against him, killing all on board; then bombarded the city. After concluding a treaty with the ruler of Cannanore, he returned to Portugal and retired to Évora. He was made Conde de

Vidigueira in 1519. In 1524, he was appointed viceroy of India and arrived there in September 1524, only to die in December in Cochin. His discovery of the route around South Africa was commemorated by the poet Camões.

GAMBANG KROMONG *Gambang kromong* refers to a type of ensemble, based in and around Jakarta, that combines Indonesian and Chinese instruments and styles. Its name derives from two of the instruments played: the *gambang*, a xylophone, and the *kromong*, a set of kettle-gongs on a rack. These are combined with instruments originating from China: a two-stringed fiddle and a side-blown flute. The remaining instruments in the core ensemble are percussion (hanging gongs, drums, and a set of clashing metal plates). Male and female singers, who sing lyrics in the popular Malay form of pantun, round out the ensemble. Western instruments may also be added, including electric guitars, trumpets, clarinets, saxophones, and electronic keyboards.

The music is performed and patronized by two groups who live in and around Jakarta (in Bekasi, northern Bogor, and Tangerang): Peranakan, people of mixed Chinese and Pribumi (native Indonesian) ancestry; and Betawi, who are considered Pribumi. Ensembles accompany male-female dancing at Peranakan weddings and other family celebrations. In this context, female dancers are hired as partners for men. Ensembles also accompany a form of popular theater called *lenong*.

Ethnomusicologist Philip Yampolsky has identified two repertoires that are part of modern performance practice: *lagu lama*, older songs oriented toward Chinese musical features; and *lagu sayur*, newer songs that tend to be based in Malay musical idioms. *Lagu lama* melodies were probably brought from the Fujian province of southern China to the Dutch colonial city of Batavia, presumably in the seventeenth and early eighteenth centuries. At that time, *gambang kromong* groups played for private weddings and parties. During the latter part of the nineteenth century, as the music became part of a more public sphere, the instrumentation embraced Indonesian instruments, in-

cluding drums, gongs, and *kromong*. The *lagu sayur* repertoire emerged at this time, and in the early twentieth century embraced popular songs in the region around Batavia. The music became even more hybrid in the 1920s and 1930s, as it blended with U.S. and European popular music and jazz. A genre called *gambang moderen* ("modern gambang [kromong]"), associated with the actor and popular music composer Benyamin S. (1939–1995), is an important marker of Betawi cultural identity in contemporary Indonesia.

GAMBUH The classical Balinese dance drama *gambuh* probably originates from the last eastern Javanese Hindu kingdom of Majapahit. Majapahit fell to the coastal kingdom of Demak—then mostly Muslim—around 1520, but its dance drama tradition continued in Bali. *Gambuh* was traditionally performed on secular and ritual occasions in temples, palaces, or villages, and related the life in the ancient Hindu-Javanese courts—the ancestral home of the Balinese nobility. Nowadays, *gambuh* is predominantly staged during rituals, and is flourishing after almost vanishing between the 1930s and the 1980s. Plots draw on the old-Javanese mythical epic, *Malat*, narrating the adventures of Prince Panji and Princess Candra. The old-Javanese historical epic, *Rangga Lawe*, is another source. The knowledgeable audiences appreciate the refined performance, complicated choreography, and accom-

Performers getting ready for a *gambuh* dance performance at Besakih Temple in Bali in 1997. (CATHERINE KARNOW/CORBIS)

plished dancing and singing. *Gambuh* is considered the basis for all the other classical dance forms. The dancers-cum-singers are accompanied by a *gamelan gambuh* orchestra consisting of bamboo flutes, a bowed lute, drums, cymbals, bells, and gongs.

GAMELAN The term "gamelan" refers to various indigenous music ensembles of Java and Bali, the core instruments of which are usually drums, variously tuned bronze gongs, different sets of bronze metallophones, cymbals, and flutes. The bas-reliefs of some of the ancient Hindu and Buddhist temples in Central and East Java, dating from the eighth to fourteenth centuries CE, depict many examples of instruments similar to some of those used in contemporary gamelan orchestras, such as drums, flutes, small knobbed gongs, cymbals, and xylophones. Most contemporary instruments, however, are not represented on these reliefs. They actually much more resemble those used in traditional court orchestras throughout mainland Southeast Asia. The largest of the Javanese court gamelan, usually accompanying the sophisticated court dances (e.g., *bedaya*, *serimpi*, *wayang wong*) and shadow plays (*wayang kulit*), consist of various sets of metallophones (*demung*, *sarong*, *slentem*, *gender*), differently sized horizontally or vertically suspended gongs (*kenong*, *kempyang*, *ketuk*, *bonang*, *gong*), and spoon-shaped, cymbal-like instruments (*kemanak*) made of bronze, as well as drums (*kendang*), flutes (*suling*), plucked (*celempung*) and bowed (*rebab*) string instruments, xylophones (*gambang kayu*), and singing (*pesinden*, *dalang*).

In Bali, a variety of gamelan ensembles have been in use for centuries, both in village life and at the various courts, accompanying rituals as well as dance dramas and shadow plays. They, too, are usually different sets of bronze metallophones (*gangsra*, *kantilan*, *calung*, *jegogan*, *gender*), vertically and horizontally suspended gongs of different sizes (*gong*, *kempur*, *kemong*, *kempli*, *reyong*, *trompong*), cymbals (*ceng-ceng*), drums (*kendang*), and flutes (*suling*). Some of the ensembles

Musicians perform in a gamelan orchestra in Bali. (CHRISTINE OSBORNE/CORBIS)

also include a bowed string instrument (*rebab*) and singing.

Among the most conspicuous instruments of both the Javanese and Balinese gamelan are the various metallophones. Their bronze plates, struck with mallets, are vertically suspended over either a wooden resonance trough or resonance tubes made of bamboo. Each gamelan is unique in tone color and pitch, fine tuned by master gong-smiths in accordance with the seven-tone *pelog* tonal system, consisting of unequal intervals, or the five-tone *slendro* tonal system, consisting of equal intervals. Javanese gamelan are, in fact, composed of both a *pelog* and a *slendro* set of instruments, whereas in Bali the *slendro* scale is reserved for the ensembles (*gender wayang*) that accompany the shadow plays. Both *pelog* and *slendro* are determined by their respective relative intervals, that is, independently of absolute pitch. Each tonal system allows for different scales, which are classified according to different modes (in Java called *patet* and in Bali *tetekep*).

GANDAN LAMASERY Gandan lamasery, nestled in the modern city of Ulaanbaatar, is the seat of Mongolian Buddhism and the largest monastery in the Mongolian People's Republic. Founded at nearly the same time as Ulaanbaatar, in the seventh century CE, Gandan lamasery shares a common history with the nation's capital. In 1651 Gandan lamasery was established at the behest of Dalai Lama Ngawang Lobsang Gyatso (1617–1682) in the young nomadic religious settlement of Orgoo in Mongolia. For over a century, the lamasery moved with Orgoo and became the center of the settlement's religious activities. Orgoo and Gandan lamasery settled in 1778 on the site of modern-day Ulaanbaatar, and gradually a city of merchants and craftsmen formed around the religious center. By 1900 Gandan lamasery boasted a majority of the city's 25,000 inhabitants. This changed with the beginning of socialist rule in the 1920s, when the government instituted strict rules against the practice of Buddhism and destroyed most of the monasteries in Mongolia. Due to its special status, Gandan was preserved as a religious museum during this time, but the number of lamas in its service decreased dramatically. With Mongolia's transition to democracy beginning in 1989, Gandan monastery reopened as a center of the Buddhist faith and has grown to include several thousand monks.

GANDHI, INDIRA (1917–1964), prime minister of India. Indira Gandhi, daughter of Jawaharlal Nehru (1889–1964), the first prime minister of independent India, married Feroze Gandhi, a Parsi (not related to Mohandas [Mahatma] Gandhi); their sons were Rajiv (who also served as India's prime minister, 1984–1989) and Sanjay. She joined the Indian

Indira Gandhi with her sons Rajiv and Sanjay in New Delhi in 1967. (HULTON-DEUTSCH COLLECTION/CORBIS)

National Congress (INC) in 1938 and was its president from 1959 to 1960. She was a minister in Prime Minister Lal Bahadur Shastri's cabinet from 1964 to 1966 and succeeded him in 1966. As prime minister, she concluded a friendship treaty with the Soviet Union and backed the secession of Bangladesh from Pakistan. In 1974 she ordered the test of a nuclear device. When she nearly lost her mandate due to petition for early elections, she proclaimed a national emergency in 1975 and postponed the elections of 1976. In the elections of 1977 she was defeated, but she returned to power in 1980. When Sikh separatists occupied the Golden Temple of Amritsar, a site sacred to Sikhs, she ordered the army to capture the temple, resulting in 450 Sikh deaths. She was shot fatally by her Sikh bodyguards in October 1984.

GANDHI, MOHANDAS K. (1869–1948), Indian nationalist and promoter of nonviolent resistance. Mohandas Karamchand Gandhi grew up in Porbandar, Gujarat, the son of a minister of a princely state. His father became a judge at a special court in Rajkot, Gujarat, settling disputes among princes. In such a court, nobody could be sentenced: the judges had to bring equitable compromises between the princes. Gandhi's father was good at this, and young Mohandas admired him for it. His mother was a pious woman who often took vows and observed them religiously. These parental virtues left a deep impact on him.

MOHANDAS GANDHI ON THE IMPORTANCE OF LAND OWNERSHIP FOR THE PEOPLE OF INDIA

"Real socialism has been handed down to us by our ancestors who fought: '*All land belongs to Gopal, where then is the boundary line? Man is the maker of that line and he can, therefore, unmake it.*' *Gopal* literally means shepherd; it also means God. In modern language it means the State; the People. That the land to-day does not belong to the people is too true. But the fault is not in the teaching. It is in us who have not lived up to it.

"I have no doubt that we can make as good an approach to it as it possible for any nation, not excluding Russia, and that without violence. The most effective substitute for violent dispossession is the wheel with all its implications. *Land and property is his who will work on it.*

"Unfortunately the workers are or have been kept ignorant of this simple fact.

"Continuous unemployment has induced in the people a kind of laziness which is most depressing. Thus whilst the alien rule is undoubtedly responsible for the growing pauperism of the people, we are more responsible for it. If the middle-class people, who betrayed their trust and bartered away the economic independence of India for a mess of pottage, would now realize their error and take the message of the wheel to the villagers and induce them to shed their laziness, and work at the wheel, we can ameliorate the condition of the people to a great extent."

Source: Jagdish Saran Sharma. (1962) India's Struggle for Freedom: Select Documents and Sources. Vol. 1. Delhi: S. Chand, 29

Gandhi was sent to London at the age of eighteen to study law. After obtaining his degree, he returned to India in 1891, but did not do well as a lawyer, as he was too shy. A Muslim businessman sent him to South Africa to resolve a legal dispute between two rich Muslims. Gandhi persuaded them to settle the issue out of court. He was about to return to India when he noticed that Indian immigrants in South Africa were about to be deprived of their right to vote. He

organized the Natal Indian Congress to fight against this measure. Soon he became involved in more issues affecting the civil rights of the Indian minority. He stressed that rights also implied duties and, during both the Boer War and the Zulu rebellion, he organized an Indian ambulance corps. The white militia's brutal massacre of the Zulus brought about a fundamental change in Gandhi's life. He renounced his profession, took a vow of chastity and decided to devote his life to political and social work. In this new capacity, he developed *satyagraha* ("holding on to the truth"), a strategy of nonviolent resistance to unjust laws. He empowered the Indian minority by organizing campaigns along these lines. He also wrote his manifesto *Hind swaraj* ("Freedom of India"), which was published in 1909. He stated that the British ruled India only because they could rely on the cooperation of the Indians. Nonviolent noncooperation would thus put an end to colonial rule.

When Gandhi returned to India in 1915, there was no scope for political campaigns. During World War I, the British-Indian government was armed with emergency powers. Gandhi devoted himself to local issues such as oppression of peasants by British indigo planters in Champaran, Bihar. After the war, the British extended their wartime emergency powers by means of an act that became known by the name of Justice Rowlatt, who had drafted it. In 1919, Gandhi organized a *hartal*, a kind of general strike of all traders, in protest. To his dismay, the campaign did not remain nonviolent, and the strike was brutally repressed by the British. When he launched his *satyagraha* campaign in 1920, he restricted it to a series of boycotts (for example, of elections, of the schools and law courts, and of foreign cloth). Gandhi also drafted a new constitution of the Indian National Congress, the political party agitating for India's independence. The participation of rural India in Congress politics and the creation of the Working Committee as a permanent leadership for agitation were the main features of this new constitution. Through his hold on the Working Committee, Gandhi controlled the Congress, even when he had no official position in the organization.

The British hesitated to arrest Gandhi during the noncooperation campaign for fear of adding fuel to the fire. In 1922, Gandhi terminated the campaign, as an outbreak of violence in a remote village had alarmed him. He was then sentenced to six years of rigorous imprisonment but was released for health reasons in 1924. Most people thought at that time that he was a spent force. When the Congress planned another political campaign in 1930, however, Gandhi was again

Mohandas K. Gandhi praying in December 1949. (BETTMANN/CORBIS)

its main strategist. This time, he found the unjust salt law to be a proper target for *satyagraha*. The law gave the government a monopoly over the production of salt; Gandhi organized a march to the sea to collect sea salt. When agrarian prices dropped by half due to the Great Depression, peasants who had to pay revenue and interest at their old rates flocked to the Congress. The British viceroy, Lord Irwin, fearing a peasant rebellion, concluded a pact with Gandhi, who hoped that he could arrive at a similar pact with the British prime minister to secure substantial concessions for India. In this, he was to be disappointed. In subsequent years Gandhi devoted himself to constructive work in Indian villages and to the uplift of the untouchables.

Gandhi was only once more called on to launch a major campaign, when the Congress rejected the offer that the British minister, Sir Stafford Cripps, had taken to India in 1942, promising independence after World War II if Congress would back the British war effort. Gandhi asked the British to "Quit India" immediately, but before he could organize a campaign, he and all other Congress leaders were imprisoned.

On the eve of Independence, Gandhi had to be reconciled to the partition of India into two states, India and Pakistan, which he had opposed. The new Indian government was reluctant to agree to this, as India was already at war with Pakistan over Kashmir. Gandhi saw to it that Pakistan got its share, and for that he was shot fatally by a radical Hindu nationalist, five months after India's independence. Beloved by millions of Indians and admired by people worldwide, he became known as the Mahatma, or Great Soul.

GANG OF FOUR The Gang of Four (*siren bang*) is the name given to the four most influential supporters of the Chinese Cultural Revolution in its later stages, other than Mao Zedong (1893–1976). The group's main focus of activities was in Shanghai. There were three men, Zhang Chunqiao (1917–1991?), Yao Wenyuan (b. 1931), and Wang Hongwen (1935–1992), and one woman, Jiang Qing (1914–1991). According to the official Chinese Communist Party (CCP) version of history since the early 1980s, it was their arrest and overthrow on 6 October 1976 that signaled the end of the Cultural Revolution (1966–1976).

The term "gang of four" was actually coined by Mao. It was first used publicly in a speech given by Beijing CCP First Secretary Wu De (1910–1995) on 24 October 1976 to an enormous crowd in Tiananmen Square in central Beijing. After Wu's speech, the term was widely used in China, with these four being blamed for virtually all the ills of the Cultural Revolution.

All except Wang Hongwen had been members of the CCP Politburo since April 1969. In August 1973, Zhang Chunqiao was added to the Politburo Standing Committee, the most powerful governing body in China, while Wang Hongwen became not only a member of the standing committee but a CCP deputy chairman as well. In July 1977, the CCP Central Committee dismissed all four from all posts, accusing them of being "bourgeois careerists, conspirators and counterrevolutionary double-dealers."

Jiang Qing, Mao's wife, had been extremely powerful since 1966 as a member of the Cultural Revolution Group, the body Mao set up that year to guide the Cultural Revolution, and she also gained power by being the person who transmitted instructions from Mao. Her best-known initiative was the reform of the Chinese theater, involving elimination of traditional items among many other changes. Zhang Chunqiao was noted as a radical ideologue, and it was he who led the abortive Shanghai People's Commune of January 1967. In November 1965, Yao Wenyuan wrote an article in a Shanghai newspaper that at the time was credited with launching the earliest stage of the Cultural Revolution.

The members of the gang of four were tried by a special court toward the end of 1980. They were accused of a range of crimes, especially of persecuting large numbers of people, including CCP and state leaders. Jiang Qing was most vocal in her own defense, arguing that she was simply carrying out Mao's wishes, despite which all four were convicted. Actually, she was right in the sense that none of the four could have done what they did without Mao's support, and it was he, not they, who was leading the Cultural Revolution. However, the Chinese press went to considerable lengths to clear Mao of any criminal motivation or action, instead laying blame on the gang.

The court issued its verdicts against the gang on 25 January 1981. It sentenced Jiang Qing and Zhang Chunqiao to death with two-year reprieves. As it happened, neither was executed, and Jiang committed suicide in May 1991. Zhang Chunqiao died in prison, probably in 1991. Wang Hongwen was sentenced to life imprisonment, dying in 1992, while Yao Wenyuan was given twenty years but was released in October 1996.

GANGES RIVER The Ganges River, or Ganga, as it is known to Hindus, is the great river of India. By the fourth century BCE, the fame of the Ganges had reached the West. Alexander of Macedon (356–323 BCE), who regarded the river as the farthest

limit of the Earth, hoped to reach the Ganges and, by continuing east, to return to Europe through the Pillars of Hercules. However, he never reached his destination. Virgil, Ovid, and Dante all mentioned the Ganges, and the river held a unique position in medieval thought. In a curious blend of scripture and classical geography, Christian church leaders came to regard the Ganges as the Phison, the first river of paradise. Accepted by such notable figures as Saints Augustine, Ambrose, and Jerome, that belief prevailed throughout the Middle Ages.

What about the river so kindled people's imaginations? The sanctity of water has been a part of the Indian tradition from its beginnings in the Indus Valley well over four thousand years ago into the twenty-first century. At the start of the plowing season, before the seeds are sown, farmers in the Indian state of Bihar place water from the Ganges in a pot in a special place in the field to ensure a good harvest. Newly married women unfold their saris to the Ganges and pray for children and for long lives for their husbands. In the Ganges Valley and along the Bengal Delta, the Ganges is known as Ganga Mata or Mother Ganges. The image of the Ganges echoes throughout Indian history in the many tales of its generative powers: giving birth, restoring life, conferring immortality.

Historically the Ganges Valley was an entry point into the subcontinent for the first Indo-European invaders, who probably moved into India starting around the eleventh or twelfth century BCE. To these early wanderers the river loomed massive and omnipresent. Its current held the thread of contact with other settlements, old and new, and its route pointed ever eastward toward some unknown destination. As civilization grew on its banks and cities arose, the Ganges

increasingly became a part of the Indian ethos. With the flourishing of commerce and agriculture, its water performed a thousand functions. Just as few can resist someone who is utterly devoted, so people came to worship the river that offered them so much.

Beginning with the Hindu scriptures of the third century CE, the Ganges has played a vital role in religious ceremonies, especially in rituals of birth, initiation, and death. As a goddess the river has appeared with the great celestials of Hinduism, at times the child of Brahma, the wife of Shiva, or the metaphysical product of Vishnu. Always conferring a benediction, the river shares none of the destructive qualities of some other Indian goddesses or the sepulchral

HARNESSING THE GANGES

"A new development of the irrigation system is the Ganges Canal hydro-electric scheme in the United Provinces, of which the power stations were opened towards the end of 1937. This supplies power both for agricultural and industrial purposes. It protects 1 1/2 million acres against famine; it provides 88 towns with power for electric lighting, electric fans, and industrial undertakings; and it assists rural development by mechanizing agricultural processes and energizing industrial activities by means of the cheap power provided for local sugar-mills, oil-crushing plants, flour-mills, &c. By substituting electric power for manual and animal labour, the electric grid is transforming the social economy of the area which it serves. Flour used to be ground by hand; sugar-cane was crushed by primitive stone crushers operated by bullocks going slowly round and round in a circle; the water required for irrigating the fields was raised from wells, tanks, and ditches by bullocks pulling it up in leather bags or men swinging it up in baskets. These operations are now performed by electricity, and the labour of millions of hands has been released for more profitable work."

SUNDARBANS—WORLD HERITAGE SITE

Stretching across the border of India and Bangladesh, and containing the world's largest region of mangrove forest within its ten-thousand-square kilometers; Sundarbans National Park was designated a World Heritage Site in 1987 for its fragile ecosystem and abundant Ganges Delta wildlife.

goddesses of Greece. Even in mythical travels in the underworld, the Ganges forever points the way to paradise.

The river itself is born in the Gangotri glacier in the high Himalayas, and it flows 2,510 kilometers to the Bay of Bengal. The Gangotri glacier is a mountain of ice 32 kilometers long and close to 4 kilometers wide surrounded by peaks six or seven thousand meters high. From there the river's two main sources, the Alakananda and the Bhagirathi, flow past the sacred villages of Gangotri and Badrinath, revered centers of pilgrimage. The two streams merge just above Rishikesh and enter the plains at Haridwar (Hardwar), the Gate of Vishnu (Hari is a name of Vishnu; *dvara*, the Sanskrit word for "door" or "gate").

Pilgrims gather at Haridwar in May and September to provision for the long journey north. The water at Haridwar and at Rishikesh is considered the river's holiest, and people travel great distances to fill their vessels for special occasions, such as marriages, deaths, or when they must call on the Ganges to remind them of the dreams that have faded from their hearts.

In the Ganges Valley the river is joined by another sacred river, the Jumna (Yamuna). Legend has it that the two rivers are joined by a third, invisible course, the Sarasvati, which can be seen only through the eye of wisdom. This point where the three rivers meet, known as *triveni* (the three braids), is the place of oneness, where opposites cease to exist and the true believer steps beyond time.

Bengal, more than elsewhere along the river's course, feels the power of the Ganges. In Bengal its restless current has created and destroyed great cities, and its shifting silt has devastated entire regions. No wonder the river is so prominent in the literature and religion of the delta. The folk poet Phatik Chand sang:

On a river without water, a lotus blossom floats
while gazelles leap silver in the moonless night.
Whoever can surmount the vortex of Triveni,
where three rivers meet,
will float forever on the waves of time.

Such is the dream of the Ganges that people carry
in their hearts.

GANGTOK (2001 pop. 29,000). The capital of Sikkim State in northeastern India, Gangtok ("top of the hill") is wedged between Tibet, Nepal, and Bhutan on a long ridge flanking the Ranipul River, with breathtaking Himalayan views. It was the government seat of the kingdom of Sikkim until the area was annexed by India (1975). Tradition, hospitality, and ceremony prevail over speed in this version of Shangri-la, where steep slopes are striped with rice terraces and plantations of tea or cardamom, and temples and fairy-tale towns hang on the faces of sheer cliffs.

The capital is an active market center for corn, rice, oranges, spices, subtropical fruits, Nepalese silver spread on sarongs, and the work of tribal weavers; gardens bloom with hundreds of varieties of orchids and rhododendron. Gangtok has a hospital, secondary school, law court, and modern shops, hotels, and cinemas, along with the former royal palace and chapel, Enchey Monastery, and the Namgyal Institute of Tibetology, including a library and museum. The Buddhist monastery of Rumtek lies to the southeast. Mask dances performed by lamas in the monastery courtyards are among the most colorful in the world. Gangtok's spectacular scenery has made the city a popular vacation destination among Bengalis, especially during the ten-day Durga Puja holiday in September and October.

GANSU (2002 est. pop. 27.1 million). Gansu (Kansu) Province is located in northern China at the upper reaches of the Huang (Yellow) River. In the west, the province borders on Qinghai and Xinjiang, in the north on Mongolia, in the east on Ningxia and Shaanxi, and in the south on Sichuan. Gansu covers an area of 454,000 square kilometers and divides into three distinct topographical regions. The western region composes part of the Gobi desert and the so-called "Gansu corridor," a more than 1,000 kilometer-long and only 50 to 70 kilometer-wide east-west passage between the Tibetan Plateau in the south and the Gobi Desert in the north. The Gansu corridor was an important part of the ancient silk route, and agriculture in the oases here depend on the glacial streams from the Tibetan Plateau. The main crops are wheat, sugar beets, and cotton. The central region is part of the great loess plateau of northern China, an extremely eroded area, parts of which are the poorest districts in China. The southern region is a mountainous earthquake area rising between 2,000 and 4,000 meters above sea level.

About 90 percent of Gansu's population is Han Chinese. The remaining 10 percent is distributed over a number of minority nationalities who are either Muslims or who belong to Tibetan religions. The capital of the province, Lanzhou (1996 estimated population of 1.5 million), is situated in the rich agricultural area of the Huang River valley in the central region.

Gansu has been under Chinese control and influence on and off since the third century BCE and has played a continuously important role in trade between Central Asia and China. When China was strong, Gansu constituted the western frontier of China, and the Great Wall ends here. During the Yuan dynasty (1279–1368), Gansu became part of the empire along with Xinjiang and Qinghai. The suppression of a Muslim rebellion in 1862–1878 almost devastated the area, and in 1928 Xinjiang and Qinghai became independent provinces. The present borders of Gansu changed several times in the twentieth century, and in 1958 a large part was cut out to become Ningxia Hui Autonomous region. In the fertile river valley of the central region, agricultural products such as millet, wheat, tobacco, melons, and fruit dominate. Gansu mainly has heavy industry, which is concentrated in and around Lanzhou, and manufactures heavy machinery, petrochemical products, and nonferrous metals. The pollution of the industrial center is high.

GAO XINJIANG (b. 1940), Chinese writer and Nobel Laureate. Gao Xinjiang, the first Chinese-language writer awarded the Nobel Prize in literature, in 2000, was born in 1940 in Ganzhou, Jiangxi Province, China, and grew up in a family that encouraged his interest in art, literature, and music. He studied French literature at the Beijing Foreign Language Institute from 1957 to 1962 and worked after graduation as a French translator for a bookstore.

During the Cultural Revolution (1966–1976), along with numerous other intellectuals in China, he had to destroy all his writing and go to the countryside for "rehabilitation." After the Cultural Revolution, however, he emerged on the literary scene as an important writer for his short fiction, plays, novels, and literary criticism. His essay entitled "Preliminary Exploration into the Techniques of Modern Fiction" contributed to the demolishing of "socialist realism," the then-regnant method of literary representation under Mao Zedong (1893–1976). But on the whole, Gao's voice was heard in China not so much for his fiction or literary criticism as for his works in such experimental plays as *Bus Stop*, a work highly reminiscent of Samuel Beckett's *Waiting for Godot*.

After he left China to settle in Paris in 1987, Gao supported himself mainly by painting. Meanwhile, he continued to write his novels and plays, which gradually gained recognition in France and Australia, though remaining less studied in Britain and the United States. His winning the Nobel Prize "for an oeuvre of universal validity, bitter insights and linguistic ingenuity," as the Swedish Academy stated, and his claim in his Nobel speech that literature is an apolitical enterprise, were not received without a sense of irony, since his selection and his award of the prize are felt by many to be unavoidably a political statement.

GARABIL PLATEAU Situated mainly in southeastern Turkmenistan, the Garabil (also spelled *Karabil*) plateau is a geological curiosity whose deposits of rock salt are among the largest in the world. The plateau marks the end of the sandy Turkmen Karakum Desert, between the Murgab and Amu Dar'ya Rivers. This area represents the foothills of the Paropamisus Mountains, part of the Hindu Kush, located in northern Afghanistan.

The plateau is rather low (only 832 meters at its highest point) and is semidesert; it is highly eroded, with large ancient valleys and basins. The region is known for its great variations in temperature and its rare precipitation. Savanna and groves of wild pistachio are the most common vegetation. However, the ecoregion has a wealth of plant and animal life, with more than 1,100 species of vascular plants (ferns) and a variety of birds, reptiles, urials (wild sheep), onagers, and gazelles.

Mainly used for pastures and for a little agriculture, the Garabil plateau is also of great economic importance because of large deposits of rock salts, estimated at 4 billion tons. Since Turkmenistan's independence, these deposits have begun to be cataloged and exploited.

GARCIA, CARLOS P. (1896–1971), fourth president of the third Philippine republic. Garcia was born in the town of Talibon on the island of Bohol. His father served as mayor of the town for four terms. Garcia earned a law degree from Philippine Law School in 1923 and taught high school for several years after that. Due to his poetic abilities, he was known as the

"Bard from Bohol." He entered politics in 1925 as a member of the Nacionalista party and served as congressman of the third district of Bohol until 1931, when he became governor of Bohol. In 1941, he was elected senator, and was reelected after World War II. He became vice president in 1953. He assumed the presidency when President Ramon Magsaysay died in a plane crash on 17 March 1957. He subsequently won the presidency in his own right in elections of November of that year.

When Garcia won the presidency, his running mate, Speaker of the House Jose Laurel, Jr., was defeated by Diosdado Macapagal, marking the first time in Philippine politics that the president was elected with a vice president from the opposition. (Macapagal was from the Liberal Party.)

With serious economic problems confronting the Philippines, Garcia advocated fiscal austerity. He opposed a return to free enterprise in the Philippine economy and put forward the Filipino First policy, seeking economic independence from foreign dominance for the Philippines. His administration was tainted by corruption and, along with the dissatisfaction in some quarters with his nationalistic Filipino First policy, this led to his defeat in 1961 by Diosdado Macapagal.

Garcia was a delegate from his home district to the 1971 Constitutional Convention. He was elected president of the Constitutional Convention on 11 June 1971, but died three days later.

GARDENING—CHINA The Chinese garden is in essence an encapsulation of nature in a prescribed framework. Gardens are considered venues for spiritual and artistic endeavors, loci for celebrations, and themselves works of art. The history of Chinese gardens is complex and divergent, and it is important to understand not only their design principles, but also the spiritual basis of their construction.

History of Chinese Gardens

Two main garden traditions in China evolved over time: the vast imperial gardens, emblematic of the

power and wealth of the empire; and the scholar, or literati, gardens, built as retreats from the onerous world of officialdom. The earliest references to gardens in China are found in Zhou-dynasty (1045–256 BCE) records describing vast tracts of land to be reserved for hunting parks for kings and princes. Success in the hunt was a metaphor for a successful reign. Later, in the *Chu ci* (Songs of Chu), a fourth-century BCE text, a shaman singer attempts to entice the soul of a dying king back to life with a description of the beauties of a garden with winding streams, lotus lakes, and distant views of the mountains. In the Shanglin park of China's first emperor, Zheng (Shi Huang Di) (259–210 BCE), were countless animals, birds, and exotic plants gathered as tribute from vassal states, thus creating a living replica of his entire domain. Poets such as the famed Tao Yuanming (365–427 CE) recorded in verse the pleasures of strolling through one's garden. Both the Sui (581–618) and Tang (618–907) dynasties saw the further development of imperial and individual gardens. Wang Wei (699–759) created his Wangchuan villa in Lantian County, Shaanxi, a rustic retreat immortalized in poetry and paintings for centuries as the epitome of the scholar's retreat.

The Song dynasty (960–1279) gave rise to the proliferation of urban literati gardens, and at Kaifeng, Song Huizong (1082–1135) erected the Gen Yue mountain, an artificial construct approximately seventy-seven meters tall, including many famous garden rocks. Kublai Khan (1214–1294) of the Yuan dynasty (1279–1368) built at Beijing an extravagant city complete with lakes and hunting parks. The subsequent Ming dynasty (1368–1644) revised and embellished the Forbidden City with myriad courtyards and gardens and developed the Park of the Sea Palaces, a vast complex of gardens and retreats for the imperial family. The most famous of the gardens of the Qing dynasty (1644–1912) was the imperial Yuan Ming Yuan, commissioned by the Qianlong emperor (1711–1799), within the precincts of which were countless watercourses, pavilions, libraries, farms, training fields for the emperor's soldiers, and European-style fountains and buildings.

Cosmology of Chinese Gardens

The unique character of Chinese gardens has its roots in Chinese philosophy, most notably Taoism. A garden was seen as a mirror of the natural world. Everything in the universe was created from and a conduit for *qi* (vital energy, or life force). The universe was understood to be a combination of yin (female) and yang (male) elements in a state of constant fluidity. A balance of opposites in the construction of buildings, nat-

Gardens and pagoda at the Yu garden in Shanghai, China, in 1996. (STEPHEN G. DONALDSON PHOTOGRAPHY)

ural features, and plantings was a goal of the garden designer. Recreating the natural world in a garden was thought to replicate the benefits of immersing oneself in nature, a belief similar to ideas about the benefits of landscape painting. Scholars whose official duties prevented them from visiting the mountains could enjoy the benefits of nature in their own gardens. The ancient practice of feng shui (literally, "wind-water," often translated as geomancy) consisted of situating homes, buildings, graves, and gardens properly in a landscape to receive the optimum benefit.

Elements of the Garden

The two main elements of a garden are rocks and water, symbolizing the yang and yin, respectively. Traditional Chinese gardens are constructed in a series of walled outdoor courtyards, joined by walkways or doorways. Use of garden rocks (yang) at strategic locations within a garden brings to mind the mountain ranges and peaks of nature. Incorporation of a watercourse, pool, lake, or cascade adds the water (yin) and

all its mutable forms. Plants are included for literary and cultural references, for seasonal suitability, and for aesthetic reasons, such as the beauty of their shadows against the light garden walls, or the harmony of the sound of wind and rain in their foliage. Buildings such as *ting* (pavilions with open sides), *xie* (gazebos), *tang* (formal halls), and covered walkways make accessible the featured sites in the gardens and the effects of the changing hours of the days and seasons.

Such garden structures are named with references to classical literature, and the addition of calligraphy adds another layer of appreciation to the garden. Often potted plants are placed in courtyards at the peak of their blooming seasons, and pools and lakes house water lilies, lotus, and fish. Gardens also include rockeries that are constructed of aggregates of bizarrely shaped rocks made into miniature mountains or roofs for artificial caves, both symbolic of the entrance to the realms of immortals and useful as an escape from the heat of summer.

Yuan Ye (The Craft of Gardens, datable to 1631–1634), written during the late Ming dynasty by Ji Cheng (late sixteenth–early seventeenth century), is considered the classic text on garden design. Encompassing both practical and aesthetic advice, the manual advises the garden designer to be sensitive to the proper use of contrasts and juxtapositions of elements and to seek the essence lying behind the forms. Details concerning window lattice patterns, doors and wall openings, brickwork for paths, and suitable alignment of the garden with existing landscape features are included.

Chinese Gardens Today

Beihai Park in Beijing in the Forbidden City, which was first built in the tenth century as a hunting lodge, currently encompasses approximately 67 hectares of lakes and artificial islands. There an example of a pre-revolutionary walled garden, the Limpid Mirror Studio (Jing Qing Zhou), once housed the Qing-dynasty princes. The West Lake in Yangzhou had its origins in the Sui and Tang dynasties. Suzhou's gardens include the Shizi Lin (Stone Lion Grove), built around 1336 for a Buddhist monk, Tian Ru, and the Wang Shi Yuan (Garden of the Master of the Fishing Nets), first constructed there in 1440.

Suzhou also contains the Zhouzheng Yuan (Garden of the Unsuccessful Politician). The Zhouzheng Yuan has antecedents dating back to the Tang dynasty. It has been variously a Confucian scholar's home, a garden, a Buddhist monastery, and a warlord's headquarters. It has changed hands many times and once was even sold

to pay gambling debts. It is most renowned for its association with the Ming artist Wen Zhengming (1470–1559), who lived there for a time and recorded it in paintings. Wen Zhengming, a Wu School artist and one of the so-called four masters of the Ming, was an unsuccessful politician who after many failed attempts at success in the imperial examination system finally secured a minor post but quickly relinquished it to devote himself to artistic pursuits and teaching.

Hangzhou's West Lake is one of China's most beloved parks. Many new Chinese gardens have been built within the last twenty years in America, notably the Astor Garden Court at the Metropolitan Museum of Art in New York City and the Chinese scholar's garden at the Staten Island New York Botanical Garden.

GARO The Garo are a tribal people of India, about half a million of whom live in the Garo Hills of Meghalaya, northeastern India. Others live in neighboring West Bengal, Assam, Nagaland, and Tripura. In Meghalaya they are the major Scheduled Tribe (an ethnic subgroup that has faced discrimination and economic privation). They are well known as a matrilineal society who practice shifting cultivation. Being so numerous, they are divided into several dialectal and cultural groups, but nonetheless there is a strong sense of Garo identity, and the culture is still fairly uniform. The biggest distinction today is between Christian and non-Christian Garo, who live in separate villages.

The Garo have uxorilocal households; that is, a man usually finds himself living with his wife, her parents, her sisters, and all their children. The oldest of the sisters is recognized as the heiress. Neolocal residence (establishment of a new household rather than residence with a spouse's parents) also occurs today.

The society is divided into five matrilineal descent groups, or phratries. The clans that make up each phratry are exogamous; that is, members are required to find a spouse who is not a member of the same clan. Within each clan the most significant unit is called the

machong, a group of close matrilineal relations who play a key role in the formation and maintenance of each household, and in controlling the cross-cousin marriages. Only an heiress is expected to marry her father's sister's son, while other girls are free to marry more distant cross-cousins. In common with a number of other Indian tribes, the institution of the bachelor's dormitory—a building where young unmarried men lived—was until quite recently an important social institution.

The traditional Garo religion is Sangasarek, which recognizes a supreme being, but is much concerned with the propitiation of spirits that may otherwise bring misfortune. Today, however, about 70 percent of the population is Christian, an effect of British missionary work in the late nineteenth and early twentieth centuries that followed upon British seizure of the area in 1873.

Several centuries ago the Garo were infamous as headhunters. The isolation this fostered gave way to numerous trade links with the plains, usually through bartering goods with Koch, Bengali, and various other Hindu or Muslim traders. Garo still go to the plains to sell baskets, ginger, chilies, and bamboo mats, getting rice in exchange. The traditional form of shifting cultivation, called *jhum*, is still practiced by about half the Garo today. Other land is farmed on a permanent basis, and is losing some of its fertility thereby.

GAWAI DAYAK *Gawai*, a ritual festival, is celebrated by the Dayak people (a collective name for the native ethnic groups of Borneo, an island in the Malay Archipelago). *Gawai* is a form of communication with the spirit world. It is important to communicate with the spirit world in order to obtain blessings and to thank the spirits that have aided the Dayaks in agriculture or in healing an ailment. This ritual, involving chants and incantations, is a way to show gratitude to the spirits for the good harvest and health of the Dayak people.

There are four main *gawai*: rituals connected with cultivation of rice; with health and longevity; with acquisition of wealth; and with headhunting and prestige. The celebration of all *gawai* involves a series of

rites—first, sacrificial offerings (*piring*) are made; second, there is a cleansing ceremony (*biau*), which involves a summoning of spirits by incantation and a slaughter of cockerels and waving them as another sacrificial offering to the spirits; and third and most important, prolonged sacred chanting (*timbang* or *pengap*) by ritual experts or bards (*lemambang*).

Today, a *gawai* is usually a festival celebrating the Dayaks' bountiful harvest. (The other types of *gawai*, especially related to healing and head-hunting, are rarely practiced today due to modernization and mass conversion of the Dayaks to Christianity.) The festival marks the end of one paddy-harvesting season and the beginning of another. It is a time to show gratitude to the gods for the good harvest and to ask for their blessings for the coming season. The contemporary Gawai Dayak is a statewide celebration in Sarawak (a state on the island of Borneo), and is also an occasion to renew communal and cultural ties as well an opportunity for the Dayaks to share their festive mood with other communities.

GAZIANTEP (2002 pop. 795,000). Gaziantep, previously Aintab ("good spring") and commonly referred to as Antep, is the capital of Gaziantep Province in southeastern Anatolia, Turkey, forty-five kilometers from the Syrian border. Situated where important routes converge and first settled by the Hittites, Antep assumed importance only after the Byzantines captured Duluk (Doliche, now Dulukbaba) in 962. During the First Crusades (1096–1099) Antep was ruled by Armenian Philaretus and fell to the Byzantines in 1150 only to be captured by the Seljuks of Konya in 1151. After falling to various peoples, it became part of the province of Aleppo in 1153.

Timur (Tamerlane, 1336–1405) captured Antep in 1400, and various Turkmen dynasties conquered it before it fell to the Ottomans in 1516. Antep was occupied by the English in 1919 and by the French from

1920 to 1921. Mustafa Kemal Atatürk (1881–1938), founder of the Turkish Republic, renamed it and added the prefix *Gazi* ("Muslim warrior for the faith") in honor of the Turkish nationalist forces who withstood a ten-month siege by French troops at the end of World War I.

Today Gaziantep is renowned for its pistachio nuts (*antep fistigi*) and the grape preserve called *pekmez*. Economically the city has benefited from the GAP Project (*Guneydogu Anadolu Projesi*, Southeastern Anatolia Project), a massive hydroelectric project under construction since 1974.

GEISHA Geisha are professional entertainers and hostesses, skilled in the traditional Japanese arts. They are found throughout Japan; the largest and most highly respected geisha districts, however, are in Kyoto and Tokyo. The Western tendency to associate geisha with prostitution is based on a misunderstanding. The word "geisha" literally means "arts person," and a geisha must undergo rigorous training in the traditional arts—playing *shamisen* and *koto* (traditional Japanese stringed instruments) and dancing *nihon buyo*. Her job is to create a convivial atmosphere for her customers, typically wealthy businessmen and politicians, and entertain with music, dance, and intelligent conversation.

Male entertainers in the seventeenth century were the first to call themselves geisha. By the mid-eighteenth century they were outnumbered by female geisha, who were looked to as trendsetters and fashion icons. Bound by a code of secrecy, geisha became the confidants of important men and were influential in political affairs. The numbers of women who became geisha decreased during the twentieth century, although there are still several thousand and the profession shows no immediate signs of dying out.

Prior to World War II, geisha began their training before puberty and many girls were sold to geisha houses (*o-kiya*) by their impoverished parents. Those showing aptitude would be permitted to commence training as *maiko* (novice geisha), bound to the adoptive geisha mother by a strict contract. In the early 2000s, girls may apply to join a geisha house and become a *maiko* upon completing middle school. A *maiko* accompanies senior geisha to parties, wearing an or-

Geishas laughing at a party in the Gion district of Kyoto, c. 1993. (MICHAEL S. YAMASHITA/CORBIS)

nate long-sleeved kimono, an elaborate hairstyle, and distinctive thick white makeup. After several years of intensive artistic training, she must decide whether to become a geisha or to leave the geisha world. Transition to geisha status is marked by a ceremony and the adoption of more sober dress. Geisha may eventually leave their geisha house to set up their own establishment. Lesson fees and clothing costs are very high and many geisha receive financial support from a patron. A geisha must give up her profession upon marriage.

Geisha entertain at special teahouses (*o-chaya*), where Japanese-style rooms may be rented and food and drink is served. An air of exclusivity is an essential aspect of the geisha world, and accordingly, new patrons must be recommended by established customers and fees are extremely high. The geisha world has inspired numerous plays, films, and novels, including *Madam Butterfly* (1904), Nagai Kafu's *Geisha in Rivalry* (1917), and Arthur Golden's *Memoirs of a Geisha* (1997).

GENGHIS KHAN (c.1162–1227), Mongolian ruler. Genghis Khan, also known as Chinggis or Chinghiz Khan, was born with the name of Temujin. After surviving tribal wars in Mongolia following the death of his father Yesugei, Temujin built a tribal confederation that dramatically restructured Mongolia.

After rising to power in 1185, Temujin experienced numerous setbacks and eventually victories. By 1206 Temujin was the paramount power in Mongolia and received the title Genghis Khan (thought to mean Oceanic Ruler). The years between 1185 and 1206 were, without doubt, the most difficult years for one of the most feared and respected men in history.

After uniting the various tribes of Mongolia into the Mongol supra-tribe, Genghis Khan went on to conquer much of northern China and Central Asia. In 1209, the Uighurs voluntarily submitted to Genghis Khan. Later in that year, the Mongols began their conquest of the Tangut kingdom of Xi-Xia, located in northwestern Gansu Province of China. After the Tanguts submitted in 1210, hostilities erupted between Genghis Khan and China's Jurchen Jin dynasty (1125–1234). Although the Jin were not defeated until seven years after Genghis Khan's death, the Mongols conquered much of northern China during his lifetime.

Genghis Khan led his army toward Central Asia in 1219. In fighting with the Khwarazmian empire, the Mongols utterly devastated most of Central Asia and eastern Iran. After the destruction of the Khwarazmians, the Mongols withdrew to deal with their disobedient vassal Xi-Xia, which had refused to send troops for the campaign in Central Asia. It was during this campaign that Genghis Khan died from internal injuries suffered after he fell from his horse while hunting in August 1227.

His wars were as often a matter of retaliation as they were for territory or riches. Genghis Khan's organizational and strategic genius created one of the most highly disciplined and effective armies in history, but this same genius gave birth to the core administration that ruled it. Even after his death, the Mongol armies dominated the battlefield until the empire stretched from the Pacific Ocean to the Adriatic Sea.

His nonmilitary achievements include the introduction of a writing system to the Mongols, the ideal of religious tolerance throughout the empire, and unity among the Mongols. Genghis Khan's accomplishments should not be seen in terms of territory or military victories but in the presence of a Mongol nation and culture. Mongols still venerate him as the founding father of Mongolia.

GERINDO Gerindo (Gerakan Rakjat Indonesia, Indonesian People's Movement), an Indonesian national political party, was formed in May 1937. Its leaders included A. K. Gani (1905–1958), Muhammad Yamin (1903–1964), and Amir Sjarifuddin (1907–1948). Like the earlier Partai Nasionalis Indonesia Baru (New Indonesia Nationalist Party), Gerindo's aim was to raise public consciousness of nationalist ideas by organizing the people. Gerindo's foundation, however, also reflected a growing willingness on the part of many left-wing Indonesian nationalists to cooperate with the Dutch. This willingness arose both from despair over the prospects for organizing effective nationalist resistance in the face of Dutch military and police power and from a conviction that collaboration against fascism (especially Japanese fascism) had the highest priority in world affairs. Gerindo hoped to achieve from this collaboration a full parliament for Indonesia. Shortly before the Japanese attack on Java, Amir Sjarifuddin received funds from the Dutch authorities to organize underground resistance. This movement was quickly ended by the Japanese, however, who also banned Gerindo along with all other political parties.

Gerindo's willingness to work with the Dutch prefigured the postwar strategy of the Socialist Party—including that of Amir Sjarifuddin as defense minister and later prime minister of the Indonesian Republic—in making far-reaching concessions to the Dutch to obtain international recognition of Indonesia's sovereignty.

GERMANS IN CENTRAL ASIA Germans were first invited to settle in the Russian empire by Empress Catherine II. Large German communities on the lower Volga, the Black Sea coast, the Transcaucasus, and other areas prospered and soon sent out their own settlers. Several thousand Germans made their way to various parts of Russian Central Asia. By the outbreak of World War I, more than 50,000 settlers were living there and were cultivating more than 300,000 hectares.

Following the Russian Revolution the Soviet government initially seemed to favor the German minority, which received the first autonomous area (ASSR) in 1924. Things changed quickly, though, and the collectivization campaigns saw thousands of Germans sent into exile to Siberia and Central Asia. After Nazi Germany's invasion of the Soviet Union in June 1941, ethnic Germans were immediately suspected of collaboration. Mass deportations of German communities in Russia, the Ukraine, and the Caucasus began on the day the Germans invaded. Hundreds of thousands were deported to Central Asia. By 1945 more than 400,000 ethnic Germans had been deported to Kazakhstan alone. Though many Germans opted to emigrate after they were granted the right to leave their places of exile in 1972, substantial German communities remain in Central Asia, especially in Kazakhstan.

GESER KHAN Although Geser Khan may have been a historical personage, he is primarily known as a protective deity of warriors and herds in Mongolian religion, both Buddhism and Shamanism, as well as in literature. The numerous epics concerning Geser Khan are rich sources of information about Mongol mythology and cosmological beliefs. He is particularly revered among the Buryat Mongols of Russia. It is thought that the worship of Geser Khan did not enter Mongolia until the early seventeenth century.

The Geser Khan of the Mongols may be the same figure as the Geser Khan of the Tibetans. They share many characteristics, both as cult and literary figures. Despite Geser Khan's possible Tibetan origin, the Mongol epics are distinct from their Tibetan

counterparts. For example, whereas the Tibetans deified some of the companions and opponents of Geser, this appears less frequently in the Mongolian cult of Geser.

In the Mongol tradition, Geser Khan comes into the world to rid it of evil for the betterment of humankind. Throughout time, Geser Khan's importance in Shamanism and Buddhism has remained constant for the Mongols, and special shrines to him existed into the 1940s. Some shrines may remain today; however, Soviet influence, whether overt or covert, seriously undermined not only the Buddhist religion among the Mongols but also the folk religion so that many traditions died out. Whether the Geser cult remains today is uncertain but probable, as more and more Mongols have begun to seek out their past religious systems. The epic certainly remains a vital part of Mongolian literature.

GESTAPU AFFAIR The Gestapu affair was an ambiguous and abortive leftist coup on 1 October 1965, which triggered the end of Indonesia's Guided Democracy period. The term "Gestapu" is an acronym of Gerakan September Tiga Puluh (September Thirtieth Movement); Indonesians now generally use the term "G-30-S."

Troops under Lieutenant Colonel Untung, commander of the Presidential Guard, allegedly conducted the coup, ostensibly to prevent an expected rightist coup by pro-Western generals. Six senior generals, including the army commander General Achmad Yani, were killed, though the defense minister General A. H. Nasution escaped. Plotters seized radio and telecommunications buildings and formed a Revolutionary Council but otherwise failed to follow up their actions. The coup was suppressed within twenty-four hours by Strategic Reserve troops under General Suharto.

Contemporary observers believed the coup was directed by the Indonesian Communist Party (PKI). The failed coup provided a pretext for a massacre of party members in which perhaps 500,000 people were killed, mainly in North Sumatra, Central and East Java, and Bali. Hatred of the Communists was exacerbated by the deliberate spreading of false rumors that the generals were tortured before being killed. More than a million people were detained for longer or shorter periods on grounds of "involvement" in the coup, though the events of 1 October were clearly the work of a small group of conspirators. Even in the early 1990s, family or other connections with those "involved" could mean exclusion from sensitive jobs, including teaching. Most of the conspirators themselves were tried in 1965–1966 in special military tribunals and then executed.

Evidence of PKI involvement in the coup is slight, and the leftist officers involved possibly acted mainly on their own initiative, though they would have expected approbation from the PKI and perhaps from President Sukarno, who feared a rightist military coup. Circumstantial evidence suggests that Suharto may have encouraged, or at least known of, the coup plans, which he was then in a position to foil and exploit to his advantage. Lack of evidence still makes it impossible to reach a conclusion on the origins of the coup, but the general scholarly consensus is that the PKI was too weak to take power and that the coup was a pretext for rather than a cause of the military takeover.

GHALIB, MIRZA ASADULLAH KHAN (1797–1869), Indian poet. Ghalib (Mirza Asadullah Khan), commonly regarded as the greatest Urdu poet, also wrote poetry and prose in Persian and was a great wit and conversationalist. Born to a noble family of Mughal descent in Agra, India, he migrated to Delhi around 1813 and later became the poetic mentor of the last Mughal emperor, Bahadur Shah Zafar (1837–1858). As he was accustomed to living like an aristocratic nobleman, his needs far out-

stretched his means, so that he was forced into a life of penury.

Ghalib started writing poetry at a very early age under the pen name Asad, which he later changed to Ghalib. A study of his earliest manuscripts demonstrates that he produced most of his significant verses before he was twenty-one. He spent much of his youth writing poetry in Persian, putting together his Persian Diwan (*Diwan-e Farsi*, c. 1835) at least three years before the Urdu Diwan (*Diwan-e Ghalib*, c. 1838). His two collections of letters, *Ud-e Hindi* (Indian Harp) and *Urdu-e Mua'lla* (High Urdu), show him to be a classic writer of Urdu prose. *Dastanbu* (Persian, Pellet of Perfume, 1858) records his impression of the 1857 upheaval (the Sepoy Mutiny; also regarded by some as the first war of Indian independence), while *Mibr-e Nim Roz* (Persian, Midday Sun, 1854–1855) is the first volume of a projected multivolume history of the Timurid dynasty (ruled in India 1513–1857, with a brief interruption of Pathan rule).

However, Ghalib's Urdu Diwan, containing 1,458 verses, has been most instrumental in establishing his reputation as a great writer. Each generation reads the poetry of Ghalib for its own reasons; the metaphysical cogitations and the tough intellectual content strike a chord in every mind.

The themes of Ghalib's poetry are varied—love, the nature of human life and existence, people's role in the universe, free will versus predestination. However, love between a man and a woman, the traditional subject of the *ghazal* (Arabic, a poetic genre), does not substantially engage his mind, and he views this transcendental passion with profound skepticism. Ghalib was a product of the Sufi tradition and had a highly eclectic mind and an attitude of cheerful irreverence toward God and institutionalized religion. If he asserted the dignity and self-respect of people in their relationship with God, he also advocated the value of humans as human, regardless of their religion and race.

To Ghalib the poet, sorrow and pain are essential conditions of human life. He does not neglect or underplay any experience but savors each to the full, even if it is painful. To him every experience becomes an ontological end in itself, regardless of the attendant pain or pleasure. In one of his couplets, he yearns for the inclusion of hell in heaven, as that would provide greater scope for his mind and imagination. In another verse, he exhorts his heart to find solace even in sorrow's song, because one day the body would be deprived of even this sensation, having become insensate and inert. This insatiable appetite for new experiences

remains the driving force behind much of his poetry and imparts to his images a private significance and an illuminating power.

GHAZNA (2002 pop. 39,000). Ghazna is the old name of the present town of Ghazni, situated 145 kilometers southwest of Kabul in east-central Afghanistan at an altitude of 2,220 meters. The town is the administrative center of the province of Ghazni.

The early history of Ghazna is obscure. The town was probably the political center of the region of Zabulistan, invaded during the seventh century CE by the Arabs. In 977 CE, a slave commander of the Samanid dynasty, Sebuktigin, established himself in the city and founded the dynasty of the Ghaznavids. Under Mahmud of Ghazna (971–1030), it became the core of a vast empire, stretching from western Persia to the Indian subcontinent. With the decline of Ghaznavid power, Ghazna was sacked by the Ghurids in 1150–1151 and finally lost in 1163. Afterward, different kingdoms and empires, such as the Mongols, Timurids, and Mughals, contended for the city, but it never regained its old glory.

In 1747 Ghazna became part of the new Afghan kingdom of Ahmad Shah Durrani (1722–1773). During the first Anglo-Afghan War (1838–1842), the town was captured by the British, due to its important strategic position on the way to Kabul. During the twentieth century, Ghazni became the form in use for its name; the town rose again in importance as one of the main Afghan centers, mainly due to its geographical position along the Kabul-Kandahar road.

GIFU (2002 est. pop. 2.1 million). Occupying an area of 10,596 square kilometers, Japan's Gifu Prefecture is situated in central Honshu Island in the middle of the so-called Japan Alps region. Its primary geographical features are the Hida and Ryohaku mountain ranges and the Nobi Plain in the south. Gifu's main rivers are the Nagarakawa, Kisogawa, and Ibigawa. It is bordered by Shiga, Fukui, Ishikawa, Toyama, Nagano, Aichi, and Mie Prefectures.

The capital of the prefecture is Gifu, on the Nagara (Nagarakawa) River. The prefecture's other important cities are Ogaki, Tajimi, Kakamigahara, and Takayama. Gifu evolved from Inokuchi, the castle town of the Toki family during the Muromachi period (1333–1573). The warlord Oda Nobunaga (1534–1582) assumed control of the town in the late sixteenth century and changed its name to Gifu. During the Edo, or Tokugawa, period (1600/03–1868), Gifu flourished as a post station along the Nakasendo route, one of the five main highways that traversed Japan. Traditional crafts associated with the city include fans, paper lanterns, and paper parasols. A major attraction is cormorant fishing (*ukai*), the use of trained and colored birds to catch small river fish, which is carried out on moonless nights.

Present-day Gifu Prefecture was created from Hida and Mino provinces in 1876. As a historic crossroads of inland and marine routes, the region became the locus of such military encounters as the 1600 Battle of Segikahara, in which Tokugawa Ieyasu (1542–1616) defeated his enemies to become shogun, the paramount military leader of the newly reunified Japan.

As part of the Chukyo industrial zone, the prefecture produces lumber, pulp and paper, textiles, ceramics, and transportation equipment. Visitors are drawn to the scenic national parks and to the highland town of Takayama, known as "little Kyoto" for its fine old architecture and crafts, as well as for its Sanno Matsuri and Yahata Matsuri festivals.

GINSENG *Panax ginseng* (Chinese *renshen*), popularly known as ginseng, is China's best-known medicinal product and has been highly sought after both in China and abroad. The swollen root is used (usually the whole root) after careful cleaning, drying, and wrapping in paper. Also used are medicinal extracts made primarily with alcohol and, primarily to suit Western tastes for medicinal teas, ginseng powders. Ginseng belongs to the Araliaceae family and is one of a number of related plants used primarily for their effects on the brain and nervous system. In China, ginseng is most prized because of perceived benefits to the urogenital systems of aging males, whose sexual problems were a major focus in traditional Chinese medicine.

The natural range of ginseng is comparatively limited. In China it grows principally in the lush forests of Manchuria. It is also cultivated to replace and expand root sources in areas where wild ginseng has died out. By the nineteenth century, interest in ginseng as a cure-all had also grown in the West, and the remotest parts of Manchuria were soon penetrated from end to end by ginseng hunters. They advanced far into Siberia as Manchurian resources were depleted, and by the late nineteenth century, China was even importing ginseng from the United States and Canada, a trade that still continues to a limited extent, although both of these countries are now net importers of ginseng, mostly from South Korea.

GION MATSURI Kyoto's Gion Matsuri, or Gion Festival, is one of Japan's grandest festivals, consisting of a series of major and minor events throughout July. Dedicated to the deity of the Yasaka Shrine in the Gion district of Kyoto, the festival has a history of more than 1100 years. It originated as a purification ritual (*goryo-e*) to placate angry spirits. The highlight occurs on 17 July, when thirty-two magnificent festival floats, some as much as twenty-four meters in height and twelve tons in weight, decorated with sumptuous textiles and figures are paraded through the city, accompanied by dancers and musicians.

In 869 CE, when plagues were raging across the country, the emperor ordered that special prayers be

offered at Yasaka Shrine. The plagues abated, and a thanksgiving procession was held. The procession was repeated later, and in 970 CE it was decreed an annual event. The procession gradually became more and more splendid with large and increasingly elaborate floats. By the sixteenth century Kyoto's prosperous merchants competed to create the most spectacularly decorated floats, donating mechanical figures and fine tapestries from China, Persia, and Europe.

The thirty-two floats, each belonging to a Kyoto neighborhood, are of two types. The nine massive *boko* floats, roofed and topped by a long pole, are hauled by teams of forty men and carry musicians who play distinctive folk tunes. The twenty-three smaller *yama* floats display historical and mythological figures and sacred pine branches. Following construction by traditional methods, the floats and art treasures are displayed for a three-day "eve of the festival" period (*yoi-yama*) prior to the Grand Procession (*yamaboko-junkô*) on 17 July. The order of the floats is determined by drawing lots, and the lead float has the honor of carrying the *chigo*, a young boy chosen to represent the "celestial child." He is entrusted with the task of severing a sacred straw rope stretched across the procession route, symbolically allowing the floats to enter the realm of the gods. Following the parade the floats are returned to their neighborhoods and are taken apart quickly to banish any unlucky spirits the festivities may have attracted.

While retaining its importance as a purification rite, the Gion Matsuri has become a celebration of Kyoto's heritage and a source of enormous civic pride. The greatest of Kyoto's three foremost festivals, it is designated an Intangible Cultural Asset by the Japanese government and attracts more than a million spectators.

GOA (2002 pop. 1.4 million) The Indian state of Goa is approximately 400 kilometers south of Mumbai (Bombay). The states of Maharashtra and Karnataka lie to the north and southeast, respectively, and the Arabian Sea to the west. Goa occupies 3,702 square kilometers and has a population of 1,169,793. It is 62 percent Hindu, 34 percent Christian, 3 percent Muslim, and 1 percent "other." Divided into eleven *talukas*

The Dom Bosco Church in Goa. (EYE UBIQUITOUS/CORBIS)

(districts), Goa is governed by its chief minister. The union government in New Delhi appoints the governor, whose function is largely ceremonial. Its legislature is unicameral.

In addition to Goa University, there are numerous schools and colleges. The population of Goa is 77 percent literate, far above the national average of 52 percent. Goa's principal languages are Konkani (the state language), Marathi, and Kannada. Twenty newspapers have been published in English, Marathi, Konkani,

and Portuguese. English is the dominant language of journalism in Goa.

Goa is an agricultural state, rice being the principal crop. Coconuts, mangoes, and cashew nuts are also grown. The principal industries are iron mining and tourism. Although Goa is India's smallest state, it produces one-third of India's iron ore: annually, 14 million metric tons of iron ore are mined. Sandy beaches, temperate weather (25–30° C), and historical monuments make Goa a major tourist attraction.

The city of Old Goa is famous for the Sé Cathedral, the Basilica of Bom Jesus (which houses the sarcophagus of Saint Francis Xavier, the patron saint of Goa), and the Church of Saint Cajetan. Ponda is noted for the Mangesh, Mhalasa, and Mahalakshmi Hindu temples and the Safa Muslim mosque. Vasco connects Goa to the rest of India by rail, and the Dabolim airport is reached by domestic flights.

Panaji (population 43,165), the capital, is a port city on the Mandovi River. The origin of the name is uncertain. There are two possible meanings: *panalkhalli* ("place of running water") and *ponnje* ("marshy, fertile place"). The city of Old Goa was the original capital. When its population was decimated in 1759 following plagues, the viceroy moved his residence to Pangim (as it was known then). Pangim was renamed Nova Goa in 1843 and made the capital city.

Mormugao (population 83,200), at the estuary of the Zuari River, is the chief shipping center of Goa

CHURCHES AND CONVENTS OF GOA— WORLD HERITAGE SITE

These beautiful manifestations of the spread of Portuguese Catholicism in Asia were designated a World Heritage Site in 1986. The most famous of the churches, the Church of Bom Jesus, is popular with pilgrims all over the world who marvel at the mysteriously undecomposed corpse of Saint Francis-Xavier, the Apostle of the Indies.

THE SIGHTS OF COLONIAL GOA

"Goa, the Metropolis of *India*, under the Dominion of the Crown of *Portugal*, stands on an Island about 12 Miles long, and 6 broad. The City is built on the North Side of it, on a Champaign Ground, and has the Conveniency of a fine salt Water River, capable to receive Ships of the largest Size, where they ly within a Mile of the Town. The Banks of the River are beautified with noble Structures of Churches, Castles and Gentlemens Houses; but in the City, the Air is reckoned unwholsom, which is one Cause why at present it is not well inhabited. The Vice-roy's Palace is a noble Edifice, standing within Pistol Shot of the River, over one of the Gates of the City, which leads to a spacious noble Street, about half a Mile long, and terminates at a beautiful Church, called *Misericordia*. The City contains many noble Churches, Convents, and Cloisters, with a stately large Hospital, all well endow's, and well kept. The Market-place stands near the *Misericordia* Church, and takes up about an Acre square, where most Things of the Product of that Country are to be sold; and, in the Shops about it, may be had what *Europe*, *China*, *Bengal*, and other Countries of less Note furnish them with. Every Church has a Set of Bells, that one or other of them are continually ringing, and, being all christned, and dedicated to some Saint, they have a specifick Power to drive away all Manner of evil spirits, except Poverty in the Laity, and Pride in the Clergy; but, to those that are not used to nocturnal Noises, they are very troublesome in the Nights."

Source: Alexander Hamilton. (1702) *A New Account of the East Indies*, as quoted in *The Sabibs* (1948), edited by Hilton Brown. London: William Hodge, 23–24.

and, after Mumbai, India's largest port. Margao (population 58,500) is the chief industrial city of Goa, specializing in electronics, textiles, pharmaceuticals, plastics, and metals.

From the second century CE until 1312, Goa was under the Kadamba rulers, and for most of the fourteenth century Goa was dominated by Muslim invaders. It was annexed by Vijayanagar and later

conquered by the Bahmanis, who subdivided it in 1382, making it a part of the Bijapur kingdom, which it remained until the coming of the Portuguese. Alfonso de Albuquerque conquered Goa in 1510 and made it the headquarters of Portuguese possessions in India. Daman and Diu were added later. After India gained independence in 1947, a freedom movement led to the annexation of Goa by force in December 1961. Goa became a union territory in 1962 and a state in 1987. Daman and Diu have remained union territories.

GOAT The goat (*Capra hircus*), an even-toed hoofed animal that chews a cud, was probably domesticated in the area of present-day Iran in the mid-eighth millennium BCE and from there spread towards Southeast Europe. Its wild progenitors were three species: the markhor (*C. falconeri*), the pasang (*C. aegagrus*), and the extinct Balkan *C. prisca*. In recent times, domesticated goats have been kept throughout West Asia, South Asia, and northwestern China, as well as in the Mediterranean basin and Africa.

Being herded animals, sheep (*Ovis aries*) and goats are sometimes farmed together, with a goat serving as the leader of a flock of sheep. Yet their distribution is not identical, because sheep require dry grassland, whereas goats can flourish in a much wider variety of settings, including India and tropical Africa. Goats do better than sheep in the most marginal of dry lands.

Like other ruminants, goats have complex four-part stomachs in which vegetable food is slowly digested by a process of regurgitation and chewing the cud. They are about one meter in length, with hollow, curved horns, and are covered in long hair useful for spinning into thread. They produce one or two young at a birth; and the udders have two teats. Goat's milk is widely used for food, including cheese making, and goat meat is easily transported to market on the hoof.

GOBI DESERT The Gobi Desert, 1.3 million square kilometers (500,000 square miles) of rugged plains crossing Mongolia and northeastern China, extends roughly from the Great Khingan Mountains (Da Hinggan Ling) in the east to the Tian Shan in the west and from the Altun Shan, Qilian Shan, and Yin Mountains in the south to the Altay Shan and Hangai Mountains in the north. Under this definition the Gobi Desert extends approximately 1,600 kilometers from east to west and 480 to 960 kilometers from north to south. In the Mongolian language the term "gobi" refers to any vast, flat, dry area where people are scarce and where sand and coarse pebbles cover the ground. In fact several deserts on the Central Asian Plateau bear the name, including Gaxun Gobi, Junggar Gobi, Trans-Altay Gobi, and Eastern or Mongolian Gobi.

The Gobi Desert's chalky plateaus consist of bare rocks with intermittent areas of shifting sand. The climate is continental and dry, with severe winters and hot summers. Annual precipitation varies from 6.9 centimeters (2.7 inches) in the west to 20 centimeters (8 inches) in the east. The average lows in January drop to -40°C (-40°F), and the average highs in July reach 45°C (113°F).

Although the region's harsh terrain is a natural barrier, it would be a mistake to describe the land as life-

less. Shrubs and bushes grow on plains watered by mountain streams. Sandy desert occupies only 3 percent of the total area, and much of the Gobi is high mountains and dry grasslands. These areas are home to wild camels, sheep, ibex, snow leopards, lynx, and steppe foxes. The Gobi was also home to the modern world's last remaining wild horse species, Przewalski's horse, which disappeared from the Mongolian steppe in the 1950s but has been reintroduced to the region since 1992. Animals, grazing lands, and subterranean wells are abundant enough to support sparse human populations of one person per square kilometer.

In the twentieth century the Gobi became noted for its wealth of dinosaur fossils. In 1922 the Central Asiatic Expedition under the direction of Roy Chapman Andrews (1884–1960) first discovered the fossilized remains of dinosaurs in the region, and subsequent researchers found the remains of hundreds of dinosaurs in the Gobi Desert. Many of these finds, including *Oviraptor*, *Stegoceras*, *Protoceratops*, and *Velociraptor*, were the first of their kind. In some instances the fossils were lying on the desert floor, covered only by a thin layer of dust.

Although the Gobi region has supported a rich variety of flora and fauna from prehistoric to present times, increasing urbanization, livestock grazing, and agricultural development in the last century have upset the Gobi's delicate ecological balance in many areas. For example, the outskirts of cities, such as Sainshand, Mongolia, have seen brushy and grazable land turn to infertile shifting sands as herds overgraze near the city and motorized vehicle traffic increasingly tears up the Gobi's delicate surface. Both the Chinese and the Mongolian governments have instituted projects to counter this man-made degradation, but only time will tell if the Gobi desert is destined to become in actuality the wasteland that many outsiders think it is.

GODAVARI RIVER The Godavari (or Godavery) River, 1,445 kilometers long, originates in India's Western Ghats, in Nasik District, and then flows in a southeasterly direction across Maharashtra and Andhra Pradesh, bisecting the Deccan Plateau, and then cutting a valley through the Eastern Ghats in a magnificent gorge only 200 meters wide. Above this,

however, the river in parts is 2 to 3 kilometers wide. After crossing a vast fertile delta, the river empties into the Bay of Bengal through three main distributaries in the central part of Andhra Pradesh. Rice is grown on the delta, which benefits from a system of irrigation canals as well as the several distributaries. The main canals are all navigable, totaling some 793 kilometers in length, and irrigating 268,000 hectares. The catchment area of the river has been estimated at 290,600 square kilometers.

GODPARENTHOOD—PHILIPPINES In the Philippines godparenthood based on *compadrinazgo* or *compadrazgo* is known as the *compadre* or *kum-pare* system. It is the mechanism whereby new relationships are created through participation in certain rites of passage. Ritual kinship is created through sponsorship at baptisms, confirmations, and marriages required by the Roman Catholic Church. *Compadrinazgo* combines *padrinazgo* or spiritual godparenthood with *compadrazgo* or ritual co-parenthood, with *padrinazgo* emphasizing the vertical relationships, that is between godparents and godchildren, and *compadrazgo* stressing horizontal relationships, that is, between the godparents and the natural parents.

The *compadre* system is not indigenous to the Philippines but an alien institution that has been adapted at different times to meet specific circumstances. Found in Europe as early as the ninth century, the practice was brought to the New World by the Spaniards, where it was quickly accepted and later exported to the Philippines. The *compadrazgo* system includes a mixture of Spanish, Latin American, and Filipino aspects.

In Philippine societies, which were emerging from the kinship stage (Phelan) at the time of the Spanish intrusion, *compadrazgo* represented possibilities for extended kinship systems. Among the features of the *compadre* mechanism are its adaptability to different situations and changing needs. What began as a means of creating extended kinship evolved into a mechanism for survival in a society controlled by colonial powers. Family in the Philippines should be seen as "the strongest unit of society, demanding the deepest loyalties of the individual, and coloring all social activity with its own demands" (McCoy 1995: 1). As such, its responsibilities include providing employment and capital, educating and socializing the young, providing medical care, and sheltering the handicapped and elderly. While blood kinship might not

be able to meet all these needs, a system that includes extended kinship has a better chance of doing so. As a result, kinship in the Philippines is not primarily vertical but horizontal and expands within each generation, creating an ever-wider safety net of fictive relationships.

With the emergence of a local elite, the *compadre* system became a tool for reinforcing the patron-client relationship. Both sides of the equation can gain by entering into a *compadre* relationship. The weaker party, the client, seeks the assistance of the stronger, wealthier party. The patron gains the allegiance of others, and can use this for political, social, and economic power.

GODSE, NATHURAM VINAYAK (1911–1949), assassin of Mohandas Gandhi. Nathuram Vinayak Godse, perhaps the most notorious assassin of the twentieth century, was the Hindu fanatic who shot Mohandas (Mahatma) Gandhi dead on 30 January 1948 in Delhi. He was a member of the Rashtriya Swayamsevak Sangh (RSS), a political faction angered at what it saw as Gandhi's pandering to the Muslims of India and his "emasculatation of the Hindu community" through a long-standing policy of nonviolence (*ahimsa*). With the end of British rule, this radical faction wanted Hindu Raj, a chauvinistic Hindu government.

In that time of extreme tension between Muslims and Hindus on the subcontinent, a Muslim's attempt on the saintly Gandhi's life would have ignited a bloodbath even greater than the one that had marked the splitting of Pakistan from India. But Godse was, like Gandhi, a Hindu, albeit a militant extremist and

Godse (front row, left) and codefendants at their trial. (BETTMANN/CORBIS)

a Brahmin. He was editor of two magazines published in Pune by the Hindu Mahasabha, another political organization. The immediate cause of Godse's anger was Gandhi's embarking on yet another fast to protest the communal violence that was tearing India apart. A fellow conspirator, Madan Lal, had failed to kill Gandhi the previous day with a bomb explosion. But Godse shot Gandhi at point-blank range after bowing to him, while Gandhi was on the way to evening prayers. Godse was tried, defended himself eloquently, and was sentenced, with his associate Narayan Apte, to execution and was hanged on 15 November 1949.

GOH CHOK TONG (b. 1941), prime minister of the Republic of Singapore. Born in Singapore on 20 May 1941, Goh Chok Tong was educated at the elite Raffles Institution and later earned his B.A. from the University of Singapore in 1964. Upon graduation, Goh joined the Singapore Civil Service. In 1967, he earned a masters degree in economics from Williams College. Goh began his political career in 1976, becoming a member of parliament as a member of the ruling People's Action Party (PAP). In 1977, he became a minister of state for finance, and between 1979 and 1990 he held a variety of cabinet posts, including minister of trade and industry and minister of health. In 1985, Goh became minister for defense and the first deputy prime minister. In 1990, following the

Goh Chok Tong addressing the United Nations in New York in September 2000. (REUTERS NEWMEDIA INC./CORBIS)

resignation of Singapore's founding prime minister, Lee Kwan Yew (held office 1965–1990), Goh was elected prime minister. In addition to his cabinet posts, Goh has held senior PAP positions since 1979, including the post of secretary general, which he has held since 1992. Goh is a leading voice in the regional organization the Association of Southeast Asian Nations (ASEAN) and has overseen Singapore's consolidation as a regional financial and economic power. A devoted party loyalist, he has ensured the PAP's domination of Singapore politics.

GOH KENG SWEE (b. 1918), finance minister and minister of education of Singapore. Goh Keng Swee was born in Melaka to parents of Chinese ancestry. After earning a doctorate from the London School of Economics, he became finance minister of Singapore in 1959. When Singapore became independent in 1965, Goh embarked on a pragmatic program of industrial development, which was to be financed by foreign capital. His program brought prosperity to the island republic while neighboring countries floundered economically.

At the core of his development plan were incentives to foreign corporations. Foreign firms were allowed to operate in tax-free enclaves, exempt from local regulations pertaining to working and other conditions. As a result, Singapore induced many multinational corporations to establish Southeast Asian regional offices there.

In 1979, Goh became minister of education during a crisis in which the government feared that Singapore's students were not ready to meet the challenges posed by an economy based on high technology. In response, Goh revamped the public school system, stressing English as the preferred language of instruction.

Goh retired from politics in 1984. Subsequently, he has served as an advisor to the governments of the People's Republic of China and Singapore on economic matters. His legacy to Singapore is that it became one of the top-ten countries in the world in per capita gross national product, surpassing even Great Britain, by the 1990s.

GOLDEN CRESCENT The Golden Crescent is the name given to Asia's principal area of illicit opium production, located at the crossroads of Central, South, and Western Asia. This space overlaps three nations, Afghanistan, Iran, and Pakistan, whose mountainous peripheries define the crescent. In 1991, Afghanistan became the world's primary opium producer, with a yield of 1,782 metric tons, surpassing Burma, formerly the world leader in opium production. The Golden Crescent has a much longer history of opium produc-

tion than does Southeast Asia's Golden Triangle, even though the Golden Crescent emerged as a modern-day opium-producing entity only in the 1970s, after the Golden Triangle did so in the 1950s.

The distribution of opium in the Golden Crescent was a by-product of early commerce along the Silk Road and of Arab maritime trade. Indeed, places such as Kunduz and Kabul in Afghanistan, Peshawar in Pakistan, and the Makran coast of Pakistan served as commercial relays for merchants who undoubtedly traded in opium as early as the first century of the Common Era.

From at least the seventeenth century, the area's main opium-producing state was Persia (later Iran), until the Shah banned all production and consumption in 1955. Only as late as 1979, however, did opiate production really emerge with the establishment of the Islamic Republic of Iran and the Soviet invasion of Afghanistan. During the 1970s, Afghanistan produced a mere 90 to 270 metric tons of opium per year, almost the same yield as neighboring Pakistan, before the latter achieved 720-metric-ton crop in 1979. If Persia's prohibition of opium trade had earlier contributed to Golden Triangle opium production, the 1978 drought that affected Southeast Asia contributed, in turn, to the growth of the Golden Crescent, as shown by the doubling of Afghanistan's opium output in 1983.

Although Pakistan has almost stopped production, it still has a huge addicted population that relies on Afghanistan's opiates. Afghanistan doubled its production again in 1999, reaching a stunning 4,123 metric tons of dry opium. Afghanistan thus emerged as the world's leading producer of opiates before suddenly and dramatically reducing this production by 85 percent in 2001, when it was banned by the Taliban rulers. At the close of 2001, with the Taliban forced from power, opium production is reappearing.

The evolution of opium production in the Golden Crescent was clearly the outcome of the protracted twenty-year Afghan conflict. Afghanistan's current socioeconomic situation makes opium production one of the country's only available economic means of access to land, labor, and credit. Along with the Golden Triangle, the Golden Crescent (with Afghanistan as its preeminent producer) remains one of the world's main areas for the production of illicit opiates. Short-term trends show great irregularities of production, while long-term trends indicate continuing strength in the region's illicit opiates industry.

GOLDEN HORDE The Golden Horde is best known as that part of the Mongol empire that ruled the lands we now know as Russia from approximately 1237 to 1359. Originally, however, it consisted of those lands that Genghis Khan (1165–1227) bequeathed to his son Jochi (flourished 1184–1225). These consisted of the territories west of the Irtysh River (in modern Kazakhstan) and Khwarizm (in present-day Uzbekistan).

During the reign of Ogodei Khan (d. 1240/1241), the successor of Genghis Khan, the realm exploded in size. In 1237, Jochi's son Batu (reigned 1227–1255), assisted by Genghis Khan's famous general Sabutai (d. 1279), led a large army westward. They destroyed the Bulgar state, pacified the numerous Turkic tribes of the steppes, and conquered Russia's cities. In 1240, Mongol armies invaded Hungary and Poland. As news spread of the ferocity of the Mongol attack, Europe trembled in anticipation of an invasion that never came. In 1241, Ogodei Khan died and the Mongol armies withdrew to elect a new khan.

Batu established the Golden Horde, as his territory was known, as a semi-dependent part of the Mongol empire. The origins of the name Golden Horde are uncertain. Some scholars believe that it refers to the camp of Batu and the later rulers of the Horde. In Mongolian, Altan Orda refers to the Golden Camp or Horde. The golden color (*altan*) also connoted imperial status.

Batu died in 1255 and the next significant ruler of the Golden Horde was his brother Berke (1255–1267). Berke had converted to Islam and focused most of his energies against the Il-Khans of Persia. He completed an alliance with the Mamluks of Egypt, who also were enemies of the Il-Khans. The Il-Khanate collapsed in 1334.

The golden age of the Golden Horde occurred between 1313 and 1341, during the rule of Oz Beg (Uzbek) Khan. During this period, the Golden Horde

reached its pinnacle in terms of wealth, trade, influence, and military might. Also during this period Oz Beg Khan forced the conversion of the Golden Horde to Islam. During the mid-fourteenth century, however, the Golden Horde weakened as it, like much of the world, suffered from bubonic plague, civil wars, and ineffective rulers.

Toqtamish (reigned 1379–1391, 1392–1395) restored the Golden Horde to some of its former glory, but he also became embroiled in a series of wars with the Turkic conqueror Timur (Tamerlane; reigned 1369–1404). Timur emerged victorious; Toqtamish died in obscurity. The cities of Sarai and New Sarai were sacked and the trade routes never recovered from Tamerlane's predations. With the death of Toqtamish, the Golden Horde went into a downward spiral and eventually fragmented. By the mid-fifteenth century, it had shattered into the Crimean khanate, the Astrakhan khanate, the Siberian khanate, the Kazan khanate, the Nogai Horde, and the Great Horde.

GOLDEN TRIANGLE The Golden Triangle is one of Asia's two main illicit opium-producing areas. It is an area of around 350,000 square kilometers that overlaps the mountains of three countries of mainland Southeast Asia: Myanmar (Burma), Laos, and Thailand. Along with Afghanistan in the Golden Crescent (together with Iran and Pakistan), it has been one the most important opium-producing area of Asia and of the world since the 1950s.

The term first appeared in 1971, referring to the shape of Myanmar, Laos, and Thailand when taken together. The gold of the triangle is most probably that which the first opium merchants of the region used in exchange for the crops. Although the opium production that exists in the Golden Triangle is fre-

quently and erroneously thought to be an old traditional activity, in fact, opium growing is an altogether recent phenomenon. It is only at the end of nineteenth century that the poppy-growing tribal populations began their southernmost forced migration from China toward the highlands of mainland Southeast Asia. There they scattered and settled, having brought with them the practice and techniques of farming the opium poppy (*Papaver somniferum*).

As World War II drew to a close, this area was producing less than eighty tons of opium per annum. All that changed when China clamped down on opium production and addiction, spurring Southeast Asia to take over production. The sudden suppression of opium production in Iran in 1955 further reinforced the transfer toward Southeast Asia.

Later, due mainly to the internal protracted Burmese conflicts and ethnic and communist rebellions, the Golden Triangle's opium production literally exploded, exceeding 3,000 tons in 1989, with Burma alone producing more than 2,500 tons in 1996. The narcotics trade linked a marginal and isolated Southeast Asian region with principal cities of the Western world. The United States became the main destination of the Golden Triangle's heroin, the so-called China White, or heroin No. 4, renowned for its 98 percent purity.

At the end of the twentieth century, the Golden Triangle was clearly dominated by Burmese production, Thailand had suppressed almost all its poppies, and Laos was still fighting the battle. But a new scourge had arrived in the region: an explosion in amphetamine production in Burma and a large population of addicts in Thailand.

GOLKAR Golkar (Golongan Karya, or Joint Secretariat of Functional Groups) was a government party in Indonesia during President Suharto's New

Order. It was created as an umbrella of anti-Communist civilian associations and trade unions in order to balance the influence of the Indonesian Communist Party (PKI, or Partai Komunis Indonesia), which had grown during the period of Guided Democracy (1959–1965) established by President Sukarno. Golkar was sponsored by the Indonesian army. With Suharto's ascent to power in 1967, Golkar became the electoral organization of the New Order government. At first Golkar lacked the individual membership and special cadre of activists needed to form a strong political party. By 1971, however, it won the national election and subsequently had little competition from the other two political parties—the United Development Party and the Indonesian Democratic Party—that had emerged from Suharto's rationalization of the political system in 1973. By 1983, Golkar was considered a strong political party, widely supported because of Indonesia's economic successes under it but also because opponents were intimidated and election results were manipulated. At the general election of June 1999, Golkar was relegated to second place after Megawati Sukarnoputri's Indonesian Democratic Party, signifying the final demise of the New Order.

GOND The Gonds, for the most part located in the state of Madhya Pradesh in central India, are the largest Scheduled Tribe (low-caste tribe) in southern Asia, numbering over 7.3 million in 1981. The more southerly Gonds speak Parji or Gondi, two Dravidian languages, whereas those in the north speak dialects of Hindi or Marathi, which are both Indo-Aryan languages.

The Gonds live, often as extended families, in dispersed housing in villages. Even where other tribes and castes are present, the Gonds tend to remain in separate hamlets. They either farm or work in the forests, collecting timber, honey, or wild plants. Most have been obliged to abandon their former pattern of shifting cultivation for settled farming, in some areas

on terraces. Millet, rice, wheat, gram, and other crops are grown, and animal husbandry is practiced. Women play an important role in farming, as well as in collecting fuel and forest produce.

Monogamy is the normal marriage pattern, though polygyny does occur, as well as divorce and widow remarriage. While it has a large population, the tribe was never a political unit. It has always been split into many subgroups, with little or no political influence in modern India. The main authority is the village headman and his council. These traditionally had a judicial role in the society.

The religion of the Gonds may be characterized as Hindu, but with many animistic practices devoted to nature spirits. Gonds believe all humans have two souls. They believe in an almighty god named Bhagwan, but little ritual is directed to him.

GONG LI (b. 1966), Chinese actress. Gong Li was born in Shenyang, Liaoning Province, China, in 1966. She graduated from high school in 1983 and was mentored by Yin Dawei, a stage director with the Jinan Military Drama Troupe, before entering Beijing's Central Drama Academy in 1985. While a student there, she was chosen by director Zhang Yimou to play the lead in his film *Red Sorghum* (1987), which went on to win the Golden Bear award at the Berlin Film Festival.

Zhang and Gong's first creative partnership led to many more films, including *Ju Dou* (1989), *Raise the Red Lantern* (1991), *The Story of Qiu Ju* (1992), *To Live* (1994), and *Shanghai Triad* (1995). For her role in *The Story of Qiu Ju*, Gong was awarded the best actress prize by the Venice Film Festival.

Over her career, Gong has tackled a wide variety of roles from the glamorous to the workaday, always imbuing her performance with tremendous confidence and charisma. She frequently portrays strong, inde-

pendent women who go against society's grain to pursue their own unshakable convictions.

Gong has also appeared in numerous films by other directors, including Chen Kaige, Wayne Wang, Lu Yue, and Huang Shuqin. In 1998 she became a delegate to the Chinese People's Political Consultative Conference.

GORKUT ATA The Gorkut Ata epic, or *Book of Grandfather Korkut*, is a collection of twelve narratives in a mixture of verse and prose, telling the heroic exploits of the Oghuz, a Turkic tribe from which the modern Turks, Azerbaijanis, and Turkmen arose. The telling of these tales is attributed to Grandfather Korkut, variously called Dede Korkut (Qorqut) or Gorkut Ata, the legendary singer and narrator of the Oghuz. The text of these epic tales is transmitted in two sixteenth-century manuscripts, but the narratives themselves are considerably older. Some may go back to the period when the Oghuz still lived on the Syr Dar'ya River in Central Asia (ninth–eleventh centuries CE). Famous among these narratives are the tales of Basat and Tepe Goz, a variant of the story of Odysseus and the Cyclops, and of Bamsi Beyrek, a version of the Alpamish epic. In spirit and form these narratives can be considered some of the first Turkic epics. The figure of Gorkut Ata is the subject of a number of legends and traditional songs in Central Asia, where he is venerated as the patron saint of epic singers.

GOTO SHINPEI (1857–1929), Japanese politician. Trained in medicine, Goto made his name as a colonial administrator in imperial Japan's burgeoning

empire. He was subsequently influential as a bureaucratic politician in the transition period between oligarchic and political party rule.

Of samurai lineage from the Sendai domain (present-day Miyagi Prefecture), Goto studied medicine in Fukushima and Nagoya and at age twenty-five gained public recognition as the head of Aichi Prefectural Hospital. After two years of study in Germany, he served the empire as chief of the Sanitation Bureau of the Home Ministry (1895–1898), director of the Army Quarantine Office (1895), first head of civilian administration in Taiwan (1898–1906), first president of the South Manchuria Railway Company (1906–1908), and director general, alternately, of the Railway Agency and the Colonization Bureau between 1908 and 1918.

Among Goto's political appointments were membership in the House of Peers (1903–1929), minister of communications (1908–1911, 1912–1913), home minister (1916–1918 and 1923–1924), minister of foreign affairs (1918), and mayor of Tokyo (1920–1923). In addition to his service to the empire, Goto is celebrated for work in reconstruction after the 1923 Tokyo earthquake and his attempt to normalize relations with the Soviet Union in 1923.

GRAMEEN BANK In 1999, Grameen Bank (GB) distributed \$1.5 million in microcredit loans every day. The bank was established in Chittagong, Bangladesh, in 1983 with the belief that credit is a "fundamental human right." The concept is also based on the belief that if poor people are provided with money and a few sound financial principles to live by, such as collective responsibility, close monitoring of repayment of loans, and compulsory and voluntary saving, they will help themselves.

The idea of Grameen Bank became a reality in 1976, when Professor Muhammad Yunus loaned \$27 of his own money to forty-two people living in a village in rural Bangladesh. The people to whom he lent the money were stool makers who only needed enough credit to purchase raw materials for their trade.

GB has reversed conventional banking practice by removing the need for collateral and has created a banking system based on mutual trust, accountability, participation, and creativity. Participants, typically small groups of borrowers, are required to set aside 5 percent of a loan as a fund from which all participants can draw, pending group approval. For GB, credit is a cost-effective weapon in the fight against poverty, and it serves as a catalyst in the overall socioeconomic development of the poor, who have been kept outside the banking orbit on the ground that they are not bankable.

Currently, GB is the largest rural finance institution in the country. It has more than 2.3 million borrowers, 94 percent of whom are women. With 1,128 branches, GB provides services in 38,951 villages, covering more than half of the total villages in Bangladesh. The repayment rate of its loans, which average \$160, is more than 95 percent. Interest on all loans is currently fixed at 16 percent.

Grameen Bank's positive impact on its poor and formerly poor borrowers has been documented in many independent studies by external agencies, including the World Bank, the International Food Research Policy Institute (IFPRI), and the Bangladesh Institute of Development Studies (BIDS). Grameen Bank has inspired people and institutions throughout the world with its success in poverty alleviation. More than 4,000 people from some 100 countries have gone through Grameen's training programs over the last ten years. Some of those visitors have returned to their countries and replicated the Grameen Bank financial system to help poor people in their own country to overcome poverty. A total of 223 Grameen replication programs in fifty-eight countries have been established during the last decade. Taken together, they have reached several hundred thousand poor borrowers with credit around the world.

GRAND CANAL China's longest canal is the Grand Canal, stretching more than 1,700 kilometers from Beijing in the north to Hangzhou in the south. It is the world's longest man-made waterway and was built over the course of centuries beginning in the fourth century BCE. Major work was undertaken on it during the Sui dynasty (581–618) and the Tang dynasty (618–907); under the Yuan dynasty (1279–1368) the course of the canal was shifted. All China's major rivers run west to east, but the Grand Canal runs north to south, connecting the Chang (Yangtze) River in the south with the Huang (Yellow) River in the north and providing a valuable alternative to overland or sea transport of goods.

The canal's primary use during the Sui and Tang dynasties was to bring grain grown in the fertile south to expanding cities in the north. It became a major trade route, with goods and people flowing in both directions. One important innovation was the invention of the pound lock in the tenth century. The pound lock allowed boats to move along waterways of different levels; the Grand Canal, for instance, rises more than 40 meters above sea level over its course. Currently there are twenty-four locks on the Grand Canal.

The Huang River's flooding and silting have always caused problems for the canal, but it was regularly maintained and used into the twentieth century, when the rise of coastal ports and railroad transportation led sections to fall into disuse. In the 1950s much of the canal was reopened for use, and it is again a major trade route as well as a tourist attraction.

Paul Forage

GREAT GAME The Great Game is the term widely used to describe the bitter nineteenth-century Anglo-Russian rivalry for influence in Central Asia. British and Russian strategists (mainly young military officers) saw the need for influence over Central Asia from a historical perspective. They argued that most military campaigns against the Indian subcontinent were undertaken through the territory of Central Asia, which at that time included Afghanistan and the eastern part of Iran. Thus for the British, primary influence over Central Asia was pivotal to defense of their interests in India against Russian advancement, while it was crucial for Russia to defend its communications lines with Siberia and the Russian Far East, the "soft underbelly" of the Russian Empire in Winston Churchill's words.

Both sides undertook a number of spying and counterespionage operations and highly adventurous geo-

graphic expeditions in search of allies and routes for troops, all of which were glorified by such writers as Rudyard Kipling. The Russians conducted the first expedition to Khiva in 1839–1840, but the campaign was unsuccessful, and they lost a number of soldiers and officers in this ill-prepared expedition. Then in 1842, two British officers, Colonel Charles Stuart and Captain Arthur Connolly, were hanged in Bukhara. The Russians collided with the Kokand Khanate when they captured Tashkent (1865), an important economic outpost of the khanate; Khodzhent (1866); and later Kokand (1875), which established their influence over the Bukhara Khanate (1868), advancing all the way to the borders of Afghanistan, the last political barrier before India. Perceiving this as a direct threat to British interests in India, the British advanced north-west in an attempt to establish direct control over Afghanistan.

In the eighteenth century, Ahmad Shah (reigned 1747–1773), the leader of the Abdali tribe of the Pashuns, had proclaimed Afghan rule as far east as Kashmir and Delhi, north to the Amu Dar'ya, and west into northern Persia. In the nineteenth century, as internal conflicts gradually weakened the Afghan empire, both the British in India and the Russians to the north sought to bring Afghanistan under their control. This resulted in two Anglo-Afghan Wars (1838–1842 and 1878–1880), which the British finally won, establishing their dominance over Afghanistan's foreign relations. Gradually, both sides, British and Russian, accepted Afghanistan as a buffer zone between their respective empires.

The strategic importance of Central Asia was highlighted again in the early twentieth century by Sir Halford John Mackinder, the British political geographer, who in 1919–1920 went as British high commissioner to southern Russia in an attempt to unify the White Russian forces against the Bolsheviks. He produced a simple geopolitical formula: "Who rules the Heartland [which included Central Asia] commands the World-Island [Eurasian Continent]. Who rules the World-Island commands the World."

Since the Soviet Union's dissolution in 1991, a new competition for political influence and a share in the Central Asian market, especially for its natural resources, has emerged between various actors. This competition has often been described in terms of establishing influence over the newly independent Central Asian Republics on a basis strategically similar to the competition between Britain and Russia in the nineteenth century.

GREAT LEAP FORWARD The Great Leap Forward was the campaign launched by the Chinese Communist leadership in 1958 to quickly catch up to and leapfrog over Great Britain and the United States. Having become disenchanted with the Soviet-style development strategy that prioritized heavy industry, China's leaders, particularly Mao Zedong (1893–1976), believed that massive social mobilization would allow China simultaneously to develop industry and agriculture. Unfortunately, the campaign ended in utter failure and caused what is today known as the Great Leap famine.

Mao's Successful Promotion of Large Collectives

Any explanation of the Great Leap must begin with the ideological preferences of Mao and his colleagues. Mao's efforts to promote large collectives and communes were based on a belief in economies of scale and a desire to promote social equality. Even though Mao's earlier pursuit of progressively larger rural institutions, ranging from mutual-aid groups to cooperatives and then to collectives, had caused many disruptions in agricultural production, the disruptions were dismissed as temporary. Mao forged on with demands for larger collectives in the late 1950s.

The Chinese political system had no room for dissent at this time. Repeated political campaigns, particularly the Anti-Rightist Campaign of 1957, had banished those who spoke up, primarily intellectuals, to hard labor and even imprisonment. Those who raised questions a little later about Great Leap policy practices, such as the defense minister Peng Dehuai (1898–1974), were persecuted as rightist opportunists. In such a political system, those who aspired to mobility on the political ladder of success watched for cues to Mao's preferences and eagerly supported everything that Mao liked.

Once Mao endorsed the term "people's commune" in early August 1958, local leaders and political activists raced to establish communes and competed to build ever-larger ones. The number of communes proliferated. In just two months, most provinces claimed a successful transition to people's communes. Rural China was organized into 26,500 gigantic communes, each averaging 4,756 households. The communes

abolished private property and, in most cases, did away with all economic incentives. The commune mess hall epitomized the frenzy of the Great Leap. Commune members were encouraged to abandon their private kitchens, donate the pots and pans to backyard iron furnaces, and dine in communal mess halls so that women could join the labor force.

The Free-Supply System and Other Wasteful Practices

Amid the euphoria of Communist transition, China's leaders ceased to manage the economy but instead encouraged practices that in hindsight were downright criminal. The state statistical system stopped functioning and was replaced by wild claims of bountiful harvests. Such claims in turn engendered wildly exaggerated output forecasts and prompted prominent regional leaders such as Ke Qingshi (1902–1965) and Tan Zhenlin (1902–1983) to exhort peasants to eat as much as they could. As a consequence, the free-supply system was widely adopted, and the mess hall became the site of communal feasts in many places. The free-supply system induced overconsumption and waste of food, even while state grain procurement was increased sharply on the basis of wildly exaggerated output forecasts. With worsening Sino-Soviet relations, the Chinese leadership increased grain exports, again under the illusion of bountiful harvests, to accelerate China's debt payment to the Soviet Union.

Other practices, including the massive diversion of rural labor to backyard iron furnaces and water-conservation projects, led to gross neglect in harvesting the bumper crops of 1958 and contributed to the ensuing famine. By spring 1959, many communes, caught between higher government procurement and free supply, had exhausted their grain reserves and witnessed a collapse of production incentives. At this point, much could still have been done to avoid the worst of the famine. Unfortunately, during the Lushan Conference of 1959, in which Mao came down hard on Peng Dehuai, Mao unleashed a "second leap" and another push for commune mess halls. This further exacerbated the rural situation and undoubtedly contributed to the jump in China's mortality rates from 12 per 1,000 in 1958 to 14.6 per 1,000 in 1959 and 25.4 per 1,000 in 1960. Statistics reveal that those provinces that had a higher mess-hall participation rate at the end of 1959 also tended to have a higher mortality rate in 1960, the year that China had a net population loss of 10 million people.

Effects of the Great Leap Famine

The Great Leap famine was thus clearly rooted in politics rather than nature. Unfortunately, the peas-

ants who had put their faith in Mao's regime were largely left to fend for themselves when they had exhausted their food supplies. The demographer Judith Banister estimated that the number of excess deaths over 1958–1961 was between 15 and 30 million. In aggregate numbers, the Great Leap famine is the worst famine in human history. The incidence of the famine was emphatically rural, with the grain producers becoming the main victims of famine.

The intensity and magnitude of the Great Leap famine far exceeded the Great Depression in the United States and produced a lasting change in Chinese preferences and behavior. It shattered any nascent beliefs that the rural people might have had about large rural organizations and led them to question government policies. It also prompted Mao and his colleagues to moderate rural policies and scale down the sizes of rural collective organizations. But the famine also induced fissures among the top leaders. As Mao turned his attention away from the economy, he launched the notorious Cultural Revolution in 1966.

While the basic collective institutions were maintained during Mao's lifetime, the famine profoundly undermined popular support for such institutions and laid the foundation for China's eventual decollectivization following Mao's death. Through the early 1980s, the provinces that had suffered more severely during the famine were less likely to adopt radical rural

policies and institutions. Following Mao's death in 1976 and the defeat of radical leaders, farmers again turned to household contracting (contracting land to the household), particularly in those areas that had suffered the most during the famine. By the turn of the 1980s, the national leadership, now led by Deng Xiaoping (1904–1997), had embraced rural decollectivization. The Great Leap famine was thus not just a monumental tragedy; it also laid the ground for institutional innovation. It is a great historical irony that the Great Leap Forward, launched to accelerate China's march toward communism, actually served to hasten the arrival of market reforms by precipitating the greatest famine in human history. The tragedy is that China had to go through such a terrible detour.

GREAT WALL The best-known work of Chinese civil engineering is the Great Wall, a line of fortifications extending for more than 6,324 kilometers, if all the branch walls are counted, and 3,460 kilometers, if the main line alone is measured. As was customary, the wall was built with rubble foundations without binding material and with thin layers of bamboo stems spread between blocks to speed drying. Granite blocks as large as 4.3 meters by 0.9 meters were used in the foundation, and apparently only the simplest of tools were used, though on a vast scale. Reinforcements of wood and iron were used in some sections of the wall. Despite this, during periods of neglect, parts of it collapsed. After the third century CE, there was very little maintenance, though reconstruction was undertaken in later periods, particularly under the Ming dynasty (1368–1644). The wall was not a single massive engineering project, but was the connection of various walls that had been built in previous periods to protect northern Chinese regimes from attacks by the Mongols from the north. In the late twentieth and early twenty-first centuries, with China open to visitors from the West, the Great Wall has become a major tourist attraction, with sections reconstructed for that purpose.

THE GREAT WALL OF CHINA— WORLD HERITAGE SITE

Built to repel the marauding nomadic cavalry of Central Asia, the Great Wall of China was begun in 220 BCE under the Qin dynasty and completed in the Ming dynasty. Clearly visible from outer space, the Great Wall of China became a World Heritage Site in 1987.

GREATER XING'AN RANGE The Greater Xing'an Range (Da Xing'anling) is a crescent-shaped mountain range running 1,400 kilometers from south to north in the northwestern parts of Heilongjiang and Jilin Provinces in northeastern China. The range is divided into a southern and a northern part by the Taer River near the border between the two provinces. The northern part of the range runs for about 670 kilometers, with peaks rising 1,000 meters above sea level; a few, like Mount Fengshui and Mount Dajiluqina, reach over 1,390 meters. The eastern slopes are steep; the western slopes merge into the Inner Mongolia Plateau, which is about 700 meters above sea level. It is an extremely cold area, with winters lasting more than eight months and an average temperature in January of -28° C. The southern part generally consists of lower mountains and has a slightly warmer climate.

The Greater Xing'an Range is one of China's most important timber areas and has been heavily forested since 1949, which is increasingly threatening the region's ecological balance. The range is sparsely inhabited by minority nationalities, of which the Orogens are most numerous. Their main sources of income are hunting and forestry. Some agricultural products for local consumption are grown in the lower valleys.

GREEKS IN TURKEY The Greek presence in Turkey and its islands has been continuous since at least the eighth century BCE. The legendary Greek poet, Homer, was from western Turkey, and with the division of the Roman empire into western (Rome) and eastern (Byzantium) portions, Greek culture flourished in the region, with Constantinople (Istanbul) and the Church of Hagia Sophia as the high watermarks of Hellenic civilization.

Although Byzantium endured and flourished for many centuries, its death knell was struck in 1453, when the Ottoman Turks, led by Mehmed II (1432–1481), invaded the region and toppled the eastern Roman empire. They quickly captured Constantinople and converted the Hagia Sophia into a mosque. Thus was established the modern state of Turkey.

The Fall of Byzantium

With the fall of Byzantium, the majority of the Greeks fled either to Greece or westward into Europe. They took with them a vast amount of learning and knowledge, which would provide the incentive for the exuberance of the Renaissance.

However, a large number also remained behind, and they faced the brunt of the ethnic cleansing to which the conquering Turks, who were Muslims, subjected the people. A large number were forcibly converted to Islam, and huge swaths of the nation were ethnically cleansed. Before long, Byzantium, which had been ethnically and linguistically Greek, became Turkish and Muslim.

Persecution of the surviving Greek minority continued through the ages, but in the early twentieth century, it became systematic extermination just after the Armenian genocide by the Turks during World War I and the ensuing Greco-Turkish War of 1922. The latter war ended with the Treaty of Lausanne when the two sides exchanged populations in 1923. Thereafter, a mere 200,000 Greeks remained in Turkey. Because of continuous civil-rights violations, the present Greek population in Turkey is only about 1,500 people, who are concentrated around the Bosphorus.

Pogrom of 1955

The worst form of persecution took the shape of a pogrom on 6–7 September 1955. This outburst of violence was directed at the Greek community in Istanbul, with a great loss of personal and commercial property, instances of rape, beatings, and murder. Many churches and schools were torched, houses and

businesses looted, and Greek cemeteries desecrated, with some bodies of the patriarchs of the Orthodox Church exhumed and defiled. Also, countless relics were destroyed. In 1995, the U.S. Senate passed a resolution that recognized this pogrom against the Greek community of Turkey and called upon the president to declare 6 September 1955, a day of remembrance of the victims of this state-organized massacre. In 1964, all Greek permanent residents of Istanbul (those who were born in the city but held Greek citizenship) were expelled on a two-day notice.

Religious Persecution

The tiny Greek community that currently resides in Turkey is still persecuted. It faces discrimination, intimidation, threats against its religious leaders, and an ongoing desecration of its holy places. The persecution is immediately discernible in the treatment of the Ecumenical Patriarchate of Constantinople, which is one of the oldest active institutions in Eastern Europe, having been established around 330 CE. It is the spiritual center for Orthodox Christians worldwide, as the Vatican is for Roman Catholics. The Patriarchate's printing facilities have been shut down; the Turkish government will not allow non-Turkish citizens to become bishops, and even the patriarch must be a Turkish citizen. This demand is next to impossible to meet because there are few Greeks left in Turkey, and the Turks themselves are Muslim. Turkey also did not allow the Patriarchate to open a representative office in Brussels, Belgium, in 1994, claiming that the Patriarchate was not a legal body and that thus there was no need for it to be represented in Brussels. In 1995, the U.S. Senate passed a resolution condemning the relentless persecution of the Patriarchate by the Turkish government because it violates international treaties to which Turkey is a signatory.

The Turkish government also closed the Patriarchal Theological School of Chalke, which was the primary educational institute for the Patriarchate clergy; many patriarchs throughout the world graduated from Chalke. Despite requests from the Patriarchate, the Turkish government refuses to reopen the school. In its 1995 resolution, the U.S. Senate also condemned the arbitrary closing of the School of Chalke.

Turkey also refuses to recognize the ecumenical nature of the Orthodox Church and thus will not allow anyone who is not a Turkish citizen to participate in the Patriarchate's affairs in Istanbul; this effectively bars most patriarchs and clergy, who are citizens of other nations.

Denial of Economic and Cultural Rights

Further, in 1986, Turkey revoked the right of ethnic Greeks to buy, sell, trade, or inherit property. This meant that all property once held by Greeks in Turkey eventually passed into Turkish hands. The Greek language is not allowed to be taught at Greek schools, and many young people face discrimination because of their ethnicity.

There are also Greek communities throughout Turkey, and these people have been completely disenfranchised. They live dual lives of sorts, in that they carry on as Turks in the wider society but practice their Orthodox faith secretly; they do not have a right to promulgate their language or culture. There is also a drive toward "Turkification," especially of names. The Orthodox Christians who live to the east of Istanbul cannot worship in Greek, nor can they claim to be Greek Orthodox in official documents and must describe themselves as Turkish; thus even their ethnicity is denied them—which is what the Turkish government hopes to achieve.

The islands of Imvros and Tenedos have been aggressively made Turkish. School property was seized, the thriving meat export industry was shut down, and a large prison was established on Imvros. The government also appropriated property that once belonged to Greeks and turned it over to Turkish settlers from the mainland.

Thus, through a systematic policy of persecution, the ethnic Greek population of Turkey has been driven out, its property turned over to the state, and its freedom to pursue its own culture, religion, and language denied.

GREEN REVOLUTION—SOUTH ASIA

The Green Revolution, a transformation in the organization of South Asian agriculture that took place mainly between 1964 and 1978, was attendant upon the adoption of high-yielding varieties (HYV) of major crops, including rice, wheat, maize, and some millets. While farmers traditionally planted seeds selected each year from their own crops, seeds for the high-yielding varieties were created in central facilities by systematic selection, hybridization, and genetic transfer. These HYV cultigens do not breed true to type, and pests and diseases constantly evolve adaptations to the new varieties. Consequently, once farmers adopted them, they became dependent on this large and advanced technological infrastructure. The result is a system of peasant agriculture that combines traditional farm management with some of the world's most advanced agricultural science.

Although the new cultigens are often described as "miracle" varieties, they do not produce increased yields under all conditions. They give increased yields primarily in response to heavier and more regular water, fertilizer, and pest control. Without such inputs, the yields of the new varieties are not consistently better than the yields of the traditional varieties, and they may be worse. Accordingly, even though adoption of the HYV crops has been widespread in South Asia, the benefits have depended largely on the quality of the agricultural-support structure in the several countries. Where yields of HYV cultigens have increased, as a rule the yields of many traditional varieties have increased also (Leaf 1998: 109–112). The transformation has been most widespread and most successful in India, followed by Sri Lanka and Pakistan. The effect has been marginal in Bangladesh and Nepal.

Technology

The core methods for transferring desired characteristics from one species to another were initially developed in two major international laboratories. Beginning in 1942, wheat and maize were developed at the International Maize and Wheat Improvement Center in Mexico under the combined sponsorship of the Mexican government and the Rockefeller Foundation, headed by Norman Borlaug (b. 1914). Beginning in 1960, rice varieties were developed at the International Rice Research Institute (IRRI) in the Philippines, sponsored by the Rockefeller Foundation and the Philippine government and based on the Mexican model. Later, millets were developed in India by the Indian Council for Agricultural Research (ICAR), again in collaboration with the Rockefeller Foundation,

with a view toward replicating what had been done to improve the yields of commercial millets in the United States.

Infrastructure

Since the resources on farms are limited in South Asia, much of the infrastructure necessary to provide the required input to HYV plants and to take the resulting crops to market must be created by organizations at or above the village level. The organizations specifically involved with the Green Revolution were primarily government package programs, agricultural universities and research centers, and cooperatives.

Before independence, agricultural research took place in state agriculture departments and a few central institutes, while agricultural colleges aimed almost exclusively at providing departmental staff. These institutions did little to change the historic pattern of a large but poor agricultural population producing only slightly more than it consumed. After independence, the governments of India and Pakistan recognized the contrast between their inherited institutions and the dynamic, productive system of agricultural research and education in the United States. On the basis of agreements between the government of India, the United States Agency for International Development (USAID), and a consortium of five U.S. land-grant universities, signed in 1954 and 1955, India in 1960 began to develop a series of agricultural universities modeled on the American land-grant colleges (Naik and Sankaram 1972: 83, 99).

Concurrently, in 1959, a team from the government of India and the Ford Foundation conducted a study of constraints on agricultural productivity. The result was the formation of the Integrated Agricultural Development Programme, begun in 1961–1962 with support from the Ford Foundation. The main idea was to concentrate development inputs in a few especially promising districts selected from around the country. The newly formed agricultural universities would recommend a package of crops for these districts, based on the best available science, and prescribe the services needed to produce them. The state governments would provide the services (Gill 1983: 205). The plan was successful and was quickly expanded to one district in every state under the new designation of the Intensive Agricultural Areas Programme and to still other districts starting in 1964–1965. Parallel efforts were urged in Pakistan but with little success, largely because Pakistan's rural economy is dominated by a small class of wealthy absentee landholders whose main historical interest has been in maintaining their

TABLE 1

Wheat production for 1965, 1975, 1980, 1995				
(in percentages)				
	1965	1975	1980	1995
South Asia	100	189	189	258
Bangladesh	100	338	2,382	3,604

Pakistan	100	167	167	237

SOURCE: Food and Agricultural Organization of the United Nations.

own power (Sims, 1988: 161–162, 189). A strong district administration responsive to the actual farmers would not serve this end.

The package programs demonstrated that the response of traditional crop varieties to increased inputs with increased yields was limited, and this set the stage for the adoption of the high-yielding varieties. In 1962, M. S. Swaminathan (b. 1925), "father" of the Green Revolution in India, urged the Indian Agricultural Research Institute to bring Borlaug to India to arrange a large-scale collaboration, arguing that otherwise it would be impossible to realize the full benefits of the package program (Randhawa 1980–1986: 4:367). The institute agreed, and in 1964 the cooperative effort established new centers that, along with several of the new universities, conducted adaptive research and began testing and multiplying seeds of the most promising varieties.

Results

Results varied according to the crop. Wheat yields in India increased from 9,132 kilograms per hectare in 1965 to 12,384 kilograms per hectare in 1975 and to 14,356 kilograms per hectare in 1980. By 1995, the yield in India was 25,590 kilograms per hectare. The yields in Pakistan were 8,631 kilograms per hectare in 1965, 11,375 kilograms per hectare in 1975, 15,680 kilograms per hectare in 1980, and 20,811 kilograms per hectare in 1995. That is, between 1965 and 1995, wheat yields in India increased about 280 percent, and those in Pakistan increased about 240 percent. Increases in total yields for the four producing countries in South Asia are given in Table 1. All production figures are from the agricultural database of the statistical service of the Food and Agriculture Organization (FAO) of the United Nations. The FAO in turn receives data from the statistical services of the respective countries; therefore data quality varies widely.

SOURCE: Food and Agricultural Organization of the United Nations.

The impressive proportional gains for Nepal and Bangladesh largely reflect the fact that their calculations start from a particularly small base.

South Asia produces about twice as much rice as wheat. Improvements in rice production have lagged behind those in wheat production but have been sufficient to eliminate substantially the threat of famine. In India, an initiative by ICAR, IRRI, and USAID in 1967 introduced the new varieties through the Central Rice Research Institute in Cuttack, Orissa, and the new All-India Coordinated Rice Improvement Project at Hyderabad, Andhra Pradesh. Several states were involved in the project. In 1965–1966, the entire Indian production of rice was 30.6 million metric tons. By 1976–1977, it was 52.7 million metric tons. The percentage increases in paddy production from 1965 to 1995 for South Asia as a whole and for each major producing country are given in Table 2.

Assessment

In the early 1960s, South Asia faced the threat of severe food shortfalls. The Green Revolution averted that threat. Although hunger still exists in the region, it is the consequence of inequities in distribution rather than insufficient production. The Green Revolution accomplished what its authors promised, and its potential is far from exhausted.

GREEN REVOLUTION—SOUTHEAST ASIA

The term "Green Revolution" is used for big increases in wheat and rice yields in developing countries from the 1960s brought about by new high-yielding crop strains combined with the use of fertilizers and agricultural chemicals. It was launched in Asia in 1960 at the International Rice Research Institute in the Philippines; rice is the staple food for people living in Southeast Asia. Southeast Asia as discussed herein consists of Cambodia, Indonesia, Laos, Malaysia, Myanmar (Burma), the Philippines, Thailand, and Vietnam but excludes Brunei and Singapore. The Green Revolution in Southeast Asia as was a technology package comprising improved high-yielding varieties of rice, irrigation or controlled water supply, improved moisture utilization, fertilizers and pesticides, and associated management skills. Some two decades later, several Southeast Asian countries adopted more of a market approach to rural finance. At the same time, local governments improved rural infrastructures such as transportation, telecommunication, postal, irrigation, and electrical systems to assist large and small farmers previously beyond the reach of technological innovations. The utilization of this technology package in suitable socioeconomic environments has resulted in greatly increased yields and incomes for many farmers in Southeast Asia.

Results

The beneficiaries of the Green Revolution have been the farmers and the consumers. Southeast Asia's population increased by 68.2 percent, or 139.3 million people, between 1970 and 1995. Cereal production in Southeast Asia more than doubled from 33.8 million metric tons to 73.6, and cereal yield increased from 1,352 to 2,237 metric tons per hectare. Food availability (measured as calories available per person per day) increased by 34 percent. Rural incomes (measured as per capita gross domestic product) increased by 193

percent, driven increasingly by urban-industrial growth from the 1980s onwards and by growth in the rural nonfarm economy. Using a benchmark of the international poverty line of US\$1 per day (purchasing-power parity, 1985 dollars), the absolute number of poor declined by 41.4 percent from 108 million in 1975 to 40 million in 1995.

Real food prices in Southeast Asia, indeed throughout the world, have steadily declined over the last thirty years as a result of the Green Revolution. Lower real food prices benefit the poor relatively more than they do the rich, since the poor spend a larger portion of their available income on food. Stationary threshers, tube wells, and flour mills have all reduced the drudgery of women. Recent studies of the impacts of the Green Revolution also suggest that it extended beyond the rice producers of Southeast Asia to include other crops and other socioeconomic settings.

The Green Revolution clearly averted a major food crisis in Southeast Asia. Indonesia attained rice self-sufficiency in 1984. Several Southeast Asian countries—Indonesia (pre-1997 crisis) and Vietnam, for example—went from running food deficits in the 1960s to being surplus producers in the late 1980s, despite increasing population. The Green Revolution was the foundation for startling economic growth in Southeast Asia. Since Green Revolution technologies boosted production using less labor without requiring a lot of capital, agricultural labor could easily flow to other sectors. As economies ceased to need to import food, foreign exchange was freed up for other uses. Higher incomes from agriculture caused domestic markets to expand. Indonesia, with the most rapid agricultural growth, has had the most rapid reduction in total poverty. In the Philippines, agricultural growth has been highly inequitable due mainly to the skewed distribution of land holdings and poor rural infrastructure. Overall performance in poverty reduction there has been disappointing because of the unequal distribution of wealth.

The use of high levels of inputs and the achievement of relatively high rice yield in Southeast Asia have made it more difficult to sustain the same rate of yield gains, as yields approach the economic optimum yield levels. Indeed, increased intensity of land use has led to increasing input requirements in order to sustain current yield gains. Environmental pressures are increasing as existing land and water resources come under threat from rapid urbanization, which increasingly withdraws land from agricultural production and create pressure for reallocation of water now used in agriculture.

Furthermore, the Green Revolution technologies were not without their problems. The necessity of using large amounts of agrochemical-based pest and weed control in some crops has raised environmental concerns as well as concern about human health. The chemicals applied as fertilizer and as pest and weed control can pollute rivers and lakes through runoff, and can pollute groundwater through leaching.

The land is increasingly unable to support the burden of intensive agriculture. Intensive farming practices have virtually mined nutrients from the soil. When fertilizers are added to a crop, a plant absorbs not only the extra nitrogen, phosphorus, and potassium from the fertilizer, but also proportionately increased levels of micronutrients from the soil, including zinc, iron, and copper. Over time, the soil becomes deficient in these micronutrients. Their lack, in turn, inhibits a plant's capacity to absorb nitrogen, phosphorus, and potassium. Consequently, crop yields are declining alarmingly. Many farmers are heavily in debt from their investments in new equipment and reliance on chemicals, and rural unemployment is increasing. These are ominous signs of a deteriorating farm economy.

The move to a higher-input environment naturally favored those farmers who had access to capital and skills. They strengthened their roles in society, sometimes at the expense of less well-endowed groups. Many studies have claimed gender bias in the development of the Green Revolution. The established roles of women in the farming systems were challenged by the new technology and the new economic structures, as work performed by women was now handled by machines.

A limitation of the Green Revolution has been its inability to have much direct influence on rain-fed farming systems, whose production may be adversely affected by droughts. As a result, income disparities between irrigated and rain-fed villages and regions have worsened and many rain-fed regions have barely benefited. The prospects for significant technological advances in rain-fed areas are hampered by limited and uncertain rains that often make water a critical constraint in plant growth, and by the diversity of local growing conditions that limits the geographic applicability of improved technologies.

For Indonesian rice farmers, the high costs of high-yielding rice varieties and the chemical nutrients and fertilizers are driving a return to organic farming using organic seeds, minimal fertilizer, and no pesticides. Across Indonesia, about a dozen nongovernmental organizations are seeking to popularize organic farming

methods as a sustainable, profitable, and environmentally safe alternative to fertilizers and pesticides.

The Future

In the twenty-first century, the world faces the prospect of a new and complex food crisis that will require better ways of ensuring that the hungry and the malnourished will be able to meet their food needs. To tackle this enormous challenge, a new Green Revolution must be launched that will protect the environment and boost agricultural output. Future agricultural growth will continue to be driven by improvements in crop productivity based on genetic manipulation of plants, and biotechnology will eventually accelerate this process, though genetically modified crop strains have foes in Asia, just as they do in Europe. The need for continuing and aggressive research in all related areas and disciplines is self-evident. Today's farmer requires far more knowledge in order to make environmentally appropriate decisions and to cut production costs. Information resources will need to substitute, in the future, for the currently all-too-frequent excessive use of physical resources.

GUANGDONG (2002 est. pop. 74 million). Located in southeast China, Guangdong Province covers an area of 196,891 square kilometers (76,000 square miles). It is bordered to the northeast by Fujian Province, to the north by the provinces of Jiangxi and Hunan, and to the west by the Guangxi Autonomous Region. A coastal province on the northern shores of the South China Sea, Guangdong has long played an important role in China's foreign trade—a

role that was expanded after the opening of the country in the 1980s and the creation of the Special Economic Zones at Shenzhen, Shantou, and Zhuhai.

The area was first integrated into the Chinese empire during the Qin dynasty (221–206 BCE), although ethnic Han Chinese did not begin to settle there until the Tang era (618–907 CE). The region experienced a major influx of Han settlers during the Southern Song dynasty (1127–1279), when migrants began to arrive after fleeing the Mongol invasion of northern China. In 1997 the majority (61.6 percent) of the province's population was ethnic Han Chinese, although minority peoples such as the Zhuang, Yao, Shui, Mulam, and Jing are present in sizable numbers, primarily in the mountainous regions of the interior. The main spoken dialect in the region is Cantonese. Another major dialect, Hakka, is the principal spoken tongue in the north and northeastern regions of the province.

Guangdong is also the point of origin for many overseas Chinese in North America and Southeast Asia, whose relatives left the province in search of work or to escape the political turmoil of the nineteenth and twentieth centuries. During the late 1910s and early 1920s Guangzhou (Canton), the provincial capital, served as the headquarters of the Nationalists, first led by Sun Yat-sen (1866–1925), the province's most famous son, and following his death by Chiang Kai-shek (1887–1975). It was from Guangzhou that Chiang Kai-shek launched the Northern Expedition in 1926 to unify China and end the warlord era.

Between the Tang and Qing dynasties (618–1912) Guangdong emerged as an important agricultural province within the empire, producing large volumes of rice, sugarcane, silk, and fruits, and also as a point of contact with the outside world. Guangzhou was one of China's first great trading centers, first visited by Arab merchants during the Tang dynasty and European merchants during the late Ming and early Qing periods. This tradition of commerce was reinvigorated in the post-Mao period, as Guangdong capitalized on its proximity to the former British colony of Hong Kong to become a primary point of entry for foreign investment and trade with the People's Republic of China. Guangdong stands as one of the best examples of China's ability to move from a state-planned to a market economy that is open to the outside world.

GUANGXI (2002 est. pop. 50.5 million). The Autonomous Region of Guangxi is located on the southern coast of China. Since 1958 the official name has been the Guangxi Zhuang Autonomous Region. The Zhuang nationality is China's largest minority group and constitutes a third of the region's population of 45.5 million (1996). Guangxi covers an area of 236,661 square kilometers and borders on Vietnam and Yunnan in the west, on Guizhou and Hunan in the north, on Guangdong in the east, and on the Gulf of Tonkin in the south. The region is dominated by mountains with peaks over 2,000 meters above sea level in the far west and the far north. Guangxi is traversed by sixty-nine rivers, most of which are tributaries to the Zhu (Pearl) River.

Guangxi has a subtropical monsoon climate, and the rainy season from April to September accounts for 80 percent of the annual precipitation of 1,250 to 1,750 millimeters. Average temperatures during January lie between 6° and 15°C, while the July average is between 23° and 28°C. The capital, Nanning (1996 estimated population of 1.1 million), is situated in the southern central part of Guangxi. The eastern part of the region became part of the Qin empire (221–206 BCE) in 214, and after a brief period of independence, it was conquered by the Han empire (206 BCE–220 CE) in 112–111 BCE. From the Tang dynasty (618–907 CE) onward, the area has been part of various southern administrative divisions, sometimes divided into a Han Chinese region in the east and a Zhuang region in the west. Throughout the centuries, the region has been marked by rebellions against succeeding imperial governments and tribal warfare between the Zhuang and other minority nationalities that were pushed south by the Chinese migration from the north. The Taiping Rebellion (1851–1864) originated in Guangxi, and later in the nineteenth century, the French colonial power in Indochina extended its activities to the region.

Guangxi is one of China's most diversified areas with regard to population. Although the Han Chinese

today constitute 62 percent of the population, there are eleven minority nationalities, of which the Zhuang is the largest by far. Several of these minority groups number fewer than 100,000 people. The most important agricultural crops are rice, millet, and sugarcane, but the region grows a wide variety of crops, including tobacco, tea, fruit, soybeans, sweet potatoes, and peanuts. In the mountains in the northwest, forestry dominates, with pine, fir, oak, and camphor trees. Major industries include textiles, chemicals, machine building, and food and tobacco processing. The scenic areas, with karst mountains and underground caves, around Guilin and Yangshuo in the northeast provide a major source of income through tourism.

GUANGZHOU (2002 pop. 3.4 million). Guangzhou (Canton) is located on China's southeastern coast in the Pearl River Delta. It is the largest city in southern China and the capital of Guangdong Province, which is the main point of entry to China from the Hong Kong Special Administrative Region.

Guangzhou has had a long history as a center of economic activity. As far back as the eleventh century, foreign traders lived in Guangzhou trading ivory and spices for silk and tea. Guangzhou was further opened to the West in the nineteenth century when European nations imposed unequal trade treaties with China that gave European traders access to the Chinese markets. In addition to its importance as a trading center, the city played a central role in the Opium War, the Republican Revolution of 1911, and current economic and political reforms in China.

Following the founding of the People's Republic of China in 1949, Guangzhou achieved notoriety for another reason—families with overseas Chinese relatives. Those with families abroad were either reeducated or punished. During the Cultural Revolution (1966–1976), Guangzhou residents were again attacked, this time by Red Guards for their overseas family connections. Those residents with relatives

overseas were either persecuted or endured harassment for their contact with decadent lifestyles.

Buoyed by its liberal economic policies, Guangzhou has played a pivotal role in China's recent modernization effort, attracting foreign capital and investment. Western companies seeking to enter the vast Chinese market have set up factories, shops, and hotels. Yet, despite their investment, overseas Chinese investors account for the majority of foreign capital.

GUANXI The concept of *guanxi*, or "social relationships," is an important concept in Chinese everyday life. Both individual and group interests are asserted via such relationships. There is a particular image of society behind this concept. Many Chinese see society in the first instance as a hierarchically structured order covered by an interlaced network of relationships. While for many Europeans a person's outward appearance and behavior may be important, for many Chinese, who one knows and to which group or work unit one belongs are of consequence.

Not all interpersonal relations are based on *guanxi*. Relations between members of an immediate family or between spouses are based on other obligations (for example, obedience or respect). *Guanxi* relations arise when people have certain things in common, such as coming from the same local area, mutual experiences, or other social connections, and they are developed first of all with people with whom one is in direct contact.

Tong Relationships

Tong, or having something in common, is the most important basis for *guanxi*. The *tongban* (classmate), *tongbao* (person from the same region), *tonghang* (person in the same business), *tongshi* (colleague), *tongxiang* (person from the same hometown or village), and *tongxue* (person who studied at the same school) all have special relations with one another (*tong* relationships). Relations can also be forged through gifts, personal favors, or mediation by third parties. They include mutual obligations and expectations. For every action, something is expected in return. *Guanxi* is less a private relationship than a role-playing game that on

the basis of previous or current situations produces expectations. Those who do favors gain "face" and are recognized by others as people who have respect for those around them.

Friendship and *tong* relationships involve certain obligations, such as constant readiness to help and support not only the person directly involved in the relationship but also his or her family and friends. Refusing to give this help and support was and is seen as negative social behavior, as a complete lack of any kind of human feeling, or alternatively as proof that someone does not love those to whom he or she is naturally linked and therefore obliged to help. In these cases, refusing to help is seen as the highest form of inhumanity and a break with morality.

Guanxi as Connection

To make use of *guanxi*, both sides have to be able to give each other something (influence, protection, access to scarce goods and services, opportunities for promotion or profit). If no connection exists with an influential person, a link is "created" (*la guanxi*). To do this, a person from the same *guanxi* network is sought who can, via various channels, set up the connection: A requires something from D. However, there is no *guanxi* between them. In A's relationship network, there is B, who is connected with C. And C has *guanxi* with D. A therefore asks B to get in touch with C. B helps A and turns to C; C wants to help B and speaks with D. D wants to do C a favor and therefore helps A. Through this sort chain, new *guanxi* connections develop and with them new mutual obligations. In this way, *guanxi* fulfills the function of a social investment and can be seen as a relationship between people or institutions based on exchange and with a mutual understanding of the rights and obligations of both parties.

Guanxi Versus Corruption

Although there are distinct similarities between *guanxi* and corruption, the two phenomena are not identical, because the social and ethical concepts behind them are (at least theoretically) different. Unlike corruption, *guanxi* is based on real or imagined things in common and is therefore a question of personal emotions. This means that one looks after the person in question personally and is prepared to help him or her. These feelings can be maintained and extended through favors and gifts. Presents of this kind can be found in the traditions of many peoples, and it becomes corruption only within the framework of a rational state form.

***Guanxi* as Network**

There are different degrees of intensity of *guanxi* depending on the degree of emotion involved. The bigger the emotional aspect, the closer the relationship. And if the emotional aspect is less, the relationship is less intense. *Guanxi* relationships based on experiences in common plus emotional connections are therefore stronger than those that came about merely via mediation by a third party. The stronger a relationship, the more social, political, and economic use can be made of it; the more social capital it has.

Guanxi relationships have always played an important role in Chinese history. In premodern China, there was a life-long bond, including mutual political loyalty, between officials who had passed the same top-level exam. At the same time, they were politically loyal to the higher-rank officials who had examined them. This was an important basis for the emergence of "old-boy networks," which today still exist in the form of loyalty to those who studied at the same university or to former political leaders. People from the same village or from the same province clubbed together in areas far from their local region to form regional groups, the members of which are obligated to assist one another (this was still happening in 2002).

In the People's Republic, a system of personal dependencies on superiors developed, because superiors were responsible for hiring, promotion, rewards, punishment, or evaluation of political attitude and therefore could determine the whole life and career of their subordinates. This was encouraged by the fact that the *danwei* (work unit) was responsible not only for work matters but also for political, economical, and social affairs. In this way, an authoritarian culture with relationships based on personal loyalty and "old-boy networks" was encouraged. *Guanxi* relationships are particularly important here, because before the reforms, there were many shortages of goods and services that the state in its monopolist position oversaw, and officials enjoyed privileges that allowed them to use *guanxi* to obtain everything that was officially not available or available only in limited quantities. Friendship and acquaintance with official cadres still help ease some material problems, and political careers and promotion continue to depend on connections with leading functionaries.

Today, *guanxi* still runs through the entire social framework: from employment (retaining or changing jobs) to finance and economics (granting business licenses, loans, tax rates) and everyday life (distribution of housing, access to good medical care), to name only a few examples. Just about everybody has to use *guanxi*

to ensure trouble-free living and working. The reform era has even led to a significant expansion of *guanxi* relationships. The strong orientation toward a market economy, combined with the simultaneous retention of the party's monopoly on power, has led to more fostering and development of *guanxi* in the form of an explosion of present-giving and hospitality, which has meant significantly higher costs for individuals and institutions.

Specifically Chinese Institution

The main reason for *guanxi* is social uncertainty, particularly when other security structures such as the clan or the village community are no longer able to provide social protection. Those affected try to obtain personal protection through *guanxi*, particularly when in positions of political and legal uncertainty. In addition, studies have shown that the Chinese (because of their political and social experiences) are a lot more suspicious of other people and of their environment than, for example, Americans are. The conclusion from this is that suspicion and uncertainty make people seek security and trust not in the political sphere but in the private sphere and in *guanxi* relationships—an important factor in the creation of factions and "old boy networks."

Guanxi is an important instrument for contact and communication between social groups and communities (villages, clubs, associations, professional groups) and also between individuals and the state or party, particularly since it eases reciprocal bargaining processes and can lead to decisions that otherwise would not be taken or would be only partially reached. Where there are no formal avenues for participation and the mechanisms for institutional pressure are weak, *guanxi* becomes a means to influence politics and political decisions and serves to link the state (party) with society. However, because individuals and groups use *guanxi* to seek influence, power, or advantages and in doing so disregard state, ethical, moral, social, or political standards, actively breaking with norms when it is advantageous to those involved, this behavior encourages corruption and overlaps with it in part.

Guanxi is neither a "typically Confucian" nor a "typically socialist" concept. It should instead be interpreted as a principle on which society is organized that is explicable in both cultural and political terms and that functions in the People's Republic of China as well as in Taiwan and among Chinese living abroad. For example, in Taiwan, which is more modernized than the mainland, the phenomenon occurs mainly in the *guanxi* networks between entrepreneurs (known as

network capitalism or *guanxi* capitalism). In business, families are seen more as hierarchical and weak organizations, whereas *guanxi* guarantees incorporation in a relatively stable network of relationships that go beyond the family.

GUERRERO, FERNANDO MARIA (1873–1929), Filipino patriot and writer. Fernando Maria Guerrero believed that the only way to create a genuine Philippine literature was to draw on Philippine legends, history, and national life. Guerrero was the son of an artist, Lorenzo Maria Guerrero. He studied at the Ateneo Municipal and later at the University of Santo Tomas, where he obtained a law degree. Instead of becoming a lawyer, however, he became a writer for the newspaper *La Independencia* (Independence), writing under the pseudonym Fluvio Gil. His incisive writing made *La Independencia* a dynamic newspaper and brought fame to Guerrero.

In 1900, Pablo Ocampo (1853–1925), newspaper editor and later a member of the Philippine Assembly, employed him to write for *La Patria* (Fatherland), a short-lived newspaper because of the Sedition Law, which banned organs that espoused independence from the United States. Guerrero then tried his hand at running his own newspaper, *La Fraternidad* (Fraternity), but this too was short lived. He later joined *El Renacimiento* (Rebirth) and eventually became its chief editor; during his tenure, it was the most outstanding Spanish-language newspaper in the Philippines.

Guerrero pursued literature with a passion. From 1898 to 1900, he had written several lyric poems and

short stories. In 1914, he published *Crisalidas* (Chrysalis), a compilation of poems adjudged one of the ten best books about the Philippines. This was followed by another book, *Aves y Flores* (Birds and Flowers).

Guerrero was also active in politics. He was elected to the first Philippine Assembly in 1907 and later became secretary of the Philippine Senate and then secretary of the Commission on Independence. He was editor of the newspaper *La Opinion* (Opinion) when he died on 12 June 1929.

GUEST HOSPITALITY. See **Qingke**.

GUIZHOU (1999 pop. 37.1 million). "Not three days of weather the same, not three *mu* of flat land, not three *fen* in the pocket." Given that three *mu* is about half an acre and three *fen* is 0.4 U.S. cents, this traditional saying aptly sums up the southwestern Chinese province of Guizhou, located south and east of Sichuan and Yunnan provinces, respectively, and north and west of Guangxi and Hunan. Here some 37 million people are crowded into 176,100 square kilometers, much of which is habitable only at low densities or not at all, for three-quarters of the land is hills and mountains, mostly limestone. So limited is agricultural land that each acre must support seven people; each acre, even on slopes, must be cropped, on average, 1.8 times a year. Population pressure results in two-fifths of the total land being seriously eroded—3 percent of it is bare rock.

Seventy-two percent of Guizhou's workers are employed in the primary sector, mainly in agriculture. The main crops are summer rice and maize, winter wheat and rapeseed, with potatoes as a major subsistence crop at high elevations, plus some apple growing.

Secondary industries produce 43 percent of the wealth from 24 percent of the workers. These are concentrated mainly around the provincial capital, Guiyang, a city of just under a million people (the associated administrative region has a larger population), though there are industrial plants located in smaller towns, such as the large steel works at Anshun in the west, built at the height of the Cold War.

Provincial gross domestic product per person is the lowest in China. Poverty is widespread, exacerbated by relatively high levels of dependency and, for China, high birthrates. These conditions reflect the facts that 24 percent of the population is not Han Chinese, thus not subject to the "one family, one child" policy, and that most Han are rural and are thus allowed two children. Although Guizhou was part of the Chinese empire by the Han dynasty (206 BCE–220 CE), the Han population even in the sixteenth century probably did not exceed a few hundred thousand.

While the province is rich in coal and limestone resources, it will take very large investments to exploit them fully. Although annual rainfall ranges from 800 to 1500 millimeters, surface water is scarce. Limestone landscapes attract tourists mainly from within China, but all kinds of infrastructure in the province are weak. Levels of literacy are low, a quarter of the people being illiterate. Self-supported economic and social development is unlikely in the near term, for poverty extends to government. So long as the central government obtains better returns from development expenditure in the coastal provinces, growth in Guizhou is likely to remain relatively slow, with the province functioning basically as a reservoir of cheap labor. Until transportation infrastructure, especially, is improved, exploitation of that labor reservoir is likely to continue outside the province.

Ronald David Hill

GUJARAT (2001 pop. 50.6 million). The state of Gujarat is located on the west coast of India and is bounded by the Arabian Sea on the west, Pakistan in the north, and the states of Rajasthan in the northeast, Madhya Pradesh in the southeast, and Maharashtra in the south. It covers an area of 196,024 square kilometers, and its principal language is Gujarati. Gandhinagar is the capital city. Other important sites are Ahmedabad, Jamnagar, Rajkot, Junagarh, Bhuj, Cambay, and Surat.

The history of Gujarat goes back to 2000 BCE. It is believed that Lord Krishna left Mathura to settle on the west coast of Saurashtra, which came to be known

as Dwarka. Several kingdoms sprang up here at various times. Of these, the Mauryas, Guptas, Pratiharas, and Chalukyas were the most significant. During the medieval period, Gujarat passed under the rule of the Delhi sultans, who were followed by the Mughals, and finally by the British. The present state of Gujarat came into being on 1 May 1960, following the reorganization of the Indian states.

One of the most prosperous states, Gujarat is the main producer of tobacco, cotton, and groundnuts in the country. Other important agricultural products include paddy rice, wheat, and millet. Gujarat is also one of India's leading industrial states and a major center of trade and commerce. It has forty ports, of which Kandla is the most important. Gujarat is famous for industries such as chemicals, petrochemicals, fertilizers, engineering, and electronics. Registered working factories in the state numbered 19,771 at the end of 1999.

Among the annual fairs and festivals of the state is the Tarnetar fair, held at the village of Tarnetar in honor of Lord Siva in the month of Bhadra (mid-August–mid-September). The Madhavrai fair celebrating the marriage of Lord Krishna and Rukmini is held at Madhavpur in Chaitra (mid-March–mid-April). The Ambaji fair, held in the Banaskantha district, is dedicated to the mother goddess Amba. The traditional Hindu festivals of Janmashtami (the birthday of Lord Krishna), Makar Sankranti, and Navaratri are popular throughout Gujarat.

Gujarat attracts a large number of tourists. Tourist spots include sacred Hindu sites such as Dwarka, Somnath, Ambaji, Bhadrashwar, Shamlaji, Taranga, and Girnar. Porbandar, the birthplace of Mahatma Gandhi, Gandhi's ashram at Sabarmati, and archaeological sites at Lothal and Dhabol also draw visitors, as do the beaches at Ahmadpur-Mandvi, Chorwad, and Tithal; the lion sanctuary at Gir Forest; and the wild ass sanctuary at Kutch.

Sanghvi, Nagindas. (1996) *Gujarat: A Political Analysis*. Surat, India: Centre for Social Studies.

Ward, Philip. (1998) *Gujarat, Daman, Diu: A Travel Guide*. New Delhi: Orient Longman.

GUJARATI Gujarati is the name of both an Indian language and the people who speak it. The language is the official language of Gujarat state, in the west of India and just to the north of Mumbai (Bombay), with a population of 50.6 million in 2001.

Gujarati is an Indo-Aryan language, with considerable amounts of vocabulary borrowed from Sanskrit, Urdu, Arabic, Persian, Portuguese, and English. It is written in its own script, akin to Devanagari, which uses thirty-four consonants and eleven vowels.

The state of Gujarat has the longest coastline of any Indian state, about 1,600 kilometers, and has had strong overseas trade connections ever since the Harappan civilization, over four thousand years ago. The present Gujarat state, with Gandhinagar as its capital, came into existence in 1960 for reasons of linguistic politics, by merging the three former entities of Gujarat, Saurashtra, and Kachchh (Kutch).

Gujaratis of many castes practice farming, the Patidars and Rajputs being especially prominent as landholders. Sorghum, wheat, and rice are the major food crops, but there is also important commercial cultivation of cotton, tobacco, groundnut, and sugarcane. The Gujaratis who are more urbanized have a strong tradition of trading and money lending, especially those groups called Banias. These latter may be Hindu, Jain, or Muslim in religion; all three faiths have a large following in Gujarat.

Some parts of the state are extremely dry and desertlike, so that goat and camel pastoralism is a widespread subsistence practice. In recent times the state government has done a good job of industrializing and attracting foreign capital to support industry. However, many cities suffered a severe setback in 2001 because of a devastating earthquake centered on Bhuj, which was almost completely destroyed.

Foreign investment has been more easily attracted here than to many Indian states because of the large number of Gujaratis who are businesspeople and traders overseas, in East and South Africa, Britain, Canada, and the United States. In the United States today one finds Gujaratis holding a virtual monopoly on the management of certain motel and donut chains and in the running of magazine stalls in the New York City subway.

GULF OF OMAN The Gulf of Oman is an extension of the Indian Ocean and the Arabian Sea lo-

cated between the countries of Oman in the southwest and Iran in the north. The Strait of Hormuz in the northwest links it with the Persian Gulf. The Gulf of Oman is 560 kilometers (350 miles) long and 320 kilometers (200 miles) wide. Summertime temperatures can reach over 49°C (120°F), making this one of the warmest regions of the world. The main ports along its shores are Gwadar Bay in Pakistan, Bandar Beheshti and Jask in Iran, and Suhar, Muscat, and Sur in Oman. For centuries local vessels have carried on a considerable trade across the Gulf of Oman between Iran, Arabia, India, and East Africa. Recently it has become quite important for the shipping of oil from the Persian Gulf region to the rest of the world. Fishing is also a minor industry.

Thabit A. J. Abdullah

GULF OF THAILAND The Gulf of Thailand is west of the South China Sea, surrounded by the Southeast Asian nations of Vietnam, Cambodia, Thailand, and Malaysia. This semienclosed sea of about 320,000 square kilometers is on the Sunda Shelf. It is considered relatively shallow with a mean depth of

45 meters. The Chao Phraya, Tha Chin, Mea Klong, and Bang Pakong rivers drain into the gulf.

Given its abundance of both living and mineral resources, millions of people derive their livelihoods from the gulf; its environment affects many more. Its ecosystem is of great concern. High demand for food items such as shrimp, crayfish, and prawns, for example, has led to the establishment of aquaculture to supplement those species depleted by overfishing and environmental destruction. The fisheries in 1996 were determined to be near collapse, with fishermen continually experiencing lower catches. There is worry over the presence of petroleum and other contaminants such as mercury in the gulf. Governments are reportedly enacting sustainable-use policies to preserve both resources and the environment; nevertheless, the environmental devastation has created problems for the surrounding population where fish and shellfish are often the only source of dietary protein available.

GULGEE (b. 1926), Pakistani artist. Abdul Mohammed Ismaili, better known as Gulgee, was born in Peshawar in 1926. This famous Pakistani artist began his career as an engineer, receiving advanced degrees from universities in the United States. Gulgee's early works were sketches and oil paintings, mostly government commissions, such as *Afghans*, a 1957 series of 150 portraits of King Zahir Shah and his household. He also composed mosaic portraits, using chips of lapis lazuli, of Saudi Arabian kings and leaders of his Ismaili faith.

In the 1960s Gulgee, like his Western contemporaries, turned to abstract expression, and he has continued in this genre for the past forty years. However, in its vibrant use of color and gold leaf and silver leaf, his painting is clearly inspired by local Sindhi craftsmanship, such as mirror work and block printing. Often, Gulgee's paintings incorporate abstracted Qur'anic verses that further the artist's claim that his paintings mark his Sufi disposition. The generous sweep of his brushstrokes and his dancelike performance when painting are indeed reminiscent of the devotional dances of mystics. The emotive intensity of Gulgee's paintings may thus place them in the context of Islamic devotional art.

GULISTON (2000 est. pop. 54,000). Guliston is a city in eastern Uzbekistan. It is the administrative center of the country's Syr Dar'ya Province, famous for its extensive irrigation network and cotton growing. Guliston is situated in the southeastern part of the Mirzachul, formerly the Golodnaia ("hungry") steppe, 120 kilometers southwest of the capital city of Tashkent.

Guliston was founded in the late nineteenth century as a Russian settlement with the name of Golodnaia Step (Hungry Steppe). After Soviet power was established in the region (1921), Golodnaia Step was renamed Mirzachul in 1922. In 1961, it was recognized as a town and received the name Guliston ("flower garden"). From 1963 until the dissolution of the Soviet Union in 1991, Guliston was the administrative center of the Syr Dar'ya subdivision of the Uzbek Soviet Socialist Republic. Since 1991 Guliston has been the administrative center of the Syr Dar'ya Province and the Golodnaia Steppe Economic Region of the republic of Uzbekistan. Present-day Guliston has a railway station, a state university, and cotton processing, mechanical, and construction material plants.

GUMMA (2002 est. pop. 2 million). Gumma Prefecture is situated in the central region of Japan's island of Honshu. Essentially a satellite of Tokyo, it occupies an area of 6,356 square kilometers. Gumma's main geographical features are a mostly mountainous terrain and a section of the Kanto Plain in the southeast. The Tonegawa, the nation's second longest river (322 kilometers), intersects the prefecture. Gumma is bordered by Saitama, Nagano, Niigata, Fukushima, and Tochigi Prefectures. Once known as Kozuke province, it assumed its present name and borders in 1876.

Gumma's capital is Maebashi, an important provincial town since the eighth century. In the Edo period (1600/1603–1868) it became a castle town and a market center for silk production. Recent decades have seen a greater reliance on lumber production and the development of factories for transportation machinery and electrical appliances. The prefecture's other important cities are Ota, Takasaki, and Shibukawa.

Today Gumma's extensive truck farms produce vegetables for the Tokyo market. The textile industry continues in Kiryu, Isesaki, and Tatebayashi, while the northward encroachment of the Keihin Industrial Zone has fostered chemical, electrical, and machine plants. Visitors are drawn to the Iwajuku archeological site; to the hot spring resorts of Minakami, Ikaho, and Kusatsu; and to skiing and hiking in Nikko and Joshin'etsu Kogen National Parks.

GUNEY, YILMAZ (1937–1984), Turkish director and actor. YKlmaz Guney, also known as Cirkin Kral (Ugly King), was one of the most popular directors and actors of Turkish cinema. Born as YKlmaz Putin in rural Adana (Turkey) to poor Kurdish parents, he began his career doing odd jobs on movie sets and worked his way up as an actor, scriptwriter, and director. As a militant Communist, he spent more than eleven years in Turkish prisons. Nevertheless, he acted in 111 films, directed 17, and wrote 53 movie scripts.

Yilmaz Guney set new standards for realism in Turkish cinema. His script for the movie *Suru* (Herd) won the Berlin Film Festival prize in 1979. His most famous work, *Yol* (Path), was filmed according to his script and directions while he was in prison in 1980. *Yol* shared the top prize, the Palme d'Or, at the Cannes Film Festival in 1982, with Costa Gavras's *Missing*.

Guney spent his last few years as an exile in Europe. The military government of Turkey expelled him from citizenship and banned and destroyed his films. *Yol* (Path) was screened in Turkey for the first time in 1999. Guney died of cancer and was buried in Père Lachaise cemetery in Paris. He remains a cult figure in Turkish popular culture.

GUNPOWDER AND ROCKETRY The development of gunpowder and the rocket have related

A woman with rockets and fireworks in her shop in Vietnam, c. 1995. (STEVE RAYMER/CORBIS)

histories, and both are believed to have originated in China by the late Song dynasty (eleventh century CE). Gunpowder was the first explosive and propellant and one of world history's most important inventions. It has three ingredients mixed together: potassium nitrate (also called saltpeter), sulfur, and charcoal. Gunpowder, also called black powder, propelled the first bullets and rockets. The rocket used a low nitrate, slower-burning gunpowder and was self-propelled once the powder ignited.

Origins

Most likely gunpowder and the rocket were surprise discoveries rather than inventions. For centuries, Chinese Taoist philosophers experimented with chemicals to seek the answer to longevity. One Taoist book, *Zhen yuan miao Dao yao lue* (Classified Essentials of the Mysterious Tao) of around 850 CE, warned not to mix certain ingredients, including sulfur, saltpeter, and other ingredients, because the mixture had been known to flame up, singe beards, and burn a house. This was one of several known Taoist alchemical explosions, and the Chinese of the period do not appear to have understood the true nature of combustion. As late as the seventeenth century, they still believed the combustion of gunpowder was caused by the interaction of the yin, or female element, and yang, the male element.

Early Chinese military terms are often difficult to interpret, but the earliest recognizable gunpowder formulas are found in *Wu jing zong yao* (Essentials of Military Classics), edited in 1044 by Zeng Guangliang. The first true gun appeared about 1260. Many theories have been proposed as to how the rocket appeared. One is that the discovery was made when a Chinese soldier modified an ordinary incendiary "fire arrow."

For certain, Chinese chronicles contain numerous accounts of gunpowder weapons from the late Song dynasty, though it is often unclear whether they refer to rockets. The most famous examples are the flying fire arrows, or more correctly, flying fire spears, used by the Chinese against the Mongols in the siege of Kaifeng in 1232. Some authorities believe the devices were no more than thrown "flying fire" spears, or perhaps handheld lances that merely shot fire into the air; others contend they were true self-propelled rockets.

The term *huo chien* (fire arrow) at first meant simply an incendiary arrow but later came to mean rocket. The earliest known depictions of Chinese rockets, in the *Wu bei zhi* (Treatise on Armament Technology, c. 1628) of Mao Yuanyi, show many variations of arrows with rocket tubes attached, which were therefore true rocket arrows. This may be strongest evidence that Chinese rockets evolved from ordinary incendiary arrows.

Ironically, the clearest early Chinese reference to a rocket device involves fireworks. In 1264, according to *Qi dong ye yu* (Rustic Talks in Eastern Qi, c. 1290) by Zhou Mi, a fireworks display was held in the courtyard of the royal palace. One firework, called a "ground rat," went up the steps of the throne of the empress mother and frightened her. It was thus self-propelled, that is, it was a rocket.

However the rocket appeared, it spread to Arabia by the late 1200s, and apparently from there into Europe, probably to northern Italy first, via maritime trade routes. By the fourteenth century, the first guns appeared in Europe. The spread of gunpowder and the rocket throughout the rest of Asia is less well known. The first rockets in Korea appeared in 1377 and may have been directly introduced from China.

Spread to Southeast Asia and India

One possible way to establish the spread of rocketry in Asia is by tracing the origins of allegedly centuries-old Asian rocket festivals. Northeast Thailand holds the annual Boun Bang Fai festival in which giant, decorated gunpowder rockets with bamboo guide sticks are fired by different villages to please the rain gods and ensure a good rice harvest. Neighboring Laos celebrates the identical animistic and Buddhist festival. A very similar practice is found in the remote Xishuangbanna Dai Autonomous District in Yunnan Prefecture, adjacent to both northeast Thailand and Laos. In Myanmar (Burma), there is the Pa-O Rocket Festival of the Pa-O minority group in the Shan states.

Closer examination shows a definite link between festivals in Thailand, Laos, Yunnan, China, and

Burma, whose practitioners are all of the same Tai cultural stock. The actual histories of the festivals are unknown, but one theory advanced is that basic gunpowder and rocket technology started in China, in the eastern, more advanced area of the country, probably in the Song-dynasty capital of Hangzhou.

From this region, knowledge of gunpowder and the rocket probably spread via Chinese maritime trade missions to India in the early fifteenth century CE. In India, gunpowder, fireworks, and especially the rocket became well developed; Indian war rockets were used for centuries. From India, the technology may have spread first to neighboring Burma and from there to Thailand (Siam), Laos, and back again to China, to the more rural agricultural area of Yunnan.

Spread to Japan

In Japan, in several prefectures near Tokyo, annual Ryusei (Ascending Dragon) rocket festivals celebrate good harvests. However, the origin of the rocket festivals in Japan is more problematic. Undoubtedly knowledge of the rockets was imported at an unknown date to Japan and the festival was adapted to local culture. The Japanese had a seventeenth-century colony in Siam that conducted trade in gunpowder between the two countries, but no records have been found mentioning rockets.

Japan was introduced to gunpowder and guns in 1543 by the Portuguese. Fireworks were introduced in 1600, whereas one historian, without verification, claims that Japan imported "rocket arrows" from China about 1595.

Further Areas of Research

More research needs to be done to expand the picture of the overall development and spread of gunpowder in Asia. Information coming out of the rocket festivals presently held in Thailand, Laos, China, Myanmar, and Japan may be a key to determining the origin and spread of the earliest rockets through Asia and elsewhere.

GUO MORUO (1892–1978), Chinese intellectual. Born in Leshan, Sichuan Province, Guo Moruo (or Kuo Mo-jo) studied in Japan from 1914 to 1923 and graduated from Kyushu Imperial University with a medical degree. After returning to China, he began to write and became a famous poet, playwright, paleographer, historian, politician, short story writer, essayist, and translator. His collection of poetry, *Nu Shen* (The Goddesses; published in 1921), is generally regarded as the first significant book of poetry in modern China. His scholarly works on Chinese history and paleography are well regarded.

Guo founded the Chuang Zao She (Creation Society) with a small group of young and idealistic poets and writers who, like him, had recently studied in Japan. But although a writer and historian, Guo was also deeply involved in twentieth-century Chinese politics. During the Northern Expedition (1926–1927), a war that the Nationalists and Communists fought against the northern warlords, he served as a colonel and later a lieutenant general, in charge of public relations. In the Nanchang Uprising of August 1927, which gave birth to the Red Army, he served as director of public relations and during this period joined the Chinese Communist Party. After the establishment of the People's Republic of China on 1 October 1949, Guo Moruo served in many important positions, such as vice premier in charge of culture and education, president of the Chinese Academy of Science, president of the Chinese Writers' Association, vice president of the National People's Congress, and member of the Communist Party Central Committee.

GUOMINDANG The Guomintang (Kuomintang), or Chinese Nationalist Party, has its roots in a movement established in 1894 and is China's oldest political party. The history of the Guomintang (GMD) can be divided into six periods. During the first period (1894–1912), before it was known by its current name, it was a movement led by Sun Yat-sen (1866–1925), the so-called father of modern China, aimed at overthrowing the Qing (Manchu) dynasty

(1644–1912). Sun changed the movement's name several times, but it was best known in the early days as the Tongmenghui (Revolutionary Alliance).

In the second period (1912–1919), the name Guomintang was used for the first time, and the movement became a parliamentary party active primarily in the new national legislature in Beijing. Then, during the third period (1919–1928), Sun Yat-sen reorganized the Guomintang as an armed political force seeking to overthrow China's warlords and establish a one-party government. During the fourth period (1928–1949), under the leadership of Chiang Kai-shek (1887–1975), who had become the party's leader, the party followed Sun Yat-sen's plan to set up the Republic of China in Nanjing (Nanking) under the tutelage of the Guomintang until China was ready for full democracy. That regime became recognized internationally as the government of China, but it did not control all of Chinese territory.

In the fifth period (1949–1995), the Guomintang's Republic of China withdrew to the island of Taiwan, where it became an authoritarian one-party state allied with United States in the Cold War. For most of the fourth and fifth periods, Chiang Kai-shek (and later his son, Chiang Ching-kuo), occupied both the presidency of the Republic of China and chairmanship of the Guomintang.

Following economic growth in the 1960s, the Republic of China in the early 1980s began a process of political and social liberalization. By the mid-1990s it had developed into a multiparty constitutional democracy. In the 2000 Presidential election, the Democratic Progressive Party candidate, Chen Shui-bian, emerged as the victor with a plurality. This marked the beginning of the Guomintang's sixth period, in which it operates as one party within a multiparty constitutional democracy. This final form fulfills Sun Yat-sen's dream for a full-fledged democracy.

The Guomintang under Sun Yat-sen

Sun Yat-sen's supporters founded the Guomintang in 1912 to represent his views in the legislature of the newly established Republic of China. Sun had intended to serve as president of the new republic but in early 1912 lost out to Yuan Shikai (1859–1916), a general and diplomat formerly in the service of the Qing dynasty. As president, Yuan Shikai opposed parliamentary power and had the Guomintang's parliamentary leader, Song Jiaoren (1882–1913) assassinated.

In the chaotic politics of the next decade, the Guomintang survived as a parliamentary party but had no

power. Sun Yat-sen tried to revive the Guomindang in 1919 by moving its headquarters to Guangzhou (Canton), where he cooperated with a local warlord. This effort failed, and in 1923 Sun undertook a further reorganization. Combining assistance and inspiration from the Soviet Union, Sun Yat-sen re-created the Guomindang as a Leninist style party with a clear ideology, limited membership subject to firm party discipline, and a strong army under party control. Sun Yat-sen also permitted members of the tiny Chinese Communist Party to join the Guomindang without giving up their earlier affiliation, so the two parties were allied. Chiang Kai-shek, a military man loyal to Sun Yat-sen, headed the Guomindang's new Whampoa military academy but had no sympathy for Communism or the Soviet Union.

The Guomindang under Chiang Kai-shek

After Sun Yat-sen's death 1925, Chiang Kai-shek emerged as the Guomindang's leader. In the summer of 1926 the Guomindang's newly trained army undertook the Northern Expedition, an effort to end warlordism in China and establish a national government on Sun Yat-sen's model. In April 1927, Chiang Kai-shek's army and local gangs slaughtered Communist members in Shanghai, permanently alienating the Communists.

The Northern Expedition produced a new national government with its capital in Nanjing. Under a provisional constitution, based on Sun Yat-sen's ideas, it was a one-party regime tutoring the Chinese people for democracy. Chiang Kai-shek held both the presidency and chairmanship of the party, which operated along Leninist lines, with top-down control, political commissars, and enforced adherence to the party line. In actuality, however, the Guomindang could never suppress differing agendas within its ranks. Chiang Kai-shek became adept at manipulating factions but could never achieve the total control that Guomindang ideology advocated. In the cities, the Guomindang made alliances with bosses deeply involved in illegal activities. In rural areas, the Guomindang again lacked progressive allies and so had few effective programs. This Guomindang government at Nanjing had many weaknesses including limited territorial control, but promised to evolve into a stable regime that could represent all of China.

In the 1930s, with the rise of fascism in Europe, Chiang Kai-shek promoted some fascist-style organizations, including the New Life Movement, whose goal was to improve public morals, and the Blue Shirts, an organization of young men with ultranationalist

ideas. Also in the fascist style, his government asserted control over business and kept the media under close rein. From 1937 to 1945, the Republic of China was locked in war against Japan. During these years the Guomindang atrophied, and the state and military apparatus grew. The party's members, still split into factions, lost both their spirit and a vision for the future. At the war's end bureaucrats and generals, not the Guomindang, ran the regime, and the party lacked broad popular support. These fatal weaknesses in the Guomindang are seen as a major cause of Chiang Kai-shek's defeat in China's 1945–1949 civil war.

On Taiwan after 1950, Chiang Kai-shek established a garrison state committed to recapturing the Chinese mainland. A revived Guomindang had two important functions: As a parliamentary party, it controlled the national legislature. As a mobilizing force, it was intended to spur all levels of society to realize Chiang Kai-shek's dream of returning to rule the Chinese mainland. In practice, Guomindang members came from the ranks of 1.5 million mainlanders who had accompanied Chiang Kai-shek to Taiwan in 1949–1950, rather than from the 11 million Taiwanese. Most Taiwanese had limited interest in Chiang Kai-shek's dream of retaking the mainland. Thus, although the Guomindang had become a more effective party, it still lacked widespread popular support.

The Guomindang under Chiang Ching-kuo and Lee Teng-hui

After Chiang Kai-shek's death in 1975 and under the leadership of his son, Chiang Ching-kuo, the Guomindang underwent important changes. Economic prosperity for all on Taiwan replaced a return to the mainland as the regime's principal goal. Chiang Ching-kuo encouraged youth groups, offering outlets for energies pent up by his father's stifling authoritarian anti-Communism. Also, Taiwan's provincial politics became an arena in which the Guomindang made common cause with some Taiwanese interests. By the late 1980s, the Guomindang, with more than 2 million members in a population of 23 million, had become well integrated into Taiwan on the local and provincial levels. Also, the Guomindang had become exceptionally wealthy through ownership of many of Taiwan's most profitable businesses.

Under the leadership of Lee Teng-hui (b.1923), a Taiwanese who succeeded Chiang Ching-kuo in 1987 as chairman of the Guomindang and president of the government, a sweeping series of political and general reforms gave Taiwanese a real voice in the regime. At the same time, increasing prosperity was accompanied

by a general liberalization in Taiwan's social atmosphere. The Guomintang remained in control of politics in Taiwan but in 1986 permitted the emergence of an opposition party, the Democratic Progressive Party (DPP). In elections during the 1990s the Guomintang saw its control over political power erode as the Democratic Progressive Party and the New Party gained more and more positions.

The Guomintang after the 2000 Presidential Election

The Guomintang's dominance in Taiwan was crippled by the March 2000 presidential election, when James C. Y. Soong, a defector from the ranks of the Guomintang, ran as an independent and Lien Chan ran as the official party candidate. They split the party's vote, and the presidency went to the DPP candidate, Chen Shui-bian (b. 1950), who received a plurality but not a majority. Though deprived of the presidency, the GMD retained firm control over the legislature until the December 2001 parliamentary elections. In those elections the GMD's share of seats fell sharply from a majority to less than one-third of the seats, whereas the DPP increased its power to well over one-third. Yet, minority parties, including the People First Party (PFP) led by GMD dissident Soong, collectively won the remaining seats. In this new multiparty era, any government must be based on a coalition. Although the GMD has great financial resources and remains a major player in Taiwan politics, its era of dominance has ended.

GUPTA EMPIRE From the fourth through the middle of the sixth century CE the Gupta empire extended over all of northern India and much of the south. Under the patronage of the Gupta dynasty Indian culture flourished, and the era has rightly been termed the Classical or Golden Age of India.

At the end of the third century, before the rise of the Guptas, the Indian subcontinent was an aggregation of small kingdoms and autonomous states. Around this time a king named Srigupta and his son Ghatotkacha Gupta established an independent kingdom on the eastern Gangetic plain.

The family became preeminent under Chandra Gupta I (flourished c. 320), the son of Ghatotkacha Gupta. Chandra Gupta's son Samudra Gupta greatly expanded the empire and is considered by some to be the real founder. Samudra Gupta (reigned c. 340–380), a formidable warrior, established relations with (and probably some degree of suzerainty over) kingdoms adjoining his frontiers. Samudra Gupta was a patron of learning, a poet, and a musician.

Samudra Gupta's son Rama Gupta probably succeeded him for a short period, followed by another son (or grandson) Chandra Gupta II (reigned 380–c. 415). Under this ruler's long reign the empire flowered. Gupta territory extended in the west beyond the Hindu Kush range into today's Afghanistan and in the east to the western borders of today's Assam and Myanmar (Burma).

Chandra Gupta's son Kumara Gupta (reigned 415–455) had an uneventful and generally prosperous reign. His son Skanda Gupta fought the invading Hunas on the western border on at least three occasions and completely crushed them. Following the death of Kumara Gupta the Gupta empire gradually declined. By the seventh century it was fragmented and reduced in size by the Hunas in the west and by Indian kings on the other three borders.

Nevertheless the Guptas left an indelible mark on subsequent Indian history and culture. They established an efficient administrative system, and under their patronage intellectual and cultural activity flourished as never before. In literature, Sanskrit reached its peak with Kalidasa (drama and poetry), Dandin (poetry and prose), and Subandhu and Banabhatta (prose). Eminent writers from across the country made their

ideas universally available through the universal language, Sanskrit. Amara (flourished late fourth and early fifth century) composed the critical Sanskrit lexicon *Amarakosha*, and important explicatory texts in Brahmanic and Buddhist philosophy were created. Brahmanical Hinduism, both Saivism (worship of Siva) and Vaishnavism (worship of Vishnu), was established, while Buddhism and Jainism went into a decline. Much of the Puranic literature (literature reflecting ancient history, laws, and codes of behavior) and the *Dharmasastra*—the basis of Brahmanical Hinduism and Hindu law—took shape. Aryabhata (476–c. 550), one of many astronomers and mathematicians, wrote about quadratic equations and other algebraic rules as well as trigonometry; he also wrote that the earth rotated on its axis and explained solar and lunar eclipses. A great university was established at Nalanda.

The Gupta empire's excellence in metallurgy is evidenced by the outdoor iron pillar near Delhi. This architectural piece, which was erected to glorify the conquests of one of the Gupta kings, remains untarnished to this day.

The Gupta period is also known for the large, beautifully carved figures of Buddha, often with clinging drapery. Sculpture in the form of reliefs on walls of sanctuaries cut from rock was another achievement of this period, as evidenced by the caves at Ajanta; Gupta temple architecture and sculptural decoration are exemplified by the temple of Saranatha. Pillar engravings left intimate details of the empire and emperors. Relations were established with foreign cultures and rulers. Indian kingdoms were established on the subcontinent and across the seas in today's Myanmar, Thailand, Cambodia, the Malayan Peninsula, Java, Bali, and Borneo. The Guptas dominated Indian history and culture for two hundred years after their empire disappeared, and even today they are considered exceptional figures of Hindu India.

GURRAGCHAA, JUGDERDEMIYIN (b. 1947), Mongolian astronaut. Jugderdemidiyn Gurragchaa was the first Mongolian astronaut. He was born 5 December 1947 in the town of Gurvan-Bulak, in the Bulgan province of Mongolia. After attending the Ulaanbaatar Agricultural Institute, he was drafted

into the Mongolian army in 1966. In 1973, Gurragchaa attended the Zhukovskiy Air Force Academy in Moscow. Then, in 1978, Captain Gurragchaa trained for three years at the Yuri Gagarin Cosmonaut Training Center in the USSR. In 1981, Gurragchaa and the Soviet cosmonaut Dzhaniybekov were launched into space aboard the *Soyuz 39* spacecraft. They spent seven days aboard the *Salyut 7* space station, performing a variety of tests that focused on mapping Mongolia.

Upon his return to Mongolia, Gurragchaa was promoted to colonel, then major general, and received several honors. He became a deputy of the People's Great Khural (parliament) in 1982, serving until the fall of communism in Mongolia in 1990. During the democratic elections he became the chairman of the electoral commission that organized and supervised the elections. He was also elected the chairman of the Federation of Societies for Friendship between Mongolia and the countries of the Commonwealth of Independent States in 1992.

GUSMÃO, XANANA (b. 1946), East Timorese resistance leader. As the leader of the struggle for independence, Xanana Gusmão became the most important resistance figure of East Timor. Born on 20 June 1946 in Laleia, East Timor, José Alexandre "Xanana" Gusmão was educated at a Jesuit seminary and worked in the civil service. In 1974, he joined the Revolutionary Front for an Independent East Timor (Fretelin) and became its leader in 1978. After years of violent struggle, he was elected commander of Fretelin armed forces (Falintil).

Believing that the fight for independence transcended political loyalties, Xanana developed a policy to unite various pro-independence groups and became the charismatic leader of the national Timorese resistance against Indonesian occupation. In 1992, he was captured by the Indonesian armed forces and imprisoned in Jakarta.

Despite imprisonment, Xanana remained the leader of Timorese resistance. A historic visit by Nelson

Xanana Gusmão arrives at a ceremony formalizing his release on 7 September 1999. (REUTERS NEWMEDIA INC./CORBIS)

Mandela in 1997 raised international awareness of the deteriorating situation in East Timor. In 1999, Xanana was transferred from prison to house arrest but was not allowed to participate in the pro-independence campaign during the process of the U.N.-organized consultation on the future of East Timor. As the president of the National Council of Timorese Resistance (CNRT), he returned to his home country in 1999 and is seen by many observers as the person most likely to lead an independent East Timor.

GUWAHATI (2001 pop. 808,000). Formerly Gauhati, Guwahati is the largest city in Assam State, India. It is situated on the Brahmaputra River, 300 miles northeast of Calcutta. As Pragiyotishpura ("the Eastern City of Light"), it was the capital of the Hindu kingdom of Kamarupa around 400 CE and is named in the *Mahabharata*. It was controlled alternately by the Muslims and Ahoms in the seventeenth century; the Ahom raja made it his capital in 1786. The Burmese held it from 1816 until 1826, when it became the British capital of Assam Province.

Guwahati is a busy river port and communications center. It is also the site of one of India's most important Kali temples, Kamakhya and Navagraha, "temple of the nine planets," once a great center of astrology and astronomy. The Siva temple of Umananda stands on an island bluff. Nearby are Hindu pilgrimage centers, a university and law college, the state high court, scientific museums, and a zoological garden. The Srimanta Sankaradeva Kalakshetra opened in 1998, promoting dance, drama, music, and art. Tea is the principal business, and the new Assam Tea Auction Center holds the world's largest tea auctions, supplanting those of Calcutta and London. A large oil refinery on its outskirts symbolizes Guwahati's recent growth.

HA LONG BAY Located in northeastern Vietnam 160 kilometers east of Hanoi and 55 kilometers northeast of Haiphong, Ha Long Bay is a 1,500 square kilometer area of water that stretches from the northern Gulf of Tonkin nearly to the Chinese border. In the bay are approximately 3,000 islands of limestone and dolomite that geologists attribute the formation of to sedimentary limestone formed between 300 and 500 million years ago, in the Paleozoic Era. Over millions of years, the water in the bay receded and exposed the limestone to rain, winds, and tidal erosion, resulting in the formation of the uniquely shaped small and large limestone outcroppings that now attract a multitude of tourists each year. The bay has been named by the United Nations Educational, Scientific, and Cultural Organization or UNESCO as a World Heritage Site.

Ha Long literally means "dragon descending" and, according to local myth, the bay and its many islands

were formed long ago when the forefathers of the Vietnamese were fighting Chinese invaders from the north. The gods from heaven sent a family of dragons to help defend their land. This family of dragons descended on what is now Ha Long Bay and began spitting out jewels and jade, which, on hitting the sea, turned into the various islands and islets dotting the seascape and formed a formidable fortress against the invaders. The locals were able to keep their land safe and formed what is now the country of Vietnam. The dragon family fell so much in love with this area for its calm water and for the reverence of the people of Vietnam that they decided to remain on earth. The mother dragon lies on what is now Ha Long (her scales forming the rocky islets) and her children lie on Bai Tu Long. The dragon tails formed the area of the beaches of Bach Long Vi. The myth compliments that of the origins of the Vietnamese people, which describes the union between a king (representing the dragon) and his bride (representing a goddess) who gives birth to one hundred children (the ancestors of the Vietnamese people). The myth of Ha Long Bay perpetuates the Vietnamese belief that throughout their history, they have been aided by their ancestors—the dragon and the gods—in the defense of their land.

Richard B. Verrone

HA LONG BAY—WORLD HERITAGE SITE

Ha Long Bay, a beautiful and almost completely uninhabited area off the Gulf of Tonkin in Vietnam, was designated a UNESCO World Heritage Site in 1994 for its thousands of limestone pillars and abundant wildlife.

HABIBIE, B. J. (b. 1936), third president of the Republic of Indonesia. Bacharuddin Jusuf Habibie, known as B. J. Habibie, was born in Pare-Pare in southern Sulawesi (Celebes), Indonesia. The young Habibie has been described as a serious student and strongly religious. Raised in an orthodox Muslim family, he met the future president of Indonesia, Suharto (b. 1921), when the latter was posted to Sulawesi as an army officer. During this period, when Habibie was still a young child, his father passed away. Suharto is believed to have taken a personal interest in Habibie, and the two formed a bond that later led to Habibie's rise in Suharto's government when the latter became the president of the Republic of Indonesia.

B. J. Habibie did his high school diploma course in Java, at the prestigious Bandung Institute of Technology, and got his diploma in 1954. In 1960, he graduated with an engineering degree from the Aachen Institute of Technology in Germany. He received his doctorate in engineering in 1965 from the same institution, graduating *summa cum laude*.

After completing his education, Habibie worked as a specialized scientist at the Hamburger Flugzügbau

President B. J. Habibie on 5 January 1999 shortly after withdrawing from the election for president. (AFP/CORBIS)

in Germany, later known as the Messerschmitt-Bölkow-Blohm company (which had absorbed the company founded by Willy Messerschmitt [1898–1978], the designer of the Messerschmitt fighter aircraft that played so prominent a role in Hitler's Luftwaffe during World War II). Between 1969 and 1973, he headed the methods and technology division for commercial airplanes and military transport at this firm. He was called back to Indonesia in 1974 to develop strategies for achieving Indonesia's technological goals. The then president Suharto backed Habibie's strategy to enable Indonesia to compete technologically with the rest of the world by the end of the twentieth century.

Habibie headed several high-cost ventures supported by the Indonesian state, including the aircraft industry. In 1982, he became a member of the Indonesian parliament as a representative of the ruling party, Golkar. Between 1978 and 1998, he was the state minister of research and technology. In 1990, he became the chairman of the Association of Indonesian Muslim Intellectuals (ICMI); some observers have viewed this as a political role that Suharto gave Habibie to counterbalance the power of the Indonesian armed forces. ICMI also served as an alternative power base to the army.

Habibie was made the seventh vice president of the Republic of Indonesia in March 1998, when the authoritarian president Suharto was fighting for his political survival in the aftermath of the economic crisis in Southeast Asia. In May 1998, Suharto decided to step down after thirty-two years in power. Habibie then assumed the post of president.

Habibie has been described as highly energetic, mercurial in temperament, and excitable, as well as dismissive of criticism. His tenure as president, given the economic problems facing Indonesia, was troubled. In view of the voters' negative reaction to the ruling Golkar Party, which Habibie represented and which was blamed for the country's economic woes, it is not surprising that he lost his election bid in 1999. Habibie now lives in Germany.

HADOOD Hadood (plural of *badd*, Arabic for "punishments"), are four Law Ordinances that were ordered by General Zia ul-Haq of Pakistan on 10 February 1979, and passed by the Council of Islamic Ideology in Pakistan. The main purpose of the Hadood Ordinances is to Islamize the laws of Pakistan. The Hadood provide for stoning to death for unlawful sexual intercourse, even if consensual; amputation of hands for theft; and lashing for intoxication and gambling. The Hadood are based on the Qur'an (the holy book of Islam) and Hadith (traditions of Muhammad, the Prophet of Islam) the two sources of the *shari'a*, or the Islamic law. Although no person has been so far stoned to death and no limb amputated in Pakistan, such punishments have been carried out in Saudi Arabia. The Federal Shari'a Court of Pakistan, and the Shari'a Bench of the Supreme Court have the authority to listen to appeals against convictions reached by the criminal courts working under the Hadood Ordinances. According to the Law of Evidence the testimony of one woman, unless corroborated by another woman or man, is not admissible in a court. This provision makes it extremely difficult for a victim of rape, as women have found themselves in jail for the "crime" of naming their attackers.

HAEJU (2001 est. pop. 260,000). Haeju, the capital of South Hwanghae Province (Hwanghaenamdo), is a port and industrial city on the west coast of the Democratic People's Republic of Korea (North Korea), 140 kilometers south of Pyongyang. The city covers approximately thirty-two square kilometers. The major industries of Haeju are cement manufacturing and chemicals. In addition, the region is emerging as a tourist center because of its historical sites, such as the ancient fort at Suyang Mountain and the 128-meter Suyang waterfall nearby.

Because Haeju is located far to the south (just above 38° N latitude), it has nearly ice-free port conditions throughout the year. For this reason the South Korean companies Hyundai and Samsung plan major joint ventures there.

Haeju is historically significant because it is the birthplace of Kim Gu (1876–1948), a fighter for Ko-

rean independence. During the Donghak Rebellion of 1894, Kim led an attack against Japanese soldiers at the fort at Haeju. He was not captured in that attack, but following another the next year, he was imprisoned and tortured in Haeju. Ahn Chung-gun (1879–1910), another independence fighter, was also born in Haeju. Ahn was the assassin of Ito Hirobuni, Japan's resident general over Korea, in 1905.

HAIDAR ALI (1721–1782), Indian warrior. Haidar Ali (or Hyder Ali) was the son of a Panjabi Muslim adventurer. Although not formally educated, Haidar was a sagacious and pragmatic warrior who had many military successes. He learned the skills of warfare during the Anglo-French wars of 1751–1755 in South India and was fighting constantly with his neighbors. His three main enemies were the Marathas to the northwest of Mysore, the Nizam of Hyderabad to the northeast of Mysore, and the British to the southeast in Madras. Haidar would not go to war against any one of them except when confident the other two would not join in against him. He admired the British and French armies in India, and equipped the Mysore army along similar lines.

Haidar became commander of that army in 1759, and in 1761 rose to be chief minister of Mysore State. In 1766 the ruler of Mysore became a mere figurehead, and Haidar assumed complete control of the expanding kingdom. He unified Mysore for the first time since the fall of the Vijayanagar Empire in 1565. In 1766 he controlled the west coast through his conquests, and even organized a small fleet there, one of very few Indian commanders ever to do such a thing.

He then went on to fight the First and Second Anglo-Mysore Wars with great success (1767–1769, 1780–1784), but died before the second war was over. In the first of these wars he dictated terms to the British outside Madras City, and in general demonstrated that the British army was not invincible. When he lost some possessions to the British, however, he hoped that the French would come to his aid, but they never provided sufficient support for him to oust the British from South India; and indeed, when they

killed his son Tipu Sultan in 1799, British paramountcy was assured.

HAIKU Haiku is a seventeen-syllable Japanese poetic form divided into three phrases: five syllables, seven syllables, and five syllables. Although the term "haiku" came into common use only after 1892, when Masaoka Shiki (1867–1902) revived and modernized the form, its origins as *bokku*, the opening verse of *haikai* (comic linked verse) date back to the Kamakura period (1185–1333) or even earlier.

Haiku came to maturity in the late sixteenth and early seventeenth centuries. Matsuo Basho (1644–1694) developed what was a trivial form and made it into a serious poetic vehicle. As the opening verse of a linked-verse sequence, this form represents a dynamic movement in two directions simultaneously. It represents a breaking up of the traditional *waka* (a thirty-one syllable poetic form in phrases whose syllable lengths were 5-7-5-7-7) into two smaller units,

the 5-7-5 *bokku* and a 7-7 unit, called *waki no ku*. At the same time these smaller units can be linked and repeated to form a longer poetic sequence. Thus *bokku* always implies an incomplete poetic statement to be completed by the reader, and it requires complicity between reader and poet to complete the poem.

Due to its brevity haiku has always been in danger of becoming trivial, and indeed after Basho's life haiku relapsed into a period of easy popularity. Yosa Buson (1716–1783) encouraged a revival of Basho's style, and in the last years of the nineteenth century, after another lapse into triviality, Masaoka Shiki sought both to resurrect Basho's seriousness and to modernize haiku, keeping in step with the modernization of Japanese literature. Shiki insisted that the seventeen-syllable form stand as an independent poetic unit, which he called "haiku."

Early Western students of Japanese literature, such as Basil Hall Chamberlain (1850–1935), who introduced haiku to the world outside Japan, regarded these verses as nothing more than epigrams because of their brevity. Later Ezra Pound (1885–1972) and others recognized haiku as a serious poetic form.

One enduring feature of haiku is the *kigo* (seasonal word), which grounds the poetic moment in a natural context by locating it in the cycle of time. *Kigo* occur in other forms of Japanese poetry and link haiku with its broader cultural context. Another feature of haiku is the *kireji* (cutting word), which acts as a caesura and breaks the already short poem into two parts, making possible a contrast or association that serves both to engage the reader and to allow for poetic complexity. Haiku poetry has flourished in Japan and throughout the world and remains the most popular and well-known form of Japanese poetry.

Stephen Kobl

**THREE HAIKU BY BASHO
(1644–1694)**

Waterjar cracks:
I lie awake
This icy night.
Sick on a journey:
Over parched fields
Dreams wander on.
Lightning:
Heron's cry
Stabs the darkness

HAINAN (1996 est. pop. 7.1 million). Hainan, an island province in the South China Sea off the coast of China's Guangdong Province, covers an area of 34,000 square kilometers. Before 1988, when the is-

land obtained provincial status, it was part of Guangdong Province. The island has a mountainous inland with dense forests. The highest peak, Mount Wuzhi, rises to 1,867 meters above sea level. The coastal regions consist of plains, low hills, and volcanic terraces. The island has a tropical climate, with average temperatures of 22° to 26°C all year, but in extreme cases in the northern part of the island, temperatures may drop to 0°C. Annual precipitation varies; the western parts have an average of 1,000 millimeters, while the southeast, which is frequently hit by typhoons, averages 1,500 to 2,600 millimeters.

Hainan has a population of 7.14 million (1996), 12.8 percent of which belong to the indigenous Li nationality. Another important minority nationality is the Miao. The province's capital, Haikou (406,000, 1996), is situated on the north shore of Hainan, and there are several autonomous counties and townships mainly concentrated in the middle of the island and on the south coast.

Since the Han dynasty period (206 BCE–220 CE), the island has nominally been part of the Chinese empire, but for long periods, the Li evaded government control. During the Song dynasty (960–1279), when immigration from the mainland began, the island became part of Guangdong Province, a status that continued for centuries except for brief periods—during the Yuan dynasty (1267–1368) and in 1912–1921—when Hainan enjoyed independent provincial status. In imperial China, undesirable officials were commonly exiled to the island. Hainan was occupied by the Japanese from 1939 to 1945, and since 1950 the island has been part of the People's Republic of China.

Hainan is the only part of China with tropical crops. Forestry accounts for almost half of the agricultural output; Hainan has a big rubber production and coconut farming. Other important tropical crops include coffee, pepper, cashew nuts, cacao, pineapples, bananas, carambolas, longans, litchis, and jackfruits. As one of China's special economic zones, Hainan attracted foreign investments and underwent rapid economic growth in the 1990s. The economy is mainly based on light industry and tourism. Industries are concentrated in the area around Haikou, and industrial products include processed rubber and food, electronic articles, and textiles. The tourist industry is located on the south coast in the area around Sanya (145,100, 1996). The flow of outside investment to Hainan subsided drastically toward the end of the 1990s, and many unfinished construction sites have been abandoned.

HAIPHONG (2002 pop. 572,000). Located 103 kilometers (64 miles) east of Hanoi on the coast of northern Vietnam, Haiphong, Vietnam's third-largest city (behind Ho Chi Minh City and Hanoi), is a major seaport and the main hub of northern Vietnam's industrial activity, and has been for more than a century. Haiphong has been a major seaport since the Tran dynasty (1225–1400) and, because of its strategic location, has seen numerous foreign invaders, including the Chinese, the Mongols under Kublai Khan, the Japanese, the French, and the Americans. The French bombing of Haiphong in 1946 precipitated the eight-year First Indochina War. During the Second Indochina War between Vietnam and the United States, Haiphong figured prominently again because of its strategic location and because of its role as an industrial hub and seaport. The United States bombed the city (especially notorious were the 1972 "Christmas bombings") and mined the city's harbor in 1972. In 1979, in the wake of the conflict between China and Vietnam, as many as 100,000 ethnic Chinese fled the city fearing Vietnamese reprisals, taking with them a large percentage of Haiphong's merchant class and economic power. In the last two decades of the twentieth century, Haiphong has sought recovery from its troubled past and has regained much of its economic and political power. Its port remains one of the busiest in Southeast Asia and the city's industry continues to develop.

HAJI, RAJA (d. 1784), Bugis dictator of Riau-Johor. The Bugis were seafarers from the southwest arm of Sulawesi who were known as warriors and enterprising traders throughout the Malay Archipelago. Raja Haji reigned briefly from 1777 to 1784, a period that saw the deterioration of Dutch-Bugis relations.

Raja Haji was the son of Daing Chelak (reigned 1728–1745), one of the five Bugis brothers that fled their homeland of Makassar in Southern Celebes and subsequently imposed Bugis power and influence in the southern Malay Peninsula during the eighteenth century. Raja Haji continued the family tradition by extending Bugis hegemony to the old Malay empire of Johor and the Riau-Lingga Archipelago.

Raja Haji was determined to oust the Dutch in Melaka, the Burgis' rival for control of the archipelago's commerce. To thwart Dutch ambitions in the Riau-Lingga Archipelago, he offered the English a commercial base at Riau. Dutch-Bugis enmity came to the open when they quarreled over the spoils of a captured ship of the English East India Company. The Bugis attacked Melaka and the Dutch in turn raided Riau.

In 1784 Raja Haji and his nephew, Sultan Ibrahim of Selangor, launched an all-out siege of Melaka. A Dutch fleet under Admiral Jacob Pieter van Braam relieved Melaka in June 1784. In the ensuing battle Raja Haji was killed at Telok Ketapang near Melaka. His death marked the decline of Bugis influence in the archipelago, and by October the Dutch had expelled the Bugis from Riau.

HAKATA MATSURI Held from 1 to 15 July in the Hakata district of the city of Fukuoka in Japan, the Hakata Festival is officially named Hakata Yamagasa Gion, linking it to the famous Gion Matsuri in Kyoto. Like that festival, the Hakata Matsuri originated in a purification ritual (*goryo-e*) performed as a plea to the gods to stop a plague ravaging the city.

Dating back to the mid-thirteenth century, the festival marks the start of summer and has long been the highlight of Fukuoka's festival year. A series of purification rituals and festive processions leads up to the climactic high-speed race (*oiyama*) of festival floats that takes place at dawn on the final day. Each of the seven festival district committees selects a team of strong, healthy young men, who must then undergo purification and rigorous training. Participants cleanse themselves with sacred sand, receive an auspicious bamboo branch, and offer prayers for safety during the frenzied race. Each group constructs festival floats (*yamagasa*), which are of two types. *Kazariyama* are extraordinarily ornate, mountain-shaped floats adorned with dolls, ornaments, and lanterns and displayed around the city during the festival. *Kakiyama* floats are smaller but are still elaborately decorated with sacred pine branches and dolls representing heroes from legendary and historical tales. The seven *kakiyama*, each weighing about a ton, are raced through the city streets.

On 12 and 13 July the floats are paraded to Kushida Shrine, where the guardian deity of the city is enshrined. At 4:59 in the morning on 15 July, on the signal of a drumbeat, the first float leaves the Kushida Shrine grounds with the other six following at five-minute intervals. Shouldered by teams of twenty-eight young men in traditional festival dress of loincloths and *happi* coats (light cotton jackets), the floats speed along the five-kilometer course at a furious pace, while thousands of spectators cheer and splash them with purifying (and cooling) water. Many generations of local men have participated in this grueling contest, and the teams have developed fierce rivalries. The average time taken to cover the course is thirty minutes.

After crossing the finish line, the team members fight among themselves to obtain the best of the decorations to keep as souvenirs and talismans. Stripped down to its base, the float is returned to the Kushida Shrine to await use in the following year's festivities.

HAKKA The Hakka are a Chinese ethnolinguistic minority group. The word "Hakka" means "guest people" or "newcomers" in Yue (Cantonese) and reflects

their migration from central to southern China from about the ninth century into the early twentieth century. They tended to settle in distinct Hakka communities. There are about 40 million Hakka in China. Most live in southern China, with Guangdong Province having the greatest concentration, particularly in northern Meizhou Prefecture. There are also sizeable populations in Fujian, Jiangxi, Guangxi, Hainan Island, Hong Kong, and Taiwan. Estimates suggest that there may be more Hakka outside of China than in it, with large overseas communities in Malaysia, the United States, Canada, and Australia. The Hakka language is classified with Yue and Min as a southern Chinese language.

As an ethnolinguistic minority and late arrivals in southern China, the Hakka often had tense and sometimes violent relations with the Yue- and Min-speaking Han. The Han considered the Hakka to be inferior and a tribal people. Research indicates that their origins are Han Chinese, and the government classifies them as Han. Hakka men and women were known as skilled and hardworking farmers who grew sweet potatoes, rice, and vegetables on harsh land ignored by non-Hakka farmers. They also often served in the military and outside China worked in construction and on plantations. In cities, Hakka have been notably successful in academia, politics, and the professions. Well-known Hakka include China's leader Deng Xiaoping, Taiwan's President Lee Teng-hui, Singapore's President Lee Kwan Yew, and Myanmar's President Ne Win.

Both inside and outside China, the Hakka are known for their ethnic solidarity, which may be a product of centuries of discrimination by the Han. Hakka interests are advanced by the Tsung Tsin (Cong-zheng) Association and the United Hakka Association.

HAKKA LANGUAGES Hakka languages are one of the seven major Chinese language groups (the others groups are Mandarin, Wu, Yue, Gan, Min, and Xiang). Although linguists class these as independent Chinese languages, traditionally they have been re-

garded as dialects, as they will be in this discussion. Native speakers of Hakka are found in Guangdong, Guangxi, Fujian, Xiangxi, Hunan, and Sichuan provinces on the mainland, as well as on Taiwan. Outside of China, Hakka speakers are found in Indonesia, Malaysia, Singapore, Thailand, Brunei, Cambodia, Vietnam, and Laos. The estimated population of the native Hakka dialect speakers in 1988 was 37 million. In some places, Hakka dialects are also called Aihua, Majiehua, Xinminhua, or Tuguangdonghua.

The term Hakka is of Cantonese origin, *bak* meaning "guest", *ka* meaning "family/people." According to Chinese migration history, there were five major migration waves of the Hakka-speaking people, from the central plains of China to the south, beginning during the Eastern Jin dynasty (317–420) and in response to various non-Chinese invasions, civil wars, and other clashes with local peoples. The term Hakka itself, however, did not appear in any Chinese historical documents until the Song dynasty (960–1279). When Hakka-speaking people migrated to the northeastern part of Guangdong Province during the late Ming dynasty (1368–1644) and early Qing dynasty (1644–1912), the local people referred to the new immigrants, with whom they clashed over farmland as Hakka. From 1850 to 1920, the Hakka and the indigenous population clashed, which contributed to the development of the well-known strong sense of ethnic and linguistic identity of the Hakka. The famous family precept of the Hakka, "One would rather to sell one's ancestor's land than to forget one's ancestors' speech," shows this strong loyalty to their mother tongue.

Due to the different destinations of the various waves of Hakka migration, currently several Hakka dialects exist. Among them the Mexian subdialect, spoken in the northeastern part of Guangdong Province, is considered the standard. Chinese uses tone, the musical pitch of the voice, as a distinguishing mark of morphemes (characters or syllables). Traditionally, since Middle Chinese (seventh century CE), Chinese characters have been classified into four tonal categories: *ping* tone (even tone), *shang* tone (rising tone), *qu* tone (going tone), and *ru* tone (entering tone). Each tonal category may have undergone tonal split into two subcategories, *yin* and *yang*. But each tonal category has evolved into different tonal values (different types of pitches) as reflected in modern dialects. Mexian Hakka has six tones: *yin ping* tone (high level), *yang ping* tone (low level), *shang* tone (low falling), *qu* tone (high falling), *yin ru* tone (short low level), and *yang ru* tone (short high level). It has seventeen consonants, the primary of which are: *p*, *p'*, *m*, *f*, *v*, *t*, *t'*, *n*, *l*, *ts*, *ts'*,

s, \tilde{n} , ng, b; six nuclear (main) vowels: i, \tilde{i} , u, e, a, o; and three pairs of consonant endings: -m/-p, -n/-t, and -ng/-k. The bilabial and velar nasal, m and ng, may occur alone and form syllabic syllables.

Distinctive Characteristics of Hakka Dialects

The Hakka dialects are set apart from the other major Chinese dialects by unique phonological, lexical, and syntactic characteristics. Phonological characteristics that are typical in Hakka dialects include (1) the fact that Middle Chinese (from around the seventh century CE) voiced obstruent (obstruents are stops and spirants, such as b, d, g, v, and z) initials are pronounced as voiceless aspirated consonants; (2) Middle Chinese *shang* (rising) tone syllables with nasal, liquid, or glide initials are merged with Middle Chinese *ping* (level) tone syllables with a voiceless initial consonant; and (3) most of the velar fricatives (sounds like voiced b) of Middle Chinese are pronounced as f. Because the Hakka dialects share some common phonological features and lexical items with Gan, Yue, and Min (to a lesser degree), some scholars have argued that the Hakka dialect should be grouped with Gan to form a major Gan-Hakka group, while others prefer to assign the Hakka dialects to a different group. Some even suggest that the Hakka dialects should be considered subdialects of the Gan-Yue dialect group. Historically, Min dialects are known to preserve several Old Chinese (c. 1000 BCE) characteristics, which distinguish them from other dialects. Therefore, no scholar has ever tried to group Min and Hakka together. Currently, the most popular view is to treat Hakka as a separate group.

EDIB ADIVAR, HALIDE (1884–1964), Turkish feminist reformer and writer. Halide Edib Adivar was a key figure in the emancipation of women in Turkey. After graduating from the American College in Istanbul in 1901, she married Salih Zeki Bey, with whom she had two sons. She divorced him in 1910 after learning he had taken a second wife. In the following years, she became involved in teaching, social relief work, and nursing. In 1917 Halide Edib married the Turkish politician Adnan Adivar.

An ardent champion of Turkish independence during the War of Liberation (1918–1922), she supported the movement through writing, mobilizing women, and organizing relief work and is one of the few women to have held military rank during the war. For many years Halide Edib lectured at universities in the United States and India. In 1939 she was appointed chairperson of the English department at the University of Istanbul and in 1950 was elected an independent member of parliament for İzmir. Halide Edib retired from political life in 1954 and died 9 January 1964 at eighty years of age.

Her novels include *Atesten Gomlek* (Shirt of Flame), *Vurun Kabpeye* (Strike the Whore), *Sinekli Bakkal* (Grocery with Flies), and *Akile Hanım Sokagi* (Madame Akile Street). Her works in English include historical writings and memoirs such as *Turkey Faces West*, *Conflict of East and West in Turkey*, and *Inside India*. Her own life served as a model for other women and combined with her advocacy of women's rights made her a pioneer in the women's rights movement in Turkey.

HAMADAN (2002 pop. 409,000). Hamadan (once called Ecbatana), an ancient city in western Iran, was the capital of Media; after the Persians overthrew

their Median overlords, the city became the Persian royal summer residence. Alexander of Macedon conquered the city in 330 BCE, while pursuing the last Persian ruler, Darius III. The Seleucids besieged Hamadan, and the Parthians incorporated it into their empire. The Arabs took the city in the seventh century, and the Seljuk Turks in the twelfth century, the Seljuks making Ecbatana their capital. After the Mongols invaded Iran in the thirteenth century, they devastated Ecbatana in 1220; the city of Hamadan rose above Ecbatana's ruins. Timur sacked Hamadan in 1386.

More recently Russians, Turks, and British have held Hamadan for various periods, with the Iranians finally gaining the city in 1918. In the 1980s, the Iran-Iraq war caused much damage to Hamadan.

Hamadan's location explains its history. The city lies on the road between modern Tehran and Baghdad, and whoever controlled the city also dominated north-south and east-west routes—between the Caspian Sea and Persian Gulf and between Europe and China. About one hundred kilometers west of Hamadan, in a mountainous region, is Darius the Great's inscription at Bisitun, meant to impress travelers passing between Assyria and Media. The Persian king's trilingual inscription on the rocky bluff was used to decipher cuneiform in the nineteenth century.

Modern Hamadan is a commercial center noted for fine Persian rugs and leather goods. Ironically Ecbatana's remains are buried beneath modern Hamadan, except for the Sang-e Shir (stone lion), a majestic but time-ravaged guardian of the city gates from the fourth century BCE. The fabled golden treasures of the Median and Persian palaces of Ecbatana await excavation, which is unlikely to occur because the modern city would have to be demolished.

The tomb of Avicenna (Abu Ali al-Husayn ibn 'Abd Allah ibn Sina; 980–1037), a Persian Islamic philosopher and physician, stands in Hamadan; Avicenna's medical text was widely studied in Europe as well as Asia. Also in Hamadan is a tomb said to be that of the biblical Esther and Mordecai; designed in Islamic style, the tomb is guarded by a Jewish family, who serve as custodians and guides.

HAMENGGU BUWONO IX, SRI SULTAN (1912–1988), vice president of Indonesia. Sri Sultan Hamengku Buwono IX was Indonesia's vice president from 1973 to 1978 during the New Order under Suharto (ruled 1966–1998). He also was the sultan (1940–1988) and the governor of Yogyakarta (1950–1988). The position of sultan has only a symbolic status in modern Indonesian, but it nonetheless became very influential under Hamengku Buwono IX.

Raden Mas Dorodjatun (his birth name before being appointed as sultan) was born in Yogyakarta on 12 April 1912. He was educated in Indonesia and the Netherlands. As sultan, he mobilized the people's army against the Dutch in the war of revolution in 1945 in central Java and declared that the Yogyakarta kingdom was part of the Republic of Indonesia. He initiated the famous *Serangan Oemum* (General Combat) against the Dutch on 1 March 1949, which showed the world that the new republic still existed.

He served in various ministerial posts after independence, with the exception of the period between 1953 and 1959. His ability to deal with the Dutch during and after the revolution and to mediate conflict between the civilian and the military authorities in the 1950s made him a respected minister of defense during 1949–1953. In the early years of the New Order (1966–1973), together with Suharto and Adam Malik (1917–1984), he was part of a leadership triumvirate, given the task of rehabilitating the economy. As the coordinating minister for economy and finance (1966–1973), he was successful in attracting Western donor countries to the Inter-Governmental Group on Indonesia (IGGI). As the first vice president during Suharto's era (1973–1978), he also held other important positions, including the national head of the Indonesia Sport Committee and the head of the Indonesian Scout Movement. Hamengku Buwono IX passed away in the United States on 3 October 1988. Hundreds of thousands of people lined the twenty-six-kilometer length of road from the palace in Yogyakarta to the sacred Mataram cemetery at Imogiri, where the sultans of both Yogyakarta and Solo are buried.

HAMHUNG (1993 pop. 709,730). Hamhung is the capital of South Hamgyong Province in North Korea (Democratic People's Republic of Korea). It is located on the Songch'on River on the eastern coast, 315 kilometers (200 miles) northeast of the capital city of Pyongyang. Together with the adjoining outer trade port of Hungnam, this industrial city plays an important role in the country's economy. It was the hometown of Yi Song-gye (1392–1398), founder of the Choson dynasty (1392–1910).

Hamhung is the center of the chemical industry in North Korea (plastic materials, synthetic tar). Chemical factories use local resources such as limestone and anthracite. There are large deposits of magnesite, lead, and zinc. Major industries include heavy equipment (metallurgy, mining, energy, chemical equipment), the electro-technical industry, agricultural machinery, and a hydroelectric power station. The city is also an important center for nonferrous metallurgy (aluminum), textiles (silk and wool), footwear, food, tobacco, fishing, and building materials.

Major industrial plants include the February 8 Vinalon Complex, the Hungnam Fertilizer Complex, and the Ryongsong Associated Machinery Bureau. The Hamhung Branch of the Academy of Sciences founded in 1960 is a general research institute involved in the scientific and technological development of the national chemical industry.

HAN The Han are the majority people among China's fifty-six state-recognized nationalities, and comprise the people usually known worldwide as the Chinese. They are the most numerous of the world's nationalities, approaching 1.2 billion in 2000, and are renowned for their highly distinctive and powerful languages and cultures and for their long and eventful history. The main concentrations of Han Chinese are in the eastern half of China, including Taiwan. Under the People's Republic of China, the state decides who belongs to which nationality. This decision is made according to a rigid definition devised by Joseph Stalin. One group that has, on occasion, requested separate identity is the Hakka, but the state considers them part of the Han nationality.

Population

In the mid-seventeenth century, China's population was about 200 million, the overwhelming majority be-

ing Han. The 1953 census showed the Han population at 547 million, which was 93.9 percent of the People's Republic of China (PRC) total. Census figures for 1990 and 2000 put the Han population at 1.04 billion and 1.16 billion, respectively, or 91.99 and 91.59 percent of the PRC total. Since the late 1970s, Han families in the PRC have been subject to a very strict policy rarely allowing more than one child per couple, without which the 2000 Han population would have been somewhat higher than in fact it was. About 98 percent of Taiwan's 1997 population of 21.7 million were Han.

At the end of the nineteenth century there were an estimated 4 million overseas Chinese. In 1990, this figure had grown to about 37 million Chinese living outside China and Taiwan, with 88 percent living elsewhere in Asia. The country with the largest Han population outside China was Indonesia, with about 7.3 million Chinese; the country with the highest Han proportion was Singapore, where the 1990 census showed a total population of 2.69 million, 2.09 million of them (77.7 percent) Han. Hong Kong and Macao, then colonial territories, had about 6 million Han Chinese, the overwhelming majority of both populations. Outside Asia, the country with the largest Chinese population is the United States (about 1.6 million in 1990).

Language

Chinese belongs to the Sino-Tibetan family of languages. The Chinese written language dates at least to the fourteenth century BCE and consists of monosyllabic characters or ideographs. The characters were standardized in the third century BCE and remain essentially unchanged, although the PRC adopted a simplified writing system in the 1950s. Literate Chinese have always been able to understand each other through writing, which has acted as a unifying force throughout history.

Each character represents both a sound and a concept, but meaning is conveyed through characters either singly or in combinations. Chinese is not monosyllabic; objects, actions, or ideas are more likely to be represented through groups of two or three rather than a single character.

Spoken Chinese is sharply regional and divided into several sublanguages and numerous dialects. All of these are tonal and express grammatical relationships through word order, not word endings. The official language is Modern Standard Chinese, or Mandarin, which is based on the pronunciation found in Beijing. The north and southwest of the Han regions (essen-

tially the eastern half of those territories ruled as part of the People's Republic of China, plus Taiwan) of China are dominated by the Mandarin dialects, most of them intelligible to a speaker of Modern Standard Chinese. Sublanguages of the southeast include Yue (Cantonese), Wu (spoken in Shanghai), Hunanese, Jiangxi, North and South Fujian, and Hakka. In the south, even dialects are often mutually unintelligible. Fujian is known for strong dialect differences from one valley to the next.

Approximately two-thirds of Han Chinese speak one of the Mandarin dialects as their mother tongue. In the twentieth century, successive regimes have attempted to have Modern Standard Chinese spoken, or at least understood, by all Chinese through education, radio, and television. Of the southern sublanguages, Wu has the greatest number of speakers, followed by Cantonese.

Culture and Economy

Under Emperor Han Wudi (reigned 140–87 BCE), Confucianism began to dominate the Chinese state, including its ritual, and formed the ideological basis of duty and service for the scholar-official class, which ruled the country. Confucianism laid great emphasis on morality within hierarchical human relationships, on creating and maintaining harmony within society and on the family as the central social unit.

Confucianism accorded greater social respect to men than women and to sons than daughters. Until the twentieth century, marriages were arranged by parents through the aid of matchmakers, and women were very subordinate. Although the revolutions of the twentieth century greatly raised women's status, allowing them to enter the work force, gender equality is nowhere on the horizon among the Han.

Confucian ideology was one primary reason why Han governance was generally far more secular than that found in other great civilizations. In the twentieth century, Confucianism came under strong attack from modernist nationalism and Marxism-Leninism. Modernist nationalists denounced Confucianism as hierarchical, patriarchal, and oppressive, even though Confucianists argued that they were the real nationalists because they upheld Chinese values and traditions. Mao Zedong (1893–1976) orchestrated attacks on Confucian and religious values everywhere in China, but there has since been a revival of Confucian influence in the PRC, and it remains strong in Han communities outside China.

Secularity of governance does not mean the Han are irreligious. To this day, folk religions, which at-

tempt to harmonize relations between humankind and the cosmic order, remain highly influential. Buddhism and Taoism still have Han followers and their places of worship are common, though visitors are more often tourists than believers. However, religions that emphasize belief in a single God have never attained more than minor influence among the Han. Muslims are never classified as Han, but as Hui.

Below the scholar-official, Confucianism prized the peasant. Han society is based on agriculture. The staple in the south is rice and in the north wheat-based products, supplemented by a wide variety of vegetables. The meat most associated with the Han is pork. The Han do not care for dairy products, a taste even extensive Western influence has failed to change. To this day, local markets are important for the economy.

During the Song dynasty (960–1279), China was the world's most technologically developed society. Although Confucianism looked down on the merchant, China underwent a commercial revolution during that time, which produced a degree of prosperity that Marco Polo marveled at in the thirteenth century. However, China later fell far behind technologically and failed to undertake an industrial revolution until the second half of the twentieth century. Under Mao, the Han entrepreneurial spirit was suppressed. But since the late 1970s it has revived, with heavy industry being replaced by more consumer-oriented enterprises and self-reliance by foreign trade.

The commonalities of the Han should not disguise important regional differences. These apply not only to language but also to many aspects of culture and society, including cuisine, festivals, clothing, marriage customs, village architecture, and music and theater. Cuisine provides one example. The Han of the southwest (Hunan, Sichuan, and Yunnan provinces) favor spicy dishes; in the southeast, Cantonese food is noted for its quick cooking and stir-frying at high temperatures, and for rich, sweet dishes.

Unity in the Twenty-First Century

The strength of their culture and the size of their population have made the Han at times inwardly focused, at times outwardly focused. Although there are periods of division in China's long history, and although localist elements remain influential to this day, the Chinese have shown a highly enduring sense of national unity. China's joining the World Trade Organization late in 2001 should reduce isolationist tendencies but will not undermine the essential features of Chinese culture or eliminate nationalism.

HAN DYNASTY The Han dynasty (206 BCE–220 CE), which was founded by Liu Bang (256–195 BCE), or Han Gaozu, marks an era of consolidated imperial institutions in Chinese history. After the short-lived Qin regime (221–206 BCE), the Han ruled China for four centuries, governing one of the most successful empires of the time. Conventionally, the dynasty is divided into two periods separated by a short interregnum. The Former, or Western, Han (206 BCE–8 CE) had its capital in Changan; the Latter, or Eastern, Han (25–220) had its capital in the east at Luoyang.

Political Changes

As soon as he established the Han, Gaozu, the first commoner to found a dynasty in imperial China, abolished the brutal laws and heavy taxes of the Qin. With regard to governmental institutions, however, he basically copied the preceding dynasty's system. The imperial throne, whose succession was hereditary, was assisted by a civil bureaucracy. Officials at various administrative levels were recruited through recommendation and examination and appointed by the imperial court. The empire was organized into commanderies (*jun*) and kingdoms (*wangguo*); the former, subdivided into districts (*xian*), were centrally controlled, while the latter were largely autonomous under enfeoffed kings. Commandery and district officials were responsible for the census of the population and the register of the land, which constituted the basis of the main forms of taxation (the poll tax and the land tax) and military conscription. To relieve the threat from the powerful nomadic peoples of Central Asia known as the Xiongnu (called Huns later in Europe), Gaozu adopted a conciliatory policy, which was continued by his immediate successors. They wooed the Xiongnu leaders by sending valuable gifts and imperial princesses as brides.

Subsequent emperors followed the early Han policy of light labor service and taxation. Due in part to peace and frugal government, the economy expanded, and production soared; as a result, the state treasury was full, and granaries bulged. Meanwhile, the court took steps to isolate the kingdoms and reduce the size of their territories. After 154 BCE, when the imperial court defeated a revolt staged by seven kingdoms, the authority of the central government was further consolidated by splitting the kingdoms' territories and curtailing their powers.

Emperor Wudi (156–87 BCE) oversaw an expansionist era in Han history. Domestically, he sought to expand central power by imposing state monopolies for salt and iron, proclaiming Confucianism the state ideology, and establishing a Confucian imperial university to train officials. In foreign affairs, besides military campaigns, the Han court relied on diplomatic efforts to establish favorable relations with other peoples. As a result, the Han armies advanced to the southwest, into present-day Korea and Vietnam, and to the northeast as far as Dunhuang. It was at this juncture that the trade routes known as the Silk Road were established. The Silk Road connected the Chinese and Roman empires. China imported wool and linen fabrics, amber, wines, acrobats, and gold coins and bullion from the Romans. In imperial Rome, Chinese silk became a major luxury article. Under Wudi, the Han became one of the most powerful empires in the world.

After Wudi, most emperors of the Western Han were young and weak, and regents, eunuchs, and imperial consorts' families dominated court politics. In 9 CE, the regent Wang Mang (45 BCE–23 CE) took imperial power from the Liu family and named his dynasty the Xin (New). Claiming to have received the new Mandate of Heaven, Wang Mang initiated a series of social and institutional reforms. But his attempts antagonized the wealthier members of society and failed to increase the resources of the state. Wang Mang's regime was overthrown by large-scale peasant rebellions.

The Han house was restored by Guangwudi (6 BCE–57 CE), who established the Eastern Han dynasty with its capital at Luoyang. In his efforts to consolidate the government, Guangwudi reestablished the institutions of the Western Han and promoted the cause of scholarship. He also minimized the influences of eunuchs and imperial consorts' families. Under Guangwudi's immediate successors, the Han was once again rich and strong enough to adopt an aggressive foreign policy and assert its influence in Central Asia.

CHINA—HISTORICAL PERIODS

 Ming dynasty (1368–1644)
 Qing dynasty (1644–1912)
 Republican China (1912–1927)
 People's Republic of China (1949–present)
 Republic of China (1949–present)
 Cultural Revolution (1966–1976)

The dynasty started to decline during the time of Hedi (79–105); his reign saw the return of powerful eunuchs and imperial consorts' families in court politics. All ten Han emperors who ruled after Hedi took the throne as minors aged between one hundred days and sixteen years. Political factions manipulated the imperial succession, and factional struggles corrupted politics and weakened the central government.

In local areas, powerful landowners defied the government by evading taxes and enlarging their holdings. Helpless peasants became the virtual serfs of these landowners in return for economic and physical security. The great families converted their manors into fortresses, taking over many of the functions of government in their respective localities. Their estates were largely self-sufficient, so that trade declined and cities shrank correspondingly.

In 184 CE, because of political corruption and land annexation, peasant groups across north China known as the "Yellow Turbans" revolted, severely attacking the great families and shaking the Han house. Cao Cao (155–220), who led the suppression of the rebels, dominated the court after the rebels were put down. He claimed the title of chancellor of the imperial government. In 220, after Cao Cao died, his son Cao Pi (reigned 220–226 as Wendi of the Wei state) forced the last Han emperor to abdicate. China then entered a prolonged period of disunity and disorder similar to that in the West following the collapse of the Roman empire.

Socioeconomic Changes

Han society was largely rural and its economy agrarian. According to the census of 1 CE, the Han population numbered about 60 million. Peasants made up the majority of the population; they paid the government land and poll taxes, rendered labor services, and served in the army. The average peasant family was estimated to consist of five people working about seven hectares of land. Women were significant economic assets to poor peasants: both husband and wife performed hard manual labor in the fields. In the north, millet, wheat, and barley were the grain crops; in the south, rice. Pigs and fowl were the common meat animals. Peasants used a variety of tools, but the most important was the plow. Wooden plows were still used, while cheaply made, yet more effective iron plows grew in popularity. More and more peasants used new tools such as three-legged seeders, iron harrows, and levelers, which were pulled by either draft animals or human laborers. Agricultural production was facilitated by government-sponsored irrigation projects, including reservoirs and canals.

In addition to grains, the Han also promoted sericulture (raising silkworms and spinning and weaving silk cloth). Silks were China's most valuable export commodity, and bolts of silk were used as currency and given as state gifts. Tending silkworms and carding the spinning silk was women's work, and each family was required to pay a tax in silk fabric.

Both manufacturing and commerce flourished. Craftspeople continued the Chinese tradition of excellent metallurgy. By the beginning of the first century CE, China had about fifty state-run ironworks, which smelted iron ore, processed it with chemicals, and fashioned the metal into ingots for tools and weapons. Bronze workers produced jewelry, utensils, and ritual objects. Perhaps the most remarkable product of Han imagination was the invention of paper, which the Chinese traditionally date to 105 CE. By the fifth century, paper was in common use, preparing the way for the invention of printing.

Merchants made tremendous fortunes during the Han. Retail merchants set up shop in stalls in the

markets, grouped according to their wares. All the butchers, for example, congregated in one part of the market, each trying to outsell the others. The markets were also the haunts of entertainers and fortune-tellers. The newly developed sturdy carts and wagons as well as networks of roads and waterways facilitated the transportation of goods. Nevertheless, according to government policy, merchants were put at the bottom of the social order, below scholars, peasants, and artisans. Emperor Wudi of the Western Han promulgated sumptuary laws that forbade merchants to flaunt their wealth. He nationalized the iron and salt industries and established a liquor-licensing system, setting up a pattern that persisted into the twentieth century. He also set up state granaries to stabilize grain prices and to discourage speculation. These legal and social restrictions became obstacles for further development of commerce.

Peasants often faced more serious problems. Without reserves to tide them over during times of poor weather or other difficulties, small landholders often went into debt; if they could not pay their debt, they lost their land and had to work as sharecroppers. As sharecroppers, peasants could keep only 50 percent of their yield. Some left the land to become laborers, and the most unfortunate had to sell their children or themselves into slavery to pay off debts. Rich families, meanwhile, accumulated great estates worked by tenants and slaves, and through their political connections they could often evade taxes, which placed a greater strain on the remaining small freeholders. Under these miserable conditions, peasants from time to time revolted. Indeed, it was the large-scale peasant uprisings that destroyed Wang Mang's Xin regime and precipitated the downfall of the Eastern Han dynasty.

Cultural and Intellectual Changes

Han China witnessed dynamic changes in religious and intellectual life. Under the first several emperors, Han thought was dominated by the Taoist notion of "nonaction," which emphasized frugal government and delegation of imperial authority. Han thinkers argued that the emperor must on the one hand uphold basic principles of government and on the other hand leave specific decisions and actions to the care of his officials. Meanwhile, government must adopt the policy of light taxation to alleviate the suffering of the people. Historians attributed early Han prosperity partly to lenient government policies guided by Taoist ideas.

Craving a grandiose empire, Emperor Wudi embraced Confucianism, a belief system that advocated active social participation. To facilitate Confucian

learning, the emperor established an imperial university and employed Confucian scholars to prepare future government officials with a curriculum based on Confucian classics. Han Confucianism, however, was influenced by other schools of thought, including yin-yang cosmology, legalism (the doctrine that emphasizes government by legal apparatus), and Taoism. The great synthesizer of Confucian teachings was Dong Zhongshu (c. 179–104 BCE), one of the court advisers of Emperor Wudi. According to Dong's interpretation, the universe consisted of heaven, Earth, and humans, operating on the basis of yin-yang forces and the five agents of water, fire, metal, wood, and earth. Having received the Mandate of Heaven, the human ruler, or Son of Heaven, served as the intermediary between the worlds of humans and spirits. It was his duty to develop his subjects' moral goodness, nourish their livelihood, and maintain social and cosmic harmony. If the ruler failed in such tasks, cosmic portents or even disasters would occur, and Heaven would punish him by revoking the Mandate. While Confucianism strengthened imperial authority, it certainly imposed heavy responsibilities on the emperor.

During the Han, a new form of Taoism—religious Taoism—flourished. Based on popular beliefs, this new trend was concerned primarily with drugs and potions to prolong life and attain immortality, and with alchemy to produce gold from base materials. These interests led to experiments that produced information valuable for chemistry, pharmacology, and other sciences and gave rise to the invention of the compass, which greatly helped navigation, and the discovery of sulfur and saltpeter, the ingredients of gunpowder. By the mid-second century CE, religious Taoists organized themselves into political groups. In 142, Zhang Daoling founded the sect named "Way of the Celestial Masters" in Sichuan. Decades later, Zhang Jue (d. 184) created the sect called "Way of Great Peace" in north China. These Taoist groups, to which peasants belonged, eventually revolted against the Han regime and expedited the fall of the dynasty.

Buddhism was introduced into Han China by Central Asian merchants. During the reign of Emperor Mingdi (28–75), the second ruler of the Eastern Han, some Chinese combined the Buddhist rites and fasts with Taoist practices aimed at physical immortality. In the next century, Buddhist monasteries appeared in the Han empire, and Buddhist texts were translated into Chinese. The Parthian monk An Shigao, for example, reached the Han capital of Luoyang in 148 and began translating a set of texts dealing with meditation practices and the Buddhist worldview. In later dynasties, Buddhism transformed the Chinese cultural landscape.

The Han produced great historians. Sima Qian (c. 145–86 BCE) wrote the first comprehensive history of China entitled *Shiji* (Historical Records). Divided into five sections—basic annals, chronological tables, monographs, hereditary families, and biographies—and 130 chapters, this massive work provided both historical information and moral instruction. Following the example of Sima Qian, Ban Gu (32–92) wrote the first dynastic history of China, *Hanshu* (History of the Han Dynasty). Ban Gu's sister Ban Zhao, the most famous female literary figure of the Han, assisted in the writing of the *Hanshu*. Possessing great historical and literary values, both the *Shiji* and *Hanshu* set the standard for later dynastic histories that continued to the early twentieth century.

Legacy of the Han

The Han dynasty set the pattern of civilization for subsequent Chinese history. It provided future generations with a model of a long-lasting, extensive, and unified empire. It consolidated an effective form of bureaucracy and established a distinguished tradition of political philosophy. It laid a solid foundation of belief system, social structure, and economic form for later dynasties. It also developed a basic mode of thinking and a scheme for dealing with foreign peoples. So strongly did the Han dynasty influence Chinese culture that 95 percent of present-day Chinese call themselves Han, their language the Han language, and their written script Han characters. The Han achievements made China a dominant force in the preindustrial world.

HAN RIVER The Han River flows about 514 kilometers through Seoul, capital of the Republic of Korea (South Korea), rising from a spring in Odae Mountain in Kangwon Province and emptying into the Yellow Sea. Several prehistoric human settlements

have been excavated along the river. At present the Han supplies drinking water for 20 million people living within its basin—Kangwon and Kyunggi provinces, including the cities of Seoul and Inchon.

The South Han River, a distinct tributary of the Han River, flows through Kangwon province and North Ch'ungch'ong Province before it joins the North Han at Paldang Reservoir, an artificial dam providing the major source of drinking water for Seoul metropolitan area residents. The river also provides water for agricultural and industrial purposes and generates electrical power through three major dams. The Han is a symbol of South Korea's remarkable economic development in the 1970s and 1980s, which is known as the "Han River miracle." The 1988 Seoul Summer Olympic stadium is located along its banks. Other recreational facilities include the Yeouido Han Riverside Park, a 36.9-kilometer bicycle trail, swimming pools, and fishing areas. The Han is also popular for water skiing and yachting.

The water quality of the Han River is deteriorating due to increasing nonpoint sources of pollutants from agriculture and rapid urbanization of traditionally rural areas surrounding Seoul. The lack of a buffer zone between the river and increasing human settlement is another cause of environmental concern.

HAN YONG-UN (1879–1944), Korean monk, poet, nationalist. Born to a farming family in Chungchong Province, Han Yong-un was originally educated in Chinese classical literature in his village, where he became involved in the Tonghak sect. The Tonghak insurgency led to regional strife and subsequent Japanese intervention. Han went into hiding in the Paektam monastery near Seoraksan in eastern Korea, where he adopted the name Manhae (Ten Thousand Seas).

As a monk, Han traveled to Japan to study Zen Buddhism. When Japan annexed Korea, however, he left for Russia to form a base of resistance against the Japanese. Han returned to Korea and was one of the original signers of the Declaration of Korean Independence, for which act he was imprisoned by the Japanese until 1923. In prison he wrote "A Letter of Korean Independence," which is regarded as one of the founding documents of the 1919 independence movement.

Han's writings are considered among the best of Korean and Zen poetry, and his works have been published internationally. A memorial to him was erected at the site of the 1 March uprising in Tapkol Park (formerly Pagoda Park) in Seoul.

HANGAI MOUNTAINS The Hangai (Khangai, Hangayn) Mountains dominate central Mongolia with their rich pastures and forests. The range extends 800 kilometers northwest-southeast and parallels the Mongolian Altai Mountains. Several of the range's snowy peaks reach an altitude of 3,500 meters above sea level, and the highest of these peaks, snow-capped Otgon Tenger (3,905 meters above sea level), remains a central and sacred place in Mongolian folklore. Medicinal herbs and minerals gathered from its slopes are a popular commodity in Ulaanbaatar, Mongolia's capital.

The Hangai Mountains drain into the Arctic basin via the Orhon, Ider, and Selenge rivers, the last being the main tributary of Lake Baikal in Siberia. On the range's southern slopes, the dry beds of occasional watercourses feed into the Valley of Lakes, an arid plateau interspersed with freshwater and saline lakes. The Hangai Range's northern slopes are covered with forest and mountain meadows, while the southern slopes are generally treeless and arid. Frequent earthquakes in the region (the most recent in 1905) have left dramatic fissures referred to as the "trails of a giant snake." In this environment, musk deer, willow grouse, lynx, snow leopard, brown bear, wild boar, golden eagle, and the central Asian viper make their home.

HANGUL SCRIPT Hangul is a script used in writing Korean, a language of 72 million speakers. It is, like the Roman alphabet, an alphabetical writing, consisting of 24 basic alphabet letters, 14 for consonants and 10 for vowels. Unlike the Roman alphabet in which independent alphabet letters are arranged linearly, for the hangul script, consonant and vowel letters are combined to create syllable blocks.

Whereas the origins of most writing systems are unknown, hangul, originally called *hunminjeongeum* (meaning "the correct sounds for the instruction of the

people"), was invented in 1443 by King Sejong the Great (1397–1450), the fourth monarch (reigned 1419–1450) of the Yi (Choson) dynasty (1392–1910), with his royal scholars.

Although it was promulgated in 1446, it was not until 1894 that the hangul script began to be used in official government documents. The first all-Korean script newspaper, *Tongnip Sinmun* (Independent News), was published in 1896 by Seo Jaepil (1863–1951). The name hangul ("Korean script") was given by Ju Sigyeong (1876–1914), one of the earliest modern Korean grammarians.

The design of the Hangul letters resulted from a deep understanding of phonetic principles and Chinese cosmological philosophy on the part of the king and his scholars. Originally, 28 basic letters (17 consonant letters and 11 vowel letters) were introduced, of which 3 consonant letters and one vowel letter have disappeared in the current writing system.

The consonant letters for *k* (or *g*), *n*, *s* (or *sh*), *m*, and *ng* are designed after the shape of the speech organs when they are pronounced. The other consonant letters are made by adding a stroke or two to these or by extending the initial forms. An extra stroke indicates a different articulatory feature, such as aspiration (extra puff of the air in producing a sound). In this respect, the Hangul Script is unique and more refined in representing sounds than any other script.

Vowel letters are designed based on the yin-yang philosophy of universal complementary forces and the East Asian cosmological belief that heaven, earth, and humanity are the three most fundamental features in the universe. The three initial vowel letters are designed after the round shape of heaven, the flat shape of earth, and the vertical shape of a man standing. The other letters are made by combining the three initial letters, with the combinations being guided by the principles of the yin-yang theory as to how heaven interacts either with the human being or with the earth.

Because of its systematic and scientific organization as well as its sophisticated phonetic representation, the hangul script is regarded as one of Korea's cultural treasures. Its linguistic and cultural value is also recognized by scholars outside Korea as a great intellectual achievement.

HANGZHOU (2002 est. pop. 1.2 million). Hangzhou was visited by Marco Polo in the thirteenth century. The city is one of the seven ancient capitals of China and today is the capital of Zhejiang province. Hangzhou was first mentioned in 221 BCE during the Qin dynasty (221–206 BCE).

The city prospered after it was linked with the Grand Canal (the world's longest man-made waterway) in 610 during the Sui dynasty (581–618). Under the Tang dynasty (618–907), West Lake, now a famous tourist attraction, was created on the western edge of Hangzhou. An old harbor was also filled in, greatly expanding the size of the city.

At the inception of the Southern Song dynasty (1127–1279), Hangzhou became the dynasty's capital. After the Mongols invaded China in the thirteenth century, Hangzhou continued to prosper through its river and sea trade, ship building, and naval industries. The city was opened to foreigners in 1895 under the terms of the Treaty of Shimonoseki.

Silk production has remained the mainstay of Hangzhou's trade and handicraft industries; the city is also noted for its Longjian (Dragon Well) tea, cotton textiles, steel and chemicals, scissors, hemp, mulberries, and crafts including sandalwood fans, bamboo items, and silk parasols.

Today Hangzhou's primary reputation is as a tourist mecca. West Lake is considered the symbol of Hangzhou, along with the popular Lingyin Si (Temple of Inspired Seclusion).

HANOI (2002 est. pop. 1.3 million). Hanoi, the capital of Vietnam, is located in the center of the northern part of the country and is bounded by the Red River to the north and east. It is considered one

of Asia's most beautiful cities, boasting a number of lakes, including Ho Tay (West Lake) and Ho Guom (Sword Lake), and parks. The Old Town, known for its thirty-six narrow and winding streets named after various trades, is still a vibrant part of the city. Founded in 1010, over the centuries Hanoi bore several names, such as: Dai La, Thang Long, Dong Do, Dong Quan, Dong Kinh, and Hanoi.

In 1009 Ly Cong Uan (974–1028) was proclaimed emperor and founded the Ly dynasty (1010–1225). The following year he decided to move the capital from Hoa Lu to the site of the Dai La citadel, about 70 kilometers to the north. En route, the emperor had a vision in which he saw a golden dragon rising from the Red River. He then decided to change the citadel's name from Dai La to Thang Long, meaning "ascending dragon." The capital city was then developed. The imperial quarters were located near Ho Tay. A civil area was created and divided into artisan, agricultural, and commercial sectors. Both the imperial

The Hanoi Municipal Theater in 1995. (STEVE RAYMER/CORBIS)

and the civil areas of the city were located within and protected by a citadel. Within a century of its founding, Thang Long had become an important cultural, economic, and political center. Under the Tran dynasty (1225–1400), the imperial quarters were reinforced, and new palaces were built. In addition, administrative units were constructed. By this time the capital city boasted sixty-one quarters. From 1258 to 1288, the city was subjected to three separate, but unsuccessful, Mongol attacks. In 1400 Ho Quy Ly replaced the Tran and founded the Ho dynasty (1400–1407). He moved the capital to Thanh Hoa, which he renamed Tay Do. He also changed Thang Long's name to Dong Do.

In 1407 China invaded Vietnam, and Thang Long was renamed Dong Quan. After Le Loi (flourished 1428–1443) succeeded in liberating Vietnam in 1428, the city changed its name to Dong Kinh. In 1802, Emperor Gia Long (1762–1820) of the Nguyen dynasty (1802–1955) moved Vietnam's capital to Hue, and Dong Kinh became Thang Long once again. Then in 1831 Emperor Minh Mang (1792–1841) changed the city's name to Hanoi, which means "within the river."

In 1884, after France had consolidated its rule in Vietnam, Hanoi was placed under French control. The city became the headquarters of the French administration in Indochina (Vietnam, Laos, and Cambodia). During the French colonial era, the city was expanded, blending French and Vietnamese architecture, and numerous broad avenues and tree-lined boulevards were created. On 2 September 1945, Ho Chi Minh (1890–1969) proclaimed the Democratic Republic of Vietnam, and Hanoi became its capital. Hanoi remained the capital after the country's reunification in 1975.

HANSHIK In Korea the 105th day after the winter solstice is known as Hanshik. This spring observance, falling on or near 5 April, has long been a day for paying homage to one's ancestors. In the most traditional of Korean families, ancestral rites are still observed. In the early hours of the morning, the ancestral rite, *charye*, is performed before tables piled with food

offerings to one's ancestors. After sunrise, families make their way to tombs—often located in auspicious spots on the many hillsides—of their most immediate ancestors for another ancestral rite called *songmyo*, which also includes food offerings and bows of respect.

Hanshik literally means "cold food," and traditionally no foods are cooked on this day. Consuming cold foods and performing ancestral rites on Hanshik date back to China's Three Kingdoms period (220–265 CE) and has its roots in Chinese legend. According to the legend, the date of Hanshik was set in commemoration of the ancient Chinese statesman of the Jin dynasty (third–fourth century CE) Jie Jitui (Chieh Chi-t'ui), who elected to die in a forest fire set to capture him rather than surrender and compromise his loyalty to his deposed emperor. Impressed by this act of fealty, the reigning emperor decreed that no fires be kindled and that only cold foods be eaten on this day.

The observance most likely originated out of an ancient spring festival at which new fires were set to symbolize spring. Hanshik became one of the four main observances of the Choson period.

HARA TAKASHI (1856–1921), Japanese politician and statesman. Born in Morioka (in present Iwate Prefecture) into a samurai family, Hara Takashi was an influential figure in Japanese politics in the first decades of the twentieth century. Also known as Hara Kei, he is regarded as one of the principal architects of party government (governing by formation of a cabinet, as opposed to the previous party system dominated by the so-called Meiji oligarchy, mainly former samurai from the clans of Choshu and Satsuma) in modern Japan. In 1918, he became the first prime minister in the history of modern Japan who was a commoner.

Hara was educated in the Nanbu domain school near his place of birth. In 1871, he left for Tokyo, where he joined the law school of the Ministry of Justice. He took a position in the ministry of foreign affairs in 1882. Under the auspices of Mutsu Munemitsu (1844–1897), Hara served as vice minister of foreign affairs and as ambassador to Korea.

After an interlude as a journalist, Hara in 1900 joined the Rikken Seiyukai party and became the party's first secretary general. He ran successfully for the lower house and served as home minister in several cabinets between 1906 and 1913. In 1914, he was elected president of the Seiyukai. After the resignation of Prime Minister Terauchi Masatake (1852–1919) in 1918, Hara formed his own cabinet—the first in Japanese history to be headed by an elected member of the majority party in the lower house.

Hara's popularity declined during his time as prime minister, since he undertook no major institutional reform. He was stabbed to death in Tokyo Station on 4 November 1921 by a right-wing nationalist. His diary continues to be regarded as an important source for historians.

HARAPPA The Harappan culture, also known as the Indus Valley civilization, is one of the world's first urban civilizations. It thrived between 2500 and 1500 BCE in the fertile floodplains of the Indus River—present-day Pakistan and western India. Archaeologists have discovered two cities, Harappa and Mohenjo Daro, and numerous settlements. Excavations have revealed painted pottery, terra-cotta figures, and inscribed stamp seals. The cities are brick built and feature a high central citadel with public buildings, granaries, and a ritual great bath. The grid layout and extensive drainage and sewerage systems are early evidence of town planning and central administration. The economy appears to have been agricultural, with extensive trading links.

Excavations have uncovered several thousand square soapstone seals. Finely carved with animal images and short inscriptions, they may have served as merchants' signatures. The Harappan script has not yet been deciphered and remains one of archaeology's great enigmas. Little is known about the Harappan religion as well; however, an engraved figure, horned and seated in a yoga position, may be linked to the Hindu god Siva. Other figures have been interpreted as goddesses and high priests. The Harappan culture

The ruins of a neighborhood of artisans in the ancient city of Harappa, Pakistan. (PAUL ALMASY/CORBIS)

appears to have declined around 1500 BCE, perhaps because it was conquered by invaders or destroyed by flooding and climatic change.

HARBIN (2002 est. pop. 2.8 million). Located on the southern bank of the Songhua River, Harbin is the capital city of Heilongjiang Province. Founded as a railway town by Russian engineers in 1895 when czarist Russia began to build the Trans-Manchurian Railway (later named the Chinese Eastern Railway), Harbin became home to the Chinese Eastern Railway's headquarters and tens of thousands of Russian engineers, colonial bureaucrats, soldiers, traders, and their families. It experienced an early boom in its economy and infrastructure during the Russo-Japanese War (1904–1905) when it served as the major supply base and staging area for the Russian armies in Manchuria. Following the Bolshevik Revolution, tens of thousands of new settlers arrived in Harbin—White Russians (supporters of the czar, or people who opposed the new regime). Its population swelled by these new arrivals, in the 1920s, Harbin boasted the largest European community in Asia.

The Japanese Guandong Army occupied Harbin in 1932 and used it as an outpost to observe developments in the far eastern reaches of the Soviet Union until 1945. Harbin was also the location of one of the most notorious branches of the Japanese military during World War II—Unit 731 of the Guandong Army. This unit was responsible for developing and testing chemical and bacteriological weapons using Chinese and Allied prisoners. After the Communist victory in the Chinese Civil War (1945–1949), Harbin continued to play a central role in the transportation network in northeastern China. The city's industrial base was expanded to include tractor, cement, petrochemical, turbine, and machine factories. With the opening of China to foreign trade and investment in the late 1980s and early 1990s, Harbin witnessed a revival, and the city was again at the forefront of Sino-Russian border trade and contact.

HARI RAYA PUASA Hari Raya Puasa literally means "feast of fasting," and refers to 'Id al-Fitr, the celebration marking the end of Ramadan, as it is known to the rest of the Muslim world. This phrase is only known in the Malay world, i.e., Indonesia, Malaysia, Singapore, Brunei, South Thailand, and South Philippines. It represents a return to original purity, after the cleansing of one's sins. It is also known as 'Id al-Saghir (minor feast), as opposed to 'Id al-Kabir (major feast) or 'Id al-Adha (feast of the sacrifice).

Though subject to the sighting of the crescent moon or astronomical calculations (*bisab*), Hari Raya Puasa always falls on the first of Shawwal. Celebrations start with prayers and a two-part sermon (*khutbah*), and continue over three days during which Muslims visit family, friends, and neighbors in order to ask their forgiveness for having wronged them. The Hari Raya Puasa sermon closes an intense period of

seeking God's forgiveness for past sins by fasting, reading from the Qur'an, reciting prayers, and almsgiving (*zakat al-fitr*) throughout Ramadan. Indeed, after this particular sermon is delivered, the value of almsgiving decreases to that of an act of charity (*sadaqah*), entailing lesser rewards.

For this feast, it is recommended that Muslims wear their best attire and perfume. In the Malay world, the meals served on this occasion feature traditional Malay-Indonesian food, such as rice wrapped in leaves. Children usually receive presents and special attention.

HARSA (c. 590–647 CE), Indian ruler and poet. Born in Thaneshwar, Harsa (also Harsha or Harsavardhana) brought order to northern India when he conquered the region and became king (reigned 606–647). Harsa first ascended the throne of a small kingdom in the state of Haryana, Sthanvishvara (modern Thaneshwar), but became the last monarch of classical India to rule an empire covering the Indo-Gangetic Plain from Bengal to Gujarat and from the Himalayas to the Vindhya Range. Kanauj was his chosen capital. To conquer this hard-won territory, Harsa collected a large army and waged incessant war against other kings for six years.

His reign was noteworthy not only for the vast lands he ruled but also for the philosophical change that marked the emergence of medieval Hinduism from the earlier Brahmanic religion. Harsa proved to be as efficient in administration as in war. His court was celebrated by later authors for the king's patronage of art and literature; he himself was a poet and author of three major Sanskrit plays. His own religious practices were eclectic, as he worshiped Siva, the Sun, and the Buddha. In later life he was especially attracted to Mahayana Buddhism.

HART, ROBERT (1835–1911), head of Chinese Maritime Customs Service. Born in Northern Ireland, Robert Hart went to China in 1854. He served in British consulates in Ningbo and Guangzhou (Canton) for several years before he became the second head of the Chinese Maritime Customs Service and a key instrument in the British "informal empire" in China in the latter half of the nineteenth century. In 1863, Hart succeeded Horatio Nelson Lay, whose brusque manner offended many in the Qing dynasty (1644–1912) government. Hart, by contrast, viewed himself as an employee of the Chinese government and urged the foreign employees in the service to learn about China and, indeed, the Chinese language and to respect Chinese customs and values. Chinese officialdom greatly appreciated Hart and looked to him as a trusted foreign advisor.

Under Hart, the Chinese Maritime Customs Service became one of China's few modernized institutions and relatively effectively collected the 5 percent ad valorem tariff permitted by the so-called unequal treaties that China had signed with foreign powers, and this helped provide a dependable and major source of income for the Qing dynasty. Although most of China's tariff revenue was used to pay indemnities to the imperialist powers required by the unequal treaties, some of the revenue did go to support reform efforts in the self-strengthening movement.

For his efforts in China, Hart was knighted by Queen Victoria (1819–1901), and as long as he was alive, the Qing dynasty appointed no other inspector-general for customs. Hart even declined an opportunity to serve as British minister to China in order to remain with his beloved Customs Service.

HARVEST MOON FESTIVAL. See **Ch'usok**.

HARYANA (2001 est pop. 21 million). With the partition of 1947, the Muslim part of the Punjab was assigned to Pakistan, and the Sikh and Hindu parts to India. In 1966 the mostly Sikh, Punjabi-speaking area

became Punjab, and the primarily Hindi-speaking area became Haryana. Haryana is said to mean "home of Hari," a name of the god Vishnu. The state has a proud history dating to the Vedic age. It was home to the legendary Bharata dynasty. The battle between the Kauravas and the Pandavas, described in the Sanskrit epic poem the *Mahabharata*, is believed to have been fought on the site of the modern Kurukshetra (a plain in the northern part of Haryana). Here Lord Krishna is said to have delivered to the warrior Arjuna the teachings of the Bhagavad Gita, venerated by Hindus as the highest code of ethics.

Epigraphic evidence indicates that Haryana was part of the Maurya empire in the third century BCE, and that a string of empires controlled the city after, including rulers from the Kushan, the Gupta, and the Harsha empires. In 1192 the region became part of the Delhi sultanate and remained so until 1526, when the city was seized by Mughals. With the decline of the Mughal empire in the seventeenth century, the region was claimed alternately by the Marathas and the Sikhs, and the British East India Company took control in 1803. In 1858 the region became part of the new province of Punjab and began to be overshadowed by a shift of power to Lahore in the Sikh-dominated, northern area. Well before India's independence from the Britain and the subsequent partition of Pakistan, strong sentiment existed among the region's Hindu residents for a separate statehood, due to cultural and linguistic differences. Increasingly fierce and violent calls were made for Sikh independence, so that the creation of a new state in 1966 was widely welcomed by both sides.

The state occupies a fertile tract of river plain and is the "bread basket of the nation," with irrigation canals and modern crop technology producing nearly a quarter of India's wheat, along with millet, rice, corn, sugar cane, and cotton, and one-third of its milk and dairy foods. Machine tools, electrical goods, cement, paper, and bicycles are manufactured. Passing through Haryana are the Northern Railroad and the Grand Trunk Road, the most famous highway in India. Described by Rudyard Kipling in his novel *Kim*, it stretches 2,000 kilometers from Peshawar to Calcutta. Haryana has a network of forty-three tourist complexes named after birds. The state boasts several colleges, temples, and archaeological sites. Annual fairs and festivals preserve Hindu religious and cultural traditions.

HASINA WAJID, SHEIKH (b. 1947), Bangladesh prime minister. Sheikh Hasina Wajid, the elder daughter of former Bangladesh president and prime minister Sheikh Mujibur Rahman (Mujib) (1921–1975), was born 28 September 1947 at the family's home in Tungipara, Gopalganj district. She had been generally uninterested in politics and was absent from Bangladesh when Mujib and many of his family were assassinated on 15 August 1975. However, when political activity was fully revived following the 1979 parliamentary election in which her father's Awami League fared badly, the party was left without a strong and well-known leader. Hasina was called back to Bangladesh and assumed leadership of the party on 17 May 1981. She opposed the Hussain Muhammad Ershad (b. 1930) regime, and she participated in the 1986 election, leading the Awami League. Despite a strong rivalry with Khaleda Zia (b. 1945) of the Bangladesh Nationalist Party (BNP), Hasina joined hands with Zia in a movement that led to Ershad's fall in December 1990. Following the February 1991 election, the Awami League became the principal opposition, a position from which the party and Hasina harassed the BNP government. In June 1996, the Awami League, in coalition with Ershad's Jatiya Party, formed a government, and Hasina became prime minister. Ershad himself left the coalition, but a faction of the Jatiya Party remains in Hasina's government. The lack of cooperation between the government and the opposition since the restoration of parliamentary government has hindered political development in Bangladesh.

HASSANAL BOLKIAH (b. 1946), Brunei ruler. Born on 15 July 1946, Hassanal Bolkiah Mu'izzaddin Waddaulah II had his early education in Brunei. On 14 July 1961, he became crown prince. He continued his studies in Kuala Lumpur, Malaysia, at the Gurney Road School and the Victoria Institution. He left for Britain in 1966 to enroll at the Royal Military College, Sandhurst. He returned to Brunei in 1967, when he was installed as ruler.

Hassanal Bolkiah ascended the throne of Brunei Darussalam ("Brunei abode of peace") upon the sudden voluntary abdication of his father, Sultan Omar Ali Saifuddin III (d. 1986). Concurrently sultan and Yang Di-

Sultan Hassanal Bolkiah addressing the United Nations Millennium Summit on 8 September 2000. (AFP/CORBIS)

Pertuan ("He Who Is Made Lord," supreme ruler) of the kingdom of Brunei, from 1984 onward he has held numerous posts, among them prime minister, minister of defense, and minister of finance. Since 1967 he has been head of the Islamic faith in Brunei. He is also inspector-general of the Royal Brunei Police, commander-in-chief of the Royal Brunei Armed Forces, and the chancellor of Universiti Brunei Darussalam.

Hassanal Bolkiah concluded two treaties with Britain, one in 1971 whereby Brunei became a self-governing kingdom with full internal sovereignty, another, the Anglo-Brunei Treaty of Friendship and Cooperation (1979), that set forth a five-year schedule for full independence. A sovereign and independent Brunei came into being on 1 January 1984.

HASTINGS, WARREN (1732–1818), governor of Bengal and governor-general of British India. Born in Churchill, Oxfordshire, in England, Warren Hastings was the son of a clergyman who abandoned him at an early age. Hastings was educated by his uncle at the Westminster School in London, but his education was cut short by his uncle's death, and Hastings sailed for India in 1750 to become a "writer" (junior clerical employee) for the East India Company. Directly or indirectly, he played a role in the transition of the East India Company from a commercial to a political power in the third quarter of the eighteenth century.

In 1765 disputes forced Hastings to leave service, but he returned to Bengal as the chief administrator in 1771. The administration of Bengal was then awkwardly shared between the nominally sovereign nawab of Bengal, in charge of governance, and the East India Company, in control of the finances. Hastings moved to take control of governance and reformed the administration of justice and the fiscal system, serving as governor of Bengal from 1771 to 1773. His tenure was weakened by corruption and bitter rivalries. From 1774 until his return to England in 1784, Hastings served as governor general of British India, and was mainly occupied in trying to contain belligerent Indian regimes perceived to be dangerous to British power. His method of financing wars in India, by politely forcing his allies to pay, was the subject of an inquiry and a trial (1788–1795) in which he was honorably discharged. Aside from his controversial but critical political role, Hastings is significant for his curiosity about Indian traditions in literature and scholarship, which led the way to a flourish of European studies of these subjects.

HATOYAMA ICHIRO (1883–1959), prime minister of Japan. Hatoyama Ichiro was born in Tokyo, the first son of Dr. Hatoyama Kazuo, a legal scholar, lawyer, and (later) leading politician, and Hatoyama Haruko, a pioneer in women's education. After graduating from Tokyo Imperial University in 1907, Ha-

toyama served in the Tokyo City Assembly and then in 1916 was elected to the Diet as a member of his late father's party, the Rikken Seiyukai (Friends of Constitutional Government). He was elected a total of fifteen times.

Hatoyama was a nationalist, dismissing liberal professors from Kyoto University when serving as education minister from 1931 to 1934, and writing in support of Hitler and Mussolini in a book published in late 1938 following a trip to Europe. After the war, Hatoyama formed the Liberal Party, heading it until his purge by Allied Occupation forces in early 1946. Allowed to return to politics in August 1951, Hatoyama succeeded Yoshida Shigeru as party president and then prime minister in late 1954. During his time as prime minister (1954–1956), Hatoyama restored diplomatic relations with the Soviet Union and subsequently secured Japan's entry into the United Nations. Domestically, he brought the Liberal Party and the Democratic Party together in 1955 to form the Liberal Democratic Party in what become known as the "1955 System," which pitted the conservative Liberal Democratic Party against the leftist Socialist Party.

HATTA, MOHAMMAD (1902–1980), Indonesian nationalist leader and politician. Born in West Sumatra, Mohammad Hatta studied economics in the Netherlands, where he led the student group Perhimpunan Indonesia (Indonesian Association, or PI) from 1922. In 1927 he was tried in the Netherlands for sedition but was acquitted. His thinking was strongly influenced by socialism, but by 1931 Communists dominated the PI, and he was expelled. He returned to Indonesia in 1932 and led the PNI-Baru (the "New" Indonesian National Education), a nationalist party that aimed to build a large but unobtrusive cadre party. In 1934, however, he was exiled, first to Boven Digul in Dutch New Guinea, and then in 1936 to the Banda Island of Indonesia. In 1942 he reluctantly agreed to work with the Japanese occupation, and in August 1945 he became vice president of the independent Indonesian Republic.

Although the vice presidency had no power, Hatta became a rallying point for opposition to the left, and from January 1948 he led a nonparliamentary cabinet

Vice President Mohammad Hatta in 1949. (HULTON-DEUTSCH COLLECTION/CORBIS)

that suppressed the Communist Party following its participation in an abortive revolt in the East Java town of Madiun in September–October 1948. He was a member of the Indonesian delegation that concluded negotiations with the Dutch for the formal transfer of sovereignty in December 1949. In the 1950s he again attracted those opposed to President Sukarno (1901–1970) and the left, but when he resigned as vice president in 1956, he was unable to marshal enough support to return to executive power.

HAWKINS, WILLIAM (1560–1613), first Englishman to reach the court of the Mughal emperors. William Hawkins, thought by some to be related to the famous sea-faring family of Plymouth, commanded the British East India Company's ship *Hector*, which reached Surat on India's western coast on 24 August 1608. In his possession were gifts and a letter from King James I of England (1566–1625) to the Great Mughal of India, Jahangir (1569–1627). Hawkins survived several assassination plots by the Portuguese—who were already present in India—and journeyed overland to the court of Jahangir at Agra. Hawkins, who spoke fluent Turkish, soon became a favorite of the emperor, who granted him the title "Khan." Jahangir also granted Hawkins permission to set up an English factory (trading post) at Surat.

The Portuguese, feeling their interests in the region threatened by this, convinced Jahangir to reverse his decision allowing the English to trade in India. Unable to persuade Jahangir to change his mind, Hawkins left Agra for Surat in November 1611. He and his wife—an Armenian Christian whom Hawkins had married at Jahangir's insistence—sailed for England via Java on 26 January 1612. Hawkins died at sea on 20 May 1613. Although he was unsuccessful at opening India to English trade, he led the way for the English mercantile venture that eventually resulted in Britain's Indian empire.

HAYASHI As a small ensemble typically consisting of a flutist and three drummers, the *bayashi* is the main source of music for Japanese festivals. The term refers to both the musical accompaniment and the ensemble itself. The flute is a simple bamboo pipe with six or seven holes. The *o-daiko*, large drum, has a convex wooden body and two tacked heads and may be set on a crate or tipped with one head toward the player who strikes it with two blunt sticks. The smaller *taiko* drums consist of two heads lashed together with rope and tightened by a second encircling rope, through which a stick is inserted to tip the drum toward the player. A fourth addition is the voice of the drummers used instrumentally at a rhythmical high-point. An occasional fifth component is a small brass gong, *atari-gane*, suspended or held in the hand. The music tends to be casual and somewhat repetitive, and its primary function is to spur on folk dances.

In Noh accompaniment, the *bayashi* ensemble consists of one flute and two or three drums—*taiko*, *ko-tsuzumi*, or *o-tsuzumi*—the latter two of which have two heads lashed together and resemble an hourglass. In Kabuki, a similar ensemble performs onstage together with singers and shamisen players, while another group provides additional music backstage.

HAYASHI RAZAN (1583–1657), Japanese Neo-Confucian scholar. Hayashi Razan, known also as Doshun, was one of the foremost Japanese Neo-Confucian scholars and an influential adviser during the Edo period (1600/1603–1868) in Japan.

Hayashi was born in Kyoto and trained himself as a Buddhist priest during his childhood. Later he abandoned Buddhism and studied Confucianism, devoting himself to the doctrines of Zhu Xi (1130–1200). In 1605, he met Tokugawa Ieyasu (1543–1616), who served as the first shogun of the Edo period from 1603 to 1605, at Nijo Castle in Kyoto. The meeting became a vital encounter for both men, as well as the basis for changes in the Japanese social order.

Ieyasu's main concern was the restoration of peace and order to the war-ravaged society. In order to accomplish this, Ieyasu turned to China and Confucianism, particularly Hayashi's thoughts on Neo-Confucianism.

Hayashi introduced the Confucian stress on loyalty and obligations that provided a standard code of conduct with which the Edo shogunate could govern autonomous territories and still maintain social order. Furthermore, he emphasized that the understanding of things can be derived only from understanding the Confucian principle of *li* (universal natural law) operating behind them. This led to the development of an empirical science in Japan, a method of knowledge that stressed the observation and study of material and human things. In addition, he emphasized the study of history and inaugurated several centuries of great Japanese history writing. Supported by Ieyasu, many social changes based on the teaching of Zhu Xi, such as establishing prohibitions for samurai families, occurred in Japan.

Hayashi continued to serve as an adviser until the fourth shogun, Ietsuna (1651–1680). Because of his position in the government, Hayashi Razan established a dynasty of Neo-Confucian philosophers in the Edo court. He, his son, and then his grandson built the uniquely Edo version of Chinese Neo-Confucianism in Japan; the Hayashi family ultimately headed Daigaku-no-kami, the state university, until 1906.

HAZARA The Hazaras, an isolated group of Shi'a Muslims who lived in the mountainous regions of central Afghanistan until political upheavals forced them to scatter, were once the second-largest, although least-known, ethnic group in the country. Many scholars believe that the Hazaras are descendants of the Mongol army of Genghis Khan (c. 1162–1227), which invaded this area of Afghanistan in the thirteenth century. According to other theories, the Hazaras' ancestors were Buddhist monks who lived in the city of Bamian in central Afghanistan, when it became a center of Buddhism some two thousand years ago, but this explanation ignores the fact that the Hazaras are now Shi'a Muslims. Their physical characteristics suggest a Mongol ancestry, yet their language, called Hazaragi, is a unique, archaic version of Persian, albeit with remnants of Mongolian vocabulary.

Hazara children stand in front of the alcove that housed a statue of Buddha destroyed by the Taliban government of Afghanistan. (REUTERS NEWMEDIA INC./CORBIS)

The Hazaras lived mainly as shepherders in the center of the Hindu Kush mountain range. In recent Afghan history, they have become an oppressed minority, partly because of their Shi'ite beliefs. Due to the lack of arable land in this harsh, mountainous region, as well as the recent political developments limiting their access to trade routes in the Hindu Kush, many moved to the cities to work as menial laborers to provide food for their families.

During the Taliban regime in Afghanistan, the Hazaras suffered massive losses from starvation and massacres by the Taliban, who brutally slaughtered thousands of Hazaras in an attempt to eradicate Shi'a Muslim believers. Most Hazaras now live as refugees in Pakistan, India, China, and Mongolia.

HEBEI (2002 est. pop. 70.4 million). Hebei (Hopei, Hopeh) Province in northern China covers an area of 187,700 square kilometers, borders in the west on Shanxi, in the north on Inner Mongolia and Liaoning, in the east on the Bohai Gulf—part of the Yellow Sea—and Shandong, and to the south on Henan. The province surrounds the self-governed municipalities of Beijing (8,400 square kilometers) and its seaport, Tianjin (3,900 square kilometers). To the west, the Taihang mountain range, with peaks up to 2,870 meters above sea level, form a physical barrier between Hebei and Shanxi, and in the north the Yanshan range, rising to 1,500 meters, constitutes the traditional frontier between China and the nomads in the north. It is

here that the eastern extension of the Great Wall is located. Southern Hebei, covering an area of about 78,000 square kilometers, is part of the north China plain, most of which is lowland under 50 meters above sea level.

The province has a temperate continental monsoon climate. Winters are cold and dry, and in January temperatures may drop to -21°C in the north (a minimum of -42.9°C has been recorded). It is less cold in the south. The rainy season stretches from June through August, and temperatures in July average 18° to 27°C , but most regions have recorded temperatures over 40°C . The capital, Shijiazhuang (1.6 million, 1996), is situated in the southern lowlands, which is also where the majority of Hebei's 64.6 million (1996) people live.

Hebei is divided into 10 regions, 142 counties, and 2 autonomous counties between Beijing and Tianjin that are inhabited by the Hui Muslims, who are the largest minority group in the province. There also are Manchu and Mongolian people in the northeast, but the Han Chinese make up 98 percent of the population. Traces of agriculture date back to 4000 BCE, but the marshy lowlands of southern Hebei were first drained and settled during the Han dynasty (206 BCE–220 CE), and for centuries this densely populated area was one of the most productive in the empire. During the Tang dynasty (618–907 CE), the area declined as the Chang (Yangtze) River valley was developed. Hebei was incorporated into a number of foreign dynasties, the Liao (916–1125) and the Jin (1115–1234). Beijing became the capital of the Yuan empire (1279–1368), and with brief interruptions, Beijing has remained capital of China.

The economy of Hebei has for centuries been dependent on Beijing, and the intensive agriculture in the lowlands has supplied the capital with wheat, corn, vegetables, and fruit. Light industry is distributed over the province, with major textile centers in Shijiazhuang and Handan. In 1976 a major earthquake (7.8 on the Richter scale) devastated the city of Tangshan in eastern Hebei.

HEIAN PERIOD The Heian period (794–1185) started with the transfer of the capital from Nara to the new imperial city of Heian-kyo (Kyoto) and ended with the establishment of a warrior government in Kamakura. This period was the peak of Japanese aristocratic and court life, a time during which literature and the arts flourished.

The *Ritsuryo* System

The *ritsuryo* system, first established in the Nara period (710–794 CE), was modeled on the political and economic system of Tang-dynasty (618–907 CE) China, which was composed of both a centralized government dominated by the emperor and nationally controlled estates. Although various attempts were made to preserve and augment the system, the expansion of *sboen* (private landed estates) and their exemption from taxation encroached on public land and reduced the authority of the central government. The creation of extra-statutory officials, such as *sessho* (regent) and *kampaku* (chief councillor), opened the way to power for non-imperial families among the nobility.

From the mid-ninth century, members of the Fujiwara family dominated the court and controlled the imperial line as *sessho* or *kampaku* by marrying their daughters to imperial successors. The rise of the Fujiwara family proved the failure of the *ritsuryo* emperor-dominated political system. From the late ninth century to the first half of the tenth century, however, emperors controlled the court without the Fujiwara regents. Emperor Uda (867–931), having no connection to the Fujiwara family, singled out Sugawara Michizane (845–903) to balance Fujiwara authority. But in 901, a member of the Fujiwara family, envious of the influence of Michizane, deceptively reported that Michizane was plotting against the emperor. Michizane was exiled to Kyushu and died there two years later. Emperor Daigo (885–930), Uda's successor, also avoided Fujiwara influence.

The Aristocracy

In the tenth and eleventh centuries, the Fujiwara ruled the court by reestablishing the tradition of regents. The period from 967 to 1068 was called *sekkon seiji* (Fujiwara regency government). Emperors were born of Fujiwara mothers and were completely dominated by their uncles, fathers-in-law, or grandfathers. Their influence reached its peak under Fujiwara Michinaga (966–1028), who dominated the court from 995 to 1027. Michinaga's son Yorimichi, a high-ranking

noble for three-quarters of a century, continued Fujiwara glory until the accession of emperor Go-Sanjo in 1068, when the Fujiwara declined and a succession of non-Fujiwara emperors came to power.

This period was characterized by the development of a truly Japanese culture in art and literature, after having absorbed Chinese values. The *kana* script, one of the most important inventions in Japanese cultural history, contributed to the creation of great quantities of verse and prose. Murasaki Shikibu's *Genji Monogatari* (*The Tale of Genji*, c. 1000), is not only a brilliant record of life among the aristocracy, but also a masterpiece of world literature. *Waka*, or Japanese poetry, was a crucial part of aristocratic daily life, and proficiency in making *waka* was regarded as essential for nobles. In religion, the secret sects of Tendai and Shingon Buddhism continued to flourish, but they lost their purely religious goals by connecting Buddhism to formalistic court rituals. Instead, the doctrines of the Jodo (Pure Land) sect, which emphasized simple faith in Amida Buddha, grew in popularity in the late Heian period. These doctrines offered consolation to the common people during the social disturbances that occurred in this period.

Age of *Insei*

The accession of Go-Sanjo, the first emperor in one hundred years whose mother was not of the Fujiwara regents' line, initiated the last part of the Heian period, which extended until the establishment of the Kamakura shogunate (military government) in 1185.

This last phase was dominated by three successively powerful retired emperors—Shirakawa, Toba, and Go-Sanjo—who replaced the reigning emperors of the earlier period and the regents of the mid-Heian period as the supreme political figures. It was a time of imperial revival.

Emperor Shirakawa (1053–1129) retired early, became a nominal Buddhist monk, and established *insei* (often translated as "cloistered government," because it was government by retired emperors who had taken the monk's tonsure) to rule behind the throne. His successors continued the system off and on until the late Kamakura period. *Shoen* continued to expand, with the imperial family under the active leadership of retired emperors replacing the Fujiwara as the largest *shoen* holders in the land. The imperial family developed a strong household organization that attracted a number of clients among the nobility, and the fortunes of the imperial house increased immensely.

During this time, however, the *ritsuryo* system almost faded away. In the absence of central authority in the provinces, powerful local individuals, banding together in *bushidan* (large military groups), caused confusion. Meanwhile, the Buddhist temples in the capital collected large armies and fought against one another, against the nobles, and against the court, for both economic and religious prizes. The general anarchy led many to believe that the world had entered *mappo* ("latter days of the law"), the final phase of human decline according to Buddhist doctrine.

With the outbreak of civil disturbances in 1156 and 1160, caused by conflicts over political power in both the imperial and the Fujiwara families involving two warrior clans, the Taira and the Minamoto, the military or warrior class became essential to the maintenance of civil government in the capital and indispensable to court politics. The warrior-noble Taira Kiyomori (1118–1181) maintained tenuous control over the court until 1185, but lost power eventually to the powerful Minamoto clan, which established the Kamakura *bakufu* and ushered in a new era in Japanese history.

HEILONGJIANG (2002 est. pop. 38.3 million). Lying in the northernmost part of Northeast China, Heilongjiang Province has a total area of 453,900 square kilometers, of which 60 percent is made of mountains, 10 percent rivers, and 30 percent farmland. It has a common boundary with the Inner Mongolia Autonomous Region and Jilin Province. In the north, it borders on the Russian Federation. Within its population are 2 million people of minority nationalities, including Manchus, Koreans, Huis, Mongolians, Daur, Hezhens, Oroqens, and Evenkis.

Heilongjiang has a cold-temperate continental climate and a mean annual temperature of 3° to -2°C, an ice-bound period of five to six months, and a frost-free period of 120 days. It has warm, rainy summers with an annual rainfall of 400 to 650 millimeters and long hours of sunshine, which is favorable to crop growth.

Named after its longest river, Heilongjiang—the Black Dragon River—has five large river systems: the Heilong, Songhua, Wusuli, Nenjiang, and Suifen rivers. Rivers and lakes provide good-quality water resources for agriculture, industry, and human consumption. It has vast expanses of flatland and wide areas of fertile back soil and is one of China's major commodity grain growers. It is nicknamed "the Great Northern Granary," denoting its abundant production of soybeans, maize, wheat, millet, sorghum, sugar beets, flax, and sunflower seeds.

Its land area also includes the country's largest known oil reserve. The Daqing oil field is not only the biggest one in China, but it also is one of the largest known oil fields in the world. The province is rich in coal, gold, copper, aluminum, lead, zinc, silver, molybdenum, bismuth, and cobalt. Heilongjiang has a forest area of close to 210,000 square kilometers, or 49 percent of the province's total area, and leads the country in timber reserves. The mountains and forests abound in alpine weasels, sables, otters, deer, and musk deer. Ginseng is cultivated.

Rail is the principal means of transport in Heilongjiang, with Harbin as the central hub. Heilongjiang has the most developed inland shipping among the northern provinces.

Harbin, the provincial capital (with an estimated population of 2.8 million in 2002), is located on the south bank of the Songhua River and is the economic, cultural, and communications center of the province. The city used to be called "Little Moscow," as a result of colonialism, cooperation with, and immigration from nearby Russia. The town looks a little like the last threadbare outpost of imperial Russia. Harbin is also famous worldwide for its annual Winter Ice Festival.

HEISEI PERIOD With the death of Emperor Hirohito (b. 1901) in January 1989, the Showa period, which had taken Japan from 1926 through the post-war recovery, came to an end. In its place came a new emperor, Akihito (b. 1933), and a new period, Heisei. Already the Heisei period has seen dramatic changes. The tremendous Heisei economic boom has taken a precipitous turn into lasting recession. Faltering financial institutions, crashes in land prices, and the erosion of the lifetime employment tradition have altered Japan's economic and social climate. International conflicts have thrust Japan onto the geopolitical stage, while domestic political changes have begun to rattle the established bureaucracy and disasters such as the great Kobe earthquake and the Tokyo subway sarin gas attack have further shaken the nation's nerves.

The Heisei Boom

The Heisei period started out with a boom, riding in on a period of economic prosperity that had begun in 1986 and would last until early 1991. Not since the Izanagi Boom (1965–1970) had the Japanese economy experienced such a long, uninterrupted period of economic expansion. Domestic consumer demand, helped by government monetary policy, boosted the economy. With the signing of the Plaza Accord in 1985, the Japanese government had pledged to encourage consumer demand, let the value of the yen better reflect the strength of the Japanese economy, and regulate against inflation. In 1986, the government had cut the official discount rate. By February of the next year, the rate had fallen to 2.5 percent, the lowest in the post-World War II period. Spurred by lowered

JAPAN—HISTORICAL PERIODS

Jomon period (14,500–300 BCE)
 Yayoi culture (300 BCE–300 CE)
 Yamato State (300–552 CE)
 Kofun period (300–710 CE)
 Nara period (710–794 CE)
 Heian period (794–1185)
 Kamakura period (Kamakura Shogunate) (1185–1333)
 Muromachi period (1333–1573)
 Momoyama period (1573–1600)
 Tokugawa or Edo period (Tokugawa Shogunate) (1600/1603–1868)
 Meiji period (1868–1912)
 Taisho period (1912–1926)
 Showa period (1926–1989)
 Allied Occupation (1945–1952)
 Heisei period (1989–present)

interest rates, investors snapped up land and property and bought more durable goods and machinery. This economic momentum continued into the early years of the Heisei period.

A strengthened yen, likewise, brought more buying power to individuals and corporations looking to invest abroad. From a record low of 240 yen to the dollar in 1986, the yen strengthened steadily to 130 yen to the dollar just two years later. By 1991, the last of the boom years, the yen stood at around 140. The yen went to 99 to the dollar in January of 1995, reaching 84 to the dollar in June 1995 and continuing to hold below 100 until September. The strengthened yen did little to curb Japan's export competitiveness abroad, as manufacturers could import raw materials at lower costs. A strengthened yen also helped government efforts to curb Japan's wide trade deficits and the associated "Japan bashing" that had arisen with trading partners abroad, particularly the United States.

During the same period, land prices soared as more and more investors turned their capital to real property. Prices nationwide, but particularly in Japan's largest cities (Tokyo, Yokohama, Osaka, and Nagoya), rose to a peak in 1990. Golf course development, along with other resort development initiatives, also gained steadily during the wealthy years of the Heisei boom. Concurrently, golf course memberships themselves were looked to as indicators of the economy's health. A golf membership fees index tracked the exorbitant prices that Japan's corporate wealthy were willing to pay for the privilege of belonging to and networking

at the nation's most prestigious golf courses. When Japanese investors bought the famed Pebble Beach Golf Course in California (along with a host of other high-publicity real estate purchases such as Carnegie Hall and Columbia Pictures movie studio), business professionals worldwide began to study the Japanese "economic miracle." Indeed, with Japan's gross domestic product (GDP) averaging about 4.5 percent growth, including a peak of over 6 percent growth in 1989, and unemployment rates at an all-time low, it looked as though the Japanese economy would increasingly dominate the twenty-first century.

Recession

However, as heady as the late 1980s and early 1990s were for many, there were signs that Japan's rising economy was, in fact, an overinflating bubble, filled with emptiness and ready to burst. By the middle part of the 1990s, it had. The overheated land prices with which the bubble had been inflated dropped precipitously. Corporations and financial institutions that had overextended themselves, often on risky investments and real estate ventures, found that they could not repay their loans or collect from bankrupt creditors. In August 1995, Hyogo Bank, the nation's thirty-eighth largest, and Kizu, the nation's largest credit union, shut their doors. Larger banks were to follow: in November two years later, Sanyo Securities, Yamaichi Securities, and Hokkaido Takushoku Bank announced financial collapse.

During the same period, eight of the country's mortgage lending companies (*jusen*) revealed 6 trillion yen (\$67.5 billion) of debt caused mainly by investments in high-priced real estate that had since lost value. When the Ministry of Finance (MOF) stepped in to prop up bad *jusen* loans, more controversy ensued. Historically reluctant to give out money, the MOF spent 685 billion yen (\$6.52 billion) of taxpayer money to recover investor losses. When rumors circulated of poor investment practices by *jusen* managers (a number of whom were retired MOF bureaucrats) and possible underworld involvement, the public labeled the incident the *jusen* scandal. Confidence in the Ministry of Finance declined, and greater public cries for transparency in financial institutions ensued. Further turmoil erupted when agricultural cooperative credit unions that had also extended real estate investment loans experienced similar troubles and demanded similar government bailouts.

To relieve the fears of depositors, in 1996 the national government committed itself to unlimited guarantees on all deposits at failed banks. Some critics,

however, complained that the government was not prompting bankers to change faulty policies rapidly enough. So-called Big Bang measures to bring more transparency, oversight, and accountability to financial bureaucracies were also introduced in 1996 and have been instituted with varying degrees of success.

In addition to propping up failing institutions, the government continued past policies aimed at priming the economy through government-funded development projects. Giving money to transportation infrastructure and resort and rural development projects, the government hoped to promote work throughout the country. However, although the construction industry flourished and the economy had made signs of recovery with GDP growth at slightly over 4 percent in 1996, by 1997 the GDP had once again begun to fall. By the following year, the GDP had slipped into negative numbers, and although slight growth rates were recorded in the following years, recession continued.

Not only company accounts suffered. Workers who once assumed lifetime employment and company-subsidized benefits found their jobs less secure. Companies began to trim excess workers from their payrolls, creating thousands of new jobless. Japan's jobless rate reached a record 6 percent in October 2001. In conjunction, the rate of homelessness has also risen.

The Asian Economic Crisis

The strength of the Japanese yen in the beginning of the Heisei period had prompted investment in neighboring nations. When the economic bubble burst, however, many companies began to restrict cash flow to overseas holdings and to withdraw capital from overseas banks. As regional currencies lost value, Asian banks struggled to meet dollar-denominated foreign debts. Japan's economic crisis directly contributed to economic crises in Southeast Asia and Korea at the end of the 1990s (particularly in 1997 and 1998, when various Asian nations struggled with plummeting currency values and bank failures).

In turn, Asia's poor economic performance has hindered Japan's recovery. In the late 1990s, nearly 38 percent of Japan's exports were aimed at Southeast Asia, but devastated currency values stopped many Southeast Asian consumers from buying higher-priced Japanese exports. Although the region has rebounded, economic performance is not yet what it was in the boom years of the "Asian Miracles."

Political Changes

Great changes have also taken place in Japan's political arena during the Heisei period. For the first time

in thirty-eight years, the long-ruling Liberal Democratic Party (LDP) was knocked out of power in 1993 and joined a coalition government with various opposition parties. Although the LDP regained power the next year, significant political restructuring has followed.

Most sweeping has been electoral reform. In a large-scale effort at demographically based redistricting not seen since the end of World War II, Japan created three hundred new electoral districts. The newly drawn districts were designed to alleviate disparities between rural and urban voting power that disproportionately favored rural districts. Under the new system, the Lower House membership consisted of three hundred single-seat constituencies and two hundred proportionate seat constituencies elected from eleven regional districts (in proportionate seat elections, voters vote for a party slate whose members then proportionately fill the number of seats allotted to their party). The number of proportionate seats was reduced to 180 in 2000.

Although political reform was aimed at creating a two-party adversarial system similar to that in the United States, the LDP, along with its coalition partners, has continued to dominate national politics. In the summer 2001 election, for instance, the LDP, helped by the wave of popularity surrounding Prime Minister Junichiro Koizumi, won the national election handily and was able to continue its rule along with its New Komeito and New Conservative coalition parties. Moreover, the new electoral system has not kept smaller parties from entering into the political process. In fact, over thirty new political parties have been created since 1994, and more voters are describing themselves as independent. Similarly, redistricting has not alleviated rural-urban voting disparities and differences. Although rural support for the LDP has lessened somewhat (from what was once an assured support for the LDP's generally protectionist policies toward farmers and small business owners), rural districts still vote primarily for the LDP and its allies.

Peace and Conflict Abroad

Political challenges have not happened only on the domestic front, however. During the Heisei period, the bounds of Japan's postwar constitution have come under international scrutiny. Article 9, the constitutional "peace clause" that forbids Japan's involvement in acts of foreign aggression, has been overwhelmingly popular with the Japanese public. International allies, however, severely criticized Japan for not promptly sending more support during the 1991 Gulf War. A

belated \$13 billion in monetary support did little to bolster Japan's image as an international player.

To maintain better diplomatic ties with the United States and European allies, Japan committed financial aid and elections observers in support of U.N. efforts in the Bosnia-Herzegovina region in 1996. Following East Timor's independence in 1999, Japan contributed similar forms of aid and development personnel to peacekeeping and reconstruction projects.

More recently, after the 11 September 2001 terrorist attacks in the United States, Japan took its largest steps yet into the arena of international conflict. Pushing to the limits of Article 9 and banking on his great popularity, Prime Minister Koizumi pledged not only money, but also noncombatant support troops from Japan's Self-Defense Force (SDF) to war and rebuilding efforts in Afghanistan. SDF personnel would be able to provide medical aid, intelligence-gathering support, and refugee relief in the Afghan and Middle East region. The move is significant and controversial because it sent SDF troops to an area of active conflict.

Agriculture

Debates on agricultural markets have also continued throughout the Heisei period, with intense controversy over the extent to which Japan should open its markets to foreign produce. At issue are questions of price, selection, health, rural economics, and food security.

Through quotas, tariffs, and rigid quarantines, Japan managed to buffer its small farmers from the brunt of international competition for decades. With small farm sizes (on average, 1 to 1.5 hectares), high operating costs, and an aging farm population, Japan's farmers have long feared unchecked imports and unsubsidized farming. However, as electoral politics began to shift and as more farmers began to retire, popular support for large farm subsidies began to decline. Price supports for rice fell, and more and more imported goods began to find their way into Japanese markets.

With the signing of the Uruguay Round of the General Agreement on Tariffs and Trade (GATT) in September 1993, Japan agreed to limited imports of its most symbolic and most protected grain: rice. The agreement was a shock to rice farmers, who had suffered poor harvests in 1993 but had recovered with bumper crops by 1994. Angry farmers publicly derided the quality of imported rice, feeding it to their livestock on national television. However, the agreement

stood, committing Japan to yearly increases in rice imports.

Besides rice, Japan has been increasingly importing other food products from abroad, including apples and various vegetables, as well as meat and preprocessed products. At the beginning of the twenty-first century, it is possibly China that causes the most concern. Controversy has already raged over the import of Chinese leeks, garlic, ginger, mushrooms, and reed matting (tatami).

Proponents of continued agricultural protections point to the likelihood of exacerbated economic disparities between rural and urban regions if Japan's small farms go under. Japan must also consider issues of food self-sufficiency and national security. At present, Japan has the lowest food self-sufficiency ratio in the industrialized world, with only 40 percent of average caloric intake provided from domestic sources.

Shocks

Two particularly infamous events will forever mark the Heisei period. On 17 January 1995, an earthquake measured at 7.2 on the Richter scale rocked the city of Kobe in the early morning, killing 6,425 people. Fires raged around the city, highways and buildings lay toppled, and rescue teams had a difficult time reaching the wounded. In addition to the horrific human costs, the Kobe earthquake was Japan's costliest in economic terms. The earthquake also toppled the nation's feeling of security because many "earthquake-proof" structures crumbled.

Although all Japanese know that their land will shake, most had assumed that they remained relatively safe from crime and domestic terrorism. That peace, as well, was shattered a few months after the Kobe earthquake when, on 20 March 1995, members of the Aum Shinrikyo cult released sarin gas inside a Tokyo subway. The attack killed twelve and injured six thousand. Communities and law enforcement moved to squelch the cult, and membership is reportedly down from the ten thousand members it had acquired by 1995. The cult's leader, Asahara Shoko (b. 1955), has been jailed. The subway attack, however, painfully revealed Japan's vulnerability. It also revealed an alienated segment of Japanese society that some scholars say grew in number after the economic bubble collapsed.

What Will Come Next?

In December 2001, the nation celebrated the birth of Imperial Princess Aiko, the daughter of Crown

Prince Naruhito and Princess Masako. Many hope that the imperial family will revise current rules that permit only male heirs to take the throne. The idea of reform in imperial succession in the years to come cheers many in the current era of dim economics and uncertain international politics.

The Heisei period has already seen significant changes and challenges. The outcome of the period remains to be seen, but the events of its first years have already made a lasting imprint on Japan's modern history.

HENAN (2002 est. pop. 100.8 million). Located in north-central China, Henan Province covers an area of 167,000 square kilometers and is bordered by Hebei, Shandong, and Shanxi Provinces. Today, Henan has a population of 92 million; its capital is Zhengzhou. Located on the North China Plain and with its close proximity to the Huang (Yellow) River, Henan Province has had a long history of flooding. For thousands of years, the Chinese have built dams and dikes here in an effort to stem the devastating effects of these yearly floods. Yet the floods have also deposited large quantities of rich silt, leaving Henan one of China's most fertile regions. The temperature is hot in the summer and cold in the winter, and annual rainfall averages 1,250 to 1,750 millimeters.

The province, known as the cradle of Chinese civilization, is one of the oldest inhabited regions of China. Archeologists have found evidence that Henan was inhabited as far back as the Neolithic period. Recent excavations have unearthed artifacts dating back to the Shang dynasty (1766–1045 BCE). Several cities in Henan have served prominently in Chinese history. Anyang, located in northern Henan, was the first capital of the Shang dynasty, while Luoyang served as imperial capital of the Eastern Zhou dynasty (770–221 BCE), and Kaifeng was the imperial capital during the Five Dynasties period (907–960 CE) as well as the Northern Song dynasty (960–1126 CE).

The province is known as a major producer of wheat, tobacco, and cotton. Textile, electricity, and other industries developed recently. The provincial capital, Zhengzhou, located at the crossroad of several major railroad lines that transverse China, is one of the key points of China's national transportation system.

HENG SAMRIN (b. 1934), president of the People's Republic of Kampuchea. Heng Samrin, president of the People's Republic of Kampuchea (PRK) from 1979 to 1991, was born in Kompong Cham Province in 1934. He became involved in Communist activity in the 1950s and later rose to become a Khmer Rouge division commander in the Eastern Zone. He fled to Vietnam with Hun Sen and others during the Khmer Rouge purges of 1978. On 3 December 1978 Radio Hanoi announced the formation of a united front of the National Salvation of Kampuchea under the leadership of Heng Samrin. Weeks later Vietnamese forces entered Phnom Penh, defeated the Khmer Rouge, and began their occupation of the country. On 10 January 1979 they formed the PRK and named Heng Samrin president. The PRK government was formed from the top down by recruiting those who both strongly opposed the return of the Khmer Rouge and were willing to work within the Vietnamese political structure. The Heng Samrin government was never widely recognized as the legitimate government of Cambodia. It was not seated at the United Nations, was refused

U.N. aid, and was boycotted by the United States. In the mid 1980s, power moved to Hun Sen, who became prime minister in 1985. Heng Samrin remained head of state until Sihanouk returned in 1991. Following the election of 1998, he became first vice chairman of the National Assembly.

HENGDUAN RANGES The Hengduan region in northwest Yunnan Province in China, extending into neighboring Tibet and Sichuan, is China's longest and widest mountain system. The area is transversed by several big rivers running from north to south: the Nu, Lancang, Yalon, and Jinsha. The river valleys are 1,500 to 2,000 meters above sea level, while peaks in the southern part reach 4,124 meters (Tiancang); Guangmao in the eastern part reaches 4,023 meters. The peaks stand close together, and the area is almost without plateaus and broad valleys. There is a relative high annual precipitation, up to 2,500 millimeters on the western slopes of the mountains while the eastern slopes receive markedly less rain, about 900 millimeters annually. The region is sparsely populated. Most inhabitants belong to minority nationalities like the Yi, Lisu, Bai, and Tibetans, and the majority of the region is divided into autonomous districts. The main city of the area is windswept Xiaguan, situated at the southern end of Lake Erhai. Main sources of income are forestry, cattle, and sheep. Since tea plants were introduced in the nineteenth century, the region has become a major tea producer. The area is also one of China's important nonferrous metal industrial bases.

HENTII MOUNTAINS Located in northeast Mongolia, the Hentii (Khentii) range consists of

smooth, rounded mountains covered by large stretches of well-watered virgin forest. The range lacks the high mountaintop relief that one observes, for example, in the Rockies of North America. The highest point is located at Asralt Hairhan (2,751 meters above sea level).

The Hentii mountain range is one of the wettest regions in Mongolia, with a total annual precipitation of 250 to 300 millimeters at altitudes higher than 1,000 meters. Water collects in the range's glacial lakes or drains into one of two oceanic basins—the Pacific Basin via the Herlen and Haraa Rivers, and the Arctic Basin, via the Tuul, the Yoroo, and the Onon, a tributary of the Amur River.

Mountain forest, or taiga, covers a large portion of the lower Hentii range. Cedar and cedar-larch are the most commonly found tree species in the taiga-dominated areas. At higher elevations, low-lying shrubs and rocky outcroppings predominate. A variety of animals make the mountains their home. These include lemmings, sable, glutton (wolverine), northern pika, musk deer, elk, bear, Manchurian deer, and the Hentii mountain stout.

HERAT (2002 est. pop. of province 1.3 million; 2002 est. pop. of city 167,000). An important historical, commercial, and cultural center in Central Asia, Herat (ancient Aria) is a city on the Hari River in northwest Afghanistan and the capital of Herat Province. Herat played an important role in the military and cultural history of the Central Asian region due to its strategic location on the Silk Road from China and Central Asia to Western Asia and Europe. According to historical records, a large settlement in this area had existed at least since the fifth century BCE; Herat Province may be the ancient homeland of Aryan-speaking people, and Aria was a satrapy of the Persian empire (sixth–fourth centuries BCE). Alexander of Macedon (356–323 BCE) destroyed the Persian citadel and the city around 328 BCE, during his conquest of the Persians. Nonetheless, the city was rebuilt and continued to serve the flourishing trade on the Silk Road, surviving turmoil and frequent wars.

In the eleventh century, Herat was captured by the Seljuks, and in the twelfth century, it was taken over

by the powerful Khwarizm empire centered on the valley of the Amu Dar'ya River. In the thirteenth century, Herat was destroyed by Mongols led by Genghis Khan (c. 1162–1227), who ordered the slaughter of all 80,000 citizens of the city, yet it was rebuilt again. In 1381, Timur (Tamerlane, 1336–1405) conquered the city, but his son, Shah Rokh (1377–1447), rebuilt Herat and made it his capital and an intellectual and cultural center. During this time, Herat was famous for its poets, painters of miniatures, and architecture.

From the seventeenth to nineteenth centuries, Herat was fought over by various regional powers, and only in 1863 did Abdorrahman Khan (c. 1844–1901), the Afghan ruler, finally integrate it into Afghanistan with British support. During the last quarter of the twentieth century, the city experienced decay due to political turmoil, the Soviet occupation in 1980, and civil war. Presently it remains a commercial center that relies on agriculture and small-scale manufacturing, including food processing and textile and carpet manufacturing.

HIGASHIKUNI NARUHIKO (1887–1990), prime minister of Japan. Higashikuni Naruhiko was Japan's first prime minister following its surrender to the U.S. on 15 August 1945; he served from 17 August to 9 October 1945. An uncle to Emperor Hirohito by marriage (Higashikuni's wife, Toshiko, was the ninth and youngest daughter of the Meiji emperor), Higashikuni acted in the role of caretaker prime minister to peacefully turn over control of Japan to the Allied Occupation armies.

Higashikuni was born in Kyoto in 1887. As a member of the nobility, following the custom of the times, he entered the attached Primary School of the Imperial Army, followed by Officers' School and Army College. After graduation, Higashikuni married and in 1920 went to France to study, staying for seven years. While in France, Higashikuni developed affection for

Impressionist art and had a wide circle of friends, including Claude Monet and Georges Clemenceau. Through these acquaintances, Higashikuni learned about Western social and political thought and developed a reputation as a liberalist among the nobility.

Upon his return to Japan, Higashikuni rose to the rank of field marshal. After the fall of the Konoe Fumimaro cabinet in October 1941, he was recommended to become prime minister in the belief that he could prevent the march toward war, but Army Minister Tojo Hideki took the post instead. In August 1945, Higashikuni became prime minister; his main tasks were preparing for the official surrender and the start of the Allied Occupation. In October of that same year, Higashikuni and his Cabinet resigned due to policy differences with the Occupation authorities. In 1950, Higashikuni formed his own religious sect, Higashikunikyo. In 1990, one year after the death of Emperor Hirohito, he died at the age of 103.

HIGH-TECHNOLOGY INDUSTRY Asian development strategies typically have three stages. Initially, low-cost labor attracts labor-intensive and low value-added assembly businesses. Second, countries attempt to increase value-added capabilities to sustain economic development as wage rates rise. Finally, successful development requires that local firms expand operations into the global marketplace. Industry growth requires competitive economies of scale, which means that firms must obtain global market shares. Long-term leadership requires brand names to ensure global brand recognition and acceptance.

Electronics' Low-Cost Imperative

Less-developed countries such as China, India, and many Association of Southeast Asian Nations (ASEAN) countries with low-cost labor attract companies with labor-intensive operations. In the 1970s and 1980s South Korea, Taiwan, Hong Kong, Singapore, and Malaysia benefited from such foreign direct investments; they are now newly industrialized economies (NIE). Unfortunately, per capita incomes have increased to only \$11,100 for Malaysia but to \$26,800 for Hong Kong. (See Table 1.) To stay competitive, NIE firms are moving operations to

TABLE 1

Comparative economic statistics					
	Malaysia	Hong Kong	Singapore	South Korea	Taiwan
GDP per capita	\$11,100.00	\$26,800.00	\$24,600.00	\$13,700.00	\$14,200.00

SOURCE: AsiaSource (2001).

less-developed countries (LDCs) such as Indonesia, the Philippines, Vietnam, and China. China received nearly 80 percent of all foreign investments in Asia.

Hong Kong's Shift to Mainland China Hong Kong's wages are among the highest in Asia. Between 1982 and 1994, Hong Kong's manufacturing firms lost cost competitiveness and moved labor-intensive operations to China; Hong Kong's industrial base declined nearly 10 percent annually between 1988 and 1991.

Hong Kong now lacks technical competitiveness with mainland China as well as with other NIEs, including South Korea, Taiwan, and Singapore. Mainland China's successful attraction of leading-edge electronics firms has usurped Hong Kong's role in technology transfer. Today Hong Kong struggles to find a new competitive strategy that fits its high labor costs. Hong Kong continues to provide China with logistics support and capital, but these roles will be diminished as China builds its own capital markets, deregulates markets, and builds its infrastructure. However, in 2000 Hong Kong's gross domestic product (GDP) increased by 10.5 percent, the highest growth rate in thirteen years.

Taiwan's Search for Lower-Cost Labor Taiwan also found its competitiveness dwindling in labor-intensive businesses. To address the problems of increasing wage rates, the Taiwanese government allowed firms to import foreign workers for up to two years. Twenty-five percent of Taiwan's manufacturing workforce was foreign by 1996; the majority were well-educated and hard-working Filipinos.

Taiwanese firms also sent labor-intensive operations to countries like the Philippines, Vietnam, and China. (See Table 2.) Companies producing products such as power supplies, keyboards, and computer mice had been moved offshore by the late 1990s. Trade, investment, and travel restrictions between Taiwan and mainland China were rapidly lifted as Taiwan became the largest investor in China.

Singapore's Off-Shore Industrial Parks Singapore became a corporate headquarters center, with the

strategy of helping firms stay competitive by means of labor-intensive operations. Both domestic and foreign companies were encouraged to minimize overall costs by maintaining management and research functions in Singapore while shifting production and marketing operations to less-developed economies. Singapore created the first economic-development triangle in Southeast Asia in 1989. The Indonesian province of Riau and the Malaysian state of Johor supplied low-cost land and labor, while Singapore provided technology and capital. Singapore has built high-tech industrial parks in China, Vietnam, and India. The China-Singapore Suzhou Industrial Park (CS-SIP), initiated in 1995, provided revenue of 1.63 billion yuan (\$196 million) to China in 2000, with an import and export value of \$3.4 billion.

Singapore's Vietnam Industrial Park was launched near Ho Chi Minh City in 1996. The International Tech Park in Bangalore, India, was officially opened in January 2000, with 150 infotech companies and 5,000 computer specialists. By 1999 India's software industry had reached revenues of \$3.9 billion and was projected to reach \$50 billion by 2008. In 1999 India had more than 160,000 programmers.

China's Mastery of Industrial Parks China has five special economic zones (SEZs), which are in Shenzhen, Zhuhai, Xiamen, Shantou, and Hainan. Across the border from Hong Kong, Shenzhen has 1,500 factories producing computer components. Thirty-six of the world's top-500 companies and 150 large multinationals have set up high-tech businesses in the city. Shenzhen bested larger Chinese cities in revenue from the high-tech sector, turning out high-tech products worth nearly \$10 billion.

The "Torch Program," established in 1988, promotes commercialization, industrialization, and the internationalization of China's high-tech achievements. By 1995 the central government had approved fifty-two high-technology development zones, which integrate research institutions like universities with start-up incubator facilities and firms that are committed to using the technologies. Six high-tech devel-

TABLE 2

Countries with low labor costs					
	China	India	Indonesia	Philippines	Vietnam
Population	1,236,914,658	984,003,683	212,941,810	77,725,862	76,236,259
GDP per capita	\$3,460.00	\$1,600.00	\$4,600.00	\$3,200.00	\$1,700.00

SOURCE: AsiaSource (2001).

opment zones have been established in the cities of Shanghai, Najing, Wuxi, Changzhou, Suzhou, and Hanzhou.

The Beijing Zhongguancun Science and Technology Park was the first science and technology industrial park in China, approved by the State Council in May 1988. In June 1999 the central government approved a ten-year construction plan for this park, now called China's "Silicon Valley" because it houses more than 4,000 high-tech enterprises. It is near Tsinghua University and Beijing University—the two leading seats of learning in China—and the Chinese Academy of Sciences.

The Chang (Yangtze) River Delta is one of China's economic powerhouses. One of the high-tech development zones in the area is Shanghai's Caohejing High-Tech Development Zone. It is six square kilometers in size, with 500 companies, of which 150 are funded from overseas. Major multinationals, including AT&T, General Electric Company, 3M, ICI, Philips, Toshiba, and DuPont, have subsidiaries there. High-tech firms in the zone are in microelectronics, bio-engineering, new materials, automation, aviation, and space technology.

The Shanghai Pudong Jinqiao Export Processing Zone is nineteen square kilometers in size and is located in the middle of the Pudong New Area. Pudong attracted \$6.13 billion of overseas investment for 661 projects in 2000 alone and accounted for \$20 billion in foreign trade. In microelectronics Pudong projects added ten production lines of integrated circuit chips and more than one hundred ventures for chip design, production, testing, and assembling.

The government plans to create about twenty industrial zones in inland regions during the next five-year plan, with more than 60 percent of resources earmarked for investment in western China to ease the tensions arising from economic disparity. The plan is to shift more capital-intensive industries into coastal areas as labor-intensive industries move inland.

Upgrading Electronics Technologies

Asian NIEs are upgrading their technologies. Strategies include developing government research institutes, targeting growth industries, and building technologies and components needed for next-generation products.

Building Research Centers Government-supported research institutes (GRIs) "prime the pump" for technology development. They focus on basic problems relating to technology development and transfer. Through the 1970s Korean GRIs carried out high-risk research in low-profit areas and in areas where universities lacked research capabilities. Private research focused on the imitation of foreign products and the licensing of foreign technology. Between 1982 and 1989 the number of private Korean industrial research institutes increased from 46 to 749 through the government's cooperative research and development (R & D) programs. By 1992 the number was 1,435 as a result of government support and tax incentives.

Singapore established the National Science and Technology Board (NSTB) in 1991 to promote R & D. NSTB initiated five programs for (1) partnering with industry; (2) recruiting and training of R & D personnel; (3) establishing and maintaining national research institutes and centers; (4) providing R & D infrastructure; and (5) building international alliances and cooperative agreements. Its GRIs encourage development in microelectronics, wireless communication, data storage, manufacturing technology, information technology and multimedia technology, neural networks, and artificial intelligence.

Taiwan has similar institutes. In electronics the Industrial Technology Research Institute (ITRI) has been the dominant player, with more than 6,000 engineers.

Building the Microelectronics Infrastructure The government of Taiwan has targeted electronics as a growth industry requiring component and product developments. Integrated circuits (IC) fabrication, IC

TABLE 3

Taiwan IC industry growth			
(in millions of dollars)			
	2000	1999	00/99 Growth rate
Industry revenue	16,480	12,512	31.7%
Design	2,660	1,973	34.8%
Fabrication	10,609	1,973	33.3%
Foundry	6,322	4,525	39.7%
Packaging	2,474	1,995	24.0%
Domestic-owned packaging	2,103	1,707	23.2%

Product revenue	6,947	5,407	28.5%

SOURCE: Industrial Technology Information Services (2001)

module packaging, printed wire board assembly, liquid crystal (LC) module assembly, and final systems assembly were considered the critical capabilities. Each component and technology was systematically targeted for development. By 2000 the electronic-components industry reached revenues of more than \$16 billion. (See Table 3.) IC fabrication approached \$11 billion in revenues, and IC packaging was projected at nearly \$2.5 billion.

Taiwan's share of global IC capacity grew from 11.9 percent in 1999 to 13.4 percent in 2000. The first IC fabrication facility was established in 1979, and Taiwan had forty such facilities by 2001. The four leading firms had twenty-five facilities with eight-inch wafer production and had announced plans to build advanced twelve-inch fabs. In IC fabrication, wafers are the silicon disks that are used for water fabs. The

largest firm, Taiwan Semiconductor Manufacturing Corporation (TSMC), had revenues of \$5.3 billion, with net income of more than \$2 billion in 2000.

Building Essential Components and Products Taiwan continues to be a one-stop shop for electronic products and components and has led the world in information-technology production in fourteen product categories. (See Table 4.) Taiwan held 49 percent of the world market share in notebook computers, surpassing Japan's 40-percent share in 1999, with \$10.2 billion in sales, a trend that continues today. Other figures are equally impressive, with Taiwan holding more than 50 percent of the market share in computer monitors, motherboards, keyboards, scanners, video cards, and power supplies. Taiwanese firms have become original design manufacturers that sell "ready-to-go" products to original equipment manufacturers. With growing strength in product design and new product development, Taiwanese companies have continued to strengthen their global market position.

China's IC Industry According to the Ministry of Information Industry, the output value of China's electronics industry was expected to reach \$110 billion in 2000. China's electronic equipment production is expected to continue growing at a compounded annual rate of 16.8 percent to 2003, when it will reach about \$100 billion. China's \$7 billion semiconductor market has been growing annually at an average of 37 percent since 1992. Table 5 shows the breakdown between demand for metal oxide semiconductor (MOS) memory and logic ICs and analog devices. With only 10 percent of those chips made locally, the government had recruited foreign investment to establish IC facilities

TABLE 4

1999 Sales of Taiwan's major information-technology (IT) hardware products					
(Value in millions of dollars; volume in thousands of units or thousand of cards)					
Ranking	Product	Value	Value growth	Volume	Volume growth

to supply the local market. China produces less than 1 percent of the world's ICs, and the Chinese government added favorable policies to support the development of the microelectronics industry. Such overseas giants as Motorola, NEC, Philips, Siemens, and Toshiba are transferring technology, building wafer fabs, and forming joint ventures with Chinese partners. The Shanghai Grace Semiconductor Manufacturing Company plans a \$1.63 billion facility in Zhangjiang High-Tech Park, Pudong New Area, in Shanghai.

China's leading-edge semiconductor facility was NEC Corporation's \$1.2 billion fab, a joint venture with the Shanghai Hua Hong Group known as the government's "Project 909." Hua Hong invested \$250 million, a sum matched by Shanghai's local government. NEC put up \$200 million, and a Japanese bank and some Chinese banks will lend the remaining \$500 million. Although NEC is a minority equity partner, it keeps management control of the fab. NEC has been running a small Beijing foundry that has had modest success in the low-end market, producing 8,000 six-inch wafers per month at the 0.5-micron level.

Building Globally Competitive Brands

To sustain developing world-class technologies and products, firms must invest heavily in R & D. To support the high cost of R & D, a firm must expand sales beyond its home market, building global market recognition and brand names. Successful global competitors create a national dilemma in which global competitiveness requirements supersede national priorities. This becomes especially difficult in countries where industrial development policies are closely tied to company success.

Of the leaders outside Japan, Korean conglomerates (called *chaebol*) like Samsung, LG Goldstar, and Daewoo have built global brand names. By 2000 Tai-

wanese electronics firms had surpassed some of the leading Korean firms. (See Table 6.)

Promoting Local Enterprises Singapore's Economic Development Board has supported local enterprises with strong core capabilities, clear vision, and high growth potential—enterprises that could become multinational companies with strong brand names. Success stories include Aztech Technology, which has had the leading share of the world's sound card market. Chartered Semiconductor Manufacturing (SCM) and IPC Corporation have established international market niches in ICs. SCM, Singapore's largest government-backed semiconductor foundry, has produced application-specific integrated circuits.

China's State-Owned Enterprises With deregulation and opening markets, China's state-owned enterprises (SOEs) must become profitable and competitive. China has 305,000 state enterprises, 118,000 of which are industrial. World Bank statistics report that 50 percent of SOEs lost money in 1996 and that debt ratios reached 80 to 90 percent of assets. More than half of the SOEs were operating in the red in 1999. The government encouraged restructuring of SOE debts into equity holdings of banks and government. In 1996 three hundred Chinese firms were targeted to go global, becoming joint-stock companies with improved technological capabilities. The most likely candidates are firms that hold strong national brands. Some Chinese brands have moved into the international market on the back of competitive pricing, while Haier, one of China's leading home-appliance producers, has competed on product quality and efficient distribution and after-sales service. SOEs have improved management practices, acquired advanced technologies, entered joint ventures and strategic alliances, and commercialized research. To upgrade and modernize state-owned enterprises, China has reduced barriers to foreign venture with them.

39	79	Acer	Taiwan
42		Quanta Computer	Taiwan
50		Chartered Semiconductor	Singapore

SOURCE: Financial Times (2000)

In 1999 Telecom equipment maker Shenzhen Huawei Technology had \$1 billion in revenue. The television firm Konka Electronics exported its own brand-name televisions into the U.S. market. China's leading personal computer (PC) vendors, Legend and Founder, dominated the domestic PC business. Legend has been China's leading domestic information-technology vendor, with production of 1.3 million units in 1999, a share of more than 20 percent. To become one of the world's top-ten PC makers in 2000, Legend increased capacity to 3 million units in 2000. In 1999 Legend surpassed Changhong, China's dominant television supplier, to rank as China's largest electronics firm in that year. Legend's goal was to reach \$10 billion in sales (five times its 1998 sales level) by 2004, the twentieth anniversary of its founding.

Future Considerations

Asian countries continue to aggressively build a strong competitive base in electronics. China is now the country to beat because it provides the largest potential market in Asia and captures nearly 80 percent of foreign direct investment. It provides an attractive low-cost labor force supported by special incentives and infrastructures such as high-technology industrial parks. At the same time, China is building nationally successful corporations that are beginning to move into the global marketplace. This evolution has been supported by heavy foreign direct investments by leading global players. Taiwan, with its leadership in information technologies, is the top investor in China and will probably be the primary long-term funnel of advanced technologies. Hong Kong continues to struggle to find a competitive strategy, but still provides capital and logistics support to mainland China. As the remainder of Asia continues to recover from the Asian financial crisis, countries must also compete for investment with China—a battle that they have been losing.

HIKAYAT AMIR HAMZA The *Hikayat Amir Hamza* is a legendary prose story in the Malay language, based upon a Persian romance, which has Hamza, the paternal uncle of the Prophet Muhammad, as its main protagonist. The historical Hamza presented a highly suitable Muslim hero for tales of chivalry and courage. As the quest for fame, respect, and honor was a major preoccupation in Malay literature, the battlefield takes pride of place in this story. Its translation from Persian into Malay may well have taken place not much later than the fourteenth century because the story, in both its Persian and Malay forms, mentions firearms, which first became known in the Muslim world in the 1380s. The *Hikayat Amir Hamza* was certainly written before 1511 because it is mentioned in the so-called *Sejarah Melayu* (Malay Annals). The Malay version was adapted in Buginese, Macassarese, Balinese, and Javanese, whereas the Sundanese version seems to be based on the Javanese one. The Javanese work is generally known as the *Menak*, after a noble title given to the hero Amir Hamza. The adventures of Amir Hamza also form part of the repertoire of the Javanese and Sundanese rod-puppet theater (*wayang golek*).

HIKMET, NAZIM (1902–1963), Turkish poet, playwright, and novelist. Nazim Hikmet is considered Turkey's foremost modern poet. A socialist whose humanistic views transcended national borders, he gained international acclaim for his writings. Nazim Hikmet was born in Thessaloniki, in today's Greece, then part of the Ottoman empire, into an upper-class family of bureaucrats. During the Turkish war of independence, he left the Turkish naval academy and worked in Anatolia as a teacher. He joined the Turkish Communist Party, which was founded in Ankara in 1920. The appeal of the Russian Revolution and its promise of social justice led him to Moscow, where he studied economics and political science. After returning to Turkey in 1926, he was soon arrested for his leftist activities. He escaped to Russia, where he stayed for two years; he returned to Turkey following the general amnesty of 1928. For the next ten years he was in and out of prison on a variety of political charges.

In 1938, Nazim Hikmet was arrested for inciting the Turkish armed forces to revolt through his writings and was sentenced to twenty-eight years in prison. While in prison, he published numerous novels and plays, as well as poems that revolutionized Turkish poetry, including his epic masterpiece, "Memleketimden İnsan Manzaraları" (Human Landscapes from My Country.) In 1949, an international committee formed in Paris to agitate for his release; it included Pablo Picasso and Jean-Paul Sartre. His name was finally included on the political amnesty list of the Democratic Party in 1950. Following his release, however, at the age of forty-nine, he was drafted for military service in Korea. Fearing for his life, he fled from Turkey for the second time. He spent the rest of his life as a political refugee in Poland, Bulgaria, and the Soviet Union. Stripped of his Turkish citizenship in 1959, he chose to become a citizen of Poland. He died of a heart attack in Moscow at the age of sixty-one.

Although Nazim Hikmet's works have been translated into more than fifty languages, none were published in Turkey between 1938 and 1965. The ban on his books was lifted only after his death. Since the late 1960s his poems, novels, and plays, as well as a vast number of biographical works about him, have been published in Turkey.

The main themes of his works were universalism, social justice, and compassion. He expressed a passionate love for his native country in his poetry. Although he used his writings in the service of his political beliefs, his brilliant use of Turkish lyrics in almost-musical compositions saved his verse from becoming a propaganda tool.

HILL TRIBES OF INDIA The term "hill tribe" was long and inexactly applied to the indigenous inhabitants of upland and mountain areas in South Asia. The hill tribes are and were culturally distinct groups, usually endogamous social units, bearing a tribal name and having a distinct material culture, including, very often, characteristic styles of housing and dress. Often the isolated hill tribes speak their own languages.

The term "hill tribe" is little used today by anthropologists, yet it is not disappearing altogether, because the concept is enshrined in some national legislation. In India the two broad social categories of disadvantaged people, known since independence as the Scheduled Tribes and the Scheduled Castes, have incorporated nearly all of those groups formerly known as hill tribes.

Hill tribes are characterized by great diversity of culture. While early census officials often designated them as "Animists," many in fact follow a variety of "universal" religions, including Islam, Hinduism, Buddhism, and Christianity. Most practice some form of agriculture, but there are groups like the Todas who are pastoralists, others like the Kotas who are craftsmen, and some groups who are itinerant peddlers, magicians, or entertainers.

HIMACHAL PRADESH (2001 est. pop. 6.1 million). Crowned by the "snowy mountains" from which comes its name, Himachal Pradesh is a state in northwestern India originally constituted in 1948, after independence, as an administrative unit of thirty hill states. It grew to include the former states of Bilaspur, Kulu, Simla, Lahaul-Spiti, and Kangra before achieving full statehood in 1971. A region of scenic splendor, with an area of 55,673 square kilometers, it is surrounded by Jammu and Kashmir, Uttar Pradesh, Haryana, Punjab, and Tibet, enveloped by the Pir

Panjral and Dhauladhar ranges in the northwest, and dominated by the great Himalayas in the north and east. Five snow-fed rivers provide an estimated 20 percent of India's total hydroelectric potential.

The earliest inhabitants were tribal Dasas who came from the Gangetic plains in 3000 to 2000 BCE. Aryan speakers arrived around 2000 BCE; tribal republics called *janapadas* (territory of the clan) emerged. The Guptas held parts of the region during the second to fifth centuries CE; then came other rulers, including, as early as 550 CE, the Hindu Rajputs. Muslim rulers appeared at the close of the tenth century. By the eighteenth century under Maharaja Ranjit Singh, the Sikhs had gained considerable strength in the west, while the Gurkhas consolidated power in the south. The Gurkhas were succeeded by the British, who made Himachal's capital Simla the summer seat of the viceroy and thus the government headquarters.

Among other distinctions, Himachal proved ideal for growing apples, and modern apple-growers figure importantly in area politics. Each of the state's districts has its own architecture, from rock-cut shrines and *shikharas* temples (a Hindu temple with a spire or tower) to colonial mansions and Buddhist monasteries. Culturally heterogeneous, with 90 percent of the population living outside the main towns, Himachal's districts maintain distinct customs, agricultural methods, and dress. Each village has its own patron saint or god. Hinduism dominates, but there are many Sikhs, Muslims, and Christians, and Lahaul-Spiti, and

Kinnaur has been home to Tibetan Buddhists since the tenth century. The approximately two hundred temples are dedicated mainly to Siva, Durga, and Buddha. The capital Simla, India's largest and most famous hill station, is a favorite destination for Indian families and honeymooners with its cool air, crisp light, and superb panoramas.

HIMALAYA RANGE The Himalaya Range is the world's highest mountain range, with the fourteen highest mountain peaks in the world; it spans over 2,400 kilometers. It is also one of the world's longest ranges. It runs from the Pamir Mountains in the west to the Indian state of Arunachal Pradesh in the east, in a series of mountain ridges that help designate the border and form a buffer between India and Nepal and also between Nepal and Tibet. The entire mountain system forms the southern boundary of the Tibetan Plateau and divides North and Central Asia from the South Asian subcontinent.

Among the best-known Himalayan peaks are Everest (Qomolangma Feng), the world's highest mountain (8,848 meters), on the border between Nepal and Tibet; and K2 (Qogir Feng), the second highest (8,611

A portion of the Himalaya Range as seen from Nepal. (DAVID SAMUEL ROBBINS/CORBIS)

meters), on the border between Tibet and Kashmir. The third-highest mountain in the world is Kangchenjunga at 8,598 meters, on the border between Nepal and India; seventh-highest is Annapurna (8,091 meters) in Nepal. Not until the 1950s were these peaks successfully scaled.

The Himalayas are actually a series of parallel ranges running roughly northwest to southeast, the most important being the Great Himalayas, the

NANDA DEVI—WORLD HERITAGE SITE

Nanda Devi National Park's rugged terrain, high altitude and remote location have kept this national park in northern India relatively intact. Designated a UNESCO World Heritage Site in 1988, Nanda Devi is home to several endangered species, including the snow leopard and Himalayan musk deer.

THE FOUR SEASONS AND LIFE IN THE HIMALAYAS

"The Sherpa are one of the peoples of the Himalayas and perhaps the best known in the Western world because of their role as guides on mountaineering expeditions. Their life is governed by the four seasons which are symbolized by colors and marked by festivals.

"Four images of divinity corresponding to the four seasons of the years are generally found in the *gompas*. They have a special importance in the life of a Sherpa. *Ygri-gyemo* is the summer queen of azure colour; *gungi-gyemo* is the yellow winter queen; *tongy-gyemo* is the green coloured queen of autumn; and *chigi-gyemo* the red queen of spring.

"During the four seasons the Sherpa community is called upon to attend and participate in certain ceremonies to be performed at fixed times. The village or the temple is the place where such festivals and ceremonies take place. They take on special importance when the Lama clergy along with a number of representatives participate. They are of great value even from a choreographic point of view. Some festivals last only for a day, others six days. On such occasions the work in the villages comes to a halt and everybody goes to the festival. A responsible person of the village called Lawa is entrusted with the charge of organising such festivals. He collects funds, fixes duties and turns for assistants, regulates various phases of the festival and arranges for the distribution of good among spectators."

Source: Mario Fantin. (1974) *Sherpa Himalaya Nepal*. New Delhi: S. D. Chowdri for the English Book Store, 68.

Karakoram, the Zaskar, and the Ladakh Ranges. These were thrust upward by the abutment of the Indo-Australian tectonic plate against the Eurasian plate. All of these ranges are over 3,000 meters above sea level, and the highest series, the Great Himalayas, exceed 6,100 meters, with most of the highest mountains being in Nepal and the small Indian state of Sikkim. The Middle Himalayas range between 1,800 and 2,000 meters; to the south of them the low-lying Sub-Himalayas border India and Nepal.

The climatic variation is enormous, ranging from below freezing temperatures in the north to a subtropical climate in the south. The range protects the Indian subcontinent from the cold weather of Central Asia and affects seasonal rainfall markedly.

The ancient name of the range was Himavat (Sanskrit for "abode of snow"; in Pali, Hemavata), and there are numerous descriptive references to it in the *Mahabharata*, an ancient Indian epic. The people who have lived in the Himalayas did not scale mountain peaks, which were considered sacred places where gods resided; but they did use the high slopes for grazing yaks, goats, and other cattle. This changed in the late twentieth century, when foreign visitors began to overrun the region, to climb the mountains or to visit Buddhist and Hindu sacred sites. Most famous are the expeditions to Everest, named for Sir George Everest, a surveyor-general of India (1830–1843). From the mid-twentieth century the Himalayas became a major tourist attraction, and nowadays as many as a million people may visit them yearly. So popular has mountain climbing become that wealthy amateurs join expeditions that attempt to reach the summit of Mount Everest; even a blind man succeeded in 2001. The difficult route to the top and the harsh weather conditions sometimes result in injuries or death, even to the experienced climbers who lead these expeditions.

HINA MATSURI Hina Matsuri (Doll Festival or Girls' Festival) is a Japanese celebration of girlhood held on the third of March. Girls display special dolls, hold parties for friends and relatives, and receive good wishes for health and happiness.

Baby girls are traditionally presented with a set of ceremonial *hina* dolls with which to celebrate the festival. A full set consists of fifteen dolls: the emperor and empress, three ladies-in-waiting, three guards, two ministers, and five musicians, all dressed in the elaborate court costumes of the Heian Period (794–1185). They are displayed on a tiered stand covered with bright red cloth, accompanied by miniature furniture and household goods. The imperial couple sits on the highest tier, before a golden folding screen with

lanterns to either side. Decorations of peach blossom symbolize traditional ideal female qualities of contentment and gentleness.

Girls and their guests drink *shirozake*, a mild, sweet rice wine, and eat colorful diamond-shaped rice cakes (*bishi-mochi*) and other delicacies. Following the celebrations the dolls are carefully packed away, for it is considered unlucky to display them year-round. Hina Matsuri originated in ancient purification rituals in which dolls acted as charms against evil spirits. Today *hina* dolls are greatly treasured and often passed down from mother to daughter.

HINDI-URDU Hindi and Urdu belong to the Indic branch of the Indo-European language family. Thus they are closely related to other Indic languages spoken in India, Pakistan, Bangladesh, Nepal, and Sri Lanka (for example, Panjabi, Sindhi, Marathi, Gujarati, Bengali, Nepali, and Sinhala) and more distantly related to other Indo-European languages such as English or Russian. Both modern Hindi and Urdu developed from New Indo-Aryan vernaculars spoken in north India around the eleventh to fourteenth centuries CE. With the influx of Turkic- and Persian-speaking peoples in the Muslim courts and armies, first under the Delhi sultanate (1192–1526) and later under the Mughals, Persian and Turkic words began to enter the language. Urdu began to differentiate from the common spoken language of the area as the *Zabaan-e-Urdu-e-Mu'alla* (language of the royal camp), which developed in Delhi after the Mughal court shifted there from Agra in 1648. Modern Urdu was first referred to as "Urdu" by the poet Mashafi (1750–1824) toward the end of the eighteenth century. Since then, Urdu and Hindi have increasingly differentiated over time because of both natural linguistic change and conscious attempts to shape the languages, in particular by the use of quite different scripts. As the Mughal empire declined, an effort was made to exclude Sanskrit words from Urdu and to increasingly Persianize the language. Later, in the nineteenth century, as Hindi and Urdu came increasingly to be associated with religion, attempts were made to Sanskritize Hindi. Similar lan-

CREATING A NATIONAL LANGUAGE

In an effort to create national unity in the face of much cultural, religious, and linguistic diversity, the advocates of Indian independence recommended that Hindi be made the common language and that it be taught in all schools.

The object of including *Hindustani* as a compulsory subject in the school curriculum is to ensure that all the children educated in these national schools may have a reasonable acquaintance with a common *lingua franca*. As adult citizens they should be able to cooperate with their fellow countrymen belonging to any part of the country. In teaching the language the teacher should in various ways quicken in the students the realization that this language is the most important product of the cultural contact of Hindus and Muslims in India. It is the repository—in its more advanced forms—of their best thoughts and aspirations. They should learn to take pride in its richness and vitality and should feel the desire to serve it devotedly.

In *Hindustani*-speaking areas this language will be the mother-tongue, but the students as well as the teachers will be required to learn both the scripts, so that they may read books written in Urdu as well as in Hindi. In non-*Hindustani*-speaking areas, where the provincial language will be the mother-tongue, the study of *Hindustani* will be compulsory during the 5th and 6th years of school life, but the children will have the choice of learning either one or the other script. However, in the case of teachers who have to deal with children of both kinds, knowledge of both the scripts is desirable.

guage planning efforts continue in the twenty-first century, resulting in the present situation.

The Language Continuum

Hindi and Urdu can be considered as two ends of a language continuum in which the grammar is almost entirely shared, but differences in vocabulary and to a lesser degree in phonology develop in the more formal and literary registers of the languages. The Hindi end of the continuum incorporates many words newly added from Sanskrit, the Indic ancestor language of Hindi, whereas the Urdu end includes many Arabic and Persian words. The middle range of the continuum represents the common spoken language of North India and Pakistan, which is understood by speakers of any variety of these languages. In contrast, the language varieties at each end of the continuum

are, to a significant extent, not mutually intelligible. This situation can be schematized as follows:

Urdu	"Hindustani"	(High) Hindi
Many exclusively Urdu words of Perso-Arabic origin	Common vocabulary	Many exclusively Hindi words; Sanskrit words

Phonology

Except where noted, the following description applies to both Hindi and Urdu. The consonant system includes the following contrastive oppositions: (1) voiced versus voiceless (pronounced with as opposed to without vibration of the vocal cords, as in the contrast between English /b/ and /p/); (2) aspirated (including an audible puff of breath immediately after the

consonant sound) versus unaspirated (with minimal breath). This difference is like the difference in the /p/ sound in English "pin" (aspirated) and "spin" (unaspirated); (3) dental versus retroflex (position of the tongue touching the front teeth, or at a point farther back in the mouth). Hindi has these consonant phonemes: /k/, /kh/, /g/, /gh/, /c/, /ch/, /j/, /jh/, /T/, /Th/, /D/, /Dh/, /t/, /th/, /d/, /dh/, /p/, /ph/, /b/, /bh/, /m/, /n/, /y/, /r/, /R/, /Rh/, /l/, /w/, /s/, /ś/, /h/. (Capital letters represent retroflexes.) Urdu has the additional consonants /q/, /γ/, /x/, /z/, and /f/. The vowel phonemes are /a/, /ā/, /i/, /ī/, /u/, /ū/, /o/, /e/, plus the diphthongs /ai/ and /au/. The vowels have nasalized counterparts.

Hindi is written in the Devanagari script (derived from Brahmi), whereas Urdu script (Nastaliq) derives from Arabic, with modifications introduced to represent Persian and then Urdu sounds not present in Arabic.

Morphology

The noun system distinguishes the grammatical categories of number (singular and plural) and gender (masculine and feminine). Some nouns bear a characteristic mark of grammatical gender, that is, *ā* for masculine nouns like *laRkā* (boy) and *ī* for feminines like *laRkī* (girl), whereas others are not so marked, like *mez* (table, feminine) and *dūdh* (milk, masculine). Similarly, some adjectives bear markers for gender that are the same as those for nouns, for example, *acchī laRkī* (good girl), *acchā laRkā* (good boy), and some do not, for example, *lāl mez* (red table).

Basic verb forms are constructed on the verb stem, the imperfective participle, with characteristic ending *-t-@*; or the perfective participle with characteristic ending *-(y)@*, where @ represents gender/number adjectival marking. Hindi is a "split-ergative" language, in which perfective tenses of transitive verbs agree with an unmarked direct object (rather than with the subject). The normal word order in a sentence is subject, object, verb.

Hindi Speakers

Hindi is the official language of the Union of India and of the following states: Bihar, Haryana, Himachal Pradesh, Madhya Pradesh, Rajasthan, Uttar Pradesh, Andaman and Nicobar Islands, Delhi, and Chandigarh. Because it is spoken over such a vast region, there is much dialectal variation within Hindi. Important varieties include Braj, Bhojpuri, Khari Boli, Awadhi, Bangaru, and Bundeli. It is difficult to give a precise number of Hindi speakers because of differences in the way languages are grouped in census reports and the language that people choose to report as their "mother tongue." But it appears clear that

Hindi is spoken by over 180 million as a first language in India and another 2 million worldwide. Including second-language speakers, the total number of users is over 346 million in India and 418 million worldwide. Large numbers of Hindi speakers live in Bangladesh, the United States, Mauritius, South Africa, Yemen, Uganda, Singapore, Nepal, New Zealand, Germany, Kenya, Canada, the United Arab Emirates, and the United Kingdom.

Urdu Speakers

Urdu is the national language of Pakistan, where it is spoken as the first language by about 8 percent of the population (approximately 11 million speakers) and understood as a second language and used as a lingua franca by an increasing majority in all parts of the nation, whose total population is approximately 142.4 million. It is the main language of education and the information media. In India, where there are over 45 million Urdu speakers, it is one of the eighteen designated national languages and is the official language of Indian-held Jammu and Kashmir. A distinctive Dakhini variety of Urdu, which developed from the common language of Delhi carried to the Deccan in the fourteenth century, is spoken around Hyderabad, India. Significant numbers of Urdu speakers live in the United States, the United Kingdom, Canada, the Middle East, Norway, and Germany. The worldwide total of first-language Urdu speakers alone is over 58 million. Taken together, Hindi and Urdu rank fourth in the number of speakers worldwide, after Chinese, Spanish, and English.

HINDU KUSH The Hindu Kush, a rugged mountain range in Central and West Asia, lies mostly in eastern Afghanistan. The range extends for a total distance of about 965 kilometers, from the plateau of the Pamirs on the east in eastern Tajikistan, along the borders of Jammu and Kashmir, and Pakistan, and west and southwest into Afghanistan as far as the Koh-i-Baba range west of Kabul. It forms a watershed between the Amu Dar'ya River tributaries on the north

and the Kabul River on the south. The range is an extension of the Himalayan system, with its main expanse toward the southwest. Several peaks of the Hindu Kush exceed 7,000 meters, and one, Tirich Mir, rises to 7,690 meters.

The range is crossed by several important passes that were ancient trade routes, with the Baroghil Pass, at a height of 3,797 meters above sea level, being the most significant. The Amu Dar'ya, Helmand, Kabul, and Konar Rivers rise in the Hindu Kush.

The local warrior tribes inhabiting the region are collectively called Pathans (in Pakistan) or Pashtuns (in Afghanistan). The modern Salang Tunnel allows the Afghan capital, Kabul, to be linked to the north-eastern part of the country and to Tajikistan through this mountain range. At the end of 2001, these mountains saw fierce fighting, including heavy bombing, when U.S., British, Afghan, and other forces were jointly breaking the power of the Taliban and al-Qaeda leadership.

HINDU LAW Hindu law has several denotations: (1) the whole body of ancient Indian law; (2) under British rule, only those aspects of Hindu civil law not covered by general laws; (3) Hindu law in independent India. In this last sense, it encompasses a series of laws that have radically reformed family law.

Ancient Hindu Law

The all-encompassing term for ancient Hindu law is dharma, which can refer to either a code of conduct or the cosmic law of the universe. The ancient *dharmaśāstras*, the Hindu law books, prescribe rules of conduct and penalties for misconduct; they also regulate all kinds of rituals, including expiations. The most comprehensive early book of this genre is the *Manusmṛiti*, which originated between the second century BCE and the second century CE. It was probably preceded by the *Arthashastra*, a treatise on politics and economics, attributed to the Hindu statesman and philosopher Kautilya (flourished 300 BCE). The *Arthashastra* contains a chapter on judges in which Kautilya distinguishes four sources of law: dharma, the tra-

ditional law; *vyavahara*, transactions, procedures, and court practice; *caritra*, local customary law; and *rajāsana*, the king's edict. According to Kautilya, the order of these sources indicates a ranking, in which the king's edict occupies the highest position.

An Indian king was himself subject to dharma and was obliged to uphold it, but in litigation he was the final court of appeal, and his interpretation of dharma prevailed. The Brahmans who established the norms tried to provide the king with appropriate advice—which might also limit his discretionary powers. In establishing these norms, the Brahmans took care to define the institution of caste and to enshrine their own privileges in Hindu law.

The *Manusmṛiti* reflects this tendency. It is the subject of numerous commentaries, and with each one arguments were further refined and recommendations for verdicts in special cases increased. This tradition of jurisprudence culminated around 1100 CE with the *Mitākshara* of Vijnanesvara and the *Dayabhaga* of Jimutavahana. (The former originated in western India and the latter in Bengal.) The authors agreed on most legal issues, but fundamentally differed on the law of inheritance. According to the *Mitākshara*, a son is a coparcener (joint heir) in his father's estate from birth; according to the *Dayabhaga*, he is not—a son can inherit and divide his father's property only after his father's death. This difference is essential. The *Mitākshara* severely restricts the rights of the father concerning disposal of his property: he must respect the rights of his coparceners. This protects the joint Hindu family as a legal institution.

Hindu Law under British Rule

The British gradually imported an enormous body of their own law—English common law—into India. Early on in their colonial rule, they showed great interest in Hindu law. Sir William Jones (1746–1794), the chief justice of the Supreme Court of Calcutta, requested that Jagannatha Tarkapanchanana, his Brahman associate, compile a code of Hindu law, which was then translated into English by Henry Thomas Colebrooke (1765–1837) and published in 1797. Colebrooke was an excellent Sanskritist and had also served as a judge. The code that he translated was the *Digest of Hindu Law*, known as Colebrooke's Digest, which became the most important reference manual for British courts in India when dealing with Hindu personal law.

By this kind of codification, however, the British reduced the flexibility of Hindu law, freezing it once and for all. There was no attempt to reform the law:

the main aim of the British was to do "justice" to their Hindu subjects and not disturb their "prejudices." In the process, Hindu law was more or less reduced to property relations within the family, everything else being a matter for British civil and criminal law.

Hindu Law in the Republic of India

A uniform civil code was initially sought in independent India, but the idea was dropped so as not to disturb Indian Muslims. Instead, the government concentrated on a reformed "Hindu code." Since this was opposed by orthodox Hindus, the first Indian president, Jawaharlal Nehru (1889–1964), opted for piecemeal reform enshrined in the following acts: the Hindu Marriage Act of 1955, the Hindu Succession Act of 1956, and the Hindu Adoption and Maintenance Act of 1956. Nehru regarded this reform as his major political achievement.

Departure from the old patriarchal order and emphasis on the rights of women were the main features of this reformed Hindu law. Earlier, Hindu men could have had several wives, but now only monogamy was recognized. As long as polygamy had been permitted, divorce was unnecessary; now even women were permitted to sue for divorce. Inheritance had earlier been restricted to men only; now women could also inherit, disrupting the old pattern of the joint Hindu family. The asking for and giving of dowry was also prohibited. The orthodox Hindus particularly resented this, and the practice survived in the form of "gifts."

The act regulating adoption was also seen as violating traditional Hindu custom, which had prescribed the adoption of a son by a man without male issue and permitted a widow without a son to do the same. There was, however, no adoption of daughters. The new act changed all this and permitted men and women to adopt both sons and daughters. Critics predicted that these acts would be repealed after the generation of reformers had passed away, but this did not happen. The new Hindu law had come to stay.

HINDU NATIONALISM Since the end of the 1980s, Hindu nationalism has emerged as a major po-

litical force in India. Although it had played only a marginal role in Indian politics for many decades, the Hindu nationalist Bharatiya Janata Party (Indian People's Party, or BJP) succeeded in gaining more and more votes during the various national elections from 1989 on, ultimately forming the central government of India as leader of a multiparty coalition in 1998. For the first time in the history of modern India, Hindu nationalists had come to power at the national level. Parallel to the growing support for the BJP, the Congress Party lost its former ideological and political hegemony and now finds itself in the role of an opposition party. However, the Hindu nationalists' gradual accession to power was also marked by a high level of militancy, at its worst on 6 December 1992, when Hindu fanatics destroyed the Babri Mosque at Ayodhya and subsequent riots left more than one thousand people dead and many others injured.

History

The origins of Hindu nationalism can be traced back to the 1920s and even further to 1875, when the neo-Hindu organization Arya Samaj (Society of Aryans) was founded by Dayanand Saraswati. In 1915 the Hindu Mahasabha (Hindu General Assembly) came into being, followed in 1925 by the elitist Rashtriya Svayamsevak Sangh (National Volunteer Union, or RSS), which is still the organizational and ideological backbone of Hindu nationalism today. The Bharatiya Janata Party, the political party of Hindu nationalism, was created in 1951 under the name of Bharatiya Jan Sangh (Indian People's Union); it was renamed in 1980. Other important Hindu national organizations include the Vishva Hindu Parishad (All-Hindu Council, founded in 1964) and its youth wing, Bajrang Dal (Bajrang's Troop, founded in 1984). Together they form the *sangh parivar* (Sanskrit term for RSS family) and play different roles in a common strategy to create a Hindu India. Most BJP leaders are also members of the RSS.

Ideology

The Hindu national organizations all share a common ideology of cultural nationalism—the ideology of *Hindutva*, Hindu-ness. This ideology was expounded first by V. D. Savarkar (1883–1966) and later in a more radical form by M. S. Golwalkar, both Brahmans from Maharashtra. In his booklet *Hindutva*, published in 1923, Savarkar defined what makes an Indian a Hindu and what joins Indians together in a Hindu nation mainly in terms of opposition to others, that is, Muslims and Christians. According to Savarkar, a Hindu is a person who regards India as his or her *pitrabhu*

(hometown, land of his or her forefathers) as well as *punyabhū* (holy land). With this definition, Muslims and other minorities are seen as foreign to the Indian nation. Their loyalties are divided, and they do not look on India as their holy land.

In this ideology India is the land of the Hindus; the Indian nation is a Hindu nation. To be an Indian means to be a Hindu, and *Hindutva* is the national identity of India. The inner unity of the Hindus is firmly anchored in this Hindu-ness, which rests on a common homeland (*rashtra*), a common ancestry (*jati*), and a common culture (*sanskriti*), which have existed since time immemorial. In its election manifesto of 1998, the BJP openly referred to the three essentials of *Hindutva* when formulating the slogan: "One nation, one people, and one culture." This exclusiveness leads to the Hinduization of the nation and the nationalization of Hinduism.

This idea of the common territorial, genealogical, and cultural basis of the Hindu nation is central to Hindu national ideology and politics. It first evolved in response to the colonial challenge and is rooted in fears of inferiority, weakness, and domination by others. Hindus, the Hindu nationalists say, are in danger of becoming a minority in their own country, Hindustan, Land of the Hindus.

Hindu nationalists see this deplorable situation as arising from a lack of unity among Hindus. The solution is for Hindus to stand together and to defend themselves against the West and the Muslims. They must resurrect the glorious Hindu past with its timeless cultural heritage, to overcome the misery of the present.

The *sangh parivar*, the RSS family, tries to organize people along ethnic-cultural lines. Since the 1980s, well-orchestrated campaigns have been launched to strengthen Hindu unity and to integrate Hindus into a defensible community against the threatening "others." The overarching goal of the *sangh parivar* is to make India a strong and prosperous Hindu nation where all live in harmony and peace as they do in a large Hindu extended family. Therefore Hindu nationalism rejects the idea of a hierarchical caste system and, in particular, untouchability.

The most prominent of these campaigns was aimed at the "liberation of Rama's birthplace." (The god-king Rama, hero of the epic *Ramayana*, is seen as a perfect incarnation of a righteous Hindu ruler ready to defend a posited Hindu nation.) In December 1992, the campaign led to the demolition of the Babri Mosque in Ayodhya, regarded as the epitome of Muslim conquest and intolerance. This mosque, it is al-

leged, had been erected in 1528 by the first Mughal ruler, Babur, on the ruins of a great Rama temple marking the birthplace of the beloved god-king. This attack on a religious monument was justified as an act of Hindu self-assertion against Muslim aggressiveness. Only by the reconstruction of a magnificent new Rama temple on this very site would the "liberation" be consummated.

Support from the Middle Classes

The rise of the BJP to the center stage of Indian politics can be attributed to political, socioeconomic, and cultural factors. The self-induced decline of the Congress Party created a political vacuum that gave the BJP the chance to present itself as a disciplined body of principled, selfless politicians and to successfully position itself as a second major national party in India. The mounting political assertiveness of minority groups such as the Sikhs and the Muslims, together with the growth of separatist movements in the Punjab, the northeastern states, and Kashmir, has also contributed to the success of the BJP. The conversion of untouchables to Islam stirred up fears of a Muslim conspiracy supported by the oil-rich Arab countries. The BJP has always criticized the Congress Party for its "pseudosecularism," which conceded special rights and privileges to the minorities at the expense of the Hindu majority.

However, more important factors are the socioeconomic changes resulting from the ongoing modernization process and leading to new constellations in the social fabric of Indian society. The middle classes in particular have been becoming more assertive. Traditional roles and values are eroding and need to be redefined. The new material success has to be legitimized. The growing economic competition in a liberalizing and globalizing economy makes these people fear other competitors and the possibility of becoming a loser. This new situation must be reflected in a meaningful set of explanations offering a firm anchor in a quickly changing, unpredictable social environment.

In the face of this challenge, Hindu nationalism today can be interpreted as an attempt to redefine modernity by reconciling modernity and tradition. Economic progress and material success are embedded in a traditional interpretation of the glorious Hindu culture that must be resurrected. Economic competition is balanced by the idea of a harmonious society of equals where trust, solidarity, and mutual respect prevail. In theory, all people, including the minorities, would be equals in a true Hindu nation.

The *Hindutva* ideology obviously addresses the anxieties and aspirations of Indians who belong mainly to the upward-moving middle classes. Surveys have shown that the majority of the BJP voters are young, male Hindus of high-caste origin, having a good educational background, living in cities, and enjoying a relatively high standard of living. During the recent elections, however, the BJP has also broken new ground among lower castes.

Future Prospects

In its propagation of a strong Hindu nation founded on a uniform Hindu culture, Hindu nationalism is a political attempt at building a national identity based on a highly questionable and selective interpretation of Indian tradition, with a strong Brahmanical bias. It uses religious symbols and beliefs for political ends. The concept of *Hindutva* as the basis of a Hindu cultural nation contradicts the very nature of the Hindu tradition, with its extreme heterogeneity in almost every respect. Moreover this heterogeneity, on the level of the individual, often goes hand in hand with multiple, overlapping identities that change according to context and go beyond a politicized Hindu-Muslim antagonism.

To be successful, the politics of *Hindutva* would need to homogenize a cultural tradition that has evolved over more than three millennia. Furthermore, the *Hindutva* ideology rests on a foreign concept of cultural or ethnic nationalism imported from the West during colonial times, which makes the "Hindu-ness" of *Hindutva* fictitious. The social reality in present-day India, with its extreme hierarchy and social cleavages, openly contradicts the idea of equality and solidarity among all Hindus.

To broaden its electoral base, the BJP has refrained from a radical pro-Hindu, anti-Muslim policy since 1993, so that it seems more liberal. Since then, intra-party differences have surfaced also because of the issue of a strict *svadeshi* (national economic policy). It is doubtful that the RSS and other hard-liners will support this policy of "soft" Hindu nationalism in the long term. The question remains whether the Hindu nationalists can provide convincing answers to the manifold problems India faces at the beginning of the third millennium.

HINDU PHILOSOPHY Hindu philosophy is a collective title for the vast number of doctrines and beliefs that evolved in the Indian subcontinent (called *Bharatvarsha* or *Bharatakhanda* in Sanskrit texts) from ancient times to the present. In the first millennium BCE, the Persians used the term "Hindu" for the lands around the Indus River; with the Greeks the word became "India." This initially geographic term was first applied to the religious and philosophical doctrines of India by Arab and Turkish historians in the second millennium CE. In the eighteenth century, European scholars restricted the term "Hinduism" to the beliefs and philosophies following the Vedas (the earliest Hindu sacred writings), thus separating Hinduism from the Buddhist, Jain, and Sikh sects, despite the overlapping of these systems with Vedic beliefs.

The Vedic Foundation

The Rig Veda is the oldest text of religious and cosmic vision in India. Scholars date it anywhere from 1500 to 4000 BCE. Along with the other three Vedas, the Sama, Yajur, and Atharva, it is the only record of the beliefs that existed well before the epic age of the *Ramayana* and the *Mahabharata* (beginning of the first millennium BCE). The Vedas indicate that major deities like Indra, Varuna, Mitra, Prajapati, Sarasvati, Usha, Rudra, Savita, Agni, and many others were worshiped with offerings made through sacrificial fire (*yajna*). These gods were not given iconic form but were prayed to and placated only through various *yajnas*. The Greeks and Iranians also shared this mode of worship through fire.

The Vedic religion did not have a single prophetic founder; the Vedas are a collection of inspired verses

THE SPIRITUAL LIFE OF THE ELDERLY

Across much of Asia, the aged were usually venerated and treated with much respect. Depending on the religious tradition, the elderly were also expected to devote much time to spiritual matters, as with Hindus in India. This particular extract pertains to Tamil Indians in South India in the 1950s.

As his sons grow into the age of *grabasta* or married adulthood, an old man is customarily expected to retire gradually from the world, to curb his enjoyment of living, and to turn his thoughts still further towards spiritual life. This is ideally the period of *sannyasa* or meditation and chastity in old age. To undertake it fully, a man should surrender his home and property to his sons and wander forth as a stranger begging food and engaging in meditation. As a less extreme course, he may go with his wife to occupy a small hut outside the village, and lead a life of prayer, simplicity, and chastity. One Brahman of the next village had done this. He conducted daily fire-offering to the Vedic gods, and tried by silent meditation to attain union of his soul with the divine soul which he believed to be immanent in all creation but to be personified as Siva. He received young disciples on weekends and instructed them to memorize Sanskrit prayers, to meditate, to perform yogic exercises, to fast periodically, and to gain control over earthly desires. One old man in Kumbapettai lived quietly apart from his family in a separate small house on the street, returning home only for meals. Four others performed regular meditation, prayers and offerings to Siva in their homes, and claimed to live in chastity.

Source: Elizabeth K. Gough. (1956) "Brahman Kinship in a Tamil Village." *American Anthropologist* 58: 838.

or mantras, revealed to seers called *rishis*. The texts have been preserved by oral transmission, a practice that survives even now. Whether written versions of the Vedic text were used to aid this transmission before the tenth century CE is still unknown.

The Vedas postulate that the gods who grant devotees' desires are themselves governed by the cosmic and just principle of truth called *Rit*, which is also called Brahma because it is the universal reality. Other beliefs are explicitly stated or implied in the Vedic hymns. These include beliefs in the existence of the individual soul after death; in the accumulation of merit and demerit in the soul (the theory of karma); the existence of upper and lower worlds (*lokas*); the return of the soul to this world (rebirth); the existence of a world of ancestors; merit in rituals, and moral conduct; purity as

a power of soul, mind, body, and environment; word or speech as a psychic force; and obligations or debts to gods, ancestors, teachers, and guests.

No archeological evidence of Vedic civilization has yet been unearthed. The earliest excavated remains are those of the Harappan civilization (ending around 2000 BCE). There is a debate over whether the Harappan culture preceded, succeeded, or equaled the Vedic. Harappan beliefs are virtually unknown, although some motifs in Harappan art recur later.

The ritual aspects of the poetic mantras of the four Vedas were elaborated in later texts called the Brahmanas and Aranyakas. The philosophic kernel was elaborated in the Upanishads, which hold that the ultimate reality is Brahma, manifested as this and other worlds. Brahma can be perceived through inner con-

templative knowledge, a practice bringing immortality. Despite intense metaphysical speculation, life was not considered a vale of tears, and subsidiary texts on medicine, archery, grammar, drama, and music (Upanvedas, or subsidiary Vedas) were composed to uphold its fullness. The later texts of the classical period stated that a complete life must have four aims (*purusharthas*): dharma (right action), *artha* (wealth), *kama* (satiation of desire), and *moksa* (enlightenment). The epic and mythic texts called *Itihasa* and Purana connect these values to daily living through the lives of heroes.

Vedic literature also indicates that some faiths neither followed the practice of sacrifice nor revered the pantheon of the Vedic gods. Some sects' members were phallic worshipers; in others, wandering saints preached beliefs scarcely recorded. As they all rejected the authority of Vedic ritual and mantras, they were collectively called *Nastikas* and are supposedly the precursors of the later Jain, Charvaka, Shakta, Tantric, and Buddhist sects.

The Advent of Temple Worship

In the middle centuries of the first millennium BCE, the worship of deities conceived as idols emerged. Major deities, transformations of the earlier Vedic gods, were Brahma the creator (not to be confused with Brahma, the ultimate ground of reality, mentioned earlier), Vishnu the preserver, and Siva the destroyer. The mother goddess of the Harappan age became Shakti, who later developed into different forms such as Uma, Bhavani, or Annapurna the benign, or Kali, Karali, or Chamundi the destroyer. By the third century BCE, temples to Vasudev, Surya the sun god, Kamadeva or Eros, Saraswati, and many other deities proliferated. The elaborate temple rituals, supported by dance and music, which characterize Hinduism to this day, were established as a distinctive feature.

Rules of moral and social conduct were formalized in codes called the *smritis*, of which those of Manu and Yajnavalkya are most prominent. The earlier but looser division of society into four major-castes (*varnas*) was now more rigorously imposed. These four castes—Brahmans (intellectuals), Kshatriyas (rulers), Vaishyas (merchants and farmers), and Sudras (servers)—supplemented by other mixed categories, were primarily an economic order of Hindu society, not part of its crucial religious or philosophic tenets, as is often presumed by non-Indians.

The Six Systems of Philosophy

The story of formal philosophy in India is best told in reference to the *shatdarshanas*, or the six schools.

Buddhists, Vaishnavas, Pashupatas, Jain, Charvak, Tantra, Shaktas, and Saivas all developed distinct systems by using the precepts of the *shatdarshanas*.

Nyaya Founded by Gautama, this system defined knowledge as dependent on *pramatri* (subject), *prameya* (object), *pramiti* (cognition), and *pramana* (means of knowledge). The last depends on five things: *pratyaksha* (intuition), *indriya* (senses), *panchamatra* (five elements), *manasa* (mind), and *gyan* (perception).

Vaisheshik Founded by Kanada, this system relied on the text called Vaisheshikasutra, which Kanada composed. The system dwells on the particularity (*visheshatva*) of things. All objects of experience (*padarthas*) fall into six categories of substance: quality, activity, generality, particularity, inherence, nonexistence. The first three are known intuitively; the last three are known by intellectual discrimination. The system propounds nine *tatvas* (primary substances): *prithvi* (earth), *jal* (water), *agni* (fire), *vayu* (wind), *akash* (ether), *kala* (time), *desh* (space), *atma* (self), and *manas* (mind). The system posits a belief in the particularity of everything, including the self. Things are said to be made of *anu* (atoms), which are incapable of further division.

Samkhya In this system, the categories of the cosmos were reduced to basic forces called *purusha* and *prakriti*. There is a constant evolutionary change based on these two principles, and all experience is based on this duality. *Purusha* is the knowing subject, and *prakriti* is objective existence both physical and psychological. The latter is the source of the world of becoming and consists of three qualities that when unbalanced cause evolution. Yoga brings release from ego and leads to salvation. The system was founded by Kapila (flourished 550 BCE), who composed the Sankhyapravachana Sutra. The other basic text is the Sankhya Karika, by Ishwarakrishna (third century CE).

Yoga Yoga is the practical methodology for realization and salvation founded by Patanjali (second century BCE) and given a commentary by Vyasa (fourth century CE). Vachasapati Mishra wrote the Tatvavisharada in the ninth century CE. Yoga relies on Samkhya for its philosophy but accepts Ishwara or God or Brahma as the ultimate reality. The method of achieving *moksha* (liberation) has eight parts: *yama* (precepts), *niyama* (routine), *asana* (postures), *pranayama* (breath control), *pratyahara* (withdrawal), *dharana* (fixation), *dhyana* (meditation), and *samadhi* (highest consciousness). The great masters of all sects and denominations in India have used Yoga in different ways.

Purva Mimamsa This philosophy investigated the definitions of dharma in the Vedas, which are defined as having no maker (*Apaurusheya*). Mimamsa dwells on the subject of sound and meaning and the ethical code of the Vedic mantras. It accepts the idea of the self and future life. It propounds the idea that all action is done for the sake of fulfilling desires and all *yajnas* for the sake of achieving enjoyment in heaven, or *Svargamukti*. In later stages of Mimamsa, around the seventh century CE, the philosopher Prabhakara described liberation as cessation of dharma and nondharma; Kumarila (flourished 730 CE) called it freedom from pain. The system was founded around the third century BCE by Jaimini, the writer of the Mimamsa Sutra, who believed in the existence of various gods but not one supreme god. Kumarila, who wrote the Shlokavartika, argued for the necessity of the supreme god.

Vedanta Founded by Badarayana around the fifth century BCE, this system focused on the Upanishadic teachings about Brahma as opposed to the value of sacrifice (*Karmakanda*) as propagated by Purva Mimamsa. Its basic text is the Vedanta Sutra, also called the Brahma Sutra or Sharirika Sutra. The system was not popular until the seventh century, when Shankaracharya revived it. He postulated that Brahma (the ultimate) and *Jiva* or *Atma* (individual soul) are not two but one. He repudiated the subjectivism of the Buddhist sect of Yogacharas by asserting that the world changes but is not a mental fiction and is also not nonexistent (*Abhava* or *Sunya*). Brahma appears as *sansara* (the world) through *maya* (ignorance), just as a rope may appear to be a snake when it is dark. *Vidya* (understanding) through practice of Yoga brings *Moksa*, or freedom from rebirth.

The Non-Vedic Systems

Most other sects followed modified versions of tenets of the Vedic tradition. Except for the materialists, they all accepted karma theory, the existence of the soul, the essentialness of liberation, rebirth, and the moral code of Yama and Niyama.

Charvakas (Lokayatas, Jabalikas) This system of materialist philosophy is referred to only in later schools. It was probably enshrined in the Brihaspati Sutra of the sixth century BCE. It opposed ancestor worship and the concept of life after death. Perception is purely sensory and consciousness a product of chemical reactions. There is no soul or god, and salvation is an illusion. Nature is the only reality, indifferent to good and bad, which are mere social conventions.

Jainism Vardhamana Mahavira (599–527 BCE) consolidated the teachings of twenty-four previous teach-

ers in the Jain tradition. The aim of life is to attain *kaivalya* (the state of ultimate realization of selfhood) by right knowledge, faith, and action. The most distinctive feature of action is total nonviolence, or ahimsa, as living and nonliving objects have souls.

Buddhism Consolidated by Siddhartha Gautama (563–483 BCE), the aim of Buddhism is to attain nirvana (extinction or release). There are four noble truths: (1) the world is sorrow; (2) sorrow is born of desire; (3) freedom from sorrow is attained by freedom from desire; and (4) one ends desire by the eightfold path: right views, right words, right action, right living, right effort, right thinking, right resolution, and right concentration.

The Bhakti Movement

The worship of Vishnu or Vasudeva, which began around the fifth century BCE, acquired great momentum around the seventh century CE with the so-called philosophy of personal and individual *bhakti* (devotion). This sect had two broad divisions: those who worshiped God as an incarnation with human and divine attributes (*Saguna*) and those who contemplated him as the formless (*Nirguna*) source of creation, preservation, and destruction. For the former, the life deeds of incarnations like Krishna or Rama were a divine play or a *lila* that must be sung for liberation. The poetry of the saints of this sect was filled with expressions of submission to the divine, chosen as the most desirable form (*ishta*) by the devotee (*bhakta*). Singing the attributes (*gunakirtana*) of the lord was the chief mode of worship, whether done individually in isolation or in a community of the faithful. For the latter, the formless god (*Nirankar*) was contemplated by calling or singing only his name, which led to a state of yogic awareness (*samadhi*). Ramanuja, Ramananda, Kabir, Raidas, Nanak, and a host of others produced poetry that inspired the Nirguna tradition, one of the many sects of the Bhakti movement and philosophy.

Hindu Philosophy in Perspective

Hindu philosophy has adjusted well to a contemporary pluralistic world. Its major doctrines were not contradicted by modern theories of science, humanism, equality, or democracy. Modern exponents of Hinduism such as Ramakrishna, Vivekananda, Dayananda Saraswati, Sri Aurobindo, and Gandhi demonstrated that its ancient beliefs could deliver practical results in the contemporary world. The Hindus and the people of India in general have always believed that there is an underlying ultimate reality behind all beliefs and philosophical systems. This

philosophic conviction is reflected nowhere better than in the benedictory verse of the play *Mahanatakam* by the eleventh-century poet Hanuman.

The One who is worshiped as Siva by the *Saivas*, as Brahma by *Vedantis*, as Buddha by *Buddhas*, as *Karta* by *Naiyayikas* the logicians, as *Arhat* by the *Jainas*, and Karma (*yajna*) by *Mimansakas*; such a Vishnu, the lord of three worlds, may fulfill your desires.

HINDU VALUES India is home to more religious systems than any other Asian country, implying that it has a more varied range of ethical principles or cultural values than any other part of the continent. Hinduism itself embraces a multiplicity of beliefs, practices, and peoples that emphatically do not fall under the umbrella of one church, one pope, one liturgical system, or one hierarchy of priests or monks.

The word "Hinduism" and even the concept are English, deriving from the Persian Hindu or the Sanskrit Sindhu, names for the Indus River. Indian languages do not have a word that corresponds with *Hinduism*, only such words as dharma (social duty) and karma (fate). Cultural values are pervasive yet difficult

to pin down, at the same time a part of behavior, a part of culture, and a part of social structure (Hockings, 1988: 39–46). Moreover they are commonly specified in both sacred texts and secular proverbs.

Ethical obedience is the pathway to salvation. Life should be governed by the discharge of accumulated duties or debts. These debts are diffuse: to the gods, to the seers and sages who discovered truth, to ancestors, and to humanity at large. Debts to the gods can be discharged through sacrifice and *puja* (offering and veneration); to the ancestors by raising good, virtuous children; and to society by acts of hospitality and charity.

Hindu values fall broadly into five categories: moral values (dharma), politico-economic values or concern with worldly affairs (*artha*), hedonistic values and amorous desires (*kama*), spiritual values and deliverance (*moksa*), and absolute reality (brahman). Although categorized thus, values in actual use create a more complex picture altogether. This is readily evident from the corpuses of proverbs, each of which embodies a value: Sebastiao Dalgado (1898) arranged 223 subject headings to present 2,177 Konkani proverbs; Herman Jensen (1897) employed 352 subject headings to present 3,644 Tamil proverbs; and Paul Hockings (1988) used 393 subject headings to analyze some 1,600 Badaga proverbs and 130 other clichés. The Hindu Badagas, for example, have specific cultural values relating to such topics as respect, wealth, exertion, waste, matricide, forgiveness, subjection, and impotence. But just as the complexity of a society based on many hundreds of castes was simplified in ancient times into a model of five *varnas*, or ranked-caste categories, so too the ancient philosophers simplified the multiplicity of values expressed in proverbs and prayers into the neatly comprehensible idea of the fivefold ends of human life outlined above under the headings of dharma, *artha*, *kama*, *moksa*, and brahman.

The Hindu individual is constrained by his or her position in a caste-organized society. The caste into which he or she was born and where he or she will always remain belongs to one of four ranked *varnas* unless that individual is of the very low "untouchable" or tribal status. In that case he or she falls outside this system. The Brahmans are the highest of the four *varnas*, Brahman males traditionally function as priests, teachers, and literati. It is essential that such men and women live in accordance with their dharma and maintain their high level of purity. Kshatriyas are the second-ranking *varna*; Kshatriya males include rulers and warriors. Their duty is essentially concerned with

artha, the material interests. Next are the Vaisyas who should pursue *kama*, the hedonistic values. These three categories are considered "twice-born" because of their male initiation ceremonies. Sudras, ranked fourth and lowest, are not twice-born. Above the four *varnas* are the few renouncers who abandon the material world for the pursuit of *moksa*, which means deliverance from the cycle of rebirths (*samsara*). Release from rebirth is the highest aspiration.

HINDUISM—INDIA Hinduism, possibly the oldest surviving religion in the world, began well over three thousand years ago in India. A product of a variety of peoples and cultures, it evolved out of the varying faiths in different regions, assimilating all the diverse cultural practices of India. Its original followers knew the faith as *Sanathana Dharma*, or "a way of life"; it was Europeans, who first encountered it being practiced on the banks of the Indus River, who called it "Hinduism," after the Persian name for the river, *Sindhu*.

Beliefs

Though Hinduism is quite complex and practiced in a variety of ways, it is based on simple tenets, which include a belief in one supreme being who is without forms or attributes; a belief that God accepts everyone's prayer directed towards every form they worship; the espousal of nonviolence (*ahimsa*); vegetarian

MAHABALIPURAM— WORLD HERITAGE SITE

Designated as a UNESCO World Heritage Site in 1984, this group of sanctuaries around Mahabalipuram was hewn into rock off the Coromandel coast in India by Pallava kings in the seventh and eighth centuries CE. The wide variety of temples and statues include the famous open-air relief known as the "Descent to the Ganges," sun chariot ratha temples, and even sanctuaries built into caves.

food habits (where possible); compassion to all lives; divine duty (dharma); activity without attachment (karma yoga); and devotion and surrender to God (bhakti). Hindus also believe in the indestructibility of the soul, a cycle of rebirth, and the ultimate liberation of the soul, or *moksa*.

One widespread misperception of Hinduism is that it is a polytheistic religion with pagan rituals. The reality of Hinduism is that there exists *Nirguna Brahman*, or "god without attributes," which we are unable to comprehend. Thus, God appears to us veiled in a *maya* (illusion), as *Saguna Brahman*, or "god with attributes," so that we can relate to it. As a prism of light can be broken down into colors for us to see, Brahman (the ultimate goal of all being) assumes many forms to enable people to understand it. The main three forms of Brahman (also seen spelled Brahma) are Brahma, the creator; Vishnu, the preserver; and Siva, the destroyer. Hindus may worship one form exclusively, as Vaishnavas do for Vishnu, or Saivas do for Siva, or still others do for many, even thousands, of other forms. What is most important is that people from all walks of life and all intellectual levels can worship God; thus, Hinduism espouses tolerance and the freedom to worship God in any form. This tenet of the faith is the foundation for its acceptance of other religions. Whatever form one worships, one is worshipping Brahman.

Hindus understand that in order for a being to live, it must take other lives for nourishment. However, life is put into a hierarchy of sensory perception, with humans having the most sensory perception. To Hindus, the more sensory organs a being has, the more pain it will suffer in the process of being killed. Hinduism does not have specific rules about what to eat and not to eat, but it has the goal of causing the least amount of pain possible when deciding what to consume.

Thus, it is believed to be more advisable to kill a plant than to kill an animal for food.

The ultimate goal of a Hindu is to be freed from the cycle of rebirth by *moksa*, or liberation of the soul. Hindus believe the soul is eternal, with no beginning or end. With the ending of each life, the soul leaves a body and enters another, and manifests itself within that body. One's good actions through duty (dharma), and actions having consequences (karma), determine the form of one's next life. If the good done by an individual greatly exceeds any wrongdoing, then the soul may ultimately be liberated from the cycle of rebirth and become one with God.

Development

Hinduism's evolution over time is now denoted by reference to periods that correspond with significant events in Indian history. The earliest period of Indian history is called the Vedic age, dating from roughly 1500 BCE or even earlier, to about 500 BCE. The Vedic age is subdivided by Indian historians into the ages of the Manthras, the Brahmanas, and the Upanishads, all Vedic texts. The second period, during the Maurya empire, from about 324 BCE to 200 BCE, is the age of Vedanga and the Kalpa Sutras. Then, from 200 BCE until 300 CE, around the time of the Gupta empire, is the age of the epics, primarily the *Mahabharata* and the *Ramayana*. The period from 300 CE to 650 CE is the age of the Puranas, Agamas, and Dharsanas, and the period ending around 1000 CE is the age of the later Puranas. The *bhakti* devotional movements started at this time and continued until the eighteenth century. The last four centuries saw the decline and then the renaissance of Hindu religious practice under the Moghul and British rules.

In the twentieth century, Hinduism has been a powerful unifying force in India. In the 1990s it emerged as a political force and was set forth by some political parties as the major unifying and distinctive element of Indian culture.

HINDUISM—THAILAND In the Buddhist Thai kingdom, the Hindus constitute about one-tenth

Although Buddhism is the major religion across Thailand, Hindu elements are also often present. Here, cleansing water is thrown over a young man in traditional dress at the Thai Buddhist New Year's festival in 1995. (KEVIN R. MORRIS/CORBIS)

of the population. However, various aspects of Hinduism are deeply entrenched in Thai society. Although it sometimes is difficult to distinguish the Hindu elements in Thai culture, Hinduism has survived in Thailand through the concepts of royalty, festivals, music, architecture, the pantheon of Hindu deities, language, and literature.

The Hindu *dharmasastras* (religious scriptures), the concept of kingship, and brahmanical rituals have become essential features of state formation, and rulers have legitimized their position with the help of *brabmans* (priests, *phrams* in Thai). These priests perform various rituals connected with royalty. In the *rajyab-hiseka* ceremony (consecration), they invoke the blessings of Hindu deities and present royal regalia to the king, and Thai ceremonies adhere to the tenets of the Satapatha Brahmana and Aitreya Brahmana. The steed

of the Hindu God Vishnu Garuda is the royal symbol of Thailand.

The influence of Hinduism is also ingrained in popular Thai culture. Icons of Hindu gods and goddesses have been discovered in ancient excavations, and sculptures of such icons as Parvati, Hanumana, Ganesha, Vishnu, Indra, and Brahma adorn wats (temples) in Thailand. Images of Ganesha, the patron of Thai arts, are sometimes installed in newly constructed buildings. Hindu deities are worshipped along with Buddha and *phis* (spirits). Even to the present, the Thai congregate at the Erawan shrine in Bangkok to invoke Brahma.

The *Ramayana* tradition is important in Thailand. In the process of adoption, the stories of *Ramayana* have been transformed into a Thai version known as the *Ramakien*. Performing arts forms like classical dance, masked plays, theater shows, and shadow plays have continuously used the themes of this classic. The Thai features in these works are so predominant that only the origin of the *Ramakien* remains as a non-indigenous element. An admixture of Hindu and Buddhist elements exists in the popular festivals like *Lob Chingecha* (swing ceremony), *Loi Krathong* (festival of lights), *Baruna Satra* (rain festival), and *Songkran* (astrological New Year). The *brabmans* also have a role in such family ceremonies as births, deaths, purifications, and weddings. The similarities of Thai beliefs in the existence of the other world with such Hindu concepts as *savan* (paradise) and *narok* (hell) and with the Hindu names for deities (*devata*), worship (*pussa*), and God (*isuan*) point toward the cultural interaction between Thailand and India. Thai society has shown a tremendous capacity to harmonize Hindu elements and yet retain its distinct identity.

HIR RANJHA STORY The story of Hir and Ranjha is an important part of Punjabi cultural life. A

seminal part of the region's vibrant oral tradition from at least the sixteenth century, the story is also prominent in the Punjab's print culture from the mid-nineteenth century onward. Composed in many languages, among them Arabic, Hindi, Persian, Rajasthani, Sindhi, and Urdu, and famous beyond the geographical boundaries of the Punjab, the Hir Ranjha story is considered the region's premier epic romance.

The story concerns Dhido, known throughout the tale by his clan name Ranjha, the favored son of a landowner in the village of Takht Hazara (Punjab, Pakistan). Upon his father's death, Ranjha is cheated of his inheritance by his brothers and leaves home in search of a renowned beauty, Hir, a member of the prominent Sial clan and the daughter of an important landowner in the area of Jhang (Punjab, Pakistan). Upon his arrival in Jhang, Ranjha and Hir fall in love. Hir's family objects to the relationship because of Ranjha's perceived inferior social status and insists that she marry Seido of the Khera clan, a match that her family considers more suitable. Hir is forced to marry Seido, and, depending on the rendition, Hir and Ranjha are either reunited at the end of the story or die for their love. The story has three primary interpretations: as a temporal love story, as an allegorical tale

about divine love (primarily in the Sufi tradition), and as an allegory for stories of Hindu divinities.

That the story was well known in the Punjab as early as the sixteenth century is shown by its inclusion in the compositions of the Sufi poet Shah Hussein (c. 1539–1599) and the Sikh writer Bhai Gurdas Bhalla (c. 1551–1633). Although the first known full-length rendition of the Hir Ranjha story is a Persian composition by Baki Kolabi, dated about 1575, the first rendition of the entire tale in Punjabi is by Damodar, completed about 1605. After Damodar, Ahmad Gujjar composed a version in 1682, Shah Jehan Muqbal in 1746–1747, and Waris Shah in 1766–1767. Although Waris Shah's is the most acclaimed rendition of the story, it has been composed by innumerable poets in both oral and printed forms, each poet giving the story his or her own flavor. Through the early twentieth century the story was always composed in verse (in various genres). Since then the Hir Ranjha story has been adapted to other genres, such as drama and prose, while at the same time continuing to be an important idiom for poetic and cultural expression.

HIRATSUKA RAICHO (1886–1971), Japanese writer and women's rights activist. Born Hiratsuka Haruko, the daughter of a privileged Tokyo family, Hiratsuka graduated from Japan Woman's College in 1906. The college rescinded the diploma in 1908, however, when her relationship with married writer Morita Sohei (1881–1949) became a public scandal. Her notoriety helped launch her writing career in 1911, when Hiratsuka adopted the penname Raicho and, with others, founded the all-women's journal *Seito* (Bluestockings, 1911–1916). Fearless and unconventional, *Seito* gave voice to the desires of the "new woman."

A Zen practitioner, Raicho used *Seito* to urge women to rediscover their creativity, to seek meaningful education and work, and to expand beyond the roles for women extolled by the state. Her most famous essay, the *Seito* manifesto "In the Beginning, Woman Was the Sun," imagines a primordial female courage that paradoxically transcends gender. Raicho brought this boldness into her own life, bearing two children out of wedlock with artist Okumura Hiroshi (1891–1964), who became her lifelong partner and whom she married in 1941.

In 1920 Raicho helped found the Shin Fujin Kyokai (New Woman's Association), which worked to expand women's rights to participate in political organizations and agitated for women's suffrage. From the early postwar years through the 1960s, Raicho was a leading figure in both the domestic and international women's movements for peace.

HIROHITO (1901–1989), Japanese emperor. On 29 April 1901, Michinomiya Hirohito was born as the first son of Japanese Crown Prince Yoshihito (later

A formal portrait of Emperor Hirohito in 1982. (BETTMANN/CORBIS)

Emperor Taisho) and Princess Sadako (later Empress Teimei). The lineage of the Japanese emperor system is traced back 2,600 years and is linked with Japanese legend and mythology. Japanese history and legend defined the emperor as a descendant of the sun goddess Amaterasu.

In 1908, Hirohito entered Gakusyuin Elementary School in Tokyo and continued his special training to be emperor. In 1912, after the death of Hirohito's grandfather, Emperor Meiji, Hirohito became crown prince. In the spring of 1921, Crown Prince Hirohito went to Europe for six months, learning of freedom and modernity in European societies through his travels and studies.

Crown Prince Hirohito's reign started in November 1921 because his father, Emperor Taisho, was unable to rule due to illness. In 1924, Crown Prince Hirohito married Princess Nagako, and together they had two sons and five daughters. On 25 December 1926, with Emperor Taisho's death, Crown Prince Hirohito officially took the 124th Chrysanthemum Throne when he was twenty-five years old. Following

tradition, Hirohito's ascendance to the throne began a new period, Showa (Illustrious Peace).

Soon after the Showa period started, Japan embarked on militarism, entering a dark period of total war. In 1931, Japan invaded China after the Manchurian Incident, which led to the Sino-Japanese War from 1937 to 1945. In December 1941, Japan entered World War II in the Pacific with the attack on Pearl Harbor. In this period, Emperor Hirohito had supreme authority as the constitutional monarch, in which position he served as the symbol of national unity for the Japanese people and military.

On 15 August 1945, Japan accepted the Potsdam Declaration that ended World War II, after the United States dropped nuclear bombs on Hiroshima and Nagasaki. Under Allied occupation from 1945 to 1952, the emperor was treated as the means of achieving democracy. On 1 January 1946, Emperor Hirohito renounced his divinity under the new constitution (effective in May 1947); the role of the emperor was redefined from "a living god" to "the symbol of the state and of the unity of people." Following this, Emperor Hirohito devoted himself to Japan's postwar recovery by visiting prefectures, making personal appearances in public, and interacting with the Japanese people.

On 7 January 1989, Emperor Hirohito died in the Imperial Palace in Tokyo. This ended the Showa period, a period that saw brutal militarism, the invasion

of Asia, World War II, Allied occupation, Japan's recovery from war and poverty, and Japan's economic miracles. Japanese people in the Showa period witnessed a rapid transformation from a military nation to a democratic nation in which Emperor Hirohito took a symbolic role through a dark and prosperous period of Japanese history. The role and image of Hirohito changed over the period due to Japan's political aims and conditions. He was an absolute monarchy and "a living god" to the Japanese before and during the war, and he became a symbol of Japan after the war and was deemed a good man to lead Japan to a modern and democratic society. The emperor system (*tennou-sei*) is deeply integrated into Japanese history, society, and people. Hirohito's birthday is still a Japanese national holiday and is translated as "Green Day."

HIROSHIMA (2002 est. pop. of prefecture 2.9 million). The city of Hiroshima (2002 estimated popula-

The devastation in Hiroshima after the atomic bombing of 6 August 1945. (BETTMANN/CORBIS)

tion 1.1 million) is the capital of Hiroshima Prefecture, situated on Japan's island of Honshu. Today a city dedicated to peace, it was the first to be devastated by an atomic bomb. Now one of the nation's most modern urban areas, the rebuilt Hiroshima is the leading industrial center of the western Honshu region.

Hiroshima grew during the Edo period (1600/1603–1868) as a castle town around a fortress completed in 1593 by the great warrior and Japanese feudal lord Mori Terumoto. After the 1868 Meiji Restoration, the city became an important military, industrial, and transport center. In an attempt to bring World War II to an end, the atomic blast of 6 August 1945 leveled Hiroshima, eventually killing some 200,000 people. Today Hiroshima is a center for world peace. Near the blast epicenter are the Atomic Bomb Memorial Dome, Peace Memorial Park, a museum, and a cenotaph memorializing the victims. There also is a smaller town of Hiroshima outside Sapporo on Hokkaido island; it was settled in 1884 by emigrants from Hiroshima Prefecture.

Hiroshima Prefecture occupies an area of 8,467 square kilometers. Its geography features the Chugoku Mountains, southern highlands, and coastal plains. It is bordered by the Inland Sea and by Shimane, Tottori, Okayama, and Yamaguchi prefectures. Once divided into Aki and Bingo Provinces, it assumed its present name and borders in 1876. In the late twelfth century, the ruling Taira family first developed the region as a commercial and trade center for Inland Sea shipping.

Today rice, citrus fruits, cattle, chrysanthemums, and rushes for tatami mats are produced. The traditional activities of forestry, fishing, and sake brewing continue as well, as do food processing and textile weaving. Heavy industries include steel, petrochemicals, shipbuilding, and automobiles. Visitors are drawn to the island of Miyajima's Itsukushima Shrine, officially one of Japan's three most beautiful views.

HITTITES The Hittite empire dominated the central plateau of Anatolia (the Asian portion of modern-day Turkey) from about 1800 BCE to 1200 BCE, and survived until about 700 BCE as a series of smaller

Remains of the Hittite presence are found at the Royal Gate of Hattusa in Bogazkoy, Turkey. (GIANNI DAGLI ORTI/CORBIS)

kingdoms based in southern Turkey and northern Syria. During its period of dominance, it was surrounded in the north by Kaska tribes, in the east by the Mitanni, and in the west by several related tribes of which little is known; on the extreme western seaboard were newly founded Mycenaean colonies.

History

The Hittites seem to have migrated into Anatolia from the Caucasus in around 2000 BCE, and achieved ascendancy over the eastern Anatolian Hurri population. By the eighteenth century BCE their king, Anitta, had conquered neighboring tribes and established a capital at Kussana, in Cappadocia. A century later they had moved the capital to Hattusa, an easily defended citadel 150 kilometers east of what is now Ankara, commanding trade routes from the Black Sea to the Cilician Gates and from the Aegean to Central Asia. Labarnas I (reigned 1680–1650 BCE) and his successors campaigned as far afield as northern Syria; in 1595 BCE Mursilis I captured Babylon from the Hammurabic dynasty, but he was murdered by a pretender to the Hittite throne.

After fifty years of dynastic chaos, the frontiers were consolidated and from the fifteenth century BCE a new dynasty used diplomacy instead of force to dominate client kingdoms. From 1450 BCE, under kings of mixed Hurrian-Hittite lineage, the kingdom again absorbed Aleppo in Syria and Arzawa in southwest Turkey. The kingdom reached its maximum extent under Suppiluliumas I (1380–1340 BCE). The widow of King Tutankhamen of Egypt was so impressed by the deeds of Suppiluliumas I that she asked for his son's hand in marriage.

HATTUSHA—WORLD HERITAGE SITE

Hattusha was designated a World Heritage Site by UNESCO in 1986 because of its historical significance as the former capital of the Hittite empire and its remarkable preservation. Hattusha's ornamented Lion's Gate and the rock art of Yazilikaya still evoke images of the Hittite empire four thousand years after their construction.

In about 1300 BCE the Hittites again encountered the Egyptians, in a battle at Kadesh (Syria), which is described in the poem of the Egyptian poet Pentaus. Maneuvering over hilly ground, the Hittite king, Muwatalli, successfully launched his three-man war chariots crewed by archers at the Egyptian forces, but as the Hittites stopped to plunder, Ramses II counterattacked. The resulting stalemate was formalized in a treaty that is described both on the temple walls at Karnak in Egypt and on cuneiform tablets found at Bogazkoy. To cement the alliance, Ramses married a Hittite princess.

The aggressive Assyrians in the east and the influx of Phrygians from the Balkans led to severe pressure on the Hittite kingdom. In unexplained circumstances the capital, Hattusas, was burned in 1200 BCE. The scattered and defeated Hittites moved southeast under pressure from the Phrygians and other "sea peoples" and established new kingdoms south of the Anti-Taurus mountains, based on fortified capital cities discovered at Carchemish (Kargamis), near Gaziantep, and Karatepe, north of Adana. These minor kingdoms, which were far less disciplined and centralized than their predecessor, were eventually overrun by the Assyrians in about 700 BCE.

Discovery and Research

The Hittite civilization was discovered from hieroglyphic inscriptions identified and catalogued by Archibald Henry Sayce (1845–1933), an expert in Sumerian and Assyrian. In 1880 he postulated that an extensive civilization, the Hittites, previously only known from the Old Testament, had existed in the wide area between northern Syria and the mid-Aegean Turkish coast, with its capital at Bogazkoy. Hugo Winckler (1863–1913), an archeologist affiliated with the German Oriental Society, obtained the concession to excavate Bogazkoy, and in 1906, within a few days

of starting work, he unearthed, in the foundations of a major temple, a library of 10,000 tablets bearing cuneiform, not hieroglyphic, inscriptions. Excavations ceased during World War I, but Bedrich (or Friedrich) Hrozny (1879–1952), professor of Assyriology at the University of Vienna, and others continued to work on decipherment of the cuneiform script. In 1915 Hrozny declared that cuneiform Hittite was an Indo-European language. Based on Sumerian and Akkadian insertions into Hittite texts, scholars were able to postulate a vocabulary, which was more or less complete by 1933. From the tablets, an outline of history complete with rulers was established, although minor controversy over dates remained. The tablets also illuminate the social and legal systems; the ones describing religious ceremonies have proved more difficult to interpret. Much later, in 1947, a bilingual tablet discovered at Karatepe proved to be in Phoenician and the hieroglyphic script. The pictographs were identified as Hittite of a slightly different form to the cuneiform language; probably cuneiform Hittite was the commercial and hieroglyphic Hittite the ceremonial language.

Government

The inscriptions revealed the Hittites as a nationalistic, feudal people with a strong code of justice outlined in over two hundred laws. The priest king was supported by the *panka*, an advisory council (later dissolved); a bureaucratic class; and an underclass of slaves. Councils of elders administered distant areas. The king's duties included serving as both military leader and high priest; his campaigns were sometimes curtailed by the need to attend religious ceremonies. Women appear to have had extensive rights; the queens entered into diplomatic correspondence with foreign rulers, many priestesses are known, and rape was one of the few capital offenses under the law. Equitable laws, mainly based on restitution for wrongs by payment in money or kind, reveal an organized agricultural society whose main crops were barley, wheat, and wine-producing grapes. The wealth of the nation lay in the gold, silver (which provided a currency), and iron, which were probably traded extensively.

Religion

The Hittite religion was based on the Hurri weather god Teshub, who rode a chariot pulled by sacred bulls, and his sun-goddess wife Hebat, referred to as "Queen of the land of Hatti, queen of heaven and earth." The city of Hattusas held many major temples, cleverly constructed so that light from huge windows fell on the sacred statue; an unidentified holy city

of Arinna is also mentioned in texts. In the countryside, huge reliefs and inscriptions appear both within and outside Hittite boundaries, often near water sources. The best known religious site, Yazilikaya, 3 kilometers east of Bogazkoy, consists of two adjacent clefts in a hillside, where lines of gods and kings have been carved into the cliffs; a cult building on level ground outside provided a center of worship. This site dates from the reign of King Tudhaliyas IV (reigned 1250–1220 BCE), just before the abandonment of Bogazkoy. The Hittites augmented their pantheon with their neighbors' gods and goddesses; up to a thousand of them were worshipped in local or national festivals with blood sacrifices, or invoked in curses and prayers.

Artifacts

The Hittite culture is represented in the Museum of Anatolian Civilizations in Ankara by many bold reliefs on basalt and limestone blocks and by statues in the round. The motifs are animals (lions, sphinxes, and bulls), the royal family, and the gods. Human figures wear conical hats or helmets, kilts, and boots with turned up toes and are armed; they are usually shown in profile. The Kultepe/Assyrian type of pottery features elegant burnished monochrome pots with long spouts. The museum also houses numerous cuneiform tablets in pottery, silver, and bronze. Hittite writings describe statues made of iron, but it seems that these have not survived. The Turks, supported by the cultural ministry, ascribe great importance to Hittite civilization and in recent years the quest for objects linking the Hittites to sites all over Turkey has become something of a holy grail for Turkish archaeologists.

HIZBULLAH Hizbullah (Arabic: "army of Allah"), an Islamic militia, was founded in December 1944 by Japanese occupation authorities in Java to assist in the island's defense against an expected Allied invasion. It was formally an organ of the Japanese-sponsored central Islamic council, Masjumi or Madjelis Sjuro Muslimin Indonesia (Consultative Council of Indonesian

Muslims), and probably numbered about five hundred at the war's end (despite official mention of 400,000 recruits). Its units received only a little Japanese training, but provided a core for many irregular Islamic units that fought the Dutch during Java's nationalist revolution (1945–1949). The Hizbullah high command under Zainal Arifin (1909–1963) remained affiliated with the Masjumi, which had become an Islamic political party in Java, but central authorities had little control over units in the field. In 1947, the Hizbullah and other irregular forces were formally merged with the Army of the Indonesian Republic (Tentara Republik Indonesia, or TRI) to form the Indonesian National Army (Tentara Nasional Indonesia, or TNI), but most units retained their autonomy. The Hizbullah was especially strong in southern West Java and refused to leave their bases when the leaders of the Indonesian Republic formally relinquished West Java to the Dutch in late 1948. Some units became the basis of the armed forces of the Darul Islam rebellion, which first fought the Dutch and then the Republic in West Java from 1948 to 1963 with the aim of establishing an Indonesian Islamic state.

HMONG Over the past two centuries, the Hmong people have migrated from the southwestern provinces of China into the foothills of northern Laos and Vietnam, parts of Myanmar (Burma), and Thailand. In China, they form approximately one-third of the minority population officially classified as Miao (a name considered distasteful to Hmong outside China), which numbers over 8 million. The Hmong in China live in remote villages scattered through the provinces of Yunnan, Sichuan, Guizhou, and Guangxi. While at times the Hmong, who are thought to have originated in eastern China, have been able to establish permanent settlements and to practice irrigated agriculture, typically they have been shifting cultivators of upland crops such as dry rice, buckwheat, millet, and maize. As pioneer shifting cultivators, they have migrated great distances from the previous locations of their villages.

History and Economic Development

Rebellious southern people called the Miao, recorded in Chinese annals as having been banished from the central plains around 2500 BCE at the founding of the Chinese state, have existed throughout Chinese history. Although the term was very generally applied to numerous southern populations by the Chinese, ancestors of the Hmong were probably included in many of these references to the Miao. With the great expansion of the Han Chinese people into southern China from the time of the Song dynasty (960–1279 CE) on, increasing pressures were placed on scarce resources of land and water, and the Hmong, together with other minority populations, were further marginalized and forced to the higher altitudes where only shifting cultivation could be practiced. Today, the greatest area of Hmong concentration in China is Wenshan autonomous district on the Vietnam border, although Bijie, in northwest Guizhou, is another area of dense Hmong settlement.

As the Hmong began to migrate into northern Indochina (now the northern parts of Vietnam and Laos) from around 1850, they found themselves inhabiting new nation-states whose borders were eventually formed under the impact of the French colonization of Indochina and the British colonization of Myanmar (then Burma). Colonial encouragement and taxation of opium production created economic improvements that helped solve the chronic shortages of staple foodstuffs and indebtedness to itinerant Chinese traders, which the Hmong had previously suffered. An integrated upland economy developed in the region, based on the cultivation of dry rice in rotation with maize and opium poppy, together with the animal husbandry of swine and poultry, some fishing, hunting of wild animals, and gathering of wild products in the forest. Opium was sold to traders in return for rice.

Hmong involvement in what soon became the global opium trade and their familiarity with remote terrains on the borders with neighboring countries brought them into strategic focus during the struggles between Communists and rightist forces that marked the Indochina wars from 1954 to 1976. Hmong mercenaries fought on both sides and suffered enormous casualties during this period.

Shortly after 1975, over 100,000 Hmong who had fled the Communist victory in Laos were resettled in third countries such as the United States, Canada, French Guyana, Argentina, Surinam, France, Australia, and New Zealand after transiting in refugee camps along the Thai border with Laos. There reportedly are now approximately 1.2 million Hmong

living outside China, with some 194,000 overseas and slightly over a million still in Southeast Asia.

Culture and Social Organization

There are two main cultural divisions among the Hmong of Southeast Asia and overseas, which are marked by strong distinctions of dialect, women's costume, domestic architecture, and ritual. These divisions are the Green and the White Hmong (*Hmoob Ntsuab* and *Hmoob Dawb*). Traditionally, Green and White Hmong had difficulties understanding each other, settled in different villages, and rarely intermarried. These distinctions remain strong today, although more intermarriage and co-residence exist than in the past. Other cultural divisions of the Hmong exist in China, such as the Hmong Pua and Hmong Xauv, and still others can be found in Southeast Asia.

All Hmong share a common language and kinship system, with twenty surname groups (*lub xeem*), which reckon descent patrilineally and have names resembling Chinese surnames. At marriage, a woman is expected to leave the household of her natal family and move to that of her husband. While free courtship is customary, the wedding is elaborately celebrated and can be a protracted business, including ceremonial presentations and wedding songs sung by go-betweens representing both parties to the marriage. At marriage, a man is expected to present to his wife's family an expensive bride-price that is traditionally paid in silver and that is said to compensate the bride's parents for their trouble in bringing her up. It may take years to amass a sufficient bride-price to marry, and a young man is often dependent on his father for this. This payment acts as a sanction against divorce, since a wife's family may be reluctant to return this payment unless it can be shown that the wife has given serious grounds for divorce. Strict monogamy is expected of a wife after marriage; a man however may take two or more wives, although this is rare.

In the village, typically located at altitudes of 900–1,500 meters, the local descent group of an exogamous patrilineage—perhaps four or five closely related families—is the main functional social unit. There are no hereditary positions of leadership, and families have considerable autonomy in deciding, for example, where to cultivate fields or whether to move from the village to a new area of cultivation. All adults are farmers, while particular adults may also specialize as blacksmiths or silversmiths, wedding go-betweens, funeral specialists, herbalists, or shamans. The most respected position is that of the shaman (*txiv neeb*). Shamans are consulted in cases of illness, mental stress, or social disturbance.

The Hmong of China and Thailand have now largely abandoned opium production. Many Hmong villages in China have managed to plant small areas of irrigated rice in a way similar to local Chinese villages. In Thailand, however, the Hmong have turned to other cash crops to replace the lucrative opium poppy, and this has led to tensions with lowland Thai, who accuse them of poisoning lowland water sources through the use of chemical fertilizers and pesticides needed for these new cash crops.

The Hmong culture and social system are rich and complex. The elaborations of the wedding ceremony and the beauty of the women's intricate batik and embroidery, the festivities of the Hmong New Year (*noj peb tsaug*), the shaking of the shaman as she enters the Otherworld to rescue the lost soul of a sick person, and the long mournful chants of the Master of Death as he guides the soul of the deceased back to the village of his or her ancestors at the dawn of historical time are unique and identifying characteristics of Hmong culture.

The Hmong share with the Chinese a system of geomancy (*saib loojmem*) for the siting of villages and graves in which human residences are aligned with the natural contours of rivers and mountains.

For over a hundred years, foreign missionaries have worked among the Hmong, and many Hmong are now Protestants or Catholics, having abandoned ancestor worship, shamanism, and the rites of death. This has led to tensions between traditional and Christian Hmong.

Redefining Traditional Roles

While traditionally Hmong women have had a higher social status than Chinese women, there has been an effective muting of women in Hmong political and ritual affairs, which may have been strengthened by male control of the cash derived from opium sales. Among the overseas Hmong, significant changes have taken place in relations between the generations as well as between men and women. Overseas Hmong communities have debated the changing role of women and elders in their society, how to pay the traditional bride-price, and above all how to preserve the Hmong culture for a younger generation, many of whom show little interest in tradition.

Returning Hmong

Recently some overseas Hmong have begun to revisit their traditional locations in Laos, Vietnam, and Thailand, and even the homes of their more remote ancestors in southern China. New connections be-

tween transnational Hmong communities have been formed, aided by the use of videos and the Internet, and some global trading relations have been established along Hmong lines. It is too early to say whether these new contacts will lead to a new kind of diasporic Hmong community, or whether they represent the sentimental nostalgia of a people hopelessly divided and dispersed by the forces of modernity and change.

HMONG-MIEN LANGUAGES The Hmong-Mien (also known as Miao-Yao—a term now rarely used outside of China) languages, are one of the major independent language families of Southeast Asia. The two branches of the family, Hmong (Miao) and Mien (Yao), respectively, may be described as clusters of dialects, which are scattered over a wide area of southern China and some adjacent Southeast Asian countries. Hmong dialects are spoken by approximately 5.5 million speakers; Mien speakers number approximately 2 million.

The most important variants of Hmong are Western Hmong (2 million speakers in the Chinese provinces of Guizhou, Guangxi, Sichuan, and Yunnan, as well as in northern Vietnam, Thailand, and Laos), Eastern Hmong (1.4 million speakers in Yunnan, Guizhou, and Guangxi), Northern Hmong (750,000 speakers in Hunan Province, China), Hmong Daw, or "White Hmong" (100,000 speakers in Thailand, Laos, and Vietnam), and Hmong Njua,

or "Blue Hmong" (200,000 speakers in Laos and Thailand). Considerable numbers of White and Blue Hmong speakers live abroad, at least 70,000 of each group in the United States. The 500,000 speakers of Punu in Guangxi are officially included in the Mien (Yao) nationality but speak a Hmong language. Only a thousand persons of the approximately 350,000 that constitute the She nationality in Guangdong Province, China, speak another Hmong language, generally known as Ho-Nte.

The Mien language is more uniform. Its most important varieties are Mien proper (approximately 850,000 speakers in Guangxi, Guangdong, Yunnan, Hunan, and Guizhou; some 60,000 in Laos; and 30,000 in Thailand), Iu Mien (200,000 speakers in Guangdong), and Mun, spoken in southern China, Laos, and Vietnam.

Hmong-Mien languages are typical Southeast Asian languages, with monosyllabic words, rich systems of tones (up to eight—in some dialects of Mien, more than ten), subject-verb-object word order, etc. Typological differences within the family include the fact that words in Hmong may end only in nasal consonants or no consonant at all, whereas Mien languages mostly tolerate different consonants in this position. In Hmong, modifiers (adjectives, etc.) usually follow the noun they modify, whereas in Mien the opposite order prevails. The She language behaves, in terms of these and other typological features, like a language of the Mien group, but can nevertheless be shown to belong to the Hmong branch.

In terms of genetic relationship, the status of Hmong-Mien as a family of related languages is not in doubt, but external relationships have not been established in a satisfactory way. The formerly widespread inclusion of Hmong-Mien into the large Sino-Tibetan phylum has now generally been abandoned.

HO CHI MINH (1890–1969), North Vietnamese president. Born on 19 May 1890 in the village of Kim Lien, in the province of Nghe An in Vietnam, Ho was originally named Nguyen Sinh Cung. At ten, his name was changed to Nguyen Tat Thanh (Nguyen Who Will Be Victorious). In 1911, he left Vietnam for France. In 1919, when U.S. president Woodrow Wilson came to France, Nguyen tried to enlist his support for Vietnamese self-determination; rebuffed, he turned to communism. He became a member of the French Communist Party in 1920 and changed his name to Nguyen Ai Quoc (Nguyen the Patriot). From 1921 to 1929, Nguyen energetically participated in the political activities of the International Communist Party and published a book entitled *Revolutionary Path* in 1927. In 1923, he went to the Soviet Union to win support for his cause among exiled Vietnamese dissidents. His travels also took him to China, Burma, and India. On 3 February 1930, with the approval of

Ho Chi Minh in 1969. (HULTON-DEUTSCH COLLECTION/CORBIS)

Moscow and the support of China, Ho formed the Indochina Communist Party (later referred to as the Viet Minh) in Hong Kong.

Nguyen renamed himself again in 1940, as Ho Chi Minh (Ho Who Aspires to Enlightenment). In 1941, Ho was arrested in China on charges of being a spy for the French. In prison, Ho composed patriotic poems, which expressed his determination and the internal strength to achieve his goal of Vietnamese independence. In 1944, he returned to Vietnam, where he led resistance against both the French and the Japanese. He declared Vietnam's independence from France on 2 September 1945 and named the country the Democratic Republic of Vietnam (DRV). He served as the DRV's first president (1945–1969). The French were unwilling to accept Vietnam's independence, however, and the First Indochina War was fought from 1946 until France's decisive defeat at the battle of Dien Bien Phu in 1954. Vietnam was partitioned at the seventeenth parallel, with the DRV governing the northern portion. Ho, determined to reunite Vietnam, soon found himself fighting the United States; he died before reunification was achieved. The Vietnamese affectionately called him "Uncle Ho." Ho lived in a modest home in Hanoi until his death; that house is on display in Hanoi as part of the mausoleum built in his honor, which is visited by thousands every day. Although highly praised as an outstanding leader, he also received much criticism for his uncompromising strategies and his willingness to achieve his goals at any price.

HO CHI MINH CITY (2001 pop. 3.3 million). Located on the southern coast of Vietnam near the Mekong Delta, Ho Chi Minh City (Saigon) is a bustling and fast-growing city that has a long and storied history. Bordered by the Ben Nghe Channel to the south, the Thi Nghe Channel to the north, and the

Saigon River to the east, the city has been fought over by many groups over the past two thousand years. The area was first settled in the second century BCE by the Khmer empire of Funan (second century CE–sixth century CE), which used the forested area as a trading post and called it Prei Nokor, meaning "Land of Forests." Over the next centuries the trading post attracted merchants from Japan, India, China, the Middle East, Malaysia, and Champa (now part of modern day Vietnam). Over seven centuries, Prei Nokor slowly grew into a small market town and administrative center. Earthen walls were built as protection from the occasional Cham raids on the growing city. By the fourteenth century, Prei Nokor became part of the Angkor empire of the Khmer, sister empire to the kingdom of Champa. In 1674 the Nguyen lords, rulers of southern Vietnam who had defeated the Cham, established a customs post in the city. The Vietnamese, who called the city Saigon, dug a four-mile trench in 1772 on the western edge of the city and, in effect, transferred control of Saigon from the Angkor to the Nguyen. Beginning in 1778, Cholon, the Chinese part of the city, was developed as a second commercial hub in the area. In 1789, the Nguyen moved their government base from Hue to Saigon to escape the Tay Son rebels. In 1802, with French assistance, the Nguyen, under General Nguyen Anh (reigned as emperor 1802–1820), defeated the Tay Son, reunited Vietnam, and moved the capitol back to Hue. The French, after demanding territorial concessions in Vietnam for their assistance to the Nguyen dynasty during the rebellion, attacked and seized Saigon in 1859 and made it the capital of their new colony. After defeat at the hands of the Viet Minh in 1954, the French abandoned Saigon. The city then became the capital of the new Republic of Vietnam (RVN) and remained so throughout the Second Indochinese War between the United States and the Democratic Socialist Republic of Vietnam (DSRV). By 1975, the DSRV had defeated both the Americans and the RVN; when they took over Saigon, they renamed it Ho Chi Minh City after the leader of the Vietnamese independence movement who had died in 1969. Today Ho Chi Minh City, Vietnam's largest, is one of the fastest growing cities in the world, both economically and in population, and remains a city of diverse cultures and influences. The city celebrated its three-hundred-year anniversary in 1998.

HO CHI MINH TRAIL The Ho Chi Minh Trail was a 12,000-mile network of jungle roads and trails paralleling the Annamite Cordillera used by the North Vietnamese to transport communications, supplies, and troops to South Vietnam during the Vietnam War. The North Vietnamese began using the system in the late 1950s and quickly expanded and improved the trail's infrastructure in the 1960s as its use increased. A complex communication system arose

with underground barracks, repair shops, hospitals, and supply warehouses located at strategic points along the trail. With the trail's improvements, the duration of the trip was shortened from six months to one month, but the travelers still endured dangers such as malaria and wild animals.

It was imperative that the North Vietnamese control the vicinities of the trail, including sections in Laos. The Ho Chi Minh Trail entered Laos at Mu Gia Pass in Bolikhamxai province and traveled south through Attapu province, where the trail branched into Cambodia and South Vietnam. Lao cities located on the system include Pakxong, Salavan, Xekong, and Xepon.

U.S. military aircraft bombed the districts around the trail as well as where communists were active in Laos. The bombings escalated after 1964 when Lao

This map from 1970 shows the route of the Ho Chi Minh Trail from North to South Vietnam. (BETTMANN/CORBIS)

prime minister Souvanna Phouma announced his approval for U.S. armed reconnaissance flights over Laos in Operation Steel Tiger. The United States also released defoliants to expose the trail and ground troops in an effort to deter the North Vietnamese. During the Johnson administration the number of bombs dropped increased from three hundred to nine hundred a day. Despite being round-the-clock over a period of years, the bombings failed to stop the North Vietnamese from using the trail.

A major defeat for the United States and South Vietnam was Operation Lam Son 719 in 1971. The target of the operation was Xepon, a major outpost for the communists where the trail diverged into three arteries. The target was never reached, and the South Vietnamese army retreated after suffering over five thousand casualties. The U.S. lost over a hundred aircraft in this failed attempt to shut down the trail.

The effects of the bombings are still felt in Laos. Two million tons of bombs were dropped on Laos during the war, making it the most heavily bombed nation per capita. Accidents involving unexploded ordnance (UXO) occur on average on a daily basis. Teams of UXO detection and demolition specialists continue to comb the countryside in an effort to rid the country of the deadly threats, but the people of Laos will feel the impact of the bombings for decades as more explosives are unearthed.

HO DYNASTY CITADEL Also known as Tay Do (Capital of the West) or Thanh Nha Ho (Ho Dynasty Citadel), the Ho Dynasty Citadel is located in Tay Giai village in Hoa Binh Province, approximately 150 kilometers west of Hanoi. It was built in 1397 under the rule of Ho Quy Ly. Unlike other Vietnamese citadels, which up until that time had been built of earth, the Ho Dynasty Citadel was made of green block granite. The citadel's shape was square, with walls of 500 meters on each side. The walls were approximately five meters high and three meters thick. On each wall was a stone entrance, and the citadel it-

self was protected by deep ditches along each of its walls. The citadel did not serve a uniquely military purpose, however, for inside the enclosure the royal palace could be found. For ten years, the Ho Dynasty Citadel served as the seat of the Ho Dynasty's central government. In 1407, the citadel was abandoned and destroyed when Ho Quy Ly was captured and taken prisoner by Ming troops. The only vestiges remaining of the Ho Dynasty Citadel are its south wall and gate, and two carved stone dragons that formerly had been part of the royal palace's structure.

HO TUNG MAU (1896–1951), Vietnamese anticolonial leader. Ho Tung Mau was born in Quynh Doi village in Nghe An Province (in north-central Vietnam) in 1896. The son of a Vietnamese scholar, he obtained a classical education before becoming involved in anticolonial activities. In 1923, along with Ho Chi Minh (1890–1969) (then Nguyen Ai Quoc), Le Hong Phong (1902–1942), and three others, he co-founded the Society of Like Hearts (Tam Tam Xa), a Vietnamese anticolonial organization with anarchist leanings. In 1925 he helped found the Revolutionary Youth League (Viet Nam Thanh Nien Cach Manh Dong Chi Hoi). In March 1926 Ho Tung Mau joined the Chinese Communist Party and worked closely with Ho Chi Minh in China. While in China, Ho Tung Mau was arrested in an anti-Communist sweep in December 1928. He managed to escape from prison in August 1929, and in 1930 he became one of the founders of the Indochinese Communist Party (ICP). French police arrested him once again in China in 1931. Condemned to a life sentence, he was released from prison in 1945. Ho Tung Mau ultimately became a member of the ICP's Central Committee. He was a combat pilot and was reportedly killed in 1951 while engaging in an air attack during the Franco-Vietminh War (1946–1954).

HO XUAN HUONG (c. late 1700s–early 1800s), Vietnamese poet and feminist. Although the exact dates of Ho Xuan Huong's life are unknown, she must have lived in the late eighteenth to early nineteenth century. Being the only daughter of a high-ranking civil servant in the Late Le dynasty (1428–1788), she was well educated. She married several times, but for short spans; for some reason, all her husbands died not long after the wedding. She managed a salon frequented by poets and writers; there her talent shone in polished, elegant, but also daring and sexually evocative poems and retorts written in *nom* (Vietnamese demotic script). The following example describes falling down while coming home from school on a rainy day: "I extend my arms to see how high is the sky/ My feet slide to measure the width of the earth!" Another is a reprimand to a close friend who had become too venturesome:

Scholar, are you sober; are you drunk?
How dare you discourse about sex in the middle of
the day?
Come here! Come here so that your elder sister
may warn you:
Don't ever finger that place: it is the tiger's den!

HOA HAO One of the six officially recognized religions in Vietnam, Hoa Hao is a Buddhist sect founded in 1939 by a mystic from southern Vietnam, Huynh Phu So (1919–1947), who claimed to be the apostle of a famous Buddhist monk. The religion emphasizes personal faith and simplicity of worship and, therefore, has no special places of devotion. Like other Vietnamese religions, Hoa Hao has been highly politicized. The Viet Minh, an umbrella group of communist organizations seeking to expel the French colonial administration of Indochina, considered the Hoa Hao a rival for the support of the poor peasants in the Mekong Delta in their struggle against the French. The Hoa Hao received political and military support from the Japanese during their World War II occupation of Vietnam and then fought alongside French colonial forces against the Viet Minh after political negotiations between the Viet Minh and the French broke down in 1946. As a result, the Viet Minh murdered So in April 1947.

During the U.S. War in Vietnam (1954–1975), the Hoa Hao raised an army and fought both the communist-backed guerrillas and South Vietnamese forces, but their numbers were greatly diminished in the 1950s. With the overthrow of Republic of Vietnam president Ngo Dinh Diem (1901–1963) in November 1963, the Hoa Hao revived as a political and military force in the Mekong Delta and by 1975, claimed to have one million adherents.

Following the reunification of the country in 1976, the relationship between the Hoa Hao and the victorious communist government that disarmed them, confiscated their properties, and banned the religion became tense. Because of their militant anticommunist activities and ties to foreign-based opposition groups, the Hoa Hao arguably have been the most persecuted of all Vietnam's religious groups, and thousands of members have been arrested since 1976. Hoa Hao followers continue to fight for religious freedom and autonomy from government control, including the right to ordain monks, perform rites, proselytize, and control church properties. While in May 1999 the government did allow 160 Hoa Hao delegates to hold a congress and gave the Hoa Hao official recognition, as of 2001 the government continued to limit religious autonomy. Relations between the Vietnamese government and the Hoa Hao remain tense and often deteriorate into armed clashes, such as the December 1999 confrontation between security forces and 300 followers. As of 2001, there were approximately two million adherents, roughly 1–2 percent of the Vietnamese population, though the government put the figure at 1.3 million.

HOAN KIEM LAKE Located in the center of the Hoan Kiem District in the Old Quarter area of Hanoi, Hoan Kiem Lake (Ho Hoan Kiem or Ho Guom) is the spiritual and social heart of the city and serves as a major gathering point during national holidays such as Vietnam National Day and major festivals such as Tet (New Year's). The small lake is called "The Lake of the Restored Sword," after the legend of Le Loi and his defeat of the Chinese. Under the

leadership of Le Loi, a wealthy landowner in the province of Thanh Hoa south of the Red River delta, a movement of national resistance started in 1418 against the Chinese occupiers. After a ten-year struggle, the Chinese were forced to evacuate Vietnam. Le Loi, who ascended the throne shortly thereafter under the name of Le Thai To, became the founder of the third great Vietnamese dynasty, the Later Le (or the Le). Legend has it that Le Loi used a magic golden sword from heaven to vanquish the Chinese invaders. While he was boating on Hoan Kiem Lake in celebration of his successful campaign, a giant tortoise rose from the water and retrieved the sword for its heavenly owner. Real turtles live in the lake and are reported to be a uniquely large species (*Rafetus swimboei*) that are surfacing for air with increasing frequency as the lake becomes more polluted.

HOANG NGOC PHACH (d. 1973), Vietnamese writer. Although known as the author who introduced the romantic novel into Vietnamese literature with his work *To Tam*, Hoang Ngoc Phach's biography reads much more like a bureaucrat's than a writer's. Born into a family of scholars in Ha Tinh, Hoang studied the Confucian classics at home until the age of fifteen, when he went to Hanoi to attend a Westernized private school. In 1914 he entered the prestigious French-established high school of the Indochinese Protectorate. In 1922 he graduated from the Superior School of Education. He was appointed teacher, school principal, and superintendent of school districts by the French colonial government and, after 1945, by the government of the Democratic Republic of Vietnam (DRV). After 1954 he joined the Publications Committee of the Ministry of Education of the DRV, where he readied for publication a great number of classical Vietnamese literary works in Hanoi. In 1959, when the Literature Institute of the Social Sciences Committee was founded, Hoang became an active member of that institute and remained there until his retirement in 1963. Hoang is the author of several books and anthologies, but the one that immortalized him was his novel *To Tam*, which he wrote in 1922 and published three years later.

HOAT, DOAN VIET (b. 1942), Vietnamese dissident. Since 1971, when he returned to Vietnam following the completion of his doctorate in education from Florida State University, Hoat has been a leading dissident intellectual in Vietnam. Hoat was assistant chancellor of Van Hanh University, a private Buddhist university in Saigon, where he became active in the Buddhist peace movement. On 29 August 1976, following reunification of the country and the closure of all private universities, Hoat was arrested for his "ties" to the United States and imprisoned for twelve years. Following his release on 9 February 1988 he began to coedit *Freedom Forum*, an underground newspaper, published between January and November 1990, that called for democracy, an end to the Communist Party's monopoly of power, and religious and press freedoms. He and six others were arrested on 17 November 1990 for the crime of "attempting to overthrow the people's government." Following a closed-door trial, on 29 March 1993, Hoat was sentenced to twenty years in prison. His case attracted much attention from the international human rights community, including Amnesty International and PEN, as well as the U.S. government. He was released in September 1998 in a presidential amnesty and forced into exile in the United States. He has been the recipient of numerous prizes, including the Robert F. Kennedy Human Rights Award and the Golden Pen of Freedom Award.

HOI AN (1994 pop. 60,000). Located on the central coast of Vietnam, thirty kilometers (nineteen miles) south of Da Nang, Hoi An, or Faifo, as it was called in previous centuries, is a small, well-preserved riverside town that has a long history built from various foreign influences. From the second to the tenth century CE, the Kingdom of Champa controlled this important port city. Ensuing battles for control of the city between the Cham and the Vietnamese during the fourteenth and fifteenth centuries caused Hoi An to cease its role as a major trading center on the central coast. In the sixteenth century, however, peace between the two sides enabled the city to reestablish its trading role. Ships from Asia and Europe landed here seeking, among other items, lacquer, medicinal herbs, porcelain, and silk. This trade status survived more turmoil (the city was badly damaged during the Tay

Son Rebellion in the 1770s) and traders, particularly the Hainan, Canton, Fukien, and Chaozhou Chinese, built more and more off-season homes. Ethnic Chinese make up a large portion of the present-day Hoi An. After arriving in the late 1800s, the French made Hoi An an administrative post and built a rail line to Da Nang. With the established rail link and the fact that the Thu Bon River was filling up quickly with silt and thus cutting the city's access to the sea, Da Nang eventually eclipsed Hoi An as the region's major trading port. Today Hoi An is fast becoming a major tourist destination with its preserved and varied architectural homes and buildings, clean beach, bustling market, and numerous vendors selling local wares.

HOKKAIDO (2002 est. pop. 5.7 million). Hokkaido, the northernmost and second largest of Japan's four main islands (83,519 square kilometers, including the 5,010 square kilometers of the Japanese-claimed but, since 1945, Russian-occupied Southern Kuriles). Hokkaido is bordered by the Sea of Japan on the west, the Sea of Okhotsk on the northeast, and the Pacific Ocean on the south and east. The most densely populated areas are the Ishikari plain in the west and the Oshima Peninsula in the south. Seventy percent of the island is covered by mountains and forests and only 10 percent is agriculturally usable. Sapporo, with an estimated 1.8 million inhabitants (2002), is the capital of Hokkaido and its administrative center. Prehistoric relics have been found on Hokkaido, but the earliest Japanese merchant contacts with the indigenous Ainu on Ezo, as Hokkaido was called before its integration into Japan proper in 1869, date from around the twelfth century. Ainu rebellions against encroaching Japanese economic activities in the seventeenth century were suppressed. The central government organized the development of Hokkaido as a frontier region against an increasing Russian presence in the Far East, following the Meiji Restoration in 1868 until the period of the Hokkaido Colonization Office (1869–1882). At the end of the nineteenth century, American advisers exerted a strong influence on city

planning and agriculture. Hokkaido was built up as a Japanese base, mainly for food and natural resources, until the end of World War II.

Although Hokkaido gained some administrative independence in 1948 (with the Local Administrative Law), responsibility for Hokkaido's economic development remained mainly with the central government and the Hokkaido Development Agency (including ten-year development plans). From 1955, the primary sector (agriculture and natural-resources extraction) lost much of its dominant role in Hokkaido (going from 25.2 percent of the island's production in 1955 to 3.8 percent in 2000). A small manufacturing sector developed, but the most important pillar today is the private and government service sector (82 percent). At the start of the twenty-first century, Hokkaido (and, particularly, "Sapporo Valley") was trying to attract information-related industries.

Hokkaido has active intercultural contact with other northern regions in the world through the Northern Intercity Conference. Since the demise of the Soviet Union in 1991, relations with Russia's Far East have intensified (as shown by the 1998 Cultural and Economic Agreement with Sakhalin, the large Russian island to the north of Hokkaido).

Hokkaido's geographic isolation was greatly diminished through the construction of the Seikan Tunnel, for the railway, in 1988, which connected Hokkaido with Honshu. Hokkaido is famous for its beautiful scenery, large national parks, many ski resorts, and its distinct northern flora and fauna, and attracted 9.2 million tourists in 1998.

HOLI Holi, the festival of colors, is celebrated especially by Hindus in north, east, and western India.

Only inhabitants of the southern states of India do not mark this festival. Holi occurs on the full moon day of the month Phalguna (falling during February–March). On this day, men, women, and children of different classes and backgrounds join together in the morning and smear *gulal* (colored powder) and spray colored water on one another. Sweetmeats are communally shared. Everybody—rich and poor, powerful and dispossessed—feels equal to everyone else on this occasion.

This festival of colors has been celebrated since ancient times, with pomp and gaiety. According to the most popular story of the festival's origins, the demon-king Hiranyakashipu wanted to be regarded as God himself and set out to kill his son Prahalad, a great devotee of the god Vishnu. Vishnu, however, saved Prahalad, and Hiranyakashipu's daughter, the demon Holika, was burned to death. To celebrate this occasion, people lit bonfires on the night before the full moon.

HOLKARS The Holkars were a dynasty of Maratha rulers in eighteenth- and nineteenth-century India. Yashvantrao Holkar (or Jaswant Rao, 1776–1811) was historically the most important. He was an illegitimate son of Tukoji Holkar and a concubine, and rose to prominence in Pune (Poona) during a chaotic period. He gathered some loyal Bhil warriors and began raiding forays until he was powerful enough to seize the territories of Sindhia and challenge Kashi Rao, his own brother, whom he replaced in 1802 after conducting a war against the Peshwa and Sindhia. Then to prevent the British from entering Maratha country to reinstall the Peshwa, their sometime ally, Jaswant Rao placed an adoptive relative, Amrit Rao, on the Maratha throne at Pune.

Jaswant Rao's medieval strategy was to plunder so that war paid for war. He next declared war on the East India Company, but was beaten twice, in 1804 and 1805. Unable to form any alliances with such rulers as Sindhia, the Raja of Jodhpur, or Ranjit Singh, the Holkar ruler was obliged to sign a peace treaty with the British. This (1805) marked the end of the Second Anglo-Maratha War.

Jaswant Rao took a keen interest in the organization of his army, and conducted numerous roving campaigns which kept him in the saddle for long periods. He led a dissipated life, with heavy use of alcohol, and soon was to become insane after poisoning a nephew and his mother. After three years of insanity, Jaswant Rao died at the age of 35.

HOMOSEXUALITY When speaking of homosexuality, one must distinguish between male homosexuality and female homosexuality, or lesbianism. Asia has a rich cultural background when it comes to male homosexuality; China and Japan offer abundant historical evidence. Research on lesbianism in Asia has only just begun, but initial results suggest that lesbianism was not uncommon. Throughout Asia, homosexuality is often confused with transvestism (wearing the clothing of the opposite sex), and gay and lesbian individuals have often presented themselves as members of the opposite sex, thereby reinforcing the confusion. This has changed in recent years, however, particularly among middle- and upper-class gay and

GAY JAPANESE COMIC BOOKS FOR THAI WOMEN

Japanese comic books with male homosexual themes have found a new audience—Thai women in Bangkok who are evidently bored with traditional male-female stories and characters. Japanese publishers estimate that Thai women make up about 80 percent of the readership in Thailand. Why women are attracted to the comic books is unclear, although conservatives complain that the comics are offensive.

Source: Pichayanund Chindahporn. (2001) "Manga Goes on a Gender-Bender." *AsiaWeek* (16 November): 16.

lesbian people. In general, gays and lesbians in Asia do not see sexuality as the main determinant of their identity.

Traditional Male Homosexuality in China

In China the oldest-known reports of male homosexuality appear in the earliest poetry anthology of the Zhou dynasty (1045–256 BCE). In this period heterosexual marriages were frequently negotiated for other than romantic reasons, and men were free to search for satisfying sex and romantic love elsewhere, including in homosexual relationships. Homosexuality was typically structured in terms of class, with courtiers seeking the love of powerful men because of the concomitant benefits of such alliances, as in the instance of Lord Long Yang, who made elaborate efforts to prove his devotion to the king of Wei. During the Han dynasty (206 BCE–220 CE), the emperor's favorites attained enormous prominence at court, and in one instance the dying emperor Ai (reigned 6 BCE–1 CE) even gave the throne to his favorite, Don Xian. Don Xian's enemies, however, forced him to commit suicide and usurped the throne.

The first-known sources on homosexuality outside court life date from the Six Dynasties (220–589). In *Shishui xinyu* (A New Account of Tales of the World) by Liu Qing (403–444), male beauty is a major focus of attention. The Tang dynasty (618–907) provides fewer records of homosexuality at court than did earlier periods, although homosexuality was more often mentioned in literature and particularly in poetry. The first derogatory term connected with homosexuality, *jijian*, usually translated as "sodomy," surfaced during this period in the story of the male prostitute Xue Aocao.

During the Song dynasty (960–1279), homosexuality apparently continued to be more common outside court circles, and evidence for it increased. Whereas in earlier times patronage consisted of emperors and other high-placed persons bestowing presents and honors on their favorites, in the Song period this patronage took the form of straightforward prostitution in the major cities. Prostitutes rather than patrons were typically seen as passive and anally receptive, whereas in earlier times, the relationship had been one of love.

In the early twelfth century male prostitution was legally prohibited, but the law seems not to have been often enforced. The Ming dynasty (1368–1644) was a time of greater tolerance, with a flowering of literature depicting homosexuality, as ever marked by patronage relationships. During this period clashes over homosexual activity with foreigners occurred, for in-

stance in Manila, where the Spanish arrested and condemned Chinese immigrants, who protested that homosexuality was an accepted custom in their culture.

During the Qing dynasty (1644–1912), literature on homosexuality remained rich, and prostitution was common. In 1860 a Western visitor to Tianjin reported that there were thirty-five brothels and an estimated eight hundred boys engaged in prostitution. Sources of information about male prostitutes largely described actors, who were elite prostitutes. There were sodomy laws at this time, and under Manchurian influence intolerance toward homosexuality began to emerge, though the practice continued to flourish.

Traditional Male Homosexuality in Japan

In Japan, homosexuality has been related to the introduction of Buddhism. Kukai, also known as Kobo Daishi (774–835), the founder of the Japanese Shingon (True Word) sect of Buddhism, was said to have brought male homosexuality from China to Japan. Only from the tenth century, however, is there evidence of homosexual activity in Buddhist monasteries, with novices being seduced by older monks.

Male homosexuality also occurred among the samurai, especially during the Onin War (1467–1600). Male homosexuality was generally thought to be superior to heterosexuality, a view that was probably related to the defilement associated with the female body in both Buddhism and Shintoism. Moreover, love between men was practical during war campaigns, when male lovers could accompany each other.

In the Tokugawa era (1600/1603–1868), a third form of homosexuality came to the fore: that between the patrons and performers of Kabuki theater, an all-male Japanese drama form. The position of *kagama*, or Kabuki trainee, was often a guise for the practice of male prostitution. The popular *Danshoku okagami* (Great Mirror of Male Love) by Ihara Saikaku (1642–1693) provides many insights into the various forms of homosexuality in the Tokugawa period. During the Meiji period (1868–1912), Japan adopted a sodomy law based loosely on the Qing-dynasty legislation. It was, however, little enforced and soon revoked.

Traditional Male Homosexuality in Korea and Vietnam

In Korea, the institution of the *bwarang* (flower of male youth), an elite group of young warriors founded in the sixth century, emphasized such virtues as faithfulness to friends and courage in battle; it was also a seat of male homosexuality. Korea also had theater-related homosexuality, known as *namsadang*.

Little information has been published about homosexuality in Vietnam, but transsexuality and transvestism were apparently linked to shamanistic practices. Homosexuality was reported by Westerners, who reacted with outrage, as had Westerners visiting China and Japan, when they found that Vietnamese did not much object to the practice. Vietnamese legal codes do not mention homosexuality, and Vietnam did not follow the Qing dynasty in criminalizing sodomy.

Traditional Male Homosexuality in Islamic Cultures

As in East Asia, Western observers commented on the prevalence of homosexuality in Islamic cultures, and Islamic culture has a rich literary history of homosexuality. Only in recent years have Islamic people, like other East Asians, overlooked the occurrence of homosexuality. Islamic law in principle condemns homosexual activity as a form of adultery. It is not, however, seen as evil in itself. In practice, it is tolerated in most Islamic countries, as long as it takes place with discretion. Between 1979 and 1984 several men were executed in Iran for homosexual practices, but these events mark an exceptional period, when homosexuality was seen as evil in itself and as representative of Western decadence.

Traditional Male Homosexuality in India

In India the tolerance for homosexuality has been not unlike that in China and Japan. The *Kama Sutra* includes descriptions of men being fellated by eunuchs. According to Hinduism, homosexuality was less of an impediment to escaping the cycle of rebirth than was heterosexuality, although both forms of attachment had to be overcome to achieve immortality. In Indian Buddhism, however, homosexuality, like heterosexuality, was derogated to an extent. Nevertheless, love and friendship between men were considered preferable to similar relationships between men and women, and in monastic life laxity toward homosexuality sometimes existed.

So-called *bijras* (an Urdu word meaning "hermaphrodite," a person with both male and female sexual organs) were considered neither men nor women and were categorized as belonging to a third sex, with institutionalized roles as practitioners of female occupations like singers, dancers, and prostitutes. It was not uncommon for these *bijras* to have their genitalia cut off, but it is surmised that fully equipped gay men sometimes acted like *bijras* to be able to have sex with men. This does not mean, however, that there were not also many gay men who were not *bijras*.

Traditional Male Sexuality in Southeast Asia

Transvestism and homosexuality are confounded throughout Southeast Asia, where, for example, one finds the ladyboy or *katboey* of Thailand, the *waria* of Indonesia, and the *bakla* of the Philippines. These terms, rooted in local histories and cultures, refer to transgendered males (that is, males who feel feminine and dress as women), often working as prostitutes. Among these types, homosexuality is characterized by femininity, and the masculine partner, supposedly sexually active, is considered a "real" man, straight, not gay.

Female Homosexuality in Asia

The relative scarcity of information about Asian female homosexuality is partly attributable to the predominance of male researchers who have little access to places where women gather together. Islamic harems have been regarded as hotbeds of lesbian activity, but there is little proof of this notion. In Pakistan, female homosexuality has apparently met little opposition, as long as the women properly fulfill their roles of spouses and mothers. In fact a similar view can be discerned throughout Asia. Women's sexuality has not been considered as independent from men, and therefore whatever activities women engage in together are not taken very seriously by men.

Nevertheless there are depictions of women engaging in sexual activity with other women, often involving dildos (artificial penises). Examples include seventeenth-century Indian Mughal paintings and Japanese woodblock prints of the Edo era. In some of the latter, men spy on the women; the prints were probably used by men for their own pleasure and certainly represent a male viewpoint.

Traditional Female Homosexuality in China There is relatively well-documented information about women's communities in imperial China, especially in southern Guangdong. In such communities women could resist social demands that they marry, and particular economic opportunities enabled these women to live largely independently of men. This appears to have been the case in the silk industry. Women in these communities held marriage ceremonies and lived like couples. In Chinese-dominated states, including Singapore, such communities have persisted.

As early as the Han dynasty (206 BCE–220 CE), there is literary evidence of female homosexuality, including a love relationship between two slave women, as well as an empress's servant who dressed in male attire, suggesting a lesbian relationship. The famous

Qing dynasty novel *The Dream of the Red Chamber* also contains depictions of lesbian affairs.

Traditional Female Homosexuality in India In India texts that refer to female homosexuality appeared as early as 1500 BCE. In texts such as pre-Vedic hymns, dual goddesses were fused into twins, and those in female relationships were depicted as mothers, daughters, sisters, lover-maidens, and more, with clearly erotic undertones. Later, in Vedic times, heterocentrism (focus on heterosexuality) occurred in texts in which female relationships were broken up in favor of the formation of heterosexual couples.

Traditional Types of Female Homosexuality in Asia

As with male homosexuality, female homosexuality has often been confounded with transgender phenomena in Asia. In Japan for instance, the term *onabe* refers to a woman who dresses and behaves like a man. Many find employment in specific *onabe* clubs, where they entertain female clients. Most contemporary Japanese lesbian women, or *rezubian*, do not cross-dress, however.

In Indonesia, class differences seem to be expressed in various types of lesbian relationships. Butch (*sentul*)–femme (*kantil*) relationships, where butch women behave like men and femme ones like women, are more typical of poor, lower-class women. As in the case of male transgender types, the *sentul*, also known as *tomboi*, is generally seen as more lesbian than the nontransgendering *kantil*. Elite lesbians, however, have tended to align themselves with Western types of female homosexuality and have thereby found access to international networks denied to lower-class women.

Contemporary Male and Female Homosexuality in Asia

Homosexuality in Asia today continues to be associated with male as well as female transgender practices, but such viewpoints have begun to be questioned. Nowadays the words "gay" and "lesbian" are often used in place of the traditional terms, especially among highly educated people, who tend to distance themselves from the transgender implications of indigenous concepts. In Indonesia, for instance, there has been a clash between the *warias* and the gays, who see each other as rivals. The same "real men" who paid the *warias* for sex were paid by the gays to have sex. This matter has been resolved by talks between representatives of the two groups, and the conflict shows signs of dissipating, with gays adopting behavior typical of

warias by wearing drag (clothing typical of the opposite sex) and some *warias* becoming educated and thus equipped to associate with educated gays.

In China as well as Hong Kong and Taiwan, a movement has developed to accommodate this conflict between traditional and contemporary ideas of homosexuality. The common denominator used for gay men, lesbian women, transgender and transsexual people, and even sympathetic and supportive heterosexuals is *tongzhi*, which is the Chinese Communist term for "comrade." The introduction of the term *tongzhi* is a product of the wish to avoid the explicit sexual overtones of other terms for gay men and lesbian women and at the same time to create a network that overcomes the limitations of identity-oriented categories like gay and lesbian. Rather than creating a gay-straight binary, the aim is to question sexuality in general.

In other Asian countries similar attempts to circumvent the pitfalls of identity politics are occurring. Generally people seem to want to be accepted as decent citizens, without an emphasis on sexuality. In Japan there is a division between those who adopt the line of desexualization—a group that, unlike the *tongzhi* movement, does not include transgendered people, let alone heterosexuals—and those who take a more sex-positive approach, explicitly aligning themselves not only with transgendered people but also with sex workers. Members of the first group seem to have largely abandoned the idea of making an impact among Japanese lesbian and gay people and instead mostly direct their attention abroad or toward Japan's politicians and bureaucracy; the other movement is limited in number but is gaining adherents.

In most of Southeast Asia, literature on homosexuality is scarce, and, although the practice is common, it is little spoken of. The discourse of Asian values as promulgated by government leaders of Indonesia, Singapore, and Malaysia denies the existence of homosexuality among Asians, denouncing it as a Western perversion. Ironically this attitude seems to have arisen from an adherence to Western norms according to which homosexuality is a perversion; such norms were introduced during the colonial period and confirmed during the following period of Western cultural dominance. Contrary to the goals of Asian leaders, this denunciation of homosexuality seems to have led to its increased recognition. Gay and lesbian networks have developed throughout Asia and have contacted international organizations, such as the International Lesbian and Gay Organization. While the local branches of these organizations remain somewhat elitist, they are developing Asian perspectives of lesbian and gay

liberation and are accepting the various transgender types indigenous to their cultures, rather than simply following Western patterns.

HONEN (1133–1212), founder of Jodo (Japanese Pure Land) Buddhism. Honen initially studied the doctrines of the Tendai sect at Enryakuji temple on Mount Hiei near Kyoto. Dissatisfied with the political intrigues of the priests there, he became a mountain ascetic and continued his studies of Tendai teachings and those of the Nara sects. Finally, he came to the realization that few ordinary beings possess the ability to attain enlightenment through their own efforts. To the contrary, such striving is conceitedness that actually impedes emancipation. He concluded that one need only rely on Amida Buddha.

After leaving Mt. Hiei, Honen began preaching the exclusive practice of the *nembutsu*, unceasing meditation on and repeated chanting of the name Amida Buddha in order to obtain rebirth in the Pure Land. The notion that even those who did not devote their lives to Buddhist practice might achieve rebirth had great appeal among the general populace, bringing a sense of crisis to the priests of the older Buddhist sects. These sects appealed to the government to suppress the movement, and in 1207 Honen was banished to Shikoku. The banishment was lifted at the end of that year, and in 1211 Honen returned to Kyoto where he continued to propagate his ideas until his death.

HONG KONG (2001 pop. 6.7 million). Hong Kong was part of China's Guangdong Province until it became a British colony in 1842. In 1997, Hong Kong was returned to the People's Republic of China (PRC) and is now known as the Hong Kong Special Administrative Region. During its colonial era, Hong Kong became one of the most important import-export and finance economies in the Pacific region. Today, it remains a vibrant, modern Chinese city with a diverse range of cultural influences and a thriving capitalist economy.

The Dragon Statue and Hong Kong skyline from Victoria Peak in 1997. (STEPHEN G. DONALDSON PHOTOGRAPHY)

History

Located on the south coast of China near the mouth of the Pearl River, the area that is now known as Hong Kong comprises Hong Kong Island, Kowloon Peninsula, and the New Territories. Until the 1840s, this area was part of Xinan County in the Guangdong

Province of the Qing dynasty (1644–1912). The region was populated mostly by Han Chinese and Hakka (a Chinese minority people), and the local economy was dominated by pearl fishing, salt making, incense tree cultivation, and piracy and smuggling.

The British, seeking a new location from which to maintain their lucrative opium trade with China, occupied Hong Kong Island in 1841. They were granted formal control of the island by China in 1842 through the Treaty of Nanjing, which ended the First Opium War (1839–1842), and the island became a colony on 26 June 1843. The second Opium War (1856–1860) resulted in Britain's acquisition of Kowloon Peninsula, located across the bay from Hong Kong Island, and in 1898 Britain acquired a ninety-nine-year lease on the New Territories. Britain maintained control of Hong Kong until 1997, except from 1941 to 1945, when the Japanese controlled the territory. The impending end of the lease on the New Territories led to a 1984 agreement between the British and Chinese governments for Hong Kong's return to China as an autonomous region.

Political System

Under the British, the governor, who was appointed, had executive power and was assisted by a Legislative Council, of which a small percentage was elected. This system, which was made somewhat more democratic under the leadership of Governor Chris

PREAMBLE TO THE CONSTITUTION OF HONG KONG

Adopted on 4 April 1990; effective since 1 July 1997.

Hong Kong has been part of the territory of China since ancient times; it was occupied by Britain after the Opium War in 1840. On 19 December 1984, the Chinese and British Governments signed the Joint Declaration on the Question of Hong Kong, affirming that the Government of the People's Republic of China will resume the exercise of sovereignty over Hong Kong with effect from 1 July 1997, thus fulfilling the long-cherished common aspiration of the Chinese people for the recovery of Hong Kong.

Upholding national unity and territorial integrity, maintaining the prosperity and stability of Hong Kong, and taking account of its history and realities, the People's Republic of China has decided that upon China's resumption of the exercise of sovereignty over Hong Kong, a Hong Kong Special Administrative Region will be established in accordance with the provisions of Article 31 of the Constitution of the People's Republic of China, and that under the principle of "one country, two systems", the socialist system and policies will not be practised in Hong Kong. The basic policies of the People's Republic of China regarding Hong Kong have been elaborated by the Chinese Government in the Sino-British Joint Declaration.

In accordance with the Constitution of the People's Republic of China, the National People's Congress hereby enacts the Basic Law of the Hong Kong Special Administrative Region of the People's Republic of China, prescribing the systems to be practised in the Hong Kong Special Administrative Region, in order to ensure the implementation of the basic policies of the People's Republic of China regarding Hong Kong.

Source: International Court Network. Retrieved 8 March 2002,
from: <http://www.uni-wuerzburg.de/law/home.html>.

Patten in the 1990s, has remained essentially intact in the post-1997 era. In March 1990, the PRC's National People's Congress approved a Basic Law, based largely on English law, that constitutes the basis for Hong Kong's current legal system. Under this system Hong Kong has an appointed chief executive who serves for five years, an appointed cabinet, and a legislature that is selected by both direct and indirect elections.

As a condition for the 1997 handover, China agreed to maintain a "one country, two systems" approach to governing Hong Kong for fifty years. Under this sys-

tem, Hong Kong is to have a high degree of political and economic autonomy from China. Its foreign and military affairs, however, have been taken over by the PRC government. In addition, Hong Kong's chief executive is appointed by the PRC.

Geography

Hong Kong has a tropical monsoon climate. It has an area of 1,097 square kilometers with 733 kilometers of coastline and a large deep-water harbor. The territory consists of a peninsula and over two hundred small islands and is mostly mountainous with a very

small percentage of arable land. The hilly terrain provides relatively little living space, and so both Hong Kong Island and Kowloon have been enlarged through land reclamation. Architecturally, Hong Kong is composed almost entirely of large office and apartment blocks. Hong Kong is connected to the rest of China by waterways, such as the Pearl River, as well as railroads and roads.

Demographics

According to Hong Kong's 2001 census, approximately 80 percent of its 6.7 million people live on 8 percent of the land, making Hong Kong one of the world's most densely populated areas. Ninety-five percent of the population is ethnically Chinese, with Filipinos, Indonesians, the British, and Indians constituting the largest other ethnic groups.

Economy

Prior to its colonization by the British, Hong Kong had long been the site of both legal and illegal trade with neighboring Asian nations, Arabs, and some Westerners. Under the British, the colony replaced Guangzhou (Canton) as the principal locus of Anglo-Chinese trade in southern China, much of which, in the nineteenth and early twentieth centuries, was based on opium. This trade was controlled by a few large trading houses, known as *hong*. Following the establishment of the PRC in 1949, Hong Kong experienced a huge influx of refugee industrialists, mostly from the Chinese industrial city of Shanghai. These industrialists, using refugee labor that continued to flow into Hong Kong through the second half of the twentieth century, turned Hong Kong into a center of manufacturing and finance. Hong Kong has limited natural resources, however, and must import most of its food and raw materials. As China increasingly opened up for trade in the 1980s and 1990s, Hong Kong's economy again became more oriented toward China.

Culture

Hong Kong's culture has been influenced by its mostly Chinese population as well as its British colonial past. Its official languages are Cantonese and English. Its population has always been mostly Chinese, and this is reflected in the cuisine, popular culture, and many aspects of the landscape. The British elite who dominated colonial Hong Kong were mostly merchants, civil servants, and missionaries. As the post-1949 Shanghai industrialists established themselves financially, however, Hong Kong's elite culture became increasingly Chinese.

Hong Kong's colonial past led it to develop differently from the rest of China, especially during the period since 1949. Unlike the rest of China, Hong Kong has a thriving, free market, capitalist economy, and the very identity of Hong Kong is rooted in that successful economy. Although the PRC has committed itself to protect Hong Kong's economic and political autonomy until 2047, what, exactly, will be the impact of Hong Kong's reintegration into China remains to be seen. Will Hong Kong remain distinct from China, or will it become just another Chinese city?

HONG LOU MENG *Hong lou meng* (*Dream of the Red Chamber, The Story of the Stone*) is universally acclaimed as China's greatest work of fiction. It has been hugely influential ever since its appearance in the eighteenth century. A simultaneously realistic and mythical coming-of-age story of a young aristocrat named Jia Baoyu, the novel presents an encyclopedic and lyrical window onto traditional Chinese culture.

Circumscribed by a desire for a transcendent, feminized lyricism and by the need for socially embedded, masculine responsibility, Jia Baoyu's journey from childhood to adulthood probes the limits of self-realization for scions of elite families. A love triangle between Jia and two beautiful, learned, and sensitive young women, Lin Daiyu and Xue Baochai, who embody conflicting ideals of femininity, exacerbates the tensions between sense and sensibility. The story of the rivalry, friendship, and love between Jia, Lin, and Xue is set against the detailed portrayal of over four hundred characters of various social classes.

For all its panoramic scope and its wealth of erudition relating to literature, painting, philosophy, and medicine among other scholarly topics, *Hong lou meng*

is a deeply introspective and self-reflexive novel. Playing upon the conventions of Chinese historiography, fiction, poetry, and drama, the simultaneous designation of a stone as the repository of the story itself ("The Story of the Stone") and as the incarnation of Jia Baoyu ("False Precious Stone"), creates an elaborate dialectic between fictionality and reality, with one element continuously destabilizing the primacy of the other. In doing so, the novel slyly affirmed the power of fiction to represent human experience genuinely in an age that valued history as the primary vehicle of truth.

The author, Cao Xueqin (1715–1763), the impoverished and eccentric offspring of a once politically influential family, circulated the first eighty chapters in various manuscript drafts among relatives and friends. In 1791, two men published a version of 120 chapters. Cao is thought to have incorporated autobiographical elements into the text, though his authorship of the last forty chapters remains a subject of debate. Partly due to its adaptation into other popular media, including a highly successful television drama series in the 1980s in the People's Republic of China, the novel and its characters continue to be household names in many Chinese cultural contexts.

HONG SHEN (1894–1955), Chinese playwright and director. Hong Shen was born in China's Jiangsu Province and entered Qinghua University in 1912. Four years later, he went to the United States and studied ceramics at Ohio State University. In 1919, after the New Culture Movement started, he studied drama at Harvard University and theater performance and management at Boston Performance School. He was the first person from China to go abroad to study modern drama, which was only introduced to China at the beginning of the twentieth century.

After returning to China in 1922, Hong devoted himself to improving Chinese drama. As a director, he did not follow the traditional Chinese custom of using male actors in female roles. He also established the

modern Chinese director and rehearsal systems. Besides constructing directing theories, Hong wrote many plays. In the 1930s, as a main member of a left-wing drama organization, he wrote *Rural Trilogy*, which was composed of *Wukui Bridge*, *Fragrant Rice*, and *Dragon Pool*, and which showed the class struggle in the countryside.

Hong also played an important role in Chinese movie development. He was one of the leaders of the left-wing movie movement and wrote many movie screenplays in his life. After 1949, he became the vice chairman of the Chinese Dramatist Association and also held other leading positions in government. He died of cancer in 1955.

HONGCUN AND XIDI In 2000 two ancient Chinese villages, Hongcun and Xidi in Anhui Province, were selected for the UNESCO World Cultural Heritage List. The villages and their relics are preserved as a national historical treasure to interpret China's feudal rural past. Founded in 1131 by the Wang family, Hongcun thrived during the Ming (1368–1644) and Qing (1644–1912) dynasties. Xidi was built in the Northern Song dynasty (960–1126). Anhui also has a Neolithic site archaeologists hypothesized might be the origin of Chinese civilization.

Shaped like an ox, Hongcun's design emphasizes waterways. Approximately 140 historical stone buildings, courtyards, and alleys form a living museum. Lexu Hall, the Wang family ancestral temple, is located by a pond. Tourists can visit homes and purchase souvenirs related to village and family history. The village was the location for the 2000 movie *Crouching Tiger, Hidden Dragon*.

The architectural legacy of both villages reveals intricate workmanship, especially carvings, engraved in wooden beams, depicting social activities such as the Lantern Festival. Significant stone masonry includes a memorial archway at Xidi built in 1578.

Another southern Anhui ancient village site, at Lu'an, was discovered in fall 2000. Archaeologists estimated this village existed during the Western Zhou

dynasty (1045–771 BCE). Artifacts, including human and animal skeletons and weapons, provide insight into technological developments and the community's agricultural, trading, and military concerns.

HONSHU (2001 est. pop.101,000). Honshu is the largest of Japan's four main islands. From northeast to southwest, Honshu is a long, narrow island, 1,500 kilometers in length and 300 kilometers in width, with an area of 230,940 square kilometers. It makes up 62 percent of the total area of the Japanese archipelago and forms the main part of the country. Honshu consists of five regions: Tohoku, Kanto, Chubu, Kinki, and Chugoku; the Fossa Magna fault line separates the northeast from the southwest.

Regional physical features and natural resources are very diversified. Honshu is predominantly mountainous (the Japanese Alps), with plains along the coasts. High peaks that exceed more than 3,000 meters are Mount Fuji (3,776 meters), Mount Shirane (3,192 meters), Mount Okuotakadake (3,190 meters), and Mount Yarigadade (3,180 meters). The mountain ranges influence the climatic differences between the Pacific Ocean and the Sea of Japan. There is little rain on the Pacific Ocean coast in winter, whereas the Japan seacoast is characterized by snowy weather. The climate is temperate, and annual precipitation often exceeds 1,000 millimeters. Lake Biwa

is the largest lake on the island. In central and northern Honshu, mixed temperate forests are associated with conifers such as Japanese cypress, Japanese cedar, and pine.

Fishing is an important activity. Agriculture is regionally diversified. In the northern part of Honshu, products include apples, soybeans, cereals, and vegetables. In central Honshu, truck farming is predominant, with the production of vegetables, potatoes, and sweet potatoes. Along the Pacific and the Inland sea-coasts, the main products include wheat, sweet potatoes, barley, tobacco, and mandarin oranges.

The major economic activities and most of the population of Japan are concentrated in Honshu. The coastal areas of the Pacific Ocean and the Inland Sea, extending from southern Kanto to Yamaguchi prefecture, are the most industrialized and urbanized regions. This region includes major metropolitan areas such as Tokyo, Yokohama, Nagoya, and the Keihanshin (Kyoto-Osaka-Kobe), where 44 percent of the population is concentrated. Together with northern Kyushu, these districts are called the Pacific coastal belt.

On the other hand, regional differences in economic growth have accentuated regional disparities, particularly on the Japan Sea side. In Hokuriku Prefecture, traditional industries and rice farming are now declining, and depopulation in the Tohoku region is the result of increasing migration of the working population toward the Pacific belt. Due to increasing urbanization, living conditions are not improving, particularly with environmental problems such as noise and pollution.

Nathalie Cavasin

SHIRAKANI-SANCHI—WORLD HERITAGE SITE

Shirakani-Sanchi, in northern Honshu, is the site of the last untouched remnants of the beech forests that once covered Japan. Preserved as a UNESCO World Heritage Site in 1993, the forest houses many rare species and is historically significant as a glimpse at the natural forces that shaped Japan.

HORSE, AKHAL-TEKE The Akhal-Teke horse was developed on the southern fringe of the great Kara-Kum Desert of Central Asia, in the foothills of the Kopet-Dag Mountains along the border of modern Turkmenistan with Iran. It is probably the oldest purebred horse in the world; its tall stature, golden color, and beauty were known to the ancient writers. Marco Polo noticed the popularity of Turkmen horses ("Argamaks") among the Turks. Anatomical research

shows a great similarity between the modern Akhal-Teke and the English Thoroughbred horse. Some Akhal-Teke characteristics are also recognizable in the conformation of the Syrian Arab horse. Before the Russian takeover of the Transcaspian Region in the 1880s, the nomadic Turkmens of the Teke tribe bred Akhal-Tekes for mercenary raids as well as for racing. Later, in the USSR, Akhal-Tekes suffered heavy losses from mismanagement and direct slaughter. In 1935, Akhal-Tekes were used for a famous marathon trek from Ashgabat to Moscow (around 2,500 miles).

Only about 2,000 Akhal-Tekes now exist in the world, including between 1,200 and 1,300 in now independent Turkmenistan, where the state promotes this horse as a national symbol. "If the carpet is the Turkmen's soul, the horse is his wings," says the Turkmen proverb. A millennium-old cult of the noble Akhal-Teke horse also explains the fact that Turkmens, unlike other Muslim peoples of Central Asia, never use horsemeat for food.

HORSE, KARABAIR Also known as Karabair-skaya (Russian), the Karabair is one of the most ancient horse breeds of Central Asia. In appearance the Karabair resembles the Arabian, Persian, and Turkmenian as well as the steppe horse breeds. The breed is improved through pure breeding. Karabair horses show good endurance and versatile working qualities. This breed was developed in Uzbekistan and northern Tajikistan (former Soviet republics of Central Asia) under the influence of southern and steppe breeds. It is well adapted to both saddle and harness, and has the typical build of a saddle and harness horse. The coat color is bay, chestnut, gray, or black.

The Karabair horse is distinguished by sound health and average longevity. It is a good horse for long rides. The breed consists of three intra-breed types—basic, heavy, and saddle—as well as eight sire lines and five mare families. The Karabair are currently bred in all zones of Uzbekistan; the main studs

are in the Jizak region of Uzbekistan. The Karabair performs very well in sports, mainly in the equestrian game of *kokpar* (similar to the related Afghan sport known as *buzkashi*), in which riders fight over a goat carcass.

HORSE, LOKAI The Lokai is a mixed breed from Central Asia. At 140–150 centimeters high, it is the shortest of Central Asian horse breeds. Strong and sure-footed, it is a good riding and pack horse, agile and enduring. Its coat is gray, bay, or chestnut (often with a golden tint), sometimes curled. It is an excellent riding horse, well-suited to competitive sports. The Lokai originates from the Pamir Mountains, now in Tajikistan, south of the Tian Shan range. Its name comes from the Lokai tribe of Uzbeks who, starting from the sixteenth century, improved this breed by crossing it with Akhal-Teke, Karabair, and even Arabian horses. The Lokai horse is common in Uzbekistan and Tajikistan, where it is a good, tough saddle and pack pony in its native mountains, at altitudes of 2,000 to 4,000 meters. It can carry a rider eighty kilometers a day over mountain tracks at an average speed of eight or nine kilometers per hour. In a nomadic tradition, the mares are also milked. The tough and swift Lokai is famous for its use by Tajik riders in the equestrian game of *kopar* (*kokpar*) where riders fight over a goat carcass (similar to the related sport of Afghanistan known as *buzkashi*).

HORSE, PRZEWALSKI'S Przewalski's horse (*Equus przewalski*), or *takhi* in Mongolian, is the last remaining species of wild horse in the world. Przewalski's

horse stands around 1.3 meters high, has a large head, a short stocky body, and an upright mane. It has a solid tan coat with a black stripe running along its back, faint zebra stripes on its lower legs, and lighter coloring around the muzzle. Some experts argue that it resembles the common ancestor of all modern horses.

The wild horse was brought to European attention by the Russian naturalist Nikolai Michailovitch Przewalski (1839–1888) after he observed several of the species in Mongolia in 1881. Soon after his sighting, hunting pressure and competition for grazing land and water led to the horse's gradual extinction in the wild. The last reliable sighting in the wild of this horse occurred in 1969 near the Takhin Tal (Wild Horse Mountain) in Mongolia. From a population of thirty to forty Przewalski horses in zoos around the world in 1950, several hundred have now been bred in captivity. In 1992 a breeding group of Przewalski horses was introduced to Mongolia in the hope of later reintroducing the animals to the open steppe.

HOSEN, IBRAHIM (1917–2001), Indonesian religious figure. Ibrahim, a son of Hosen bin Abdul Syukur, emerged as a colorful religious figure in Indonesia, with bold and unorthodox opinions. He was born in the South Sumatran town of Bengkulu to a Bugis father and a South Sumatran mother. During Ibrahim's early years, his father took the family first to Jakarta and Singapore, where he was in the retail business, and then to Lampung in South Sumatra, where he ran a religious school. Ibrahim's four-year stay in Singapore as a child and pupil at the As-Sagaf School left a strong imprint on his worldview, which tended to be tolerant, open-minded, modern, and pluralist. In 1934 he went to Java for further study of the Qur'an, Islamic law, Arabic literature, and rhetoric. According to his biographers, Ibrahim met and studied under a number of religious scholars and Hadrami (Yemeni Arab) teachers in Java.

After one year of study and travel in Java, Ibrahim returned to South Sumatra. In 1939, for the first time,

he successfully represented an established school of Islamic law in a debate, defending its stance on many social and religious issues. During the rapid political disruption in the 1940s, precipitated by the Japanese occupation of Indonesia during the Pacific War and the return of the Dutch, Ibrahim, as a religious scholar-cum-official, energetically took part in socioreligious and political activities in the region of Bengkulu, his native town. He married twice, in 1946 and again in 1948 following the death of his first wife, and had eight surviving children.

In 1955 Ibrahim went to Cairo to study at al-Azhar University. Returning to Indonesia with a degree in Islamic law in 1960, he joined the Department of Religious Affairs in Jakarta. In 1964 he was appointed rector of the newly opened State Institute of Islamic Studies in Palembang.

Following the major political changes in Indonesia in the mid-1960s in the wake of the purge of the Indonesian Communist Party and the rise to power of Suharto, Ibrahim began a major career as a national figure. In 1966 he moved to Jakarta, assuming the post of bureau chief in the Department of Religious Affairs. He continued to occupy an important post in the department until his retirement in 1982. At the same time, capitalizing on his credibility as a religious figure and official, Ibrahim won financial support from many wealthy sponsors to institute and lead two centers of higher learning for Qur'anic studies in South Jakarta, one for men, in 1971, and another for women, in 1977.

Ibrahim was appointed to the chairmanship of the Indonesian Council of Religious Scholars in 1980. Here he found an official platform from which to launch his religious views, considered by many Indonesians to be innovative but also controversial, on account of his toleration of beer drinking, bank interest, the lottery, and contraceptive devices. Although Ibrahim did not write major works detailing his jurisprudential principles, religious philosophy, or reformist ideas, he responded to the religious controversies that occupied the minds of many Indonesian Muslims.

Ibrahim's religious interpretations arose in the context of the nature of Islam in Indonesia, with its often-declared openness, moderation, tolerance, and pluralism. He responded positively to the tolerance and open-mindedness of his countrypeople, and at the same time he saw the religious justification for many practices under scrutiny, such as those mentioned. This religious predilection, not surprisingly, annoyed or even angered many religious leaders who strictly adhered to scripture. At some point, he was even

branded a religious scholar who could be hired to issue legal opinions or a religious scholar who always supported government policy.

Ibrahim himself claimed that his approach to any issue was based on the Islamic legal principle of permissibility; that is, that all matters are inherently permissible. Only when there are specific and unequivocal prohibitions in Islam does such permission end. Considering his religious and educational background, Ibrahim can be seen to belong to a scholarly tradition that tackles religious issues on the basis of Islamic jurisprudence, or a legalistic approach. All his references and quotations may be traced to earlier opinions of Muslim jurists or their equivalents. Not surprisingly, he claimed that his legal opinions were not novel, let alone un-Islamic, since his rulings were based on earlier, established scholarly opinion.

HOUSEHOLD RESPONSIBILITY SYSTEM—CHINA The household responsibility system has been a crucial national policy of the Chinese Communist Party (CCP) since 1978. Literally, "responsibility" means that an individual household, or a set of households, assumes the task of production for and payment to the government. As University of Hong Kong scholar Steven Cheung notes, the so-called responsibility contract is "equivalent to the granting of private property rights [sic] through a state lease of land. . . . The duration of the lease may be any number of years or, in principle, it may be in perpetuity. Ownership is not relinquished by the state, but the rights to use and to obtain income are exclusively assigned to the lessee. The right to transfer or to sell the leased resource may take the form of subletting. Various dues exacted by the state may be lumped together in the form of a fixed rent, and since this rent is paid to the state it becomes a property tax" (Cheung 1990: 22).

The household responsibility system was introduced four times in Chinese history: 1957, 1959–1961,

1964, and 1978. In its first three incarnations it was permitted only in extremely poor areas, such as the provinces of Anhui and Sichuan, where it was introduced in an attempt to rescue the provinces from their agricultural crises. A number of Chinese leaders, including Deng Zihui (1896–1972) and Liu Shaoqi (1898–1974), tried to implement the household responsibility system more extensively, but Mao Zedong (1893–1976) crushed their attempts. For instance, in 1961, the secretary of the CCP in Anhui Province tried to employ the household responsibility system throughout the province by requesting permission from the central government. His proposal, if accepted, would have meant a decentralization of power because it would have given provinces more authority to make decisions relating to provincial governance. Along with Liu, many other leaders, including Deng Zihui and Chen Yun (1905–1995), supported reform of the agricultural sector. However, Mao rejected the proposed reforms, accusing these leaders of encouraging capitalist initiatives and widening the gap between rich and poor among Chinese farmers.

Despite prohibitions at the national level, a few areas experimented with the household responsibility system. A village in Guizhou Province adopted the system secretly for more than ten years before 1978. The village did not dare to admit its practice of the official household responsibility system until the new policy was announced. Toward the end of 1978, in Feixi County and Chuxian Prefecture in Anhui Province, a small number of production teams (a communal unit) began to try the system of contracting land, other resources, and output quotas to individual households. However, the practice was restricted to the poor agricultural regions.

Zhao Ziyang (b. 1919) launched the household responsibility system as a reform in Sichuan Province in 1975, during his tenure there as general secretary of the CCP. In 1980, as Deng's protégé, Zhao was made prime minister of China. Subsequently, almost all households in China's rural areas adopted the household responsibility system as national policy by the end of 1983.

Mandatory Production Targets

Prior to 1980, Chinese farms were given mandatory production targets that extended to yields, levels of input applications, and planting techniques. Members of a production team, working under the supervision of a team leader, were credited with work points for jobs they performed. At the end of a year, net team income was first distributed among members accord-

ing to some basic needs; then the rest was distributed according to the work points that each one accumulated during that year. Work points were supposed to reflect the quality and quantity of effort that each member performed rather than the result of his or her efforts. Therefore, the work point system was not an incentive scheme.

In contrast, under the household responsibility system, land is contracted to individual households for a period of fifteen years. After fulfilling the procurement quota obligations, farmers are entitled to sell their surplus on the market or retain it for their own use. By definition, peasants become residual claimants. The marginal return on their efforts is the marginal product of their efforts. In other words, by linking rewards directly to effort, the contracting system enhanced incentives and promoted efficient production. The most conspicuous effect, however, is the impact on productivity arising from the increased incentive to work. It is estimated that total factor productivity increased 15 percent as a result of the improved incentives inherent in the household responsibility system. The household responsibility system reform was implemented in 1979 and was completed in 1984. During this period, agricultural output increased by 45 percent. About one-third of the output growth between 1979 and 1984, therefore, can be attributed to the household responsibility system reform alone.

The Key to Economic Reform

The household responsibility system symbolized the key to economic reform. Eventually, the system spread to areas other than agriculture. Whereas it took a revolution to abolish private property, the process in reverse may be done through peaceful contracting. The word "private" was scrupulously avoided until March 1988. However, as it turns out, the so-called responsibility contract, with all its modifications and refinements, is a Chinese version of the deed of trust—the right to use and develop land that one does not own outright. The contract is not in perpetuity. Individual households running their own small enterprises can now be found everywhere, and in southern China even state-owned enterprises now refuse to hire state employees; rather, they opt for contract workers. In July 1988, for instance, a Japanese firm won a public auction of land—a first for nonagricultural use in China. Importantly, for the first time since the Communist Revolution, a foreign entity had openly gained a private interest on China's soil.

The responsibility contract as applied to agriculture comes very close to what in the Western world is a

grant of private property in land. The main defect of the production system as an institution for agricultural development is its incentive structure. One of the major reasons for the success of China's economic reform today, unlike that of the former Soviet Union, is the household responsibility system. Nevertheless, the household responsibility system faces some problems, including declining arable land area, stagnating grain production, and shrinking income at the rural level. As a result, millions of peasants have migrated to cities such as Beijing and Shanghai to seek employment.

HSUN-TZU. See **Xunzi**.

HU JINTAO (b. 1942), political leader of China. Born in Shanghai in December 1942, with ancestral roots in Anhui Province, Hu Jintao graduated from China's Qinghua University, Department of Irrigation Engineering, in 1965. He joined the Chinese Communist Party (CCP) in April 1964 and became a political/ideological counselor for students while in college. After graduation, he became an engineer at

the Liujiaxia Irrigation Works in Gansu Province, northwestern China.

Chosen by Deng Xiaoping (1904–1997) to be the yet-to-be-confirmed paramount leader of the so-called fourth generation of leadership of the People's Republic of China (PRC), Hu has ranked as the fifth and the youngest standing member of the seven-member Political Bureau of the CCP since 1997. His current posts include vice president of the PRC and vice president of the CCP's Military Affairs Committee. He has held the posts of head of the Chinese Communist Youth League (January 1983–July 1985), party secretary of Guizhou Province (July 1985–November 1988), and the eighth party secretary of the Tibet Autonomous Region (December 1988–January 1991).

Hu is known for his deep affiliation with the Chinese Communist Youth League, his longtime supervision of the CCP's ideological work and the training of the CCP's young ideologues, and his crackdown on the Tibetans' uprising in Lhasa, Tibet's capital. He generally evades media coverage and has granted especially little access to the international media.

HU SHI (1891–1962), Chinese intellectual. Born in Jixi, Anhui Province, Hu Shi was China's leading liberal scholar and educator of his time. Hu laid an important foundation for the 1919 May 4th Movement with an essay published in 1917 in the Chinese journal *Xin Qing Nian* (New Youth), which advocated the avoidance of the classical language and the adoption of the vernacular in literature. *Chang Shi Ji* (The Trials), his collection of poetry published in March 1920, was the first noticeable attempt at vernacular poetry in modern China. During the May 4th period, Hu criticized Confucianism and called for individualism and women's liberation. From 1917 to 1948, Hu worked at Beijing University at intervals, serving as the chair of various departments, academic dean, dean of humanities, and university president. The framework he designed in 1922 for the Chinese school system, from primary school to college, remained in practice until the early 1950s. He died as president of the Academia Sinica in Taiwan, which position he had held since 1958.

Hu studied at Cornell (1910–1914) and Columbia (1915–1917, awarded a Ph.D. in 1927), served as China's ambassador to the United States (1938–1942), and resided in the United States from 1949 to 1958. A student of the West, he promoted Western ideas in China in an attempt to better serve the country. However, his advocacy of the total Westernization—reworded later as Internationalization—of China in his earlier years has remained controversial.

HU YAOBANG (1915–1989), Chinese Communist Party reformer in the 1980s. Born in Hunan Province into a peasant family in 1915, Hu Yaobang joined the Red Army and the Chinese Communist Party (CCP) and was included in the 1934–1935 Long March. His career was closely linked with that of Deng Xiaoping (1904–1997). Along with Deng, Hu was purged twice during the Cultural Revolution (1966–1976) and was sent into the countryside for "reeducation." He gained membership in the CCP Politburo in 1978 with Deng's support. Hu organized the rehabilitation of intellectuals disgraced during the Cultural Revolution and presided over a radical liberalization of the party structure between 1982 and 1986.

Hu supported combining economic liberalization with political liberalization. On 16 January 1987, he resigned as general secretary of the CCP after he was forced to accept responsibility for student demonstrations that occurred in December 1986. He went into seclusion, although he remained a member of the Politburo. On 15 April 1989, Hu died of a heart attack. His resignation and subsequent death dimmed the hopes of those who supported political reforms. His funeral sparked student demonstrations that ended with the Tiananmen incident in June 1989.

HUANG HAI. See Yellow Sea.

HUANG RIVER Called "China's sorrow," or Huang Ho in Chinese, the Huang (Yellow) River is the second-largest river in China, flowing 5,954 kilometers from its origins in the Bayan Harshan Mountains on the Qinghai-Tibet Plateau in western China until it empties into the Bo Hai Gulf. The Huang River derives its name from the yellow color of the silt in the water. Each year, tons of silt are deposited on the riverbed, causing annual flooding. The Huang River flows east and then northeast through Qinghai, Gansu, and Ningxia Provinces and then through Inner Mongolia before turning south, forming the border of Shaanxi and Shanxi Provinces. From there, the Huang turns east through Henan and Shandong Provinces before emptying into the Bo Hai Gulf.

Throughout China's long history, the Huang River has overflowed its banks, causing extensive damage to nearby farmland and surrounding communities. Dikes have been built to stem the flooding but have to be continually rebuilt to prevent the river from overflowing its banks. The river has also changed course many times, causing untold damage. During the Yuan dynasty (1279–1368), the Huang River changed its course from northern to southern Shandong Province, flooding 7,769 square kilometers of farmland. Between

1853 and 1855, the river began flowing through northern Shandong Province, destroying large areas of farmland. In modern times, General Chiang Kai-shek (1887–1975) ordered his troops to destroy the dikes along the river in Henan Province, causing disastrous effects, including the drowning of 1 million Chinese civilians.

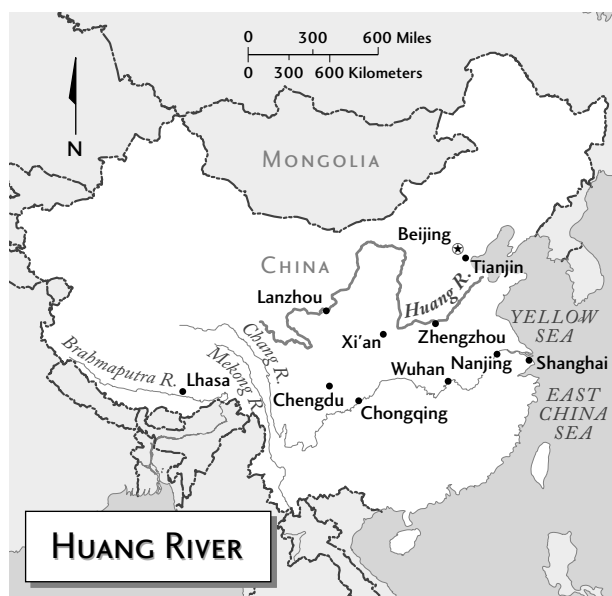

The lower region of the Huang River is considered the birthplace of Chinese civilization, because archaeologists have discovered sites dating as far back as 5000 BCE and have chronicled the emergence of the Yangshao culture (5000–3000 BCE) and the Longshan culture (3000–2200 BCE) on the North China Plain along the Huang River. Since 1949, the Chinese government has accomplished many flood control and reforestation projects to conquer the capricious nature of the river.

HUANG SHAN Mount Huang (Huangshan), known as the "most beautiful mountain in China," is located in the southern part of Anhui Province in eastern China. Huang Shan actually is a complex of mountains, covering 154 square kilometers (50 square miles), with seventy-seven peaks above 1,000 meters (3,280 feet). Lotus Flower, the highest peak, reaches 1,864 meters (6,116 feet) above sea level. The mountain has a complex geology but consists mainly of granite rock; the formation derives from faulting and folding processes dating back 100 million years.

HUANG SHAN—WORLD HERITAGE SITE

An important theme in sixteenth-century Chinese Shanshui art and literature, this spectacular granite mountain remains a popular subject for artists and photographers. It was designated a UNESCO World Heritage Site in 1990.

Huang Shan consists of numerous weirdly shaped rock pillars, and frequent fog and mist give the appearance of stone islands rising from a sea of fog. The area also contains waterfalls, lakes, hot springs, and pine forests. From the Tang dynasty (618–907 CE) on it has assumed great importance in Chinese culture, being extolled in art and literature. Huang Shan was proclaimed a site of scenic beauty and historic interest by the Chinese government in 1982 and inscribed on the World Heritage List in 1990.

HUANGLONGSI Huanglongsi, China, and the neighboring ravine to the north, Jiuzhaigou, are two outstanding natural resource areas on the Tibetan plateau. Both areas are national parks and have recently been designated by the United Nations as World Heritage Sites for their extraordinary natural scenery. Jiuzhaigou (Ravine of the Nine Stockade-Villages) is named after the rural Tibetan communities (*sde dgu*) that populate the area and is most notable for dramatic waterfalls and glacier-formed lakes. The limestone geology of the area, combined with hot spring algae growth, has produced an incredible range of colored waters (turquoise, green, yellow, and milky white). Formerly the domain of giant pandas, much of the area was heavily logged in the 1980s. Red pandas, golden monkeys, takins (large ruminants), and water deer are said to still populate the region, but vast areas of rhododendron, wild roses, clematis, and wild ginger are more easily found.

Yellow Dragon Temple (Chinese: Huanglongsi) is a Taoist monastery located in Sichuan Province, China, 35 kilometers from the county seat of Songpan. Because it is located so high (3,430 meters) in the Minshan mountain range, the temple was previously known as the Snow Mountain Temple (Yueshansi). The temple is situated at a pass into a forested valley surrounded by glaciated peaks (up to 5,000 meters) and dotted with over three thousand natural pools of various-colored water, from which the Tibetan name of the temple,

Gser mthso lha khang (Yellow Pool Temple), is derived. The existing structure was founded in the Ming dynasty (1368–1644) and is the rear, and only surviving, of three halls built at that time.

HUBEI (2002 est. pop. 63.3 million). Hubei (Hubei, Hupeh), a central China province that covers an area of 185,900 square kilometers, borders on Sichuan and Shaanxi in the west, on Henan in the north, on Anhui in the east, and on Hunan and Jiangxi in the south. The province is traversed by the Chang (Yangtze) River from west to east, with the greater part of the province located north of the river. More than three-fourths of the province is hilly and mountainous, with peaks in the western parts reaching to more than 3,000 meters, while the eastern part mainly consists of low-lying plains.

The climate is subtropical, with monsoon rain in spring and summer. Summers are hot and humid; winters generally are mild. The annual average precipitation varies between 700 and 1,700 millimeters, which is the highest average in the southeast. The vast majority of Hubei's population lives in rural areas along the rivers and in the lake district in the eastern part where the capital, Wuhan (4.4 million, 1994), also is situated.

Wuhan was originally three cities separated by the Han and Chang Rivers, but these were joined by bridges in the 1950s. During the Eastern Zhou dynasty (770–221 BCE), the Hubei area was the center of the Chu kingdom, and copper mines were operating near present Daye County, not far from Wuhan. With the unification of China in 221 BCE, Hubei became part of the Chinese empire, but it was not until the Tang dynasty (618–907 CE) that immigration from the north accelerated and the province became a wealthy rice-producing area. In the nineteenth century, the province suffered greatly under the Taiping Rebellion (1851–1864). Cities along the Chang River were

opened for trade with the Europeans, and tea became a major commodity. The rebellion that ended the Qing dynasty (1644–1912) originated in Hubei. During the Japanese occupation of eastern China, parts of Hubei were controlled by Japanese troops, and industrial works were bombed.

Large areas of the province are well suited for agriculture; the major crops are rice, wheat, corn, sweet potatoes, cotton, and rapeseed. Products indigenous to Hubei include lacquer, tangerines, tremella, camphor trees, and various sorts of medical herbs and tea. The iron works and steel yards of Wuhan are among the largest in China, and its industry manufactures farm machines, railcars, engines, transport machinery, and so forth. In 1994 the Chinese government initiated the so-called "Three Gorges Dam," a gigantic dam to be built just west of Sandouping, located about thirty-five kilometers west of the river port of Yichang. The project is scheduled to be completed in 2009, by which time the reservoir behind the dam will extend about 500 kilometers upstream, having displaced an estimated 1.9 million people in western Hubei and the neighboring province of Sichuan.

HUE (2001 pop. 262,000). Located thirteen kilometers inland from the South China Sea on Vietnam's central coast and bisected by the Song Huong (Per-

fume River), Hue is regarded by many as Vietnam's artistic, spiritual, and cultural center. Hue was Vietnam's capital and the Imperial City during the Nguyen dynasty (1802–1955). Even as early as the second century BCE, Hue was home to rulers. From 111 BCE to 222 CE, the Han dynasty (206 BCE–222 CE) Chinese empire occupied Vietnam; during this time, the city (then called Tay Quyen) was headquarters for the Han army. Local chieftains captured the city in the second century CE and renamed it K'ui Sou. The Vietnamese and Cham (who ruled central Vietnam from the second to fifteenth century as the Kingdom of Champa) fought over the city between the tenth and fourteenth centuries. By the fifteenth century, the Vietnamese had captured the city and renamed it Phu Xuan.

In 1847 two French warships bombarded Tourane (Da Nang), to protest the Vietnamese treatment of French missionaries in Vietnam. The attack killed an estimated 10,000 Vietnamese civilians. Emperor Thieu Tri (ruled 1841–1847), recognizing the French technological power advantage, sued for peace, the first step down the road to the establishment of a French protectorate over the country. During the U.S. War in Vietnam, Hue was devastated by the fighting, especially during the 1968 Tet Offensive, which destroyed much of the old Imperial City and Citadel.

Hue continues to adapt itself to different times and circumstances. Today, Hue's main draw is its past. Every year thousands of visitors flock to the ancient Vietnamese capital to soak up its rich history. Elaborate tombs of emperors, ancient pagodas, outstanding cuisine, the Imperial City and Citadel, and a flourishing art business will keep Hue bustling with activity and tourists for years to come.

HUI Hui is a state-recognized nationality of China that is characterized by being Muslim religiously but Chinese culturally. Alternative names include Huihui and Dongan. The Hui are among the most populous of China's minorities. The 1990 census put their population at approximately 8.6 million, third after the

HUE—WORLD HERITAGE SITE

A UNESCO World Heritage Site since 1993, Hue was the capital of Vietnam during the feudal Nguyen dynasty. All but abandoned now, the Hue monuments are a poignant reminder of imperial Vietnam.

The Great Mosque in Xi'an, one of the oldest and largest mosques in China and spiritual center for the large Hui population in the city. (CARL & ANN PURCELL/CORBIS)

Zhuang and Manchus. The Hui are also the most widely distributed of China's minorities. Although the main concentrations are in the northwest, such as in Ningxia, Gansu, and Shaanxi provinces, communities also exist in Yunnan and elsewhere, and even in Hong Kong, Taiwan, and overseas Chinese communities. Most are Chinese-speaking, retaining Arabic only to read the Qur'an.

Muslims have lived in China since the seventh century CE, notably in the southeast. But it was not until the Mongol conquest of the thirteenth century that many came, gradually becoming settlers, not immigrants, and adopting Chinese culture, speaking Chinese, and marrying Chinese women. To this day, most Hui maintain a belief in a single God, abstain from pork, practice circumcision, and attend mosques in Hui communities. Intermarriage is becoming more common, but it remains infrequent. Hui dedication to Islam is much stronger in the northwest than elsewhere. In the southeast, some people of Muslim descent regard themselves as Hui while following customs and beliefs hardly different from their Han neighbors.

The Hui Muslim tradition is Sunni, but sectarian divisions have been common historically. Relations with the Han Chinese have often been contentious. The nineteenth century saw a high point in Hui rebellions against Chinese regimes. However, since China became a republic in 1912, the Hui have generally been loyal to the Chinese state and fought for

it against foreign enemies and even against non-Hui Muslim rebels. During the Cultural Revolution (1966–1976) Muslims were persecuted and mosques were desecrated; the Hui suffered serious religious and ethnic persecution and many hid their identity. However, the Hui remain loyal to China, showing little support for and much opposition to Muslim secession from China. Since the early 1980s, Hui ethnic consciousness has revived strongly.

A tradition of Hui Chinese-language Islamic scholarship developed in China, including in mysticism (Sufism). In addition, the Hui have contributed to such Chinese arts as the Peking Opera. Their tradition of commercial skills remains strong to this day. Over the centuries they have been sinicized, and currently few physical or nonreligious cultural characteristics distinguish them from the Han. The Hui do well socially and educationally, with literacy rates among the highest of the minorities; many urban Hui, including women, enter the professions.

HUK REBELLION The Hukbalahap, a Tagalog acronym for the Hukbo ng Bayan Laban sa Hapon (People's Anti-Japanese Army), was founded in March 1942 as the military arm of the outlawed Partido Komunista ng Pilipinas (PKP), or the Communist Party of the Philippines. The Hukbalahap (or Huks) sought to defeat Japan, destroy the exploitative landholding system in Central Luzon that for decades had resulted in widespread peasant poverty, and ultimately establish a communist government. As a large and well-organized guerrilla group, the Huks inflicted heavy casualties on the Japanese army, and, significantly, killed an estimated twenty thousand Filipino collaborators, class enemies, or personal rivals. When Japan surrendered, the Huks controlled many local governments in Central Luzon and had appointed governors of Pampanga and Laguna provinces.

Seven Hukbalahap-supported politicians, including Huk Supremo Luis Taruc, were elected to the Philippine Congress in 1946. Their expulsion from congress to ensure the passage of a constitutional amendment favorable to American economic interests and President Manuel Roxas's "mailed fist" policy drove the Hukbalahap underground and into armed conflict with the government. From the four Central Luzon provinces of Bulacan, Nueva Ecija, Pampanga, and Tarlac, the original area of "Huklandia," the Huks increased their political activities in other Luzon provinces and on the island of Panay. The name of the Hukbalahap was changed in November 1948 to Hukbong Mapagpalaya ng Bayan (HMB) or the People's Liberation Army to reflect the PKP's goal of overthrowing the Philippine government.

The turning point in the Huk insurgency was President Elpidio Quirino's appointment of Ramon Magsaysay as secretary of defense in 1950 and an increase in American military assistance to the Philippines. A charismatic former guerrilla leader from Zambales province and a popular congress member with strong ties to the military, Magsaysay was given a free hand in reestablishing law and order. He reorganized the military, retiring or court-martialing corrupt and incompetent officers and soldiers, and worked to regain the confidence of the peasantry. Magsaysay pursued the Huks aggressively and took

steps to protect the peasantry from Huk terrorism. He also established the Economic Development Corps (EDCOR) in December 1950 to relocate landless peasants in Hukbalahap-controlled areas to unoccupied land in Mindanao. By 1954, when Huk Supremo Taruc surrendered, the HMB was no longer a threat to the stability of the government. Although remnants of the Huks continued to operate in Central Luzon for more than a decade after Taruc's surrender, the movement was dead by 1970.

HUMAYUN (d. 1556), Mughal ruler. Eldest of four sons, Humayun was the designated successor of Babur, ascending to the throne of the Mughal empire in December 1530 at the age of twenty-three. Humayun inherited an Indian kingdom that was riven by internal dissension and subject to external threats. He had some experience as governor of Badakshan, but as emperor proved a poor replacement to Babur.

A cultivated man, interested in mathematics and astronomy, and with considerable personal valor, Humayun lacked political astuteness. He failed to capitalize on his victories, was indecisive, prone to long bouts of indolence, and addicted to opium. His ambitious brothers were allowed to carve niches for themselves (Kamran, for instance, took control of Kabul and Punjab) and they proved fickle allies, even plotting to overthrow him.

Externally, the two biggest threats came from Bahadur Shah in Gujarat in the west and the Afghan ruler Sher Shah in Bihar in eastern India. In 1535, Humayun defeated Bahadur Shah and established control as far as Cambay on the coast. However, when he marched east to confront Sher Shah, Bahadur Shah recovered his kingdom. Sher Shah inflicted two crushing defeats on Humayun at Chausa (1539) and Kanauj (1540), forcing him into exile. Eventually the Persian emperor Shah Tahmasp helped him recover Delhi and Agra in 1555. Humayun died soon after in January 1556 following a fall in his library in Delhi.

HUMOR IN CHINESE HISTORY Humor has a rich history in China. As in other cultures, comedy and humorous literature have often been criticized as immoral by somber ideologues. Nevertheless, playful writing and humorous anecdotes survive from China's earliest times and were produced throughout the imperial era (221 BCE–1912 CE). In Chinese history, humor has been used for a variety of purposes,

including entertainment, cultural criticism, personal attacks, and bolstering group solidarity against outsiders. Humor is thus important to study for a full appreciation of the complexity, tensions, and joys of Chinese life over the ages.

Zhuangzi and Confucius

The most famous and influential humorist of ancient China was the philosopher Zhuangzi (Chuang Tzu, 369–286 BCE), whose writings make up one of the two primary texts of Taoism, the other being the mystical Daodejing. Zhuangzi used playful parables, parody, and clever wordplay to ridicule other

**SITCOMS COME TO CHINA**

Until the 1990s, the government of the People's Republic of China (PRC) exercised tight control over the content of the Chinese television, and TV was used more as a propaganda tool than an entertainment medium. However, in the early 1990s, government subsidies of television were reduced while the number of cable TV stations increased. The government began to allow paid advertising, and marketers saw an opportunity to gain revenues by bringing a different kind of programming to China's 1 billion television viewers. Film-maker Ying Da thought the time was right to create China's own version of the American situation comedy.

Ying Da, son of the noted Chinese actor Ying Ruocheng, had studied in the United States and worked with U.S. theater and film companies. However, the inspiration for his television career came, appropriately enough, from watching episodes of "The Cosby Show" and "Cheers" during his time in the United States. In 1993, he struck a chord with the sitcom "I Love My Family," about a retired PRC official who has to adjust to the social changes in China. In the late 1990s, he had another hit in "Chinese Restaurant," about the misadventures of Chinese immigrants who make up the staff of a Chinese restaurant in Los Angeles.

Although Chinese television has come a long way, some things remain the same. The government still has ultimate control over the content of programs, so producers have to watch how certain topics are covered. For example, government overseers find it decidedly unfunny to make jokes about authority figures such as teachers or police officers. Even with some restrictions, though, sitcoms have found a happy home in China.

philosophers' belief in the power of human reason. According to Zhuangzi, people's understanding of the world is always limited by their limited perspective, just as a frog in a well cannot see more than a small patch of the sky or a sleeping man has no way of knowing that he is not the butterfly he dreams himself to be. Zhuangzi's stories have delighted generations of Chinese readers and served as models of humorous writing.

A chief target of Zhuangzi's joking was another prominent philosopher, Confucius (551–479 BCE). In contrast to Taoists like Zhuangzi, who believed in living in intuitive harmony with the natural order, Confucius promoted a strict ethical code and a hierarchical social order. Confucius is often depicted as a rather stern teacher, but there is some evidence in the conversations with his disciples recorded in the *Analects* that he too had a sense of humor. One of the most amusing images from ancient China was actually produced to illustrate the Confucian ethical principle that one should be filial to one's parents. A stone carving in the Wu Liang shrine, constructed during the second century CE, depicts the well-known story of a seventy-year-old filial son persuading his even more elderly parents that they are still young by acting like an infant.

Confucianism and Humor

Since the Han dynasty (206 BCE–220 CE), Confucianism has tended to reject humor, seeing it as incompatible with sincere devotion to ethical principles. The famous female writer Ban Zhao (c. 45–116 CE) stated that a good woman should shun jests and laughter and solemnly devote herself to serving her husband and his parents. Some Confucian scholars criticized as frivolous all humorous popular novels and plays, which were often banned by the government. Even poetry did not escape the attacks of sterner Confucian critics in the late imperial era (Ming and Qing dynasties, 1368–1912), who saw it as a waste of time that might have been better spent studying history and promoting morality.

The question of the value of humor was never definitively settled within the Confucian tradition, however, and Confucian thought continuously coexisted and interacted with other schools of thought, such as Taoism, that did encourage a humorous sensibility. Buddhism entered China during the Han dynasty, and the Chan school of Buddhism (Zen, in Japanese) made use of the "shock effect" of humorous and incongruous images to bring about enlightenment, much as Zhuangzi used humor to question rationality. The use

of humorous and incongruous images for their shock value was borrowed by poets in the Song dynasty (960–1279) and later periods.

Humor in Periods of Unrest

Advances in printing and publishing contributed to the spread of humorous literature. Two periods of political unrest and technological change in later Chinese history produced a flood of humorous writing spanning the spectrum from escapist entertainment to harsh satire: the early seventeenth century, when the Ming dynasty was in decline, and the Republican period between the fall of the Qing dynasty (1912) and the founding of the People's Republic (1949). In the earlier period, humorous and erotic novels, such as *Jinpingmei* (Golden Lotus), and comic short stories, such as those collected by Feng Menglong (1574–1646), were immensely popular. During the 1920s and 1930s, China's greatest satirist, Lu Xun (1881–1936), criticized Chinese society and politics in essays and short stories published in some of the hundreds of newspapers and literary journals that appeared in those years. Lu Xun also promoted woodblock printing and satirical cartoons that the illiterate masses could understand. In this era, the writer Lin Yutang (1895–1976) introduced the English word "humor" into the Chinese language and argued that China needed more of it.

During the era of Mao Zedong (1949–1976), and particularly during the Cultural Revolution (1966–1976), sincere revolutionary fervor was held up by the Communist Party as the only proper attitude toward life. Humor did not entirely die out, but it was dangerous politically. In Taiwan, the Nationalist Party also clamped down on political expression, but apolitical humor was not discouraged.

Humor Themes

The themes of Chinese humor often resemble those in other parts of the world: stock characters such as the henpecked husband and the lusty widow abound in published joke books. Confucian and Buddhist institutions and thought are also popular objects of humor, especially in plays and opera plots from before the twentieth century. Residents of one part of China often make fun of those of another. However, this sort of regional humor and jokes about foreigners are not as prominent in China as humor involving ethnicity and nationality is in Europe and North America. The nature of the Chinese language, which has a relatively small number of different sounds, encourages puns and wordplay. These are particularly common in the per-

formance humor called *xiangsheng*, which resembles vaudeville dialogue.

Humor Today

The decades of the 1980s and 1990s, during which ideological orthodoxy disintegrated in both the People's Republic of China and Taiwan and the use of the Internet mushroomed, may be the beginning of another great age of humor in Chinese history. A growing appetite for humor in the People's Republic of China (PRC) has led publishers to comb traditional literature and pull out the funny bits for hot-selling anthologies. Lin Yutang's writings from the 1920s and 1930s are enjoying new popularity, and, in both Taiwan and the PRC, the television sitcom has become a well-established form.

HUN SEN (b. 1952), prime minister of Cambodia. Hun Sen is the prime minister of Cambodia and has been the dominant player on the Cambodian political stage for more than fifteen years. Born at Peam Koh Sna village in Kompong Cham Province on 4 April 1952, Hun Sen attended a local primary school before attending the Lycée Indra Devi in Phnom Penh (1965–1969). In 1970, he joined the Cambodian lib-

eration forces under the leadership of the Communists and the patronage of deposed ruler Prince Norodom Sihanouk. In 1975, as Communists troops launched their final assault on Phnom Penh, Hun Sen was being treated in a field hospital and eventually lost his left eye. In the same year, he married Bun Rany, with whom he had three sons and three daughters (one of them adopted).

Hun Sen rose through the ranks of the Khmer Rouge before eventually defecting to Vietnam. He was a leading figure in the Vietnamese-sponsored invasion that ousted the Khmer Rouge in 1979. At age twenty-seven he became the new regime's foreign minister and was appointed prime minister in 1985 at the age of thirty-three. Hun Sen was a leading figure in the negotiations that led to Cambodia's 1991 peace agreements and to the elections of 1993. After his party lost those elections, he refused to concede defeat and was appointed second prime minister. In July 1997, Hun Sen ousted First Prime Minister Ranariddh and eventually secured absolute power at the 1998 elections. A controversial figure, widely criticized for his record on human rights and his links with corrupt business persons, Hun Sen is often referred to as the "strongman" of Cambodian politics.

HUNAN (2001 pop. 63.1 million). Located in south central China, Hunan Province covers an area of 209,773 square kilometers and is bordered by Hubei Province to the north, Guangdong and Guangxi Provinces to the south, Kiangsi Province to the east, and Sichuan Province to the west. Hunan Province lies on the fertile Hunan plain, the richest agricultural land in China. The province's summers are hot and humid; the temperature there can reach close to 38°C. Heavy rains are also common during the summer months. Hunan's capital is Changsha, which has a population of 2 million. Other major cities in Hunan Province include Hengyang, Xiangtan, and Zhuzhou.

Hunan Province has a long history and can trace its origins to the Warring States period (475–221 BCE), when it was a part of the kingdom of Zhu. Later, the region around Changsha became the center of Zhu culture. Sometime between the seventh and tenth centuries, ethnic Han Chinese began migrating to Hunan, displacing the native Miao and Yao peoples. Successive invasions by the Mongols in the thirteenth century and the Manchus in the sixteenth century drove the Miao and Yao farther south and west as Han Chinese immigrated in large numbers.

Hunan Province has long been known for its agricultural and industrial output. It is a major rice-growing region, but it also produces large amounts of citrus fruit, shellfish, sugarcane, tobacco, and tung oil seed. Hunan Province also has large deposits of non-ferrous metals, including lead, zinc, mercury, tungsten, and copper. Industrially, Hunan produces chemical fertilizers and locomotives as well as iron and steel.

Hunan has also influenced the course of modern Chinese politics. Zeng Guo-fen, who suppressed the Taiping Rebellion, was born in Hunan, as was Mao Zedong (1893–1976), chairman of the Chinese Communist Party and founder of the People's Republic of China.

HUNDRED DAYS REFORM Defeat by Japan in the Sino-Japanese War (1894–1895) greatly affected the Qing dynasty (1644–1912) government of China

and many young Chinese Confucian scholars. Some of these scholar-officials, particularly Kang Youwei (1858–1927) and Liang Qichao (1873–1929), called for dramatic changes in the structure of government, the examination system for entrance into government service, and the relationship of the government to the Chinese people, although they clothed these changes in traditional Confucian principles.

The young emperor, Guang Xu (1871–1908), was caught up in the fervor for reform and committed himself to carrying out a comprehensive reform program for approximately one hundred days, hence the phrase "Hundred Days Reform." From mid-June to mid-September 1898, the emperor issued some forty reform decrees.

The decrees called for education reform by replacing the centuries-old "eight-legged" essays with an exam more reflecting current affairs, establishing an Imperial University, and providing classes in foreign affairs and languages, economics, medicine, and the sciences. The decrees also sought changes in government, including eliminating the dual Manchu-Chinese system of control, eliminating some unneeded positions, and streamlining administration. Finally, the decrees called for government support for building railways, developing the economy, and improving the capital as well as for providing government protection of missionaries, simplifying legal codes, and preparing an annual budget. These measures were designed both to reform the government and to impress foreign powers in order to slow down the pace of foreign encroachments on Chinese sovereignty.

As one might expect, there was a backlash. The empress dowager, Cixi, allied with conservative elements in the Imperial City and across the nation and prepared a counterstroke. Rumors had floated around Beijing for days of a coup, and as the emperor slowly moved, the empress dowager and her allies moved faster. On 21 September 1898, she seized control of the emperor, announced that he was incapacitated, took over all reform documents, and seized control of the government. Many of the reformers were arrested and executed, but Kang and Liang managed to escape. The reforms were undone, and one outcome was the so-called Boxer Rebellion, which accelerated foreign encroachments on China.

HUNDRED FLOWERS CAMPAIGN In May 1956, Mao Zedong, the paramount leader of the People's Republic of China (PRC), announced that the Communist government would relax its strict control over freedom of thought and expression. Mao adopted the slogan of "Let a hundred flowers bloom together, let the hundred schools of thought contend" and invited intellectuals to voice criticism of party cadets and government policies. Mao intended to win over the alienated intellectuals by giving them a degree of intellectual freedom. More access to foreign publications, for example, was given to intellectuals who worked in schools, colleges, and universities, as these people were losing faith in the Chinese Communist Party (CCP) after the introduction of a Soviet-style education system to China starting from 1949, in which liberal arts education was discarded in favor of science and technology education.

The Hundred Flowers Campaign was not quick in taking off. On the one hand, there was resistance to criticism within the CCP. On the other hand, Chinese intellectuals were reluctant to criticize the government, fearing reprisal. It was only in the spring of 1957, after Mao's open reassurance, that members of democratic parties, writers, journalists, teachers, and professionals in China started to criticize communist rule, government policy, and party members openly. In extreme cases, wall posters appeared in public denouncing the whole communist system. Some even questioned the legitimacy of CCP rule over China. Mao and other leaders of the CCP were all shocked by the volume and intensity of the criticism.

By early July, just five weeks after the inauguration of the Hundred Flowers Campaign, a dramatic new campaign was launched by the CCP, shifting the target of criticism from the CCP to the intellectuals. Recent critics of the regime were severely criticized by party members, and about half to three-quarters of a million intellectuals were denounced or blacklisted. Some were arrested, and many were sent to the countryside to "rectify their thinking through labor." It was only in 1979, three years after the death of Mao, that Deng Xiaoping, the new leader of the CCP, restored a "decent name" to these denounced intellectuals.

HUNGRY GHOST FESTIVAL After Chinese New Year, the annual Hungry Ghost Festival (*Zhong Yuan*) is perhaps the next most popular celebration among the Chinese. Celebrated for thirty days beginning on the first day of the seventh moon of the Chinese lunar calendar (usually around August), the festival has roots in Chinese forms of social life, Taoist folk religion, and Buddhism. It is believed that during this period the gates of hell (purgatory or the underworld) are thrown wide open, and ghosts—euphemistically called "good brothers"—are free to roam the realm of the living once again.

The Feast of the Wandering Souls, more commonly known as the Hungry Ghost Festival, is an inauspicious time. Hungry ghosts may prey on the living out of anger and resentment. Weddings are not held in this month, and ghost stories of mishaps and ill fortune circulate to keep the living alert. Children are particularly vulnerable, and parents take care to prevent them from swimming in the open sea or camping in forests, for example.

To appease this legion of anonymous ghosts, offerings are made outside of Chinese homes at nearby road junctions, country lanes, and open spaces, but care is also taken not to invite them into the homes. Neighborhood groups and clan and trade associations have more elaborate celebrations lasting for a few days. Temporary sheds are built in open spaces to house a

A ritual specialist jumps over a fire at the Hungry Ghost Festival held by the Chinese community in Kuala Lumpur, Malaysia, in August 1999. (AFP/CORBIS)

number of deities. These deities are made of papier-mache and are burnt at the end of the festival. The chief of these deities—called Phor Tor Kong in Hokkien—is the keeper of purgatory, who keeps a watchful eye over the wandering ghosts. Sumptuous feasts are provided to fete both deities and ghosts. An assortment of meat dishes, rice, noodles, sweet cakes, fruits, wine, and other drinks, as well as joss sticks, paper money, and paper clothes, are laid out. Additionally, entertainment is provided in the form of traditional Chinese opera, live singing bands, and open-air film showings. Besides fulfilling ritual obligations, the Hungry Ghost Festival is occasionally used to raise funds and awareness to address concerns pertaining to the well-being of diaspora Chinese communities, particularly in areas like Chinese education, ethnicity, and culture.

HUNZA Deep in the mountains of the Hindu Kush in present-day northern Pakistan, high above sea level, lies a valley called Hunza. The Hunza valley is surrounded by the Karakoram Mountain Range, which extends from present-day India to Pakistan and into Jammu and Kashmir; its highest peak is K2 (8,611 meters), and sixty of its peaks in all tower around 6,700 meters. The Hunza River itself lies in Jammu and Kashmir, in the area controlled by Pakistan, and flows west and then south for 193 kilometers. Though most of the Hunza valley is located in Pakistan, it crosses the borders of today's Afghanistan and China. Karimabad, a grouping of six villages, is the principal populated area in this fertile valley.

The Hunza valley is dotted with glacial lakes and rivers that form in concurrence with glacial ice flows in the mountains. Due to these glacial flows, the Hunza valley is fertile and has sustained isolated pop-

ulations of Hunza people, who speak a language unrelated to any other, throughout the centuries. As these glaciers melt, the glacial water (sometimes referred to as glacial milk due to its opaque white color from the minerals found in it) flows through the valley, and the people living in Hunza use it to irrigate their crops. The entire valley is well cultivated; every inch of arable land is put to use. Perhaps because of the mineral-rich water and fertile soil, the Hunza people are famous for their long lives, some living to be 120 years old.

HUSSEIN ONN (1922–1990), prime minister of Malaysia. Hussein Onn became the third prime minister of Malaysia (1976–1981) upon the sudden demise of Abdul Razak. His renowned strength of character and impeccable integrity saw him through various challenges. Son of Onn bin Ja'afar, founder of the United Malays National Organization (UMNO) party, Hussein spent his early years in the military and in World War II saw action in the Middle East. Following his discharge, he joined his father's struggle in UMNO; they both left UMNO in 1951. Hussein went to Britain to read law.

Urged by Abdul Razak, his brother-in-law, Hussein rejoined UMNO in 1968. He became minister of education (1971), deputy prime minister (1974), and prime minister. During his single-term premiership, Hussein faced severe political challenges, including pressure from right-wing elements within his own party (UMNO) over the "Harun case," divisions within the ruling coalition (which since 1971 was the Barisan Nasional [National Front], comprised of UMNO, two other major parties, and several minor parties), and a secessionist threat from the state of Sabah.

In the "Harun case," Harun bin Idris, a prominent and charismatic UMNO politician, was charged with corruption and criminal breach of trust and subsequently convicted in November 1977 to serve a two-year prison sentence. His appeal to the Privy Council was rejected; his appeal for pardon from the king of Malaysia was also turned down. The political repercussions were immense because Harun commanded mass Malay support not only from the youth but also

from the "UMNO Old Guard." Hussein as president of UMNO and prime minister withstood the pressure from Harun's partisan supporters to at least arrange a pardon. Hussein stood his ground, and Harun served out his prison sentence.

In 1976, Hussein supported Berjaya (United People's Party of Sabah) in ousting Mustapha bin Datu Harun and his United Sabah National Organization (USNO), the ruling party in Sabah since 1967. Mustapha had been accused of having secessionist tendencies—namely, the separation of Sabah from Malaysia to join with three territories of the southern Philippines—Mindanao, Palawan, and Sulu—to form a new nation.

In December 1977, the Barisan Nasional expelled a component member, the Pan-Malayan Islamic Party (PAS), for its recalcitrant stand over the imposition of emergency rule in the state of Kelantan following the dismissal of PAS-appointed *Mentri Besar*.

Hussein hastened implementation of the New Economic Policy (NEP), emphasizing rural development to improve the economic situation of the Malays in relation to that of other ethnic groups. At the same time, more non-Malays benefited from civil service employment and land ownership. And more safeguards were afforded to foreign investments. Nonetheless, there were worrying signs of non-Malay dissatisfaction over the pro-Malay economic and education policies of the government.

HUSSEIN, SADDAM (b. 1937), president of Iraq since 1979. Saddam Hussein presides over one of the most repressive regimes in the Middle East. He was born near Takrit, a small town on the Tigris about one hundred miles from Baghdad. In 1955, attracted by Arab nationalism, he joined the fledgling Iraqi Ba'ath Party.

In July 1958, the Iraqi monarchy was overthrown and a republic installed. In October 1959, Saddam Hussein was involved in an unsuccessful attempt to assassinate the president, 'Abd al-Karim Qasim. He fled to Egypt until Qasim's overthrow in February 1963.

Saddam Hussein at a ceremony honoring military officers in Baghdad on 4 January 2000. (AFP/CORBIS)

On his return, he headed the civilian wing of the Iraqi Baath and by 1969 had become Iraq's vice president. Through the 1970s he gradually consolidated his power.

The nationalization of the Iraqi Petroleum Company in 1972 gave the government—now equivalent to Saddam Hussein and his entourage—full control over the country's oil revenues. Saddam Hussein defeated the Kurdish opposition movement in 1975 and turned against the Communists. By the mid-1980s, most Iraqi intellectuals, and almost all Iraqi leftists, had been killed, imprisoned, or forced into exile.

In July 1979, Saddam Hussein took over the presidency and less than a year later he launched an invasion of the Islamic Republic of Iran. After initial successes, the Iraqis were driven back by Iran; the war continued for eight years, during which Iraq used chemical weapons against Iranian forces. In 1988, Saddam Hussein initiated a massive campaign against the Iraqi Kurds, known as *al-Anfal* (the spoils of war), during which at least 100,000 Kurds were captured and killed. During and after the Iran-Iraq War, a personality cult evolved around the "Great Leader."

In another bid for regional supremacy, Saddam Hussein invaded Kuwait in August 1990. By late February 1991, however, he had negotiated a cease-fire with the multinational forces under United Nations auspices and U.S. leadership, after weeks of aerial bombardment and five days of ground war, followed by rebellions in the Kurdish North and the Shi'ite

South. Iraqi troops retreated from Kuwait, but Hussein soon regained control in southern Iraq and Kurdistan.

U.N.-imposed sanctions after the Gulf War caused the people of Iraq great suffering but hardly affected its leaders. An oil-for-food agreement, which, if adopted earlier, might have alleviated much of the malnutrition and infant mortality the country experienced, was eventually accepted in 1996. Saddam Hussein's power base is fragile, but his monopoly of the means of coercion, the fragmentation of the opposition, the absence of serious rivals, and fear of the chaos that might follow his downfall have combined to keep him in supreme power for over two decades.

HUYNH TAN PHAT (1913–1989), vice president of Vietnam. Huynh Tan Phat was born into a family of small landowners in 1913 in the province of Ben Tre, South Vietnam. After graduating from high school in My Tho, Phat attended the Superior School of Fine Arts in Hanoi, where he involved himself in anticolonial student organizations. Back in Saigon he opened his own architectural firm in 1940. Although a very successful architect, he devoted more of his time to political activities than to his profession. He played an important role in the August Revolution that brought independence to Vietnam in 1945. During the War with France (1946–1954) he was arrested many times by the French because he was responsible for the information and press services of the underground Vietnamese government. In 1962, he was elected to the position of vice chair of the National Liberation Front of South Vietnam, an organization that fought against the South Vietnam regime, assisted by the United States. In 1976, the National Assembly elected him vice president of the Socialist Republic of a reunited Vietnam. He died in 1989 at the age of seventy-six.

HWANG SUN-WON (1915–2000), Korean fiction writer. Hwang was born near Pyongyang, Korea (now North Korea), and educated at Waseda University in Tokyo. He was barely in his twenties when he published two volumes of poetry. His first volume of stories appeared in 1940, and he subsequently concentrated on fiction, producing seven novels and more than a hundred stories.

In 1946 Hwang and his family moved from the Soviet-occupied northern sector of Korea to the American-occupied southern sector. He taught at Seoul High School in September of that year. Like millions of other Koreans, the Hwang family was displaced by the civil war of 1950–1953. From 1957 to 1993 Hwang taught at Kyung Hee University in Seoul.

Hwang is the author of some of the best-known stories of modern Korea, including "Pyol" (Stars, 1940), "Hak" (Cranes, 1953), and "Sonagi" (Shower, 1959), among others. He began publishing novels in the 1950s; his most important work in this genre includes *Namu tul pital e soda* (Trees on a Slope, 1960), about the effects of the civil war on three young soldiers; *Irwol* (The Sun and the Moon, 1962–1965), a portrait of an outcast man; and *Umjiginun song* (The Moving Fortress, 1968–1972), an ambitious effort to synthesize Western influence and native tradition in modern Korea.

The length of Hwang's literary career, spanning seven decades, is virtually unparalleled in Korean letters. But it is his craftsmanship that sets Hwang apart from his peers. His command of dialect, his facility with both rural and urban settings, his variety of narrative techniques, his vivid artistic imagination, his diverse constellation of characters, and his insights into human personality make Hwang at once a complete writer and one who is almost impossible to categorize.

HYDERABAD (2001 pop. 3.1 million). The capital of the Indian state of Andhra Pradesh, Hyderabad lies in the eastern part of the Deccan plateau in southern India on the banks of the Musi River. Established in 1591, the city served as the capital of the Qutb Shahi dynasty and of the independent state of Hyderabad. The Qutb Shahi ruler Mohammed Quli Qutb Shah (1580–1612) founded the city of Hyderabad, and under his patronage it became the leading center of Islamic art, literature, and scholarship in southern India. He constructed the royal and ceremonial structures, which became the focal point of the city. Notable among these is a large archway, the Charminar, which stands at the junction of the four major streets of the city. During the reign of his successor, Mohammed Qutb Shah (1612–1626), work was begun on the imposing Mecca Mosque, which could accommodate nearly ten thousand people.

Hyderabad lost its independence when the Mughal empire (1526–1857) extended its rule over the Deccan. Taking advantage of the political turmoil after the death of the Mughal emperor Aurangzeb in 1707, Asaf Jah, Nizam ul Mulk (1734–1748), the Mughal viceroy in the region, declared the independent state of Hyderabad. Toward the end of the eighteenth century, the state of Hyderabad became a protected ally of the British East India Company.

The Nizams of Hyderabad concentrated on developing the city as a center of Islamic learning. The Dairatul-Maarif-it Osmania was founded in 1888 to collect and translate into Urdu rare original Arabic manuscripts. Today the Salar Jung Museum houses a large collection of Persian, Arabic, and Urdu texts amassed by the Nizams. In 1918, the Osmania University was established by Nizam Mir Usman. It was the first Indian university to use an Indian language (Urdu) as the medium of instruction. A University College for women was founded in 1926.

After India gained independence in 1947, conferences were held with the rulers of the princely states to ensure their joining the Indian Union. In September 1948, the Nizam surrendered, and the state of Hyderabad became part of the Indian nation. In 1956, the states of the Indian Union were reorganized according to language groups, and the city of Hyderabad became the capital of the newly formed state of Andhra

The Charminar, Hyderabad's best-known monument. It was built in 1591 to ward off an epidemic. (REUTERS NEWMEDIA INC./CORBIS)

Pradesh. Today Hyderabad is a modern city boasting several industries. It is particularly famous for its film industry and as a center of computer science and information technology.

HYOGO (2002 est. pop. 5.5 million). Hyogo Prefecture is situated in the western region of Japan's island of Honshu. Once mainly agricultural, it has been overtaken by industry in the south. It occupies an area

of 8,382 square kilometers. Hyogo's main geographical features include a hilly north, central mountains and highlands, and coastal plains in the south. Awajishima, the largest island in the Inland Sea, forms a partial land bridge between Honshu and Shikoku. Hyogo is bordered by the Sea of Japan, Osaka Bay, and the Inland Sea and by Kyoto, Osaka, Okayama, and Tottori prefectures. The present prefecture was formed in 1876 from the old provinces of Harima, Tajima, and Awaji and incorporated parts of the former provinces of Settsu and Tamba as well.

The prefecture's capital is Kobe, situated on Osaka Bay. A cosmopolitan port of around two million residents, including seventy thousand foreigners, Kobe is second only to Yokohama in its volume of international shipping. Operating as a China trade port since the Nara period (710–794 CE), it was little more than a cluster of fishing villages until 1858, when the Tokugawa shogunate declared it an open port. Hyogo Prefecture is a modern industrial center, specializing in ships, railway cars, iron and steel, rubber, and textiles, as well as sake and the famous beer-fed Kobe beef. The city largely has recovered from the 1995 earthquake, which killed five thousand people and destroyed one

hundred thousand structures. It is home to Kobe University, to museums displaying Chinese art and *nam-ban* (western-style) works by Japanese artists, and to a unique inventory of nineteenth-century Japanese and Victorian architecture. Hyogo's other important cities are Nishinomiya, Amagasaki, and Himeji.

Archaeological remains near the city of Akashi indicate prehistoric habitation of Hyogo. The prefecture's strategic location made it a frequent battlefield during the twelfth-century war between the Taira and Minamoto warrior clans. In the Edo period (1600/03–1868) it was divided into small domains. Hyogo's rich cultural tradition includes Bunraku theater, which originated in the folk puppet theater of Awajishima, and the Himeji castle, the most spectacular of the nation's twelve remaining feudal fortresses. Scenic areas include the Inland Sea and the San'in Coast National Park.

Survey of Asia's Regions and Nations

The *Encyclopedia of Modern Asia* covers thirty-three nations in depth and also the Caucasus and Siberia. We have divided Asia into five major subregions and assigned the thirty-three nations to each.

West and Southwest Asia

The West Asian nations covered in detail here are Turkey, Iran, and Iraq. Afghanistan and Pakistan form Southwest Asia, although in some classifications they are placed in Central and South Asia, respectively. Afghanistan, on the crossroads of civilizations for thousands of years, is especially difficult to classify and displays features typical of Central, West, and South Asia.

Despite diversity in language (Persian in Iran, Arabic in Iraq, Turkish in Turkey) form of government (theocracy in Iran, dictatorship in Iraq, and unstable democracy in Turkey) and international ties (Iran to the Islamic world, Iraq to the Arab Middle East, Turkey to the West), there are several sources of unity across West Asia. Perhaps the oldest is geographical location as the site of transportation routes between Europe and Central, East, and South Asia. Since ancient times, people, goods, wealth, and ideas have flowed across the region. In 2002 the flow of oil was most important, from the wells of Iran and Iraq through the pipelines of Turkey. Another source of unity is Sunni Islam, a major feature of life since the seventh century, although Iran is mainly the minority Shi'a tradition and there have long been Zoroastrian, Jewish, Christian, and Baha'i minorities in the region. Diversity is also evident in the fact that Turkey is a "secular" state while Iran is a theocracy, and in the conflict between fundamentalist and mainstream Islam in all the nations.

Another important common thread is the shared historical experience of being part of the Ottoman Empire and having to cope with British and Russian designs on their territory and, more recently, American influence. And, in the twentieth century, all three nations have sought to deal with the Kurdish minority and its demands for a Kurdish state to be established on land taken from all three nations.

Unity across Afghanistan and Pakistan is created by adherence to Sunni Islam (although there is a Shi'ite minority in Afghanistan) and the prominence of the Pash-tun ethnic group in each nation. Both nations also experienced British colonialism, although the long-term British influence is more notable in Pakistan, which had been

tied to India under British rule. West Asia is the only region in the world never colonized by Britain, although some experts argue that it did experience significant British cultural influence. In all nations resistance to external control—British, Russian, or United States—is another common historical experience.

Across the region (although less so in Afghanistan) is the stark contrast between the traditional culture and the modernity of liberation from imperial rule, still not complete across the region. This contrast is apparent in clothing styles, manners, architecture, recreation, marriage practices, and many elements of daily life.

In 2002 all the nations faced a water crisis of both too little water and water pollution. They all also faced issues of economic and social development, including reducing external debt, controlling inflation, reducing unemployment, improving education and health care, and continually reacting to the ongoing Arab-Israeli conflict, which exacerbates many of these problems. The governments also faced the difficult task of solving these problems while resisting Americanization and also while controlling internal political unrest. Political unrest is often tied to efforts at creating democratic governments and the persistence of elite collaboration with tyrannical governments.

Central Asia

Central Asia is known by many names, including Eurasia, Middle Asia, and Inner Asia. At its core, the region is composed of five states that became independent nations following the collapse of the Soviet Union in 1991: Kazakhstan, Kyrgyzstan, Tajikistan, Turkmenistan, and Uzbekistan. Scholars sometimes include Afghanistan, Mongolia and the Xinjiang province of China within the label Central Asia. For this project, Central Asia is restricted to the five former Soviet countries, while Afghanistan is classified in Southwest Asia, and Mongolia and Xinjiang as part of East Asia. These states have a shared landmass of 1.5 million square miles, about one-half the size of the United States.

The region's unity comes from a shared history and religion. Central Asia saw two cultural and economic traditions blossom and intermix along the famed Silk Road: nomadic and sedentary. Nomadic herdsman, organized into kinship groupings of clans, lived beside sedentary farmers and oasis city dwellers. Four of the countries share Turkic roots, while the Tajiks are of Indo-European descent, linguistically related to the Iranians. While still recognizable today, this shared heritage has developed into distinct ethnic communities.

The peoples of Central Asia have seen centuries of invasion, notably the legendary Mongol leader Genghis Khan in the thirteenth century, the Russians in the nineteenth and the Soviets in the twentieth century. For better or worse, each invader left behind markers of their presence: the Arabs introduced Islam in the seventh century. Today Islam is the predominant religion in the region, and most Central Asians are Sunni Muslims. The Russians brought the mixed legacy of modernism, including an educated populace, alarming infant mortality rates, strong economic and political participation by women, high agricultural development, and environmental disasters such as the shrinking of the Aral Sea. It was under Russian colonialism that distinct ethno-national boundaries were created to divide the people of the region. These divisions largely shape the contemporary Central Asian landscape.

Today the five Central Asian nations face similar challenges: building robust economies, developing stable, democratic governments, and integrating themselves into the regional and international communities as independent states. They come to these challenges with varied resources: Kazakhstan and Turkmenistan have rich oil reserves; several countries have extensive mineral deposits; and the Fergana Valley is but one example of the region's rich agricultural regions.

Finally, the tragic events of September 11, 2001, cast world attention on Afghanistan's neighbors in Central Asia. The "war on terrorism" forged new alliances and offered a mix of political pressure and economic support for the nations' leaders to suppress their countries' internal fundamentalist Muslim movements.

Southeast Asia

Southeast Asia is conventionally defined as that subregion of Asia consisting of the eleven nation-states of Brunei, Cambodia, East Timor, Indonesia, Laos, Malaysia, Myanmar, Philippines, Singapore, Thailand, and Vietnam. Myanmar is sometimes alternatively classified as part of South Asia and Vietnam as in East Asia. The region may be subdivided into Mainland Southeast Asia (Cambodia, Laos, Myanmar, Thailand, and Vietnam) and Insular Southeast Asia (Brunei, East Timor, Indonesia, Philippines, and Singapore). Malaysia is the one nation in the region that is located both on the mainland and islands, though ethnically it is more linked to the island nations of Indonesia, Brunei, and the Philippines.

Perhaps the key defining features for the region and those that are most widespread are the tropical monsoon climate, rich natural resources, and a way of life in rural areas based on cooperative wet-rice agriculture that goes back several thousand years. In the past unity was also created in various places by major civilizations, including those of Funan, Angkor, Pagan, Sukhothai, Majapahit, Srivijaya, Champa, Ayutthaya, and Melaka. Monarchies continue to be significant in several nation—Brunei, Cambodia, Malaysia, and Thailand—today. Subregional unity has also been created since ancient times by the continued use of written languages, including Vietnamese, Thai, Lao, Khmer and the rich literary traditions associated with those languages.

The region can also be defined as being located between China and India and has been influenced by both, with Indian influence generally broader, deeper, and longer lasting, especially on the mainland, except for Vietnam and Singapore, where influences from China have been more important. Islamic influence is also present in all eleven of the Southeast Asian nations. Culturally, Southeast Asia is notable for the central importance of the family, religion (mainly Buddhism and Islam), and aesthetics in daily life and national consciousness.

In the post–World War II Cold War era, there was a lack of regional unity. Some nations, such as Indonesia under Sukarno, were leaders of the nonaligned nations. Countries such as Thailand and the Philippines joined the U.S. side in the Cold War by being part of the Southeast Asia Treaty Organization (SEATO). A move toward greater unity was achieved with the establishment of the Association of Southeast Asian Nations (ASEAN) in 1967, with the founding members being Indonesia, Malaysia, the Philippines, Singapore, and Thailand. Subsequently other Southeast Asian nations joined ASEAN (Brunei, 1984; Laos, Myanmar, and Vietnam 1997; Cambodia 1999). As of 2002, communism was still the system in Laos and Vietnam and capitalism in Brunei, Cambodia, East Timor, the Philippines Thailand, Indonesia, Malaysia and Singapore. Political, economic, and cultural cooperation is fostered by the Association of Southeast Asian Nations (ASEAN), with headquarters in Jakarta, Indonesia. Economically, all the nations have attempted to move, although at different speeds and with different results, from a reliance on agriculture to an industrial or service-based economy. All nations also suffered in the Asian economic crisis beginning in July 1997.

Alongside these sources of similarity or unity that allow us to speak of Southeast Asia as a region is also considerable diversity. In the past religion, ethnicity, and diverse colonial experience (British, Dutch, French, American) were major sources of diversity. Today, the three major sources of diversity are religion, form of government, and level of economic development. Three nations (Indonesia, Malaysia,

Brunei) are predominately Islamic, five are mainly Buddhist (Vietnam, Laos, Cambodia, Thailand, Myanmar), two are mainly Christian (Philippines and East Timor), and Singapore is religiously heterogeneous. In addition, there is religious diversity within nations, as all these nations have sizeable and visible religious minorities and indigenous religions, in both traditional and syncretic forms, also remain important.

In terms of government, there is considerable variation: communism in Vietnam and Laos; state socialism in Myanmar; absolute monarchy in Brunei; evolving democracy in the Philippines, Thailand, Cambodia, and Indonesia; and authoritarian democracy in Malaysia and Singapore. The economic variation that exists among the nations and also across regions within nations is reflected in different levels of urbanization and economic development, with Singapore and Malaysia at one end of the spectrum and Laos and Cambodia at the other. Myanmar is economically underdeveloped, although it is urbanized, while Brunei is one of the wealthiest nations in the world but not very urbanized.

In 2002, Southeast Asia faced major environmental, political, economic, and health issues. All Southeast Asian nations suffer from serious environmental degradation, including water pollution, soil erosion, air pollution in and around cities, traffic congestion, and species extinctions. To a significant extent all these problems are the result of rapid industrial expansion and overexploitation of natural resources for international trade. The economic crisis has hampered efforts to address these issues and has threatened the economies of some nations, making them more dependent on international loans and assistance from nations such as Japan, Australia, and China. The persisting economic disparities between the rich and the poor are actually exacerbated by rapid economic growth. Related to poverty is the AIDS epidemic, which is especially serious in Cambodia, Myanmar, and Thailand and becoming more serious in Vietnam; in all these nations it associated with the commercial sex industry.

Politically, many Southeast Asian nations faced one or more threats to their stability. Political corruption, lack of transparency, and weak civic institutions are a problem to varying degrees in all the nations but are most severe in Indonesia, which faces threats to its sovereignty. Cambodia and Thailand face problems involving monarch succession, and several nations have had difficulty finding effective leaders. Myanmar's authoritarian rulers face a continual threat from the political opposition and from ethnic and religious separatists.

In addition, several nations faced continuing religious or ethnic-based conflicts that disrupt political stability and economic growth in some provinces. The major conflicts involve Muslim separatists in the southern Philippines, Muslims and Christians in some Indonesian islands and Aceh separatists in northern Sumatra, and Muslims and the Karen and other ethnic groups against the Burman government in Myanmar. Since the economic crisis of 1997, ethnic and religion-based conflict has intensified, as wealthier ethnic or religious minorities have increasingly been attacked by members of the dominant ethnic group. A related issue is the cultural and political future of indigenous peoples, including the so-called hill tribes of the mainland and horticulturalists and former hunter-gatherers of the islands.

In looking to the future, among the region's positive features are the following. First, there is Southeast Asia's strategic location between India and China, between Japan and Europe, and between Europe and Oceania. It stands in close proximity to the world's two most populous countries, China and India. Singapore, the centrally located port in Southeast Asia, is one of two major gateways to the dynamic Pacific Basin (the other is the Panama Canal). Second, there is the region's huge population and related economic market, with a total population approaching that of one half of China's. Indonesia is the world's fourth most populous nation. Third, there is enor-

mous tourist potential in sites and recreational locales such as Angkor Wat, Bali, Borobudur, Phuket, and Ha Long Bay. Fourth, there is the region's notable eclecticism in borrowing from the outside and resiliency in transcending tragedies such as experienced by Cambodia and Vietnam. Fifth, there is the region's significant economic potential: Southeast Asia may well have the world's highest-quality labor force relative to cost. And, sixth, there is the region's openness to new technologies and ideas, an important feature in the modern global community.

South Asia

South Asia is the easiest region to demarcate, as it is bounded by the Hindu Kush and Himalayan ranges to the north and the Bay of Bengal and Arabian Sea to the south. It contains the nation-states of Bangladesh, Bhutan, India, Nepal, and Sri Lanka and the more distant island nations of the Maldives and Mauritius. Myanmar and Pakistan, which are considered part of South Asia in some schemes, are here classified in Southeast Asia and Southwest Asia, respectively.

While the region is diverse economically, culturally, linguistically, and religiously, there is unity that, in some form, has existed for several thousand years. One source of unity is the historical influence of two major civilizations (Indus and Dravidian) and three major religions (Hinduism, Buddhism, and Islam). Regionally, Sikhism and Jainism have been of great importance. There is also considerable economic unity, as the majority of people continue to live by farming, with rice and especially wet-rice the primary crop. In addition, three-quarters of the people continue to live in rural, agricultural villages, although this has now become an important source of diversity, with clear distinctions between urban and rural life. A third source of unity is the caste system, which continues to define life for most people in the three mainland nations. Another source of unity is the nature and structure of society, which was heavily influenced by the several centuries of British rule. A final source of political unity in the twentieth century—although sometimes weakened by ethnic and religious differences—has been nationalism in each nation.

South Asia is diverse linguistically, ethnically, religiously, and economically. This diversity is most obvious in India, but exists in various forms in other nations, except for the isolated Maldives, which is the home of one ethnic group, the Divehi, who are Muslims and who have an economy based largely on tourism and fishing.

The dozens of languages of South Asia fall into four major families: Indo-European, Austroasiatic, Dravidian, and Tibeto-Burman and several cannot be classified at all. Because of its linguistic diversity, India is divided into "linguistic" states with Hindi and English serving as the national languages.

Hinduism is the dominant religion in South Asia, but India is the home also to Buddhism, Jainism, and Sikhism. India also has over 120 million Muslims and the world's largest Zoroastrian population (known in India as Parsis) and Bangladesh is a predominately Muslim nation. India also has about twenty-five million Christians and until recently India had several small but thriving Jewish communities. Nepal is mainly Hindu with a Buddhist minority, and Bhutan the reverse. Sri Lanka is mainly Theravada Buddhist with Hindu, Muslim, and Christian minorities. Mauritius, which has no indigenous population, is about 50 percent Hindu, with a large Christian and smaller Muslim and Buddhist minorities.

Linguistic and religious diversity is more than matched by social diversity. One classification suggests that the sociocultural groups of South Asia can be divided into four general and several subcategories: (1) castes (Hindu and Muslim); (2) modern urban classes (including laborers, non-Hindus, and the Westernized elite); (3) hill tribes of at least six types; and (4) peripatetics.

Economically, there are major distinctions between the rural poor and the urban middle class and elite, and also between the urban poor and urban middle class and elite. There are also significant wealth distinctions based on caste and gender, and a sizeable and wealthy Indian diaspora. There is political diversity as well, with India and Sri Lanka being democracies, Bangladesh shifting back and forth between Islamic democracy and military rule, the Maldives being an Islamic state, and Nepal and Bhutan being constitutional monarchies.

In 2002, South Asia faced several categories of issues. Among the most serious are the ongoing ethnic and religious conflicts between Muslims and Hindus in India, the conflict between the nations of Pakistan and India; the ethnic conflict between the Sinhalese and Sri Lankan Tamils in Sri Lanka; and the conflict between the Nepalese and Bhutanese in both nations. There are also various ethnic separatist movements in the region, as involving some Sikhs in India. The most threatening to order in the region and beyond is the conflict between India and Pakistan over the Kashmir region, as both have nuclear weapons and armies gathered at their respective borders.

A second serious issue is the host of related environmental problems, including pollution; limited water resources; overexploitation of natural resources; destruction and death caused by typhoons, flooding, and earthquakes; famine (less of a problem today), and epidemics of tropical and other diseases. The Maldives faces the unique problem of disappearing into the sea as global warming melts glaciers and raises the sea level. Coastal regions of Bangladesh could also suffer from this.

There are pressing social, economic, and political issues as well. Socially, there are wide and growing gaps between the rich and middle classes and the poor, who are disproportionately women and children and rural. Tribal peoples and untouchables still do not enjoy full civil rights, and women are often discriminated against, although India, Sri Lanka, and Bangladesh have all had women prime ministers. Economically, all the nations continue to wrestle with the issues involved in transforming themselves from mainly rural, agricultural nations to ones with strong industrial and service sectors. Politically, all still also struggle with the task of establishing strong, central governments that can control ethnic, religious, and region variation and provide services to the entire population. Despite these difficulties, there are also positive developments. India continues to benefit from the inflow of wealth earned by Indians outside India and is emerging as a major technological center. And, in Sri Lanka, an early 2002 cease-fire has led to the prospect of a series of peace negotiations in the near future..

East Asia

East Asia is defined here as the nations of Japan, South Korea, North Korea, China, Taiwan, and Mongolia. It should be noted that Taiwan is part of China although the People's Republic of China and the Republic of China (Taiwan) differ over whether it is a province or not. The inclusion of China in East Asia is not entirely geographically and culturally valid, as parts of southern China could be classified as Southeast Asian from a geographical and cultural standpoint, while western China could be classified as Central Asian. However, there is a long tradition of classifying China as part of East Asia, and that is the approach taken here. Likewise, Mongolia is sometimes classified in Central Asia. As noted above, Siberia can be considered as forming North and Northeast Asia.

Economic, political, ideological, and social similarity across China, Korea (North and South), and Japan is the result of several thousand years of Chinese influence (at times strong, at other times weak), which has created considerable similarity on a base of pre-existing Japanese and Korean cultures and civilizations. China's influence was

greatest before the modern period and Chinese culture thus in some ways forms the core of East Asian culture and society. At the same time, it must be stressed that Chinese cultural elements merged with existing and new Korean and Japanese ones in ways that produced the unique Japanese and Korean cultures and civilizations, which deserve consideration in their own right.

Among the major cultural elements brought from China were Buddhism and Confucianism, the written language, government bureaucracy, various techniques of rice agriculture, and a patrilineal kinship system based on male dominance and male control of family resources. All of these were shaped over the centuries to fit with existing or developing forms in Korea and Japan. For example, Buddhism coexists with Shinto in Japan. In Korea, it coexists with the indigenous shamanistic religion. In China and Korea traditional folk religion remains strong, while Japan has been the home to dozens of new indigenous religions over the past 150 years.

Diversity in the region has been largely a product of continuing efforts by the Japanese and Koreans to resist Chinese influence and develop and stress Japanese and Korean culture and civilization. In the twentieth century diversity was mainly political and economic. Japanese invasions and conquests of parts of China and all of Korea beginning in the late nineteenth century led to hostile relations that had not been completely overcome in 2002.

In the post-World War II era and after, Taiwan, Japan, and South Korea have been closely allied with the United States and the West; they have all developed powerful industrial and postindustrial economies. During the same period, China became a Communist state; significant ties to the West and economic development did not begin until the late 1980s. North Korea is also a Communist state; it lags behind the other nations in economic development and in recent years has not been able to produce enough food to feed its population. In 2002 China was the emerging economic power in the region, while Taiwan and South Korea hold on and Japan shows signs of serious and long-term economic decline, although it remains the second-largest (after the United States) economy in the world. Mongolia, freed from Soviet rule, is attempting to build its economy following a capitalist model.

Politically, China remains a Communist state despite significant moves toward market capitalism, North Korea is a Communist dictatorship, Japan a democracy, and South Korea and Taiwan in 1990s seem to have become relatively stable democracies following periods of authoritarian rule. Significant contact among the nations is mainly economic, as efforts at forging closer political ties remain stalled over past grievances. For example, in 2001, people in China and South Korea protested publicly about a new Japanese high school history textbook that they believed did not fully describe Japanese atrocities committed toward Chinese and Koreans before and during World War II. Japan has refused to revise the textbook. Similarly, tension remains between Mongolia and China over Mongolian fears about Chinese designs on Mongolian territory. Inner Mongolia is a province of China.

Major issues with regional and broader implications are the reunification of Taiwan and China and North and South Korea, and threat of war should reunification efforts go awry. Other major regional issues include environmental pollution, including air pollution from China that spreads east, and pollution of the Yellow Sea, Taiwan Strait, and South China Sea. A third issue is economic development and stability, and the role of each nation, and the region as a unit, in the growing global economy. A final major issue is the emergence of China as a major world political, economic, and military power at the expense of Taiwan, South Korea, and Japan, and the consequences for regional political relations and stability.

Overview

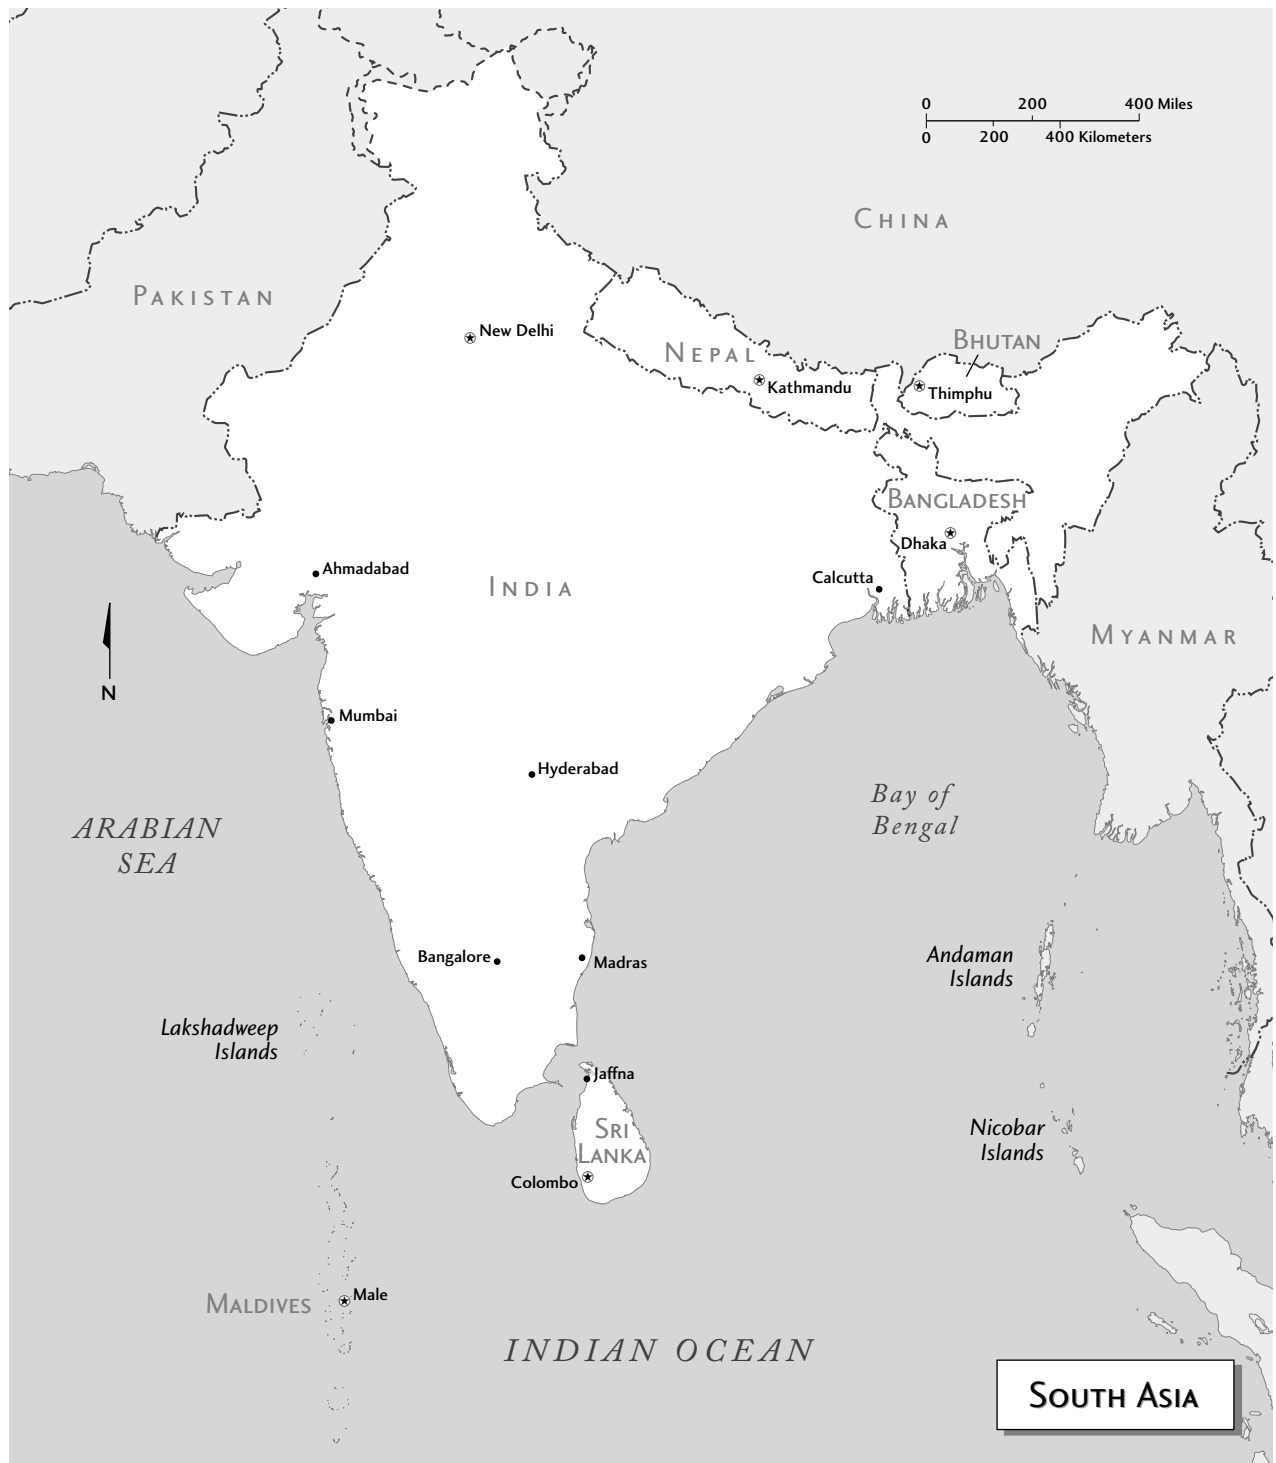

As the above survey indicates, Asia is a varied and dynamic construct. To some extent the notion of Asia, as well as regions within Asia, are artificial constructs imposed by outside observers to provide some structure to a place and subject matter that might otherwise be incomprehensible. The nations of Asia have rich and deep pasts that continue to inform and shape the present—and that play a significant role in relations with other nations and regions. The nations of Asia also face considerable issues—some unique to the region, others shared by nations around the world—as well as enormous potential for future growth and development. We expect that the next edition of this encyclopedia will portray a very different Asia than does this one, but still an Asia that is in many ways in harmony with its pasts.

David Levinson (with contributions from Virginia Aksan, Edward Beauchamp, Anthony and Rebecca Bichel, Linsun Cheng, Gerald Fry, Bruce Fulton, and Paul Hockings)

IAIDO *Iaido* is a Japanese martial art that is practiced primarily for personal physical and spiritual development, but also for competition. *Iaido* is characterized by drawing a sword from the scabbard and cutting in one motion; the name means "having the presence of mind to be flexible in response to an emergency." Developed during the Tokugawa period (1600/1603–1868), when a symbol of samurai authority was the long, curved, single-edged sword, the art was perfected by Jinsuke Shinenobu (c. 1546–1621) and his students. *Iaido* practice involves drawing the sword, making the initial cut, making the finishing cuts, cleaning the blade, and sheathing the sword. Different techniques are used depending on the position of the opponent and the number of opponents. *Iaido* is generally performed alone, with the performer facing an imaginary opponent. In competitions, the performers stand side by side and their technique is rated by judges. *Iaido* is less popular than other Japanese martial arts and has been less influenced by efforts to make it an international competitive sport.

IBARAKI (2002 est. pop. 3.1 million). Ibaraki Prefecture is situated in the central region of Japan's is-

land of Honshu, where it occupies an area of 6,095 square kilometers. Ibaraki's main geographical features are the Abukuma and Yamizo mountains in the north and the broad plains of the Kanto in the south. The prefecture is bordered by the Pacific Ocean and by Chiba, Tochigi, Saitama, and Fukushima prefectures. Once known as Hitachi Province, Ibaraki assumed its present name and borders in 1875.

The prefecture's capital is Mito, which grew around a castle erected during the Kamakura period (1185–1333) by the Daijo family. After the Battle of Sekigahara (1600), it was taken over as castle town by a son of the first Tokugawa shogun. The Tokugawa, or Edo, period (1600/1603–1868) was an era of political and cultural predominance for the Mito domain, comprised of parts of Hitachi and Shimotsuke Provinces. Its rulers founded two schools of imperial learning, the Shokokan and later the Kodokan, together known as the Mito school. In 1864, at the outset of the Mito Civil War, pro-imperial rebels led a major uprising against the Tokugawa shogunate; they were crushed, but the shogunate itself soon crumbled. The focus of present-day Mito is commercial activity, including the production of *natto* (fermented soybeans). The prefecture's other important cities are Hitachi, Tsuchiura, and Koga.

Ibaraki Prefecture has large areas of arable land, producing great quantities of vegetables, fruit, rice, and other grain primarily for the Tokyo market. Fishing remains a leading activity as well. In recent decades heavy industries from the Keihin Industrial Zone have spread into the prefecture. Among them are facilities for the manufacture and processing of electrical equipment, steel, petrochemicals, and foodstuffs.

This transformation has been accompanied by such mammoth projects as Tsukuba Academic New Town and the Kashima Coastal Industrial Region. There is also a city named Ibaraki in northern Osaka Prefecture.

IBN AL-QASIM, MUHAMMAD (d. 715), Arab conqueror of Sind in India. An Arab military commander from the tribe of Thaqif, Muhammad ibn al-Qasim is famous in Islamic history as the conqueror of the western Indian province of Sind under the Umayyad dynasty (661–750). He won favor with the Umayyad governor of Iraq, al-Hajjaj, who dispatched him to Sind at the head of a military expedition between 708 and 711; Ibn al-Qasim was probably about fifteen or seventeen years old at this time.

He arrived by land in India to punish Dahir, the ruler of Sind, who had failed to curb pirates operating off the coast of his province and who were disrupting Muslim shipping. His forces conquered several Indian cities, among them the Hindu pilgrim city of Multan, and killed Dahir.

In some Arabic sources, Ibn al-Qasim is said to have accorded the Hindus the status of "protected people" (*ahl al-dhimma*). This status is traditionally reserved under Islamic law for Jews and Christians, who as kindred followers of a revealed scripture, are granted protection by the Islamic state upon payment of a poll tax. On account of this concession to the Hindus, Ibn al-Qasim is regarded by modern Muslims in particular as a paragon of religious tolerance. He is also greatly admired for his youthful military prowess. Ibn al-Qasim's career came to an abrupt end, however, with the death of al-Hajjaj in 715. Under the new administration, he was dismissed from his post and brutally put to death.

IBN BATTUTAH (1304–1368/69), Arab traveler and writer. Abu'Abd Allah Muhammad ibn'Abd Allah al-Lawati at-Tanji ibn Battutah, one of the greatest

travelers of the Middle Ages, spent thirty years visiting every Muslim country of his day and recorded in accurate detail the social and political life he observed on his journeys. Born in Tangier, a seaport in present-day Morocco in North Africa, he began to travel at the age of twenty-one years, when he made the hajj (pilgrimage to Mecca). On his way he passed through today's Egypt and Syria and returned through Iran and Iraq. On a second journey, he explored southern Arabia, East Africa, and the Persian Gulf.

Ibn Battutah next traveled north to Constantinople and crossed southern Russia, Samarqand (now in Uzbekistan), and Afghanistan to arrive in Delhi, India, around 1333. In 1342, Muhammad ibn Tughluq (c. 1290–1351), the son of the sultan of Delhi, sent him as an envoy to the Chinese emperor. Ibn Battutah reached present-day Beijing via the Maldiv Islands in the Indian Ocean, Ceylon (today's Sri Lanka), and Assam (a state in India) and from the East returned to Fes (Fez) in northern Morocco, thereby crossing half of the Earth. From Fes he went north to al-Andalus (Muslim Spain) in Europe and later traveled south across the Sahara Desert to the Sudan in north central Africa.

Although historians and geographers largely ignored his journals until the late twentieth century, Ibn Battutah is estimated to have traveled about 125,000 kilometers, much farther than Marco Polo (1254–1324) and other medieval travelers, and his observations of the countries he visited are far more detailed and accurate than those of Polo.

IBN SINA (980–1037), philosopher, scientist, physician. Ibn Sina was a philosopher, scientist, and physician better known in the West as Avicenna. His full name was Abu 'Ali al-Husain ibn Sina. Ibn Sina was born in Bukhara, Uzbekistan, in 980 CE and died in Hamadan, Persia, in 1037. By age sixteen, Ibn Sina had learned all he could from his teachers and went on to complete his education at the library of the Samanid dynasty (864–999 CE) of Bukhara, to which he was granted access after curing a member of the dynasty.

IBN BATTUTAH

The markets around the Umayyad mosque in Damascus as described by Ibn Battutah:

An eastern door, the largest of the doors of the mosque, called the Jairun Door. It has a large vestibule, leading out to a vast and broad arcade, entered through a quintuple gateway [of arches] formed by six tall columns. . . . Along both sides of this arcade there are pillars upon which are supported circular passages, where the cloth-merchants amongst others have their shops; above these again are long passages in which are the shops of jewellers and booksellers and makers of admirable glassware. In the square adjoining the first door are stalls belonging to the principal legal witness, two stalls among them belonging to the Shafi-ites [a legal school] and the rest to those of various schools. In each stall there may be five or six notaries [that is, a legal witness known for honesty whose testimony would be readily accepted by an Islamic judge and employed for witnessing contracts] and the person authorized to draw up contracts of marriage on behalf of the qadi [Islamic judge]. The other notaries are scattered throughout the city. In the vicinity of these stalls is the bazaar of the stationers, who sell paper, pens and ink. In the centre of the vestibule which we have been describing there is a large circular basing, made of marble, surmounted by an unroofed cupola, which is supported by marble columns, and in the centre of the basin is a copper pipe which violently forces out water so that it rises into the air more than a man's height. They call it the Waterspout, and its aspect is striking.

Source: Ibn Battuta. (1958) *The Travels of Ibn Battuta, A.D. 1325–1354*. Translated by H.A.R. Gibb. London: Hakluyt Society, 131.

Unfortunately, he lived in very unsettled times and was never able to stay for very long in one place. Ibn Sina was actually imprisoned and forced into hiding more than once. He did enjoy two reasonably stable times at the courts of princes in Hamadan and later in Isfahan, Persia. He died accompanying the latter prince on a campaign against Hamadan.

Ibn Sina is best remembered for his two books, *Shifa* (Book of Healing) and *Qanun*. *Shifa* is a book on philosophy drawn largely from the works of Aristotle. *Qanun* is a medical text drawn mostly from the works of the ancient Greek physicians Hippocrates (c. 460–c. 377 BCE) and Galen (129–c. 199 CE). *Qanun*, however, recast their ideas along with his own observa-

tions into a highly accessible form and became the most widely used medical text in Europe and the Middle East for nearly seven hundred years.

ICHIKAWA FUSAE (1893–1981), leading Japanese politician, activist in Japan's women's liberation movement. Ichikawa Fusae was born in Aichi Prefecture and graduated from Aichi Women's Normal

School, after which she first pursued a career in elementary school teaching and journalism. In 1919, she entered the Yuukai, a leading labor union, and took an active part in promoting the status of women workers. In the following year, she established the New Woman's Association with the feminist Hiratsuka Rai-cho (1886–1971). Resigning from the Association in 1921, Ichikawa went to the United States for two and a half years to study women's issues.

While working for the Tokyo branch of the International Labor Organization, Ichikawa formed the League for Women's Suffrage in 1924 and worked in the popular rights movement until the dissolution of the League in 1940. During World War II, Ichikawa played a significant role in numerous activities of the suffrage movement, which faced difficult compromises with the government over wartime collaboration. After the war, she established the New Japan Women's League (changing the name to The Japanese League of Women Voters in 1950), and she devoted herself to enlightening the public about women's issues and to promoting electoral ideals and political reform. From 1953, Ichikawa was elected five times to the House of Councilors, the last time being in 1980, the year before she died.

Kyoko Murakami

IENAGA SABURO (b. 1913), Japanese historian. Born in Aichi Prefecture in 1913, Ienaga Saburo graduated from Tokyo Imperial University (now the University of Tokyo) in 1937. He began his career as a high school teacher, later moving to Tokyo University of Education and, subsequently, to Chuo University. In 1948, he was awarded the Japan Academy Prize and became professor emeritus at Tokyo University of Education.

Ienaga brought three lawsuits (1965, 1967, and 1984) against the Ministry of Education, challenging the constitutional legitimacy of the textbook-screening system to which his high school Japanese history textbooks had been subjected. These suits raised a number of fundamental issues about the powers and qualifications of government officials to make decisions on curriculum content and the extent to which those powers could be reviewed in the courts. Although Ienaga lost the first two cases in the Supreme Court, he achieved a partial victory in his third court battle in the 1997 Supreme Court decision, which ruled that government may not tamper with historical truth in textbooks. Ienaga's lawsuits have had a significant influence, not only on the administrative

procedure of the textbook-screening system, but also on diplomatic relations between Japan and its neighbors as well as on human rights issues worldwide.

IGLESIA NI CHRISTO The Iglesia ni Cristo ("Church of Christ") was founded in the Philippines in 1913 by Felix Manalo (1886–1963). Manalo was raised a Roman Catholic but as a teenager was influenced by a secretive local spiritual sect, as well as by Methodist and Presbyterian churches, the Church of Christ, and Seventh-Day Adventism. Following a religious experience, he founded the Iglesia ni Cristo, which he incorporated with twelve followers in 1914. In 1922 he proclaimed that he was God's final messenger, and around 1930 he began to preach the church's most controversial claim, that Christ was not divine.

The church aggressively sought new members and after World War II expanded rapidly: it claimed 60,000 adherents in 1948 and 200,000 in 1960. The church also expanded outside the Philippines, particularly in Philippine diaspora communities in Hawaii and California. In 2002 it is second only to the Roman Catholic Church in the Philippines, with 2,500 congregations in the Philippines and several hundred more overseas. Its worldwide membership is estimated at between three and six million.

In part because of its perceived anti-Christ and anti-Trinitarian doctrines, its secrecy, and its aggressive proselytizing, the church has received much attention from organizations that oppose cults. Much of what is known of the church is from what it publishes in its magazine, *Pasugo*, which began publication in 1939 and is now available in Pilipino and English.

IJIME *Ijime* is considered a major social problem in Japan. Although translated as "bullying," *ijime* is really collective bullying and may include everything from name-calling to extortion or physical violence. The collective nature of *ijime* makes it difficult for adults to observe, and peer pressure silences students; most *ijime* occurs among peers. Audiences often play a significant role in promoting *ijime*.

Within Japan, popular opinion has linked *ijime* with excess academic competition and the growth of *juku* (cram schools). Academic research suggests that the contemporary characteristics of *ijime* have appeared largely since the end of the 1970s. Characteristics such as the collective nature of *ijime* and its "invisibility" to adults have been linked to school features such as high levels of social homogeneity, limited physical space, and uniformity-oriented curricular goals. Scholars have also linked some types of *ijime* to the influence of mass media and a cultural cynicism. Economic changes in society also may have weakened traditional social controls that restricted adolescent behavior in the past.

IKAT DYEING Lowland Lao women primarily use *ikat* dyeing to decorate their lower garment, the tube skirt (*sin*). *Ikat* patterns are created before the textile is actually woven. Either the vertical threads, the warp, or the horizontal threads, the weft, are bound by strips of plant or plastic fiber to form the patterns for a textile, and then the tied threads are dyed. The plant fiber ties are removed in stages so the threads can be dipped in subsequent dye baths until the dyeing process is complete. After the dyed threads are dry,

they are carefully woven to line up the patterns of the thread to form the cloth.

Only a few groups, such as the Tai Daeng, continue to utilize a simple warp *ikat*. Weft *ikat* is more common and is used to decorate the body of the tube skirt. The weft *ikat* patterns are dyed in rows separated by plain stripes (*sin mii khan*) or bands of supplementary patterns, or the patterns cover the entire body of the tube skirt with repetitive patterns. The origin of the patterns comes from the weaver's surrounding environment. Plant and animal motifs such as scorpions, spiders, birds, elephants, jasmine flowers, and trees or religious iconography such as mythical animals are abundant. The *naga* (or *naak*) is one mythical creature important to both Buddhist and animist beliefs and is a common image. An exception to the confinement of *ikat* to women's clothing is its use to decorate large, rectangular coffin covers. The design of the cloth is inspired by Khmer silk *ikats* and ultimately Indian *ikats* (*patolas*). The use of *ikat* dyeing by Lao women is a distinguishing characteristic of their dress and identity.

IKEDA HAYATO (1899–1965), prime minister of Japan. A finance ministry bureaucrat who served as Japan's prime minister from 1960 to 1964, Ikeda is associated with the high economic growth in Japan of the 1960s, which he helped promote with his celebrated campaign for a doubling of national income in ten years.

A native of Hiroshima Prefecture, Ikeda graduated from Kyoto University in 1925, after which he worked in several prefectural tax offices. He was elected to the Lower House of the Japanese Diet (parliament) in January 1949 as a member of the Democratic Liberal Party (*Minsbu Jiyuto*). Ikeda served as vice minister of finance (1947–1948), minister of finance (1949–1952), and minister of international trade and industry (1950) under Japan's most powerful early postwar politician, Prime Minister Yoshida Shigeru (1878–1967). He and

Sato Eisaku constituted the core of what was known as the Yoshida school.

Ikeda served in Japan's delegation to the San Francisco Peace Conference in 1951. And he played a critical role in normalizing U.S.-Japanese security relations as Yoshida's special emissary in Washington for talks with Assistant Secretary of State Walter S. Robertson over Japanese rearmament in October 1953.

IKKYU (1394–1481), Japanese Zen monk. Born in Kyoto and reputedly the son of the emperor Go-Komatsu (1377–1433) and a noblewoman who was expelled from court by a jealous imperial consort, by the age of five, Ikkyu (also called Ikkyu Sojun) was sent to a Zen temple to be raised. Early on, he was recognized as a brilliant student, quick-witted and mischievous. Appalled at the corrupt behavior of the senior monks, he fled the temple at the age of sixteen to commence instruction under the eccentric Rinzai Zen priest Kenno Soi (d. 1415), who gave him the name Sojun. Kenno had earlier caused consternation by refusing a certificate of enlightenment, necessary for obtaining a position at a major temple. Such uncompromising behavior matched Ikku's temperament closely.

Upon the death of this master, Ikkyu continued training under Kaso Sodon (1352–1428) at a small retreat on the shores of Lake Biwa, east of the ancient capital of Kyoto. Under Kaso, Ikkyu's firmness of purpose in achieving enlightenment turned to uncompromising, righteous indignation, perhaps partly motivated by his resentment at the manner in which his mother had been banished from the court. He condemned the trivialization of Zen teaching and the indolence of pleasure-seeking priests and the general populace. Ikkyu became known for his unconventional behavior and humane character. His best-known work is *Kyounshu* (The Crazy Cloud Collection), a compilation of more than one thousand Chinese poems.

IMPERIAL PALACE Located in the heart of Beijing, the Imperial Palace is the largest and best-preserved palace complex in China and the city's most famous tourist attraction. Formerly known as the Forbidden City, the palace took fifteen years to build and was home to twenty-four emperors from Yongle (1360–1424), at the start of the fifteenth century, to Pu Yi (1905–1967), the last Chinese emperor, who finally left in 1924. The complex also housed Communist leaders in Zhongnanhai, which lies a short distance to the west of Imperial Palace, and Mao Zedong proclaimed the birth of the People's Republic of China on 1 October 1949 from the Gate of Heavenly Peace, at the southernmost point of the complex.

A portion of the interior of the Imperial Palace or Forbidden City in Beijing. In 2001 restoration continued on the site, which became a major tourist attraction. (CHARLES & JOSETTE LENARS/CORBIS)

IMPERIAL PALACE— WORLD HERITAGE SITE

The Ming and Qing dynasties' Imperial Palace (the Forbidden City) was designated a UNESCO World Heritage Site in 1987. The nine thousand furnished rooms in the palace are an invaluable testament to the culture and civilization of imperial China.

The Imperial Palace, once banned to all commoners, covers an area of 250 acres and contains 800 buildings, all made of wood and brick, with more than nine thousand rooms. The Forbidden City was located at the center of the imperial capital and is still considered to be the heart of the modern city. Within the Imperial Palace, there is a clear progression of important buildings along its north-south axis. Beyond the Gate of Heavenly Peace lie the three grand halls of the Outer Court, in which the emperor and his officials carried out administrative and ceremonial duties, and the sumptuous Inner Court, formerly the living quarters of the emperors and their families. The Imperial Palace today houses a museum that contains a vast array of precious artifacts, including paintings, bronze artifacts, and calligraphy as well as a collection of several million official documents.

IMPERIAL RESCRIPT ON EDUCATION

The Imperial Rescript on Education (*Kyooiku Chokugo*) of 1890 is one of the most controversial documents in prewar modern Japan. It governed the basic purpose of education from its promulgation in 1890 to the end of World War II.

The modern era of Japanese education is commonly dated from 1872 with the *Gakusei* (First National Plan for Education) issued just four years after the Meiji

Restoration (1868–1912) brought to a close 350 years of the feudal Tokugawa military regime (1600/1603–1868). The *Gakusei* set up a national school system patterned after educational practices in the West. Of all the modern reforms of feudal educational patterns carried out in the 1870s and 1880s by the Japanese oligarchy, however, the most prominent was the replacement of traditional morals education based on Confucian classics from China. As the core of the curricula, Confucian teaching was overshadowed by science, mathematics, and technology imported from the West.

A controversy emerged when figures within the Imperial Household such as the Confucian scholar Motoda Nagazane (1818–1891), acting on behalf of Emperor Meiji, protested these trends. The Imperial Will on Education (*Kyooogaku Taishi*) of 1879, written by Motoda, called for education in the modern world based on the teachings from the ancient world, particularly those of the Confucian classics. *Kyooogaku Taishi* led to a confrontation between the modernizers, such as the great statesman Ito Hirobumi (1841–1909) and his political confidant Inoue Kowashi (1843–1895), along with Mori Arinori (1847–1899), first Minister of Education, pitted against conservatives like Motoda and other like-minded officials within the Imperial Household and the government, including Prime Minister Yamagata Aritomo (1838–1922).

The struggles ended with a unique compromise. Inoue Kowashi, author of the first Japanese Constitution of 1889, which was patterned after the German Constitution, wrote the initial draft of the Imperial Rescript during the summer of 1890. He referred to the modern constitutional state and the necessity of abiding by the laws. Motoda, representing the Emperor, submitted revisions based on cherished Confucian concepts previously included in the 1879 Imperial Will on Education. When Inoue, the German-oriented modernist, incorporated Motoda's recommendations, an East-West compromise was achieved. The Imperial Rescript on Education combined traditional Confucian moral principles governing the relationship between the Emperor and his people with a modern sovereign state based on constitutional laws. Its purpose was to develop a spirit of nationhood and love and respect for the Imperial tradition.

With the rise of Japanese militarism in the first half of the 1900s, however, nationalists turned to the Rescript as a means to foster extreme nationalism and ultramilitarism in the name of the emperor. The Rescript became a sacred document read with great

reverence at special school meetings. The original intent of 1890 was subverted, rendering the Rescript a repressive instrument of social and political control. It was controlled by militarists and used to repress any opposition to government policy leading to World War II and the ensuing defeat of Japan. During the Occupation of Japan, American authorities abolished the Rescript as an antidemocratic document of state repression. It was replaced in 1947 by the Fundamental Law of Education, which gave the purpose of education in a democratic society as the development of the individual.

IMPHAL (2001 pop. 217,000). The capital of Manipur State in northeastern India, Imphal lies in a Manipur River valley at an altitude of around 792 meters. It is believed to have existed as early as the third century BCE. Imphal was the seat of the kings of Manipur before the British took control of the region in 1926. In 1944 it was the site of a decisive battle in which a British garrison held off advancing Japanese

Women in the market with their piles of textiles for sale. (LINDSAY HEBBERD/CORBIS)

troops, thereby halting the Japanese march through Myanmar (Burma) and ending Japan's attempt to invade India.

A polo field dominates the city center; the Manipuri game of *Sagol Kangjei* (*Kangjei* means a stick made of cane) is considered the original form of polo. The city is a major trade center, noted for its weaving, brassware, and bronze ware. The market of Khwairamband is run by 3,000 women. Half is devoted to textiles, including the *moirangphee*, the traditional Methei dress. (The Methei are Hindus of Mongoloid stock.) The other half of the market sells fish, vegetables, and basic provisions. The Shri Govindjee temple is an important center for Vaishnavite Hindus. Two cemeteries commemorate heroes of World War II. The Khonghampat Orchidariums feature 110 species of orchids. Nearby are zoological gardens, famous for rare indigenous brow-antlered deer.

INCHON (2002 est. pop. 2.4 million). Located on the northwestern coast of South Korea at the mouth of the Han River and bordering the Yellow Sea, Inchon (Inch'on) is perhaps best known as the site of General Douglas MacArthur's Inchon Landing on 15 September 1950, when U.N. troops landed behind North Korean forces, effectively cutting the North Korean army in two and reversing the tide of the Korean War.

Formerly known as Chemulpo (Chemulp'o), Inchon was founded during the Unified Shilla dynasty (668–935 CE). Throughout much of its history Inchon has played second fiddle to Seoul, its larger eastern neighbor, serving as Seoul's chief port and manufacturing base. Inchon International Airport is the Koreans' largest.

INDIA—PROFILE (2001 pop. 1 billion). The spatial dimension of what came to be known as the Republic of India (in Sanskrit, Bharata), kept changing until it became independent on 15 August 1947. Although the concept of India as a nation-state emerged after British colonial rule, the idea of Bharata had been there from time immemorial. Deriving from

geography, history, and culture, a sense of unity has been present throughout its history. Despite the presence of diverse elements, a unifying force is present in India's literature, music, dance, art, behavioral patterns, and societal norms. The concept of *Bharatavarsha* (the idea of Bharata as a territorial entity) is a part of Indians' common psyche.

INDIA

Country name: Republic of India
Area: 3,287,590 sq km
Population: 1,029,991,145 (July 2001 est.)
Population growth rate: 1.55% (2001 est.)
Birth rate: 24.28 births/1,000 population (2001 est.)
Death rate: 8.74 deaths/1,000 population (2001 est.)
Net migration rate: -0.08 migrant(s)/1,000 population (2001 est.)
Sex ratio—total population: 1.07 male(s)/female (2001 est.)
Infant mortality rate: 63.19 deaths/1,000 live births (2001 est.)
Life expectancy at birth—total population: 62.86 years; male: 62.22 years, female: 63.53 years (2001 est.)
Major religions: Hinduism, Islam, Christianity, Sikhism, Buddhism, Jainism, Zoroastrianism (Parsi)
Major languages: Hindi, Bengali, Telugu, Marathi, Tamil, Urdu, Gujarati, Malayalam, Kannada, Oriya, Punjabi, Assamese, Kashmiri, Sindhi, Sanskrit, Hindustani, English
Literacy—total population: 52%; male: 65.5%, female: 37.7% (1995 est.)
Government type: federal republic
Capital: New Delhi
Administrative divisions: 28 states and 7 union territories
Independence: 15 August 1947 (from UK)
National holiday: Republic Day, 26 January (1950)
Suffrage: 18 years of age; universal
GDP—real growth rate: 6% (2000 est.)
GDP—per capita (purchasing power parity): \$2,200 (2000 est.)
Population below poverty line: 35% (1994 est.)
Exports: \$43.1 billion (f.o.b., 2000 est.)
Imports: \$60.8 billion (f.o.b., 2000 est.)
Currency: Indian rupee (INR)

Geography

The second most populous nation and the seventh largest nation in land area in the world, India covers 3,287,590 square kilometers, stretching from the Bay of Bengal in the east to the Arabian Sea in the west. It shares borders with Bangladesh, Bhutan, Myanmar (Burma), the People's Republic of China, Nepal, and Pakistan. The Himalayas rise above peninsular India in the north, and here the three great rivers of the subcontinent—the Indus, the Ganges, and the Brahmaputra originate. The southern tip of India ends in Kanya Kumari, where the peninsula merges into the Indian Ocean. The Palk Strait and Gulf of Mannar

divide India from Sri Lanka. The terrain varies from mountains to flat river valleys. The Vindhya range of mountains divides north from south India. The alluvial plain of the Ganges in the north contains much of the country's arable land. Between Gujarat in the southwest and Delhi in the northeast lies the Aravalli range. Two mountain ranges, the Eastern and Western Ghats, border the rocky and triangular Deccan plateau in the south. The Godavari, Krishna, and Kaveri rivers flow eastward in this region. The climate of India varies according to area and elevation, but is generally tropical. Dependent on two monsoons, India's rainfall also varies from region to region.

People

India occupies about 2.4 percent of the world's land area, but 17 percent of the world's population is found here. The population has crossed the 1 billion mark. The influx of alien peoples down the centuries has resulted in a remarkable racial and cultural synthesis as well as considerable ethnic and linguistic diversity. The age-old caste system is present, although caste distinctions are gradually disappearing due to social mobility, modern perceptions, and the policy of reservation (seats reserved for admission to colleges, jobs, political offices, and so on). The scheduled castes and tribes (that is, the lower castes), which make up 16.5 percent of the total population, are coming into the mainstream.

With eighteen officially recognized languages (Assamese, Bengali, Gujarati, Hindi, Kannada, Kashmiri, Konkani, Malayalam, Manipuri, Marathi, Nepali, Oriya, Punjabi, Sanskrit, Sindhi, Tamil, Telugu, and Urdu) and sixteen hundred dialects, India is truly a Tower of Babel. Hindi is the official language and is the mother tongue of about 18 percent of the population. English enjoys an important status as an official language and the language of urban India and is used extensively in such fields as education, international business, science, medicine, information technology, and communication.

India is a nation of religious diversity. Hindus constitute 83.5 percent of the total population. India also has the second largest number of Muslims, after Indonesia. They form about 13 percent of the population. India, which does not have a state religion and professes secularism, also is home to Christians, Sikhs, Buddhists, Jains, and Parsis (Zoroastrians).

Historical Overview

Human activity began in India about a half million years ago. Archaeological excavations have brought to light the urban civilization commonly referred to as the Indus Valley civilization, concentrated in India and modern-day Pakistan, during the period between 2700 and 1500 BCE. The Vedic civilization preceded the rise of cities in India. The invasion of Alexander of Macedon (356–323 BCE) in 326 BCE was followed by the Maurya empire (c. 324–c. 200 BCE), the first unified empire to cover most of present-day India and Pakistan. Asoka (d. 238 or 232 BCE) was the greatest of the Mauryan emperors. A period of chaos and foreign invasions by the Scythians, Parthians, Huns, and others followed until political stability was achieved under the Gupta dynasty (c. 320–c. 500 CE). In south India, the Pallavas and Chalukyas emerged as powerful kingdoms during the seventh century. Harsha

(606–647), Sasanka (606–637), and Pulakeshin II (609–642) carved out kingdoms in north India, Bengal, and south India, respectively, in the seventh century. In the early medieval period, spanning the eighth to fourteenth centuries, north India witnessed the coming of Islam from the northwest.

Muhammad bin Qasim (invaded Sind in 712), Mahmud of Ghazna (raided India 1000–1025), and Muhammad of Ghur (reigned 1192–1206) brought the north Indian subcontinent under their domain, and it was the establishment of the Delhi sultanate (1192–1526) that resulted in the consolidation of Muslim power. India's Muslim conquerors had been drawn to the subcontinent by the desire for territorial conquest, the lure of wealth, and religious zeal. Powerful regional kingdoms such as the Palas, Senas, Ahoms, Gangas, and Cholas rose and fell in different parts of India. The Gajapati empire of Orissa and the Vijayanagar empire of the south were able to survive until the 1560s. The Mughals (1526–1857) brought almost all of north India under their control, and Akbar (1542–1605) was one of India's greatest monarchs.

From the eighteenth century onward, the Mughal empire began to crumble. The Marathas under the intrepid leader Sivaji (1627 or 1630–1680) had already encroached on Mughal power. The coming of the Europeans as traders and later as seekers of political power sounded the final death knell. The British East India Company became the master of the subcontinent. By adroit diplomacy, warfare, and political conspiracy, the British subjugated the subcontinent. The Indian Mutiny, or the First War of Independence (1857), gave a serious jolt to the colonial power, and the administration was transferred from the East India Company to the British throne. Mohandas (Mahatma) Gandhi (1869–1948) used nonviolence and mass movements to shatter the foundation of Britain's Indian empire. A tenacious struggle for freedom by people of all classes, led by nationalists such as Jawaharlal Nehru (1889–1964), Subhas Chandra Bose (1897–1945), and Sardar Vallabhbhai Patel (1875–1950), resulted in India's independence on 15 August 1947. However, the subcontinent was partitioned at that time between India and Pakistan.

Economy

The Indian economy, which encompasses traditional village agriculture, the use of modern technology in farming, heavy industries, and a multitude of support industries, is often seen as two entities: one rural and one urban. About 30 percent of the people live below the poverty line, and India's gross national product is \$450 billion. In terms of purchasing parity, India is the

CREATING A UNIFIED, CIVIL INDIA

One of the major problems facing India as a new nation was the tremendous ethnic, religious, and linguistic diversity of its people. One attempt to create national unity amidst this diversity was a pledge to affirm India as a civilized and peaceful society. The pledge was signed by national leaders and the people of India at public meetings on 2 October 1962.

The National Integration Conference held in 1961 decided that a pledge should be taken by every adult Indian to affirm his faith in the universal principle of civilised society to resolve civil disputes by peaceful means and to abstain from resort to violence.

A campaign for such a pledge to be taken by all the people of our country will be inaugurated on the birthday of Mahatma Gandhi on October 2, 1962. The campaign will be continuous and will be carried on during all the months of the year, but the week from October 2 to 9 will be particularly devoted to it.

No person should be asked to sign the pledge unless its meaning and significance have been fully explained to and understood by him.

Emotional integration is the essence of national integration. Even with all the outward attributes of nationhood, a people would still be lacking in real national cohesion in the absence of complete emotional integration. India has always had a basic unity and a peculiar and distinctive identity and this should provide a basis for the task of national integration.

A serious obstacle to the emotional integration of our people is the resort to violence in the course of disputes arising out of regional, linguistic, religious and other similar matters. In a large country like India with its many diversities, it is but natural that differences between sections or groups of people should arise from time to time. But it is not so much the existence of such differences and disputes which endangers the integrity of the nation as the manner in which we conduct them. When brothers quarrel and settle their differences peacefully, the spirit of fraternal accord remains unbroken. Should they, however, in their quarrel become violent and strike each other, the feeling of brotherhood may come to an end. Similarly, when Indians assault or kill Indians and burn and loot in the name of caste, sect, religion, language or religion, the resulting hatred, bitterness and spirit of vengeance create a psychological estrangement which makes it difficult for people to feel that they all belong to one another as citizens of the same nation.

It was in pursuance of this line of thought that the National Integration Conference decided to launch this campaign. It is to be hoped that a countrywide campaign of this nature will create a powerful psychological climate which will help in every way in promoting national integration.

Source: Jagdish Saran Sharma. (1965) *India's Struggle for Freedom: Select Documents and Sources*. Vol. 2. Delhi: S. Chand & Co., 481–482.

world's fifth-largest economy. Agriculture employs about 70 percent of the people and contributes about 25 percent of the gross domestic product (GDP). The industry and service sectors account for 30 and 45 percent of GDP, respectively.

India has seen broad-based industrial development for the last five decades. The most important crops are rice, wheat, millet, oilseeds, jute, and tea. Rubber, coffee, pepper, and sugarcane are other profitable cash crops. Foreign trade is important to India's economic development. Exports cover such items as agriculture and allied products, coffee, tea, spices, iron ore, textiles, leather, and computer software. Export earnings for 2000 were \$43.1 billion. Petroleum and its products, fertilizers, cereals, edible oils, drugs and pharmaceuticals, and precious and semiprecious stones are major items of import, with imports amounting to \$60.8 billion in 2000. The United States is India's largest trading and investment partner.

Planning is a major instrument of India's economic development. Planned economic development began in 1951 with the first five-year plan; the period 1997–2002 was covered by the ninth plan. The objectives were rapid economic growth, modernization, self-reliance, and social justice. During the 1990s, India shifted to a market-driven economy from its decades-old centralized planning model.

Culture

India's cultural richness may be seen in religion, philosophy, literature, science, music, dance, painting, and architecture. The Vedas, the Upanishads, and the *Bhagavad Gita*, ancient Hindu texts, deal with such metaphysical concepts as the doctrine of Brahma (universal self), atman (individual self), and *moksa* (liberation). India is also the birthplace of Buddhism and Jainism. With the coming of Islam, Indian culture was confronted with a new religion. However, gradually there was an attempt at rapprochement. In art and architecture, literature, and social norms, a common culture began to evolve, which contained elements of both Islam and Hinduism. The Sufi and Bhakti saints, with their simple message of egalitarianism, brought about a reconciliation of the two communities. Monuments like the Taj Mahal and the Red Fort are great contributions to Indian culture, as are the Buddhist remains at Sarnath, the sun temple of Konarak, or the Sri Minakshi temple complex at Madurai.

Contemporary Government and Politics

After independence, India continued as a dominion within the British Commonwealth until 26 January

1950, when it became a sovereign, democratic republic with a parliamentary form of government upon the promulgation of a new constitution. The president of India, elected for a five-year term, possesses full executive power, but the prime minister, who normally belongs to the majority party in the parliament and the cabinet, exercises real power.

Jawaharlal Nehru was premier from independence until his death in 1964. He espoused socialism, non-alignment, a planned economy, and industrialization. The 362 princely states, such as Hyderabad and Junagarh, merged with the Indian Union; a war occurred with Pakistan in 1948 over Kashmir; and Mahatma Gandhi was assassinated in 1948. A Chinese attack on India in 1962 resulted in a humiliating defeat for India. Another war with Pakistan occurred in 1965; in 1974 India successfully tested nuclear weapons at Pokhran. Sikh militants became active in the 1980s, and in 1984 Indira Gandhi (1917–1984), then prime minister, was assassinated by a Sikh bodyguard following her order of an attack on the Golden Temple, a sacred site for Sikhs. In the last decade of the twentieth century, the Congress Party lost its monopoly on power, and a trend to the right was visible with the emergence of the BJP (Bharatiya Janata Party) and the proliferation of regional parties. Relations with Pakistan took a nosedive, and again a limited war, known as the Kargil conflict, occurred in Kashmir. Militancy in Kashmir has become one of India's main problems. Eradicating poverty, maintaining steady economic growth, and fighting overpopulation remain India's other major problems.

INDIA—ECONOMIC SYSTEM India's economy is one of the largest in the world. Converting Indian rupees to U.S. dollars at the rate of exchange in 1995, that year India ranked fifteenth in the world in total gross domestic product. When measured in purchasing power parity terms (that is, the number of rupees required to buy the same amount of goods and services in India as one dollar would buy in the United States), India's gross domestic product was the fifth highest in the world in 1995, exceeded only by the United States, China, Japan, and Germany.

However, using the conventional 1995 rate of exchange measure, India ranked 107th in the world in per capita income, with an average of \$340 per annum. That figure was a result of an average annual growth rate in the gross national product of 5.5 percent and a growth rate in per capita income of 2.2 percent from 1950 to 1995. The half-century before 1950 was a period of economic stagnation during which growth in economic output barely kept up with India's population increase. During the second half of the twentieth century India achieved significant growth and improved well-being compared with the first half. In 1995 approximately 2.5 times as many Indians produced 5 times the output of 1950, so each Indian had on average twice as many goods and services in 1995 as in 1950.

FIVE LARGEST COMPANIES IN INDIA

According to *Asia Week* the five largest companies in India are as follows:

Company	Sector	Sales (\$ millions)	Rank in Asia
Indian Oil	Oil Refining	28,504.6	34
Hindustan Petroleum	Oil Refining	10,806.6	121
Bharat Petroleum	Oil Refining	10,322.8	130
Reliance Petroleum	Oil Refining	6,889.5	192
Reliance Industries	Textiles, Chemicals	6,232.0	209

Source: "The Asia Week 1000." (2001) *Asia Week* (9 November): 112.

Despite this massive increase in overall output, in 1993 and 1994 approximately 320 million Indians, or over one-third of all the Indian people lived below a very low level of poverty, measured by their spending less than \$10 per month (at the 1995 exchange rate) for food. Also almost one-half of the entire population—male and female—are illiterate, but two-thirds of all females are, reflecting both the low levels of education throughout society and the low level of educational opportunity for women in particular. In addition many villages and urban slums lack clean water, decent sanitation, and basic health care.

India's rural population has benefited less than its urban population from the economic growth after 1950. Consequently rates of poverty, illiteracy, and poor health are higher in rural areas than in the cities. India has achieved major industrial advances since 1950. Industrial output has increased by over twenty times, and employment in the organized sector (largely industrial and government) has tripled. The share of industrial and services output in the total national income increased from about 40 percent in 1950 to over 70 percent in 1997. Yet of the more than 300 million workers in 1991, over 240 million—two-thirds of the workforce—were rural workers. India remains a mainly agricultural economy as far as its population is concerned. While farm output has exceeded population growth and the country has experienced no famines since independence, the overall well-being of its population is largely determined by the experiences of the agricultural sector.

Goals, Policies, and Problems after Independence

India's economic achievements and history have not matched the hopes of the country's political, business, and intellectual leaders at independence in 1947. Prior to independence, India's political and business leaders put forth plans that sought, as a medium-term goal of about fifteen years, to end poverty in the country. They planned to reach this goal by increasing the growth of the economy as a whole and by shifting from a predominantly agricultural economy to an industrialized one. Their anticipated result was higher incomes, which would end extreme poverty. The experiences of the 1930s depression, the wartime economic controls in the country, the apparent Soviet achievements of industrialization and military power, and the decline of world trade during the depression provided rationales for a socialist, planned economy that emphasized an industrialization policy based on import-substitution and heavy capital goods. Mohandas (Mahatma) Gandhi (1869–1948) urged policies to

strengthen agriculture, improve rural life, and encourage small-scale rural industrialization. Those policy directions were largely downplayed after his assassination in 1948.

The Indian constitution, written in 1950, included in its directive principles various economic and social goals. It aimed toward an equal economic and social order in which all people have a right to be educated, to work, and to receive unemployment benefits, health assistance, and disability benefits. These were not legal rights but goals. Prime Minister Jawaharlal Nehru (1889–1964) headed a planning commission, set up in 1950, to prepare outlines and policies for legislation to achieve those goals within the framework of a socialistic pattern of society. Indian socialism was a mixture of private property and ownership in the agricultural sector. Existing private industrial and commercial firms in large part remained private, but the government controlled the private sector and also engaged extensively in economic activities, including manufacturing, banking, and infrastructure construction. It was a mixed economy within a democratic political framework.

Under Nehru and a Congress Party government, a series of five-year plans was prepared, and policies were adopted to promote the growth of heavy industry under government ownership. The government ensured protection against imports and prohibited or tightly controlled foreign investment or ownership of industries. The aims of this industrial policy included self-sufficiency and little foreign control based on the substitution of domestic production for imports. The agricultural sector was seen essentially as a source of capital, labor, and raw materials for industrial growth. The Green Revolution of the mid-1960s introduced new, high-yield varieties of grains into India, and government policies encouraged their adoption. The results were positive for the first twenty years. Industrial and national growth did accelerate, and stimulated by the Green Revolution, agricultural output also grew substantially. Despite these positive results, poverty and inequality continued on a large scale, and by the late 1960s economic growth had slowed significantly.

The public-sector industrial firms were relatively inefficient and unprofitable. Constrained by a network of controls, they needed permission for expansion or output changes. Banks had been nationalized, and financial markets were tightly restricted. Foreign trade and investment were discouraged by high tariffs, overvalued exchange rates, and direct governmental controls. The so-called license-permit raj these controls created resulted in stagnation in terms of the quality

of goods and services produced and the introduction of new technology. Corruption increased at all levels as businesses and individuals sought the permits required for production and trading rights and access to scarce domestic goods, services, imports, foreign exchange, or credits. The bureaucracy administering the controls became a powerful political and economic force at both the national and the local levels, and various social inequalities strengthened rather than declined. While agricultural output rose, the rural sector subsidized the urban and industrial sectors. The controlled prices of farm products were substantially below world prices and the potential internal free-market prices that would have resulted if exports had been permitted freely. To balance these losses of income within the farm sector, the government subsidized below-cost prices for government-supplied electric power, for water supplies for irrigation, for fertilizer from public-sector plants, and for transportation facilities. Functioning at a loss, the public agencies supplying those infrastructure inputs could not expand to meet the growing demands of industry and urbanization. This placed a heavy burden on public utility users, which raised the costs of industrial production. It also burdened the fiscal resources of the central and state governments, which had to support the loss-incurring infrastructure enterprises with budget subsidies. It was estimated in 1997 that subsidies totaled over 15 percent of India's gross domestic product, almost equaling the tax revenues. This had been the case for many years.

These systemic problems were apparent even to the supporters of socialism and the government officials administering the economic programs. In the early 1980s the administration of Indira Gandhi (1917–1984), considering possibilities for reducing controls, set up various committees to explore particular problem areas and to recommend policies to deal with them. After Indira Gandhi was assassinated in 1984, Rajiv Gandhi (1944–1991) introduced a number of reforms to reduce governmental control of industry.

The Economic Reforms of the 1980s and 1990s

The economic reforms of the 1980s reduced the controls on industry with respect to licensing, prohibitions against firms producing related products in addition to their major products, and the monopoly restrictions on large Indian firms. These first steps did not receive wide popular or political support. Nevertheless, together with good harvests and an expansionary fiscal policy, they contributed to the acceleration of industrial growth and national output in the second half of the 1980s. From 1985 to 1990,

real national income rose at its highest annual rate since independence, and industrial production rose at its highest rate since the early 1960s.

Despite this acceleration in economic growth, Rajiv Gandhi's government was defeated in the 1989 elections. The expansionary fiscal policies of Rajiv Gandhi's government also produced an inflationary price rise. India's foreign-trade position then worsened and its foreign-exchange holdings fell. These low standings forced the government to ask the World Bank for emergency aid in 1991. The government collapsed, and the elections in 1991 reinstated the Congress Party, though in a minority position. The new government—headed by Prime Minister R. V. N. Rao and Finance Minister Manmohan Singh—quickly introduced further reforms in the financial, foreign trade and investment, and industrial sectors. The economic crisis broadened popular support for reform in general, and public and political attitudes toward the economic goals and the reform process changed strikingly. The extensive corruption of the "license-permit raj" forced public recognition of the desirability of reducing those controls not only among businesspeople but also within the Communist Party governments in West Bengal and Kerala. However, various economic groups and political parties in the governing coalition disagreed over the specific actions required, reflecting their anticipated effects on each group.

In the end the government ceased licensing for all but eight industries; granted foreign investors automatic approval for equity holdings of 51 percent in most Indian industries; lifted entirely restrictions on imports of technology; removed the priority for public-sector investment except in petroleum, infrastructure, and defense-related industries; abolished the restrictions on growth or expansion by purchase of "monopoly firms"; and ended limitations on credit to larger firms and subsidies for credit to small and medium-size firms, so credit rating and safety became the determining elements in credit availability. The government continued its review of the policy of reserving production of 851 products for small-scale firms only. These new policies were intended to encourage competition within India's industries, to provide India's firms with access to new and better technology, and to give Indian consumers access to higher-quality products than had been available in the past. The rupee was devalued to reflect internal price increases and to encourage exports. Free convertibility of foreign currency was introduced, and exporters were allowed to retain overseas earnings for six months. The new system allowed a certain amount of

foreign portfolio investment in India's security markets and in the securities of Indian firms, and permitted Indian firms to enter foreign bond markets and to borrow funds overseas. Of major importance, tariff rates were reduced from an average rate of 87 percent in 1991 to 27 percent in 1995, and the maximum rate fell from 150 percent to 50 percent. As a result India's foreign trade, particularly exports, rose significantly, as did foreign investment in India. The foreign-exchange problem that had led to the 1991 crisis ended and with it the need for assistance.

The government also reformed the financial system. Its goals were to increase the lending flexibility of banks, thereby encouraging the growth of financial markets, and to increase the transparency of the financial sector as a whole. At the same time the Reserve Bank of India established broad supervisory agencies to monitor the financial markets, in part in response to a major financial scandal in those markets. The new oversight agencies proved effective. Interestingly, India avoided the financial collapse that affected the Southeast Asian countries and Korea in the late 1990s. India's limitations on foreign exchange flows may have contributed to its immunity.

While reforms in the industrial, trade, and financial sectors have stimulated the Indian economy, further reforms in other major areas would spur further economic growth and improve the overall quality of life. One such possibility is raising the performance of the government-owned industrial enterprises. Except for the petroleum industry, most of the other public-sector firms are of low profitability and are a drain on the economy and the budget. Reform of these enterprises is difficult because of their bureaucratic management and their political connections. Also, if they are shut down in the absence of unemployment support and a retraining program for workers, unemployment is an understandable fear. Beneficial programs to assist the unemployed and to retrain workers unemployed by closures have not been developed, in part owing to fiscal problems.

In many fields India lags in technological advances. Expenditures on research and development in Indian manufacturing firms are still comparatively low overall, although in the information-technology and pharmaceutical industries such expenditures are higher. Policies to encourage relevant programs are important if Indian industry is to be competitive in the global economy.

India's inadequate and poorly performing infrastructure sectors—power, communication, transportation, and shipping—seriously hamper the economy and raise production costs. Many of these sectors are the responsibilities of the state governments, which

continue to face fiscal shortages from past inefficiencies and cost overruns. While the central government permits foreign investment in those areas, bureaucratic and political barriers in the decision-making processes discourage investment.

In agriculture, past policies and the resulting subsidization have made financial changes politically difficult and costly. Improvements in rural infrastructure, reductions of subsidies, and limiting public distribution of low-priced grains to the genuinely poor portion of the population would stimulate output growth and spread the benefits of that growth to a larger portion of the population. Improving education and making health services more accessible in rural areas, along with encouraging industries to move to rural and semirural locations, would improve the lives of the rural poor.

The Future of India's Economy

India has achieved major successes in economic policy reform, but further advances are necessary if the country is to accomplish its long-standing goals of ending poverty and ensuring social equality. With widespread agreement on the general desirability of economic reform, India's political parties have the opportunity to develop an effective program and convince the voting public of the possibilities of a better quality of life. Indian political democracy might then accomplish its long-term goals of ending poverty and significantly reducing social inequality.

INDIA—EDUCATION SYSTEM Indian education in the modern era shows the influence of two traditions, British and native Indian. Remnants of the British education system in the modern Indian system show the durability of British influence, but while independent India has preserved much of the British educational system, "national education," initiated by Indian nationalists and reformers in the latter half of the twentieth century, has left its own legacy. It seeks to revive the glorious heritage of knowledge and culture originating in India itself.

Indian Education before British Colonization

Ancient Indian civilization required an elaborate system of education for the transmission of its cultural heritage. Scriptures of great length were not written down; instead, the text was learned by heart. Each generation of Brahmans was thoroughly trained in this way. Sanskrit words had to be pronounced faultlessly, as mistakes were believed to cause spiritual harm. The main educational institution was the *gurukul* ("family of the teacher"), a term used in ancient and medieval times, but revived by Hindu reformers in the twentieth century. Students lived with the teacher for twelve to sixteen years, joining him as young boys and leaving him as young men ready to establish a household of their own. While the boys stayed in the *gurukul*, they had to observe chastity and lead a disciplined life.

This education was available only to the higher castes, and women and the lower classes were excluded. The teachers were mostly Brahmans. In addition to religious lore, the Brahmans transmitted worldly knowledge of law, political science, mathematics, astronomy, and medicine. Brahmans also invented the zero and introduced algebra, designed calendars, and even taught martial arts. Students specialized in such subjects and continued the tradition of their teacher. With the advent of Muslim invasions of India (beginning c. 1000 CE), schools devoted to the

Indian schoolchildren and their parents in Mumbai in July 2001 protest a government decision to cut tuition grants for students attending English-language schools. (AFP/CORBIS)

Muslim tradition sprang up, and the Hindu and Muslim systems of education coexisted side by side for centuries. Interaction between the two systems of education was limited. Muslim schools taught the Qur'an and texts on science and mathematics of Arab and Persian origin. Hindu schools reflected a variety of different traditions with their specific sacred texts and specializations in astrology, astronomy, mathematics, etc.

Indian Education under the British

Under British rule (from 1858) a new system of education was introduced in India; it too was not aimed at mass education. The highest educational institution became the college. Entrance qualifications often were obtained by means of private tuition. Wealth replaced caste distinction as the key to educational success, although Brahman families with little wealth still secured education for their sons, so as to get them positions in government service. The Hindus showed greater interest in British education than did the Mus-

lims, who feared that it would affect their religion. Thomas Babington Macaulay, who served on the Supreme Council in India, wrote in his "Minute on Education" (1835) that the British should aim to educate gentlemen—Indian in blood only, British in every other respect. He also deprecated all Asian learning, although he knew little about it. At the time there was a debate in British circles in India on how to spend the limited funds available for Indian education. Those who wished to spend it on teaching of Arabic, Persian, and Sanskrit, etc. were called Orientalists; their adversaries, who favored English education, were termed Anglicists. Macaulay settled the debate in favor of the latter. Later generations of Indians, who knew more about English literature and philosophy than did the British, actually made Macaulay's words come true to such an extent that the British felt threatened. Although British civil servants in India were selected after completing their studies at Oxford or Cambridge, they often could not match the English literary erudition of the most brilliant Indians.

In 1858 three universities were established in Mumbai (Bombay), Calcutta, and Madras as examining institutions. These universities were initially not teaching institutions; rather they determined the syllabi and curricula and controlled the examinations of affiliated colleges throughout India. This standardization produced large numbers of educated Indians imbued with the same ideas and values, and able to contribute to a common discourse.

Under the British administration in the nineteenth and early twentieth centuries, hundreds of primary, middle, and secondary schools were established. These schools were most commonly run by Christian missionaries, who received some financial support from the provincial government. The schools were important in teaching basic literacy and numeracy.

British higher institutions focused primarily on the liberal arts, law, and medicine, with little emphasis on engineering and technology. The Victoria Jubilee Institute in Mumbai, which trained Indian spinning and weaving masters for the cotton textile industry, and a school of civil engineering at Roorkee in northern India were the only exceptions. When the great industrialist Jamsetji Nasarwanji Tata (1839–1904) donated a large sum of money for the establishment in 1907 of the Indian Institute of Science in Bangalore, the British did not take kindly to the idea, believing that no one would want to employ Indian scientists. Because of the obstacles to its founding, the institute came into being only after Tata's death. It was a testament to Tata's vision, but India had very few wealthy visionaries of this kind.

FROM ENGLISH TO INDIAN LANGUAGES

Advocates of Indian independence proposed broad changes in the education system to make it relevant to life in India. One call for reform was instruction in the indigenous languages of India, the benefits of which are listed in the following extract from the *Report of the Zakir Hussain Committee* published in 1939.

The proper teaching of the mother-tongue is the foundation of all education. Without the capacity to speak effectively and to read and write correctly and lucidly, no one can develop precision of thought or clarity of ideas. Moreover, it is a means of introducing the child to the rich heritage of his people's ideas, emotions and aspirations, and can therefore be made a valuable means of social education, whilst also instilling right ethical and moral values. Also, it is a natural outlet for the expression of the child's aesthetic sense and appreciation, and if the proper approach is adopted, the study of literature becomes a source of joy and creative appreciation. More specifically, by the end of the seven years' course, the following objectives should be achieved:

1. The capacity to converse freely, naturally and confidently about the objects, people and happenings within the child's environment. This capacity should gradually develop into:
2. The capacity to speak lucidly, coherently and relevantly on any given topic of every-day interest.
3. The capacity to read silently, intelligently and with speed written passages of average difficulty. (This capacity should be developed at least to such an extent that the student may read newspapers and magazines of every-day interest.)
4. The capacity to read aloud—clearly, expressively and with enjoyment—both prose and poetry. (The student should be able to discard the usual lifeless, monotonous and bored style of reading.)
5. The capacity to use the list of contents and the index and to consult dictionaries and reference books, and generally to utilize the library as a source of information and enjoyment.
6. The capacity to write legible, correctly, and with reasonable speed.
7. The capacity to describe in writing, in a simple and clear style, every-day happenings and occurrences, *e.g.*, to make reports of meetings held in the village for some co-operative purpose.
8. The capacity to write personal letters and business communications of a simple kind.
9. An acquaintance with, and interest in, the writings of standard authors, through a study of their writings or extracts from them.

In the early twentieth century, two denominational universities were founded: Aligarh Muslim University in Aligarh and Banaras Hindu University in Varanasi. The secular principles of post-1947 independent India would not have permitted the establishment of such universities but, because they were founded earlier, they survived as "central universities." Their curriculums closely follow those of hundreds of other universities in India.

There were several attempts to set up national institutions of education in the twentieth century, for example, Gurukul Kangri at Haridwar and the university set up at Shantiniketan by poet and Nobel laureate Rabindranath Tagore (1861–1941). There were many varieties of "national education" that focused on indigenous rather than English traditions. For example, Gurukul Kangri intended to revive ancient Indian education by teaching Sanskrit texts whereas at Shantiniketan the emphasis was on contemporary Indian literature and art. Mohandas Gandhi sponsored a scheme of basic education closely linked to his idea of constructive work in villages. But such institutions had a basic flaw—they did not confer degrees recognized by the government and, thus, could not help people to find employment.

Education in Independent India

Independent India preserved the British educational heritage. No attempts were made to revive the initiatives of "national education." Shantiniketan survived as a central university, with government funding. The only new departure was a proliferation of engineering colleges, including the five Indian Institutes of Technology (IIT), one each in Chennai (Madras), Kanpur, Kharagpur, Mumbai (Bombay), and New Delhi. These elite institutions select their students from hundreds of thousands of applicants. Their graduates are highly qualified—about 50 percent of each class secures a job in the United States. Many of those who remain in India acquire an additional Master of Business Administration degree (MBA) so as to qualify for administrative posts in the private corporate sector, which are better paid than those in production or research and development. Management positions were more attractive because until the end of the twentieth century, Indian industry mostly worked with imported technology and therefore invested very little in research and development.

The most neglected sector of education is still primary schooling. Official statistics show about one hundred million pupils in primary schools, but there are high dropout rates. Approximately half of the popula-

tion of India is illiterate. There are frequent complaints that village schoolmasters take their jobs as sinecures and therefore do not teach regularly. This deficiency at the primary level has had serious consequences. At the end of the twentieth century, suicides occurred among peasants grieving crop losses in southern India. Not knowing to get the soil examined, they had shifted to cotton cultivation, although the soil was unsuitable. The fruition of Mohandas Gandhi's quest for combined primary and practical education at the village level is still unrealized.

INDIA—HUMAN RIGHTS The architects of the Indian constitution envisioned a democratic, secular polity to guarantee people's fundamental rights without distinction of caste, color, creed, religion, or sex. Fundamental rights and freedom, as incorporated in India's constitution, reflect the ethos and spirit of the charter of the United Nations, reaffirming faith in "the dignity and worth of the human person, in the equal rights of men and women" (Levin 1996: 5). The judiciary acts as custodian to uphold these rights.

Despite built-in safeguards, violation of human rights has become common in India, often at the hands of lawmakers and law enforcers. In a tightly knit hierarchical social order reinforced by abject poverty, illiteracy, and lack of social awareness about constitutional rights, the rule of law is not strictly adhered to by law-enforcement agencies. Incurable corruption and criminalization of politics offer a fertile ground for human rights abuses by these agencies, which make an overt distinction between privileged and nonprivileged, majority and minority groups, elite and nonelite classes. A result is profound social unrest among marginalized and minority sections of society, with some even taking up arms against the state.

To deal with the increase in militancy, insurgencies, and ethnopolitical and community violence in India, state agencies often misuse laws such as the Armed Forces (Special Powers) Act of 1958, the Terrorist and Disruptive Activities (Prevention) (TADA) Act of 1985 (now in disuse), and the Jammu and Kashmir Disturbed Areas Act. These laws empower executive authorities to resort to warrantless searches, illegal detention, physical torture, harassment, and summary execution. In most cases, however, abuses happen in the name of the law without being officially sanctioned.

Most reported cases of human rights violations are custodial rapes and deaths at the hands of police. This fact has been acknowledged by India's National Human Rights Commission, established in 1993 to investigate such cases. The state authorities justify these violations on the ground that militants and insurgents indulging in indiscriminate killings of innocent people are even worse violators of human rights.

Community Violence

Community violence between Hindus and Muslims and between Hindus and Christians took an ugly turn in the Hindu-belt Indian states of Gujarat, Madhya Pradesh, Maharashtra, and Orissa. Extremist Hindu fundamentalist groups such as Vishva Hindu Parishad, Rashtriya Sevak Sangh, and Bajrang Dal have actively fomented violence. In violent acts against Christians, churches were damaged and burned, and Christians were physically assaulted and robbed in 1999 and 2000.

Opposition parties in parliament protested these acts, especially when the media reported in January 2000 that the Bajrang Dal was responsible for burning to death an Australian missionary, Graham Stewart Staines, and his two sons, in Orissa, where Staines had spent more than two decades serving lepers. Hindu extremist groups charged him with mass conversion of Hindus to Christianity. A judicial commission appointed by the central government to probe into the incident exonerated the Bajrang Dal, and opposition parties termed this a whitewash. Amnesty International reported that the social violence against Christians, Muslims, and *Dalits* (untouchables) was the outcome of the extreme Hindu nationalist policies espoused by the Bharatiya Janata Party-led government under A. B. Vajpayee. Caste and community violence increased, especially in the eastern Indian state of Bihar. Clashes between the Ranvir Sena (government-banned private militia of upper-caste landlords) and lower-caste minorities claimed many lives. As reported by Amnesty International on 25 January 2000, "at least twenty-two Dalit ('untouchable') men, women, and children in Bihar's Jehanabad district" were killed

by the Ranvir Sena (Human Rights Watch World Report 2000). In retaliation, the People's War Group, Maoist guerrillas, killed about three dozen upper-class people in the Jehanabad district in March 2000.

Corrective Measures

To protect human rights, the government created the National Human Rights Commission under the Protection of Human Rights Act of 1993. The commission is a statutory recommendatory and advisory body, with the powers of a civil court to summon and examine witnesses under oath. It recommends a code of conduct for state and nonstate agencies, including employers in the private sector, to prevent human rights abuses by state agencies.

Because of the commission's effective intervention, the controversial TADA Act was allowed to lapse in May 1995. The commission has also conducted numerous probes into human rights violations and compelled authorities to recognize crimes in light of its recommendations.

As an autonomous body, the commission has acquired a reputation as fair and impartial in safeguarding civil liberties. It is headed by a judicial functionary with the status of a retired Supreme Court chief justice or justices. While commenting on the state of human rights in India, the commission's chairman, Justice J. S. Verma, a retired chief justice of India, observed that although India's record of human rights is comparatively good, it is important to protect and guarantee the social and economic rights of the poor and downtrodden sections of society. In its 1998–1999 report, tabled in the Indian parliament in the winter session of December 2000, the commission expressed concern about the protection of rights of the displaced population, the Dalits, and ethnic minorities. It observed that child labor, child prostitution, and sexual harassment and violence against minorities are on the rise. The commission considered 53,711 cases and disposed of 47,061 cases in the 1999–2000 year. While looking into the plight of thousands awaiting trials in jails, the commission recommended a speedy disposal of criminal cases pending in courts.

In March 2001, the Indian government decided to set up fast-track courts in each district of the country to dispose of long-standing cases awaiting trial. According to the sixty-first report of the Parliamentary Standing Committee on Home Affairs, 25 million cases are still pending in various courts of India. In March 2001, the Supreme Court ruled that if cases are not disposed of in five years, the accused should be freed from jail.

To improve the human rights record in India, it is essential to reform the police and armed and paramilitary forces, to improve the criminal judicial system, and to educate law enforcers about preventive measures to help reduce the recurrence of custodial rapes, torture, deaths, gender violence, and atrocities against poor and minority people. Good governance is essential to achieve these goals.

INDIA—MEDIEVAL PERIOD The medieval period (eighth–eighteenth centuries) in India is an important phase in the history of the South Asian subcontinent. Not only is it notable for cultural and political developments, but it also marked the coming of Islam and all its consequences.

Parameters of Period

In the twentieth century, the history of medieval India became the rallying point for the two-nation theory that culminated in the partition of the Indian subcontinent. The vastly differing natures of the religions, cultures, and histories of the Hindu and Muslim communities were stressed. Ancient India was identified with Hindu rule, and the medieval period was identified with Muslim rule. That characterization is simplistic, however: although the rulers of a portion of India may have been Muslim during the medieval period, at any given time many parts of India were not under Muslim rule, so that periodization according to the ruler's religion is incorrect.

The beginning date of medieval India is controversial. Historians have taken different demarcation lines—the death of Harsa in 647 CE, the invasion of Mahmud of Ghazna, the establishment of the Delhi sultanate in 1192, and so forth—as the beginning of the period. Likewise, the end of medieval times is variously given as 1707, 1739, and 1757. Here, the medieval period is considered to cover the eighth to eighteenth centuries and the area encompassed by present-day India, Pakistan, and Bangladesh.

Early Medieval India

In the early medieval period, roughly the eighth to thirteenth centuries, the Indian subcontinent experienced significant change. Islam came to India through territorial conquest, the lure of wealth, and religious zeal. Muhammad bin Qasim (691–716) fulfilled the Arab dream of seizing the fabulous wealth of India when he defeated King Dahir (reigned 690–712) of Sind (Sanskrit Sindhu) in 712 CE. Qasim's conquest made possible further cultural rapprochement between the Indian subcontinent and the Arab world. Mahmud of Ghazna (971–1030) attacked North India seventeen times between 997 and 1027. His aim was not political; he was interested in amassing vast wealth from the temples of India. Muhammad of Ghuri (first invaded in 1175, d. 1206) established political control after his victory over Prithviraj Chauhan (reigned 1178–1192) in the second battle of Tarai in 1192. Muhammad controlled much of northern India and parts of Gujarat and Gwalior. The Turkish conquest from Central Asia was possible because of the internecine struggles between regional powers, the prevailing feudal system, the superior military technology of the Turks, the general detachment of the masses from the defense of the king, and the Turks' religious zeal that led to jihad.

The regional kingdoms of the Rashtrakutas (in northern Deccan, eighth–tenth centuries), Pratiharas (in eastern and central India, eighth–eleventh centuries), and Palas (in Bengal, mid-eighth–mid-twelfth centuries) also rose and fell in early medieval India. These kingdoms fought one another over the capital city of Kanauj, and their internecine struggle made them weak. The Pratihara kingdom broke into small principalities. In the eleventh century, the later Chalukyas and Senas replaced the Rashtrakutas and Palas, respectively. Meanwhile, the Rajputs (c. seventh–twelfth centuries) ruled most of the kingdoms in northern India, but their disunity prevented them from resisting aggression from the northwest. The Chola kings of south India, made wealthy through trade and commerce, were the most powerful figures

on the Indian peninsula during the ninth through twelfth centuries.

The early medieval period was also a time of agrarian expansion, with land grants to Brahmans, temples, and officials. Officials were granted revenue from land, and their salaries were generally equal to the amount of revenue collected. Their obligation was to send troops to the king. Feudalism and the emergence of hierarchical landed intermediaries made the position of the king weak. The peasants suffered from heavy taxation, the obligation to provide free labor, and indebtedness.

Urban centers began to grow during the ninth century as a result of trade and the rise of new markets. The mercantile community accumulated wealth and prospered. The Arabs, Chinese, Indians, and Southeast Asians were active in sea commerce. The eastern coast of India had a major share in trade with Southeast Asia, and Indian culture began to spread in that region.

A new social ethos was also developing in this period. Castes were changing position, and mixed castes were emerging; Indian social hierarchy was not static, as is evident from the social changes experienced in the period. Saints of south India were popularizing the Bhakti movement, with its message of personal devotion to God, among the masses. The intellectual movement of the eighth-century philosopher Sankara (c. 700–c. 750) emphasized the *advaitavada* (the doctrine of nondualism). Ramanujacharya (c. 1017–1137) called for spiritually experiencing God through intuition. Sanskrit was continuing to develop as the language of learning. The *Katha-sarita-sagara* (a collection of stories) and the *Gita Govinda* of the twelfth-century poet Jayadeva were two important Sanskrit works.

Linguistically, regional languages were beginning to develop, and Lahore was becoming an important center for Persian. The early medieval period also witnessed the development of unique regional temple architecture, such as the Brihadesvara temple at Tanjore and the gigantic Siva temple at Gangaikondacholapuram, both of which were famous Chola temples. The Sun temple of Konarka in Orissa and the Chandella temple at Khajuraho demonstrate exquisite craftsmanship.

The Delhi Sultanate of 1192–1526

The Delhi sultanate took form under Muhammad of Ghuri and Qutubuddin Aibak (reigned 1206–1210). The period between 1206 and 1290 is popularly known as the slave dynasty, although no sultan was a slave when he became ruler, and there were actually three dynasties during the period. Shamsuddin Iltutmish

(reigned 1210–1236) consolidated the sultanate in northern India. He bequeathed to his capable daughter Raziya (reigned 1236–1239) a large empire extending in the west to the Indus River. The struggle between the Delhi rulers and the Turkish nobility (the Forty, or *chahalgani*) had already started; the latter plotted against Raziya. It was Ghiyasuddin Balban (reigned 1265–1286) who destroyed the Forty; he also strengthened the army, ran an efficient spy system, suppressed revolts, and repulsed the ever-menacing Mongols.

The reign of the Khalji sultans (1290–1320) was marked by territorial expansion of the Delhi sultanate as well as the end of the Turkish monopoly of the ruling class. Jalauddin Khalji (reigned 1290–1296), the founder of the Khalji dynasty, was assassinated by his nephew and son-in-law Alauddin Khalji (reigned 1296–1316). Alauddin carved out a kingdom extending to south India and carried out market reforms by fixing the price of essential goods. Ghiyasuddin Tughluq (reigned 1320–1325), the founder of the Tughluq dynasty, was a capable ruler. His son Muhammed bin Tughluq (reigned 1325–1351) ruled over extensive territory. However, his ill-fated experiments, including moving the capital city and creation of token currency, created havoc. The process of disintegration had begun, and the reign of his successor, Firuz Tughluq (reigned 1351–1388), was followed by civil war. The sack of Delhi by the Mongol chief Timur (1336–1405) in 1398 further weakened the sultanate.

The Sayyid dynasty (1414–1451) was a mere shadow of a sultanate, and its control was confined to the Delhi region. The Lodi dynasty (1451–1526) witnessed the end of the sultanate, when Babur (1483–1530) defeated Ibrahim Lodi (reigned 1517–1526) at the first battle of Panipat in 1526. While the sultanate declined, a number of kingdoms came into existence. In eastern India, the Ilyas Sahi dynasty of Bengal arose in 1350. The powerful Gajapatis of Orissa had resisted the onslaught of the sultans. In the west, the kingdoms of Malwa and Gujarat came into existence in the fifteenth century, and in north, Kashmir in the fourteenth century. In the south, the Bhamani sultanate (1347–1527) and the Vijayanagar empire (1336–1565) emerged.

The period of the Delhi sultanate marked a new era in cultural, social, and economic history of the subcontinent. The teachings of the Sufi saints appealed to the common people, and saints' *dargah* (tombs) remain places of pilgrimage for both Muslims and Hindus in the present day. The Bhakti movement saw the emergence of Kabir (1440–1518), Nanak (1469–1539), and Caitanya (1485–1533). They preached cooperation between Hindus and Muslims, egalitarianism, and the rejection of a social system based on caste. Nanak

was the founder of Sikhism, which became an important religion after his death.

Indo-Islamic architecture, a fusion of the Hindu and Islamic styles, developed in this period. Arches, domes, and ornamentation of different kinds were main features of the style. Among the important structures built by the Delhi sultans are Qutab Minar, Siri fort, the city of Tughluqabad, Firozabad, and the tomb of Firuz. Murals, painted cloth, and Qur'anic calligraphy were landmarks in painting. Amir Khusrau (1253–1325), composer of Hindi and Persian verses, is credited with having introduced *qawwali*, different ragas, and the *khayal* form of singing. Such regional languages as Bengali, Assamese, Oriya, Punjabi, and Marathi developed. Interchange between the dialects of Hindi and the court language, Persian, resulted in the growth of Urdu.

The ruling class and nobility led a life of luxury. The ulamas (theologians) were an influential section of the population. (Indian Muslims [converted Hindus and their descendants] were disliked by the foreign Muslims, who thought themselves more pure and more strict in their adherence to the tenets of Islam.) The covering of a woman's face by a veil, or the *pardah* system, became more rigid. As non-Muslims, or *zimmi*s, Hindus had to pay a discriminatory tax known as *zajiyah*. However, the Hindu autonomous rajas lived well. The Hindus were in a dominant position regarding revenue, money lending, and agriculture.

In the early period of the sultanate, the territory was divided into units, or *iqtas*. The owners collected the revenue and defrayed the costs of their salaries. With urban expansion came the growth of a money economy and trade with West Asia, Southeast Asia, and China. Ports like Melaka and Aceh in Southeast Asia had large settlements of Indian traders. It was mainly Indian Muslim traders from Gujarat, Malabar, Tamil Nadu, and Bengal who brought a liberal brand of Islam to Southeast Asia.

The Mughal Empire of 1526–1857

In the sixteenth century, Babur laid the foundation of Mughal rule in India after defeating Ibrahim Lodi. Rana Sanga and the Afghans also lost to him in the battles of Khanwa (1527) and Ghahra (1529), respectively. His son Humayun (1508–1556) inherited the difficult task of preserving the kingdom. Sher Shah Suri (c. 1486–1545), the ambitious Afghan ruler of Bihar, defeated him at the battle of Chausa in 1539. Sher Shah's reign (1540–1545) witnessed a brilliant overhauling of the administration. Coming back from Persia, Humayun recaptured the throne of Delhi in 1555.

Akbar (1542–1605) carved out an empire bounded by Kabul in the northwest, Kashmir in the north, Bengal in the east, and beyond the Narmada River in the south. He consolidated the empire by annexation, matrimonial alliance with the Rajputs, religious tolerance, and sound administration. His broad vision, the policy of *sulh-i-kul* (universal tolerance), and his humanitarian outlook befitted his name, Akbar, which means "the Great." His son Jahangir (1569–1627) was a great dispenser of justice. Queen Nur Jahan (d. 1645), his wife, took an active interest in politics.

Shah Jahan (1592–1666), who ruled from 1628 to 1658, oversaw the Mughal empire's golden age. The last of the great Mughals, Aurangzeb (1618–1707), captured the throne by killing all his brothers and imprisoning Shah Jahan. His religious orthodoxy, wars in Deccan, and the alienation of such groups as the Sikhs, Rajputs, Marathas, and Jats marked the beginning of the end of the empire. Aurangzeb's destruction of temples might have been the result of political considerations, but it was a deviation from the policy of tolerance of his predecessors. Other factors that led to the decline of the empire after Aurangzeb included the draining of the treasury by protracted wars, crises in the bureaucracy, the decline of the army's efficiency, weak successors to Aurangzeb, and the independence of provincial governors.

After the invasion of Nadir Shah (1688–1747) in 1739, the Mughal empire remained in name only. Powerful regional kingdoms arose in this period. Sivaji (1627–1680) carved out a strong kingdom and fought relentlessly with the Mughals. Bengal, Awadh, and Hyderabad became independent. The Europeans, who had come as traders, began to interfere in states that had become independent from the Mughals. The absence of a central authority and naval technology made their task easier.

During the Mughal period, mosques, palaces, forts, and tombs expressed the rulers' relatively settled condition and the refinement of the period. The buildings of Akbar are beautiful structures, with carved and painted designs, many-sided pillars, the use of red sandstone, and so forth. The Taj Mahal, poetry in marble, stands apart for its beauty. Lavish ornamentation, use of marble, inlaid mosaic work of costly stones, engraved arches, and foliated pillar bases mark the architectural splendor of Shah Jahan's monuments. Landscape architecture as exemplified by ornamented gardens was another contribution of the Mughals. Painting reached its high-water mark under Jahangir, and Hindustani music developed.

Persian remained the court language, but Urdu was becoming popular. Regional languages were mature

with lyrical poetry. Tulsidas (1543–1623) and Surdas (1483–1563) were famous Hindi poets of the times. Saints of the Bhakti movement from this period include Dadu Dayal (1544–1603) of Gujarat and Tukaram (1607–1649) of Maharashtra. The notable Sufi saints included Sheikh Salim Chisti (sixteenth century), Sheikh Abdul Kadir (1459–1533), and Sheikh Miyan Mir (1564–1624). However, certain trends developing in Sufism led to orthodoxy. Sheikh Ahmed Sarhindi (1564–1624) called for strict adherence to the Shari‘a. The missionary activity of some Sufi saints, particularly those belonging to the Qadriya order, resulted in large-scale conversion of Hindus.

The Mughal monarchs believed they had a divine right to the throne. The administration provided stability and peace in the empire. The *mansabs* (ranks) were assigned to both civil and military officers. The holders of the ranks, or *mansabdars*, were paid either in cash or in land assigned to them (*jagirs*). Abuses crept into the system of assigning ranks during the eighteenth century.

India’s trade relationships with the outside world expanded, and Indian textiles were in great demand. Delhi, Agra, Lahore, Dhaka, Surat, and Masulipatnam flourished with the growth of urbanization. Asian merchants initially controlled a major share of trade, but from the eighteenth century onward, European shipping was in ascendance.

During the medieval period, Hindus and Muslims developed many common traits. There was fusion of the old with the new in the arts, literature, society, and religion. The composite culture that emerged, an amalgamation of different traditions, was the beginning of a national culture for India as a whole.

INDIA—POLITICAL SYSTEM With a civilization of nearly five thousand years’ antiquity, India is continental in scale and displays a wide range of social, religious, racial, ethnic, caste, cultural, and linguistic diversity. Given this heterogeneity, the modern Indian political system has had to be a unique synthesis of diverse castes, cultures, and religions. India is by far the largest functioning democracy in the world and as such merits careful study. Of its more than 1 billion people—next in size to China—624 million are over eighteen years of age and have the right to vote. The vast majority of voters, mostly in rural areas, are illiterate or semiliterate, and women constitute half of the total electorate.

Evolutionary Process

India’s political system has evolved over the past fifty years against the background of the country’s cultural values, its long struggle for freedom from British imperialism, and the Gandhian political and economic philosophy of nonviolence, decentralization, and democratic socialism. After becoming independent on 15 August 1947, India instituted a parliamentary democracy under which the president is the constitutional head of state, while real power is vested in a prime minister and cabinet, collectively accountable to parliament. There are three main principles of the Indian political system: democracy, secularism, and federalism.

The Party System India’s multiparty political system has witnessed a proliferation of political parties. Fifty-six parties participated in the first Lok Sabha (lower house) election of 1952; now there are 200, growth partly attributable to splits within parties, and partly to narrow, personal political considerations. (Political considerations are determined mainly by immediate political gains, such as offering more seats to party candidates in local and national elections to legislative bodies at the time of seat adjustments with various political parties; and offering ministerial berths in the government or lucrative positions in government-run organizations and enterprises.) In hindsight, Indian politics has been characterized by the one-party rule of the dominant Indian National Congress under the Nehru dynasty: Jawaharlal Nehru (1889–1964), Indira Gandhi (Nehru’s only daughter; 1917–1984), and Indira Gandhi’s son Rajiv Gandhi (1944–1991). India entered the era of coalition politics following the Congress Party’s debacle in the November 1989 parliamentary elections. The Janata Party was the first non-Congress party to form the central government, in March 1977 under the leadership of Morarji Desai (1896–1995), a Gandhian and strict disciplinarian. The Desai government tried to give new direction to

Indian politics by basing it on moral values. That did not work: bickering among its coalition partners ultimately caused the fall of the Desai government in July 1979.

In the January 1980 elections, Indira Gandhi returned to power. The black days of her state of emergency rule (1975–1977) were fresh in the minds of Indians who had suffered the excesses of that time. She had failed to benefit the people and manage incremental intrastate conflicts. Her populist slogan of *garibi hatao* (eliminate poverty) rang hollow and failed to enthuse the masses.

After her assassination on 31 October 1984, her eldest son Rajiv Gandhi was sworn in as prime minister. In the 1984 elections the Congress Party again won an overwhelming majority, attributed chiefly to sympathy following Gandhi's assassination. Rajiv Gandhi, India's youngest prime minister at just over forty, had a vision of taking India into the twentieth century, making it progressive, prosperous, and powerful in the comity of nations. He advocated economic reforms to attract foreign investment and boost exports. In foreign policy, he served the country's best

interests by maintaining balanced relations with both the United States and the USSR. But his image was sullied when he was charged with involvement in kick-backs in the purchase of guns from the Swedish company Bofors. This became a major issue in the parliamentary elections of November 1989, which his party lost.

Since then, Indian politics have been generally characterized by instability. The Janata government, formed under the leadership of V. P. Singh (b. 1931) in December 1989, collapsed after a year when it lost outside support. In the May 1991 elections, the Congress Party fared better and managed to form a government under P. V. Narsimha Rao (born 1921), who completed his five-year term as prime minister. The main achievement of the Rao government was the June 1991 introduction of economic reforms intended to loosen stifling export and import restrictions, promote public-sector privatization, and encourage foreign investment. This policy of liberalization was a major departure from the "Nehruvian" model of socialist economic development. But Rao compromised his and his party's image by bribing some members of parliament to stay in power. Then in the June 1996 elections, no single political party won an absolute majority, and three central governments were formed in 1996 and 1997.

In the March 1998 elections, a coalition of about two dozen parties led by the Bharatiya Janata Party (BJP) formed the government under Atal Behari Vajpayee (b. 1924). But his government was toppled after thirteen months by a single vote during a vote of confidence in the lower house of parliament. New elections were held in September–October 1999. Again the BJP-led National Democratic Alliance (NDA), an alliance of eighteen national and regional parties, formed under the leadership of Vajpayee. The NDA government, in principle based on consensus politics, has developed a common minimum program to run the government smoothly. Its ruling partners have agreed not to abrogate Article 370 of the Indian constitution guaranteeing special status to the state of Jammu and Kashmir. Nor will they advocate a common civil code also applying to Indian Muslims or raise the controversial temple issue that rocked the country following the destruction of the Babri Masjid (mosque) by Hindu fundamentalists in December 1991.

The NDA government has not, however, met the expectations of the people. Law-enforcement agencies avoid acting against powerful, influential individuals, including smugglers, drug mobsters, and economic offenders, who have direct links with ruling political leaders. Bandits such as Veerappan (charged with nu-

PREAMBLE TO THE CONSTITUTION OF INDIA

Adopted on 26 Jan 1950

We, the people of India, having solemnly resolved to constitute India into a sovereign socialist secular democratic republic and to secure to all its citizens: justice, social, economic and political; liberty of thought, expression, belief, faith and worship; equality of status and of opportunity; and to promote among them all fraternity assuring the dignity of the individual and the unity and integrity of the nation; in our constituent assembly this twenty-sixth day of November, 1949, do hereby adopt, enact and give to ourselves this constitution.

merous murders, violent gang robberies, and kidnappings) or the hard-core Hindu fundamentalist Bal Thakeray (charged with inflammatory writings against a minority religious community, leading to a massacre in Mumbai) have a free run. Poverty is still rampant, youth unrest is on the rise due to increasing unemployment, scams and scandals in public office are commonplace, and minorities suffer physical assaults by thugs from the majority community.

India has shifted from the value-based politics of 1950s and mid-1960s to the politics of sheer opportunism, characterized by a cancerous growth of communal hatred and violence, vote buying, divisions along caste and communal lines, and power-brokering, all of which contribute to moral degeneration in both the public and private lives of politicians, legislators, and party functionaries from top to bottom. Caught in decay and degeneration, the state has miserably failed to provide social security and ensure social harmony.

Democratic Decentralization of Power

Indian democracy is unique in its devolution of power to the grass roots, initiated with the introduction of the Panchayati Raj system in October 1959. Under this system, village councils (*panchayats*) comprise the smallest units of local self-government. Panchayati Raj is specifically designed to empower rural people to facilitate rapid socioeconomic development. The seventy-third amendment to India's constitution (adopted on 22 December 1992 and implemented on 24 April 1993) provides for a three-tier structure of local self-government, starting with the village at the bottom, ascending through the subdivision, to the district at the top. There is a 33 percent quota for representation of women in Panchayati Raj institutions. (Another radical initiative would establish a 33 percent quota for women members in the national and state legislatures.)

Federalism

India is a federal polity with a clear-cut division of powers between the Union and states. Despite that, center-state relations have been far from satisfactory, mainly due to the centralization of power by the Union government and to its discriminatory policies in allocating funds to states for development programs. India's northeastern states, Jammu and Kashmir in particular, have often complained that the Union government fails to address their various development and socioeconomic problems, problems resulting in large-scale violence and frustration among youths. This is a main reason why people are demanding separate state-

hood: they are agitating for the devolution of more authority and administrative and financial powers from the Union government. The states themselves are also demanding more autonomy. On 25 June 2000, the Legislative Assembly of Jammu and Kashmir passed an autonomy resolution for the restoration of its pre-1953 status. The central government staunchly opposes this, fearing that it would threaten national unity; it has, however, agreed to consider a state's demand for autonomy within the framework of the constitution.

Judiciary

The judiciary is an important part of the Indian political system. It is a custodian of the constitution and has the right to review legislative enactments and executive acts. Though the Indian judiciary is independent, political considerations do influence judicial appointments, promotions, and transfers. Nonetheless, it was due to independent judicial activism that the Indian Supreme Court took action against top public functionaries—including the prime minister and top bureaucrats—who either had indulged in corrupt practices or were apathetic in the discharge of their public duties.

The major challenge before the Indian judiciary is to ensure prompt resolution of the cases piling up in the courts, sometimes for decades, to restore confidence in the efficacy of the judiciary. "Justice delayed is justice denied" aptly describes the Indian judicial system. Since the judicial process is so expensive and cumbersome, people prefer to suffer injustice rather than go to court.

Secularism

The principle of secularism in the Indian constitution requires that the state not discriminate against anyone on grounds of religion. The secular character of the Indian polity cannot be altered even through constitutional amendment. The term "secularism" was first incorporated into the preamble to the constitution through the forty-second amendment. The constitution guarantees religious minorities the right to establish and administer educational institutions in accordance with their language, culture, and script.

The credibility of Indian secularism has been eroding, however, with the emergence of *Hindutva*, a narrow Hindu cultural nationalism. This has recently been promoted as the "essence" of the Indian state by a handful of self-styled representatives of Hinduism, including Bajrang Dal and Rastriya Sevak Sangh. Consequently, religious conflict between Hindus and Muslims and between Hindus and Christians is on the rise. The destruction of the Babri Masjid (a mosque said to have been constructed by the Muslim ruler Babar) in December 1991 shook the foundation of Indian secularism. Purportedly secular political parties are now exploiting the religious card as a vote-getter.

Freedom of the Media

The Indian media enjoy complete freedom in expressing their views without government interference, perhaps to the envy of some of their Western counterparts. Control exercised by media magnates does, however, largely nullify this freedom. Transparency is further eroded by the media's declining commitment to professional values: in a case recently disclosed by the Indian journalist Virendra Kapoor, some forty-odd Indian journalists "on a no-expense-spared conducted tour of Pakistan" accepted "expensive carpets and other gift items" from their Pakistani host (*Economic and Political Weekly* 5–11 August 2000: 2810). The media largely serve the interests of parties in power, who in return provide them with political patronage. As well, a coterie of pro-establishment intellectuals and top bureaucrats—some retired—who air their views in the media has gained tremendous influence, to the detriment of independent and incisive analysis of national, regional, and international issues.

India's Foreign Policy

The main plank of India's foreign policy is non-alignment. Its chief architect, Prime Minister Jawaharlal Nehru, defined this as an "independent policy," taking decisions on international and regional issues on the basis of the merits or demerits of each case. This policy was motivated by several factors, includ-

ing a desire to avoid Cold War superpower politics and alliances, and India's ambitions to play a significant independent role in world affairs. Nonalignment was pursued continuously and consistently during the Cold War era, except during the Morarji Desai government (1977–1979), which favored what it termed a "genuine nonaligned policy," implying a balanced policy not tilting in favor of either superpower. By prefixing "nonaligned policy" with the word "genuine," the Desai government claimed a major shift in India's policy of nonalignment: unlike Mrs. Gandhi's tilt toward the Soviet Union, the Desai government tilted neither in favor of Russia or the United States. Critics branded India's positive tilt toward the USSR during the regime of Mrs. Gandhi a clear departure from nonalignment. India's nonaligned ideology in general, and its tilt toward the USSR in particular, was the main source of irritation between India and the West, especially the United States.

After the end of the Cold War and the collapse of the USSR, India's nonalignment underwent radical transformation. Putting aside ideology, India has gone ahead and forged a defense and strategic relationship with the United States. India not only established full diplomatic relations with Israel in 1992, but has also forged close strategic and defense ties with it—unthinkable during the Cold War period. At the same time, India introduced economic reforms in 1991, giving greater weight to the economic content of its diplomacy by encouraging foreign investment, disinvestment in the public sector (privatization), and loosening of export and import restrictions to integrate its economy into the global market. India is still attempting to justify the relevance in the post-Cold War world of being a leading member of the Non-Aligned Movement (NAM). India feels NAM can contribute to restructuring the United Nations and can help establish a nondiscriminatory trade regime while safeguarding human rights. In practice, India's nonaligned policy has lost both its ideological appeal and moral moorings.

India has been dubbed a "soft state," one vulnerable to internal and external pressures, bending its laws, rules, and regulations to political exigencies: its political system is under profound strain, as it has failed to tackle underlying caste, class, cultural, and ethno-religious tensions. That failure is likely to undermine the country's unity and integrity as well as its secular character. On the economic and foreign policy fronts, India needs to adopt a more distinct, long-term policy, as opposed to the "ad hocism" practiced today, if it wants to carve out a meaningful place in the world community.

INDIA-MYANMAR RELATIONS Myanmar (Burma until 1989) became the second-largest member of the Association of Southeast Asian Nations (ASEAN) on admission in 1997. Rich in natural resources, especially oil and gas, Myanmar could emerge as an economic leader in Asia. Moreover, its strategic importance has made India, China, and Southeast Asian nations take note of Myanmar's critical role when shaping their relations as well as Indian Ocean policies.

Historical Background

During Britain's colonial rule of India, the British considered Burma (as Myanmar was then known) an important post for monitoring activities of hostile powers such as Japan, Russia, and China. The first Anglo-Burmese War (1824–1826) was the culmination of Burma's early-nineteenth-century intrusion into India. Thereafter, Britain extended colonial rule to Burma, which remained in the Empire (though administratively separate from India) from 1886 until independence in 1948. During World War II, Burma was important for both the Axis and Allied powers for purposes of defending security and strategic interests in South and Southeast Asia. The seizure of Burma by Japanese forces during World War II made it difficult for Britain to maintain administrative control over India.

Given this background, India-Myanmar relations are of special importance. The countries have close historical and cultural ties, sharing 1,643 kilometers of

common border along the Potkai Hills. They enjoyed friendly relations from 1948 to 1962, and early on India provided Rangoon (now Yangon) with military and economic assistance to fight insurgents along their common border. Prime Ministers Jawaharlal Nehru (1889–1964) of India and U Nu of Burma (1907–unknown) were instrumental in cementing initial political and diplomatic ties between two countries.

The military regime of General Ne Win (1962–1988) and India's support for Burma's pro-democracy movement were largely responsible for the two countries' estrangement. After the September 1988 coup that brought the military junta, the State Law and Order Restoration Council (SLORC), to power in Myanmar, the government of Rajiv Gandhi in India not only gave moral support to the restoration of democracy but also provided sanctuary to refugees. However, India gradually realized that its tough policy toward the new regime might complicate the problems of cross-border insurgency, drug trafficking, and smuggling in northeastern India. The Indian government also feared that rigid opposition to SLORC might drive Myanmar closer to China. This led New Delhi to adopt a policy of realism and pragmatism.

Policy of Engagement

In March 1993 India's foreign secretary, J. N. Dixit, visited Myanmar to hold talks with Myanmar's officials on wide-ranging issues. Talks were again held in Yangon at Myanmar's initiative in 1994. A Memorandum of Understanding on cooperation between the border authorities of both countries for maintaining border tranquillity was signed in 1994. Although India assured Yangon it would not interfere in Myanmar's domestic affairs, New Delhi openly extended moral support to Myanmar's pro-democracy activist Aung San Suu Kyi. Bilateral relations deteriorated further when the Jawaharlal Nehru Award for promoting international understanding was given to Suu Kyi.

Despite such irritants, India has kept political and diplomatic channels open with Myanmar. India's foreign secretary, K. Rangunath, visited Myanmar in February 1998 to forge wider strategic cooperation on internal security and border management. He discussed several issues of mutual concern with U Khin Maung, Myanmar's deputy foreign minister, to enhance border trade between two countries. To boost momentum, a high-level India-Myanmar meeting took place in Yangon in August 2000. Under discussion was "effective border management," including steps to curb drug trafficking and smuggling. Both countries underlined the need to strengthen infrastructure and security to promote border trade.

The China Factor

China has always been key in India-Myanmar relations, due mainly to Myanmar's strategic location and to India's and China's clashing security and strategic interests. With implementation of the 1914 McMahon Line Agreement in 1918, the India-Burma northern boundary was set near the Talu Pass. China contested this when it signed the Boundary Treaty with Myanmar in October 1960, but despite Chinese opposition, India still considers the Talu Pass demarcation valid. Furthermore, India and Myanmar agreed on their land border in December 1967, with the exception of the three-way border between China, India, and Myanmar. In March 1984 both New Delhi and Rangoon successfully concluded a maritime boundary agreement.

China has begun building a naval base on Coco Island, much to India's distress. Also, China and Myanmar have agreed to establish a 30,000-square-mile offshore economic zone to facilitate exploitation of natural resources to their mutual benefit. This will, however, affect India's maritime and economic interests.

Growing Pakistan-Myanmar ties are also of concern to India. Increasing links between Pakistan's Inter-Services Intelligence and Myanmar's intelligence agency serve Pakistani interests, as Pakistan considers Myanmar to be a safer base from which to launch militant activities in northeastern India. This rapprochement acquires added significance, since the military regimes of both Pakistan and Myanmar share common strategic perceptions and political interests. The India-Myanmar relationship presents a complex scenario, given the Sino-Myanmar, Sino-Pakistan, and Pakistan-Myanmar triangle of relations. To counter this, India is keeping tabs on developments and has launched a multipronged diplomatic effort both to engage and contain Myanmar.

India's Connection with Myanmar through ASEAN

Myanmar became a full member of ASEAN in 1997 despite American opposition; the same year, India was admitted as a full dialogue partner. ASEAN has allowed both New Delhi and Yangon to increase and expand economic, commercial, and trade ties. India will also gain greater access to ASEAN markets: India's trade volume with ASEAN member countries has increased since India joined, first as an observer in 1993 and then as a full dialogue partner. Undoubtedly, Myanmar understands that given India's industrial, technological, military, and nuclear capabilities, it is capable of influencing the politics, economy, and security of Southeast Asia. India and Myanmar now

have better opportunities collectively to address the security, defense, and strategic issues confronting Southeast Asia, since India is also a member of ASEAN's Regional Forum (ARF, established 1994).

Good India-Myanmar relations might gradually help reduce Chinese influence on Myanmar. Although China and Myanmar have drawn closer in their common goal of launching an antidemocratic movement, Myanmar does not want to remain isolated from the world and seems eager to cast off its pariah image. In pursuit of greater international ties, Myanmar's military regime has become more pragmatic. This is likely to prompt New Delhi and Yangon to cooperate in areas of mutual concern and interest, especially in the areas of cross-border insurgency, drug trafficking, and arms smuggling, threats to the security and economic interests of both countries.

INDIA-PAKISTAN RELATIONS With India's and Pakistan's May 1998 nuclear tests, world attention focused on South Asia. The fear was not only a regional nuclear arms race, but the effect on volatile areas such as the Middle East. The fear was well-founded, because the two nations have been at odds over Kashmir since the partitioning of the Indian subcontinent in August 1947. India and Pakistan have a history of armed conflict, having fought four major wars (1947-1948, September 1965, December 1971, and May 1999). The hostilities have cost both countries economically, physically, and psychologically without producing tangible gain. Besides Kashmir, other unresolved, long-standing bilateral problems include sovereignty over the Siachen Glacier, the Sir Creek maritime boundary, and the Tulbul Project/Wuller barrage. Many factors have contributed to this

INDIA'S EARLY VIEW ON INDIA-PAKISTAN RELATIONS

The following resolution passed by the Indian National Congress party in September 1950 sets forth several key elements in India's policy toward Pakistan, including a desire for peace and the contradictory desire to prevent peoples in India from affiliating with Pakistan.

The Jaipur Congress drew the particular attention of the country to the menace of communalism and called upon the people to put an end to all communal and separatist tendencies which had already caused grievous injury and which imperiled the hard-won freedom of the country. Anti-national and socially reactionary forces have continued to function and come in the way of India's progress.

The partition of India caused deep wounds in the political, economic and emotional life of the country. Passions were roused and many difficult problems arose, leading to continuing tension, and ill-will between India and Pakistan. These problems can only be solved satisfactorily with patience and goodwill, tolerance and firmness, keeping always in view the honour and interests of India. These interests of India, as of Pakistan, require peaceful and cooperative relations between the two countries. This Congress, therefore, commends and approves of the proposal made by the Government of Pakistan for an agreement between the two countries that all disputes should be solved by peaceful methods and without resort to armed conflict.

For this reason, among others, the Congress records approval of the Indo—Pakistan Agreement of 8th April, 1950, which represents a peaceful and effective approach to the solution of a very difficult problem and which is in keeping with the traditions and policy of the Congress. It is with this approach and in this spirit that such problems can be most effectively dealt with and can yield enduring results.

Whatever disputes and conflicts may exist now or may arise in future between India and Pakistan, they should be considered as political problems between the two countries and should be treated as such. In no event should the spirit of communalism or the misuse of religion be allowed to mar and distort the consideration of our internal problems. We cannot forsake our own policy in a spirit of retaliation. We have not only to treat our minorities with full justice and fairness, but should make them feel that they are so treated.

This Congress, therefore, declares that it is the basic policy of the nation, as reaffirmed in the Constitution, that India is a democratic State which, while honouring every faith, neither favours nor discriminates against any particular religion or its adherents, and which gives equal rights and freedom of opportunity to all communities and individuals who form the nation. It is the primary duty of every Congressman to carry this great message and to live up to it and to combat every form of communalism or separatism in India.

antagonism, including Cold War politics, competitive geostrategic perceptions, ideological and cultural differences, and the dynamics of extraregional politics.

Kashmir

Hostility began with the breakaway of primarily Muslim Pakistan from predominantly Hindu India in 1947. It continued with Pakistani advances in the Kashmir Valley in October 1947, and its forceful occupation of Azad Kashmir—the one-third of the valley thenceforth known in India as "Pakistan-occupied Kashmir." Immediately thereafter, Hari Singh, ruler of Jammu and Kashmir States, signed an instrument of accession with India on 26 October 1947, making Kashmir into Indian territory. Pakistan has contested this on the grounds that Kashmir is a Muslim-dominated area. It has consistently demanded that the problem be resolved in accordance with the U.N. resolution of August 1948, which called for a plebiscite to determine the wishes of Kashmiri Muslims. The Indian government opposes this on the grounds that it would undermine India's basic secularism. Pakistan maintains that the Kashmir issue needs to be resolved before bilateral relations can be improved and sees resolution of the Kashmir problem as essential to ensure regional peace and stability. India insists that the Kashmir issue cannot be resolved unless Pakistan stops cross-border terrorism. These rigid postures have further deepened the estrangement.

The Cold War

Geopolitics remains key in India-Pakistan relations. Pakistan's fear of India induced it to join two U.S.-sponsored military alliances, the Southeast Asia Treaty Organization and the Central Treaty Organization, in 1954 and 1955, respectively, to bolster national security and identity vis-à-vis India. In contrast, India adopted a policy of nonalignment to avoid the superpower rivalry and concentrate scarce resources on modernization and development for the well-being of its people. New Delhi and Islamabad focused on achieving their own security and development rather than addressing common geopolitical and geostrategic issues or trying to implement a subregional security system.

During the Cold War, the United States provided massive military assistance to Islamabad to help maintain the balance of power between India and Pakistan (India being by far the larger), triggering a regional arms race in the process. India gradually came to favor the USSR, becoming its chief arms buyer. India also signed the Treaty of Peace, Friendship and Cooperation with the USSR in August 1971, to ward off Chinese or U.S. adventurism during its 1971 war with

Pakistan. The war proved costliest to Pakistan, which lost East Pakistan, the latter becoming Bangladesh. India's overt hand in the emergence of Bangladesh as a separate nation hardened Pakistani enmity.

Simla Agreement

After Pakistan's defeat in the 1971 war and the surrender of its armed forces before the Indian army in Dhaka, the new capital of Bangladesh, Pakistani president Zulfikar Ali Bhutto (1928–1979) and Indian prime minister Indira Gandhi (1917–1984) met at Simla in northern India to discuss postwar relations. On 2 July 1972 they signed the historic Simla Accord, under which both countries committed themselves to resolve disputes, including Kashmir, through peaceful bilateral negotiation without third-party intervention. They also agreed to respect the line of control (LoC) resulting from the cease-fire of 17 December 1971 and not to attempt to alter it unilaterally.

Post-Simla Developments

The Simla Accord helped prevent the outbreak of major conflict between two countries till 1999. Despite fluctuation in their bilateral relations, New Delhi and Islamabad agreed to begin composite and integrated dialogue on eight issues during talks held by their foreign secretaries in Islamabad in June 1997. Further talks in New Delhi in November 1998 dealt with contentious bilateral issues, including Kashmir. The improvement in relations picked up momentum when the new Indian prime minister, Atal Behari Vajpayee (b. 1926), undertook a bus journey to Lahore in February 1999. He signed the Lahore Declaration

In February 2000, Indians protest what they claim is Pakistan's support for terrorism against India. (AFP/CORBIS)

UPDATE: INDIA–PAKISTAN RELATIONS WORSEN AT END OF 2001

At the close of 2001 India–Pakistan relations worsened considerably following a suicide attack on the Indian Parliament that left five terrorists and nine Indians dead. India blamed the bombing on the Lashkar-e-Taiba and Jaish-e-Muhammad, two Muslim fundamentalist groups in Pakistan that support Pakistan's claims to Kashmir. Senior Indian officials also claimed that the Pakistan government supported the attack and has long supported terrorism aimed at India. India also rejected Pakistan's offers to jointly investigate the attack and denied government involvement.

Source: Celia A. Dugger. (2001) "India Raises the Pitch in Criticism of Pakistan." *The New York Times* (18 December): A14.

with his Pakistani counterpart, Nawaz Sharif (b. 1949), and they resolved to settle bilateral disputes in a friendly and peaceful manner. But the Lahore spirit quickly dissipated following the May 1999 Kargil conflict in Indian territory in the Kashmir Valley. In October 1999, General Pervez Musharraf (b. 1943) took power in Pakistan in a bloodless coup. In 2002, the United States acted as a third party to encourage dialogue between the two countries. The Vajpayee government has made it clear that it will not legitimize Pakistan's military regime.

The Nuclear Dimension

Ever since India detonated its first nuclear device in May 1974, the nuclear issue has increased the tension between New Delhi and Islamabad. In reaction to the Indian nuclear test, President Bhutto called for Pakistan to make nuclear weapons even if it had to "eat grass" to make it possible. His determination was pursued by his successors, enabling Pakistan to attain nuclear parity with India in May 1998. The United States and Japan imposed economic sanctions on India and Pakistan, refusing to lift them unless India and Pakistan sign the Comprehensive Test Ban Treaty (CTBT), but India and Pakistan are proceeding with missile upgrading programs. The Indian government has emphasized that unless China stops transferring sophisticated weapons, nuclear technology, and missiles to Pakistan, nuclear restraint in the region will

remain impossible. From an Indian perspective, China remains a critical factor in the India–Pakistan relationship, a view not shared by Pakistan.

Given the nuclear threat, especially in view of the unresolved Kashmir problem, India and Pakistan need to undertake a series of confidence-building measures, such as entering into arms control and no-first-use agreements, improving nuclear command-and-control systems, and undertaking risk-reduction measures. In the interest of long-term regional peace and stability, Pakistan should stop cross-border terrorism. It is equally important to encourage friendly relations by enhancing contact between the citizens of the two nations, contact that will, one hopes, reduce mutual mistrust and build friendly and harmonious relations between the former enemies.

INDIA–SOUTHEAST ASIA RELATIONS

India had close cultural interaction with Southeast Asia from prehistoric times. In modern times there were vicissitudes in the relations, but India is striving to become a major player in the regional economy and politics.

Ancient and Medieval Periods

In the gamut of Indo-Southeast Asian relations, both Indians and Southeast Asians played an active role. In prehistoric times a land route crossed north-eastern India to Burma, China, and Thailand. Apart from movements of people and racial and linguistic affinity, trading relations also united India and

MY SON SANCTUARY

The My Son Sanctuary, a UNESCO World Heritage Site since 1999, was the capital of the Champa Kingdom, a Hindu kingdom located on what is now the coast of Vietnam. It elegantly demonstrates a common phenomenon in Asia—the blending of seemingly divergent cultures.

Southeast Asia. Archaeological excavations produced evidence of trade between the two regions in the form of shared objects of material culture.

In the Common Era trade increased with intensified sea-borne commerce. Along with traders, Brahmans or priests from India traveled to Southeast Asia and acquainted the local elite with Indian rituals, scriptures, and literature. The Brahmans became counselors in court affairs and legitimized the position of rulers by giving them an investiture ceremony and a genealogical list. Indian elements like Sanskrit language, Hindu-Buddhist cults, *Dharmasastras* (treatises dealing with statecraft and administration), and the concept of royalty became essential features of the early states of Southeast Asia.

The common people in Southeast Asia were influenced by stories from the *Mahabharata* and *Ramayana*. Indian religion and deities became popular, and Indian culture diffused throughout the indigenous societies of Southeast Asia, whose cultures were open to foreign elements.

The "Indianized" states of Southeast Asia persisted until medieval times, when the arrival of Islam in the latter part of the thirteenth century changed the situation. From Gujarat and the Coromandel coast (whose contact with Southeast Asia preceded the coming of Islam), traders responsible for the spice and pepper trade in the Mediterranean visited the region and helped to spread Islam by establishing Muslim settlements. Islam as brought to Southeast Asia by Indian Muslims differed from the orthodox Islam of Arabia. The Southeast Asians preserved some Hindu-Buddhist characteristics acquired by their contact with India, and there was no break with the pre-Islamic past.

Modern Period

In the nineteenth century Indian immigrants moved to the British colonies of Malaya, Singapore, and Burma (present-day Myanmar) to work on rubber, cof-

fee, and tea plantations as indentured laborers. Indian textile merchants and moneylenders also appeared in the French colony of Indochina. These immigrants were seen as advancing the interests of colonial masters, and a feeling of antipathy developed toward them. The Indian independence movement stimulated anti-colonial struggles in Southeast Asia. Indian personalities like Mohandas K. Gandhi (called Mahatma; 1869–1948) and Rabindranath Tagore (1861–1941) were much admired by Southeast Asian leaders like Sukarno of Indonesia (1901–1970), Norodom Sihanouk of Cambodia (b. 1932), Aung San of Burma (1914?–1947), and Ho Chi Minh of Vietnam (1890–1969). In the framework of the freedom struggle, Indian leaders mooted the concept of "Asianism" and called on formation of a common Asian identity to oppose the West.

After independence India pursued a dynamic policy toward Southeast Asia. Acting as intermediary, India contributed to lessening tensions by hosting conferences like the Asian Relations Conference in 1947 and the Conference on Indonesia in 1949. The Bandung Conference (1955) was the high-water mark in Indian diplomacy. The prime minister of India, Jawaharlal Nehru (1889–1964), architect of basic principles of Indian foreign policy like anticolonialism and nonalignment, believed that India could play a meaningful role in the Cold War period.

However Indian relations with Southeast Asian countries lost momentum after India's humiliating defeat in the Sino-Indian border war of 1962. Closeness with the then Soviet Union resulted in the Friendship Treaty of 1971, and an inward-looking economy and deep commitment to the cause of Arabs resulted in neglect of Southeast Asia. India was viewed with suspicion after its 1974 nuclear tests. Its wholehearted support of the Indochinese Communists in the Vietnamese conflict caused other Southeast Asian countries to stand aloof. The end of the Cold War, the onset of a liberalization process, and economic imperatives improved India–Southeast Asia relations during the 1990s.

Contemporary Indian–Southeast Asian Relations

Free from ideological rhetoric and the Cold War phantom, India moved closer to Southeast Asia. The Indian prime minister visited Indonesia, Thailand, Vietnam, Singapore, and Malaysia in the first half of the 1990s, and Southeast Asian leaders paid reciprocal visits. India became a full dialogue partner of the Association of Southeast Asian Nations (ASEAN) in December 1995 at the fifth ASEAN summit in Bangkok. India's eastward-looking policy as well as security considerations made India a member of the ASEAN organization of security concerns, the Asian

Regional Forum. There were joint naval exercises and defense cooperation.

India also tried to improve bilateral ties and increase trade with Southeast Asia. Indian companies invested in Southeast Asia, and India invited capital from the region. Whereas India's exports and imports with ASEAN in 1993–1994 were \$1.676 billion and \$1.102 billion, respectively, these increased to \$2.201 billion and \$4.949 billion, respectively, in 1999–2000. Although the trade balance is presently tilted in favor of ASEAN, military cooperation and the January 2001 agreement for cooperation in education and information technology will redress the balance to an extent.

India also took the initiative in multilateral cooperation apart from ASEAN. The Bangladesh, India, Myanmar, Sri Lanka, and Thailand Economic Cooperation, or BIMSTEC, aims at close cooperation among member countries. The Mekong–Ganga Cooperation, an Indian initiative, was floated in November 2000 in Vientiane for better understanding among member countries (Cambodia, India, Laos, Myanmar, Thailand, and Vietnam). Promotion of tourism, development of transport networks, and educational and cultural cooperation are items on the agenda.

India's size, population, ancient cultural relations, and its emigrant population in Southeast Asia, as well as its industrial base, military strength, and scientific and technical capacity make it a major force in Southeast Asia. It is likely to continue to play a dominant role in the region as the twenty-first century unfolds.

INDIA–SRI LANKA RELATIONS Sri Lanka (Ceylon until 1972), with its mixture of Buddhist and Hindu institutions, has always been Indian in culture, though its identity is distinct from its northern neighbor's. The Sinhalese language occurs only in Sri Lanka and has a distinguished literary tradition. Likewise, Theravada Buddhism remained the religion of the island, while Hinduism displaced it on the subcontinent.

From the third century BCE, Ceylon was involved in the politics of southern India for more than a millennium. Beginning in 177 BCE, it faced a succession of invaders from southern India and itself invaded mainland kingdoms as political alliances shifted, until they finally broke down in the twelfth century. In the fourteenth century, the Sinhalese kingdom moved near the coast, where the rulers, originally southern Indian traders, founded the Kotte Kingdom (1415–1580). Merchant communities moved back and forth between Ceylon and the mainland. These included Chettiar traders and bankers who traveled throughout South and Southeast Asia. Muslims came for trade and on pilgrimage to what they believe is the footprint of Adam on a mountain still called Adam's Peak.

European colonial rule (1517–1948) restrained relations between Ceylon and India. The British East India Company briefly united Ceylon with India, but in 1802 the British removed it from company control and ruled it directly as a Crown Colony. The governments of the two colonies were separate at the level of the British Parliament, sometimes leading to disagreements on trade, labor migration, navigation, and transport.

People of Indian Origin

During British colonial rule, Indians and Ceylonese were British subjects, and many Indians migrated to the island to work on plantations. Administrative separation and the British compulsion to classify their subjects, however, discouraged assimilation. Earlier migrants, such as the *karava* and *salagama* castes, who arrived before the colonial era, became fully Sinhalese; but during British rule communities of Indian origin were considered "Indian" even after generations on the island.

With British support, Chettiars eventually dominated domestic finance in Ceylon. They traded between India and Ceylon and were intermediaries between British bankers and Ceylonese clients, both as guarantors for borrowers, and as moneylenders who borrowed money from banks for relending at high interest. Since many Chettiars retained their Indian identity, their role occasioned anti-Indian animosity on the part of Ceylonese traders and planters.

Plantation workers were and are primarily of southern Indian origin. The resident labor population grew as coffee, tea, and then rubber plantations advanced across central and southwestern Ceylon. The Indian government could not insist on the protection that indentured migrants had elsewhere because they could not control emigration, due to the proximity of the

island. The Indian Emigration Act No. 7 of 1922 demanded reformed treatment of Indian immigrants on threat of prohibiting emigration altogether, a threat finally enforced in August 1939. Indian intervention resulted in improved wages, educational opportunities, housing, and health services for plantation laborers.

Tamil immigrants sought employment in other occupations in Ceylon, often in menial, low-wage occupations. Recent Indian immigrants made up about one-sixth of the population in the 1920s and 1930s—a serious concern for the indigenous population, and a matter of legitimate national interest for India. When the Great Depression struck, Sinhalese politicians condemned merchants, moneylenders, and laborers of Indian origin.

Under the Sinhalese-dominated State Council (1931–1946), voting rights of people of Indian origin were restricted. Jawaharlal Nehru (India's first prime

India has served as a temporary home for Tamil refugees fleeing the ethnic fighting in Sri Lanka. Here, a Sri Lankan Tamil family stands with their belongings on Manar Island, Sri Lanka, after their return from India. (HOWARD DAVIES/CORBIS)

minister) and D. S. Senanayake (prime minister of Ceylon, 1947–1952) met fruitlessly several times in the 1940s to settle the question of their citizenship. Ceylon finally passed three citizenship and franchise acts that effectively made people of Indian origin stateless. As recently as November 1964, only 140,185 people who had applied for citizenship by registration were granted it, while 975,000 remained stateless. That year India and Ceylon negotiated the Sirima-Shastri Pact, under which Ceylon agreed to grant citizenship to 300,000 people (later raised to 375,000) and their progeny. More than 630,000 applied, but when the pact expired in October 1981, only 162,000 people of Indian origin had been registered as Sri Lankan citizens. In the same period, 373,900 received Indian citizenship and 284,300 were repatriated to India. Legislation in the 1980s finally granted citizenship to the remainder.

Civil War

India has been active in several ways in the ethnic conflict ravaging Sri Lanka. India's responses were influenced by its own Tamil separatist movement, which waned in the 1960s, and its position after the 1971 Indo-Pakistan war as the most powerful South Asian state. After 1977, Sri Lanka abandoned neutralist foreign policy, becoming openly pro-Western when India was forging closer Soviet ties.

As violence against Tamils increased in Sri Lanka, militant separatists organized and trained in Tamil Nadu in southern India, possibly with Indian support. When civil war erupted in July 1983, more than 100,000 refugees from northern Sri Lanka fled to India. These events, and increased violence by security forces against Sri Lankan Tamils, made the crisis the major political issue in the Indian state of Tamil Nadu.

Mediation by India's central government began after July 1983, and Indian-facilitated proposals to resolve the conflict were presented to an All Party Conference that met fruitlessly throughout 1984. President Jayawardene of Sri Lanka and India's prime minister Rajiv Gandhi met in early June 1985, and the Sri Lankan government and Tamil organizations held peace talks in August at Thimpu in Bhutan, but these efforts failed too. In late 1986 talks were held in Delhi, which arrived at a proposal for devolution of power that would allow considerable autonomy at the provincial level.

After severe fighting in Jaffna in April and May 1987, India intervened directly. India wanted neither Sinhalese hegemony over the Tamil minority (unacceptable to Indian Tamils) nor the establishment of a separate state (which would encourage secessionist

movements among India's Tamil population). An agreement between the governments of Sri Lanka and India "to establish peace and normalcy in Sri Lanka" was signed on 29 July 1987. To ensure implementation, India stationed more than 60,000 troops in the northern and eastern provinces of Sri Lanka as the Indian Peace Keeping Force (IPKF).

By October 1987, the IPKF was waging all-out war against the Liberation Tigers of Tamil Eelam (LTTE). IPKF maintained order in parts of northern Sri Lanka and helped conduct elections in 1988 and 1989, but withdrew in March 1990 after more than 1,200 soldiers had died. On 21 May 1991, an LTTE suicide bomber assassinated Rajiv Gandhi, who as prime minister had negotiated the peace agreement. India banned the LTTE and has not intervened since, although it opposes creation of a separate Tamil state and has been asked by some Tamils to facilitate peace talks.

India and Sri Lanka signed a Free Trade Agreement in 1998 and were working to eliminate trade restrictions in early 2000. Both nations are active in the South Asian Association for Regional Cooperation (SAARC), which was established in 1985 and also includes Bangladesh, Bhutan, the Maldives, Nepal, and Pakistan. Tensions between India and Pakistan have impeded progress toward multinational cooperation, however, and the November 1999 summit was postponed indefinitely because of India's protest of the military coup in Pakistan.

INDIA-UNITED KINGDOM RELATIONS

Relations between India and Britain (the United Kingdom was not formed until 1801) date from the founding of the East India Company in 1600, but relations between the two as sovereign nations did not begin until India became independent in 1947. Indian independence marked the beginning of a new relationship

based on trade and cultural exchange. Today, the Indian diaspora and private business form strong links between India and the United Kingdom.

Economic Relations

The United Kingdom emerged from the World War II pessimistic as to the political and economic worth of her South Asian colonies. Disengagement of private British capital from India began in the 1930s, and India's importance as a buyer of British goods or as a destination for British investment was generally in decline in the interwar period—an effect of the worldwide Great Depression. When independence came in 1947, these processes of decolonization had already made India of little value as a business partner and too costly to maintain. Trade and investment ties between India and the United Kingdom grew still weaker in the decades that followed independence. India's external transactions shifted from the United Kingdom to the United States, Germany, the USSR, and Japan. In 1947 the United Kingdom was by far the most important supplier of machinery and intermediate goods to India; after independence, other industrial countries gradually displaced it. For its part, the British external sector was integrating more closely with Europe, and tended to disengage itself from the former colonies. The early 1990s saw some slight reintegration, however, as India's trade with the former Soviet Union and Eastern Europe collapsed. The United Kingdom was among the four largest markets for India in the 1990s, and if oil imports are excluded, among its four largest sources of imports.

Economic ties have strengthened in other ways as well. The 1960s saw large-scale migration of labor to the United Kingdom from its colonies and former colonies, chiefly the West Indies and South Asia. Acute industrial labor shortages created the demand; colonial roots shaped the sources of supply. The United Kingdom was quickly becoming truly multiracial.

Political Relations

Immigration controls were halfhearted and partially effective, though they became increasingly stringent from 1973. Twenty years later, when migration from Europe had been made considerably easier than migration from the former colonies, the United Kingdom's economic realignment away from its former colonies was complete.

The United Kingdom's influence on India's international relations has declined since India's independence. Formally, this influence can be exercised through the Commonwealth of Nations, an association

HOLDING ON TO INDIA

The following statement by British Lord Linlithgow on the future of Indo-British relations was made on 18 June 1934 and published in the Report of the Joint Committee on Indian Constitutional Reform (Session 1933–34). It reflects the British position of retaining control of India while affording Indians more political power.

There are moments in the affairs of nations when a way is opened for the removal of long-standing differences and misunderstandings and for the establishment between people and people of new relations more in harmony with the circumstances of the time than those which they replace. Adjustments of this order, when they involve a transference of political power, must inevitably provide a sharp test of national character; and the instinct for the time and manner of the change is the sure mark of political sagacity and experience. If there are those to whom the majestic spectacle of an Indian Empire makes so powerful an appeal that every concession appears almost as a betrayal of a trust, we would ask them to look at the other side of the picture, different indeed in content, but not less charged with realities. India also has a right to be heard before judgment is pronounced; and her plea to be allowed the opportunity of applying principles and doctrines which we ourselves have taught cannot be met by a simple traverse or by a denial of her interest in the cause.

It has seemed to some that to permit India to control her own destiny is to sever the tie which unites her to the Crown and to the United Kingdom. Never could we contemplate the rupture of that beneficent and hon-

ourable association; but we believe that a union of partners may prove an even more enduring bond. We do not deny that the creation of an Indian Empire has profoundly affected the position of the United Kingdom and has magnified its influence in the affairs of the world; but we do not think that the selfish or vainglorious element predominates in the pride which this country takes in the work accomplished. The best of those who were and are responsible for it have ever regarded themselves as the servants of India and not merely as the agents of a foreign power; nor do we forget that it could not have been carried through without the cooperation of Indian hands. It has not needed our inquiry to remind us how great a place India fills in our own history. There is no part of His Majesty's Dominions with the same power to recall memories or to stir emotions, and none with so great a succession of warriors and administrators, by the story of whose achievements our hearts are still moved, as Sir Philip Sidney by the song of Percy and Douglas, more than with a trumpet. But the whole earth is the sepulchre of famous men, and those of whom we speak are now become a part no less of India than of English history. Their arduous and patient labours founded a new and mighty State; and it is upon the foundations which they have laid that, as we hope, people of India will find political contentment as well as scope for the free and orderly growth of national life.

of the United Kingdom and her former colonies. London had initially hoped that creating this association would mitigate the effects of the partition of India in 1947, and keep South Asia from veering towards Communism. However, the Commonwealth has never succeeded as an effective agent of political mediation within South Asia, though it has periodically played an important role in matters of South Asian collaboration. Its potential role as an agent of dispute settle-

ment within South Asia has been eroded by several circumstances.

First, external mediation was resisted or failed in the two most critical disputes that beleaguer South Asia, namely, Kashmir and the citizenship of Sri Lankan Tamils. Second, the influence of the Soviet Union, the United States, and China on South Asian affairs steadily increased in the course of the Cold War. After 1970,

India's defense policy shifted toward the Soviet Union, partly in response to Pakistan's relations with the United States and China, and partly as an extension of stronger socialist leanings in economic ideology. The United Kingdom's membership in NATO also distanced her from India in its Cold War alignments.

The Commonwealth itself was weakened by several developments. As more Commonwealth members gained independence, the United Kingdom's informal leadership of the body, and consequently British foreign policy interests in Commonwealth affairs, tended to weaken. The United Nations and the Nonaligned Movement (NAM) became more effective, or at any rate competing, bodies for negotiation and dispute resolution. Finally, European integration and immigration controls weakened the relative importance for the United Kingdom of the poorer nations in the Commonwealth as partners in trade, investment, and labor exchange.

Despite these developments and a few points of difference in political interests and perspectives, Indo-U.K. relations have generally been cordial. The end of the Cold War and the retreat from socialist sentiments in India in the 1990s removed some of the old irritants. Though these developments also mildly revived trade and investment between the two countries, a clear realignment has yet to emerge. The United Kingdom and the Commonwealth continue to be of marginal importance in internal South Asian affairs.

Cultural ties between India and the United Kingdom, however, continue to grow. The presence in the United Kingdom of well over a million people of South Asian origin is the most important factor sustaining such exchanges. This population is now highly differentiated, though its constituent segments or communities display common patterns in how they have adapted their Indian heritage to their new home. This process of transplantation and transformation is now the subject of a large and growing body of scholarly and creative literature, of which travel, mixed identities, displacement, and nostalgia are major themes.

INDIA–UNITED STATES RELATIONS

Relations between the United States and India since India's independence have been decidedly mixed: a former American diplomat called the countries "estranged democracies"; an Indian scholar described them as "unfriendly friends"; and one book on the relationship is subtitled *The Cold Peace*. Why have ties between the two been so fraught with tensions? Different national, regional, and global priorities, reflecting the countries' different histories, geographies, resources, societies, and cultures, explain their problematic relations.

Such differences are not unusual, and India and the United States have good relations with other countries despite such differences. They are problematic for United States–India relations because, ironically, of similarities between the two countries, such as democratic political systems, a free press, a shared language (English), and self-perception of unique importance in the world. Because India and the United States share attributes, there are expectations that they will get along; when they do not, there is puzzlement. Also, the fact that the two countries can express, and understand, their differences through public dialogue means that disputes are aired openly and passionately, with negative consequences for the relationship. Balancing unrealistic expectations against what is possible given differing priorities is a fundamental challenge for United States–India relations.

Importance of India–United States Relations

India–United States relations are important for many reasons. First, because these countries are the two largest democracies in the world, there is the expectation they share values and interests. Some argue that democracies make better and more peaceful partners in trade and diplomacy; the example of India–United States relations may be used to confirm or refute this, and the record so far is problematic. Second, since the United States is the world's strongest power, while India, though the largest democracy, is largely poor and weak, their relations highlight the challenges facing relations between developing and industrialized countries. Third, many critical issues confronting the world—including the United States—in the twenty-first century involve India. Nearly one-sixth of humanity lives in India. So whether in fighting poverty, preventing nuclear conflict, managing population growth, limiting environmental damage, or stopping drug trafficking or AIDS, relations with India figure prominently. Finally, there are immediate, concrete reasons why Indian–United States relations matter, including the presence in the United States of many

CONSTITUTIONAL COMMITMENTS

A shared commitment to democracy is reflected in the preambles to the United States and Indian constitutions:

From the Constitution of the United States:

We the People of the United States, in Order to form a more perfect Union, establish Justice, insure domestic Tranquility, provide for the common defense, promote the general Welfare and secure the Blessings of Liberty to ourselves and our Posterity, do ordain and establish this Constitution for the United States of America.

From the Constitution of India:

We, the People of India, having solemnly resolved to constitute India into a Sovereign Socialist Secular Democratic Republic and to secure to all its citizens:

JUSTICE, social, economic and political;

LIBERTY of thought, expression, belief, faith and worship;

EQUALITY of status and of opportunity;

And to promote among them all

FRATERNITY assuring the dignity of the individual and the unity and integrity of the Nation

In Our Constituent Assembly this twenty-sixth day of November, 1949, do Hereby Adopt, Enact and Give to Ourselves this Constitution.

politically active Americans of Indian origin, increasing business opportunities in India, and India's growing role in Asia—a role made more critical by India's increased emphasis on political and military engagement and nuclear-weapons capability.

Recurring Issues in India–United States Relations

Four general issues that dominated relations between the two nations from India's independence to the end of the twentieth century are likely to continue to be important. First and foremost is India's neighbor Pakistan. The end of British rule led to the creation of two hostile states, India and Pakistan, which immediately fought over an area they both claimed, Kashmir. Indians believe the United States initially sided with Pakistan in the Kashmir dispute. Much

worse in Indian eyes, in 1954 the United States signed a security agreement with Pakistan to involve it in U.S. Cold War efforts to "contain" Communism. India, concerned about Pakistan, perceived the rapprochement as a direct threat and an effort to counterbalance India's superior power and resources. The first Indian prime minister, Jawaharlal Nehru (1889–1964), argued that United States–Pakistan relations would spur an arms race in the subcontinent. The next four decades saw other periods of close United States–Pakistan military and political cooperation, but in recent years India and the United States have striven to cooperate despite differences regarding Pakistan.

A second major issue involves nuclear weapons. In 1968, the United States was instrumental in negotiating the Nuclear Non-Proliferation Treaty (NPT). India refused to sign, complaining that it allowed five

states (the United States, China, France, the United Kingdom, and the USSR) to possess nuclear weapons legally, while other countries were barred from possessing them. India claimed this was discriminatory, calling instead for global abolition of nuclear weapons. In 1974, however, India tested a nuclear device; again in 1998 India conducted five nuclear explosions and declared itself a nuclear-weapons state. The India–United States dispute over nuclear weapons now focuses less on the NPT and more on recent U.S. requests that India sign a treaty banning further tests, negotiate to ban production of materials for nuclear weapons, ensure that India’s nuclear technology is not exported, and restrict development of ballistic missiles. The United States and India have yet to bridge their differences regarding India’s nuclear and missile programs.

A third important issue concerns aid, trade, and investment. The United States was a major bilateral and multilateral donor to India for the first three decades of their relations, and this sometimes produced friction. India often perceived political strings to be attached to the aid, while the United States complained of a lack of gratitude for and poor utilization of the aid. More seriously, until the early 1990s India had a highly regulated, inward-looking economy, and U.S. businesses had few opportunities for trade with or investment in India. Since India launched economic reforms in 1991, the situation has changed somewhat. The United States and India have expanded trade and investment, though economic interchange falls short of its potential and is considerably less than U.S. trade with and investment in China or some Southeast Asian nations. The opening of India’s economy and the development of its information-technology sector may provide the basis for a significant expansion of economic and technological cooperation. However, given the differing economic needs and power of the countries, there are still important disagreements regarding global trade rules and other issues bearing on economic relations.

A final contentious area is security and defense cooperation, which has been extremely limited. United States–Pakistan military relations meant India was not keen on dealing with the United States, and that the United States did not want to upset Pakistan by transferring certain military items to India. Until the early 1970s, India’s nonalignment policy also made it unwilling to enter into military relations with other countries. Following the establishment of close Indo-Soviet relations in 1971, the USSR became India’s principal military supplier, angering the United States, which was still involved in the Cold War. India and the United States also share few common security and strategic out-

looks that could form the basis for cooperation. India showed itself a poor counterbalance to China when it was involved in the 1962 Sino-Indian border war. India has also seen the costs and conditions attached to the U.S. transfer of weapons systems as excessive. But the end of the Cold War, changing United States–Pakistan relations, the collapse of the Soviet Union, growing Chinese power, and general improvement in India–United States relations may bring better, if still limited, prospects for defense cooperation.

United States–India relations were clearly mixed over the first five decades of Indian independence. But international changes in the 1990s, particularly in Asia, and shifts in India’s economic and foreign policies may yet provide the basis for warmer, more substantial relations. In 2001, the United States took on a peace-keeper role vis-à-vis India and Pakistan as both nations amassed forces on the border in response to Muslim terrorist attack on the Indian Parliament and Indian charges that Pakistan supported the terrorist activities.

INDIAN OCEAN The Indian Ocean, with an area of 75 million square kilometers, is the smallest of the three oceans bounded by Africa, Asia, Australia, and the Antarctic. Nevertheless occupying a huge area, the Indian Ocean extends over some 10,000 kilometers from South Asia to the Antarctic on the one side, and from South Africa to Tasmania on the other. The Indian Ocean accommodates 15 percent of the earth’s total surface and occupies 21 percent of all ocean surfaces. While the mean depth is around 3,900 meters, its maximum depth is 7,125 meters (Java Trench). The seabed of the Indian Ocean is rather complex, with a multifold topography that includes huge basins as well as large ridges.

The vast area of the Indian Ocean is commonly divided into various sectors. The Arabian Sea and the Bay of Bengal are the major seas that bound the Indian peninsula, while the Lakshadweep and Andaman

Sri Lankan fishermen fishing from stilts in the Indian Ocean in 2000. (KEREN SU/CORBIS)

Seas are the minor seas around the homonymous Lakshadweep and Andaman Islands; the latter are further extended by the Nicobar Islands. The Arabian Sea is straddled by two important branches, the Gulf of Oman (elongated by the Persian Gulf) and the Gulf of Aden, which extends into the Red Sea. In 1869 the Red Sea was connected with the Mediterranean Sea by the gigantic Suez Canal, opening a new era of sea trade between Europe and Asia. The Suez Canal is still the leading shipping route between the two continents. Along its southern region the Indian Ocean is commonly called the Indian South Polar Sea, except for the Great Australian Bight that bounds South Australia. For the big islands lying opposite continental land masses, such as Madagascar, Sri Lanka, and Sumatra, the Mozambique Channel, Palk Strait, and Strait of Malacca, respectively, serve as connecting seas.

The Indian Ocean accommodates many isolated islands and island groups without hosting large island archipelagos. Apart from Madagascar and Sri Lanka, large island nations, a few small island groups are of importance, some of which have nowadays become tourist destinations. Comparably big island groups include the Comoros, Amirante, Seychelles, and Mascarene Islands (including Mauritius and Réunion), the Lakshadweep, Andaman, and Nicobar Islands as well as the Maldives, Chagos Archipelago, New Amsterdam, Saint Paul, the Kerguelles, Heard, Marion, Prince Edward, Crozet, Christmas, and Cocos Islands, all dispersed across the vast Indian Ocean.

Politically the various islands and island groups are independent small island nations or still belong to other countries. In the past all the islands were colonial outposts of various European powers, as their old colonial names still underline; they gained independence only after the Second World War (and sometimes decades later).

The Indian Ocean is divided by the equator in its northern part, and most of it is located south of the equator. As a result the climate incorporates (from north to south) the monsoon, the passates or the major air current also known as the tropical easterlies (south of the equator), and the temperate climates under the westerlies (farther south). Characteristic of all climate zones is the oceanic impact that weakens the temperature contrasts between the seasons. By nature the Indian Ocean and bounding coastal land surfaces rarely have tropical cyclones or storms, except for the Bay of Bengal and Mascarene Islands, which are irregularly visited by cyclones.

Since early times the northern Indian Ocean was heavily traveled between Arabia and India by Arabian seafarers who sailed with the seasonal monsoon winds. While in ancient times Egyptians, Arabs, and Chinese traveled the Indian Ocean, the European colonial discovery of the Indian Ocean occurred only in 1497, with the legendary expedition by Vasco da Gama, who first rounded the Cape of Good Hope to cross the Indian Ocean toward India. Traditionally the

countries bordering the northern Indian Ocean, such as Arabia, India, and the countries of Southeast Asia, were best known to the foreign sailors and merchants because of their spices, gems, gold, ivory, and other rare goods. Only since the colonial age commencing with the sixteenth century did a regular trade develop across the Indian Ocean between Europe and Asia. In modern times air travel has absorbed much of the commerce between Europe and the countries around the Indian Ocean.

Fishing is a traditional practice on the lands bordering the Indian Ocean. Nowadays, however, oil and gas are heavily exploited, and offshore wells represent valuable resources, mostly in the Persian Gulf nations of the United Arab Emirates, Saudi Arabia, Iran, and the emirates of Kuwait, Qatar, and Bahrain.

Though most islands in the Indian Ocean are uninhabited, some are heavily populated, even seriously overpopulated, by native peoples. The mostly poor living conditions are based on marginal subsistence agriculture. Having limited resources for development, some islands and island groups benefit from tourism as a profitable industry; these include Mauritius and Réunion, Comoros and Seychelles, and the Maldives. All such islands are favored destinations, mostly for European tourists, who are attracted by the "exoticness," the tropical climate and sandy beaches, and superb diving conditions (in case of the Maldives, due to their nature as coral islands).

Life on all the small islands in the Indian Ocean may have a hazardous future, due to the impact of global warming, which will lead to rapidly shrinking island surfaces and result in coasts flooded and life conditions worsened by the impact of increasing hurricanes and typhoons in the region. Many instances of serious coastal erosion processes have already occurred on the islands in recent times. The Maldives are worst afflicted because most of the land surfaces of all 1,200 small islands are not higher than half a meter above sea level. If critical predictions of a sea level rise of 50 to 100 centimeters are borne out during this century, disastrous results must be expected for many millions of coastal inhabitants in South Asia, mostly in India and Bangladesh.

INDIAN SUBCONTINENT (2001 pop. 1.4 billion). "Indian subcontinent" geographically refers to the area covering the southern section of Asia (often called South Asia), but not the Southeast Asian mainland. It comprises the vast peninsula bounded on the north by the Himalayan Ranges and projecting as a triangle in the south far into the Indian Ocean, with the Bay of Bengal lying to the east and the Arabian Sea to the west. The area is divided between five major nation-states, Bangladesh, India, Nepal, Pakistan, and Sri Lanka, and includes as well the two small nations of Bhutan and the Maldives Republic. The total area can be estimated at 4.4 million square kilometers, or exactly 10 percent of the land surface of Asia. The latitudinal range is between the equator and 37°N, thus embracing various environments from desert to mountain, from dry plateau to humid rain forest. In 2000, the total population was about 22 percent of the world's population and 34 percent of the population of Asia. Life expectancy was then in the range of 55 to 64 years throughout most of the subcontinent.

INDIGO An important blue dyestuff, until about 1900 indigo was obtained entirely from the plants of the genera *Indigofera* and *Isatis* but is now manufactured synthetically. Indigo plants are stiff-stemmed shrubs with pinnately compound leaves and small, reddish or reddish-yellow flowers.

The growing of indigo plants for dye was widespread, from the East Indies to the New World, although the plant originally came from India. In the sixteenth century, indigo was brought to Europe from India by Dutch, Portuguese, and English traders. During the early years of British occupation of India, natural indigo was a major export. In 1883, a German scientist, Adolf von Baeyer, elucidated its chemical structure, and indigo then was synthesized commercially.

In addition to being used as a dye, the plant has several medicinal uses. It is a stimulant, alterative (a medicine that, taken over a course of time, gradually restores health), and purgative, and also is an antiseptic and astringent. It is used particularly in the treatment of the enlargement of the liver and spleen, epilepsy, and nervous afflictions. Leaves of indigo are used in treating whooping cough, lung diseases, and kidney complaints

such as dropsy. The synthetic indigo dye is used for dyeing and printing cotton and rayon and as a pigment in paints, lacquers, and printing inks.

INDO-ARYAN LANGUAGES Indo-Aryan (IA) languages constitute one of the largest groups of related languages in the world, spoken by close to a billion speakers in India, Pakistan, Nepal, Bangladesh, Sri Lanka, and the Maldives. Due to migration, Indo-Aryan languages are also spoken in Fiji, Mauritius, Guyana, Trinidad, and South Africa, as well as in Britain, Canada, and the United States. Moreover there are inscriptions in Indo-Aryan languages (Sanskrit and Pali) not only on the Indian subcontinent proper and in Sri Lanka but in other areas, such as Uzbekistan and the nearby central Asian republics, Myanmar (Burma), Thailand, Vietnam, Malaysia, Indonesia, and China; some records from around the first or second century CE have been found in Egypt.

The 1991 census of India registers native speakers of the IA languages included in the eighth schedule of the Indian constitution as follows: Asamiya (Assamese): 12,962,721; Bangla (Bengali): 69,595,738; Gujarati: 40,335,889; Hindi: 337, 272,114; Konkani: 1,760,607; Marathi: 62,481,681; Nepali: 2,076,645; Oriya: 28,061,313; Panjabi: 23,085,063; Sanskrit: 49,773; Sindhi: 1,551,384; Urdu: 43,358,978.

Census data for Kashmiri are not available for 1991; the most recent earlier count (1981) showed 33,845 speakers. (Four million is a reasonable estimate of the number of speakers, as of the early twenty-first century.) Bangla and Urdu are also the national languages of Bangladesh and Pakistan; according to the most recent estimates of speakers, there are respectively 107 million and 6,403,228. There is no accurate full count for Nepali, which is the national language of Nepal (an estimated 6 million). In addition Sinhala (Sinhalese) is an official language of Sri Lanka, with the most recent estimate being 18.5 million speakers.

Hindi is not only a co-official language of the republic of India but also a lingua franca in much of the subcontinent and a language of instruction throughout a large part of northern India, from the borders of West

Bengal to the Gujarat border. Moreover, the total count for Hindi includes speakers of languages with substantial numbers, such as Bhojpuri (23,102,050), Magahi (10,566,842), Maithili (7,766,597; concentrated in the state of Bihar), Chattisgarhi (10,595,199; in Madhya Pradesh), and various languages of Rajasthan. In all there are approximately 877 million speakers of IA languages on the subcontinent, accounting for 78.7 percent of the population. The Dravidian, Munda, and Tibeto-Burman families account for the rest.

The precise subgrouping of modern IA languages on the subcontinent has not been settled, although there are certain fairly well-defined groups. For example languages of the east, in particular Asamiya, Bangla, and Oriya, form a group characterized by features that set it apart from Hindi and other languages of the midlands; these eastern languages lack a construction called "ergative" and do not have lexical gender distinctions for nouns.

Historical Background

The history of Indo-Aryan falls into three major stages: Old, Middle, and New (or modern) Indo-Aryan. These are divisions according to linguistic characteristics only; there is evidence that languages with characteristics of one stage of development coexisted with those of earlier stages. In earliest Old Indo-Aryan (OIA) some forms have Middle Indic characteristics.

Old Indo-Aryan is represented principally by literary documents in Sanskrit (*samskṛta*—refined, adorned, purified), which is also used in inscriptions, the earliest from the first century CE. The oldest stage is attested in texts of the four Vedas. The oldest of these is the Rgveda (possibly third millennium BCE); the other Vedas are the Samaveda, Yajurveda, and Atharvaveda. There is a large body of literature, including dramas and poetry such as those composed by the poet and dramatist Kalidasa and the epics *Ramayana* and *Mahabharata*, didactic works such as the *Pancatantra* and *Hitopadesa*, and treatises on logic, medicine, and mathematics. One of the most sophisticated grammars ever produced is the *Aṣṭādhyāyī* of *Pāṇini* (sixth–fifth centuries BCE), describing the OIA speech of his native area (the northwest subcontinent) as well as characteristics of earlier Vedic usage. Sanskrit is not restricted to Hindu works; Buddhist and Jain scholars used Sanskrit in original texts and commentaries. Even today Sanskrit remains a vehicle for original literature as well as technical works such as modern commentaries, and periodicals are published in Sanskrit. The language is officially recognized in the eighth schedule of the Indian constitution and is

used in daily newscasts on All India Radio. Moreover speakers report Sanskrit as their mother tongue in the census of India, and due to factors that are not yet clear, the number of speakers has increased in recent years: 2,212 and 6,106 for 1971 and 1981, respectively, and 49,736 for 1991.

Middle Indo-Aryan (MIA) languages are known from inscriptions, literary sources, and grammarians' descriptions. The earliest extant MIA documents are the inscriptions of Asoka (third century BCE), in various dialects according to areas of his empire, stretching from the extreme northwest (Shāhbazgarhī) to the south (modern Karnataka) and from the farthest reaches in the east (Kaliṅga, modern Orissa) to the west (Girnar, in modern Gujarat). Pali, the language of Theravada Buddhist works, also reflects an early MIA stage. Ardhamāgadhī is the language of the Jaina canon, and two other MIA varieties (Māhārāṣṭrī and Śaurasenī) also are used in Jaina works.

MIA languages and dialects other than Pali are known as *prākṛta* (a term opposed to *saṃskṛta*), which refers to a form of speech viewed as derived from an original source (*prakṛti*). Literary theoreticians of poetics and grammarians of Prakrits (generally composing in Sanskrit) usually consider the original in question to be Sanskrit. Another view, which is historically more justified, was also entertained—that the source of Prakrits was the unadorned speech of the people. These vernaculars varied according to region and were named accordingly. They were also associated with different groups in literary compositions. According to one division of literary usage, there are four major groups: Sanskrit, Prākṛit, Apabhraṃśa, and mixed.

New Indo-Aryan (NIA) languages, whose earliest documents date from approximately the twelfth century, include national languages, state languages in the republic of India, and languages spoken in restricted areas. The early stages of NIA were already vehicles for literary productions such as the Ramacaritamanasa of Tulsidas (1532–1623), in Avadhī, and modern languages have been the vehicles for literary works, including those of the great Bengali author and musician Rabindranath Tagore (1861–1941).

Indo-Aryan is most closely affiliated with the Iranian language, with which it constitutes the Indo-Iranian subgroup of Indo-European languages. OIA and Old Iranian, represented by the Zoroastrian texts of the Avesta and the Achaemenid inscriptions in Old Persian, show phonological, grammatical, and lexical affinities that demonstrate their close affiliation. There is, in addition, a small group of languages, spoken in the Hindu Kush and subsumed under the name Nuris-

tani, whose affiliation has been the object of dispute. Most informed scholars hold that these languages represent either a distinct subgroup separate from IA and Iranian or a special area in IA that remained isolated after the main group of Indo-Aryan speakers moved south into the Punjab. The majority of informed scholars also accept that the Indo-Aryans migrated into the subcontinent. There are ongoing debates, however, concerning an alternative position: that the Indo-Aryans—and indeed the Indo-Europeans—originated on the subcontinent, from where they migrated to the Iranian territory and beyond. This controversy is connected with the interpretation of the documents of the Indus Valley civilization: Those who maintain that Indo-Aryans originated on the subcontinent view this culture, which they call the Indus-Sarasvati civilization, as Indo-Aryan. Literary and archaeological evidence is not decisive, but the linguistic evidence most plausibly supports the view that Indo-Aryans migrated into the subcontinent.

Characteristics of Indo-Aryan Languages

More than for any other group of Indo-European languages, IA inscriptional and literary evidence and descriptions by grammarians offer an extraordinarily rich picture of the earliest stages of the languages and their developments down to the present.

Phonology Two characteristic features set most IA languages apart from other Indo-European languages from very earliest times. IA languages have a contrast between unaspirated and aspirated plosives, not only in the voiceless sets (*k c t t p* versus *kh ch th th ph*, the latter with a strong puff of air), but also in the voiced sets (*g j ḍ d b* versus *gh jh ḍh dh bh*).

In addition they have a contrast between dental and retroflex consonants: dental *t th ḍ dh n s* versus retroflex *ṭ ṭh ḍ ḍh ṇ ṣ*. Dental consonants are produced with the tip of the tongue pressed against the roots of the upper teeth. A retroflex stop is produced by curling the tongue back and letting the top of the tongue make contact at the area just back of the ridge behind the upper teeth (the alveolar ridge); the retroflex *ṣ* has a similar position, but the air is allowed to escape in a continuous stream. The retroflex stops originally arose through particular developments involving inherited Indo-European terms, but their frequency and distribution doubtless increased under the influence of borrowing from other languages on the subcontinent.

MIA differs from OIA in several important respects. Two of the major differences are: 1) that in the course of historical development final consonants other than *-m* were lost; and 2) that MIA ceased to allow syllables

in which a long vowel was followed by more than one consonant. Due to subsequent developments, including the borrowing of Sanskrit words, modern Indo-Aryan has reintroduced word-final consonants and syllables of the type noted.

Grammar Old Indo-Aryan morphology and syntax were of the general type seen in other early Indo-European languages such as Greek or Latin. The nominal system (i.e., pertaining to nouns, pronouns, and adjectives) was of the inflectional type represented in these languages (e.g., Skt. *vāc-am*, *vāc-ā*; *vāc-au*, *vāg-bhāam*; *vāc-as*, *vāg-bhis*, in which a stem *vāc-/vāg-* "speech, voice" is followed by different accusative and instrumental singular, dual, and plural endings), with three numbers (singular, dual, plural) and seven syntactic cases in addition to a vocative. Nouns can have any of three genders (masculine, feminine, neuter). The pronominal system, including personal pronouns and demonstrative pronouns with three degrees of reference involving distance (e.g., nominative [nom.] singular [sg.] neuter [nt.] pronoun *idam* "this," *tad* "that," *adas* "that one yonder"), also has distinctive forms. The verb system is similar to but considerably richer than that of other ancient Indo-European languages. There is a contrast among six tense forms (present, aorist, imperfect, perfect, future, distant future), with several stem types for each, and five moods (indicative, imperative, subjunctive, optative, precativ), with different singular, dual, and plural forms. In addition a contrast between active and mediopassive forms applies throughout.

This system was considerably simplified in MIA, where case forms and stem types were reduced and the dual was eliminated. The nominal inflectional system was gradually replaced by a system involving nominals with postpositions (parallel to English prepositions). Modern languages too are predominantly of this kind, though they all show remnants of true case forms, especially in pronouns. The verbal system also gradually changed. Here again, the dual was given up. Moreover, mediopassive endings were eliminated, with the result that the contrast involving these came to depend on different stems. For example in Pali *chijja-ti* ("is cut"), the stem *chijja-* is followed by the ending *ti*, but in the Sanskrit passive *chid-ya-te*, the root *chid* is followed by the suffix *-ya-* and the mediopassive ending *te*. In addition, the various past tense forms were gradually reduced to the point that a single type, the aorist, according to Western terminology, came to predominate in early MIA. Moreover the aorist could now be formed from a present stem instead of a root, as in Old Indo-Aryan (e.g., the Pali passive aorist *chijj-im-su* "were cut down" represents a type that was not per-

missible earlier: *chijj-* of the present stem is followed by the third plural aorist ending). In the equivalent permissible OIA form *achit-s-ata*, the root *chid* (with augment *a*) is followed by the sigmatic aorist affix and the mediopassive ending *ata*. Later the single predominant finite past form also was eliminated, and past participles served as verb forms. For example where OIA could have either *agamat* (3d sg. aorist) "went, has gone," or its participial equivalent *gataḥ* (nom. sg. masc.), *gatā* (nom. sg. fem.), *gatam* (nom. sg. nt.), the participial type Pali *gato* (nom. sg. masc.), Pkt. *gao* came to be the norm.

In modern Indo-Aryan this continues to be the norm. In addition, the majority of modern languages have what is called a semiergative verb system, such that past forms of transitive verbs agree in number and gender with an object, as opposed to the agreement of such forms with subjects for intransitive verbs. The examples from Gujarati given below serve to illustrate. Numbers 1 and 2 have the third-person future form *āvśe* construed with the phrases *tamāro bbāī* and *tamārī baben*, in which the masculine and feminine possessive pronoun forms *tamāro* and *tamārī* are used with *bbāī* and *baben*. In numbers 3 and 4 the perfective verb forms *āvyo* (masc. sg.) and *āvī* agree in number and gender with the phrases *tamāro bbāī* and *tamārī baben*. Numbers 5 and 6 are like 1 and 2 except for the verb *kar-* "do" instead of *āv* "come." Numbers 7 and 8, on the other hand, differ from 3 and 4: the verb *karyuṃ* (nt. sg.) agrees here with the object *śuṃ* "what" instead of with the subject, and the phrases *tamārā bbāīte* and *tamārī babene* contain agentive forms with the postposition *-e*.

- | | | | | |
|----|----------------------------------|--------------|--------------|--------------|
| 1. | <i>tamāro</i> | <i>bbāī</i> | <i>kyāre</i> | <i>āvśe</i> |
| | your | brother | when | will come |
| | "When will your brother arrive?" | | | |
| 2. | <i>tamārī</i> | <i>baben</i> | <i>kyāre</i> | <i>āvśe</i> |
| | your | sister | when | will come |
| | "When will your sister arrive?" | | | |
| 3. | <i>tamāro</i> | <i>bbāī</i> | <i>kyāre</i> | <i>āvyo</i> |
| | your | brother | when | came |
| | "When did your brother arrive?" | | | |
| 4. | <i>tamārī</i> | <i>baben</i> | <i>kyāre</i> | <i>āvī</i> |
| | your | sister | when | came |
| | "When did your sister arrive?" | | | |
| 5. | <i>tamāro</i> | <i>bbāī</i> | <i>śuṃ</i> | <i>karśe</i> |
| | your | brother | what | will do |
| | "What will your brother do?" | | | |
| 6. | <i>tamārī</i> | <i>baben</i> | <i>śuṃ</i> | <i>karśe</i> |
| | your | sister | what | will do |
| | "What will your sister do?" | | | |

7. *tamārā bhāte śum karyuṃ*
 your brother what did
 "What did your brother do?"
8. *tamārī bahene śum karyuṃ*
 your sister what did
 "What did your sister do?"

These examples also illustrate the neutral word order Subject-Object-Verb, which is prevalent in modern languages and was the norm for Indo-Aryan languages from earliest times.

Scripts

The earliest scripts used for Indo-Aryan languages are Brāhmī and Kharoṣṭhī, both used in inscriptions of Asoka, whose northwestern inscriptions are in Kharoṣṭhī. Though Kharoṣṭhī continued in use for some time, the dominant script on the subcontinent was Brāhmī, and modern Indo-Aryan scripts reflect historical developments of this script in different areas. One such script that has attained a major status is known as Devanagari. This is the officially recognized script for Hindi and is used for other Indo-Aryan languages such as Marathi and Nepali. Sanskrit texts are increasingly also written in Devanagari, although the earlier tradition of regional scripts for Sanskrit texts continues. In addition the Perso-Arabic script is used for some Indo-Aryan languages, such as Urdu, Kashmiri, and Sindhi, with diacritic modifications for representing sounds like retroflex stops, aspirates, and implosives.

INDOCHINA WAR OF 1940–1941 The Japanese threat to French Indochina (Vietnam, Laos, and Cambodia) became clear in the late 1930s, when it began its war of aggression against China in 1937 and occupied the island of Hainan in February 1939, all the more so because to the west the Japanese could

count on the support of the government of Siam. In fact, since the coup of Pibul Songgram (1897–1964), Siam had begun drawing nearer to Japan. It changed its name to Thailand, a clue to its expansionist position because "Thailand" seemed to correspond to pan-Thai ideology. Facing this double threat, the French colony organized its defense. When Europe entered into a state of war in 1939, the army in Indochina boasted ninety thousand men (fewer than fifteen thousand of them Europeans) but only mediocre equipment. It was a force to maintain colonial order, not an army formed to confront the troops of a great power such as Japan.

Japan's Demands

Since 1937 Tokyo had been criticizing Paris for permitting the resupplying of Nationalist China by the Yunnan railroad. In June 1940 Japan took advantage of France's defeat by Germany. On 19 June an ultimatum was sent to Indochina's Governor-General Georges Catroux that all transport of goods toward China must be stopped and that the Japanese must be able to verify this stoppage. Catroux yielded, in the belief that the balance of power left him no other option. The Vichy government of Philippe Pétain replaced him as leader of Indochina with Admiral Jean Decoux. The latter had to face new Japanese demands and a military convention was negotiated. Since Decoux delayed signing, the Japanese sent a new ultimatum that if the matter were not settled within three days, the Japanese would force the issue. The convention was signed on the afternoon of 22 September, just before the ultimatum. It organized and limited the stationing and passage of Japanese troops to the north of Indochina. This agreement did not prevent the Japanese Army of Canton from opening hostilities that same evening. For four days, a battle raged around the city of Lang Son. The French troops were overcome and Lang Son was taken. A landing in the region of Haiphong constituted another blow to colonial France. This time Decoux did not resist. This double humiliation did not call into question the agreement of 22 September; in theory French sovereignty over Indochina remained complete. But this Japanese eruption had struck a blow at the prestige of the colonial power.

Further Erosion of French Power

In the autumn of 1940, the French colonial government had to confront two revolts. In the north, at the Chinese border, various gangs, notably Vietnamese partisans of Prince Cuong De (1882–1951), attacked French outposts, killing isolated soldiers and local notables. Order was swiftly reestablished by the colonial

army. In the south, in Cochin China, a Communist insurrection broke out on 22 November. In Saigon the Sûreté (investigation police), forewarned, nipped the movement in the bud. But in rural areas in the west (especially in the province of My Tho), the uprising lasted several weeks. The insurgents, numbering more than ten thousand, killed about thirty Vietnamese notables. Here and there a people's regime was installed, very briefly, and land was confiscated and redistributed. The foreign legion and air corps participated in a brutal repression of the insurgents. The number of insurgents killed is not known with any certainty, but courts martial pronounced one hundred death sentences. Admiral Decoux refused to show clemency in those cases, despite a recommendation to that effect from the minister of colonies in Vichy. Added to arrests made in 1939, this repression struck a harsh blow to the PCI (Indochinese Communist Party). It was from China that its leaders, still free, continued to fight. In 1941 the border region would see the creation, around the future Ho Chi Minh (born Nguyen That Thanh, 1890–1969), of the Viet Minh, a National Front with Communist tendencies.

The End of the Conflict

The government of Thailand learned a lesson from the French difficulties. It made territorial demands, then entered into hostilities. The "war," which lasted from September 1940 to January 1941 and consisted only of skirmishes, reached its culmination in the middle of January 1941. On 16 January the French troops had to fall back when they experienced the same weaknesses they had exhibited at Lang Son, in particular the desertion of Indochinese soldiers. But on 17 January 1941, the best ships in the Thai fleet were sunk at Ko Chang, in the Gulf of Siam. Japan then imposed an armistice and its mediation. Negotiations ended in a compromise that accorded Thailand the two Lao provinces to the west of the Mekong and a third of Cambodia's territory (in short, what Siam had had to cede to Indochina at the beginning of the century). Peace was signed in Tokyo on 9 May 1941. It satisfied Thai public opinion, which had fully supported Pibul Songgram during his war against France.

The entente with Thailand was all the more useful to Japan because the latter had decided to expand toward the south rather than the north, at the expense of the colonial empires of the European powers that had been defeated or were in difficulty. The new concessions demanded by Japan in Indochina revealed this orientation. Vichy yielded. The Darlan-Kato agreements (29 July 1941) allowed Japanese troops to be stationed throughout Indochina; moreover, they in-

stituted the principle of a common defense of the colony. At the same time, Japan imposed its economic stranglehold on Indochina. Given the state of France and the situation of its forces in the Far East, this chain of concessions could have been avoided only with the intervention of some outside support, which at the time was not forthcoming.

INDO-EUROPEAN LANGUAGES The Indo-European languages form the best-known, most widely spoken, and best-explored family of undoubtedly genetically related languages. Genetically related languages are demonstrably derived from a common ancestor, a "Proto-Language," which, in the case of Indo-European, is thought to have flourished during the fourth–third millennia BCE, before it split up into the daughter languages from which scholars are able to infer its existence. No theory about the area where this language may have been spoken has become generally accepted among scholars so far, but the south Russian steppes, Anatolia, or south-central Asia are most often mentioned as likely locations.

Attempts to reconstruct key aspects of the material and spiritual culture of the people who spoke Proto-Indo-European are likewise highly controversial, but the available lexical data (reconstructed words) point to a culture that already knew the most important cultural innovations (agriculture, animal husbandry) developed during the Neolithic Period.

The discovery by the Orientalists Sir William Jones and Franz Bopp around the turn of the eighteenth and nineteenth centuries that most languages of Europe (the only exceptions being, among living languages, Finnish, Estonian, Hungarian, some other languages of Finno-Ugric stock, and isolated Basque) and some important languages of South and Southwest Asia are demonstrably related laid the foundation for the scholarly discipline of historical-comparative linguistics.

THE BEGINNING OF COMPARATIVE LINGUISTICS

In 1786 Sir William Jones delivered his third discourse, in which he laid the foundation for modern comparative linguistics by suggesting a close relationship between Sanskrit and the classical languages of Europe.

The *Sanskrit* language, whatever be its antiquity, is of wonderful structure; more perfect than the Greek, more copious than the Latin, and more exquisitely refined than either, yet bearing to both of them a stronger affinity, both in the roots of verbs and in the forms of grammar, than could possibly have been produced by accident; so strong indeed, that no philologer could examine them all three, without believing them to have sprung from some common source which, perhaps, no longer exists; there is a similar reason, though not quite so forcible, for supposing that both the Gothick and the Celtick, though blended with a very different idiom, had the same origin with the Sanskrit; and the old Persian might be added to the same family.

Source: Lord Teignmouth, ed. (1807) *The Collected Works of Sir William Jones*. Volumes I to XIII. London: John Stockdale and John Walker, vol. III: 34–35.

On the European continent, the members of the family are Greek, Latin, and the Romance languages (languages derived from Latin), which together with some extinct languages of ancient Italy (like Oscan and Umbrian) form the Italic branch of Indo-European; the Slavic (Russian, Polish, Czech, Serbo-Croat, Bulgarian, etc.) and Baltic languages (Lithuanian, Latvian, extinct Old Prussian), the combination of which into a Balto-Slavic branch has won some support; Armenian; Albanian; Germanic (Gothic, German, Dutch, English, the Scandinavian languages); Celtic (Irish, Welsh, Breton); and some extinct and mostly only fragmentarily attested languages like Thracian and Illyrian, both once spoken on the Balkan peninsula. In Asia, Indo-Iranian and the extinct Tocharian and Anatolian language families are members of Indo-European stock.

Anatolian Languages

After Hattushash, the capital of the Hittite (or *Nes-šan*, according to the self-designation of its people) empire (c. sixteenth–twelfth centuries BCE), was discovered in 1906 and excavated near the modern Boghazköy in central Anatolia, a hitherto unknown group of languages, clearly Indo-European, but not belonging to a well-known group, entered the roster

of Indo-European languages. These languages came to be known as the Anatolian branch of Indo-European, its members including the Hittite language itself, which together with Palaic was written in a variant of the cuneiform script; Luwian, which was partly written in this script as well and partly in a peculiar script, which is generally known as "Luwian Hieroglyphs" (but which is not to be confused with Egyptian Hieroglyphic writing); and Lydian and Lycian. (The latter two are fragmentarily attested languages of southwest Anatolia.)

Though Anatolian languages differ greatly, both in terms of structural makeup and material commonalities, from other Indo-European languages, their membership in the family has never been seriously in doubt. The theory that Proto-Anatolian was a sister to Proto-Indo-European rather than a daughter like all other branches has sometimes been popular (the "Indo-Hittite" theory). Whether the poorer morphological system of Anatolian or the more elaborate ones of Indo-Aryan and Greek, for example, more closely reflect the situation of the parent language continues to be debated.

Tocharian Languages

Like the Anatolian languages, Tocharian was unknown until the early twentieth century, when between

1908 and 1914 members of European and Japanese expeditions to Chinese Turkestan (modern Xinjiang Uygur) found documents written in a variety of the Indic Brāhmi script and in a hitherto unknown but clearly Indo-European language. The documents contain texts written in two dialects (or rather, separate languages), usually referred to as Tocharian A (or East Tocharian, Agnian) and B (West Tocharian, Kuchean), respectively. West Tocharian is generally viewed as more archaic.

Like Anatolian, Tocharian differs considerably from the better-known Indo-European languages, though less dramatically, and its status as one of the daughter languages of Proto-Indo-European has never been doubted. Some (especially morphological) phenomena of Tocharian, the easternmost Indo-European language, find their best parallels in the far West, in Celtic and Italic, but attempts to unite these languages into a single subgroup have been unsuccessful.

Indo-Iranian Languages

By far the largest and most important Indo-European branch on the Asian continent is the Indo-Iranian or Aryan group. The latter name is derived from the attested self-designation of the earliest-known speakers of these languages.

Indo-Iranian languages form an uncontroversial primary branch of Indo-European, which is further subdivided into the Indo-Aryan (or Indic) and the Iranian groups. A third group, consisting only of unwritten languages spoken in eastern Afghanistan, is the Nuristani group (formerly also known as the Kafiri languages), with languages such as Kati, Waigali, Ashkun, and Prasun.

Both Indo-Aryan and Iranian languages have been attested since at least the first millennium BCE. Old

Indian is represented by Vedic, the language of the sacred literature of Brahmanic religion, and Sanskrit, the highly normed and thus to a degree artificial language of classical Indian literature.

The various Prakrit variants, which began to be attested with the inscriptions of the Mauryan emperor Asoka (273–232 BCE), and Pali, the language of the classical Buddhist canon, form the corpus of Middle Indian. From the beginning of the second millennium CE, New Indian languages are attested. Not unlike the Romance languages, which are derived from what is commonly called Vulgar Latin, New Indian languages can be seen as continuations of a protolanguage that was close to, without being identical with, an attested language, Sanskrit, which continues to be used as a language of religion and learning.

The better-known New Indian languages include: the Hindi-Urdu dialect-cluster, Panjabi, and Gujarati as the central group; Nepali and other languages of the Pahari branch, Oriya, Bengali, and Assamese (eastern group); Marathi and Konkani (southern group); Sindhi and the Lahnda dialect-cluster (northwest group); and Sinhalese on Sri Lanka, which occupies a special position in the family. In the northwest of the Indian subcontinent, the Dardic languages were often grouped with the Nuristani languages, but nowadays they are classified as a special Indo-Aryan group, the most important member of which is Kashmiri.

Old Iranian is represented by Old Persian, the language of the Achaemenid royal inscriptions, and Avestan, in which the sacred writings of the Zoroastrian religion were composed. From the Middle Iranian period onward, the Iranian family is clearly subdivided into western and eastern branches. Western Middle Iranian languages are Middle Persian and Parthian; eastern Middle Iranian languages are Bactrian, Khotanese, Sogdian, and Chorasmian. The most important modern languages of the Iranian family are (West Iranian) Persian (Farsi, Dari, and Tajiki), Tati, Baluchi, Zaza, and numerous unwritten languages spoken in Iran, which are often erroneously classified as Persian dialects, such as Mazanderani, Gilaki, Sangesari, and many others. Modern East Iranian languages are Pashto, Ossetic, and numerous unwritten languages of the Pamir region (Tajikistan), such as Wakhi, Bartangi, Sarykoli, and many others.

INDO-GANGETIC PLAIN The Indo-Gangetic Plain stretches from the Arabian Sea in the west in a broad crescent to Bangladesh, a distance of nearly 3000 kilometers, with a huge river delta at each end. The drainage basin of the Indus River covers 960,000 square kilometers, while that of the Ganges and the Brahmaputra Rivers together embraces another 1,730,000 square kilometers. Excluding the hilly borders of these catchments, one is still left with an immense alluvial plain in excess of two million sq. km., watered by numerous large rivers, and consequently of the greatest agricultural and historical importance to India, Pakistan, and Bangladesh. This crescent-shaped plain was created geologically by the in-filling of a trough that lay between the ancient, northward-drifting Gondwana block and the recent uplifting Himalayan Ranges. This alluvial fill may be several thousands of meters deep. Today the Ganges carries some 900,000 tons and the Indus some 1 million tons of suspended matter daily, and the Brahmaputra yet more. As a consequence, each river terminates in a broad delta.

Historically, the plain has been the regular entry corridor for invaders and migrants pushing through the passes from Afghanistan to the northwest. Nearly all of the most defining and dramatic events in South Asian history have transpired primarily on this plain, from the growth and decline of the Indus Civilization, to the supposed "Aryan invasion," to the birth and development of early Buddhism, to the battle on the Plain of Kurukshetra that is commemorated in the *Mahabharata*, to the brilliant Mughal empire, to the Indian revolt of 1857, to the bloody splitting of Pakistan from India, and of Bangladesh from Pakistan.

INDONESIA—PROFILE (2001 est. pop. 228.4 million). The Republic of Indonesia, with an area of 1,919,440 square kilometers, is the fourth most populous country of the world. The former Dutch colony had an advanced civilization and connections with the outside world more than two thousand years ago. The idea of the Indonesian archipelago as an entity became pronounced after the area came under the control of the Dutch East Indies in the late seventeenth century. In the twenty-first century, a common culture unifies the far-flung Indonesian archipelago.

Geography

Situated strategically between the continents of Asia and Australia, the archipelago of Indonesia is composed of approximately 17,500 islands, of which about 13,000 are inhabited, and is bounded by the South China Sea, the Celebes Sea, and the Pacific Ocean to the north and the Indian Ocean in the south. About 85 percent of the world's east-west commercial shipping passes through Indonesian waters. The country's principal islands are Java, Sumatra, Kalimantan (South Borneo), Bali, Sulawesi (Celebes), Maluku (Moluccas), and West Papua (Irian Jaya). The archipelago experiences frequent earthquakes, and it has about one hundred volcanoes. The country has the world's longest coastline (80,000 kilometers). Indonesia has a tropical climate, with temperatures hovering between 19° and 32°C, depending on the area. Some 70 percent of the country is covered by tropical rain forest, and the landscape is covered with mountain peaks, valleys, and a network of rivers. Zoologically, the country forms a connecting link between Asian and Australian faunal species. Jakarta is the capital; the other notable cities are Surabaya, Medan, and Bandung.

People

Indonesia is a country having diverse ethnic groups and languages. Migrations in different periods of history have resulted in a complex ethnic structure. The primary ethnic group is Javanese (45 percent); the others are Sundanese, 14 percent; Madurese, 7.5 percent; coastal Malays, 7.5 percent; and others, 26 percent. The Chinese constitute the majority of the non-indigenous population. The predominant religion is Islam (90 percent), and Christians, Hindus, and Buddhists constitute about 10, 2, and 1 percent of the population respectively. The island of Bali has the largest concentration of Hindus. Centuries-old indigenous religious beliefs still are prevalent.

Bahasa Indonesia, a form of Malay, is the official language. English replaced Dutch as the main Western language in the 1950s. Local languages, such as

INDONESIA

Country name: Republic of Indonesia
Area: 1,919,440 sq km
Population: 228,437,870 (July 2001 est.)
Population growth rate: 1.6% (2001 est.)
Birth rate: 22.26 births/1,000 population (2001 est.)
Death rate: 6.3 deaths/1,000 population (2001 est.)
Net migration rate: 0 migrant(s)/1,000 population (2001 est.)
Sex ratio: 1 male(s)/female (2001 est.)
Infant mortality rate: 40.91 deaths/1,000 live births (2001 est.)
Life expectancy at birth—total population: 68.27 years, male: 65.9 years, female: 70.75 years (2001 est.)
Major religion: Muslim
Major languages: Bahasa Indonesia (official, modified form of Malay), English, Dutch, local dialects, the most widely spoken of which is Javanese
Literacy—total population: 83.8%; male: 89.6%, female: 78% (1995 est.)
Government type: republic
Capital: Jakarta
Administrative divisions: 27 provinces, 2 special regions, and 1 special capital city district
Independence: 17 August 1945 (proclaimed independence; on 27 December 1949, Indonesia became legally independent from the Netherlands)
National holiday: Independence Day, 17 August (1945)
Suffrage: 17 years of age; universal; and married persons regardless of age
GDP—real growth rate: 4.8% (2000 est.)
GDP—per capita (purchasing power parity): \$2,900 (2000 est.)
Population below poverty line: 20% (1998)
Exports: \$64.7 billion (f.o.b., 2000 est.)
Imports: \$40.4 billion (c.i.f., 2000 est.)
Currency: Indonesian rupiah (IDR)

Javanese, are also spoken. The literacy rate, currently 83.8 percent, is high. The population growth rate is 1.63 percent. Java and Madura, which have 7 percent of country's area, contain 65 percent of the population.

History

The remains of ten-thousand-year-old *Homo sapiens* have been discovered at Wajak in East Java. Powerful kingdoms in Java, Sumatra, and Kalimantan arose from the first century CE. The greatest of the ancient Indonesian empires was the fourteenth-century Majapahit, which was based on eastern Java. Islam, which was brought by Indian traders in the late thirteenth century, became firmly entrenched in northeast Java

and north Sumatra. Indonesia fell under Dutch control in the late seventeenth century. Indonesian nationalism grew through various organizations like the Budi Utomo, Sarekat Islam, the Communist Party of Indonesia, and the Indonesian Nationalist Party. The country's notable twentieth-century leaders have included Sukarno (1901–1970), Mohammad Hatta (1902–1980), and Sutan Sjahrir (1909–1966). On 17 August 1945 the Indonesian Republic was proclaimed. It achieved independence on 27 December 1949, after winning its struggle against the Dutch. Sukarno was elected president, and Hatta became the premier. Dislocation of the economy; the revolt for autonomy by Aceh, Maluku, and North Sulawesi; and the setting

up of a rival rebel government, the Pemerintah Revolusioner Republik Indonesia (PRRI), led to the period of Guided Democracy after 1959. Suharto (b. 1921), who succeeded Sukarno as president, instituted his New Order after an abortive Communist coup in 1965. Indonesia became a member of the Association of Southeast Asian Nations (ASEAN), which was formed in 1967. Papua was recognized as Indonesian territory in 1963, and East Timor, a former Portuguese colony, was integrated into Indonesia in May 1976. In October 1997 an economic crisis paralyzed the country. Riots became widespread. Amid charges of corruption, Suharto stepped down in May 1998, and his vice president, Bacharuddin Jusuf Habibie (b. 1936), assumed the presidency. Discontent in East Timor, which had never reconciled to its incorporation into Indonesia, erupted into bitter fighting. After much bloodshed, it finally gained independence following a referendum on 30 August 1999. Calls for independence also rose in other provinces, particularly Aceh, Riau, Maluku, East Kalimantan, and Papua. Ab-

durrahman Wahid, better known as Gus Dur, became Indonesia's president in October 1999.

Economy

Indonesia is rich in natural resources, including vast supplies of rubber, timber, oil, and tin. Agriculture accounts for almost 21 percent of the gross domestic product (GDP) and more than 45 percent of the labor force. Crops include rice, coffee, maize, palm oil, and pepper. Industry and services make up 35 and 44 percent of GDP respectively. Liquefied natural gas, petroleum, rubber, tin, timber, and textiles are major foreign-exchange earners. Natural gas and oil are a major source of export revenue. The deposits are mainly located in Sumatra, and U.S. companies have heavily invested in these. The major imports are foodstuffs, chemicals, and machinery and equipment. Japan is Indonesia's largest trading partner.

Indonesia had one of world's fastest growing economies, with an average growth rate of 6 to 8 percent

The Welcome Statue at one of Jakarta's main roundabouts is used to display a political flag during the June 1999 election campaign. (AFP/CORBIS)

annually, until the Asian financial crisis hit the country in 1997, and its currency, the rupiah, lost 80 percent of its value. Inflation reached 77 percent in 1998. Locally produced products were hard hit. Unemployment rose to 20 million people, GDP contracted by an estimated 13.7 percent, and external debt was \$140 billion. However, the Indonesian economy improved in 1999. A tight monetary policy reduced inflation to 2 percent in 1999. The government abolished major import monopolies, expanded the privatization program, and liberalized market access. Modest economic recovery began with stabilization of exchange and interest rates. The decision of some ASEAN members in February 2001 to set up a free-trade zone in the coming year will help Indonesia's economy.

Culture

Indonesia's culture is an expression of the creative genius of a people nurtured by indigenous traditions enhanced by Hindu, Buddhist, and Islamic influences. Knowledge of navigation, wet-rice cultivation, puppet shadow theater (*wayang*), the gamelan (an orchestra

composed mainly of gongs, xylophones, and percussive metal bars), batik textile dyeing, and megalithic building traditions give evidence of a developed material culture that predates contact with Indian elements in the first century CE. The greatest representative of Javanese art and architecture is the famous Buddhist stupa of Borobudur, built c. 778–850 CE. The *Ramayana*, the great Indian epic poem, has influenced the social life of the people. Islam in Indonesia was of liberal hue, with an emphasis on pantheism and a sense of divine presence in all creation. The wood and stone carvings of Indonesia, which take their themes from Indian mythology and indigenous traditions, are highly regarded, as are Indonesian metalwork, basketry, pottery, and bead making. *Pantun*, the famous poem form of interlinking four-line stanzas, are popular in some villages. Gamelan music performs an all-pervasive role in Balinese traditions: it is played at temple offerings, when immersing the ash of a cremated body in river or seawater, when driving evil spirits away, and for street dances, bull races, and so forth. The *suling*, a bamboo flute, is very common. Such nontraditional music styles as *kroncong*, which originated in the eastern part of the country and shows Portuguese influence, and *dangdut*, of Indian influence, possess Indonesian elements. Indonesian dances take their themes from Hindu mythologies and indigenous Pandji plays. The Djanger and Legong dances from Bali, Serimpi and Bedoyo from Java, the candle-and-umbrella dance of West Sumatra, and the handkerchief dance of Ambon are famous throughout the archipelago.

Looking Ahead

The horrific violence in Maluku between Christians and Muslims, the clamor for secession by Papua and Aceh, the exodus of Muslim refugees from East Timor, and widespread riots throughout the archipelago combine to continue to threaten the stability of Indonesia. The increasing role of the military is another matter of concern, and there is a growing need for separation of the political and military agendas. For political stability, it is advisable that the ruling class look to the needs of the people and adopt some measures of decentralization for the provinces. The inherent wealth of the nation and its huge market potential should take Indonesia toward a better future.

INDONESIA—ECONOMIC SYSTEM The Indonesian economy is based on agricultural production and extraction of natural resources, especially oil, natural gas, timber, and fish. State-sponsored attempts to promote industrialization had meager results until the 1980s and received a major setback with the Asian economic crisis of 1997. Although tourism has developed as an important service industry, Indonesia remains otherwise insignificant as an exporter of services.

From Early Times to Independence

In precolonial times, the economy of the Indonesian archipelago was characterized by subsistence agriculture in most regions; the production of rice for export in areas with fertile volcanic soil and high rainfall (notably on Java, Bali, and parts of Sumatra); the cultivation of high-value spices (especially pepper, cloves, nutmeg, and cinnamon) for export to China, India, the Middle East, and Europe; and the collection of forest products (camphor, benzoin, gums, bird feathers, and fragrant woods), also for export. Especially on the coasts of the Strait of Melaka (Malacca) and on the northern coast of Java (known as the Pasisir), many cities developed as trading entrepôts, pro-

viding sophisticated services to merchants. Initially, trade within the archipelago and between the archipelago and China and India seems to have been mainly in the hands of indigenous merchants, but from about the thirteenth century, foreign traders, including Indians, Arabs, and Chinese, played an increasingly prominent role.

The European presence in the archipelago, beginning with the Portuguese capture of Melaka in 1511, appears to have inhibited indigenous trade. The Portuguese were effective tax gatherers, while the Dutch East Indies Company (VOC) imposed a monopoly on trade in a wide range of lucrative commodities. These restrictions increasingly choked the economic base of the entrepôt cities, shifting the balance of power within indigenous societies away from merchants and toward those controlling agriculture.

During the seventeenth century, the VOC generally left production in the hands of indigenous growers. During the eighteenth century, however, Dutch interests shifted from high-value, low-volume spices to higher-volume, lower-priced commodities such as sugar, coffee, and indigo. The Dutch also took an increasingly interventionist role in production and began to bind indigenous labor to the land, sometimes in explicitly feudal arrangements, but more often by using the traditional authority of indigenous elites to mobilize peasant farmers for work on behalf of colonial interests. Indonesians had traditionally supplied

Terraced fields like these rice fields in Bali are common in Indonesia as they make better use of the land and conserve irrigation water. (WOLFGANG KAEHLER/CORBIS)

labor services to their rulers, and this tradition was extended to serve Dutch interests. Although there was much discussion of the possible advantage of using economic incentives rather than coercion and traditional authority to mobilize labor for plantation work, duress remained a key feature of labor control throughout the colonial period. Fees collected for licenses (generally granted to Chinese entrepreneurs) to manage toll roads, gambling establishments, and the sale of opium were major sources of state income.

From the late nineteenth century, many observers identified a sharp threefold division in the colonial economy. Large European firms, which developed rapidly after the colonial government introduced a policy of economic liberalization in 1870, dominated much of the modern, capital-intensive, export-oriented sectors of the economy. Chinese firms dominated retail trade and medium-level commerce. The indigenous peoples of the archipelago occupied only the margins of the commercial economy, being engaged mainly in agriculture and state employment. Colonial economists, notably J. H. Boeke (1884–1944), attributed this stratification primarily to cultural factors, arguing that the traditional culture of village life emphasized community obligations and discouraged capital accumulation and individual advancement.

From the late nineteenth century, population growth in Java seems to have led to a declining standard of living for most Javanese, because limited resources on the island were spread ever more thinly among its people. The colonial Ethical Policy, announced in 1901, involved an attempt to overcome this problem by agricultural intensification, emigration from the island (later called transmigration), and limited industrialization. These efforts, however, had only meager results and were largely ended by the Great Depression. The decline of infrastructure during the 1930s was exacerbated during the 1940s by the Japanese occupation (1942–1945) and the war of independence (1945–1949).

Independence

The terms of Indonesia's eventual settlement with the Dutch in 1949 left the position of Western firms intact (insofar as they had physically survived the years of warfare). Indonesia's economy in the 1950s, therefore, resembled that of the colonial era in its pronounced racial stratification and its emphasis on the export of plantation products. Except during the brief Korean War boom, however, the economy faced sluggish international commodity prices and a much-reduced political capacity to obtain cheap, partly coerced labor. Strong arguments were heard within

Indonesia that political independence had failed to end the economic dimension of colonialism and that action should be taken to restrict or dispossess Western firms. Those firms responded by steadily decapitalizing their investments in Indonesia.

Successive governments attempted to strengthen the indigenous presence in the commercial economy by awarding licenses and permits to promising indigenous entrepreneurs and by restricting the access of Chinese business owners to certain sectors of the economy. These measures largely failed to stimulate an indigenous entrepreneurial class; rather, they encouraged rent seeking on the basis of political connections. From 1950, governments also sought to establish a significant state sector in the economy, nationalizing the railways and the Java Bank, the semi-private bank of circulation in the colonial era. State enterprises were also established in shipping, air transport, and industry (textiles, cement, hardboard, automobiles, and glass). A large number of government bodies, including military units and civilian departments, maintained semiformal "economic organizations" to supplement the dwindling allocations they received from the state budget. In December 1957, all Dutch enterprises in Indonesia were nationalized, most of them being placed under military management. Many of these enterprises languished because of corruption and inexperienced management; those that succeeded did so mostly because their political or military connections enabled them to function as rent collectors rather than because they showed true entrepreneurial skill.

The failure of independence to stimulate extensive industrialization in Java exacerbated tension between Java and the so-called Outer Islands, especially after the 1955 elections gave political power in Jakarta to Java-based parties. The 1953–1955 and 1956–1957 governments of Ali Sastroamidjojo (1903–1975) imposed exchange rates that favored importers (mainly in Java) and penalized exporters (many of them in Sumatra, Sulawesi, and Kalimantan). These economic tensions contributed to regional rebellions in 1956–1959.

The 1957–1965 Guided Democracy of President Sukarno (1901–1970) included a plan for rapid industrialization based on state planning and investment, but most of the planning had no grounding in economic reality, while the economy, impoverished and plagued by corruption, could not deliver the necessary tax revenues. By 1965, the central government was unable to produce a state budget, and, with recurrent expenditure being funded by printing money, serious inflation began. The infrastructure was in exceptionally poor condition, and both imports and exports stag-

nated, leading to hardship, including occasional starvation in some regions.

The New Order and After

The 1967–1998 New Order government of President Suharto (b. 1921) achieved a remarkable rehabilitation of the economy. Per capita income, which had been less than \$50 in 1966, reached \$1,155 in 1996, and Indonesia was increasingly identified as an imminent recruit to the ranks of the Asian newly industrializing countries.

The funding for this rehabilitation came from a massive exploitation of the country's (largely nonrenewable) natural resources, chiefly oil, natural gas, and timber, as well as fish, coal, bauxite, gold, copper, and other minerals. This funding through resource exploitation was augmented by extensive marshaling of foreign aid, coordinated by the Intergovernmental Group on Indonesia until 1992 and thereafter by the Consultative Group for Indonesia. These sources of income enabled the government to invest heavily in infrastructure and to provide capital for state-owned industrial enterprises.

Although New Order Indonesia abandoned the officially tight economic planning of Guided Democracy, government intervention in the economy remained extensive. Management of the economy was principally in the hands of the National Development Planning Agency, whose leading figures were sometimes referred to as the "Berkeley mafia," because many of them had been trained at the University of California at Berkeley. State-owned banks dominated the financial sector.

Under Indonesia's constitution, all mineral resources belong to the state. In 1960, all concessions to foreign firms were abolished, and the exploitation of minerals was placed in the hands of state enterprises. A new foreign investment law in 1967 reopened the sector to foreign firms, and the Freeport corporation (now Freeport McMoRan) obtained especially favorable conditions for its massive gold and copper mine in western New Guinea (then called West Irian). Foreign investment in oil was permitted only on a joint-venture basis with the state oil corporation, Pertamina, though Pertamina's contribution was often no more than arranging official permits and taking a share of the production or the profits. During the 1970s, exports of liquefied natural gas took on major importance alongside oil exports. Indonesia's main reserves of oil and gas are located offshore in the South China Sea and near the Bird's Head peninsula of New Guinea, but important reserves also exist in Sumatra, Kalimantan, and the Java Sea.

Extensive exploitation of Indonesia's tropical forests began in 1968, and timber soon ranked as Indonesia's third-largest export after oil and gas. Whereas oil and gas exploitation remained under relatively close state supervision, timber licenses were widely allocated as patronage among individuals and groups close to the government. Sound regulations to ensure that the forests would be cut in keeping with a plan of sustainability were put in place, but until the 1990s, these regulations were virtually never enforced and were commonly ignored. During the 1980s, domestic and international environmentalists increasingly expressed concern over the irresponsible logging practices, and some attempts were made to punish firms that violated the regulations, but the firms targeted in this way were generally those with weak political connections. Fishing in Indonesia is also conducted largely as a mining operation with no attention to sustainability or maintenance of stocks. The large-scale granting of concessions to foreign tuna and shrimp fishing fleets began in 1987.

Active promotion of industry began in 1979 with the third five-year plan. The government played a major role in this process, both through state-owned enterprises and through joint ventures with private investors. Initially, such enterprises were commonly protected by tariffs and exclusive license systems, which tended to promote inefficiency and increase costs for other domestic producers. During the 1980s, increasing emphasis was placed on adding value to Indonesia's traditional exports. In 1985, the government banned the export of raw logs to promote local processing, especially the production of plywood. Processing plants for crumb rubber, rattan, palm oil, and petrochemicals were also established, as was a large aluminum smelter on the Asahan River in North Sumatra.

FIVE LARGEST COMPANIES IN INDONESIA

According to *Asia Week* the five largest companies in Indonesia are as follows:

Company	Sector	Sales (\$ millions)	Rank in Asia
Pertamina	Oil Exploration, Refining	19,488.5	50
Astra International	Car Assembly, Trading	3,372.6	399
Per. Listrik Negara	Power Generation	2,678.4	498
Gudang Garam	Clove Cigarettes	1,776.9	743
Indah Kiat Pulp & Paper	Paper, Pulp	1,545.5	846

Source: "The Asia Week 1000." (2001) *Asia Week* (9 November): 113.

Coal production in Indonesia dramatically expanded in the 1980s, with Indonesia becoming the world's third-largest exporter. Gold production also expanded in this period, but reliable statistics on production levels are unavailable because of extensive illegal mining. Substantial volumes of tin and bauxite are also exported.

The importance of agriculture in the Indonesian economy declined steadily under the New Order. Whereas agricultural products accounted for 70 percent of total export value in 1969, that percentage had declined to 9 percent by 1983. Before the 1997 Asian crisis, agriculture as a whole employed around 40 percent of the Indonesian workforce in 1996, whereas in 1976 it had employed 61 percent.

Government intervention played a major role in transforming rice production. Rice is the major food crop and the preferred staple food of most Indonesians. It is cultivated mostly on small farms, but complex social arrangements that used to give most members of each community at least some share in the annual production have often given way to simple commercial arrangements for planting, weeding, harvesting, threshing, and milling. In the early 1960s, much of Indonesia's scarce foreign exchange went to pay for imported rice, but from the 1970s, a massive investment in irrigation, fertilizers, high-yielding rice varieties, pesticides, and agricultural advice (the so-

called Green Revolution) led to increased production, so that Indonesia achieved self-sufficiency in rice in 1984. From the late 1980s, a sophisticated Integrated Pest Management Program dramatically reduced some of the adverse ecological consequences of the early Green Revolution.

Other food crops are generally known by the name *palawija* and include maize, cassava, soybeans, and sweet potatoes. Indonesia's main cash crops are rubber, palm oil, copra, tea, coffee, sugar, cocoa, and tobacco, all of which are produced both on large-scale plantations and by smallholders, as well as teak, which is produced in long-established government-owned plantations in Java. During and after colonial times, smallholders often competed unequally with the better-connected plantations for access to processing and export facilities. In the 1980s, however, the government delivered increased assistance to smallholders, comparable to the Green Revolution facilities given to rice producers, and established a "nucleus estate and smallholder" program to give the smallholders access to plantation facilities.

From the early 1980s, tourism developed as a major industry. International tourist arrivals rose from 366,000 in 1975 to 5 million in 1996.

Controversy has repeatedly emerged over the state sponsorship of strategic industries, including nuclear power and the aerospace industry, both backed by Suharto's technology minister and eventual successor B. J. Habibie (b. 1936). These initiatives were widely criticized as wasteful prestige projects rather than as genuine contributions to industrial development. Also criticized was President Suharto's decision to grant one of his sons a license to produce a national car, which was eventually to have a local content of more than 60 percent. Although the project was seen as useful in principle, there was widespread indignation over the fact that the project received tax and tariff concessions while importing the cars fully assembled from South Korea. Suharto's children and many other relatives were involved in commercial ventures in which their connections with the government, rather than any entrepreneurial flair, appeared to be the main factor in their success.

Successive governments in Indonesia have stressed the importance of cooperatives as a just and effective form of commercial activity for local communities, but the economic performance of cooperatives has generally been disappointing.

Throughout the New Order period, licenses, patronage, and outright corruption were extensively used to channel profits into the hands of figures in and close

to the government. The fact that many of these figures were Chinese Indonesian business owners was a constant source of domestic criticism of the economic system. Much of the capital accumulated in this way, however, was productively invested in new industrial enterprises, creating a business sector that increasingly had the capacity to prosper without close government support or regulation. Nevertheless, domestic pressure and pressure from international donor countries and agencies led Indonesia to embark on a sustained deregulation of the economy from the mid-1980s. Deregulation led to strong growth in the manufacturing sector, but it contributed to the emergence of an overheated bubble economy that collapsed spectacularly in the Asian financial crisis of 1997.

The financial crisis caused serious damage to Indonesia's industrial sector, which was starved of credit and equity funds for several months, leading thousands of businesses to shut their doors and leaving hundreds of thousands of workers unemployed. Under International Monetary Fund instruction, the Habibie government established the Indonesian Bank Restructuring Agency in January 1998 to reorganize the banking sector and close down banks that were not viable. Lack of political will, however, meant that relatively little was achieved in restructuring. For the most part, economists have argued that the economic strategies of the Suharto era were sound and that the economic crisis was an acute response to investor disquiet over corruption and nepotism in ruling circles.

INDONESIA—EDUCATION SYSTEM

The Indonesian educational system reflects influences from Hindu, Buddhist, Islamic, and Western educational systems introduced by foreign rulers and settlers. Hindu and Buddhist educators taught royal family members in their palaces and temples, particularly between 100 and 1500 CE. The Islamic system of education was first introduced in courts, mosques, and bazaars between the seventh and the thirteenth centuries. In the sixteenth century, European traders and colonialists—particularly the Portuguese, Spanish, and Dutch—established themselves in the Indonesian archipelago and introduced their secular Western educational systems. While some signs of all these influences exist today, the Islamic and Western systems are most strongly evident.

School Systems

Traditional Islamic schools are referred to as *pesantren* in Java, *pondok* in Sumatra, *pondok-pesantren* in Sulawesi, and *dayah* in Aceh. These are managed predominantly by Muslim philanthropists or organizations. Religious students (*santri*) study classical religious books (*kitab kuning*), written mainly in Arabic by Muslim scholars. A guru (*kyai*) heads the institution and guides the teachers in these boarding schools. *Pesantren* recruit graduates from primary schools (both public and private schools run under Islamic or secular systems). Over a million students are enrolled in approximately six thousand *pesantren* operating across the country. While most *pesantren* provide secondary education only, some also offer a B.A. program as well as continuing education for adults. The teaching of Islamic sciences, Arabic, and theology in *pesantren* is done in the vernacular. Other subjects taught include English, the Indonesian language, and the Pancasila ("five principles"), a concept developed by Sukarno and others in 1945, which was adopted as the basis of the national ideology. (The five principles are belief in one God, humanitarianism, Indonesian nationalism, democracy based on deliberation, and social justice.) Most *pesantren* are affiliated with the Nahdlatul Ulama, a traditionalist socioreligious organization. The Muhammadiyah, another socioreligious organization, also has set up *pesantren*, which use more modern teaching methods than the Nahdlatul Ulama.

The modern system of education essentially is drawn from the Dutch educational system. While in power from the seventeenth to the mid twentieth century, the Dutch set up three types of schools patterned after those in the Netherlands. The Hollandsche Europeische School (HES) trained primarily European and Eurasian students, while the Hollandsche Chinese

School (HCS) system taught ethnic Chinese and other Far East Asian pupils. The third system, the *Hollandsche Indische School* (HIS), set up in the mid-nineteenth century, enrolled students from indigenous communities.

Although this system formed the basis of modern education in Indonesia, it fostered discrimination and racism in the student population, and created a breeding ground for the forces of nationalism. After Indonesia gained sovereignty in 1949, the number of educational institutions from elementary to postgraduate level increased considerably.

Most schools offer secular studies, a step encouraged by the government as a means of providing a balanced education, raising the literacy level and, hence, promoting economic development in general.

Education Units

Education is divided into two units—learning and teaching activities—and two paths—within school and out of school. In-school education is conducted in a traditional school environment through teaching and learning activities that are gradual, hierarchical, and continuous. Out-of-school education is provided outside of the formal schooling system through teaching and learning activities that are not necessarily hierarchical and continuous. Family education is regarded as an important part of the out-of-school system. Its most crucial role is generally recognized as instilling socioreligious, moral, and cultural values. The two paths both offer general, vocational, and service-related education.

Preschooling is aimed at stimulating the mental, intellectual, spiritual, and physical development of children outside the home environment. It encourages early behavioral development and discipline, through creative, innovative, and stimulating games and playtime. Play groups are available for toddlers three years old and younger. Four- to six-year-olds attend kindergarten, where the stress is on intellectual and creative stimulation as well as on the teaching of language, religion, and social skills.

Primary and junior secondary schools are grouped by the Ministry of National Education (formerly the Minister of Education and Culture) under its compulsory basic education policy. Under this policy, general education is provided for nine years (through the third year of junior high school), divided into six years for primary school and three years for lower secondary school. The curriculum covers at least thirteen subjects: Pancasila education, religious education, citizenship education, Indonesian language, reading and

writing, mathematics, introduction to science and technology, geography, national and general history, handicrafts and arts, physical education and health, drawing, and English language.

Primary school is aimed at teaching reading, writing, and arithmetic, and prepares students for lower secondary school. The latter aims at character development, building up social consciousness, civic responsibilities, and national awareness, as well as preparation for senior high school. Special schools also have been established at both levels for handicapped students. An Islamic basic education system, run parallel to this secular system, is managed by the Ministry of Religious Affairs.

Both systems (Islamic and secular) provide general secondary training (senior secondary levels) in two programs: academic and professional (vocational). The academic program includes the following subjects: Pancasila and education citizenship, religious education, Indonesian language and literature, national and general history, English language, physical and health education, mathematics, natural sciences, social sciences, and arts education.

Vocational secondary schools implement three-year programs according to the perceived present and future demands of the employment market. Programs include agriculture and forestry, industrial technology, business and management, community welfare, tourism, and arts and handicrafts.

Higher education is provided by public universities run by the government and by private colleges and institutes. Academies and polytechnic schools specialize in applied sciences, while colleges provide academic and professional training in one particular discipline. The Department of Religious Affairs also operates colleges in Islamic Studies. Institutes provide similar academic and professional programs as well but in a variety of related disciplines. The network of fourteen Institutes of Islamic Studies, for example, is managed by the Minister of Religious Affairs. Universities provide academic and/or professional education in diverse disciplines, including natural and social sciences and the arts. In 1994, the minister of national education established five consortia representing major universities to streamline the teaching of science and technology, social sciences, agriculture, medicine, and education.

Late-Twentieth-Century Changes in Education

The educational system in Indonesia is centralized and, while this facilitates unity and uniformity under the center (Java), it also has raised fears of contributing to the demise of local languages, customs, and values.

The renaming of the Ministry of Education and Culture to Ministry of National Education in 1999 represented a move to give greater autonomy to the regions in choice of educational systems. Local communities received a say in the running of the educational system. It was hoped this would revitalize locally managed institutions and, ultimately, contribute to overall development. How successful the country will be in implementing this ideal is, however, dependent on the participation of the local population and the successful application of the autonomy policy initiated by the government in January 2001.

INDONESIA—HISTORY Once the seat of several Indianized Hindu and Buddhist empires, Indonesia, at the beginning of the twenty-first century, is the largest Muslim country in the world. Between the sixteenth and the first half of the twentieth centuries, Indonesia was under Dutch colonial control. Independence from the Netherlands in 1949 brought about a fragile democratic system under President Sukarno (1901–1970). His government having failed to meet the challenges of governance, the country faced a long period of authoritarian rule until succeeded by a democratic government in 1998. This democratic system is still fragile, and the military continue to exercise significant influence in the political affairs of the country. Nevertheless, as a founding member of the Association of Southeast Asia Nations (ASEAN), Indonesia plays an important role in the region. The country's situation on the trade route between Australia and Europe makes Indonesia a strategically important country.

Indonesia, the largest archipelago in the world, is a collection of more than 13,500 islands. The most populous of these are Java, Sumatra, Kalimantan (on the island of Borneo), Irian Jaya (western New Guinea), and Sulawesi. According to anthropologists, Java was home to one of the earliest hominids, *Pithecanthropus erectus* or Java man. Two major population groups in Indonesia are the Proto or Older Malays and the Younger or Deutero Malays.

Foreign Influences

For centuries, wet-rice cultivation provided the subsistence basis for the people of the islands. Then, after the second century CE, trade became an equally important factor in socioeconomic, political, religious, and cultural development. The Indonesians traded with East, South, and West Asia. From early times, India, not China, had the most cultural impact on the Indonesians. As a result, Indian Hinduism and later Buddhism found a fertile soil in Indonesia. During the fifteenth and sixteenth centuries, most Indonesians embraced Islam, despite the arrival of the Portuguese, who attempted to convert the islanders to Christianity in the sixteenth century. The Dutch, who followed the Portuguese in the seventeenth century, were probably responsible for the small but significant minority of Christians.

Early History

In the fifth century, the disintegration of the Fulan, the first historic empire in Southeast Asia, led to the establishment of many smaller successor states in the region, such as Srivijaya on the Palembang River on Sumatra. Contact with India, which was lost when Fulan disintegrated, was renewed. The increased volume of Indian trade was one reason for Srivijaya's growth into a thriving empire during the seventh century.

The empire grew to include almost all of the Malay Peninsula and dominated both the Malacca and Sunda Straits. Srivijaya remained a major force in the region for the next six centuries. An Indianized Buddhist state, Srivijaya lavishly patronized Buddhism.

In central Java, another Buddhist state, Mataram, arose in the late seventh century. Devoted to Mahayana Buddhism, Mataram was ruled by the already established Sailendra dynasty (flourished eighth–ninth centuries). Sanjaya (flourished c. 730), the first Sailendra ruler, had been a Saivite, a devotee of the Hindu god Siva. By the middle of the eighth century, the Sailendras had become Buddhists. They built the world-famous Borobudur Buddhist monuments in central Java. In 832, when the last adult member of the Sailendra dynasty, a woman, married the ruler of a rival state, the Sailendra line ended. The queen's younger brother fled to Srivijaya, where he became the ruler.

During the eleventh century, Srivijayan commercial rivalry with the eastern Java state of Mataram and the Chola rulers of southern India became intense. After establishing good relations with the Cholas, Srivijaya turned against Mataram. Between 1006 and 1007, Srivijaya attacked and burned the Mataram capital and destroyed its fleet. Meanwhile, Srivijaya's relations

KEY EVENTS IN INDONESIA'S HISTORY

- 5th century CE** With the destruction of the Fulan empire in Southeast Asia, the Srivijaya state on Sumatra emerges as a regional power.
- 7th century** The Mataram state emerges as a regional power in central Java.
- 13th century** The Majapahit rulers in eastern Java create a vast empire in the western islands which lasts until the arrival of the Portuguese in the sixteenth century.
- 1511** The Portuguese capture Melaka.
- 1641** The Dutch take Melaka from the Portuguese and begin to extend their rule.
- 1795** The British become the dominant European power in the region and take some Dutch territory.
- 1799** The Dutch East India Company is disbanded and the Netherlands assume direct responsibility for the Dutch East Indies.
- 1830** The Dutch are reinstated in Java.
- 1920s–1930s** Indonesian nationalist organizations are repressed by the Dutch.
- 1942–1945** period of Japanese occupation.
- 1945** Indonesia declares independence with Sukarno its first leader.
- 1949** The Dutch grant Indonesia independence.
- 1955** The Bandung conference is held on Java.
- 1964** Indonesia invades Malaysia but is repulsed.
- 1967** Parliament removes Sukarno and he is replaced by Suharto.
- 1969** Tribal elders in Irian Jaya vote to become part of Indonesia.
- 1975** Indonesia annexes East Timor.
- 1984** Indonesia is a founding member of ASEAN.
- 1993** Suharto's rule becomes more repressive.
- 1997–1998** The economy declines during the Asian economic crisis.
- 1998** Suharto resigns and is replaced by B. J. Habibie.
- 1999** The East Timorese vote to become an independent nation.
- 1999** Abdurrahman Wahid is elected president and Megawati Sukarnoputri vice president.
- 2001** Wahid is removed from office and replaced with Megawati.

with the Cholas deteriorated, leading to a Chola attack in 1025. Chola forces raided the entire Sumatran coast and captured Srivijayan territories on the Malay coast, seizing the Srivijayan king. The Cholas, however, did not follow up on their victories. In 1028, Srivijaya made peace with the Mataram ruler Airlangga (991–1049?). A Chola attack nevertheless rendered a devastating blow to Srivijayan fortunes and led to civil war in Java.

Toward the end of the thirteenth century, with the help of the Mongols (who at that time ruled China), the Javanese prince Vijaya established a new capital at Majapahit in eastern Java. The Majapahit rulers claimed control over a vast area, including Bali, Macassar (modern Ujung Pandan), Singapore, Sumatra, and western Java, until after the arrival of the Portuguese in the sixteenth century.

The Portuguese in Southeast Asia

Portuguese entry into Southeast Asia followed the successful voyage of Vasco da Gama (c. 1460–1524) from Portugal to India in 1498. Hoping to monopolize the European spice trade, the Portuguese captured Melaka (or Malacca, as it has traditionally been spelled in English) in 1511 and slaughtered its Muslim inhabitants. The Portuguese attempt to dominate the spice trade led to open rivalry with the Javanese, who attacked Melaka in 1513 but suffered a defeat.

Since the Javanese were then unable to send spices to Melaka, coastal states like Madura, Tuban, Surabaya, and Demak all lost their independence to the new state of Mataram by the 1620s. Demak, a state on the east coast of Java, encouraged the people in the

area to become Muslims in an attempt to deny the Portuguese access to the region. Such was the intensity of the Javanese opposition that the Portuguese were left with no choice but to use the north Borneo straits to reach the Spice Islands (the Moluccas).

The Chinese were also unhappy with Portuguese control of Melaka because they no longer received unconditional access to the commodities they had once enjoyed. Soon the state of Aceh, on Sumatra, at the western end of the Indonesian archipelago, became the chief Muslim rival of the Portuguese. Aceh not only defeated the Portuguese efforts to capture the Sumatran ports of Pasai and Pedir but also staged several attacks on Melaka between 1537 and 1575. Nevertheless, Aceh was forced to make peace with the Portuguese in 1587.

The Dutch in Indonesia

Until the end of the sixteenth century, Spain and Portugal monopolized the Oriental spice trade. The Dutch, denied access to Oriental spices in Europe, were forced to seek supplies in the East itself. The English and Dutch worked together to drive the Portuguese out. Since the Dutch were not involved in the Thirty Years' War (1618–1648) in Europe, they were free to develop their trade in the East Indies. Finally, after several attempts, the Dutch dislodged the Portuguese from Melaka, captured it in 1641, and established themselves in Java, the Moluccas, and other islands.

The Dutch and English, who traded with Bantam, a well-known pepper port in western Java, were often subjected to blackmail by both the sultans and the local Chinese. Therefore, the new Dutch governor-general, Jan Pieterszoon Coen (1587–1629), decided to build a fortified place for trade in western Java. The Dutch picked Jakarta, which they renamed Batavia.

In 1588, Mataram had annexed the port city of Demak, and the sultan converted to Islam. Sultan Agung (d. 1645) of Mataram embarked on an aggressive course of conquest and expansion. Having conquered Madura (1624) and Surabaya (1625), he turned against Batavia, but the Dutch easily defeated his forces. Mataram continued as a significant power for another half-century but never completed its expansionist program.

The Dutch did not allow Indonesian ships to use the Java straits unless they carried a Dutch company passport. Indonesian crews that refused to carry the passport were subject to execution or enslavement. Macassar, which refused to accept this Dutch demand, fell in 1667. The Buginese (of Sulawesi, Indonesia) under Aru Palakka of Bone (near the Gulf of Bone) and the forces of Ternate (an island in the Moluccas) con-

quered most of the commercially valuable islands such as Mataram (1678–1680), Bantam, and most of the eastern islands.

After 1587, Aceh had become a powerful state, whose control extended all the way from Johor in the south to Kedah and Patani in the north of Indonesia, although Melaka remained outside its control. The sultan of Aceh tried to monopolize the cloth trade and required European traders to acquire permits to trade in pepper in the Sumatran ports. Having taken Melaka with the help of Johor and Minangkabau, the Dutch turned against Aceh and stopped its attempts to monopolize trade. Nevertheless, the interior of Kalimantan (Borneo) and Sumatra remained unaffected by the Dutch. Melaka under Dutch control never regained its importance as a shipping center.

In addition to being a trading monopoly, the Dutch East India Company also exercised sweeping authority in political, military, and diplomatic matters affecting the East Indies. Its agents exercised great freedom of action in making decisions affecting the company. Jan Pieterszoon Coen is generally regarded as the "architect" of Dutch empire in the East. His ruthlessness drove out competitors, both foreign and domestic. He defeated the Portuguese and the Spanish and made it difficult for the British to operate in the region. By 1660, the Dutch could resist any aggressor.

Dutch participation in settling local disputes enabled them to bring Sumatra under control. By extending protection to several native peoples, the Dutch also gained a trade monopoly over several groups of people, although the Dutch domination of the pepper trade was neither complete nor effective. The Dutch intervened in Java when the Madurese, with the help of pirate refugees from Macassar, attacked Mataram. The Dutch sided with Mataram, and the Madurese were defeated. As a result, the Dutch received valuable territorial and commercial privileges in western Java and Mataram.

Bantam had continued to resist the Dutch, and a domestic rivalry there helped the Dutch to bring that state under control. The eldest son of the sultan, angry that he was passed over for succession, led a successful revolt with Dutch help. As a result, the Dutch received Cheribon and other territories extending to the southern parts of Java. In 1682, they received the right to trade at Bantam. The Dutch consolidated their position in Java after the death of Amangkurat II, son of Amangkurat I of Mataram and puppet ruler of Mataram, in 1705.

The Dutch introduced slavery as well as forced cultivation of coffee and sugar into Java. Corrupt

company officials and native middlemen worked together to exploit the peasants. Stingy with payments, the company forced its unscrupulous officials to resort to private trade. During the eighteenth century, the company no longer paid salaries after employees had established a sizable outside income. Shady business practices by employees finally forced the company to pay annual dividends to company shareholders from its capital reserves. By 1780, the situation grew so bad that the company began to force donations from its employees.

The Dutch had other problems as well. An epidemic of malaria in 1732 and the massacre of several thousand Chinese residents by the Dutch in 1740 were reasons for the decline of Bantam. Moreover, the Dutch were unable to suppress Buginese piracy in the Straits of Malacca and could not exercise effective control on the west coast of Sumatra or in pirate-infested Kalimantan. British ascendancy in India cost the Dutch their trade with the Coromandel coast of south-east India. The British defeat of the Netherlands in 1781 shattered the Dutch monopoly in Southeast Asia. Finally, the French conquest of the Netherlands in 1795 completed the dissolution of the Dutch East India Company in 1799. Between 1795 and 1825, Britain enjoyed a predominant commercial position in the region. In 1799, the Dutch East India Company was disbanded, and the Netherlands assumed direct responsibility for the Dutch East Indies.

England's territorial acquisitions in the region included Penang (1786), Melaka (1795), Province Wellesley (1800), and Java (1811). England also acquired Singapore (1819–1824) and territories in Burma (Myanmar). The Dutch ruler, living in exile in England (because of French occupation of his nation) authorized England to take control of overseas Dutch possessions. England agreed to restore the possession after the war. Local Dutch officials in Indonesia disliked this arrangement and continued to exercise their control in Ternate, Macassar, Palembang, and parts of Borneo. There was a temporary restoration of peace in 1802, and the English theoretically returned the territories to the Dutch. The creation of the kingdom of Holland (1806) under Louis Napoleon led to the reestablishment of English control over Dutch colonial possessions.

Thomas Stamford Raffles (1781–1826) was appointed English governor of Java. He reformed the administrative and judicial systems in Java. In Europe, the Napoleonic wars had come to a close with Napoleon's defeat and exile. Although Raffles was expected to leave Java in 1814, he remained there until 1816 hoping to convince his superiors to keep Java but

was recalled. He was then placed in temporary charge of Melaka until it was returned to the Dutch in 1818. Raffles went on to establish an entrepôt in Singapore. In 1824, the Dutch exchanged Melaka with England for Bengkulu, a pepper port.

After the Napoleonic wars, the Dutch were fully restored in Java by 1830. They introduced the culture system to maximize production and profits. The culture system, also known as the cultivation system, was introduced by Governor Vanden Bosch. Under it, Javanese cultivators were compelled to set apart one-fifth of their land for the cultivation of commercial cash crops for export. The local chiefs were used to see that the laborers met their quota. Other aspects of the system, like assignment of land, transportation, and export, were handled by the Dutch. Native middlemen cooperated with the Dutch in exploiting the people and resources. Criticism of this government-sponsored system led to its abandonment in 1848 and the reintroduction of private enterprise in agriculture. Production increased phenomenally, but the natives did not benefit from this boom. Dutch domination of the Indonesian economy was total and complete.

The Russo-Japanese war of 1904–1905 and Russia's defeat at the hands of the Japanese encouraged the rise of nationalism throughout Asia, including Indonesia. Therefore, after the First World War, there were limited efforts to introduce local self-rule, such as the people's councils or *Volksraad* (1918). However, during the 1920s and 1930s, the growth of domestic radicalism met with resistance from Dutch authorities in the Netherlands as well as in Indonesia, rather than hastening the progress toward local autonomy.

A major nationalist movement of the 1920s had been Sarekat Islam ("Islamic Association"), which the Communists infiltrated. During the 1930s, the Dutch authorities turned down proposals for reform even as war broke out in Europe, and the Dutch government was forced into exile in Britain. Although the Netherlands hoped to keep Indonesia under its control indefinitely, the Japanese army was in Indonesia by 11 January 1942.

The Japanese Occupation

The Japanese occupation of Southeast Asia (1942–1945) significantly changed the region in many ways. The Dutch East Indies surrendered to the Japanese in March 1942. The Japanese released imprisoned nationalist leaders like Sukarno and Muhammad Hatta (1902–1980, leader of the Indonesian independence movement, vice president of independent Indonesia). The Japanese attempted to win over the conquered

people, and some nationalist leaders, hoping to advance the cause of Indonesian freedom, collaborated until they realized that the Japanese wanted to supplant Dutch colonialism with Japanese imperialism. The Japanese defeat of Dutch colonial rule, however, helped the growth of Indonesian nationalism.

Independence and After (1949–1965)

A few days after the Japanese surrendered on 17 August 1945, the Indonesians under Sukarno declared independence. Sukarno became the first president of the country. The Dutch were unwilling to grant independence, and, following on the heels of the British who had landed to disarm the Japanese, the Dutch returned to Indonesia. They took back much of Indonesia but could not completely crush the nationalists. With United Nations intervention, the Netherlands agreed to grant Indonesia independence on 27 December 1949.

The government under Sukarno could not handle the serious economic problems facing the country. Ethnic, religious, linguistic, and ideological divisions once kept in check by the desire to expel the Dutch reappeared shortly after independence. Revolts broke out in different parts of the country such as West Java, Kalimantan, south Sulawesi, and Sumatra. When people became disillusioned with Sukarno's leadership, he turned to a centralized system of government called guided democracy. Having dismissed the elected parliament (1960), he appointed a new one, which elected him president for life in 1963. His attempts to use the Communist partisans to shore up his support did not endear him to the army, which was anti-Communist.

Despite his poor record at home, Sukarno was influential in international relations. In 1955, he convened the first conference of twenty-four heads of state of the Afro-Asian countries at Bandung in West Java. The conference sought closer cooperation in economic, cultural, and political fields.

When the Dutch granted Indonesia its independence, their refusal to allow West New Guinea to become part of the new country was a source of conflict between Indonesia and the Netherlands. Indonesia threatened to use force to annex the contested territory. Finally The Netherlands agreed to hand over the territory to the UN for the Indonesians to administer. In a 1969 plebiscite in which around one thousand tribal elders voted, west Irians (Irian Jaya) agreed to become part of Indonesia, and the UN accepted that decision.

Irian Jaya was not the last of Indonesia's territorial problems. The creation of the new state of Malaysia,

consisting of North Kalimantan (on Borneo), Sarawak, Malaya, and Singapore, earned Indonesia's ire. It vehemently opposed the new country as a British colonialist plot against Indonesia. In 1964, Sukarno sent his forces into the new country, but the British, with the help of the Malaysians, defeated them. In 1965, protesting the election of Malaysia as a permanent member of the U.N., Indonesia resigned from the world body. In 1975, Indonesia invaded and annexed East Timor. (In 1999, under a U.N.-sponsored referendum, East Timor voted to become independent. Unwillingly, Indonesia granted independence to the Timorese, which exacerbated secessionist tendencies in places like Aceh.)

Suharto and the New Order

In October 1965, thousands of people, perhaps as many as 500,000, perished in the reprisals of a leftist coup attempt by sections of the military. The Communists were blamed, but many innocent people were caught up in the violence. People of Chinese origin suffered most. Later, in March 1967, the parliament removed Sukarno from the presidency. Suharto became the acting president and in 1968 was appointed president. He remained in that capacity until political demonstrations, combined with economic problems, riots over food, international pressure, and the insistence of the Indonesian political and military elite, forced him out of office in May 1998.

During his presidency, Suharto (b. 1921) banned the Communist Party and embarked on a program to achieve economic recovery and political stability. Under Sukarno, the country had remained poor and backward, troubled by poverty, unemployment, and spiraling inflation. Suharto led the country back to the U.N., normalized relations with Malaysia, moved

Boys in Jakarta play next to a large painting of Sukarno, the first president of Indonesia, who ruled from 1945 to 1970. (SERGIO DORANTES/CORBIS)

Indonesia closer to the West, and joined with other Southeast Asian countries to form ASEAN in 1984. The government was able to reschedule its debt payment and to secure foreign loans through a consortium of Western countries, including the United States and the Netherlands. Foreign loans and investments and improvements in agriculture helped increase rice production. However, people in the outlying islands remained impoverished, and civil and political liberties and democratic institutions became casualties of the new order.

The fall of the Soviet Union in 1991 and the emergence of democratic governments in eastern Europe and in most Southeast Asian nations led Suharto to call for openness in his own country. Intellectuals, religious leaders, and even legislators began to air grievances long held back. The press began to report on a vast array of once forbidden subjects. The ruling dynasty and their business practices also were scrutinized. In 1993, when Suharto was reelected president for another five-year term, openness abruptly ended.

Repression, although neither massive nor widespread, continued. Reaction to it was expressed in many forms in different parts of the nation. In some places it led to Muslim-Christian clashes and to Muslim rioters burning churches in Java. Also during this period there was intense fighting between native Dayak people and the Javanese immigrants on the island of West Kalimantan. As a result, hundreds of people lost their lives. The protesters who turned against ethnic Chinese were angry about close cooperation between the military and the Chinese elite. Corruption, police brutality, and increased inequality in the distribution of wealth also caused resentment and protest.

On the political front, the rising popularity of the leader of the opposition Indonesian Democratic Party, Sukarno's daughter Megawati Sukarnoputri (b. 1947), invited the ire of Suharto. The government incited a faction of the party to conduct party elections without Megawati and expelled her from the party leadership. Megawati's supporters occupied the party office and refused to leave until she was reinstated. The military forcibly entered the party offices and evicted the occupiers, leading to the worst rioting in Jakarta's recent history.

In 1997 and 1998, Indonesia was caught up in the Asian economic crisis and faced severe economic troubles. Indonesian currency lost its value, the stock market fell, banks failed, and millions of people lost their jobs. Popular clamor for Suharto to step down reached feverish heights and led to violent protests in several major cities. In May 1998, Suharto resigned, and his

vice president, B. J. Habibie (b. 1936), became president. In the elections held in June 1999, Megawati's party received the most votes in the house of representatives.

The following October, the people's consultative assembly elected Abdurrahman Wahid (b. 1940), the leader of the National Awakening Party, president and Megawati vice president. Wahid's tenure as president was short and tumultuous, marked by religious violence, secessionist revolts, and corruption charges. In July 2001, the People's Consultative Assembly removed Wahid from power and replaced him with Megawati, signaling a return to democratic government.

The return of democracy has not solved all of Indonesia's problems. Ethnic rivalries, religious animosities, and political squabbles continue to exist. Religious intolerance in some areas caused the torching of more than three hundred churches and the death of scores of people in the 1990s alone. Separatist tendencies exist in Aceh and Irian Jaya. Globalization continues to have its impact on the Indonesian economy. The military remains an important factor in domestic politics, and democracy is still fragile.

Nevertheless, Indonesia has come a long way; its infrastructure has improved; there are now many foreign businesses and investments; and many people's lives have improved. Indonesia has managed its oil revenues sensibly and has diversified the economy, so that it is not unduly dependent on oil revenue alone. As an active member of ASEAN, the country plays a key role in maintaining regional peace and stability. Despite its emphasis on developing closer ties to China and India, Indonesia continues to maintain good relations with Europe and North America.

INDONESIA—POLITICAL PARTIES The origin of political parties in Indonesia dates back to the preindependence days of nationalist struggle against the Netherlands, which ruled Indonesia as the Dutch East Indies from the late seventeenth century until 1942, when the Japanese invaded during World War II. The PKI (Partai Komunis Indonesia, or Communist Party of Indonesia) of 1920 and PNI (Partai Nasional Indonesia, or Indonesian Nationalist Party, 1927) were major colonial-period parties. When Indonesia became independent in 1945, its constitution and the pluralist ideology of *Pancasila* (Five Principles, that is, nationalism, internationalism, consent, social justice, and belief in God) were accepted in principle by political parties. Personalities rather than ideology generally determine party affiliation.

Political Parties under Sukarno

Sukarno (1901–1970), Indonesia's first president, held office from 1946 to 1967. In the early years of his presidency, liberal democracy and a multiparty environment were in the ascendancy. However, political instability caused the collapse of successive cabinets during this period, although the power of the president and the military was kept in check. The PNI, the Masjumi (Council of Indonesian Muslim Associations), the Indonesian Socialist Party (PSI), the PKI, and the Nahdatul Ulema (a party of Muslim scholars) were the major parties of the period. Their mutual wrangling made it difficult for party coalitions to function. Bitterness and ideological appeals marked the campaigns for the first general elections of 1955. The elections witnessed a broad party alignment: PNI and PKI on one side and the Masjumi and the Socialists on the other. The PNI fought for a state based on the ideal of *Pancasila*, whereas Masjumi's call was for an Islamic state. The PNI and the Masjumi shared fifty-seven seats in the newly elected parliament; the Nahdatul held forty-five, and the PKI held thirty-nine. With strong party discipline and maneuvering, PKI was thriving. When Sukarno later announced a change to "guided democracy," political parties were suppressed, and parliamentary democracy was nearly destroyed. In 1959 the presidential form of government was adopted, and the PSI and the Masjumi were banned the following year. A presidential decree on "party simplification" allowed just ten out of twenty-five parties to continue to function. The PNI, the PKI, and the Nahdatul Ulema were among those permitted to continue. Parliament members were nominated by Sukarno, so the parties did not have much power.

Political Parties under Suharto

Suharto (b. 1921) acted as president from 1967 until 1998, when he was forced to resign. His New Or-

der policy increased the membership of the House of Representatives from 347 to 460, with the president having the right to nominate 100 (later reduced to 75) members from the armed forces (ABRI). The members of three-fifths of the People's Consultative Assembly (Majelis Permusyawaratan, or MPR) were also to be selected by the president. The Golkar Party, which was composed of different groups, became the ruling party and Suharto's vehicle for holding power. Apart from Golkar, nine parties were allowed to participate in elections. In 1970 the two broad divisions of parties that were merged were the Group for Democracy and Development and the Group for Unity and Development. The 1971 elections were stage managed. The New Order was able to assure its position because opposition parties had so little power as to be almost defunct. In 1973 the opposition forces were merged into two parties: The four Islamic parties joined the Unity Development Party (PPP), and the remaining five parties joined the Indonesian Democratic Party (PDI). By the thwarting of the democratic process, Suharto was reelected in 1978, 1983, 1988, 1993, and 1998.

Political Parties after Suharto

Since Suharto's resignation in May 1998, the office of president has been divested of much power, with a concomitant increase in the power of parliament and political parties. The earlier authoritarian regime, which ruled with government-dominated parties, has given way to a multiparty system. President Bacharuddin Jusuf Habibie (b. 1936), who served as president until 1999, lifted controls on political parties, and a special session of the MPR in November 1998 advanced the dates for elections to June 1999. The new laws allowed 48 out of the 150 parties that were formed since May 1998 to participate in the elections. The parties generally adhered to the principles of *Pancasila* and shared such common programs as provincial autonomy, clean administration, and elimination of corruption. The major difference between them seemed to be their attitude toward Islam. The nationalist parties clamored for a pluralist society and the Islamic parties advocated a religious framework. The PDI-P (Partai Demokrasi Indonesia-Perjuangan, or Indonesian Democracy Party-Struggle) of Sukarno's daughter, Megawati Sukarnoputri (b. 1947), drew support from nationalists, liberal Muslims, and minority groups. The PDI-P promoted a pluralist Indonesia, free market, and civil-military cooperation. The PKB (Partai Kebangkitan Bangsa, or National Awakening Party) epitomizing the views of Nahdatul Ulema chief Abdurrahman Wahid and its chairman, Matori Abdul Djilil, supported tolerance and

accommodation befitting a diverse country. The PKB's main support was from eastern and central Java, with a sizable rural base and close rapport with PDI-P. The Golkar, led by Akbar Tanjung, faced an uphill task of winning the elections by legitimate means, but its secular credentials and money power were plus points in its favor. The former Muhammadiyah chairman, Amien Rais, led the major Muslim party PAN (Partai Amanat Nasional, or National Mandate Party). Amien, with a strong base in social and educational institutions of Muslims, advocated federalism, strong leadership, democracy, moderation, and reforms. The PPP (Partai Persatuan Pembangunan, or United Development Party) is an Islamic party chaired by Hamzah Haz. Another Islamic party, PBB (Partai Bulan Bintang, or Crescent Star Party), was established in July 1998. Its chairman, Yusril Ihza Mahendra, followed a pro-Muslim agenda. In the elections held in June 1999 for 462 seats of the House of Representatives, the PDI-P came out on top, winning 154 seats and securing 37.4 percent of the vote. Golkar came in second, with 20.9 percent of the vote and 120 seats. The breakdown for the others was PKB, 51 seats (17.4 percent); PPP, 58 seats (10.7 percent); PAN, 35 seats (7.3 percent); and, PBB 14 seats (1.8 percent). Megawati could not muster enough strength in the presidential elections of October 1999, and Wahid of the PKB became the president. Megawati was chosen as vice president.

The free and fair elections established parliamentary democracy. However, secessionist tendencies, ethnic violence, and economic problems plagued the new administration, and a day after the MPR voted to impeach Wahid in July 2001, Megawati was proclaimed president. Indonesia has democratized to a large extent and the role of political parties in the coming years will be crucial for the smooth functioning of democracy. Megawati showed political acumen after the 11 September terrorist crisis; the fundamentalists did not destabilize the nation, and nationalist parties rallied behind her. In the post-Taliban world, Indonesia can look ahead with renewed hope for a viable political process.

INDONESIA—POLITICAL SYSTEM Although there have been dramatic changes to the Indonesian political system since the fall of President Suharto (b. 1921) in May 1998, Indonesia continues to operate under the constitution first promulgated by Indonesia's founding president, Sukarno (1901–1970), in 1945. The 1945 constitution, briefly surpassed by the 1950 constitution, which established a parliamentary system, was readopted in 1959, and a presidential system was returned to Indonesia. The presidential system remains to this day. While both the constitution and the Pancasila (the state philosophy) state that Indonesia must be a democratically governed country, the interpretation of what that means has changed over time. Elections held under Suharto (who ruled from 1966 to 1998) were not open to contest in Indonesia's "guided democracy," and the incumbent always won. Now the political system is marked by open political competition between parties and a greater separation of the three main branches of government—executive, legislature, and judiciary.

The constitution defines six organs of state: the Presidency, the People's Consultative Assembly (Majelis Permusyawaratan Rakyat, or MPR), the House of Representatives (Dewan Perwakilan Rakyat, or DPR), the Supreme Advisory Council (Dewan Pertimbangan Agung), the State Audit Board (Badan Pemeriksa Keuangan), and the Supreme Court (Mahkamah Agung).

Executive Branch

Under the presidential system, the head of state has the power to initiate and give final approval to legislation and to appoint the cabinet. In a time of crisis, the president also can assume control over all of the functions of state. The president is appointed for a five-year term, but is now restricted to serving no more than two terms. If the president is incapacitated or removed, he or she is automatically succeeded by the vice president. The MPR is the highest constitutional body in Indonesia and has the power to appoint and dismiss the executive (the latter with a two-thirds majority), as well as to decide amendments to the constitution (also with a two-thirds majority). Sometimes described as an "upper house," the MPR consists of 700 representatives, who are drawn from the "lower house," or DPR (500); regional representatives (135); and "functional representatives" (65) appointed by the electoral commission. The MPR must meet at least once every five

THE PANCASILA

On 1 June 1945 President Sukarno of Indonesia set forth the Pancasila (Pantja Sila), the five principles that form the ideological basis of the Indonesian state.

Now that I have dealt with the question of Freedom, and Independence, I will proceed to deal with the question of principles . . .

The First Principle, which is to be the foundation of Our State of Indonesia, is the *principle of Nationalism*. . . .

Briefly speaking, the people of Indonesia, the Indonesian nation are not the group of individuals who, having "*le désir d'être ensemble*," live in a small area like Minangkabau or Madura or Djokja or Pasundan or Makassar; no, the Indonesian people are those human beings who, according to God-ordained geo-politics, live throughout the entity of the entire archipelago of Indonesia from the northern tip of Sumatra to Papua! All, throughout the islands! Because amongst these seventy million human beings there exists already "*le désir d'être ensemble*," the "*Charactergemeinschaft*." The Indonesian nation, the people of Indonesia, the Indonesian human beings which number seventy millions who have united to become one, and form one single entity . . .

We must not only establish the State of Free Indonesia, but we should also aim at making one family out of all nations of the world. This is the Second Principle of my philosophy of State, the *Principle of Internationalism*. But when I say "internationalism," I do not mean cosmopolitanism, for this negates nationalism, denies the existence of such nations as Indonesia, Japan, Burma, England, America, and so on. Internationalism cannot flower if it is not rooted in the soil of nationalism. Nationalism cannot flower if it does not grow within the garden of internationalism. . . .

What is the Third Principle? This is the *Principle of Consent*, the *Principle of Representative Government*. We are to establish a State "all for all," "one for all, all for one," not a State for the wealthy. . . . Allah, God of the Universe,

gave us the capacity to think, so that in our daily intercourse we might constantly burnish our thoughts. Just as the pounding and husking of paddy results in our getting rice, our best food, argument and discussion in our daily intercourse results in the clarification of our thoughts.

The Fourth Principle I am proposing is the *Principle of Prosperity*, the principle: that there be no poverty in free Indonesia. . . . The democracy we are seeking is not the democracy of the west, but a politico—economic democracy, which will result in the good life and social prosperity. . . . The people know what it is not to have enough to eat nor enough to wear, and now wish to create a new world of justice in accordance with the precepts of Ratu Adil. . . .

Thus, the people's assembly to be established must not be a body for the discussion of political democracy only, but a body which is to translate into reality the two principles: *Political Justice* and *Social Justice*. . . .

The Fifth Principle should be the recognition of the *Divine Omnipotence*, the organization of Free Indonesia on the basis of *Belief in God*. . . . The Christian should worship God according to the teachings of Jesus Christ. Moslems according to the teaching of the Prophet Mohammed, Buddhists should discharge their religious rites according to their own books. . . .

Hence, if the people of Indonesia desire that the Pantja Sila I propose become a reality . . . we must not forget the condition for its realization, viz. struggle, struggle, and once again, struggle! . . . If the people of Indonesia are not united, not determined to live or die for freedom, this freedom will never come to the Indonesian people, never, until the end of time. Freedom and independence can only be won and enjoyed by a people when the soul is aflame with the determination of "MERDEKA- FREEDOM or DEATH!"

Source: Indonesian Review. (n.d.) Vol. 1, no. 1. Jakarta.

THE PREAMBLE TO THE CONSTITUTION OF INDONESIA

Whereas freedom is the inalienable right of all nations, colonialism must be abolished in this world as it is not in conformity with humanity and justice;

And the moment of rejoicing has arrived in the struggle of the Indonesian freedom movement to guide the people safely and well to the threshold of the independence of the state of Indonesia which shall be free, united, sovereign, just and prosperous;

By the grace of God Almighty and impelled by the noble desire to live a free national life, the people of Indonesia hereby declare their independence.

Subsequent thereto, to form a government of the state of Indonesia which shall protect all the people of Indonesia and their entire native land, and in order to improve the public welfare, to advance the intellectual life of the people and to contribute to the establishment of a world order based on freedom, abiding peace and social justice, the national independence of Indonesia shall be formulated into a constitution of the sovereign Republic of Indonesia which is based on the belief in the One and Only God, just and humanity, the unity of Indonesia, democracy guided by the inner wisdom of deliberations amongst representatives and the realization of social justice for all of the people of Indonesia.

years to appoint the president, although special sessions can be called by the DPR. Since the fall of Suharto, a precedent or convention has developed of holding an MPR session annually (known as *Sidang Tahunan*). So far those sessions have been landmark events and have typically called for the president to account for the government's actions over the past year. In the 2000 session, President Abdurrahman Wahid (b.1940) felt compelled to offer an apology to this body for the shortcomings of his administration. A "special session" of the MPR can also be called by the DPR. On 23 July 2001, a special session ended the presidency of Wahid and overwhelmingly selected his vice president, Megawati Sukarnoputri (b. 1946) to assume the role of executive. This represents a much-changed body politic from the more authoritarian days of President Suharto.

Legislative Branch

The 500-member DPR is elected by popular vote, with the exception of the sixty-eight seats reserved for army and police appointees. The DPR, largely a powerless rubber-stamping institution until 1998, has now taken a crucial role in the creation and approval of legislation. Legislation must gain DPR assent (in tandem with presidential approval), and the DPR can also initiate bills.

Indonesia's freest elections since 1955 were held in June 1999. Elections for the 462 elected seats in the DPR are regarded by observers as the most complex in the world. Indonesia operates a system of proportional representation, uniquely combining it with elements of a district system. Seats gained in the DPR are determined at the provincial, not the national, level. Thus, for electoral purposes, Indonesia is split

into component provinces. While the allocation of seats is broadly based on population numbers, the electoral law also stipulates that there must be a minimum of one seat at the rural (*kabupaten*) and city (*kotamadya*) district level. At the time of the 1999 election, Indonesia's then 27 provinces had 327 *kabupaten* and *kotamadya*. The rest of the 135 elected seats were allocated on the basis of population, to give provinces of higher population density a fairer representation—although this did not completely solve the problem. The number of seats a party receives is determined by the number of votes it obtains in each province. Once the number of DPR members for a given party is determined, based on its proportion of the vote for a given province, the central committee of that party then has the sole decision over who should be chosen to sit in the DPR.

The 1999 election was a strong endorsement for the Indonesia Democratic Party-Struggle (*Partai Demokrasi Indonesia-Perjuangan*, or PDI-P) of Megawati Sukarnoputri, the daughter of Sukarno and the current president, which gained nearly 34 percent of the vote. The Golkar Party, Suharto's party while he was president, was its nearest rival, with almost 22.5 percent of the vote. Most of the remaining seats were won by Islamic parties. Support for Megawati did not translate into gaining the presidency in 1999, as Wahid, from the small National Awakening Party, was able to coalesce with all the other parties during the 1999 MPR session to obtain the presidency. This was very controversial in Indonesia and has led to discussion on switching to a system whereby the president is directly elected by the voters.

The Judicial Branch

The judiciary, established constitutionally as a separate arm of government, was in practice unable to challenge the wishes of the Suharto regime. However, even under a democratizing Indonesia, the courts struggle to revive their reputation and free themselves from past government and corporate collusion. The final court of appeal is the Supreme Court, with High Courts in provincial capitals, and District Courts beneath that. The Indonesian legal system, largely based on an antiquated code inherited from the Dutch, is placed into four distinct juridical spheres: the general court deals with criminal and civil issues; the religious court (*pangadilan agama*) applies to all Muslims (and only Muslims) in the family matters of marriage, divorce, and inheritance; the court martial for military discipline; and the administrative court for bureaucratic issues. This formal structure exists alongside more traditional notions of legality, known as *bukum*

adat (traditional law), which varies markedly throughout Indonesia. There is no constitutional court in Indonesia, the MPR being the sole decision maker on constitutional issues.

Provincial Level

Indonesia is now formally divided into thirty-two provinces, after the creation of new provinces since the 1999 election, although a division of the old Irian Jaya Province into three provinces is not operational, so the effective number is actually thirty. Three of these provinces are given a different status under Indonesia law: the two special provinces (*daerah istimewa*) of Yogyakarta and Aceh and the capital city of Jakarta (*daerah khusus ibukota*). Below the provincial level there are now some four hundred districts. Recent plans to devolve governmental authority in such matters as schooling, health, transport, and roads, as well as in some aspects of economic planning, are centered on these districts. Indonesia has deliberately avoided any devolution of power to the thirty-two provinces on the

Students demonstrate near parliament in Jakarta in October 1999. They are calling for the military to end its involvement in Indonesian politics. (AFP/CORBIS)

grounds that this may lead to federalism—and the current government wishes to retain the unitary state structure.

Movement toward Democracy

Despite remaining based on a constitution it inherited from more authoritarian times, Indonesia has had since 1998 a genuine separation of powers, notably between the president and parliament. While Indonesia is not yet a consolidated democracy, it has democratized to a large degree. Parliament regularly critiques the president, while a newly freed media and an emerging civil society expose government to rigorous scrutiny.

INDONESIA-MALAYSIA RELATIONS Indonesia-Malaysia relations are marked by normalized ties and general cordiality, albeit with a troubled past and some contemporary bilateral difficulties.

Natural Affinities

The majority of people in both countries are the descendants of early Austronesian peoples who have interacted with each other over maritime Southeast Asia's various trade routes since ancient times. The Malay peoples of Malaysia have close kinship, cultural, and linguistic ties with, predominantly, the Indonesian

peoples of Sumatra, Java, Kalimantan, Sulawesi, and other islands. The Sumatran-based Srivijaya empire (c. eighth to c. fourteenth century) held sway over both sides of the Malacca Strait. The national languages of Malaysia and Indonesia, respectively, Malay (*Bahasa Melayu*) and Indonesian (*Bahasa Indonesia*), share a common root in the Malay tongue, and despite some divergence are still largely mutually intelligible. Indonesia by far the largest country in Southeast Asia, has a population of 220 million, while the more developed, middle-income Malaysia has a population of just over 22 million.

Postindependence Relations

Postindependence relations between Indonesia and Malaysia were immediately marked by conflict. Indonesia under founding president Sukarno (1901–1970) viewed the establishment of the Federation of Malaysia, which included Malaya, Singapore, and former British Borneo (Sarawak and Sabah) on 16 September 1963 as an extension of colonial rule. Sukarno announced that he would "crush Malaysia" and launched a military campaign in Borneo known as Konfrontasi (the Confrontation). The conflict lasted until 1965 (although formally wound down in 1966) and in the latter stages included attacks on peninsular Malaysia and Singapore. When General Suharto (b. 1921) seized effective power in Jakarta in 1965, one of his first initiatives was to bring the conflict to an end in the interests of pursuing normalized relations with Malaysia, and he generally took a less radical foreign policy path than Sukarno.

The end of Konfrontasi paved the way for the establishment of the Association of Southeast Asian Nations (ASEAN), in which Indonesia and Malaysia were founding members alongside the Philippines, Singapore, and Thailand. Although Sukarno had pursued anticolonial policies, the Suharto regime saw Communism as the paramount threat to Indonesia, and relations with its non-Communist neighbors were seen as crucial to regional confidence and stability. The countries within ASEAN agreed to the principle of noninterference in each other's affairs and to renounce any claims to territory legally held by another member state (this was later formally adopted in ASEAN's Treaty of Amity and Cooperation—TAC). Subordination to this framework effectively pacified relations between Indonesia and Malaysia, and this remains the case to this day. Indonesia, for its part, discouraged supranationalists, who had, since Indonesia's declaration of independence in 1945, promoted Indonesia Raya (Greater Indonesia) that would include all Malay and related peoples. Malaysia has refused to become embroiled in

Indonesia's domestic and regional difficulties, most notably in Aceh (situated in northern Sumatra and quite close to the Malaysian peninsula), where Malaysia has continued to recognize Indonesia's state boundaries. However, given the proximity and the ties of ethnicity and sympathy of some within the Malaysian community to Aceh, stopping all lines of supply from private Malaysian channels to the Acehnese independence movement has proved difficult.

Current Tensions

The relationship since the end of Konfrontasi has been marked by a degree of rivalry and elements of bilateral tension. There is contention over the ownership of two islands near the Sabah-Kalimantan coast—Ligitan and Sipadan. Much of the border between Kalimantan and East Malaysia is also poorly demarcated, although some progress has been made to establish part of the boundary. On two occasions (1997 and 2001) in recent years, the Malaysian authorities have had to close the border with Kalimantan because of uncontrolled ethnic violence on the Indonesian side in which elements of the Dayak community (which straddles both sides of the Borneo island) have committed acts of violence against transmigrants from other parts of Indonesia.

Although many Indonesians have entered Malaysia legally, looking to undertake employment in the domestic help and service industries, the porous land and sea boundaries have seen even larger numbers of Indonesians traveling to Malaysia through unofficial channels. It is thought that around 1 million Indonesian currently reside illegally in Malaysia. Although large numbers of these people, given the racial, cultural, religious, and linguistic similarities, have integrated themselves, often through intermarriage, into almost every Malay village and community in Malaysia, there has also been some tension with the Indonesian migrants. The presence of so many Indonesians in Malaysian society in relatively peaceful times is a sobering lesson for the Malaysian authorities about the vast numbers of Indonesians that could potentially flood Malaysia if Indonesia becomes a lot more turbulent.

In recent years Malaysia's proximity to Indonesia has made it the victim of a new hazard. In 1997, out-of-control forest fires in Sumatra and Kalimantan (later proven to be the work of large Indonesian conglomerates clearing land for plantations) saw air pollution levels rise to extremely unsafe levels in Malaysia and Singapore, and to a lesser extent Thailand. President Suharto felt compelled to apologize for the fires of

1997, and yet the same problem returned in 1998, and to a lesser extent every subsequent year during the dry season. The response of Malaysia and other affected countries has been twofold. First, with other ASEAN member nations, it subjected Indonesia to heavy criticism and joined in pressuring Indonesia to implement a "zero burning policy" in the affected regions. Second, with Singapore it gave technical assistance to help monitor "hot spots" and effectively combat them.

In the past, both countries have sought regional and Third World leadership, but in quite different ways. Indonesia has been very active in Third World forums, such as the Nonaligned Movement (NAM) and G-77. While Malaysia is an aligned state (through the Five-Power Defence Arrangements, or FPDA), the current prime minister, Mahathir Mohamad (b. 1925), has been harshly critical of the West. Elements of the Indonesian government have questioned the need for Malaysia's membership in FPDA, which links Malaysia to Australia, Britain, New Zealand, and Singapore. Indonesia's long-term goal is to remove extraregional powers from the Southeast Asian region, which it considers its own backyard. Indonesia has also been far less critical than the Malaysian leadership of internationalism and of such bodies as APEC (Asia Pacific Economic Cooperation). Differences in domestic politics have also been minor irritants. While Malaysia's prime minister has been critical of Indonesia's attempt at democracy, Indonesian officials, including the president, have openly met with Malaysian opposition figures visiting Indonesia (most notably Wan Izidah, who visited Indonesia in 2000 after the imprisonment of her husband, Anwar Ibrahim). Malaysia has asked Indonesia not to become involved in its domestic politics, deeming such involvement to be undue "interference"; however, Indonesian officials do not view such involvement as undue interference given the active multiparty environment they now must negotiate in their own country. These differences, while at times presenting bilateral difficulties, have not undermined the relationship to any significant extent.

INDONESIA-UNITED STATES RELATIONS Indonesian leadership has long held a consensus about foreign policy, conditioned by needs of the country dating from the beginning of the struggle for independence in 1945. Indonesia has sought to be active in regional affairs without getting involved in conflict among major powers. Relations between Indonesia and the United States have fluctuated with the times and have generally, though not always, been cordial.

As conflict with the Dutch continued during the revolutionary period, Indonesia developed an anti-Western attitude, seeing Asian events as a struggle against Western imperialism. The United States was generally sympathetic to the Indonesian cause, giving it *de facto* recognition on 23 April 1947. Indonesia's first president, Sukarno (1901–1970), followed a policy of nonalignment while aspiring for a larger role in international affairs; he also became aggressively opposed to the West. The United States was neutral in the Dutch-Indonesian conflict concerning the status of Irian Jaya, and late in his incumbency Sukarno became markedly anti-American.

Relations during the Suharto Era

The ascension of Suharto (b. 1921) in 1967 changed all this, and relations with the United States became warm. Indonesia was vital to U.S.-Asian security interests because of its importance as a regional power and oil-producing nation and its strategic location at the entrance of the Indian Ocean.

Though Indonesia has entered into no military alliances, it has received military assistance from the United States since 1950, with breaks in the 1965–1966 period. The military equipment grant, used for communication systems, internal security, and so forth, averaged \$13 million per year up to 1978. The

Presidents Sukarno and Kennedy at Andrews Air Force base in Maryland on 24 April 1961. (BETTMANN/CORBIS)

International Military Education and Training (IMET) program trained four thousand Indonesian military personnel between 1950 and 1992. Since 1974, Indonesia has received Foreign Military Sales (FMS) credits for purchasing military equipment. In the U.S. House International Relations Committee meeting of 7 May 1998, it was revealed that U.S. Special Operations Forces had trained elite Indonesian Kopassus special forces at a cost of \$3.5 million. These forces were active against the political opponents of the government.

Indonesia and the United States have been involved in various multilateral organizations promoting international peace, nuclear disarmament, and economic development. Both are members of the ASEAN Regional Forum (ARF) and Asia Pacific Economic Cooperation (APEC), and Indonesia's effort to restore democracy in Cambodia and mediate in disputes concerning the South China Sea have been appreciated by the United States.

Some discord did, however, arise in bilateral relations between Jakarta and Washington in the 1990s. The United States did not support Indonesia's claim over the straits linking the Indian and Pacific Oceans and opposed Jakarta's promotion of an ASEAN nuclear-free zone. There were differences too over the issue of intellectual property rights, and under the Generalized System of Preferences (GSP) legislation, Indonesia was criticized for not meeting recognized labor standards. The U.S. Congress suspended IMET grants after Indonesian security forces killed East Timorese demonstrators in November 1991; these grants were partially restored in 1995. The United States also favored the peaceful resolution of the East Timor problem, and many Americans saw to it that U.S. policy toward Indonesia depended on the latter's actions in East Timor. The United States and non-governmental organizations vehemently criticized human-rights violations, and U.S. president Bill Clinton announced suspension of U.S.-Indonesian military relations on 9 September 1999. Many perceived the United States as supporting secessionist forces, and anti-American demonstrations were held.

Relations in the Post-Suharto Era

Relations improved after Abdurrahman Wahid became president and visited the United States (10–12 November 1999). President Clinton welcomed him, stressing the territorial integrity of Indonesia and the importance of building an ongoing partnership with a democratic country. The new Indonesian president, Megawati Sukarnoputri, supported the United States after the brutal events of 11 September 2001,

becoming the first Islamic leader to visit the United States and meet U.S. president George W. Bush (19 September 2001) in the wake of the attack. She was receptive to U.S. appeals for assistance in antiterrorist measures but cautioned the U.S. president against any action that could be construed as revenge against Muslims.

U.S.-Indonesian Economic Relations

The United States has long had commercial and economic interests in Indonesia, and Indonesia received \$146.3 million in economic assistance and \$377.2 million in credit from the United States between 1950 and 1961. The U.S. Agency for International Development (USAID) has given assistance in health care, family planning, rice production, and overseas training programs. It also provided financial and technical aid during the mid-1980s oil crisis. U.S. investors dominate mining and oil sector projects, and U.S. banks, service providers, and manufacturers began expanding in Indonesia after the reforms of the 1980s.

During the Asian economic crisis that began in 1997, Indonesia received aid from the United States, among other bilateral donors. The U.S. president urged Suharto in January 1998 to follow the International Monetary Fund (IMF) plan to mitigate the crisis. New schemes were launched to help Indonesia. A USAID program totaling \$520 million was directed toward economic reform and public welfare, and Indonesia received another \$450 million through other programs. USAID also made \$70 million in the form of medical supplies and small construction projects available for rural people in eastern Indonesia. U.S. technical personnel came to implement economic reforms, and USAID supported democratization and civil society development activities through non-governmental organizations. Temporary work permits were issued to Indonesian students of U.S. universities, and the U.S.-ASEAN Business Council provided financial assistance to Indonesian students so they could finish their courses. However, pouring billions of dollars of U.S. aid into Indonesia under the Suharto regime was criticized; it was felt that the beneficiaries were large corporations and members of the armed forces and Suharto's family.

Since the establishment of diplomatic relations in December 1949, Indonesia and the United States have passed through phases of understanding as well as discord. Indonesia remains vitally important to U.S. interests, both as a key to Southeast Asian security and as a moderate nation with the world's largest Muslim population. U.S. economic assistance and support of In-

donesia's territorial integrity will continue to mark the relations between the two nations as primarily cordial.

INDONESIAN DEMOCRATIC PARTY In 1973, the Indonesian new Order government merged all existing political parties into two: the United Development Party (PPP) and the Indonesian Democratic Party (PDI), which were allowed to form a kind of alibi "opposition" to Golkar (acronym for *Golongan Karya*, "functional groups"), the electoral vehicle of the government. Whereas the PPP contained four Muslim parties, the PDI incorporated the Indonesian National Party, two Christian parties, the leftist Murba, and the army-backed Association Supporting the Independence of Indonesia. The growing alienation between the then president Suharto (1921-1998) and the military over Suharto's benign attitude toward moderate strands within resurgent Islam led to Suharto's tacit support for the Christian-backed PDI, nationalist and secular in outlook, in the 1987 general elections.

In 1993, the daughter of the former president Sukarno, Megawati Sukarnoputri (b. 1947), was elected to the PDI Party chair. Her popularity led the regime to have her ousted from party leadership in 1996. This resulted in the schism between the legal PDI and the illegal Party Fighting for Indonesian Democracy (PDI-P), the latter being led by Megawati. A few months after Suharto's demise in May 1998, Megawati and her PDI-P were massively supported in a congress in Bali. Her party emerged as the winner of the general elections in June 1999. Four months later, in October, Megawati was elected as vice president of Indonesia.

INDONESIAN REVOLUTION On 17 August 1945, three days after the Japanese forces occupying Indonesia had surrendered to the Allies, Sukarno and Muhammad Hatta proclaimed independence and established the Republic of Indonesia. However, it took five years of guerrilla warfare and diplomatic efforts to establish unchallenged independence.

British troops arrived in Java in September 1945, followed by the Dutch governor-general Van Mook. Dutch efforts to regain control resulted in bitter fighting and the archipelago was divided between Republican-held territory and land reoccupied by the Dutch with British help. The Republican government made diplomatic efforts, entering into the Linggarjati Agreement in November 1946. According to this agreement, ratified on 25 March 1947, the Dutch recognized Republic of Indonesia sovereignty over Java, Sumatra, and Madura, while the Republic agreed to join with the Dutch-created regional states to form the United States of Indonesia.

In July 1947, the Dutch, claiming Republican interference with rice shipments, launched a full-scale attack, the so-called first "police action." Australia and India proposed a cease-fire and the U.N. became involved. In January 1948, the Renville Agreement was signed, instituting a truce and proposing a plebiscite. The Dutch, however, blockaded Republican territory, and in December again attacked the Republic in the second "police action." The Republic's capital, Yogyakarta, was captured and Sukarno and Muhammad Hatta allowed themselves to be arrested to help galvanize world opinion. Indonesian guerrilla forces armed with primitive weapons fought bravely, and the resistance became a people's war. Even in Dutch-held territory, the colonial army was forced to retreat to urban areas. World reaction was sharp, and Indian premier Jawaharlal Nehru convened the Asian Conference on Indonesia in January 1949, urging the U.N. to intervene. The Security Council ordered an imme-

diately cease-fire, and the Dutch government, bowing to international pressure and popular resistance, entered into negotiations. The Hague Agreement of 27 December 1949 transferred sovereignty to the Indonesian Federal Government consisting of the Republic and fifteen Dutch-created states. By 17 August 1950 the, the Dutch-created states of the Federation had joined the Republic, and the unitary state of the Republic of Indonesia was restored as originally proclaimed five years previously.

Adroit Republican diplomacy, internationalization of the issue, guerrilla warfare, and popular desire for independence foiled Dutch attempts to restore colonial rule. The revolution has become integral to Indonesian consciousness, and *Merdeka* (freedom) has acquired a special meaning.

INDORE (2001 pop. 1.8 million). Indore is the largest city of Madhya Pradesh state in central India. It is situated on the banks of the Saraswati and the Khan rivers and derives its name from the eighteenth-century temple of Sangamnath, or Indreshwar, located at the confluence of the two rivers.

Indore's importance developed from its location on the route the Maratha guerrilla warriors of the Deccan took to North India. The Marathas were constantly battling against the Mughal empire (1526–1857). Their army transit camps drew the local zamindars (landlords) who, attracted by trade possibilities, settled in the villages at the confluence of the Khan and Saraswati rivers. The city grew rapidly under the Holkar dynasty (1733–1818). It became the capital of the Indore state in 1818, after the British forces defeated the Holkars. Between 1948 and 1956, Indore served as the summer capital of the former Madhya Bharat state.

Indore today is the commercial capital of Madhya Pradesh. It has the fourth largest cotton textile industry in the nation. Besides iron and steel, chemicals and machinery are also manufactured here. It is also famous for its oilseed extraction industry and manufacture of confectionery, paper, machine tools and

accessories, and electronic goods. It also has one of the largest transshipment centers for truck transport.

INDUS RIVER The 3,180 kilometer-long Indus River, anciently called the Sindhu (whence our word Hindu) and mentioned as such by Greek writers, is the major river of Pakistan, running throughout the length of the country. It begins in Tibet in the glaciers of the Kailas Range (where it is known as the Xiquan He), passing through Ladakh, Kashmir, Punjab, and Sind before emptying into the Arabian Sea in a level, muddy delta near Karachi. Although this delta is little cultivated, the broad river plain was the locus of the Indus Valley civilization (also called the Harappan or Mohenjo Daro civilization). Geological research has shown that the lower course of the river has changed often; such a change is one possible explanation for the end of that civilization.

The Himalayan sections of the river's course present some of the most impressive scenery in the world,

particularly where it cuts through the Ladakh Range about 160 kilometers above Leh. In this region the Indus derives from three tributaries coming out of the Kailas glaciers. The northernmost of these tributaries forms the road from Leh to the Jhalung goldfields, and the southern one forms the ancient trade route from Ladakh to Lhasa and on to China.

The river is navigable by small craft as far as Hyderabad in Pakistan. A modern dam at Sukkur supplies irrigation and electric power. Another vast dam is under construction at Tarbela, near Gilgit in the disputed area of Azad Kashmir. The drainage basin of the Indus has been computed at 963,400 square kilometers.

INDUS RIVER DOLPHIN The Indus River dolphin (*Platanista minor*), known in Pakistan as the *susu*, is sometimes called the "blind dolphin" because its eyes lack lenses. This virtual blindness, scientists speculate, is due to the high silt content of its river habitat. The dolphin relies on a highly developed system of echolocation (using sound waves to locate prey) to navigate and hunt for fish.

The Indus River dolphin is a separate species from the Ganges River dolphin (*Platanista gangetica*). It is 2 to 2.5 meters long and weighs 80 to 90 kilograms. A freshwater cetacean (aquatic mammal), the dolphin is an endangered species, having a population of about 675 in the mid-1990s. The dolphin is fully protected in Pakistan; in 1974 the Indus River Dolphin Reserve was established on the Indus River from the Sukkur Barrage to the Guddu Barrage in Sind Province in Pakistan. About 500 dolphins live in Sind Province, and about 175 live in Punjab Province. Despite legal protection, since the 1930s the dolphins have been threatened by the construction of dams throughout the Indus River system, which have degraded their habitat and impeded migration. The dams have also separated the dolphins into several small groups, which threatens the genetic diversity of the population. Occasionally, the dolphins are accidentally caught in fishing nets.

INDUSTRY—WEST ASIA Industry is a fundamental economic sector for West Asian nations (Iran, Iraq, and Turkey) nowadays. Since the end of the 1980s, the main sources of industrial growth in the region are local and foreign investments and the dynamism of the private sector. In the 1990s, industry contributed between 25 and 35 percent to the gross national product (GNP) of the West Asian nations and employed approximately 25 percent of their labor forces.

Industrial Resources

West Asia has a wide range of mineral resources. Petroleum is the most important subterranean asset, found in large amounts in Iran and Iraq. These two nations are among the main producers and exporters of oil in the world. The remaining oil reserves of Iraq and Iran are estimated at 126 and 108 billion barrels, respectively. With Russia, Iran has the world's largest reserves of natural gas. Turkey has no known

extensive petroleum resources, but it has large deposits of high-grade bituminous coal, which lies along the Black Sea coast, with Zonguldak as the chief mining center. Poor-quality coal is found in various locations in West Asia.

West Asia's ores are associated predominantly with the geologic fold of the Taurus and Elburz Mountains. Turkey and Iran have commercial quantities of chromites, West Asia's second most important mineral in world terms after petroleum. Turkish and Iranian deposits of iron, lead, zinc, and copper ores are found in various locations and have significance chiefly for their internal markets. Turkey also has rich deposits of boron salts, meerschaum, and perlite. Iran is rich in gypsum, manganese, lead, tin, and gold. Iraq's main raw materials excluding oil are phosphates and sulfur, though there are also deposits of glass sand, iron, copper, and salt. Iraqi natural sulfur reserves, at an estimated 515 million metric tons, are among the largest in the world. Clay, building stones, and limestone, suitable for cement production, are widespread in West Asia.

The agrarian sector also produces many raw materials needed in West Asia's manufacturing industry. Among the most important materials available for processing are cereals, cotton, sugar beets, olive oil, wool, skins, and hides. Generally, Turkey and Iran have more diverse agricultural bases for industrial development than does Iraq.

A marble quarry near the ancient city of Aphrodisias, Turkey, in 1984. (JONATHAN BLAIR/CORBIS)

Industrial Policies

Early efforts toward industrial development in West Asia focused on the processing of local products. Factories were initially built to produce food, beverages, textiles, and leather goods. After World War II, the emphasis switched from light to heavy industry. The main goals of the governments of Turkey, Iraq, and Iran have been to build up basic industries as a means of import substitution, and in the cases of Iran and Iraq, to develop a broader industrial base to reduce reliance on oil. In Iran, state companies dominate industry, but many new private-sector companies have been formed since the 1979 Islamic Revolution. Moreover, the share of the private sector grew in the mid-1990s after approximately four hundred state-owned companies, mostly in light manufacturing, were privatized. Due to the war with Iraq (1980–1990), several major industrial schemes had to be postponed. After the end of the war, a government reconstruction program revived these projects and restored war-damaged industries. In the 1990s, the Iranian government gave priority to the development of the mining and metals processing, automotive, pharmaceuticals, and petrochemicals sectors.

During the first decades after World War II, Iraq established its basic steel and chemical industries. In the 1970s, automobile industries, as well as production of construction materials and household consumer goods, were established and expanded. Most funding, however, was directed toward petrochemicals. In the 1980s, the development of a local arms industry was the government's top priority because of the war with Iran and the arms embargo by foreign countries on both Iraq and Iran. In the 1990s, the Iraqi government gave priority to establishing downstream oil and natural gas industries (that is, industries that further process oil and natural gas). Import substitution of basic heavy goods is still an important aspect of Iraqi industrial policy.

In the early 1960s, the Turkish government introduced five-year development plans and a related annual economic program within each five-year period, which aimed to encourage industrial growth and a shift away from agriculture. In 1980, an economic stability program was adopted, followed by radical changes in the monetary, fiscal, foreign-trade, and foreign-currency exchange-rate policies. A transformation was initiated in the direction of industrialization based on exports directed to foreign markets, instead of industrialization based on substitution of imports directed to domestic markets. Free-trade zones and international fairs in the 1980s were influential in the development of Turkish industry and its integration with world markets. As a result of these efforts aimed at the

development of the industrial sector, the share of industrial products in the total exports of Turkey increased from 36 percent to 77.4 percent between 1980 and 1998. Certain problems in the performance of Turkish industry arise from the State Economic Enterprises, which are a system of public-sector companies. They are generally inefficient and add a heavy burden to the government budget deficit.

Mining Industry

Expansion of minerals production in West Asia has traditionally suffered from shortages of foreign currency for machinery and from limited technical skills. Technical cooperation and joint-venture negotiations with foreign governments and companies to develop the mining sector are important for all West Asian countries. The main minerals companies in West Asia are state owned, but governments are trying to encourage private investment in mineral exploration and production.

The main products of Turkish mining are iron ore, coal, lignite, bauxite, and copper. Turkey is also among the world's largest producers of boron and a leading exporter of chrome, meerschaum, and perlite. Other important minerals mined in Turkey are barite, mercury, and wolfram. Iraq's mining industry produces phosphates, sulfur, and building materials. Uranium is also available as a by-product of phosphates. The phosphates industry was established late, in 1982, and two towns were built, together with water-, oil- and gas-supply facilities in the sparsely populated western desert region. The Mishraq natural sulfur project near Mosul began production in 1971.

The Iranian mining industry produces iron, coal, and copper. Iran is also among the largest producers of gypsum and chrome in the world. Iran and Turkey together produce around 15 percent of the world's output of chromites each year.

Energy

In 1998, West Asia's oil-refinery capacity was above 125,000 metric tons of oil per year. Iran is the leading nation, ensuring more than half of the whole production. (See Table 1.)

The beginnings of the oil industry in West Asia date back to 1908, when petroleum was discovered on the western side of the Zagros Mountains in southwest Iran. Iranian oil facilities were quickly expanded during World War I. As important oil discoveries were made and new oil fields were brought into production during the following decades, the geographical pattern was changed, and oil was found in other areas. However, due to geological conditions, the western slopes

of the Zagros Mountains near the Persian Gulf are still the site of the largest Iranian oil fields. Immediately before World War II, Iranian oil production exceeded 10 million metric tons. Starting in 1943, the development of the Iranian oil industry was accelerated when more petroleum fields were connected to the Abadan refinery on the Shatt al Arab by pipelines. In the beginning of the 1950s, the oil industry experienced troubles due to political disagreements between the Anglo-Iranian Oil Company and the Iranian government. A compromise was reached in 1954, when an agreement was signed between the Iranian government and a group of oil companies generally known as the Consortium. In the Consortium were seventeen U.S., British, Dutch, and French companies.

Iran and Iraq were among the nations that established the Organization of Petroleum Exporting Countries (OPEC) in 1960. Production of oil, gas, and electricity was seriously affected by the Iran-Iraq war. In the early 1990s, Iran rebuilt its devastated oil and gas facilities, including the 628,000-barrels-per-day Abadan oil refinery and the oil installations at the Persian Gulf port of Lavan. Several petrochemical projects realized in the 1990s have transformed Iran from a major importer of petrochemicals to a net exporter. Three state companies are now responsible for the oil, gas, and petrochemicals sectors in Iran. Oil exports are crucial to the Iranian economy, providing over 90 percent of foreign-exchange earnings.

Creation of the oil industry in Iraq began later and was carried out at a slower speed than in Iran. Petroleum was first discovered in commercial quantities along the Iranian border, in 1923. An important oil discovery took place in 1927, when oil was found at Kirkuk. Subsequently, new fields have been brought into production at Mosul, Basra, Rumaila, and other places, but Kirkuk has remained the main source of Iraqi crude oil. The monopoly position of the Iraqi Petroleum Company caused some difficulties after

1952, which strongly affected the development of the oil industry. The situation was changed in the 1970s through nationalization of the northern oil fields and most of the oil facilities. The Iraqi oil sector was seriously damaged by Iranian air raids in the early 1980s. After the war, Iraq rehabilitated its oil-refining and gas industries. However, during the Persian Gulf War (1990–1991), some oil refineries, petrochemical plants, and about 90 percent of Iraq's electricity-generating and -distribution capacity were damaged by Allied air raids. During the 1990s, Iraqi oil and energy facilities were gradually repaired.

Although a leader in the total production of electricity in West Asia, Turkey usually experiences energy shortages. Additionally, Turkey is only 15 percent self-sufficient in its oil needs. Consequently, large quantities of crude oil have to be imported, mainly from OPEC countries, as well as some electricity. Contemporary Turkish energy policy is focused on ensuring reliable and sufficient supplies, broadening energy imports, and achieving greater energy efficiency. Investment in the energy sector has remained a priority. In comparison with the other two countries, Turkey has much better developed hydroelectric power. (See Table 1.) In 1998, West Asia's oil-refinery capacity was above 125,000 metric tons of oil per year. Iran leads in West Asia, accounting for more than half of West Asia's total refinery production.

Manufacturing

The beginning of West Asia's manufacturing took place in Turkey and Iran, countries with a relatively diversified resource base and large populations. Copper-smithing, carpet making, and other craft industries had developed for many centuries, until textile manufacture and food production were established during the nineteenth century, using mechanical power and machines in factories. Sustained industrial development continued in the twentieth century and acceler-

TABLE 2

Production of selected manufacturing products						
(in thousands of metric tons)						
Country	Crude steel (1997)	Sulphuric acid (1997)	Cement (1997)	Paper and paperboard (1998)	Cigarettes (in millions; 1999)	Meat (1999)

SOURCE: Euromonitor (2001).

ated after World War II, when a start was made on building up heavy industry. Turkey has the highest level of manufacturing development in West Asia nowadays. At the end of the 1990s, Turkish manufacturing accounted for about 80 percent of the country's total industrial production. Fourteen percent of Turkey's GDP comes from textile and apparel production, and this sector accounts for over 20 percent of manufacturing employment.

In Iran, the largest industrial conglomerate is the National Iranian Industries Organization, a state-owned group, whose companies are in nine industrial sectors: textiles, chemicals, pharmaceuticals, food, footwear and leather, electrical goods, construction, cement, and celluloid. These companies account for about 25 percent of Iran's total industrial output. In the 1980s and 1990s, West Asia's consumption of manufacturing goods fluctuated because of the war between Iraq and Iran and

the lack of foreign exchange, especially for the products of heavy industry. The major metallurgy factories are in Turkey and Iran. These countries are also the main producers of chemical products, woodworking, and food and leather products. (See Table 2.)

The reconstruction programs in Iran and Iraq have greatly increased cement requirements, but Turkey is still the main producer of cement. Contemporary West Asia's machine-building industry imports machines and spare parts, and most of its branches are heavily dependent on Western technology. Moreover, the normal running of existing machinery is often interrupted by poor servicing caused by a shortage of technicians and skilled workers. The leading producer of machinery is Turkey, whose internal market shows increasing interest in a variety of items.

The increasing local demand for cars, for example, has encouraged more foreign companies to consider

The "X7"—the first entirely Iranian-conceived automobile—on display at the Tehran International Automobile Fair in June 2001. (AFP/CORBIS)

establishing a local operation in Turkey. The number of cars assembled in Turkey increased from 31,529 in 1980 to 250,000 in 1998. The biggest car maker is TOFAS (Turk Otomobil Fabrikasi A.S). In late 1988, the largest Iranian automobile manufacturer, Iran Khodro, reverted to the private sector after having been taken over for the war effort. Both Turkey and Iran manufacture trucks, cars, vans, buses and minibuses, and appliances for household use.

Regional Disparities

West Asia is a region of grave regional disparities, to a large extent due to the pattern of industrial development. The main industrial centers are the capitals of Ankara, Tehran, and Baghdad, with their large and wealthy markets, and the major provincial towns, like Istanbul, Esfahan, and Mosul. They concentrate much of the industrial establishments and workforce, and the gap between them and the other regions is considerable. This generates the inevitable uneven development.

The future of industry in West Asia depends on several factors, mainly the economic policies of the three nations, the presence of adequate investments, both foreign and domestic, and political stability in the Middle East.

INFORMATION TECHNOLOGY INDUSTRY Emerging economies in Asia are experiencing dramatic changes in patterns of ownership and investments in their information technology (IT) sec-

tors. Such investments continue to revolutionize societies across political frontiers, leading to a race for a larger share of global markets.

Information technology is the various ways by which communication takes place electronically, whether for personal, corporate, or intergovernmental services. It represents convergence, which is the merging of content and carriage via multimedia channels. The Asian nations that are leading in this area are Japan, South Korea, Singapore, and Taiwan. China has a vast market potential and profits from the advances made by Hong Kong. Japan took the lead when the government in the 1970s declared its pursuit of a *joboka shakai* (information society) and directly encouraged the growth of its semiconductor industry competing in global markets. South Korea led with *chaebols* (large family-owned corporations) that imported IT and adjusted technology to suit its domestic market. In Singapore and Taiwan, government-led advances in IT were directed toward export-led growth. Malaysia, Indonesia, and India lagged behind because their governments lacked political vision, leadership, and funding resources at a time when the IT sector was taking off.

Information technology is important because it contributes to the growth of all other sectors in an economy. Information technology development has made the region concentrate on its competitive strengths in global markets through continued priority in investments in the IT sectors. This has resulted in the emergence of more democratic government and greater scope for entrepreneurship.

The Internet Economy and the Information Technology Sector in Asia

Asia has made strong inroads into the world Internet economy, which will top \$1 trillion by the end of 2002, as estimated by Accenture, a U.S.-based consulting firm. Hong Kong, Singapore, Malaysia, and Taiwan have invested vast sums of money in teleports, cyberports, and technology parks to advance the use of the Internet and electronic commerce. South Korea takes the lead in using broadband (wider electromagnetic spectrum) technologies for faster access to the Internet and higher volumes of data exchange and storage. Japan takes the lead in the Third Generation (3G) wireless technology, which enables Internet access on cellular telephones. Internet users in Asia totaled 37 million in 2001, compared with 30 million in Europe. In Asia, digital networks redefine what kinds of infrastructure are possible under the sweeping trend of converging technologies. Both the Asian Tigers (Singapore, South Korea, and Taiwan) and develop-

ing nations such as Malaysia, Indonesia, and Thailand have moved to liberalize their state-owned telephone companies and introduce competition. Investments in improving access to telephones depend on the degree of liberalization as well as the willingness of the telecommunications companies to provide citizens with affordable telephone services.

E-commerce is soaring in Asia; B2B (business-to-business) transactions are expected to soar to 7.3 trillion in 2004, according to Accenture. The feverish activities of the "dot com" firms in Asia are not the full extent of the changes that the Internet is bringing to Asia. Some nations, such as Singapore, Malaysia, and Hong Kong, have invested in cybercities to house IT companies.

China

China has the second-largest market in the world for telecommunications equipment. It invested \$100 billion in its ninth Five-Year Plan between 1995 and 2000 to upgrade and extend its fiber-optic land lines, with contracts awarded to Alcatel (a French firm) and to Lucent of the United States for digitized telephone exchanges. China's gross domestic product (GDP) in 2000 was \$1.08 trillion, compared with \$9.87 trillion in the United States and \$4.75 trillion in Japan. But what is more amazing is that China's IT sector was growing at 25 percent per annum, overtaking the growth of GDP of 12 percent per annum. Internet connections have been installed under the directive of the Ministry of Information Industries (MII) to cover forty-three cities that constitute the Chinapac network for data transmission. The MII is also connecting one thousand universities under CERN (China Educational Research Network) to use the Internet. Cisco Systems has the contract for the routers and Sprint for the telephone backbone. According to Minister Wu Jichuan, one more telephone company is to be developed to compete with China Telecom, which will provide services to the neglected provinces in the north. With so much liberalization and with China's entry into the World Trade Organization (WTO) in November 2001, China still has to make some drastic changes to its market economy. It must make it possible for other member nations of the WTO to reach its 1.3 billion consumers and lift some restrictions on foreign participation in its joint ventures, increasing to 33 percent and to 49 percent after three years. Even within its own domestic sector, it will have to give a larger role to its private enterprise. China's foreign trade now totals \$475 billion per year, making it the world's seventh-largest trading nation.

China manufactures and launches its own satellites. Its satellite-launch equipment, called the Long March

II and III rockets, is used for international spacecraft. China has permitted contracts with Hughes, Lockheed Martin, and Space Systems Loral for satellite equipment in the past. But when the U.S. Congress approved the Cox Commission's report (1999), all new contracts were stopped, dealing a severe blow to the U.S. satellite industry. Chinasat is a flourishing company within China. In November 2001, the MII authorized a new telecom giant called China Telecommunications Satellite Group Corporation, involving Chinasat and AP Star in Hong Kong, to serve as a telecom operator.

The wireless revolution is also overtaking China as 2 million cell phone users are being added every month, and 14 million pagers are imported each year in addition to those produced domestically. In 1994, a cell phone in China cost \$2,000, but today it costs \$200 because of economies of scale.

Malaysia, Indonesia, and Thailand

Malaysia's Vision 2020 program has become the linchpin for its IT sector and has helped the nation out of its financial crisis despite the capital controls instituted by Malaysia's prime minister, Mahathir Mohamad. Vision 2020 involves a \$20 billion investment in the Multimedia Super Corridor (MMSC). The corridor will include two cities based on electronic networks: Putrajaya, to house a paperless bureaucracy, and Cyberjaya, to develop convergent IT. Malaysia was the first nation to privatize its telephone authority, in 1976, and promulgated the Multimedia Communication Reform Act in 1998. The Japanese company Nippon Telephone and Telecommunications Company (NTT) invested \$2.5 billion to install ATM (asynchronous transfer mode) switches and a fiber backbone for Cyberjaya. A new broadband infrastructure has been put in place to propel Malaysia to the forefront of the region's industry and to compete with neighboring Singapore. Since privatization of its telephone company, Malaysia has spent \$4.5 billion to upgrade its fixed-line services and to install ISDN (integrated services digital network, a high-speed Internet infrastructure) to the interior of the peninsula. The teledensity rose to 19 percent, and the market for telecommunication services has been growing at 12 percent, overtaking GDP growth. Private-sector investment has been 15 percent of the total. A private company, Benariang, was given the contract to launch MEASAT (Malaysian East Asian Satellites), with the two first satellites' beam extending over Singapore and the Philippines. The third-generation satellite has a more extensive footprint, covering India and South Africa. It uses DTH (Direct to Home)

technology for its broadcasts and attracted an investment of \$1.8 billion from U.S. West in a joint venture. American computer and technology firms such as Microsoft, Sun Microsystems, and Oracle have located their subsidiaries in the Cyberjaya experiment. Japan announced an aid package of \$2.1 billion in 1999 to help Malaysia expand its semiconductor export industry.

Indonesia, despite its troubled economy, was the first Asian nation to own its own domestic satellite, called Palapa. It leased the transponders (channels) of that satellite to Malaysia, Singapore, Thailand, and Papua New Guinea as far back as 1976 to earn revenues for several years. Even so, Indonesia has only two telephones per one hundred people despite having the fourth-largest population in the world. Indonesia's state monopoly, PT Telekom, sought a loan of \$40 million to pay for its new satellite, Telekom I, which was launched in February 1999. The total cost of the satellite was \$191 million; it was built by Lockheed Martin of the United States. It will serve Indonesia's voice and data needs for fifteen years. The best technology to link an archipelago of thirteen thousand islands has been satellite. Despite the economic malaise that hit the nation in 1997, Lockheed Martin joined a three-nation venture for a roaming access cellular system called AceS with Indonesia's Nusantara system and Jasmine International of Thailand. It will provide telephone, television, and multimedia services to all the islands. The satellite is called Garuda, and it also provides radio communication.

Thailand is also developing its telecommunications infrastructure rapidly with foreign direct investment, which increased after the partial privatization in 1995 of its telephone networks, both domestic and international. Contracts were awarded to private firms to build a 1.9-million-telephone land line throughout the nation. Telecom Asia is the biggest private company in the IT field. The goal is to build as many telephone lines in Bangkok as there are in Manhattan. The World Bank has given loans to Thailand to build public telephone booths in the rural areas of the nation. Thailand's satellite industry is entirely in the private sector, which consists of the Shinawatra Company, owned by the prime minister. Thaisat satellites supply communications throughout Thailand. The Samarat Company supplies Internet services in a joint venture with Sun Microsystems. The same company provides the Thai Tradenet, which allows foreign companies to access their subsidiaries for intranet services. As predicted by the World Bank's *Annual Development Report 1999*, IT is the driving force behind the recovery of Bangkok's economy.

Singapore and Taiwan

The economies of Singapore and Taiwan have been in the vanguard of the technology revolution, which enabled them to withstand the financial crisis in 1997–1998. Singapore prides itself in being the "Intelligent Island" of Asia. It retained the confidence of its foreign investors because of the integrity of its government system. Sing Tel is Asia's most efficient telecommunications company, with a market capitalization of \$40 billion in joint ventures in twenty-one nations. From 2000, Sing Tel opened its local and international call services to competition and provides broadband open network services to all homes and businesses. Singapore was the first nation in Asia to set up a teleport, which it set up on Batam Island in collaboration with Indonesia and Malaysia. The teleport operates like an airport with communications traffic instead of passengers. Singapore has a Tradenet system, which documents on computers all trade that passes through its busy harbor, making it the transshipment center of the Pacific. Singapore's computerized stock exchange, Simex, is linked to the Chicago Mercantile Exchange twenty-four hours a day. A national computer board has been responsible for the development of the nation's Science Park and the computer education of all its citizens, young and old.

Despite Internet content being restricted in Singapore, the government encourages the growth of "netpreneurs" and venture capitalists and discourages resellers of telecom services. DSL (digital subscriber lines, a broadband Internet infrastructure) is proliferating on the island to provide video on demand on the same platform as other telecom services. Additionally, there is Group W network services, which houses the Asia Broadcast Center with 11-meter satellite receiving dishes for incoming signals from Panamsat 2 and 4, Apstar I, and Palapa C1, which are satellites whose footprints cover the entire Pacific Rim. Its Media One service links all homes to cable television services.

Taiwan has been one of the prosperous Asian Tigers. It planned its economic growth around its export sector to build large foreign currency reserves as high as \$100 billion when the financial crisis arose in Southeast Asia in 1997. Taiwan has permitted private competition in its telephone service supplies and built a strong semiconductor industry, moving on to sophisticated computers. The nation's private sector has played a leading role in its high-tech development. Hsinchu Park is the world's third-largest technology center, making Taiwan a global leader in producing notebook computers, ahead of the United States, Japan, and South Korea. Taiwan also manufactures the lowest-priced circuit boards that go into 65 percent of

the world's computers. Acer is the largest computer manufacturer in Taiwan, selling its products in China and the rest of Asia. Asustech is another Taiwanese company. It supplies 8 percent of the world's market for motherboards for computers. On the whole, Taiwan has large investments overseas, with \$25 billion in China and \$30 billion in Vietnam, Indonesia, and the Philippines combined.

South Korea and Japan

In contrast to Singapore, South Korea was battered by the financial crisis. Korea Telecom had already been privatized as far back as 1989 under the Telecommunications Business Law. Dacom, which was set up for data communications, is still in the private sector and competes with Korea Telecom, in which the government still has a major stake. Dacom has set up the online infrastructure for the entire nation, which stimulates the Internet economy domestically. South Korea has attained convergence in telecommunications better than any other Asian Tiger. It distinguishes between different suppliers, which converge in their operations such as networking, programming, and broadcasting. It is the Asian leader of the broadband spectrum to provide speed and volume on the Internet. The global market for Internet-ready cell phones is likely to rise to \$1 trillion in the next five years, placing South Korea in competition with Japan for the Asian market.

In Japan, the longtime monopoly of Nippon Telephone and Telecommunications (NTT) was ended by decree in December 1996, and later NTT was divided into three companies, consisting of two local exchange carriers and one long-distance carrier. Despite this decree, NTT continues to dominate the domestic market and competes with Kokusai Denshin Denwa (KDD). KDD has merged with Tokyo Telecommunications Network, which is a subsidiary of the Electric Company of Tokyo. Japan has taken the lead in wireless communications with the rollout of the new global standard called 3G (Third Generation) for its DoCoMo service, now used by 25 million Japanese. The new I-mode standard in Japan equips cell phones with cameras so that pictures taken are immediately transported on the Internet. This broadband access is thought to give the best benchmark for a nation's progress toward widespread access. South Korea still leads with 38 percent broadband access, compared with Japan's 3.4 percent.

So far, Japan has kept its telecommunications market restricted to domestic suppliers; thus in February 2001, the European Union and the United States increased their pressure on Japan to enhance competi-

tion and threatened to file a complaint to the WTO if this was not done with speed. There are an estimated 50 million Internet users in Asia, of whom 22 million are in Japan, thereby giving the advantage of a critical mass to Japanese suppliers. Fujitsu of Japan and Nokia of Finland are competing to build transmission stations around the globe for wireless telephony because it is a trillion-dollar industry. Sony of Japan is experimenting with building cell phones that will double as multimedia players.

The *Wall Street Journal* ("A Tidal Wave Sweeps Asia," 12 March 2001: 5–8) reported that "a tidal wave sweeps Asia because of the deregulation of undersea cable construction and continued leaps in fiber optic technology." Today's equipment can transmit three times more data over a given pair of fibers than could the same-priced equipment in 1999. Singapore's SEA ME WE (Southeast Asia, Middle East, Western Europe) cables, along with the PacRim cables, have linked Asia with the United States and Europe. The FLAG (Fiber Link Around the Globe) undersea cable has linked the Atlantic with the Pacific landing in Shanghai. Global Crossing Asia has completed its system linking Asia with the United States. It is equipped with an automatic backup system called a self-healing capability that reroutes data transmission if there is a break in the cable. Lack of demand perhaps led to the bankruptcy of Global Crossing, and Sing Tel and Hutchison Wahampoa considered purchasing it. In this competitive environment, Fujitsu of Japan and Alcatel of France built the Southern Cross undersea cable, which passed through Hawaii and landed in San Luis Obispo in the United States. Tyco is also a player in the Pacific, with a system called Pacific Crossing-1, connecting the United States with Japan. The principal

INFORMATION TECHNOLOGY GIANTS

Of the ten largest information equipment firms in Asia, eight are in Japan. They are Hitachi, Toshiba, Fujitsu, NEC, Mitsubishi, Canon, IBM Japan, and Ricoh. The two non-Japanese firms are Samsung Electronics in South Korea and Flextronics in Singapore.

Source: AsiaWeek (9 November 2001), 121.

owners are KDD, Marubeni of Japan, and Global Crossing. The first link came into service in 2000. It is estimated that \$36 billion will be spent on submarine cables worldwide, of which \$15 billion will be invested in trans-Pacific routes, eclipsing the investment across the Atlantic.

India

In India, the Internet is cable based and is growing rapidly. The International Data Corporation predicts that India will have 5 million Internet users by 2003, making it the fourth-largest market in Asia. Currently, 200 of the Fortune 1,000 companies outsource their requirements to India. India earns considerable foreign exchange in IT-based exports, which are expected to rise to \$50 billion by 2008. Even traditional corporations are investing in supply chain management, e-commerce, and e-business solutions. The nation's expertise in software production enables it to lead other Asian low-income nations in IT. India's National Association of Software and Service Companies estimates that India will earn \$1 billion in 2002 from its software industry.

Minister for Information Technology and Parliamentary Affairs Pramod Mahajan of India at a press conference on 8 June 2000, where he discusses plans to expand the Indian IT sector. (AFP/CORBIS)

From 1999 onward, regulations have permitted 100 percent foreign direct investment in India's IT industry but not in retail trading. India reformed its telecommunications sector in 1999 by setting up its Telecom Regulatory Authority and a new telecommunications policy to liberalize this fastest-growing sector of the economy. The monopoly carrier has been VSNL (Videsh Sanchar Nigam Ltd.), but the government had planned to end its monopoly in April 2002. The government has licensed nine private operators of VSAT (very small aperture terminals) to supply phone services to remote and rural areas via satellite. Even for corporate communications VSATs are used for data transmission using wideband channels. In 1999, the government appointed the Commission on Convergence of Broadcasting, Telecommunications, and Information Technologies, which recommended a regulatory body to take care of spectrum allocation disputes as well as licensing of service providers. Also, the Information Technology Act of 2000 is an important milestone in India's development because it deals with electronic transactions and protects digital signatures. It also recognizes the digital filing of government documents. In India, the slow speed of web connections hinders obtaining information on the Internet.

Bridging the Asian Digital Divide

Asia is leading the web phone race because Asian nations have the world's newest digital networks. According to author Jeremy Rifkin, only one-fifth of the world's population has access to information technology. Half the world's population has never used a telephone. Villages in India, Indonesia, and China are isolated by their lack of communications. Farmers do not know the market prices for their crops and are swindled by businesspeople who profit from their ignorance. In emergencies farmers have to walk to get help because there is no access. The Independent Commission of the International Telecommunications Union, based in Geneva, issued its *Missing Link Report* to emphasize this disparity of access to telephones in the Third World and recommended that there be a public phone booth within twenty minutes of walking in every village around the globe. However, even in the twenty-first century the link is still missing despite the advances made in information technology and growing investments by national governments to place their nations on the global information superhighway. Although the metropolitan centers in China, India, Indonesia, and the Philippines have all the sophisticated technologies, including wireless services, the remote areas of those nations are starved for access. Such disparities have led to social

OUTSOURCING INFORMATION TECHNOLOGY TO ASIA

A combination of high overhead in the United States and strong cultural ties between the domestic and Asian information technology industries have led many companies to outsource labor-intensive software programming to Asia and Eastern Europe.

India has always been a major player in information technology (IT); they even make their own supercomputers for predicting monsoons. It wasn't until the Y2K bug emerged that the need for legions of cheap programmers really arose, however, and American companies began to see the potential for outsourcing overseas. After Y2K the IT service industry exploded, with American companies outsourcing everything from data entry to customer service to India and other Asian countries.

India was a natural choice for outsourcing. Many American technology companies were either created by or employ nonresident Indians (NRIs) or Indian-Americans who still have strong ties to family and friends in India. This cultural bridge combined with the vast pool of cheap, technically skilled, English-speaking engineering talent produced by India's engineering colleges creates the perfect environment for information technology.

Despite its distinct advantages for companies looking to outsource their IT services, India's volatile political climate and rampant corruption present problems. Some of the 185 Fortune 500 companies that outsource software to Asia are choosing places like Vietnam or China with more predictable politics and less corruption. Other companies that outsource their customer service are finding that their customers prefer the Americanized English of the Philippines to the British English that predominates in India, though all of these countries have their drawbacks, from censored Internet lines in China and Vietnam to Muslim militancy in the Philippines.

Despite the hiccups the IT service industry continues to grow as the software industry becomes more competitive and U.S. companies try to reduce overhead. The Asian IT service market is still in its infancy, but by 2008 industry think tank Nasscom-McKinsey predicts a \$17 billion IT service industry in India alone.

unrest and to large migrations of people from rural regions to the cities, causing congestion and ghettos even in the United States. In 1998 and 1999, the U.S. National Telecommunications and Information Admin-

istration published two reports dealing with this problem and describing the problems of drugs and crime as a consequence of the lack of access, which also hinders education and employment.

The Group of Eight (G8) ministers of affluent economies met in Okinawa, Japan, in July 2000 to deal with the differences of affordability. The G8 recognized that IT empowers, benefits, and encourages respect among global citizens. The ministers issued the Okinawa Charter on the Global Information Society and set up the Digital Opportunities Task Force. One of the major recommendations of the charter was the principle of inclusion to provide universal, affordable access to all persons everywhere at all times, to foster the free flow of information and knowledge, and to promote human development. G8 ministers vowed to exercise their leadership to optimize global networks to bridge the digital divide, to invest in people, and to promote global participation. G8's meeting in Qatar in 2002 continued its appeals to global public and private sectors to continue efforts to bridge the digital divide.

Despite the enormous growth of investments in China's IT sector, there is great disparity in wage incomes in China. Wages in Shanghai are eight times higher than the per capita GDP. Workers in the remote areas of central and western China bordering on Mongolia are deprived of links to markets in their own nation. Unequal access in China is caused by a substantial wealth gap, leading to a poverty belt stretching from Yunnan in the south to Xinjiang in the north. Wireless communications hold the potential for closing this divide, provided that the cost is subsidized. The promise of mobile communications lies in reducing the cost of laying land lines to remote and mountainous regions by national telephone companies. In nations like India and China and Indonesia, mobile networks, including satellite-based services, are being introduced. For example, people who fish in Cochin in the state of Kerala in southern India use mobile phones for access to markets. Similarly, in Bangladesh, where the per capita income is less than \$200 a year, an organization called Grameen Telecom was set up in 1997 to provide low-cost phone services to sixty-eight thousand villages. This organization is headed by women who collect the charges from users and generate revenues of \$12,000 per year per village from one of the world's poorest nations. Such services are being provided through kiosks in Africa by the International Development Research Corporation of Canada and by World Space, based in the United States. Two private companies in India have provided village phones at low cost. Escotel provides mobile phones to villages in Uttar Pradesh, and BPL provides fifteen hundred mobile phones in rural areas of Kerala to boost the fishing industry there. Likewise in Mongolia, low-cost mobile phones are provided by the government to the nomads (*ghirs*) for use in selling the cashmere wool from their herds. In China, pagers

are found to be more practical in providing access to rural residents.

Many conclusions can be drawn from the growth of IT investments in Asia. On the one hand, such investments are resulting in economic growth and greater human resources; on the other hand, they are deepening the digital divide. *The Asia Recovery Report 2001*, issued by the Asian Development Bank (ADB), indicates that poverty is declining, which may be a sign that the digital divide is being bridged. However, after the 11 September 2001 terrorist attacks in the United States, with the slowdown in the American economy and the global recession, with the electronics sector losing profits, Asian nations are finding it difficult to compete with exports in IT-related products. The entry of China into the WTO makes the export sectors of other Asian nations more challenging. With political unrest and the war on terrorism, investor confidence in Asia will have to be restored. The ADB forecasts that income growth in Asia may rise to 5 percent in 2002. Surviving the value chain is becoming difficult for private companies in India, and even companies like Leading Edge and China dot Com in China are not reporting high profits. Depending on the political and currency stabilities in various nations, bridging the digital divide will not be the same in China as in Thailand or Indonesia. The rising tide of IT may not lift all boats at the same time, but the IT transformation holds out hope of converting the divide into a dividend for Asia.

INLE LAKE REGION Inle Lake is the second-largest lake of Myanmar (Burma). Twenty-two kilometers (14 miles) long and up to four kilometers (2.5 miles) wide, it forms an integral part of a major water system that extends from the southern Shan Plateau to Kayah State, 110 kilometers (69 miles) to the south. It is also famous as the home of the Intha people, who practice a unique style of "leg rowing" and speak a distinctive dialect of Burmese that is similar to that of the Tavoyan people of the Tenasserim (Tanintharyi) Division in Myanmar's far south.

Other ethnic nationality peoples inhabit the lake and surrounding highland regions, including the Shan, Pao, Taungyo, Danu, and Palaung. The population around the lake is estimated at eighty thousand people dwelling in sixty-four villages. The largest of these villages is Haiya Ywa-ma, which is located halfway down the lake. Many of the lakeside houses are accessible only by boat and are built over the water on wooden stilts.

Fishing and farming have traditionally been the main occupations of local inhabitants. An unusual feature is the floating gardens, where crops such as tomatoes, potatoes, eggplants, cucumbers, and flowers are cultivated on artificial islands. Tourism has also become an important part of the local economy in recent years, encouraged by the proximity of the Shan State capital, Taunggyi, and the Heho airfield nearby. The main entry point to the lake is at Nyaung Shwe, which lies by the northern shores. In addition to weaving and silverware, a main attraction is the Phaung-Daw-Oo pagoda. The present buildings are of modern construction, but the temple houses five renowned Buddha images that, according to legend, date from the twelfth century CE. A major event is the boat festival each October.

The increasing number of visitors, however, has placed the fragile ecosystem of the lake under severe pressure. This has been exacerbated by declining water levels, caused by decades of oversilting from deforestation in the surrounding hills. As a result, more and more earth washes into the lake each rainy season. During the 1990s, various schemes were contemplated to increase environmental protection, including the banning of logging, reforestation, and the designation of nature sanctuaries to preserve the lake's endangered flora and fauna.

INONU, MUSTAFA ISMET (1884–1973), Turkish president. Ismet Inonu, the second president of Turkey, oversaw the creation of a multiparty political system. Inonu, originally known as Ismet Pasha, received a military education and served as a colonel in the Ottoman army during World War I. He became a commander on the western front during the Turkish War of Independence (1919–1923), and led Turkish forces to two major victories against the Greek army near the Anatolian town of Inonu (the origin of the name he took after the victories). Subsequently, he led the Turkish delegation in peace talks with the Allies at Lausanne in 1922–1923.

Ismet Inonu served as the Turkish Republic's first prime minister and became president following the death of Mustafa Kemal Ataturk (1881–1938). As Turkey's national chief and permanent leader of Turkey's only party, the Republican People's Party (RPP), throughout World War II, Ismet Inonu worked to maintain Turkish nonbelligerency. In 1945 Ismet Inonu called for the creation of a multiparty system and worked to ensure its success. After the RPP lost to the Democrat Party, led by Celal Bayar (1884–1987), in the 1950 elections, Ismet Inonu remained active in politics, serving as chair of the RPP until 1972 and as prime minister from 1961 to 1965. In his memoirs Ismet Inonu wrote that his greatest achievement was the creation of the multiparty system.

INTELLECTUAL PROPERTY Intellectual property, by which is meant proprietary interest in such intangible yet commercially valuable things as trademarks, technology, and entertainment content,

has proven a knotty problem in the adjustment of trade differences between East and West. Several Asian nations, most especially China, have permitted business practices that developed nations, the United States in particular, consider little better than theft. Such "piracy," as it is often called, involves using patented technology or media content without paying royalties to the patent or copyright holders. Some progress in resolving differences was made as the twenty-first century began, but substantial disagreement remains.

Development of Issue

From the nineteenth century, it has been common practice for nearly all Western nations to regard certain processes, trade symbols, and items of manufacture as a species of property, rights to which may be vested in the inventors or those to whom they assign them. The United States came somewhat late to these agreements, being notorious during the nineteenth century for allowing its citizens to freely appropriate the work of others and sell it for profit. In the twentieth century, the Soviet Union was, likewise, notorious for its refusal to honor international copyright conventions, asserting that all humankind alike was freely entitled to the full fruits of knowledge.

The question of what constitutes legally protected intellectual property became increasingly complex during the second half of the last century as human knowledge increased. In the West, the law expanded to include such innovations as genetically engineered organisms and computer software. Some of these technologies were so vital to a modern postindustrial economy that any nation-state that lacked access to them must inevitably remain relatively backward. At the same time, however, these technologies were often so extraordinarily expensive to nurture that without commercial protection for the developers, some feared that useful innovation might disappear. There is, thus, a natural conflict of interest between wealthy nations that originate new technology and possess its property rights and less-wealthy ones that feel shut out. In practice, much of this conflict occurs between the newly industrializing countries (NICs) of East Asia and the Western industrial giants—especially the United States.

This conflict of wealth is further exacerbated by Asia's colonial legacy. It is often the case that precisely those nations that hold essential intellectual property rights are the ones that formerly colonized Asian NICs. A certain postcolonial resentment only adds bitterness to these disagreements between the haves and have-nots.

India is a prime example of an Asian country with a postcolonial entitlement. With masses of impover-

ished people and relatively scant financial resources, modern India cheerfully allows its domestic pharmaceutical companies to manufacture and distribute medication developed in the West at a fraction of its usual commercial price and without a penny paid to Western patent holders. Indians cite the rampaging AIDS epidemic as sufficient justification for this practice. Why, they ask, should impoverished Indian citizens die for lack of needed drugs because of the exorbitant prices charged by Western patent holders, when a cheap, Indian-made copy can save them? Western nations, which watched India spend billions of dollars to develop nuclear arms, may retort that the problem in India is priorities, not funding.

U.S. Leadership in Protecting Rights

Regardless, the Western nations, led by the United States, have rallied to extend their concept of intellectual property throughout the world. Their overwhelming economic and technological superiority has enabled them to prevail in most, although not all, instances.

The U.S. insistence on protecting intellectual property is understandable, because it towers above all others in innovation. In 1992, for instance, an estimated 45 percent of all research and development in the world's industrialized countries occurred in the United States. By the mid-1990s, technology products constituted nearly a fifth of all U.S. exports, and the overall technological balance of trade was lopsidedly in the favor of the United States.

The United States was also peculiarly sensitive to intellectual property rights because of its vast dominance over the world entertainment market. By the 1990s, it was common for these American properties to be duplicated in Asian countries without payment of licensing fees and distributed widely via bootleg videotapes and CDs. China was a particular offender in this regard, although it was far from alone.

Ratification of TRIPS

Thus, the United States was uniquely instrumental in drawing up the Trade Related Aspects of Intellectual Property Rights (TRIPS) agreement that was ratified by most of the international community in 1994. This convention, which codifies intellectual property rights and provides enforcement mechanisms, was in large part the work of the United States Trade Representative (USTR), an office reporting directly to the president and charged with promoting U.S. commerce. The main offenders during the 1990s, in the view of the USTR, were Thailand, South Korea, Tai-

wan, India, Brazil, and the Philippines, while the People's Republic of China was in a class by itself.

Tools for enforcement of TRIPS were not lacking among the Western states, especially the United States. Access to the huge U.S. market is so vital to the NICs that U.S. threats of retaliatory tariffs were taken seriously. In addition, the United States made clear that it would block application for membership in the General Agreement on Tariffs and Trade for nonmember nations, China especially, if compliance were not forthcoming. During the 1990s, pirated American CDs, movies, software, and the like, while still not difficult to obtain, became somewhat less common on the streets of such cities as Taipei and Manila.

China, however, constituted the largest obstacle to full Asian compliance with property rights as understood by the industrial West. In April 1991 the USTR targeted that country for special attention, and China quickly made certain concessions to conform its laws to international trade conventions. It did so largely because the United States threatened trade sanctions. Shortly thereafter, the Sino-U.S. dispute on intellectual property rights turned especially nasty.

By the mid-1990s, the United States was running a wide trade deficit with China in that country's favor, and loss of intellectual property rights was cited as one cause. At the same time, China was in increasingly poor odor in congressional circles because of its repressive political stance at home. In May 1996 the United States threatened especially severe trade sanctions against China but was met by retaliatory moves. While U.S. trade diplomacy had prevailed against lesser Asian nations such as South Korea, Taiwan, and even Japan, China was so large and nationalistic that it felt free to defy U.S. pressure. The United States responded more subtly by targeting especially vulnerable exporters in China's Guangdong Province, and this produced results.

Simmering Sino-U.S. Relations

The twentieth century closed with Sino-U.S. tension over intellectual property rights being just one element of an increasingly combative trade relationship between the two powers. Nevertheless, both nations were loath to escalate the dispute to an all-out trade war, and China seemed inclined to make grudgingly small, but steady, accommodation to international trade conventions in property rights. Smaller Asian nations had, likewise, begun to fall in line.

INTERNATIONAL LABOR DAY—CHINA

The celebration of International Labor Day, 1 May, as an annual public holiday originated in North America in the 1880s. It was adopted by the ruling Nationalist Party (Kuomintang, or KMT) in China as early as the 1920s as a symbol of its willingness to bring all political groups into the fold. Following the founding of the People's Republic of China (PRC) in 1949, 1 May assumed much greater importance and was designated by the Chinese Communist Party as a key public holiday. In the early years of the PRC, workers enjoyed a paid day off from work and, along with party leaders, attended large-scale government-sponsored parades and other festivities in urban parks and squares throughout the country.

The celebrations included cultural activities, displays of military prowess, the carrying of banners and flags extolling the value of labor, and even mass wedding ceremonies, before climaxing with raucous fireworks displays. Recently, in a society that is more pluralistic and increasingly less dominated by the Communist Party, the focus has moved away from public ceremonies and military parades. Workers have been granted a week off from work and encouraged to travel, with the dual aims of stimulating consumer spending and developing China's tourism industry.

INTERNATIONAL MONETARY FUND

The International Monetary Fund (IMF, or Fund) came into official existence on 27 December 1945, when twenty-nine countries signed its Articles of Agreement (its charter), which had been agreed upon at a conference held in Bretton Woods, (in New

Hampshire, United States), 1–22 July 1944. The IMF commenced financial operations 1 March 1947. Today the IMF has near global membership of 182 countries. The Fund employs approximately 2,700 staff members from 122 countries. The Fund is headed by a managing director, who is also chairman of an executive board of twenty-four executive directors. The five largest members—the members that make the largest contributions to the fund, namely the United States, Japan, Germany, France, and Britain—are each entitled to appoint an executive director. By tradition, the managing director is a European. Most staff members work at the Fund headquarters in Washington, D.C., though a few are assigned to small offices in Paris, Geneva, Tokyo, and at the United Nations in New York. Some represent the IMF on temporary assignment in member countries. At present about seventy of these resident representatives are assigned to sixty-four member countries.

Purpose

The purpose of the IMF as established by its charter can be summarized as follows: (1) to provide the means for consultation and collaboration between members on international monetary issues, (2) to promote exchange stability and to maintain orderly exchange arrangements among members so as to facilitate international trade, (3) to assist in the creation and expansion of markets in which members can exchange currencies without restriction, and (4) to support members that are faced with a shortage of foreign currency by making the financial resources of the IMF temporarily available to them under adequate safeguards. Under the institution's Articles of Agreement, the member countries have committed themselves to promoting global trade and deepening economic integration by maintaining a stable international monetary system. This goal is to be achieved by maintaining orderly exchange arrangements among members (in order to avoid competitive exchange depreciation) and allowing individual national currencies to be exchanged without restriction (currently only 117 members have agreed to the full convertibility of their currencies). Member countries are obligated to keep the IMF informed of any changes in their financial and monetary policies that may adversely affect fellow members' economies, and to expeditiously modify or reform national policies on the advice of the IMF in order to facilitate international trade.

In addition to supervising the international monetary system and providing financial support to member countries, the Fund also makes technical assistance available to member countries in certain specialized

areas of its competence. It runs an educational institute in Washington to train personnel, and it issues a wide range of publications relating to all aspects of international monetary matters and IMF operations.

Operations

The Fund operates much like a credit union, serving as a manager of a common pool of financial resources estimated to be over \$300 billion in 1999. This resource base allows the Fund to establish a stable value for each currency and to demonstrate confidence in members by making the general resources temporarily available to them, thus providing them with the opportunity to correct maladjustments in their balance of payments without resorting to measures destructive to national or international growth. The Fund's capital comes almost entirely from quota subscriptions (membership fees), assessed on the basis of each member country's economic size and the extent of current account transactions. The size of a member's official foreign currency reserves is also taken into account. As a general rule, 25 percent of quota is required to be subscribed in an international reserve currency (international reserve currencies are the euro, the U.S. dollar, the British pound sterling, and the Japanese yen). The balance can be paid in the member's own currency. The combined contributions of the members form a pool of currencies that is known as the General Resources Account. This pool of currencies comprises the core resources from which the IMF funds lending to members. As each member has a right to borrow several times the amount it has paid in as a quota subscription, quotas may not provide enough cash to meet the borrowing needs of members in a period of great economic stress. To deal with this eventuality, the IMF has had since 1962 a line of credit for its members.

Those who contribute the most to the IMF have the strongest voice in determining its policies. The United States, with the world's largest economy, contributes about 18 percent (approximately \$38 billion in 1997) of the total quota, followed by Japan and Germany, which contribute 5.67 percent each. This means that the U.S. has 18 percent of the total votes. Quotas are reviewed every five years, allowing member countries to either increase or lower their contributions. The size of quotas not only determines the voting power of the member country but also what a country can borrow in time of need. While most of the matters that go to the executive board are decided by consensus, the voting power of the individual members often provides an important backdrop to how the consensus is shaped. A simple majority of the votes is

required for most matters, but the more important policy matters must receive 85 percent of the votes—which means that the United States has a veto power by virtue of its 18 percent share of the total quota.

The two principal functions carried out by the IMF today are surveillance of the members' economic policies and provision of short-term conditional financing to members facing balance-of-payment difficulties. The scope of the surveillance is quite wide, and covers, for example, trade and investment policies, the financial sector (including the functioning of capital markets), and exchange-rate policy. The scope of surveillance has been bolstered in the wake of the Mexican peso crisis of 1995 and the Asian financial crisis of 1997–1998.

Conditionality is attached to all IMF loans. This generally means that IMF financing requires the recipient country to adopt economic adjustment programs. Interest is also charged on the loans made under the IMF's standard lending facilities at a rate set to cover its costs, plus a margin to cover operating expenses. For certain other IMF loan facilities, interest surcharges or concessions apply. For example, the Enhanced Structural Adjustment Facility (ESAF), established in 1987, is designed to support macroeconomic adjustment and structural reforms in low-income countries. This is a concessional facility in that the interest rate is only 0.5 percent per annum. In November 1999, the ESAF was renamed the Poverty Reduction and Growth Facility (PRGF), and its objectives were changed to support programs to strengthen economic growth in poor countries. The PRGF loans carry an interest rate of 0.5 percent and are repayable over 10 years with a 6-year grace period on principal payments.

Besides supervising the international monetary system and providing financial support to member countries, the Fund also assists its members by making technical assistance available to member countries in certain specialized areas of its competence; by running an educational institute in Washington to train personnel; and by issuing a wide range of publications relating to all aspects of international monetary matters and IMF operations.

The IMF and the Asian Financial Crisis of 1997

The principal responsibility for dealing with the recent Asian crisis at the international level was assumed by the IMF, and the hitherto relatively unknown institution was put into the global spotlight as never before. Its every official utterance and policy move became the subject of intense public scrutiny and scathing criticism—from both the right and the left.

With the benefit of hindsight, it is clear that the IMF's record in dealing with the Asian financial crisis has been mixed.

The conditions that the IMF imposed on Thailand, Indonesia, and Korea in exchange for IMF-led rescue packages consisted of three basic components. The first concentrated on macroeconomic policy reform, in particular, the introduction of tight fiscal and monetary policy (that is, an increase in interest rates and the adoption of strict limits on the growth of the money supply), in order to produce current account surpluses and to stabilize the value of the currency by slowing currency depreciation. Policy reform also included the maintenance of high interest rates to stem (or reverse) capital outflows. It was believed that such a strategy would improve the current account and the balance of payments, halt the depreciating exchange rate, reduce money growth and inflation, and reduce the government budget deficit. The second component focused on structural reforms of the financial sector. The third consisted of nonfinancial microeconomic policies, such as the removal of trade barriers, the elimination of monopolies, enterprise reform and restructuring, creating competitive factor markets, and curtailment of government budgets—in particular, the elimination of subsidies. It was presumed that all these measures could be implemented without significantly harming the real economy.

However, the initial results of the Fund-supported programs in Indonesia, Korea, and Thailand were not what had been hoped. Specifically, the programs were not successful in quickly restoring confidence. On the contrary, capital continued to exit and the currencies continued to depreciate after the IMF-supported programs had been adopted. Moreover, the economies sank deeper into recession, contrary to initial projections of only a mild slowdown. Why was this the case? Critics have asserted that the IMF's unimaginative one-model-fits-all prescriptions actually made Asia's financial turmoil worse. Suffice it to note that these issues will remain the subject for much debate for some time.

IQBAL, MUHAMMAD (1877–1938), Poet-philosopher of Islam and Pakistan. Muhammad Iqbal, known as the poet-philosopher of Islam and Pakistan, was born on 9 November 1877, at Sialkot, India, and died at the peak of his fame on 21 April 1938, at Lahore. In Sialkot, Iqbal finished high school and then joined the Scotch Mission College, subsequently named Murray College. At this college, Iqbal completed two years of his education and then joined the Government College in Lahore, fifty miles from Sialkot. By this time, Iqbal had acquired a good education in Urdu, Arabic, and Farsi under the guidance of Sayyid Mir Hassan (1844–1929), who had been profoundly influenced by the Aligarh movement of Sir Sayyid Ahmed Khan (1817–1898). Under Sayyid Mir Hassan's care, Iqbal's poetic genius blossomed early.

In May 1899, a few months after Iqbal's graduation with a master's degree in philosophy, he was appointed the Macleod-Punjab reader of Arabic at the University Oriental College of Lahore. From January 1901 to March 1904, when he resigned from the position, Iqbal taught intermittently as assistant professor of English at Islamia College and at the Government College of Lahore. In 1905, Iqbal went to Europe, where he studied in England and Germany. In London, he studied at Lincoln's Inn to qualify at the bar, and, at Trinity College of Cambridge University, he enrolled as a student of philosophy while he prepared to submit a dissertation in philosophy to Munich University. Munich University exempted him from a mandatory stay of two terms on the campus before submitting his dissertation, "The Development of Metaphysics in Persia." After his successful defense of his dissertation, Iqbal was awarded a Ph.D. degree on 4 November 1907.

Iqbal was never at home in politics, but he was invariably drawn into it. In May 1908, he joined the British Committee of the All-India Muslim League. With the exception of one brief interruption, Iqbal maintained his relationships with the All-India Muslim League all his life.

When Iqbal came back from Europe in 1908 after earning three degrees in England and Germany, he started his professional career as an attorney, professor, poet, and philosopher all at once. At length, however, the poet and philosopher won out at the expense of the attorney and professor while he continued to be partially active as a political leader. Iqbal was elected a member of the Punjab Legislative Assembly from 1926 to 1930 and soon emerged as a political thinker. In 1930, the All-India Muslim League invited him to deliver a presidential address, which became a landmark in the Muslim national movement for the creation of Pakistan.

Iqbal's philosophical and political prose works are actually few in number, most notably *The Development of Metaphysics in Iran* (1908) and *The Reconstruction of Religious Thought in Islam* (1930). The latter work was actually a collection of his seven lectures that he had delivered in December 1928 in Madras. The lectures are reflective of his mature philosophical and rational approach to Islam, emphasizing a responsible *ijtihad*, the right of interpreting the Qur'an and the Sunna. A third work is *Iqbal's Presidential Address to the Annual Meeting of the All-India Muslim League* (1930). This address is an extensive review of the interaction among the British, the All-India National Congress, and the All-India Muslim League from the perspective of a Muslim thinker. In it, Iqbal expounded the concept of two nations in India. This address came to be known as the origin of the idea for an independent state of Pakistan.

Iqbal composed his poetry in Persian and Urdu. His six Persian works are *Asrar-I Khudi wa Ramuz-I Bekhudi* (1915), *Payam Mashriq* (1923), *Zabur-I Ajam* (1927), *Javid-Namah* (1932), *Pas Chas Bayad Kard Ay Aqwam-I Sbarq* (1926), and *Armaghan-I Hijiz* (1938). His Urdu works, which are primarily responsible for his popularity in Pakistan as well as in India, are *Bang-I Dara* (1924), *Bal-I Jibril* (1935), and *Darb-I Kalim* (1936). Poetry, like visual art, is susceptible to varied interpretations; consequently, his admirers, relying primarily upon his poetry, have attempted to prove him a nationalist, a Muslim nationalist, a Muslim socialist, and even a secularist.

Iqbal remained a steady supporter of the founder of Pakistan, Mohammad Ali Jinnah (1876–1948). During 1936–1937, Iqbal wrote eight letters to Jinnah, advocating the partition of India into two nations. His presidential address of 1930 formulated the two-nation theory, which Jinnah finally accepted when he presided over the All-India Muslim League's annual meeting in Lahore in 1940 and demanded that Pakistan be created by partitioning India.

IRAN—PROFILE (2001 pop. 66.1 million). The Islamic Republic of Iran (Iran's official name since 1979) is a nation whose social, cultural, political, and economic affairs are conducted based on the tenets of Islam. Although this theocratic republic is still in its infancy, it has faced many challenges both internal and external. Externally, its main challenges have come from the United States and Iraq. Internally, beyond staggering inflation and high unemployment rates, it currently faces demands from a youthful population for more moderate policies.

Iran covers 1.648 million square kilometers and borders Afghanistan and Pakistan in the east, Turkey and Iraq in the west, Armenia, Azerbaijan, Turkmen-

istan, and the Caspian Sea in the north, and the Persian Gulf and the Gulf of Oman in the south. Its main geographic features are an interior central plateau, which is arid or semiarid in nature, and mountainous regions that include the Zagros mountain range in the west, the Elburz and Talish mountains in the north, and the mountains to the east along the border with Pakistan and Afghanistan. Its climate is as varied as its topography, with temperatures ranging from minus 26°C to 55.6°C.

Iran is one of the most populous countries in the Middle East. Most Iranians live in the northwest and by the Caspian Sea. More than 50 percent of the population lives in urban areas. Besides its capital, Tehran,

IRAN

Country name: Islamic Republic of Iran
Area: 1.648 million sq km
Population: 66,128,969 (July 2001 est.)
Population growth rate: 0.72% (2001 est.)
Birth rate: 17.1 births/1,000 population (2001 est.)
Death rate: 5.41 deaths/1,000 population (2001 est.)
Net migration rate: -4.51 migrant(s)/1,000 population (2001 est.)
Sex ratio—total population: 1.03 male(s)/female (2001 est.)
Infant mortality rate: 29.04 deaths/1,000 live births (2001 est.)
Life expectancy at birth—total population: 69.95 years, male: 68.61 years, female: 71.37 years (2001 est.)
Major religions: Shi'a Islam, Sunni Islam, Zoroastrianism, Judaism, Christianity, Baha'i
Major languages: Persian, Turkic languages, Kurdish, Luri, Balochi, Arabic, Turkish
Literacy—total population: 72.1%; male: 78.4%, female: 65.8% (1994 est.)
Government type: theocratic republic
Capital: Tehran
Administrative divisions: 28 provinces
Independence: 1 April 1979 (Islamic Republic of Iran proclaimed)
National holiday: Republic Day, 1 April (1979)
Suffrage: 15 years of age; universal
GDP—real growth rate: 3% (2000 est.)
GDP—per capita (purchasing power parity): \$6,300 (2000 est.)
Population below poverty line: 53% (1996 est.)
Exports: \$25 billion (f.o.b., 2000 est.)
Imports: \$15 billion (f.o.b., 2000 est.)
Currency: Iranian rial (IRR)

Iran's other cities and towns are Esfahan, Mashhad, Tabriz, Shiraz, Ahvaz, Bakhtaran, Orumiyeh, Qazvin, Kerman, Ardabil, Yazd, Karaj, Qom, Rasht, and Hamadan. Persians account for two-thirds of the population, with the remainder coming from a variety of ethnic groups (Azeri, Kurd, Lur, Baluch, Arab, Turkmen, Armenian, and Jewish). It is a young population, with 36 percent of the population below fourteen years of age and 60 percent of the population between the ages of fifteen and sixty-four. This youthful population has brought about the recent mass political shift and demand for reforms in the government from its conservative base to a more open forum.

The Birth of the Islamic Republic of Iran

When Ayatollah Khomeini (1900–1989) came to power in January 1979, he gave the job of drafting

a constitution to the provisional government and named Mehdi Bazargan (1907–1994) as the prime minister of the provisional government. In March 1979, a national referendum was conducted to determine what political system should be instituted. On the referendum day, however, the Islamic Republic was the only choice on the ballot. Reportedly, over 98 percent of the voters supported an Islamic republic, and the Islamic Republic of Iran was established on 1 April 1979.

By the end of the year, the constitution of the Islamic Republic had come into force. This document was originally drafted by the provisional government, then modified by the Assembly of Experts, and finally approved by a national referendum. This constitution made the concept of *veleyet-e-Faqih* (rule of religious jurisprudence) a political reality.

Language and Culture

Iran's official language is Persian, also known as Farsi, which is spoken by a majority of the people. Persian dialects such as Gilani and Mazandarani are also spoken throughout the country. Other regional languages found in Iran include Kurdish, Azeri, Armenian, Baloch, Luri, Arabic, and Hebrew.

Iran is a very ancient country whose history dates back to the eve of the Persian civilization and empire. Due to its colorful and rich background, it has much to offer in terms of the arts, as is evident from its architecture, paintings, and a variety of handicrafts. Moreover, Persian literature is famous for its beautiful poetry, thought-provoking stories, and epic writings.

Government

Similar to Western states, the political power of the Iranian government is horizontally divided into three branches: executive, legislative, and judiciary. Unlike the Western powers, however, the *faqih* (spiritual leader of the nation) oversees all three branches. The constitution clearly outlines the requirements for the *faqih*, including Islamic training and age. Ayatollah Khomeini was named the first *faqih* for life.

Several institutions were formed to monitor the government's conduct to make sure that it conformed to Islamic principles and laws. The three branches of government—executive, legislative, and judiciary—are monitored by religious leaders and institutions to make sure they operate according to the precepts of Islamic rule. Moreover, several of the government officials within all branches of government are clerics. One such institution is the Council of Guardians, half of whose members are appointed by the *faqih* (spiritual leader).

Ayatollah Sayed Ali Khamenei (b. 1939) is the current *faqih*. He succeeded Ayatollah Khomeini (1900–1989) in 1989. The constitution gives considerable powers to the *faqih* to ensure the government functions within Islamic law. The constitution also clarifies *faqih* selection criteria, which entails training in and experience with Islamic history, laws, and philosophy.

The current president is Muhammad Khatami (b. 1943) who was elected in 1997. He had been the minister of culture in the cabinet of the former president, Hashemi Rafsanjani (b. 1934). Khatami's election signaled the shifting of the political climate. The 2000 *majlis* (parliament) elections echoed that change: moderates and reformers overwhelmingly defeated more conservative candidates. The presidents and the *majlis* representatives are elected for four-year terms.

Religion

The constitution names the official religion in Iran as Shi'a, the branch of Islam that believes the lineage of 'Ali ibn Abi Talib, the son-in-law of the Prophet Muhammad, is the true succession. Approximately 93 percent of the population are Shi'ite Muslims. About 5 percent are Sunni Muslims; Sunni Muslims believe that Muhammad's disciples were his true successors. While there has been rivalry between the two sects, the government has worked to keep it to a minimum. Christians, Jews, and Zoroastrians are recognized as lawful religious minorities and have their own representatives in the *majlis*. The Baha'i faith, however, is not a recognized religion, and its followers face religious restrictions and even discrimination at the hands of individuals as well as the state.

This marriage of government and religion reaches out into the society, where Islamic ways have become law. Women are required by law to completely cover their body and hair, showing only their hands and face. Men are also restricted in what parts of their body they

Iranian president Muhammad Khatami at a meeting with college students in December 1999 where he agreed that students have the right to protest government policies, but urged stability. (AFP/CORBIS)

can show in public. For example, they must wear long-sleeved shirts, buttoned up to hide any chest hair. Men and women who do not comply with this dress code may be harassed by their more religious fellow citizens and can actually be arrested and charged by officials. Also, the interaction between men and women is carefully monitored. For instance, public displays of affection are not condoned.

Education

Education is compulsory for all children from seven to thirteen years old, but it has been difficult to enforce this law in the rural areas. After the Islamic Revolution, a panel, the Cultural Revolution Headquarters, was formed to reform the educational system in accordance with Islamic values. Higher education in Iran consists of government-sponsored colleges as well as technical, vocational, and teacher-training schools.

Human Rights

By Western standards, the human rights record of Iran has been poor both before and after the revolution. After the revolution, opponents of the new regime were severely dealt with. Illegal searches and arrests as well as quick trials and executions were the norm. Nevertheless, there have been significant improvements, especially during the Khatami era. Emphasis on human rights is one of the factors leading toward change.

Freedom of expression has been a controversial issue from time to time. The media, particularly the periodicals, are given free rein except when it is believed Islamic principles are being threatened or criticized. In one international incident, Ayatollah Khomeini publicly formally condemned British writer Salman Rushdie (b. 1947) to death for his criticisms of Islam in his book *The Satanic Verses*. The freedom of the press was seriously threatened in early 2000 when several liberal newspapers were shut down by the conservative forces before the upcoming election. This was met with outcries from the people and further represents the clash that is currently taking place between the conservative and moderate elements.

Economy

The currency in Iran is the Iranian rial. Iran's gross domestic product (GDP) in 1998 was estimated at \$100.3 billion. Its main source of income is from the sales of its natural resources, particularly fossil fuels. Iran is one of the founding members of the Organization of Petroleum Exporting Countries (OPEC). It has worked hard to diversify its economy and has faced sev-

eral challenges, including the trade embargo imposed by the United States in 1995 and the high cost of the reconstruction program after the war with Iraq (1980–1990). Currently, pressure is mounting in the United States to lift the embargo, particularly from U.S. oil companies. For instance, it would be much cheaper to run an oil pipeline through Iran (rather than Turkey) in order to transport the oil of landlocked Central Asian states to the international market. One step has already been taken in the direction of relaxing U.S. pressure on Iran. Madeleine Albright, the U.S. secretary of state from 1993 to 2000, lifted the embargo on certain products (for example, carpets) in March 2000.

Iran and the United States

The relationship between the United States and Iran since the establishment of the Islamic Republic of Iran has been strained at best. Soon after the success of the Islamic Revolution, both the Iranian and U.S. leaders demonized each other. Revolutionary Iranians claimed that the United States was pursuing a hegemonic role in the Persian Gulf region; the Americans accused Iran of sponsoring terrorism. The United States in the 1990s has been concerned about Iran achieving nuclear capability. However, toward the end of the decade there were a few signs of a thaw in relations with overtures being made by both sides, slowly and carefully. However, in 2002, U.S. President George W. Bush declared Iran, along with Iraq and North Korea, to be one of the "Axis of Evil," leading to increased hostility toward the United States.

IRAN—ECONOMIC SYSTEM The Iranian economic system is a combination of a centrally planned economy, public ownership of fossil-fuel and

The interior courtyard of an upper-class family's home in Na'in, Iran, in 1997. (BRIAN A. VIKANDER/C ORBIS)

other large industries, village agriculture, and small market-based ventures. The economy relies on the nation's abundant natural resources but has been negatively affected by political events such as the U.S. trade embargo of the 1990s and the Iran-Iraq War (1980–1990). The current president, Mohammed Khatami (b. 1943), is working to follow in his predecessor's footsteps with regard to economic reforms and diversification. These include decreasing the military budget and improving foreign relations. However, he has found these tasks difficult to implement because of the deeply different opinions among the political elite. Ever since the establishment of the Islamic Republic, there have been heated debates in the *majlis* (parliament) and in the Council of Guardians (an organization charged with ensuring that legislation adheres to the constitution and to Islamic law) about what direction the economy should take and which policies should be enforced.

Historical Perspective

Before World War II, agriculture was the foundation of Iranian society and economy, and the oil industry was largely in the hands of foreign interests. Not much had been developed in the manufacturing sector, with some exceptions in food processing and textiles.

After World War II some capitalistic ventures became more commonplace and the government began implementing long-term economic plans, which were

instrumental in the development of the economy. The government invested large amounts of capital in infrastructure and education, plans that were financed by the export of Iranian oil. In the early 1960s, the Western powers encouraged the shah to initiate a major reform. In response, he instituted the White Revolution program, an economic plan based on land reform and industrialization. This economic reform, however, met with widespread criticism led by Ayatollah Khomeini, who began the undercurrent that eventually led to the overthrow of the shah and the establishment of the Islamic Republic.

Nevertheless, the White Revolution did succeed in raising Iran's gross national product (GNP) as well as increasing its investments in fixed capital. Metallurgical, petrochemical, and appliance businesses were developed and ultimately led to a reduction in the importance of agriculture. This industrial development led to the rapid growth of old commercial centers such as Tehran, Tabriz, Esfahan, and Abadan as well as new industrial centers like Arak, Ahvaz, Bandar-e Shah, Shiraz, and Bakhtaran.

The rapid economic achievements were halted with the advent of the 1979 Revolution. The Islamic Republic nationalized several private industries, banks, and insurance companies; skilled labor and capital fled the country. The 1979–1981 hostage crisis, in which Iranian revolutionaries seized Americans at the U.S. embassy in Tehran, seriously damaged Iranian

economic relations with the United States, and the Iran-Iraq war (1980–1990) further debilitated the national economy. Several major ports were bombed, which decreased oil revenues. Since the end of the war, Iran has diligently worked to reconstruct its devastated economy. This has been a difficult task due to declining oil revenues and growing reliance on imports. In 1993, the Iranian economy experienced a crisis over exchange rates. In 1995, President Clinton instituted a trade embargo against Iran, which caused a massive devaluation of the Iranian currency. This resulted in the Iranian government linking the value of its currency to the dollar as well as to personal attacks on private foreign-currency dealers who were thought to be cheating their fellow citizens and corrupting the economy.

Currently Iran aims to diversify its economy to make it less vulnerable to the rise and fall of the price of fossil fuels in the international markets. Since the 1991 demise of the Soviet Union, the Iranian government has hoped to capitalize on its location and emerge as the main gateway to the landlocked Caspian Sea republics. It would like to take advantage of profitable transit fees exacted on imports to and exports from these states. In this regard, the Islamic Republic has succeeded in establishing cooperative working ties with these states. At the same time, the Iranian people would like the government to do more to control the rampant inflation and unemployment rates plaguing the country.

Industries

Most of Iran's national income derives from the vast oil resources that were discovered in the southwestern part of the country in the early 1900s. They contain an estimated 48 billion barrels of petroleum, and oil comprises over 90 percent of the country's exports. A founding member of the Organization of Petroleum Exporting Countries (OPEC), Iran is one of the largest oil producers in the world. The oil industry is run by the government-owned National Iranian Oil Company. The major refineries are located at Abadan, Tehran, Bakhtaran, and Shiraz. Abadan was the largest export-producing refinery in the world until it was damaged during the war with Iraq.

Service Industries

About half the country's GDP comes from service industries such as banks, insurance companies, restaurants, and retail shops, and from institutions such as hospitals, educational facilities, and government agencies. Almost half of all workers are employed in the service industries.

Besides oil, Iran exports carpets, hides, caviar, cotton, nuts, spices, dried fruits, and mineral ores. The nation exports a great deal of raw and semiprocessed materials and imports manufactured goods such as electrical appliances, industrial machinery, and military equipment, as well as food and medicine. Most of the trade goes through the Persian Gulf ports, with Kharg Island being the principal terminal for exporting oil. Iran's major export trading partners are Italy, Japan, Greece, France, Spain, and South Korea. Its exports were estimated at \$12.2 billion in 1998, while its imports were assessed at \$13.8 billion. Iran's major import trading partners are Germany, Italy, Japan, Belgium, the United Arab Emirates, and the United Kingdom. Although the United States has extensive interests in Iranian natural resources, it is operating under the restrictions of the trade embargo imposed in 1995. In March 2000, however, certain luxury products such as caviar and carpets were removed from the embargo list to reward Iran for its changing political climate.

Transportation Buses are the main means of transportation throughout Iran, but more primitive means are still used in rural areas, such as horses, donkeys, mules, and bicycles. Rough terrain makes building modern transportation infrastructure difficult. There are 162,000 kilometers of highways in Iran, but only half of them are paved. The railway system extends over 7,286 kilometers. The Iranian railway system and airline are both owned by the government. There are approximately 288 airports in Iran, but only 110 of them have paved runways. The main international airport is located in Tehran, the nation's capital.

The merchant marine has 132 ships in its inventory in several classifications: bulk cargo, chemical tanker, combination bulk-container-liquefied gas tanker, multifunction large-load carrier, oil tanker, refrigerated cargo, roll-on/roll-off cargo, and short-sea passenger. Several ports and harbors exist on the Caspian Sea and Persian Gulf areas. Abadan, damaged in the Iran-Iraq war, is being rebuilt.

Media and Communications Regarding communications, information is disseminated through twenty-five newspapers, over three hundred magazines, two television stations, and many radio stations. In 1999, it was estimated the Iranian population owned 13 million radios and 7 million televisions. The information distributed is monitored by the government for its content in order to make sure it is not contrary to the teachings and tenets of Islam. At various times, the government has cracked down and closed the newspapers. This happened in March 2000 when conserv-

ative elements in the government felt threatened by the upcoming *majlis* elections.

There are over 9 million telephones in Iran. In 1996, twenty-five regional telecommunications authorities were set up to oversee the development of paging and cellular services and systems. There were believed to be 230,000 cell phone subscribers in 1996.

Agriculture and Fishing Iran's mountains and deserts make it hard for the country to cultivate enough land to feed its population. Only 10 percent of its land is arable. Irrigated land was estimated in 1993 at 94,000 square kilometers. Farming employs approximately 28 percent of the workforce. Most of the land is set aside to grow wheat and barley. Other crops grown are rice, cotton, corn, dates, tea, tobacco, lentils, nuts, and sugar beets. Livestock raised include cows, goats, and sheep, which provide meat and dairy products. Agriculture makes up roughly 23 percent of Iran's GDP.

Iran borders both the Caspian Sea and Persian Gulf, and has a profitable fishing industry. Sturgeon, whose eggs are processed into caviar, are the main catch for Caspian Sea fishermen. Other fish to be found in the Caspian Sea are carp, catfish, whitefish, and white salmon. Sardines, shrimp, sole, and tuna are found in the Persian Gulf.

Manufacturing, Construction, and Mining Manufacturing and the construction industry employ about one-fourth of the Iranian work force and are estimated to account for 18 percent of the GDP. The principal manufactured goods are cement, fossil-fuel products, armaments, textiles, bricks, and food items. However, Iran also manufactures tools, chemicals, leather products, copper, steel, and tobacco products. Tehran is the home of over 50 percent of the factories in Iran, followed by Esfahan and Tabriz.

Although it is an important industry, mining only employs 1 percent of Iran's workers and makes up only 9 percent of the GDP. Among minerals that Iran exploits are coal, manganese, sulfur, copper, lead, zinc, chromium, iron ore, and gemstones such as turquoise. Iranian natural gas reserves are considered the second largest in the world, approximately 15 percent of the world's reserves.

Tourism Tourism fell with the advent of the Islamic Revolution. However, it is on the rise due to the nation's changing image and political environment. Iran's ancient history and favorable exchange rate make it one of the most interesting and inexpensive places to visit. In this regard, the number of visitors to the historical cities of Esfahan, Tabriz, and Shiraz

as well as the charming coastal cities of the Caspian Sea and Persian Gulf is gradually on the rise.

Economic Indicators

Iran's GDP was estimated at \$100.3 billion in 1998. This shows a slight decrease from the year before and represents a downtrend over the previous ten years. In 1977, the GDP was \$76 billion, and in 1987 it had risen to \$137.7 billion. However, this upward swing was not to continue. The average annual growth of GDP is down from 3 percent in 1997 to 1.7 percent in 1998. The gross national product per capita in 1998 was \$1,770, with the GNP at \$109.6 billion. The GNP per capita has likewise seen a decrease in its average annual growth, actually seeing a negative growth in 1998, standing at -0.3 percent. The early 1990s witnessed a financial crisis in Iran, which led the country to reschedule \$15 billion in debt. Fluctuating oil prices dramatically affect the Iranian economy. When oil prices are high, as they were in 1996, Iran is able to make its debt service payments. But when oil prices are low, the country finds it hard to keep up with its debt service payments and is forced to decrease its imports.

The currency in Iran is the Iranian rial (IR), divided into one hundred dinars. Internationally, the IR is used for calculating figures; domestically, however, the toman (ten rials) is used. In January 1999, one U.S. dollar was worth 1,754.63 IR. However, the black market exchange rate in December 1998 was 7,000 IRs to the dollar. In 1996, it was estimated that over 53 percent of the population was below the poverty line. Despite a workforce of 15.4 million people, the country lacks highly skilled labor in terms of technology, largely because of emigration following the revolution. The unemployment rate is more than 30 percent and the inflation rate about 24 percent.

The fiscal year in Iran goes from 21 March (which is the first day of spring and the Iranian New Year) to 20 March. The budget is divided into two sections: the general budget and the development budget. For the fiscal year 1996–1997, Iran was unable to balance the budget. Revenues were \$34.6 billion, but expenditures were \$34.9 billion. Most of the revenues came from taxes and oil sales, while the expenditures were allotted mainly to education, housing, welfare, and defense. The government's main social expenditures for its growing population are medical coverage, unemployment, retirement, and veterans' benefits.

The Future

The Islamic Republic has continued the practice of the previous regime in devising five-year economic

plans. Its first plan was created with the vision of ultimately quadrupling GDP by 2003. Subsequent plans were designed to revitalize the economy by putting more emphasis on the private sector. Iran had an estimated external debt of \$21.9 billion in 1996. In 1995, it received \$116.5 million dollars in economic aid.

IRAN—EDUCATION SYSTEM The education system of Iran was patterned on the French system and evolved during the twentieth century to its present configuration. Although some preprimary schooling is available, the first educational cycle for most students is primary school (*debestan*) beginning at age five. This is followed by a three-year middle school (*doreh-e rahanamaii*) in which students are tested and evaluated for future educational tracking and at the end of which they receive a certificate of general education. Depending on their middle school experience, they may continue to a four-year intermediate school (*dabirestan*) whose diploma entitles them to proceed to college, to a two-year vocational school, to an agricultural secondary school that awards a trade certificate, or to a four-year technical secondary school that awards a terminal second-class technician's certificate. Women who have earned a diploma may enter a two-year normal school preparing primary teachers for rural areas. Higher education is furnished by universities offering bachelor's, master's, and doctor's degrees, institutes of technology, and one-year teacher training colleges.

Traditional education in Iran was for centuries conducted in *maktabs*, private schools conducted by Muslim clergy for boys aged seven to twelve. Located in every city and virtually every village, these free schools inculcated basic literacy in Persian and Qur'anic Arabic, as well as the fundamentals of arithmetic.

Almost as numerous were the *madrasabs* (religious schools) attached to the mosques. In these, older boys

studied Arabic and Persian literature, the Qur'an, theology, philosophy, law, and other subjects suited to pursuing a religious vocation. The students who took advantage of these schools were almost always the children of the well-to-do. If their families wanted them to pursue an education broader or deeper than this curriculum provided, they were given tutors or sent abroad to study, many of them to Britain or France. In 1851, the first state-sponsored school appeared: the College of Science in Tehran, founded to provide higher studies in business, technology, and military science. Apart from some Western-style secondary schools under German, French, or English auspices, this was the only alternative to Islamic religious education until the end of the nineteenth century.

Twentieth-Century Education before the Islamic Revolution

In 1899, publicly supported elementary and secondary schools, most of them modeled after French institutions, were established in the major cities, and in 1911, the Ministry of Education was created to develop a national system of primary schools. By 1925, there were approximately 3,300 public schools enrolling over 100,000 students.

The modernization of Iran under the Pahlavi dynasty (1925–1979) demanded the creation of an educated secularized middle class with technological and commercial expertise. Although the education system was crucial to the effort, its expansion was relatively

Older men attending a literacy class in Iran. (PAUL ALMASY/CORBIS)

slow. By the 1960s, Iranian schools offered five years of primary instruction and seven years of secondary, including both terminal and college preparatory curricula. Six universities, located in Tehran, Tabriz, Esfahan, Mashhad, Shiraz, and Ahvaz, enrolled about seventeen thousand students. To accelerate the pace of education reform, Iran created in 1963 a "knowledge corps" utilizing military inductees with secondary diplomas to teach villagers to read. When the dynasty fell in 1979, enrollment in elementary schools had reached three-quarters of the elementary-age group, but high school enrollment lagged behind at less than half of the secondary-age group.

Education after the Revolution

The 1979 revolution brought to power a government of ayatollahs (religious leaders) to whom educational secularization was anathema. They purged teachers and texts that were perceived to be antireligious and introduced religious coursework into the curriculum. The university students resisted, often violently, and so universities were closed for four years while their curricula and personnel were reorganized. They reopened with much smaller student bodies. Although the postrevolutionary government has acted to counter this impact, the situation remains difficult, the problems many. At the end of the twentieth century, education spending had reached nearly 6 trillion rials, which was about 6 percent of the gross national product (GNP) and 18 percent of government expenditure (as compared with about 500 million rials or 7.5 percent of the GNP and 16 percent of government expenditure in 1980). More than 3,300 preprimary schools enrolled nearly 200,000 children. About 92 percent of the boys of elementary school age and 87 percent of the girls—nearly 10 million students—attended school; 79 percent of the boys of secondary school age and 69 percent of the girls—over 7.5 million students—attended school. Teacher-student ratios were 1 to 32 at the elementary level and 1 to 30 at the secondary level. Yet adult literacy was a disappointing 72 percent, unevenly distributed among males (78 percent) and females (66 percent). In 1997, a cross-national program testing mathematics and science ranked Iranian students thirty-eighth of forty-one nations studied in eighth-grade math performance and thirty-seventh in eighth-grade science. It ranked Iranian students twenty-fifth of twenty-six nations studied in both fourth-grade math and science. At all education levels, fewer women than men are enrolled, a disparity that is fairly constant over time. Higher education has not bounced back from its purging and reorganization under the revolution. The nation's thirty

general universities, thirty medical universities, twelve specialized universities, and two distance-learning universities enrolled only half a million students. This enrollment drop was caused largely because the secularized economic and political elites were sending their children to university abroad in increasing numbers in the 1980s, to the detriment of Iranian universities. As if this were not bad enough, the fraction of those studying abroad who elect not to return to Iran after their studies has constituted a serious brain drain that renders national development more difficult.

IRAN—HISTORY Iranian history is inevitably linked with that of Persia. The state was not officially named Iran until the Pahlavi dynasty, which made the name change in March 1935. But Persian history goes back to ancient times and is laced with stories of foreign invasions, battles, conflict, and glory.

Ancient Times

In the 1500s BCE, nomads of Aryan descent began to move to southwest Asia, between the Caspian Sea and the Persian Gulf. This area is now known as Iran, which literally means "land of the Aryans." Two groups, Medes and Persians, settled in the northern and southern parts of the Iranian plateau, respectively. The Medes grew in power, ruling the Persians and other Indo-European peoples in the region. Cyrus the Great (c. 585–c. 529 BCE), a member of the Achaemenid Persian dynasty, ousted the Medes and founded the Achaemenid empire, which would bring glory to the Persian people. Cyrus went on to conquer Asia Minor, Palestine, Syria, and Babylonia. His son, Cambyses II (d. 522 BCE), added Egypt to their list of conquests. Darius I (550–486 BCE), also known as Darius the Great, came to power in 522 BCE. Although his attempt to conquer Greece failed, Darius earned his title for sound military and administrative practices, which allowed the Achaemenids to remain in power despite the less adept leaders who followed. Darius's son, Xerxes I (c. 519–465 BCE) also

- 1998** A majority of moderates is elected to parliament.

tried and failed to conquer Greece, leaving his successors, Artaxerxes I and II, to make peace. Eventually, after uprisings and unrest had gradually undermined Achaemenid rule, the empire was conquered by Alexander of Macedon (356–323 BCE).

The Seleucids and the Sasanids Alexander hoped to fuse the Greek and Persian cultures, even ordering his soldiers to marry Iranian women. His hopes were not realized, however, as he succumbed to fever and died without naming an heir. After his death four of his generals struggled for control of his empire; one of them, Seleucus, eventually established the Seleucid dynasty (312–64 BCE). The Seleucid dynasty was ultimately brought down by the Parthians, whose control eventually extended from India to Armenia. During this time, Ardashir (reigned 224–241 CE), who claimed to be a descendant of the legendary hero Sasan, became a Parthian governor. He used this position to consolidate his power, overthrew the Parthians, and established the Sasanid dynasty (224/228–651).

The Sasanids ruled for four hundred years within the approximate boundaries of the Achaemenid empire. It was a time of renewal of Iranian traditions, as well as of large-scale improvements in agricultural and

urban development. The Sasanids proclaimed themselves *shabanshab* (king of kings) and oversaw minor rulers dispersed throughout the region. Zoroastrianism became the state religion, and priests played a major role in the government. Sasanid strength was eventually eroded by constant fighting with the Romans, who had replaced the Greeks as their main enemy. Initially, the Sasanids fought victoriously against Rome, with Shapur I (reigned 241–272), Ardashir's son and successor, at the helm. Continued fighting, however, diminished Iranian resources, and, coupled with domestic unrest, allowed the Sasanids to be conquered by the Arabs.

Arab and Mongol Conquests The Arabs invaded Persia soon after they were united under the banner of Islam, a religion to which, eventually, a majority of Iranians were converted. Even though the Arabs were clearly the ruling party, Iranians were permitted to participate in and contribute to the new government; several Iranian practices were adopted by the Arabs, and Persian continued to be spoken even though Arabic became the official language. During the 900s, the Arabs began to lose control and the region broke into factions. Eventually the Seljuks, a Turkish group led

by Toghril Beg (c. 990–1063), conquered the territory. Toghril Beg was given the title King of the East by the religious leadership. Malik Shah (1055–1092) succeeded him, bringing an era of cultural and scientific achievement to Iran. When he died the region once again split into warring dynasties.

At around this time the Mongol Genghis Khan (c. 1162–1227) began a conquering spree, starting in China and heading west, destroying everything in his path. Iran suffered tremendously: cities were decimated and populations massacred. Genghis Khan's death did little to ameliorate Iran's situation, however, as the Mongol rulers who followed were just as ruthless. One exception, Ghazan Khan (1271–1304), did allow improvements in agricultural techniques and road conditions, which favorably affected the Iranians. Eventually, fighting among Mongol tribes loosened their control over Iran and allowed the emergence of the Safavid dynasty (1501–1722/1736).

The Safavid Dynasty The Safavids rose to power in 1501 under the leadership of Ismail, who was ultimately crowned shah of Iran. Shi'a Islam, instituted as the state religion, played a central role in the governance of the state, and resources were employed to convert the Muslim population to the Shi'a sect. Striking a balance between religion and the state, as well as between the Turkic and the Iranian populations, were among the most important challenges faced by the empire. In addition, the Safavids faced enemies in the northeast and west: the Uzbeks and Ottomans, respectively. One particular confrontation had serious repercussions: In 1524, the Ottomans occupied the Safavid capital of Tabriz; although brief, the occupation called into question the divine leadership of the Safavids.

Confrontations with the Ottomans continued until the Safavids, led by Shah Abbas I (1571–1629), counteracted Ottoman encroachment. After entering into a treaty with the Ottomans, Abbas first defeated the Uzbeks, then turned on the Ottomans, achieving control over Iraq, Georgia, and parts of the Caucasus. With his external enemies in check, Abbas worked internally to centralize his power. His reign saw a gradual distance arise between state and religion, even though the shah built mosques and donated large sums to religious institutions. The shah also actively advanced trade, architecture, and the arts. He moved the capital from Tabriz to Esfahan, the latter becoming a city of beauty, equipped with mosques, palaces, schools, and a marketplace. When Abbas died, the empire spiraled downhill, and the way was opened for Afghan tribes to take control; in 1722 they brought an end to the Safavid dynasty.

The Afghans did not rule for long. They were overthrown by a chief of the Afshar tribe, Tahmasp Qoli (1688–1747), who asserted the right to do so in the name of a member of the Safavid family. Nevertheless, soon after, he claimed the power in his own right as Nader Shah (1736). He went on to conquer Afghanistan and lead successful campaigns into India. These military incursions proved taxing on the population financially and physically, however, and resulted in the death of Nader Shah at the hands of one of his own chiefs.

The Qajar Dynasty Once again, Iran erupted as petty dynasties and tribes vied for power. One tribal leader, Karim Khan Zand (c. 1705–1779), was briefly able to gain control, but when he died, chaos reigned again. Finally, Agha Muhammad Khan Qajar (1742–1797) emerged as the leader. The Qajar dynasty began in 1794, when Muhammad Qajar named himself master of the country, and ended in 1925. Qajar's successors, Fath 'Ali (reigned 1797–1834), Muhammad Shah (reigned 1834–1848), and Naser od-Din Shah (reigned 1848–1896), were able to bring some measure of stability to the country, restoring the concept of shah, which had been called into question during the Safavid era. Religion and state once again became closely associated.

Modern Period

The history of Iran in the modern era is characterized by heavy foreign involvement—first Russia and Britain, later the United States—in the economic and political affairs of the nation, which eventually led to revolution in 1979.

In the beginning of the nineteenth century, Russia and Britain began to make their presences felt. Russia wanted Iranian territory, and in two wars that ended with two treaties—the Treaty of Gulistan (1812) and the Treaty of Turkmanchai (1828)—gained land in the Caucasus region. Later in the century Russia annexed territories in Central Asia. Britain's involvement stemmed from a desire to safeguard trade routes to India. The Treaty of Paris (1857) resulted in Britain's controlling Afghanistan.

Russia and Britain were able to exert considerable control over Iranian affairs due to their superior military and technological capabilities, and Iran's lack of centralized control. During Naser od-Din Shah's reign, attempts were made to tighten administrative processes, but these failed due to jealousy and corruption. An idea began to circulate that the way to stop foreign interference was to adopt European practices, which led to the creation of a cabinet based on the European model. Foreign involvement, however, did not

The Crown Prince of Iran and Egyptian Minister of National Defense Hussein Sabry Pacha watch a military demonstration in Egypt in March, 1939. (HULTON-DEUTSCH COLLECTION/CORBIS)

diminish, especially in commerce, where trade concessions were constantly given to Russia and Britain. The people protested these concessions; in one instance, under the leadership of the religious community, they forced the government to cancel a tobacco monopoly that had been awarded to Britain. The people became increasingly unhappy with the oppression, corruption, and foreign concessions, and Naser od-Din Shah was assassinated in 1896.

The Constitutional Revolution His son and successor, Mozaffar od-Din (reigned 1896–1907) ruled in the same vein that had characterized his father's later years. He relied on Russia to provide loans—money he used extravagantly and ostentatiously, which angered the populace and ultimately led to what became known as the Constitutional Revolution. Religious leaders and merchants pressured the shah to agree to a constitutional monarchy, which would operate within the framework of law, and a constitution that limited the role of the royal family and provided for an elected parliament (*majlis*) was signed on 30 December 1906. Mozaffar, however, died just five days later, and his successor, Muhammad Ali Shah, had no intention of adhering to the constitution. He started an all-out campaign to crush it, but was defeated and forced into Russian exile. Constitutional rule did not take place, however, as once again outside influences intervened.

In 1907, Russia and Britain decided to divide Iran into spheres of influence: Russia would control the north, while Britain retained control of the south and east. A neutral area was established in the center, open

to both. In a confrontation that ensued due to the hiring of a U.S. administrator, Russian troops advanced on Tehran, and the *majlis* was forced to close down and concede to Russian demands.

The Pahlavi Dynasty Iran tried to maintain its neutrality during World War I, but became the battlefield for Russian, British, and Turkish forces. The end of the war brought an increased British presence, as the Russians were otherwise preoccupied with the Bolshevik revolution. The Anglo-Persian Agreement of 1919 amounted to Iran becoming a British protectorate, which enraged the population. In February 1921, a military officer, Reza Khan (1878–1944), aided by the journalist Sayyid Zia od-Din Tabatabai, seized power, first becoming war minister, then prime minister, and finally, in 1925, shah. Reza Khan changed his name to Pahlavi and thus began the Pahlavi dynasty.

The shah exerted considerable military control over the country and worked at modernization: He minimized religious influences, welcomed Westernization, and instituted economic and educational reform. The shah also worked to minimize British and Russian influence by increasing trade relations with Germany—which worked against him with the outbreak of World War II. Again, Iran tried to maintain its neutrality, but to no avail. Angered at its relationship with Germany, British and Russian troops invaded Iran in 1941, and the shah relinquished the throne to his son, Mohammad Reza Shah Pahlavi (1919–1980). Although Iran played a critical role in the war, providing passageway for military equipment and eventually declaring war on Germany, the presence of foreign troops did not create a feeling of camaraderie; in fact just the opposite occurred, and ultimately a nationalist movement took hold.

Several oil agreements had been signed with Britain and Russia. When it became apparent that Britain was benefiting more financially from the Anglo-Iranian Oil Company (AIOC) than was Iran, nationalists within the *majlis*, led by Muhammad Mosaddeq (1880–1967), began pushing for the AIOC agreement to be renegotiated, and on 15 March 1951 the *majlis* passed a bill nationalizing the oil industry. When the prime minister spoke against the law, he was assassinated and replaced by Mosaddeq. Nationalization resulted in Britain taking the case to the International Court of Justice at The Hague. Economic and political turmoil ensued, and the shah forced Mosaddeq from office. His popularity, however, proved to be such that the shah was forced into exile, and Mosaddeq assumed the reigns of government. His power was short-lived, however: the United States, finding Mosaddeq too in-

flexible, supported the return of the shah through a Central Intelligence Agency operation.

With the shah's return, Iran began to experience more U.S. involvement in its economic and political affairs. The shah launched several ambitious economic plans, but it was difficult for the Iranian economy to recover from the effects of the nationalist movement. Discontent with the shah's repressive practices and reliance on the United States increased. In an effort to quell these voices the shah devised the White Revolution, an ambitious plan of economic and land reform. The land reform was not met with enthusiasm by religious leaders; neither was his decision to extend the right to vote to women. In June of 1963, Ayatollah Khomeini (c.1900–1989) began speaking out against the shah and his White Revolution. Khomeini was ultimately sent into exile, but continued to speak against the shah and question his legitimacy. The shah responded by cracking down on all opposition.

Establishment of an Islamic Republic In the late 1970s, Ayatollah Khomeini encouraged massive strikes throughout the country. In January of 1979, the shah left Iran under pretense of taking a vacation, allowing Khomeini to seize power. He immediately declared the shah's government illegitimate and instituted a provisional government, giving it the task of drafting a constitution establishing an Islamic republic in which the functions of government would be guided by the teachings of Islam. Several institutions, such as the Revolutionary Council, were created with the same thought in mind. Finally, Ayatollah Khomeini was named *faqih* (spiritual leader) for life.

Because of U.S. involvement in the area and its support for the shah, Khomeini regarded the United States as an enemy. These anti-American feelings were fueled in October 1978, when Washington allowed the shah to enter the United States for medical treatment—perceived as an attempt by the shah to gain support for his return to power. This resulted in Iranian students taking U.S. hostages at the embassy in Tehran. Eventually, the hostage crisis was peacefully resolved, but only after Iranian assets were frozen and a disastrous hostage rescue attempt by the United States. Negotiations began in earnest in September 1980, most likely because the Iranians were facing a new enemy: Iraq. Iraq invaded Iran in part because Iraq's president, Saddam Hussein (b. 1937), had territorial ambitions and in part because it feared the Iranian message of revolutionary Islam. The Iran-Iraq war was a brutal conflict that lasted eight years. Although it helped rally the Iranian people to a common cause, it had devastating effects on the economy, which

ultimately led Khomeini to agree to a cease-fire in August 1988. The ayatollah died one year later. Ali Khamenei was named his successor as *faqih* and Hashemi Rafsanjani was elected president in 1989.

The revolutionary regime is characterized by restrictive practices and strict religious requirements. The late 1990s saw a movement calling for political reform, most likely due to the largely youthful population; as a result, a moderate, Muhammed Khatami, was elected president in 1997, and *majlis* elections in 2000 resulted in the election of a majority of moderates to the parliament.

These developments have had a positive effect on the Iranian relationship with other countries, including the United States, whose ties with Tehran have remained strained since the hostage crisis. The United States, however, is still concerned with the nature of the Iranian Islamic Republic, and with the possibility that nuclear capability might fall into the hands of revolutionary Iranian leaders as a result of the 1991 demise of the Soviet Union. Despite such considerations the United States has lifted its trade embargo on certain Iranian products, and there has been considerable pressure on the U.S. government, most notably from the oil industry, to end the trade embargo altogether. The future of Washington-Tehran ties remains unclear. From a domestic perspective, however, Iran has economic and political challenges to face in the years to come as it aims to stabilize its economy and enact the political reforms for which the people are clamoring.

IRAN—HUMAN RIGHTS The Islamic Republic of Iran was established in 1979 after a populist revolution toppled the Pahlavi monarchy. The monarchy, last headed by Mohammad Reza Shah Pahlavi (1919–1980), repressed political expression and frequently violated human rights. Unfortunately,

subsequent governments of the Islamic Republic have continued this tradition.

The Islamic Republic is dominated by Muslim clergy of the Shi'a denomination. The head of state, an ayatollah (high ranking Shi'ite cleric), holds the title of Supreme Leader of the Islamic Revolution and has direct control of the armed forces, internal security forces, and judiciary. A popularly elected unicameral Islamic Consultative Assembly, or *majlis*, legislates, but all legislation is reviewed for adherence to Islamic and constitutional principles by an appointed Council of Guardians, which has also the power to screen and disqualify candidates for elective office.

Among the agencies responsible for internal security are the Ministry of Intelligence and Security, the Ministry of Interior, and the Revolutionary Guards. Paramilitary volunteer forces known as Basijis, and gangs, known as the Ansar-e Hezbollah (Helpers of the Party of God), have acted as vigilantes who intimidate citizens suspected of counterrevolutionary activities.

Despite citizen protests, the government's human-rights record has remained poor. According to Amnesty International and Human Rights Watch, systematic abuses have included extrajudicial killings and summary executions, disappearances, widespread use of torture and other degrading treatment, arbitrary arrest and detention, and prolonged and incommunicado detention. The judiciary lacks independence and does not ensure citizens the right of due process. The government has used the courts to stifle dissent and obstruct progress on human rights.

Recent years have witnessed an intense political struggle between Iranians favoring greater liberalization in government policies, particularly in the area of human rights, and hard-liners in the government and society, who view such reforms as threats to the survival of the Islamic republic.

Torture and Other Cruel Punishment

There have been numerous, credible reports that security forces and prison personnel torture detainees and prisoners. Some prison facilities, including Tehran's Evin prison, are notorious for the cruel and prolonged acts of torture inflicted upon the government's political opponents. Common torture methods include suspension for long periods in contorted positions, burning with cigarettes, sleep deprivation, and severe and repeated beatings with cables or other instruments on the back and on the soles of the feet. Prisoners also have reported beatings about the ears, inducing partial or complete deafness, and punching in the eyes, leading to partial or complete blindness.

Prison conditions are harsh. Some prisoners are held in solitary confinement or denied adequate food or medical care in order to force confessions. Female prisoners reportedly have been raped or otherwise tortured while in detention. Prison guards reportedly intimidate family members of detainees and torture detainees in the presence of family members. The U.N. Commission on Human Rights Special Representative for Human Rights in Iran reported receiving numerous reports of overcrowding and unrest in Iranian prisons. The authorities do not allow human-rights monitors to visit imprisoned dissidents. In August 1999, however, Iranian President Mohammad Khatami (b. 1943) publicly criticized the use of torture and defended the rights of prisoners as a legitimate concern based on "Islam and human conscience."

Harsh punishments are carried out, including stoning and flogging, which are expressly mandated by the Islamic Penal Code as appropriate punishments for adultery. According to Article 102 of the code, "the stoning of an adulterer or adulteress shall be carried out while each is placed in a hole and covered with soil, he up to his waist and she up to a line above her breasts" (Bureau of Democracy, Human Rights, and Labor 1999).

Political Executions and Arbitrary Arrest and Detention

In November 1995 the *majlis* passed a law that criminalizes dissent and applies the death penalty to offenses such as "attempts against the security of the State, outrage against high-ranking Iranian officials, and insults against the memory of Imam Khomeini and against the Supreme Leader of the Islamic Republic" (Bureau of Democracy, Human Rights, and Labor 1999). This law has been used to eliminate political dissidents.

Though the constitution prohibits arbitrary arrest and detention, these practices remain common. There is reportedly no legal time limit on incommunicado detention in jails or in local Revolutionary Guard offices. International observers believe hundreds of citizens have been imprisoned for their political beliefs.

Denial of Fair Public Trial

Trials in the Islamic Revolutionary Courts are notorious for their disregard of international standards of fairness. Pretrial detention often is prolonged, and defendants lack access to attorneys. Indictments often lack clarity and include undefined offenses such as "antirevolutionary behavior," "moral corruption," and "siding with global arrogance." Defendants do not

have the right to confront their accusers. Secret or summary trials occur. In 1992 the Lawyers Committee for Human Rights concluded that "the chronic abuses associated with the Islamic Revolutionary Courts are so numerous and so entrenched as to be beyond reform" (Bureau of Democracy, Human Rights, and Labor 1999). As of 2000 there has been no major reform of the Revolutionary Court system.

Freedom of Speech and Press

Since the election of President Khatami in 1997 the independent press has played an increasingly important role in providing a forum for an intense debate regarding reform in the society. However, basic legal safeguards for freedom of expression are lacking, and the independent press has been subjected to arbitrary enforcement measures by elements of the government, notably the judiciary.

The 1995 Press Law prohibits the publication of material "insulting Islam and its sanctities" or "promoting subjects that might damage the foundation of the Islamic Republic." Generally prohibited topics include criticisms of the late Ayatollah Khomeini (1900–1989), direct criticism of the current Supreme Leader, questioning the tenets of certain Islamic legal principles, promotion of the views of certain dissident clerics, and promotion of rights or autonomy of ethnic minorities.

Police raid newspaper offices, and the Ansar-e Hezbollah attack the offices of liberal publications and bookstores without interference from the police or prosecution by the courts. The government directly controls and maintains a monopoly over all television and radio broadcasting facilities. Satellite dishes that receive foreign television broadcasts are forbidden, even though many wealthy citizens own them. The Ministry of Islamic Culture and Guidance screens books prior to publication and inspects foreign printed material prior to its distribution.

Privacy Rights and Freedom of Assembly and Association

Security forces monitor the social activities of citizens, enter homes and offices, monitor telephone conversations, and open mail without court authorization. The government restricts freedom of assembly and closely monitors funeral processions and student, labor, and Friday prayer gatherings. In July 1999 students at Tehran University who were protesting the government's closure of a prominent reform-oriented newspaper as well as proposed legislation by the *majlis* that would limit press freedoms were attacked by security forces and Ansar-e Hezbollah. At least four

Author Salman Rushdie in London on 15 March 1995 while under a death sentence issued by Iran for writings critical of Islam. (AFP/CORBIS)

students were killed and three hundred were wounded. Four student leaders were later tried and sentenced to death by a Revolutionary Court for their role in the demonstrations.

Freedom of Religion

Iran's population is 99 percent Muslim, of which 89 percent are Shi'ite and 10 percent are Sunni. Baha'i, Christian, Zoroastrian, and Jewish communities account for less than 1 percent of the population.

The Ministry of Intelligence and Security monitors religious activity closely. The Constitution declares that the official religion of Iran is Twelver sect Shi'a Islam. It accords other Islamic denominations full respect and recognizes Zoroastrians, Christians, and Jews as protected religious minorities. Religions not specifically protected under the Constitution do not enjoy freedom of religion. This situation most directly affects the nearly 350,000 followers of the Baha'i faith,

which originated in Iran during the 1840s as a reformist movement within Shi'a Islam. Political and religious authorities joined to suppress the movement and have always been hostile to it. They consider Baha'is to be apostates and claim the Baha'i faith is a counterrevolutionary sect historically linked to the shah's regime, even though the Baha'is had also faced discrimination under the shah.

The government does not ensure the right of citizens to change religions. Apostasy, specifically conversion from Islam, can be punishable by death.

Political Rights

The government represses attempts to separate state and religion or to alter the state's existing theocratic foundation. Regularly scheduled elections are held for the president, members of the *majlis*, and the Assembly of Experts. (The 86-member Assembly of Experts consists of clerics who serve an eight-year term and are chosen by popular vote from a list approved by the government. It has the power to remove the Supreme Leader.) Over 90 percent of the eligible population voted in the 1997 national election. Khatami won nearly 70 percent of the vote, with his greatest support coming from the middle class, youth, minorities, and women. The election results were not disputed, and the government does not appear to have engaged in fraud.

Christians, Jews, and Zoroastrians elect deputies to specially reserved *majlis* seats. However, religious minorities are barred from holding senior government or military positions.

Rights of Women

Women are underrepresented in government. In 1999 they held 13 of 270 *majlis* seats. There were no female cabinet members. After his election, President Khatami appointed the first female vice president (for environmental protection) since the Islamic Revolution. He also appointed a woman to serve as Presidential Adviser for Women's Affairs. The Minister of Islamic Culture and Guidance appointed a woman to the senior post of Deputy Minister for Legal and Parliamentary Affairs.

Women have access to primary and advanced education and work in many fields, including medicine, dentistry, journalism, and agriculture. A 1985 law instituted three months of paid maternity leave and two half-hour periods per day for nursing mothers. Pension benefits for women were established under the same law, which also decreed that companies hiring women should provide day-care facilities for their children.

The State enforces gender segregation in most public spaces, and prohibits women from mixing openly with men not related to them. Women are subject to harassment by the authorities if their dress or behavior is considered inappropriate, and may be sentenced to flogging or imprisonment for such violations.

Women have the right to divorce, alimony, and a share in the property that couples acquire during their marriage, in accordance with Islamic law. Mothers are granted custody of minor children in divorce cases in which the father is proven unfit. (Where the father is not proven unfit, custody varies case by case.) Muslim women may not marry non-Muslim men. The testimony of a woman is worth only half that of a man in court, and a married woman must obtain the written consent of her husband before traveling outside the country.

The government restricts the work of local human-rights groups. It denies the universality of human rights and does not permit international human rights NGOs such as Human Rights Watch and Amnesty International to establish offices or conduct regular investigative visits to Iran.

Despite the Islamic Republic's dismal human-rights record, there are some signs of improvement. In 1995 an Islamic Human-Rights Commission (IHRC) was established under the authority of the head of the judiciary, and in 1996 the government established a human-rights committee in the *majlis*. Thus far, however, these have had little impact on governmental practices.

IRAN—POLITICAL SYSTEM Constitutionally speaking, Iran is a theocratic republic in which the state and religion are closely intertwined. The Iranian system, which is based on Islamic law, was approved by a referendum in December 1979, soon after the

success of the revolution that deposed Mohammad Reza Shah Pahlavi (1919–1980), Iran's last shah (1941–1979). Before the constitution was publicly voted on, it was first modified by the Assembly of Experts, which worked on the draft provided by the provisional government established by Ayatollah Khomeini (1900–1989). Another referendum followed ten years later added forty-five amendments to the constitution. A significant change was the removal of the role of the prime minister within the government. Another major change modified the criteria for selecting the *faqih* (spiritual leader). The criteria were revised in order to allow the Assembly of Experts to choose Ali Hussein Khamenei (b. 1939) as *faqih* when Ayatollah Khomeini died in 1989 even though Khamenei was considered relatively junior at that time (his religious title was only Hojjat al-Islam) with respect to religious scholastic requirements for the role.

Religious Oversight of the Government

The Iranian government has three branches: executive, legislative, and judiciary. However, there are several religious bodies that oversee these branches. The main religious authority is the *faqih*, who is a recognized religious scholar selected by the Assembly of Experts. The idea is that the *faqih* rules during the absence from earth of the Twelfth Imam, who, according to the main sect of Shi'a Islam, will return one day to bring salvation, peace, and prosperity to the community of believers. The *faqih's* task is to ensure that the executive, legislative, and judiciary branches comply with the tenets of Islam; thus, he is given considerable powers. For instance, he can declare war or peace based on the recommendation of the Supreme Defense Council, half of whose membership he appoints. The *faqih* commands the military and security forces of Iran. He also appoints the office of the supreme judge and chief of the general staff as well as half the members of the Guardians Council, a council that determines whether laws proposed in the *majlis* respect the tenets of Islam and are in the spirit of the constitution. In addition, the *faqih* reserves the right to question any candidate's bid for the presidency. Ayatollah Khomeini always used this right and often prevented candidates from running when he felt they had positions contrary to the ideals of the Islamic Republic. The *faqih* has the authority as well to impeach an elected president if either the supreme court or the *majlis* (parliament) finds the president shirking his responsibilities or violating the principles of Islam. This actually happened to the first elected president of the Islamic Republic, Bani Sadr. He was impeached because he constantly clashed with the prime minister of the time, Rajai.

The Assembly of Experts is another religious body that oversees the functions of the government. It is composed solely of clerics elected by the people. The first Assembly was elected in 1982, and succeeded by a second in 1990.

The Executive Branch

The president heads the executive branch of government and is elected for a four-year term. Currently, the president is Mohammed Khatami (b. 1943), whose election in 1997 marked a significant shift in the attitude of the people toward a more moderate system. He succeeded former President Ali Akbar Hashemi Rafsanjani (b. 1934). The president has the authority to select his cabinet called the Council of Ministers, but his appointments must be approved by the *majlis* before they can take effect.

An Election Supervisory Council manages all the election procedures. Anyone fifteen and over can vote. The minimum voting age used to be twenty but was no doubt modified due to the youthful orientation of the population. Women were given the right to vote in 1963.

The Legislative Branch

Legislation is the jurisdiction of the 270 members of the *majlis*, who are elected for four-year terms. Lively debate occurs on the floor of the *majlis* as there is ample variety of opinion concerning economic, political, and social topics. Essentially there are three camps of thought nestled within the *majlis*: conservatives, radicals, and moderates.

Conservatives, mainly comprising the religious community and the bazaar merchants, closely follow the party line and tend to be xenophobic and wary of outside influences, particularly those of the West. They are also orthodox in the cultural application of Islamic principles, such as establishing a dress code for men and women and keeping a tight rein on the media and what it is allowed to depict. The conservatives were clearly setting the political agenda when the Islamic Republic was first established in 1979. The radicals (or followers of Imam Khomeini's line) make up another faction; they support programs for the disadvantaged classes of society. They favor fair methods of distribution of income as well as keeping a watchful eye on the private sector. They are more progressive in their social programs than the conservatives, but share their fear of the encroachment of Western ideals and dependency on foreign power. The radicals have long been present in the *majlis* and often debate issues of land reform and nationalization of industries.

PREAMBLE TO THE CONSTITUTION OF THE ISLAMIC REPUBLIC OF IRAN

Adopted on: 24 Oct 1979

The Constitution of the Islamic Republic of Iran advances the cultural, social, political, and economic institutions of Iranian society based on Islamic principles and norms, which represent an honest aspiration of the Islamic Ummah. This aspiration was exemplified by the nature of the great Islamic Revolution of Iran, and by the course of the Muslim people's struggle, from its beginning until victory, as reflected in the decisive and forceful calls raised by all segments of the populations. Now, at the threshold of this great victory, our nation, with all its beings, seeks its fulfillment.

The basic characteristic of this revolution, which distinguishes it from other movements that have taken place in Iran during the past hundred years, is its ideological and Islamic nature. After experiencing the anti-despotic constitutional movement and the anti-colonialist movement centered on the nationalization of the oil industry, the Muslim people of Iran learned from this costly experience that the obvious and fundamental reason for the failure of those movements was their lack of an ideological basis. Although the Islamic line of thought and the direction provided by militant religious leaders played an essential role in the recent movements, nonetheless, the struggles waged in the course of those movements quickly fell into stagnation due to departure from genuine Islamic positions. Thus it was that the awakened conscience of the nation, under the leadership of Imam Khomeini, came to perceive the necessity of pursuing a genuinely Islamic and ideological line in its struggles. And this time, the militant 'ulama' of the country, who had always been in the forefront of popular movements, together with the committed writers and intellectuals, found new impetus by following his leadership.

Source: International Court Networks. Retrieved 8 March 2002, from: http://www.uni-wuerzburg.de/law/np00000_.html.

However, their influence was the strongest during the 1980s. The radicals mainly comprise students and members of such organizations as The Bureau for the Promotion of Unity and the Young Combatant Clerics. The moderates, also known as the centrists or pragmatists, form the last major faction. They are made up of the middle class—professionals and bureaucrats—and are more open to outside ideas and to liberalization policies. They believe in coexisting peacefully in the world and are not threatened by outside influences. The moderates took center stage in the last part of the twentieth century and the begin-

ning of the twenty-first, as evidenced by Khatami's election to the presidency in 1997 and the landslide victory by the moderates in the 2000 *majlis* elections.

When the *majlis* passes a bill, it is reviewed by the Guardians Council to ensure its acceptability. The Guardians Council consists of twelve lawyers, six of whom are clerics appointed by the *faqih*, and six appointed by the High Council of the Judiciary and approved by the Assembly of Experts. The Guardians Council has often used its right to reject any bill proposed by the *majlis*, in particular bills relating to land reform and nationalization. When a bill is rejected by

the Guardians Council, it is sent back to the *majlis* for revision. In February 1988 a committee called the Committee to Determine the Expediency of the Islamic Order was formed to mediate disputes that arise between the *majlis* and the Guardians Council. This committee was legitimized by the constitution in July of 1989.

The Judiciary

The judiciary is composed of a Supreme Court, with five justices, and lower criminal and civil courts. Clerics are tried in a special clerical court; people facing charges of treason against the Islamic Republic are tried in revolutionary tribunals. Judges are required to be members of the Islamic clergy and their judicial decisions must be rooted in Islamic law. A minister of justice operates as the liaison between the three branches of government.

Freedom of the Press and Political Parties

The constitution provides for freedom of press except in cases where the press undermines Islamic ideals—a clause responsible for Iranian strained relations with the United Kingdom. Iran actually cut off diplomatic relations with the United Kingdom in March 1989 because a British company published Salman Rushdie's book *The Satanic Verses*, which was perceived to be against Islamic values. It took over a year for full diplomatic relations to be reinstated.

The same criteria of adhering to Islamic values is applied with respect to the creation of political parties and associations as well as religious institutions. Islam is listed as the official religion of Iran in the constitution. The sect that is followed is Twelver Shi'a, the dominant Shi'a sect. Other Muslim sects are recognized and represented in the government. Christians, Jews, and Zoroastrians have the status of lawful religious minorities. However, the Baha'is are not considered a recognized religious minority; they are not allowed representation in the *majlis* and their behavior is restricted by the government.

Iran's best-known political party was the Islamic Republican Party (IRP), which was created in 1978 and led by Ayatollah Khomeini. It was instrumental in the unfolding of the Islamic Revolution and became the ruling party after the Islamic Revolution's success. But Khomeini disbanded the IRP in June 1987 under pressure by the other political parties.

Other political parties that have played a part in Iranian history are the Liberation Movement of Iran, the Union of National Front Forces, the National Democratic Front, the Muslim People's Republican Party, the Party of the Masses, the Communist Party

Family members of dissidents on trial before Iran's Revolutionary Court in January 2002 protest political repression outside the court building. (REUTERS NEWMEDIA INC./CORBIS)

of Iran, the Party of the Toilers, the Kurdish Democratic Party, and the People's Mujahidin Organization of Iran. Parties may be subject to harassment if they criticize the government. For example, the Liberation Movement of Iran that was founded by Mehdi Bazargan, the first prime minister of the provisional government of the Islamic Republic, often found its offices ransacked due to its criticisms of the government, even though the government tolerated the party's existence and permitted its representation in the *majlis*. Other parties are not as fortunate. The Party of the Masses, a pro-Soviet Communist party, was banned in 1983. The Kurdish Democratic Party was prohibited in 1979. Some political parties are organized by Iranians who live abroad and are working to change the system of government. For instance, the Muslim People's Republican Party would like to see a secular government in Iran rather than a theocracy.

Other political groups are violent in nature and use terrorist tactics against the government, which in turn responds with force. Such radical groups include the People's Mujahidin Organization of Iran, Warriors of the People, the Forghan Group, and Black Wednesday. The first group originally supported the Islamic Republic and had been known for carrying out assassinations against the shah's regime and the U.S. government, but in the early 1980s a shift occurred within the organization and its members began attacking the current regime.

The recent liberalization of policies and the shift toward moderation have allowed the formation and activities of several new political parties, including Executives of Construction, Islamic Iran Solidarity Party, and the Islamic Partnership Front.

Regarding human rights, the Iranian constitution provides for the basic rights of individuals in Articles 19 through 42. But Iran is not considered a free nation by Western standards. At the start of the new republic, the revolutionary regime showed little regard for human rights. Quick trials and executions of opponents were frequent; newspapers could be closed or ransacked at a moment's notice. However, when conditions stabilized, Khomeini issued an eight-point statement, which prohibited such acts of censorship and illegal entries into homes. Although some abuses continue, conditions have significantly improved and there is a structure in place to correct the abuses. Currently, the Iranian electorate is pursuing more rights and reforms.

The Military

Iran has four military and security forces: the regular armed forces, the Pasdaran (Revolutionary Guards), the Basij (militia), and the police. The army, navy, and air force are the components of the regular armed forces, which were heavily purged after the revolution. The Pasdaran were created with the formation of the Islamic Republic to protect the revolution, because the Ayatollah was suspicious of the loyalty of the regular forces, which had been trained by U.S. advisers in the shah's era. The Pasdaran were largely responsible for the purging of the shah's regime as well as opponents of the new government. Both the regular armed forces and the Revolutionary Guards are responsible for defending the country if threatened by a foreign power. The Basij is called upon when the government is threatened by violence.

Local Government and the Civil Service

Iran is divided into twenty-five *ostans* (provinces). The *anjumans* (provincial councils) are slowly but surely expanding their power base. The provinces are further divided into 195 *shabrestans* (counties), then into 500 *bakhsbes* (districts), and finally into 1,581 *desbitans* (groups of villages). Respectively, each level is commanded by *ostandars*, *farmandars*, *bakhsbadars*, and *debdars*. Individual villages are run by *kakhdods* (headmen). Mayors and councils are either elected or appointed by the Ministry of Interior to run the towns and cities.

Iran has a civil service in place that still operates according to codes established in 1922 and 1966. It contains seven grade levels with fifteen in-grade steps between each grade level. To become a civil servant requires taking an entrance exam. There are over 700,000 civil servants in Iran.

The Future

The trend toward moderation demonstrated by the 2000 *majlis* elections was encouraging. Despite pre-

election crackdowns on the media, the will of the people was respected. Only time will tell how the volatility in the Middle East brought about by the U.S. responses to the 11 September 2001 terrorist attacks will affect Iran's political system.

IRAN-IRAQ RELATIONS For thousands of years, the inhabitants of the neighboring areas of today's Iran and Iraq have known conflict alternating with periods of tranquillity. Both Muslim countries, Iran and Iraq share a common cultural orientation, but religious views and languages differ widely. Present-day Iranians are Shi'ite Muslims, whereas Iraqis are largely Sunni, although with a significant Shi'ite population; Persian is the official language of Iran, while Arabic is the language of Iraq, and Kurdish- and Turkish-speaking peoples also live in both countries.

Relations up to the Nineteenth Century

Boasting long histories, both these countries are strategically situated on the Persian Gulf, a position that has shaped their unique national identities. Ancient Iraq (Mesopotamia) and Iran (Persia) were home to some of the world's first great urban civilizations. After the Arab invasion of the seventh century and the replacement of Zoroastrianism by Islam, a unique blend of Persian and Arab culture united Iran and Iraq during the long rule of the Abbasid dynasty (749/750–1258) over both countries, until both were devastated by successive Mongol invasions.

The paths of Iran and Iraq then diverged. The Safavid dynasty (1501–1722/1736) in Iran encouraged the transformation of Shi'ism, its school, and its religious hierarchy into the official religion of the region. Iraq fell under the hegemony of the Ottoman empire (1453–1922), for whom Sunni orthodoxy was the imperial religion. Ottoman-Safavid rivalries erupted across the Iran-Iraq border innumerable times for several centuries.

Nineteenth- and Twentieth-Century Iran-Iraq Relations

In the nineteenth century, the territories of Iran and Iraq were the site of the great power struggle (among Britain, France, and Russia), sometimes referred to as the "Great Game" (in the Caucasus and Iran) or the "Eastern Question" (in Iraq). Anglo-Russian-Ottoman rivalries were conducted on the ground in Iran, as conflict after conflict erupted over the Caucasus and Transcaucasus territories such as Georgia, annexed by Russia in 1801. Iraq remained under Ottoman control until World War I, when it was the scene of some of the worst fighting between the British and their Arab allies and the Turks. Iran's sovereignty was theoretically guaranteed by the presence of Russian and British forces stationed there supposedly to protect the Caucasus from Ottoman-German invasion, but in reality to keep control over the oil fields.

Iraq's present boundaries were constructed by the victorious World War I allies after Faisal led an Arab revolt against the Ottomans; the British supported Faisal as king (reigned 1921–1933). Iraq remained a kingdom until after World War II, when a dictatorship disguised as a republic eventually replaced the constitutional monarchy.

In Iran Reza Shah Pahlavi (1878–1944) seized power in 1925 and was succeeded by his son Mohammad Reza Shah, who ruled until 1979. During that time, oil catapulted the Middle East into world prominence, and both Iran and Iraq tried to consolidate their

new nations through rapid economic development and attempts to unify their various peoples, an attempt that was resisted by the Kurds, an ethnic minority in both Iran and Iraq. The Kurds figure as a significant source of conflict in Iran-Iraq bilateral relations.

World War II saw increased German influence in Iran, and under Anglo-Soviet pressure Reza Shah abdicated in favor of his son Mohammad Reza. British oil interests were on the rise, and concessions were given to them in 1943, following which the Soviets asked for similar rights. Iraq was reoccupied by the British during World War II to protect British access to Iraqi oil fields. After World War II external economic pressures, especially in the competition for oil, and conflicts with ethnic minorities complicated any sense of historical unity and prevented regional cooperative development between the two neighboring states.

The Arab-Israeli war of 1973 temporarily restored Iran-Iraq bilateral relations when, in a show of anti-Zionist solidarity, the oil producing and exporting countries (OPEC) brokered a settlement between Iran and Iraq after Saddam Hussein (b. 1937), the ruler of Iraq, ordered his troops to occupy two offshore islands in the Shatt al-Arab.

The Iranian empire had begun to decay in the 1970s, and in 1979 a triumphant Ayatollah Khomeini (1900–1989) declared the new Islamic (Shi'ite) Republic of Iran, a direct threat to the Ba'ath (Socialist) Party of Saddam Hussein's secular Iraq. Hussein was

fearful of the Shi'ites who formed 51 percent of Iraq's population and whose theological seminaries had been in close contact with Khomeini.

Iran-Iraq War, 1980–1990

The roots of the Iran-Iraq War were partly planted in the question of the sovereignty of the islands in the Shatt al Arab, a waterway 193 kilometers long, flowing from the Tigris-Euphrates confluence in Iraq to the Persian Gulf near Kuwait and forming part of the Iran-Iraq border. Iraq's right to the waterway, established in 1937, was a bone of contention with Iran. Provocation had occurred in 1969 over the passage of a group of Iranian vessels flying the national flag. In 1975, after Iran-supplied weapons had allowed the Kurds in northern Iraq to revolt, Iraq agreed to recognize the Shatt al Arab as the border between the two countries if Iran agreed to stop sending weapons to the Kurds. In hopes of reversing this border agreement, with an eye on the Iranian oil fields in Khuzestan province, and also desiring to stop the threat to Iraq's secular government posed by the Islamic government of Iran, Saddam Hussein invaded Iran in 1980.

The Iran-Iraq War was a bloody conflict; it dragged on for eight years and cost a million lives. In 1980 Iraq expected an easy victory, but Iran fought back and even attempted to capture Al Basrah, Iraq's main Gulf port. Much of the time the war was a stalemate; Iran refused to surrender, but Iraq enjoyed superior military advantage and did not refrain from using gas warfare against Iranian troops. World opinion was nevertheless anti-Iranian because of the fear that an Islamic revolution would spread throughout the Middle East. This perception was shared not only by the United States, which already had a strained relationship with Iran, but also by the Arab regimes who were its allies, and by the Soviet Union.

Iraq failed in its attempts to capture the oil fields of southern Iran due to tough resistance from the Iranian army. While purges and internal strife took a toll on the Iranian army, Khomeini relied on a cadre of revolutionary guards (Pasadaran) and a massive volunteer force of young men, instant martyrs in the fight for the Iranian Islamic Revolution.

The fighting continued for eight years, in a series of offensives and counteroffensives that devastated the oil economies of both nations and wreaked havoc on a generation of young people. The conflict acquired ethnic overtones of Persian versus Arab, rather than a religious versus secular confrontation. Iraq's pipelines were damaged, and oil could be exported only through Turkey and Jordan.

By 1988 the ravaged economies of Iran and Iraq, a war-weary public, OPEC, the United States, and the Soviet Union finally combined to force both sides to the negotiating table. The efforts of the secretary-general of the United Nations resulted in a cease-fire on 20 August 1988, under the direct control of the U.N. Iran-Iraq Military Observers Group. In October 1988 Ayatollah Khomeini accepted negotiation, comparing it to drinking poison. Khomeini died in June 1989, and a new wave of enthusiasm to end the war came about. Before peace could be signed, Saddam Hussein attacked Kuwait, precipitating the Persian Gulf War. The Iran-Iraq War was not settled until August 1990, when Iraq abandoned its demand to control of the Shatt al Arab, which was divided between the two countries.

IRAN-RUSSIA RELATIONS Since the collapse of the Soviet Union in 1991, Iran has become Russia's principal ally in the Middle East. The two countries have cooperated in a number of regional conflicts, and Russia is Iran's primary supplier of military equipment and nuclear technology. Both Moscow and Tehran oppose what they claim are U.S. efforts to create a unipolar world. While there are some areas of dispute between the two countries, primarily over the Caspian Sea, the durability of the relationship was underscored in November 2000, when Russia unilaterally abrogated an agreement with the United States to stop selling arms to Iran when existing contracts expired at the end of 2000.

Development of Iran-Russia Relations

Relations between Moscow and Tehran began to develop in the later part of the Gorbachev era (1985–1991). After alternately supporting first Iran and then Iraq during the Iran-Iraq war (1980–1990), by July 1987 Moscow had clearly tilted toward Iran. The relationship between the two countries was solidified in June 1989 with the visit to Moscow of the Iranian president Ali Akhbar Hashemi Rafsanjani (b. 1934), when a number of agreements, including one on military cooperation, were signed. The military

agreement permitted Iran to purchase highly sophisticated military aircraft from Moscow, including MIG-29s and SU-24s.

Russian Aid to Iran

The Iranian air force had been badly affected by the eight-year war with Iraq and by U.S. refusal to supply spare parts, let alone new planes, to replace losses in the F-14s and other aircraft that the United States had sold to the regime of Muhammad Reza Shah Pahlavi, the shah of Iran (1919–1980). Soviet military equipment was badly needed. Iran's military-supply dependence on Moscow grew as a result of the 1990–1991 Persian Gulf War. After that war, the United States, Iran's main enemy, became the primary military power in the Gulf. U.S. defense agreements with a number of Persian Gulf states included prepositioning arrangements for U.S. military equipment, and Saudi Arabia, Iran's most important Islamic challenger, acquired massive amounts of U.S. weaponry.

As Russia-Iran relations deepened, Moscow stepped up the quantity and quality of its arms sales, and by 1993 it had agreed to supply Iran with submarines that could be used to challenge the U.S. fleet operating in the region. Another Russian action angering the United States was the 1995 agreement to supply Iran with a nuclear reactor for the nuclear installation at Bushehr in southwest Iran. Under heavy U.S. pressure, Moscow did renege on a promise to provide a graphite reactor that could have been used to construct nuclear weapons. The Russian natural gas company, Gazprom, was also a major investor in Iran's South Pars natural-gas field, reaching an agreement to help develop the field in 1997.

Iran's Support of Russia

In addition to supplying Tehran with military equipment and nuclear reactors and investing in one of Iran's major natural gas fields, Moscow, whose position in the world had been eroding as its economy and military power weakened, found Iran to be a helpful ally in dealing with a number of sensitive Middle Eastern, Caucasian, Transcaucasian, and Central and Southwest Asian hot spots. These included Chechnya, where Iran has kept a low profile during both Russian-Chechen wars, despite the Chechen rebels' use of Islamic themes in their conflict with Russia; Tajikistan, where Iran helped Russia achieve a political settlement of the civil war, albeit a shaky one; Afghanistan, where both Russia and Iran have stood together against the Taliban; and Azerbaijan, which neither Iran, with a sizable Azeri population of its own, nor Russia wishes to see emerge as a significant economic and military

Russian and Iranian foreign ministers Igor Ivanov and Karmal Kharazi at talks on the Middle East in Damascus, Syria, in October 2000. (AFP/CORBIS)

power, particularly as it develops closer relations with the United States. Furthermore, as NATO expands eastward, many Russians have called for a closer Russia-Iran relationship as a counterbalance. Turkey is seen by many in the Russian elite as closely cooperating with its NATO allies in expanding its influence in both Transcaucasia and Central Asia—areas that Moscow regards in its own sphere of influence. Finally, Moscow also considers Tehran as an ally in resisting what both the Iranian and Russian regimes see as an attempt by the United States to create a unipolar world that it would dominate.

Problems in Russia-Iran Relations

Despite these areas of cooperation, the Russian-Iranian relationship has not been without its problems. First, with a chronically weak economy, Iran has not always been able to pay for its military and other imports from Russia and by the year 2000 had run up a trade deficit of \$2.5 billion. Second, the Bushehr nuclear-reactor project has lagged badly. The then director of Russia's Ministry of Atomic Energy, Yevgeny Adamov, to spur on the project, signed an agreement with Iran in 1998 to transform Bushehr into a turnkey installation, in which Russian, not Iranian, technicians would build the project, whose completion date was set for 2003.

A third problem lay in the supply of Russian missile technology to Iran. The United States brought heavy pressure against Russia, including sanctions against Russian companies accused of supplying the technology. Iran, in the eyes of the United States, was a rogue state, and its development of the Shihab III intermediate range (1,300-kilometer) missile threatened a number of U.S. allies in the region. First Boris

Yeltsin (b. 1931) and then Vladimir Putin (b. 1952) denied that supplying missile technology was official Russian policy. Nevertheless, the missile agreement severely damaged relations with the United States, especially with the Congress, and an economically weak Russia, particularly after the economic collapse of August 1998, was hard put to deflect the U.S. pressure. The rise in oil prices in 1999 and 2000 gave Iran some breathing room and allowed funds to pay down its debt to Moscow. Nevertheless, the missile-technology issue remains a serious problem in U.S.–Russia relations, which may well affect Russian-Iranian relations as well.

A fourth area of conflict lay in the issue of developing the oil and natural-gas resources of the Caspian Sea. Moscow initially shared Iran's opposition to the division of the Caspian into national sectors for the exploitation of oil and natural gas deposits (Iran called for joint development and joint sharing of the profits on a 20 percent basis for each of the five countries bordering the Caspian). By the mid-1990s, however, Moscow had changed its position and called for limited national sectors. By 1998, it had moved further and signed an agreement with Kazakhstan on the division of the Caspian. In January 2001, Moscow signed a similar agreement with Azerbaijan. The improvement in Russian-Azeri relations displeased Iran, which, unlike the other four Caspian riparian states (Russia, Azerbaijan, Kazakhstan, and Turkmenistan), had found little oil or natural gas in its small portion of the Caspian shoreline.

The Future Course of Russia-Iran Relations

A final Russian-Iranian conflict is more of a future possibility than a current problem for the relationship. It involves a rapprochement between Iran and the United States. Some Russian observers had first feared such a rapprochement following the overtures of the Iranian president Mohammed Khatami (b.1943) to the United States in late 1997, and again after the overwhelming victory of the reformers in the February 2000 Majlis (Iranian parliament) election. On both occasions, a strong counterattack by Iran's conservative forces prevented any rapprochement. Nonetheless, should a reconciliation occur, Russia and Iran would become competitors in providing export routes for Caspian oil and natural gas. The major fruits of an Iranian-American rapprochement would be the lifting of sanctions on the construction of oil and natural gas facilities in Iran, including pipelines. And Iran, as many U.S. oil executives continue to point out, is the shortest, safest, and most secure export route for Caspian oil to travel to the outside world.

In sum, Russia and Iran enjoyed a fruitful relationship in the first decade following the collapse of the Soviet Union. Whether the relationship will remain as close in the second decade remains to be seen.

IRAN–UNITED STATES HOSTAGE CRISIS

On 4 November 1979, a group of Iranian students occupied the U.S. embassy compound in Tehran and took U.S. diplomats hostage. This event was a major turning point in American-Iranian relations in the period following the Iranian Revolution earlier that year. The causes of the hostage crisis are rooted in the late 1970s political environment.

Relations in the 1970s

The Islamic Revolution had heralded the end of the monarchy in Iran. The shah had left the country at the urging of the prime minister, Shapour Bakhtiar (1935–1991). This paved the way for Ayatollah Khomeini (1900–1989) to return to Iran from his exile in France and establish the Islamic Republic. Anti-American sentiments were high, encouraged by Ayatollah Khomeini, who spoke of the United States as the Great Satan and fueled people's anger at foreign intervention in Iran.

Iranian history had been replete with foreign interference in national economic and political affairs, commencing with the Russians and British and then the Americans. However, the government of the prime minister Mehdi Bazargan (1907–1994) continued to maintain a working relationship with the United States, procuring military equipment and receiving U.S. intelligence reports concerning Soviet and Iraqi activities in Iran.

In a pivotal moment in October 1979, the United States allowed the shah to enter the country to receive medical treatment. This news was received skeptically and violently by the Iranian people. They believed the shah was trying to secure American support to regain power in Iran as he had done in 1953 in an American-engineered coup. Khomeini and hundreds of thousands of Iranians, who marched in Tehran on 1

November 1979, demanded the extradition of the shah. Unfortunately for Premier Bazargan, on that very day, he was meeting with the U.S. national security adviser Zbigniew Brzezinski in Algiers and was lambasted in the Iranian press for it.

The U.S. Embassy Takeover and Its Aftermath

Three days later, the U.S. embassy was occupied by young men who called themselves Students of the Imam Line, a reference to the ayatollah's ideas and policies. The students took sixty-six American diplomats as hostages. Bazargan tried to secure the release of the hostages, even pleading with Khomeini for his support, to no avail. Two days later, disillusioned with his powerlessness, Bazargan resigned. No one replaced him at that time. Elections were held in January 1980, and Abolhasan Bani-Sadr (b. 1931) was elected president.

Bani-Sadr also tried to resolve the hostage situation but found his efforts thwarted at every turn. In one instance, he contacted the United Nations to request that a commission be set up to investigate Iranian grievances, in return for the hostages being turned over to the Revolutionary Council as a first step toward their final release. On 23 February 1980, just one day before the UN commission was due to arrive, however, Ayatollah Khomeini vetoed this plan by proclaiming that only the *majlis* (parliament), which had yet to be elected, had the power to determine the fate of the hostages. In another instance, Bani-Sadr hoped to resolve the situation by arranging the extradition of the shah from Panama, where he had relocated after his medical treatment in the United States. However, these plans were soon foiled when the shah managed to flee to Egypt on 23 March 1980, thus avoiding extradition and dashing Bani-Sadr's hopes of ending the crisis.

Meanwhile, Washington was putting the pressure on Tehran as well. Financial restrictions were exerted on the country when President Jimmy Carter (b. 1924) froze all Iranian assets held in American banks (over \$12 billion) on 14 November 1979, soon after the hostages were taken. Then, in April 1980, President Carter authorized a risky rescue attempt, which involved landing aircraft and troops in deserts near Tabas in eastern Iran. The ambitious covert operation failed when two of the helicopters developed mechanical difficulties, leading the commander to abort the mission. A helicopter and a transport aircraft collided, causing eight American service men to die. The political fallout of this disaster operation undoubtedly cost President Carter his reelection and intensified already strained ties with Tehran, which consequently delayed the release of hostages further.

Furthermore, this failed rescue mission resulted in a purge of the Iranian military, since some revolutionary leaders suspected that military officers might have helped the Americans escape radar detection as they entered Iranian air space. Bani-Sadr was, however, powerless to stop the military purging; his effectiveness was compromised at every turn. For instance, he was forced to accept the *majlis's* choice for prime minister, Mohammad Ali Rajai (1934–1981). Major political and personality differences prevented Bani-Sadr and Rajai from working as a team in resolving the crisis.

Through a diplomat in West Germany, the Rajai government let the United States know that it was now serious about negotiations to bring about the release of the hostages. One reason for this sudden shift in the hard-liners' attitude toward negotiations was the fact that Iran found itself in an imposed war with Iraq in September 1980.

Settlement of the Hostage Crisis

Therefore, constructive negotiations began in earnest on 14 September 1980. However, the release of the hostages did not take place until 20 January 1981, which coincided with the inauguration of President Ronald Reagan (b. 1911) as president. Some believe the timing was no accident; Khomeini might not have wanted Carter to be credited with the release of the hostages. In return for the freedom of the hostages, the United States was to release the frozen Iranian funds held in American banks. Iran agreed to honor its loan commitments to the United States and to put \$1 billion aside pending the resolution of claims made against Iran by U.S. companies, to be reviewed by the International Court of Justice.

American hostages in Tehran in December 1980. (BETTMANN/CORBIS)

Although the hostage crisis was settled peacefully, it served to strain Iranian relations with some other states. Some in Iran believed the settlement put Iran at a disadvantage financially and politically. In addition, it furthered antagonized the professional relations between Bani-Sadr and the Rajai government, since Bani-Sadr had been left out of the negotiations. Finally, this peaceful resolution did not, unfortunately, remove the tension and antagonism between the United States and Iran. These undercurrents have remained and are only recently ameliorating.

IRAN–UNITED STATES RELATIONS

The relations between Iran and the United States have experienced major transformations since the Iranian revolution of 1978–1979 and the overthrow of the pro-Western monarchy in Iran. In 1953, Shah Mohammad Reza Pahlavi (1919–1980) was restored to the throne (following his deposal by his popular prime minister, Muhammad Mosaddeq) by a military coup organized and funded by the United States and British intelligence agencies. The shah gradually developed close relations with the United States in political, economic, and military areas, and Iran became one of the most significant U.S. allies in the Third World.

The alliance between the two nations reached its zenith during the presidency (1969–1974) of Richard M. Nixon (1913–1994). The shah and President Nixon developed a close personal relationship. This helped cement the already close alliance between Iran and the United States, and Iran became the largest purchaser of advanced U.S. weaponry outside of the member nations of the North Atlantic Treaty Organization (NATO). Notwithstanding the shah's efforts to reap the benefits of his close ties with the United States, he was never able to establish legitimacy for his rule, largely due to the perception that he had become an agent of the West, promoting outside interests in the Middle East at the expense of his own nation. When

the uprising in January 1979 succeeded in forcing the shah to flee Iran, the United States, as his closest benefactor, was dealt a heavy blow.

The Hostage Crisis and Two Persian Gulf Wars

After a few months, diplomatic relations between the United States and Iran were strained beyond repair after a group of student militants stormed the U.S. Embassy in Tehran on 4 November 1979 and took its staff hostage. This action was ostensibly taken to protest the shah's admission to the United States for cancer treatment. The militants saw the shah's admission as yet another attempt by the United States to restore the shah to his throne after another popular uprising against his regime. The hostage crisis, which lasted 444 days, consumed President Jimmy Carter (b. 1924), who failed to gain the release of the hostages.

On 21 September 1980, in the midst of the hostage crisis, Iraqi President Saddam Hussein (b. 1937) took advantage of the widening chasm between Iran and the United States and invaded Iran, thus precipitating one of the longest and bloodiest wars of the twentieth century. The Iran-Iraq War (1980–1990) provided the United States with an opportunity to punish Iran by developing close ties with Saddam Hussein's regime. The most significant of Iraqi-U.S. ties were in the field of intelligence, where the United States provided crucial information to Iraq about Iranian troop deployments and movements and other types of satellite intelligence. The U.S. support of Saddam Hussein further strained Iran's relations with the United States.

The budding anti-Iran Arab coalition organized informally by the United States during the Iran-Iraq War was shattered after Saddam Hussein invaded Kuwait in August 1990. With the massive deployment of U.S. troops in the Persian Gulf and the ensuing war against Iraq, Iran emerged from its regional isolation. Even the United States began sending feelers toward Iran in the hope of gaining its support in the Persian Gulf War. Although Iran did not join the coalition of nations fighting against Iraq, it did not undertake any measures to undermine the U.S.-led war efforts. A window of opportunity to improve relations between Iran and the United States had opened.

From Dual Containment to the Axis of Evil

Notwithstanding some hopeful developments in the immediate period of the Persian Gulf War, relations between the United States and Iran further deteriorated after the United States adopted its so-called dual containment policy during the first term of the presidency (1993–2001) of Bill Clinton (b. 1946). This

Iranians demonstrating outside the United States embassy in Tehran during the Islamic Revolution in 1979. (BETTMANN/CORBIS)

policy was designed to isolate both Iran and Iraq, preventing economic and trade ties as well as political relations between the United States and these two nations. It also called for punishment of non-U.S. third parties that invested in the petroleum industries of the targeted nations. The policy proved to be impractical and counterproductive. Most of America's major allies expressed varying degrees of opposition to this policy, especially when it affected their commercial interests and political sovereignty. Toward the end of Clinton's presidency, it was clear that dual containment had not achieved its goal with respect to Iran. As a consequence, the Clinton administration sought to find avenues to engage the moderate elements within the Iranian government who had come to power as a result of the landslide victory of Mohammad Khatami (b. 1943), the reformist cleric who became Iran's president in 1997. Years of mistrust and political animosity between the two governments again made improvements in relations impossible.

The U.S.-led war in Afghanistan and the campaign against terrorism again presented a unique opportunity for Iran and the United States to improve their relations. After an initial period of cooperation between the two nations, their relations deteriorated when President George W. Bush (b. 1946) included Iran as a node in his "Axis of Evil" State of the Union address in January 2002. Again, America's major allies took exception to this categorization and expressed their determined policy of engaging, not isolating, Iran.

Several areas of mutual interest should create close ties between the two nations. Iran is a significant oil producer, and its location makes it a major player in the Middle East and Central Asia/Caspian basin regions. Under the right circumstances, Iran can play a major role in stabilizing Afghanistan and can contribute to the Arab-Israeli peace process. However, its divided government and internal factional disputes have prevented it from advancing its foreign policy interests. In many ways, the current stalemate between the United States and Iran benefits neither nation.

IRAQ—PROFILE (2001 est. pop. 23.3 million). In 1916, Britain invaded the Ottoman provinces of Mosul, Baghdad, and Basra; in 1921 it united these provinces and renamed the country Iraq. As a modern state, Iraq is young, but the history of the land and its people dates back more than five thousand years. From 1921 to 1932, the country was known as the Kingdom of Iraq; after the overthrow of the monarchy in 1958, the official name was changed to the Republic of Iraq.

History

Here, in ancient Mesopotamia, the Sumerian civilization appeared about six thousand years ago. The lush river valleys of the Tigris and the Euphrates had a plentiful water supply and allowed for the production of surplus food and the rise of city-states and kingdoms. The region of present-day Iraq was the cradle of civilization and the background against which many biblical events occurred. Some of the most notable

IRAQ

Country name: Republic of Iraq
Area: 437,072 sq km
Population: 23,331,985 (July 2001 est.)
Population growth rate: 2.84% (2001 est.)
Birth rate: 34.64 births/1,000 population (2001 est.)
Death rate: 6.21 deaths/1,000 population (2001 est.)
Net migration rate: 0 migrant(s)/1,000 population (2001 est.)
Sex ratio—total population: 1.02 male(s)/female (2001 est.)
Infant mortality rate: 60.05 deaths/1,000 live births (2001 est.)
Life expectancy at birth—total population: 66.95 years, male: 65.92 years, female: 68.03 years (2001 est.)
Major religions: Shi'a Islam, Sunni Islam, Christianity
Major languages: Arabic, Kurdish, Assyrian, Armenian
Literacy—total population: 58%, male: 70.7%, female: 45% (1995 est.)
Government type: republic
Capital: Baghdad
Administrative divisions: 18 provinces
Independence: 3 October 1932 (from League of Nations mandate under British administration)
National holiday: Revolution Day, 17 July (1968)
Suffrage: 18 years of age; universal
GDP—real growth rate: 15% (2000 est.)
GDP—per capita (purchasing power parity): \$2,500 (2000 est.)
Population below poverty line: not available
Exports: \$21.8 billion (2000 est.)
Imports: \$13.8 billion (2000 est.)
Currency: Iraqi dinar (IQD)

rulers in this area included the Babylonian Hammurabi (reigned 1792–1750 BCE), whose law code included the *lex talionis* ("an eye for an eye") better known in biblical law; the Assyrian king Tiglath-Pileser III (reigned 745–727 BCE), who carried the Israelites off into captivity; the Chaldean king Nebuchadnezzar (c. 630–562 BCE), who completed the conquest of the Jews; and the Achaemenid Persian rulers Cyrus the Great (c. 585–c. 529 BCE) and Darius the Great (550–486 BCE).

In 637 CE, the battle of Kadisiya (Arabic al-Qadisiyah, on the Euphrates River), between the Arab Muslims led by the caliph 'Umar (586–644) and the forces of the Zoroastrian Sasanid Persian empire, marked the introduction of Islam to present-day Iraq and opened up Iran and Central Asia as well to the Muslims.

Baghdad became the capital of the Islamic Abbasid dynasty (749/750–1258), which ruled the lands from North Africa to Iran. The dynasty ended with the Mongol invasions of 1258 and the subsequent sack of Baghdad. The area was then governed by various rulers until 1534, when it became part of the Ottoman empire (1453–1922). However, for nearly six hundred years, between the collapse of the Abbasids in the thirteenth century and the final years of the Ottomans, government authority was tenuous, and the area of modern-day Iraq was, in effect, autonomous.

Beginning with its League of Nations Mandate in 1920, the British government laid out the institutional framework for Iraqi government and politics. Britain imposed a monarchy and nominated King Faisal (1885–1933) of the Hashemite family from the Hejaz

area in modern-day Saudi Arabia as the first king of Iraq. The British drew the territorial limits of Iraq with little knowledge of the natural frontiers or traditional tribal and ethnic settlements. They also had a prominent role in the writing of a constitution and the structure of the Iraqi parliament. The Iraqi state became independent in 1932, but Iraq's disconnected ethnic, religious, and tribal social groups showed little allegiance to the central government. As a result, the Iraqi government has been challenged with forging a nation-state in a land plagued by ethnic, sectarian, and tribal divisions.

Iraq became a republic after a 1958 coup of army officers under the leadership of Abdul Karim Kassem (1914–1963) overthrew and executed King Faisal II (1935–1958). Between the overthrow of the monarchy in 1958 and the emergence of Saddam Hussein (b. 1937) in 1979, Iraqi history was characterized by coups, countercoups, and fierce uprisings on the part of its Kurdish minority.

Iraq invaded Iran in 1980, beginning the costly Iran-Iraq war (1980–1990). In 1990, Iraqi troops invaded Kuwait but were driven out in 1991 by an international

force. The victors did not occupy Iraq, however; the regime of Saddam Hussein remained in control.

Geography

Iraq is located in Southwest Asia, at the head of the Arabian/Persian Gulf. Iraq's longest border is with Iran (1,458 kilometers), followed by those with Saudi Arabia (814 kilometers), Syria (605 kilometers), Turkey (331 kilometers), Kuwait (242 kilometers), and Jordan (181 kilometers).

Iraq's two major rivers, the Euphrates and Tigris, whose headwaters are in Turkey, converge in the southern plains of Iraq and terminate in the Shatt al Arab waterway that flows into the Persian Gulf. The country is divided into four major geographic areas: the desert in the west and southwest, rolling uplands between the upper Euphrates and Tigris Rivers, highlands in the north and northeast, and alluvial reedy marshes along the Iranian border in the south, with large flooded areas in the central and southeast sections.

The climate varies from extreme cold in the north to subtropical weather in the south and southeast. Baghdad has cool winters and hot summers. The desert region experiences cool winters with dry, hot summers. The northern mountainous regions along the Iranian and Turkish borders are characterized by cold winters with occasionally heavy snows that melt in early spring, sometimes causing extensive flooding in central and southern Iraq.

Baghdad is the capital and largest city of Iraq, followed by Basra in the south and Mosul in the north. Iraq's oil industry is concentrated in the northern city of Kirkuk, and the towns of Karbala (with the shrine of the caliph Hasan, who was murdered there in 680) and An Najaf (with the shrine of 'Ali, Muhammad's son-in-law) are pilgrimage centers for all Shi'a Muslims. There are eighteen governorates, or provinces, in Iraq, which are divided into districts and subdistricts. In the early 1970s, limited self-rule was granted to Kurds in three northern governorates officially known as autonomous regions.

Politics

Political power in Iraq is concentrated in a one-party system dominated by the president. The provisional constitution of 1968 states that the Ba'ath Party rules Iraq through the Revolutionary Command Council (RCC), which exercises both executive and legislative authority. The political system is designed to concentrate enormous powers in extremely few hands, with all power ultimately situated in the person of the president, who is also prime minister, chairman of the RCC, and secretary-general of the Regional Command of the Ba'ath Party. The system is a dictatorial, totalitarian state, which allows no political dissent or freedom of expression or assembly.

Economy

Oil was discovered north of Kirkuk on 15 October 1927, and the petroleum sector has dominated Iraq's

economy since the 1950s. The oil boom in the 1970s funded large-scale development projects, increased public-sector employment, and significantly improved education and health care. Because financial awards, as well as positions of high social status in the workplace, were usually based on membership in the Ba'ath Party and not on merit, the oil economy also tied increasing numbers of Iraqis to the ruling party.

Civil war with the Kurds, damage incurred during the war with Iran and the Persian Gulf War, and U.N. sanctions, coupled with economic mismanagement, led to economic disaster in the 1990s. Oil remains Iraq's main resource, but a U.N. trade embargo in 1990 halted all of Iraq's oil exports. New U.N. resolutions in effect since August 1996 have allowed Iraq to export a limited amount of oil to meet humanitarian needs.

People

Arabs form approximately 75 percent of Iraq's population, while Kurds form 20 percent; the remaining 5 percent are composed of Turkmen, Assyrians, and Armenians. Assyrians are Orthodox Christians who revolted against the Ottoman empire during World War I, after which they were later settled in Iraq with aid from the British. At least 95 percent of the Iraqi population adheres to some form of Islam. Shi'a Muslims, mostly in the south, form 65 percent of Iraq's total population; 35 percent of Iraqis are Sunni Muslims. Most Iraqi Shi'ites are Arabs, and almost all Kurds are Sunnis. Fifteen percent of the population are Sunni Arabs, but they tend to hold the highest administrative positions. Christians form the remaining 3 percent and include the Assyrians, Chaldeans (Uniat Christians who adhere to papal authority), and Armenians. Yazidis, who are of Kurdish stock, follow a syncretistic Islamic faith, and a few Jews remain in Iraq.

Arabic is the official language. It is the mother tongue of about 75 percent of the population and is understood by most others. Kurdish is spoken in Al-Sulaimaniyya, Dahuk, and Irbil governorates. Minorities speak Turkic and Armenian languages.

Culture

Iraq has for millennia attracted waves of ethnically diverse migrations due to its borders with non-Arab Turkey and Iran and because of the great agricultural potential of its river valleys. The influx of these peoples has enriched Iraqi culture but also has led to deep-seated ethnic and sectarian tensions.

Iraq's cultural zenith occurred when it was the center of the Abbasid dynasty, which created great scientific, literary, and architectural works. During the

Abbasids, *The Thousand and One Nights* (or *Arabian Nights*; in Arabic, *Alf laylab wa laylab*) emerged, a collection of fables and folk stories. In the last century, Iraq has produced some of the Arab world's best-known poets, musicians, and artists, such as the Nazim al-Ghazali and Kazem al-Saher.

Current Issues

Following the Persian Gulf War, the U.N. Security Council demanded that Iraq scrap all weapons of mass destruction and long-range missiles and allow U.N. verification inspections. U.N. trade sanctions remain in effect due to incomplete Iraqi compliance with these resolutions. Iraq has had disputes with Turkey over the Euphrates and Tigris Rivers; their headwaters are in Turkey, which has its own water development plans for the rivers. Since 1991, Iraq has had to deal with resistance from Shi'ite Muslims in the south and Kurds in the north. In many areas in the north, the Kurds have established de facto independent regions, under

A team of United Nations weapons inspectors at their Baghdad compound in November 1998. (AFP/CORBIS)

the protection of U.N.-created safe havens in this area. The future of Iraq remains uncertain. The debate over an Iraqi role in the attack on the World Trade Center in New York was raised after 11 September 2001. Nevertheless, the possibility of a U.S. military strike on Iraq seems possible as Iraq has refused U.N. weapons inspectors back into Iraq after their expulsion in 1998.

IRAQ—ECONOMIC SYSTEM The government of Iraq regards data on national economic performance as a state secret, particularly since the Iran-Iraq War (1980–1990); therefore, information on the nation's current gross domestic product (GDP), GDP growth, and inflation and unemployment rates is unavailable from the government itself. (See Table 1 for estimates from the U.S. Energy Information Agency.)

The economy of Iraq has been dominated by the oil sector since the 1950s. (Oil was discovered north of Kirkuk on 15 October 1927.) Until the imposition of United Nations sanctions beginning in 1990, most economic activities were derived from government expenditures, whose revenues came from the oil sector. Agriculture has had a minor role in Iraq's economy. Iraq's economy, infrastructure, and society, however, were devastated by its two recent wars.

During the Iran-Iraq War (1980–1990), massive expenditures caused financial problems, and Iranian attacks damaged oil-export facilities. The government resorted to austerity measures and incurred massive foreign-debt payments. Iraq's estimated economic losses from the war were \$100 billion.

Iraq's invasion of Kuwait in August 1990 (the start of the 1990–1991 Persian Gulf War), and the subse-

TABLE 1

Selected estimated data showing Iraq's national economic performance for 2000 through 2002

(ID = Iraqi dinar)

Official exchange rate	U.S.\$1 = ID0.3

quent economic sanctions imposed by the United Nations, combined with damage from military action, had dire effects on the Iraqi economy. The regime of Saddam Hussein (b. 1937) survived by funding Iraq's internal-security forces and awarding scarce resources to key internal government allies, thus exacerbating the current economic situation.

Iraq's GDP fell drastically after 1991, but increases in oil production led to an estimated Iraqi real GDP growth of 18 percent in 1999 and 4 percent in 2000. Iraq's inflation is estimated at around 80 percent (down from 100 percent in 2000). Under United Nations control, its merchandise trade surplus is over \$3 billion. Iraq has a heavy debt burden, possibly as high as \$140 billion. In addition to having erratic fiscal and monetary policies, the nation has no meaningful taxation system. The dinar was valued at 1,900 per dollar on the black market, as of August 2001, compared with around 900 dinars per dollar at the beginning of 2000.

In December 1996, the United Nations oil-for-food program was implemented, ameliorating living conditions for Iraqi citizens, many of whom had to balance two to three jobs to afford basic foodstuffs. Iraq was allowed to export limited amounts of oil in exchange for food, medicine, and necessary spare parts. In December 1999, the U.N. Security Council allowed Iraq to export oil to meet its humanitarian needs. Oil exports rose to more than three-quarters of their prewar level.

Iraq's Prewar Economy

Industrial development halted after the 1958 revolution, during which the monarchy was overthrown. Socialist rhetoric, which called for nationalization of industry and redistribution of large landholdings, as well as allowed the Communist Party to operate openly in postmonarchy Iraq, scared away Iraqi private investors, and capital began leaving the nation.

After the 1968 coup of the Ba'ath Party, the government gave priority to industrial development. The Ba'ath Party, whose platform was based on Arab unity and socialism, began nationalizing many private industries. With increased oil-export revenues, the state pursued a policy of import-substitution industrialization to move the economy away from dependence on oil exports and to obtain foreign exchange. In the 1960s, investment in industry accounted for almost one-quarter of the development budget, about twice the amount spent under the monarchy in the 1950s. After 1968, the share allocated to industrial development grew to about 30 percent of development spending. With the outbreak of the Iran-Iraq War, this share decreased to about 18 percent.

After 1968, the government used central planning to manage the national economy. Budgeting and planning became obsolete in Iraq due to the extremely high revenues accrued from the oil boom in the 1970s. As a result, the government's role shifted from the allocation of scarce resources to the distribution of wealth. Economic planning focused on subsidies and social welfare rather than on economic efficiency.

The Iran-Iraq War (1980–1990)

On the eve of the Iran-Iraq War, the petroleum sector dominated the Iraqi economy, accounting for two-thirds of GDP. The war diminished oil production, and by 1983 petroleum accounted for only one-third of GDP. The nonpetroleum sector of the economy also shrank, and real GDP dropped about 15 percent per year from 1981 to 1983.

Since economic-development planning depended on massive expenditures, the Iran-Iraq War brought central planning to a halt. The government resorted to ad hoc planning due to limited resources and deficit spending. In the late 1980s, the state relaxed its control of private-sector activities to increase domestic industrial and agricultural output. In 1987, Saddam Hussein shifted from a socialist economic ideology to a more open market, in response to the Iraq's increasing war debt.

At this time, approximately 95 percent of Iraq's exports were raw materials, primarily petroleum, while

foodstuffs made up most additional exports. Half of Iraq's imports were capital goods. Prior to the 1991 Gulf War, the government traded with Japan, Germany, Turkey, Italy, France, the former Yugoslavia, Brazil, and Britain. Kuwait was Iraq's most important Arab trading partner.

The Persian Gulf War (1990–1991) and Its Aftermath

The imposition of comprehensive U.N. sanctions in 1990 placed the Iraqi economy under siege. Rationing was introduced for foodstuffs, and large parts of the country's industrial sectors closed due to shortages of imported raw materials and spare parts. Agriculture received much greater attention than before, but although farmers were ordered to increase their acreage, they were hampered by the exodus of Egyptian farm workers and the lack of fertilizer. The overall effect of the war in Kuwait, combined with the economic sanctions, was to reduce the GDP by around 63 percent in 1991.

In theory, there have been no exports from Iraq since 1990, due to the U.N. sanctions. However, illegal exports range from \$1 to 2 billion annually, with illegal trade conducted with Turkey, Iran, and Jordan. Iraq has also smuggled crude oil and petroleum products to Turkey, Jordan, Syria, Iran, and the United Arab Emirates, where it was used for domestic use. According to press reports, these illegal shipments have been estimated to provide Iraq with as much as \$600 million to \$2 billion per year in illegal revenues.

During late 1995 and early 1996, with oil reserves almost exhausted, the government began to privatize state institutions and to sell state property to ameliorate the most critical economic crises—maintaining the balance of payments and dealing with accumulated debts.

As a result of the food-for-oil program under U.N. Resolution 986, implemented in December 1996, Iraq earns \$4 billion annually. Under this Resolution, Iraq can sell specified dollar amounts of crude oil over six-month periods in exchange for the purchase of humanitarian supplies. The distribution in Iraq of these supplies is under U.N. supervision. Proceeds are also used to pay compensation for Persian Gulf War victims, pipeline transit fees for Turkey, and funding for U.N. weapons-monitoring activities.

In November 2000, Saudi Arabia opened a border-crossing point with Iraq (the land border had been closed since 1990) to allow Saudi exports under the oil-for-food program. In January 2001, Iraq signed free-trade deals with Egypt and Syria, with the possibility of exporting oil via a pipeline to the Syrians.

In February 2001, U.S. Secretary of State Colin Powell (b. 1937) proposed a system of smart sanctions, barring military-related items while allowing import of civilian goods. In early July 2001, the U.N. Security Council agreed to postpone indefinitely a vote on the U.S. plan, extending the oil-for-food program another five months.

Oil

Iraq's oil reserves are estimated to be between 10 and 15 percent, or 112 billion barrels, of the world's proven oil reserves, the second largest in the world (after Saudi Arabia); there are also an additional approximately 215 billion barrels of probable and possible resources. Iraq's largest active fields are Rumaila and Kirkuk, but they are troubled by problems with technical matters, export terminals, and pipelines. Although the oil sector has dominated the economy, Iraq did attempt to create a more diversified industrial infrastructure before the war.

Agriculture

One-fifth of Iraq's area consists of farmland. In the 1950s, Iraq was self-sufficient in agricultural production, but by the early 1980s, food imports made up approximately 25 percent of total imports. Iraq has the potential for agricultural growth, but restrictions on water flow, due to Syrian and Turkish dam building on the Tigris and Euphrates Rivers, have produced difficulties.

Natural Gas

Iraq contains proven natural gas reserves. Since most of Iraq's gas is associated with oil, progress on increasing the nation's oil output directly affects the gas

sector as well. Gas is both produced with oil and also used for reinjection for enhanced oil-recovery efforts.

Banking and Finance

Commercial banks, primarily British, emerged during the British mandate (April 1920 to October 1932), although the traditional money dealers still offered limited banking services. In 1964, all banks were nationalized and consolidated; the banking system then consisted of the Central Bank, the Rafidayn Bank, and the Agricultural, Industrial, and Real Estate banks. The Rafidayn Bank had to balance the role of a commercial bank while acting as a government intermediary in securing loans from private foreign banks. In 2001, the United Nations urged Iraqi authorities to provide more food for the civilian population and to allocate a greater part of their oil revenues to improving the health infrastructure.

IRAQ—EDUCATION SYSTEM Historically, Iraq's educational system was the product of a mostly urban-based community of religious scholars dedicated to instilling in its adherents the principles of the Qur'an, and the sunna (Way) of the Prophet Muhammad. Similarly, education in the shrine cities of the Shi'a sect of Islam meant passing on the corpus of law and devotional practices of the Shi'ite imams to the students of the religious schools.

In Iraqi Kurdistan (northern Iraq, home of a large population of Kurds), Kurdish *tariqas* (mystic brotherhoods) monopolized education in the countryside. There, instruction was less formal and consisted for the most part of the teachings of the Qur'an and sunna, heavily laced with the mystic nuances of a particular brotherhood, as well as the oral transmission of tribal genealogies and lore.

Up to the mid-nineteenth century, formal education in Iraq was centered on the *madrasah* (religious school). These ranged in type and sophistication from

primary-level instruction, in which young boys (and infrequently, girls) were taught the Qur'an, to the more elaborate circles of learning, which drew mature students from far and wide in a scholarly network composed of individual sheikhs (professors of law and theology) and their followers, all drawing on chains of transmission of knowledge emanating from a rich Islamic past.

Education in the Ottoman Period

Iraq's educational system was based on informal circles of learning consisting of teacher-student networks assembled in mosques or other religious centers, and constantly revitalized by the input of traveling scholars from all over the Islamic world. Education thrived on government sponsorship and, especially in the Ottoman period (1453–1922), remained tied to official patronage until the beginning of the twentieth century. Very few *ulama* (scholars of law, teachers of religion) were able to survive independently of the state, which, from the sixteenth century onward, became the main guarantor of Islamic networks of education, as well as its chief beneficiary. But changes were afoot. From the first part of the nineteenth century onward, both the structure and the systems of meaning of Iraq's education process were to suffer an eclipse, as other methods of education combined to change the worldview of Iraqis radically.

Education witnessed many changes in structure and organization throughout the nineteenth century, and much of what we now view as modern instruction had its beginnings in the later Ottoman era. A wave of military-influenced reforms occurred in the Ottoman empire; these were largely inspired by the desire to upgrade the armed forces to resist Western encroachment. Military preparatory schools were established throughout the empire, as were an Imperial Military College, School of Public Administration, School of Law, and other universities in Istanbul. Iraq came under the influence of reformist-minded *walis* (provincial governors), who oversaw the creation of the *rushdiyya-I'dadiyya* (primary and secondary) system of schools (both military and nonmilitary).

Starting in 1870, Ottoman schools were established in Baghdad; they quickly spread to other provinces. Consisting of elementary and three- and four-year secondary schools, these institutions pursued the systematic teaching of mathematics, sciences, and foreign languages. After Ottoman Turkey was defeated in World War I, the British army entered Baghdad in March 1917, ushering in a new period of educational reforms.

EDUCATION AND MODERNIZATION IN IRAQ

The following quote from Sati' al-Husary, first director general of the Ministry of Education, in 1923–1927, refers to the resistance mounted by the leadership of the religious schools or *madrasabs* to the institution of modern curricula in Iraqi schools.

But I believe that anyone who has the true interests of the people at heart would not be sorry to see these [teaching] institutions decline, for they grouped the worst hygienic conditions with the stupidest teaching methods.

The Religious Legacy and an Emergent Secular Ideology

The educational system of Iraq underwent a radical change under British administration, and this change was stepped up throughout the years of the Iraqi monarchy. Because education was viewed as the mold of a new Iraqi generation, it quickly became a contested field. Sati' al-Husary (1880–1968) was a pre-eminent Arab nationalist theoretician and first director-general of education. According to his memoirs, the struggle for public education in Iraq centered on the unremitting hostility of some of the more traditionalist groups to the promotion of a secularist agenda in Iraqi schools throughout the 1920s and 1930s. Al-Husary's opponents were for the most part from the Shi'a community of Iraq; they resented the highly centralized nature of the new system of education, which favored urban centers (chiefly Baghdad) over tribal areas (which were mostly Shi'ite), and they were even less receptive to the secularist, national ideology that formed its core. To be sure, religious education throughout Iraq, not only in the Shi'ite south, suffered a grievous decline under the monarchy, as modern curricula adopted by the centralizing state made important inroads in the older, *madrasab*-style educational system.

Education during the Royalist Era

By 1950, the new educational system of Iraq had made deep strides among the population. A cornerstone of that system was free instruction at all levels,

EDUCATIONAL IMPROVEMENTS

"Before the [Iraq-Iran] war, the government had made considerable gains in lessening the extreme concentration of primary and secondary educational facilities in the main cities, notably Baghdad. Vocational education, which had been notoriously inadequate in Iraq, received considerable attention in the 1980's. The number of students in technical fields has risen threefold since 1977, to over 120,090 in 1986. The BAATH regime also seemed to have made progress since the late 1960's in reducing regional disparities . . . Baghdad was the home of most educational facilities above the secondary level, since it was the site not only of Baghdad University, which in the academic year 1983–84 . . . had 34,555 students, but also of the Foundation of Technical Institutes with 34,277 students, Mustansiriyya University with 11,686 students and the University of Technology with 7,384 students. The universities in Basra, Mosul and Irbil, taken together, enrolled 26 percent of all students in higher education in th[at] academic year."

Source: Mokless Al-Hariri. *Iraq—A Country Study*. Library of Congress. Retrieved 11 February 2002 from: <http://www.loc.gov>.

with primary school compulsory for all Iraqi children. Teacher-training institutes also developed rapidly; of six thousand primary teachers in government schools, nearly a third were women. Vocational schools also flourished. Although no university had yet emerged, many bodies of higher education existed, such as the Law School, the Engineering College, the Royal College of Medicine, and the College of Agriculture. Finally, scholarships sent young Iraqis abroad to further their academic study; on their return, some of them joined the cadre of the emerging oil industry.

Revolutionary Iraq and the Pursuit of Mass Education

The revolution of 1958, which overthrew the monarchy, accelerated changes already under way in the educational system, such as the universalization of learning for all Iraqis, no matter their background or gender. But it also added a different ideological interpretation to state curricula, by attempting to inculcate

the principles of Arab nationalism in schools. Since most education was public, with few private institutions still in operation from monarchical times (such as the famed Baghdad College, an American-administered high school run by Jesuit priests), the experiment had some success.

After the coming to power of the Ba'ath regime in 1968, however, a pronounced shift toward an Iraqi identity became manifest. As a result of this emphasis, Iraq's rich archaeological and folkloric history, as well as its store of pre-Islamic history and traditions, was incorporated into a more comprehensive educational vision. Long a bastion of Arab nationalism, Iraq's education system introduced school curricula that began to promote the notion of a particularist identity.

In the late 1970s, flush with oil, the Iraqi state aggressively pushed to promote universal literacy, claiming, by the end of the 1980s, to have reached an astounding literacy rate of 95 percent. More significantly, the Iraqi commitment to raise the literacy rate had resulted in the expansion of the educational system in the 1970s, especially in the larger cities. By the end of the Iraq-Iran War in 1988, approximately 180,000 students had entered universities or colleges. Seven institutes of higher learning, including one university of technology, had been established (increasing to eleven in the 1990s), as well as eighteen technical institutes. Because there was a need for educated university graduates, the government, despite a steady shortage of manpower in the armed forces, exempted students from military service during the Iraq-Iran war. Between 1977 and 1988, the number of technical students increased almost 300 percent.

Iraqi Education under Sanctions

During the Persian Gulf War (1990–1991), a system of United Nations–sponsored sanctions against Iraq, the most comprehensive in history, was put in place, inhibiting the state's normal economic activity and depriving its citizens of basic human needs. Because the U.N. initially banned Iraq from freely exporting its oil, state sponsorship of education was severely affected. Unable to fund schools and universities or to build new ones, Iraq was effectively hobbled, and its educational programs were arrested. Several international agencies and organizations attest to the alarming decline in the educational system of the country.

For instance, a 1996 UNESCO report speaks of a crumbling structure, with few teachers showing up to teach in primary schools (and those that did being paid derisory salaries in wildly inflated post-sanctions currency), a near-absence of reading materials, and an av-

A girl writing on the blackboard in her classroom in Iraq in 1996. (DAVID & PETER TURNLEY/CORBIS)

erage of one desk for four students. Some 40 percent of educational institutions had been destroyed or damaged, and many schools needed urgent repair. A UNICEF report in August 2000 noted that the situation had still not improved. Under the sanctions, the Iraqi government's education budget fell by 90 percent, from \$230 million to \$23 million, and as many as 83 percent of primary schools were in disrepair.

Iraqi medical education, formerly among the best in the region, continues to suffer from a physical breakdown of educational and health facilities, broken or obsolete equipment, and a dearth of the most basic medicines with which to treat patients. The facts are clear: The embargo on intellectual activity that has isolated Iraq from the outside world since 1990 is proving to be an unmitigated catastrophe for a state that devoted so much of its earlier history to making education a universal right for all Iraqis, and later boasted of having one of the best school systems in West Asia during the oil-boom days of the 1970s.

IRAQ—HISTORY The modern nation of Iraq, established in 1932, is relatively young. But the land and its people have a history that dates back to the dawn of human civilization. Historians usually use the Greek term "Mesopotamia" to refer to the land between the Tigris and Euphrates Rivers in ancient times. It was not until the late sixth or early seventh century that the Arabs came to refer to this land as "Iraq."

Ancient Mesopotamia (10,000 BCE–637 CE)

Most historians agree that agriculture, the domestication of animals, and sedentary life were first developed in the valleys of northern Mesopotamia and southern Anatolia around 10,000 BCE. This Neolithic revolution soon spread to southern Mesopotamia, where by 4000 BCE the world's first cities appeared, including Eridu, Nippur, Kish, and Uruk. The inhabitants at this time represented a variety of ethnic and linguistic groups, but those who had the most profound impact were the Sumerians and Semites. The Sumerians were responsible for the development of complex irrigation works, large temples (ziggurats), legal codes, state institutions, a sexadecimal system of calculation, and, most important of all, the world's first system of writing, known as cuneiform script. Politically, Mesopotamia was divided among a multitude of city-states whose growing competition for land and water gave rise to endemic warfare. It was not until 2350 BCE that the Semites of Akkad succeeded in unifying Mesopotamia into a single empire.

The Semites would continue to rule through a succession of expanding empires for more than fifteen hundred years. In addition to the Akkadians, these included the Amorites of Babylon, the Assyrians of Nineveh, and the Chaldeans, who reestablished the rule of Babylon. Under the Assyrians, the empire included the entire Fertile Crescent and Egypt as well as Mesopotamia, and under the Chaldeans, Babylon became one of the leading cities of the ancient world with such architectural accomplishments as the Gate of Ishtar, the Temple of Marduk, and the Hanging Gardens. In 539 BCE, Semitic overlords of Mesopotamia were removed by the Achaemenid Persians. Under their rule, Mesopotamia became part of

KEY EVENTS IN IRAQ HISTORY

- c. 10,000 BCE** Agriculture and sedentary life emerges in the region.
- c. 4000 BCE** The first cities in human history appear in the region.
- 2350 BCE** The Semites of Akkad unify Mesopotamia as a single empire.
- 539 BCE** The Persians displace the Semites as rulers.
- 330–129 BCE** Alexander of Macedon defeats the Persians and the region comes under Seleucid rule.
- 129 BCE–224 CE** During the Parthian period Greek influence continues.
- 224/228–651 CE** The region comes under the rule of the Sasanid dynasty.
- 637** The Arabs defeat the Sasanids at the Battle of al-Qadisiyah, opening the region to Muslim Arab rule.
- 749/750–1258** The region is ruled by the Muslim Abbasid dynasty.
- 762** Baghdad is founded.
- 945** Baghdad comes under the control of the Buyid dynasty.
- 1055** The region comes under Seljuk Turk rule for 50 years.
- 1258** The Mongols destroy Baghdad and the region becomes an impoverished province.
- 1508** Much of the region comes under Safavid rule.
- 1534** The region comes under the rule of the Ottoman empire.
- 1639** The Treaty of Qasr-I Shirin establishes the present-day boundary between Iraq and Iran.
- 19th century** The Ottoman empire institutes reforms and British influence increases.
- 1914–1918** During World War I, the British take Iraq.
- 1920** Iraq is made a British mandate by the League of Nations.
- 1921** The British agree to more Iraqi control and Faisal is made king.
- 1932** Iraq becomes an independent nation.
- 1936** The first of several military coups takes place.
- 1950s** The Iraqi Communist Party becomes a leader of the nationalistic movement.
- 1958** A military coup leads to a decade of political instability.
- 1963** The Ba'ath Party comes to power but is quickly pushed aside.
- 1968** The Ba'ath Party comes to power again.
- 1972–1975** Iraq nationalizes the oil industry.
- 1974** A Kurd rebellion is put down.
- 1979** Saddam Hussein comes to power.
- 1980–1990** Period of the Iran-Iraq War.
- 1990** Iraq invades Kuwait.
- 1991** In the Persian Gulf War, Iraq is driven out of Kuwait.
- 1992** International sanctions are placed on Iraq.

a vast empire stretching from Egypt and Greece in the west to northern India and central Asia to the east. The Persians brought a relatively tolerant rule, excellent administration, and the dualistic Zoroastrian religion. In 330 BCE, Persian rule was temporarily interrupted by the conquest of Alexander of Macedon (356–323 BCE). It was under his Seleucid successors

(321–129 BCE) that Greek influences spread widely. Although Greek government, religion, art, and culture existed side by side with their Mesopotamian counterparts, in time syncretism did take place. Greek influences continued well into the Parthian period (129 BCE–224 CE), which also witnessed the spread of universalist religions (Zoroastrianism, Judaism, Chris-

tianity). The Parthians were replaced by the Sasanid Persians, who inherited a destructive seesaw conflict with Rome and its successor, the Byzantine empire. The most important social changes during this period were the growth of Christianity (both Monophysites and Nestorians) and the continuous influx of Arabs from the southern deserts. In 580, the ruling family of the Arab kingdom of the Lakhmids (vassals to the Sasanids), converted to Christianity.

Early and Middle Islamic Period (637–1534)

The unification of the Arabs in Arabia under the banner of Islam was the precursor to their conquest of the Middle East and beyond. With respect to Mesopotamia, the decisive Battle of al-Qadisiyah (Kadisiya) took place in 637. Taking advantage of Sasanid exhaustion due to their wars with the Byzantines, the Muslim Arabs scored a comprehensive victory, pillaging the capital Ctesiphon in its aftermath. During the rule of ‘Ali ibn Abi Talib (c. 600–661), the son-in-law of the Prophet Muhammad (c. 570–632) and the fourth caliph, Syria and Iraq were used as bases for rival claimants to the caliphate. After ‘Ali’s murder, however, the Umayyad clan, under the leadership of Mu‘awiyah (602?–680), gained control of the caliphate and moved the capital from Medina to Damascus. Despite being the wealthiest and most populous province, Iraq was subordinated to Syria, leading to discontent and numerous rebellions against Umayyad rule. Among the most important of these rebellions was that of Hasan (624–680), the son of ‘Ali and grandson of Muhammad, whose death in the Battle of Karbala in 680 proved to be a defining moment in the development of Shi‘a Islam. Opposition to the Umayyads culminated in 749, when they were defeated by a broad coalition led by the Abbasid family. (The Abbasid dynasty ruled from 749/750 until 1258). The Abbasid takeover represents a real social and economic revolution that transformed the Islamic world, particularly Iraq. In 762, the caliph al-Mansur (reigned 754–775) founded the new capital of Baghdad, which, during the reign (786–809) of Harun ar-Rashid (c. 763–809), became a great cosmopolitan center of economic prosperity, artistic and literary creativity, and intellectual dynamism rarely matched anywhere in medieval times.

The fault lines in this golden age began to form as early as the mid-ninth century when interdynastic feuds; regional separatism; revolts by peasants, slaves and the urban poor; and the increasing dependence on Turkish mercenaries led to economic and political decline. In 945, Baghdad came under the control of the Buyid princes. These tribal people, who originated from the Caspian Sea area, were Shi‘ites who never-

theless kept the Sunni Abbasid caliph as a figurehead. This attempt at compromise did not reduce the rising Shi‘ite-Sunni tensions, which became a feature of Buyid rule. Another feature was the fragmentation of Iraq (and much of the Islamic world) into ever smaller political entities ruled by rival princes. An apparent turn of fortunes in 1055 instigated by the return of Sunni rule under the Seljuk Turks did not last long. Seljuk power waned after only fifty years, resulting in a return to fragmentation and decline. The most terrible disaster to strike Iraq, however, came in the form of the Mongol invasion. In 1258, under Hulegu Khan (c. 1217–1265), the Mongols took Baghdad, destroyed much of the city, looted its treasures, burned its priceless libraries, and engaged in widespread massacres. Iraq was reduced to an impoverished province well into the sixteenth century, during which political fragmentation was punctuated periodically by Turkic tribal invasions, notably by Timur (1336–1405) in 1393 and 1401.

Ottoman Rule (1534–1918)

In 1508, most of Iraq came under Shi‘a Safavid rule when Shah Esma‘il (1487–1524) entered Baghdad. The Safavid hold, however, remained tenuous, and in 1514, the Ottoman sultan Selim I (1467–1520) took Mosul and northern Iraq after defeating the Safavids at the Battle of Chaldiran. In 1534, the conquest of the nation was completed when Sultan Suleyman the Magnificent (1494/1495–1566) entered Baghdad. Iraq remained part of the Ottoman empire despite numerous attempts by the Safavids and their successors to capture Baghdad and the Shi‘a holy cities of Najaf and Karbala. The only exception to this was between 1623 and 1638, when Shah ‘Abbas (1571–1629) briefly reoccupied the nation. The land was divided into the three provinces of Mosul, Baghdad, and Basra. Overall conditions were improved through integration into the empire’s vast trade networks, enhanced security, and a relatively stable administration and judicial system. During the seventeenth and eighteenth centuries, several local powers (like the Afrasiyabs in Basra, the Jalilis in Mosul, the Mutafiq tribes in the south, and the Kurdish tribes in the north) developed at the expense of central control. Still, Ottoman rule was never really threatened, particularly after the signing of the Treaty of Qasr-i Shirin with the Safavids in 1639. This treaty established the boundary between Iraq and Iran, which is virtually unchanged today.

During the eighteenth century, the Ottomans were increasingly pressed in Europe, the danger from Persia returned, and tribal raids grew bolder. This forced Istanbul to grant more autonomy to the governors of

Baghdad, who came to rely on Georgian slaves (Mamluks) as the backbone of their army. The Mamluks eventually seized control of the governorship of Baghdad, reaching the height of their autonomy by the end of the century. A temporary peace in Europe allowed the Ottomans to reestablish central control in 1831. During the mid-nineteenth century, the Ottomans embarked on a broad series of state reforms (known collectively as the *Tanzimat*), geared particularly toward greater centralization. In Iraq, the most significant reforms were put into effect by Baghdad's Governor Midhat Pasa (1869–1872), who rationalized the provincial administration and established freehold ownership of land, modern schools, a printing press, modern communications, and various urban and industrial construction projects. At this time Iraq also witnessed a qualitative rise in European (especially British) economic penetration. The growing commerce with Britain and British investments in river navigation, telegraph lines, and oil exploration aroused British imperial interests even prior to World War I.

British Rule (1918–1932)

A British expeditionary force from India was already in place to invade Iraq when the Ottoman empire made its fateful decision to join World War I on the side of Germany in November 1914. The British easily took Basra and moved north along the Tigris and Euphrates Rivers. After encountering some stiff resistance (notably at Al Kut), they entered Baghdad in March 1917. Mosul was not seized until after the Armistice of Moudros in 1918. Despite the claims of General Mode that they had come as liberators, the British had, according to the Sykes-Picot Agreement of 1916, planned to divide the Arab provinces of the Ottoman empire with France. Immediately after the conquest, a British administration was set up over a bordered territory that had hitherto been socially, economically, and culturally part of the Arab Ottoman lands. In 1920, the new League of Nations awarded Britain a mandate over Iraq. Theoretically, this was to be a temporary period during which Iraq would be assisted until it could stand alone. Effectively, it was a cover for British rule over a territory deemed to be of vital interest due to its strategic location near India and its valuable oil resources.

Creating a nation in a land separated from its historic ties with Syria and Arabia and having an extremely diverse population was a challenge in its own right. But when the task was forced on a nation by an unpopular occupying power, it proved disastrous. The establishment of the mandate triggered a broad uprising in 1920, initiated by the tribes of the south. Despite a

massive British show of force, it was not put down until the following year. At the Cairo Conference of March 1921, the British agreed to loosen their direct rule over Iraq through the establishment of a king and local administration. The choice of Faisal (1885–1933), son of Sharif Husayn of Mecca (whose attempt to create a united Arab kingdom after the war was foiled by French guns at Damascus), as king proved to be acceptable to a broad segment of Iraqi notables. Although Faisal was crowned in August 1921, the nation did not achieve formal independence until 1932.

The Monarchy (1932–1958)

The independence of the new kingdom was threatened on several fronts. In addition to the ethnic, religious, regional, and tribal social divisions, which actively disrupted the formation of a cohesive nation, the integration into the international market gave rise to severe class divisions, especially in the countryside. Resentment focused on the British-Iraqi treaties that ensured a commanding role for Britain in vital areas like foreign policy, defense, and the exploitation of natural resources (especially oil). Faisal did well to balance the various conflicting interests and keep the developing anti-British movement in check. He insisted on a constitution, national referendums, and universal male suffrage. After his death in 1933, however, these tensions erupted in the form of sectarian violence, tribal uprisings, and a more militant nationalist movement. In 1936, the first military coup by General Bakr Sidqi took place, followed by others, often at the instigation of one political faction against another. Although the nation suffered from political instability, some important progress was made in areas like irrigation, oil export facilities, railroads, education, construction, and trade.

Arab nationalist officers led by Rashid Ali felt that World War II was an opportunity to disengage the nation from Britain and push for unity with Syria. In 1941, they seized power, forcing regent Abdul-Ilah and Prime Minister Nuri al-Sa'id to flee. Fearing German influence on this movement, the British occupied Baghdad and reinstated the previous government, causing further resentment. After the war, the marked increase in oil revenues did little to ease class divisions or resentment at the government's ties with Britain. During the 1950s, the Iraqi Communist Party came to play an important role in the nationalist movement, leading several mass uprisings in 1948, 1952, and 1956. The last was directed against Iraq's entry into a U.S.-British-led defense system known as the Baghdad Pact. Opposition to the monarchy was also stirred by Egypt's Gamal Abdel Nasser (1918–1970),

who was emerging as a symbol of Arab independence from the West.

The Republic (1958–1979)

In 1958, a group of army officers led by Brigadier Abdul Karim Kassem (1914–1963) overthrew the monarchy, declared a republic, and plunged Iraq into a decade of political instability. Initially, the takeover attracted enthusiastic popular support, particularly when the new government declared its withdrawal from the Baghdad Pact, the establishment of a more independent foreign policy by having diplomatic relations with the Soviet Union, and the initiation of a land-reform program to reduce the power of the big landowners and aid landless peasants. In less than a year, however, the revolutionary group began to fall apart. Among the issues that threatened the new regime were Kassem's refusal to join the United Arab Republic, his claims over Kuwait, growing hostility with the oil companies, a Kurdish rebellion in the north, and a rise in authoritarianism. The Ba'ath Arab Socialist Party soon came to lead the opposition, and in 1963, Kassem was overthrown in a bloody coup that was accompanied by widespread executions and arrests, especially of Communists. The group seized power was led by 'Abdul-Salam 'Arif, a pan-Arabist army officer and an admirer of Nasser. Within a couple of months, 'Arif kicked the Ba'athists, who were blamed for most

of the repressive measures, out of his ruling coalition and began a series of nationalizations of banks and leading industries. The regime, however, never managed to gain any amount of popular legitimacy, and the fractious political atmosphere in Baghdad was accentuated by the continuing rebellion in Kurdistan and the 1967 Arab defeat at the hands of Israel. Taking advantage of the resulting unrest, the Ba'ath Party managed to rally enough support within the army to recapture power in a bloodless coup in 1968.

The new Ba'athist government was led by Colonel Ahmad Hasan al-Bakr (who assumed the presidency), Saddam Hussein (b. 1937), and a number of associates drawn mainly from their Takriti kinsmen. Although a civilian, Hussein had distinguished himself as an able party organizer and ruthless conspirator. During the next decade, he would build a powerful intelligence network and gradually assume more control at the expense of al-Bakr and the military. Mostly under his guidance, the Ba'ath Party came to dominate the military and most organizations and clubs, setting the stage for a totalitarian state. Initially, Ba'athist rule seemed focused on national unity, with an agreement on Kurdish self-rule reached in 1970 and the establishment of a National Progressive Front with the Communists and others in 1973. Between 1972 and 1975, in a highly popular move, Iraq nationalized the entire oil industry, placing huge revenues at the dis-

In a move that reduced sanctions, the U.N. Security Council voted on 31 March 2000 to allow Iraq to double expenditures on rebuilding its oil industry. (REUTERS NEWMEDIA INC./ CORBIS)

posal of the government. These revenues were used to extend and improve various social services and significantly raise the overall standard of living. They were also used, however, to strengthen the repressive apparatus of the government, especially the army and the intelligence services. In 1974, negotiations with the Kurdish Democratic Party over implementing Kurdish self-rule broke down, and war ensued. After defeating this latest Kurdish rebellion, the government turned to harassing other opposition groups, and by 1979 the Communist Party was outlawed and most of its members arrested or exiled.

Dictatorship and War (1979–Present)

A few months after the tumultuous 1979 Islamic Revolution in Iran, al-Bakr relinquished power to Hussein. After executing his rivals in the Ba'athist leadership, Hussein turned to the perceived threat from revolutionary Iran. On 22 September, Iraqi forces invaded Iran, launching a destructive war. During the first year, Iraqi forces made important advances, especially in Khuzestan Province. The following year the tide had turned, and Iranian counteroffensives recaptured most territory. For the next six years, fierce fighting continued with little advantage to either side, although U.S. and French support for Iraq was beginning to have an effect. Fearing greater U.S. involvement and setbacks, Iranian leader Ayatollah Khomeini (1900–1989) reluctantly accepted a U.N.-brokered cease-fire. (Iraq did not officially agree to Iranian peace terms until after its invasion of Kuwait in 1990). The war did great damage to Iraq's economy, transforming it from a creditor to a nation with a debt of nearly \$100 billion. The war also assisted in the establishment of dictatorial rule through a more thorough militarization of society and the development of Hussein's personality cult. Iraq, however, continued with an ambitious armament program (including chemical, biological, and nuclear weapons), and the peace did little to resolve internal and regional tensions. Fearing opposition from the army and angered by Kuwaiti oil policies (seen as depressing prices), Iraq invaded Kuwait on 2 August 1990 and then formally annexed it. After Iraq refused to withdraw, a 28-member coalition led by the United States (and including several Arab nations) launched an air and land war that liberated Kuwait in April 1991. The massive rebellion against Hussein's rule that followed was eventually crushed at great human cost. Iraqi infrastructure suffered massive damage during the air campaign, and the continuing U.N. economic sanctions (the most comprehensive in history) have crippled the nation. The northern Kurdish areas, with

Allied protection, have since achieved autonomy from Baghdad. Nevertheless, Hussein's hold on power appears to have actually strengthened, and recently his son has been groomed to succeed him.

IRAQ—HUMAN RIGHTS Iraq is a dictatorial, totalitarian state, with all political power concentrated in a repressive one-party apparatus dominated by the president, Saddam Hussein, and the Arab Socialist Ba'ath Party. The state implements systematic human-rights abuses and internal repression through a network of internal-security organizations, secret intelligence services, Ba'ath party agencies, and police, military, and militia units. The state indiscriminately conducts these human-rights abuses against all sectors of the population. Officers and officials are regularly executed for their supposed involvement in subversive political activities. The government creates ethnically homogenous zones by expelling families from their homes and forcibly deporting them to other parts of the country. Freedoms of opinion, expression, association, and assembly are forbidden.

The vast Iraqi security apparatus maintains an order of repression through widespread terror, systematic use of torture, amputations, summary executions, forced "disappearances," and arbitrary arrests and detention. As socioeconomic conditions worsen under United Nations sanctions, the state punishes those accused of economic crimes and military desertion. Freedom of the press and expression is nonexistent, and Iraq's media outlets, such as television, radio, and newspapers, are government owned. Many foreign publications are banned, as is ownership of satellite dishes, computers, and typewriters.

Background History

When the current regime took power in Iraq in a coup in July 1968, the first victims executed were the

Kurd refugees from Iraq living in tents in Turkey in 1991. (DAVID & PETER TURNLEY/CORBIS)

very military officers who had aided in the takeover. Non-Ba'athists were removed from state institutions. Even Ba'ath party members who were seen as potential rivals were executed. These practices continued throughout the 1970s, and increased when Saddam Hussein took over the presidency in 1979.

In 1971 the regime began a systematic campaign of deporting Iraqi Shi'ites and Kurdish citizens to Iran. They were accused of being Iranian, opposed to "pure Iraqi," and expelled, even though some of these families had been living in Iraq for 300 years. The campaign gathered additional momentum in the 1980s, due to the Iran-Iraq War (1980–1990). An estimated 250,000 to 300,000 people, including Arabs, Kurds, and Turkmen, were deported during this period. In 1975, after the Algiers Accord with Iran ended the shah's support of the Kurds, the regime systematically targeted Kurdish citizens, forcing thousands to flee to neighboring countries. In 1978 the Iraqi state executed thousands of members of the Iraqi Communist Party.

The state has also systematically eliminated opponents, who are accused of complicity in plots against the president. Many of them have included high-ranking civilian and military officials, tribal leaders, as well as members of Saddam Hussein's own family and al-Majid clan. His two sons-in-law, Hussein Kamel and Saddam Kamel, defected to Jordan in August 1995, but returned because they believed the president's promise of a pardon. They were murdered in

a gun battle on 23 February 1996, just three days after they came back. Not only were they killed, but forty relatives, including women and children, also died. Other members of Saddam's clan were also arrested, as well as mid-level military and civilian officials, for their association with the defectors.

Religious Persecution

Although Iraq's Shi'ite Muslims constitute about half of the country's population, Iraq's government has been traditionally dominated by the country's Sunni Muslim minority. The majority of the country's Shi'ite population lives in the areas south of Baghdad, with a large concentration in the southern marshland regions near the Iranian border.

Iraqi Kurds in the north and the Iraqi Shi'ites in the south launched an armed revolt against Saddam's regime at the end of the Gulf War. Iraqi troops crushed the uprising, razing Shi'ite mosques and other Shi'ite shrines and executing thousands. Thousands of rebels and Shi'ite civilians fled into the southern marshlands between the Tigris and Euphrates Rivers and continued the revolt. Ayatollah Abul-Qassem al-Khoie (1889–1992), Iraq's most respected Shi'ite leader, was put under house arrest after the failed uprising, and a few years later died under mysterious circumstances during his detention. In February 1999 security forces assassinated one of the leading Shi'ite clerics, Ayatollah Mohammad Sadiq Al-Sadr.

In 1992, in the aftermath of the Persian Gulf War (1990–1991), the allied forces opposed to Iraq imposed no-fly zones over both northern and southern Iraq, to deter Iraqi governmental aerial attacks on the marsh dwellers in southern Iraq and residents of northern Iraq. However, the Iraqi government conducted artillery attacks on villages in both areas, and a large-scale burning operation in the southern marshes. The government began a water-diversion project and other projects in the south, accelerating the process of large-scale environmental destruction. The army constructed canals to divert water from the wetlands, resulting in hundreds of square kilometers burned in military operations. Moreover, the diversion of supplies in the south limited the population's access to food, medicine, drinking water, and transportation.

The Assyrians, a Christian minority in Iraq, have also suffered from state-sponsored massacres from the 1930s. They have not only been targeted by the current state, but are also attacked by Kurdish groups who have traditionally been at odds with the Assyrians.

Ethnic Persecution

The regime's ethnic hostility has been directed at three main targets: Kurds, Turkmen, and Kuwaitis. The Kurds have suffered the brunt of Iraq's dismal human-rights practices. For example, as Baghdad was making advances against Iranian forces during the final years of the Iran-Iraq War, the state turned its attention to the Kurds. In 1988, the Iraqi military attacked the Kurds in a campaign Baghdad called *vAnfal*, meaning "spoils of war," based on the eighth sura, or verse, in the Qur'an. The security apparatus demolished villages, executed thousands with firing squads, buried people in mass graves, and committed other atrocities. The Iraqi military attacked the Kurds with poison gas in the town of Halabja on 16 March 1988. Delivered over a three-day period, the gas left more than 5,000 dead and 30,000 injured. The campaigns against the Kurdish people by Iraq resulted in more than 4,000 villages destroyed and as many as 250,000 Kurds reported killed.

The Turkmen are a Turkic people, primarily living in the northern Iraqi city of Kirkuk and its surroundings. Not only have they been the victims of the Iraqi government's policies, but they also have come under attack from Kurdish parties who live in the same area.

Finally, six hundred Kuwaitis were taken prisoner during Iraq's occupation of Kuwait. The Kuwaiti government called for their immediate release and asked for the names of those who may have died in captivity to be revealed. Iraq disregarded the requests.

The Future

The Iraqi government continues to employ torture, summary executions of suspected opponents, forced disappearances, arbitrary arrests, and denial of the basic right of due process. Current resistance to the central government is minimal as the Kurdish opposition continues with its infighting, and most of the Shi'ite opposition is limited to hit-and-run raids launched from Iran. Many attempted coup plans devised by Sunni opponents in the government have been foiled. A sustained series of U.S. attacks in the future may unite and encourage the opposition, just as these groups launched a coordinated, albeit unsuccessful, uprising after the Gulf War.

IRAQ—POLITICAL SYSTEM After the current government in Iraq came to power in a coup on 17 July 1968, removing 'Abdul Rahman 'Arif, another Ba'ath Party leader, Ahmad Hasan al-Bakr (1914–1982) became president and Saddam Hussein (b. 1937) vice-chairman. A provisional constitution, adopted on 16 July 1970, concentrated all executive and legislative powers in the Revolutionary Command Council (RCC), the chairman of which was also the president of the country. Iraq's political system is divided into three mutually checking branches, the executive, the legislative, and the judicial, but in reality the executive wields complete authority over the legislature and the judiciary.

The Arab Socialist Ba'ath (Resurrection) Party is in firm control of Iraq's political system. The government, dominated by the higher echelons of the Ba'ath Party, must sanction any formal political activity. Outlawed opposition political movements include Kurdish, Shi'a, and Communist parties.

The Constitution

After the 1968 takeover, a constitution was drafted on 22 September 1968 and became effective on 16 July

A large mural featuring Iraqi leader Saddam Hussein is meant to build nationalism. (DAVID & PETER TURNLEY/CORBIS)

1970. Another constitution was drafted in 1990 but has not been adopted. The constitution states that Iraq is "a sovereign people's democratic republic" dedicated to Arab unity and socialism (Metz 1988: 177). Islam is the state religion, but freedom of religion and of religious practices is guaranteed. While both Arabic and Kurdish are official languages for administrative purposes, the constitution also states that the "national rights" of the Kurds and other minorities are to be exercised only within the framework of Iraqi unity. The 1970 constitution is officially designated as provisional, yet it has remained in force because a permanent constitution has never been promulgated.

The President and Vice President

The president is the chief executive of the RCC and serves as the commander in chief of the armed forces and the head of state. The president has authority to appoint and dismiss members of the judiciary, civil service, and military. The constitution does not stipulate the president's term of office or provide for his successor.

Ahmad Hasan al-Bakr served as the first president, from 1968 to 16 July 1979, when he resigned (whether voluntarily or involuntarily is still debated). Saddam Hussein, the former vice chairman of the RCC, assumed the presidency. Saddam Hussein's power is based on a small group of supporters, especially relatives from the Talfah family from the town of Tikrit.

He deals ruthlessly with suspected opposition to his rule, both external and from within the party. He is known for monopolizing power and promoting a cult of personality. The vice presidency is largely a ceremonial post, and the vice president is appointed or dismissed solely at the will of the president.

The Council of Ministers

The Council of Ministers serves as the presidential executive arm. The council discusses presidential policies and subsequently creates specific programs based on these policies. The council's activities are closely monitored by the *diwan*, or secretariat of the presidency, from which executive orders are issued.

The Cabinet

The president convenes all cabinet sessions. The cabinet usually consists of forty members, including the president and vice president. In addition to the president and the vice president, other senior members of the RCC serve on the cabinet, often, but not always, in the positions of minister of defense, minister of foreign affairs, minister of the interior, and minister of trade. Other ministerial positions include those for agriculture, communications, culture and arts, education, finance, health, higher education, industry, information, irrigation, justice, labor, oil, planning, housing, religious trusts, and transport.

The Revolutionary Command Council

The Revolutionary Command Council (RCC) was first formed after the July 1968 takeover. The constitution states that the RCC is the supreme body in the state and has the authority to promulgate laws, approve the government's budget, and deal with matters of national security, such as declarations of war. The RCC can override the constitution at any time and without judicial review. All who serve in the RCC must be members of the Ba'ath Party.

The president serves as chairman of the RCC. The RCC may dismiss any of its members by a two-thirds majority vote and can send to trial any members of the council, as well as any deputy to the president or any cabinet minister. The RCC has sweeping constitutional powers. It serves a legislative role in cooperation with or independently from the National Assembly. The powers of the National Assembly are defined by the RCC. The RCC also approves government decisions on national defense and internal security, such as declarations of war and ratifications of any international treaties or agreements. The chairman presides over the RCC's closed sessions and signs all laws and decrees issued by it. The RCC supervises the operations of cabinet ministers and the institutions of the state.

State Security Apparatus

The Iraqi state relies on a network of security and intelligence agencies, which protect it from internal enemies. These agencies are coordinated through the National Security Council, chaired by the president, and include the Iraqi army, the Special Security Service, the General Intelligence Directorate (Mukhabarat), Military Intelligence, the General Security Service, and the Office of the Presidential Palace. The responsibilities of different agencies overlap, so that no agency emerges as a threat to the power of the president. The Iraqi Department of General Intelligence is the most extensive arm of the state security system.

Local Government

There are eighteen governorates, each administered by a governor appointed by the president. Each governorate is divided into districts headed by district officers, with each district divided into subdistricts, which are administered by subdistrict officers. Mayors head cities and towns, while the president appoints the mayor of Baghdad and the mayors of other important cities.

The National Assembly

The Iraqi constitution provides for an elected, unicameral National Assembly, known in Arabic as al-

Majlis al-Watani. The RCC first promulgated a draft law creating the Assembly in December 1979, and this took effect in March 1980. The first National Assembly was elected in June 1980, in the first parliamentary elections since Iraq became a republic in 1958.

The National Assembly consists of 250 members elected by secret ballot every four years. Two hundred twenty seats are elected by popular vote, and thirty seats are appointed by the president to represent the three northern provinces of Dahuk, Irbil, and Al-Sulaimaniyya, where Kurds who have demonstrated loyalty to the government are appointed as representatives. All Iraqi citizens over the age of eighteen years are eligible to vote for the candidates. There are 250 electoral districts, and one representative is elected to the Assembly from each of these constituencies.

Only members of the Ba'ath Party and pro-Ba'ath independent candidates are permitted to participate in the elections. Furthermore, a state-appointed election commission must approve the qualifications of all candidates for the Assembly. This system has maintained Ba'ath Party control over the National Assembly. To qualify as a candidate for National Assembly elections, individuals must be at least twenty-five years of age, must have Iraqi fathers and be Iraqi by birth, and must not be married to foreigners.

The National Assembly generally holds two sessions per year; the first session is held in April and May, and the second session in November and December. During these sessions, the Assembly carries out its legislative duties concurrently with the RCC. Its primary function is to ratify or reject draft laws proposed by the RCC. In addition, it has limited authority to enact laws proposed by a minimum of one-fourth of the Assembly, to ratify the budget and international treaties, and to debate domestic and international policy. However, its actual powers are restricted, and ultimate decision-making authority resides with the RCC.

The Judiciary

The RCC promulgated the laws that formed the judiciary, since the constitution guarantees an independent judiciary but has no provisions for the organization of courts. The judiciary is divided into civil, criminal, administrative, and religious affairs. The Ministry of Justice has jurisdiction over the courts, while the president appoints all judges.

Political Parties

Although the Ba'ath party is the only sanctioned political party, others have exerted an influence in the

past. Some continue to have an effect despite their outlawed status.

The Ba'ath Party Two Syrians, Michel Aflaq (1910–1989) and Salah ad Din al Bitar (1912–1980), founded the Ba'ath Party in Damascus in 1947. Several Iraqis who attended the meeting returned to Baghdad and formed the Iraqi branch of the Ba'ath.

During the 1950s, the Ba'ath was an outlawed party, and its members were subject to arrest if their identities were discovered. In the 1960s, the party was reorganized under the direction of General Bakr as secretary-general, with Saddam Hussein as his deputy. Both men were determined to bring the Ba'ath to power, and in July 1968, the Ba'ath finally staged a successful coup. After the takeover, when Bakr became president of the regime, he initiated programs aimed at the establishment of a nation based on the Ba'ath ideals of socialism and Arab unity.

The Ba'ath Party claims that about 10 percent of the population are supporters and sympathizers; of this total, full party members, or cadres, are at 0.2 percent of the population. Participation in the party is essential for social mobility.

The Ba'ath Regional Command is the party's top decision-making body, and its members are chosen by Saddam Hussein. Theoretically, the Ba'ath Regional Command makes decisions about Ba'ath Party policy based on consensus. In practice, all decisions are made by the party's secretary-general, Saddam Hussein.

The Iraqi Communist Party The Iraqi Communist Party (ICP) was founded by Yusuf Salman Yusuf (1901–1949; known as Comrade Fahd, or the Leopard) in 1934. Although the ICP was legalized in 1973, the Ba'ath Party regularly suppressed it after 1963 and outlawed it altogether in 1985. The Ba'ath hierarchy had earlier perceived the ICP as a Soviet arm ready to interfere in internal affairs, but after the successful 1968 coup Ba'ath leaders joined ICP officials in calling for a reconciliation of their decade-long rivalry.

Despite several decades of arrests, imprisonments, repression, assassinations, and exile, in the late 1980s the ICP remained a credible force and a constant threat to the Ba'ath leadership. Because the ICP is a clandestine party fighting for the overthrow of the Ba'athist regime, its true membership strength may never be known.

The Shi'a Parties The religious opposition to the Ba'ath originates from the devout Shi'a population, who form the majority of Iraq's population but are excluded from positions of power. The most important

opposition party was Al-Da'wa al-Islamiyya. After the Ba'athist coup in 1968, Al-Da'wa opposed the regime's secular policies, which led to the party's state persecution. Al-Da'wa was banned in 1980, and membership in the organization was punishable by death.

All anti-Iraqi Islamic organizations, such as Al-Da'wa al-Islamiyya, moved their headquarters to Tehran. Iran set up an umbrella organization, the Supreme Assembly for the Islamic Revolution in Iraq (SAIRI), in November 1982. It is headed by the Iraqi cleric Hujjat al-Islam Muhammad Baqir al Hakim. SAIRI subsumed Al-Da'wa and other small Shi'a groups. It still launches military raids from Iran into southern and northern Iraq.

The Kurdish Parties The Kurds have maintained a violent struggle against the central government in Baghdad almost since the founding of Iraq. The Kurdish Democratic Party (KDP) was formed in 1946 under the leadership of Mullah Mustalafa-al-Barzani (1904–1979), with assistance from the Soviet Union, in northern Iran. Here, a Kurdish territory, the Republic of Mahabad, was established. When the Republic was crushed by Iranian forces a few years later, the KDP moved its activities to northern Iraq. The Iraqi government then launched a military campaign against the KDP forces, which responded with guerrilla attacks on Iraqi government forces and installations with the support of Iran and the United States.

In 1975, the shah of Iran withdrew his support of the Kurds as part of the Algiers Accord (which also delineated the Shatt al Arab channel that forms the border between Iraq and Iraq) between Tehran and Baghdad, leading to divisions in the Kurdish movement. At this time, a breakaway faction emerged from the Kurdish Democratic Party (KDP), known as the Patriotic Union of Kurdistan (PUK), under Jalal Talabani (b. 1933). The PUK engaged in low-level guerrilla activity against the Iraqi government from 1975 to 1980. The war between Iraq and Iran in 1980 gave the PUK and the KDP the opportunity to intensify their military campaigns against the Iraqi government.

Most of the rural areas in northern Iraq were under the control of the guerrillas during the Iran-Iraq war years. Since the 1991 Gulf War, all central government functions in northern Iraq have been performed by local administrators, mainly Kurds, because the state withdrew its military forces and civilian administrative personnel from the area. A regional parliament and local government administrators were elected in 1992. This parliament last met in May 1995, when fighting between the PUK and the KDP disrupted normal parliamentary activity.

Iraq Today

Iraq maintains tenuous control of northern Iraq, while a low-intensity revolt has been launched in the marshes of southern Iraq. As a response, Saddam Hussein built a series of canals to drain the marshes and contain this revolt. Saddam Hussein's popularity has diminished as Iraqis suffer from the hardships caused by the United Nations-imposed sanctions. His most loyal support comes from members of his al-Majid clan from Tikrit in northern Iraq and from the Special Republican Guard. Saddam Hussein will most likely be succeeded by one of his sons, Uday Hussein and Qusay Hussein.

IRAQ-TURKEY RELATIONS Since the early twentieth century, when both Turkey and Iraq achieved independence in the aftermath of World War I, relations between the two states have been pragmatic. Given an overlapping history, complementary concerns, and sometimes conflicting values, Turkey-Iraq relations have been defined and informed by a relatively limited number of issues, each varying in significance. Some of the most important issues relate to Western interests.

Pre-World War I Relations

Prior to World War I, neither Turkey nor Iraq existed as independent states. The Ottoman empire, ruled by the Anatolian Turks, included the Arabic province of Iraq, which had been incorporated into the empire by the Ottomans in 1534. For the following four hundred years, the Turkish sultan was both

the political and spiritual ruler of the province of Iraq (the position of Islamic spiritual ruler, or caliph, having been wrested from the Mamluk regime of Syria and Egypt in 1517). Periodic attempts at rebellion in the Iraqi province failed, but over time, the slow demise of the Ottoman empire allowed Iraq greater freedom in its own affairs. World War I found the Ottomans on the side of the Germans, presenting the Western Allies with an opportunity to weaken the empire further and establish greater influence in the Middle East by supporting Arab nationalism through promises of independence. With British backing, the Arabs rebelled against the collapsing Ottoman empire, and the Middle East, Iraq included, achieved nominal independence.

Relations from World War I to the Persian Gulf War

By 1923, Turkey had also consolidated its independence, expelling foreign powers from its vastly reduced territory, but maintaining positive relations with Western states for trade and developmental purposes. In Iraq, the League of Nations Mandate of 1920 gave control of the Iraqi province to the British, to the disappointment of Iraqi nationalists. From 1920 until Iraq achieved full independence in 1932, Iraqi relations with its former Turkish rulers were guided by the British and dealt primarily with British trade interests. Two main concerns existed for the British at this time, each economic in nature and giving substantial benefits to both Turkey and Iraq. The first was the construction of a transcontinental railroad bypassing the African trade route and linking British-held Kuwait to Europe. The second was the development of the Kirkuk oil fields, discovered in northern Iraq in 1927, and the shipment of its oil to Turkey's Iskenderun Gulf.

During the 1930s, Turkey-Iraq relations were at their most cordial, with both the Hashemite king Ghazi (1912-1939) of Iraq and Kemal Ataturk (1881-1938), the founder of the modern Turkish state and its leader since 1923, continuing to maintain close relations with the British. Although there was some conflict over border issues and resource questions, the relations of both states remained relatively stable, limited, and oriented toward the West.

From the late 1930s, after the deaths of both Ataturk and Ghazi, to the 1970s, Turkey and Iraq each suffered a series of military coups alternating with democratically elected governments with strong military elements. Relations between the two states focused on issues that remained significant for the rest of the twentieth century, transcending whatever regime hap-

pened to be in power, and institutionalizing the pragmatism of their ties. At times complementary, yet often at odds, the policy concerns of the two countries formed a basic pattern of behavior that was consistent on some fronts, although not necessarily friendly, and fluid on others. Islam, water issues, and the oil trade are examples of the former, whereas relations with the West and Kurdish minority questions are examples of the latter.

The 1940s saw differences emerging in Turkey-Iraq foreign relations, with Iraq shifting support away from Europe. Iraq took part in the first Arab-Israeli war (1948) and, in the early 1950s, examined the possibility of a union between itself and Syria. Turkey opted to look in the other direction, supporting the Western states and, after its ascension to the North Atlantic Treaty Organization (NATO) in 1952, placing itself firmly in the sphere of Western influence. Different foci in their extended foreign relations, however, did not preclude Iraq and Turkey from cooperating in common areas of interest. In 1955, both countries joined with Iran, Pakistan, and the United Kingdom to form the Baghdad Pact, a mutual-defense organization intended to contain the growth of Soviet influence in the region. This experiment ended when Iraq, after alienating many of its Arabic neighbors by joining the pact, found itself with a new military government and withdrew from the agreement.

The historically sensitive issue of water rights became a strong point of contention for the two countries beginning in the 1960s, when Turkey implemented a massive public-works project (the GAP project) aimed at harvesting the water from the Tigris and Euphrates Rivers through the construction of a series of dams, for irrigation and hydroelectric energy purposes. The intended level of control of common water resources by Turkey upon completion of the GAP project was unacceptable to Iraq, which remains dependent upon both rivers to supply a significant portion of its water needs.

First raised in the 1920s, the Kurdish question became a prominent concern of both Iraq and Turkey with the radicalization of a Kurdish independence movement and the formation of the Kurdistan Workers' Party (PKK) in the 1970s. Operating primarily out of Turkey, the PKK's revolutionary activity was aimed at the establishment of a Kurdish state in Turkey's southeast. For Iraq, the situation was less volatile, as divisions among the Kurds in northern Iraq prevented any real challenge to Baghdad's rule. However, as the Kurdish issue was a cross-border concern, it took center stage in Turkish-Iraq relations during the 1970s and the 1980s.

The establishment of military-backed regimes in Turkey and Iraq by 1980 helped strengthen relations on several core issues, as both governments supported secularist and antiradical policies, stable borders, and closer ties with the West—needed by Iraq for its conflict with Iran (1980–1990) and by Turkey in its desire to join the European Union (EU). The Iraqi invasion of Kuwait in 1990, under the orders of President Saddam Hussein (b. 1937), reversed this decades-long trend as Turkey again chose to support the West.

Post-Persian Gulf War Relations

The pragmatism of Turkish-Iraqi relations is most evident in the post-Persian Gulf War era. While Turkey gained international praise for siding against Iraq and allowing United Nations forces to fly missions from its air bases, this favor did not compensate the country for the massive disruption of the Turkish economy resulting from the imposed U.N. sanctions. From 1991 until 2001, estimates of Turkey's economic losses ran between \$30 billion and \$40 billion. As Turkey's economy steadily declined in the 1990s, the government turned a blind eye toward increased trade between its southeastern provinces and Iraq. Oil and agricultural products were actively traded between the two states in explicit violation of the U.N. sanctions. By 2000, the Turkish government had even gone so far as to tax the illegal tanker trade in oil.

Iraq, for its part, often ignored Turkey's close ties with the United States, out of the desire to maintain relations with the country that, since the 1930s, had been one of Iraq's most significant trading partners and remained one of the few outlets for Iraqi goods, legal and illegal. Iraq also generally ignored the periodic incursions into its territory by Turkish forces pursuing PKK groups, a continuing threat to Turkey, but mostly harmless to Iraq, as Kurdish factions remained disunited.

While foreign relations diverged after the Persian Gulf War, Turkey-Iraq relations have remained closely defined by parameters established decades earlier, dependent upon both local circumstances and foreign influence.

IRIAN JAYA (2000 est. pop. 2.2 million). Irian Jaya, the easternmost province of the Republic of Indonesia, covers 421,981 square kilometers on the western half of the island of New Guinea, nearly 55 percent of the total area of Indonesia. Irian Jaya is encircled by other islands (Dolak, Misool, Salawati, Waigeo, Biak, Yapen, and Kelopom) and is bordered by the Seram and Banda Seas to the west, the Pacific Ocean to the north, the Arafura Sea to the south, and Papua New Guinea to the east. New Guinea is the second largest island in the world, after Greenland; from west to east it measures almost 2,500 kilometers, the distance from London to Istanbul.

The most populated and cultivated parts of the island are the Paniai Lakes district and the Balam Valley to the east. The population comprises migrants from Java and indigenous people from diverse *suku* (tribes), such as the Dani of the Baliem Valley in the central highlands, the Asmat of the southern coastal region, and the Ekari of the Wissel Lakes region. The official language is Bahasa Indonesia, but at least 250 languages are spoken by the indigenous people, reflecting the isolation and small numbers of many of the tribes.

Irian Jaya is a tropical island with primeval rainforests, powerful rivers, beautiful beaches, lakes, and mountains. The highest mountain is Gunung Jayawijaya, with snowcaps covering its 5,000-meter-high peaks. The area is also rich in natural resources, including fish, timber, and precious metals. These, how-

ever, have become a source of conflict between the central government and local peoples.

After a plebiscite in 1969, Irian Jaya became an Indonesian province, with its capital at Jayapura. However, frustrated by the exploitation of their natural resources, and poor social and economic conditions (e.g., high infant and maternal mortality rates), a growing number of Irian activists, who prefer to call themselves Papuans, consider the plebiscite illegitimate, and have demanded independence.

LORENTZ—WORLD HERITAGE SITE

The Lorentz National Park has been the largest protected region in Southeast Asia since its designation as a UNESCO World Heritage Site in 1999. Located at the intersection of two tectonic plates on New Guinea, the massive park is exceptionally biodiverse—including both snowcaps and a tropical marine environment.

IRIAN JAYA CONQUEST Irian Jaya, also known as Papua, has effectively been governed by Indonesia since May 1963, and its estimated 2 million inhabitants speak languages belonging to more than 200 distinct groups. The Netherlands ruled the western half of Papua island after transferring sovereignty of the rest of the archipelago to Indonesia in 1949. The Indonesian president Sukarno consistently argued that this territory was rightfully Indonesia's. The Netherlands, under U.S. pressure, finally acquiesced to Sukarno's demand, and an agreement was concluded on 15 August 1962, transferring power to the United

Nations on October 1962 and to Indonesia on 1 May 1963. The agreement stipulated that Indonesia hold an Act of Free Choice, but the 1969 plebiscite is widely regarded as fraudulent and unrepresentative (Indonesian military intelligence carefully selected 1,022 tribal leaders to endorse Indonesian rule). The U.N. "noted" the Act of Free Choice, but failed to give stronger endorsement of the heavily rigged process.

The Free Papua Movement (OPM or Organisasi Papua Merdeka) has resisted Indonesian rule since the mid-1960s (1,500 Indonesian paratroopers who entered Irian Jaya in early 1962 met stiff local resistance; 200 were either killed or went missing). Rejecting the 1969 Act of Free Choice, in 1971 the OPM announced the establishment of an independent government, and from the late 1970s to 1984 staged sustained guerrilla attacks. Indonesian armed forces broke the resistance by 1984 with advance knowledge of an attack on Jayapura. Retaliation by the Indonesian armed forces mirrored its tactics in Aceh and East Timor, and aerial bombardment affected thousands of civilians, causing them to flee into Papua New Guinea. OPM campaigns against mining operations reflect resentment over Indonesian exploitation of Irian Jaya's vast reserves of copper, gold, petroleum, and other resources. The OPM, however, suffers from serious divisions along tribal lines; as Robin Osborne argues, "For at least 20,000 years, for indigenous Melanesians of New Guinea, 'foreigners' were people of other language groups, even close neighbours" (Osborne 1986: 49).

Since the end of the Suharto era, the OPM and other independence supporters have adopted a peaceful strategy of using their new freedoms to push for recognition of Irian Jaya's distinct history. A government-sponsored conference in June 2000 backfired on Indonesia when delegates overwhelmingly resolved that West Papuan independence leaders had declared independence from the Dutch on 1 December 1961—before the transfer of power to Indonesia. (In 1961 Papuans elected to the new National Committee adopted emblems of state with Dutch approval.) The conference also concluded that this should prompt political review of Papua's status. The strategy of the independence movement is to correct "history" as the first step in reconsidering the province's future. Transmigration to Papua has been considerable, and more than 200,000 mainly Javanese settlers now live in the province, particularly in coastal areas.

IRIOMOTEJIMA ISLAND (2000 est. pop. 2,000). Iriomotejima is located approximately 440 kilometers southwest of Okinawa. It is the largest island of the Yaeyama group, with an area of 289 square kilometers. Mountains average 400 meters and cover 70 percent of the island. The highest mountain is Komidake (470 meters). About 90 percent of the island is covered with tropical rain forests and mangroves flourish at the estuaries of the Urauchi and Nakama rivers. Because of repeated cases of malaria since 1637, people were forced to leave the island. The crested serpent eagle and the Iriomote wildcat are found in the island's forests. The latter, a species of mountain cat, was discovered in 1965 and was designated an endangered species by the Japanese government in 1994. The Iriomote National Park, which occupies several of the Yaeyama islands, is primarily located on Iriomotejima. The park has subtropical forests and vegetation, poisonous snakes, rare butterflies, and mangrove swamps. The island's economy depends mainly on farming and tourism, which began to flourish in the 1970s. The main agricultural products are wetland rice, sugarcane, and pineapples.

IRON TRIANGLE The Iron Triangle, about twenty miles northwest of Saigon in Vietnam, served as a base for attacks by the National Liberation Front (NLF) on the Saigon area and Tan Son Nhut Airport during the height of the American war in Vietnam (1965–1970). An area of 200 to 280 square kilometers of dense forests, its corners were the villages of Ben Suc, Ben Cat, and Cu Chi. The Triangle was also bordered by the Saigon and Thi Tinh Rivers. The area

was so called because of its shape and because it was solidly under the control of the NLF and difficult to penetrate.

Use by the Viet Minh

The area had first been used by the Viet Minh during the Franco–Viet Minh War (1946–1954), and it comprised a vast and complex system of tunnels and underground facilities, including hospitals, living quarters, meeting halls, and command posts. From the tunnels, located near Cu Chi, the NLF was able to plan strategy and could avoid capture. The 240 kilometers of tunnels and underground facilities had allowed the Viet Minh and later the NLF to survive numerous military sweeps and massive bombings of the area. Some of the underground facilities were 6–9 meters deep and some of the passageways were as narrow as 60 centimeters by 60 centimeters.

Operation Cedar Falls

By 1966, the U.S. military in southern Vietnam considered the area a threat to its operations and to the safety of Saigon, and decided to destroy the Iron Triangle (referred to as War Zone D by the U.S. forces). Operation Cedar Falls was launched in January 1967. Approximately thirty thousand American and South Vietnamese (ARVN) troops took part in the search-and-destroy operation led by General William Westmoreland, among others. The primary aim of the mission was to eliminate the NLF presence and threat in the area. American military experts claimed this would require U.S. and ARVN troops to flush out and destroy the tunnels. In addition, all non-NLF inhabitants would have to be permanently relocated, and at least four villages would have to be razed.

One of the first missions of Operation Cedar Falls was the evacuation of the village of Ben Suc. On 8 January 1967, U.S. and ARVN troops surrounded the village. The estimated 3,500 residents of the village were rounded up and interrogated. Those considered non-combatants were evacuated to a refugee camp several miles from the village. Those suspected of being NLF troops were taken in as prisoners. Once the evacuation of Ben Suc was completed, U.S. demolition teams moved in to destroy the village itself. Tractors and bulldozers were brought in by helicopters in order to clear the surrounding jungle and to raze the village. Within a few days the forest had been cleared and the houses had been destroyed. This technique was used in other surrounding villages as well.

At Cu Chi, entrances to the tunnels were exposed and special U.S. military units, known as the Tunnel

Rats, were sent in to destroy the tunnels and to capture any NLF troops in hiding. In addition the U.S. military used flooding and shelling to flush out any NLF troops in hiding. After the area had been defoliated and cleared, it was bombed and burned in order to destroy any remaining, undetected tunnels. Although considerable damage was done to the tunnels, NLF troops were quickly able to repair them and to continue to use them as protection.

Operation Cedar Falls lasted approximately eighteen days. It was followed by Operation Junction City and several others. Initially deemed a success by the U.S. military command, it failed to make the Iron Triangle safe, despite the amount of resources it received. The operation had created at least seven thousand Vietnamese refugees, resulting in stronger resentment of the U.S. presence in Vietnam.

Evaluation

Despite casualties of approximately 750 on the NLF side and 250 on the U.S. and ARVN side, there was very little fighting, as most NLF troops managed to escape and fled to sanctuaries in Cambodia. Within weeks, however, NLF activity resumed in the area. American intelligence units spotted NLF troops transporting supplies, on bicycle, toward Saigon. The NLF rebuilt camps and resumed operations. The Iron Triangle then served as the base from which the Tet Offensive was launched on Saigon (31 January 1968). The tunnels of Cu Chi were not successfully destroyed until they suffered repeated special B-52 bombings in 1970.

IRRAWADDY DIVISION (2002 est. pop. 7.2 million). The 35,138-square-kilometer territory that comprises the modern-day Irrawaddy (Ayeyarwady) Division is one of the most important political and economic regions in Myanmar (Burma). Flanked by the Arakan Yoma range in the west and the Irrawaddy River in the east, until the British annexation of Burma in the nineteenth century much of the territory consisted of wetlands and forests. Under British rule, however, large areas were cleared for paddy cultivation, leading to its preeminent position as the main rice producer in the country, a position it has retained into the twenty-first century.

The British encouraged immigration, changing the ethnic balance in an area that had previously been inhabited largely by Mons and Karens. In the 1990s, the population of the division was calculated by the government to be 5.84 million, including 1.19 million Karens, 60,000 Rakhines, and 160,000 inhabitants of other nationalities. The majority population of 4.43 million was classified as ethnic Burman. The Mon language disappeared more or less entirely in the division by the end of the twentieth century.

Many parts of the territory suffered severe disruption during World War II as well as during the insurgencies that broke out shortly after independence was granted in 1948. It was not until the 1970s that both the Karen and Communist insurgencies were suppressed throughout the division.

In the last two decades of the twentieth century, sectors of the local economy slowly revived. The capital of the division, Bassein (Patheingyi) in the western Delta region, is Myanmar's second busiest port. Other important centers are the road-rail junction towns of Henzada (Hinthada) and Myanaung, both of which lie farther north on the Irrawaddy River.

Agriculture and fisheries are the main industries. In addition to paddy and jute, crops such as pulses, groundnut, sesamum, coconut, bananas, chilli, and vegetables grow well in the alluvial soil. A variety of fish-based industries also developed. Fish-paste, dried fish, and prawns are all produced, and salt-making and fishing enterprises are located along the estuaries and Andaman seashore.

Manufacturing or heavy industries remained small-scale during the Burma Socialist Programme Party era (1962–1988), and included a jute mill at Myaungmya, a glass factory in Bassein, and the Myanaung Oil Field and Gas Turbine Power Generating Plant.

Under the State Law and Order Restoration Council government, which assumed power in 1988, major road and bridge building programs were introduced during the 1990s in an attempt to improve communications with Yangon and the rest of Myanmar. Particular emphasis was placed on expanding rice cultivation, which, it was intended, would produce an export surplus for the country, but economic progress in the division continued to be slow.

IRRAWADDY RIVER AND DELTA The Irrawaddy (Ayeyarwady) River is the major waterway of Myanmar (Burma). It originates at the confluence of two small rivers, the N'mai Kha and Mali Kha, in Kachin State and flows through the heart of the country before entering the Andaman Sea more than fourteen hundred kilometers to the south. Up to 1.6 kilometers wide in places, the river is navigable for much of its length.

NAVIGATING THE IRRAWADDY

The Irrawaddy is the major inland north-south transportation route in Myanmar. The following account describes one of two types of boats used to navigate the river in the 1800s.

Of boats there are numerous kinds, from the small canoe to the large earth-oil or rice-boat; but all have a dug-out for the foundation whilst those in use on the Irrawaddy differ considerably from those found elsewhere. The Irrawaddy boats again are of two kinds. In one the keel-piece is a single tree hollowed out and stretched by the aid of a fire when green, a complete canoe in fact. From this ribs and planking are carried up. The bow is low with beautiful hollow lines. . . .

The stern rises high above the water and below the run is drawn out fine to an edge. A high bench or platform for the steersman, elaborately carved, is an indispensable appendage. The rudder is a large paddle lashed to the larboard quarter, and having a short tiller passing athwart the steersman's bench. . . .

The mast consists of two spars, it is in fact a pair of shears bolted and lashed to two posts rising out of a keel-piece. . . .

Above the main yard the two pieces run into one forming the top-mast. Wooden rounds run as ratlines from one spar of the mast to the other, forming a ladder for going aloft. The yard is a bamboo or line of spliced bamboos of enormous length and is suspended from the masthead by numerous guys or halyards, so as to curve upwards in an inverted bow. A rope runs along this from which the huge mainsail is suspended, running on rings, like a curtain, outwards both ways from the mast. There is a small topsail of similar arrangement: the sail cloth used is a common light cotton "stuff for clothing."

Source: Gazetteer of Burma. (1893) New Delhi: Cultural Publishing House, 436-437.

Steamer service, carrying both passengers and goods, operates from the capital, Yangon (Rangoon), through Prome (Pyay) and Mandalay to Bhamo in Kachin State fourteen hundred kilometers to the north.

In its upper reaches, the river passes through mountain valleys and gorges, but beyond a major defile south of Bhamo the river begins to broaden. Here, as it crosses the Dry Zone of Myanmar, passage is seasonally interrupted by low water and shifting sandbanks. In these reaches are located the former royal capitals of Amarapura, Mandalay, Ava, Sagaing, and Pagan, testifying to the pivotal role the river has played in Myanmar's history and culture.

North of Pakokku, the Irrawaddy gains fresh impetus when it is joined by the Chindwin (Chindwin) River through a network of channels. Flowing south, the river has created a long alluvial plain during thousands of years as it passes between the Arakan Yoma and Pegu Yoma ranges. On this stretch are located the historic oil fields between Chauk and Myanaung as well as the important road-rail-river junction at Prome.

Myanaung marks the upper gateway to the Irrawaddy Delta. In these lower reaches, the Irrawaddy flows through vast flatlands, dividing and subdividing on its way, before entering the Andaman Sea through

eight major mouths. Yangon is further linked to the delta by the Twante Canal, constructed in 1883.

Amid a maze of creeks, mangrove forests, and agricultural land, road transportation is often difficult in the 33,670-square-kilometer delta region, which was largely a frontier area until British annexation in the nineteenth century. Silting and flooding remain annual problems, but the economy of this region, especially rice production, has become increasingly important to the nation over the past one hundred years. Local fishing industries are also located in several southernmost towns, such as Bassein (Pathein), Pyapon, Labutta, and Bogale.

For much of the twentieth century, the Irrawaddy was spanned only once—by the road-rail bridge at Sagaing. However, in a spate of building at the end of the 1990s, bridges were constructed at Maubin and Nyaungdon in the delta region, as well as at Prome, Chauk, and Myitkyina farther north.

IRTYSH RIVER The Irtysh River flows northwest for 4,248 kilometers (2,640 miles) through China, Kazakhstan, and Russia, and ends in western Siberia. It begins in the southwest slopes of the Chinese Altay mountain range (Xinjiang province) and it flows west into Kazak territory, where it is known as the Kara-Irtysh up to the point where it enters Lake Zaysan. Once it exits the lake, it is called Irtysh and continues its flow northwest within Kazakhstan, passing the cities of Ust'-Kamenogorsk, Semipalatinsk, and Pavlodar. A canal that was constructed in the 1960s from the Irtysh to Karaganda allows the use of the river's water for agricultural purposes in central Kazakhstan. Leaving Kazakhstan, the Irtysh river then crosses into Russia, passes the city of Omsk, and joins the Ob river.

The river is the principal source of water for almost four million Kazaks and a vital base for industry. China and Kazakhstan have been involved in discussions and

negotiations regarding the future of the river. China's plans to build a canal on the upper part of the Irtysh (called Ertis He in China) in order to divert the water flow into the Xinjiang province of western China has caused concerns in Kazakhstan. At present, an agreement has been reached that allows China to divert only 10 percent of the river's flow—about one billion cubic meters—per year until 2020.

Daphne Biliouri

ISE SHRINE Located in Mie Prefecture, the Grand Shrine of Ise (Ise Daijingu) is the most important shrine in Japan. It comprises two main shrine complexes, Naiku (the Inner Shrine), which consecrates Amaterasu, the Sun Goddess, and Geku (the Outer Shrine), which enshrines Toyouke, an agricultural deity worshiped as parent to Amaterasu, together with more than 120 subordinate shrines. Naiku enshrines *Yata-no-kagami* (the Sacred Mirror), one of the three Imperial regalia. The two main shrines, built in the *shinmei* style, with plain wood and reed-thatched roofs, are ritually rebuilt every twenty years. Each building has an adjacent alternate site, where the new building is constructed with strict attention to detail. When completed, rites are held for the transfer of the deity to the new shrine. Following further rites, the shrine on the old site is disassembled and the materials distributed to affiliated shrines around the nation.

During the Tokugawa period (1600/1603–1868), branches of this shrine throughout Japan promoted pilgrimages to Ise, and large numbers of ordinary people, representing their local devotional groups, visited the shrine as part of a once-in-a-lifetime journey away from the farms and distant towns. In an average year, pilgrims numbered between 600,000 and 700,000; in the spontaneous mass pilgrimages of 1705 and 1830, however, they numbered between two and three million.

ISHIHARA SHINTARO (b. 1932), Japanese novelist and politician. Born in Kobe, Ishihara Shintaro graduated from Hitotsubashi University with a law degree in 1956. In 1954, he published his first novel, *Hai iro no kyoshitsu* (The Gray Classroom), in *Hitotsubashi Bungaku*, a literary magazine. In 1955, he won two of Japan's most prestigious literary prizes, the Bungakukai Award for New Writers and the Akutagawa Award for his novel *Taiyo no kisetsu* (Season of Violence). Other novels include *Kiretsu* (The Crevice, 1958), *Sobei no Heya* (The Punishment Room, 1956), and *Kanzennaru Yugi* (Utter Decadence, 1957). In 1968, he entered politics and won a seat as a member of the Liberal Democratic Party (LDP) in the upper house of the Japanese legislature; in 1972, he was elected to the House of Representatives. Together with Sony Corporation Chairman Morita Akio (1921–1999), he coauthored an essay "'No' to ieru Nihon" (The Japan that Can Say 'No,' 1989). After an authorized translation raised concern among members of the U.S. Congress, Morita withdrew from the project. The book was published in English in 1991 under Ishihara's name. He coauthored with Malaysia's prime minister Mahathir Mohamad (b. 1925) another essay titled "An Asia That Can Say No" (1994). In 1995, he resigned from the LDP and in 1999 was elected governor of Tokyo.

ISHIKAWA (2002 est. pop. 1.2 million). Ishikawa prefecture, in the central region of Japan's island of Honshu, combines rustic scenery with the high culture of old Japan. With an area of 4,197 square kilometers, the island has such picturesque geographical features as the Noto Peninsula and Hegurajima (Hegura Island), as well as several other small islands. Ishikawa is bordered by the Sea of Japan and Toyoma Bay and by Toyoma, Gifu, and Fukui prefectures. Ishikawa subsumed parts of the ancient provinces of Echizen, Noto, and Kaga and assumed its present name and borders in 1872.

The prefecture's capital is Kanazawa, situated on the southern plain of the Kaga region. Because it was not bombed during World War II, the city today ex-

emplifies traditional Japanese architecture. Initially a fifteenth-century Buddhist temple town of the Ikko sect, after 1580 it became the castle town of the Maeda family, patrons of scholars and artists. The traditional crafts include Kutani-ware porcelain, decorated lacquer ware, and printed silk. Visitors are drawn to the garden Kenrokuen, the Nagamachi samurai quarter, the ruins of Kanazawa Castle, and numerous temples and museums. The other important cities of the prefecture are Komatsu, Kaga, and Nanao.

The fertile Kanazawa Plain is planted in rice, and the Noto Peninsula, also the site of rice paddies, is the center of a profitable fishing industry. Apart from some textile and heavy machinery plants, there is little other industry. Tourists are attracted to the Noto Peninsula, with its scenic rocky coast and unspoiled rural ways, as well as to the regional hot-spring resorts, including Yamanaka, Yamashiro, and Awazu.

ISHIM RIVER The Ishim is a Siberian river that flows through northern Kazakhstan and the southern part of central Russia, between the two great rivers Tobol and Irtysh. It rises in the Niyaz Mountains, between Qaraghandy and Astana, the new Kazakh capital, and flows west for about 500 kilometers, before suddenly curving north to join the Irtysh in the Omsk region of southern Siberia. Its total length is about 2,140 kilometers, and it waters a rather small basin (compared with other Siberian rivers), which covers only 144,000 square kilometers. The main towns irrigated by the Ishim are Astana and Petropavlovsk in Kazakhstan and Ishin city in the Tyumen' region of Russia.

The Nura River, which flows near the Ishim upstream and shares much of its underground basin, suffers from mercury pollution from former Soviet industries situated in Qaraghandy. As the Nura is an endoreic river (a river with an inward-flowing basin), a channel was built in the mid-1990s to allow it to flow into the Ishim and thus increase the available water supply. When the mercury pollution was discovered, however, the government closed the channel, despite the water shortage in Astana.

ISKANDAR MUDA (1590–1636), ruler of Aceh. Iskandar Muda (reigned 1607–1636), with the exalted title of *mahkota alam* (crown of the universe), is considered to have been the greatest ruler of the northern Sumatran principality Aceh. A ruthless and tyrannical ruler, reputed to have murdered his way to the throne, Iskandar Muda brought Aceh to the peak of its power and territorial expansion during the first half of the seventeenth century, dominating Sumatra and the Malay Peninsula except Portuguese Melaka.

In the three-way struggle for control over the Straits of Malacca and the Malay Archipelago between the Malays of Johor, the Acehnese, and the Portuguese at Melaka, Aceh appeared to have been the most successful because of Iskandar Muda and his powerful fleet.

In 1612, the kingdom of Aru, a vassal of Johor, was seized by the Acehnese. In 1613, Batu Sawar, the capital of Johor, was sacked by Iskandar Muda, and Sultan Alauddin (reigned 1597–1612) and his entire royal court suffered the humiliation of being brought as prisoners to Aceh. Alauddin's half-brother, Abdullah (Sultan Hammat Shah), was dispatched as a vassal ruler of Johor. Iskandar Muda then dominated the peninsular Malay kingdoms of Pahang (1617), Kedah (1619), and Perak (1620). In 1629, he attacked Portuguese Melaka with two hundred ships and a force of twenty thousand but failed to breach the fortress walls. Portuguese reinforcements from Goa repelled Iskandar Muda's Acehnese forces.

Iskandar Muda died in 1636. Nonetheless, Aceh remained a preeminent power during the reign of his successor, Iskandar Thani (1636–1641), a Pahang prince, but its territorial expansion was halted.

ISLAM—BRUNEI As a Malay Islamic kingdom, independent Brunei Darussalam has undergone a profound Islamization of institutions and society. The temporal leader and head of religion in Brunei, the reigning sultan, Hassanal Bolkiah (b. 1946), wields absolute power. Just as the Sunnite orthodoxy is closely invigilated in Brunei Darussalam, so too the institutions of government share many of the features of Middle Eastern dynastic rule.

The date at which Islam entered Brunei is controversial, just as the date of conversion of a pre-Islamic ruler, likely a Hinduized maharaja, is unknown. By the early sixteenth century Brunei was a Muslim state. Nevertheless, Muslim merchants, including those from China, were active in Brunei by the thirteenth century. Conversion of the largely animist peoples outside of Brunei's royal center only gained ground in the last century, a process that continues to this day through marriage or active Islamic proselytization. However, more than is officially admitted, pre-Islamic beliefs frequently coexist with more doctrinal forms and practices.

Stemming from closer links with Mecca and the influence of pan-Islamic ideas promoted by the Ottoman sultan in the nineteenth century, a more scripturalized Islam took root in Brunei that superseded informal *tariqa*, or mystical, orders. Equally, the imposition of the British Residency system in Brunei between 1906 and 1959 introduced many innovations in the application and administration of Islamic law.

But with the rising tide of the Islamic resurgence in the 1980s, the religious authorities in Brunei have determinably harnessed the oil-rich state's resources to such pro-Islamic actions as the endowment of mosques and religious schools, sponsorship of the pilgrimage, and the mainstreaming of religious education in the nation's schools and universities. By the 1990s, Islam had been elevated as the leading prop of an arcane intellectual indoctrination in official history and religion termed Malay Islam Beraja (monarch), the mastery of which has become a loyalty test for all Brunei youths. In responding to the international Islamicist challenge, Islamic conservatism in Brunei has not only touched the style and demeanor of the sultan but has also stimulated the push for the total Islamization of Brunei society. For example, Arabized script, or Jawi, and even the Arabic language have seen new life in the Brunei education curriculum in a discourse where secular and liberal have become suspect categories. Still, civil law, which is based on British precedent and lifestyle, including gender relations, is more relaxed than in Brunei's Middle

Eastern counterparts. Moreover, no apparent contradiction exists between ostentatious materialism, especially on the part of the Brunei royal family, and Islamic rectitude to which the *ummat*, or community of believers, are obliged to conform.

ISLAM—CENTRAL ASIA Islam in Central Asia is a domestic religion, an experience of Muslim life in the household. The visitor's first impression is that there are few mosques and that few women wear veils. This does not mean that Islam is weak, only that under Communist pressure Muslim life made a strategic retreat into home and neighborhood. Islam is now reemerging into the public square: new mosques are going up everywhere, often with the help of gifts from Turkey, Pakistan, and Saudi Arabia. Islamic dress is seen again, notably among schoolgirls attending spe-

cial classes for religious instruction. Where teachers are available, even public schools are offering Arabic as a subject. Each new republic has a Muslim directorate and an Islamic training center headed by a mufti (jurist) who is approved by the government. The Islamic revival has spawned "fundamentalist" reform movements against which the post-Soviet governments are on guard, although the extent of the threat they pose is disputed.

With the exception of Persian-speaking peoples in Tajikistan and Afghanistan, the native peoples of Central Asia are Turks of nomadic origin. Some of the Turkic peoples (those now called Uzbeks and Uighurs) settled centuries ago in bazaar towns and agricultural villages, building mosques and *madrasabs* (Islamic schools). Other Turks—Kazakhs, Kyrgyz, and Turkmen—remained pastoral nomads into the twentieth century. For them the Muslim life has always been lived primarily in the home and by extension at the "homes"—that is, the tombs or shrines (Arabic *mazar*)—of Sufi saints called *auliye* in Kazakh, the word deriving from the Arabic *wali*, "representative of God on earth." Dotting the arid landscape, these tombs and adjacent Muslim cemeteries far outnumber mosques; it has been said that in Central Asia the *mazar* is a holier place than the mosque. Groups and individuals make *ziyarat* (pilgrimages) to these shrines in search of the *baraka* (sacred power) of the Muslim saints, of the Prophet Muhammad and his family, and ultimately of God.

Central Asians are often accused of being weak and unobservant Muslims. They seldom deny the charge, exonerating themselves by pointing to historical circumstances: "We studied in Russian schools," "Our mullahs were fools," "Our father and mother were afraid to teach us the prayers for fear of the Communist Party," and so forth. The Kazakhs and Kyrgyz have additional excuses: "We were shepherds, roaming the steppe far from town," "We never had mosques," and so forth. Russian scholars concluded that religion in Central Asia is a survival of an archaic shamanism or animism overlaid with a thin veneer of Islam. In the West, most scholars adopted this Russian conclusion because the West is fascinated by primal religion and prefers shamans to Muslims. Such stereotypes have obscured an understanding of religion in Central Asia. Even where *shari'a* (Islamic law) is poorly understood, felt to be inconvenient, or perceived as a foreign Arab culture, the popular religion of the Turkic peoples is a genuine Muslim spirituality.

Historical Background

Religions crossed paths in Central Asia. Buddhists traveled from India to China by way of Central Asia, and the Manichaean religion made a strong impact. The Zoroastrians left archaeological evidence of their place in the history of Central Asian religion. As early as the fifth century CE, there were missions of Nestorian Christianity in Central Asia. Beginning in 652, Arab armies raided Transoxiana (the part of Central Asia to the north of the Amu Dar'ya River), and its major cities fell to the Arab general Qutayba ibn Muslim in the decade after 705. Bukhara became a center of Islamic civilization in the ninth century under the Samanids from Iran, as did Kashgar in the tenth century under the Karakhanids. To the north, the Turkic Oghuz people, later known as Turkmen and Seljuks, accepted Islam in 985 in return for the right to cross the Syr Dar'ya River into Muslim Transoxiana and Iran.

The Mongol invasion that began in 1219 put all of Central Asia under non-Muslim rulers. The Mongol empire tolerated all religions, and Muslims, Christians, and Jews lived side by side in Central Asian cities. In the fourteenth century, Emir Timur (Tamerlane) made Samarqand a pearl of Islamic architecture whose reputation was known in the West; he also wiped out the last vestiges of Nestorian Christianity in Central Asia.

The ancestors of today's Uzbeks and Kazakhs were the Kipchaks of the Golden Horde, who accepted Islam in the fourteenth century after a miraculous trial of fire between a band of traveling Sufis and the court shamans of Oz Beg Khan. In 1499–1500, the Uzbek

ruler Muhammad Shaybani Khan conquered Transoxiana, which thus became the land of the Uzbeks, or Uzbekistan. Between the tenth and fifteenth centuries, the sedentary Turkic people in eastern Turkistan (today's Xinjiang province, northwest China) accepted Islam. Their descendants are the Uighurs. Today an underground Islamic movement struggles for the independence of Uighurstan from China.

The Islamization of Central Asia was complete in essentials by the fifteenth century. In the cities of Transoxiana and eastern Turkistan, Islam has been dominant ever since. Nomads, as always, were selective in their observance of the *shari'a*: among the Kazakhs, Islam was "*firmly*, albeit rather *superficially* established" (Akiner 1983: 301). In the eighteenth century, Russia's Catherine the Great deputized Tatar mullahs to "civilize" the Kazakhs, who, she imagined, would be more manageable subjects of the Russian empire if they were better Muslims, but this policy was

short lived. In the late nineteenth century, the Russian Orthodox Church converted small bands of Kazakhs; the mission came to little, but Muslims in Central Asia still perceive the Russians as Christian invaders of the Muslim world.

Religious Concepts

The Turks readily adopted the conceptual structure of Islam, and the vocabulary of Central Asian religion comes largely from Arabic and Persian Islamic terms. The word for "God" is Allah in Arabic and Qudai in Persian. A few concepts from Turkic sources were used to translate Islamic ideas, such as Tengri (a Turkic deity who was equated with the heavens, as an alternate name for God). Very few non-Islamic terms have survived. The word for "spirit" in the Central Asian languages (Kazakh *aruaq*) comes from Arabic (*rub*), leaving no memory of archaic Turkic words for this fundamental concept. Thorough Islamization of religious vocabulary in Central Asia belies the stereotype that its people have a shamanistic worldview.

Religious Roles

Native *bakshi* (shamans) were healers and mediums who diagnosed and cured illnesses with the aid of their helping spirits while in a state of ecstasy or trance. When Islam came, the shaman tended to become a Muslim folk healer (Arabic *tabib*, Kazakh *tauip*). A male healer is also called a mullah when he learns to recite a few verses from the Qur'an, and the Uzbek *otin* is, in effect, a female mullah and healer. The shaman had always been a quixotic and socially marginal figure and therefore was open to easy ridicule by the Communist authorities; the few shamans who survived persecution failed to pass on their methods to their skeptical modern children. The Muslim *tabib*, however, was at the center of society, survived undercover in the Muslim home and neighborhood, and is enjoying a revival today. In every Central Asian neighborhood, there are one or more *tabibs*, often women, to whom the sick can resort when modern medicine fails them.

The mystical Sufis gave Islam in Central Asia its special quality, but Sufi spirituality tended to ossify over time into mundane social forms, losing its spiritual depth. The Sufis' ascetic discipline and inner search for the love of God can be seen in early Turkic poetry such as the *Diwan-i Hikmet*, attributed to Ahmet Yasawi, a twelfth-century Sufi master (Arabic *sheikh*, Persian *pir*). Sufi movements inspired by such charismatic figures were organized later into *tariqa* (brotherhoods), the most important of which was the Naqshbandi order. There was profit to be made by the Sufi brotherhoods at the tombs of famous Sufi mas-

ters, both from Muslim pilgrims and from endowments of land, irrigation systems, and businesses that came to be attached to the shrines. Descendants of famous Sufis vied for control of the shrines of Ali in Balkh (Mazar-e Sharif) in northern Afghanistan, Zangi Baba in Shash (Tashkent), and Ahmet Yasawi in Yasi (Turkistan) in southern Kazakhstan.

The descendants of the Sufis are religious honor groups called *kboja*, a Persian word meaning "master" or "teacher" (Kazakh *qoja*, Turkish *boca*). In the Arab world, they are called *sayyid*, descendants of Ali, the fourth caliph and nephew of the Prophet Muhammad. Typically each *kboja* lineage preserves a *nasabnama* (genealogical manuscript) by which it proves its descent from Ali. The key links in these genealogies are the Sufi masters from whom a *kboja* group takes its name. Spiritual succession in Sufi communities tended to become hereditary over time; so that families claiming descent from a Sufi who had been called by the title *kboja* came to think of themselves as *kboja* bloodlines. They have a quasi-ethnic identity, calling themselves "Arabs" because of their descent from Muhammad, even though they speak no Arabic. Traditionally a Kazakh clan was the client of a *kboja* patron, who recited the Qur'an for them, taught their children, healed their diseases, prayed for rain, and so forth. Persecuted by the Communists, many *kbojas* have melted into modern society and no longer claim a religious role, but they are given the place of honor at banquets and referred to with respect because a harsh word from a *kboja* is believed to be a powerful curse. Whereas a *kboja* healer is believed to have special powers because of his or her descent from Muhammad, today's *kbojas* have only a shadowy awareness of their Sufi heritage. The social honor bestowed by descent from Muhammad has become more important to them than the spiritual values of the Sufi tradition from which they sprang.

When Russia conquered Central Asia after 1864, it brought European civilization with it, and a new elite of European-oriented Muslims emerged in Central Asian cities. This led to an Islamic renewal movement called Jadidism, which published progressive newspapers and opened "new method" schools where children were taught secular subjects as well as religious ones. The Jadidists were condemned by the *kbojas* and mullahs, who had a vested interest in the *madrasabs*, where Qur'anic recitation was the only instruction offered. The Jadidist renewal was cut short by the Communist Revolution, which had its own educational agenda and purged both the conservative mullahs and the forward-looking Jadidists. For the rest of the twentieth century, a domestic version of the Muslim life

was taught to children in the home, when religious learning was passed on at all.

Elements of Popular Religion Today

In Central Asia, memorial meals in honor of the dead are observed in the home according to the *shari'a*. An ancient pattern of ancestor veneration seems to have been at the root of funeral customs in both Arabian Islam and the Turko-Mongol tradition, so that the Turkic peoples readily adopted the Islamic funeral pattern as their own. After the death of a loved one, a feast is prepared for all the relatives and neighbors on the seventh and fortieth days after death, every Thursday between the death and the fortieth day, then on the anniversary of death. One or more mullahs recite the Qur'an (in Arabic) and add a blessing of dedication to the deceased, the family's ancestors, the prophets, and the local Sufi saints (in the vernacular language).

A related observance is that on every Thursday *qu-dayi nan* (sacred bread) is fried in oil, the aroma of which is thought to go up to the ancestor spirits. The family then dedicates the evening meal to its ancestors. Thursday is the day when the spirits are believed to leave their graves by the permission of God and return to their homes, waiting for the Qur'an to be recited and food to be dedicated in their memory. When someone in the house has a dream in which the ancestors appear, seven loaves of fried *qu-dayi nan* are distributed to neighbors, binding the Muslim neighborhood together in a common experience of the spiritual world. The woman of the household is the key person in this domestic cult of the ancestors. It is she who "emits the aroma" (Kazakh *iyis shigaradi*) of the sacred bread fried in oil, she who has her children distribute the seven loaves to the neighbors, and often she who has the dream that impels her to do so.

Pilgrimages or visits (*ziyarat*) to tombs and Sufi centers hark back to the medieval tradition of Muslim travels (Arabic *rihla*) in search of spiritual wisdom and power. The trip may be short, because almost every Central Asian town and village has a tomb or cemetery that is held in special reverence. More elaborate pilgrimages may be organized by families or by a healer with his patients. A common pattern is to prepare oneself by ritual ablutions, make a special request of God called an "intention" (*niyet*), greet the saint upon arrival at the shrine, walk around the shrine up to seven times, pay one of the shrine mullahs to recite the Qur'an and say a blessing on one's behalf, leave a monetary contribution in a box designated for votive gifts and/or make an animal sacrifice, and promise specific acts of devotion if the saint answers one's prayer.

Important Sufi tombs may be referred to as "the second Mecca," thus relating the Islamic hajj (pilgrimage to Mecca) with *ziyarat* in local sacred space. It is widely believed in Central Asia that three visits to one of the major shrines is equivalent to the hajj. A visit to family graves at the local cemetery has a similar purpose, because the spirits of the Muslim dead are believed to be closer to God than are the living. In essentials, this pattern is similar to pilgrimage practices everywhere in the Muslim world, as is the funeral pattern mentioned earlier.

Personal observance of the five pillars of Islam (profession of faith, prayer five times a day, almsgiving, fasting during the holy month of Ramadan, and the hajj) is often neglected in Central Asia, but it is not absent or ignored altogether. In traditional extended families, the grandfather and grandmother are most likely to say the five daily prayers (*namaz*); the grandfather may do so at the neighborhood mosque. Although the Ramadan fast is becoming popular again, during the Soviet period it was only the elders who fasted; the Tashkent Muslim directorate, under pressure from the government, issued a *fatwa* (decree) that persons of working age need not fast.

In general this pattern persists today: elders perform the requirements of the *shari'a* vicariously, in effect, as surrogates for their family. If the grandchildren learn to say the *namaz* and recite verses of the Qur'an, it is the grandparents who teach them because the parents were the "lost generation," denied a religious upbringing in their Soviet schools. Or children may be sent to a neighborhood mullah or *otin* for Arabic lessons after school. Circumcision of boys at around the age of six years is now universal again and was widely practiced even during the Soviet period.

A standard practice of Muslim folk healers in Central Asia is the technique of diagnosing all manner of illnesses simply by taking the pulse and curing by reciting the Qur'an and breathing forcefully on the patient. The mullah or *tabib* does this to bring both the Qur'an and his or her ancestor spirits to bear on the patient's illness. Healers subscribe to the Islamic humoral theory of medicine, according to which an imbalance between hot and cold foods in the diet is the cause of disease, so that treatment often involves special diets or herbal remedies. For example, licorice root (native to the desert steppe) is chewed for stomach problems, and hummingbird nests soaked in horse fat are used to treat venereal disease. Wild rue or steppe sage (*adraspan*) is burned as incense or hung in the corner of the room to ward off evil spirits.

Representing the healer's spiritual power, the knife and whip are shamanic symbols that were long ago taken over by the Muslim healer, as was the ancient Turkic belief that each disease has a "master" (Kazakh *iye*, Uzbek *ege*) who must be overcome by the healer's spiritual energy (Kazakh *kiye*). Despite these shamanic elements, the Kazakh *tauip* today is more like the *tabib* elsewhere in the Muslim world than she is like the Siberian shaman.

Central Asian Muslims experience the spirit-world in dreams and dream-visions called *ayan*, the Arabic and Sufic word for "personal illumination." It is sought at the shrines of the Muslim saints, and someone who has neglected his or her Muslim duties will often be reminded to do so in a dream. The individual's conversion often begins with *ayan*: he or she will begin saying the five daily prayers after dreaming of the ancestor spirits. Healers say that *ayan* helps them diagnose and cure illness. Fortune-tellers called *balger* in all the Central Asian languages (Persian *pal*, divination) can see into the future when their ancestor spirits give them *ayan*. Modern folk healers influenced by Russian parapsychology and so-called New Age religion draw on the *ayan* tradition: some claim to be heirs of the shamans, and others go to Turkey and Pakistan to study Islam, claiming to be Sufis when they return.

Religion and Ethnicity

That Muslim life in Central Asia survived the political turmoil of the twentieth century is due in no small part to religious memories sacralized by Islamic landscapes, the shrines of Sufi saints, and the cemeteries of Muslim ancestors. Except for elites influenced by Communism and now by Western secularism, the Central Asian peoples have a strong sense of their Muslimness. Their Turkic ancestors have been Muslims for centuries, so that they feel their ethnic identity as a Muslim identity, believing that their blood is Muslim. Soviet policy allowed Muslim ethnic groups to become nations in the modern sense even before the breakup of the Soviet Union. Ethnic and national consciousness understood in a Muslim way has given Central Asian Muslims a revived sense of their place in the Muslim world.

ISLAM—INDONESIA Islam has made important contributions to nation-building and socioeconomic development in Indonesia. Since the dawn of Islam in the Indonesian archipelago in the seventh century, the ulama (religious scholars) have played a significant role in the integration of its many ethnic communities. Successions of Western rulers caused various Muslim communities to band together to resist and repel the infidels (*kafir*) who, it was believed, only came to exploit the archipelago's economic resources and erode local cultural and religious values. Having been exposed to the Western way of life, twentieth-century Indonesian Muslims were acquainted with the concept of modernism, with "modern" social structures, schools, and print media. Islam became a bonding force against the imperial system, spurring communities to set aside cultural differences and work toward a common goal. Muslim organizations became keenly concerned with sociocultural, economic, and political life.

Arrival and Propagation of Islam

Three successive processes led to the Islamization of the country: the arrival of Muslim traders who prop-

agated Islam (seventh to twelfth centuries CE), the integration of foreign settlers into local communities (eleventh to twelfth centuries), and the creation of states ruled by Muslim sultans (thirteenth to seventeenth centuries). The religious landscape into which Islam came was one of indigenous beliefs: Hindu-Buddhist religions. But Islam that came through Hindu-Buddhist areas had already adapted to specific circumstances before coming to the archipelago, notably between Islamic Sufism and Hindu-Buddhist Sufism. Islam that was brought by traders whose approach was Sufistic was more tolerant; that made Islam easily welcomed. Furthermore, local traditions were soon Islamized, and Islamic teachings were localized. This made Islam in Indonesia different from Islam in other parts of the world.

Islam in Opposition to Colonialism

Since Islam was introduced by Muslim traders in the archipelago, it has been the basis for cultural integration. Several factors facilitated this integration, primary among them being internal and international trade, the preaching of religious teachers, and the use of Malay as the common language. Wandering teachers guided local sultans in the teachings of Islam. Their writings were disseminated across the country, creating an Islamic culture in the archipelago.

Dutch colonialists, who arrived in the seventeenth century, were perceived as a threat to the authority of local rulers and also affected the intellectual activities of the ulama. Islamic resistance to foreign rule became unavoidable, particularly as urbanization took place. Dutch rule began to be perceived as imperialistic exploitation and as an attempt to forcibly Westernize the country. As a result, Muslims were determined to overthrow the Dutch government. The ulama, along with students from their network of traditional religious schools (*pesantren*), rose in support of this resistance. Peasant revolts broke out across the country. Local social associations were set up, including the Islamic Trade Association (Sarekat Dagang Islam, or SDI) in 1905, which became the Islamic Association (Sarekat Islam, or SI) in 1912, the first mass organization to participate in the indigenous economy and in the struggle for independence. In its anticolonialist activities, the SI was active at various levels. It campaigned against the suppression of Indonesians, and Islamic ideology became the foundation of its political struggle.

Muslims did not concentrate solely on politics, however. They were also concerned with social issues, primarily poverty and illiteracy. The "modernist" Muhammadiyah and "traditionalist" Nahdlatul Ulama

INDONESIA: THE LARGEST MUSLIM POPULATION OF ANY NATION

The Top Ten in 2000

Nation	Muslim Population	As a Percentage of the Population
Indonesia	201 million	88%
Pakistan	140 million	97%

(NU) were active in education and social development during their establishment in 1912 and 1926, respectively.

Furthermore, the unification of Indonesian communities as a result of the Dutch colonization provided new opportunities for solidarity among ethnic and Islamic groups that had different backgrounds and politics, and adhered to different approaches and strategies. At the time, during the last days of Japanese rule in 1945, Islamic political ideology could not provide a strong enough unifying focus, and secular nationalists eventually claimed the most powerful heroes and created the most powerful myths, pushing Muslim nationalists into the background.

As a result, Muslim nationalists experienced a crucial shift in their relationship with Japanese and Dutch rulers. From a position of subordination with the Dutch to one of favor with the Japanese, the secularist nationalists took over the leadership role. Both the secular and Muslim nationalists agreed to endorse the Pancasila ("Five Principles": belief in one God, humanitarianism, nationalism, democracy, and social justice) as the basis of the new state; the Muslims believed that Pancasila was based on Islamic law. Yet the Muslim nationalists soon realized that they were in fact marginalized, their factions fragmented, while secularists were in control of the government.

This became even clearer when the government used a divide-and-rule approach in dealing with Islamic

Muslims gather at the Indonesian parliament building in Jakarta on 10 April 2000 to offer their services in a jihad against Christians in Indonesia. (REUTERS NEWMEDIA INC./CORBIS)

factions. Sukarno (1901–1970), the first president of Indonesia, banned the Masyumi Party, the party of the Masyumi, a modern comprehensive confederation of Islamic organizations, in the belief that it supported Darul Islam, a movement for the establishment of an Islamic state, which continued in Aceh, West Java, and South Sulawesi. Instead, he created a new idea, Nasakom, which was meant to unite nationalists, Muslims, and Communists, an idea that was tolerated by the NU but not by Masyumi members. For the next two decades, the NU established its presence in the religious ministries and bureaucracy. After the 1965 alleged coup by Communists, the NU worked with Suharto (b. 1921) to expel not only Communists, but also other radical nationalists from the political arena. After Suharto replaced Sukarno as president in 1967, the NU was amalgamated with the Development Union Party (PPP), which Suharto controlled.

During the Suharto presidency, Islamic parties, as opposed to sociocultural Islamic organizations, remained marginalized. In particular, Suharto's economic modernization of the nation created discontent among Muslims, who were wary of the possible negative effects on the community. Suharto made Pancasila mandatory for all parties, thus preventing the revival of Islamic parties because no parties were allowed to be founded on religion, including Islam. Although the NU was the first to accept, it broke away from the PPP, renounced politics, and returned to its original mission as a socioreligious organization.

In 1990, Muslims established the All-Indonesian Association for Muslim Intellectuals (ICMI). Wanting to return to the center of power, intellectuals gathered in Malang, East Java, and appointed Bacharuddin Habibie (b. 1936), a figure close to Suharto, as presi-

dent of the association. Cooperation with Suharto served the purposes of the Muslims, but Suharto's power had dwindled. After Suharto's dramatic fall from power, Habibie became president in 1998 and implemented democratic measures on behalf of the Muslim majority. He established a multiparty system, and several Islamic parties emerged, including the National Awakening Party (Partai Kebangkitan Bangsa, or PKB), which was founded by Abdurrahman Wahid (b.1940), leader of the NU. However, because of his closeness to Suharto and probably his non-Javanese origin, Habibie lost the 1999 presidential elections, which went to Wahid. Wahid remained in power until 23 July 2001, when the People's Consultative Assembly (MPR), the highest legislature of the nation, impeached him, and his vice president, Megawati Sukarnoputri (b. 1947), from a secularist group, was elected president by members of the MPR in its special session.

To what extent the government under Megawati will address the aspirations of the Muslim majority remains to be seen. The rivalry between the secularists and the Muslims is ongoing, and Islam continues to be a decisive factor in Indonesian politics. Having contributed to the evolution of modern Indonesia, Islam remains an important actor in the social and cultural identity of the nation.

ISLAM—MAINLAND SOUTHEAST ASIA

Aside from Myanmar (Burma), three countries of mainland Southeast Asia have significant Muslim populations: Thailand, Cambodia, and Vietnam.

Thailand

Thailand, a country with approximately 62 million citizens, of whom 95 percent profess Theravada Bud-

THE INTERPLAY OF ISLAM AND BUDDHISM IN THAILAND

Islam is a minority religion in mainland Southeast Asia and in many communities Muslims must live alongside Buddhists, the majority religion in Thailand. The following extract pertaining to the village of Bang Chan in Central Thailand shows how the two groups differ in their spiritual approach to water.

As a symbol of water for crops, Mother Water is taken seriously by both Muslims and Buddhists, though more so by Buddhists. As a symbol of physical and ritual purity, however, Mother Water is relevant only to the Buddhists. The reason, clearly, is that the Muslims have their own, more elaborate, system of purification through ritual bathing, and this system is well integrated into their daily ritual life. Village Islam thus has, as it were, no "need" for the purificational aspect of Mother Water. This is but one more illustration of the generalization that in all instances where Islam has taken a clear doctrinal or ritual stand on some issue, syncretism with other types of belief or ritual is likely to be at a minimum. The generalization does not hold nearly so strongly in the case of Buddhism, though perhaps a better formulation would be that Buddhism less often takes a "clear" stand on an issue. Another way of stating this difference at the general level is simply to say that Islam is more "compulsive" than Buddhism.

dhism, has a population of about 4 million Muslims. The Muslims in Thailand make up two broad self-defined categories: Malay Muslims, who speak the Malay language and reside primarily in southern Thailand in a number of provinces bordering on Malaysia, and those who call themselves Thai Muslims and who reside in central and northern Thailand.

The majority of the Muslims in Thailand live in south Thailand. Prior to the nineteenth century, these southern Malay Islamic regions were informal tributary states tied to Thai monarchical authorities. After the nineteenth century, the Thai state began to take direct administrative control over these southern areas. The four southern provinces of Patani, Narathiwat, Satul, and Yala bordering Malaysia contain over 3 million Muslims. As in the other areas of the Malayan-Indonesia region, the form of Islam that took hold was based on the Sunni-Shafii tradition. However, since the time of its arrival, Islam has coexisted with earlier Hindu-Buddhist-animistic spiritual beliefs

and practices. In addition, both Shi'a and Sufi elements influenced local forms of the belief system in this area.

Various Thai military governments from the 1930s through the 1970s adopted assimilationist policies toward these Malay Muslim regions through "development" or socioeconomic and education programs. However, these assimilationist policies were perceived by the Muslims as Buddhist-based attempts to subvert Islamic education and political, religious, and cultural ideals. Subsequently, a number of Islamic-based factions emerged during the 1960s and 1970s in southern Thailand and became engaged in separatist activities. These insurgency movements resulted in repressive military campaigns by the Thai government. Although there have been sporadic skirmishes in the recent past, since the 1990s the Malay Muslim communities of southern Thailand have largely turned away from extremist separatist movements, though they still want to preserve their "Malayness" and Islamic identity.

Because of historical and cultural conditions, the experience of Muslims in central and northern Thailand has been much different from that of the Malay Muslims to the south. Altogether there are approximately a half-million Muslims in central and northern Thailand. Historically, these Muslims of the central and northern corridors of Thailand have migrated, either voluntarily or by force, into these regions, bringing distinctive ethnic, social, and religious conventions. Thus, these Muslim communities are much more heterogeneous than the Muslims of the south. And unlike the Islamic population in the south, these Muslims are ethnic and religious minorities residing in the centers of a predominantly Thai Buddhist cultural environment.

By far the largest group of Muslims in central Thailand, especially in the capital city of Bangkok, are descendants of peoples from the southern provinces of Thailand and parts of Malaysia. As part of the assimilationist campaigns, the Thai government relocated Malay Muslims to central Thailand. Other communities of Muslims in central Thailand, including Chams, Indonesians, and Iranians, have a long-term history that extends back into the Ayutthayan period (1351–1767). Muslims from India, present-day Pakistan, and Bangladesh, and a small number of Arabs have also settled in the Bangkok area. In North Thailand, most of the Muslims came from the Islamicized portion of China, though there are also smaller numbers of Malay and South Asian Muslim migrants.

Cambodia, Vietnam, and Laos

The Muslim population and settlements in Cambodia and Vietnam are intimately related to the historical development of what was known as the Champa kingdom in mainland Southeast Asia. The kingdom of Champa lasted from the second to the seventeenth century CE and extended over the central and southern coastal regions of Vietnam. Persian and Arab Muslims traveled to Champa bringing both Shi'a and Sunni traditions to the areas. Islam began to diffuse into the Champa region during the eighth or ninth century. Most of the Cham population converted to Islam and were ruled by Muslim religious and political officials. Following its defeat by Vietnam in 1471, Champa was gradually absorbed into the Vietnam state.

The Cham Muslims of Vietnam adopted many cultural features of the Vietnamese including housing style, clothing, lunar calendar, and the Sinitic twelve-animal cycle of years.

Traditionally, the Chams of Vietnam were involved in cultivating crops such as sugarcane, maize, bananas, coconut trees, beans, and various types of chili peppers.

Unlike their patrilineal Vietnamese Buddhist neighbors, the Chams maintained matrilineal groups that were embedded within matriclans with totem-like symbols associated with the particular clan. The Cham Islamic tradition maintained in Vietnam was based on the Shi'a tradition. Along with the Shi'a tradition, other indigenous elements of animism and Hindu and Buddhist beliefs and practices were apparent among the Chams.

Continual Vietnamese state pressures for assimilation of these Muslims resulted in a considerable number of Cham refugees moving to Cambodia, establishing permanent communities in about seventy villages along or near the banks of the Mekong and Sap Rivers. By 1975, the population of Chams in Cambodia had grown to 250,000. Traditionally most of the Cambodian Cham practiced small-scale family fishing on the various rivers. They were well known for excellent construction of boats for use along the rivers, lakes, and canals in the region. The Cham refugees that settled in Cambodia maintained a very different form of the Islamic tradition from their Vietnamese counterparts. As these Cambodian Cham had had more contact with the main currents of Islam in Malaysia and Indonesian society, they gradually moved from a Shi'a to a Sunni-Shafii form of Islam. They were also influenced by Sufism as well as by Sufistic, animistic, and Hindu-Buddhist religious elements. Sufistic traditions such as saint worship and praying at the tombs of Islamic saints were imported from Malaysian Islamic precepts and practices.

As a result of French colonialism and the war in Southeast Asia, the Chams of Cambodia and Vietnam began to develop their own ethnonationalist movements. Chams began to view their ethnic and religious cultural traditions as different not only from those of Europeans and Americans but from those of Vietnamese and Cambodians as well. These ethnonationalist movements resulted in tragic episodes for the Chams. Following the victories of the Khmer Rouge in Cambodia and Ho Chi Minh's regime in Vietnam, the Chams were relentlessly persecuted. Active genocidal policies were directed at the Cham Muslims by the Khmer Rouge, and some 90,000 Chams were executed by the Pol Pot regime. In Vietnam, the Cham Muslims have been subjected to intensive assimilation pressures directed by state authorities.

A small community of Muslims from India and other areas of South Asia has established a mosque in the center of Vientiane, Laos. This Muslim community has intermarried with the Laotian community.

Various reformist and mild forms of Islamic fundamentalism known as *da wab* (religious awakening)

movements have influenced the Muslim populace of Thailand, Cambodia, and Vietnam. In Southeast Asia, these current Islamic trends correspond with the global impact of new forms of media, including increases in print journalism, television, and general improvements in literacy, especially within urban centers. Some Muslims from Thailand, Cambodia, and Vietnam have traveled to the Middle East for work or to participate in the hajj (the pilgrimage to Mecca that every Muslim is enjoined to undertake). They have become familiar with recent Islamic theology and political thought and have introduced these ideas into Southeast Asia. In the *da'wah* movements in Southeast Asia, Muslims are called on to devote their lives to improving the social welfare of Muslims. They promote the revitalization of Islamic cultural and religious values and sponsor a variety of community-based social programs.

ISLAM—MALAYSIA Islam is the official religion of Malaysia and the professed faith of half its population. Islam has played a significant role in the political and social development of Malaysia.

However, Malaysia has many ethnic cultures (Malays, Chinese, and Indians) and religious communities (Muslims, Buddhists, Confucianists, Hindus, and others). Ethnicity is often defined by religion; for example, Malays are generally considered to be Muslims. This distinction is reinforced by the constitution,

which states that Malays who forsake Islam automatically forfeit their status as Malays. Conversely, non-Malays who embrace Islam can qualify for citizenship. The upholding of Islam as the official Malay identity defines the key role the religion has come to play in every sphere of Malaysian life, in its cultural definition, economy, and politics.

Islam in Early Malay History

Islam has been a part of Malaysian history from the days of the Melaka sultanate (1400–1511). It was integrated into local culture in three major phases: the coming of Muslim traders (seventh–tenth centuries), the settlement and integration of these traders (eleventh–twelfth centuries), and the establishment of the Malay Islamic States (thirteenth–seventeenth centuries until the present).

Networks of Islamic organizations active in the peninsula began inspiring anticolonial feelings in the population. The area remained under British rule until the late nineteenth century, and the British rulers were perceived as infidels. The ulama (religious scholars) and their followers saw British representatives as agents sent to promote Christian evangelism. To prevent this domination of Malays, an Islamic identity was actively promoted. The creation of traditional religious schools (*pondoks* or *madrasabs*) was encouraged to teach the Islamic way of life. After World War II, the people of the Malayan Union strongly rejected the political entity that colonial rulers had established. The Islamic identity further brought a bonding of community leaders, which became crucial in mobilizing people against the British.

Islam's Role in Malay Independence

With the return of fresh graduates from Islamic reformist schools in the Middle East, the pace of mobilization accelerated. The issues of political independence, economic prosperity, and education were championed and disseminated in schools and the media. The first popular journal was *Al-Imam* (the Leader), initially established in Singapore in 1906 and then in Penang. Published by a reformist group later known as the Young Group (Kaum Muda), it promoted *ijtihad* (religious reasoning) and rejected religious *takhyul* (myths), *taqlid* (blind imitations), *bid'ah* (unlawful religious innovations), and *khurafat* (superstition), practices accommodated by the Old Group (Kaum Tua). The Young Group accused non-Muslim communities in urban areas of monopolizing economic resources. These reformists promoted Malay Islamic nationalism but were eventually marginalized, especially during the Japanese occupation in the Second

ISLAM IN THE MALAYSIA CONSTITUTION

The constitution of Malaysia establishes Islam as the official religion but also protects the religious freedom for all citizens.

The Constitution of Malaysia, Article number: 3

(1) Islam is the religion of the Federation; but other religions may be practised in peace and harmony in any part of the Federation.

(2) In every State other than States not having a Ruler the position of the Ruler as the Head of the religion of Islam in his State in the manner and to the extent acknowledged and declared by the Constitution, all rights, privileges, prerogatives and powers enjoyed by him as Head of that religion, are unaffected and unimpaired; but in any acts, observance or ceremonies with respect to which the Conference of Rulers has agreed that they should extend to the Federation as a whole each of the other Rulers shall in his capacity of Head of the religion of Islam authorize the Yang di-Pertuan Agong to represent him.

(3) The Constitution of the States of Malacca, Penang, Sabah and Sarawak shall each make provision for conferring on the Yang di-Pertuan Agong shall be Head of the religion of Islam in that State.

(4) Nothing in this Article derogates from any other provision of this Constitution.

(5) Notwithstanding anything in this Constitution the Yang di-Pertuan Agong shall be the Head of the religion of Islam in the Federal Territories of Kuala Lumpur and Labuan; and for this purpose Parliament may by law make provisions for regulating Islamic religious affairs and for constituting a Council to advise the Yang di-Pertuan Agong in matters relating to the religion of Islam.

World War, when both elitist and traditionalist groups suppressed them.

This discrimination was evident from the fact that when radical nationalists established the United Malays Nationalist Organization (UMNO) in 1946, and the Islamic nationalists established the Hizbul Muslimin party in 1948, the latter was banned while the former was not. The Pan-Malaysian Islamic Party (Partai Islam Se-Malaysia—PAS) was created within UMNO as a defection of the ulama faction in 1951 and was recognized as a political party four years later. The idea of an independent Islamic state resurfaced, but the British rejected the notion and instead set up the independent Federation of Malaya in 1957. Al-

though Islam and Malay customs were guaranteed under the constitution, the new prime minister, Tunku Abdul Rahman (1903–1990), acceded to British preferences for a secular government. The PAS and other Islamic Malay groups protested against this government, and riots broke out on 13 May 1969. Five years later, the PAS forged a coalition with the government—Barisan Nasional (National Front). The government established an Islamic center within the prime minister's office as part of Islamic religious affairs.

Islamization in Malaysia

Islam has a defining role in the political system of Malaysia, at both local and national levels. The adop-

tion of the Islamic system of administration and government gave the religion an intrinsic role in all aspects of life. The government took measures toward Islamization, promoting Islamic principles in broadcasting and the print media and in public life in general. The use of Islamic references and names of former states suppressed during the colonial period was reinstated.

However, these measures were perceived as token formalities rather than a genuine attempt to practice Islamic values and teachings. Some attempts at Islamization were overzealous and merely stressed the symbolic aspect of faith. As a result, so-called Islamic organizations mushroomed professing Sufi or otherwise spiritual traditions, and *dakwah/tabligh* (propagation) movements, youth associations, and political parties arose. The Muslim Youth Movement of Malaysia (Angkatan Belia Islam Malaysia—ABIM), for example, works to remove misconceptions about Islam. The Islamic Republic group, along with PAS, declares the goal of establishing an Islamic state willing to channel the aspirations of Muslims and non-Muslims. Darul Arqam (the House of Arqam, in reference to one of the prophet Muhammad's companions), a controversial movement later banned by the government, made significant efforts in community-based development, which the government perceived as a potential political threat. Jamaah Tabligh (an Islamic propagation group) is more concerned with Islamic missionary work among Muslim communities: members of the group encourage piety and abide by the traditions of the prophet Muhammad.

In 1977, the PAS was forced out of the National Front coalition because of its public demand for an Islamic state and implementation of the Islamic law (*shari'a*). The PAS accused the government of insincerity in its Islamization initiatives. In 1982, Anwar Ibrahim (b. 1947), the former leader of ABIM, joined UMNO and attempted, with the support of the prime minister, Mahathir Mohamad (b. 1925), to implement Islamic principles within the administration. This heralded a new chapter in Malaysian history, with the Islamization of the administration, education system, legal system, and financial institutions. Through this policy of Islamization, Mahathir not only demonstrated his anti-Israel and pro-Palestinian feelings in his foreign policy, but was also critical of the West.

Anwar called for a stringent incorporation of Islamic ideas in the administration of the country and stressed the importance of responding to social demands. The Malaysian Reform Group (Jamaah Islam Malaysia), Darul Arqam, and ABIM also championed Islamic community development as well as people's economic wel-

The Blue and White Mosque in Shah Aslam, Selangor State, Malaysia, in 1992. (BOB KRIST/CORBIS)

fare, particularly in the fields of basic needs and education. This approach was different from that of Mahathir, who was more concerned with large-scale development projects. Islamic leaders and scholars believed that such projects were detrimental to the Muslim community, fostering bureaucratic corruption, collusion, and nepotism and endangering the environment.

The concerns of various Muslim communities have also been stressed by the Jamaah Tabligh within the *dakwah* movement during the Islamic resurgence in Malaysia that began in the 1970s. Although this group does not operate as an organization per se and is not affiliated with any political party, it has followers in urban and rural areas, inside and outside Malaysia. All followers are required to travel from mosque to mosque, from home to home, in Malaysia and overseas and give informal talks encouraging worship and a return to the holy scriptures.

The approach of Malay (and Malaysian) society to community development in the last quarter of the

twentieth century is rooted in both religious and secular ideas. While UMNO has been struggling for Malay Muslims, religious groups portray the former as narrow-minded, secular, even infidel. As a result, UMNO publicly addresses Islamic issues and portrays religious groups as fundamentalists, extremists, and fanatics. Both groups now attempt to approach Muslims and non-Muslims. The *dakwah* movement has been active in universities, where a significant proportion of faculty members belong to the movement, and it is attracting youngsters on and off campus.

During the 1990s and particularly during the 1997 economic crises in the region, the frustration over corruption, collusion, and nepotism intensified. The direct criticism of Mahathir's economic policy resulted in the sacking of Anwar from his position as deputy prime minister and minister of finance in September 1998. Although he denied all accusations, Anwar was charged, tried, and found guilty and imprisoned on charges of corruption, abuse of power, and immoral conduct.

The issue of Anwar Ibrahim has split the population along political lines—those who believe Anwar is a victim of a conspiracy, and those who support Mahathir. The former's supporters established a new coalition and a new party: the Justice Party (Partai Keadilan). This was founded by Dr. Wan Azizah Wan Ismail, Anwar's spouse, and is a coalition of reform and opposition parties, including the PAS. In 1999, Mahathir's party won the hastily arranged elections.

Future Prospects

The struggle between the Islamic and secular groups clouds the future of the country and threatens the fabric of Malaysian society. However, the importance of implementing Islamic values in government is a key factor in reaching an agreement. The reinterpretation of *shari'a* and redefinition of the concept of an Islamic state could lead the way to a healthy relationship and peace in the country.

ISLAM—MONGOLIA Traces of Islamic culture are to be found throughout Mongolia, and Mongolians of Turkic and Muslim origin are also concentrated in Xinjiang (China) and Kazakhstan to the west and south of Mongolia. Although it is now a minority religion in Mongolia, Islam has been practiced there since at least the tenth century.

Historical Context

Although the Mongols emerged historically as a distinct group only about 1080 CE, Islam appeared in Central Asia little more than a century after the Revelation to the Prophet Muhammad, 622 CE. The Battle of Talas (751 CE) established Arab, and hence Islamic, dominance of the area south of the Syr Dar'ya (known to the Greeks as the Jaxartes River). North and east of the river, in the central Siberian steppe (present-day north Kazakhstan, south Siberia, and parts of Mongolia), lived various nomadic groups speaking Altaic languages, related to modern Mongolian and Turkish, and professing Nestorian Christianity, Manichaeism, or shamanism. The largest of these groups, the Uighurs, adopted Manichaeism as a religion in 750 CE.

The Central Asian Samanid dynasty (864–999), based in Bukhara, established Sunni Islam as the re-

gion's dominant religion, although the area remained religiously mixed, with Muslims a minority in the population of Christians, Jews, Manichaeans, and Buddhists. The Samanids attempted to spread Islam, and with it their political power, among the Christian and shamanist Turks and Mongols in the steppe. Despite this, however, and despite the strong trade links that existed between the steppe and Central Asia, Islam made little headway east of the Altay and Tian Shan Mountains, which today separate Kazakhstan from Mongolia and China. In contrast, successive waves of Turko-Mongolian peoples spread west. In 1211, Kuchlug, head of the Mongol Naiman tribe, conquered the Samanid state in Central Asia and instituted attacks on Islam.

Mongolian power reached its height under the leadership of Genghis Khan (1167–1227), who took Bukhara in 1220. Genghis Khan's conquests in China resulted in the introduction of Buddhism into the steppe, adding to the religious mix. He also initiated the custom of inviting men of all faiths to his capital of Karakorum (now in the Inner Mongolian Autonomous Region of China) to debate religious affairs. The purpose of this appears to have been to establish a common religious "glue" by which the various peoples of the empire could be bound together.

Genghis Khan's empire was divided after his death between his sons. In the west, where Islam was long established as the religion of both governance and learning, the so-called Golden Horde was converted to Islam under Genghis Khan's grandson, Berke (1206–1267). Later Central Asian rulers such as Timur (Tamerlane, 1336–1405) were expected to be Muslim and to be descended from Genghis Khan. In the east, where Genghis Khan was succeeded first by his son Ogodei (1185–1241), then by a grandson, Guyuk (1206–1248), and from 1248 by a second grandson, Mongke (1209–1258), the religious situation was more fluid. We know from William of Rubruk, a Western traveler to the region, that in 1253 there were two mosques in Karakorum.

On 30 May 1254, Mongke initiated a debate between a Christian (William of Rubruk), a Muslim, and a Buddhist. The aim was to establish a state religion binding the Mongolian people together. This was followed by a debate in 1255 between Buddhists and Taoists. In 1256, Mongke adopted Mahayana (Tibetan) Buddhism as the religion of the Mongolian people, although Islam survived there for some time longer. As late as 1447, the ambassador of the Oirat Mongols to the Chinese Ming court was named Muhammad.

The successors of Khubilai Khan (1215–1294) gave the leader of Mahayana Buddhism the title Dalai Lama

(most high priest). From this time on, Mongolian identity and culture were inextricably linked with Buddhism.

Adoption by Kazakhs

Islam exists in Mongolia today because of the country's Kazakh minority, which is concentrated in the west of the country. People of this minority arrived as nomads in the west of Mongolia in the 1860s in response to Russia's advance into their traditional grazing areas. Whereas the Mongolian peoples came to identify with Buddhism, Turkic peoples such as the Kazakhs adopted Islam. The process was gradual, lasting one hundred years and ending with the complete conversion of the Kazakhs during the eighteenth century. The Kazakhs' nomadic pastoral way of life had much in common with the life of the Mongols. Some people have linked the name "Kazakh" to "Cossack" (Russian *kazakh*), meaning a people beyond the bounds of urban society.

It was Sufi missionary activity from the shrine town of Yasi (in Turkistan in present-day south Kazakhstan) that brought Islam to the Kazakhs in the eighteenth century. Although Islam came late to the Kazakhs, being Muslim is important to the Kazakhs, as it distinguishes them from Buddhist Mongols, or Buriyats, and from Christian Russians and aligns them with Muslim Tatars, Uighurs, and Uzbeks. The British missionary Henry Lansdell, writing in the 1880s, noted that Kazakhs were not overly religious unless it was suggested that they were other than Muslim, at which time they became very defensive of their Muslim identity.

The exact number of Muslim Kazakhs in Mongolia is impossible to state. This is in part due to the traditionally nomadic lifestyle of these people, who prior to the collapse of the Soviet Union (1991) crossed the borders separating the Soviet Union, China, and Mongolia in response to political changes in each country. A major emigration from the Soviet Union occurred during the 1920s, and other Kazakhs came from China after China recognized Mongolian independence in 1946 and during China's Cultural Revolution (1966–1976). There also were reverse trends as the political situation in China and the Soviet Union became more favorable. It is estimated that in 1989 there were 120,500 Kazakhs resident in Mongolia, accounting for 5.9 percent of the population. Another 1989 estimate gave a Mongolian Kazakh population of 130,000, of whom 10,000 lived in the capital, Ulaanbaatar. Since 1991 the government of Kazakhstan has encouraged a "return" of the Kazakh diaspora. Perhaps 60,000 Kazakhs had left Mongolia for Kazakhstan by 1994.

Kazakhs are concentrated in the western Bayan-Olgii province bordering the Altay and Tuva Republics

of Russia, where they form around 95 percent of the population, and in the Ili-Kazakh Autonomous Province in Xinjiang (China), where they form up to 75 percent of the population.

Muslims in Mongolia suffered from religious persecution during the 1930s, but there was relatively less to destroy than was the case for Buddhists. Kazakh Islam has always been of a less formal nature than has Islam in other areas. Although all mosques were destroyed in the persecution, no more than four (one in Ulaanbaatar) existed initially. Other Muslim institutions, such as *madrasabs* (law and theology colleges), were absent (traditionally in Kazakh society, Hadith, or customary law, took precedence over *shari'ā*, or religious law). Owning a copy of the Qur'an was forbidden, but very few Kazakhs did own one. It has been estimated that at the beginning of the twentieth century, no more than one in two hundred Kazakhs could read, and traditionally the Qur'an had more the status of a talisman used for divination than of a sacred text.

Post-Communist Resurgence

It has often been said that Mongolia under Communism became one of the most completely nonreligious societies on earth. Certainly, knowledge of the formal teachings of any religion was at a very low ebb. Kazakh Islam in Mongolia had however always existed at a level of folk practice rather than formal theology. Traditional Siberian practices such as divination by means of reading horses' bones, bride-price (or to avoid bride-price, *kalym*, ritual abduction), and the role of female divines in folk medicine, which were all associated with Islam, continued.

Since the end of one-party rule in Mongolia, formal Muslim life has experienced a resurgence. In 1990 the Mongolian Muslim Society was founded in Ulaanbaatar under the leadership of the Moscow-educated former Mongolian ambassador to China, Hajji Hadiryn Sayraan. A few Mongolian Kazakhs have made pilgrimages to Mecca, at least two mosques (in Ulaanbaatar and Olgiy) have opened, and Islamic literature has entered the country from India, Pakistan, and Turkey. There has been some political agitation for guaranteed Kazakh representation at the high government level, but this is not coupled with any Islamic ideology.

ISLAM—MYANMAR When Myanmar (Burma) became part of British India, it had possessed a Muslim community since the beginning of the early modern period (from the fourteenth century), introduced by Muslim Chinese into northeastern Myanmar and by Muslim traders from Southwest Asia and India into Arakan and Lower Myanmar. Myanmar's Muslim population remained relatively small, however, until the establishment of British rule in the nineteenth century. Increased trade and the immigration of Muslim Indian laborers into Lower Myanmar and Muslim Bengali agriculturalists into Arakan to service the growing colonial economy encouraged a rapid growth in the Muslim population, indicated partly by large mosques that were built in Myanmar's major town-ports, including Sittwe (Akyab) and Yangon (Rangoon).

The Muslims of Myanmar are divided into three groups. The first group consists of the Rohingyas, the Bengali-speaking Muslim minority of Arakan state. This group has often been forced to flee to Bangladesh, the Middle East, and Malaysia because of communal violence between Muslim and Buddhist agriculturalists and hostile government policies (many Muslims of Arakan state have been defined as foreigners by the government and thus denied citizenship).

The second group consists of mainly Urdu-speaking Muslims who are descendants of Indian immigrants of the nineteenth and twentieth centuries. Indian Muslims tend to be strict in their observance of Orthodox Islam. Prior to 1962, this group was the most powerful of the three Muslim groups of Myanmar. They are concentrated in the Irrawaddy Valley and Yangon, the capital of both colonial and independent Myanmar, and are close to Myanmar's chief economic and political centers. After 1962, however, many Indian Muslims joined in the general Indian exodus from Myanmar that had begun in 1948.

The third group consists of Myanmar Muslims of various Burmese ethnic groups, heavily represented in Mandalay and Upper Myanmar. These Muslims share many cultural practices with Buddhists in Myanmar. Myanmar Muslim women expect equal treatment to men, reflecting the relative independence of women in Southeast Asian societies compared with many

other Asian societies (and with Muslim societies in general). *Purdah*, the custom of keeping women's faces covered, is not generally practiced. Myanmar Muslim men are also monogamous, a custom that differs from other Muslim societies. Most significantly, Muslims in Myanmar adopted certain rituals involved in *nat* (spirit) propitiation. Some religious sites in Myanmar are held in reverence by both Muslims and Buddhists, for example, the famous Buddhmokan near Sittwe (Akyab) in Arakan.

ISLAM—PHILIPPINES Muslim Filipinos (or as many prefer to be called, Philippine Muslims) represent about 4.5 percent of the Philippines population. They are concentrated in the islands of the Sulu archipelago,

western and central Mindanao, and southern Palawan, and include some thirteen ethnolinguistic groups, though four of these—Maguindanao, Maranao-Ilanun, Tausug, and Samal—account for over 90 percent of the Muslim population. As in most of Southeast Asia, they are Sunni Muslims.

Origins of Islam in the Philippines

Islam came to the Philippines in the thirteenth century, and by the middle of the fourteenth century there were settlements of Muslim Indian, Malay, and probably Arab traders and missionaries in Mindanao and Sulu and extensive commercial relations with the Islamic world to the west. The first to embrace Islam were the Tausug of the Sulu archipelago, and by the mid-fifteenth century a Sulu sultanate had been established at Buansa (Jolo) under Sultan Abu Bakr. At its peak, the Sulu sultanate extended from Basilan north to Palawan, east to the coast of Mindanao, and west to Borneo. Jolo was the center of a trading network that stretched west to Java and north to China.

In the sixteenth century, Sharif Muhammad Kabungswan arrived from Johore and established himself in the Cotabato area of southern Mindanao, providing the foundation for the Maguindanao sultanate. From the Maguindanao-Ilanun area, Islam expanded along the coast from northern Mindanao to the Gulf of Davao and inland to Lake Lanao and

Three Muslim women of Basilan Island attend Friday prayer in June 2001. (AFP/CORBIS)

Bukidnon. Also in the sixteenth century, Islam spread from Brunei to the islands of Mindoro and southern Luzon. The Philippines thus became part of the *dar-al-Islam* (international community ["household"] of Islam) in Asia.

Philippine Muslims and Colonial Forces

When the Spaniards arrived in the Philippines in 1565, they immediately came into conflict with the Moros ("Moors" or Muslims), beginning a bitter struggle for religious and commercial control in the Philippine islands that continued over some 350 years. Assisted by converted Christian *indios* (native Filipinos), the Spaniards reversed the expansion of Islam, vanquishing the Muslims from Luzon and the Visaya Islands, but they never gained effective sovereignty over Mindanao and Sulu.

When the United States took over control of the Philippines in 1898, the Moros continued to resist the foreign intrusion until a major military defeat in 1913.

Subsequently, administration of Mindanao and Sulu passed from the U.S. Army to civilian authorities. Governance of Philippine Muslims initially came under the Bureau of Non-Christian Tribes. Under a "policy of attraction," the U.S. administration increased expenditures on infrastructure in Muslim areas and provided scholarships for Muslims to study in Manila and the United States. Many Muslims, however, saw this as an attempt to assimilate the Moros into mainstream, predominantly Christian, Filipino society, and there were intermittent outbreaks of armed resistance. In 1946, the Philippines became independent, but there was no independence constitution, and policies essentially followed those of the Philippine Commonwealth established under U.S. rule in 1935.

Muslim Separatism

By the 1950s, increasing migration to Mindanao and consequent competition for land and political influence, combined with an Islamic resurgence reflected among other things in the proliferation of mosques and *madaris* (or *madrasabs*; Islamic schools), had brought new tensions in relations between Muslim and Christian communities. These tensions escalated during the 1960s, and in 1969 a Muslim independence movement was established. By the early 1970s, Muslim Mindanao and Sulu were in a state of armed insurgency, spearheaded by the Moro National Liberation Front (MNLF). This group, which demanded a separate Islamic state, or Bangsa Moro (Moro nation), received financial, logistical, and diplomatic support from the international Islamic community and was granted observer status with the Organization of Islamic Conference (OIC). The Marcos government made a number of concessions to Moro demands in the 1970s, including the codification of *shari'a* (Islamic law) for use in specific areas of jurisdiction in Muslim regions, the proclamation of Muslim holidays (proclaimed nationally but generally recognized only in Muslim areas), the revival of the historic barter trade between Malaysia and Muslim Mindanao, and the establishment of the Philippines Amanah Bank, which employed Islamic banking principles. With the signing of the Tripoli Agreement between the MNLF and the Philippine government in 1976, autonomous regions were created in western and central Mindanao and Sulu. Following the People Power Revolution of 1986, the Autonomous Region of Muslim Mindanao (ARMM) was established, though the MNLF refused to participate in the election that set it up. An Office of Muslim Affairs was also established within the Office of the President.

The Moro insurgency has continued, albeit on a reduced scale, since the 1970s; however, in 1996 a peace agreement signed between the MNLF and the Philippine government created a Special Zone of Peace and Development (SZOPAD) in the fourteen provinces claimed for the Bangsa Moro by the MNLF and provided for a Southern Philippines Council for Peace and Development (SPCPD) with limited powers of administration in the SZOPAD. The SPCPD was to be assisted by a *Darul Iftab* (religious advisory council). The OIC, which had helped bring about the 1996 agreement, was given a specific role in supporting its implementation and helping monitor the peace process. The 1996 agreement also provided for the drafting of legislation for an expanded ARMM, to be submitted to a referendum. In August 2001, the referendum was finally held, but of the fifteen provinces and fourteen cities covered by the agreement only one province and one city voted to join the four existing provinces in the ARMM. After this, the ARMM and MNLF chairman, Nur Misuari, lost office and briefly attempted to revive the armed struggle. He was arrested in Malaysia.

Two other Muslim groups—the Moro Islamic Liberation Front (MILF), which is a 1977 breakaway from the MNLF, and Abu Sayyaf, a group that has been heavily involved in kidnapping for ransom—have meanwhile continued the armed struggle for an Islamic Bangsa Moro. In 2002, peace negotiations with the MILF continued. The Ulama League of the Philippines has supported the peace process.

ISLAM—SOUTH ASIA South Asia is home to more than 360 million Muslims, more than a third of the world's total. The majority of the populations of Pakistan and Bangladesh are Muslim (98 and 87 percent, respectively), as are 12 percent of Indians, almost all Maldivians, and tiny fractions of Sri Lankans and Nepalese.

The first Muslims to set foot in the subcontinent were Arab invaders who conquered parts of Sind and southern Punjab in 711. The Islamization process started with the establishment of the Delhi sultanate (1192–1526), a series of Turco-Afghan Muslim dynasties in Delhi. But the invaders-turned-rulers did not come to spread Islam, nor did they represent Islam's high culture. They came at the end of what was once the magnificent Abbasid caliphate (749/750–1258). The sultanate, theoretically subordinate to the Abbasids, proclaimed itself the protector and patron of Islam after the destruction of the Baghdad-based caliphate in 1258.

The Mughal dynasty (1526–1857), theoretically more secular and Indianized than the preceding sultanate, nevertheless named Muslim theologians to high government positions. Most of these rulers never identified themselves with India, despising its climate, religion, and people. But unlike Islam in Iran and the Ottoman empire (1453–1922), Indian Islam was saved from bureaucratization and state control by Indian pluralism. Most importantly, Islam came to India when the latter already possessed a developed civilization with well-structured peasant and village communities, urbanization, organized religions, and sociopolitical systems. Today, South Asia has all the principal varieties of Islam: scholasticism, Sufism (Islamic mysticism), scholastic-Sufi synthesis, Islamic modernism, and reformist or militant Islam. An appraisal of all the varieties is essential for an understanding of South Asian Islam.

Sufis and Settlers

Although the bulk of Central Asian and Iranian warriors, Sufis, and fortune-seekers settled in northwestern India and elsewhere in the region, most South Asian Muslims are descendants of local converts. Persianized Turco-Afghans and Mughals constituted the bulk of the nobility and aristocracy (*ashraf*), enjoying the lion's share of the state patronage during the Muslim rule. They not only alienated themselves from the popular culture and local traditions of the subcontinent; they also despised Hindus and the indigenous Muslims (*atraf*) as inferior. But the *ashraf* classes did not play the most decisive role in the Islamizing process. Had it been so, Delhi, Agra, and the adjoining districts in the core areas of Muslim rule would have Muslim majorities. It is interesting that peripheral eastern Bengal (Bangladesh) and western Punjab, Sind, North-Western Frontier, and Baluchistan (modern Pakistan), on the average, are more than 90 percent Muslim. During the thirteenth through sixteenth centuries, Sufis converted large sections of pre-agrar-

Muslims outside Dhaka's Baitul Mukarram National Mosque donate money to help flood victims in October 2000. (AFP/CORBIS)

ian nomads and tribal people, as yet not integrated into the Hindu community, in the areas of present-day Bangladesh and Pakistan. The Islamization process accelerated in the sixteenth century, especially in eastern Bengal, due to the state patronage of Sufis who brought the Qur'an and the plow, creating a large number of peasant adherents of Islam. It is noteworthy that Muslim masses throughout the subcontinent still nourish the culture of saint-veneration, paying homage to Sufis and their tombs.

The High Culture of Islam

Muslim rulers, elite, scholars, artisans, and artists brought elements of art and architecture, music and literature, food and attire, perfumes and jewelry, philosophy, and high culture from central Asia and Iran, including Sunni Islam and various mystic Sufi methods of meditation and prayer (*tariqas*). The Qutb Minar and Red Fort at Delhi, Agra Fort, Taj Mahal at Agra, and hundreds of beautiful buildings—mosques, palaces, tombs, and shrines—may be cited in this re-

gard. The synthesis of Indian and Middle Eastern and Central Asian philosophy, literature, art, architecture, music, and painting gave a unique Indo-Islamic character to almost every branch of human endeavor and knowledge. Islamic philosophy and culture, monotheism, and the seclusion of women, for example, affected Indian religions and belief systems. The emergence of religious reformers such as Nanak (1469–1539), the founder of Sikhism; Kabir (1440–1518), an Indian mystic revered by Muslims, Hindus, and Sikhs; and Mahabir (fifteenth–sixteenth century), all of whom developed iconoclastic and monotheistic philosophies, may be attributed to the impact of Islam. Similarly, Muslim Sufis borrowed Hindu and Buddhist mystic ideas that were quite unknown in orthodox Islam. The development of the Urdu language and literature synthesizing Persian, Arabic, and Hindi literary traditions and styles, and especially the emergence of romantic Urdu love songs and poetry (*ghazal*) in northwestern India, with typical Islamic and Sufi imagery, would not have taken place without this Indo-Islamic fusion.

Major Sufi orders in India, such as the Chishti, Suhrawardi, Naqshbandi, and Qadiri, had their origins in Iran and central Asia. Many of them came along with the Muslim conquerors and some of them were themselves "warrior Sufis" who established Muslim rule by fighting local Hindu rulers, mostly in remote areas of eastern Bengal. Sufis in South Asia preached love and tolerance on the one hand, and syncretism (the fusion of multiple beliefs) and escapism on the other. While they were mainly responsible for the spread of Islam in the subcontinent, they arrived in the region after the decay of Islamic civilization had already begun in the heartland of Islam from the tenth century onward. So escapist, next-worldly, and syncretistic Islam—with Persian, Indian, Buddhist, and Hindu elements—came into being in the subcontinent. Sufis also absorbed Indian languages, music, yoga practices, and literary styles into Islamic practice. This explains why certain rituals and institutions among South Asian Muslims are unique to the region, unheard-of in the Islamic heartland.

The Power of Orthodoxy

Islam in South Asia entered a crucial phase in the late sixteenth and early seventeenth centuries, during the reigns of the Mughal emperors Akbar (1542–1605; reigned 1556–1605) and Jahangir (1569–1627; reigned 1605–1627). Orthodox Muslim scholars and Sufis campaigned against the heterodoxy practiced by Akbar and Jahangir, and especially against Deen-i-Ilahi (the Religion of God), the syncretistic religion introduced by the former. Sufis belonging to the orthodox

Naqshbandi Tariqa under the leadership of Shaykh Ahmad Sirhindi (1564–1624) confronted the Mughal court. Sirhindi despised syncretism as heresy and considered any interaction with Hindus and other non-Muslims undesirable. Jahangir arrested him only to release him later, as the Shaykh had a large number of followers in the royal court. His overwhelming influence helped Muslim scholars reestablish orthodoxy in Indian Islam. He reaffirmed the views of al-Ghazali (1058–1111), a Sufi theologian who had rejected mathematics as "intoxicating" and "un-Islamic" and Greek philosophy as "dangerous."

It would be misleading, however, to suggest that Sirhindi and his followers alone were responsible for the isolationist and backward-looking nature of South Asian Islam. If the retrogression of South Asian Muslims is imputed to Sirhindi's influence, how does one explain the state of backwardness, next-worldliness, and the lack of scientific inquiry prevalent before his time? One cannot name a single university or institution for the study of science and technology in South Asia either during the Delhi sultanate or during Mughal rule, though leaders excelled in the building of beautiful mosques, forts, shrines and tombs. Unlike the Arab and Berber rulers of Egypt, North Africa, and Spain from the ninth to thirteenth centuries, who established universities and cultivated secular scientific knowledge, South Asian Muslim rulers, nomadic invaders from Central Asia, lacked the vision, education, and skill to contribute to science and high culture. They inherited only the retrogressive culture and institutions of the already decayed and degenerate Abbasid empire. The Mongol invasion of Baghdad in 1258 merely formalized the destruction of the empire and shattered the entire Muslim world, especially the vast region between the Nile and the Ganges.

Sufism and the Sultanate

Meanwhile, Sufis had their heyday in the chaotic environment of plunder and pillage in Iraq, Iran, Central Asia, and India between the twelfth and sixteenth centuries. They preached mysticism, devotion, and escapism to large numbers of Sunni and Shi'ite devotees. Henceforth Sufism became the most important aspect of South Asian Islam. Many Sufis and most of their disciples preached syncretism, shunning the Qur'anic exhortation to learn, study, and inquire. The Delhi sultanate remained unstable due to internal dissension and external invasions. The sultans were prejudiced against Hindus and some had no qualms about destroying Hindu temples or converting them into mosques. As for the Mughals, despite their generous patronage of secular art, architecture, music, painting,

and literature—at least up to the late seventeenth century—Mughal rulers exclusively employed Islamic clergy as judges and jurists, and endowed Muslim shrines, seminaries, and mosques with land grants. Emperor Aurangzeb's reign (1658–1707) was a departure from the hitherto syncretistic and tolerant Mughal traditions. He antagonized liberal Muslims and many Hindus with his ultra-orthodoxy and the discriminatory poll tax on the majority Hindu community. Rebellions by Hindu rulers, especially in the Deccan and Maharashtra, ultimately led to the empire's decline and downfall.

Shi'ite and Shi'a Sufi Currents

Shi'ite Islam and Shi'a Sufi orders came to the subcontinent mainly from Iran after the elevation of the sect as the state religion of Iran in the early sixteenth century. Shi'ite scholars and courtiers played important roles in the Mughal courts and elsewhere in northern and southern India and Bengal. There were several Shi'ite dynasties, in Kashmir and Golconda for example, during the precolonial period. Shi'a sects represented include the Twelvers, Bohras, and Ismailis. The Ismailis, successors of the twelfth-century Assassins who in 1845 fled from Iran to India under the leadership of Aga Khan I (1800–1881), are also known as the "Aga Khani" community, renowned for their philanthropy and wealth. But South Asian history is replete with conflict between Shi'ite Muslims and Sunni Muslims. Their mutual hatred has been responsible for killings, pillage, and plunder, especially in north India and parts of Pakistan. There are followers of various Muslim sects and schools of thought, including the Ahmadiya (Qadiani), throughout the subcontinent. In the early 1970s, the Pakistani government, responding to popular demand, declared the Ahmadiya a non-Muslim minority community on the grounds that its belief system was heretical.

The Growth of British Power

The onset of the British rule did not augur well for Indian Muslims. The consequential loss of political power, jobs, and state patronage as the most favored community turned the bulk of Muslims into disgruntled and confused masses or into the sworn enemies of the British. British expansion was slow, steady, ruthless, and calculating. British occupation of Bengal, Mumbai (Bombay), and Madras by the mid-eighteenth century and other regions by the early nineteenth frightened the feeble Mughals and hundreds of other Indian rulers. By then, raids by Hindu Maratha invaders from the west were frequent. The upshot was the growth of Muslim solidarity and

militant reformist movements in British-occupied Bengal as well as in Indian-administered regions under the Mughals and some petty dynasties in north-western India.

Shah Wali Allah (1702–1762), Sirhindi's great follower from Delhi, spearheaded the introduction of the orthodox, militant Islamic revivalist "Wahhabi" movement into the subcontinent. To secure the future of Islam in the subcontinent, this well-versed theologian invited Ahmad Shah Durrani (1722?–1773) of Afghanistan to fight the Marathas. Durrani routed the vast Maratha army and saved India from the Maratha menace at the battle of Panipat (1761). Meanwhile, Sikhs, Marathas, and Afghans had been vying for the control of the moribund Mughal empire. The exit of the Marathas allowed the Sikhs to occupy the Punjab, Kashmir, and parts of the Afghan territories in the northwest. Afterwards, the Sikh persecution of Muslims led to further mobilization of Muslim militants under the leadership of Wali Allah's son and successor, Shah Abdul Aziz (1746–1824).

Rebellion and War

In the early nineteenth century Abdul Aziz declared British India "Dar-ul-Harb" (an abode of war), making it obligatory for every pious Muslim to join the holy war against the British. One of his disciples, Sayyid Ahmad Brelwi (1786–1831), organized the jihad and moved to the northwest frontier to establish an Islamic state. Thousands of Muslims joined Brelwi's jihad to fight the Sikhs and then the British. Brelwi died fighting the Sikhs. His followers later supported the Indian Mutiny of 1857–1858. In 1867, a group of Brelwi's followers established the famous Deoband Madrasah (seminary) in north India. This ultraorthodox seminary produced thousands of traditionally educated graduates, some of whom joined Gandhi in the Freedom Movement or the Muslim separatist Pakistan movement. Thousands of Deoband-style *madrasahs* have been functioning throughout the subcontinent. (Afghanistan's Taliban, militant successors of the Indian Wahhabis, were graduates of such *madrasahs* in Pakistan.)

Several other reformers, such as Titu Meer (d. 1831) near Calcutta and Shariatullah (1781–1840) in eastern Bengal, started Puritan and militant anti-British movements. While the former died fighting at the hands of British troops, the latter organized the more successful and long-lasting Faraizi movement, to establish the *faraiz*, or obligatory rituals, discard syncretism, and fight the British.

Branching Out

Soon after Brelwi's death, his supporters split into several groups. One of his disciples, Karamat Ali Jaunpuri (1800–1873), shunned militancy after 1831, promoting loyalism and advising Indian Muslims to learn English and adopt orthodoxy by discarding syncretism. His main base was rural eastern Bengal (Bangladesh). He successfully neutralized the bulk of Faraizi supporters through peaceful reformism and by synthesizing the various Sufi *tariqas* into the Tayyuni movement. His brand of Sufism is still quite popular throughout Bangladesh and parts of Assam. Sir Syed Ahmad Khan (1817–1898), founder of the Aligarh Muslim University in north India, and Nawab Abdul Latif and Syed Ameer Ali of Bengal (d. 1928), contemporaries of Karamat Ali, were doing the same thing. Their movements ultimately promoted orthodoxy, "Islamic modernism," and separatism among Indian Muslims, who played the decisive role in the partition of the subcontinent in 1947 into Hindu India and Muslim Pakistan.

There have been scores of other Islamic movements and organizations throughout the region. The Jamaat-e Islami and the Tabligh Jamaat are the best known among them. The former has promoted a totalitarian Islamic state since 1941 and the latter Puritanism since the 1920s. The political use of Islam by civil and military dictators for the sake of legitimacy, and the mass frustration due to the failure of the welfare state in post-colonial Pakistan and Bangladesh are mainly responsible for the growth of political Islam and escapism or next-worldliness in these countries. The post-Cold War Islamic resurgence and Hindu revivalism, especially the demolition of the Babri Mosque by Hindu militants in 1992, are largely responsible for Muslim militancy in India. Last but not least, Islamic resurgence in neighboring Afghanistan under the Taliban, the terrorist attacks on America in September 2001, and the American retaliation against the Taliban regime, have had a tremendous impact on South Asian Muslims.

ISLAM—SOUTHWEST ASIA The region now occupied by Afghanistan and Pakistan is unique in the Islamic world in the degree to which it looks both to the Middle East and to Central Asia. As a consequence of the latter connection, the region has remained orthodox, as has Muslim Central Asia itself. Although Iranicized in culture, the region is not Iranicized in religion. Shi'ites (the majority Muslim sect in Iran, though representing only 10 percent of the worldwide Islamic population) are only a small minority.

Afghanistan and Pakistan were both Buddhist prior to the appearance of Arab armies in the seventh century. They were at first comparatively untouched by the new religion of Islam. Arab armies swept through Afghanistan quickly, pressing on into Khorasan and points beyond, an expansion that culminated in the 751 Arabic victory on the Talas river against Tang China. That victory opened eastern Turkistan and even China itself to Islam. India was still only occasionally raided. Nowhere did the garrisons left behind by the Arabs, some quite large, and a scattered Islamic urban community, have much effect on the locals.

Real conversion began much later. It was long inhibited by the practice of taxing nonbelievers, turning them into a major fiscal resource of the state that would be lost if they converted. Nonbelievers, of course, had a financial interest in becoming Muslims, but their conversion was resisted by local governments. Social issues were important too. The form of Islam brought in by the Arabs was not attractive to former Buddhists. Only with the eleventh-century arrival of Sufism (mystical Islam), which offered a religious experience closer to what they were used to, and which was strongly influenced by Buddhism in any case, was real progress made.

Early Islamic States

The first important Islamic state in Afghanistan was that of the Ghaznavids (977–1187). Its appearance marked the emergence of the Turks as a major force since its ruling family was descended from Turkic military slaves. Despite this, the Ghaznavids were associated with Iranian revival rather than Turkicization and played an important role in making Islam Iranian as well as Arabic. In promoting Iranian Islamic culture, the Ghaznavids, particularly Mahmud of Ghazna (971–1030), tried to avoid the doctrinal controversies of other parts of the Islamic world.

By his time serious penetration of India had begun, largely by Turkic warriors. Going on simultaneously with an overland advance were overseas contacts following Indian Ocean trade routes. Despite these advances, India, with traditions largely alien to those of the Middle East, proved resistant to Muslim penetration. For centuries, Islamic influence remained confined to the Punjab, an area first infiltrated by the Ghaznavids, and a few trading communities. Only gradually did Islam spread more widely in north India, in part due to the active efforts of the successors of the Ghaznavids, the Ghurids (1187–1215). Throughout India, the Buddhist or formerly Buddhist areas seem to have been the most receptive to the new religion.

A major turning point in the history of the region was the coming of the Mongols followed by the emergence of various Mongol successor states, including

The octagonal tomb of of Sufi leader Sheik Rukn-i-Alam in Multan, Pakistan. The tomb was built in 1320–1324 for the father of Sultan Muhammad Tughlaq. (ROGER WOOD/CORBIS)

the Timurid and Mughal empires. The Mongols controlled Afghanistan as well as Iran, but did not invade India. They were at first little interested in Islam and it was only after the breakdown of unified Mongol empire in 1259 that Islam began to make any real headway among them. The Iranian Il-Khans (1260–1335) officially converted to Islam under Ghazan (1271–1304), and under Oljeitu (1280–1316) began the process of official patronage of Shi'a that resulted in the Shi'ite Iranian state of today. This change had little impact on Afghanistan since it was controlled by a competing khanate, that of Ca'adai (1260–1334), later a convert to Sunni Islam. Muslims in India could also remain orthodox since they were isolated from Mongol Iran under their own rulers. This included the various Delhi sultans, mostly of Turkic origin, although Iranicized, who gradually expanded their rule through much of India. Other Muslim regimes emerged there as well, including in Bengal, once a Buddhist stronghold. Throughout Muslim India, Sufism enjoyed great importance because of its ability to form a bridge between an Iranicized elite and Hindu converts.

Islam under the Mughals and the British

India's relative isolation changed radically due to the new wave of post-Mongol states. Timur (1336–1405), born a Muslim, led an invasion of India in 1398–1399, sacking Delhi and doing immense damage to local Islamic culture. The next wave was that of the Mughals, based in Afghanistan. Under Babur (1483–1530) and his successors, the Mughals became the first Islamic rulers to conquer all of India (except its extreme southern tip), although the majority of their subjects were non-Muslims.

The Mughals continued cultural patterns already established under the Delhi sultans. They promoted a court culture that was heavily Iranian but made one concession to their Turkic culture in encouraging use of the Turkic literary language of Central Asia, Chagatay, in which Babur himself wrote. More influential was their Iranian dialect, Urdu, the language of the *ordu*, or palace, now the second language of the Indian subcontinent and the official language of Pakistan. In religion they continued the toleration of almost all religious communities, even patronizing Shi'ite shrines when they could do so quietly. The Mughals were also accepting of the Hinduism of most of their subjects and of local cults combining Islam and Hindu beliefs, as long as it was done in acceptable ways. Personally, the Mughal emperors remained heavily influenced by the quiet introspection of Sufism.

The Mughal empire survived as the theoretically dominant power in India until 1858, although it no

longer controlled Afghanistan by then and had been superseded by the British in much of north India. The British continued the system that the Mughals had created in ruling India and sought also to preserve the balance between the religions achieved under them. Although there were growing tensions between Muslims and non-Muslims in India, they remained in check during almost the entire period of British rule. Once the British were gone, the bloodshed began.

The intent of Mohandas Gandhi (1869–1948) and his followers was a united India, but this had become impossible, and British India was instead partitioned between a Muslim Pakistan and a Hindu India. As these two states were set up, and populations exchanged, there was considerable violence resulting in hundreds of thousands of deaths. The two states also went to war almost as soon as declared, and have engaged in several wars since. In 1956, Pakistan officially became an Islamic state and in recent years the power of Islam within it has grown. It has not, however, become fundamentalist, despite fundamentalism's growing influence.

Islam in Modern Afghanistan and Pakistan

While India was slowly moving toward religious conflict, Afghanistan was going its own way. Although Islam was certainly a factor in Afghanistan's ability to defend itself against British invasion in the nineteenth century, this was primarily a military success. Within Afghanistan, the divisions that existed were ethnic and not religious. This has changed as a consequence of decades of upheaval in the aftermath of the 1979 Soviet invasion and the failure to achieve stability following the Soviet withdrawal. Searching for a uniting ideology, many Afghans have turned to fundamentalism, resulting in the recent Taliban regime (1996–2001), which was entirely atypical of the past history of Islam in Afghanistan.

Nonetheless, how much of an aberration this episode will appear over the long term remains to be seen. The Islamic world is awash in a demographic wave of volatile young people, and until this generation grows up and quiets down there will be no peace. Playing a critical role in determining the future will be what happens in Pakistan. The government of Pervez Musharraf (b. 1943) is pro-Western, but as in most of the Islamic world, the real force is in the streets. A shift to Islamic radicalism in Pakistan would quickly find its echo in Afghanistan, which is now governed by a northern, largely Uzbek and Hazara minority, but still has a restive Pashtun majority. No one knows at this point exactly how the pieces will fall.

ISLAM—WEST ASIA Although people have practiced Islam in parts of West Asia (present-day Iraq, Iran, and Turkey) since its inception, different versions of the religion have been created by the region's differing cultures, language groups, and histories.

Islam was brought to modern Iraq during the reign of Abu Bakr (c. 573–634), the first successor to the

Prophet Muhammad. Abu Bakr attacked and defeated the Persians near An Najaf in southern central Iraq in 634. In 642, under the caliph 'Umar (c. 585–644), the Muslim invaders again defeated the Persians, this time at the so-called victory of victories near modern Hamadan in northwestern Iran. This defeat resulted in the destruction of the old Sasanid empire (224/228–651 CE), whose religion had been Zoroastrian.

By contrast, Islam did not become a major force in the area of present-day Turkey until 1071, when the Muslim Seljuk Turks defeated the Christian Byzantines at the battle of Manzikert. Subsequently, as the Byzantine empire shrank, Turkish Muslim power grew.

Iraq was a battleground in the disputes surrounding who would govern the community of Muslim faithful, which split Muslims into Sunni and Shi'ite sects. (Today, Sunnis account for 90 percent of the

SUPPORT FOR THE POOR

In many Islamic societies, the poor or otherwise disadvantaged are helped by taxes collected by the government and also charity given by individuals. This means that begging has a special meaning in Muslim societies.

In 1949 I was traveling by bus from Tehran to Hamadan. At a certain ford the driver stopped. A blind woman, nursing a baby, arose from a brush shelter beside the road and approached the bus. The driver passed the hat, everyone put in a coin or a bill, and he handed the collection to the poor woman, who replied with an invocation to God to bless her benefactors. The blessing was returned by the occupants of the bus, and the driver drove on. (If, in visiting an oriental city, you find yourself pestered with beggars and remark, "There ought to be an institution to take care of these people," remember that there is an institution, and an old one, the zaka. Give, in moderation as the Muslims do, and take it off your income tax.)

The zaka is not the only tax imposed in Muslim states. There is a special tax on Christians and Jews, which was abusively levied on Berber converts to Islam in the early days of the conquest of North Africa. There are also customs, gate taxes, market taxes, and other sources of revenue most of which appeared after Muhammad's death. But the zaka differs from those in that it was not originally designed to support the state, being rather a means of leveling out the income of the various elements in the community so that no one would go hungry, of financing the conversion of the heathen and of facilitating travel between the various parts of the Islamic world.

world's Muslims.) Many of the most important sites in Shi'ite history are to be found on Iraqi soil, including the site of the battle of Karbala (10 October 680), when the Prophet's grandson Hussein was killed. Shi'ites annually mark this event at the Ashura festival (10 Muharram in the Islamic calendar).

Shi'ism has also always been strong in Iran, partly because its messianic tendencies grafted relatively easily onto the base of Zoroastrian culture and partly because this border region of the early empire attracted dissidents at a time when Shi'ism was a movement of social protest almost as much as a religious. A decisive moment in Iranian religious and cultural history occurred in the early sixteenth century, when the forces of Esmā'il I (1487–1524) conquered the country. The new Safavid dynasty (1501–1722/1736) proclaimed Shi'ism the state religion. Shi'ism ceased to be a movement of social protest and was closely associated with the Safavid and later Qajar state (1784–1925).

A defining moment in Turkish Islam came with the capture of Constantinople by the Ottomans in 1453. The Ottoman empire (1453–1922), which at its height covered Southeast Europe, North Africa, and most of the Middle East, including modern Iraq, created a cultural synthesis of Turkish, Greek, Persian, and Arabic elements but was above all a Sunni state based on an ideology of universal empire. In the eighteenth century, Sultan Selim I (1467–1520) transferred the relics of the Prophet to Constantinople (modern Istanbul), and the title "caliph," implying leadership of the world Muslim community, came into use to describe the Ottoman rulers. Within the Ottoman and Persian states, the Muslim religion was the basis of all laws and of the education system. It was necessary to be Muslim to participate in government. However, during the nineteenth century, pressure from the West led to a decline in religious institutions. In 1826, the Tanzimat reforms, undertaken in the Ottoman empire to modernize society and limit the power of Muslim clerics, allowed Christians to participate in the administrative and legal systems and created state schools.

Iran also witnessed a gradual decoupling of religion and the state from the 1850s on. A gradual transfer of power from religious to secular authorities has been a recent feature of all three countries, although the 1979 Iranian revolution has challenged this trend.

Turkey

Turkey emerged as a result of a nationalist struggle that began in 1919. Ironically, modern Turkey is much more Muslim than the Ottoman provinces it replaced. Roughly 2.5 million Christians left Turkey, to

be replaced by Muslims from Europe. Turkey is now 98 percent Muslim. Estimates of the number of Shi'ites among these vary from 5 to 40 percent, a spread caused in part by widespread ignorance of the finer points of Muslim theology.

Theoretically, Turkey was to be ruled by the sultan-caliph, who based his legitimacy on his leadership of the Islamic community. However, real power lay in the hands of Turkish army officers, chief among them Mustafa Kemal (Kemal Atatürk; 1881–1938), who had seen that Islamic ideology had failed to bind the Arabs to the empire and who attributed the country's weakness to the Islamic institutions the sultan represented. A republic was proclaimed in 1923, and the following year the caliphate was abolished. Since then, Turkey has been constitutionally secular, with the army regarding itself as the guarantor of this secularity.

During the 1920s and 1930s, Atatürk drove through a program of modernization that involved assaults on Islamic institutions and traditions. Education and the courts were taken out of religious hands; pious endowments (*waqf*) were confiscated, Sufism outlawed, religious dress permitted only within the mosque, and Western dress enforced elsewhere. The government abolished the Muslim calendar, made Sunday the day of rest, and replaced Arabic with the Latin alphabet. Women were given legal equality with men. The number of mosques was reduced and the content of sermons supervised. In all, this amounted to the greatest attack on Islam anywhere outside the Soviet Union.

The Ortakoy Mosque with its towering minarets in Istanbul, Turkey. (MICHAEL NICHOLSON/CORBIS)

PILGRIMAGE AND LOCAL TRADITIONS

All Muslims adhere to the basic beliefs and practices of Islam but in many places Muslims also worship personages of regional or local significance. The Kurds of West Asia are one people who follow this practice as described in the following extract.

The typical indication of a shrine is either a low, quadrilateral, rubble wall about the grave or a cairn of stones. Those who visit the shrine with some purpose characteristically tie a piece of white rag on the end of a pole and lean the pole against the inner surface of the wall. Some shrines have bundles of these crude banners standing in them. The meaning of the rag is variable. In some cases the visitor will return and reclaim it, incorporating it in a charm, while in others it is simply the sign of a vow that the suppliant, if the shaykh buried there will bring about the desired favor, will sacrifice so many animals or give so much money to the poor. The most auspicious days, it might be noted, to visit a shrine are Wednesdays and Thursdays. The six most noted shrines near the town of Rowanduz are as follows:

1. Shaykh Piri Mawili near the village of Kani Kah. Shaykh Piri Mawili is said to have lived about two hundred years ago, "in the time of Kor Pasha."
2. Shaykh Sa'idi Galikarak near the village of Karak. The shrine is said to be very old, dating perhaps from the time of the Islamic conquest.
3. Shaykh Saran in the village of Saran itself. Shaykh Saran is said to have died about fifty years ago.
4. Shaykh Usu Shaykhan on the road to Kawlok. No one knows how old it is, but it is very ancient.
5. Shaykh Muhammad or Shaykh Balik, the second most famous shrine in the district, at Haiji Umran.
6. Shuwani Shaykh Muhammad or Shuwani Mala, The Shepherd of Shaykh Muhammad.

In 1925, the Naqshbandi Sufis (an order of Sufis, or Islamic mystics) led a revolt among the Kurds, a non-Turkish ethnic group present in large numbers in eastern Turkey, but the revolt was ruthlessly suppressed.

Turkey's constitution banned religious parties, but from the 1960s there began to be calls for greater recognition of religion in public life. Religious parties

have appeared by disguising their religious nature. Such parties, with messages of social justice and respect for traditional culture, have particularly appealed to recent migrants to urban areas, but they are led and often supported by the urban middle class. In part, the rise of these parties has been fed by resentment at the European Union's seeming preference for the membership claims of Christian countries over Turkey's

The leader of the Islamic Revolution in Iran, Ayatollah Khomeini, greets followers in Tehran in February 1979. (BETTMANN/CORBIS)

long-standing application. Recently the issue of whether female university students may wear Islamic head scarves has aroused political controversy. In addition, Sufi groups have reorganized in several cities.

Iraq

As part of the Ottoman empire, Iraq experienced the modernizing trends of the Tanzimat reform. Arab nationalism, although not strong, was felt here, and neither the British nor the Turks who fought over the area in World War I could count on the support of the local population. At the time of Iraq's establishment by the British in 1921, the population was approximately 90 percent Muslim, with small Christian and Jewish communities. Roughly one-third of Iraqi Christians fled to Syria in 1933 following persecution.

Although the ratio of Shi'ites to Sunnis has been approximately 7 to 5 in Iraq, Sunnis have been politically dominant both under the British protectorate (until 1927) and subsequently. This has been particu-

larly the case since a 1968 coup brought the Ba'ath Party to power.

For much of modern Iraqi history, the state has gradually taken over services traditionally provided by religious organizations (education, welfare, justice), although Islam has never faced the outright assault it did in Turkey.

The dominance of Sunni Arabs has left Shi'ites and Kurds relatively disadvantaged. Whereas among the Kurds political discontent is expressed through nationalism, in the Arab south this is expressed via the medium of Shi'ism. This situation is heightened by the presence of the Shi'i holy cities of An Najaf and Karbala on Iraqi territory. Ironically, Iraq has given shelter to Shi'ite leaders such as the Ayatollah Khomeini (1900–1989), who opposed the government of Iran, while suppressing outspoken leaders of its own Shi'ite community.

Antistate revolts articulated via Shi'ism have periodically broken out, notably in 1979 and after the expulsion of Iraqi troops from Kuwait in 1991. The regime's response has been both the suppression of Shi'ism and an increased Sunni religiosity on the part of political leaders.

Iran

In 1920, Iran was 95 percent Shi'i, with small Baha'i, Christian, Jewish, and Zoroastrian communities. Traditionally, Shi'ism had kept politics at arm's length, but Iranian religious leaders began to become politically involved toward the end of the nineteenth century, their anger directed particularly against concessions granted by the Qajar shahs to Western economic interests (especially tobacco). Whereas in Turkey the constitutional movement was secular and nationalist, in Iran opposition to the power of the ruler came from the clergy, which was closely allied with the class of small shopkeepers most economically threatened.

A declining Islamic empire was taken over by a military strong man, Reza Pahlavi (1878–1944), in 1921. Fearful of a repetition of events in Turkey, the clergy opposed the creation of a republic, and Reza was proclaimed shah. However, he rapidly introduced secularizing policies similar to those of Ataturk. His son Mohammed Reza (1919–1980), who was placed on the throne by British and American interests after a short-lived socialist experiment, continued these policies in his so-called White Revolution of 1963.

One upshot of the fall of the leftist government in 1953 was that left-wing political parties were ruthlessly suppressed. Religion was now the only means of articulating political dissent, and during the 1960s two

developments radically altered Shi'i political thought. 'Ali Shari'ati (1933–1997), the philosopher whose thought most influenced Iran's Islamic revolution, created a synthesis of Marxist sociology and Shi'i theology that for the first time provided religious justification for revolution, while the minor cleric Ruholla Khomeini, from his exile in An Najaf, Iraq, elaborated a theory of the ideal Shi'ite state.

As the shah's rule became increasingly oppressive, the urban middle class became attracted to Shari'ati's ideas. Migrants to the cities identified with Khomeini's formulation of a genuinely Shi'ite, just state untainted by foreign influences, although many senior clerics strongly disagreed with his formulation. The 1979 revolutionary slogan—Neither East nor West but Islam—expressed the anticolonial sentiment of the people, the desire for a genuinely Iranian political order, and frustration with the iniquities of the shah's regime. Popular dissatisfaction was expressed particularly toward the United States.

Since the establishment of the Islamic Republic of Iran in 1979, Iran has formally been a participatory constitutional democracy. However, Khomeini's insistence that legislation be vetted by a religious council has created tensions within the state, as power is split between the presidency and the Council of (Religious) Experts. The limits of Khomeini's conception have become increasingly clear.

Present-Day Problems

In recent years, West Asian Muslims have faced similar pressures but have responded to them in a variety of ways. In Iran, Islam has become a substitute for nationalism and socialism. In Turkey, the government has, with limited success, presented nationalism as a substitute for Islam. In Iraq, where both Kurdish nationalism and Shi'i Islam could threaten the governing class, a variant of Islamic socialism has held sway since 1968. All these countries feel the twin pressures of modernization and urbanization. Whereas a small group in each country is happy with the social changes, for most the experience has been deeply unsettling. They have therefore sought support from a form of their traditional culture and have sought to expand that culture into the alien secular environment, which in all cases was imposed from above by the state.

ISLAM, KAZI NAZRUL (1899–1976), Bengali poet and playwright. Kazi Nazrul Islam, known as the *bidrohi kobi* (rebel poet), was both a poet and a playwright who was deeply influenced by leftist ideology and who championed the working class. Many Bengalis consider Nazrul Islam a "nonconformist" who despite not having a formal education and not having traveled outside India acquired a worldly outlook. He took the Bengali literary world by storm with his poem *Bidrohi* (The Rebel). That poem, along with his many other patriotic poems and songs, inspired Bengalis during their struggle against the British and during the Bangladeshi war of liberation in 1971.

Nazrul Islam was born to an impoverished family in West Bengal, India. He lost his father at an early age and to support his family started working as a domestic servant and later as a baker's assistant. In 1917, at the age of eighteen, Nazrul quit high school and joined the Forty-Ninth Bengali Regiment. After the regiment was disbanded in 1919, Nazrul went to Calcutta to pursue his writing career.

Nazrul Islam is regarded as the greatest Bengali poetic force after the Nobel laureate poet Rabindranath Tagore. His chief works include *Agnibeena*, *Sbonchita*, *Dolon Champa*, and *Chayanot*. Although Nazrul's life as a poet lasted a little over twenty years, he wrote three thousand songs, twenty-one books of verses, fourteen books of songs, six novels and collections of stories, four books of essays, three plays, four books of poems and plays for children, and three books of translations of Persian poetry and Qur'anic verses. Many of his works remain uncollected in out-of-print journals and periodicals.

Tragically, Nazrul's literary career was cut short in July 1942 when he suffered a stroke and lost his speech. Within weeks his condition deteriorated further, and he lost contact with reality. He lived for another thirty-five years and died in Dhaka, Bangladesh.

commercial center, but it was not considered an appropriate administrative center. Therefore, the decision was to construct a new city at the eastern part of the Margalla Hills, which are located at the base of the Himalayas in northern Punjab region.

Islamabad, which officially became the capital of Pakistan in 1959, was designed to maximize its relationship with nature, thus adding to its natural beauty. Many streams flow through the landscape, over 6 million trees have been planted since Islamabad's inception, and, more recently, several lakes, such as Simly, Khanpur, and Rawal, have been added to the terrain.

ISLAMIC BANKING Islamic banking refers to a modern banking system practiced in the Muslim world from about 1975, which pays no interest on deposits. Although the Qur'an condemns the taking of interest (*riba* in Arabic) on the grounds that it is exploitative and unjust, not all Muslim countries have instituted interest-free banking.

Today about 170 Islamic financial institutions worldwide, controlling over \$150 billion in funds, follow this procedure, particularly in Saudi Arabia and the Gulf States; Iran and Sudan have recently implemented this system. Pakistan was scheduled to adopt it in 2001; in Turkey only a small minority of banks operate in this manner (3 percent of deposits nationally). In Kuwait, Morocco, and Malaysia, where Islamic banking is popular, depositors and borrowers can choose which sort of bank to patronize. Conventional banks such as Citibank also offer "Islamic services."

In countries with interest-paying and interest-free banks, Islamic banks can and do compete. Instead of paying interest on deposits and charging it on loans,

HAWALA (TRANSFERRING DEBT)

Hawala is a form of Islamic debt exchange that is used to move money around the world cheaply without attracting government notice. The system gained worldwide attention in 2001, because Hawala was thought to be one of the ways in which the terrorist attacks of 11 September were financed.

A person wishing to transfer money gives it to a Hawala broker, and the two agree on a password. The Hawala broker then contacts a Hawala agent in the recipient's country, who gives the amount of money to whoever gives him the password. No real money is transferred between the Hawala agents, who receive a small fee paid at each end. Below is one of the Islamic rules that govern Hawala.

If a debtor directs his creditor to collect his debt from the third person, and the creditor accepts the arrangement, the third person will, on completion of all the conditions to be explained later, become the debtor. Thereafter, the creditor cannot demand his debt from the first debtor.

these banks seek profit- and loss-sharing arrangements with depositors and borrowers. One procedure is the *mudarabah* contract, which allows depositors to share the bank's profits rather than receive interest. Perhaps because of the frequent unfeasibility of this contractual procedure, Islamic banks make much more income from *murabaha*, a contract similar to an interest-bearing loan. A bank will, for example, buy a printing press from a client for \$20,000, but leaves it on the client's premises. The client then buys it back later for \$22,000, according to contract. The bank thus makes \$2,000 on the transaction, and the client has his printing press.

ISLAMIC RENAISSANCE PARTY—TAJIKISTAN Despite being proscribed by the government, the Islamic Renaissance Party (IRP) was formed in the Tajik Soviet Socialist Republic just before the dissolution of the Soviet Union. The IRP emerged as an important force for democracy in 1990 and was legalized soon after Tajikistan proclaimed its independence in September 1991.

The IRP soon came into conflict with Tajikistan's ruling Communist Party, and violence erupted. After the party was banned in 1993 for attempting to establish an Islamic state in Tajikistan, the leadership fled to Iran and Afghanistan and led the formation of the United Tajikistan Opposition (UTO). Until 1996 the UTO fought against the Tajik government in a war that cost tens of thousands of lives. A peace agreement was signed in March 1997, and the IRP and other parties of the UTO returned to Tajikistan. Despite an attempt to ban religious political parties, the IRP was registered as a political party in September 1999 and unsuccessfully ran a candidate in the country's presidential elections that November. The IRP went on to win two seats in the lower house of Tajikistan's parliament in March 2000. The IRP's platform is the revival of Islamic spiritual values in politics and society.

Andrew Sharp

ISLAMIC REVOLUTION—IRAN The Islamic Revolution in Iran began simmering during the Pahlavi dynasty (1925–1979) and boiled over in 1979. It represented the discontent of both the middle class

and the lower class regarding the nation's rapid shift to secularism, its economic hardships, and the perception that foreign interests were controlling Iran.

Islam has strong roots in Iran, being introduced as a result of the Arab conquest in the seventh century. When the Islamic empire fell some two hundred years later, Islam was firmly entrenched within the communities of believers, which broke up into warring clans and dynasties. When the Safavid empire (1501–1722/1736) came to power in Persia (as Iran was known until 1935), it established Shi'a Islam (one of the sects of Islam) as the state religion while the government operated under the auspices of a monarchy. The Safavid empire came to an end with several tribes vying for power. Ultimately, the Qajars won, beginning a dynasty that would last from 1794 to 1925.

In the beginning, the Qajar dynasty respected many of the wishes of the Islamic clerics, and the clerics were able to exercise influence in government affairs. At the same time, the Qajars worked to reaffirm the concept of the shah (king) being connected to God in order to legitimize their standing and position. However, during the reign of the third Qajar monarch, changes began that undermined the authority of the clerics. Many of these changes were at least partially due to the increased pressure and influence of Britain and Russia in Iranian affairs. In the late nineteenth century, the Qajars gradually started to adopt European methods of government in an effort to strengthen their system. Inadequate funds to run the government, however, resulted in the Qajars selling economic concessions to the British and Russians. The religious community strongly voiced its opposition to this by encouraging, in one instance, a boycott of tobacco when Britain was given a tobacco monopoly. In another instance, a cleric encouraged one of his disciples to assassinate the shah.

The economic troubles and foreign manipulations led the populace to question royal authority. This resulted in the Constitutional Revolution (1906), in which proponents demanded a constitution that would limit royal powers and institute the Majlis (Parliament). Although Muzaffar al-Din Shah, the fourth Qajar monarch, signed the constitution into law, he died soon after, and his successor fought its implementation.

Britain and Russia continued to meddle in Iranian affairs; they divided the nation into spheres of influence in 1907. With the advent of World War I, Iran found itself unable to prevent the war's being played out on Iranian soil as Russian, Turkish, and British troops fought one another on Iranian territory. Soon, Russia was dealing with pressures from its own revolution. Britain seized the opportunity to increase its

A young Iranian woman carries a photo of the late Ayatollah Khomeini at the 11 February 2000 celebration of the 1979 Islamic Revolution. (REUTERS NEWMEDIA INC./CORBIS)

influence and backed the ascension to power of Reza Khan (1878–1944). Reza Khan eventually had himself crowned shah (becoming Reza Shah Pahlavi), founding the Pahlavi dynasty.

Reza Shah Targets Clerics

Reza Shah's policies were designed to decrease the clerics' power. He organized a secular school system and borrowed Western ideas and technology to modernize Iran's cities and institutions. In addition, he established laws that excluded clerics from the justice system, and he monitored the administration of licenses to seminaries. Finally, he required the populace to wear European-style clothes and opened education and the workforce to women.

Initially, such reforms were welcomed because they were seen as improving the economic conditions of the nation. However, Reza Shah's repressive policies soon caused public approval to wane. He did not tolerate opposition; he jailed opponents and religious leaders or sent them into exile, censored the press, and executed bureaucrats and tribal leaders.

When World War II started, outside events again intruded on Iran. Iran's declaration of neutrality was unacceptable to the British and Russians, who invaded Iran. This resulted in the transfer of power from Reza Shah to his son, Mohammad Reza Shah Pahlavi (1918–1980). However, it took a while before the shah (as Mohammad Reza Shah Pahlavi was known) was in control of the nation, mainly because of the presence of foreign troops, who were also not appreciated by the masses. Premier Mohammad Mosaddeq (1880–1967) spearheaded a nationalist movement that compelled the shah to nationalize the oil companies. Eventually, popular opposition to the shah and support of

Mosaddeq led to the former's exile and the latter being left in control of the country. The shah was able to return only with the support of the United States—a fact that was not forgotten by the Iranian masses.

The shah launched several ambitious five-year economic plans that were funded by oil revenues. He was equally ambitious in containing opposition. This led to several confrontations with Ayatollah Ruhollah Khomeini (1900–1989), a conservative cleric and harsh critic of the government.

In 1963, the shah arrested Khomeini after Khomeini criticized the shah and his policies. His arrest sparked riots, which the shah tried violently to suppress, resulting in many deaths. Soon, the shah was pressured by clerics to release the ayatollah, who continued to criticize the shah. Eventually, the shah exiled him; the ayatollah took refuge in Iraq and then France. In exile, the ayatollah mobilized opposition groups to organize and concentrate their criticism of the Shah. The ayatollah also further developed his concept of *veleyet-e-faqih* (rule of religious jurisprudence). This concept was significant because it would form the theoretical backbone of the new regime in Iran after the Islamic Revolution.

A booming economy and repressive social controls helped the shah maintain control. When the economy eventually declined as a result of the shah's overly ambitious programs, the country suffered runaway inflation. The result was increased opportunity for corruption and a growing gap between the rich and poor. The shah tried to correct the situation with new programs, but his efforts were seen as catering to the West and subverting Islamic values. The shah also was pressured to restrict his repressive tactics in order to placate international concern over human-rights violations.

The Revolution Arrives

Iran was now ripe for revolution, as a middle-class protest movement seeking restoration of constitutional rule swept the nation. As the movement expanded its social base, it soon proclaimed Ayatollah Khomeini its leader and an Islamic state the ideal government. In November 1978, the shah tried to hold out the olive branch by arresting several of his officers involved in repression and by releasing several political prisoners. However, it was too little, too late, and the strikes started by the opposition continued. The shah opened a dialogue with the protest movement and agreed to appoint Shapour Bakhtiar (a National Front leader) as prime minister. Bakhtiar consented to the appointment only after the shah agreed to leave the country.

The new prime minister was unable to curb the revolutionary movement, as Khomeini had already declared that nothing less than a new political system was acceptable. Despite Bakhtiar's attempts to keep him out, Khomeini returned to Iran in early 1979. Immediately, he proclaimed the government illegal and set up a provisional government with Mehdi Bazargan as its prime minister. The main task of the provisional government was to produce a constitution. After the referendum result was announced, on 1 April 1979, Khomeini declared Iran to be the Islamic Republic of Iran. His concept of *veleyet-e-faqih* had become a political reality.

ISMAILI SECTS—CENTRAL ASIA The Ismaili sect of Shi'a Islam (Shi'a Islam itself being the minority current of Islam, accounting for only some 10 percent of the world's Muslim population) separated from the mainstream of Shi'a Islam in 765, when a minority of Shi'ites accepted Ismail, the son of the sixth Shi'ite imam, as the seventh and final imam. The Ismaili sect entered Central Asia around 1000 CE.

Ismaili Areas in Central Asia

The Ismailis of Central Asia reside mainly in the ethnolinguistic area of the Pamir and eastern Hindu Kush Mountains, including the Pamirs in present-day Tajikistan, Afghanistan, and China, Dardistan Province in Pakistan, and Nuristan Province in Afghanistan. On the fringes of this area, the Ismailis are scattered in some places in Hazarajat in central Afghanistan and in isolated pockets in the Afghan provinces of Kunar and Lagman, as well as in some small communities in Herat and among the Turkmen of Balkh. Ismaili migrants also live in Kabul, Afghanistan, and Dushanbe, Tajikistan. The center of the Afghan Ismailis is the town of Pul-i Khumri (central Afghanistan), where they dominate local economic and political life.

It is difficult to provide exact up-to-date demographic data on the Ismailis of the Tajik Pamirs, but various records indicate that in the early 1990s the population of the region reached approximately 250,000. The number of Afghan Ismailis is estimated at anywhere between 100,000 and 500,000 people, and several thousand Ismailis live in the Chinese Pamirs.

The bulk of the Pamiri and Hazara Ismailis are village dwellers, dependent for their livelihood on irrigated and usually terraced fields in the valley bottoms. Those living in Afghan cities are often engaged in commerce or in the service sector. The Tajik Ismailis have the highest ratio of high school and university graduates in all of post-Soviet Central Asia.

Ethnolinguistic Composition

The great majority of the several groups who live in the Pamirs speak different East Iranian languages. None of these is fixed in writing, and the language of culture and civilization is Tajiki (Persian). Before the late nineteenth century, the knowledge of Tajiki was confined almost exclusively to literate religious leaders.

The Ismailis of Badakhshan Province in Afghanistan refer to themselves as *panjtani* (followers of the five people of the *abl al-bayt*, or the Prophet Muhammad's family). The Hazara Ismailis of Afghanistan are known as *qayani* after the father of the current head of the Afghan Ismaili community, al-Hajj Sayyid Mansur Nadiri, Nasir-Shah Qayani. The religious beliefs of the Hazara Ismailis shape their ethnic identity: They consider themselves a distinct ethnic group within the Hazara people, who are predominantly Twelver Shi'ites (Shi'ites who accept the twelve imams, rather than the seven of the Ismaili sect) of mixed Turkic-Mongolian and Iranian origin.

Religious History

Nasir-i Khusrav (1003/1004–1072/1077) was the first Ismaili propagandist associated with the spread of Ismailism in the Pamirs; he was an important Persian writer sent on his mission to the eastern part of the Islamic world by the Fatimid (an Arab dynasty ruling in Egypt) caliph al-Mustansir (1029–1094). Khusrav is believed to have contributed significantly to the initial Islamization of the Pamirs. It is reported, however, that even three hundred years after his death the Ismaili propagandists from Khorasan in northeast Iran still encountered fire-worshippers in the Pamirs.

Due to its isolation, which lasted until the end of the nineteenth century, the Pamiri Ismaili community preserved a number of unique Ismaili manuscripts and

developed religious practices specific to their cultural and geographical identity.

Pamiri Ismailis maintained more or less regular contacts with the Ismaili imam (the Aga Khan), whose seat is in India, only during the forty-year period from the mid-1890s to 1936. The mid-1890s marked the arrival of Russian troops in the Pamirs, which brought the end of Ismaili persecution at the hands of Afghans and Bukharans. In 1936, the Soviet-Afghan border was firmly sealed, which again isolated these Ismailis.

During the 1990s, a number of programs were developed by the Aga Khan Development Network, in collaboration with the government of Tajikistan and other international agencies, to promote social and economic development in the region. The current imam, Aga Khan IV (b. 1937), paid two visits to the area in 1995 and 1998, and there is now a growing awareness of and contact with the international Ismaili community and its institutions.

Beliefs and Religious Practices

Apart from maintaining the general Ismaili tradition, the Pamiris developed their own practice of deeply venerating Nasir-i Khusrav. According to the 1944 proclamation issued by the Tajik Pamiri Ismaili authorities, the Ismailis based their understanding of religion on the *Vajb-i din*, one of Nasir-i Khusrav's treatises, which is sometimes ascribed by the Pamiri Ismailis to the teaching of al-Mustansir himself. This book is esteemed as a *maghbz-i Qur'an* (kernel of the Qur'an), in which the esoteric aspects of the Holy Book are explained.

When Pamiri Ismailis describe their faith, certain points keep recurring, namely, the doctrine of the outer (*zahir*) and the inner (*batin*) meaning of life and, in particular, of religion, which is of utmost importance. Thus, one should strive for pure sincerity and reject what is done solely for outward appearance. Therefore, righteousness and abstinence from evil thoughts and acts are more important than the ostentatious manifestations of religiosity.

Ismailis strive to attain perfection whatever their tasks in life might be, for this path leads to the cognition of God and unity with him. Participation in religious ceremonies, as well as recitation of and listening to devotional religious poetry, is considered to be an educational activity helping a human being to reach his or her real origin—God. However, humans are not the only creatures traveling along this path. Although only humans possess reason (*'aql*), the faculty that puts them closer to God than all other beings, humans and nonhumans alike strive to get closer

to their creator. However, if the lower soul (*nafs*) overwhelms a human being, he or she loses the privilege of possessing the faculty of *'aql*, or intellect, and his or her soul regresses to a lower, nonhuman state. The Pamiris have preserved pre-Islamic traditions, with a complicated system of cosmology linked to the Indo-European substratum, commonly occurring in other Iranian cultures as well.

Community Organization

The Pamiri Ismailis believe that Ismailism is the most progressive and tolerant creed in the world because it is constantly adapting itself to the needs and requirements of the time through the mediation of the current imam, who guides his followers according to the prevailing circumstances.

In daily life, community religious authorities, or *pirs* (elders, masters), and their *khalifabs* (deputies) act as agents of the imam: they give believers guidance in matters of religion and accompany people in the events of life, especially during the rites of passage. They also give general moral guidance and counsel and are sometimes believed to have healing power. In their functions, they make use of the Qur'an and the *Vajb-i din*. Every Ismaili seeks to learn from a *pir*, or, if he is inaccessible, from his deputy. Usually this relationship is passed on to succeeding generations wherever they may live.

Since the mid-1950s, due to the pressure of the Soviet authorities in the Tajik Pamirs, *khalifabs* were elected by the people of a big village or a number of small neighboring villages. Before that, the position of *khalifab* tended to be hereditary. The *pirs* were always hereditary, but from the 1890s, the period that contacts between the community and the Aga Khan were reestablished, the *pirs'* succession had to be confirmed by the Aga Khan. The *pirs* left the Tajik Pamirs for Afghanistan in the 1930s for political reasons and due to the hostile climate of Soviet antireligious politics, and then the *khalifabs* became the main spiritual authorities in the area. In Afghanistan, the traditional hierarchy and system of *pirs* and *khalifabs* are still in place.

ISMAILI SECTS—SOUTH ASIA An important Shi'ite Muslim community, the Ismailis arose in 765 from a disagreement over the successor to the sixth imam, Ja'far al. The Ismailis chose Isma'il and then traced the imamate through Isma'il's son Muhammad and the latter's progeny. The bulk of other Shi'ites, however, eventually recognized twelve imams, descendants of Isma'il's brother Musa al-Kazim. The two main Ismaili branches are the Musta'lis (Bohras) and the Nizaris (Khojas), both in India. The Nizaris, led by the Aga Khan, also have populations in Pakistan, Iran, Central Asia, East Africa, Europe, and North America.

By the middle of the ninth century the religiopolitical message of the Ismaili *da'wa* (mission) aiming to win recognition for the Ismaili imam as the rightful interpreter of the Islamic revelation was disseminated in many regions by a network of *da'is* (missionaries). The earliest Ismaili missionaries arrived in Sind (in today's Pakistan) in 883, initiating Ismaili activities in South Asia.

By 909 the Ismailis had succeeded in installing their imam in the new Fatimid caliphate, in rivalry with the Abbasid caliphate (750–1258) established by Sunni Muslims. Around 958 an Ismaili principality was established in Sind, with its seat at Multan, where large numbers of Hindus converted to Ismailism. Ismaili rule ended in Sind in 1005, but Ismailism survived in Sind and received the protection of the ruling Sumra dynasty. The Sulayhids of Yemen, who acknowledged the suzerainty of the Ismaili Fatimid caliph-imams, played a crucial role in the renewed efforts of the Fatimids to spread the Ismaili cause in South Asia. In 1067 missionaries sent from Yemen founded a new Ismaili community in Gujarat in western India. The mission maintained close ties with Yemen, and this new Ismaili community evolved into the present Bohra community.

In 1094 the Ismaili community became divided over who would become the nineteenth imam; the two branches resulted from this division, each of which developed its own religious and literary traditions.

Musta'li Ismailis (Bohras)

The Musta'li Ismailis founded their stronghold in Yemen, where in the absence of the imams the *da'is* acted as executive heads of the *da'wa* organization and as community spiritual leaders. They were designated as *da'i mutlaq* (*da'i* with absolute authority).

The Musta'li *da'wa* in South Asia remained under the strict supervision of the *da'i* and the *da'wa* headquarters in Yemen until the second half of the sixteenth century. In South Asia the Musta'li Ismaili *da'wa* orig-

inally spread among the urban artisans and traders of Gujarat; the Hindu converts became known as Bohras.

Many were converted in Cambay, Patan, Sidhpur, and later in Ahmadabad, where the Indian headquarters of the Musta'li *da'wa* were established. Early in the sixteenth century the headship of the Musta'li Ismailis passed to an Indian from Sidhpur, and later the headquarters of this Ismaili community were transferred permanently from Yemen to Ahmadabad, where the *da'is* could generally count on the religious tolerance of the Mughal emperors. By then the Ismaili Bohras of South Asia greatly outnumbered their co-religionists in Yemen.

In 1589 a succession dispute over the position of the *da'i mutlaq* split the Musta'li Ismailis into the rival Daudi and Sulaymani branches, each of which followed a separate line of *da'is*. Subsequently the Daudi Bohras were further subdivided in India as a result of periodic challenges to the authority of their *da'i mutlaq*. In 1624 a third Bohra splinter group appeared under the name of Aliyya, a small community of 8,000 still centered in Baroda. In 1785 the headquarters of the *da'wa* organization of the Daudi Bohras were transferred to Surat, still a center of traditional Islamic and Ismaili learning for the Daudi Bohras.

The Bohras, like other Shi'ite Muslims, were periodically persecuted in South Asia, and many converted to Sunni Islam, the religion of the Muslim rulers of Gujarat and elsewhere. However, with the consolidation of British rule in India in the early nineteenth century, South Asian Ismailis were no longer subjected to official persecution. The total Daudi Bohra population of the world is currently estimated at around 700,000 persons, more than half of whom live in Gujarat. Since the 1920s Bombay has served as the permanent seat of the *da'i mutlaq* of the Daudi Bohras and the central administration of his *da'wa* organization.

The Sulaymani Ismailis, numbering around 60,000, are concentrated in northern Yemen, with only a few thousand Sulaymani Bohras living in South Asia, mainly in Mumbai (Bombay).

Nizari Ismailis (Khojas)

In the late eleventh century, the Nizari Ismailis founded and organized a state with a network of mountain strongholds in Iran and Syria, which the Mongols destroyed in 1256. In the thirteenth century or a little earlier, the Nizari Ismaili *da'wa* was introduced into the Indian subcontinent. The earliest Nizari *da'is* operating in South Asia apparently concentrated their efforts in Sind (modern-day Punjab in Pakistan), where Ismailism had persisted clandestinely

since Fatimid times. Nizari *da'is* were referred to as *pirs* in South Asia. Pir Shams al-Din is the earliest figure associated with the commencement of Nizari Ismaili activities in Sind. The Nizari *da'wa* continued to be preached secretly in Sind by descendants of Shams. By the time of Pir Sadr al-Din, a great-grandson of Pir Shams, Nizari missionaries had established their own hereditary dynasty of *pirs* in South Asia with sporadic contacts with the Nizari imams who continued to reside in Iran.

Pir Sadr al-Din consolidated and organized Nizari activities in South Asia and strengthened the Nizari Ismaili, or Khoja, community in the Indian subcontinent. His shrine is located near Ucch, south of Multan. Sadr al-Din converted many Hindus from the Lohana trading caste and gave them the title of Khoja. The specific Nizari Ismaili tradition that developed in India is sometimes referred to by the vernacular translation of the Qur'anic term *sirat al-mustaqim*, rendered as Satpanth (*sat panth*) or the "true way."

Pir Sadr al-Din was succeeded by his son Hasan Kabir al-Din, who eventually settled in Ucch, which served as the seat of Nizari Ismailism in South Asia. Pir Hasan was reportedly affiliated with the Suhrawardi Sufi order, at the time prevalent in western and northern India. Multan and Ucch in Sind, where Ismailism had become established, were also the headquarters of the Suhrawardi and Qadiri Sufi orders. In the next two or three centuries Ismailism, in its Nizari form, reemerged in the subcontinent, in forms and ideas having much in common with Sufism. The nature of this relationship is not clear, but recent research suggests that the Ismailis along with the Sufis spearheaded the spread of Islam in rural areas of India. The Ismaili heritage and contribution to Islam in South Asia are best reflected in their literary traditions, preserved and developed over centuries and aptly called *ginnan*, from the Sanskrit *jnan*, meaning reflective or contemplative knowledge.

After the death of Pir Hasan Kabir al-Din a section of the community seceded and established itself in Gujarat, becoming known as Imam Shahis. The majority continued to adhere to the authority of the Nizari imams.

Ginans and Their Historical Context With scholars' growing realization that oral and so-called popular expressions of Muslim devotion and spirituality constitute a vital component of Islamic life and practice, there is increasing interest in the texts that preserve, in local languages, the devotional spirit of Muslim mysticism in the Indian subcontinent. In the South Asian context such texts represent part of the

processes of conversion, negotiation, and transmission of established traditions of Muslim spirituality and ideas. The *ginnans* emerged in a milieu where both oral and written traditions were well established. Because of their primary role in ritual and religious life, the performative and recitative elements of such devotional expressions were much more pronounced than was the case, for instance, for Sufi poetry.

Among the Nizari Ismailis *ginnan* has come to refer to that part of their tradition whose authorship is attributed to the *pirs* who undertook conversion and preaching. It is important to distinguish the various strands making up the hagiography of the *pirs* and to isolate the elements that reflect traces of ancient tradition and form the nucleus of later narratives. These are rarely concerned with imparting objective records of the past; the true value of the *ginnan* narratives lies in their dual perspective on the tradition: one level mirroring the impact and continuing influence of the earlier *pirs* on the community's collective memory, and the other revealing the community's beliefs and understanding at various stages in its history.

Modern Period The forty-sixth Nizari Ismaili Imam Hasan Ali Shah (1817–1881), who received the honorific title of Aga Khan ("lord") from the monarch of Iran, Fath Ali Shah Qajar, emigrated from Iran to India in the 1840s and eventually settled in Bombay; he was the first Nizari Ismaili imam to live in India. Aga Khan I established elaborate headquarters and residences in Bombay, Poona, and Bangalore. As the spiritual head of a Muslim community, like other communities in British India, Aga Khan I was accorded recognition of his role in the legal framework of the empire. Aga Khan I tried to strengthen the religious identity of his followers. His successors to the Nizari Ismaili imamate adopted modernization policies and introduced new administrative and institutional frameworks for guiding the affairs of their Khoja and other Nizari followers. Sultan Muhammad Shah, Aga Khan III, the forty-eighth imam, led the Nizari Ismailis for seventy-two years (1885–1957), longer than any of his predecessors. He became well known as a Muslim reformer and statesman owing to his prominent role in Indo-Muslim and international affairs, as well as a wealthy sportsman and breeder of racehorses.

The Nizari Khojas, along with Bohras, were among the earliest Asian communities to settle in East Africa. Many from the Nizari Khoja communities of East Africa, India, and Pakistan have emigrated to Europe and North America since the 1970s. The Khojas today represent an integral part of the Nizari communities scattered in more than twenty-five countries.

They currently recognize Prince Karim Aga Khan IV as their forty-ninth imam. The present Nizari imam continued and substantially expanded the modernization policies of his grandfather and predecessor and developed new programs and institutions, including the prestigious Aga Khan award for architecture. Under the leadership of their recent imams, the South Asian and other Nizari Ismailis, numbering several millions, have entered the twenty-first century as a prosperous and progressive community with a distinct identity and a variety of regional traditions.

ISTANBUL (2002 pop. 10.3 million). Istanbul (called Byzantium until 330 CE and Constantinople until 1930), is an ancient city in northwest Turkey that straddles Europe and Asia. Istanbul lies on both sides of the Bosphorus, a narrow, thirty-two-kilometer-long strait that separates the European and Asian parts of the city, so that the northern city is in Europe and the southern in Asia. The city was the capital of the Byzantine and Ottoman empires and also of the Turkish Republic until 1923, when the capital was moved to Ankara. Tourists, temporary workers, and transit passengers may increase the city's population to close to 12 million. Divided into twelve districts (*kazas*), Istanbul covers 240 square kilometers, three-quarters of it in Europe.

History

Istanbul is largely a product of the millennia-long interaction between Eastern Europe and Asia and thus represents a unique mixture of Eastern European and Oriental cultures. Founded by Greeks around 660 BCE, the ancient city became a strategically important seaport due to its position on the Bosphorus, which connects the Black Sea and the Sea of Marmara. Emperor Constantine the Great (d. 337) selected it as the capital of the Byzantine empire in 324 and renamed it Konstantinou polis (Constantine's city) in 330.

Constantinople became the largest and most prosperous city in Europe, benefiting from its strategic location and a vibrant trade. However, the city's wealth and situation made it an attractive prize, and through the centuries it was often attacked. For instance, in 1204, during the Fourth Crusade (1202–1204), the Crusaders captured and sacked the city, causing enormous damage. The Byzantines retook it in 1251, and for many centuries, Constantinople was the spiritual and political center of the Eastern Orthodox Church and the Byzantine empire. At first, the city was situated entirely on the European side and was encircled by a wall. This ancient part of the city was home to numerous Orthodox churches, palaces, and public buildings, with some Byzantine monuments, such as the magnificent church of Hagia Sophia (Saint Sophia or Holy Wisdom, today a museum) surviving today.

In 1453 the Turks under the Ottoman sultan Mehmed II (1432–1481) captured Constantinople, and soon afterward the city became the Ottoman capital. One symbol of the city, Hagia Sophia, built by the emperor Justinian (483–565) in 532–562, was converted into a mosque in the fifteenth century. The Turkish sultans nevertheless patronized ethnic and

ISTANBUL—WORLD HERITAGE SITE

Historical areas of Istanbul were designated as UNESCO World Heritage Sites in 1985 for their immense historical value, beauty, and the threat posed by increasing environmental and population pressures on the onion-domed Hagia Sophia, Hippodrome of Constantinople, and other masterpieces.

Galata Bridge and Galata Tower at the Golden Horn in northern Istanbul, in 1996. (STEPHEN G. DONALDSON PHOTOGRAPHY)

religious minorities and ordered the preservation of the city's major Byzantine churches and the retention of the Orthodox patriarchate. When in 1509 a devastating earthquake damaged many parts of the city, the Ottomans had the city rebuilt, adding numerous public buildings, including magnificent mosques, palaces, public baths, and gardens. As the capital of the Ottoman empire, Constantinople became the cultural center of the Middle East and for the next four centuries influenced the cultural, political, and economic development of the region.

Constantinople experienced a new wave of significant changes during the nineteenth and early twentieth centuries with the *Tanzimat* (Reorganization), the Ottomans' attempt to catch up with the West and to modernize the country. Textiles, weapons, shipbuilding, and other industries proliferated in the city, and Constantinople was significantly enlarged to take in new areas south of the Bosphorus. In 1838 the first bridge was built across the Golden Horn, an inlet of the Bosphorus, which forms Istanbul's harbor. In June 1883, a railroad, the renowned *Orient Express*, first connected Constantinople with Paris via Vienna.

During the Crimean War (1853–1856), in which Turkey was allied with France and Britain against Russia, French and British troops had been quartered in Constantinople. Yet close relations with the major great European powers did not last, and attempts to reform the country's political and economic systems

met major resistance among conservative elements in Turkish society. In the early twentieth century, Turkey shifted its alliances and established close relations with Germany. The First World War left the Ottoman empire significantly weakened and unable to cope with separatist movements in its numerous provinces, combined with pressure from the European great powers, and Turkey collapsed.

At war's end in 1918, Britain, France, and Italy occupied the city until 1923, but then evacuated under pressure from the Turkish liberation movement led by Kemal Atatürk (1881–1938). In 1923, the Turkish republican government established Ankara as the capital of the secular Turkish Republic, but Constantinople (renamed Istanbul in 1930) has remained a major industrial, financial, and cultural city of the republic and by the end of the twentieth century was the largest city in Europe.

Economy and People

Istanbul is one of the most important commercial centers in Turkey and southeast Europe. Its deepwater seaport and international airport enable it to serve as a transportation and communication hub for all the Black Sea countries, including the Russian Federation and Ukraine. The city's manufacturing sector involves petrochemicals, cement, machinery, food and tobacco processing, textiles, garments, and various other goods. Tourism is another important sector of Istanbul.

bul's economy, providing not only direct employment for more than 100,000 people, but also hard-currency earnings for the city and country. The number of tourists visiting Turkey rose steadily throughout the 1980s and 1990s, reaching 10 million in 2000 (official estimate), though the number of arrivals sharply declined in 2001. Most tourists to Turkey chose Istanbul as an entry point or destination of choice.

During the second half of the twentieth century, Istanbul became the fastest-growing city in Europe; its population almost doubled from approximately 2.3 million in the 1950s to 5.5 million in 1985 and in 2000 (official estimate) doubled to 10.1 million, approximately 15 percent of Turkey's total population. Only about half of the people who live in modern Istanbul were born in the city; the rest moved there from other parts of Turkey in search of jobs and better living standards. Due to the rapid population growth, many shantytowns called *gecekondu* ("set down by night") appeared on the city's outskirts. In the 1990s, Istanbul became an important transit hub for immigrants from the Middle East, South Asia, and Northern Africa on their way to Europe. The majority of the population are Turks, although there is a sizable minority that includes Greeks, Jews, Armenians, and Albanians.

ITO NOE (1895–1923), Japanese writer and feminist. Ito Noe achieved notoriety as a freethinker whose autobiographical writing, political associations, and unconventional love relationships epitomized the "new woman" of modern Japan. Noe initially earned attention for her contributions to *Seito* (Bluestock-

ings), a controversial feminist literary journal published from 1911 to 1916 by a small group of young Tokyo women also known as the Bluestockings. Noe joined the Bluestockings in 1912 when, as a teenager, she illegally fled from an arranged marriage in her Kyushu hometown to live with her former high school English teacher, Tsuji Jun, in Tokyo. The stories that Noe wrote about her arranged marriage and about the later failure of her love marriage to Tsuji Jun are some of her most significant contributions to *Seito*. Noe argued for women to have a choice about when to enter and when to leave a marriage. She also wrote essays championing the new woman, translated the works of Emma Goldman, and debated other Bluestockings over issues such as prostitution and charity work. She took the editorial helm of *Seito* in its last thirteen months of publication.

In 1916, Noe left Tsuji and their two children for the anarchist Osugi Sakae, winning him away from his wife and another lover. Noe bore five children with Osugi while working with him in labor organizing, writing, journal editing, and public speaking.

With Yamakawa Kikue, Noe participated in the socialist women's group Sekirankai (Red Wave Society). Both Noe and Osugi were murdered in the wave of police brutality following the great earthquake that devastated Tokyo in 1923. *The Collected Works of Ito Noe* was published in two volumes in Japanese in 1970, when the women's liberation movement renewed interest in Japanese feminist history.

IWASHIMIZU HACHIMAN SHRINE One of the oldest and most important Shinto shrines in Japan Iwashimizu Hachiman Shrine is located southwest of Kyoto on Mount Otokoyama. It is one of the main shrines dedicated to Hachiman, popularly viewed as the *kami* (deity) of war and learning. The shrine's main festival (and that of its numerous branch shrines throughout Japan) is on the fifteenth day of the ninth month.

The shrine was established about 859 CE by a Buddhist priest, Gyoko, and its buildings have been rebuilt several times. The current design is from 1634, when the shrine was patronized by the third shogun of the Tokugawa period (1600/1603–1868). One of

the early patrons of the shrine was Minamoto no Yoshiie (Hachiman Taro), and the shrine was a favorite of Minamoto and Ashikaga shoguns because of its association with warrior values, as well as with their clan ancestors. The shrine was patronized by the imperial house, and homage is paid there annually, in the presence of an imperial envoy, for the defeat of Taira no Masakado and Fujiwara no Sumitomo, both accused, at different times, of plotting to usurp the throne. The shrine's original association with Buddhism was severed during the campaign to expel the buddhas in the early years of the Meiji Restoration (1868–1912).

IWATE (2002 est. pop. 1.4 million). Iwate Prefecture is situated in the northern region of Japan's island of Honshu. Once on the untamed frontier, in the early 2000s it remains a bastion of early culture. With a population of 1,418,000 residents, Iwate occupies an area of 15,278 square kilometers. Its main geographical features are the Ou and Kitakami Mountains, which enclose the river Kitakamigawa plateau. Iwate is bordered by the Pacific Ocean and by Aomori, Akita, and Miyagi Prefectures. Once known as Mutsu Province, it assumed its present name and borders in 1876.

The prefecture's capital is Morioka. Although a bustling commercial city and home to Iwate University, it retains much of the flavor of its origins as the Edo period (1600/1603–1868) castle town of the Nambu family, famous for breeding fine horses. Its attractions include the old merchant quarter, the Hachiman shrine to the god of war, and the ruins of Morioka Castle. The prefecture's other important cities are Mikayo, Hanamaki, and Ichinoseki.

Iwate has a long history. In ancient times, it was home to the aboriginal Ezo people. In the Heian period (794–1185), the Fujiwara family assumed control of the province and established a capital at Hiraizumi, which became the military, political, and cultural center of all northern Japan. The Fujiwara became wealthy from the gold found in the area and they built splendid temples and palaces. In the late Muromachi period (1333–1573), control of the province passed to the Nambu family in the north and the Date family in the south. The Tokugawa shogunate (1600/1603–

1868) oversaw the division of the area into some twenty domains.

Iwate's main agricultural activity is rice farming and livestock raising, along with lumber production and fishing. Mining makes the prefecture a leading source of iron and copper ore. A major tourist destination is Hiraizumi, today a small country town compared to its past days of splendor. Still standing are the temple known as Golden Hall (Konjikido), the first National Treasure to be so designated, and the Heian-style gardens and ruins of the Motsuji, once a complex of forty temples. Iwate's traditional crafts include the wooden folk toys known as Kokeshi dolls and Nambu cast iron made into bells, statues, and heavy kettles. The region's traditional dances include the deer dance (*shishi odori*) and sword dance (*kembai*).

IZMIR (1997 pop. 2.0 million). Izmir (Smyrna), the third-largest city of Turkey and an important commercial center, is located on the Aegean coast of Anatolia, in the gulf of Izmir. Reputedly the birthplace of Homer, Izmir was an important city during the Classical Greek and Roman periods and was a provincial capital under the Byzantine empire. In 1081, it was conquered by the Seljuks, a Turkic empire that had invaded Anatolia a decade earlier. It was retaken by the Byzantines in 1097, but was lost to another principality, Aydinogullari, in 1344. The Ottomans took control of Izmir, along with the rest of Aydin territories, in 1390 under Sultan Beyazit I (reigned 1389–1402). After Beyazit's defeat by Timur (Tamerlane) at the Battle of Ankara in 1402, the Aydinogullari were able to briefly retake control, though they submitted sovereignty to the Ottomans once again in 1415.

Izmir maintained its importance throughout the Ottoman period, serving as a naval base, and has remained an important center for international trade. The city was noted for its cosmopolitanism. Its population was distinguished by ethnic and religious variety including Turkish-speaking Muslims, Ladino-speaking Jews, and Greek-speaking Orthodox Christians. In the nineteenth century Izmir was arguably the wealthiest city in the Ottoman empire. European capital promoted the development of advanced infrastructure, such as a modern port (1868), new industries, and gas streetlights (1864). Railways were built to connect

The city of Izmir, Turkey, on the Aegean Sea. (YANN ARTHUS-BERTRAND/CORBIS)

Izmir's port with its agricultural hinterland. In 1901 the German kaiser, Wilhelm II (reigned 1888–1918), donated a clock tower to the city, which today is its most famous landmark.

After the defeat of the Ottoman empire in World War I, Izmir became the center of an attempt by Greece to expand into western Anatolia. The Greek army landed in Izmir in May 1919, but this move precipitated a movement of Turkish nationalist resistance, which eventually forced the Greeks to withdraw from Izmir in 1922. As the Turkish army took control of Izmir, fires destroyed most of the city. Many non-Muslims fled with the Greek army, and the remaining Orthodox Christian population of the region was deported to Greece in the Greek-Turkish population exchanges agreed on in the treaty of Lausanne (1923).

Izmir has recovered from these traumas and is still an important trading and industrial city, with one of the highest standards of living in the country. It is home to several universities, an important archaeological museum, and NATO (North Atlantic Treaty Organization) installations.

IZNIK (2002 est. pop. 21,000). Iznik, a town in northwestern Turkey on the eastern shore of Iznik Lake, is surrounded by walls with four gates. Within the town are many historic baths, mausoleums, *madrasabs* or Muslim religious schools, mosques, minarets, and imarets or inns. Notable buildings include the fourteenth-century Green Mosque and the fourth-century Saint Sophia Cathedral.

The Macedonian Greek ruler Antigonus I (382–301 BCE), once a general of Alexander of Macedon (356–323 BCE), founded the town, which he named Antigoneia, in 316 BCE. Later renamed Nicaea, the town rose to prominence during the Byzantine empire, when influential Christian ecumenical councils met there. The First Nicene Council, held in 325, put forth the Nicene Creed as the description of the persons of the Trinity and condemned Arianism, a Christian heresy that disavowed Jesus' divinity. The Second Nicene Council, in 787, rescinded the ban on the veneration of images, which had been introduced during the iconoclastic controversies of 726 and 730.

In 1078 the Seljuk Turks conquered Nicaea. The Ottoman Turks captured the town in 1331 and gave it its present name of Iznik. From the late fifteenth to the early eighteenth centuries, Iznik was a famous production center for quartz-based tiles and clay pottery.

The colorful, abstract decoration of Iznik ware was painted in blue, turquoise and purple, and red, against a white ground. Iznik's ceramics industry was revived beginning in 1985. Some residents of Iznik grow olives, grapes, tomatoes, and peaches on nearby farmland, and fishers catch crayfish from Iznik Lake. The town has many hotels, restaurants, and cafes.

IZUMO SHRINE Izumo Taisha (also known as Izumo no Oyashiro, the Grand Shrine of Izumo), one of the oldest and most influential shrines in Japan, is located in Kizuki, Shimane Prefecture, once the feudal Izumo domain. It enshrines the deity Okuninushino-mikoto, known popularly as Daikoku-sama.

Izumo Shrine is built in the archaic *taisha-zukuri* ("great-shrine building") style of shrine architecture. The present buildings date from 1744, although a major fire in 1953 necessitated some rebuilding. The main building, surmounted by a great thatched, slightly concave roof rising eighty feet above the foundation, is the largest shrine in Japan. During the month of October, by the lunar calendar, all the Shinto deities of the country are believed to depart their local shrines and gather at Izumo Taisha. Various rites are observed to welcome, honor, and later send off these deities on their return to their local shrines. This period, known throughout Japan as *kaminazuki* ("month when the gods are absent") is known at Izumo as *kamiarizuki* ("month when the gods are present").

The Great Shrine of Izumo in Shimane Prefecture, Japan. (SAKAMOTO PHOTO RESEARCH/CORBIS)

The shrine is popular among young couples for bestowing felicitous marital relations and is also thought to protect agriculture and offer good fortune.

JADE Jade (Chinese *yù*), a dense, luminous stone of various colors including white, yellow, green, gray, mauve, and brown, has been an artistic medium from at least the fifth millennium BCE in China. The term "jade" is generally applied to two types of stones: nephrite, a crystalline calcium magnesium silicate from northeast China (Jiangsu Province) and Central Asia's Khotan and Yarkand regions, and jadeite, a green, glassy sodium aluminum silicate mineral of the pyroxene family from Myanmar (Burma). It is nephrite, however, that early Chinese artists utilized for ritual objects, personal items, and ornaments.

Prized for its innate beauty, jade came to be regarded as having moral virtues and magical properties and was believed to be the congealed semen of a celestial dragon. The Han dynasty scholar Xu Shen described jade as having five virtues: charity, epitomized by its bright warm luster; rectitude, as signified by its translucence; wisdom, as typified by its purity and penetrating sound when struck; courage, in that while it can be broken, it cannot be bent; and equity, represented by its sharp angles that injure none.

Special techniques for carving jade were devised because of jade's extreme hardness. Unlike other stones, which can be chiseled, jade must be fashioned through a laborious abrasion process utilizing drills and quartz sand. This labor-intensive process makes jade artifacts very costly. From earliest times, it seems that jade was the ultimate symbol of wealth and power. Thus, the finest workmanship and artistry were lavished on the precious stone.

The earliest artistic use of jade occurred in the Hongshan culture of the middle Huang (Yellow) River basin, Liaoning Province, dated to the fifth to fourth millen-

nia BCE. Examples of jade carvings in this period include coiled dragons, owls, turtles, and cloudlike plaques. Jades are so predominant among Hongshan artifacts that some specialists have referred to the period as the Jade Age. In tombs, jade objects were positioned on, around, and under the body of the deceased. Thus, jade was regarded as having more than social status; it had ritual and protective properties as well.

Ritual use of jade in burials continued in China through the Western Han dynasty (206 BCE–24 CE). Most notable are the full jade body suits from Lingshan, Mancheng, Hebei Province, belonging to Prince Liu Sheng and his wife Princess Dou Wan. The two royal figures were covered from head to foot in outfits made entirely of jade plaques drilled at the four corners and fastened with gold wire. It is believed that these functioned as shrouds, protecting the body from decay and from attack by evil forces.

A jade carver holds a piece of carved jade in Changchun, China. (RIC ERGENBRIGHT/CORBIS)

Jade implements were important in statecraft during the Shang and Zhou dynasties (1766–256 BCE) in that various pieces came to signify specific courtly ranks. Because jade was associated with the imperial court and with great virtue, it became likened to the Confucian ideal of the perfect gentleman (*junzi*).

From the Warring States period (475–221 BCE) on, jade was used more and more for secular items and personal adornment. By the Tang dynasty (618–907 CE), the secular use of jade was widespread. Jewelry, fine vessels, and utensils, as well as objets d'art having no particular religious connotation, were crafted from jade. Decorative and functional items such as bowls, cups, dishes, ewers, vases, containers, hair ornaments, beads, and bracelets received lavish, delicate ornamentation.

After centuries of Chinese jade working, the tradition spread westward through Central Asia into India and Turkey. There are fine Mughal pieces, known as Hindustan jades, many of which are embellished with intricate designs incorporating precious gems held in place with gold filigree.

JADIDISM The term "Jadidism" denotes a range of modernist movements that flourished among the Muslims of the Russian empire between 1880 and 1920. Beginning as a movement of religious reform, Jadidism quickly acquired broad cultural, social, and ultimately political dimensions. The movement's name came from its advocacy of the *usul-i jadid* ("the new method"), new phonetic approach to teaching the Arabic alphabet, an indication of the centrality of educational reform to Jadidism. Historians refer to the proponents of Jadidism as Jadids, although the Jadids did not usually use this term themselves.

The late nineteenth century saw the rise of modernist movements throughout the Muslim world. While they existed in markedly different political contexts, these movements shared a concern over their societies'

political and economic decline relative to Europe and a belief in the compatibility of Islam and modernity.

Jadidism originated in the intellectual ferment created in Tatar society by rapid economic change occurring in the mid-nineteenth century, including the emergence of a Tatar mercantile bourgeoisie with extensive trading networks in Russia, Siberia, and Central Asia. Religious scholars such as Abdunnasir al-Kursavi (1776–1812) and Shihabeddin al-Marjani (1818–1889) questioned the authority of traditional Islamic theology and argued for creative reinterpretation of Islam. But the efforts of the Crimean Tatar noble Ismail Bey Gaspirali (1851–1914) gave shape to Jadidism as a cultural movement. In 1883 Gaspirali received permission to publish the newspaper *Terjuman* (Interpreter) in his native Bakhchisaray. *Terjuman* became the standard bearer of Jadidism throughout the Russian empire and beyond, influencing cultural debates in the Ottoman empire as well. In 1884 Gaspirali opened the first "new method" elementary school, in which children were taught the Arabic alphabet using the new phonetic method of instruction. These schools quickly became the flagship of Jadid reform. The emphasis on enlightenment also gave rise to a boom in publishing among the Tatars, as Jadid authors wrote and translated (from Russian, French, Ottoman Turkish, and Arabic) thousands of books on various subjects.

At the turn of the twentieth century a Jadid movement emerged in Central Asia, where different social and political contexts imparted a distinct hue. The *ulama* (religious scholars) retained much greater influence in Central Asia, while the new mercantile class was much weaker. The market for publishing was also much smaller, and Central Asian Jadids were more strongly rooted in Islamic education. Nevertheless, they faced opposition from their own society as well as from a Russian state always suspicious of unofficial initiatives.

Jadidism's rhetoric of cultural reform was directed at Muslim society itself. The basic themes were enlightenment, progress, and "awakening" the nation to take its place in the modern, "civilized" world, which meant sovereign states possessing military and economic might. Given the lack of political sovereignty, however, it was up to society to lift itself up through education and disciplined effort. Jadid rhetoric was usually sharply critical of the present state of Muslim society, which the Jadids contrasted unfavorably to their own glorious past and the present of the "civilized" countries of Europe.

The single most important term in the Jadid lexicon was *taraqqi*, meaning progress. For the Jadids progress and civilization were accessible to all societies

solely through disciplined effort and enlightenment. Nothing in Islam prevented Muslims from joining the modern world; indeed, Islam enjoined disciplined effort and enlightenment on Muslims. Only a modern person equipped with knowledge "according to the needs of the age" could be a good Muslim.

The new method of teaching the alphabet marked a shift in the understanding of the purposes of literacy and, ultimately, of knowledge. Literacy for the Jadids was a functional skill with no sacral connotations. The Jadids claimed that the true meaning of Islam could be acquired through a critical reading of the scriptures without recourse to the tradition of interpretation represented by the *ulama*. This claim had radical repercussions for the authority of the *ulama*, and for Islam itself.

Jadidism would have been impossible without the advent of print. Print allowed the new intellectuals to assert their claims to interpretation to a broad audience and thus to undermine the monopoly of the *ulama* over cultural debate. At the same time, newspapers and translations into Turkic or Arabic of European works made available to the Jadids new ways of thinking about the world and their place in it, so that when they looked at their own society they did so with new eyes.

The object of Jadid reform was the *millat*, the Muslim community, which quickly acquired national and ethnic overtones and led to the rise of nationalism and political radicalism. While Gaspirali was revered as the father of Jadidism, by the time of his death younger Jadids had grown wary of his political caution and were attracted to more radical political stances. The Russian revolution of 1917 radicalized Jadidism even further, and many Jadids came to espouse both nationalist and socialist agendas as the most efficient path to enlightenment and progress.

Jadidism provides a good argument for questioning the dichotomy between Islam and modernity, since it represented both. It was rooted in a long Islamic tradition of reform, but it also shared a post-Enlightenment understanding of the world and used such aspects of modernity as the press and schooling. New economic and social forces produced alternative understandings of the world and consequently new national and religious identities.

JAFFNA (2002 est. population of the peninsula 480,000). Jaffna refers to the capital city, peninsula, adjacent islands, and hinterland of the northernmost region of Sri Lanka. It has been a major avenue of trade and migration between India and Sri Lanka since prehistoric times. After the collapse of the Anuradhapura kingdom and its conquest by the Chola dynasty, the area became a homogeneous Tamil-speaking Hindu region, and the city became the capital of a Tamil kingdom that periodically waged war with the Sinhalese kingdoms to the south. The area successively fell under Portuguese (1591), Dutch (1658), and British (1795) colonial rule. In the nineteenth century, it was integrated into the British Crown Colony of Ceylon. It remained part of the unified state when the colony gained its independence in 1948. Tamil claims of discrimination in favor of the majority Sinhalese Buddhists led to a separatist movement that erupted into a bloody civil war in 1983. The Liberation Tigers of Tamil Eelam (LTTE) emerged as the leaders of Tamil separatism through a violent contest with other separatists. The peninsula was occupied by the Indian army in 1987. When the Indian army withdrew in 1990, the LTTE established a harsh regime. The Sri Lankan army captured Jaffna in 1995. Despite government attempts to rehabilitate the region, fighting continued throughout 2001.

JAHANGIR (1569–1627), Mughal emperor. Sultan Salim, who ruled northern India under the name Nuruddin Muhammad and the title Jahangir, was born

PLEASING THE EMPEROR (MUGHAL EMPEROR JAHANGIR)

"Mr Edwardes presented the Kinge [the Mughal Emperor Jahangir] a mastife, and speakinge of the dog's courage, the Kinge cawsed a younge leoparde to be brought to make tryall, which the dogge soe pinchtt, thatt fewer howres after the leoparde dyed. Synce, the Kinge of Persia, with a presentt, sent heather haulfe a dozen dogges—the Kinges cawsed boares to be brought to fight with them, puttinge two or three dogges to a boare, yet none of them seased; and rememberinge his owne dogge, sentt for him, who presently fastened on the boare, so disgraced the Persian doggs, wherewith the Kinge was exceedingly pleased."

Source: Letter from Kerridge, East India Company President at Surat (1612), as quoted in *The Sabibs* (1948), edited by Hilton Brown. London: William Hodge & Co., 158–159.

in Sikri in 1569. His mother was a Rajput princess, and his father was the great Mughal emperor Akbar (1542–1605). As a prince, Salim had sought to lead a rebellion against his father, but the two were later reconciled, and it was only with Akbar's death that Salim became emperor under the title of Jahangir (world seizer). Jahangir was fortunate in inheriting an extensive, prosperous, and politically stable empire from his father. Unfortunately, Jahangir's court was saturated with intrigue and corruption, and he faced a powerful rival in his eldest son, Prince Khusru, who was eventually subdued. His favorite wife, Noor Jahan, was the power behind the throne and placed her family members in important court positions. Her father received a title; the daughter of her brother married Prince Khurram, the eventual heir; and her daughter from her first marriage became the wife of Jahangir's youngest son, Prince Shahryar.

Western influence in India was growing, and Jahangir had contact with the Portuguese and the fledgling British East India Company. James I's ambassador, Sir Thomas Roe, was received warmly at court and managed to secure major concessions (1615–1618). Hunting and drinking were Jahangir's passions, and his rule did not leave any military or administrative landmarks. However, Jahangir was ar-

guably the greatest of all Mughal connoisseurs of the arts and a lover of beauty—both natural and artistic. He took a keen interest in commissioning jewelry, calligraphy, and manuscript illustrations.

JAINISM Jainism, like Hinduism and Buddhism, is one of India's ancient, indigenous religions. The word "Jain" derives from the Sanskrit word *ji* meaning to conquer. The founder of Jainism was Vardhamana (c. 599–527 BCE), later known as Mahavira, who lived in Magadha (in present-day Bihar state). Mahavira, an

In Karhataka, India, a Jain priest stands before a figurine of Mahavira, the founder of Jainism. (CHARLES AND JOSETTE LENARS/CORBIS)

The Palitana Jain Temple in Gujarat, India, in 1987. (TIZIANA AND GIANNI BALDIZZONE/CORBIS)

unorthodox teacher, firmly opposed the prevailing religion of the day, the sacrificial Vedic religion, and the already dominant authority of the Brahman caste.

Origins and Development

Mahavira was a contemporary of Siddhartha Gautama Buddha (c. 566–486 BCE), and like the Buddha he was the son of the king of a politically powerful clan, was educated as a prince, married, and fathered a child. Despite his royal upbringing, at the age of thirty he left his home to pursue a life of asceticism in search of spiritual salvation. First he joined the Nirgranthas ("Free from Bonds") ascetic sect founded by the teacher Parshavanatha, who lived during the ninth century BCE. The Nirgranthas were later absorbed into the order Mahavira founded. Parshavanatha is remembered as the twenty-third tirthankara ("ford maker"), or enlightened teacher, and Mahavira is the twenty-fourth in this long line of realized masters who attained enlightenment (*kevalajnana*). No doubt Jain beliefs and practices originated in remote antiquity, and the Jain connection to the Nirgranthas establishes the religion as far older than Buddhism. Jain mythology has it that the first tirthankara was Rshabhanatha, whose mother Marudevi attained *kevalajnana* upon seeing her son. According to Jain beliefs, she was the first human of this world to attain liberation.

During his long search for enlightenment Mahavira realized the necessity of renouncing all attachments and possessions, including even the one garment he

wore. As a religious reformer he was critical of the Vedas and the Brahmans, seeing no relevance in the priestly class and their rites of sacrifice, particularly in the matter of freedom from the endless cycles of reincarnation and the attainment of transcendent knowledge. His teachings denied both a powerful god creator and a superhuman origin of the universe. He asserted that there was no creation per se; instead there was an unceasing evolution involving endless transmigration of souls. Upon achieving enlightenment, Mahavira spent his remaining life wandering unclothed and begging for food. According to tradition, he taught for thirty years with the patronization of kings and finally died of self-imposed starvation at the age of seventy-two.
