Notwithstanding many disadvantages and hardships associated with the Soviet imposition of power—civil war and emigration, unfair national delimitation (which created a republic whose population was less than 60 percent Tajik), Stalin's purges of the 1930s, the Soviet struggle against religion, forcible resettlement of various ethnic groups in the 1950s and later, experiments with the Tajik language—there were also great achievements in education, health care, culture, and arts. During this time, examples of unique national literature, media, and historiography were formed and preserved. A basis for the national economy was established, collectivization of primitive private farming was carried out, and relatively stable transport links between the different regions of Tajikistan and with the neighboring Soviet republics were constructed. Authority at the nation level was developed that covered the whole territory of the Tajik SSR. A modern literary language was developed, common to this day for all Tajiks. The capital city, Dushanbe, emerged as a shared administrative and cultural center. The Tajiks, cut off from their southern Muslim neighbors, communicated mostly with other peoples of the Soviet Union and with Slavs. All these factors shaped the outlines of Tajik national identity and of their state.

Soviet rule was also destructive, however. Most important was the obvious disharmony in terms of distribution of power and resources between regions, enhanced by the inequality of regional economies. In addition, Tajikistan was the poorest republic with the lowest per capita gross domestic product.

Postindependence

Tajikistan, following the examples of the other republics of the Soviet Union, adopted a declaration of state independence in September 1991. In 1990–1992, this political awakening took the form of a struggle of the Islamic opposition allied with the newborn secular nationalistic and democratic movements versus the old Soviet elites who had remained in power. This conflict was gradually overtaken by the region-based group discord that soon led to civil war.

The opposition's initial aim was to take power from the pro-Communist, northern, Leninabad (current Sogd) province that had been the center of the dominant political elite during Soviet times. Fighting broke out intermittently in Dushanbe and in central and southern Tajikistan in 1992. Paradoxically, the regions opposing the north finally achieved their aim through bloody struggle among themselves. The Kulabis (south), initially clients of the north, were supported by the Hisoris (center), and proclaiming slogans of struggle against "Islamic fundamentalism," entered into conflict with their closest neighbors, the Gharmis and Qarateginis (both center) and the Pamiris (east). In fall 1992, the Kulabis and Hisoris received the help of external powers, mostly countries of the former Soviet Union, and reestablished central control of the country. The November 1992 session of the Tajikistan parliament appointed a Kulabi, Imamali Rakhmonov, as chairman, thus putting the end to the Leninabadis' domination. Nevertheless, in south and central Tajikistan, the struggle lasted into 1993 and later, causing a massive flow of refugees into neighboring Afghanistan. During this brutal civil war of 1992–1993, as many as 50,000 people lost their lives, and more than 650,000 people—one-tenth of the population—fled in terror. More than 35,000 homes were destroyed, and the costs of damage and destruction reached \$7 billion, one of the bloodiest and costliest wars in the former Soviet Union.

United Nations-sponsored peace talks led to the General Agreement on the Establishment of Peace and National Accord in June 1997, followed by the incorporation of the United Tajik Opposition into the government. Nevertheless, today's Tajikistan remains a country with an ailing political regime, a weak national identity, and a fragile economy. Although open warfare has ended, the Tajiki national solidarity is still undermined by subnational contests between rival, regionally based entrepreneurs for political and military dominance. Quasi-military groups formally incorporated into the national army are beyond civilian control. In spite the efforts of Russian border guards, the Tajik-Afghan border is unreliable, and there is

constant narcotic trafficking. In 2002, because of its strategic importance as a neighbor of Afghanistan, Tajikistan drew more attention from the United States, which sought and to some extent gained its cooperation in the military against the Taliban in Afghanistan.

TAJIKISTAN—POLITICAL SYSTEM The emergence of the Republic of Tajikistan after the dissolution of the Soviet Union in 1991 is one of the most painful state-building attempts in modern Central Asian history. During the last years of the twentieth century and into the twenty-first century, this country has experienced civil war, the subsequent return of opposition and Islamic fighters, and a redistribution of power as a consequence of the conflict. Born in crisis and chaos, the current political system is a product of deep-seated traditional political loyalties, Soviet-style norms and practices, and recent rationalization of the old system.

Traditional Institutions of Power

The basic unit of traditionally sedentary Tajik society and the dominant institution of power was the *avlod*—a patriarchal extended family that sometimes took the form of a patrilineal clan. The *avlod* was loyal to regional groupings and, ultimately, to the local ruler. For generations this system gave its members survival, autonomy, and adaptability, serving tradition and sustaining society, despite the fact that *avlod* loyalties sometimes challenged a monarch's power and authority. Representative government and the concept of popular sovereignty were only weakly rooted in Tajik political culture. In the Soviet era (1918–1991) the *avlod* system was considerably eroded, yet it persisted as a parallel system of power in the quasi-national government. This community-oriented identity

and clan network determined political loyalty during the civil war in 1992–1993 and after.

System of Power in Transition

Tajikistan, following the example of other Soviet republics, in September 1991 declared independence and proclaimed a presidential system of government. The presidential election of November 1991 led to a struggle of an opposition coalition of Islamic groups and newborn secular democratic movements against old Soviet elites. The struggle turned into open armed confrontation in 1992, with the antagonism to communism that had united the opposition coalition gradually eclipsed by discord among regional groups. In November 1992 a government led by Emomali Rakhmonov gained control of the state with the backing of Russia and Uzbekistan. In November 1994 Rakhmonov (by this time a chairperson of the parliament) was elected president of Tajikistan.

The current constitution of the Republic of Tajikistan was adopted on 6 November 1994 after a nationwide referendum. It replaced the Soviet constitution that had been in effect since 1978 and that had been amended after independence. According to the constitution, Tajikistan is an independent, democratic, unified, and secular state with separate executive, legislative, and judicial powers. The supreme legislative body, a parliament, is the Majlisi Oli (Supreme Council). Amendments to the constitution, adopted in a general referendum on 26 September 1999, authorized direct presidential elections for one seven-year term (instead of a maximum of two five-year terms). In the November 1999 presidential elections, Emomali Rakhmonov won 96.91 percent of the votes, while his opponent, Davlat Usmon (representing the Islamic Revival Party), received only 2.1 percent. The amendments also replaced the national unicameral parliament with a bicameral one. In March 2000, the Majlisi Oli consisted of two chambers: the Majlisi Namoyandagon (Assembly of Representatives, or lower chamber) and Majlisi Melli (National Assembly, which acts as the upper chamber, or senate). The Majlisi Namoyandagon has sixty-three members directly elected on a half-mixed basis (65 percent as single-member district candidates and 35 percent according to party lists) for a five-year term. Members of the upper house—the Majlisi Melli—are indirectly elected for a five-year term; thirty-three members are elected by local *majlises* (legislative bodies), and the remaining eight deputies of the Majlisi Melli are appointed by the president. The new election laws simultaneously guarantee pluralism and proportional representation. The lawmakers' aim was to undermine traditional patron-client networks and to

provide for a presidential system balanced by a strong legislature. However the autonomy of the legislature vis-à-vis executive power is challenged by a growing presidential authority. According to the constitution the prime minister's post is nominal, because the president is the head of both state and government. As high administrator the president has exclusive authority to appoint heads (chairpersons) of *veloyats* (provinces), *nobiyas* (regions), and cities, thus providing a strong vertical chain for the exercise of executive power. The president controls religious affairs as well, because heads of regions appoint local religious administrators. Through the Council of Justice, the president enjoys exclusive power to nominate judges and control the courts. Finally, as leader of the most powerful of the regional groupings in the country, the Kulabis, the president enjoys considerable support from the regional elite and Kulabi-dominated military forces.

Multiparty Developments

In the 1990s eleven parties (in addition to the previously existing Communist Party of Tajikistan, or CPT) were formed in the country, but by 1999 only six remained. The biggest of the current Tajik political parties is the People's Democratic Party of Tajikistan (PDPT).

The PDPT was formed in December 1994, one year after the current government came to power. In March 1998 President Rakhmonov joined the PDPT and assumed its leadership. Second place is occupied by the Communist Party of Tajikistan (formed in December 1924). The Communists inherited a relatively well-developed administrative infrastructure throughout the country, as well as considerable assets, and they enjoy the support of that part of the Tajik citizenry that longs for the restoration of the USSR. From another perspective, the CPT, lacking the protection of outside patrons and the effective support of regional elites and armed forces, has all but lost mass-elite linkages and therefore any real influence on politics.

The opposition forces are represented by the Islamic Renaissance Party of Tajikistan (IRPT) and the Democratic Party of Tajikistan. These parties formed the Demo-Islamic bloc in 1990 to operate within the legal-framework of a secular legal and political system. The failure of this anticommunist initiative, leading to open warfare in 1992 and the cessation of the activity of these parties in June 1993, did not prevent the formation of another alliance of the same elements, the United Tajik Opposition (UTO), on the eve of the inter-Tajik peace talks in 1994. In 1994–1999 the UTO took part in these peace talks, which culminated in

June 1997 in the signing of the General Agreement on the Establishment of Peace and National Accord.

After some debates and United Nations involvement, in November 1998 the Majlisi Oli legalized the IRPT. Thus Tajikistan is so far the only state of Central Asia where an Islamic movement, after a long period of confrontation with the government, has been permitted to participate in the political process.

All Tajik political parties generally lack institutionalized ties connecting voters, leaders, candidates, and activists. They have an elitist character, lack a mass base, and have an amorphous infrastructure. Both pro-government and opposition parties poorly articulate issue-based programs in their agendas.

Future Problems

Tajikistan's political structure has proved politically unstable in the long term. The facade of the Western-patterned legal system in Tajikistan hides a remarkable blend of secular and traditional features that can only poorly connect civil and political society or promote the interests of individuals and different solidarity groups. Quasi-democratic rule is being built on a highly fragmented society in which protection of civil liberties is promised but not practiced.

This situation has led to increasing violence and corruption in both society and government. The instability of the political system has been worsened by a severe economic crisis that has discredited the present regime. The noninclusive character of the government and the absence of free competition for leadership positions, with a resultant disproportionate distribution of power among regions, enable *avlod* loyalties to continue to hamper nation-building efforts. The position of the central government is uncertain, and its authority is disregarded in many areas. As a result, sectarian militias and foreign governments exert great influence.

The current political system of Tajikistan prevents effective political mobilization and impedes the development of a coherent party system, opening the way to the consolidation of strong authoritarian rule, but there are some grounds for positive developments in the future. During the 1990s the Tajiks gained a far richer experience in political struggle than did other Central Asian nations. It is to be hoped that this political education will yield promising strategies for the future and will indicate a way to escape from the present impasse and conflicts.

TAJIKISTAN CIVIL WAR A civil war erupted in Tajikistan in May 1992 and lasted until December 1997, when the winning faction, called the Kulabis, succeeded, after bloody clashes, in expelling the bulk of the opposition forces, known as Gharmis, along with tens of thousands of civilians, who took refuge in Afghanistan.

When the Soviet Union collapsed at the end of August 1991, Tajikistan was the only former Soviet Muslim republic in which the Communist Party immediately lost power, although during the presidential elections of November 1991, the former head of the Communist Party, Rahman Nabiev, was elected president. His victory, however, exacerbated political factionalism. Two coalitions fought each other, with different regional identities and ideological alignments. The conservative or neo-Communist faction was composed of two regional groups: the Leninabadis, originating in the northern province of Leninabad, which had provided all the first secretaries of the Communist Party since 1949, including Nabiev; and the Kulabis, from the province of Kulab in southern Tajikistan. The opposition coalition brought together four groups: the Democratic Party, headed by Shadman Youssof; the Rastakhiz (Resurrection) Movement; the Pamiris (Ismaeli people, from the Gorno-Badakhshan autonomous region; Ismaili is a heterodox branch of Shi'a Islam); and the Islamic Renaissance Party, headed by Mohammed Sharif Himmatzade; the latter is an Islamic fundamentalist party whose constituency is almost exclusively people originating from the Gharm Valley in southern Tajikistan.

Fighting erupted in Dushambe, the capital, in early May, due to a clash between Kenjaiev, the chairman of the parliament, who was supported by the Kulabis, and Naujavanov, the minister of the interior, a Pamiri who was supported by the Gharmis. The conflict extended throughout the south of the country, with the opposing forces mainly Kulabis and Gharmis, who provided the leadership and the bulk of the fighters on each side. In May 1992, the Gharmis succeeded in

expelling the Kulabis from Dushambe. They established a coalition government, but kept Nabiev as president until his forced resignation in September. The Kulabis, entrenched in their province, undertook an offensive toward Dushambe beginning in September 1992, with the covert support of Russian troops. After months of fighting and massacres of civilians, the opposition coalition was driven out of Dushambe in December and fled to Afghanistan.

The victorious Kulabis chose Imamali Rahmanov as president. His government included some Leninabadis, but clearly expressed the Kulabi monopoly in the state. Nevertheless in 1993, a process of negotiation brought together the Kulabis, supported by Moscow, and the Gharmis, supported by Tehran, under United Nations auspices. In June 1997, a peace settlement established a coalition government, headed by Rahmanov, with one-third of cabinet appointments allocated to the Gharmis. The settlement ended the civil war and ensured the supremacy of southern Tajikistan. The civil war in Tajikistan indicates the prevailing role of regional identities in ideological commitments in the former Soviet Central Asia.

TAJIKS Tajiks (or Tadzhihs) are the original Iranian population of Central Asia, the present-day inhabitants of the nation of Tajikistan. Various groups of Tajiks, in Tajikistan, parts of central and southern Uzbekistan, northern Afghanistan, the Uighur Autonomous Region of Xinjiang in northwestern China, northern Pakistan, as well other parts of the Central Asia, sprang from various sources at various times and places; yet they all represent disparate branches of the common Iranian world. Tajiks were the first to settle in Central Asia, in the region that was later overwhelmed by peoples of Turko-Mongolian stock.

Origin and Cultural Traits

The origin of the word "Tajik" is disputed. Most scholars of the Tajik language currently believe that the word "Tajik" is derived from *toj* (crown). Some other scholars have suggested that the word was originally the name of an Arab tribe (Taj or Tazik) that

invaded Central Asia, bringing Islam to the region in the seventh and eighth centuries. In medieval Tajiki-Farsi literature and historical chronicles the word "Tajik" was used in the general sense of "Persian," as the opposite of "Turk." In Russian usage of the sixteenth century and later, "Tajik" was applied to the urban populace of Central Asia, distinct from the ruling Uzbek nomads. Currently the term "Tajik" applies to the people of the Central Asian Trans-river, who are Europeans of Pamiro-Ferghanian type.

The Tajiks are Muslims, predominantly Sunnis of the Khanafi school; there are also 300,000 Shi'a Imami Ismailis. Tajiks today speak different Iranian languages. In addition to Western Iranian (Tajiki and Dari), Tajiks in Tajikistan, Afghanistan, and China speak Eastern Iranian (Permian and Yaghnoibi languages), using Tajiki, an Iranian tongue, as a common language.

Tajiks lived in houses constructed of mud and stones in urban centers and oases of Central Asia. They were famous gardeners, merchants, poets, and scholars. Tajik arts reached high levels, and the towns along the caravan routes linking the Near East, China, and India were centers of trade. The tenth through sixteenth centuries were a golden age for Tajiks. Their language served as a lingua franca in Central Asia and was the mother tongue of famous poets such as Rudaki (c. 859–940 or 941), Sa'di (c. 1213–1294), Hafez (c. 1325–c. 1389), Omar Khayyam (1048?–1131), and Firdawsi (c. 935–c. 1020). The celebrated medieval doctor Avicenna (Abuali Ibn Sina; 980–1037) also spoke the Tajik language.

Turko-Mongol tribes constantly migrated westward into the area inhabited by the Tajiks, pushing them to the periphery. By the early twentieth century the term "Tajik" was used to label so-called mountainous Tajiks (the population of Qarategin, Mastchah, Darvaz, and Badakhshan in modern Tajikistan), while Tajiki-speakers on the plains were called Sart.

Dispersion

As an ethnic group the Tajiks never formed a stable political unit. Until the 1920s there was no official Tajik territorial-administrative unit. In Tajikistan there are four historical areas of the Tajik population: the valleys of the northern part of the country (Fergana Valley); the foothills and mountains of central Tajikistan (Zarafshon River basin); the foothills, mountains, and narrow valleys of southern Tajikistan (Qarategin, Khatlon); and the vast alpine country of Pamir. Each of these subgroups of Tajiks is marked by distinct political and material culture, physical appearance, dialect, customs, music, and folklore.

A Tajik herdsman in traditional dress. (DEAN CONGER/CORBIS)

The valley dwellers of the north are descendants of the Sogdian culture, representatives of the rich urban civilization of Samarqand, Bukhara, Khujand, and Fergana. After Russian dominance was established in the area and according to the national delimitations drawn by the Soviets in 1924, the Tajik descendants of these cultural centers live in different states. The Tajiks of Sogd (former Leninabad) Province, known as Leninabadis, live almost exclusively in Tajikistan, while most of the Bukharan and Samarqandi Tajiks dwell in Uzbekistan. This part of the Tajik-populated area joined Russia in the second half of the nineteenth century, and these Tajiks experienced the political, cultural, and economic transformations of Communism.

The Tajiks of the central and southern regions, living in narrow valleys, foothills, and mountains, in contrast to the northern Tajiks, were almost completely independent and free of outside influence until the twentieth century. The most important of these groups were the Kulabi, Gharmi, Qarategini, and Hisari Tajiks. Their traditional communities were strongly

attached to their places of origin. Both northern and southern Tajiks speak the Tajik language, albeit with dialectical peculiarities, and are Sunni Muslims.

In Tajikistan's Gorno-Badakhshan region live other Iranian peoples known as Pamiris. Officially identified as Tajiks, they are ethnically and linguistically distinct from the previously mentioned groups of Tajiks. Pamiris are almost all Shi'a Ismailis, speaking a language unconnected to Tajik and to other nonwritten Pamirian languages. In addition to 200,000 Tajikistan Pamiris in Gorno-Badakhshan, almost 100,000 Pamiris live in the adjacent mountain regions of Afghanistan, China, and Pakistan. The number of Tajiks in Tajikistan has risen from approximately 738,000 in 1926 (approximately 72 percent of the total population) to approximately 4.2 million in 2000 (69 percent of the population).

Like the Tajiks of Tajikistan, the Tajiks of the left bank of the Amu Dar'ya River, being autochthonous and the oldest inhabitants of today's Afghanistan, have no known common place of origin, nor is it known when they appeared here. Currently compact masses of Tajik population live in central Afghanistan—in Kabul Province, areas of Charikar, Istalif, Panjsher, Gurband, Salang, and the southern and northern slopes of the Hindu Kush. Another large group of Tajiks lives in western Afghanistan—in Herat, Ghor, and partly in Nimroz and Farakh Provinces. Tajiks constitute the main population of northeastern Baghlan, Takhor, Qunduz, and Badakhshan Provinces in Afghanistan. In the northern provinces of Balkh, Juzjan, Samangan, Fariab, and Badgis, Tajiks live together with Uzbeks and Turkmen.

Estimates of the number of Tajiks in Afghanistan vary widely from 25 to 50 percent or even more of the total population of the country. According to official data, Afghanistan's total population in 1987 reached 16.1 million. Thus, on the eve of the 1989 Soviet invasion, the number of Afghani Tajiks varied between 4 and 8 million. This number equals or even exceeds the number of Tajiks in Tajikistan. In addition to the Tajiks of Tajikistan and Afghanistan, more than 1 million Tajiks live in Uzbekistan, predominantly in Samarqand, Bukhara, and Surkhandarya Provinces. This disassociation of various groups of Tajiks has always been a principal obstacle to the creation of a unified Tajik state.

TAKLIMAKAN DESERT The Taklimakan Desert, the world's second largest sand desert, is located in the southern part of the Xinjiang Uygur Autonomous Region in northwestern China and covers an area of 338,000 square kilometers. About 85 percent of the desert consists of shifting sand dunes, averaging 100 to 150 meters in height, while dunes in the western parts only average 5 to 25 meters in height. The desert has a temperate climate and very low precipitation of under 50 millimeters annually. It constitutes the central part of the Tarim Basin, which in the western part rises to 1,560 meters above sea level. The basin is partly surrounded by mountains reaching more than 6,000 meters in height. In the north, the desert borders on the Tian Shan and in the west and the south, it borders on the Kunlun and the Altun Mountains. Glacial streams from the mountains run far into the desert, where they disappear, and there is some growth of poplar and

tamarisk trees along the riverbeds. There are a few oasis towns along the Hotan River bed, which also constitutes the main route across the desert from south to north. Since the 1980s, large oil fields have been exploited, and in the 1990s more than 500 kilometers of roads have been constructed for the oil industry.

TALIBAN The Taliban (plural of *talib*, which is Arabic/Persian for "student of Islamic religious law") regime ruled Afghanistan from November 1994 to November 2001 under the leadership of mullah Muhammad Omar (b. 1959). After the terrorist attacks on the United States on 11 September 2001, when

more than three thousand people were killed in New York and Washington, DC, the United States believed that the Taliban regime was sheltering the al-Qaeda terrorists of Osama bin Laden, a Saudi dissident and millionaire who was suspected of having masterminded the attacks. Earlier, the United States had also accused Osama bin Laden of masterminding the bombings of American embassies in Kenya and Tanzania on 7 August 1998, which killed more than two hundred people, including nineteen Americans.

In spite of repeated calls from the United States and other nations, including some Muslim nations, the Taliban did not hand over Osama bin Laden to the United States for interrogation and trial. The administration of President George W. Bush (b. 1946) starting bombing Afghanistan on 7 October 2001, leading to the collapse of the Taliban regime in Kabul. The U.S.-led international community installed an interim regime, composed of anti-Taliban forces of the Northern Alliance, under the leadership of a Pashtun tribal elder, Hamid Karzai (b. 1957), who took the oath of office in Kabul on 22 December 2001.

Although most of the Taliban foot soldiers disbanded and rejoined their communities, Taliban pockets of resistance continued in eastern parts of Afghanistan, especially in Kandahar Province.

Four former Taliban soldiers on a street in Kandahar in January 2002, after general amnesty was given to Taliban fighters. (AFP/CORBIS)

The Taliban came to power in November 1994 at the end of a civil war (1992–1994) that raged between different mujahideen (holy warrior) factions. Once in power, the Taliban imposed a strictly puritanical and literal interpretation of the *shari'ah* (Islamic law). The Taliban closed female educational institutions and banned women from working outside of their homes. Women could not venture out of their homes unless a male relative accompanied them. Women were forced to wear the Afghan traditional veil (*burqa*).

Taliban authorities also banned music, television, theater, cinema, kites, cards, and other activities as useless and time wasting. They also required men to grow beards and to strictly observe Islamic rituals, including the daily five prayers. The Taliban carried out the Haddood (Islamic punishments) in public: stoning to death for adultery, fornication, or any sexual, even consensual, relations outside wedlock. They amputated hands of thieves and flogged gamblers and alcohol users.

When the Taliban regime collapsed in November 2001 as a result of the U.S. bombing of its strongholds in Afghanistan, some women in Kabul threw away their *burqas*, and some men shaved off their beards to demonstrate freedom from the Taliban.

TAMAN SISWA The Taman Siswa, or "Garden of Students," was an anticolonial educational movement in the Dutch East Indies founded by the Javanese nobleman Raden Mas Soewardi Soerjaningrat, also known as Ki Hadjar Dewantoro (1889–1959), in July 1922. Dutch-educated, Dewantoro was an active member of the nationalist movement, the founder of the Indies Party, and a member of the Sarekat Islam (Islamic Association), the first political party in the Netherlands East Indies with Indonesian nationalist leanings. He propagated a course of action that would use Western methods to fight the Dutch. During his exile in the Netherlands (1913–1918), he became convinced that strengthening the cultural roots of his people through "nationalist" education would effectively counter the impact of colonialism. Influenced by the educational theories of Maria Montessori and Ra-

bindranath Tagore, Dewantoro established the Taman Siswa school system, enlisting the support of many fellow nationalists. The curriculum included lessons in Javanese ethics, traditional handicraft, dance, and music, as well as Western subjects. In the late 1930s, Taman Siswa operated 207 schools in Java, Sumatra, and Kalimantan. Following independence, Taman Siswa survived as an appendage of the state school system. Dewantoro retained leadership until his death in 1959. As minister of education, he helped to shape the educational policy of the modern Indonesian state.

TAMERLANE. See **Timur**.

TAMIL LANGUAGE Tamil belongs to the South Dravidian subgroup of the Dravidian family of languages and has been spoken from prehistoric times in southern India and northeastern Sri Lanka. There are about 60 million speakers of Tamil in these two areas today; outside India and Sri Lanka, Tamil speakers are reported from Malaysia, South Africa, Singapore, Fiji, Thailand, and Mauritius. During its more than two-thousand-year uninterrupted history, three distinct stages in its development may be distinguished: Old Tamil (c. 300 BCE–ce 700), Middle Tamil (700–1600), and Modern Tamil (1600 to the present). Apart from distinct historical variations, Tamil exhibits three other dimensions: geographic (regional and local dialects), social (primarily Brahman versus non-Brahman speech), and diglossic (i.e., "high" formal variety against "low" informal varieties). The central dialect spoken by educated non-Brahmans around the cities of Tanjore, Trichy, and Madurai is considered to represent the standard.

The modern Tamil sound system has a native core and a borrowed periphery. The core inventory contains twelve vowels, the native *a*, *i*, *u*, *e*, *o*, both short and long; there are two peripheral diphthongs. There is a core of sixteen consonants in three groups: stops

k, c, ṭ, t, p; nasals *ñ, ŋ, n, m*; and liquids *y, r, l, v, r̥, z, ʃ*. The consonantal periphery, borrowed mostly from Indo-Aryan, Perso-Arabic (Persian and Arabic), and English sources, includes *b, d, ḍ, j, g, s, f, b*. The specific sounds of Tamil are primarily the retroflexes *ʃ, ŋ, ʎ, ẓ*—consonants articulated with the reversed tongue-tip against the palate—and the alveolar flap *r̥*—a consonant articulated like a "flap" with the tongue-tip behind upper teeth.

Like other South Asian languages, Tamil is written in alphasyllabic script descended from the southern variety of Asokan Brahmi (the script used in India from around 250 BCE for Buddhist inscriptions carved at the order of Emperor Asoka).

Morphology

Tamil morphology is agglutinating (words change meaning through the addition of lexical elements to a base) and suffixal (these additional elements are added on at the ends of base words rather than at the beginning or in the middle), inflections (changes in tense, number, person, and so on) are marked by suffixes attached to a lexical base (root), which may be enlarged by derivational suffixes so as to form a stem. There are two main parts of speech, nouns and verbs. So-called indeclinables indicate such categories as adjectives, adverbs, and postpositions, and these may originally have been nouns and verbs. Nouns mark grammatically gender (two basic genders, rational and nonrational, corresponding roughly to human, nonhuman; human classified further as masculine and feminine), number, and case. Tamil nouns distinguish singular and plural in eight cases: nominative, accusative, dative, sociative, genitive, instrumental, locative, and ablative. Personal pronouns in the plural distinguish between first person inclusive and exclusive.

Tamil verbs consist of a lexical stem and a set of bound suffixes. The stem consists of a base and, optionally, a set of stem-forming suffixes. Inflected verbs are finite and nonfinite. Finite verbs mark both tense and subject-verb agreement, nonfinite verbs do not. Finite verbs typically mark the end of a sentence; all other verbs must be nonfinite. For example, the sentence, "When I came home and saw him, I said, 'How are you?' and then I went to eat," would be translated into Tamil as, "Having-come home after, him having-seen, 'You-how' having-said, then I to-eat went." There are basically three tenses: past, nonpast (including future), and present (which is a later independent development). The basic order of constituents in a Tamil clause is Subject-Object-Verb. Hence the sentence structure may be described as head-final and left-branching. Head-final means that the main part of a

word or a sentence is always placed at the end (final); for example, "He came fast" would be "fast came-he" in Tamil. Left-branching indicates that the finite verb stands at the right end of a sentence, which runs from left to right. Each sentence has one finite predicate; all other predicates are nonfinite.

The lexicon of Tamil consists of a native Dravidian core and borrowings from Sanskrit (and other Indo-Aryan languages), Perso-Arabic, Portuguese, and English. At the beginning of the twentieth century a movement to remove Sanskritic elements from the Tamil vocabulary and replace them with Tamil ones was initiated and is still vigorous.

TAMIL NADU (2001 est. pop. 62.1 million). Spread over an area of 130,058 square kilometers, the state of Tamil Nadu is located on the southeastern side of the Indian peninsula. Bounded by the Bay of Bengal and the Indian Ocean in the east and the south respectively, the state has more than 1,000 kilometers of coastline. To its north and west lie the southern states of Karnataka, Kerala, and Andhra Pradesh. Apart from the coastal plain in the east, the state contains the range of Western Ghats, a mass of hilly regions in the north and the west averaging 1,220 meters above sea level. All the rivers in the state are rain-fed and flow eastward from the Western Ghats. The most prominent river, Kaveri (Cauvery), is 760 kilometers long.

Tamil Nadu has a 6,000-year history, predating the Aryan entry into India. The Dravidian culture associated with the state was concentrated in the south after the Aryans settled in north India in the third millennium BCE. Tamil Nadu was formerly a part of the Dravida country ruled by three significant dynasties, Chola, Pandya, and Chera from the fourth century BCE. The end of this rule in the thirteenth century saw these territories annexed by the rising Vijayanagar empire in the south. Later, the area was divided into a number of small kingdoms. The English arrived in Madras in 1639 as representatives of the East India Company. Most of south India, including Tamil

Nadu, came under British rule. After Indian independence and under the States Reorganisation Act of 1956, the erstwhile Madras province was divided into the states of Madras, Andhra Pradesh, and Kerala on the basis of language. Tamil-speaking Madras state changed its name to Tamil Nadu on 14 January 1969. The state capital changed its name from Madras to Chennai in 1996. The state legislature has one house—the Legislative Assembly—with 235 seats. Fifty-seven members from the state are elected to the national parliament—18 for the upper house (Rajya Sabha) and 29 for the lower house (Lok Sabha). The state is divided into twenty-nine administrative districts.

The backbone of Tamil Nadu's economy is agriculture. Rice and sugarcane are major crops, giving highest yields nationally. Tea and coffee plantations are a major source of revenue. The state government encourages small, medium, and large-scale industries through corporations set up for the purpose. In recent years, the state has seen a spurt in industrial investment growth, particularly in key sectors such as power and information technology. The state excels in the production of cotton, sugar, leather, and petrochemicals.

The cultural life of Tamil Nadu is a repository of rich forms and traditions. The dance style of Bharatanatyam and the practice of Carnatic music, important elements of Indian cultural ensemble, trace their origins to this state. Tamilians are great lovers of food, music, and films. Pongal, celebrated in the month of January to mark the time of harvest, is the major festival of the state.

TAMILS The name "Tamil" denotes native speakers of the Tamil language, mainly residing since antiquity in the southernmost region of India and in northern and eastern Sri Lanka, but found today also as immigrants in Southeast Asia, Africa, Guyana and the Caribbean, the United States, Canada, and England.

The Tamil language, of the Dravidian family, appears in third-century BCE inscriptions, and Dravidian influences noted in Sanskrit suggest that an ancestor of Tamil was widely spoken in India as early as 1000 BCE. Today it is the official language of the state of Tamil Nadu in India and one of the national

languages of Sri Lanka; related languages are spoken in neighboring states.

Tamils were prominent in sea trade, and there is evidence of Tamil commerce with Greece and Rome and with Southeast Asia from around the first century BCE. Areas of the Tamil region were ruled from about the early third century BCE to the fifth century CE by the Chera, Chola, and Pandya dynasties and from about the sixth to the ninth centuries CE by the Pallava dynasty. These and other dynasties were displaced by the Vijayanagara empire at its peak (fourteenth century) and then by the Telugu-speaking Nayaka rulers (sixteenth to early eighteenth centuries CE).

The Tamil region has figured prominently in India's cultural history. Tamil literature dates from as early as around the second century BCE; it includes the Sangam (Academy) poetry and the *Tolkappiyam* (Ancient Poem), a grammar. Even in these works, there are signs of the influence of Sanskrit from the north. The gradual process of Sanskritization was driven by Brahman priests and scholars, whom local rulers settled on donated lands. Nevertheless, Tamil poetry retained a personal voice and a vivid immediacy that contrasted with the impersonal and stylized character of Sanskrit works.

From around the sixth century CE, a new Tamil literature of devotional poems began to be composed by traveling bards, who applied the conventions of the Sangam poetry to poems praising the gods of famous temples. During this period, local deities were assimilated to pan-Indian deities of the Brahmanical Sanskrit sources. This sparked a wave of vernacular religious expression throughout India over the next several centuries. Jainism and Buddhism vied with devotion to the gods Vishnu and Siva for royal patronage in the region. Meanwhile, Brahmins integrated Tamil devotional texts with their Sanskrit liturgies, creating the distinctive Saiva Siddhanta and Shri vaishnava traditions, Tamil religious movements teaching devotion to the deities Siva and Vishnu, respectively.

In postcolonial India, the linguistic and ethnic rivalry between south and north has continued. In South India, Tamil was touted as the original language and culture of India, with the carriers of Old Indo-Aryan (Sanskrit) represented as the first imperialist invaders, warlike barbarians who drove the peace-loving Tamils toward the south. An analogous situation was perceived in the dominance of North Indians in national politics and the adoption of Hindi (the language of a broad swath of North India) as the principal national language. Hence, South Indians (and Tamils in particular) have fiercely resisted using Hindi.

In Sri Lanka, where Tamils have often been treated as foreigners by the Sinhalese-speaking majority, Tamil nationalist guerrillas called the Liberation Tigers of Tamil Eelam (Nation) (LTTE) seek an independent Tamil homeland in the Jaffna Peninsula in the north and along the northeast coast. Many Indian Tamils have provided support to this insurgency, and the Indian prime minister Rajiv Gandhi (1944–1991) was assassinated by an LTTE suicide bomber protesting India's intervention in Sri Lanka.

Meanwhile, regional parties claiming to represent the interests of Dravidian culture have long dominated the politics of the state of Tamil Nadu, often promoting Tamil chauvinism. During British rule and immediately after independence, Tamil-speaking regions were subsumed within Madras state, but in the 1950s Telegu-, Kannada-, and Malayalam-speaking regions were hived off as separate states, and in 1969 the Madras state's name was officially changed to Tamil Nadu (Tamil Country). Under chief minister Jayalalitha (b. 1948), Tamil Nadu in 1996 discarded the British colonial name of the capital (Madras) to adopt the older Tamil name Chennai. Yet opposition to Hindi has receded somewhat as English gets entrenched as the language of national affairs.

TAN SIEW SIN (1916–1988), Malaysian political figure. Tan Siew Sin was born in Malacca, Malaysia, on 21 May 1916, the only son of Tan Cheng Lock, a prominent businessman and founding member of the Malaysian Chinese Association. He was educated in Malacca and also attended Raffles College in Singapore as well as Middle Temple in London. Tan was a *baba*, a descendent of Chinese families that had migrated to Malaya before British colonization; these families adopted the local Malay customs, cultural practices, and language.

Tan Siew Sin was a major political figure in Malaya after it gained independence from the British and after the formation of Malaysia. He was elected a member of parliament in 1955. Between 1957 and 1959 he was minister of commerce and industry and in 1959

became the first minister of finance, a position he held until 1969, when he became minister with special functions (finance). In 1970 he resumed his duties as finance minister, a position he held until his retirement in 1974.

Tan Siew Sin knew the Malays well and spoke the language fluently. However, although president of the Malaysian Chinese Association—part of the Barisan Nasional coalition, the ruling political party in Malaysia since its independence from British rule—he spoke no Chinese. He, together with Malaysia's first prime minister, Tunku Abdul Rahman, who was a close friend, oversaw the imposition of Malay as the national language and the withdrawal of government assistance for schools providing Chinese-language education. The perception among the Chinese community that he had neglected their cultural interests led to the erosion of support for the Malaysian Chinese Association during his tenure as president.

TANAKA GIICHI (1863–1929), Japanese politician. Tanaka Giichi was a soldier and politician from the former feudal domain of Choshu (modern Yamaguchi Prefecture). He started his career in the Imperial Army, later becoming president of Japan's largest party, the Rikken Seiyukai, and prime minister in 1927.

Tanaka was born in 1863, the son of a samurai retainer. He attended the Army Academy and the Army War College. During the Russo-Japanese War (1904–1905) he served as an aide to General Kodama Gentaro (1852–1906), chief of staff of the Manchurian army. In 1906, Tanaka drafted the infamous Imperial Defense Guideline (Teikoku Kokubo Hoshin), a basic document for Japan's foreign and military policy until 1945.

In 1910, Tanaka played a leading part in founding the reservists' association (Teikoku Zaigo Gunjin-kai). He also served as army minister from 1918 until 1921, and again in 1923. Two years later, Tanaka was asked to become president of the Seiyukai party. He accepted, thus starting a new career as a party politician. As the leader of the largest party in the lower house, he was named prime minister in 1927, serving concurrently as foreign minister and minister of colonization. Unable to deal with urgent budgetary

problems or to settle Japan's China policy, the cabinet had to resign in July 1929. Tanaka died shortly afterward.

TANCH'ONG *Tanch'ong* is the Korean technique of decorating wooden buildings. Although *tanch'ong* work dates back to at least the Three Kingdoms period (57 BCE–668 CE), the earliest extant examples date to the Koryo dynasty (918–1392). In *tanch'ong*, the eaves, ceilings, and upper column supports of buildings were painted in bright primary colors for beauty, as well as to protect the wood, hide imperfections, and emphasize the building's function. These techniques continued to be developed throughout the Choson dynasty (1392–1910).

Specially trained artisans were required for the exacting work. The ends of supporting beams or eaves of ceilings often featured a dominant motif of flowers or pomegranates. The space between the ends or eaves might depict a narrative featuring auspicious symbols such as dragons and cranes, or scenes from Buddhist sutras. Elegant designs and geometric patterns might be used elsewhere on the building, or a single flower or animal could contrast the more elaborate decorations.

The use of contrasts in design and colors was very important in *tanch'ong*. Reds were used on sun-exposed areas and provided a sharp contrast to the green-blue tones used on unexposed areas. The natural paints were composed of clay, iron, copper, or malachite pigments for their vivid colors and resistance to the elements.

TANG DYNASTY China's Tang dynasty (618–907 CE), which was founded by Liu Yuan (also known by his temple name Gaozu, reigned 618–626), marked one of the most glorious periods in the history of China. After the short-lived Sui dynasty (581–618 CE), the Tang ruled China for nearly three centuries, governing one of the most successful empires of the time in the world. Its government institutions, legal establishments, economic developments, cultural achievements, and territorial expansions all exerted significant impact on later Chinese dynasties and defined the identity of Chinese civilization.

Political Changes

Li Yuan, who inherited the title of the dynastic duke of Tang during the Sui dynasty, was a member of a northern aristocratic family who had intermarried with the ethnic minority Xianbei tribal aristocracy. When the Sui collapsed in 617, he seized the Sui capital Chang'an, and ascended the throne in 618, thus founding the Tang dynasty.

During Gaozu's reign, the Tang undertook the enterprises of expanding and consolidating the empire and establishing various institutions. The Gaozu's armies defeated several major rivals and completed the pacification of the country in 624. Gaozu basically continued the administrative institutions of the previous Sui dynasty. In the central government, three agencies reporting to the emperor (the Secretariat, the Chancellery, and the Department of State Affairs, which were collectively known as the Three Departments) served as the administrative core. Local administration consisted of two tiers: the inferior district and the superior prefecture. The military system of garrison militia (*fubing*) combined agricultural and military duties. Gaozu revived the civil-service examination system to recruit government officials on the basis of merit, although aristocrats continued to be influential in dynastic politics.

Like the Sui, the Tang legal system consisted of four major components: the *Code*, *Statutes*, *Regulations*, and *Ordinances*, which not only laid the foundation for later dynasties of imperial China, but also influenced the legal systems of Japan, Korea, and Vietnam.

Gaozu's second son Li Shimin (temple name Taizong, reigned 626–649) took the throne in a military coup. Taizong's reign, traditionally known as the "era of good government," was one of close personal interaction between the ruler and his Confucian advisers. Generally, Taizong developed and refined the policies of his father's reign, including revision of the law codes and expansion of the civil-service examination

system. He made particular efforts to balance the political influence of the regional aristocratic groups and uphold the pre-eminent position of his own clan, the Li. In foreign affairs, Taizong subdued the eastern Turks and began to expand Chinese power in Central Asia.

Empress Wu Taizong's ninth son, Li Zhi (temple name Gaozong, reigned 649–683) ascended the throne at the age of twenty-one. In the early years of his reign, Gaozong relied on advice from the statesmen of his father's court and continued some reform programs. Gradually, however, Gaozu's court came to be dominated by Wu Zhao (627–710, reigned 690–705), one of the most remarkable women in Chinese history. Born into a merchant family, Wu Zhao had been a low-ranking concubine of Taizong's who managed to become Gaozong's legitimate empress in 655. In 660, when Gaozong suffered a stroke, the empress took charge of the central government. Over the next twenty years, while Empress Wu continued many of the policies of the former Tang rulers, she initiated some practices to consolidate her position. For instance, she designated Luoyang as a second capital in 657 and took up permanent residence there in 683, thus removing the political center from the base area of the northwestern aristocracy. Empress Wu also encouraged lower ranks of bureaucracy by creating new posts, providing more opportunities for advancement, and increasing their salaries. In order to promote the legitimacy of the dynasty, Empress Wu revived the ancient *feng* and *shan* sacrifices on Mount Tai (Taishan), the eastern holy peak in present-day Shandong Province, and patronized Buddhism.

Under Gaozong and Empress Wu, the Chinese continued their efforts to extend and consolidate the empire. By 661, they had defeated the western Turks and established a Chinese protectorate in the western regions. But they faced serious threat from Tibet. By the early seventh century, Tibet had emerged as a unified state. Although Tibet became China's tributary state under Song-tsen Gampo (reigned 620–649), the Tibetans exerted constant pressure on present-day Qinghai and Sichuan. After Gaozong died in 683, Empress Wu, now the empress dowager, took control of the imperial succession and purged her opponents at court by means of terror and a secret police force. In 690, she ascended the throne and proclaimed a new dynasty: the Zhou. Empress Wu then formally became an "emperor," the only woman sovereign in China's history. Some senior officials at court forced her to abdicate in 705 and restored the Tang dynasty.

Li Longji (temple name Xuanzong, reigned 712–756) took the throne by means of series of political in-

 Cultural Revolution (1966–1976)

trigues. The early years of his reign saw the heyday of the Tang, a time of institutional progress, economic prosperity, and cultural flowering. The most important change occurred in the military. In the early Tang, troops were organized through the *fubing* militia system, under which men of agricultural households served in the army on a rotation basis. Such a system proved inadequate to defend the empire against threats from the highly mobile nomadic horsemen of the frontiers. Xuanzong's reign saw the development of professional soldiers who settled permanently in military colonies and a consequent growth of the military commanders' power. In the 740s, some non-Chinese governors were appointed to take charge of certain strategic military domains, among whom An Lushan, a professional soldier of Sogdian and Turkish ethnic background, rose to prominence. He was later to lead a rebellion.

Under Xuanzong, the aristocracy reasserted its political dominance. Although under Empress Wu and in the early years of Xuanzong's government many chief ministers obtained their positions by passing the civil-service examinations, after 720 men of aristo-

cratic origins increasingly received appointments. What complicated court politics more was that from the 740s, the emperor refused to take active interest in government affairs, being taken up by the charms of his concubine Yang Guifei, one of the most famous beauties in Chinese history. Those close to the emperor strove to become the power behind the throne; among them was An Lushan, who rebelled against the Tang in 755.

The An Lushan Rebellion The An Lushan rebellion (755–763) marked a turning point in the history of the Tang and nearly destroyed the dynasty. The rebel troops seized the Tang capitals Luoyang and Chang’an and controlled most of north China. Xuanzong fled to Sichuan. Although An Lushan was assassinated by a subordinate in 757, the rebellion continued for six more years.

Influence of Eunuchs Although the rebellion was put down, the Chinese lost their grip on many frontier areas, including the western regions. Within the Tang empire, the political authority of the central government declined. Some northern regions became virtually autonomous, and other areas fell under the control of military governors, who enjoyed enormous power in both military and civil matters. Under Xianzong (reigned 805–820), the Tang court regained a great deal of control over the powerful provinces and put down several major rebellions in Sichuan, the Chang (Yangtze) delta, Hebei, and Shandong. Xianzong’s success, however, to a great extent was based on the loyalty of his eunuchs, who controlled the dynasty’s elite palace armies and supervised the provincial administrations. Eunuchs began to play an increasing part in Tang politics under Daizong (reigned 762–779). They murdered Xianzong and determined the succession of most subsequent young emperors. Although Wuzong (reigned 841–846) temporarily revived the fortunes of the dynasty by imposing some restrictions on the eunuchs’ power, Yizong’s reign (859–873) saw a resurgence of their influence at court.

During its last several decades, the dynasty suffered serious floods and drought as well as political chaos and foreign threats. In 874, a wave of peasant rebellions broke out; their leader Huang Chao (d. 884) took Luoyang in 880 and Chang’an in 881. Although the rebel forces were finally suppressed and the Tang court returned to Chang’an, the dynasty was left powerless. Most parts of the empire was either occupied by non-Chinese forces or controlled by rival military leaders. In 907, the warlord Zhu Wen ended the Tang and established his own Liang dynasty.

Socioeconomic Changes

The Tang era witnessed economic prosperity. Under Gaozu, the government undertook a land distribution policy known as the equal-field system. This system had been used during the northern dynasties and under the Sui; it granted peasants a certain amount of land, in return for which they paid taxes in grain, cloth, and labor on public-works projects. This land and tax system remained in force until An Lushan’s rebellion. Gaozu also established mints and issued a new currency that remained standard throughout the Tang dynasty. The Grand Canal, an extensive system of waterways that were constructed during the Sui dynasty to link wealthy south China with the Yellow (Huang) River valley, facilitated the Tang economic transactions as well as political stability.

The Tang was cosmopolitan and open to foreign influences. About two million people lived in the capital Chang’an, the most populous city in the world at that time. A variety of foreign goods were displayed in the marketplaces of the major cities, where Chinese mingled with people from various Asian countries, including Japan, Korea, and India. Foreigners not only came to trade and study, but also served as grooms, entertainers, dancers, and musicians. Some foreign customs, such as playing polo, became fashionable.

The social structure in the Tang changed significantly after An Lushan’s rebellion. With the decline of the aristocracy, the ruling class obtained their political power more from education and possession of landed property than from birth alone. When the equal-field land distribution system collapsed, many peasants disposed of their lands and became tenants or hired laborers of the rich based on formal contracts. Local elites seized opportunities to establish large, landed estates that were managed by bailiffs and cultivated by tenants, hired workers, or slaves.

After mid-750s, the old taxation system ceased to function. During Dezong’s reign (779–805), the chief minister, Yang Yan, applied a new two-tax system generally to the empire. This system combined various taxes into one single tax, which was to be paid, in the summer and autumn, on the basis of the value of property instead of number of household members. This taxation method generated revenues for the Tang, and remained China’s basic tax structure until the sixteenth century.

The late Tang also saw important demographic changes. By 742, according to an official population survey, there were about 9 million households or more than 50 million registered individuals in the empire. Due to factors such as warfare and natural disasters,

the population in the north fell dramatically, and more and more people migrated to the lower Chang valley and into Zhejiang.

Despite political instability, the economy continued to grow in the late Tang. The population movements to the south promoted the agricultural expansion in the more fertile and productive lands of the country. New crops such as tea, sugar, and new varieties of grain were developed, and the double-cropping of land with rice and winter wheat produced greater quantities of foods. Silk production also increased rapidly in the Chang delta region. With regard to commerce, the merchant class enjoyed legal freedom to engage in business, and became prosperous dealing in salt, tea, banking, and overseas trade. In addition to the two great markets in Chang'an and Luoyang, large markets appeared in local areas, and the local markets facilitated the development of new urban centers. The increased volume of trade brought an increasing use of money, particularly the privately circulated silver, and various credit and banking institutions began to emerge. To facilitate commercial transactions, money drafts were invented in 811.

Cultural and Intellectual Changes

One of the most dramatic cultural achievements in the Tang was the development of Buddhism. Although the Tang court gave their preference to Taoism due to the claim that they were descended from Laozi, the legendary founder of the belief system, they also recognized the strength of Buddhism and provided it with great favor and lavish patronage through most of the period. The famous pilgrim Xuanzang (c. 596–664) went to India in 629 and returned in 645 with a large number of Buddhist sutras. It was during the Tang that Buddhist doctrine became sinicized and Chinese indigenous Buddhist schools emerged. Three were most prominent. The Celestial Terrace (Tiantai) school, named after a famous monastery, emphasized synthesis and harmony of all Buddhist teachings. The Pure Land (Jingtu) school believed that salvation, or rebirth in the Pure Land, could be attained by chanting the Buddha's name. The Meditation (Chan) school stressed intuitive enlightenment through meditation. Buddhist monasteries, free of all obligations to the state, acquired tremendous wealth by accepting gifts and conducting business. These communities, however, often encountered criticism from Confucianists and Taoists, both out of intellectual rivalry and because all these belief systems competed for economic resources from the government. In 843–845, the pro-Taoist emperor Wuzong persecuted Buddhism; during that period some 4,600 monasteries and 40,000

shrines and temples were destroyed, 260,000 monks and nuns were returned to lay status, and much monastic lands were confiscated and sold. This suppression marked the beginning of Buddhism's decline in China.

Other intellectual currents also developed in the Tang. Since Confucianism offered political theories and institutional rules to build the centralized empire, the court promoted its spread, particularly through the civil-service examinations. In the late Tang, the prominent writer Han Yu (768–824), while attacking Buddhism, emphasized the revival of the orthodox Confucianism, which influenced the development of the Neo-Confucianism during the Song dynasty (960–1279). Zoroastrianism, Islam, and Nestorian Christianity also entered China.

During the Tang, many fields of art flourished. Poetry reached its golden age. About three thousand poets are known to us today, among whom Li Bo (701–762) and Du Fu (712–770) are perhaps the most prominent. The essayists Han Yu (768–824) and Liu Zongyuan (773–819) promoted the "ancient style of prose" (*guwen*) movement to reform literature. The Tang also saw the first serious attempts to write short stories. Both Buddhist and secular sculpture flourished. Artisans created large monumental sculptures in Buddhist rock cave temples and small metal images of the Buddha and bodhisattvas. The six relief sculptures of Taizong's battle horses that guarded his tomb represented the masterpieces of the secular sculpture of the age. The frescoes at the caves of Dunhuang synthesized the cultural themes and artistic styles of China, India, and Central Asian countries. Under the Tang, woodblock printing also developed.

Legacy of the Tang

The Tang represented the golden age of China's imperial times. The early Tang epitomized the Chinese civilization achieved by then; and the late Tang initiated reforms that left long-lasting effects on later dynasties. The extensive and unified empire strengthened a political ideology of "great unity." Their achievements in political institutions and religion attracted a great number of foreign students to study, and had far reaching influences on neighboring countries. Japan, for example, learned from the Tang the imperial institutions, bureaucracy, law codes, written language, Confucianism, Buddhism, literature, art, and architecture. The economic prosperity in the Tang promoted international trade, which in turn facilitated cultural exchange between Chinese and other peoples. The technology of making paper, for instance, was transmitted to the West during the Tang. The Tang dynasty was so influential to Chinese culture that

present-day overseas Chinese call Chinatowns *Tangren jie*—the "streets of the Tang people."

TANGE KENZO (b. 1913), Japanese architect. Kenzo Tange was Japan's leading postwar architect and the first Japanese architect to win the prestigious Pritzker Prize. Beginning in 1938, Tange spent four years in the office of Kunio Maekawa (1905–1986), a pioneer of modern architecture and disciple of French architect Le Corbusier (1887–1965). Upon leaving Maekawa's employ, Tange returned to his alma mater, the University of Tokyo, to further study modernist architecture's spatial organization and urban scale.

Kenzo Tange with his first sculpture, "Theme Tower," in New York City in April 1966. (BETTMANN/CORBIS)

Following World War II, Tange's competition-winning proposal for the Hiroshima Peace Park brought his first commission and immediately established him in international architectural circles; he was the first of Japan's architects to receive such recognition.

Several of his subsequent works accommodated the international community, most notably his 1964 designs for the Olympics, as well as St. Mary's Cathedral (1964). Moreover, Tange established a vocabulary for postwar democracy in local government offices (Tokyo City Hall, 1957; Kagawa Prefectural Offices, 1959; and Kurashiki City Hall, 1960). Many of these buildings were unusual for their large public spaces, intended for gatherings of an unprecedented scale.

Several of Tange's most important designs, including his 1961 plan for Tokyo Bay and his 1964 proposal for the Tsukiji district, were never built, and in the 1970s, he turned his attention abroad. In the 1980s, however, Tange returned to Japan and produced a number of works that fulfilled his earlier intentions, including the New Tokyo City Hall (1991) and the United Nations University Building (1992). Tange's early work was a remarkable blending of bold, sculpted concrete forms and delicate detailing he ascribed to Yayoi traditions. In his later buildings, however, his work lost its delicacy and focused on monumentality.

TAN'GUN MYTH The oldest extant versions of the myth of Tan'gun, an ancient Korean myth, date to the thirteenth century, when the inhabitants of the Korean Peninsula, united by resistance to the Mongol invasions, began envisioning themselves as one people with a shared history. According to one version of this myth, in the *Samguk yusa* (Legends and History of the Three Kingdoms of Ancient Korea), Tan'gun was the product of a union between a bear-turned-woman and the son of the ruler of heaven. Tan'gun founded a state called Choson in 2333 BCE, shortly after the legendary emperor Yao assumed the throne in China. Tan'gun

ruled over much of Northeast Asia for 1,500 years. He then retired and became a mountain god.

The Tan'gun myth probably began as a foundation myth of one of the various ethnic groups that later merged to form the people known today as Koreans. However, when a national Korean cultural identity was forged during the Koryo dynasty (918–1392), the Tan'gun myth was transformed into an assertion of ancient political unity. In the early twentieth century, when ethnic identity began to be defined biologically as well as culturally, the Tan'gun myth was reinterpreted to show that Tan'gun was also the first Korean, the ancestor of all Koreans alive today.

TANIZAKI JUN'ICHIRO (1886–1965), Japanese novelist. Tanizaki Jun'ichiro was born in Tokyo and moved to Osaka after the Great Tokyo Earthquake of 1923. He is one of the most widely translated of modern Japanese novelists, and his fiction is marked by urbanity, attention to style, and themes of obsessive love, the femme fatale, and masochism. His debut short story, "Shisei" (Tattoo, 1910), set the tone for later work with its emphasis on sensual romanticism, taste for the grotesque, and admiration of beautiful, sadistic women. *Tade Kuu Mushu* (1928–1929; trans. as *Some Prefer Nettles*, 1955) is a semiautobiographical novel of a failing marriage. In it, the protagonist, Kaname, discovers his preference not for his Eurasian mistress Louise but for the old-fashioned O-Hisa, and all the traditional culture associated with her. Tanizaki's move to Osaka turned his interests to the classical literature of Japan. He spent the years 1935–1941 rendering *The Tale of Genji* into modern Japanese. In *Sasameyuki* (Thin Snow, 1943–1948; trans. as *The Makioka Sisters*, 1957), his longest work, the free-form structure, like that of *Genji*, relies on in-depth characterization and evocation of a complete world. In his fiction he preferred the sensual and sensuous over the intellectual and political. A master of historical fiction, Tanizaki continued his stylistic experimentation in the diary format of *Kagi* (The Key, 1956), a psychological study of sex and old age. His last novel, *Futen ryojin nikki* (Di-

ary of a Mad Old Man, 1961–1962), pursues this theme, ending not in death but hope. Tanizaki was frequently nominated for the Nobel Prize for Literature, but he was never awarded it.

TANO For centuries Tano was one of the four major holidays celebrated on the Korean Peninsula. Observed on the fifth day of the fifth lunar month, which usually falls in the first half of June, Tano was also celebrated in China and Japan. Tano, an auspicious day due to the double fives associated with its date, was marked by ceremonies and offerings of cartwheel-shaped rice cakes to honor the village spirits. The day was first designated a royal holiday in the Shilla kingdom (57 BCE–935 CE) and celebrated by all classes.

During the Choson dynasty (1392–1910), presents of Tano fans were made to the king and to friends and relatives. Tano became the day for women to wash their hair and bathe in sweet flag (*Acorus calamus* or, in Korean, *ch'angp'o*) water to ward off disease and guard against misfortune. Large hairpins carved from the sweet flag root and colored red were worn in the hair as an amulet to ward off evil. Swinging was also popular among women. Long ropes were strung from the tallest trees for this purpose, and stand-up swinging contests from specially constructed six- to ten-meter-high swings were held. For men, *ssirum* wrestling competitions were held as well as other contests of strength. Evening entertainment in both the king's court and the village square consisted of mask dances and theatrical presentations. The Tano tradition is marked today by televised *ssirum* matches, art exhibitions, and musical and theatrical performances.

TANZIMAT *Tanzimat* is a Turkish word meaning "regulation" or "reorganization" that refers to a period of reforms in the Ottoman Empire between 1839 and 1876 under sultans Abdulmejid and Abdulaziz. The brilliance of the Ottoman Empire began to fade in the eighteenth century, when the imperial armies suffered a series of defeats in Europe and the gap in economic and social conditions between the Ottomans and the West widened. Starting with the Tulip Era (1718–1730) Ottoman statesmen and intellectuals started to question the situation of the empire and think of ways to revive it. Initial reform movements concentrated on military institutions, but under Selim III (1789–1807), a comprehensive reform project, including reorganization of both military and civil institutions, was implemented. A corps of regular infantry was established; the first permanent Ottoman diplomatic missions were opened in the main capitals of Europe; and modern military high schools were founded. But strong opposition, especially from the Janissaries (classical infantry troops) and conservative religious circles, stopped Selim's reforms.

Mahmud II (1808–1839) restarted his uncle Selim's reform program, but in a more determined way, and eliminated all opposition, both civil and military. With the abolishment of the Janissary troops in 1826, no serious obstacle to the reforms remained. Besides military and educational reforms, Mahmud II reorganized the Ottoman government. The Grand Vizier became Prime Minister; ministerial offices were founded, and a Council of Ministers was formed. In addition, some advisory councils such as the Supreme Council of Judicial Ordinances and the Deliberative Council of the Army were established in 1836; they became the forerunners of Turkey's modern parliament.

Mahmud II's son Abdulmejid gave further impetus to the reforms. His Noble Decree of the Rose Chamber on 3 November 1839 opened a new era of multi-dimensional transformation in the empire that is called the Tanzimat Period. Under the decree, the sultan yielded some of his authority to a Supreme Council of the Judicial Ordinances, which had the power to make laws, subject to the sultan's approval. It guaranteed to the sultan's subjects the security of their lives, honor, and goods; an equal length of military service for all; open and equitable legal processes; and equality of subjects whatever their religion.

During the Tanzimat Period, three prime ministers—Mustafa Reshid, Ali Pasha, and Fuad Pasha—undertook substantial reforms in the political, social, and economic fields, mostly modeled on the French experience. In 1840 the first secular penal code was

adopted and secular courts were established. In the same year the Ottoman Bank was established and the first Ottoman banknote was printed.

In 1856 an imperial decree assured equality in taxation and in certain other levies, where previously there had been discrimination between Christians and Muslims. Nor was modernization during the Tanzimat Period limited to administration. Ottoman literature, music, theater, and sports were also transformed from classical Islamic to Western forms.

The Tanzimat reforms came to a halt in the mid-1870s, during the last years of Abdulaziz's reign. When the ideas for a Turkish constitution and a parliament were rejected by Sultan Abdulhamid II, the Tanzimat Period ended.

TAOISM The term *Taoism* (or, in pinyin romanization, *Daoism*) has been used to denote different philosophies, a variety of religious practices, numerous procedures of alchemy, and various approaches to traditional Chinese medicine. It is also used to connote things profound, mysterious, and sublime.

Although many Taoists believe that the teachings of Taoism were manifested by the cosmic Way (Tao) itself, its historical origins are obscure. Shamanistic practices of South China and Southeast Asia may be the source of Taoist ideas of nature and mystical union with nature. Some historians attribute the birth of Taoism to hermits such as Yang Zhu (c. late fourth century BCE), who is noted for advocating a type of individualism. Tradition usually credits its inception to Laozi (the "old master," said to have flourished in the sixth century BCE), who may or may not have been a historical person. Legend has it that Confucius met Laozi but did not understand him. A careful study of Confucian and Taoist teachings reveal a number of common values, such as humility, frugality, admitting ignorance, caution in speech, and ruling without coercion. Though Confucianism and Taoism may have sprung from a common ground, they parted company

to form complementary but opposing belief systems. An old saying has it that the Chinese were "Confucian by day and Taoist by night."

Early Taoism

The seminal text, called *Laozi* (after Laozi) or *Daodejing*, is attributed to Laozi. Its teaching of "acting by nonaction" makes the most sense in the political arena where the ruler "administers the empire by engaging in no activity" (Chan 1963: 166) while ministers handle the affairs of state. The *Laozi* advocates a type of limited anarchy or laissez-faire approach to government that is echoed in the *Analects* of Confucius. The Legalists (philosophers who took a generally negative view on human nature), especially Hanfeizi (d. 232 BCE), were attracted to passages in the *Laozi* advocating that the masses be kept ignorant and left to lead a simple existence. Some of the poems in the *Laozi* give guidance on self-cultivation and descriptive cosmology. These aspects of the text gave it a lasting quality, inspiring further philosophical speculation, meditative techniques, and religious ideals. By the time of Emperor Wu (156–87 BCE) of the Han dynasty (206 BCE–220 CE) the *Laozi* was being chanted at court.

Zhuang Zhou (c. fourth to third centuries BCE) is the second major figure in Taoism, and the text that bears his name, the *Zhuangzi*, has left its mark on Taoist philosophy and religion. We know very little about his life. He may have held a minor post; he probably declined being prime minister. Based on the first seven, or inner, chapters of the *Zhuangzi*, which are attributed to Zhuang Zhou, we can surmise that he was a man of letters and a very creative thinker and writer.

Because things are constantly changing, Zhuangzi advocated a type of contextual understanding in which things abide according to the circumstances of their existence. Part of his contextualism led to the realization that one's understanding is always limited to one's restricted perspective. Zhuangzi celebrates the world of change and transformation with the expectation that humans can transform and return to the serene unity of nature. The *Zhuangzi* is replete with meditative images and practices—being as clear as the dawn, being like dead ashes or a withered tree, fasting the heart-mind, losing the self—images that were used later in Zen Buddhism to describe meditation.

The *Zhuangzi* also contains many fanciful figures, gods, spiritual beings, and immortals. It is easy to see how some later readers understood the text to be proposing that in the process of entering the serene unity of nature one becomes an immortal. Zhuangzi's imaginative images were later taken to be literal de-

scriptions of the immortals; hence it was thought that immortals do not eat the five grains, that they live off of the mountain wind and dew, that they fly in the clouds or air and drive dragons, and so on. The outer chapters of the *Zhuangzi* discuss *shen* (spirit), *jing* (vital essence), and *qi* (vital breath, or energy), which became important concepts in later Taoist meditation, alchemy, medicine, and liturgy.

Yellow Emperor and Huanglao Taoism

Many innovations in philosophy, especially political philosophy, alchemy, and medicine from the third to the first centuries BCE were attributed to the mythical Yellow Emperor (Huangdi), who, according to legend, ruled China in the third millennium BCE. For example, the afterword of the classic *Lushi chunqiu* (Master Lu's Spring and Autumn Annals, c. 241 BCE) claims that the cosmic harmony teachings of that text were derived from his doctrines. Certainly *Huangdi neijing* (The Yellow Emperor's Classic of Internal Medicine) is the *locus classicus* of Chinese medicine.

The political philosophy of the Yellow Emperor and Laozi became closely associated during the Warring States Period (403–221 BCE), and the contraction Huanglao (Huang + Lao) was commonly used in the early Han dynasty. The Huanglao teachings entailed longevity practices, renouncing wealth, and governing without interference. The Huanglao political philosophy sought to make Taoism practicable.

While some read and interpreted the *Laozi* and *Zhuangzi* as philosophical guides in rulership, cosmology, and self-cultivation, others interpreted those texts in a spiritual manner as companions to the *Chuci* (Songs of Chu), which depict ecstatic journeys of shamans (*wu*). Out of shamanic, alchemical, and longevity techniques developed the magical and medical arts of the *fangshi*, the men of methods. The *fangshi* were also called *daoren* (people of *dao*) or *daoshi* (scholars of *dao*); in this context *dao* means "methods" or "arts" while also connoting the cosmic Way. The practice of acting by not acting and the quest for longevity and thus immortality, which were advocated independently in different sections of the *Zhuangzi*, became fused during the Han dynasty.

Later Taoism

During the latter portion of the Han dynasty, known as the Later, or Eastern, Han dynasty (25–220 CE), the country was weakened by flood and famine, and rebellion became inevitable. Two different revolutionary Taoist movements developed. In eastern and central China, a rebel group known as the Yellow Turbans,

THE TAO OF TEA

Tea is more than just a beverage as far as the Chinese are concerned. The Taoist philosophy views tea as a harmonization of earth, metal, water, wood, and fire—as the following extract demonstrates:

EARTH

WATER

rain and mist

and

FIRE

Sunshine

combine to make the tea leaves

EARTH is the source of colorful ceramics, tea's adornment.

METAL is the resource from which kettles are fashioned.

WATER, in its purest form, is 'the friend of tea'.

WOOD is the substance from which tea is born.

FIRE is the 'teacher of tea' in that it moulds tea's character during processing and again during its brewing.

Water and fire interact to release the hidden potentialities of the leaf.

Source: John Blofeld (1985) *The Chinese Art of Tea*. Boston, MA: Shambhala. (144)

who worshiped Huanglao, rose up, but they were vanquished by the Han army. Despite their demise, many of their practices persisted, especially among women and peasants. Those practices probably influenced the development in Sichuan of the Way of the Five Baskets of Rice (Wudoumi Dao), a Taoist movement of the same period that later evolved into the Way of the Celestial Masters (Tianshi Dao). Both the Yellow Turbans and the Celestial Masters advocated that the ideal Taoist sage-ruler is also a religious leader; both followed the *Taipingjing* (Classic of Great Peace), which advocated a utopian philosophy and was written before 140 CE by an unknown author, both effected cures through the written confession of one's faults and meditation retreats in solitude, reciting sacred texts, and an ecclesiastical hierarchy based on the triad of Heaven (executive administrators who communicated with the gods and received revealed texts), Earth (mid-level managers who administered the lower level), and Man (lower level managers who organized and instructed laypeople).

By the third century, the Celestial Masters had infiltrated the aristocracy. Kou Qianzhi (d. 448 CE) brought the Celestial Masters into prominence between 424 and 448 at the court of Wei, one of the small kingdoms that flourished between the collapse of the Han dynasty and China's reunification under the Sui dynasty in 581. This was the first time Taoism was officially instituted as a state religion. Although various sects developed later, the original system of organization and the hereditary descent of the Celestial Master as the head of the Taoist Church continue to this day.

Profound Studies

After the Han, while liturgical Taoism was gaining momentum, there was a renewed interest in philosophical Taoism, which is associated with the Seven Worthies of the Bamboo Grove and so-called Profound Studies (*xuanxue*). The Seven Worthies were noted for defying social conventions, drunkenness, and engaging in pure conversations. Two of the Seven Worthies wrote important commentaries on the *Laozi* and *Zhuangzi*. The commentary of Wang Bi (226–249) on the *Laozi* and the commentary of Guo Xiang (d. 312) on the *Zhuangzi* are the most noteworthy of this period. Wang and Guo advocated Taoist cosmology, but remained Confucians in their social and political thought. Wang Bi strengthened the understanding of imperceivable existence (*wu*, often rendered as "non-being") and vacuity (*xu*); he was also the first to outline the relationship between substance and function that would dominate later philosophical thought. Guo Xiang developed the concept of natural spontaneity (*ziran*), proposing an intriguing philosophy of spontaneous order.

Other Sects of Religious Taoism

Before the Celestial Masters movement had gained prominence in the south, Ge Hong (c. 280–343 CE), a Taoist alchemist, wrote *Baopuzi* (The Master Who Embraces Simplicity). Inspired by the descriptions of immortals in the *Zhuangzi*, *Songs of Chu*, and the *Biographies of Immortals*, Ge Hong sought immortality for himself. Some of his basic practices included physical and mental fasting and purification, aligning meditation and alchemy techniques with auspicious days of the calendar, ingesting vegetable and mineral drugs, increasing vital essence (*jing*, semen) symbolically in meditation or literally by sexual hygiene techniques, avoiding cereals, and using sacred texts and talismans that give the practitioner the divine assistance needed to effectively summon spirits, align macro- and micro-cosmic correlations, and attain immortality. Shortly af-

ter Ge Hong's death, the Highest Purity (Shangqing) sect developed.

Highest Purity

Founded at Mount Mao, the Highest Purity sect was the first school to be demarcated within, and subsequently to seek separation from, the Celestial Masters tradition. Between 364 and 370, Yang Xi (c. 330–386) received revealed texts at night from gods and spirits; these formed the foundation upon which the Highest Purity developed. The multitalented historian, biographer, herbalist, and Taoist theoretician Tao Hongjing (456–563) compiled and codified the texts, making an early Taoist canon. The Highest Purity teachings downplayed the physiological exercises, drug use, and legal aspects of the Celestial Masters and greatly modified their alchemical practices. The Highest Purity movement emphasized interiorization, placing special emphasis on visualization techniques in meditation.

Spiritual Treasure Liturgy

The Highest Purity school had reached its climax by the end of the fourth century. Drawing from the Highest Purity texts, Confucian moral virtues, and the rituals of Buddhism and the Celestial Masters, the Spiritual Treasure (Lingbao) liturgy took shape. Influenced by Buddhism, the Spiritual Treasure school advocated that one's personal liberation could only be had with the universal liberation of countless humans. Other influences led to the chanting of Spiritual Treasure texts, the use of mantra chants, and mudras (hand gestures).

The Spiritual Treasure liturgy developed in complexity over the next 1,600 years. The rites basically have three parts. First, the altar must be prepared with the announcement of vespers. The core of the ritual enacts the mystical union of the high priest with the Tao. The priest undertakes a symbolic cosmic journey to ascend into the heavens, seeking audience with the gods and Tao. He dances the "step of Yu," brandishing his sword to ward off demons while his thumb traces his footsteps on the joints of his fingers. This is accompanied by acolytes chanting texts; playing instruments, and burning incense. Finally, the master returns from the heavens to make the proclamation of merits. By uniting the forces of the cosmos within himself and the spirits that inhabit his body, the priest has increased his personal power and brought benefit to the community. Taoist rites came to play political and social therapeutic functions in that they were believed to restore political harmony or cure society and individuals of physical and spiritual problems.

Taoism continued to grow and transform. During the Tang dynasty (618–907) it became a state religion again. Tang dynasty Taoism was noted for its development of interiorization; the macrocosm was contained within the adept's body. In the Song dynasty (960–1279), Wang Zhe (1123–1170) established a monastic movement called the Complete Reality or Fundamental Truth (Quanzhen) school which still exists today.

After Buddhism entered China, Buddhist translators used Taoist terms to translate Buddhist concepts. Antinomian tendencies in Buddhism wedded Taoism to produce Chan (in Japanese, Zen) Buddhism in China. As noted above, religious Taoism borrowed ritual practices and philosophical ideas from Buddhism; these included funeral rites and the concepts of reincarnation and universal liberation. Zen Buddhism left a lasting impression in Korea and Japan, and Taoism's love of nature and the quest for immortality influenced Korean and Japanese arts and religious beliefs.

Taoist philosophy and religion are alive and well in China today. The 1982 constitution of the People's Republic of China reinstated freedom of religion, and Taoist monks and priests returned to the temples and monasteries. Taoist religion and philosophy are taking root in North America too, among Chinese immigrants and non-Chinese alike. Philosophical ideas and religious and meditative practices labeled "Taoism" continue to inspire and liberate the human imagination.

TAOISM—KOREA Taoism, along with Buddhism and Confucianism, first entered Korea during the Three Kingdoms period (c. 300–668). Unlike Buddhism and Confucianism, however, Taoism never established a significant institutional presence outside the capital. The only Taoist temples in Korea were government-sponsored temples, and the few Taoist priests performed rituals for the king and the central government only. There were no Taoist temples available to the general population.

State support of Taoist temples was sporadic. In 650 the Koguryo kingdom (37 BCE–668 CE) erected two Taoist temples in the short-lived hope of gaining a spiritual advantage over its rival Korean kingdoms. The Koryo dynasty (918–1392) funded several Taoist temples to supplement its network of Buddhist temples. One of those official Taoist temples survived into the Choson dynasty (1392–1910), and its priests continued to perform rituals on behalf of the royal family until that temple was destroyed in the Japanese invasion of the 1590s. When the last official temple disappeared, Taoism in Korea lost its separate institutional identity.

Taoism nevertheless survived in Choson Korea as a part of popular religion and as the source of longevity-enhancing practices among the neo-Confucian ruling elite. Publication of two Taoist works from China, the *Yushujing* (Classic of the Jade Pivot) and the *Qixingjing* (Classic of the Big Dipper), and their popularity among commoners in the second half of the dynasty, is evidence of the Taoist penetration of Korea's popular religion, as is the publication after 1700 of Korean

vernacular translations of Taoist manuals of life-span calculation. The inclusion of such Taoist deities as the Jade Emperor among the gods shamans worshipped is further evidence of the assimilation of elements of Taoism into popular religion.

Internal alchemy, on the other hand, was assimilated into the neo-Confucian culture of the ruling elite. Starting in the fifteenth century, scholars began reading and writing commentaries on such alchemical texts as *Hwangdingjing* (The Yellow Court Classic) and the *Cantong qi* (Triplex Unity). Renowned neo-Confucian scholars such as Yi Hwang (1501–1570) practiced Taoist breath-control techniques and physical exercises. Interest in internal alchemy techniques subsided after the seventeenth century, only to revive again in the 1970s. In the final decades of the twentieth century, there was an internal alchemy boom as centers for studying "cinnabar field breathing" and pursuing the "way of mountain immortals" began opening throughout South Korea.

TARAI The Tarai is an important geographical sub-region in the north of India and the south of Nepal that is home to several national parks and the site of a regional Green Revolution in agriculture. The Tarai is a narrow strip of land running along the base of the foothills of the Himalaya Mountains. It varies from about two to fifteen miles in width and extends from the Indo-Pakistan border through Nepal and the Indian states of Uttar Pradesh, Bihar, and West Bengal.

In the first half of the twentieth century the Tarai consisted of a series of swamps and forests famous for abundant wildlife, including elephants, tigers, and leopards. The Tarai had a small human population that included *adivasi*, or indigenous groups, such as the Tharus, Buxas, Gujjars, and Gaddis. The size of the human population was limited by the impact of the virulent malaria endemic to the area.

Beginning after 1950, the Tarai in both India and Nepal was subject to a substantial process of economic development. The swamps and forests were cleared and new agricultural technologies were introduced, which led to the initiation of the Green Revolution. As part of this process, India's first land-grant university, G. B. Pant University, was located in the Tarai

region of Uttar Pradesh. The Tarai is also home to some of the premier national parks and Project Tiger reserves in South Asia, including Corbett National Park and Dudhwa National Park in India and Royal Chitwan National Park in Nepal.

TARIAN ASYIK *Tarian Asyik*, which means "the dance of a lover," is a classical Malay court dance that was popular in Kelantan (a state on the east coast of West Malaysia) and Patani (a state south of Thailand that was part of the Patani Malay Sultanate in the fifteenth century). *Hikayat Patani* (The Story of Patani, 1730) mentions that during the reign of Raja Kuning (a queen who ruled Patani in 1644), there were twelve *asyik* dancers at her court who gave performances during official ceremonies as well as at festivals and court marriages. The dancers were maids of the palace.

The dance was created on the instructions of a king who mourned for his favorite pet, a beautiful bird that had escaped its cage. The king went on a long search to find the bird, but he came back empty-handed. Brokenhearted, he asked that a dance be created that imitated the movements of the lost bird. Initially ten dancers enter the stage and sit gracefully. Then Puteri Asyik (Princess of Love) enters and the dance begins. The gracious and delicate movements of the dancers create a romantic atmosphere. The dancers wear long dresses made of silk and display jewelry on their bodies and waistbands. The musical instruments that accompany the dance include eleven types of *gedombak asyik* (a small drum), *gambang* (a xylophone-like instrument, usually made of slabs of wood or bronze), and *rebab* (a bowed lute). Dancers wear local flowers in their hair. Today, the dance would be performed by young girls, and it has become a dance for the common people and is usually performed at festival and cultural shows, obviously no longer a court entity.

TARIAN PORTUGIS *Tarian Portugis*, or "Portuguese dance," is a term given to an eclectic performance repertoire associated with the Malaysian-Portuguese community. The dances are performed, often for tourists audiences, by troupes from the Portuguese Settlement in Malacca.

The *Tarian Portugis* tradition was "invented" in 1952, when a small group of upper-class Eurasians from Malacca who were preparing to entertain a visiting Portuguese dignitary learned a few dances from a book on Portuguese folk dances. The dance group remained popular after its initial performance and new dances were slowly added to the repertoire. The upper-class community faded away after Malaysian independence, and the dance group was taken over by youngsters from the lower-class fishing community who lived in Malacca's Portuguese Settlement (a reservation-like village established in 1926 by the British colonial government).

Since these performers were not able to learn new repertoire from printed sources, they composed and choreographed new dances in a similar style, using Kristang (the local Portuguese creole language) instead of Portuguese (which no one fully understood) for texts. In the mid-1970s, there was a new injection of repertoire from Portugal, though this time the dances were more "folkloric," with faster music and more complex choreography.

The only dance that can properly be described as indigenous to the community is the *branyo*, a flirtatious social dance in which couples advance and retreat without touching each other. Characterized by an alternating 3-2 rhythmic pattern, the *branyo* is similar to (and perhaps a precursor of) the national Malaysian social dance, *joget*. The most famous *branyo* tune, "Jinkly Nona," has become a national Malaysian folk song. Verses from this song are found in Portuguese communities from Sri Lanka to Macao, linking the Malacca community to a wider historical Portuguese diaspora.

TARIM BASIN The Tarim Basin encompasses the interior drainage in northwest China located between the Tian Shan and Kunlun Shan of Central Asia. The region comprises 906,500 square kilometers (530,000 square miles) of mostly shifting sands, dry lake beds, and undulating expanses of arid terrain. The Taklimakan Desert occupies the lower basin. The Tarim appellation appropriately describes a river that either flows into a lake or that meanders amid desert sands. Temperature extremes of minus 20° to plus 50°C (minus 4° to 120°F) and annual precipitation of just 50–100 millimeters (2–4 inches) define this desert climate. Vegetation is very sparse except for riparian stands of poplar and wormwood, willows, sea buckthorn, Ural licorice, and Indian hemps.

Oasis agriculture in small and far-flung settlements produces grains, cotton, fruits, wool, and silk. Khotan jades, and tourism are growing in importance. Recent oil discoveries will make this a significant source of China's energy supplies in the next century. Since the 1980s, archaeologists have unearthed well-preserved remains of bodies dating back at least 4,000 years. Nuclear tests have also been conducted here.

TARSUS (2002 est. pop.212,000). The town of Tarsus is located in southern Turkey on the Cilician Plain, just twenty kilometers from the Mediterranean Sea. Tarsus was the capital of a minor kingdom as far back as the Bronze Age (2500 BCE) and lies on a navigable river, the Tarsus Cayi, at the junction of the main coastal road and the link to the interior through the Cilician Gates.

Its strategic location made Tarsus a target of various powers' expansions; the Assyrians campaigned there around 700 BCE, and Rome absorbed the city in 67 BCE. The city was especially important during the Roman and early Byzantine empires. The Arabs conquered it in the seventh century, and other invaders—Byzantines, Crusaders, Mamluks—successively took the city until it fell to the Ottomans in the early sixteenth century.

Tarsus is famous as the meeting place of Cleopatra (69–30 BCE, who arrived by barge) and Mark Antony

after his triumph at the battle of Philippi; a Roman gate in the city is named after the Egyptian queen. Tarsus was also the birthplace of Saint Paul, who described it as no mean city.

Partly excavated ruins abound in the back streets; the town's current prosperity is based on cotton and light industry. With Tarsus American College and a university, it has remained an educational center.

TASHKENT (1997 pop. 2.5 million). The capital of Uzbekistan, Tashkent is the largest city in Central Asia. Located 440 to 480 meters above sea level, Tashkent occupies an advantageous position on the frontier between the Eurasian steppe and the oases of Transoxiana. The earliest archeological remains date from the beginning of the Common Era, and the city officially celebrated its two-thousandth anniversary in 1983. Known as Shash or Chach, the city lay astride the trade routes connecting East Asia with the Middle East and Europe. The first mention of the name "Tashkent" dates from the eleventh century.

Although always a substantial trading center, Tashkent was never politically prominent until the nineteenth century, when Russian armies conquered it in 1865 and made it the capital, in 1867, of Russian Turkestan. The consolidation of Russian rule catapulted Tashkent into preeminence in Central Asia. The Russians built a separate European quarter next to the old city, its planned layout a self-conscious advertisement for the new imperial order. Although this "new city" was not ethnically segregated, its spirit was very much that of a Russian city. It was here that revolution took place in 1917, accomplished mostly by Russian workers. The legal division between "old" and "new" Tashkent ended only in the mid-1920s, while in social fact its traces still remain.

In the Soviet period the city grew dramatically. The industrialization drive of the 1930s swelled the city's population, and substantial industrialization took place during World War II. Elements of urban planning transformed the old city, while parts of it were entirely redeveloped. From the 1950s on, Tashkent became a showpiece to the Third World of the Soviet path to development and industrialization. Thousands of stu-

The Davlat Muzeyi Museum and Mosque in Tashkent in 1997. (DAVID SAMUEL ROBBINS/CORBIS)

dents from Africa, Asia, and the Middle East attended its universities and institutes.

A massive earthquake leveled Tashkent in 1966; only the adobe houses in the old city survived intact. As a result of extensive rebuilding, Tashkent is an excellent example of Soviet city planning, but with few traces left of its antiquity. A new wave of construction in the 1990s produced several public buildings in a "neo-Timurid" style expressing the identity the post-Soviet regime has sought to forge for Uzbekistan.

Today Tashkent forms the core of the most industrialized zone in Central Asia, with light industry and agricultural machinery predominating. Tashkent boasts the busiest airport in Central Asia, four universities, the Uzbekistan Academy of Sciences, and numerous vocational institutes.

TATA FAMILY The Tata family, a Bombay-based family of Parsi industrialists, philanthropists, and businessmen, rose to prominence in the nineteenth century. Most prominent was Jamsetji Nasarwanji Tata (1839–1904), who had entered his father's office in 1858 after an education at Elphinstone College, Bombay, and so begun a brilliant commercial career. First he worked in establishing cotton mills in Bombay and Nagpur, and invested heavily in property, plowing the profits back into numerous educational and social welfare concerns for the benefit of the general public. Then he formed a company to exploit the iron ores of Orissa, since his elder son Dorabji Tata (1859–1932) had found the iron reserves there. A younger son, Ratanji Tata (1871–1918) helped his father form the Iron & Steel Company and its heavy engineering facilities. This enterprise culminated early in the twentieth century in the development of a new and modern industrial city, Jamshedpur, which is still the center of the Indian steel industry, located near iron ore, coal, and ready tribal labor.

Among J. N. Tata's other achievements were the introduction of a silk industry near Bangalore, on Japanese principles, and the building of the great Taj Mahal Hotel in Bombay. Among his many benefactions was the founding of a research institute at Bangalore which in time became the Indian Institute of Technology.

A grandson, Jehangir R. D. Tata (1904–1993), worked for much of his life in the Tata Iron & Steel

Company. In 1929 he became the first aircraft pilot to qualify in India, and in 1932 he started the Tata Sons Aviation Department, to provide airmail services in South Asia (initially Karachi-Bombay and Bombay-Delhi). This private airline grew to become Air India eventually. In 1938 he became the director of all the Tata companies.

TATARS The name Tatars (also spelled Tartars) refers to several Turkic peoples and ethnic groups living in Asia and Europe, among them the Astrakhan Tatars, Budjak Tatars, Crimean Tatars, Dobrudja Tatars, Siberian Tatars, and Volga-Ural Tatars. The most populous group, the Volga-Ural Tatars, numbered approximately 6.7 million people in 1989. They are the Russian Federation's second-largest nation, and together with the Astrakhan and Siberian Tatars are usually called just Tatars.

Subgroups of the Volga-Ural Tatars include the Kasimov Tatars, Kazan Tatars, Mishars, and Kryashens. In turn, the Kazan Tatars include Central, Teptyar-Bashkir, Southeastern, Perm, Chepets, and Ichkin groups. The Mishars are further subdivided into Northern, Southern, Lyambir, and Ural groups; the Kasimov Tatars comprise the White Aimak, Black Aimak, Black Zipun, and Bastan groups; and the Kryashens include Kazan-Tatar Kryashens, Yelabuga, Nagaibek, Molki, and Chistopol groups.

The Crimean Tatars consist of three main groups: the Nogais, Tats, and Yaliboilus. All Crimean Tatars were exiled from Crimea (then part of Russia; now in Ukraine) to Uzbekistan and Kazakhstan in 1944 for alleged collaboration with the Germans during World War II. They regained their civil rights in 1956 and have been permitted to return to Crimea since the late 1980s. They live mostly in Crimea (250,000), Turkey (possibly 5 million, though most are assimilated) and Uzbekistan (250,000).

The Budjak Tatars live in Romania, mostly around Medgidia, Mangalia and Kostence. They number about 25,000 people. The Dobrudja Tatars live mostly in Bulgaria. According to a 1992 census, only 4,515 Bulgarians identified themselves as Tatars. These Bulgarian Tatars are scattered throughout northeastern

TATARS—THE EARLY WESTERN VIEW

The following text written by two French missionaries in the mid-nineteenth century provides a less than positive view of Muslim Mongols.

With the exception of their equestrian exercises, the Mongol Tartars pass their time in an absolute *far niente*, sleeping all day, and squatting all day in their tents, dosing, drinking tea or smoking. At intervals, however, the Tartar conceives a fancy to take a lounge abroad; and his lounge is somewhat different from that of the Parisian idler; he needs neither cane nor quizzing glass; but when fancy occurs, he takes down his whip from its place above the door, mounts his horse, always ready saddled outside the door, and dashes off into the desert no matter wither. When he sees another horseman in the distance, he rides up to him; when he sees the smoke of a tent, he rides up to that; the only object in either case being to have a chat with the new person.

Bulgaria, especially around Dobrich. Dohric, Vetovo, Rousse, Varna and Shoumen are the towns with the largest Tatar communities. The only remaining Tatar village is Onogour (in Dohrich district).

All Tatars speak related dialects, except for Polish, Lithuanian, and Belorussian Tatars, who have lost their Tatar language and speak, respectively, Polish, Lithuanian, and Belorussian.

History

The ancestors of Tatars created numerous states, such as the Hun kingdoms in Central Asia (204 BCE–216 CE) and central Europe (376–454 CE), Avarian khaganate, or kingdom (562–803), Great Bulgaria (603; en640), and Volga Bulgaria (910–1236) in Europe; and the first and second Turkic khaganates (551–742) and Khazarian khaganate (560–969) in Europe and Asia.

The term Tatar was first mentioned in the epitaph of the Turkic *khagan* (king) Bilge and his brother Kul-Tegin in the eighth century CE. Together with the

Mongols, the Tatars conquered vast territories in Asia and Europe in the thirteenth century under Genghis Khan and set up the largest land empire the world has ever known, the Mongol empire. The western part of this Empire later became known as the Golden Horde, which flourished in the fourteenth century. At that time, several Tatar cities were larger than any contemporaneous European city. Both nomadic and settled Turkic and non-Turkic peoples of the Golden Horde contributed to the melting pot known as Tatars. Kipchak, a Turkic language, became the common language for the Tatars.

In the fifteenth century, after the Golden Horde had broken up into several Tatar states, the languages and cultures of the population of those states continued developing. Different territories had different proportions of the same components (Turkic peoples of Europe and Asia) and numerous non-Turkic elements, including Finno-Ugrians (Mordva, Udmurts, Maris), Slavs (Russians, Ukrainians), Jews, and so forth. In addition, the Tatars captured many people from neighboring countries, including Latvians and Poles, and incorporated them into the Tatar states, which led to the development of particularities in the dialects and cultures of the descendants of Golden Horde Tatars.

Later all the Tatar states were subjugated by the growing Russian state. The majority of the Tatars continued to identify themselves as such, but with modifying words (for example, Crimean Tatars); others, such as the Balkars, Bashkirs, Karachays, Kazakhs, and so forth, took one of numerous tribal names. Furthermore, the presence of "Tatar" in an ethonym does not mean that the group in question is particularly close to other groups that use the word. For example, the language and culture of the Kazan Tatars are much closer to those of the Bashkirs than they are to those of Crimean Tatars.

Though many Russian noble families were of Tatar origin and Tatars had a great positive influence on Russian history, the rulers of Russia divided the Tatars into a variety of ethnic and territorial groups, declaring them separate nations and giving separate language status to their dialects. This Russian policy continues today.

The Tatars Today

Most Tatars are Sunni Muslims, though the Kryashens are Orthodox Christians. Tatars are not very devout Muslims; they never were very devout, even when they lived in their own independent states. Most Tatars go to the mosque only twice a year, during two biggest Muslim feasts. Usually during these feast days, after visiting the mosque, Tatars go home

or visit one another and drink vodka. Drinking alcohol is not compatible with being a Muslim and Arab Muslims bitterly condemn Tatars for this habit. There are also certain Tatar groups, descended from Golden Horde Tatars and now known as Karaims and Krymchaks, who are of the Jewish faith. The contemporary Tatar lifestyle does not differ significantly from that of surrounding peoples, although Tatars do have a greater inclination toward trading and entrepreneurship than do Russians and other neighboring peoples. Being Tatar is still something of which young people are proud, even if they no longer speak Tatar.

With the foundation of the Soviet Union in the 1920s, the Volga-Ural and Crimean Tatars were established in the Tatar and Crimean Autonomous Soviet Socialist Republics, respectively, in 1920 and 1921. The Crimean Republic was dissolved in 1945, and now Tatars have only one state in the Russian Federation: the Republic of Tatarstan. It is situated in the Volga and Kama river basin, with the City of Kazan as the capital.

TATSUNO KINGO (1854–1919), first modern Japanese architect. Tatsuno Kingo was born the son of a low-ranking samurai of the Karatsu domain, in what is today Saga Prefecture. He left the province to go to Tokyo to study at the Imperial College of Engineering (forerunner of the Department of Engineering at Tokyo University) under Josiah Condor (1852–1920), a British architect who came to Japan in 1877. After Tatsuno graduated in 1879 at the top of this class, he went to London and trained under the Gothic-revival architect William Burges (1827–1881). In 1883, he returned to Japan and became a professor and dean of the School of Engineering at Tokyo Imperial University. He worked to found an architectural academy and promoted the introduction of modern architectural construction methods and materials.

His career can be divided into an early period during which he employed and introduced classic design and a later period in which he developed his free

classic style. Tatsuno helped to introduce Western-style architecture to Japan, first with the Bank of Japan Building (1896) built in Italian Renaissance style; then with the Tokyo Station Building (1914), a brick-built structure based on Amsterdam Central Station, which was the last great Meiji period (1868–1912) construction project.

TAURUS MOUNTAINS The Taurus (*Toros*) Mountains are a folded limestone range lying between the Dalaman and Seyhan Rivers in southern Turkey. The range forms a horizontal S-shape, lying parallel to the Mediterranean coast, bordered on the south by an irregular level coastal strip and on the north by the central plateau, at an altitude of 1000 meters. The Taurus range is up to 150 kilometers wide from north to south and encompasses Turkey's lake district, including the freshwater lakes of Beysehir and Egirdir and the salt lakes of Burdur, Aci, and Salda. The main subsidiary ranges are (from west to east) the jagged Beydaglar (maximum height 3,070 meters), the Sultan Daglari (maximum height 2,610 meters), the Dedegol Daglari (maximum height 2,998 meters), the Bolkarlar (maximum height 3,585 meters), and the rose-pink Aladaglar (maximum height 3,756 meters).

In Greek and Roman times the southern plain was extensively cultivated and linked to the interior by roads running north from Antalya, Perge, and Tarsus. Control of the Cilician Gates, the major pass through the Taurus, was always of vital importance to local rulers. The Seljuks made Alanya their major port, and a network of caravan roads, some still in use, with inns (*kervansaray*), linked the capital at Konya to the south coast. Present-day main roads cut the range north from Antalya, Aksu, Manavgat, Silifke, and Adana.

The sparse population inhabiting the Taurus is mainly Yoruk, an original Turkish ethnic group with a distinctive highland culture. They practice transhumance, moving in spring with their flocks of goats and sheep from the coastal strip to high summer pastures. Many have settled permanently in the lowlands, where tomatoes, cotton, and cut flowers under glass are grown, or around the lakes, where apples are grown;

mountain villages are being abandoned. The Forestry Ministry (Orman Bakanligi) owns over 50 percent of the land in the Taurus and provides employment by cultivating pines. Mineral deposits of chrome, with some iron and lead, are either worked out or uneconomic. The southern coast is a popular tourist destination; not many venture into the mountains, but the Koprulu and Goksu Rivers are seasonally used for white-water rafting; trekking is important in the Beydaglari and Aladaglari.

TAXILA Taxila was the capital of Gandhara, an ancient kingdom in northwest India east of the Khyber Pass, which flourished from the sixth century BCE to the fifth century CE. Today Taxila lies in ruins near the modern city of Islamabad in Pakistan, but in its heyday the city was a center of culture and learning. Its location on the main route through the mountains into India ensured Taxila's importance in the commerce linking India, West Asia, and the rest of the world, and its vulnerability to foreign invaders.

Enfolded into the Persian empire in the sixth century BCE by Cyrus the Great (c. 585–c. 529 BCE), Gandhara became one of the wealthiest satrapies in the empire, and Taxila absorbed Persian culture along with its Vedic traditions. Alexander of Macedon (356–323 BCE) visited the city in 326 BCE during his conquest of Gandhara, but after Alexander's death, the Maurya dynasty (c. 324–c. 200 BCE) emerged to rule India.

Taxila became a center of Buddhism after the conversion of the Mauryan ruler Asoka (d. 238 or 232 BCE) around 261 BCE. During the succeeding Kushan dynasty (78–200 CE), established by Buddhist nomadic invaders from Central Asia, Taxila maintained its importance as a Buddhist center. The Gandharan style of Buddhist art emerged in Kushan times. Mirroring the blend of foreign, particularly Hellenistic Greek, and Indian elements in the society of Taxila, Gandharan art introduced the first representations of Buddha as a human being, depicted in elegant Greek style. Through the second century CE, Gandharan art had an immense impact on Buddhist art in Central Asia, China, and Japan, as well as India.

From the second century on, however, Taxila began to decline. The city was ravaged by the armies of

TAXILA—WORLD HERITAGE SITE

Designated a UNESCO World Heritage Site since 1980, Taxila vividly displays the varied cultural influences, from Mongolian to Greek, that were incorporated into Indus architecture between the fifth century BCE to the second century CE.

the Persian Sasanid dynasty (224/228–651) in the second century and was finally destroyed by the Huns in the fifth century.

Archaeologically, the city is represented by three successive sites. The Bhir Mound (Taxila I), the earliest site, is thought to have existed for three centuries until the second century BCE. Sirkap (Taxila II) was perhaps the most important city in the early historical period in northwestern India and remained in existence until the second century CE, when the Kushan rulers shifted the capital to the nearby site called Sirsukh (Taxila III).

TAY HOOI KEAT (1910–1989), Malaysian painter. Active in Penang in British Malaya, Tay Hooi Keat became well-known during the 1930s for watercolor paintings depicting Malayan life and scenery. His style combined traditional Chinese brushwork with European techniques. Tay was a leader of the Nanyang Art movement of colonial Malaya, which was

characterized by a diffusion of studio techniques and ideas about painting brought to Penang and Singapore by teachers trained in modern-oriented schools in coastal China.

Chinese by descent, Tay was educated in English in Christian schools in Penang, where he also later taught. During the late 1940s, he studied painting in London on a British Council grant. In 1957, the year of Malaya's establishment as an independent nation, Tay founded the Thursday Art Group in Penang, a group of artists committed to promoting modern Malayan forms of artistic expression. In the later stages of his career, Tay painted mainly in oils.

Tay Hooi Keat is the best-known early proponent of modern Malayan artistic consciousness, and examples of his work may be seen in major galleries in Malaysia and Singapore.

TAY SON REBELLION The Tay Son Rebellion (1771–1802) was a major peasant uprising in Vietnam that united the country for a short time under one popular ruler. The rebellion, which ended the Le and Trinh dynasties, was led by three brothers from the village of Tay Son in Binh Dinh Province, Nguyen Nhac, Nguyen Lu, and Nguyen Hue. The ruling Nguyen family's taxation policy and internal corruption led to increased financial exactions from the population in the south. Besides the peasant support, the Tay Son brothers also attracted support from powerful Chinese merchants who opposed restrictive trade practices. The brothers' main slogan was to seize the property of the rich and distribute it to the poor. In 1771, they began to build an army of disaffected peasants and minorities in the An Khe Highlands near Binh Dinh. By 1773, the army of some ten thousand men attacked and seized the Nguyen fort at Qui Nhon and later took control of the provinces of Quang Ngai and Quang Nam. In each liberated village, the Tay Son forces punished oppressive landlords and scholar-officials and redistributed their property. The Tay Son forces also distributed the food from storehouses to the hungry, abolished taxes, burned the tax and land registers, and freed prisoners from local jails. Army deserters, merchants, scholars, local officials, and monks supported the rebellion as it moved forward.

In 1776, the Tay Son killed all of the Nguyen family in Gia Dinh (later Saigon), except one sixteen-year old nephew, Nguyen Anh, who escaped to the swamps of the Mekong Delta. The Trinh, who ruled northern Vietnam, had taken advantage of the Tay Son rebellion to invade Nguyen territory after a century-long truce in their civil war. The Trinh armies in southern Vietnam eventually reached accommodation with the Tay Son and withdrew from the south, giving the Tay Son effective control over the southern part of the country by 1778. The youngest brother, Nguyen Hue, a military genius, was able to defend the Tay Son south from a counterattack by Nguyen Anh (1783), and from a massive assault by the Siamese armies (1785). By 1786, the Tay Son had captured the north from the Trinh, who were embroiled in a succession struggle and whose land had been hit by typhoons and plagued by poor harvests. The three brothers had united Vietnam, with each brother ruling a part of the country. Nguyen Hue, who had proclaimed himself king and changed his name to Quang Trung in 1788, was able to defend the northern area of the country and the principle city of Thang Long (later Ha Noi) from the Chinese (especially at the Battle of Ngoc Hoi-Dong Da in 1789). As king, Quang Trung carried out effective fiscal and military reforms, redistributed land, promoted crafts and trade, and actively sought education reform. He was also eventually able to establish friendly relations with China. Quang Trung died of unknown causes in 1792, and his ten-year-old son took the throne, only to be easily ousted in 1802 by the surviving Nguyen lord, Nguyen Anh, who took power and established the Nguyen dynasty as Emperor Gia Long.

TEA—CHINA The English word "tea" is derived from the southeastern Chinese pronunciation of *cha*, the name by which the beverage is known in north China and areas in contact with the north. The drink is an infusion of the leaves of the shrub *Camellia sinensis*. Before the Song dynasty (960–1279), powdered tea was preferred, but more recently tea has been consumed as dried (green tea) and often as dried and fired (sometimes fermented) leaves (black or "red" tea). Tea is accorded health-promoting qualities in China, and recent research has largely confirmed claims at least for green tea, but in categories different from those of traditional Chinese medicine.

Knowledge of the tea plant goes back as far as three thousand years ago in China. Valued at first as a medicine and a stimulant for meditation, it had by late Tang dynasty (618–907 CE) times come into more general

THE WAY OF TEA

During the Tang dynasty, the poet Jiaoren wrote the following verse, extolling the great spiritual meaning of tea.

A friend from Yeuh presented me
 With tender leaves of Yen-Hsi tea,
 For which I chose a kettle
 Of ivory mounted gold,
 A mixing bowl of snow-white teeth.
 With its clear bright froth and fragrance,
 It was like the nectar of Immortals.
 The first bowl washed the cobwebs from my
 mind—
 The whole world seemed to sparkle.
 A second cleansed my spirit
 Like purifying showers of rain.
 A third and I was one of the Immortals—
 What need have we for austerities
 To purge our human sorrows?
 Worldly people, by going in for wine,
 Sadly deceive themselves.
 For now I the Way of Tea is real.
 Who but Tan Ch'iu* could find it?

*Explained as the name of an Immortal—
 which carries the implication that one must come
 to that state in order to "know" the Way of Tea.

Source: John Blofeld (1985) *The Chinese Art of Tea*. Boston, MA: Shambala, 139.

use. Its mass popularity as a beverage dates from Song dynasty (960–1279) times, when tea cultivation in the mountainous south, particularly the Fujian highlands, became one foundation for the rapid economic expansion of the period. Once well established in Chinese cultivation, tea quickly spread to China's neighbors, including various Central Asian peoples, who took to it avidly, and to Europeans. Ultimately, it became the world's most popular drink. Although tea was not originally a primary commodity of the large-scale Chinese trade with the West that developed after the sixteenth century, it soon became one, and by the eighteenth century the Chinese tea trade was one of the driving forces of the world economy and an object of intense competition among the mercantile powers.

Today tea is found in many forms, from the mundane to teas costing small fortunes per ounce. By and large, the different forms are marked by regional variants, but cultivation, harvesting, and processing technology are also important in arriving at different varieties. China has also been known for its blended medicinal teas in which tea is combined with numerous other ingredients carefully chosen for their medicinal properties. Among the varieties, legend has it that the fermented "red" teas so preferred by the Europeans were first invented by accident when a whole shipment spoiled, only to have the tea eagerly purchased by European go-betweens. In fact, such teas were already being made in China, but it is also true that China tailored its tea production for European tastes just as it prepared special forms of porcelains and textiles for European customers.

TEA—SOUTH ASIA Although tea (*Camellia sinensis*) is native to China, tea production shifted from there to South Asia in the first half of the nineteenth century. Today South Asia is the most important producer and exporter of tea (in 1998 accounting for 30.3 percent and 38.8 percent, respectively). A massive

workforce, about 1.5 million people, is engaged in tea production in South Asia, and tea is responsible for a considerable, though declining, share of export earnings for the producing countries. Tea is produced in about twenty-five countries, the most important (outside South Asia) being China, Kenya, Turkey, and Indonesia. The main consumers are (in descending order of consumption) Russia, the United Kingdom, the United States, and Egypt. Tea is produced in three main varieties: as orthodox tea (main producer is Sri Lanka), as CTC-tea (where the leaf is cut, teared and curled before firing/heating; main producers are India and Kenya) and as green tea (manufacture without firing; main producer is China). In South Asia a large and growing proportion of tea is consumed internally (in India more than two-thirds of production) as a popular and extremely cheap soft drink (often prepared on the road in "tea stalls") and sold most often in packets, very rarely in bags or as iced tea.

India

India is by far the most important tea producer in the world. In India tea production began in 1838 and slowly spread from Assam (still the most important tea-growing area) to other parts of north India and later to south India (Nilgiri Hills). First planted by individual farmers, tea quickly became a company business owned by British firms, which withdrew from the subcontinent (especially in the 1950s and 1960s) only because of declining tea prices, growing labor unrest, strict (government-imposed) social obligations (to provide employees with free housing, schooling, health care and so on), and narrow ceilings on foreign ownership.

Most Indian tea is produced on big plantations; small landholders play a role only in south India. Although India is responsible for nearly 30 percent of world tea production, it accounts for only 16 percent of world exports, as an increasing proportion is consumed locally. The government has often intervened in tea exportation by setting export quotas to protect local consumers (tea is treated as an essential commodity), by restricting plantations' land acquisition and use through land reform acts, and by imposing heavy taxes on tea companies. The Indian tea industry is in a healthy condition, apart from a few "sick gardens" taken over by the government, and productivity per hectare is very high. Nonetheless in 2001 south Indian wholesale prices of five rupees per kilogram made tea production unprofitable for small producers.

Sri Lanka and Bangladesh

In Sri Lanka tea production began in 1867. Individual planters were soon replaced by British companies,

which managed their estates by means of local agency houses. Fieldwork and picking were carried out by an immigrant workforce that arrived in large numbers from south India until the Indian colonial government called a halt to the emigrations in the 1930s. The state has supported the expansion of the plantation system by taking over land to which nobody could provide a legal title, providing infrastructure, and ensuring generous tax treatment.

Independence in 1948 led to almost immediate revolt against the plantation system, escalating export taxes, government interference, and finally (in 1972 and 1975) nationalization of the tea estates, which were brought under two state corporations. Their unsatisfactory performance slowly paved the way for privatization of management in 1992 and for full privatization after 1996. Sri Lanka has lost export market shares (1998: 21 percent) and reputation for tea quality until recently; since privatization, performance is improving.

Bangladesh is responsible for only 1.9 percent of world tea production and consumes 60 percent of its own production.

The Future

Tea was once the pillar of India's and Sri Lanka's export economy and as such an easy target of anti-colonial agitation. Since independence, tea has lost much of its former economic importance in these countries. The falling relevance of tea exports (but not consumption) for South Asia could not have been avoided, because world consumption is increasing very slowly, causing tea prices (in real terms) to stagnate or decline.

TEA CEREMONY The Japanese tea ceremony (*chanoyu*) is a ritualized form of preparing and serving tea, usually in a carefully designed and controlled setting known as the tea room (*chashitsu*). A distinctive

feature of the ceremony is its containment entirely within this single room. The host, using a kettle and other implements, prepares tea and serves it in bowls to his guests. All participants in the ceremony, host and guests, are seated on tatami (rush mats), the traditional floor covering for Japanese rooms. The host serves his guests sweets and, depending on the formality of the ceremony, a meal, consisting of perhaps a few vegetables and a piece of fish. The host himself does not partake of either tea or food.

The tea ceremony evolved during the fifteenth and sixteenth centuries and reached its high point in the time of Sen no Rikyu (1521–1590), who is universally recognized as the greatest of the tea masters. In Rikyu's day, the leading tea masters stood at the apex of Japanese cultural life. They were respected not only as skilled performers of the ceremony itself, but also as men of taste in the various arts associated with the ceremony, including ceramics and lacquerware, room construction and decoration (the masters designed and decorated their own tea rooms), painting, calligraphy, and flower arrangement. Whereas the tea ceremony was performed almost exclusively by men in premodern times, from the late nineteenth century it became predominately a female pursuit.

Tea Enters Japan

Tea entered China from Southeast Asia, and by the seventh century CE it had become a popular drink throughout the country. Tea was esteemed by the Chinese for its medicinal value; it contains tannic acid, which is good for the health. In addition, it was treasured by the elite of society for its supposed spiritual quality. It was thought that by drinking tea one would be transported to a spiritual realm transcending everyday, mundane life.

Tea was transmitted to Japan in the early ninth century. The emperor and his courtiers in the capital city of Heian-kyo (Kyoto), enamored of China's higher civilization, drank and appreciated tea as an elegant beverage. At Buddhist temples, priests and monks consumed it primarily for their health. Tea drinking largely died out, however, in the late ninth and tenth centuries as the Japanese ended what had been approximately three centuries of cultural borrowing from China. The beverage was reintroduced to Japan in the late twelfth century by the Zen Buddhist priest Eisai (1141–1215), who praised tea as a medicine beneficial to the heart. Eisai also strongly recommended tea as an aid in the Buddhist practice of seated meditation. By the fourteenth century, tea had spread throughout Japan and had become a national drink.

There are three kinds of tea: black (fully fermented), oolong (partially fermented), and green (unfermented). Tea can be prepared in two ways—through infusion (dipping tea leaves into hot water) or by dissolving the leaves, after they have been ground into a powder, in the hot water. The tea ceremony uses green tea in powdered form. After placing powdered tea into a bowl several times larger than the Western tea cup, the host ladles in water and stirs tea and water into a frothy mixture with a split-bamboo whisk.

The Four Features of the Tea Ceremony

The tea ceremony, as it evolved in the fifteenth and sixteenth centuries, consists of four principal features: rules, setting (the tea room), personal relations (between and among host and guests), and taste (the aesthetic values governing the ceremony, its setting, and the articles used and displayed in it). Rules transform the commonplace function of drinking tea into a ceremony, which today is quite complex, with elaborate and detailed procedures governing every ritualistic aspect. The principal burden rests on the host, who must conduct himself in a highly formal manner, creating a proper and hospitable atmosphere. He or she must handle every implement in a carefully prescribed way. Whereas one can learn the rules for being a guest in a relatively short time, acquiring the true art of being a host takes years.

The tea room is a variation of a style of room that took form in the fifteenth century and became what we know today as the standard Japanese room. The room has sliding doors, either *shoji*, which consist of lattice-work frames covered with translucent rice paper, or *fusuma*, opaque cardboard-covered panels. There is an alcove, asymmetrical hanging shelves, and a low, installed desk that can be used by someone seated on the floor. The floor is covered with tatami. As a variant of the standard room, the tea room may lack features such as the asymmetrical shelves and the installed desk. Some tea rooms, however, have a unique feature of their own—the "crawling-in entrance" (*nijiriguchi*). This is a square or rectangular entryway, 45 centimeters in height from the floor, cut into one of the room's walls that obliges a person to enter by crawling on the hands and knees. The willingness to use this special entrance signifies humility and the acceptance of social equality among all the participants in a ceremony, at least for the duration of the ceremony. The *nijiriguchi* also gives guests the feeling that they are entering a unique microcosmic world.

The personal relations among the participants in a tea ceremony are traditionally imbued with the spirit of Buddhism, although the non-Japanese participant

who may not be a Buddhist is unlikely to feel that there is anything particularly religious about a tea ceremony. Among the values that people of tea emphasize are harmony (*wa*) and respect (*kei*), which presumably can be accepted by all people, whatever their religion or cultural background.

The aesthetics of the tea ceremony are many; indeed, they embrace the classical aesthetics of Japanese art and culture in general as they evolved over many centuries. Of particular importance to devotees of tea, however, is the aesthetic of *wabi*, a preference for the quiet, simple, and austere. Although not all tea ceremonies embody the aesthetic of *wabi* (some are more colorful and elaborate than others), the *wabi*-style is universally recognized as the ideal.

The Tea Ceremony in the Early 2000s

The tea ceremony is one of Japan's most enduring arts, and to learn how to handle oneself correctly at a tea ceremony is to acquire the essential features of traditional Japanese etiquette and manners. This is particularly so for young women, the principal students of the tea ceremony in modern times. Through study of the tea ceremony, young women learn how to wear kimonos correctly, how to walk and sit in a kimono, how to serve tea and food properly to guests, and how to conduct themselves with elegance and style.

TEAHOUSES Conceived as a place for aesthetic and intellectual fulfillment, the Japanese teahouse (*chabitsu*) is known for the simplicity of its design. Tea was a part of Zen monastic practice as early as the twelfth century, but it was not until the fifteenth century that the Zen priest Murata Shuko (c. 1422–1502) founded the formal tea ceremony. Shuko created the first tearoom, within the Togu-do, for the shogun

A woman performs the Japanese tea ceremony at the Yabunochi Tea School in Kyoto. (MICHAEL S. YAMASHITA/CORBIS)

Yoshimasa (1435–1490). The teahouse as a separate structure came into being in the late sixteenth century when the tea master Sen no Rikyu (1520–1591) designed a building specifically for preparing and drinking tea. The teahouse provides space not only for guests to enjoy tea but also for cleaning and storing tea utensils, along with a small anteroom for the waiting guests. While the teahouse is characterized by its restraint, this was not always the case: the shogun Hideyoshi (1536–1598) took this to the opposite extreme and used his gold-covered teahouse as a gaudy display of his power.

The teahouse itself was designed to embody a style of contrived poverty, with little interior or exterior ornamentation. Raw wood, thatched roofs, and straw tatami mats are typical of the natural materials used. This minimalism, however, is the result of careful consideration in which every detail contributes to the impression of refined simplicity. Care is reflected in both the design and construction of the teahouse: the precision and expert workmanship required here far exceed that of much more elaborate buildings, and those involved in its construction are considered to be artisans of the highest order. As important as the building itself is its garden setting. One type, the dry landscape garden, is a microcosm of the natural world in which raked sand suggests water, rocks are islands, and moss and shrubs are forests. Such gardens were designed for contemplation; strolling would disrupt the patterns in the carefully raked sand.

The teahouse is reached by a path (*roji*) of stones placed in a seemingly random pattern. This path symbolizes the initiation into the tea ceremony where the guest breaks ties with the outside world and achieves tranquility with each step along the approach. The teahouse thus serves as a haven from worldly cares; once inside, the guest is encouraged to cultivate a mood of meditative calm. The interior is small and the decor is simple: a painting and a flower arrangement set within an alcove (*tokonoma*) are typical adornments. Each item is selected so that no color or design is repeated, and asymmetry prevails. The beauty of the teahouse is appreciated only by those who are able visually to complete that which is incomplete. In the sixteenth century, the teahouse offered a refuge from politics and warfare. The tranquility and refinement of the teahouse continue to offer a refuge from the outside world.

TEDZHEN RIVER Rising in Afghanistan at an elevation of 3,000 meters, the Tedzhen (Tejen) is one of the main suppliers of water to northern Afghanistan, northeast Iran, and southern Turkmenistan. Within Afghanistan and Iran the river is known as the Hari Rud, taking the name Tedzhen only within Turkmenistan, where it waters the city and oasis of the same name.

The river is 1,150 kilometers in length and drains an area of 70,600 square kilometers. Fed by meltwater, the river's main flow is between the months of March and May, with a maximum flow of 990 cubic meters per second. The mean flow is just 30 cubic meters per second, and between the months of August and November the riverbed is usually dry. The river does not freeze.

In its upper reaches the river is no more than a mountain stream, but further downstream it provides the main source of water to the important Herat oasis in Afghanistan, where large volumes of water are diverted for irrigated agriculture. Below Herat, the Tedzhen forms the border between Afghanistan and Iran before becoming the boundary between Iran and Turkmenistan. Within Turkmenistan it flows via two

reservoirs, the Tedzhen (142 million cubic meters) and the Second Tedzhen (180 million cubic meters) into a broad valley where it splits into several channels before drying in the Kara Kum Desert. The entirety of the river's flow is here used for irrigation and the lower course has to be fed via the Kara Kum Canal.

TEHRAN (2002 est. pop. 11 million). The city of Tehran, capital of Iran, is located in the north-central part of the country at the foothills of the Elburz Mountains. It is the second largest city in the Middle East, after Cairo, with a population of more than 10 million. According to the historical records, Tehran was first cited by a twelfth-century traveler named Yaqut. Since then, Tehran has been mentioned more regularly in the literature, demonstrating its growing importance.

During the sixteenth and seventeenth centuries, the Safavid monarchs chose Tehran as a temporary resi-

dence. In 1796, Agha Mohammad Shah Qajar made Tehran his capital due to its ideal geographic location. However, city conditions were not modernized much during the reigns of Agha Mohammad or his two successors. In fact, it was not until Naser od-Din Shah's reign (1848–1896) that structural changes to the city were undertaken due to the influences of what the Qajar monarch had seen in his travels to Europe.

More substantial improvements to the city were not made again until Reza Shah Pahlavi's reign (1925–1941). During this time, the architectural landscape shifted to the neoclassical style, and many of the older buildings and features of the city were torn down, including ornate gates that were considered symbols of the "old Tehran." Moreover, summer resorts were built in the foothills of the Elburz Mountains, which became a popular retreat for the city's residents. The city underwent another architectural facelift in the early 1950s that was influenced by Iranians who had studied abroad, particularly in the United States. The 1960s and 1970s witnessed a tremendous expansion of the population of Tehran and of construction in the city, mainly because of the influx of capital from ample oil revenues. This growth brought with it the usual negative externalities associated with rapid development, such as pollution, housing shortages, crime, and even traffic jams. In the 1980s, the war with Iraq caused severe structural and economic damage to Tehran, which the government worked to restore in the 1990s.

A view of the interior of the Golestan Palace in Tehran. (BRIAN A. VIKANDER/CORBIS)

Currently, Tehran is home to several universities, including the famous University of Tehran, as well as museums such as the Archaeological and Ethnological Museums and the Golestan Palace. An international airport is located within the city's periphery to the west. Buses and taxis comprise the main public transportation system in Tehran, but a light rail system is under construction. The government is a major employer of the city's residents, and several industries are based in Tehran, including construction, financial, manufacturing, and petroleum processing. For these reasons, Tehran is considered Iran's cultural, social, political, and economic center.

TELUGU Telugu are speakers of the Telugu language, a part of the Dravidian language family, which also includes Tamil, Kannada, and Malayalam. Also known as Andhras, these people mainly live in the Indian state of Andhra Pradesh (population estimated at 74.0 million in 1998), but many Telugu live in adjoining states, and a significant number are found throughout the southeastern Indian state of Tamil Nadu. Smaller migrant communities are located in the United States, the United Kingdom, Singapore, and South Africa. The Telugu are predominantly Hindus.

The Telugu region of India has undergone a long history of changes. Over two millennia ago, the Andhra kingdom, with its capital, Paithan, lying in the current state of Maharashtra, was a Buddhist stronghold. Successor kingdoms included the dynasties of the Pallavas, eastern Chalukyas, Kalingas, Kakatiyas, and Cholas. The Hindu Vijayanagar empire in Karnataka and the southern part of Telugu land were the last Hindu kingdoms that ruled the Telugu. The Bahmani and Golkonda kingdoms that followed much later reflected Muslim domination in central India. During the sixteenth century European traders began to arrive at the seaport city of Machilipatnam, and by the eighteenth century the British had control of much of southern India, which they governed from Madras. The British also controlled the sultanate of Golkonda, based at the city of Hyderabad, which in turn dominated much of the central regions. Following Indian

independence from the U.K. in 1947, most of the Telugu territory became the newly established state of Andhra Pradesh.

TEMENGGONG *Temenggong* (also spelled *temenggung*) was the title of a high-ranking official, the commander of the troops and police, in the premodern Malay states. The term is undoubtedly related to the Javanese *tumenggung*. In the kingdom of Majapahit in the second half of the fourteenth century, this title was given to the commander in chief who belonged to the five top officials of the realm. In the Malay world there is general agreement that a ruler was supported by four senior officers, but there is no unanimity as to who these four were. Depicting the world of Melaka in the fifteenth and early sixteenth centuries, the *Sejarah Melayu* (Malay Annals) mentions the *bendahara* (prime minister), *penghulu bendabari* (treasurer), and *laksamana* (admiral), along with the *temenggong*. The *temenggong*'s principal concern was Melaka's security, and he was therefore in charge of the police and acted as chief magistrate. Later he became more important than the *penghulu bendabari* and was considered to be the *bendahara*-designate, equivalent to deputy prime minister in charge of internal affairs. According to the *Undang-Undang Melaka* (Laws of Melaka, i.e., the Melaka Digest), which dates from the fifteenth century, the *temenggong* was given jurisdiction over crimes committed in the country and matters such as the investigation of crime and the apprehension of criminals in the land, and was allowed to execute people he arrested without waiting for a royal order. The *Syair Sultan Maulana* (Poem of Sultan Maulana), dealing with events in the sultanate of Kedah in the beginning of the nineteenth century, shows us the *laksamana* of Kedah acting as commander of the fleet and its *temenggong* as commander of the troops.

Concerning the expressions *adat parpatih* and *adat tumenggung*, British colonial writers have erroneously translated *adat parpatih* as "law of ministers" and *adat tumenggung* as "law of the minister for war and police," which obscures the real character of the two systems. In the first place, the term *adat* has a much wider meaning than "law"; it also means "custom" and "etiquette" and extends to the legal system. Second, Parpatih and

Tumenggung were the names (or titles) of two legendary Minangkabau ancestors, Parapatih nan Sabatang and Kyai Katimanggungan, after whom the two varying *adat* were called. So *adat perpatih* designates the custom of the Minangkabau state of Negri Sembilan, and *adat temenggung* denotes "the customs instituted by our ancestor Kyai Katumanggungan"—the custom of the surrounding Malay territories.

TEMPLE OF HEAVEN Built between 1406 and 1420, the Temple of Heaven served as the prayer site for the emperors of the Ming (1368–1644) and Qing (1644–1912) dynasties in China. Every year, on the fif-

teenth day of the first lunar month, the emperor would come to the Hall of Prayer for Good Harvest (Qi Nian Dian) to pay homage to Heaven and pray for a good harvest. He would pay homage to his ancestors as well, because he was also regarded as the Son of Heaven. In early winter, the emperor would come again to thank Heaven for the good harvest. If a drought plagued China during the summer, the emperor would also come to the temple to pray for rain.

The Hall of Prayer for Good Harvest was built with much symbolism. Of the twenty-eight pillars that support the domed structure, the four large ones represent the four seasons, the twelve inner pillars represent the months in the lunar calendar, and the twelve outer pillars represent the twelve two-hour time periods of a day. The hall, 32 meters high and 24.2 meters in diameter, is also a masterpiece of traditional Chinese architecture. The Taiji Stone—on the Circular Mound Altar—and Echo Wall are sites where Chinese architects demonstrated their mastery of acoustics. The Temple of Heaven became a UNESCO World Heritage Site in 1998.

The Hall of Prayer for Good Harvests at the Temple of Heaven in Tianan Park, Beijing. (DEAN CONGER/CORBIS)

TEMPLER, GERALD (1898–1979), High Commissioner of Malaya. Gerald Templer was born in the year 1898 and was trained at the Royal Military College in England. He replaced Henry Gurney (who was assassinated during an ambush) as the High Commissioner of Malaya in 1951. He took on this post at the time Malaya was at the height of the Malayan Emergency (1948–1960), a full-scale war between the Malayan Communist Party (MCP) and the Malayan government. It was an armed revolution by the Communists, who wanted to set up a Communist state. However, the British succeeded in crushing the rebellion. Templer held both the civil and military offices, but as he himself was a soldier, he concentrated more on the military front, leaving the civil office to the deputy high commissioner, Donald MacGillivray.

During his tenure, Templer expanded the Malay Regiment by bringing in troops from Britain, Fiji, East Africa, Australia, and New Zealand, making it a Commonwealth effort to bring the Emergency to an end.

He showed great enthusiasm in his work. He was usually associated with tough military policies. He also introduced the so-called white areas, which were also known as the New Villages. These were areas that were tested and found clear of Communist insurgencies. Templer traveled throughout Malaya investigating the black areas—areas under Communist control or in which people supported the insurgents and punished those found guilty of working with the Communists.

Templer left Malaya in 1954, after considerably improving the military situation there. His policies and actions undoubtedly reduced the activities of the Communists in Malaya.

TEMPO *Tempo* is Indonesia's largest-circulation weekly newsmagazine. Founded in 1971 by Gunawan Mohamad, the magazine was best known for hard-hitting reportage that often got its editors in trouble with President Suharto's authoritarian New Order regime. *Tempo* was respected for standing up to censorship and to the draconian regulations that regulated Indonesia's quiescent media. *Tempo* was banned in

June 1994 for a report on Indonesia's purchase of thirty-nine East German warships and the corruption surrounding the deal. *Tempo*, along with two other magazines, was arbitrarily closed under a 1984 decree that allowed the government to revoke the license of any media organ whose coverage was not "responsible." The closure and the government's two attempts to have loyal allies of Suharto purchase the magazine, which is 60 percent owned by the workers, provoked violent demonstrations among its 400 staff, trade unions, and other supporters of press freedom. On 3 May 1995, in a surprising display of judicial independence, a court overruled the ban, stating that under Indonesia's press law, censorship and press bans were illegal. Although the court ordered the government to renew *Tempo's* license, the government refused and the Supreme Court eventually overturned the lower court's decision, effectively banning *Tempo*. Undeterred, the editors began publishing *Tempo* on the Internet. *Tempo* resumed publication following Suharto's resignation in May 1998. In 1990 it became the first publicly traded print media company in Indonesia, and it expanded rapidly. In addition to *Tempo* magazine, there is now an English edition, a daily newspaper, *Tempo Koran*, and an online edition, *Tempo Interactive* (www.tempointeractive.com). *Tempo* remains the most widely read and respected newsmagazine in the country.

TENASSERIM DIVISION (2002 est pop. 1.3 million). Tenasserim (Tanintharyi) is a town (founded in 1373) and division of southeastern Myanmar (Burma). The name *Tenasserim* is a Western corruption of the indigenous name for the town (pronounced Ta-nin-tha-ree) and, since 1989, Tanintharyi has officially replaced the colonial version. The division of Tenasserim is located between Mon State (to the northeast), the Andaman Sea (to the west), and Thailand (to the east). The division's population is chiefly Burman, Karen, and Mon. The capital of the division is Tavoy (Dawei).

Tenasserim's premodern importance was as a portage for the carrying trade of maritime merchandise across the narrow Kra Isthmus separating the Indian Ocean from the South China Sea. The opening of British ports at Penang in the late eighteenth century and Singapore in the 1820s, however, ushered in the decline of Tenasserim's maritime economy. After the British acquired the province of Tenasserim as a result of the First Anglo-Burmese War (1824–1826), they seriously considered giving it back to the Burmese

because of its poor economic outlook. The British were able to build a moderately prosperous colonial economy, however, through the exploitation of teak wood reserves, shipbuilding, and tin mining, largely with immigrant labor from China and India.

TERESA, MOTHER (1910–1997), Catholic missionary in India and winner of the Nobel Peace Prize. Mother Teresa of Calcutta was born Agnes Gonxha Bojaxhiu in Skopje, Serbia (now Macedonia). In 1928 she left for India as a Catholic missionary, taking the name Teresa. At first she taught in a convent school in Calcutta, and in 1937, when she took her final vows, she became principal of the school. In 1948, however, she left this position to begin work in the vast slums of Calcutta, where she opened a school for destitute children. In 1950 she founded a sisterhood, the Missionaries of Charity, in many ways reminiscent of the much earlier Sisterhood of Charity founded by Saint Vincent de Paul in 1633. Gradually other nuns joined her, and in 1952 Mother Teresa opened the House for the Dying, an early hospice for the poor. In 1957 Mother Teresa began working with lepers, and her sisterhood ministered in many disaster areas around the world. Universally revered for her humility, Mother

Mother Teresa holds a young boy from a Catholic orphanage in Calcutta in December 1979. (BETTMANN/CORBIS)

Teresa was awarded the Nobel Peace Prize for her relief work with the poor in 1979. Soon after her death in 1997, the Vatican began taking steps toward eventually conferring sainthood on Mother Teresa.

TERMEZ (2002 pop. 128,000). Termez is a port city on the Amu Dar'ya River in southern Uzbekistan, near the border with Afghanistan. It serves as the administrative center of Uzbekistan's Surkhandarya oblast (province).

The ancient town of Termez, slightly north of the current city, flourished in the first century BCE and was destroyed late in the seventeenth century CE. The present city originated as a Russian fort built in 1897. The city and nearby area is home to the remains of a Buddhist monastery, ruined forts, and medieval mausoleums. Termez celebrated its 2500th anniversary in 2001.

Termez entered the international spotlight in 1991 because of its proximity to northern Afghanistan. The Friendship Bridge, built across the Amu Dar'ya River during the Soviet-Afghan war (1979–1989), is the only bridge connecting Central Asia and Afghanistan. It was closed by Uzbekistan in 1998 when Taliban forces took control of the northern Afghan city of Mazar-e Sharif. Beginning in late 2001, the United Nations and international aid agencies used the bridge and port to deliver food, blankets, and other humanitarian aid into Afghanistan, after the collapse of the Taliban government. The presence of American and other forces is controversial and the city is largely closed to visitors.

TERRACE IRRIGATION In much of Asia, a shortage of natural lowland areas suitable for food cultivation has led to extensive terracing along the edges of the uplands. This was done in order to increase the acreage of flooded fields, which are required for wet rice cultivation. From India and China, where terracing first originated, to many parts of Java and Bali in Indonesia, in North Vietnam, and in Luzon in the Philippines, terraced irrigation works extend like huge flights of steps far up along mountainsides. These terraced fields have been built since antiquity and maintained at a prodigious cost in human labor and toil.

One of the major tourist attractions of the Philippines are the stone-walled terraces in northern Luzon. (STEPHEN G. DONALDSON PHOTOGRAPHY)

The rice terraces provide the most spectacular agricultural landscapes in Asia. Here, permanent irrigation has allowed the conversion of slopes along uplands into rice fields and fields of other crops with which the rice crop is alternated. While much of irrigation technology on terraced land is somewhat crude, dependent on mud and brush dams and short distribution canals, some groups of farmers, such as the Balinese and the northern Vietnamese, have created complex hydraulic systems. These societies have, since an early time, developed elaborate systems for carry-

ing as well as regularizing the water supply to fields used for crop cultivation. The famous Ifugao rice terraces of northern Luzon are one example, although they contribute a relatively small proportion of the national total of rice production and are not representative of typical Filipino rice culture.

How Terraces Are Built

Terrace building and water control, reputedly the "eighth wonder of the world," is a distinctive cultural phenomenon of Asia. Terracing, as done in many parts of Asia, consists of building stone walls, often without mortar, along the slope and contours of uplands being converted into cultivated land. The walls might be given a slight batter (receding upward slope) or inward lean at the top. These walls often exceeded six meters in height and were topped with sluices for water drainage. Earth materials would then be used to fill each unit to a level just below the top of the wall. By then staggering the field units in overlapping manner at different levels, a whole mountain slope might be terraced toward the top such that it resembled a sculptured system of fields covered with rice and other types of crops. The field units may be as narrow as 2.5 meters but as long as 90 meters on steep slopes. They are, however, commonly much wider and not so long. For irrigation, water is usually introduced at the top of a terrace series or sometimes as a complementary supply at an intermediate point. The water that is sup-

RICE TERRACES OF THE PHILIPPINE CORDELLIAS—WORLD HERITAGE SITE

Designated a UNESCO World Heritage Site in 1995, the mountain rice terraces of Ifugao have been used for over 2,000 years. The outstanding beauty of the irrigated fields and the sheer enormity of the terraces make for an extraordinary landscape.

TERRACING IN THE PHILIPPINES

Terraced fields snaking up hillsides are a spectacular sight and a major tourist attraction in Southeast Asian nations such as the Philippines and Indonesia. The following extract describing the types of terraces built by the Ifugao ethnic group of the northern Philippines indicates that terracing is more complex than it appears from a distance and a technology vital to the local economy.

Habal "swidden" (slope field, camote field, kaingin). Slope land, cultivated and often contour-ridged (and especially for sweet potatoes). Other highland dry-field crops (including taro, yams, manioc, corn, millet, mung beans, and pigeon peas, but excluding rice except at elevations below 600–700 meters (2,000 feet) above sea level) are also cultivated in small stands or in moderately intercropped swiddens. Boundaries remain discrete during a normal cultivation cycle of several years. When fallow, succession usually to a canegrass association. . . .

lattan "house terrace" (settlement, hamlet terrace, residential site). Leveled terrace land, the surface of which is packed smooth or paved but not tilled; serving primarily as house and granary yards, work space for grain drying, and so forth; discrete, often fenced or walled, and named. . . .

qilid "drained field" (drained terrace, ridged terrace). Leveled terrace land, the surface of which is tilled and ditch mounded (usually in cross-contour fashion) for cultivation and drainage of dry crops, such as sweet potatoes and legumes. Drained fields, though privately owned, are kept in this temporary state for only a minimum number of annual cycles before shifting (back) to a more permanent form of terrace use. . . .

payo "pond field" (bunded terrace, rice terrace, rice field). Leveled farmland, bunded to retain irrigation water for shallow inundation of artificial soil, and carefully worked for the cultivation of wet-field rice, taro, and other crops; privately owned discrete units with permanent stone markers; the most valued of all land forms.

Source: Harold C. Conklin. (1967–68) "Some Aspects of Ethnographic Research in Ifugao." *New York Academy of Sciences, Transactions*, ser. 2, 30: 107–108.

plied then moves through sluices in each field by gravity downward across each level of the terrace. Finally, the water empties into a stream channel at the bottom of the valley.

Water control, which is crucial in the use of terraces, consists of careful adjustment of the volume of water in the beginning and, hence, its distribution throughout the system of field units making up the terraced series. The system must therefore be able to

bring in the required volume of water at any time during the growing season. The system must also be able to divert excess water at any point at any time.

Types of Terracing

The types of terrace walls built and the materials used vary across Asia. While the Ifugao in northern Luzon build terrace walls of stone with a slight batter, the Bontoc people in the same region build stone

walls with almost no batter. By contrast, the Kallnga, also in northern Luzon, use a stone base wall and upper walls of earth with a high batter. Some groups build a few high-quality terrace walls with only a few levels, while others are known for terracing that is relatively sophisticated.

In Bali, both terracing and irrigation practices are elaborately organized through a remarkable system of aqueducts, and in some cases water is carried via tunnels through hillsides in order to distribute it from reservoirs to the cultivated fields.

Tremendous amounts of labor and toil go into the construction of the terrace walls, from the gathering of the earth fill for each field unit to the maintenance and repair that ensures the soundness of the terrace walls. Skilled water control, however, is the most important factor in maintaining good soil as well and high productivity of the field units.

With the possible exception of Java in Indonesia, all the main rice-growing areas of Southeast Asia acquired the basic method of wet-rice cultivation by cultural borrowing from India or China. The skills of some Southeast Asian wet-rice cultivators have declined rather than improved within recent times. The Thai farmers who had first learned of irrigated cultivation from the Chinese farmers of Yunnan, and who would have been familiar with the art of hillside terracing for irrigation, apparently lost this art in the course of migrating to the Menam lowlands. Similarly, in peninsular Malaysia, the Malays, who it is assumed learned their wet-farming techniques from the upland peoples of Sumatra in Indonesia—where, again, terracing was in widespread use for irrigated cultivation—also show no knowledge of the practice.

Terracing and Soil Fertility

Terracing of the fields not only served irrigation purposes but also provided a high degree of protection against the ever-present threat of soil erosion as well as loss of soil fertility. In many areas of rice and other crop cultivation using terraced irrigation and such traditional methods of farming, cultivation has continued for hundreds and even thousands of years without any serious erosion or loss of soil fertility. This has been the case particularly in areas where irrigation or floodwaters bring abundant mineral matter and where there is deposited a seasonal layer of fertile silt.

The existing area of wet-field terrace systems has grown probably because of population pressures on land as well as land scarcity in areas such as mountainous parts of Asia. Other crops apart from rice that

are cultivated in terraced fields include corn, cabbages, potatoes, beans, bananas, and even coffee trees.

TET Tet marks the Vietnamese New Year, considered the most important holiday and festival of the Vietnamese lunar calendar. Falling between 19 January and 20 February, the festival is celebrated during the first week of the first month of the lunar calendar. The first night of the new moon is considered the most important. Vietnamese view the holiday as a time of renewal and integration that solidifies the family. Tet is essential to Vietnamese cultural identity. During a week of leisure and celebration, people engage in such activities as various as painting and decorating homes, feasting, buying new clothes, visiting pagodas with the family, setting off fireworks, and making offerings and paying reverence to deceased family members. The playing of drums, bells, and gongs marks Tet festivities. Tet is celebrated by Vietnamese around the world.

TEXTBOOK SCANDAL (1902–1903). Thirty years after the Meiji government promulgated Japan's first compulsory education law, which called for a national school system under its authority, a protracted political and ideological debate over local versus centralized control of curriculum and textbooks would be brought to a dramatic conclusion in 1902–1903, with the so-called Textbook Scandal. The Ministry of Education, established in 1871, initially granted local governments considerable discretion over the selection of textbooks, and there was a variety to choose from. While the Ministry sponsored some publications, including translations of Western textbooks, most were produced by the private sector with little government oversight.

Beginning in the 1880s, the Ministry of Education moved to expand the central government's control over textbooks. In 1880, the post of "investigator" was created to scrutinize teaching materials used in the schools. Translations of Western works were ordered replaced, together with some works judged too liberal. The following year, the Ministry ordered schools to report which textbooks they were using, in order to weed out those banned by the Ministry. The Textbook Authorization Ordinance of 1887 required publishers who wished to sell textbooks to schools to submit them first to the Ministry for inspection and authorization. According to the Ministry, this measure was necessary to insure uniform coverage, quality, and price. However, it also heightened the specter of bureaucratic interference in local school affairs and served to expand the debate over control from the local to the national level.

One problem that the new authorization system failed to address was graft in the publishing industry. The magnitude of this problem was revealed in 1901, when newspapers began reporting on a government investigation that eventually discovered that more than twenty publishers had distributed bribes, gifts, and entertainment to local education officials, government school inspectors, and others in an effort to market their textbooks. By the end of 1902, the government had brought charges against 152 individuals, including principals, other school officials, bureaucrats, and the publishers. Eventually, 112 people were convicted in what became known as the Textbook Scandal (*kyokasho gigoku jiken*).

This incident was the principal catalyst for parliamentary action that would consolidate government control over textbooks. After first amending the laws to discourage graft, the parliament in 1903 gave the Ministry of Education exclusive authority to commission and publish all elementary school textbooks. This system remained in effect through the end of World War II.

TEXTILE AND CLOTHING INDUSTRY—EAST ASIA Textile production has played a key role in the initial stages of industrialization of the East Asian economies by generating manufacturing

output, employment, and exports, often with government support. As labor-intensive industries, textile and garment making are suited to developing economies with comparative advantages in low-cost labor. With experience acquired in mechanization and foreign exchange earned in textile exports, a developing economy gains in manufacturing sophistication and moves on to higher value-added and more capital-intensive industries as its labor costs rise. This strategy of industrialization was established by Japan in the late nineteenth century and was followed by other East Asian economies in their successful drives to economic modernization in the post-World War II period.

Japanese Industrialization Model

The Japanese model follows four phases in the product cycle: importation; import substitution; exportation; and reimportation. In the mid-nineteenth century, imports of Western textiles generated a new demand and created opportunities for technology transfer. An indigenous textile industry developed to meet domestic demand and to substitute for imports, with 1879 being the year when domestic production first surpassed imports, and 1910 when exports first eclipsed imports. Cotton textiles became Japan's most important export industry from the 1920s through the 1930s, when Japanese colonial domination over Taiwan, Korea, and Manchuria helped to spur markets abroad.

The Textile Industry in Postwar Japan

Postwar revival restored the textiles industry as the leading export industry in the 1950s, but production and exports declined steadily from the early 1950s, as percentages of gross domestic product and total exports, respectively. Textiles and clothing's share of exports fell from 36 percent for 1950–1959 to 19 percent in 1960–1969 to 6 percent in 1970–1979. Within the sector, there was a shift to synthetic fibers and yarns, a segment that is more capital-intensive and dependent on research and development. The Japanese economy increasingly focused on other more technologically sophisticated sectors.

A turning point for Japanese competitiveness in textiles came with the Plaza Accord of 1985, an agreement between the United States, Japan, France, Germany, and the United Kingdom to drive down the price of the overpriced dollar. The result was a rising yen, making Japanese exports more expensive. Production of fabrics and spun yarns declined precipitously in the 1990s, while man-made fibers maintained output until 1997, when it began to drop. From a large exporter of textiles and clothing before the 1970s, Japan has become a net importer of clothing and a

small exporter of textiles. Japan now has the world's second-largest textiles and clothing deficit in the world after the United States.

The Textile Industry in the Newly Industrializing Economies

From the 1960s, Hong Kong, Taiwan, and South Korea took up the production of textiles, successfully penetrated export markets formerly dominated by Japan, and became world leaders in textiles and clothing. Their successful transition to industrialism prompted their collective label as the newly industrializing economies (NIEs). Hong Kong became the world's leading clothing exporter from 1973 to 1985, overtaken by Italy only in 1978–1979.

Comparative advantage in the more labor-intensive clothing segment was lost more rapidly than in textile production. The NIEs' textile exports accompanied by a shift to synthetic fibers have remained at around a

A textile worker making wool rugs in Shanghai, China, in 1996. (STEPHEN G. DONALDSON PHOTOGRAPHY)

quarter of total world trade in the 1990s, while share of clothing exports fell from around a quarter in the 1980s and early 1990s steadily to 16 percent by 1999.

China became a major player in the world textile market with the launching of market reforms from the 1980s. Output value of the textile and clothing industry grew at an annual rate of 15.6 percent from 1986 to 1995, while exports increased from \$8.5 billion to \$38 billion. China overtook Italy as the economy with the biggest trade surplus in textiles and clothing in 1991, and since surpassing Hong Kong as the world's leading clothing exporter, its lead has widened over time. In 1999, after a decade of 13 percent growth per year, China's clothing sector snared 16.2 percent of world trade, while Hong Kong had only 12 percent. In 1997 and again in 1999, China passed Germany as the world's number-one textile exporter.

The East Asian textile exporters confronted several problems that necessitated structural reform. First, world textile trade was characterized by considerable trade barriers. From 1974 to 1986, this trade was governed by four Multi-Fibre Arrangements (MFA), which allowed industrialized economies to protect their domestic industries through quotas on textile and clothing imports by bilateral agreements or unilateral action. In 1986, the MFA was to be phased out by the World Trade Organization's Agreement on Textiles and Clothing, which would remove export quotas over a ten-year period. Meanwhile China and other East Asian exporters confronted not only export quotas in the advanced economies (except Japan) but also periodic charges of dumping or illegal shipments and imposition of sanctions.

Second, as the economies of the East Asian exporters expanded, labor and production costs rose, making their textile industries vulnerable to competition by lower-cost producers. Third, the spread of preferential agreements and the formation of regional trade blocs such as the North American Free Trade Agreement in 1994 and the European Union in 1993 threatened market shares in Europe and North America. Hong Kong was hit especially hard by the erosion of its American market share by Mexican and Canadian producers.

A common response is to move up the quality and technology gradient. The NIEs have shifted from being net importers to being significant exporters of synthetic fibers. Production was upgraded by automation, mechanization, and computer-aided design. More emphasis was placed on the production of upmarket and high-fashion clothing merchandise. Taiwan and Korea increasingly moved away from textiles and clothing to such

value-added production as electronics and semiconductors. In addition, the outsourcing of labor-intensive manufacturing (clothing) by the NIEs (and Japan as well) to China, Southeast Asia, and other low-cost producers released resources for higher value-added activities and also helped to sustain demand for the textile exports of NIEs. Hong Kong especially has relocated factories to China on a large scale since the 1980s, bringing the benefits of massive investments and training efforts.

As a socialist economy undergoing market reforms, China has suffered from the problem of money-losing state-owned enterprises (SOEs), which dominated the textile industry but were plagued by labor redundancy, high pension and benefit costs, and outdated equipment. Reform of these SOEs took precedence in government efforts to reform the state-owned sector in 1998: money-losing factories were closed by the hundreds, 1.16 million workers were laid off, and 9.6 million antiquated cotton spindles were taken out of production by 1999, when the state sector realized a profit of \$97 million after having sustained staggering losses over the previous six years.

Future Prospects for the East Asian Textile Industry

Despite their increasing shift to high value-added industries and recent uncertainties in the global economy, the East Asian economies will probably retain significant positions in the world textile and clothing trade. Collectively their exports were responsible for 36.9 percent of total world trade in textiles and 32.6 percent of total world trade in clothing in 1999. Japan remains a key supplier of manufacturing technology to its Asian neighbors, and recent Japanese innovations such as clothing with built-in protection against bacteria and microwave radiation, intelligent or smart textiles that respond to the environment through the embedding of microprocessors or nanotechnology (for example, to keep people warm in cold climates and cool in hot weather), and washable suits may differentiate its manufacturers from competitors and allow them to charge high prices for such unique products.

Among economies with a surplus in textile and clothing trade, South Korea may soon overtake Italy for the number-two spot, while Taiwan and Hong Kong retain respectively the number-four and -five positions. As for number-one China, even as machinery exports replaced textiles and clothing as its top export sector in the late 1990s, its competitive position in the world textile marketplace is likely to be enhanced by its entry into the World Trade Organization.

TEXTILES—BHUTAN The weaving culture of the landlocked Himalayan kingdom of Bhutan is centuries old. Silk, wool, acrylic, metallic threads, and cotton, intricately and deftly woven on hand-hewn backstrap and treadle or shaft looms, meet a wide range of daily clothing needs, as well as religious and decorative requirements of the Bhutanese.

The rugged mountain conditions and clustered-village structure, social customs, and daily life of the Bhutanese all contribute to the need for each family to weave fabrics in their own home. The country is unique in that it is dependent on hand-weaving skills for the provision of everyday apparel. The traditional practice, which continues today, is for mothers to teach their daughters to weave. Most women over twelve years of age possess high-quality weaving skills. Men often assist with shearing, washing, carding, combing, and spinning the various local yarns.

Although past written records on weaving are sparse, the tradition of hand weaving spans several centuries, and traditional and classical motifs and designs from the past continue to be woven on a daily basis. Thus, a motif in use today may have originated several centuries ago.

Regional and cultural variations produce a vast array of unique and delightful fabric ornamentation. Although a tradition of weaving is evident among Bhutan's neighbors, weaving holds a considerably elevated position in the Bhutanese national culture.

The range of weaving output includes clothing, blankets, bedcovers, scarves, carryalls, floor and seat coverings, napkins, table covers, and decorative items for both daily use and special religious and ceremonial occasions. The indigenous resources of wool from goats, sheep, and yaks and some natural silk are supplemented by the additional use of cotton and other yarns imported through trade with neighboring countries. The limited use of silk is due to the fact that the Bhutanese are highly dependent on silk imports, as the process of destroying cocoons is contrary to Buddhist precepts adhered to by the majority of Bhutanese.

The national dress, worn daily by the inhabitants, creates a constant demand for high-quality weaving. The dress for women includes the *kira* (a wraparound garment), the *kerā* (sash/belt), *wangde* (inside or underblouse) and *teku* (outer blouse or short jacket), *koma* (clip), and *japtha* (chain jewelery). For men, the *gho* (robe or large outer coat) is the principal item of clothing and is worn with a belt and shoulder scarf. The *gho* is also known in rural areas as a *kbo* or *baku*.

Composition of the *Kira*, *Kera*, and *Gob*

The *kira* highlights Bhutanese weaving ability, imagination, sense of proportion, intricate design, and color balancing. Each *kira* is designed and woven according to size and decorative requirements and reflects family pride in their weaving and design skill. The *kira* is tightly wound around the body and belted with a woven *kerā*. Two *koma* at the shoulder hold the *kira* in place, while a joining *japtha* forms a decorative link between the *koma* and hangs at the front. This unique piece of jewelry is usually made of silver with a gold finish and is embellished with turquoise and coral.

The *kira* is composed of three loom widths of approximately 50 centimeters and is 250 centimeters in length. A complete *kira* measures about 150 by 250 centimeters, with a fringe 2.5–10 centimeters at each end. Although the *kira* is one flat piece of fabric, each differs in size both in width and length, so that it can comfortably fit the particular child or adult who will wear it. Each of the three individual loom widths consists of a continuously woven main section, two end-border panels and one central panel. The end borders contain design strips that range in number from six to fourteen and are woven according to a special and traditional sequence and always in pairs. The two strips in each pair are of similar width; however, the widths of the various pairs may vary from one to another. Designs utilized within the paired strips may be grouped as meanders, continuously repeated designs or motifs. The *kira* contains a wide range of design patterns, and may number 1,500 individual motifs on one piece. The patterns and motifs used have been strongly influenced by the Buddhist and Bonpo religions, as well as by the personal and individual expression and interpretation of craftspeople. Their inspiration is doubtless drawn from the physical structure of the country—mountains, rivers, waterfalls, clouds, mists, cascades, hills and valleys—and from the abundance of flora and fauna as well as the natural phenomena of lightning and earthquakes. The final creation is a visually pleasant and colorful garment.

During recent times the *kerā* has been reduced in width. Earlier, the belt was 30–45 centimeters in width and folded lengthwise into three sections. Currently,

the width is approximately 7.5–10 centimeters and is not folded when worn. Complex and intricate embellishments were featured extensively in the past, with designs set into complex design strips across the fabric. As many as eighty design strips have been known to be incorporated into one belt.

For males, the *gho* is made from three to four generous lengths of fabric, which allows for comfortable wrapping around the body, oversized sleeves, placement of the *kerā*, and an ample front pouch to carry personal items such as food, documents, and knives. It is woven in a striped or check design from cotton, wool, or silk or a combination of two yarns. When worn, the stripes are in a vertical position. A specially tailored white undershirt, usually of white cotton, is turned over at the cuff to form a 13-centimeter band of white. The most lavish *gho* is of silk-on-silk (raw or refined), in gold and burgundy-red stripes embellished with elaborate and ornate designs.

Other Woven Goods

Special cloths are also woven for use when dining. These are usually 208 by 90 centimeters in size. One example is the *chagsi pangkheb* (wall hanging, laptop napkin, or cloth) formed from three loom widths of woven fabric, two narrow side lengths, and one central length. The background is of white cotton with embellishments in red, dark blue, and black. The finest are of silk-on-silk, with several vibrant colors being utilized. A range of special designs is usually reserved for these pieces.

Heavy wool items such as blankets, small carpet pieces, seat and bedcovers, and outerwear for inclement weather, are also woven, generally in the central region of Bhutan. Such pieces are usually of natural and earth tones and subdued hues and adorned with bold geometric designs. A number of textiles found in the *dzongs* (monastic and administrative centers) and temples also underline the strong textile base of Bhutan's material culture. Monks' cushions, altar-pieces, and covers for religious relics are among those items where weaving skills are evident. Merit is earned when a weaver prepares a fabric as a gift to a monastery or religious person or event.

The tradition of weaving high-quality fabrics in the home continues throughout Bhutan. New designs, colors, and yarns have gradually been introduced during the past thirty to forty years. The quotidian donning of national dress and religious and other special needs ensures the continuation of traditional hand weaving in the kingdom.

TEXTILES—LAOS Historically, Lao women of most ethnic groups weave. The resulting textiles were woven for personal use and were a representation of daily life and cultural traditions. Intricate and complex designs performed such supernatural functions as warding off evil spirits and bringing good fortune and fertility to a newly wedded couple. Textiles were produced both for wear and for ceremonial ornamentation, as well as for such domestic uses as mats and wall cloths for welcoming guests to the home for special ceremonies. Textiles used for clothing could denote a person's age and social status, or both, often through the use of color. Textile motifs may be geometric, such as the diamond or lozenge shape, or mythological, such as the *sibo* or *kosasing*, a half-elephant, half-lion figure; the *nak*, a serpent prominent in the Lao Buddhist tradition; and the *mom*, a mythical bird.

Looms and Weaving Techniques

A variety of weaving technologies is used in Laos, including both frame and body-tensioned looms. The most commonly used method is the traditional Lao floor loom with a vertical heddle. This loom consists of a wooden frame loom with a horizontal warp, the threads that are stretched to form the base and width of the woven fabric. Each thread, or warp end, is passed through a primary heddle, the mechanism that raises and lowers alternating warp threads through the use of foot peddles, or treadles, to form an opening called a shed. A secondary set of long-eyed heddles is used to create and store a supplementary design. The design is preserved with a series of pattern rods that correspond to a design the weaver wants to weave. This patterning and storage method is unique to Laos and allows for the diversity and complexity of Lao weaving.

Depending on the type of weave and patterning that is in use, the weaver passes the weft threads in between the shed with either a shuttle or manually. The warp is tensioned over a back beam and then looped back above the weaver. The warp is then tied on a beam above the weaver's head. The weaver can adjust the tension of the warp as the fabric progressed by reaching overhead and adjusting the knotted warp ends.

As the weaver weaves one row of weft, a beater, or reed, is pulled forward to beat the newly woven row into the body of the textile. The reed or comb is suspended overhead and is composed of tightly spaced bamboo teeth. Two warp ends are passed through an individual tooth of the reed that in turn keep the warp ends evenly spaced. The spacing of the teeth also determines the density, or thread count, of the fabric. Lao language has a specific term to indicate the number of threads in a warp. This measurement is known as a *lope*, a unit of 40 dents in the comb. The number of *lope* identifies the density of traditional fabrics.

Most Lao weavings are decorated using a supplementary weft, and in some cases a supplementary warp, patterning. The brocade, or pattern, is inlaid into the background of the fabric by alternating the background weave with the supplemental design. A continuous supplementary weft design is one in which the pattern and color extend across the width of the fabric. Discontinuous supplementary weft design is one in which the design and color are inlaid at various intervals across the weft line. This allows the weaver to create a wide range of complex patterns and designs in various colors.

Two other traditional methods of creating design in Lao fabrics are *mat mi*, known universally as ikat, and tapestry. With *mat mi*, the weft yarns are first dyed

a base color and then wrapped onto a rectangular frame that is sized to coordinate with the width of the fabric. The yarns are wrapped in bunches depending on the length/width of the textile. These groups of weft threads are then measured and tied to form a specific design. The bundle is then dyed a second color, the wrapping removed, and the skein placed on a skein winder. The weaver winds the dyed thread onto a bobbin that is then placed into a shuttle. As the shuttle is passed back and forth between the warp threads, the design evolves as it has been dyed into the thread. An even more complex style of weaving that is used by some Lao ethnic groups, especially the Tai Daeng and Tai Kao in the north, is *sin muk*. With *sin muk*, narrow vertical bands of *mat mi* and supplementary weft are patterned with intersecting bands of supplementary warp threads, creating an intricate checkerboard patterning.

Regional Weaving Styles

Approximately sixty-eight diverse ethnic groups live within the borders of Laos, each with its own unique style of weaving. The lowland Lao today represent an amalgamation of many of these groups. Traditionally, lowland silk skirts are tightly woven with a glossy, lightweight, and stiff texture. Skirts are often accented with gold and silver threads and employ Western dressmaking elements such as darts and metal fasteners. In southern Laos, designs are more influenced by Khmer culture, employing narrow vertical bands of alternating motifs, often in *mat mi*. Elephants, humans, and tiered structures figure prominently in their designs. The Phuan are located in the central mountains of Laos. These people tend to use a more orderly design, with horizontal bands and blocks of motifs. Color is heavily used to distinguish members within their group and to separate their designs from those of other ethnic groups.

The wild and mountainous northern terrain has isolated small bands of people, resulting in an extremely diverse region of intricate weaving styles. Various Tai groups each have their own style of patterning. The Tai Daeng of the northeast are well known for weaving intricate patterns within the body of the fabric. The Tai Lue people combine various weaving techniques with the use of tapestry weave. Many of their designs use bright colors and bold motifs. Waistbands are woven into the body of the skirt rather than attached as a separate piece. Head cloths are the most distinctive design of the Tai Dam people. Black cotton rectangles are patterned with thin lines of color and a bright rectangle. Decorative patches are woven on either end. Other northern groups, especially the

Hmong and Yao, use other patterning techniques, such as batik and embroidery.

Lao Textiles Today

Following the end of civil war in 1975, large migrations of people from the north came down to the Mekong River plain. As a result, traditions from the diverse ethnic groups intermingled. Simultaneously, heirloom textiles were sold off to raise money to survive. The combination of this mingling of styles, the exodus of old textiles, and the simplification of designs threatened the loss of ancient motifs and traditions. Synthetics and Western styles also became more and more integrated into Lao weavings. Today, silk production is growing popular in rural Laos, with farmers producing high-quality, hand-reeled silk.

Traditional Lao weaving continues to be widespread and is recognized as a unique and exquisite art. The complex designs and techniques still practiced by Lao weavers make them among the most skilled in the world. Ancient Lao weaving traditions continue to be passed on from mother to daughter, which ensures the preservation of their unique textile heritage.

THAI The Thai people of Thailand (*Khon Thai*), numbering more than 46.4 million, form part of a much larger population of speakers of Tai languages dispersed through the neighboring countries of Laos, Vietnam, China, Myanmar (Burma), and Malaysia. With disputed origins in southwestern China, Tai peoples began migrating into northern mainland Southeast Asia well before the eleventh century, establishing chiefdoms from the twelfth century onwards. The characteristic political organization was a *muang*, or petty state, consisting of a royal class and king, free peasants, and slaves, which was established in river valleys based on the cultivation of paddy rice. However, smaller populations of tribal Tai people inhabited the mountains surrounding these valley states and practiced shifting upland agriculture. In southwestern China and Southeast Asia, Tai rulers adopted Theravada Buddhism, which became a constituent part of their social systems, while minority Tai populations practiced animism and ancestral worship.

THERAVADA BUDDHISM IN THAI LIFE

A strong adherence to Theravada Buddhism is one of the basic elements of Thai culture. The following extract of text describes the importance of the Buddhist priest and the reverence for life in the village of Bang Chan in Central Thailand.

One of those most serious concerns for a priest is that of killing any form of life. Association in any way with the taking of a human life removes the priest from the order and from the possibility of ever becoming a priest again. A priest is further committed to avoiding the killing of any form of life around him. Thai villagers consider all forms of life to be ranged roughly across a continuum of value. Taking the life of one's parents or of a priest is the most serious offense one could commit. Ranked below this would be taking the life of other human beings and then proceeding down through the animal kingdom. The head-priest said that killing a chicken would be much less serious than killing a buffalo, and that killing a snake would be less serious than killing a chicken. According to the seriousness of each moral offense, an individual receives moral punishment in the form of de-merit, or negative karma (baab).

Most Thais would expect to receive more baab from a more serious offense. It is particularly serious (therefore the source of much baab) for a priest to take any form of life. One informant explained that a priest gets the same amount of baab from killing any form of life. I did not check this point, but it is clear that priests and laymen alike consider it very serious for priests to take any visible form of life. The seriousness of this normative concern is manifest every day around the temple. I have described under daily role activities the cloth strainers on the bamboo water dippers which the priests use in order not to snuff out tiny insects as they water the temple garden or take their showers. Equally indicative is the fact that priests do not dig in the earth, because they might inadvertently kill some small creature.

When the village was rushing to complete a new residence hall in the temple before the celebration of the elevation in title of the head-priest and his assistant, large working parties frequently came and supplemented the regular workers. The priests and novices worked tirelessly into the night on the heavy construction work, but only the novices could dig the old pillars out of the ground and dig holes to set the new pillars. Priests could mix concrete, because the building sand was not thought to harbor any life, but they could not dig the soil. A priest must be attentive to the foliage when he spits or urinates.

The temple is associated in most people's minds with compassion for all living creatures. A number of stray cats, dogs, and chickens normally live at rural temples, cared for by the surplus food contributions which the priests cannot eat. Sometimes a farmer, unwilling to kill off a senile ox, asks to have him allowed to stay at the temple and graze. The farmer makes some offering the temple, and the aged draft animal ends his days grazing within earshot of the auspicious chants of the priests.

The priests do not, however, welcome pests such as mosquitoes. In the evening I often noticed smoke curling up from a little incense stick which people burn to drive away mosquitoes. The headpriest surprised me when a village asked if we had many mosquitoes in our house. Vigorously moving his arms in a spraying motion, the headpriest said that spraying was quite good. He seemed to be making a technical judgment rather than a moral one, and he was talking about our house. I never saw any priest spray around the temple. The priests in Thailand generally raise no objection to the World Health Organization spray campaigns. They probably did not actively support or oppose the campaigns.

The Thai and Tai

Today the major areas of dense concentrations of Tai-speaking peoples are the Xishuangbanna and Dehong regions of Yunnan province of China; parts of northern Vietnam and adjacent Laos, which are inhabited by tribal White, Black and Red Tai; the Shan (Tai Yai or Tai Long) State in Myanmar; Laos proper, in which the majority population, the Lao, are Tai speakers closely related to the Thai; and Thailand, which was itself formed out of a number of smaller Tai kingdoms: Ayutthaya and Sukhothai, Chiang Mai and Chiang Rai. There is also a small Thai population in northern Malaysia.

While the great majority of the citizens of Thailand follow Theravada Buddhism, those in the southern Thai states, whose borders were negotiated between Thailand (then Siam) and British Malaysia, are Islamic. The majority population of Thailand's impoverished and dry northeast (Isan) are ethnically Lao. In Nan province, in Thailand's north, there is a population of Tai Lu who are the same as the Tai Lu of Xishuangbanna in China. The ancient kingdom of Chiang Mai and other *muang* in north Thailand have been firmly integrated into the Thai polity, and their populations of Khon Muang (people of the *muang*) and Khoen, Lue, Nong, and Yong practically assimilated into the general Thai identity radiating from the Central Thai of the Chao Phraya (Menam) River basin. There are also populations of Tai Yai (Shan) in northern Thailand.

Thai Society and Culture

The Thai people, like other lowland Tai groups, adapted culturally to a hot monsoon climate. Cultural characteristics include a particular style of teak or bamboo stilted architecture, the wearing of the sarong, a love of boats and rivers and markets in or along the waterways, the cultivation of rice in paddies combined with fishing, and the practice of Theravada Buddhism. Traditionally every village had its *wat*, or temple, and the relation between monks assigned to the local temple and village men who would become ordained as monks for a time before marriage was particularly close. Monks were invited to officiate at most major life events, including weddings, house-building, and funerals (although they did not always officiate at weddings, and they might be replaced by Taoist monks at funerals). Art forms include traditional Thai music, temple murals and wooden carvings, the dancing of the *ramwong* (traditional Thai dance), and the survival of Hindu theater epics such as the *Ramayana* (*Ramakien* in Thai) in puppet form. Monastic Buddhism has combined with traditional beliefs in the power of spirits (*phi*), astrology, and the magic of charms,

amulets and tattoos conferring invincibility into what has appeared to many to be a seamless whole. The tying of wrists with threads is still performed to "recall the soul" (*sukbwan*) at sickness or after long journeys.

Despite this appearance of homogeneity, important differences still remain between different local Tai traditions in what is today modern Thailand, such as those of the Yuan and the Lue in the north, the Phu Tai and Lao Phuan of the northeast, and the Khon Pak Tai of the south. The northern Thai (Yuan or Khon Muang), for instance, traditionally had a form of matrilineal descent associated with spirit cults in which mediums communicated with the spirits of long-dead ancestors for the purpose of curing sickness, or with the spirits of royal princes. A period of uxorilocal residence before marriage was common for many of the Tai peoples, and women customarily inherited land and the house, the youngest daughter remaining in the house, where her husband joined her, to take care of her aged parents. Over the past sixty years such practices have inevitably been modified by the impact of modernization, but they are still maintained in some areas.

Gender

Gender relations are particularly marked in Thai society. Women have traditionally enjoyed great freedom in the realms of marketing and business, though they have been restricted in access to important public domains such as the monkhood and politics. Except among the noble classes, which for some time had already shown a tendency to reckon descent patrilineally, descent was bilaterally reckoned until King Chulalongkorn (1853–1910) introduced patrilineal surnames in 1901. A man could take more than one wife, and concubinage or the taking of a "minor wife" or mistress is still quite common today.

External Influences and Social Change

The Thai society of Thailand has been marked by both Indian and Chinese influences. Hindu and Buddhist beliefs have deeply permeated Thai society and culture, and are reflected in the many terms in the Thai language derived from Pali and in the continued presence of Brahmin priests at court. More recently, the influence of Chinese settlers who have extensively intermarried with Thai has been strong. Sino-Thai families have been dominant in both business and politics, although Chinese in-marriers often lose their Chinese identities and become assimilated as Thai within two to three generations.

Modern economic relations and the end of the absolute monarchy in 1932 have transformed Thai soci-

ety. The feudal *sakdina* system, in which social ranks were differentiated by entitlement to labor, has given way to a modern agricultural peasant society with a significant degree of industrialization, in which relations of patrons with clienteles continue to be important. The hiring of agricultural labor and the advent of cash crops have transformed the traditional agricultural cycle centered on transplanting the rice and harvesting it at the end of the rainy season. Traditional forms of labor exchange have been largely destroyed as landless and impoverished migrants increasingly flock to urban centers, particularly Bangkok, where slums, industrial and vehicular pollution, and the prevalence of child labor and prostitution are causes of major international concern.

Looking Ahead

Faced with the tensions and difficulties of modern life and continuing efforts to reform the political system, the younger generation has embraced new forms of Buddhism. Meditation, never a common feature of traditional Theravada Buddhism, is increasingly popular, and charismatic monks appeal to huge audiences via video and television. In urban centers and even rural areas, the tradition of making donations to the monks and temples has eroded even as young people are showing increasing interest in nontraditional forms of Buddhism. Thai society has often been seen as uniquely flexible and adaptable to external influences. The tensions and conflicts this has brought in its wake are rarely recognized.

THAI REVOLUTION OF 1932 On 24 June 1932, troops commanded by General Phya Bahol Balabayuha took control of Bangkok in a bloodless revolution, arresting some forty top officials and inviting King Rama VII (1893–1941), also known as Prajadhipok, the last born of King Chulalongkorn's sons, to rule under a constitution that stripped him of all authority except for the right of pardon.

Prior to the revolution, Thailand was officially an absolute monarchy, with the prime minister appointed by the king. The revolution resulted from the growing discontent felt by the populous toward the king's brothers, who dominated many positions in the government despite their incompetence, thus preventing the new educated middle class from rising to positions of responsibility. In addition, the Great Depression caused the bottom to fall out of the rice market, by 1931 resulting in an enormous budget deficit. With the king away in Europe for medical treatment, members of the cabinet clashed, and the government was in gridlock. Military officers and civil servants, whose salaries were cut, were equally discontented and unable to articulate their grievances through the channels of an absolute monarchy.

After the revolution, a constitution drafted by Chulalongkorn University law professor Dr. Pridi Panomyong came into effect on 10 December 1932. The coup leaders, many of whom adopted democratic ideals after the king sent them to study in Europe, selected members of the senate, who in turn appointed an executive council as provisional cabinet to promulgate laws and control ministers. To appease conservative opinion, the coup's military leaders did not take over the government. Phya Manopakam, respected president of the Court of the Appeal, was chosen president of the provisional executive council, though he continued policies of the past and even cracked down on dissent. The new constitution, though backpedaling somewhat on democratic reforms to gain the support of the king, nevertheless launched the country as a constitutional democratic monarchy. King Rama VII even accepted the apologies of the coup leaders for their illegal actions, recognizing that the princes, not the monarchy, were resented.

In October 1933, Prince Bovaradej led an armed counterrevolution, which failed when the king did not lend it support. However, in 1935, when the assembly tried to remove the king's power to veto cases of capital punishment, he abdicated. In the end, the bureaucracy and the military gained power at the expense of royal prerogatives, not the people.

THAILAND—PROFILE (2001 pop. 61.8 million). Thailand lies in the heart of Southeast Asia, stretching from the Mekong River in the north to the Andaman Sea and Gulf of Thailand in the south. Known as Siam until 1939, Thailand has an ancient history and a rich, unique culture.

Geography

With an area covering 514,000 square kilometers, Thailand is the third largest country in Southeast Asia. It is slightly smaller than the state of Texas and roughly the size of France. Its population is the fourth largest in Southeast Asia, with approximately 8 million residing in the capital, Bangkok. There are four fairly distinct regions in Thailand: the north, marked by mountains and valleys; the rugged, sparsely forested northeast, which suffers from poor soil, seasonal droughts, and flooding; the fertile central region, dominated by the Chao Phraya River; and the tropical southern peninsula, extending down to the Malaysian border. Climate is dependent on monsoons, but it basically provides three seasons: hot (March–June); rainy (July–October); and cool or dry (November–February). Temperatures in the hot season often reach 40°C in many parts of Thailand, while during the cool season they drop as low as 10°C in the north. Rains are hardest and longest in the south and central regions, often causing serious flooding, while the northeast frequently suffers from drought.

Economy

Approximately 70 percent of Thailand's people work in agriculture. Major farming exports include rice, sugar, and fruit. Traditionally, fishing, textiles, rubber, mining, forestry, and tourism have also been important. Over the past two decades, multinational corporations have contributed to diversifying the Thai economy, and the presence of these corporations encourages more industry. Thailand now produces an increasing quantity of manufactured goods such as vehicles, electronics, and computers. In recent years, Thailand has endured significant economic problems as a result of the Asian recession, a reduction in foreign investment, and weaknesses in Thai industrial and

business practices. However, with the assistance of international agencies such as the International Monetary Fund (IMF), Thailand's economy shows signs of recovery. For the year 2000, the gross national product of \$2,130 was again one of Southeast Asia's highest. Substantial reform in areas such as banking and the improvement of the transportation and communications infrastructure are essential for further progress.

Politics

Thailand is the only country in Southeast Asia never to have been colonized. As Siam, it was ruled solely by kings until a revolution in 1932 introduced a constitutional monarchy. Attempts to establish a parliamentary democracy failed, and Siam fell under the rule of military dictators. In 1939 Siam was renamed Thailand, and a period of anti-Western nationalism

THAILAND

Country name: Kingdom of Thailand
Area: 514,000 sq km
Population: 61,797,751 (July 2001 est.)
Population growth rate: 0.91% (2001 est.)
Birth rate: 16.63 births/1,000 population (2001 est.)
Death rate: 7.54 deaths/1,000 population (2001 est.)
Net migration rate: 0 migrant(s)/1,000 population (2001 est.)
Sex ratio—total population: 0.97 male(s)/female (2001 est.)
Infant mortality rate: 30.49 deaths/1,000 live births (2001 est.)
Life expectancy at birth—total population: 68.86 years, male: 65.64 years, female: 72.24 years (2001 est.)
Major religions: Buddhism, Islam, Christianity, Hinduism
Major languages: Thai, English, ethnic and regional dialects
Literacy—total population: 93.8%, male: 96%, female: 91.6% (1995 est.)
Government type: constitutional monarchy
Capital: Bangkok
Administrative divisions: 76 provinces
Independence: 1238 (traditional founding date; never colonized)
National holiday: Birthday of King Phumiphon, 5 December (1927)
Suffrage: 18 years of age; universal and compulsory
GDP—real growth rate: 4.2% (2000 est.)
GDP—per capita (purchasing power parity): \$6,700 (2000 est.)
Population below poverty line: 12.5% (1998 est.)
Exports: \$68.2 billion (f.o.b., 2000 est.)
Imports: \$61.8 billion (f.o.b., 2000 est.)
Currency: baht (THB)

swept the country until after World War II. The military dominated Thailand until 1973, when a bloody revolt finally brought about a civilian government. However, military leaders continued to influence politics from behind the scenes, manipulating governments into the 1990s. Another popular uprising in 1992 again forced the military from power and led to the return of civilian authority.

Since that time, Thai politics have been marked by coalition governments and scandals that have undermined both the development of democracy and international confidence in Thailand. Vote buying, patronage, and strong-arm tactics are common problems in elections. Attempts in the late 1990s to reform the system, including the adoption of a new constitution (1997) and the establishment of an elections commission (1999), have yet to be effective. Moreover, al-

though curtailed in recent years, the involvement of the Thai military in government remains a significant issue, especially given recent economic problems. On the other hand, Thai politics has an important stabilizing force in the king, Bhumipol Adulyadej (b. 1927), who has ruled since 1946—the longest-reigning living monarch in the world. Although his powers are largely ceremonial, his political skill and the popularity he commands with the people give him considerable positive influence. Similarly, Thailand's economic dependence on the international community puts emphasis on the need to reform and democratize the political system.

Religion

About 95 percent of the Thai people are Buddhists. Early Theravada Buddhism came from India in the thirteenth century CE, although most Thai themselves

refer to their faith as Lankavamsa Buddhism, which came from Sri Lanka during the fourteenth century CE. Thailand has retained the most traditional practices of Buddhism. The Theravada sect is one of the oldest, and followers consider their Buddhism to be less "corrupted" than that found in the Himalayan mountains or East Asia. Every Thai male is expected to join the Buddhist brotherhood (or *sangha*), usually between finishing school and joining the workforce. Most spend several months learning scripture, discipline, and meditation as a monk, and this time is considered one of the most important in any man's life. There are more than twenty thousand Buddhist monasteries in Thailand, and approximately 200,000 monks, many of whom are ordained.

The other 5 percent of the Thai people are predominately Muslim and live mainly on the southern peninsula. About 1 percent of the Thai are Christians, Hindus, Confucianists, Taoists, or animistic. Thailand has traditionally enjoyed religious tolerance, with little conflict between minority faiths and the majority Buddhists. In fact, various religious festivals and holidays are celebrated openly throughout the country and are a significant dimension of life in Thailand. Many Thai homes and businesses have places of worship, and most have a "spirit house," a structure (like a temple) mounted on a pedestal, where spirits of the building can live. Often spirit houses are large and ornate, reflecting Thai concerns about spirituality and the afterlife.

Peoples

Nearly 80 percent of those living in Thailand are ethnic Thai. About 15 percent are Chinese, while the remainder includes Malays, Cambodians, Lao, Burmese, Vietnamese, and various hill tribes. Although there have been periods of violent suppression of these groups (particularly the Chinese), the relationship ethnic minorities have with the majority population generally has been better in Thailand than in other Southeast Asian countries. This is partly because many minorities have been absorbed into the Thai majority over time. For example, many Chinese have adopted Thai names and customs, while retaining their culture and language at home. The Lao are ethnically and linguistically related to the Thai and blend easily into the mainstream. The hill tribes inhabit the isolated north, and many Cambodian, Vietnamese, and Burmese are refugees from war in their countries and live in camps or controlled areas of Thailand.

Culture and Customs

Thailand is a culturally rich and diverse nation. Its art, architecture, literature, and dance are world

renowned. Thai cuisine, noted for its range of flavors and spices, is extremely popular in the West. Although the country is progressively influenced by Western culture, traditional Thai values remain important to everyday life. Religion, a profound reverence for the monarchy, and deep respect for family elders and ancestors are key in this regard. Thai society is male dominated, but women play a crucial role in maintaining family structure, in addition to contributing to the workforce and economy. The Thai are known for their friendliness as well as their interest in foreigner travelers. Many speak English, particularly those in business and the service industries. With everything from jungles to deserted beaches, and ancient temples to modern cities, Thailand offers tourists a great deal. All of this helps to make Thailand the most-visited country in Southeast Asia (8.7 million arrivals in 2000).

Current Issues

Although Thailand's relative stability remains a model for other Southeast Asian nations, it nevertheless confronts major issues. Extreme poverty and other social ills such as prostitution and the drug trade are significant problems. Widespread corruption and graft continue to undermine the development of democracy. Further political reform and more stable economic growth will help better Thailand's future.

THAILAND—ECONOMIC SYSTEM Although Thailand is the only Southeast Asian country never to have been colonized, it has had a long history of international dealings and trade with other countries that have influenced its economy. Thailand has been fortunate to have a rich supply and diversity of natural resources, as well as large stretches of fertile land and

FIVE LARGEST COMPANIES IN THAILAND

According to *Asia Week*, the five largest companies in Thailand are as follows.

Company	Sector	Sales (\$ in millions)	Rank in Asia
Petroleum Authority	Oil Refining	9,211.6	151
Electric Generating Authority	Energy	4,013.6	327
Siam Cement	Cement	3,196.0	420
Thai Airways International	Air Transport	3,034.3	449
Esso Standard Thailand	Oil Refining	2,220.3	616

favorable growing conditions. This base of natural resources and cultivatable soil gave Thailand a strong agrarian foundation on which it has built a complex, multifaceted economy, which is now well established in the industrial and high technology sectors.

Chinese Migration

Between the early nineteenth century and 1940, there was an in-migration of Chinese. The Thai kings encouraged this migration so long as these immigrants assimilated, that is, adopted Thai names, spoke the Thai language, and so on. Many remained in Thailand, where they excelled in business ventures. Although they became Thai, they used personal connections within families and between other Chinese families both in Thailand and in China to foster a strong business community. Through the 1940s, Thailand's business was distinctly small scale. Some families did well, but the most of the population was still dependent on agriculture, with only 2 percent of the labor force working in industry. The change in Thailand's economic climate began to occur after the Japanese occupation of World War II. Several Chinese families established banks, with the Bangkok Bank dominating trade, financing, and remittance back to China. For the next two decades, a third of the nation's savings flowed into the Bangkok Bank, while three other banks accounted for most of the remaining funds accrual.

Growth Led by Agricultural Exports

Between 1950 and 1970, the Thai government developed a strategy of growth led by agricultural exports. Agribusiness grew and thrived through a

government policy using both public and private initiatives. The government expanded the irrigation and road systems and encouraged leading banks to channel funds to agribusiness. This growth in agriculture resulted in a significant increase in exports, making Thailand the world's leader in rice exports. Thai politicians and government officials also encouraged expansion through import substitution (a push to produce domestic substitutes for imported essentials). Although the government was heavily dependent on revenue from trade tariffs, the rates were lower on capital goods and industrial inputs. As a result, a relatively small percentage of the manufactured growth was attributed to import substitution.

Business leaders in the Asian countries of the Four Tigers, (South Korea, Taiwan, Hong Kong, and Singapore) were being pushed (and coerced) by government officials into export-led industrialization. Thai bureaucrats, on the other hand, let business leaders take the lead. The government stayed out of the way or supported policies and strategies suggested by business leaders. This freedom for development led to a rapid rise in industrialization, but sometimes with environmental and social ramifications, as companies wholeheartedly exploited natural resources.

Modern Thai Economy

In the early 1960s, agriculture's share of the national income was about 40 percent, while manufacturing accounted for only about 13 percent. Indeed, until the 1990s, the agrarian portion of the economy continued to dominate, supporting the rest of the nation during economic slowdowns. As the economy shrank, farmers took up the economic slack by purchasing less and

receiving less money for their rice and other agricultural products.

During the 1960s, the Thai industrial and service sectors slowly began to contribute a greater share of the gross domestic product (GDP). In 1989 manufacturing commanded over 28 percent of the GDP (and nearly 60 percent of the exports), while agriculture had fallen to nearly 14 percent. These ratios continued to magnify during the 1990s. (See Table 1.)

During the late 1980s and early 1990s, Thailand's economy grew at the fastest rate of any member of the Association of Southeast Asian Nations (ASEAN). Of its ASEAN trade neighbors, Thailand had the greatest growth for the period through 1995.

Thailand's Economic Crisis

The economic boom carried with it greater consumer and legislative confidence than ever before. In the mid 1980s, the baht was again attached to the U.S. dollar. As the dollar value slipped against the yen, the baht grew cheaper for the Japanese, encouraging greater investment and trade with Thailand. This gave

TABLE 1

Thailand a distinct export advantage, which strongly supported its manufacturing industries. Increased trade with Japan and a general increase in its exports resulted in greater amounts of foreign investments being made in Thailand. This gave Thailand's leaders the confidence needed to liberalize its economic structure.

Although finance companies, which followed different rules from banks, came close to collapse in a 1983–1985 economic slowdown, they flourished in the late 1980s and beyond. Similarly, the Securities Exchange of Thailand (SET) had an historic high of 1753.73 in January 1994. Numerous companies floated their stock at this time.

Between 1990 and 1993, Thailand liberalized its financial market. Foreign funds flowed into Thailand as investors saw great opportunities. With so much money, financial institutions and banks approved loans for projects that only a few years earlier would have been rejected, not the least of which were property development projects. Then exports began to decline drastically. Japan's purchasing power faltered as the yen weakened due to Japan's economic recession. Furthermore, Japanese investments in Thailand also fell. Thailand no longer could boast of being the lowest-cost labor market in Asia, as other developing countries began to compete in the labor-intensive markets. Thailand's finance companies were approaching dire straits. They had escalated their asset values through leveraging, a successful strategy so long as money continued to flow inward. In June 1997 sixteen finance companies were instructed by the central bank to cease operation. In the next month, forty-two more were closed. By the end of 1997, fifty-six finance companies had been closed.

Property opportunities abounded during the early 1990s. Major landholders began a construction boom

FLOWERS IN THAI CULTURE

Before the flower industry was commercialized in rural Thailand and most flowers were grown for export, flowers were grown mainly for display in the home and sold by vendors. The following is the opening of a flower-buying repartee played as a game by children in villages in Central Thailand.

Nag: Ta-log-tog-terg

Villagers: What can I do for you?

Nag: I'd like to buy some flowers.

Villagers: What kind of flowers?

Nag: *Campii* flowers

Villagers: They haven't bloomed yet.

Nag: How about *Campaa* flowers?

Villagers: They haven't bloomed yet.

Nag: How about going to a movie with me?

Villagers: Which one?

unheard of in other parts of the world. A large amount of money had been borrowed abroad at interest rates lower than those obtainable in Thailand. Consequently, when the economy slowed, foreign loans had to be repaid in devalued baht currency as the baht floated from about twenty-five baht to the dollar to well over forty baht to the dollar. Few people had anticipated the risk of monetary devaluation when they considered borrowing money abroad.

Many of these financial problems exacerbated one another, leading to a financial crisis for Thailand in July 1997. Finance companies were closed. The major banks held billions of baht of nonperforming loans—those that are not being repaid in a timely manner—and numerous people were either unemployed or underemployed. In Thailand in general and in Bangkok specifically, thousands of square meters of office space, homes, and warehouses sat unoccupied and often unfinished. The SET, having hit a high in 1994, was at its lowest point on 1999, with an index of 481.92. The tentacles of the financial crisis reached every person in the Kingdom of Thailand in one way or another. Although an economic recovery was in process, the economic crisis continued to be real and evident in 2001.

Looking Forward

Thailand's economic development has differed from that of the Asian Tigers. The government encouraged business leaders to shift the nation's agrarian economy to an advanced industrial economy. This was successful until Thailand's economic and financial liberalization during the boom period of the late 1980s and early 1990s. When hit by the economic crisis in mid-1997, Thailand, together with many other Asian countries, was not capable of correcting its economic system quickly enough.

Although Thailand has corrected some of its problems, the crisis left the financial system with a large number of nonperforming loans. New bankruptcy laws have been implemented, but the bankruptcy process needs to be accelerated to resolve disputes between creditors and debtors more quickly. Growth rates will undoubtedly continue to be slower than they were before the crisis, but export levels have increased somewhat, lending a longer-term optimism.

THAILAND—EDUCATION SYSTEM Known as Siam until 1939 and between 1945 and 1948, Thailand has been ruled by absolute monarchs from the founding of the nation in 1238. In 1932, it became a constitutional monarchy, and it remains so today. The current ruler, H. Bhumipol Adulyadej (King Rama IX) (b. 1927), who has shown a great commitment to education, is the longest-reigning monarch in the world. The fact that Thailand was never colonized has had important implications for the evolution of its educational system, which for the most part uses the Thai language and script.

Traditional and Missionary Education

Traditionally, Thai education took place in Buddhist temples (*wat*), and monks were the learned members of the community and teachers. Even today, so-called temple schools located on temple grounds account for 20 percent of the nation's schools. Temple schools were the dominant source of organized education from the thirteenth to the mid-nineteenth century. Buddhist priests provided both moral training and the basics of a literary culture. But since only men can be ordained as monks, the system discriminated against women.

Siam generally had an open attitude toward missionaries, and they were free to establish churches, schools, and medical facilities. A few Catholic missionaries arrived in the seventeenth century, but it was not until the early nineteenth century that missionaries were allowed to enter in substantial numbers. The missionary with the most enduring influence on Siamese education was Dan Beach Bradley, who served from 1835 to 1873 and introduced a printing press to produce materials in the Siamese alphabet. Missionary schools such as Mater Dei and Wattana are among Thailand's most prestigious.

Modernization and Reform

King Chulalongkorn (1868–1910) is Thailand's most beloved monarch and was Siam's great modernizer and visionary. He was deeply committed to improving education in Siam, and also introduced fellowships to allow Siamese to study in Europe. Under his successor,

A teacher and students at a village school in rural Thailand in c. 1994. (ROBERT HOLMES/CORBIS)

King Wachirawut (Rama VI), (1911–1925), a compulsory education act was passed in 1921. By the time of the fall of the absolute monarchy in 1932, approximately 80 percent of the country had access to primary school facilities.

During the four decades that followed the establishment of a constitutional monarchy, Thai politics were dominated by the military, primarily under the leadership of the field marshals Pibul Songgram (1897–1964), Sarit Thanarat (1909–1963), and Thanom Kittikachorn (b. 1911). During this period there was a great quantitative expansion in Thai education, with the goal of pro-

viding every village with a school. Also, there was a significant expansion in secondary and higher education. Despite such expansion, the most common level of education for most Thais remained only the completion of four years of primary schooling, hardly adequate for sustaining literacy in a complex written language such as Thai. During the first part of this period, Thailand had a 4-3-3-2 structure of education, with four years of lower primary schooling, three years of upper primary, three years of lower secondary, and two years of upper secondary. The 1960 National Scheme of Education brought in a 7-3-2 system, with seven years of primary schooling, three years of lower secondary education, and two years of upper secondary.

Also during this period, there was a serious lack of unity in education. The powerful Ministry of the Interior, responsible for local government, was in control of most primary schools, while the Ministry of Education was responsible for most secondary schools, and the University Bureau (later to become the Ministry of University Affairs) was responsible for higher education. Largely as the result of a close Cold War alliance with the United States, Thailand received substantial foreign aid, which enabled many Thais, particularly in the civil service, to receive fellowships for graduate study in the United States.

The Democratic Period

Since 1973, democratic rule has mostly prevailed, with only two successful military coups (October 1976

and February 1991). A student revolution on 6 October 1973 led to the overthrow of the military dictatorship of Thanom and ushered in a number of political and educational reforms. Curricula were liberalized to include a diversity of ideological material, particularly from the left, that previously had been banned. There were deep concerns about excessive educational disparities, inequalities, and administrative inefficiencies resulting from a lack of unity in education.

Two major changes emerging from this period were a new National Scheme of Education (approved in 1977), which established a 6-3-3 education structure. With six instead of seven years of primary education, universal primary education was more attainable. Under the previous seven-year primary system, many rural youth were completing only four years of education. The second change, approved in 1980, was the return of the control of primary education to the Ministry of Education from the Ministry of Interior. This period saw the continued expansion of education at all levels. By 1980, Thailand had more than three hundred colleges.

The 1980s and early 1990s saw Thailand achieve rapid macroeconomic growth led by rapid export expansion and industrialization. With an abundant supply of cheap labor, Thailand became an attractive site for offshore manufacturing, particularly from Japan. However, as wages rose in the mid-1990s, Thailand's international competitiveness declined. With its workforce's relatively low average level of education, Thailand's ability to raise its productivity was limited.

The Asian Economic Crisis and Renewed Efforts at Educational Reform

Thailand's economic crisis became globally known on 2 July 1997, when the government allowed the Thai baht to devalue. Thailand subsequently went into its worst economic recession since the end of World War II. However, as an important part of the response to the crisis, major political and economic reforms have been introduced. In the education area, a new National Education Law, mandated by the new 1997 constitution and promulgated in August 1999, makes nine years of education compulsory and requires that all Thai citizens be guaranteed twelve years of free education. The law also mandates the implementation of key education reforms. Two key elements of the reform are decentralization of education to Local Education Areas and school-based management and the reform of learning to a participative learner-center approach. To the extent that these reforms can become reality, Thailand's opportunities to be internationally

competitive and improve its standard of living will be dramatically enhanced.

THAILAND—HISTORY Scholars debate the origins of the Thai people and the beginning of their civilization. Modern Thai history also provokes controversy. Thailand's role in World War II and the Vietnam War remain contentious issues. Thai history is unique and important in understanding Southeast Asia.

Early History

Permanent settlements in Southeast Asia appeared roughly 40,000 years ago, with distinct ethnic and language groups developing about 10,000 years ago. Some anthropologists believe that the Tai people migrated from southern China, while others believe they evolved from earlier settlers in the region. During the first millennium CE, the Tai population increased, though their settlements were often absorbed by powerful empires of the Chinese, Vietnamese, Khmer, and Burmese. In the eighth century, the Tai peoples fragmented into five language subgroups: the northern Tai (Chuang) in southern China; the upland Tai in present-day Vietnam; the Lao; the western Tai (including such groups as the Shan and Lahu); and the central Tai (or Siamese), who settled in modern-day Thailand. Although scattered, most Tai-descended peoples retained a separate identity, language, and religion, which enabled the development of a unique culture.

Ancient Empires

During the thirteenth century, the balance of power in Southeast Asia changed dramatically. Mongol conquests weakened regional empires, making possible the rise of small Tai kingdoms. One, Sukhothai, was particularly successful in promoting Tai independence from Khmer and Burmese rule, dramatically expanding its influence as the larger empires declined. Sukhothai kings introduced a writing system, which subsequently became the basis for the modern Thai language. They also helped further the establishment of Theravada Buddhism throughout Tai lands. In this light, Sukhothai is widely regarded as the first truly Thai kingdom and represents a "golden age" in Thai history and culture.

Despite such achievements, Sukhothai was not without its rivals. After decades of warfare between several Tai kingdoms, one, Ayutthaya, came to dominate, forcibly annexing Sukhothai in 1376. Almost a

century of violent struggles with the Burmese and Khmer eventually led to Ayutthaya's collapse in 1569. However, a resurgence of Ayutthaya occurred in 1583, when King Naresuan (1555–1605) organized a revolt and repulsed the Burmese. Naresuan developed important trade and political links between Ayutthaya and China, which his successors expanded to include European powers new to the region. Tai influence increased in another new Asian order.

Siam Emerges

In the early sixteenth century, the Portuguese became the first Europeans to deal with the Tai, but it was not until a century later that the Dutch, and then the British and French, made real inroads. Trade was the primary motivation in any relationship between the Tai and Europeans, but other dimensions evolved. Tai rulers tried to balance independence with the economic and political benefits of European alliances. Meanwhile, in 1760, war with the Burmese erupted again. For years the Burmese advanced, gradually seizing Ayutthaya's provinces. Then, in 1767, the Burmese sacked Ayutthaya itself. Warlords took over most Tai lands. However, within a year, several old Tai kingdoms reasserted themselves. The most important was based at Thonburi, near the present-day capital of Bangkok. Led by Taksin (1747?–1782), Thonburi's armies recaptured most of Ayutthaya's lands and extended Tai control into Laos. Taksin's successor, Chaophraya Chakri, or Rama I (1737–1809), moved the capital to Bangkok, which quickly grew into a vibrant, cosmopolitan city. Rama I also reformed Tai laws, politics, and trade, establishing for the first time a unified Siamese empire and beginning the Chakri dynasty, which still rules Thailand today.

Throughout the early nineteenth century, Bangkok solidified its power. However, during the reign of Phra Nangklao, or Rama III (reigned 1824–1851), the threat from Europeans was renewed. British conquest of present-day Myanmar (Burma) eliminated Siam's mortal enemy, but new pressures emerged. Some Europeans demanded preferential trading privileges and challenged Bangkok's rule in remote provinces. Skillful negotiation by the Siamese avoided war. Siam became the largest empire in the region by outlasting its old foes and accommodating potential new ones. In this, Rama III is often seen as the champion of traditional Siamese culture in a region increasingly dominated by Westerners.

The Era of Colonization

During the nineteenth century, European powers colonized Southeast Asia. Siam's independence was

KEY EVENTS IN THAILAND'S HISTORY

- c. 40,000 BCE** Permanent settlements appear in Southeast Asia.
- c. 10,000 BCE** Distinct ethnic groups emerge in Southeast Asia.
- 13th century** Tai kingdoms emerge, including Sukhothai..
- 1376** Ayutthaya kingdom achieves dominance.
- 1569** Ayutthaya kingdom collapses under Burmese and Khmer assault.
- 1583** Ayutthaya kingdom revives and expels the Burmese.
- 1760–1767** The Burmese capture much of the Ayutthaya kingdom.
- 18th century** Late in the century and into the nineteenth, The Burmese are expelled and a Tai kingdom established at Bangkok.
- 19th century** Contact with Western nations (Britain, France, United States) intensifies and Thailand modernizes.
- 1910** Thailand has lost land to Britain and France but remains independent.
- 1917** Thailand joins World War I as an ally of the United States.
- 1932** A coup ends the absolute monarchy.
- 1939** Thailand becomes the official name.
- 1941** Japan invades Thailand.
- 1942** Thailand declares war on Britain and the United States.
- 1950s–1960s** Thailand and the United States develop a strong relationship.
- 1973** Political unrest sweeps the nation leading to to more freedom and then a return to military rule into the 1980s.
- 1990s** Politics remain unstable with conflict over military versus civilian rule.
- 1997** Thailand suffers from the Asian financial crisis.
- 1997** A more democratic constitution is enacted.
- 2001** The general election is undermined by widespread fraud.

seriously threatened, but strong leadership and artful diplomacy kept it intact. Two of Thailand's most revered kings, Mongkut, or Rama IV (1804–1868), and his son Chulalongkorn, or Rama V (1853–1910), were instrumental in this process. King Mongkut introduced political, bureaucratic, and cultural reforms designed to "civilize" and modernize Siam. He also successfully played rival Europeans off against one another. In courting the United States, Mongkut gained an important friend outside Europe and broadened Siam's international relationships. King Chulalongkorn furthered the reforms, as well as Siam's ties with the United States. However, tensions between the British and French late in the century began a period of territorial readjustment for Siam, as both impinged on its frontiers. By 1910, Siam had been forced to surrender much of Malaya and Burma to the British and Siamese Cambodia and its Lao territories to the French, losing nearly half of the territory it controlled at the height of Rama III's reign.

Nationalism and Revolution

Vajiravudh, or Rama VI (1881–1925), attempted to strengthen his kingdom by promoting the "Thai nation": a Siamese nationalism based on love of the country, the religion, and the monarchy. Although this had antiforeign overtones, in international affairs Siam remained aligned with Western powers. When World War I broke out in 1914, Siam declared neutrality, but after the United States intervened in 1917, Siam quickly followed suit. By joining the Allies, the Siamese earned a place at the Paris Peace Conference, where, with U.S. help, they negotiated an end to the special privileges that the British and French had in the kingdom.

After the war, Siam confronted a serious financial crisis, which was worsened by the worldwide Great Depression beginning in 1929. Moreover, Siam's King Prajadhipok, or Rama VII (1893–1935), was challenged by Western-educated Siamese intellectuals who demanded further reforms to modernize the kingdom. Amid these problems, a small group staged a daring coup in 1932. Prajadhipok cooperated to avoid a

bloody civil war. In doing so, he became the last absolute king of Siam.

The Military Rises

The military's participation in the coup represents a dramatic turning point in Thai history. Ideological differences between the plotters led to political instability, which worsened when Prajadhipok abdicated the throne in 1935. The new king, Ananda Mahidol (1925–1946), was just ten years old, leaving Siam effectively without a monarch. Throughout the 1930s, Siamese politics were marked by tremendous infighting. The military's influence grew considerably with the appointment of Prime Minister Plaek Khittasangkha (Luang Pibul Songgram, or Pibul; 1897–1964). He wanted to create a "new nation," renaming the country Thailand in 1939. Pibul believed the more nationalistic name would help modernize the country, rejecting Siam as an archaic "colonial" and foreign term. He also adopted a stringent economic nationalism and cultural "reforms," which banned speaking languages other than Thai and enforced traditional dress codes.

Pibul's nationalism translated into a very controversial foreign policy. He admired Japanese militarists and European dictators. Encouraged by their success and the outbreak of World War II in 1939, Pibul tried to retake the lost "provinces" of Laos and Cambodia. In a brief war with the French in 1940, Thailand regained its former territory with support from the Japanese. However, most Thais did not like the anti-Western nationalism that Japan and Pibul represented. In 1941, after being denied access en route to Malaya, the Japanese invaded Thailand. Pibul eventually allowed the Japanese transit in exchange for guarantees of Thai independence. Then, following Japanese advances against the Western powers, Pibul joined an alliance with Japan. One month later, in January 1942, Thailand declared war on Britain and the United States.

War and an Uneasy Peace

Many Thais did not support war with the West. Some formed resistance groups, most led by Pridi Banomyong, Pibul's former minister of foreign affairs and then regent, and Seni Pramoj, the Thai ambassador to the United States and leader of the so-called "Free Thai" government in exile. Others saw cooperation with Japan as in keeping with the traditional flexibility of Thai foreign policy and the only way to protect their country from what otherwise would have been a harsh Japanese occupation. Still others welcomed the Japanese over Western domination. They saw the war as an opportunity to regain territory that

had been lost to the French and British over the centuries. In fact, during World War II, Thai forces fought the British in Burma and Malaya in efforts to reestablish the old provinces.

Officially, Thailand was the only independent ally of Japan. However, Thai resistance movements worked closely with Western forces operating throughout Southeast Asia, and during the war Thai opposition to the Japanese grew. In 1944, Pibul was deposed as prime minister. A civilian government returned to power, facing the difficult task of explaining Thailand's role to the Allies. The United States was convinced that the Thai people were not truly behind Pibul and disregarded Thailand's declaration of war. Thai leaders then successfully lobbied the United States for help in negotiating with the British and French, reducing many of their reparations claims. Still, Thailand did have to pay. In addition to money and goods, the Thais surrendered to the British and French all territories temporarily gained during the war in Burma, Malaya, and Laos.

Unstable civilian governments led Thailand between 1944 and 1947. A key figure during this time was Pridi Banomyong, who became a champion of the left in Thai politics. In March 1946, he became prime minister, but rumors about his ties to Communists weakened him. In June 1946, King Ananda was mysteriously killed, and Thai conservatives linked Pridi to the incident, forcing him to resign. The military retook control. Although another civilian became prime minister, the armed forces were behind the scenes. Eliciting minimal opposition within the country and little response from the international community, the military restored Pibul to power in April 1948.

Thailand and the Cold War

Pibul's personal history was a concern, but his strong leadership was an asset during the late 1940s, when revolutions throughout Asia were gaining strength. There was concern that Thailand would be next to endure such conflict. In this context, the United States saw Pibul as an ally in containing the spread of Communism. Throughout the 1950s, the U.S.-Thai relationship flourished. U.S. economic, technical, and military assistance poured into Thailand, developing a stronger economy, but also legitimizing military rule. Many Thais were uneasy about such a strong connection to a foreign power and worried about American influence on their country. Thus, from 1955 to 1957, Pibul developed his friendship with the United States while secretly pursuing relations with China. This strategy, however, undermined confidence in Pibul. In

The historic Bridge on the River Kwai in 1998. (JOSEPH SOHM; CHROMOSOHM INC./CORBIS)

September 1957, another military coup toppled the government. Pibul fled the country, and Field Marshal Sarit Thanarat (1908–1963) took over.

Sarit considered himself the defender of traditional Thai institutions and introduced harsh reforms to preserve Thai culture. Sarit was also notoriously corrupt, amassing a huge fortune while in office. Nonetheless, Thailand's economic progress made Sarit popular with the people. He also gained support for restoring the prestige of the monarchy. The king, Bhumipol Adulyadej (b. 1927), was at the center of Sarit's nationalism and symbolized Thai unity. In foreign policy, Sarit cooperated closely with the United States. Thailand was a principal member of the U.S.-led Southeast Asian Treaty Organization (SEATO), and became a base for U.S. covert operations in Cambodia, Laos, and Vietnam. Thailand was one of only two Southeast Asian nations to join SEATO. However, Sarit often doubted U.S. resolve to fight Communism and its commitment to his country (Bamrungsuk 1988: 118–125, 156).

The War in Vietnam

Sarit's successor, Field Marshal Thanom Kittikachorn (reigned 1963–1973), did not share such reservations and built an even closer relationship with Washington. Thailand played a crucial role in supporting the war in Vietnam. Over 11,000 Thai soldiers served there, one of the largest contingents from

a U.S. ally. Fully 80 percent of the ordnance dropped on Vietnam came from planes based in Thailand. Thai support for the war also lent credibility to U.S. claims that it was defending Asian allies from Communism. Although the Thais were well compensated for their contributions, they were not simply mercenaries. They had legitimate security concerns related to Laos, Cambodia, and Vietnam. From Laos, the northeast was a potential route of Communist expansion into Thailand. Most Thais therefore supported U.S. efforts to combat Communism elsewhere in Southeast Asia, rather than wait for it to overrun their country.

There were, however, considerable problems with the U.S.-Thai relationship. Some Thais warned that their culture was threatened by such a large U.S. presence. By 1968, some 45,000 U.S. service people were stationed in Thailand, and thousands more in Vietnam rolled in on leave. Cities like Bangkok were dramatically transformed by neon lights, massage parlors, and wild bars. Many Thais thought that Americans were crude and that they did not show respect for Thai culture. They also feared that the United States was not winning the Vietnam War and that one day Thailand would be surrounded by Communist countries that would remember and resent its role in the war.

Reaction and Revolution

This scenario appeared to unfold in the early 1970s when the United States withdrew from Vietnam.

Divisions in the Thai government emerged over the direction of foreign and economic policies. There was also pressure from a new generation that wanted more democracy and an end to military rule. In 1973, growing discontent with the government led to a series of protests, culminating in mid-October with massive demonstrations by students and the population in Bangkok. When the military responded with brutal force, only personal intervention by the king prevented further widespread violence. Thanom and his associates fled the country, and major political changes swept Thailand.

Civilian governments that followed were weak, but there was an expansion of political and social freedoms. There were also changes in Thailand's foreign policy. Establishing better relations with China became a priority, especially as the United States disengaged from Southeast Asia and Communist governments came to power in Cambodia, Laos, and Vietnam. By 1976, however, many Thais worried that the country was too radical and favored a return to military rule. Clashes between students and conservative extremists often turned violent. Once again the Thai military and police intervened, with the storming of Thammasat University and the 6 October coup, this time supporting a new but harsh civilian government. Censorship, arrests, and strict laws marked the return of repressive authoritarianism to Thailand. Although another coup toppled the government within a year and restored many freedoms, the military remained the most powerful force in Thai politics. However, conscious of past events and concerned about international opinion, the soldiers remained in the shadows. Governments into the 1980s were heavily influenced by the armed forces and were led by former Thai army generals, acting as "civilian" politicians. Nonetheless, some democratic reforms did take hold. Regular elections were held without the military's direct intervention, allowing for a relatively peaceful transition of power. Moreover, fairly diverse and viable political parties began to emerge, slowly changing the landscape of the Thai polity and paving the way for more reform.

Boom and Bust

By the late 1970s, it was clear that Thailand had avoided the revolutions that engulfed its neighbors. Despite periodic rumblings, it was also clear that many Thais favored stability and traditional institutions over democratization. Still, economic development and external relations remained problematic. In December 1978, Vietnam invaded Cambodia, driving thousands of refugees into Thailand and placing the Vietnamese military near the Thai border. Bangkok secured an impor-

tant, if fairly superficial, alliance with China while supporting Cambodian resistance against the Vietnamese—even the notorious Communist Khmer Rouge. In return, the Chinese stopped their support for the Communist Party of Thailand and its insurgent movement. As part of this complex foreign policy, Thailand pursued close economic relations with Japan and Southeast Asian nations, stimulating growth during much of the decade.

In the 1990s, the question of political reform resurfaced. Following a string of corrupt governments, many Thais again demanded change. The military openly seized power in February 1991, with the promise of fair elections. However, in March 1992 voting was marred by fraud, which provoked more protests. Violence exploded in May when another general, Suchinda Kraprayoon, became prime minister. Just as he had in 1973, the king intervened, criticizing the military and calling for peace. Since then, coalition governments have struggled with reforming Thailand's political structure and economy. For much of the 1990s, the country enjoyed a financial boom, joining the economic "tigers" of Asia. However, in response to a severe debt and foreign-exchange crisis in July 1997, the Thai government elected to float its currency—the baht—precipitating a disastrous economic contagion that spread to many Asian markets and eventually to Russia and Brazil. Thailand's fortunes were clearly reversed, and doubts about its long-term economic future quickly resurfaced.

Thailand Today and Tomorrow

Thailand's recovery from the crisis has been slow. So too has the process of political restructuring. Despite a new, more democratic constitution in 1997 and changes to business, finance, and electoral practices, Thailand's reform problems continue. Corruption remains a major issue affecting both the economy and government. The most recent election, in January 2001, was undermined by widespread tampering. There are serious reservations about the new government's connections to big business and the Thai military and about its commitment to genuine reform.

Notwithstanding these difficulties, Thailand remains a relatively stable nation. Reverence for the monarchy and great respect for King Bhumipol himself continue to be stabilizing factors. So do a well-defined sense of nationhood and Thailand's good foreign relations. In fact, traditional institutions and ideas have served Thailand well during some very tumultuous times in its history. The question remains how well the country will adapt to a rapidly changing future.

THAILAND—POLITICAL PARTIES Political parties first emerged in Thailand with the end of the absolute monarchy in 1932, when the new ruling clique established the People's Party. Nevertheless, the history of Thai political parties is not a happy one. During the first four decades following 1932, political parties were banned completely for two lengthy periods: from 1933 to 1945, and from 1958 to 1968. When parties were able to function, the great majority were established by rival factions of the political elite; forming a party was typically the response of a defeated faction following a coup d'état. In other words, party

politics was often a secondary form of politics; real power lay mainly in the hands of the military and the bureaucracy. Nor was party politics about mass politics. The People's Party has aptly been described as an "oligarchy," and few Thai parties have ever had substantial numbers of members.

Thai parties have been criticized for being unprincipled, lacking clear policies, being dominated by personalities, being undisciplined, being unstable, lacking real public support, clashing with government officials, being too numerous, being dominated by financiers, and misunderstanding their own roles. Many commentators have wanted to transform the existing parties into "real" parties, based on mass membership organizations with a more ideological basis. Legislation has been introduced in an attempt to accomplish this. The 1981 Political Parties Act, for example, set minimum numbers of members for political parties and required that parties contest a quarter of all parliamentary seats. Some political parties, such as the United Thai Peoples' Party (established by the Thanom Kittikachorn government in 1968) were established specifically as "mass" parties, designed to mobilize large memberships.

The Political Economy of Parties

In practice, such attempts have been doomed to failure. Most Thai parties are actually driven by financial rather than ideological considerations. A typical Thai party is composed of a number of factions, or cliques. Each clique is led by a boss figure, who assumes the role of patron. Often, these cliques correspond roughly to geographical areas, as politicians tend to work together in regional groupings. Faction bosses cultivate close relationships with business interests in particular regions or economic sectors. It is common for these faction leaders to work closely with local crime bosses, commonly known as *chaopho* (godfathers). Sometimes the politicians are themselves *chaopho*. Godfathers typically engage in such illegal business activities as logging, smuggling, drug dealing, gambling, and prostitution rings. To operate these businesses with impunity, they require political protection; hence their willingness to fund politicians, cliques, and parties that will cooperate, passively or actively, with their businesses.

At the same time, political economy explanations of Thai political parties are not sufficient to account fully for their activities. Thai parties seek to present a respectable image to the media and to the voting public, especially the more sophisticated Bangkok electorate. While most major parties are managed by a

secretary-general, who serves as principal fund raiser and trouble shooter, they often chose a well-educated and presentable individual to act as party leader. The party leader is the public face of the party, while the secretary-general controls the purse-strings. From 1988 to 2000, Thailand had four prime ministers who were also leaders of political parties: Chatichai Choonavan (Chart Thai), Chuan Leekpai (Democrat), Banharn Silp-archa (Chart Thai), and Chavalit Yongchaiyudh (New Aspiration). With the exception of Banharn, these men were all well-respected public figures: Chatichai was a former general and ambassador from an elite family; Chavalit was a former army commander and career military man; and Chuan was a well-educated, silver-tongued lawyer. Banharn, a provincial businessman of Chinese descent, had serious problems during his short term as prime minister. He was the former secretary-general of the Chart Thai Party, a brilliant behind-the-scenes fixer who did not gain broad public acceptance as a national leader. Thai political parties could not survive on the basis of fund raising and wheeling and dealing alone: they needed to present a serious and somewhat plausible face to the wider world. Chatichai, Chavalit, and especially Chuan were able to place an apparent distance between their own leadership, and the backstairs deal making that had put them into office.

Stasis and Change

Thai parties are constantly changing. In part, this reflects movements of politicians from one party to another, as faction leaders routinely switch parties in the run-up to elections. Yet it also reflects an eternal optimism among politicians, commentators, and the wider voting public that a new party can emerge and break the existing mold of Thai party politics. Recent examples of "new style" parties have included Palang Dharma (Moral Force), founded by Buddhist ascetic and former Bangkok governor Chamlong Srimuang in 1988; New Aspiration, set up by former army chief Chavalit Yongchaiyudh in 1990; and Thai Rak Thai (Thai loves Thai), created by telecommunications magnate Thaksin Shinawatra in 1999. New parties tend to promise higher levels of integrity, greater technocratic competence, and more substantive popular support than existing parties. They are typically led by a high-profile public figure, and initially recruit some prominent individuals to bolster the party's image. Over time, however, they demonstrate a tendency toward greater pragmatism, and gradually begin to embrace many of the features of other Thai parties that they initially disdained.

Thai governments are coalitions, generally bringing together as many as five or six parties. A typical

coalition is built around one lead party, working with a couple of medium-sized parties and a couple of rather smaller partners. Because of factional defections, a large party at one election may shrink to nothing by the next. The Samakkhi Tham Party was the single largest party in the March 1992 election, but it did not contest the September 1992 election at all. Palang Dharma was the leading party in Bangkok in July 1995, winning sixteen seats; yet in November 1996, it gained only one. During the 1995 general election, Chart Thai and the Democrats were the two main rivals. By 1996, the rivals were the New Aspiration and the Democrats. And by 2000, the key contest was between Thai Rak Thai and the Democrats. These parties present slightly different images and appeal more strongly in different parts of the country. Chart Thai is a somewhat conservative, pro-business party, with its core support in central Thailand. New Aspiration uses populist rhetoric to appeal especially to government officials and farmers, especially in the Northeast. The Democrats (Thailand's oldest party, dating back to 1946) have a slightly more liberal platform and internationalist image, with their main support in Bangkok and the South. Thai Rak Thai combines a very modern image with the use of nationalist and pro-poor rhetoric.

The 1997 constitution, widely considered one of Thailand's most liberal, included provisions intended to strengthen the party system and measures designed to prevent politicians from switching parties. The effectiveness of these changes remains to be seen. However, the January 2001 general elections—the first to be held under the new rules—did see the Thai Rak Thai Party gain an unprecedentedly large electoral mandate. The campaign was characterized by a much greater emphasis on policy issues than had previously been the case. In the aftermath of the elections, there were signs that Thai Rak Thai might absorb some of its coalition partners, with the aim of establishing a one-party-dominant system.

Coalition politics can make for unlikely bedfellows. Because his Chart Thai Party had a poor image with the residents of Bangkok, Banharn Silpa-archa's 1995–1996 administration formed an alliance with the more respectable Palang Dharma. When clean-living Chuan Leekpai began his second spell as prime minister in 1997, his coalition was based on support from the Prachakorn Thai Party's "cobra" faction, led by Vattana Assavahame, a controversial figure accused of having strong connections with *chaophu*. Any coalition requires the collaboration of respectable figures and power brokers of questionable integrity. However, these collaborations are characterized by serious ten-

sions, and consequently are unstable. Thailand's current lineup of political parties is certain to continue waxing and waning, provoking alternating moods of optimism and despair among both political analysts and ordinary voters.

THAILAND—POLITICAL SYSTEM Thailand's political system has been in a state of near-constant flux since the end of the absolute monarchy in 1932. The 1997 constitution ushered in a series of reforms designed to strengthen the integrity of the political order and to promote greater stability. The reforms reflected anxieties about a surge in vote buying and electoral abuses during the 1980s and 1990s. The political system is a difficult one to classify, because it contains both democratic and nondemocratic elements. The formal structures of representative democracy coexist with a powerful bureaucracy.

On 24 June 1932 a clique calling itself the "Peoples Party" seized power from the then king, Rama VII (Prajadhipok), in a bloodless coup. This clique was composed of members of the civilian bureaucracy and of the military, some of whom had been educated in France. The new regime abolished the absolute monarchy while retaining the monarch, calling for a democratic order. Nevertheless, the ruling clique was divided from the outset over the nature of the political system it envisaged for Siam, as Thailand was then known. While elections were held at various junctures (nine in all from 1932 to 1973) and political parties emerged, for the next forty years, the country's politics were characterized by bureaucratic dominance,

elite infighting, and strong military influence. Periods of civilian rule alternated with spells of military government, with the military frequently in the ascendant from 1947 to 1973.

Instability is a hallmark of Thai politics. Between 1932 and 2000, Thailand had sixteen constitutions, sixteen successful coups, fifty-three different cabinet administrations, and twenty-two different prime ministers. Yet, despite this near-constant change, there was considerable continuity in government policy, largely because much of the day-to-day decision making remained in the hands of civil servants. The scholar Fred Riggs famously characterized the Thai political system after 1932 as a "bureaucratic polity," in which the government officials (both civilian and uniformed) ran Thailand according to technocratic and military priorities, with little reference to the needs of either the private sector or the wider public. However, the bureaucratic polity model has been criticized by other scholars, who see it as a static, conservative interpretation that underplays the extent of political opposition and conflict.

Controversies and Conflicts

The year 1973 was a turning point for politics in Thailand. In this year, student-led mass protests in Bangkok culminated in the ouster of military-backed Prime Minister Thanom Kittikachorn (b.1911), who was obliged to leave the country. A period of relatively open politics followed, which was characterized by growing ideological polarization. However, on 6 October 1976 the military and rightist forces initiated a bloody showdown with the students, beginning with a dawn massacre of student activists at Thammasat University.

Protestors outside Bangkok's government building in November 1999 wear masks of senior government officials who the protestors believe are not adequately handling the national bank scandal. (REUTERS NEWMEDIA INC./CORBIS)

PREAMBLE TO THE CONSTITUTION OF THAILAND

Enacted on the 11th Day of October B.E. 2540.

Being the 52nd Year of the Present Reign.

May there be virtue. Today is the tenth day of the waxing moon in the eleventh month of the year of the Ox under the lunar calendar, being Saturday, the eleventh day of October under the solar calendar, in the 2540th year of the Buddhist Era.

Phrabat Somdet Phra Paramintharamaha Bhumibol Adulyadej Mahitalathibet Ramathibodi Chakkri Narubodin Sayammintharathirat Borommanatthabophit is graciously pleased to proclaim that whereas Constitutions have been promulgated as the principle of the democratic regime of government with the King as Head of the State in Thailand for more than sixty-five years, and there had been annulment and amendment to the Constitutions on several occasions, it is manifest that the Constitution is changeable depending upon the situation in the country. In addition, the Constitution must clearly lay down fundamental rules as the principle of the administration of the State and the guideline for the preparation of the organic laws and other laws in conformity therewith; and whereas the Constitution of the Kingdom of Thailand, B.E. 2534 as amended by the Constitution Amendment (No. 6), B.E. 2539 established the Constituent Assembly, consisting of ninety-nine members elected by the National Assembly, charged with the duty to prepare a draft of a new Constitution as the fundamental of political reform and His Majesty the King graciously granted an audience to members of the Constituent Assembly for taking His Royal speeches and receiving blessings in carrying out this task, and, thereafter, the Constituent Assembly prepared the draft Constitution with the essential substance lying in additionally promoting and

protecting rights and liberties of the people, providing for public participation in the governance and inspecting the exercise of State power as well as improving a political structure to achieve more efficiency and stability, having particular regard to public opinions and observing procedures provided in the Constitution of the Kingdom of Thailand, B.E. 2534 as amended by the Constitution Amendment (No. 6), B.E. 2539 (1996) in every respect;

Having carefully considered the Draft Constitution prepared by the Constituent Assembly in the light of the situation of the country, the National Assembly passed a resolution approving the presentation of the draft Constitution to the King for His Royal signature to promulgate it as the Constitution of the Kingdom of Thailand;

Having thoroughly examined the draft Constitution, the King deemed it expedient to grant His Royal assent in accordance with the resolution of the National Assembly;

Be it, therefore, commanded by the King that the Constitution of the Kingdom of Thailand be promulgated to replace, as from the date of its promulgation, the Constitution of the Kingdom of Thailand, B.E. 2534 promulgated on 9th December B.E. 2534.

May the Thai people unite in observing, protecting and upholding the Constitution of the Kingdom of Thailand in order to maintain the democratic regime of government and the sovereign power derived from the Thai people, and to bring about happiness, prosperity, and dignity to His Majesty's subjects throughout the Kingdom according to the will of His Majesty in every respect.

Source: International Constitutional Law.
Retrieved 11 April 2002, from: <http://www.uni-wuerzburg.de/law>.

Yet, after a brief authoritarian interlude from 1976 to 1977, Thailand embarked on a "semidemocratic" path. Elections were reinstated in 1979, and for the next twelve years, electoral politics gained increasing significance. Bureaucratic power gradually waned as profes-

sional politicians became more and more influential. During the 1980s, a wide range of interest groups and civil-society organizations gained in strength and influence, including the print media, nongovernmental associations, heterodox Buddhist sects, and environmental

movements. This expanded public sphere also challenged state power and undermined the bureaucracy.

Conflicts again emerged during the troubled period from February 1991 to May 1992, which saw the first successful military coup in fourteen years; a period of technocratic, military-backed government; the promulgation of a new constitution; and a controversial general election. Street protests against the premiership of former coup leader Suchinda Kraprayoon (b. 1933) in May 1992 culminated in the shooting of dozens of unarmed protestors by the military. The "May events" effectively destroyed the credibility of the military as a political force, leaving civilian-elected politicians firmly in the ascendant.

However, disquiet over the way in which many elected politicians abused the electoral system—and then sought to exploit ministerial office to advance their own financial and business interests—led to growing demands for reform of the political order. These demands culminated in the promulgation of the 1997 constitution, which followed an extensive process of public consultation. For all its shortcomings, this constitution was popularly hailed as one of Thailand's most liberal and democratic.

Components of the Political System

The Thai Parliament has two chambers: the House of Representatives and the Senate. The lower house, which is the more important of the two, is composed of four hundred members elected from single-seat constituencies, and one hundred elected by proportional representation using a "party list" system. MPs elected by constituencies are not entitled to become ministers (unless they resign their seats), whereas those elected on a party-list basis are free to assume ministerial positions. Politicians have been purposely divided into two groups: local representatives chosen for their electability and more respected senior figures of ministerial caliber. Members of the Senate may not be members of political parties: the Senate is supposed to be a council of elders, a nonpartisan body that stands above the fray of day-to-day politicking. In practice, however, some of those elected to the Senate are far from politically neutral. Elections are held every four years for the lower house and every six years for the Senate.

Elected Thai governments are coalitions, typically combining the strengths of five or six political parties. Thai prime ministers therefore find their power constrained by the need to mediate the demands of competing coalition partners. An unruly form of cabinet government is generally the order of the day. Historically, Parliament has been rather weak, and relatively

little legislation has been passed. Most government decisions are issued in the form of cabinet decrees. Parliamentary debates have been largely a forum for the opposition to criticize government policy, notably in the form of set-piece, knockabout, no-confidence debates that are a regular feature of the Thai political calendar.

Several new bodies were also established after 1997 to oversee and to police the political system: an independent election commission, a national anticorruption commission, a constitutional court (to resolve legal anomalies and disputes relating to the constitution), a national human-rights commission, and an administrative court (to resolve disputes between citizens and government officials). Given well-established problems of vote buying and electoral fraud, and the persistence of political corruption, these bodies face considerable challenges in performing their functions effectively.

While the monarchy has no formal role in politics, there have been explicit royal interventions at critical junctures, most recently in May 1992. King Bhumibol (b. 1927) has emerged as the ultimate arbiter in times of political crisis. Although he has performed this role with great skill, he has done so on the basis of enormous public esteem and legitimacy built up over more than half a century. It is very doubtful whether any successor could hope to emulate this feature of his rule.

Local government remains extremely weak. With the exception of the Bangkok Metropolitan Authority—which has an elected governor—Thailand's seventy-six provinces are largely administered by appointed governors dispatched from the interior ministry in Bangkok. These governors are rotated regularly. Elections take place for provincial, municipal, and subdistrict councils, but so far these bodies have gained little autonomy from the central Thai state. The result is an excessively centralized political order, where most important decisions are made in Bangkok.

Thailand has a muddled and troubled political history, yet it has emerged as one of the most open and pluralistic societies in Southeast Asia. While the political reform process of the late 1990s has brought about a variety of changes, the Thai political system still contains numerous structural problems and weaknesses, which form the subject of intense public debate.

THAIPUSAM Thaipusam is one of three festivals celebrating aspects of the Hindu deity Lord Murugan, the others being Pankuni Uttiram (March–April) and Vaikasi Visakam (May–June). It falls on the first month of the Tamil year, Thai, on the day closest to the full moon when the constellation Pusam is in the ascendant. In one founding charter, it marks the occasion when Lord Murugan received his lance (*vel*), which symbolizes knowledge and wisdom. The mythological attributes of Lord Murugan are complex; he is variously depicted as a god-king, a warrior, an ascetic youth, a teacher, a divine lover, and a personal savior.

An attendant attaches skewers to the face and tongue of a Hindu woman celebrating Thaipusam in Singapore. (EARL & NAZIMA KOWALL/CORBIS)

In Southeast Asian countries where diaspora southern Indian communities are sizeable, Thaipusam is the most visible and spectacularly celebrated Hindu festival, attracting massive crowds of pilgrims and curious spectators alike. In Malaysia, the Batu Caves shrine complex, situated some seven miles from the Kuala Lumpur city center, is the largest and most well-known pilgrimage destination for both locals and foreigners. The celebration begins, before dawn, with a procession of a brightly decorated chariot bearing the deity through the city streets and then onward to the Batu Caves shrine. During this time, pilgrims make supplications or perform various devotional acts in fulfillment of vows or as penance. Heads are shaved, and free food and drink are distributed without discrimination. Some pilgrims carry *kavadi* ("ritual burden") for a distance, after a stipulated period of ritual preparation (e.g., fasting, abstinence, and chanting of hymns). There are various kinds of *kavadi*. Pots of milk are common with women and children; for men the typical *kavadi* consists of a metal or wooden frame decorated with an assortment of peacock feathers, flowers, colored paper, styrofoam, and other paraphernalia, which is borne on the shoulders. Additionally, many young men pierce their bodies with numerous hooks and skewers after entering a trance state.

As a complex public religious event, Thaipusam has many facets and meanings, including individual self-fulfilment, different emphases of Hindu spirituality, and as an expression of ethnic Tamil group identity in the context of religious and ethnic pluralism in countries like Malaysia and Singapore.

THAKINS Members of the Dobama Asiayone Movement, also known as the Thakin Party, were

commonly referred to in the 1930s as Thakins, by the designation they put in front of their names. During the colonial times, when addressing the British, the Burmese were generally required to use the designation *thakin* ("lord" or "master"), much as "sahib" was used in India. Young Burmese began to use this designation for themselves to make a point about their own mastery over their country. The Dobama Asiayone (variously translated as "We Burmans," "We Burmese," or "Our Burma"), founded by Ba Thung in May 1930, managed to bring together traditionalist Buddhist nationalist elements with modern political ideals. Its song became Burma's national anthem. In the early 1940s and 1950s its members—including Aung San and U Nu—were later to become extremely influential in the national independence movement and in the post-independence Anti-Fascist People's Freedom League (AFPFL) governments. During the Japanese occupation it was conjoined in 1942 with Ba Maw's Sinyetha Party to be known as Do Bama Sinyetha Asi Ayon. It lost support after its reorganization by Ba Maw into the Maha Bama Asi Ayon in 1944, when the AFPFL took over in importance.

THAKSIN SHINAWATRA (b. 1949), Thai prime minister. On 9 February 2001, Dr. Thaksin Shinawatra (pronounced "Shin-a-wat") became Thailand's twenty-third prime minister. In general elections held in January, the new political party, Thai Rak Thai (Thais Love Thais), which he founded in 1998, won a landslide victory, the first in modern Thai political history in which a single party won a near majority (248 of 500) of all parliamentary seats. A native of Chiang Mai, Dr. Thaksin is particularly strong politically in Thailand's north.

From 1973 to 1987, Dr. Thaksin served in the Royal Thai Police Department. After resigning from the government, he went on to become a dynamic telecommunications business entrepreneur and one of the wealthiest individuals in the world. In 1994, Dr. Thaksin decided to enter Thai politics and held several different cabinet posts during the period 1994–1997. As prime minister Dr. Thaksin has advocated policies that defy typical International Monetary Fund dictates. He has, for example, implemented populist policies of providing a three-year debt relief for farm-

ers, a million-baht credit scheme for every village, universal health care with a minimal charge per hospital visit, higher interest rates to strengthen the baht, and avoidance of international loans with policy strings attached. He is deeply committed to strengthening Thailand's capabilities in information technology.

The Constitutional Court of Thailand reviewed charges that Dr. Thaksin failed to report accurately his financial assets when he became involved in Thai politics in 1997. On 3 August 2001, by a narrow vote of 8 to 7, Dr. Thaksin was found not guilty. Had he been found guilty, he would have been banned from Thai politics for five years.

At present it is somewhat premature to assess Dr. Thaksin's leadership. The key question is whether he is an old-style politician in a new guise or a genuine reformer. His alleged attempt to infringe on press freedom and his image of representing "dictatorial money politics" has certainly reduced his popularity, particularly among intellectuals, journalists, activists, and urban citizens. On a more positive note, he seems open to meet with diverse social groups with grievances. Also as of March 2002, the Thai stock market was the third best performing (in U.S. dollar terms) in the world in 2002, perhaps reflective of domestic and international investors' confidence in his leadership of the country.

THAN SHWE (b. 1933), military head of state in Myanmar. Than Shwe became the first chairman of the ruling State Peace and Development Council (SPDC) in Myanmar (Burma) in 1997, having succeeded General Saw Maung as chairman of the ruling State Law and Order Restoration Committee (SLORC) in April 1992. He is generally seen as holding the balance between opposite factions in the army for and against

political reform. He is also simultaneously army commander-in-chief, head of state, prime minister, and defense minister.

Than Shwe joined the army in 1953 and in 1958 was attached to the Psychological Warfare Department. He was lecturer at the Central University of Political Science in Rangoon between 1963 and 1967. In 1981 he became central committee member of the Burma Socialist Programme Party and in July 1988 he was appointed to the central executive committee and was made deputy minister of defense. Promoted to commander of the southwest region in 1983, he became vice chief of staff in 1985. He was promoted to lieutenant general in 1987 and full general in 1990. At the time of the 1988 uprising he was chairman of the Irrawaddy Division under the Burma Socialist Programme Party. He has been the patron of the Union Solidarity and Development Association (USDA) since its foundation.

THANJAVUR (2002 est. pop. 220,000). Thanjavur (or Tanjore) is an important city in the south of Tamil Nadu, India, and one of the most ancient. Located on the Vedavar River near the head of the agriculturally rich Kaveri Delta, the city first gained prominence in the tenth through twelfth centuries under the Chola dynasty.

In about 1010, the famed Brihadishvara Temple was erected, and it is still the main attraction in the city. The pyramidal stone tower rises to a height of 66 meters and is capped by a massive stone and a gold pot finial that was donated by the royal founder, Rajaraja I (reigned 985–1014). The centerpiece inside is a massive stone lingam (phallic symbol), and facing the east entrance to the shrine is a huge bull (Nandi) in black granite, which is said to have been brought from a place some 650 kilometers away. The art gallery in the former raja's palace is also worth a visit for its fine collection of Tanjore bronzes of the Chola age. Tamil University has recently been built on the outskirts of the city.

THANOM KITTIKACHORN (b. 1911), Thai prime minister. Born August 11, 1911, Thanom Kittikachorn graduated from the royal military academy of Chula Chom Klao in 1931. He was involved in the overthrow of Pibul Songkram's government in 1957. After the inconclusive elections of December 1957, he became the caretaker prime minister until October, when Sarit Thanarat assumed power. As Sarit's deputy, Thanom became the prime minister after Sarit's death in December 1963 and became field marshal in 1964.

Thanom ruled with Field Marshal Praphat Charusathien and General Kris and continued the policies of Sarit, but without the same degree of control. The main problem was the increasing Communist insurgency. Thailand was closely aligned with the United States in the war in Vietnam. International investment and U.S. military expenditure in Thailand resulted in considerable economic growth for the country. In the February 1969 elections, Thanom's United Thai People's Party secured 75 seats out of 219 in the lower house, giving them the largest representation among the thirteen parties. However, military rule was imposed in 1971. Student unrest and mass demonstrations led to the end of Thanom's

Prime Minister Thanom Kittakachorn in Washington, D.C., in 1968. (BETTMANN/CORBIS)

regime in October 1973, shortly after which Thanom and his family fled to the United States. The end of authoritarian rule by student unrest and demonstrations has remained a symbol of the democratic aspirations of the Thai people, and the government's decision to honor Thanom in 1999 for his service to the Royal Guard was dropped due to protests.

THANT, U (1909–1974), Burmese official and secretary-general of the United Nations. Educator and third secretary general of the United Nations (1961–1971), U Thant was one of the few Burmese to have held high-level international office. Educated at National High School, Pantanaw, and at the University of Rangoon, he served mostly as headmaster of National High School, Pantanaw, until 1947. He was also briefly secretary to the educational reorganization committee of the government of Japanese-occupied Burma. U Nu recruited him in various capacities, including as press director in 1947, as director of broadcasting in 1948, as secretary of the Ministry of Information in 1949 and, briefly, as Secretary to the Prime Minister in 1954.

U Thant is best remembered, however, for his services to the U.N., where he embarked on a rapid career. He began serving as Burmese delegate to the U.N. in 1952, and became permanent U.N. representative in 1957. He was appointed vice president of the U.N. General Assembly in 1959. In November 1961, after the death of U.N. Secretary-General Dag Hammarskjöld, the United States and the Soviet Union disagreed on the successor, and U Thant was appointed in a compromise. He was elected permanent secretary-general in November 1962, and extended by a further five years in December 1966.

U Thant was a devout Buddhist and meditator, and he brought valuable qualities to the resolution of international problems. During his first term as secretary general he resolved some major international tensions, including the removal of Soviet missiles from Cuba (1962). He had less success in his second term, when the U.N. moved from peacekeeping to questions of economic and social development.

Secretary-General U Thant in his United Nations office in New York on 24 November 1961. (BETTMANN/CORBIS)

When he retired from the U.N., he was succeeded by Kurt Waldheim in 1971, by which time Burma had been under military rule for almost a decade. After his death from cancer in New York on 25 November 1974, his body was returned to Burma, only to become the focus for demands for democratic reforms. His remains were briefly seized by students on 5 December 1974 and buried in a makeshift mausoleum on the grounds of the Arts and Science University in Rangoon.

THAR DESERT The Thar Desert, or Great Indian Desert, is an arid region of 208,000 square kilometers in northwestern India and eastern Pakistan; it is the largest desert in South Asia. Located between the Indus and Sutlej River valleys, much of the Thar Desert consists of shifting sand dunes and stony plains, along with smaller areas of grassland. Rainfall is highly erratic, ranging between 100 and 500 millimeters per year. About 90 percent of rain falls between July and September. Mean average temperatures range between 24° and 26°C in summer and between 4° and 10°C in winter. Summer temperatures may reach 50°C, especially in May and June, the hottest months. Despite its dryness, the Thar Desert supports a diverse flora and fauna, including twenty-three species of lizards and twenty-five species of snakes. The Great Indian bustard, Indian gazelle, black buck, and caracal (wild cat) are also found. Much of the region's economy is based on pastoralism, especially sheep and goats, and on a limited amount of irrigated agriculture. The largest cities are Jodhpur and Bikaner, India. India tested its first nuclear device in the area in 1974.

THAT LUANG The That Luang, or Phathat Luang (Great Sacred Stupa), is a Buddhist site in Laos that is said to enshrine a relic, or bone, of Buddha. Legend states that the original shrine was built in 307 BCE. King Setthathirat (reigned 1534–1571) erected the stupa in 1566 on the grounds of the shrine after he moved the capital from Luang Prabang to Vientiane. The stupa consists of three levels: a base of 41 square meters (135 square feet), a first level containing thirty miniature replicas of the central spire, and a second level consisting of the central spire on a base of blooming lotus petals. The That Luang is 45 meters (148 feet) high. King Anouvong (1767–1829) added the cloister around the That Luang during his reign. The That Luang survived the razing of Vientiane in 1828 when the Siamese attacked in retaliation for King Anouvong's unsuccessful attempt to win independence from Siam. The French restored the stupa in 1900 in a Western style after it was abandoned following the Siamese invasion. Between 1931 and 1935, using an indigenous style, the Lao renovated the That Luang to its present state. The That Luang is an ex-

cellent example of classical Lao Buddhist architecture and a symbol of the Lao nation and appears on the Lao currency. During the twelfth lunar month, the That Luang's importance is celebrated at an annual festival held on its grounds.

THAT LUANG FESTIVAL The That Luang Festival is an important Theravada Buddhist holiday for the Lao nation. The festival is held during the full moon of the twelfth lunar month, usually November, at That Luang (Phathat Luang) or the Great Sacred

An elephant marches in the White Elephant Procession during the That Luang Festival in Vientiane, Laos. (NIK WHEELER/CORBIS)

Stupa in Vientiane (pronounced Viangchan). The site of Phathat Luang is sacred, since the Lao believe the stupa enshrines a relic of Buddha. Both monks and laypeople from the various provinces of Laos congregate in the capital to celebrate the auspicious occasion with three days of religious ceremony followed by a week of festivities occurring twenty-four hours a day.

A procession of laypeople begins at Wat Si Muang in the city center to Phathat Luang to make offerings to the monks in order to accumulate merit for rebirth into a better life. The religious part concludes as laypeople, carrying incense and candles as offerings, circumambulate Phathat Luang three times in honor of Buddha, *Dhamma* (the Teachings of Buddha), and the *Sangha* (organization of Buddhist monks). Folk and popular music troupes and drama performances provide entertainment at the festival. Merrymakers can also buy goods and food at the fair.

THICH NHAT HANH (b. 1926), Vietnamese Buddhist master. Known to followers as Thay (spiritual teacher), Thich Nhat Hanh is a peace activist, scholar, and writer. During the Vietnam War, he lobbied in the United States and Europe against the war and advocated a negotiated settlement. Martin Luther King, Jr. nominated him for the 1967 Nobel Peace Prize. He led the Buddhist delegation to the Paris peace talks. He was exiled for his pacifist views and now lives in France.

In the early 1960s, he studied and taught in U.S. universities. In Vietnam he organized wartime relief through the School of Youth for Social Service (established 1964). He also established the Buddhist University in Saigon and a publishing house. In France he founded the Unified Buddhist Church (1969) and Plum Village as a retreat center (1982). Similar centers were established in the United States. He lectures across the globe on mindful living. He conceives of religion as action-oriented and makes religion accessible to the public by projecting it as something joyful, not solemn. His teachings are practical and not aimed exclusively at followers of a particular faith. He has written many books, including *Being Peace* (1988), *Our Appointment with Life* (1990), *The Art of Mindful Living* (1992), *Peace Is Every Step* (1992), *Living Bud-*

dha Living Christ (1995), and *The Long Road Turns to Joy* (1996).

THIMPHU (2002 est. pop. 58,000). Thimphu has been the capital of Bhutan since 1962, when it replaced Paro. It is a small town, which was founded in 1581. A road now links the town with northern India. Thimphu is located on the Raidak River. It contains a major fortified monastery, Tashichho Dzong. It also has a small hydroelectric plant, a small airfield, and a secondary school. After considerable remodeling, the Tashichho Dzong now houses some central government offices, although the older section is still the home of the abbot and his monks. Thimphu is also the name of the surrounding district (2002 est. pop. 95,000). Here rice, wheat, maize, and timber are produced.

Paul Hockings

THIRTEEN MING TOMBS The thirteen tombs of Ming emperors are collectively known in China as the Thirteen Ming Tombs. In these mausoleums, located about fifty kilometers northwest of Beijing, rest thirteen emperors, twenty-three empresses, and many concubines of the Ming dynasty (1368–1644). The construction of the mausoleums started with Changling (Perpetuity Mausoleum) in 1409 and ended with Siling (Remembrance Mausoleum) in 1644, covering an area of more than forty square kilometers.

Changling is the centerpiece of the Ming Tombs, with a ten-kilometer-long Divine Path flanked by eighteen pairs of stone sculptures and the magnificent Ling'en Hall, where living emperors came to pay respect to the deceased ones. Stone Archway, the entrance to the mausoleums, stands as part of Changling.

Excavation of Dingling (Stability Mausoleum) in 1956, the mausoleum of Emperor Wanli, who ruled from 1573 to 1620, unveiled the mystery that had shrouded the mausoleums. An all-stone underground palace lies 17 meters below the ground. It is 87.34 meters long and 47.28 meters wide, divided into five halls with a total area of 1,195 square meters. Among the more than three thousand unearthed artifacts are the

emperor's gold crown, which is woven with extremely fine gold thread, and the empress's phoenix crown, adorned with 3,500 pearls and 150 precious stones. The tomb complex was listed as a UNESCO World Heritage Site in 2000.

THOMPSON, JIM (1906–1967?), developer of the Thai silk industry. Jim Thompson (James Harrison Wilson Thompson) is best known for developing the Thai silk industry, a major success story of post-World War II Asia, and making it world famous. He was the grandson of General James Harrison Wilson, who wrote *Travels in the Middle Kingdom* about his experiences in China and who was a friend of the

Siamese crown prince Vajiravudh, the son of King Chulalongkorn.

While serving in the Office of Strategic Services (OSS) at the end of World War II, Thompson developed a deep love for Thailand and subsequently decided to remain there. He lived in a specially constructed teak home that represented the best of traditional Thai architecture and housed a magnificent collection of Buddhist and Asian art. On Easter Sunday afternoon in 1967, while on a holiday in the Cameron Highlands of Malaysia, Thompson disappeared. His death remains a mystery, with many conflicting explanations, including political intrigue. In a bizarre turn of events, Thompson's elder sister, Katherine, was found brutally murdered in her Pennsylvania home a few months later. Today the Jim Thompson Thai Silk Company continues to thrive under the direction of former employees, and Thompson's magnificent home is now a museum.

JIM THOMPSON'S LEGACY

In the quote below, Jim Thompson explains his desire to leave Thailand with a legacy of great art:

I have elected to make Thailand my permanent home, and as I live here and am very interested in the artistic heritage of the country, I have tried to build up as fine a collection as I can to leave to this country. I know that the museum does not have funds to buy many of the fine pieces that turn up, and rather than see them leave the country, I have tried to buy the really exceptional ones to keep them here . . . this house and its contents will belong to the Siamese people since I have already willed it to them by way of the Siam Society.

THOUGHT WORK—CHINA The government of the People's Republic of China (PRC) relies to an unusually high degree on what its ruling Chinese Communist Party (CCP) calls "thought work." In practical terms, thought work refers to the management of communication flows, the "environment of symbols" from which people derive their understandings of the world, their values, and their action strategies to pursue interests. Crucial to managing thought work is control over the mass media and telecommunications systems. Although domination of these systems cannot lead directly to government control over the entire environment of symbols, and certainly not to control over the content of all thought, domination of the media and telecommunications is the most critical component of the thought work enterprise. If the government does not dominate these systems, other groups will. That will give these groups

a strategic bastion from which to challenge the government's leadership over society.

There was never any question of other groups challenging the government for control over thought work under Mao Zedong (1893–1976). Mao certainly worried about "rightists," "counterrevolutionaries," and "revisionists" influencing thought work, and sometimes his opponents did use the media to publish veiled criticisms of his rule. But these disagreements were among people who were essentially components of the government. They were not disagreements between people inside government and outside. Moreover, the disagreements never lasted long. They would soon be eliminated, and government control would be increased. By the decade of the Cultural Revolution (1966–1976), the government had reduced the number of media performances to which people could be exposed to eight sanitized plays, eight songs, and three film clips. There was utterly no competition for the government's own political messages, which were propagated endlessly in the CCP's newspapers and through a vast radio network that included a loudspeaker in almost every village.

After Mao died in 1976, a new generation of Chinese leaders decided that excessive control over thought work had acted as a hindrance to China's social and economic development. They began relaxing controls in the late 1970s as part of a sea change in government policy that included an opening to the outside world and transformative economic reforms. The development of a market economy fundamentally changed the incentive structures facing the managers of newspaper publishing houses, television stations, and other media units. They became much less interested in serving the government and much more interested in serving readers and audiences so that they could sell advertising. Inevitably, media content changed as a result. At the same time, technological developments such as the spread of television, telephones, and eventually the Internet also made it increasingly difficult for the government to control thought work. By the close of the twentieth century, it faced a crisis. It could still prevent the open circulation of blatantly unacceptable political messages but little else. It could not set the agenda for what people would discuss and think.

It did retain the impulse to control thought work, though—a problematic contradiction that frequently produced tensions in Chinese society. Periodically the government would launch crackdowns on undesired public communication—arresting writers and publishers, banning the sale of satellite television receivers,

and closing down Internet cafes. In this way, the government would try at least to eliminate from the thought work market such extremely pernicious items as hard-core pornography and radical social commentary. Very soon, however, people would again start producing and exchanging communications that the government did not like. They would effectively take back control of the thought work market.

The Chinese case suggests that in an era of open-market economies and expanding networks of global communication no government can control thought work. The impulse to control it lingers but should probably be seen as a legacy of centuries past that cannot survive contemporary global transformations.

THREE AND FIVE ANTIS CAMPAIGNS

In the early years after the founding of the People's Republic of China in 1949, the Chinese Communist Party (CCP) launched two political campaigns, with the purpose of reinforcing party control over rural and urban China. Both campaigns targeted mainly urban dwellers and people working in the modern business sector.

First, the CCP initiated the Three Antis Campaign against corruption, waste, and bureaucratism. The campaign targeted cadres in government and industry, especially those who had become acquainted with China's capitalists. Second, the party launched the Five Antis Campaign against bribery, tax evasion, theft of state assets (that is, state property and economic information), cheating on government contracts, and stealing capital. This campaign targeted the Chinese capitalists themselves. Some of the blacklisted capitalists were left to function as government employees; many were simply eliminated and disappeared from the business circle.

The Five Antis Campaign also had a hidden agenda. It seized factories and capital from the blacklisted capitalists and placed them under government control. Through these efforts, the CCP expanded its influence over China's modern economic sectors. At the same time, the campaign helped the party to identify potential supporters who could be recruited into the CCP, thereby consolidating the party's grip over every aspect of Chinese society. From 1947 to 1953, the membership of the CCP increased from 2.7 million to 6.1 million.

THREE GORGES DAM PROJECT The three gorges dam project, located at the middle reaches of the Chang (Yangtze) River at Yichang in China's Hubei Province, is one of the largest dam projects in the world. It will be 175 meters high and 2,335 meters long. The volume of embankment will be 26.43 million cubic meters, which is twice that of what is currently the world's largest dam, in Brazil. The capacity of the spillway will be 98,800 cubic meters. It is projected to have a hydroelectricity capacity of 18.2 gigawatts and an annual generation capacity of electricity of 84.7 billion kilowatt hours.

A passage will be built in the dam to allow ships of up to 3,000 tons to pass through. The dam reservoir, at a water level of 175 meters above the sea level, can be 662.9 kilometers long and can have a water area of 1,054 square kilometers and a capacity of 39.3 billion cubic meters. Some 17.2 billion cubic meters are allocated to dead storage and 22.1 billion cubic meters to flood control. The project was started in 1993 and is expected to be completed by 2009 and will require a total investment of about \$12 billion in 1993 currency. The actual investment will be more than \$25 billion by 2009.

The three gorges dam project faces very difficult challenges. The project affects nineteen counties and cities with an area of 54,000 square kilometers and a population of 14.4 million. It will result in the submersion of 632 square kilometers of land, including 245 square kilometers of arable land, and the largest single dam-related displacement of people ever. About 1.1 million people need to be relocated. The dam may also cause other problems such as ecological changes, water pollution, and, in particular, mud deposits. In

the upper reaches of the Chang River, the estimated land degradation area will amount to 355,000 square kilometers, and it is estimated that its annual land erosion may deposit 0.48 billion metric tons of sediment in the reservoir.

THREE IMPERIAL REGALIA—JAPAN

Symbols of the emperor's right to rule, Japan's imperial regalia (*sanshu-no-shinki*), take the form of three sacred treasures—the mirror, the sword, and the jewel, all of which are believed to have been handed down from emperor to emperor throughout Japanese history. The initial stage of imperial enthronement ceremonies occurs when the regalia are passed into the possession of the new emperor, legitimizing his claim to the throne.

The regalia are thought to have been divinely bestowed and have been venerated throughout history. Their origins are described in accounts of the mythological creation of Japan. The curved jewel of increasing prosperity (*yasakani-no-magatama*) and the mirror of illuminating brightness (*yata-no-kagami*) were used to lure Amaterasu Omikami, the sun goddess, out of a cave, where she had hidden herself after a quarrel with her brother, Susanoo no Mikoto, the storm god. The sword is said to have been cut from the tail of an eight-headed serpent slain by Susanoo no Mikoto. He named it the "sword of the gathering clouds of heaven" (*ame-no-murakumo-no-tsurugi*) before presenting it to Amaterasu. She then passed the three treasures to her grandson Ninigo-no Mikoto as symbols of his authority when he descended from heaven to rule over Japan. Later the sword is said to have been used by the imperial prince Yamato-take to cut an escape route when surrounded by fire on a grassy plain, and from then on it has been known as the grass-cutter sword (*kusanagi-no-tsurugi*).

Throughout Japanese history, the regalia have been the cause of disputes and political intrigues, and copies and counterfeits have been made. The epic *Tale of the Heike* recounts how the grass-cutter sword, or perhaps a copy, was lost in the decisive twelfth-century naval battle at Dannoura, where the infant emperor Antoku perished. During the fourteenth century, the regalia

played an important role in the power struggles between the Northern and Southern imperial courts, which arose because the princes of the two imperial lines fought for the right to rule as emperor.

The mirror is now believed to be enshrined in the inner sanctum of the Grand Shrine at Ise and the sword in Nagoya's Atsuta Shrine. The jewel and replicas of the mirror and sword are in the possession of the current emperor and are enshrined in the Kashiko-dokoro Shrine on the grounds of the Tokyo Imperial Palace. Wrapped in layer on layer of silk and enclosed in boxes, the regalia have long been kept hidden from view, and their exact appearance is uncertain. They have never been exhibited or displayed, and their use in the imperial accession ceremony takes place behind closed doors. They played a crucial role, however, in the 1989 enthronement of the present emperor Akihito and continue to legitimize the Japanese imperial line.

THREE KINGDOMS PERIOD Korea's Three Kingdoms period is generally considered to have lasted seven centuries—from the first century BCE into the seventh century CE. State institutions and autonomy, however, did not appear until the early fourth century. The three kingdoms developed out of the tribal leagues, which progressed to a stage of state-building and overpowered the Han Chinese commanderies situated on the Korean Peninsula. The combined territory of the Koguryo (37 BCE–668 CE), Paekche (18 BCE–663 CE), and Shilla (57 BCE–935 CE) kingdoms covered the entire peninsula and an even larger area to the north.

The Koguryo kingdom, by far the largest, occupied the mountainous north, including a large part of Manchuria, whereas the Paekche and Shilla kingdoms divided the southern coastal plains. In addition, a tribal league known as Kaya occupied a wedge of territory in the south but was gradually absorbed by neighboring Paekche and Shilla. The three kingdoms were fiercely competitive, and each maintained close ties with China in hopes of gaining an advantage over the other kingdoms.

CHINA—HISTORICAL PERIODS

- Xia dynasty (2100–1766 BCE)
- Shang dynasty (1766–1045 BCE)
- Zhou dynasty (1045–256 BCE)
 - Western Zhou (1045–771 BCE)
 - Eastern Zhou (770–221 BCE)
- Spring and Autumn period (770–476 BCE)
- Warring States period (475–221 BCE)
- Qin dynasty (221–206 BCE)
- Han dynasty (206 BCE–220 CE)
- Three Kingdoms period (220–265 CE)
- North and South Dynasties (220–589 CE)
- Sui dynasty (581–618 CE)
- Tang dynasty (618–907 CE)
- Five Dynasties period (907–960 CE)
- Song dynasty (960–1279)
 - Northern Song (960–1126)
 - Southern Song (1127–1279)
- Jurchen Jin dynasty (1125–1234)
- Yuan dynasty (1279–1368)
- Ming dynasty (1368–1644)
- Qing dynasty (1644–1912)
- Republican China (1912–1927)
- People's Republic of China (1949–present)
- Republic of China (1949–present)
- Cultural Revolution (1966–1976)

The warring kingdom of Koguryo was the first to firmly establish itself by overpowering China and Puyo and the nomadic tribes of Northeast Asia. Led by a strong military aristocracy, it expanded to include all the lands north of Seoul and reached deep into Manchuria. Koguryo established a Confucian academy to educate the nobility and compiled a state history consisting of one hundred volumes before it adopted Buddhism as the royal creed in 372 CE. The Koguryo kingdom reached the height of its expansion in the fifth century during the reign of King Kwanggaet'o (reigned 391–413) and his successor, King Changsu (reigned 413–491).

The Paekche kingdom developed out of the confederated Mahan states of the southwestern part of the peninsula. Due to fighting with both Koguryo and China, many people of Puyo fled to the southwest. Being more advanced than the indigenous population, they gained control, and the kingdom evolved. Paekche also developed a highly sophisticated state organization and adopted Confucian and Buddhist hierarchical structures. Constantly bothered by Koguryo incursions into its northern territory and by Shilla in

the east, Paekche allied itself with the Japanese and the North and South dynasties of China. Through these alliances, Paekche served as a conduit of culture from China to Japan. Paekche had significant influence on the culture of the Asuka period by sending diplomats, scholars, artists, and craftsmen to Japan from the middle of the fourth century.

Growing out of a confederation of Chinhan states in the southeastern portion of the peninsula, Shilla was the last of the three kingdoms to develop. It was centered around the walled city-state of Saro, later known as Kumsong and now as Kyongju. Because its territory was situated farthest from China, it was less influenced by China and did not accept Confucianism and Buddhism until the sixth century. Because of constant pressure and attacks from the Japanese as well as Koguryo and Paekche, Shilla strengthened its military. This buildup featured the Hwarang (Flower of Youth Corps), elite young soldiers with a chivalric code of leadership, unquestioned service to the kingdom, and religious and ethical zeal. Shilla absorbed the neighboring Kaya federation in the mid-sixth century and skillfully allied itself with Tang China, Koguryo's fierce enemy. Tang aid first helped Shilla defeat Paekche and then Koguryo to unify the Korean Peninsula under Shilla rule in 668.

THREE PAGODAS PASS Three Pagodas Pass or Phra Chedi Sam Ong is located in Thailand's Kanchanaburi Province on the Thai-Myanmar (Burma) border. It is the name of a settlement as well as the mountain pass. The name is derived from three miniature Buddhist shrines, memorials to the invasions of Thailand by the Burmese. This was the favorite Burmese invasion route during the Ayutthaya period (1350–1767). The shrines were constructed in the eighteenth century.

The area was used by the Japanese army in World War II as its point for invading Burma. It was a stop

on the infamous "Death Railway," a railroad route designed by the Japanese to link Bangkok, Thailand, and Moulmein, Burma. The "Bridge over the River Kwai" spanning the Khwae Noi River was part of this railway, which was constructed by Allied prisoners of war and "liberated" Asians. Most of this railway was destroyed after the war.

Today, area residents are Thai, Karen, and Mon. The Myanmar government has been trying to attract tourism, touting it as a hub for regional day trips. Many of those trips are to war-related sites. Journalist Micoool Brooke described the area in 1999 as "more like a demilitarized zone than a link between friendly countries."

THREE REVOLUTIONS MOVEMENT

The Three Revolutions movement (*Samdae hyongmyong undong*; refers to the ideological, technical, and cultural revolutions of the Communist Party) was a campaign that took place in North Korea in the mid-1970s. The purpose of the movement was to boost the sagging North Korean economy by sending young students to factories and cooperative farms to stimulate economic activity. Their task was to encourage and guide factory workers and farmers to meet their production quotas. More important than classroom learning, North Korean leader Kim Il Sung (1912–1994) emphasized, was the hands-on education that the students would receive through their experiences at the actual work site. This part of the movement naturally caused friction between students and farmers, who felt it inappropriate that they be made to accept guidance from someone who knew little or nothing about the job.

A second part of the movement was efforts by Kim Il Sung to replace the old with the young in factories as a way of promoting new ideas. Many festivals were arranged to promote the value of North Korean youth. At a broader dimension, the young were to take over the revolution and pass it on to later generations. In the higher echelons of government, the movement provided the setting for Kim Il Sung to designate his son, Kim Jong Il (b. 1941), to carry out future Worker Party (the political organ of the North Korean Com-

unist Party) operations. According to University of Hawaii professor Dae-Sook Suh, the succession issue was one that few outside of Kim Il Sung's inner circle knew of. However, by placing his son at the head of the Three Revolutions movement, Kim Il Sung sought to prepare others to accept the important role that his son would play in the party, especially after the Dear Leader had passed away.

In addition to the designation of Kim Jong Il to head the Three Revolutions movement, there were other signs that suggest that this period was an important one for the younger Kim's rise to eventually succeed his father. Kim Chong-suk (1919–1949; Kim Il Sung's first wife and mother of Kim Jong Il), a figure previously not rendered important by the Communist regime, was honored as "one who served Kim Il Sung close to her body." A museum was built in her memory, as well, at this time. In Kim Il Sung's relatively early push to establish his successor can be seen the caution that he took to ensure that his regime was not usurped by reformers, as it was in the Soviet Union following the death of Joseph Stalin (1879–1953).

According to Dae-Sook Suh, in 2000 the Three Revolutions Movement was known as the Three-Revolution Work Team Movement and defined as ideology, arms, and science and technology (Suh 2001: 76).

TIAN HAN (1898–1968), modern Chinese playwright. Tian Han, one of the founders of modern Chinese drama, was born in Hunan Province and studied science in Japan from 1916 to 1922, but his interest was in literature, drama, and movies. Beginning in the 1920s, he wrote a number of plays and became one of the most important modern Chinese playwrights.

Tian Han was a romantic dramatist. All his works were rich in poetic flavor, and his early works showed a style of both sentimentalism and aestheticism, especially *Return to the South* and *Sound of the Deep Pool*. His favorite themes were art and love. In 1929, his style changed, and he wrote his representative work, *The Noted Actor's Death*, with realism. This drama showed

the conflict between art and money and between good and evil and portrayed an actor with dignity. It has become a classic in Chinese literature. During the second Sino-Japanese conflict (1937–1945), Tian Han devoted himself to the anti-Japanese drama movement. He wrote the drama *Lugou Bridge* to reflect the war. After the war, he wrote his famous work *The Beauties*. Besides dramas, Tian Han wrote many scenarios and many song lyrics. The Chinese national anthem "March of the Warriors" was written by Tian in the 1930s.

TIAN SHAN This great sickle-shaped arc of mountain ranges and intervening valleys stretches 2,414 kilometers (1,500 miles) east/west along the frontier between Kyrgyzstan, southeastern Kazakhstan, and the Xinjiang Uygur Autonomous Region of southwestern China. The complex is 320 to 480 kilometers (200–300 miles) wide and covers 1,036,000 square kilometers (400,000 square miles). A central knot of high peaks reaches 7,439 meters (24,406 feet) on Pobeda Peak. The Pamir ranges are to the southwest, the Dzungarian and southern Kazakhstan plains fall below to the north, and the Tarim Basin lies southeast.

To early Silk Road travelers, these "Heavenly Mountains" (*tian* is Chinese for "sky" or "heaven") offered an alpine respite of steppe, forest, and glacial lakes. The interior continental location produces short, cold winters followed by long, hot summers. Winds of Mediterranean and Gulf of Arabia origin

bring moisture to the windward western and north-western slopes (up to 800 millimeters, or 32 inches, annually), while leaving the eastern and interior regions in an arid rain shadow (less than 100 millimeters, or 4 inches). Common fauna include the wolf, fox, wild boars, bears, snow leopard, mountain goat, Manchurian roe, and mountain sheep.

Kyrgyz predominate in the western Tian Shan; Uighurs form a majority on the eastern side. Ethnic Russians, Chinese, Kazakhs, Tajiks, and Tatars also settle the periphery. The economy revolves around irrigated agriculture (lowlands) and livestock herding (uplands). Oil and gas extraction, mining of nonferrous metals, and tourism are also important throughout this region.

TIANANMEN SQUARE Tiananmen Square is located in the center of Beijing, the capital city of the People's Republic of China (PRC) and is listed first among the city's sixteen scenic spots. Originally designed and built in 1651, the square was enlarged four-fold in 1958 to cover 100 acres, making it the biggest public square in the world. It is best known in the West for the "Tiananmen Incident" of 1989.

The square is actually named for the Tiananmen Gate (Gate of Heavenly Peace), which is on the northern side of the square. Outside the gate are two marble pillars called the *huabiao*. The *huabiao* are said to date back to the sage kings of Yao and Shun in China's mythical times. Originally wooden, they served as notice boards, or "wood of direct speech" (*feibang zhimu*), which stood just outside the court for the purpose of soliciting public criticism. They were replaced during the Han dynasty (206 BCE–220 CE) by stone pillars, eventually becoming elaborately sculpted columns in traditional Chinese architectural style and a common sight on the grounds of imperial palaces. However, they still symbolize people's right to speak up against official injustice.

The Presence of Mao

The posthumous presence of Mao Zedong (1893–1976) is visually and physically prominent at the

Chinese students protesting in Tiananmen Square beneath a poster of Mao Zedong in the spring of 1989. (DAVID & PETER TURNLEY/CORBIS)

square. The official portrait of the former chairman of the Chinese Communist Party (CCP) has hung on Tiananmen Gate since 1949. It is flanked by two slogans: "Long Live The Unity of the Peoples of the World!" and "Long Live The People's Republic of China!" Mao is also the only permanent resident of the square: in a mausoleum on the south side, the body of Mao lies in a crypt covered in a crystalline sarcophagus surrounding by flowers. The body is retired after public viewing hours to an earthquake-proof chamber deep in the bowels of the square. An Ancestral Hall of the Revolution contains relics of other first-generation revolutionary leaders like Liu Shaoqi (1898–1974), Zhu De (1886–1976), and Zhou Enlai (1898–1976).

In the center of the square, a marble obelisk known as *Monument to the People's Heroes* commemorates those who died for change and revolution in China from 1840. Every morning at daybreak a ceremonial guard facing it hoists the five-star red flag of the PRC. To

the east, the Museum of History and the Revolution has more often than not been "closed to the public" due to the constant vacillation of party policy and the rewriting of Chinese history. Instead, it has been used for exhibiting official and avant-garde artwork, contemporary fashion shows, and so forth. To its west is the Great Hall of the People, which, with its ten thousand seats, is the annual meeting site of the National People's Congress. All major plenums of the CCP and government are held there as well.

The Tiananmen Incident

On 15 April 1989, students gathered in Tiananmen Square to mourn the death of reformist CCP general secretary Hu Yaobang. When government officials refused their petitions at the Great Hall of the People, the students clashed with police. The party mouthpiece, *People's Daily*, published an editorial on 26 April accusing a "handful of plotters" of creating "turmoil" with the object of overthrowing the regime. The next day, 200,000 students from over forty universities marched to the square in protest. Hundreds, then thousands, of Beijing University students began a hunger strike on 13 May around the *Monument to the People's Heroes*. Premier Li Peng (b. 1928) and moderate officials affiliated with General Secretary Zhao Ziyang (b. 1919), who was later dismissed, failed to defuse the situation before the arrival of Soviet leader Mikhail Gorbachev (b. 1931) for a summit with Deng Xiaoping (1904–1997), China's paramount leader. The welcoming ceremony at the square for Gorbachev was abandoned: Chinese president Yang Shangkun (b. 1907) later gave Beijing's loss of face and international prestige as one reason for the crackdown. On 20 May, martial law was declared, but for two weeks the students, now joined by workers, reporters, army personnel, and civil servants—numbering at one point over 2 million—blocked the advance of 150,000 troops toward the city. On 3–4 June, army tanks rolled in, clearing the square and killing an undisclosed number of civilians.

The term "prodemocracy" would oversimplify description of a student-led movement that made a complex set of demands, which included dialogue with the government, crackdown on official corruption, vague political reforms, greater funding for education, a freer press, and so forth. The students used the word "democracy," but they were short on specifics. They stressed the need to improve the existing system, not to overthrow it. Many acknowledged party leadership and believed that an American-type democracy was unsuitable for China. It may also be argued that they were not sufficiently versed in liberal democratic traditions to represent their interests and aspirations.

They did, however, think that by playing to the international news media (over one thousand foreign journalists had converged in Beijing for the Deng-Gorbachev summit), they could gain Western sympathy and thereby advance their cause. This partly explains why on 30 May, students unveiled the ten-meter-high *Goddess of Democracy* statue in the square. Ironically, Deng himself had been misled by Premier Li to believe that the demonstrators wanted to overthrow the party government.

Officially orchestrated mass demonstrations were common in Tiananmen Square after 1949. Mao reviewed gatherings of Red Guards there during the Cultural Revolution (1966–1976). In the aftermath of the 1989 incident, the CCP organized Young Pioneers parades to show that the "revolutionary successors to the Communist enterprise" had taken back the square from protestors. Tens of thousands celebrate Labor Day (1 May) and National Day (1 October) with fireworks and floats. However, traditional group calisthenics like tai chi chuan, practiced daily in the square, have to an extent replaced the mass movements today.

TIANJIN (1997 est. pop. 5.15 million). Located near the mouth of the Hai River 137 kilometers southeast of Beijing, Tianjin (Tientsin) is one of three centrally administered cities in the People's Republic of China. In 1997, the metropolitan population of Tianjin was

9 million, while the city proper had 5.15 million residents. Aside from its importance as a major port in northeast China, Tianjin is also a major industrial center, producing textiles, light and heavy machinery, automobiles, and cement.

During the Ming (1368–1644) and Qing (1644–1912) dynasties, Tianjin was the northern terminus of the Grand Canal and an important transfer site for the shipment of grain northward to the imperial capital at Beijing. Under the terms of the 1858 Treaty of Tianjin that concluded the Second Opium War, the city was opened to foreign trade. Over the remainder of the nineteenth century, it grew to become the second busiest port in China after Shanghai. Nine foreign nations were granted concessions in Tianjin: France, Britain, Germany, the United States, Russia, Japan, Italy, Austria-Hungary, and Belgium. During the turmoil of the Boxer Uprising (1899–1900), Tianjin sustained heavy damage at the hands of the international army that was sent to rescue the besieged foreign community in Beijing. By the early twentieth century, the Japanese community in Tianjin had emerged as one of the largest foreign communities in the port. Observers in the 1920s and 1930s noted that many of the Japanese businesses and traders in Tianjin were involved in the booming opium and narcotics trade. When the Japanese army invaded China in 1937, the city was seized and remained under occupation until the end of the Pacific War in 1945. During this conflict, Tianjin played an important role in the regional transportation and communications networks, as it was not only a port, but also a key railway town with access to the Grand Canal and Huang (Yellow) River.

During the Chinese Civil War (1947–1949), the Communists targeted Tianjin as an important urban center in the revolution. After the victory of the Chinese Communist Party in 1949, Tianjin's industrial base was enhanced under the new government's state-planned economy, and hundreds of new factories and manufacturing plants were established. With the move to a market economy in the 1980s, Tianjin became one of the first Special Economic Zones to be opened to foreign investment and trade along the Chinese coast. The development of the Bohai oil fields in the Yellow Sea during the 1990s resulted in a corresponding development of the petrochemical plants and refineries.

TIBET (2002 est. pop. 2.7 million). Traditionally, Tibet comprises the central Asian landmass between the Himalayas in the south, the Kunlun range to the north and the Karakorams to the west, while in the east it is bounded by the region of the great rivers, the Chang (Yangtze), Mekong, and Salween. With most of its territory situated above 4,500 meters and its capital city, Lhasa, located at 3,607 meters, Tibet has been popularly termed "The Roof of the World."

While the extent to which Tibet was part of China in earlier periods is in dispute, Tibet has certainly been part of China since the Communist invasion in 1950, and exists today only in the much-reduced area of the Tibetan Autonomous Region (TAR) of China. A Tibetan Government-in-exile headed by the Dalai Lama (the spiritual and temporal leader of the Tibetan peoples), has been established in India, and there are also Tibetan exile communities in Switzerland and the United States. The Tibetan government continues to campaign for Tibetan self-determination and the ongoing Sino-Tibetan dispute invests facts and figures in regard to Tibet with important political implications. Historically, however, there has been a distinction between "political" Tibet, the area ruled by the Lhasa government prior to 1950, and "ethnic" or "cultural" Tibet, that area inhabited by mainly Buddhist peoples of Tibetan origin.

Geography

"Political" Tibet had an estimated population of between 1.8 and 3 million peoples, of whom around half

TIBET–CHINA RELATIONS IN THE 1840s

Although written over 150 years ago by two French missionaries, this account of relations between the Tibetans and Chinese could in major ways characterize relations in 2002.

The Chinese you find at Lha-Ssa are for the most part soldiers or officers of the tribunal; those who fix their residence in this town are very few in number. At all times the Chinese and the Thibetans have had relations more or less important: they frequently have waged war against each other, and have tried to encroach on one another's rights. The Tartar-Mantchou dynasty, as we have already remarked upon elsewhere, saw from the commencement of their elevation the great importance of conciliating the friendship of the Tale-Lama, whose influence is all powerful over the Mongol tribes; consequently they have never failed to retain at the court of Lha-Ssa two Grand Mandarins invested with the title of *Kin-Tchai* [*Ch'in-ch'ai*], which signifies ambassador, or envoy-extraordinary. The ostensible mission of these individuals is to present, under certain fixed circumstances, the homage of the Chinese Emperor to the Tale-Lama, and to lend him the aid of China in any difficulties he may have had with his neighbours. Such, to all appearance, is the purport of this permanent embassy; but in reality they are only in attendance to flatter the religious belief of the Mongols, and to bind them to the reigning dynasty, by making them believe that the government of Peking has great veneration for the divinity of the Buddha-La.

Source: Huc Evariste-Regis and Joseph Gabet. ([1851] 1987) *Travels in Tartary, Thibet and China, 1844–1846*. New York: Dover Publications, 185.

were semi-nomadic yak herders. (Today's TAR population includes a large number of Han Chinese immigrants, who may now constitute a majority of the population in the Tibetan capital of Lhasa.) The settled urban and agricultural populations were concentrated in the river valleys, particularly in the triangle formed by the major settlements of Lhasa, Shigatse (Xigaze) and Gyantse.

While situated at a latitude similar to Algeria, the altitude and location of the Tibetan plateau produces a cold and generally dry climate, although southeastern Tibet includes areas of tropical jungle. The western Tibetan area around the Gangdise (Kailas) mountain range and Lake Mapam Yumco (Manasarowar) is the source of four great rivers: the Indus, Ganges, Brahmaputra, and the Sutlej, while Mount Everest, which is situated on the Nepal-Tibet border, is, at 8,848 meters the world's highest mountain.

Sedentary agriculture is limited by the climate. Barley is the major crop and in its roasted form as *tsampa* comprises, with yak meat and tea (imported from China), the staple diet of the majority of the population.

History

The origins of the Tibetan peoples appear to be linked to Central Asian nomadic tribes such as the Qiang and Yue Zhi (Tokharians). The first unified Tibetan state was a tribal confederacy formed in the seventh century under the rule of King Songtsen Gampo (or Srong-brtsan Sgam-po; c. 608–650 CE), who established his capital at Lhasa. The introduction of a Tibetan script and Buddhist teachings are among the innovations attributed to his reign. The dynasty he founded lasted until the assassination of King Langdharma, around the year 842.

Tibet was a formidable military power during this period, constantly engaged in warfare with neighboring powers and strong enough to sack the Chinese capital of Xi'an in 763. At its height the Tibetan empire reached as far west as Samarkand. Buddhism became increasingly important, particularly in the court, and the first Tibetan monastery was established at Samye around 779. But there was considerable opposition to the new faith among aristocratic factions associated with followers of the indigenous Tibetan belief system (later identified with the Bon faith but probably at that time an unsystematized tradition that included elements of divine kingship and sacrificial practice).

Buddhism became firmly established during the eleventh and twelfth centuries, when Indian Buddhist texts were systematically translated into the Tibetan language. Of the four major sects of Tibetan Buddhism that developed on the basis of these teachings, the Gelugpa sect eventually emerged as preeminent, and from the sixteenth century onwards, Tibet was ruled by a line of incarnate Gelugpa monks with the title of dalai lama. Religious factions in Tibet tended to seek Mongol or Chinese patronage, and China became increasingly involved in events in Tibet in the eighteenth century. Thus, from 1793 until 1911–1912, China was able to exert at least nominal suzerainty over Lhasa.

In 1903–1904, the British imperial Government of India dispatched a mission to Lhasa that forced the Tibetans to accept British representatives and effectively opened the country to Western ideas and influences. But despite some modernization in the next couple of decades, Tibet remained an essentially conservative religious society, strongly resistant to change. The thirteenth Dalai Lama (1876–1933), a strong nationalist leader, led Tibet to independence after the Chinese revolution in 1911, and Tibet survived as a de facto independent state until the Communist Chinese invasion in 1950. Her independence, however, was not officially recognized by any major powers, with China continuing to claim Tibet as part of her territory.

Since 1950, the Tibetans have suffered a continuous assault on their cultural identity, with tens or even hundreds of thousands of Tibetans killed, imprisoned, and tortured as a result of Chinese colonialist policies.

Culture

Despite the continuing existence of the Bon faith and its many cultural manifestations, the outstanding feature of Tibetan culture is generally considered to

be its unique form of Buddhism, a synthesis of the Mahayana and Tantric forms of the faith. Buddhist influence permeated virtually all aspects of traditional society. An estimated 20 percent of the male population were monks, and more than six thousand monasteries were distributed throughout the Tibetan cultural world. These were important political and economic centers as well as the guardians of Tibetan cultural and artistic expression. Outside of the monasteries, pilgrimage to sacred cities and mountains was a particularly significant religious expression for all classes of people.

A small aristocratic class enjoyed considerable privilege, although in comparison to their contemporaries in neighboring states, the Tibetan peasantry were tolerably well treated. Women too, enjoyed greater than average freedom, particularly in the social and economic spheres, although they were almost entirely excluded from religious power.

There were cultural influences from both China and India, but Tibetan culture was strikingly distinct from that of its neighbors. This was particularly marked in such areas as literary traditions (in particular the lengthy *Gesar of Ling* epic), language, and art and architecture, with buildings such as Lhasa's Potala Palace and Jokhang temple, as well as the regional monasteries, being of striking originality. Much of this culture has been destroyed in the TAR, but much has been remembered or preserved in exile.

TIBET—IMAGE IN THE MODERN WEST Tibet occupies a unique place in the Western imagination. Since Marco Polo (1254–1324) and other thirteenth-century Western travelers provided the first European accounts of Tibetan exotic practices such as necromancy (sorcery), the West has imagined Tibet as a mythical place of magic and mystery, a peaceful land preserving esoteric spiritual wisdom. It is commonly described by such colorful allusions as the "roof of the world," the "forbidden land," the "land of the lamas," or Shangri-La, as if the country were otherworldly, beyond ordinary description.

The reality behind the image of mythical Tibet remains partly obscured today, because of a combination of historical circumstances and human and commercial needs. But many Tibetans consider the mythical image of their country to be detrimental to their prospects of political self-determination.

Origins of the Tibetan Image

During the nineteenth century, the British empire in India spread northward to the borders of Tibet, but the Tibetan government, fearing a threat to the Buddhist religious system, refused to allow Europeans to enter. Tibet refused even to enter into diplomatic correspondence with the British, who resorted to the use of spies to obtain information about their northern neighbor.

Tibet's policy of isolation from European influences was assisted by its forbidding mountainous geography. Ironically this remoteness only succeeded in making the country more attractive to Westerners, many of whom made clandestine journeys into "forbidden" Tibet. The nineteenth-century Western romantic landscape aesthetic furthered the perception of Tibet as a pristine and beautiful land. Travelers such as the botanist Sir Joseph Dalton Hooker (1785–1865) promoted this image to the reading public in his 1855 *Himalayan Journals*, with their descriptions of the "deep dark blue of the heavens . . . the perfect and dazzling whiteness of the earthly scene." While the more prosaic observations of British intelligence agents were restricted to official circulation, these images flourished alongside more exotic depictions of customs such as the use of skulls for drinking cups.

Because the public knew so little about Tibet, it became the repository for numerous fantasies. One image was promoted by the esoteric writings of Helena Petrovna Blavatsky (1831–1891), the founder of the Theosophical movement, which was concerned with occult practices and spiritism. Blavatsky claimed that the Mahatmas (Sanskrit "great souls"), a race of spiritual mas-

ters dwelling in Tibet, were the source of psychic revelations that led to the development of Theosophy.

The Western discovery of Tibet's unique form of Buddhism, a blend of Indian Mahayana and Tantric beliefs with indigenous Tibetan elements, did little to dispel Blavatsky's fantasies. Tibetan religious systems were then poorly understood, and Western observers tended to focus on the colorful and esoteric aspects of Tibetan religion. Tibetan Buddhism was even termed Lamaism (which is not a Tibetan noun), a title ideologically framed to represent a faith that had degenerated from what Western scholarship classified as pure, original Buddhism and that was infused with demonic elements.

Contemporary Western perceptions of Tibet were affected by political factors, particularly at the beginning of the twentieth century, when fears of Russian influence in Lhasa led to the invasion of Tibet by British Indian forces. The imperial media at that time sought to portray the Tibetan system as a form of Oriental despotism, with the Tibetan people oppressed by a parasitic and corrupt clergy. These images coalesced with those promoted by Christian missionaries, who were forbidden to enter Tibet and who naturally produced negative images of Tibetan religion.

After the British forces reached Lhasa in 1904, the mystical heart of Tibet in the Western imagination was relocated to more remote places, eventually to hidden valleys (a concept known to the Tibetans themselves). The image of a timeless and tranquil hidden valley in the Himalayas was featured in James Hilton's best-selling 1933 novel *Lost Horizon*. Its depictions of a Himalayan paradise known as Shangri-La were imagined as Tibet, firmly fixing the otherworldly image in the Western mind.

The writings of the French traveler Alexandra David-Neel (1868–1969) and the translation of the *Tibetan Book of the Dead* in the 1920s were other significant elements in the construction of a mythical Tibet. This trend culminated in the works of Lobsang Rampa, which first appeared in the 1950s. Rampa's tales of his fantastic life in Tibet remain best-sellers, even though Rampa was soon revealed to be an Englishman, Cyril Hoskings (1910–1981), who had never been to Tibet.

Commercial and Political Factors

Commercial factors have also encouraged the production of colorful images of Tibet, with publishers responding to the continuing demand for accounts of the esoteric aspects of Tibetan culture. That demand seems to spring from a human need for fantasies of

THE DALAI LAMA SEEKS HELP IN THE WEST

The text that follows is of a letter sent by the Dalai Lama to people in the United States in January 2002 as part of a packet seeking support for Tibetan independence from China.

Dear Friend,

I would like to commend the International Campaign for Tibet for the tremendous contribution it has made in gathering support for the cause of Tibet. ICT has been at the forefront of raising the Tibet issue. On behalf of the Tibetan people, I extend my heartfelt appreciation to ICT and its members and all of the people of goodwill who have helped our cause.

It is always a great pleasure for me to come to the United States. This country represents the universal concepts of liberty and justice for so many people around the world. It is here that we come to seek support for our cause. And with the help of dedicated individuals, it is here that we have found genuine support through the American people.

I have always tried to find a solution through direct and honest discussions with the Chinese. It is my sincere belief that if the concerned parties were to meet and discuss their future with an open mind and a sincere desire to find a satisfactory and just solution, a break-through could be achieved. We must all exert ourselves to be reasonable and wise, and to meet in a spirit of frankness and understanding.

With my prayers and best wishes.

place and from the sense that this imagined Tibet might possess the cure for the perceived ills of Western society.

There are also political aspects to the selection and continuing vitality of Tibet as the repository of fantasies. One scholar has noted that Tibet was fascinating because it was unknown; after Europeans had colonized a faraway land, it always became uninteresting.

But during the first half of the twentieth century, there was also a political purpose behind these images. After the Tibetans had expelled the last Chinese officials in 1912, British India became Tibet's main patron. In contrast to the images they had promoted earlier when Tibet was deemed hostile, the British now sought to promote the idea of a strong, unified Tibetan state with a distinct identity separate from that of China. Tibet's popular image helped to promote its separate and unique status and to strengthen the country, and while the British now provided more realistic

information on Tibet to the informed public, they made no attempt to counter the politically valuable mythical image.

The Consequences of the Image

There are many "Tibets" in the Western imagination today, the reality blending with the layers of romantic images. New images have emerged in recent years, with constructions of an environmentally conscious, feminist, nonviolent Tibet becoming increasingly widespread. These images are promoted by both the Tibetan refugee community and their Westerner supporters.

Today Tibet enjoys widespread recognition largely as a result of its many colorful associations, with much of its culture now within the realm of popular Western culture. But while the mythical image of Tibet helps the country retain the moral high ground in its struggle with China, the stereotypes not only deny the

historical realities of Tibet, they deny Tibetan agency and obscure the very real Tibetan struggle for political self-determination.

TIBETAN UPRISING Tibet, currently an autonomous region in southwestern China whose status has long been disputed, enjoyed de facto, if not legally recognized, independence during the 1913–1950 period. The Chinese, however, claimed Tibet as a part of their territory, and the Communist takeover in China in October 1949 was an obvious threat to Tibetan self-determination, as the Communists were openly prepared to use military force to take over Tibet. After failed attempts to arrange negotiations on neutral territory, Chinese military forces invaded Tibet in October 1950 and quickly succeeded in conquering the largely demilitarized Tibetan state.

During the 1950s, Chinese policies designed to transform traditional Tibetan society and to integrate Tibet into the Communist system were applied with increasing force. As a consequence, Tibetan resistance to the assault on their religion and culture rapidly increased, culminating in the nationalist revolt of 1959. But the Tibetans were vastly outnumbered and ill equipped for an armed struggle. Their resistance was crushed, and the fourteenth Dalai Lama (b. 1935), the spiritual and temporal leader of Tibet, was forced to flee into exile in India. Since that time, China has continued to rule Tibet through military force, while the Dalai Lama remains the head of the Tibetan government-in-exile in India.

Events in 1950–1958

In January 1950, when the Indian government formally recognized the new Communist government in

Beijing, the Chinese informed India of their intention to peacefully "liberate" Tibet. To the Communists, the Tibetans were an oppressed people at the mercy of a feudal elite, and they expected to be welcomed as liberators. When Sino-Tibetan negotiations failed, the Chinese forces launched their full-scale military invasion of Tibet on 7 October 1950. An appeal to the United Nations went unanswered due to Tibet's ambiguous status under international law. The Tibetan state maintained only a small army of around eight thousand men, and within days, Chamdo, the main Tibetan administrative center in Kham (eastern Tibet), fell to the invaders.

The province of Kham was home to the Tibetan-speaking Khampa peoples, who, while loyal to the Dalai Lama as head of their Tibetan Buddhist faith, enjoyed considerable autonomy and did not necessarily view themselves as subjects of either Lhasa or Beijing. The Khampas had a strong martial tradition, and the Kham region became the center of armed opposition to China.

After the Chinese invasion, the Tibetan National Assembly requested that the young Dalai Lama assume full secular power in Tibet, several years earlier than planned. The Chinese, meanwhile, forced a Tibetan delegation to sign the Sino-Tibetan Agreement of 1951 (known as the "Seventeen Point Agreement") by which Beijing absorbed Tibet into its empire. Guarantees of Tibetan autonomy and religious freedoms in that agreement were soon breached as China began to absorb the Tibetan administration and usurp the functions of the Tibetan government. Increasing numbers of Chinese soldiers and settlers moved into Tibet, particularly after the completion in 1954 of a drivable road to Lhasa through eastern Tibet. Many of the Chinese Communists had genuinely expected to be greeted as liberators by the people they saw as feudal masses; they were surprised by Tibetan opposition to their presence.

In 1954 the Dalai Lama traveled to Beijing, where he met the Chinese leader, Mao Zedong (1893–1976), and in 1956 he was permitted to travel to India for the 2,500th anniversary of the enlightenment of the Buddha celebrations. While there, he was advised by the Indian government to accept Chinese control of Tibet, and, with the Chinese hinting at compromise, the Dalai Lama returned to Tibet in the hope of reaching a solution through discussion with the Communist leadership.

The years 1955 and 1956 saw a rapid acceleration of the transition to communism throughout China, culminating in the disastrous "Great Leap Forward" policy in 1958. Within Tibet, there was an accelerated

Tibetans living in Darjeeling, India, mark the Tibetan Uprising in a march in 1989. They display banners calling for the re-establishment of Tibetan rule in Tibet. (ALISON WRIGHT/CORBIS)

program of collectivization, the widespread institution of "class struggle," particularly against monastic authorities, and attempts made to make the large Tibetan nomadic population sedentary.

These policies brought a strong Tibetan reaction. By 1956 an organized guerrilla movement, the Chushi Gandruk ("Four Rivers, Six Ranges") was active throughout eastern Tibet. The Dalai Lama's policy of nonviolence meant that he was unable to offer his personal support to the guerrillas, and he continued to attempt to mediate a peaceful solution to the crisis until his departure from Tibet. But many elements of the Tibetan government supported the guerrillas in their struggle, which was then primarily defending Tibetan Buddhism and the Tibetan social system rather than explicitly trying to build a nationalist movement.

Tibetan resistance to the Chinese Communists attracted the attention of the intelligence services of various countries, including the U.S. Central Intelligence Agency (CIA). By 1958 significant amounts of CIA aid began to reach the guerrillas.

Uprising of 1959

By 1959 the disturbed conditions throughout eastern Tibet had led to a large influx of refugees entering Lhasa, which exacerbated food shortages caused by the large numbers of Chinese troops stationed there. By early March of that year, the population of

Lhasa was further swelled by the large crowds who gathered for the Monlam Chenmo (Tibetan New Year) celebrations; traditionally an unruly period in which the monastic powers dominated the secular structures of state.

Greatly adding to the unstable situation in the Tibetan capital was the invitation to attend a theatrical performance issued by the Chinese military commander in Lhasa to the Dalai Lama. On 9 March the Tibetan leader was instructed by the Chinese to come to the military barracks the following day without his usual armed escort. This invitation was interpreted by the Tibetan public as a Chinese attempt to seize the Dalai Lama.

A large crowd, estimated at around thirty thousand people (Lhasa's population in 1950 was around twenty thousand), gathered around the Norbu Lingka, the summer palace of the Dalai Lama. Their primary aim was to prevent their leader from taking up the Chinese invitation, but the apparently spontaneous demonstrations took on a nationalist character because the crowds also began to protest against the Chinese presence in Lhasa and to demand Tibetan independence. A showdown became inevitable.

On 17 March Chinese troops fired several artillery shells into the grounds of the Norbu Lingka, apparently in an attempt to frighten the Tibetans into submission. That night, a prearranged plan was put into

operation whereby the Dalai Lama, disguised as an ordinary Tibetan soldier, was smuggled out of the palace. His escape was kept secret for several days, and with a small group of his supporters he succeeded in making his way south through the mountains to India. An estimated eighty to a hundred thousand Tibetans joined him in India, and a Tibetan government-in-exile was established at Dharmasala in north India.

Meanwhile, in Lhasa the Chinese commenced a full-scale military crackdown. Exact figures are difficult to ascertain, but thousands of Tibetans were killed or executed in the ensuing days, with Chinese army intelligence reports admitting that their forces had "eliminated" 87,000 of their opponents in Lhasa and surrounding areas in March–October 1959 alone.

Coalescence of Resistance

A sense of Tibetan national identity was greatly stimulated by the Communist invasion of Tibet and in the eyes of the Tibetans and much of the world, the events of March 1959 were a nationalist uprising against the rule of a foreign power. Tibetan resistance subsequently coalesced around the figure of the Dalai Lama, whose insistence on nonviolent resistance has meant that the history of Tibetan armed resistance to China has been largely forgotten. But the events of 1959 remain a historical division between traditional and modern Tibet.

TIBETANS The people of Tibet inhabit the Tibetan Plateau, the highest continuous landmass in the world, which averages over 3,500 meters in height, including the Himalayas in the south, the Zangbo (or Brahmaputra) River Valley, and the northern Chang-

THE TIBETAN CAMPAIGN FOR INDEPENDENCE

The following is a statement prepared by the Dalai Lama and sent to individuals in the United States with a request that they sign it and send it to Secretary of State Colin Powell.

Affirmation of Religious Freedom to Secretary of State Colin Powell

WHEREAS . . . The people of Tibet, led by the Dalai Lama, are struggling to maintain a magnificent and ancient spiritual culture on Earth; and,

"WHEREAS . . . The Tyranny that has driven more than one hundred thousand Tibetans from their homeland and threatened the existence of Tibetan culture is an affront to all humankind; and,

"WHEREAS . . . Confronting the issue of Tibet is a basic issue of morality, a defining action for the human community.

"THEREFORE . . . I Affirm my deep commitment to religious and spiritual liberty by calling on you to take immediate and strategic action to save Tibet's religious and cultural heritage.

Signed _____

thang Desert. There are between 4 and 6 million Tibetans, of whom some 2.4 million live in the area of the present Tibet Autonomous Region of the People's Republic of China. There are also substantial populations in the Chinese provinces of Yunnan, Gansu, and Sichuan and in Qinghai, formerly the Tibetan province of Amdo. Since 1959, there have also been some 100,000 Tibetan exiles in India and the southern Himalayas and small refugee populations in Western countries.

The Tibetans are basically of East Asian type, with considerable variations. The nomads of the east, the Khampas, are tall and aquiline featured, while the people of the central provinces of U and Tsang are smaller and have high cheekbones. Several dialects of one language family, the Tibeto-Burman, are spoken, with the Lhasa dialect providing the cultivated norm and classical Tibetan being used for scriptures.

The Tibetan way of life has been based on the harsh realities of geography, with nomadic animal husbandry,

particularly the yak; agriculture, with barley as a staple; and trade, frequently mixed with pilgrimage, being important. Tibetans tend to be instantly recognizable, with a traditional coat, or *chuba*, for the men and an apron in three vertical sections of colorful horizontal stripes for the women.

The consciousness of the Tibetans as a single people is based on the unity of their civilization, linked inseparably to the Buddhist religion, which pervades every aspect of everyday life. Tibetan homes have a prayer room with a scroll painting of a guardian deity with which the family is linked and statues of Buddhist saints. Tibetans are great pilgrimage goers and constantly utter sacred formulas, such as *om mani padme hum*, an invocation of Tibet's protective Buddha, Chenrezi, at their daily tasks, as well as inscribing them on prayer flags, walls, or stones.

Since Tibet's incorporation into the People's Republic of China (1951), the status of Tibetans has become controversial. China claims that Tibet has been part of China since the thirteenth century. It has attempted to control Buddhism and has launched ideological campaigns against Tibetan claims of separate nationhood, insisting that Tibetans are one of fifty-five minority nationalities in China. Tibetans in exile, led by the fourteenth Dalai Lama (b. 1935) from Dharamsala in India, affirm a distinct national identity based on separate history, ethnicity, and culture and claim that China has systematically abused the human rights of the Tibetans.

TIBETO-BURMAN LANGUAGES Tibeto-Burman languages constitute one of the two branches of the large Sino-Tibetan family of languages (the other branch, the Sinitic languages, make up the dialects and varieties of Chinese languages). Languages of this family are spoken over a vast area of South and Southeast Asia, from the Karakoram mountains in the northwest to the isthmus of Malakka in the southeast. Speakers of various Tibeto-Burman languages are found in the Himalayan regions of Pakistan and India

(Jammu and Kashmir, Himachal Pradesh, Sikkim), the Indian northeast (Arunachal Pradesh, Assam, Mizoram, Tripura, Manipur, Meghalaya) and adjacent regions of Bangladesh, in Nepal, Bhutan, Myanmar (Burma), Thailand, Laos, Vietnam, and China (Tibet, Qinghai, Gansu, Yunnan, Sichuan).

In terms of the number of single languages belonging to the family, the Tibeto-Burman stock is, in Asia, second only to Austronesian. Though the principal subgroups of Tibeto-Burman are largely established, a comprehensive and uncontroversial subgrouping cannot yet be elaborated, mainly because we do not possess linguistically adequate descriptions for the better part of the several hundred single languages that make up the Tibeto-Burman stock.

Overview

The following classificatory overview assumes Tibeto-Burman to consist of six primary subgroups: Bodic, Baric, Burmic, Karenic, Qiangic, and possibly Rungic. Given that the linguistic classification of Tibeto-Burman is, at the time of writing, still a matter of considerable debate and controversy, it should be borne in mind that different classifications exist, and the one adopted here does not claim to be the only scientifically adequate one. (Most controversies surround the Southeast Asian branches of Tibeto-Burman.)

Bodic Languages One way of classifying Tibeto-Burman languages is to divide them into those spoken in the indospheric area (that is, the area under the cultural influence of India) and those spoken in the sinosphere (that is, the area under the cultural influence of China). This division is independent of purely linguistically based subdivisions of the stock and does not necessarily coincide with linguistic subdivisions. Using this division, we can say that Bodic (from Tibetan *bod* = "Tibet") languages are spoken in the indospheric part of the Tibeto-Burman area. Bodic may be further subdivided into the variants of Tibetan proper, Kanauri, Tamangic, Newari (these four are often taken together as the Bodish subgroup), Kiranti (Rai), Kham-Magar, and Bahing or Vayu (the latter three are often grouped together as the East Himalayish branch of Bodic).

Tibetan dialects, the first of the subgroupings of Bodic languages, are often classified according to their respective behavior regarding the preservation or simplification of the often very complicated consonant clusters found at the beginning of words in the old written language. Thus, archaic dialects (with some or most of these clusters intact) are opposed to innovative dialects where the onset of words has been simplified, mostly to the degree of allowing not more than one

word-initial consonant. This feature corresponds largely to that of tonality, with innovative dialects showing more tonal contrasts than archaic ones, which may be marginally tonal or even completely atonal. Since archaic dialects are found mostly on the fringes of the Tibetan-speaking area, in the far west and far northeast, respectively, and archaisms generally do not allow classifying the dialects of a language (or the members of a family) in a historically meaningful way, the following enumeration of the most important Tibetan dialects—some of which would certainly justify treatment as independent languages—is mainly geographically based (the numbers of speakers are, where stated, approximate only): The Northeastern and Eastern groups of dialects are mostly referred to as Amdo (in Qinghai, and parts of Gansu) and Kham (Qinghai, Yunnan, Sichuan, eastern Tibet), respectively. Both include a large number of subdialects, which are mostly, but not invariably, rich in clusters and nontonal (i.e. "archaic"). Western Tibetan (mostly "archaic") is made up mainly of Balti (400,000 speakers in Northeastern Pakistan and Jammu and Kashmir, India), Purik (120,000 speakers in Kashmir), and Ladakhi (50,000 speakers in Ladakh and Jammu and Kashmir). The dialects of Lahul and Spiti (Himachal Pradesh) are described as "transitional" with respect to the archaic-innovative dichotomy. Central Tibetan dialects include the prestige variety and lingua franca for all of Tibet, Uke, (*dBus-skad*) or Tibetan proper, the best-known variety of which is the dialect of Lhasa. Tibetan dialects in Nepal are mostly innovative but sometimes transitional, the most important ones being the varieties of Dolpo and Mustang (*gLo-skad*) in the west, and Sherpa, Jirel, and Kagate in the east. Southern Tibetan includes the dialects spoken in Sikkim and Bhutan, mostly innovative, with Dzongkha being the national lingua franca of the Kingdom of Bhutan.

Tibetan has a long tradition as a literary language, beginning in the seventh century CE. Today, it continues to be the written medium of the Tibetan community in the Tibetan Autonomous Region of the People's Republic of China, as well as of the Tibetan diaspora. In Bhutan, Dzongkha is an officially written language; Ladakhi and Balti, too, are occasionally written, Ladakhi in Tibetan script, sometimes with reformed spellings. For Balti, a special script, based on the Perso-Arabic alphabet, was designed in the early twentieth century.

Kanauri (often grouped together with Tibetan into a Tibeto-Kanauri group) languages include Kanauri (25,000 speakers), Kanashi (1,000 speakers), and Bunan (2,000 speakers), spoken in Himachal Pradesh and Uttar Pradesh, India.

Almoran languages are Byangsi, Chaudangsi, Darmiya, and others, all of which are spoken in western Nepal and across the border in India, by about 2,000 speakers each.

Tamangic languages are all spoken within the boundaries of Nepal: Tamang (500,000 speakers), scattered over almost all of Nepal, but centered around the Kathmandu valley; Thakali (5,000 speakers), in the valley of the river Kali-Gandaki, Chantyal, western Nepal (Myagdi district); Gurung (150,000 speakers), in western Nepal (Gorkha and Kaski districts); and the languages of the villages of Manang, Nar, and Tsuk in the Mustang district.

Newari (500,000 speakers) is spoken in the Kathmandu valley (Kathmandu, Bhaktapur, Patan), where it continues to be the most common spoken language, despite the fact that Indo-Aryan Nepali is the state language of Nepal. Newari has been written at least since the seventeenth century.

The Kiranti (or Rai) languages are located in the eastern hills of Nepal, up to the Sikkimese border. The best known languages are Bantawa, Lohorung (10,000 speakers), Limbu (200,000 speakers), Thulung (20,000 speakers), and Chamling. Some investigators include the Kham-Magar languages (Kham, 25,000 speakers in western Nepal; Magar, 500,000 speakers to the south of Thakali) and Bahing or Vayu (3,000 speakers in eastern Nepal) in Kiranti. The theory of a closer relationship between Kiranti and Newari ("Mahakiranti") is also advocated.

Baric Languages The geographic center of the Baric branch of Tibeto-Burman (also called the Kamarupan branch; not all investigators agree that the languages subsumed under either term constitute a valid first-level branch of Tibeto-Burman) is northeastern India, Myanmar, and parts of southern China. The Konyak-Bodo-Garo subgroup includes the Konyak languages (for example, Ao, 80,000 speakers in Nagaland; Konyak proper, 95,000 speakers in Assam and Nagaland; and many more languages) and the Bodo-Garo languages (Bodo, 1,000,000 speakers in Assam and West Bengal; Garo, 500,000 speakers in western Assam and 90,000 speakers in northern Bangladesh; Dimasa, 70,000 speakers in the Cachar hills, Assam). The Kuki-Chin-Naga subgroup is further subdivided into Kuki-Chin (with 700,000 speakers of a great number of Chin dialects in Myanmar, as well as in Assam, Manipur, and Nagaland), and Kuki languages such as Anal, Lushei, and possibly Lepcha, together totaling about 412,000 speakers). Of the Naga languages, which are centered in Nagaland (Konyak languages are sometimes, erroneously, also referred to as "Naga,"

obviously for purely ethnographic reasons), the better-known languages are Sema (65,000 speakers in Nagaland and Assam), Mao (60,000 speakers in Manipur and Nagaland), and Angami (40,000 speakers in Manipur and Nagaland). The Mikir-Meithei group consists of Mikir and Meithei (Mikir with more than 1,000,000 speakers in northeastern India, Bangladesh, and Myanmar; Meithei with 200,000 speakers in Assam). Abor-Miri-Dafla or Mirish languages include, among others, Adi or Miri (400,000 speakers in Assam), Lhoba (200,000 speakers in Arunachal Pradesh), and Nisi (30,000 speakers in Assam and Arunachal Pradesh). Mru (60,000 speakers in Myanmar's Arakan hills) may constitute an independent subbranch of Baric, as may Jinghpo or Kachin (600,000 speakers in Kachin State, Myanmar, and adjacent regions of China). Kachin has alternatively been classified as Burmic or as an independent first-level branch of Tibeto-Burman, Kachinic.

Burmic Languages Burmic, or Burmese-Lolo, languages are widespread in Southeast Asia, namely in Myanmar, parts of Thailand, Laos, Vietnam, and south China (Yunnan). They can be clearly subdivided into a Burmish and a Lolo subbranch. Burmish languages may be further grouped into Northern Burmish (Achang, 20,000 speakers in western Yunnan; Atsi, 80,000 speakers in Yunnan who are officially part of the Jinghpo nationality; Maru, 100,000 speakers in Kachin state, Myanmar) and Southern Burmish, which consists mainly of Burmese and its varieties. Burmese is the national language of Myanmar, spoken by more than 20,000,000 speakers, and has been a literary language since the twelfth century. The written standard is focused on the dialect of the Irrawaddy valley. The Lolo subbranch consists of Northern Lolo and Southern Lolo. Northern Lolo in turn includes Lisu (more than 600,000 speakers in Yunnan, Sichuan, and Northern Thailand), Yi (more than 3,000,000 speakers in Sichuan, Yunnan, and southeastern Tibet; this language is also referred to as Lolo, but the term is nowadays regarded as derogatory), and Naxi or Moso (250,000 speakers in Yunnan and Sichuan). Southern Lolo includes Akha (350,000 speakers in Yunnan, Thailand, Laos, and Vietnam), Hani (more than 500,000 speakers in Yunnan), and Lahu (more than 500,000 speakers in Yunnan, Myanmar, Thailand, and Laos). There are also a number of clearly Loloish languages that could not be assigned to either group. One example is Tujia, spoken by 200,000 speakers in Hunan and Hubei, China.

Karenic Languages Karenic languages, sometimes viewed not as a part of Tibeto-Burman but as a higher-level grouping, coordinate with Tibeto-Burman

within Sino-Tibetan and are spoken on both sides of the Thailand-Myanmar frontier (notably in Myanmar's Karen state); the two most important varieties are Pwo Karen (1,300,000 speakers in both countries but mostly in Myanmar) and Sgaw Karen (2,000,000 speakers, of whom 300,000 live in Thailand).

Qiangic, Rungic, and Other Languages The remaining languages and small groups have not been assigned to any of the above-mentioned groups so far, and their ultimate place in the family remains open. These are Qiang(ic), with 130,000 speakers in western Sichuan; Nungish (including Rawang, with 100,000 speakers in Kachin state, Myanmar, Tibet, and Yunnan; and Nung, with 6,000 speakers in Yunnan); Primi, or Pumi, with 25,000 speakers in north-west Yunnan; and Gyarong (sometimes viewed as another Bodish language), with 100,000 speakers in Sichuan. The latter three groups have been tentatively united into a Rungish branch of Tibeto-Burman.

The Bai or Minjia language, spoken by more than 1,000,000 speakers in northern Yunnan, has resisted most attempts to classify it linguistically; it is sometimes viewed as a language isolate or as another Sinitic language, but the view that it forms an independent first-level branch of Tibeto-Burman ("Baic") is gaining ground.

Typology, Tone, and Morphology

Though the genetic unity of the family is clearly established, the different branches of Tibeto-Burman show a considerable degree of typological diversity. In terms of word order, most Tibeto-Burman languages are verb-final, with the notable exception of Karenic, where the basic order is subject-verb-object, as in Chinese.

The mainly culturally motivated division of Tibeto-Burman languages into sinospheric and indospheric languages has some linguistic corollaries, in that the former languages conform more to the linguistic type of Southeast Asian languages, or, for that matter, Chinese, in possessing few if any morphological markers attached to lexical roots (the so-called isolating typology widespread in the area), whereas some languages of the Kiranti group (in the indosphere) rank among the morphologically most complex languages of Asia.

Lexical tone is widespread in the family (a system of two register tones may be reconstructible for the protolanguage), but actual tone systems differ widely, and some of them, especially the systems found in the more central varieties of Tibetan, represent late and secondary developments from a nontonal stage. The general pat-

tern to be observed is that tonal systems tend to replace earlier contrasts of voicing of root-initial consonants (with initial voiceless consonants yielding high tone, and voiced consonants leading low tone, a phenomenon particularly observable in Bodish languages), but numerous details remain to be worked out. In Southeast Asia, some Tibeto-Burman languages are particularly rich in tonal contrasts, such as Nasu (Loloish), which has seven tones, but nontonal languages occur as well, such as Northern Qiang (the closely related Southern Qiang, by contrast, has six phonemic tones).

An important typological parameter in Tibeto-Burman morphological systems is that of person agreement of verbs. The range of possibilities exploited in Tibeto-Burman languages reaches from completely apersonal verbs, over verbal systems with subject agreement only, to systems that signal both subject and object person in the morphological verb complex.

A language like Thakali (Tamangic), for example, shows no person agreement at all, as in *nga tru-si mu* "I am sitting," *ki tru-si mu* "you are sitting," *the tru-si mu* "s/he is sitting" (*nga, ki, the* are the personal pronouns, *tru* the verbal root "to sit," *-si mu* a nonfinite, participle-like verbal form called a "converb," made final by the copula *mu*), where only the different personal pronouns serve to distinguish between subject persons. Byangsi, a language of the Almorán group, has a person-agreement system in verbs that shows, as in many European languages, the person of the subject in the verb. Thus *zage-ye* "I eat," *zage-no* "you eat," *zage-n* "she/he eats." In some Kiranti languages, transitive verbs encode the person of the object as well. For example, Chamling: *ta-tyok-u* "you saw him/her," *ta-tyok-a* "she/he saw you," *tyok-u-m-ka* "we saw him/her" (where *tyok-* is the verbal root "to see," *ta-* the marker of the second person, *-u* the third-person object, and *-m-ka* the first-person exclusive; note that third person is marked only when in object function). The actual verbal agreement paradigms of Kiranti languages are much more complicated than this fragment can illustrate and pose considerable problems of synchronic and diachronic interpretation. Opinions are still divided on whether the complex agreement patterns of the Kiranti type represent the original state of proto-Tibeto-Burman or, rather, are secondary developments of these languages, possibly under the influence of Munda (Austroasiatic) languages, which are spoken further south in India.

TIGER The tiger (*Panthera tigris*) is one of the world's strongest and most endangered creatures. The largest member of the cat family, it inhabits the swamps, forests, and grasslands of Asia. The tiger's coat of thick fur can vary from yellow to dark orange-brown. Tigers are the only striped cats and the pattern of each tiger's dark vertical stripes is unique (like a human fingerprint), providing excellent camouflage. White tigers, with brown stripes and blue eyes, are very rare in the wild. Tigers have sharp teeth and extremely powerful jaws, neck, and limbs. They can run very fast for short periods of time and leap huge distances. They are also strong swimmers and can cross wide rivers. Tigers are generally about three meters long, including tail. An adult male tiger weighs 180 to 250 kilograms.

All tigers belong to the same species, but there are several subspecies. The best known are the Siberian (Amur) tiger (*Panthera tigris altaica*), which lives in the forests of the Russian Far East; the Bengal tiger (*Panthera tigris tigris*), which lives in the grasslands and forests of India, Myanmar (Burma), and the Himalayas;

MANAS WILDLIFE PRESERVE— WORLD HERITAGE SITE

Designated by UNESCO as both a World Heritage Site (1985) and a World Heritage Site in Danger (1992), the Manas Wildlife Preserve is still a vitally important refuge for many animals including the majestic Bengal tiger.

and the Sumatran tiger (*Panthera tigris sumatrae*), which inhabits the Indonesian island of Sumatra.

The tiger is a carnivore that usually hunts alone and at night. Its prey ranges from large mammals, such as deer and wild pigs, to monkeys, frogs, and fish. Prey is usually killed with a strong bite to the neck. Occasionally young elephants and rhinoceroses are attacked. The killing of cattle and other livestock sometimes brings tigers into conflict with people. Rarely do tigers attack and kill people.

Tigers are solitary animals and each tiger has its own territory. Male territories often overlap with female territories. Cubs are usually born in litters of two or three and stay with their mother for two years. A tiger's life span is about twenty years.

Tigers are critically endangered. Very few tigers remain in the wild, and several subspecies, such as the Javanese tiger (*Panthera tigris sondaica*), are believed to already be extinct. Tigers are illegally killed for their bones, which are used in traditional Chinese medicines, and for their coats. They also suffer from the effects of deforestation and habitat destruction. Many zoos have set up breeding programs, and India and Nepal have designated special tiger reserves.

TIGRIS RIVER The Tigris (biblical name, Hiddekel; in Arabic, Dijlah; in Turkish, Dicle) is one of the two great rivers of Mesopotamia (present-day Iraq). Approximately 1,900 kilometers long, it rises in

southeastern Turkey at Lake Hazar in the Taurus Mountains and flows southeast for about 450 kilometers toward the city of Cizre, to form a 32-kilometer border between Turkey and Syria before entering Iraq. Unlike its twin the Euphrates River, the Tigris flows directly toward the Mesopotamian plain to join the Euphrates at the town of al-Qurnah, in southeast Iraq, whence it forms the Shatt al-Arab, 193 kilometers long, before it discharges into the Persian Gulf.

Along its upper course, the Tigris flows swiftly in well-defined channels through the gorges of east Anatolia and the Syrian and Iraqi plateaus. Numerous left-bank tributaries augment its water during its passage through Iraq. Downstream from the city of Mosul, the Tigris is joined by its two main tributaries, the Greater Zab and the Lesser Zab, originating in the eastern Zagros Mountains. Close to Samarra, the river enters the head of the Mesopotamian alluvial plain and begins to meander slowly toward the gulf. Here the Tigris receives water from other tributaries, which together with the two Zab streams provide more than 50 percent of its discharge. The flow of the Tigris, however, varies considerably, and its flow decreases rapidly along its lower course through seepage, evaporation, and intensive water use.

Losing velocity, the river deposits its silt and raises its bed level above the surrounding alluvial plain. It becomes prone to its renowned seasonal overflows and to historically altering its course. To avert the danger of inundations, in addition to expanding irrigation schemes and generating power, Iraq has constructed a system of dams and barrages on the river. Over its remaining course toward the gulf, the main stream of the river is divided into several channels 320 kilometers south of Baghdad, which irrigate the rice-growing areas and feed into the extensive marshes formed along the southern part of the plain.

Along the Tigris emerged the earliest centers of urban civilizations sustained by ancient waterworks. On its banks stood some of the great Mesopotamian cities, including the Assyrian capitals of Nineveh, Calah, and Ashur; the Hellenistic city of Seleucia; the capital of the Sasanids, Ctesiphon; and the Abbasid capitals of Baghdad and Samarra.

TILE WORK—CENTRAL ASIA Glazed bricks with painted or painted-and-molded designs had been used as early as the thirteenth century BCE, as architectural decorations in the Elamite kingdom in modern Iran; Assyrian royal architecture also made use of such glazed brick decorations, although the most elaborate known examples are undoubtedly Nebuchadnezzar's (604–562 BCE) vast constructions in Babylon and the palace at Susa, the capital of the Achaemenid Persian dynasty (559–358 BCE).

Tile work became a decorative element in the architecture of Central Asia with the establishment of Islamic culture in that region, particularly on buildings of brick. The use of embellishment incorporating geometric and vegetal patterns, harmoniously balanced colors, and elaborate script decoration is an architectural achievement unique to the Islamic tradition.

In the tenth century, the Abbasid dynasty (749/750–1258) commissioned scientists to develop a white glaze that imitated the appearance of Chinese porcelain over the local brown clays. The result was tin glaze, considered very precious and used on royal dishes. This lead-based glaze was combined with the following metal oxides to produce colors: tin for white, copper for turquoise and green, cobalt for deep blue, iron for brown and yellow, manganese for purple mauve, and combined oxides for black. Tiles were incorporated into architecture in the late medieval period. In Central Asia under the Seljuks, Mongols, Timurids, and Khanates, buildings were decorated with precious glazed tiles to provide both body and soul with a soothing environment. Designs evolved from individual colored shapes as in mosaics; textured clay tiles were carved and glazed; eventually, square tiles with patterns extending beyond the individual squares were produced. Under the Abbasids, when Persian domination extended to Central Asia, tile decoration was again introduced to this area.

In Islamic architecture in Central Asia, tile decoration adorned public buildings, mausoleums, and royal residences. At first, turquoise-colored tiles were used as contrast with the terra-cotta color of the bricks; in eastern Islamic tradition, turquoise represents good luck and heaven. In time, *eyvans* (open halls around mosque courtyards), minarets (prayer towers), *minbars* (pulpits), domes, and complete walls of mausoleums, *madrassas* (religious schools), and mosques were decorated with tile work. Patterns could be created by using individual mosaic pieces of different colors to form

Detail of an Islamic tile work geometric motif from Samarqand, Uzbekistan. (GERARD DEGEORGE/CORBIS)

extremely complex geometric or floral designs that were intertwined to magnify a text or floral, astrological, or geometric themes.

Colored patterns were achieved by various methods. Mosaics were glazed pieces cut after firing; a colored pattern was arranged face down and covered with plaster, with reinforced sticks embedded into the mixture. Such panels could be lifted and attached to a façade. *Cuerda seca* (Spanish, "dry line") technique allowed the separation of color on a tile in chambers segregated by a grease line. Another method of coloring tiles was to use thick tin glaze with color additions painted on the unfired surface. Tin glaze is highly viscous, and colors stay fixed. Golds and red luster (a metallic glaze developed in Seljuk pottery) painted onto the tin-glazed fired surfaces required an additional firing to achieve a brilliant gold color. Designs could also be painted onto small tiles of various shapes. Textured patterns sometimes formed elaborate sections of columnar structures bordering doorways and accentuating the colored themes of a building.

The building process *banna'i*, developed under Timur (1336–1405) and his successors, created patterns of glazed brick ends in blue, white, or black, contrasting with the unglazed terra-cotta building material. Further color was added by using light blue, white, purple, black, green, and amber on a field of dark blue. *Thuluth* and *kufic* scripts decorated vertical and horizontal borders. The scripts often quoted from the Qur'an, sometimes passages related to the function of the particular building, or they acknowledged a donor of the building. When whole surfaces were adorned with geometric patterns that grew in algebraic complexity but had no central focus or theme, this technique reflected a philosophical aspect of Islamic design; such decoration was conducive to meditation or expressed a spiritual concept. Patterns were sometimes

based on the cycles of the moon and were amplified with subdivisions and large areas of visual unity by using color.

The best place to study architectural tiles as they were used up to the fifteenth century is at the city of Samarqand in Uzbekistan. Here one can observe every technique used in tile making: glazed terra-cotta, polychrome glazed carved tiles, *cuerta seca*, mosaic, overglaze, underglaze, and luster. During Timur's rule, when this city was his capital, large areas of architectural surfaces received decorative tile treatment with a restricted number of motifs, according to his mandates. In the mausoleum complex of the Timurid dynasty, the Sha-i Zinda, one tomb may exhibit examples of carved brick or flat tiles decorated in underglaze, glaze, overglaze, and luster techniques. On the façade of the tomb of Shirin Bika Agha (Timur's sister), every inch of surface is covered with blue, turquoise, and white patterns, creating a dazzling visual effect that encourages meditation. In contrast, stunning examples of *banna'i* on the portal and minaret of the *masjid-i jami* of Timur use bold contrast between raw terra-cotta and glazed brick ends to define the huge forms capped with a brilliant sky-blue dome. Timur's tomb retains the brilliant lustered niches that make up the interior of the dome.

TIMBER INDUSTRY—MALAYSIA Timber as an export commodity began contributing to the Malaysian economy only toward the end of the nineteenth century. The timber industry started in today's East Malaysian state of Sabah (formerly British North Borneo) in the 1880s. Despite attempts in neighboring Sarawak (ruled by the Brooke Raj and then a British colony from 1946), it was only after World War II (1941–1945) that the industry became significant there and even overtook Sabah in both production and exports. Likewise the industry became important in peninsular Malaysia (formerly British Malaya) after

1945. In 1963, Sabah and Sarawak joined the independent Federation of Malaya (1957), which in 1963 became the Federation of Malaysia.

The timber industry of Sabah began with a chance sale of felled timber from a clearance of land near the seaport town of Sandakan for sugar planting. In February 1885, the first shipment of felled timber headed for Australia. Other shipments followed, and by the 1930s Sandakan had become one of the major timber ports of the world.

The leading market for the tropical hardwood known as *billian* was Hong Kong, where it was used for sleepers in the expanding railway network then being undertaken in China. Timber companies at that time were in European hands, namely the British North Borneo Trading and Planting Company and the British Borneo Timber Company. Timber was Sabah's major export from the 1910s onward; exports, mainly in logs, reached their peak in 1937. Before 1941, Sabah was the third-largest timber exporter in the British empire, with markets in Hong Kong, Japan, Britain, and Australia.

In Sarawak, the Borneo Company exported small quantities of *billian* to Hong Kong and Calcutta. But inexperience, difficult terrain, and fluctuating timber prices hampered large-scale operations during the pre-1941 period. A few Chinese logging companies also served the overseas market, and the European-owned VAMCO Timber Company pioneered the export of sawn timber and plywood in the 1930s.

Timber Production in Independent Malaysia

Timber production and exports from peninsular Malaysia became significant only from the late 1960s. Together with production from Sabah and Sarawak, timber became the third leading export of Malaysia after rubber and tin. The 1980s and 1990s witnessed Malaysia's becoming one of the world's largest exporters of tropical hardwood, accounting for 37 percent of world production (1998). Timber-based industries produced a wide assortment of wood products, from sawn timber, plywood, and veneer to prefabricated houses and furniture, including rattan furniture for domestic and overseas markets.

The two major organizations related to the timber industry are the Forest Research Institute of Malaysia (FRIM) and the Malaysian Timber Industry Board (MTIB). FRIM undertakes research in forest development aimed at sustainable growth and conservation of the resource base. MTIB regulates and controls the timber trade, including marketing and distribution, and promotes effective utilization of Malaysian-produced timber.

Conservation Issues

Conservation and regulation of the timber industry began in Sabah in the early 1910s, with the establishment of the Forestry Department. Forest reserves were designated, and silviculture and research were undertaken to ensure that the forest remained a sustainable resource asset. In the post-1945 period, measures to arrest the adverse consequences of logging activities and to ensure sustainable management of forest resources included the creation of the Permanent Forest Estate (PFE) and the rehabilitation of logged-over forest through different types of silvicultural treatments. The National Forestry Policy implemented since 1978 was revised in 1992 to include the conservation of biological diversity, sustainable utilization of genetic resources, and the role of local communities in forest development.

The adverse effects of logging activities on the environment have been overstated, as has the negative impact of logging on forest dwellers. Measures have been undertaken to ensure that the nomadic livelihood of the Penans in Sarawak and of some Orang Asli communities in peninsular Malaysia is not overlooked or compromised vis-à-vis the timber industry. Prudent steps adopted by the Malaysian government include setting aside vast areas (44 percent of total land area) as PFE, as well as the designation of some 2.12 million hectares as national parks and wildlife and bird sanctuaries. Malaysia has actively supported organizations such as the International Tropical Timber Organization (ITTO) with its ITTO Year 2000 Objective, and the United Nations Conference on Environment and Development (UNCED). Malaysia wholly subscribed to the Statement of Principles on Forest under Agenda 21 of UNCED. Furthermore, Malaysia is undertaking bilateral-cooperation forest projects with Denmark, Germany, and Japan to enhance sustainable forest development further.

The Malaysian timber industry contributed 5.3 percent of total export earnings of some RM 17.1 billion in 1999 and steadily increasing to RM 17.7 billion in 2000.

TIMOR SEA The Timor Sea is a small stretch of water between the island of Timor and northern Australia. As a result of the colonial division of Timor between the Netherlands (west) and Portugal (east), the western half of the island is now part of Indonesia's East Nusa Tenggara Province, while East Timor, under effective Indonesian rule from 1975 to 1999, is now an independent entity. Under the provisions of the Law of the Sea, the Timor Sea had to be demarcated, but, controversially, Australia negotiated with Indonesia to divide the sea between itself and East Timor, despite Indonesia's illegal acquisition of the former Portuguese territory.

In 1989 an agreement entitled the Treaty Between Australia and the Republic of Indonesia on the Zone of Cooperation in an Area Between the Indonesian Province and Northern Australia, also known as the Timor Gap Treaty, was signed (and implemented in 1991). The treaty established a zone of cooperation of 61 thousand square kilometers to facilitate the exploitation of petroleum resources. The central area of the zone, known as zone A (or ZOCA), consists of 34,970 square kilometers of seabed estimated to be able to yield 7 billion barrels of oil and 50 trillion cubic feet of natural gas. The Timor Gap Treaty allowed Australia to divide future revenues equally with Indonesia; both countries also were to provide to each other 10 percent of revenues derived from the zones nearest their respective shores (zones B and C). On 10 February 2000, by the Exchange of Notes between Australia and the United Nations Transitional Administration in East Timor, the parties agreed to roll over the Timor Gap Treaty, but with revenues now going to East Timor. In 2001 the United Nations renegotiated the treaty in favor of East Timor (ZOCA revenues of 90 percent), and this is expected to generate between \$150 million and \$200 million a year by around 2005.

Anthony L. Smith

TIMUR (1336–1405), emperor of the Mongol empire. Born in what is now Uzbekistan, Timur, known as Temur-i-Lenk ("Timur the Lame," or in English, Tamerlane) because his right arm and leg were paralyzed from arrow wounds, was the last of the great nomadic Mongol emperors. He carved an empire from the remnants of the Mongol territories in Central Asia and spent his life campaigning throughout the Middle East, India, and Russia. He defeated the Golden Horde (a separate wing of the Mongol empire, which flourished in Russia in the latter half of the thirteenth century) in 1387 and 1391, sacked Delhi in 1398, and

SHAKHRISYABZ—WORLD HERITAGE SITE

Designated a UNESCO World Heritage Site in 2000, Shakhriyabz (in Uzbekistan) is a collection of monuments from the medieval empire of Timur. The important historical site, which dates back to the fifteenth century, represents the zenith of Timurid craftsmanship.

defeated Bayezid I (c.1360–1403), sultan of the Ottoman empire, in 1402. During his reign he was known as Emir (Amir) Timur.

Timur is remembered most for his conquests and cruelty. He orchestrated many massacres and left numerous towers of skulls as reminders to the conquered of his authority. Although today we remember him for his brutality, he was also noted for being very intelligent, an expert chess player, fluent in several languages—despite being illiterate—and well-versed in debate. Playwrights such as Christopher Marlowe (1564–1593) penned plays about him, inspired by his larger-than-life character. Timur died in 1404 while undertaking the conquest of Ming-dynasty China. Although his empire disintegrated after his death, his descendants established the Mughal empire in India.

TIN INDUSTRY The only tin-bearing mineral of any significance is cassiterite, SnO₂. It is comparatively rare, and the bulk of the world's deposits are located in a belt running from southern China to Indonesia. The deposits are of two kinds, primary deposits in lodes underground and secondary or alluvial deposits formed through erosion. Since the alluvium is close to the surface, it is easily extracted, and the heavier particles of cassiterite are separated by washing. Asia is particularly fortunate since the bulk of its deposits are alluvial.

The low melting point of tin makes it easy to reduce the cassiterite to metal through smelting and contributes to its utility in a wide variety of products. Around 3000 BCE the inhabitants of Southwest Asia recognized the metallurgical properties of tin and added a small proportion of tin to transform copper into the much more versatile bronze. Bronze made sharper weapons and better tools than did stone, and it became an essential element in the emergence of civilization. As civilization developed, especially in China, tin was consumed in large quantities for functional objects, such as mirrors, plates, and wine cups, as well as ceremonial objects, such as bells and candlesticks for ancestral altars. Religion provided a particular stimulus, and by the eighth century CE tin was beaten into thin strips to form backing for joss paper, a sacrificial paper inscribed with prayers and burned. With the industrial revolution in Europe, entirely new uses emerged, including coating for steel in tin cans, tinfoil for wrapping food, collapsible tubes for paints and pastes, solder, and bearing metals.

The combination of utility and scarcity made tin a particularly valuable commodity, and it therefore played an important role in the development of trading networks. At first these connected Southeast Asia to China, India, and the Near East. By 1850 a global market had emerged, and Southeast Asia supplied well over half of the world demand, a position the region maintained until the 1980s. The history of the industry can be divided into phases.

The Emergence of the Chinese

From earliest times the main centers of tin production were the Ko-chiu district in Yunnan, southwest China, and the Tavoy region in Myanmar (Burma). In the sixteenth century the earliest European traders, the Portuguese, found that the main centers had moved to Phuket, Thailand, and Melaka, in present-day Malaysia. By the eighteenth century the Dutch had turned the island of Bangka, Indonesia, into the largest producer. For the following two hundred years immigrant Chinese displaced local Burmese, Malay, and Thai miners, and a few became wealthy mine owners and merchants. Mines were an important source of wealth not simply because of the richness of their deposits but also because of the opportunities for exploitation of the immigrant labor force through gambling and opium. Collapsing political authority in Malaya (now Malaysia) led to open warfare from 1862 to 1872 as rival sultans and Chinese gangs vied for control over the tin trade, forcing British intervention and the creation of the Federated Malay States in 1874. Siam (now Thailand) avoided a similar fate thanks to the role played by the

Khaw family. The founder of this extended Sino-Thai family had arrived in the tin district in the 1820s and was largely responsible for its overall economic development throughout the nineteenth century. Chinese rioting in 1876 was curbed by the Khaws and the family then became the dominant economic force in the region, with extensive mining, shipping, general commerce, and tax farming. It also became a dominant political force thanks to support from the central government in Bangkok. In the Dutch East Indies (DEI) Chinese mining was subject to direct European control, on Bangka by the Dutch government and on Belitung and Singkep by private Dutch companies.

Displacement of the Chinese

Europeans had a technical advantage in smelting tin concentrates, producing a high-quality metal better suited to the needs of American and European industry. In 1886 the Singapore smelter of the Straits Trading Company (STC) opened and began to eliminate the small, local Chinese smelters. In response the Khaw family built a modern smelter in Penang (an island in present-day Malaysia) in 1907, but the family sold out to British capitalists in 1910. The whole region then had just three important smelting complexes, Bangka, Penang, and Singapore, which treated ores from Alaska to South Africa.

Traditional Chinese mining techniques became obsolete as the quality of the deposits declined, and beginning in 1900 European technologies predominated. The gravel pump, which broke down the tin-bearing alluvium under a high-pressure jet of water, was widely adopted by Chinese miners, but the most important technical innovation was the bucket dredge, which could work low-grade and hitherto inaccessible deposits at a low cost. Dredges worked on the seabeds off Thailand and the DEI, but they also reworked deposits the Chinese considered exhausted. Dredging transformed the industry, significantly increasing production in the 1920s and drawing on fresh sources of capital, mainly from Britain and Australia. Both the capital and technical requirements of dredging led to a consolidation of the tin industry into a few corporate groups, of which the most important was the London Tin Corporation (LTC).

The LTC originated in an Anglo-German jute-trading firm in Calcutta, India, that first developed dredging in Burma in the early 1920s. The company then extended its reach throughout the world, becoming the largest producer in Malaya, Siam, and Japan. Good prices and expanded production in the 1920s generated large revenues for local governments.

The tin industry avoided the worst of the depression of the 1930s thanks to the cooperation of most of the important tin producers, members of the International Tin Committee formed through the efforts of the LTC, including Malaya, the DEI and Siam, but not including China or Burma.

China remained largely insulated from these processes of modernization. The close link between Chinese miners and local smelters blocked the sale of ores to foreign interests and perpetuated obsolete technologies. However, by 1935 the Yunnan provincial government developed a smelter that produced a metal of international standards and opened a modern mine.

Displacement of the Europeans

Much mining capacity was destroyed during the Japanese conquest of Southeast Asia in 1942, which changed the balance of power in the tin industry. The United States entered the post-World War II period determined to build a stockpile to protect against any repetition of the interruption of tin supplies, a policy confirmed by the 1949 revolution in China and the Communist insurgency in Malaya (1948–1960). By 1954 the stockpile was completed, and the world again faced the problem of chronic excess productive capacity, requiring regulation through a new form of international commodity control, the International Tin Council.

In the DEI, the industry was quickly rehabilitated thanks to good contracts for the U.S. stockpile. However, these contracts coincidentally expired as Indonesia became fully independent in 1954, and it then proceeded to take over all Dutch mining interests, which the government eventually consolidated into a fully nationalized company, PT Timah. At first the lack of fresh investment, managerial inefficiency, and attacks on the Chinese miners combined to reduce production, but investments in seagoing dredges stimulated recovery during the 1970s. Political uncertainty in Malaysia, which was established as a federated country in 1963, meant that rehabilitation drew more on local Chinese capital, which also acquired control over the STC. The New Economic Policy of the Malaysian government accelerated these trends, and in 1978 Malaysia Mining Corporation was formed, which acquired London Tin and other European dredging companies. In 1981 Malaysia Mining forged close links with the remaining STC smelter in Malaysia.

The Thais restructured their interests in LTC and other foreign dredging companies to permit majority Thai ownership. In 1965 Thailand realized its goal of establishing an important domestic smelter, though it

remained under foreign control. In both Malaysia and Thailand the balance shifted away from bucket dredging back toward small-scale techniques, such as gravel pumps on land and suction boats offshore. The LTC rebuilt its Burmese dredges, which were nationalized in the 1960s. As the new state corporation shifted production toward gravel pumps, overall output declined. Government control over all the mines of Ko-chiu, China, allowed modernization and considerable expansion in production there.

China's limited cooperation with other tin-producing countries in their attempts to control output contributed to the collapse of the International Tin Council in 1985 and to a large drop in price. Indonesia and China managed to survive the tin crisis, but production fell off sharply in both Thailand and Malaysia, bringing to an end the strategic role tin played in their economies.

TIPU SULTAN (1749–1799), ruler of Mysore, a kingdom located on the southwest coast of the Indian subcontinent. Tipu Sultan is remembered for his relentless struggle against British colonial rule during his reign. The son of Hyder Ali, he was born at Devanhalli in the modern Indian state of Karnataka. Tipu joined his father in the First Mysore War (1767–1769), the first of four battles fought between the British and the rulers of Mysore, in which the British were defeated.

Gumbaz, the mausoleum of Tipu Sultan in Seringapatam, India. (SHELDAN COLLINS/CORBIS)

When he became king following the death of Hyder in 1782, Tipu inherited a powerful kingdom. The peace treaty of 1784, signed between the British and Tipu, was a temporary phenomenon that became the main obstacle to British domination in south India. Tipu had sought the help of the French and the Turks in building an alliance against the British but with little success. In the third Mysore war, Tipu was defeated by the British and ceded half of his territories to the British empire in 1792. The subsidiary alliance system (the surrender of territory by Indian rulers for the upkeep of British subsidiary troops) implemented by Richard Colley Wellesley, the new governor-general of Bengal (1797–1805), was a clever ploy to bring Indian rulers under the suzerainty of the British empire, and Tipu fiercely opposed it. His capital, Seringapatam, fell to the British army on 4 May 1799; in this final Mysore battle, Tipu died.

A Muslim himself, Tipu adopted a tolerant policy of rule; he treated Hindus well and gave grants to their religious institutions. He showed great concern for the welfare of all of his subjects. Trade and commerce

greatly improved, and he built a modern navy. Tipu's passion was driving the British out of India, and he became a martyr for that cause.

TOBOL RIVER A tributary of the Irtysh, the Tobol River rises in the southern Urals of northwest Kazakhstan not far from the Russian border and flows in a roughly northerly direction first across the Turgay Plateau and then, after crossing the border into Russia, across the West Siberian lowland. The river joins the Irtysh not far from the city and port of Tobol'sk.

With a basin of 426,000 square kilometers, the Tobol is some 1,591 kilometers long. Of this the lower 437 kilometers are navigable, the river being used among other things to float timber to the main waterway of the Irtysh. The waters are also regulated to supply industry in the cities of Rudny, Qostanay, Kurgan, and Yalutorovsk.

The river's length and the two distinct geographical areas (the high-altitude dry steppe of the Turgay Plateau and the temperate rain forest of the Siberian taiga) through which it flows give it distinct characteristics. Like other Central Asian rivers, it is fed mainly by snow. This is supplemented in Siberia by rainfall. Its upper (Kazakhstan) course freezes in November, with the melt occurring at the end of April. In this region, the river's greatest flow occurs during May and June. The lower (Siberian) course freezes in October, with the melt at the end of May. Here the greatest flow is in August. In common with other rivers of the region, the Tobol's flow is highly variable. Its average flow at the confluence with the Irtysh is 805 cubic meters per second, but the maximum August flow is 6,350 cubic meters per second.

TOCHIGI (2002 est. pop. 2 million). Tochigi Prefecture is situated in the central region of Japan's island of Honshu, where it occupies an area of 6,414 square kilometers. Tochigi's primary geographical features are the Yamizo, Taishaku, and Ashio mountains which fringe a central plain irrigated by the Nakagawa and other rivers. It is bordered by Gumma, Fukushima, Ibaraki, and Saitama prefectures. Once known as Shimotsuke Province, it assumed its present name and borders in 1873.

The prefecture's capital city is Utsunomiya, base during the Kamakura (1185–1333) and Muromachi (1333–1573) periods to the Utsunomiya family, the region's military governors. In the Edo period (1600/1603–1868), it was a castle town and post station. In the early 2000s, it manufactures aircraft, farm machinery, and television sets. The prefecture's other important cities are Ashikaga, Tochigi, Sano, Kanuma, and Oyama.

Tochigi's main economic activity is agriculture: It grows rice, grains, and vegetables. Also productive are the forestry and woodworking industries, and at one time copper mining was important. Current industries include textiles, metals processing, and machine fabrication. The former post-station town of Tochigi is noted for its traditional sake brewing, wooden clogs, and lime production.

Visitors and pilgrims are drawn to Nikko National Park, site of the Tokugawa family tomb. The famed pottery town of Mashiko features the studio of Hamada Shoji (1894–1978), a leader of the folk art revival movement. Other scenic destinations are the Nasu Highland, Kegon Falls, and Lake Chuzenji.

TOFU One of the great breakthroughs in human nutrition was the discovery of how to process difficult-to-digest soybeans into nutritious tofu, or *doufu*. Tofu is made by soaking soybeans overnight, grinding them finely with water, and boiling them into a slurry, filtered to produce soy milk. This can then be precipitated using various settlers, commonly magnesium salts, Japanese *okara*, and pressed into slabs. It is uncertain when tofu was first made, but the technology was well known in China by early medieval times and possibly as early as the Han dynasty (206 BCE–220 CE).

Imitation of cheese making as practiced in the Altaic region has been cited as one possible source of the idea.

In recent times, tofu has become a mainstay of Chinese cooking and is a cheap and easily accessible source of protein. It is less well represented in early recipe books, but this may be due to its plebeian origins. Other tofu products include the "skin," *doufupi*, skimmed off and dried, and *choudoufu*, "stinking bean curd," a fermented product that is an acquired taste.

TOHOKU REGION Japan's Tohoku region is its northeast; the word "Tohoku" means "Northeast." Tohoku consists of the prefectures of Aomori, Iwate, Akita, Yamagata, Miyagi, and Fukushima on the main island of Honshu. The region is bordered by the Sea of Japan on the west, the Tsugaru Straits to the north and the Pacific Ocean on the east. Major cities are Sendai, Aomori and Akita, located along the coasts.

Winters are long and there is considerable snowfall along the coast of the Sea of Japan and in the central mountains, making Tohoku a favorite destination for skiers. Summers are hot, but less humid than in the southern part of Honshu.

Historically Tohoku remained out of the national political and cultural spotlight. During the eleventh and twelfth centuries a branch of the powerful Fujiwara family had their seat at Hiraizumi (in present-day Iwate Prefecture), and in the sixteenth century the warrior Date Masamune (1567–1636) established the Sendai domain and extended control over almost all of Tohoku.

Primarily an agricultural area, Tohoku's serves as Japan's rice bowl. Its long winter restricts other products to such crops as apples (in Aomori), rape (Yamagata), cherries (Yamagata), and timber (throughout the region). Tohoku is characterized by low population-density, a large number of members per household, and a high number of households with members 65 years or older. This demography reflects a lack of lo-

cal economic opportunity due to the high dependence on agriculture. With the exception of Miyagi Prefecture, which had a population increase of 1.6 percent in the period from 1995 to 2000, the prefectures of the Tohoku region saw a drop in population ranging from 0.3 percent to 2 percent.

The conservative nature of the people and remoteness from the metropolises of Tokyo and Osaka allow Tohoku to retain local traditions more than other rural areas of the country. Those traditions include the large-scale early August festivals of Kanto at Akita, Nebuta at Aomori, and Tanabata at Sendai.

TOJO HIDEKI (1884–1948), prime minister of Japan. Tojo Hideki was the prime minister of Japan throughout most of World War II (1941–1945). A

Former premier Tojo testifying at the War Crimes Tribunal in Tokyo on 26 December 1947. (BETTMANN/CORBIS)

Tokyo-born career army officer, Tojo served as an attaché in Europe in the early 1920s and later joined the Control Faction, an influential clique within the Japanese military. In the mid-1930s, Tojo's star rose with the ascendance of the Control Faction over rival army cliques. In 1935 he was transferred to Manchuria, where he served on the staff of the Guandong (Kwantung) Army. Recalled to Tokyo in 1938, Tojo was appointed a vice-minister of the army, followed by promotion to army minister in the cabinet of Konoe Fumimaro (1891–1945) in 1940.

An ardent militarist, Tojo was a keen supporter of the alliance with Nazi Germany and the expansion of the war with China. Following the collapse of the Konoe cabinet in October 1941, Tojo was appointed prime minister in an atmosphere of escalating tensions with the United States. As Japan's material inferiority became increasingly apparent despite an earlier string of victories in the Pacific, Tojo attempted to centralize and coordinate the war effort by taking personal control of key posts in the cabinet and the army. However, this attempt aroused powerful opposition in civil and military circles, and Tojo resigned under pressure following the loss of Saipan, an island in the northern Marianas, in July 1944. After the war, he was convicted of war crimes and was hanged in Tokyo on 23 December 1948.

TOKAIMURA NUCLEAR DISASTER Japan's latest and largest nuclear disaster—the world's worst since Chernobyl—happened in September 1999 at a nuclear fuel processing service firm in the small village of Tokaimura, 125 kilometers northeast of Tokyo in Ibaraki Prefecture. This disaster occurred when JCO Corporation workers were handling uranium and provoking the release of high levels of radiation from the plant. It was level 4 on the International Nuclear Event Scale of 0 to 7, but according to many experts it could have been rated level 5. Previously, the worst nuclear disaster in Japan was a level 3 and took place in 1997 at a nuclear fuel reprocessing plant, also in Tokaimura. The 1979 Three Mile Island accident in the United States was a level 5, and the 1986 Chernobyl accident reached level 7.

The Tokaimura disaster has raised questions about the failure of the nuclear accident system and problems in countermeasures and crisis management to deal with disasters. In June 2000, Japan's Special Measures Law for Nuclear Accidents took effect, which requires the government to conduct a comprehensive drill every year. As Japan depends more and more on nuclear power for electricity, reforms of the nuclear safety policy are being considered.

TOKUGAWA PERIOD The Tokugawa period, also referred to as the Edo period, is typically dated from 1600, the year of the military victory of Tokugawa Ieyasu (1543–1616) at Sekigahara, to the Meiji Restoration in 1868. This period saw Japan move from a country divided by civil war to a unified, stable, and mature state. Ieyasu established central authority over the country through the Tokugawa *bakufu* (shogunate) in Edo (present-day Tokyo). Regional authority was maintained by more than 250 daimyo (military chieftains) who governed their *han* (domains) with considerable autonomy. Society was divided into four distinct classes: warriors, peasants, artisans, and merchants, and the government maintained tight restrictions on all of them. Urbanization spread rapidly in the period, creating profound economic, cultural, and social changes.

Tokugawa Political and Social Control

The Tokugawa *bakufu* grew out of Tokugawa Ieyasu's experience with clan government during his time as daimyo, before his victory at Sekigahara. In 1603, after being appointed shogun by the emperor, Ieyasu began staffing the *bakufu* with his loyal retainers.

Ieyasu maintained firm control over the daimyo by redistributing land confiscated because of his victory at Sekigahara. Domains totaling about one-fourth of all land came to be ruled directly by the Tokugawa family and its vassals; the remaining territory was divided among the daimyo. The daimyo were categorized as *fudai*, longtime loyal vassals who were given strategically important lands; *shimpan*, collateral daimyo from lineages related to the Tokugawa; and

tozama, outside lords who joined Ieyasu either shortly before or after Sekigahara and who remained potential rivals.

The *bakuban* (a combination of the *bakufu* and *han*) system of government begun by Ieyasu was, for all practical purposes, completed by the time of the third shogun, Tokugawa Iemitsu (1604–1651). In the 1630s and 1640s, in order to provide an increased sense of legitimacy and bureaucratic professionalism among samurai office holders, *bakufu* offices such as the *roju* (senior councilors), *wakadoshiyori* (junior councilors), *hyojosho* (judicial council), *sojaban* (master of shogunal ceremony), *tairo* (great councilor), *ometsuke* (inspector general), *jisha bugyo* (temple and shrine commissioner), *kanjo bugyo* (finance commissioner), and *machi bugyo* (town commissioners) were established.

Bakufu control over the daimyo was also securely in place by Iemitsu's reign. While in theory the daimyo remained autonomous rulers of their domains, in practice the *bakufu* dictated general rules of conduct and placed restrictions on personal freedom of action. For example, daimyo were not allowed to marry or repair castles in their domains without shogunal permission. They could also be shifted from one domain to another or deprived of their domains entirely. The most important control measure was the *sankin kotai* (alternate attendance) system, which required that the daimyo spend alternate years in attendance at the shogunal court in Edo and leave their wives and children behind whenever they returned to their domains.

Tokugawa control over the peasantry was also strengthened under the first three shoguns. Villages inhabited primarily by *hyakusho* (small taxpaying farmers) served as the basic unit of control in the countryside. Although villagers, led by a *nanushi* or *shoya* (headman), administered their own affairs, they were required to form *gonin-gumi* (neighborhood associations) to foster mutual assistance and responsibility regarding issues such as taxation and law enforcement. Villagers were also prohibited from changing occupations or selling their land, and restrictions were placed on what they could wear and eat.

Using neo-Confucian principles borrowed from China, Tokugawa leaders saw Japanese society as divided into four classes, with the samurai on top, followed by the peasants, artisans, and merchants. In practice, there was little distinction between the last two groups, who were generally collectively referred to as townspeople. Living outside this hierarchical scheme were outcasts called *eta* and *hinin*.

The samurai lived primarily in Edo and other castle towns and were restricted to military and government service. The peasants, who made up 80 percent of the population, lived in villages at night and cultivated their fields by day. The townspeople usually resided in designated sections of urban areas and served the needs of the samurai. Over time, these social divisions became blurred, as some townspeople and rural landlords became extremely wealthy, and certain lower-level samurai and tenant farmers faced poverty, but the legal boundaries between the classes never disappeared.

Tokugawa Policies on Trade and Christianity

As the Tokugawa political and social structures were becoming formalized, the *bakufu* also developed strict control measures regarding foreign trade and Christianity, culminating in the national-seclusion policies of the 1630s. From the earliest days, Ieyasu had attempted to control the foreign trade of the Portuguese and Spanish at Nagasaki through the *shuinsen* (vermilion seal) ship policy, which officially sanctioned vessels to trade abroad, and the *itowappu* (raw-silk monopoly) system, which granted designated Japanese merchants the exclusive right to purchase, distribute, and negotiate the price of raw silk brought into Japan by Portuguese ships.

The 1600 shipwreck at Kyushu of a Dutch ship with an English pilot aboard afforded Ieyasu another opportunity to wrest control away from the Portuguese and Spanish, who had monopolized trade and tied it to the proselytizing efforts of Catholic missionaries.

Ieyasu offered both the Dutch and English an opportunity to trade in Japan. The Dutch accepted his invitation in 1609, and the English followed four years later. Both traded out of the island of Hirado, while the Portuguese and Spanish remained at Nagasaki. The nonproselytizing Dutch and English Protestant traders gave Ieyasu exactly what he desired—foreign trade without a Christian missionary presence.

With alternatives to Portuguese and Spanish foreign trade now available, Ieyasu issued a nationwide ban on Christianity in 1614. Soon thereafter, prominent Japanese and Western Christians were deported; those Western missionaries who did stay went underground with their beliefs. The second and third shoguns stepped up efforts to eradicate Christianity in Japan, first through a series of executions and later through torture-induced recantations.

In 1622, the Spanish were expelled for continued proselytizing. The following year the English departed of their own accord after a series of financial losses. This left the Dutch at Hirado and the Portuguese in Nagasaki as the only remaining Western traders in Japan.

In the 1630s, the *bakufu* promulgated a series of edicts that became the basis for what is known as Japan's *sakoku* (national seclusion) policy regarding foreign trade and Christianity. By these edicts, the *bakufu* prohibited all ships and Japanese subjects from leaving Japan for a foreign country; those Japanese already abroad could not return. In addition, the Japanese wives and children of foreigners were deported. Other measures called for payments to Japanese who turned in Christians to the government and strict inspection of foreign ships in search of Christians and Christian materials. In 1639, in the aftermath of the Shimabara Rebellion, another edict was issued banning the Portuguese from Japan.

A statue of Tokugawa Ieyasu, the first Tokugawa shogun, at Nikko National Park. (RIC ERGENBRIGHT/CORBIS)

SHRINES OF NIKKO— WORLD HERITAGE SITE

Designated as a World Heritage Site in 1999, the Nikko shrines are a vivid reminder of the incredible craftsmanship of the Tokugawa period in Japan. The shrines are perfectly blended with the breathtaking natural beauty of the area.

Over the next few years, the *bakufu* implemented additional Christian control measures, including the establishment of religious census registers, temple registration, oaths of apostasy, *fumi-e* (requiring suspects to trample on Christian images to prove they were not Christians), and the office of religious investigation. While failing to eradicate Christian beliefs completely among the Japanese populace, the *bakufu* did manage to drive the religion so far underground that it would not reappear publicly until the mid-nineteenth century.

In 1641, the Dutch were transferred from Hirado to the man-made island of Dejima in Nagasaki Harbor. From this time on, Japanese foreign trade was conducted only with the Chinese and Dutch at Nagasaki and with the Chinese and Koreans through the Ryukyus and Tsushima.

Economic and Cultural Developments

An unexpected development in the transformation of the samurai from rural warriors to civil bureaucrats living in castle towns was the rapid urbanization of Tokugawa Japan. Edo grew to a population of 1 million people, while Kyoto and Osaka had about 300,000, and even domain castle towns recorded more than 50,000 residents. Trade in silk, cotton, paper, porcelain, and sake made some merchants rich, and they, in turn, came to support a vibrant urban culture of artists and entertainers.

Urban culture flourished in the forms of literature, theater, and painting. Ihara Saikaku (1642–1693) wrote popular prose fiction about love and money among the townspeople, and the traveling poet, Matsuo Basho (1644–1694), adopted haiku as his principal medium of expression. Chikamatsu Monzaemon (1653–1724) wrote plays about townspeople and their conflicts between duty and human emotion for both the *yorui* (puppet) and Kabuki theaters. While a number of painting schools flourished in the Tokugawa period, the one that best represented the new urban culture was ukiyo-e (literally, "pictures of the floating

world"). This school of woodblock printmaking was begun by Hishikawa Moronobu (1618–c. 1694) in the seventeenth century, and it peaked in the eighteenth and nineteenth centuries under Kitagawa Utamaro (1753–1806), Katsuhika Hokusai (1760–1849), and Ando Hiroshige (1797–1858).

Although the samurai enjoyed the cultural prosperity of the cities, many were unable to keep pace with the expanding urban economy, since their primary source of income was a fixed stipend tied to rural production. The *bakufu* made a number of unsuccessful attempts at neo-Confucian-inspired fiscal reform in the eighteenth and nineteenth centuries (the Kyōho, Kansei, and Tempo reforms), but the economic status of the samurai continued to deteriorate.

Urbanization affected the life of people in the countryside as well. The needs of urban markets turned traditionally subsistence peasants into commercial farmers, a few of whom became large landowners, while the majority fell to the status of landless laborers. Tax evasion and peasant rebellions became more and more common as the Tokugawa period evolved.

Intellectual Trends

In the Tokugawa period, the orthodox school of thought was *shushigaku* (Zhu Xi neo-Confucianism), which stressed loyalty, hierarchy, and stability. The official *bakufu*-sponsored school of neo-Confucianism was begun by Hayashi Razan (1583–1657), a trusted adviser of Tokugawa Ieyasu. A contending school of neo-Confucianism was *oyomei* (Wang Yangming), which was founded by Nakae Toju (1608–1648).

Outside neo-Confucianism were schools such as *kogaku* (Ancient Learning), which advocated returning to the original works of Confucius and his immediate disciples. Famous members of this school included Yamaga Soko (1622–1685), Ito Jinsai (1627–1705), and Ogyu Sorai (1666–1728). *Kokugaku* (National Learning) rejected Confucian ethics and searched for meaning in traditional Shinto texts. Its leading advocates were Motoori Norinaga (1730–1801) and Hirata Atsutane (1776–1843). *Rangaku* (Western Learning) explored Western science and mathematics after the shogun lifted the ban on the importation of Western books in 1720. Honda Toshiaki (1744–1821) was a leading scholar of this school.

The Downfall of the *Bakufu*

By the mid-nineteenth century, rising prices, peasant uprisings, samurai unrest, natural disasters, and famine provided formidable obstacles to effective *bakufu* rule. Exacerbating the situation was poor *bakufu*

leadership, which by this time had come to be dominated by senior councilors. Added to these troubling domestic developments was the growing threat of encroachment from the West.

In 1853 and 1854, Commodore Matthew Perry led American naval expeditions to Japan and demanded that the *bakufu* grant the United States trading and diplomatic rights in the country. The weakened bureaucracy had no choice but to agree, a fact that greatly angered some of the samurai, especially those from southern and western Japan. When *bakufu* leaders signed commercial treaties with the West in 1858, and foreign merchants, missionaries, sailors, and government officials began to pour into designated Japanese ports, the situation worsened. By the 1860s, many in Japan were demanding the dissolution of the *bakufu* and the restoration of imperial rule to unify the country and resolve the crisis. With forces from the powerful *tozama* domains of Satsuma and Choshu leading the way, the last Tokugawa shogun was overthrown in late 1867, and early the following year, in what is known as the Meiji Restoration, a new government was established.

TOKUSHIMA (2002 est. pop. 823,000). Tokushima Prefecture is situated in the eastern region of Japan's island of Shikoku, where it occupies an area of 4,146 square kilometers. Tokushima's primary geographic character is a generally mountainous terrain intersected by plains along the rivers Yoshinogawa and Nakagawa. The prefecture is bordered by the Inland Sea, the Kii Channel and the Pacific Ocean, and by Kawaga, Kochi, and Ehime prefectures. Once known as Awa Province, Tokushima assumed its present name and borders in 1880.

The prefecture's capital is Tokushima city, situated along the island's longest river, Yoshinogawa. During

the Edo period (1600/1603–1868), it was the castle town of the Hachisuka family, who completed their fortress in 1586. Under their rule, the town flourished as a port for the export of indigo dye. Following legislation enacted to promote industry in remote regions, Tokushima was declared a New Industrial City in 1964. In the early 2000s, it is the site of chemical, textile, lumber, furniture, paper, and foodstuff processing industries. The prefecture's other important cities are Naruto and Anan.

Tokushima Prefecture remains primarily a rural region. Indigo plants are still grown, and tobacco and salt are produced. The leading crops are rice, fruits, vegetables, and mulberry trees. Fishing and forestry remain important activities in the south. Visitors are drawn to Tokushima city's August dance festival (Awa Odori) and to the Naruto whirlpools and coastal scenery in the Inland Sea National Park.

TOKYO (2002 est. city pop. 8.2 million). Tokyo is the capital of Japan, and the nation's commercial and industrial center. Situated on Tokyo Bay along the Pacific coast of central Honshu Island, the city proper comprises twenty-three urban wards. The wider metropolitan area (consolidated in 1943 as Tokyo-to, or Tokyo Metropolitan Prefecture) includes twenty-seven smaller cities, one county, and four island administrative units with numerous towns and villages, all occupying an area of 2,168 square kilometers. The metropolitan prefecture has an estimated population of 11.8 million (2002 estimate).

Its site has a long history of habitation, as proven by excavated artifacts from the Jomon (10,000 BCE–300 BCE), Yayoi (300 BCE–300 CE), and Kofun (300–700) periods. In the seventh century, the area was made part of Musashi Province. Its official founding date is 1457, when warlord Ota Dokan erected a castle overlooking the centuries-old fishing village of Edo (the name means "river gate"), located near the mouth of the Sumida River and bordering the fertile Kanto Plain.

In 1590, national unifier Toyotomi Hideyoshi (1537–1598) sent his ally and rival Tokugawa Ieyasu (1543–1616) off to rule Edo. After Hideyoshi's death, Ieyasu completed Japan's unification and in 1603 founded the Tokugawa shogunate in Edo. On the ruins of the first castle, he constructed his own fortress;

Tokyo is known for its dense population and crowded streets, such as this street filled with shoppers in August 1991. (CATHERINE KARNOW/CORBIS)

it burned in 1647. Edo suffered more than ninety serious fires over the next centuries. The town which grew up around the castle consisted of the so-called High City (Yamanote) of samurai residences and the Low City (Shitamachi) of workshops, markets, theaters, bathhouses, and commoners's homes on the northwestern marshlands. Artisans, merchants, and peasants flooded into Shitamachi to work in an Edo swelled by the 1635 directive that the nation's some 300 feudal lords establish residences there. A city of canals and the terminus of five great highways, Edo in 1720 had a population of over a million, making it the world's most populous city at that time.

The unexpected 1853 arrival of American ships, followed by the devastating 1855 Ansei earthquake, helped to destabilize the shogunate. In 1868 Edo was renamed Tokyo (the name means "eastern capital") and the Emperor Meiji arrived from Kyoto to take up residence in Edo Castle, rebuilt as the Imperial Palace. Over the following decades Tokyo underwent rapid

modernization and intense growth. The 1923 earthquake almost completely destroyed it; by 1930 it had risen again.

The World War II bombing raids once again leveled the city; the war was followed by some seven years of Allied occupation, administered from Tokyo. The economic recovery of the 1950s and 1960s paved the way for the city to host the 1964 Olympic Games and led to a new spurt of construction. The ever-increasing land prices and housing shortages were addressed by a program to create a series of urban subcenters, contributing to the labyrinthine conglomeration of self-contained neighborhoods, retail hubs, and satellite towns that Tokyo is today. Increasing pollution forced large manufacturers to relocate to outlying districts and onto land reclaimed from Tokyo Bay.

Today Tokyo is the nation's center for air and rail travel, government offices, financial institutions, corporate headquarters, mass media, the arts, and higher education (with some 185 colleges and universities). Chief among its numerous attractions are the historic Imperial Palace grounds, Ueno Park with its zoo and many museums, and the Meiji and Yasukuni shrine complexes.

TONGHAK Tonghak (Eastern Learning) is the oldest indigenous organized religion in Korea. Founded in 1860 by Ch'oe Che-u (1824–1864), by the end of the nineteenth century it had attracted enough followers to pose a serious threat to the Choson dynasty (1392–1910), which had ruled Korea since the late fourteenth century. In the first half of the twentieth century, under the name Ch'ondogyo (the Religion of the Heavenly Way), it was a major contributor to nationalistic resistance against Japanese colonial rule. In recent decades in South Korea, it has retreated from political activism, returning to its purely religious

roots. In North Korea, however, a Ch'ondogyo-centered political party is a nominal junior partner to the ruling Communist Workers' Party.

The Origins of Tonghak

As its name reveals, Eastern Learning appeared in Korea in response to the penetration of Western Learning, a premodern Korean term for Catholicism. Though there were only about 20,000 Catholics in Korea in the mid-nineteenth century, Ch'oe knew that China had recently suffered its second major military defeat in three decades at the hands of Europeans, whom he identified with Catholicism. This frightened him, since China was for him, as it was for most Koreans at that time, the font of those values and moral principles that defined civilized society. He therefore began preaching Eastern Learning to counter the destabilizing and immoral effects of Western Learning.

In his attempt to defend traditional beliefs and values, Ch'oe created a new form of Korean religion. Drawing on Confucianism for his ethical principles and on Korea's folk religion for his rituals, Ch'oe added two elements borrowed from the Catholicism he was fighting against: a focus on one God, and the notion that those who shared belief in that one God constituted a separate and distinct community within Korean society.

Ch'oe's monotheism alarmed the Korean government, especially since one of the terms he used for God, the Lord of Heaven, was the same term the outlawed Catholics used for God. Since Korea's small Catholic community had insisted that loyalty to their God superseded loyalty to the king, Ch'oe's use of Catholic theological terminology made him appear subversive, as did the formation, without government authorization or oversight, of a community of Tonghak believers.

That subversive potential seemed to be realized in 1862 when there were outbreaks of antigovernment violence across the southern third of the Korean peninsula. These antigovernment protests were fueled by anger at government corruption and excessive taxation and had no connection with the infant Tonghak religion. Nevertheless, the government assumed the attacks on its authority were the result of peasants becoming emboldened by Ch'oe's claim that his Lord of Heaven was superior to any king. Ch'oe was arrested and hanged in 1864 for spreading doctrines that undermined the authority of the state.

Ch'oe's death did not end the faith in his teachings. Instead, after his death, a distant relative who was also one of his earliest converts, Ch'oe Shi-hyong (1827–

1898), succeeded him as head of the Tonghak community. The second patriarch systematized Tonghak thought by collecting Ch'oe Che-u's essays and poems and publishing them as Tonghak scripture. He also organized the Tonghak community into a nationwide underground hierarchical network, linking individual believers in their villages through their district head to regional and national leaders.

As the Tonghak community grew not only larger but also more organized and more conscious of its identity as a distinct community within Korean society, it began demanding that the government recognize it as a legitimate organization, starting with a retraction of the 1864 condemnation of Ch'oe and his ideas. Tonghak demands for an end to government persecution grew louder after a treaty between Korea and France in 1886 gave Catholics, but not Tonghak followers, the freedom to practice their religion openly. Starting in November 1892, large groups of Tonghak believers began gathering near government offices in the countryside to call for the exoneration of their founder and an end to attacks by government officials on their community.

The Tonghak Peasant Rebellion

This religious protest was overshadowed by a peasant rebellion that broke out in 1894. It was led by a local Tonghak leader, Chon Pong-jun (1854–1895), who used the Tonghak underground network to mobilize peasants throughout southern Korea for attacks on local government offices. That network helped the peasant rebellion spread rapidly and become the largest peasant uprising Korea had ever seen, strong enough to seize control of Chonju, the capital of the southwestern province of Cholla, less than two months after the rebellion began.

Chon's rebellion had not been organized or even authorized by the second patriarch. In fact, Ch'oe Shi-hyong was at first opposed to the use of the Tonghak name and organization in armed rebellion. Tonghak doctrine, however, included the assertion that Korea was on the verge of a revolutionary transformation into a utopian community. This millenarian strain in Tonghak thought made many followers receptive to rebellion. Not only had Chon utilized the underground organization Tonghak had built, some Tonghak doctrines, such as Ch'oe Che-u's proclamation that humanity was on the verge of a Great Transformation, appeared on banners carried by the rebels. Thus this rebellion is often called the Tonghak Revolution.

That appellation, however inaccurate it may have been in the early stages, gained credibility in October

1894 when the second patriarch declared that the rebellion was just and that Tonghak believers should participate in it. Ch'oe Shi-hyong's decision to join forces with Chon Pong-jun was a tactical error. Chon's rebel army was annihilated by a joint Japanese-Korean force before the year was out. Chon was quickly captured and executed. Ch'oe went into hiding, but within four years he too was captured and executed.

The defeat of the Tonghak Revolution and the execution of the second patriarch did not mean the end of the Tonghak religion. Before Ch'oe was captured, he passed the torch of Tonghak leadership to Son Pyong-hui (1861–1921), revered today as the third patriarch.

From Tonghak to Ch'ondogyo

In 1905, Son, who had fled from Korea in 1901, returned when he discovered that the government had grown too preoccupied with Japanese threats to Korean sovereignty to pay much attention to him and his followers. In a successful effort to distance his followers in 1905 from the rebels of 1894, he dropped the name Tonghak and proclaimed himself leader of a new religious organization he called Ch'ondogyo. It is as the Religion of the Heavenly Way that Tonghak has survived into the twenty-first century. Under Son's guidance, the Religion of the Heavenly Way began to operate openly as a mainstream religious organization, opening worship halls and holding regular worship services. Nevertheless, it retained a revolutionary potential because of the challenge its doctrines posed to inequality in society. Ch'oe Che-u had called for men and women to serve God. Ch'oe Shi-hyong added that just as people should respect God, they should also respect their fellow human beings. Son Pyong-hui further amplified that statement with the phrase "God dwells within each and every human being," which has become a core tenet of Ch'ondogyo doctrine.

Because of their belief that all human beings deserve respect, followers of Ch'ondogyo resisted Japanese colonial rule over Korea. Son Pyong-hui was one of the chief architects of the 1 March 1919 declaration of independence from Japanese rule, which resulted in nationwide protests.

After liberation from Japanese rule in 1945, Korea was divided into a Communist zone in the north and a non-Communist zone in the south. Political activists among Ch'ondogyo members gravitated toward the north, where the Ch'ondogyo Young Friends Party was officially recognized as a junior partner within a united front dominated by the Workers' Party.

Perhaps because of the taint of collaboration with Communists in the North, Ch'ondogyo has not been able to play any significant political role in South Korea. It survives in the Republic of Korea today as a small religious organization claiming around 1 million members and slightly less than 300 worship halls.

TONKIN GULF The Tonkin Gulf is connected to the Pacific Ocean at the northwest arm of the South China Sea. The gulf is 500 kilometers long, 250 kilometers wide, and 70 meters deep at its deepest point. It borders northern Vietnam to the west, Hainan Island to the east, and China to the north and east, and receives the Red River out of northern Vietnam. The main ports on the gulf include Ben Thuy and Haiphong in northern Vietnam and Pei-hai (Pakhoi) in China. The gulf's main shipping route is through the Hainan Strait, between China and Hainan Island.

The Gulf of Tonkin is probably best known in recent history as the site of the so-called Gulf of Tonkin Incidents, when in August 1964, torpedo boats of the Democratic Republic of Vietnam (DRV) fired on U.S. naval forces that were in the area in an intelligence-gathering operation. The incidents resulted in the U.S. Congress's adopting the Gulf of Tonkin Resolution on 7 August 1964; this resolution supported an increase in American involvement in the Vietnam War. Naval activity in the gulf was heavy during the war; Soviet ships ferried supplies to the DRV, and the United States sought to interdict the activity, particularly in 1972, when the U.S. Navy mined the entrances to North Vietnamese ports.

TONLE SAP Cambodia's Tonle Sap, or "Great Lake," is one of the unique geographical wonders of the world. Southeast Asia's largest freshwater lake, Tonle Sap is located in the center of the Cambodian Basin, a low-lying area of land only 30 to 100 meters above sea level. Bounded by the Dangrek Mountains, a steep escarpment on the edge of the Khorat Plateau to the north, and the Chuor Phnom Kravanh (Cardamom range) to the south, the Tonle Sap Basin extends west to the border with Thailand.

Connected to the Mekong River by the Tonle Sap River, the lake is part of a unique hydrological phenomenon unknown in any other part of the world: during the monsoon, or rainy season, the enormous amount of rain causes the Mekong to rise so much that the Tonle Sap River can no longer empty into it. Instead, the two rivers reverse course, and the Tonle Sap River then flows north into the lake, causing it to triple in size from 27,000 hectares during the dry season to more than 150,000 hectares during the rainy season. Flooding almost one-seventh of Cambodia, the rise in water levels provides irrigation for crops and an abundance of freshwater fish (the largest source of protein for the Khmer people), while the deposition of silt created by the river's reversal enriches the agricultural soils surrounding the lake. As a result, an estimated 75 percent of the total land area surrounding Tonle Sap—approximately 100,000 hectares—is fertile lowland.

However, there are critical concerns over the increasing environmental degradation caused mainly by

human activities. Further economic development, in addition to the lack of effective policies to manage and protect the watershed, poses significant threats to the Tonle Sap ecosystem in the future. The Tonle Sap Biosphere Reserve, officially recognized by the United Nations Educational, Scientific, and Cultural Organization (UNESCO) on 28 October 1997, is the first step in addressing these issues at local, national, and international levels.

TOTTORI (2002 est. pop. 611,000). Tottori Prefecture, situated in the western region of Japan's island of Honshu, occupies an area of 3,494 square kilometers. Its primary geographical features are the Chugoku Mountains, south of a coastal plain. Tottori is bordered by the Sea of Japan and by Hyogo, Okayama, Hiroshima, and Shimane prefectures. Once divided into Inaba and Hoki provinces, it assumed its present name and borders in 1881.

The prefecture's capital is Tottori city, which grew up as a castle town around the seventeenth-century Ikeda family fortress. Devastated by a 1943 earthquake and a 1952 fire, the city has been totally reconstructed. Today it is home to food processing, woodworking, electrical appliance, and machinery plants, as well as Tottori University. The prefecture's other important cities are Kurayoshi and Yonago.

The prefecture is archaeologically rich, with artifacts excavated from the Jomon (10,000–300 BCE) and Yayoi (300 BCE–300 CE) periods and has numerous tomb mounds from the Kofun period (300–710) scattered across the Tottori Plain. The region was controlled by a series of feudal lords through the Edo period (1600/1603–1868).

Today the region remains primarily rural, raising rice, tobacco, vegetables, livestock, and fruit, especially pears. Also important are forestry and fishing. Visitors are drawn to the Tottori Sand Dunes and to Daisen-Oki National Park.

TOURISM Asia is one of the major destination areas for today's international tourists; as home to the majority of human beings alive today, Asia accommodates the largest flows of domestic or internal tourism. East and Southeast Asia, with more than 97 million international tourists in 1999, received 14.6 percent of the world's international tourists (11.1 percent more than 1998). South Asia, with almost 6 million international tourists in 1999, received about 1 percent (and 8.3 percent more than 1998). These gross figures mask regional differences and annual fluctuations. Even the definitions are problematic: various authorities subdivide the continent differently. For instance, if Iran is included in South Asia, tourism figures are much higher than if it is omitted.

Domestic Tourism

In the largest Asian countries domestic tourism outstrips international tourism. For instance Japan has over 300 million annual tourist (overnight) trips, whereas fewer than 4.5 million international tourists visit Japan yearly. Domestic tourism in the major Asian nations has long been based on pilgrimages, most of which continue today, along with conventional Western-style cultural and environmental tourism. As in Europe, it is difficult to differentiate between pilgrims and religious tourists converging on a historical site.

South Asia In India Hindus were expected to visit sacred sites, including some now in Pakistan, Bangladesh, and Nepal. There are also Buddhist, Sikh, and Muslim sites in the same region; for all Muslims the international pilgrimage to Mecca (the hajj) is a lifetime goal. Many local shrines once operated syncretistically, as foci of worship for Hindus as well as Muslims; this is rarely the case today.

During the Raj, the period of British rule over the Indian subcontinent, nontraditional appreciation for historical, cultural, and natural sites of India was encouraged by institutions such as the Archaeological Survey and the Monuments Commission, and by the development of transportation in the country. The British not only visited historical sites such as the Taj Mahal; they established seasonal resorts in cool mountainous areas such as Simla, Darjeeling, and Pune (Poona). These resorts also attracted wealthy Indians and are still favored destinations.

After independence in 1947, Indians adopted the secular tourism of British and other foreigners. Under the Raj the Indian government provided employees and their families with the LTC (Leave Travel Concession), which covered second-class train fare for internal travel every three years. Many people used the LTC to visit relatives or tourist sites, often combining the two. After 1947 the internal travel promoted by the LTC continued, and some destinations previously exclusively religious (like the Himalayan shrines of Badrinath and Kedarnath) assumed a secular dimension. Increasingly, young, well-educated Indians (and to a lesser extent natives of Pakistan, Bangladesh, and Nepal) share the secular tourist experiences of international visitors. These include not only cultural and historical tourism but also ecotourism (travel focused on environmental concerns) and trekking as well as recreational tourism to beach and mountain resorts, major cities, and theme parks.

Southeast Asia The nations of Southeast Asia exhibit the same patterns of modern domestic tourism, interest in historical and national sites, recreational and

TOUR GUIDES IN CHINA

The Importance of Living—by Li Yutang, a popular author in pre–World War II China—aimed to give American readers a cosmopolitan glimpse at life in the Far East in the 1930s. In the extract below, Li Yutang explains the peculiar charms of Chinese tour guides.

Chinese tourists suffer like American tourists at Radio City, with the difference that Chinese guides are not professional, but are fruit-sellers, donkey drivers and peasant boys, whose information is less correct, if their personalities more lively. Visiting Huch'iu Hill at Soochow one day, I came back with a terrible confusion of historical dates and sequence, for the awe-inspiring bridge suspended fifty feet over the Sword Pond, with two round holes in the slabs of the bridge through which a sword had flown up as a dragon, and became, according to my orange-selling boy, the place where the ancient beauty Hsishih attended to her morning toilet! (Hsishih's "dressing table" was actually about ten miles away from the place.) All he wanted was to sell me some oranges. But then I had a chance at seeing how folklore was changed and modified and "metamorphosed."

Source: Lin Yutang. (1938) *The Importance of Living: A Personal Guide to Enjoyment*. New York: Reynal & Hitchcock, Inc., 329.

amusement-park tourism, and, increasingly, ecotourism, as does India. Before the dominance of Islam in Java, thousands of pilgrims from as far away as mainland Asia visited great Buddhist centers such as the thousand-year-old Borobudur. These sites fell into disuse but re-emerged in the nineteenth century as targets of secular tourism for Dutch colonists and visiting Europeans. These Javanese sites were incorporated into the international panoply of UNESCO's World Heritage Sites, and Indonesians now visit them in the same secular spirit as foreigners. All over Southeast Asia modern tourism has emerged, originating in imitation of former colonists or (in the case of Thailand) other foreigners. In Vietnam, Cambodia, and Laos, old patterns of internal travel are combined with or superseded by secular visits to places like Angkor Wat, where pre–Vietnam War colonizers visited, and where modern Cambodian tourists are joined by the ever-increasing numbers of postwar foreign tourists. In Indonesia religious tourism is now dominated by the Islamic hajj to Mecca; most domestic travel is secular. The same is true of Malaysia; its more than 25 million domestic tourist trips a year focus on hill resorts such as Cameron Highlands, beach areas such as Penang Island, and natural and historical sites, com-

bined in the instance of the Batu caves near Kuala Lumpur.

East Asia Because of the strong shared cultural and, in part, political background between the nations of East Asia, tourism here differs somewhat from tourism in the rest of the world, and especially from the Euro-American tourist system.

Japan Contemporary Japanese domestic tourism still includes traditional group pilgrimages, for instance, around Shikoku Island or to centers such as the Eiheiji Zen temple complex, the Ise Shinto grand shrine, and the many sect headquarters in Kyoto. For decades such group tourism, using public transportation, also swamped famous cultural and historical sites, especially in big cities such as Kyoto, Tokyo, and Osaka, but also in outlying places such as Kamakura, Himeji Castle, and the ancient capital of Nara. Even in the premodern period, Japanese tourists, on foot, ostensibly for health or religious purposes, numbered in the tens of millions a year.

The last two decades of the twentieth century saw a transformation of Japanese domestic tourism, partly

because of the rise in ownership of personal automobiles and a massive road-building program of inter-city expressways, tunnels, and bridges, with other roads extending to the 70 percent of Japan that is mountainous. Increased vacation time promoted the nuclear family as the unit of recreation.

Peer-group tourism, starting as day trips for preschool students and then in the form of school, club, and sports groups, continues in the adult world of work-party, union, or farmer-group tourism. These groups visit local attractions such as hot springs, travel to Hong Kong for shopping and almost anywhere for golf, and visit other Asian destinations for disguised sex tourism.

New forms of rural recreation, such as fishing, boating, camping, golf, and skiing, attract millions from crowded cities in all seasons. The government has encouraged nostalgia for the countryside, natural hot springs, organic foods, and village life to counter the flow of urbanization. The national railways and major travel companies cooperated in a (Re-)Discover Japan campaign in the 1970s and an Exotic Japan campaign of the 1980s, signaling that many urbanites were unfamiliar with hinterland Japan and were ignorant of unique regional festivals and customs.

China Domestic tourism in China was traditionally the province of priests and literati, or educated people; most ordinary Chinese could visit only local nat-

ural or historical sites. After 1949 travel was restricted except for military and party members, and many local tourist attractions were destroyed as signs of superstition. Indeed one motivation to become a Red Guard in the 1960s was the freedom to commandeer trains and travel all over China in the name of Mao's Cultural Revolution.

The overthrow of the Gang of Four in 1978 gave Chinese people more leisure time to spend in recreation and travel. Most recreation, however, is still local, limited to short holidays and concentrated in activities and areas that rarely compete for the spaces and infrastructure required by foreign tourists.

Nevertheless powerful forces impel Chinese people to travel further. Centripetal travel, until recently opposed and controlled by the central government, is symbolically equated with power and wealth in post-Mao China. These movements flow from the hinterlands to the metropolitan centers, for both tourism (where they compete with foreign tourists) and for work. They combine business with pleasure, a feature long characteristic of Chinese (and Japanese) tourism, even for Red Guards in the Cultural Revolution.

A centrifugal motivation for modern internal tourism is not spatial but temporal, the nostalgic desire to escape the here and now for the historical, cultural, and natural past. Though Westerners may be motivated to see the traditional China of *The Last Em-*

Chinese tourists taking photographs in Leshan, Sichuan, China, in May 1996. (STEPHEN G. DONALDSON PHOTOGRAPHY)

WHY DO THEY CLIMB?

It is often not apparent to people who live in tourist destinations why tourists like to come there. This certainly seems to be the case with the Sherpas of Nepal in the Himalayas.

Sherpas are generally mystified that Westerners come to Khumbu at such great expense and in such great numbers, whether to trek or to climb. Even the most experienced *sardars* admit they cannot fathom why Europeans climb, although they make guesses. One hunch is that they climb for fame, since the books they write always include plenty of pictures of themselves. But Sherpas also know that books are bought, so a second hypothesis is that people climb to make money. One *sardar*, for example, thought this was the case with the British mountaineer Chris Bonnington since he has written (and presumably sold) so many books; but the same *sardar* believed that fame drives Reinhold Messner (the first climber to ascend all fourteen 8,000-meter peaks) to the summits. Another *sardar* wondered whether science was not the prime motivation, while still another held that climbers climb to clear their minds from the worries of office work. If he were an office worker, he said, he might well need to clear his mind too, but if so he would do it by going on a weekend picnic rather than by climbing.

peror, the Chinese populace feels nostalgic, not for a return to a past way of life, but for experiences of the past that lend rootedness and stability to their present lives. This nostalgia encompasses local attractions in the countryside, old neighborhoods in cities, "lineage tourism," in which city dwellers visit ancestral home communities, and "heritage tourism," in which, for example, affluent urbanites of Hong Kong who could not visit their own home villages adopted the nearby Ping Shan walled community.

Urban Chinese seek out proximity to or images of nature. Of China's 1.2 billion citizens, 70 million are members of one of fifty-five minority nationalities, many of whom are concentrated in the southern province of Yunnan. The *minzu*, the people of nature, have inhabited the consciousness of the Han-Chinese majority for centuries. In some Chinese regions, the minorities are represented, as in Korea and Japan, by newly created folk culture villages, which bring together typical artifacts and crafts and demonstrate peasant performances for expectant Han tourists.

Nostalgia for Maoist socialism is another complex motivation for contemporary Chinese to travel. There are tearful reunions between rural villagers and bands of urbanites who were sent to live with them in the days of the Cultural Revolution. During Mao's lifetime Red Guards and other Mao devotees made pilgrimages to Shaoshan, Mao's home village, where a lucrative tourist trade came to flourish in later years.

International Tourism

International tourism is generally considered an economic phenomenon, planned since colonial times as an export industry to bring foreign exchange into relatively poor countries. Asian nations have put forth schemes to encourage inbound tourism. At the same time, many of them have in the past strictly controlled the outflow of tourists to save precious foreign currency. Many countries reap great economic benefits from incoming tourism, especially China, Hong Kong, Macao, Malaysia, Thailand, and Myanmar (Burma). For Nepal and the Maldives tourism is the most important

export industry. As hard currency is desired, the countries targeted by advertising are European, North American, and Australasian, and, within Asia, Singapore and East Asia. Major extravaganzas, such as Olympic Games, world's fairs, and trade shows, are planned to put a country or city "on the map."

In much of Asia, regional tourism from adjacent countries generally outstrips other forms of international tourism. International travel within Asia is sometimes almost domestic, as it is between Canada and the United States. Bhutan, India, and Nepal are a close-knit group, though none receives the majority of tourists from within the region. Singapore, Malaysia, and Indonesia form another near-domestic set. The ethnically related set of China, Hong Kong, and Macao exhibits levels of mutual tourism that, even with unreliable figures, surpasses any other international flows.

Generally the poorer Asian countries are recipients of tourists, and the wealthier countries are the donors. Bangladesh, India, and Pakistan all "export" less than 1 percent of their population a year; the Maldives, with a small but wealthy population, sends one in three of its population abroad. Laos and Vietnam export few travelers, whereas Singapore's affluent citizens average 1.5 overseas trips per capita. East Asia is generally more affluent than the rest of Asia. Though China (so far) allows less than 1 percent of people (still over 7 million) to travel abroad annually, nearby Hong Kong and Macao enjoy seven and twenty visits per capita, respectively. Japan, Taiwan, and, increasingly, Korea

all send 7 to 25 percent abroad annually, which allows for considerable growth by European standards.

Most international tourists to Asia travel from Europe, East Asia (mainly Japan), and North America (mainly the United States). Europeans dominate in Bhutan, India, Sri Lanka, and the Maldives, both in cultural and beach-tourism destinations. East Asian tourists dominate in Myanmar, a country whose dictatorial politics may well put off many Europeans and Americans. Southeast Asia is more evenly split, though Europe is nowhere ascendant over East Asia. Local Southeast Asian tourists are dominant in Laos and Indonesia, and East Asian tourists in most of the other countries. In East Asia every country is dominated by tourists from other East Asian countries. North America leads Europe in Japan, Hong Kong, Taiwan, and slightly in Korea, but not in Macao and China.

South Asia International tourism to South Asia is dominated by India with 2.4 million visitors and followed surprisingly closely by Myanmar and Iran with over 1 million each. India, Pakistan, Bangladesh, and Myanmar are all ex-British colonies. Their attractions are mostly cultural and historical and, for some, religious; India has more UNESCO Cultural World Heritage sites than any other country in the world. South Asia also attracts some of Europe's beach tourists, especially Sri Lanka, parts of India (Goa), and the Maldives.

The palaces that used to house Indian princes have increasingly become important destinations for both

domestic and foreign tourists. Many impoverished royal families strike deals with multinational hotel chains to turn their palaces into luxury tourist residences. Here tourists' main motivation is a colonial nostalgia for Europeans and local Indian allies. Another

form of tourism is youth drifter tourism, characterized by low-cost and low-tech travel such as trekking.

Nepal and other Himalayan regions have benefited from mountaineering. Nepal also developed "nature tourism" in its national parks in the lowland Terai,

where tourists follow yesterday's big game hunters in safari-like treks. Though encouraged by the Chinese for economic purposes, Tibetan tourism is a paradox; after the Chinese takeover in 1951, the Chinese suppressed the main attractions, Buddhist monks and their ancient establishments, and religious leaders and many other Tibetans fled abroad. While South Asian tourism is growing steadily, the cessation of hostilities in such areas as Kashmir, Assam, Myanmar, Afghanistan, and Sri Lanka would give travel a major boost.

Southeast Asia Most of Southeast Asia, like South Asia, emerged from a period of European colonization (Dutch, British, French, and Japanese) after World War II, and countries made tourism a major development goal. Though Thailand was never a colony, its near-colonial status as a rest-and-recuperation destination for allied troops in the Vietnam War in the 1960s contributed to its rise as a tourist destination.

Southeast Asia has perhaps the greatest range of tourist attractions in Asia. Singapore, Saigon, and Bangkok are modern urban destinations for shopping and entertainment. Yogyakarta, Hue, and Phra Nakhon Si Ayutthaya (or Ayutthaya) are ancient former capitals with famous architectural remains; Angkor Wat and Borobudur are World Heritage sites and ancient pilgrimage and temple complexes, once lost to the jungle, rediscovered and "museumized" by European interests, and now proudly reclaimed by local peoples. Beach tourism is popular on many coasts, especially in Bali, Penang, the Philippines, and both shores of central Thailand. Gambling is promoted in the Cameron Highlands of Malaysia, and there are also golf and horse racing. Southeast Asia is notorious for sex tourism. Though rare in the Islamic parts of Malaysia and Indonesia, it is infamous in Bangkok, parts of the Philippines, Vietnam, and Cambodia. Though much of the blame has fallen on locally based American troops, the traditionally patriarchal and stratified nature of these cultures also encouraged a flourishing domestic sex industry, which attracts foreign tourists.

East Asia The countries of East Asia have followed similar strategies in encouraging foreign tourists to visit, though China's pattern is somewhat divergent.

Japan After encouraging inbound tourism as part of its successful development strategies in the 1950s, Japan capped its efforts with the Olympic Games in Tokyo 1964 and the World's Fair in Osaka 1970. Both events produced massive infrastructural investment—the Bullet Train joined the cities in 1964—and attracted huge, mainly domestic, crowds. As Japan grew wealthy, her citizens traveled abroad and enriched their Asian destinations: Hong Kong and Singapore

for shopping, Okinawa (which reverted to Japan in 1972), Guam, and later Hawaii for recreational tourism. Japanese travelers are a major force in tourism to China and important visitors to Taiwan and South Korea. In the last decade of the twentieth century, the flow became two-way. While Japanese now increasingly visit mainland North America and Europe, their young people have taken up drifter tourism in Asia and the Mediterranean region.

China During the Maoist era's "state tourism," political allies were housed in friendship hotels and shown industrial and agricultural successes; routes were restricted, and services were not widespread. After 1978, overseas tourists were encouraged. So-called compatriots came from Macao, Hong Kong (and later Taiwan), Singapore, and Malaysia, along with some Westerners and Japanese. Travel and accommodations were separated, with lower rates for Chinese. Part of the strategy was to encourage Chinese overseas to visit "home." Much of the growth of tourism (and other developments) resulted from joint ventures combining overseas Chinese capital and mainland Chinese permission and labor.

Travels from world centers to China and more interestingly from Chinese metropolises outward are equally important aspects of modern tourism. From 1978 China developed a massive foreign tourist industry. The China National Tourism Administration spent over \$50 billion on tourism in 2000, and China has opened most areas to foreign tourists, particularly in the hinterlands, where visitors can see such attractions as the archaeological army in Xi'an, colorful minorities in the south, and the Silk Road through Xingjiang Uygur to the west.

Taiwan and Korea Both Taiwan and Korea followed Japan in attracting overseas tourists while developing industries and restricting outflows for economic or military reasons. Many of their tourists have been nearby Japanese and former colonists, and sex tourism disguised as *kasaeng* (geisha) tourism in Korea flourished with official tolerance until the 1980s. Both countries increased their overseas tourism; they constitute the largest numbers of tourists to Japan. Taiwanese, understandably, send even larger numbers to Hong Kong and Macao; at the end of the twentieth century their major destination became China.

Hong Kong and Macao Hong Kong and Macao, like Singapore in Southeast Asia, are highly urbanized former colonies with many attractions for shoppers, gourmets, and gamblers. Along with Chinese visitors, they enjoy a large clientele from North America and Europe and, for Hong Kong, from Japan. The coun-

POST-9/11 TOURIST SECURITY CONCERNS IN PAKISTAN

This notice posted by the Travel and Cultural Services of Pakistan indicates the concern for tourist safety following the September 11th attack on the United States in 2001 and the U.S.-led invasion of Afghanistan.

SECURITY SITUATION IN PAKISTAN

Security & safety has always been questioned and people have always had wrong ideas about the situation in Pakistan. We do believe and wish to assure all tourist in Pakistan of the following things.

1. There is no threat to lives or goods of any foreign tourist in any area of Pakistan. There are no purse snatchers as in South America or Africa. Nor there are any kind of hatreds or dis-likeness to foreign tourist in Pakistan
2. Pakistan being a Muslim country has a liberal atmosphere for women. They are free to roam any where they want but as it is demand of the Muslim society we do recommend modest dress for both men & Women. A T shirt and full pants or Skirt is fine. T shirt with half sleeves is perfect.
3. There had been some troubles lately in Karachi but all that is in a part of Karachi where there is no interest of tourist nor some

one ever needs to go or pass bye. Mind Karachi is spread in the area of 2200 Sq. Kms, Secondly Government is taking very strict measures to cut this problem.

4. The Interior of Sind is culturally very rich province and has no Problems as such . When you are there in Moen Jo Daro or any other place you are well taken care of by the friendly locals and our staff.

5. Khyber pass & other tribal areas have a system of tribal jury and sometimes there are clashes among the tribes but they can not be witnessed on the main road where Tourist travel. Yet we provide proper security guards for the tours in these tribal areas.

6. The Mountainous areas of Hunza, Gilgit, Chitral, Swat, Karakorum Highway & Skardu are very safe and there is no violence or any major trouble in these areas.

tries became SARs (Special Administrative Regions) of China in 1997 and 1999, respectively, with little interruption in their tourist flows.

Implications

International tourism is a fragile phenomenon. In Asia as elsewhere, tourism depends on absence of conflict. Diseases, civil strife, and physical disasters depress flows. During the past forty years of decolonization and tourist growth, events in Asia have stemmed the rising tides of tourism. Internal conflicts, civil wars, rioting, and unrest cause mass travel cancellations. Most dramatic was the televised clash between student demonstrators and the military in Tiananmen Square in Beijing in 1989, which reduced foreign visits to China for several years. Japanese and Western tourists reduced their numbers by nearly one million for a year

or so, and the number of Chinese compatriots visiting China dropped by seven million in one year. Hong Kong lost 38 percent of the Taiwanese tourists who normally stopped there on their way to China. Civil unrest in Sri Lanka, breaking into civil war since 1984, drastically reduced its attractiveness as a tourist destination. Interethnic clashes in Malaysia and later in Indonesia halted tourist visits for significant periods.

However, enmity and a state of war may not entirely prevent organized tourism. The South Korean Hyundai Company, which operates passenger ships, built a port in North Korea to allow nearly half a million South Koreans annually to visit Kumgang Mountain, sacred to all Koreans.

International conflicts can also bring a halt to local or national tourism, as did conflicts between India and Pakistan in Kashmir, an otherwise prime tourist

destination; between India and China at their Himalayan border; between Vietnam and Cambodia; between Thailand and Myanmar spilling over from Myanmar's civil wars; and even between China and Taiwan. Tensions in Afghanistan and Iran have sometimes halted tourism to or in these areas. China's suppression of nationalist and religious elements in Tibet at times broke into civil strife in which tourists were involved. In the last decade of the twentieth century, economic reversals in East and Southeast Asia caused a falling off in intraregional tourism. The diminished number of Japanese tourists, leaders in the region has considerably affected Hong Kong and China.

The future of outbound tourism in East Asia has growing global significance. Outbound tourism from China is expected to rise from 10 million in the year 2000 to 50 million by 2010 and 100 million by 2020, perhaps making China the leading source of tourists globally. In January 2001 China's leaders outlined a policy to encourage inbound tourism to reach 120 million by 2020 (putting China ahead of France) and to increase domestic tourism, already at 750 million annually.

At present, however, China limits outgoing tourism to fifteen approved countries, adding Taiwan in 2001; Europe and North America are not included. Only 2 percent of Chinese have passports, and there is a chronic shortage of airplanes even at present tourism levels. European analysts predict that in 2020 the countries foremost in tourism will be Germany, Japan, the United States, and China.

TOXIC-WASTE DISPOSAL The adoption of the Basel Convention on the Control of Transboundary Movements of Hazardous Wastes and their Disposal in Basel, Switzerland, on 22 March 1989 made it illegal to export toxic wastes to Antarctica. In 1994, the Basel Convention was strengthened by the "Basel ban," which made it illegal to export toxic waste from the world's richest twenty-nine countries to the world's developing nations. The Basel ban has only managed to hide and obscure toxic waste exports, however, as the demand for cheap and discreet waste disposal has exploded. Most of the 30–50 million tons of toxic waste that is shipped internationally every year is simply subcontracted out to the lowest bidder, with no questions asked about its final destination. Some 80 percent of this waste is exported from industrialized nations in East Asia, Europe, and the Americas to developing countries in Africa and Asia. Lax enforcement of local environmental law and an uneducated populace create easy dumping grounds for multinational corporations faced with rising disposal costs in their own nations.

Mislabeled or misrepresenting toxic waste is by no means an isolated incident: In March 1992 close to 1,000 metric tons of cadmium and lead-laced dust from Gaston Copper Recycling Corporation in South Carolina was sold to Stoller Chemical Company, who mixed it with fertilizer and sold to Bangladeshi farmers. The deception wasn't discovered until nearly all of the deadly mixture of carcinogenic and neurotoxic chemicals had already been used to fertilize fields.

Shipbreaking

A dramatic and very visible example of the toxic-waste trade is shipbreaking. Massive container ships from all over the world are sent to for dismantling to Gujarat, India, and to Guangzhou, China. Some rudimentary equipment and safety measures are used in China, but in India, when a decommissioned oil tanker or aged freighter is towed up onto the beach, thousands of people scramble onto the ships and rip them apart with their bare hands, with and no thought given to the deadly polyvinyl chlorides (PVCs), asbestos, and toxic marine effluents. According to Greenpeace, the incidence of cancer amongst the shipbreakers in nearly 25 percent.

In the slightly more restrained shipbreaking yards in China, analysis of sediment in the waters around the area demonstrated extremely high levels of heavy metals, hormone disrupters, dioxin-producing polychlorinated biphenyls (PCBs), and fuel oil. Chinese workers for the most part use adequate protective gear, but China's share of the world's shipbreaking is going down.

India handles nearly 70 percent of the world's shipbreaking at present, and Bangladesh and Vietnam are entering the fray in preparation for the scheduled doubling of shipping tonnage for scrap in 2005. Shipbreakers can take some comfort in that ships have been getting much safer in the past thirty years (about the average lifespan of commercial ship), so that future shipbreaking will be marginally safer. Growing awareness of the problem is also likely to initiate eventual reform, although it may take some time in India, which gets approximately 15 percent of its steel from scrapping ships.

Electronic Waste

One of the most serious toxic-waste disposal problems facing Asia is that of electronic waste—the deadly by-products of computer manufacturing and obsolescence. Some 315 million computers in the United States alone are expected to become obsolete by the year 2004, and most will end up in Asia. Computer manufacture was once considered an environmentally friendly operation, but it is gradually emerging from organizations such as California's Silicon Valley Toxic Coalition (SVTC) just how big the problem of computer waste really is.

According to the SVTC, a single cathode-ray-type monitor (the sort that looks like a television screen) is loaded with harmful elements or chemicals, including brain-damaging lead, PVCs, and brominated flame retardants that have been linked to birth defects and cancer. Unfortunately, according to the U.S. Environmental Protection Agency, it is ten times cheaper to send a computer monitor to China than it is to recycle it.

The computer itself also contains mercury, cadmium, and chromium—all poisonous. Regrettably, computers are also made with valuable metals, such as copper, that make them irresistible to uninformed and ill-prepared "dirty recycling" operations willing to accept them. The Computer Recyclers Association of the Philippines (CRAP) imports dioxin-laden Australian computer waste because of the copper it contained, without being aware of the hazards. Unfortunately, without effective international enforcement of the prohibitions against exporting toxic waste, toxic-waste trafficking is not likely to disappear.

TOY INDUSTRY—CHINA The world toy industry was a \$69.5 billion business in 2000. U.S. toy imports alone totaled \$15.1 billion, of which China supplied \$10.7 billion, or 71 percent. Back in the early 1980s, Hong Kong was the world's largest toy exporter. But labor and land became more expensive with Hong Kong's development. In 1984 the nearby special economic zone of Shenzhen, China, offering a tariff-free foreign investment zone with low-cost labor and factory space, was opened. Hong Kong toy manufacturers moved more and more production across the border. By the early 1990s, Hong Kong, Taiwan, and other Asian corporations, having obtained exclusive rights to produce toys according to the specifications established by the giant toy makers of the West and Japan, manufactured brand-name toys as well as toys under their own labels in joint ventures in China, concentrated in the southern province of Guangdong near Hong Kong. China became the world's largest toy manufacturer and leading exporter, reaching an export volume of \$8 billion in 1993.

But low wages; appalling safety, health, and working conditions; and prohibition on labor organizing prompted the international labor movement to call for a boycott of Chinese toys until working conditions were improved. Fatal industrial disasters in the industry were cited by American human rights and labor activists to support their call for eliminating most-favored-nation (MFN) status for China. American toy makers, with growing investment in China and dependency on Chinese exports, argued against such demands, which they claimed would lead to higher prices for American consumers and loss of jobs for American workers who packaged Chinese goods or completed the assembly of toys partially assembled in China.

Economic forces, not politics, brought about an improvement of safety standards and the increasing replacement of hazardous sweatshops by well-lit, well-ventilated modern factories employing adult workers. The product trend was swinging toward more complex, sophisticated, and interactive toys in the late 1990s. Big buyers preferred to outsource to bigger Chinese manufacturers that could meet the volume demands, handle more complex toys, and also comply with their codes of conduct regulating working conditions. The Chinese industry was consoli-

dated; many small toy factories closed shop even as the industry as a whole grew.

In the late 1990s, some six thousand toy manufacturers existed in China, more than 80 percent of which were funded by overseas capital. China and Hong Kong together accounted for some 60 percent of the world toy trade.

TOYAMA (2002 est. pop. 1.1 million). Toyama Prefecture is situated in the central region of Japan's island of Honshu. It occupies an area of 4,252 square kilometers. Its geography features mountains encircling a central plain. Toyama is bordered by Toyama Bay and the Sea of Japan, and by Niigata, Nagano, Gifu, and Ishikawa prefectures. Once known as Etchu Province, it assumed its present name in 1871 and its present borders in 1883.

The prefecture's capital is the city of Toyama, growing up as a castle town around the fortress built in 1532 by the Maeda family. Today it is home to Toyama University and is the heart of the Hokuriku Industrial Region, with shipbuilding and aluminum refining as its main industries.

During the Edo period (1600/1603–1868), the region was ruled by the Maeda family as Japan's wealthiest domain. Today rice remains the primary crop, followed by pears, tea, and vegetables. Tulip bulbs are grown for export. The fisheries are active, with Toyama Bay noted for its firefly squid. Plentiful hydroelectric power fuels the machinery, chemical, metals processing, lumber, and textile industries. Visitors are drawn to the Himi coast, the Kurobe Gorge in Chubu Sangaku National Park, and the rustic steep-roofed farmhouses of the Gokayama district.

TRABZON (1998 est. pop. of city 144,000). Trabzon (Trebizond), capital of Trabzon province (1998 est. pop. 850,000) in a mountainous region of north-

The Hagia Sophia Byzantine Church in Trabzon in 1990. (DAVID SAMUEL ROBBINS/CORBIS)

eastern Turkey on the Black Sea, took its name from the table-shaped plateau on which the city is located. Known as Trapezus in antiquity, the city was colonized by Greeks from Sinope, also on the southern shore of the Black Sea, west of Trabzon.

The city was occupied by the Seljuks at the end of the eleventh century and became the capital of the Greek empire of Trebizond from 1204 to 1461. Captured by the Mongols in 1240, it remained under their rule until conquered by the Ottoman sultan Mehmed II (1432–1481) in 1461. The Ottomans ordered the city's churches converted to mosques; one of these, the Aya Sofya, became a museum in 1964. Sultan Selim the Grim (1467–1520) served as governor (1490–1512) until his accession to the throne in 1512. His son Süleyman the Magnificent (1494 or 1495–1566) was born in Trabzon and raised there until he took the throne in 1520.

Trabzon's historical importance derives from its location on one of the most important routes between Europe and Central Asia and its use as a seaport. Venetian and Genoese merchants frequently visited Trabzon before the Ottoman conquest, and for centuries exports from Asia, such as silk, cotton fabrics, and wine, passed through its port.

During World War I Trabzon was attacked by the Russians in 1915 and was occupied by them in 1916. The Turks recaptured the city on 24 February 1918. The town's population consists mainly of boatmen and fishermen. Trabzon continues to be known for its tobacco, hazelnuts, and tea.

TRAILOK (reigned 1448–1488), reformer of Ayutthaya (Thailand). The eldest son of King Boromaraja II (reigned 1424–1448) of Ayutthaya, Prince Ramesuen (Trailok) was appointed governor of Pistanuloke Province in 1438. He succeeded his father in 1448. He attempted to subjugate the Lan Na kingdom of King Tilokracha, but his efforts were in vain. Trailok then turned his attention toward the administrative problems faced by the expanding nation because the existing structure was not adequate.

Trailok divided Ayutthaya into provinces instead of principalities, and a prince was put in charge of each province. There was to be one royal army. Army and civilian branches of civil administration were separated. Each branch was divided into departments. In view of growing maritime commerce, a separate department was created for foreign affairs and trade. The Kot Montien Ban (Palace Law) of 1458 created a hierarchy for royalty, each rank having separate laws. For smooth succession to the throne, the position of heir apparent was created for the eldest son or full brother of the king. The grades that determined the social status of a person were set in accordance with the person's land holdings. Some of the reforms of the king violated the principle of equality before law, but they gave stability to Ayutthaya. Trailok also did much to encourage the arts and literature.

TRAN DO (b. 1922), Vietnamese general. Born 1922 in Thai Binh Province, Do joined the Indochina Communist Party in 1940. A career military officer, he rose quickly through the ranks, serving in the battle of Dien Bien Phu before being sent to South Vietnam in 1963. He served as Deputy Party Secretary of the Southern Liberation Armies, the top political officer in the Central Office for South Vietnam, the

office through which Hanoi directed the National Liberation Front and its guerrilla army, the People's Liberation Armed Force. A top military commander, he helped plan the 1968 Tet Offensive. Do was responsible for infiltrating more northern troops into the south in order to maintain Hanoi's control over the southern rebellion.

In addition to his military positions, Major General Do served on the Vietnamese Communist Party's Central Committee from 1960 to 1991, as vice-chairman of the National Assembly, and head of the Central Committee's Culture and Arts Department. In that post, Do became a staunch advocate of intellectual freedom and the abolition of ideological controls on arts and letters. He drafted key documents for the party in the mid-1980s that liberalized intellectual life, but ideological conservatives forced his retirement in October 1988. Do became a vociferous critic of the regime in the 1990s and began a letter-writing campaign attacking corruption, the lack of a free press, and the lack of political and economic reform. He was expelled from the Vietnamese Communist Party in January 1999 and remains the most prominent dissident in the country.

Zachary Abuza

TRAN VAN GIAU (b. 1911), Vietnamese revolutionary and historian. Tran Van Giau was born in Tan An, south of Ho Chi Minh City (Saigon) in 1911. He received his secondary education in France and reportedly obtained a doctorate in history from the University of Toulouse. While in France he became involved in the Vietnamese revolutionary movement and joined the Indochinese Communist Party (ICP). In 1931 he was recruited, with several others, to study at the Oriental School in Moscow (the Stalin School). He returned to Saigon in 1933 and headed the ICP's executive committee. He was arrested briefly on a number of occasions (1933, 1935, and 1939) and was sent to Poulo Condore prison on Con Dao Island, but he was nonetheless able to play an active role in the war against France in 1945. In 1946 the ICP removed him from his position, allegedly for his brutal repression of potential rivals. He then was sent to Thailand as a representative of the Vietminh. By 1954 Tran Van Giau was no longer an influential political figure, but he rose to prominence once again as a leading historian of Vietnam and Vietnam's communist movement. As such, he has produced a considerable body of work on contemporary Vietnamese history.

TRANS ALAI The most northerly section of the massive Pamir Mountains, the Trans Alai Range stretches east to west for 240 kilometers along the frontier between Kyrgyzstan and Tajikistan. The unbroken and somewhat rounded summits rise abruptly from all directions with only minor foothills. The fertile Alai valley of Kyrgyzstan lies north, and Tajikistan's Muksu and Markansu valleys lie south. Lenin Peak (7,134 meters, originally Mount Kaufmann) is the second highest peak in the Pamirs and was the second highest point in the former Soviet Union. In contrast to other Central Asian summits, the gentle southern slopes and ordinarily reliable summer weather attract throngs of mountaineers.

The snowbound upper elevations give way to deep canyons that shade 12,170 square kilometers (776 square miles) of "Turkestan type" glaciers, where overburden from moraines and rock falls insulates the ice from summer heat. Winter snow and spring rains nourish lush steppes and alpine pastures that Kyrgyz and Tajik herders utilize for goats, sheep, horses, and yaks from June to August. The Pamirs Highway between Osh, Kyrgyzstan, and Khorog, Tajikistan, crosses the range at Kyzalart Pass (4,280 meters). Winter snows frequently close this lone vehicle route, leaving the Gorno-Badakhshan Autonomous Oblast of Tajikistan isolated from the outside world. Saline Kara Kul Lake nestles south of the pass and is an important stop for migratory waterfowl.

TRANS-MONGOLIAN RAILWAY The Trans-Mongolian Railway, a prominent offshoot of the Trans-Siberian Railway, connects Mongolia with

the border of China and via the Trans-Siberian Railway with Moscow. Starting at Ulaan Ude in Russia, the rail line extends approximately 530 kilometers to Ulaanbaatar, Mongolia, and a further 730 kilometers through the Gobi Desert to the border with China at Dzamiin Uud. At this point the trains must change tracks, owing to the fact that Soviets built their railways a gauge wider to prevent foreign invasions by rail. From the Chinese border, the train travels another 800 kilometers past the Great Wall to Beijing.

The rail from Ulaan Ude to Ulaanbaatar was finished in 1949 by a Mongolian-Soviet joint-stock company. Soon after, the rail extended to the border with China. The Trans-Mongolian Railway quickly became the primary mode of transportation between Mongolia and Russia and consequently increased economic and cultural relations between the two countries. In addition to providing transportation between Moscow, Ulaanbaatar, and sometimes Beijing, the line served as a main line for spurs to several important mining sites. Rail lines now run from the Trans-Mongolian Railway to mines in Choir, Erdenet, Bor Ondor, and Baganuur.

TRANSPORTATION SYSTEM—CHINA

China, with its enormous and increasingly urbanized population, faces unprecedented challenges and opportunities in the way in which it transports its citizens and goods. The country's recent rapid period of economic growth is set to continue for the foreseeable future, placing increased pressure on its political leaders and urban designers to move toward more efficient and environmentally benign transportation systems for its people and products.

Roads

The main focus for upgraded transportation systems has been on China's road and vehicle network. China's light industry and agricultural sectors rely heavily on road-based transportation. Although China has more than 100 people per motor vehicle, compared with 1.3 people per motor vehicle in the United States, the number of motor vehicles in China more than tripled in the 1985–2000 period. There are more than 11 million vehicles: 6 million trucks and buses, 3.6 million cars, and 1.4 million other vehicles (mainly motorcycles).

More foreign automobile companies are entering China to meet the demand for new vehicles. Volkswagen commenced manufacturing automobiles in Shanghai in 1985. Other major companies have also commenced manufacturing for the Chinese market, including Daihatsu, Citroen, Peugeot, General Motors, and Daimler-Chrysler. Most vehicles are built in the Shanghai region and near Dalian in the northeastern province of Liaoning.

China has increased its road system such that now all towns can be reached via the highway system. Approximately 1.3 million kilometers of roads stretch across the country. In 1998 alone, 37,000 kilometers of highways were built; of those, 1,487 kilometers were expressways.

A consequence of China's growth in motor vehicles is increased use of energy (mostly oil). If China achieved U.S. levels of vehicle ownership, it would have more than 900 million vehicles—nearly 50 percent more than the total number of vehicles in the world in 2001. China would need to consume more oil than is currently produced throughout the world.

Rail

China has an extensive rail network, with Beijing being the hub for the north-south line to Shanghai and Guangzhou. Rail lines also extend to the west and connect China to Europe. New lines are being built, particularly in southern China and other industrial areas. There are nearly 60,000 kilometers of railway lines, most of which were built since 1949.

China's first subway was constructed in Beijing in 1969. Many of the densely populated cities have developed or plan to develop commuter rail transportation systems involving subways and light rail. These include the cities of Shenyang, Changchun, and Harbin in the northeast and other major cities, including Shanghai, Guangzhou, Nanjing, Shenzhen, and Chongqing.

In 2001 the length of China's light rail system was approximately 120 kilometers. By 2005 it is expected that more than 400 kilometers of rail transit systems will have been built, reflecting a construction cost of more than 130 billion yuan (\$15.7 billion) between 2001 and 2005.

Air

In the period since 1970, China has constructed and expanded numerous airports, mainly to handle increasing tourist traffic and to link remote areas. By 1999 more than 140 airports were open to civil airplanes.

Beijing is the hub of domestic air travel from which airlines reach all provinces, autonomous regions, and municipalities. The other two international gateway airports are in Guangzhou and Shanghai. Around thirty Chinese airlines serve the domestic market. China has a fast-growing fleet of Western aircraft and is one of Boeing's top three customers.

Water

As China has a coastline of over 18,000 kilometers and 110,000 kilometers of navigable inland waterways, it is easy to understand why water transport has a long history in the country. Countless boats transport goods along rivers and the coast. The major inland navigable rivers are the Chang (Yangtze) (known as the "golden waterway" of China's inland river transport), Huang (Yellow), Pearl, Heilongjiang, Huai, Qiantang, Minjiang, and Huangpu, as well as the Grand Canal between Beijing and Hangzhou. The volume of passenger transportation is approximately 12 billion trips per year. There are more than five thousand berths at around seventy major inland river ports. There are twenty large ports for international shipping in China, with Shanghai Harbor being one of the largest in the world.

Transport Options

China is presented with enormous dilemmas concerning the most appropriate mode of development as the country seeks to continue its economic growth. The path it chooses will significantly affect numerous countries. China's transportation policies will increasingly influence the world energy market and trans-boundary environmental deterioration, particularly a reduction in regional air quality and an increase in greenhouse gases if there are increased emissions of gasoline-driven vehicles. China's transportation policies will also affect the health of its citizens, because the emissions from gasoline-driven vehicles are detrimental to people's health. However, China can focus on less environmentally harmful alternatives, such as vehicles powered by natural gas or batteries, as well as electric hybrids and fuel-cell vehicles powered by non-polluting and renewable hydrogen. China is relatively unhindered in developing these options because the country is not heavily dependent on oil. It has little existing petroleum vehicle-related investments, such as is common in many Western countries, and it can base its transport infrastructure on cleaner fuels. China is particularly interested in vehicles powered by natural gas because natural gas is abundant in several provinces.

China is investigating cleaner fuel technologies through institutions such as the Institute of Natural

Gas Vehicles in Beijing. Currently, China's transportation policy is focused both on the development of "cleaner" vehicles and on increasing investment in mass transportation systems in the cities. China's latest five-year plan (2001–2005) focuses on coordinating economic development among different regions and between urban and rural areas. The plan increases the priority given to environmental protection and indicates that China will attempt to pursue less environmentally harmful transportation systems than were favored by many Western countries at a similar stage of economic development.

TREATY OF AMITY AND CO-OPERATION OF 1976 The Treaty of Amity and Co-operation (TAC) was signed in the first Association of Southeast Asian Nations (ASEAN) summit on 24 February 1976, in Bali, Indonesia, by the five ASEAN founding members—Indonesia, Malaysia, the Philippines, Singapore, and Thailand. The TAC fundamentally mirrors the ASEAN mode of interaction among members. The TAC signifies the group's commitment to the principles of respecting each nation's independence, national identity, the right to be free from external interference, and the noninterference in internal affairs of member countries.

In the 1992 ASEAN summit in Manila, Philippines, the decision was made to allow other Southeast Asian states to join the TAC, gaining observer status and establishing links with the ASEAN group. It paved the way for other nations to join the ASEAN family: Brunei Darussalam (1984), Vietnam (1995), Laos (1997), Cambodia (1999), and Myanmar (1999). Today the ASEAN region has a total population of about 500 million with a roughly combined gross national product of \$600 billion. Against this backdrop, the TAC embodies the collective will and aspirations of all Southeast Asians.

As a political commitment, the TAC reflects one of the most important ASEAN initiatives for implementing regional order and cooperation among mem-

ber countries. With the endorsement of the United Nations General Assembly in 1992, the TAC became an important instrument in enhancing regional peace and stability. In accordance with the Charter of the United Nations, the TAC is recognized as a mechanism for promoting regional relations on a broad consensual basis and settling intra-ASEAN disputes through the rule of law.

Against all odds and despite internal rivalries and territorial disputes among highly diverse member countries, the deep-seated principles of the TAC have been inspirational in the realization of ASEAN-10, which has successfully incorporated all Southeast Asian countries to be a part of ASEAN; in developing more cohesive and effective political, economic, and social relations; as well as sustaining regional peace and stability. There has been no interstate conflict or military confrontation among ASEAN members since the founding of the group. More importantly, through an agreed code of conduct, ASEAN has played a constructive role in integrating Southeast Asia into the international economy through the Asia-Pacific Economic Cooperation Forum (APEC). The association has also enhanced regional and international security by promoting multilateral security dialogue with non-ASEAN members via the ASEAN Regional Forum (ARF), which consists of twenty-two member countries.

TREATY OF GANDOMAK The Treaty of Gandomak was signed in May of 1879 between Afghanistan and Britain. The Afghan leader, Yaqub, came to power with the death of his father, Sher Ali, in February of 1879 and soon faced a crisis: Britain, enraged by Afghanistan's refusal to allow a British mis-

sion in Kabul after witnessing an unwanted Russian mission in Kabul, had sent troops into Afghanistan at the end of 1878. Before his death, Sher Ali had tried to enlist the assistance of Russia to counteract these troops but to no avail. Because the British had already occupied a large portion of the nation, Yaqub agreed to the terms of the Treaty of Gandomak in order to stop Britain from invading the rest of Afghanistan.

For all practical purposes, the Treaty of Gandomak turned Afghanistan into a British protectorate. It provided Afghanistan with British financial support and military support if Afghanistan faced foreign aggressors. In exchange, Afghanistan relinquished control of its foreign affairs to London and allowed the establishment of British missions in the capital and other major regions of the country. Moreover, London was given control over the strategic Khyber and Michni passes as well as several Afghan frontier areas. The Treaty of Gandomak, which clearly favored London, was signed by Yaqub only because of British military superiority. Following a failed Afghan military campaign against the British in October of 1879, Yaqub was forced to resign for fear of his life after having signed a treaty so disadvantageous to Afghanistan.

TREATY OF GIYANTI The Treaty of Giyanti (1751) largely concluded the Third Javanese War of Succession, placed further parts of Java under Dutch control, and partitioned the Javanese kingdom of Mataram (1570s–1751) into the principalities of Surakarta and Yogyakarta. In 1746, Prince Mangkubumi of Mataram (1715?–1792) rebelled against King Pakubuwono II of Mataram (1710–1749) over the latter's extensive concessions to the Vereenigde Oostindische Compagnie (VOC; United East Indies Company or Dutch East India Company) on the north coast of Java. On Pakubuwono's death in 1749, Mangkubumi declared himself king, while the VOC supported Pakubuwono's son, Pakubuwono III (?–1788).

Neither side could prevail in the costly civil war, which is known as the Third Javanese War of Succession (1746–1751). In February 1755, Mangkubumi and the VOC signed a treaty, confirming the VOC's control of the north coast of Java and recognizing

Mangkubumi as ruler of approximately one-half of Mataram. He took the regal name Sultan Hamengkubuwono I and established his court at Yogyakarta, while Pakubuwono III continued to rule in Surakarta. The territories of the two principalities stretched from Cilacap in the west to Blitar in the east and were a complicated patchwork of allegiances. Only at the beginning of the nineteenth century were the two states further reduced in size and a relatively simple border drawn between them.

TRENGGANU (2002 est. pop. 927,000). The state of Trengganu lies along the eastern shore of peninsular Malaysia. It has an elongated coastline of about 250 kilometers facing the South China Sea. Until offshore oil and gas were discovered in 1978, Trengganu was one of the least developed states in the country in terms of conventional economic indicators. Mainstay activities continue to revolve around fishing and smallholding agriculture, although tourism—the state's picturesque beaches and marine life are the main attractions—and the oil boon are now bringing significant social and economic changes.

Trade links between Trengganu and China existed by the twelfth century, if not earlier, as evidenced by Chinese literary sources. The town of Kuala Berang was noted as an important trading center, and Trengganu was known by various names like Chau Chu-fei and Teng Ya-nu. An inscription dated 1303 CE uncovered in Kuala Berang indicates that an Islamic polity was also in place, predating by a century the founding of the Melaka Sultanate. However, in terms of empire building Trengganu has not been a major player. At different periods, it was a vassal state of its more powerful neighbors Melaka, Johore, and Siam before coming under British control in 1909 and subsequently becoming a constituent state of independent Malaysia in 1957.

TRIBES AND TRIBAL FEDERATIONS—CENTRAL ASIA

In Central and Inner Asia before modern states emerged, tribes and tribal federations were the dominant forms of political and social organization. When states arose in the region—whether imposed by an external power or emerging from the tribal organization itself—these new states bore the imprint of tribal relationships. Even today critical aspects of political and social life are rooted in earlier forms of organizations.

Varieties of Tribes and Federations

Many anthropologists no longer use the term "tribe," first, because it has become value laden; for example, expressions like "tribal warfare" imply that tribes are inherently warlike. Second, it is difficult to define "tribe" in terms of anthropological evidence, especially in relation to the once-favored evolutionary theory of human groups.

Nonetheless, there is something distinctive about social and political organizations in prestate Central and Inner Asia, and the term "tribe" serves to describe this distinctiveness. Some scholars have thought of tribes as "rural groups that have a name and distinguish between members and nonmembers, which occupy a territory, and which within that territory assume either all responsibility, or at least a significant proportion of the responsibility, for the maintenance of order" (Ahmed and Hart 1984: 1). Key to this view of a tribe is a relative political decentralization; power is normally exercised at the local level and is more diffuse than that experienced under state structures.

Traditionally, in Central and Inner Asia tribes were either sedentary or nomadic. Sedentary tribes practiced agriculture and sometimes engaged in commerce. They had a close relationship to the territory they inhabited; place-names often coincided with group identification. In the long-sedentary areas of Uzbekistan, for example, group identification with place remains common. Among sedentary populations, differences in dialect, customary practices, and mode of economy can become pronounced.

Tribal organization was different among nomads (those who migrated less predictably) and transhu-

mants (those who migrated seasonally). First, genealogy played a much stronger role in organizing nonsedentary tribes. Because they had a looser relationship to any given place, something other than physical location was needed to distinguish the members of a nomadic tribe from the nonmembers. Central and Inner Asian nomads were expected to commit to memory at least seven generations of ancestors and often more, to locate themselves in one or another tribal group.

A second distinguishing feature of nomadic tribal organization was a pattern of fissure and fusion. Groups cohered and dissolved, depending on outside threats and prevailing environmental conditions. A population, for example, that faced an outside threat might cohere as a single entity to address the threat, but after the threat diminished, the entity would probably disintegrate into smaller groups. Such fissure and fusion were understood to occur along genealogical lines; kin ties defined group boundaries, and ties of even closer kinship defined subunits.

Both sedentary and nomadic or transhumant tribes could cohere into federations. These typically began as political alliances but often evolved into something more stable. In Kazakhstan, for example, these federations (*zhuz* in Kazakh) came to be described in the genealogical terms usually limited to closer kin-based units. Each federation commanded a degree of bargaining authority with outsiders and could issue calls to arms against external foes. Especially in sedentary areas, what began as alliances or federations of different tribes evolved into stable quasi-state structures with centralized authority and mobilizable troops, if not a standing army.

Tribes and Statehood

Since it is decentralized and local, tribal organization stands in contrast to the organization of states, which typically centralize power and project it over a wide territory. Tribes may have standing political and social elites, but they lack the durable bureaucratic structures of a modern state. In Central and Inner Asia tribal organizations in many ways represented an alternative to state structures.

Tribal organization generated an alternative ideology that emphasized egalitarian values. In reality there was considerable social stratification, with aristocratic lineages enjoying positions of privilege and commercial strata enjoying the prospect of greater accumulation of wealth. Compared with nontribal contexts, however, egalitarian values were much more pervasive. The granting of hospitality to guests, widespread gift giving,

and attention to the social and economic standing of kin were all expressions of such egalitarian norms.

The tribally organized societies of Central and Inner Asia often resisted the imposition of state structures, especially in geographically remote regions where resistance could be more effective than in more accessible regions. For example, long after the Soviet Union had forcibly sedentarized the nomadic Kazakhs and had imposed bureaucratic structures on them, a spirit of resistance remained strong among the relatively remote populations on the Mangyshlak Peninsula. In parts of Soviet Central Asia, state authorities allowed local tribal elites to govern populations much as they always had, because patterns of tribal authority were difficult to undermine.

If states could be imposed on tribally organized populations, as in the Soviet Union from 1917 to 1991, tribes could also generate state structures from within. Prominent examples were the statelike structures created by Genghis Khan, which dominated much of Eurasia in the thirteenth and fourteenth centuries and had numerous features usually associated with states (for example, tax systems, recruitment of administrators). By creating state structures from within, Genghis Khan allowed a tribally organized core to project its power across a vast territory more effectively than had he relied on coercion alone.

Recent Transformations

What happens when states and tribally organized societies have come into contact? In Central and Inner Asia, state structures have often proved effective at governing certain populations but not others. Populations at the margins of state control have a far different relationship to the state than do populations under direct state control. Tribal populations at the margins may question the legitimacy of the ruling state elite. In Afghanistan, for example, many non-Pashtuns have felt that the ruling Taliban elite privileged Pashtuns to the detriment of non-Pashtuns. In Kyrgyzstan southern groups commonly perceive that northern elites exercise dominance illegitimately.

If urbanization and the spread of literacy accompany the imposition of state structures, a process of "detrribalization" may occur in urban areas. Given the mixing of populations and the wide array of opportunities available in cities, tribal links may weaken or even disappear. In the former Soviet Central Asia sizable populations in urban areas may know little about their tribal heritage. Any detrribalization that does occur, however, is mitigated by strong ties that many retain to the countryside, where tribal background

continues to be important. In addition, in a city, many urban dwellers use networks based on kinship or ties to place to find employment and housing. Scholars continue to debate why detribalization sometimes occurs quickly, sometimes slowly, and sometimes not at all.

Even if state structures come to govern tribes as physical entities, tribal identities continue to be vibrant and important as mental constructs with social and political significance. Thus the tribes and tribal federations of Central and Inner Asia are not merely a matter of historical or anthropological curiosity; in critical ways they remain important to the peoples themselves. Among elites, competition over scarce resources is in critical part a contest of groups based on tribal background. Moreover, much of this contest takes place behind the scenes, since elites claim to represent broad populations, not single tribal groups; they therefore often disallow public discussion of tribal backgrounds. By making such discourse difficult or even illegal, elites lend it an aura of secrecy that makes tribal background a potentially explosive issue. Not surprisingly, in genuinely democratic contexts, such as in Mongolia in 2001, tribal background and heritage are less explosive issues than in more repressive societies, but even in Mongolia they remain politically sensitive.

TRINCOMALEE (2002 est. district pop. 356,000; est. city pop. 82,600). Since the British seized the island of Sri Lanka in 1796, Trincomalee has been the main city and center of the district of the same name. It is located in the north of the Batticaloa District of Eastern Province and to the south of the Mullaitivu District of Northern Province. From the time of the medieval South Indian Chola dynasty that ruled over northern Sri Lanka in the eleventh century, the district was overwhelmingly populated by Hindu Tamils. The city of Trincomalee was established at an extensive and nearly circular natural harbor, which the

British considered the best and most beautiful in Asia. From medieval times, the city was therefore well suited to attract long-distance trade. The Cholas established a Siva temple dedicated to Trikoneshvara on the promontory of the bay. It is from this temple, which was destroyed by the Portuguese in 1624 in order to build fortifications, that the city and district derive its name. When the Vereenigte Ostindsche Compagnie (Dutch East India Company) drove the Portuguese from the island, the Dutch erected commanding fortifications at the site, and since British times the city prospered as the island's second and most important harbor and as a trade center dominated by local Hindu Tamils and Muslim merchants. Since the 1950s, however, because of Sinhalese colonization, the nationalization of the harbor, and the establishment of industrial plants, the ethnic balance has shifted in favor of Sinhalese farmers and workers. In the early 2000s, the district population consists of 34 percent Sinhalese, 37 percent Tamils, and 29 percent Muslims.

TRIPURA (2001 pop. est. 3.1 million). Tripura (formerly Tipperah) is a small state in northeast India. Its area is 10,486 square kilometers. Indian territory lies to the northeast, and Tripura is bordered on all other sides by Bangladesh. The region is mostly wooded and hilly; approximately 50 percent is forested, and shifting cultivation has been a traditional practice. The highest range of hills (up to 1,000 meters) is Jampui Kang. The chief rivers—the Meghara, Titas, Gumti, and Dakatia—are navigable throughout the year.

For approximately thirteen hundred years before its accession to the Indian Union, Tripura was a Hindu princely state ("Hill Tipperah," to the British). It became a state of India in 1949, then a centrally administered Union Territory in 1957, and reverted to a state in 1972. The capital is Agartala, which is the location of Tripura University. Tripura is divided into three districts, and is governed by a sixty-member legislative assembly. The main languages spoken by the people are Bengali, Kakbarak, and Manipuri. About 24 percent of the land is cultivated. Rice, wheat, tea, oilseeds, cotton, jute, mulberry, and sugarcane are grown. The largest industries are tea cultivation and handloom production, and there are small steel and

food processing plants. Sericulture is also developing in the state.

Paul Hockings

TRIVANDRUM (2001 est. pop. 745,000). Trivandrum, or Thiruvananthapuram as it is now officially called, is the capital of the state of Kerala, India. *Thiru-Anantha-puram* means the "abode of the sacred thousand-headed serpent Anantha," who forms the couch on which reclines Lord Vishnu, the preserver. Built on seven hills, Trivandrum has grown as a major tourist destination in recent times, as it is close to many fine beaches. The city covers an area of 74 square kilometers and is located in the extreme south of Kerala on the Arabian Sea.

Historically, Trivandrum was part of the territory ruled by the Ay kings up to the tenth century CE. The rulers of Venad concentrated their power in the southern part of Kerala and by the eighteenth century their control extended over the region between Trivandrum and Cape Comorin. The name also reflects the city's best-known temple, Sri Padmanabhaswamy Temple, dedicated to Padmanabha, or Lord Vishnu. In 1750 Marthanda Varma, the ruler of Travancore, dedicated the entire state to the deity of the temple.

The modern city is known for the high literacy rate of its population, as a regional center for music and the arts, and as the locale of India's first space center, now a tourist attraction.

TRUNG SISTERS In 39 CE, a Vietnamese nobleman named Thi Sach and his wife Trung Trac led the first revolt against the Chinese who had ruled Nam Viet ("southern country of the Viet") since 111 BCE. The successful military campaign enabled the Vietnamese to free themselves from Chinese rule. Trung Trac, along with her sister Trung Nhi, established a court northwest of Hanoi at Me-linh. Vietnamese tradition states that the execution of Thi Sach by the Chinese had ignited the rebellion, while Chinese sources indicate that Thi Sach simply followed his wife's authority. The Vietnamese recognized Trung Trac as queen until the Chinese, under General Ma Yuan, invaded with an army numbering around 20,000 and eventually defeated the Vietnamese forces. At the battle of Lang Bac, some 10,000 Vietnamese surrendered, and thousands more were executed. Vietnamese tradition holds that the Trung sisters escaped the Chi-

nese and committed suicide by leaping into the Day Hat River. Chinese sources, however, claim that Trung Trac and Trung Nhi were captured and beheaded, and their heads were sent to the Han court. By late 43, Ma Yuan had regained control over the Red River Delta area, and the Chinese thus secured their rule over the Vietnamese.

The Trung Sisters (Hai Ba Trung, "the two ladies Trung"; also known as Truong Vuong or Trung Nu Vuong, "the queens Trung") are today revered by many Vietnamese as the most important heroines in Vietnamese history. The anniversary of their deaths is Vietnamese Women's Day, and the Vietnamese hold annual ceremonies honoring them on the sixth day of the seventh month of the lunar calendar. In practically every Vietnamese city, there is a street named "Hai Ba Trung" in honor of the two Vietnamese revolutionaries.

TRUONG VINH KY (1837–1898), Vietnamese linguist, collaborator with the early French regime. Truong Vinh Ky (Petrus Jean-Baptiste Vinh Ky) was a Catholic-educated Vietnamese scholar who collaborated with the early French colonial regime in southern Vietnam. Ky was also a brilliant linguist who spoke more than twenty-five Asian and European languages and was a pioneer in early efforts to popularize *quoc ngu* (the romanized form of Vietnamese). Born in the Mekong Delta region of Ben Tre, Ky was educated by Catholic priests in his home village and later at missionary schools in Cambodia and Penang, Malaysia. In 1858 he returned home to become a village teacher, only to leave again in 1863 to serve as an interpreter for a Vietnamese imperial delegation to France. While there, he met Victor Hugo and Ernest Renan among other European intellectuals and became convinced of the value of European civilization and culture and the potential benefits of French colonial tutelage for his own country.

On his return from Europe, Ky resumed his role as an educator, now serving the French colonial regime. He taught at the College des Interprètes in Saigon, where he trained many early colonial officials and later gave French lessons to a future Nguyen emperor, Dong Khanh (reigned 1886–1888). Truong Vinh Ky

was also a prolific researcher and writer, producing more than one hundred books on topics ranging from grammar and linguistics to history and geography. He wrote and published the first work in romanized Vietnamese in 1866, and between 1869 and 1872 he served as editor of the earliest romanized Vietnamese newspaper, *Gia Dinh Bao*. Ky's *Cours D'histoire Annamite* (1875) was the first French-language survey of Vietnamese history, and he also produced the first French-Vietnamese dictionary.

TSEDENBEL, YUMJAAGIYN (1916–1991), Mongolian premier and president. Yumjaagiyn Tsendenbel was born in the Uvs province of Mongolia and ruled Mongolia as its premier from 1952 to 1974 and then as its president from 1974 to 1984.

In 1931, he had joined the Mongolian Youth League and in 1939 the Mongolian People's Revolutionary Party (MPRP). From then on, his life was dedicated to politics.

In 1940, Tsendenbel became the general secretary of the MPRP and forced the introduction of the Cyrillic alphabet into Mongolia, replacing the vertical classical Mongolian script introduced by the great Mongol leader Genghis Khan (c. 1162–1227). In the 1940s and early 1950s, he served in numerous positions in the government and the MPRP, until the death of Choybalsan (1895–1952), Mongolia's prime minister at the time. In 1952, Tsendenbel became the premier of Mongolia.

In many Mongols' eyes, Tsendenbel was merely a Soviet puppet who followed the example of Leonid Brezhnev (1906–1982), the Soviet leader and general secretary of the Communist Party. Furthermore, people believed his Russian wife possessed too much influence. His detractors had reason for criticism. Tsendenbel developed a cult of personality and in 1962

purged many of Mongolia's leading academics and politicians. Although few were actually executed, many suffered in exile. Tsendenbel's rule came to an end in 1984, when Batmonkh (b. 1926) took over the post of prime minister while Tsendenbel was in Moscow. Although Tsendenbel stayed in Moscow and died there in 1991, he was buried in Ulaanbaatar, the capital of Mongolia.

TSUSHIMA ISLAND (1996 pop. 44,000). Tsushima Island, which is actually two main islands totaling 694 square kilometers and more than one hundred smaller ones in the strait between Japan and South Korea, belongs to Nagasaki Prefecture. Its principal industries are fishing and forestry. The island's largest city is Izuhara.

As Japan's closest landmass to the Asian continent, Tsushima traditionally served as an integral link in Japan's relations with China and Korea. The island was devastated by the Mongols during their two invasions of Japan in 1274 and 1281. In the following centuries, Tsushima became a base for Japanese pirate (*wako*) activity in the area. In an effort to halt the pirate menace, Korea sent punitive expeditions against the island in 1389 and 1419. From the fifteenth through the mid-nineteenth centuries, Korean-Japanese trade was supervised by the So daimyo family of Tsushima and restricted to walled compounds (*wakan*) in Korea.

After American commodore Matthew Perry opened Japan to the outside world in the 1850s, Tsushima also played a key role in the country's new relationship with the West. In 1861, Russia failed in an attempt to take the island. Then, in 1905, the decisive naval battle of the Russo-Japanese War was fought in the waters off

Tsushima, assuring Japan of victory over the European power.

TU LUC VAN DOAN Tu Luc Van Doan (Independent Literary Group) was a literary club founded in Vietnam by a group of well-known writers, following the lead of Nguyen Tuong Tam, also known as Nhat Linh. Its goal was to use literature as a means of bringing about profound literary and social changes in colonial Vietnam. Among the "Ten Commandments" of the organization were resolutions to write original works, not to translate foreign authors, and to write simply, using pure Vietnamese language while at the same time applying Western methodologies to Vietnamese literature. Other commandments expressed the group's commitment to improve society and respect individual freedom, to encourage patriotism by emphasizing the beauty and distinctive character of Vietnam in literature, and to denounce Confucianism as anachronistic.

The club published two magazines, *Phong Hoa* (Customs) and *Ngay Nay* (Today), which attracted a wide readership. It also managed a publishing house named Doi Nay (Modern Life), which produced, from 1933 to 1936, close to sixty thousand copies of novels or poetry collections. Tu Luc Van Doan exerted a tremendous influence on Vietnamese literature. It published the first modern novels in Vietnam and initiated the new poetry movement shaped by nationalist and anticolonial sentiments.

TUJIA The Tujia are the eighth-largest ethnic group in China; numbering 5.7 million, they are more numerous than the better-known Mongols and Tibetans. Settlements of the Tujia are distributed over western Hunan and western Hubei provinces, as well as in several autonomous counties under the jurisdiction of Chongqing municipality.

Origins of Tujia Language and Present-Day Usage

Some linguists consider the Tujia language to be part of the Yi language branch of the Sino-Tibetan language family. According to others, however, although the Tujia language shares some characteristics with the Yi languages, those characteristics are not enough to make the Tujia a member of that branch. Nonetheless, it is beyond question that the language, like those in the Yi branch and some others, belongs to the Tibeto-Burman subfamily of the Sino-Tibetan family. The language has no written form.

Chinese is the dominant language used by the Tujia; many Tujia speak nothing but Chinese. Some are bilingual, speaking both Chinese and Tujia. A number also speak the language of the Miao (known outside of China as the Hmong), one of their immediate neighbors. Less than 200,000 Tujia still rely on the Tujia language as their major means of communication.

Tujia Names

In their own language, the Tujia call themselves *Bidzib-ka*. In history, they were called various names by their neighbors, based on perceived ethnic markers or distinguishing signs, such as their totem (the white tiger, at one time the totem of their chief), or names of rivers or places where they lived. The name "Tujia" came into being in the late seventeenth century when a large number of Han Chinese (the Chinese ethnic majority people) migrated into the Tujia area. The term, which means "aboriginal families" in Chinese, was coined to distinguish the natives from the immigrants. This name did not become official until October 1956, when the Tujia were granted the status of "unitary ethnic group" (*danyi minzu*) by the Chinese government.

Tujia History

The early history of the Tujia is a matter of dispute. Based on clues in Chinese historical literature, some scholars believe that the Tujia are descendents of the Ba, a tribe extinguished by the Qin Dynasty (221–206 BCE). Based on linguistic characteristics and some customs that are close to the Yi in Yunnan, on the other hand, some scholars think that the ancestors of the Tujia are the *wuman* or "black barbarians," who lived in southwestern China. The fact that in the 1970s two significant Neolithic sites were found in Tujia area suggests that those regions were inhabited as early as the prehistoric period.

The picture since the Later Han dynasty (25–220 CE) is much less uncertain. Located close to the great

historical powers, the Tujia have a longer history of involvement in China's national politics than many other Chinese minorities. As early as the tenth century, so-called bridled and tethered prefectures (*jimi fuzhou*), or native tributary administrations, were established in the area. The establishments were converted into a system of native chieftains (*tusi zhidu*) in the thirteenth century. Under this system, minority areas in the Chinese empire were ruled by families of native chieftains instead of officials appointed by the central government. This system lasted in the Tujia area until 1723.

Conflict was the keynote of the recorded early history of interactions between the ancestors of the Tujia and Chinese society. With the establishment of the tributary system and the subsequent system of native chieftains, the Tujia became increasingly sinicized. During the Ming (1368–1644) and Qing (1644–1912) dynasties, a considerable number of Tujia soldiers, called different names at different times, were sent to coastal areas to fight against the Japanese and British invaders.

In the meantime, many upper-class Tujia received a Confucian education and entered the gentry-scholar rank. Some accomplished poets and scholars of the Tujia gained national reputations. When the native-chieftain system was abolished in the eighteenth century, some Tujia customs and conventions were condemned as "corrupted" or "ugly" and were reformed by force. As a result, the Tujia were further assimilated, and many of their ethnic characteristics were lost.

Tujia Culture

Love-based marriage was a tradition among the Tujia. In recent centuries until the early 1950s, however, parental approval had become a norm, and wealth and social status became decisive factors. Cross-cousin marriage (a preferential rule requiring marriage between cross-cousins—mother's father's brother or father's sister's daughter if such a person is available) and levirate (the custom whereby a man marries the widow of his deceased brother) are commonly practiced among the Tujia. In some areas, maternal parallel-cousin marriage (a convention in which one marries an opposite-sex child of one's mother's sister) is also practiced.

Seniority of age is highly venerated by the Tujia. Elderly men and women are respected and treated well while alive, and elaborate funerals are held at their death. Mortuary ritual is also held for people who die

at a younger age, but with less care and expense. No ceremony is held for the death of a child.

There is no organized religion among the Tujia. Their faith, a mixture of animism, ancestor worship, and worship of deified deceased chiefs and heroes, has apparently been influenced by the folk religion of the neighboring Han Chinese.

The Tujia have a long tradition of sophisticated folk arts. Over seventy prescribed movements are available for dancers of the popular *bai shou wu* ("hand waving dance") to depict such things as hunting, agricultural activities, battling, and feasting. Legends tell about the genesis and migration of their ancestors as well as their aspirations for and fantasies about the ideal life. Almost every Tujia is an accomplished singer of improvised or traditional ballads, which cover all aspects of daily life and feeling.

The traditional Tujia economy is diversified. Agriculture in narrow strips of terraced fields is complemented by logging, hunting, fishing, and growing or working on cash crops. The Tujia are also known for their traditional weaving, knitting, and embroidery. A variety of light and heavy industries have been developed in the Tujia area, and Jishou University was established there in 1958. In the past two decades, over 95 percent of Tujia children received at least primary education.

TUMEN RIVER The Tumen River (Tuman-gang) is the second-longest river on the Korean Peninsula. In all, it extends 520 kilometers, first flowing northeast from the slopes of Mount Paektu and then southeast through narrow gorges to the East Sea or Sea of Japan. The river is rather shallow due to the dry climate of its drainage basin, which has an area of 24,296 square kilometers. However, in its lower reaches, the Tumen is as wide as 300 meters and is navigable for 80 kilometers. The river is frozen for three to four months of the year.

The Tumen River became the permanent northern-frontier border of Korea when six garrison forts were established there during the reigns of the Choson monarchs T'aejo (1392–1398) and Sejong (1418–1450). In 1909, the river was officially recognized as the international border between China and Korea. A Sino-Russian agreement in 1860 gave Korea and Russia a 16.5-kilometer border demarcated by the Tumen River. Korea and Russia have not signed any treaty to verify this border, but it is undisputed.

The Tumen River and its tributaries have been developed into a valuable source of hydroelectric energy. Efforts are being made to transform the Tumen River area into a free-trade zone.

Brandon Palmer

TUNGABHADRA RIVER The Tungabhadra (or Tumbudra) River is a major tributary of the Kistna River, which flows eastward across peninsular India. The Tungra and the Bhadra rivers rise in the Western Ghats, join in Shimoga District, and the Tungabhadra flows 640 kilometers eastward across northern Karnataka and Andhra Pradesh states. The river falls into the Kistna River in Raichur District, becoming its chief tributary before it continues eastwards to the Bay of Bengal. The river was of great economic importance to the Hoysala and Vijayanagar kingdoms (c. 1110–1327 and 1336–1565, respectively), and the Vijayanagar capital at Hampi lay on its right bank. Here and elsewhere its waters have been used for irrigation, but because of its rapid flow and rocky channel, most reaches are only navigable by small boats. The huge Tungabhadra reservoir was constructed at Hospet in the mid-twentieth century (1945–1953). Its power generator is located at Mallapuram.

TUNGUS LANGUAGES The Tungus (or Tungusic) languages are a group of genetically related languages spoken in eastern Siberia and northeastern China, mostly in the provinces of Heilongjiang and Liaoning, and the Inner Mongolian Autonomous Re-

gion. Smaller Tungus-speaking groups are also found in Xinjiang and Mongolia. Traditionally, the family is subdivided into a Northern and a Southern branch, though this classification has occasionally been called into question.

The North Tungus languages are Evenki (formally often called simply Tungus), spoken by around 10,000 speakers in central and eastern Siberia, between the Yenisey and Amur rivers. In China, the language of the Evenki nationality, usually called Solon, has 20,000 speakers in Heilongjiang. The Oroqen (in Chinese, *Elunchun*) language, with about 4,000 speakers in Inner Mongolia, is also close to Evenki, as is Negidal, on the lower Amur (about 200 speakers). Even, formally known as Lamut and spoken exclusively in Siberia by 5,000 people, is officially written in Cyrillic script.

The South Tungus languages include Nanai (formally known as Gold), with about 5,000 speakers on the lower Amur. The 1,500 members of the Hezhen nationality in Heilongjiang, China, also speak a language close to Nanai. Ul'cha (c. 1,000 speakers) and Oroch (fewer than 100 speakers on Sakhalin island) are vanishing languages of the Nanai group. Udi (or Udihe) and Oroch, both with fewer than 500 speakers in the Amur region, form a close-knit subgroup, which is generally considered South Tungusic.

Manchu has one of the longest written traditions of the Tungus languages. The first Manchu documents, written in Mongolian script, date from the beginning of the sixteenth century. Manchu was the official language of Qing dynasty China (1644–1912). Today, very few speakers remain; most of them living in Heilongjiang. The Sibe nationality, originally a Manchu tribe relocated to Xinjiang in 1764, numbers 80,000 speakers. An early predecessor, though some scholars view it as a mere dialect, of Manchu is the Jurchen language, recorded in a unique script from the Jin dynasty (1115–1234). Some Jurchen texts were compiled in Ming times as well.

TURA LOWLAND The Tura (or Turanian) Lowland (in Kazakh *Turan Opyty*, in Uzbek *Turan Pasttekisligi*, in Turkmen *Turan Pesligi*) is a vast plain area located east of the Ustyurt Plateau, and extending from the Kopet-Dag Mountains along the Turkmenistan-Iranian border in the southwest, to the western Siberian Plain in the north along the Russian-Kazak border. Portions of it are occupied by the republics of Turkmenistan in the south, Uzbekistan in the middle, and Kazakhstan in the north. The middle of the lowland is an internal drainage basin occupied by the Aral Sea. Once the world's fourth largest lake, the Aral Sea has been shrinking due to extensive upstream river water withdrawals from its two main water suppliers: the Amu Dar'ya and Syr Dar'ya Rivers. Beginning in the 1960s, a drastic increase in the amount of water withdrawn from the two river systems was used to irrigate more and more land to cotton. Much of the water did not reach the Aral Sea; it either drained away into lower depressions in surrounding areas or evaporated.

The Tura Lowland also contains the Kyzyl Kum (Qyzylkum) and Kara-Kum (Qorakum) deserts separated by the Amu Dar'ya River. Lying between 43° and 60° N latitude, and sitting in the rain shadow of the Tian Shan and Pamir Mountains to the south, they are the highest midlatitude deserts in the world.

TURGAY PLATEAU The Turgay Plateau is a major geographical feature of northwest Kazakhstan, extending 630 kilometers north to south and 300 kilometers east to west at an elevation of between 200 and 300 meters. Formed mostly of clay and sand and characterized by low hills, ridges, and shallow (often salt) lakes, the plateau holds deposits of magnetite, iron ore, bauxite, and coal. The plateau has a sharply continental climate. The northern region, which forms part of the steppe belt, is used for the dry farming of cereals and was incorporated into the Virgin Lands scheme initiated by Nikita Khrushchev (1894–1971) in 1954, Kazakhstan being a part of the Soviet Union until the Soviet Union dissolved in 1991. It now has a predominantly Russian and Ukrainian population.

The arid south, which is semidesert, is used for pastoralism, traditionally the preserve of the ethnic Kazakhs. This southern region is characterized by tablelands divided by deep depressions and ravines left by dried-up rivers.

The Turgay Plateau is crossed by the Turgay Ravine, which stretches north-south for a distance of some 800 kilometers, linking the West Siberian Lowland with the north Tura Lowland and connecting Siberia with Central Asia. With a flat bottom and heavily eroded sides, the width of the ravine varies from 20 to 75 kilometers. The Turgay River flows north and the Ubagan River south through the ravine. The groundwater is heavily mineralized and the ravine contains many salt lakes. Agriculturally, the region is used for pasture.

TURKEY—PROFILE (2001 est. pop. 66.5 million). Turkey, officially known as the Republic of Turkey (in Turkish, *Türkiye Cumhuriyeti*), is the European gateway to Asia, one reason that the region has been home to so many cultures and civilizations since at least 6500 BCE. The country is situated in southeastern Europe and in the peninsula of Asia Minor in western Asia. The European part of Turkey is known as Thrace (*Trakya*), and the Asian part as Anatolia (*Anadolu*). Rectangular in shape, Turkey covers 780,580 square kilometers, with almost all of the land (approximately 97 percent) located in Asia. Turkey is 1,660 kilometers long from east to west and 550 kilometers wide from north to south. It is bordered by Georgia and Armenia in the northeast, the Nakhitchevan Autonomous Region of Azerbaijan and Iran in the east, Iraq and Syria in the southeast, and Greece and Bulgaria in the northwest.

Three-fourths of Turkey's boundaries are maritime, with a coastline totaling 8,372 kilometers. The Black Sea coastline is 1,695 kilometers in length; the Aegean, 2,805; and the Mediterranean, 1,577. The Marmara coastline, which links the Black Sea to the Aegean Sea, is 927 kilometers long and includes two straits: the Bosphorus, between the Black Sea and the Sea of Marmara, and the Dardanelles, between the Sea of Marmara and the Aegean Sea.

Hittites, Urartians, Lydians, Ionians, Romans, and Byzantines are some of the many peoples who in ancient days conquered and populated the area of modern Turkey. The Seljuk Turks settled there in the eleventh century, establishing the first Turkish empire

TURKEY

Country name: Republic of Turkey
Area: 780,580 sq km
Population: 66,493,970 (July 2001 est.)
Population growth rate: 1.24% (2001 est.)
Birth rate: 18.31 births/1,000 population (2001 est.)
Death rate: 5.95 deaths/1,000 population (2001 est.)
Net migration rate: -0 migrant(s)/1,000 population (2001 est.)
Sex ratio: 1.02 male(s)/female (2001 est.)
Infant mortality rate: 47.34 deaths/1,000 live births (2001 est.)
Life expectancy at birth: 71.24 years, male: 68.89 years, female: 73.71 years (2001 est.)
Major religion: Muslim (mostly Sunni)
Major languages: Turkish (official), Kurdish, Arabic, Armenian, Greek
Literacy—total population: 85%, male: 94%, female: 77% (2000)
Government type: republican parliamentary democracy
Capital: Ankara
Administrative divisions: 80 provinces
Independence: 29 October 1923 (successor state to the Ottoman Empire)
National holiday: Independence Day, 29 October (1923)
Suffrage: 18 years of age; universal
GDP—real growth rate: 6% (2000 est.)
GDP—per capita (purchasing power parity): \$6,800 (2000 est.)
Population below poverty line: not available
Exports: \$26.9 billion (f.o.b., 2000 est.)
Imports: \$55.7 billion (c.i.f., 2000 est.)
Currency: Turkish lira (TRL)

in Asia Minor. The Ottoman Turks founded their empire in the fourteenth century.

Geography

Turkey has a rich topography, with broad plateaus in the central region, low mountain ranges in the north and south, and mountainous highlands in the east. There are three main climates with subvariations. On the western coast, from the Marmara region down to the south, the climate is mild and wet in winter and hot and dry in summer. The Mediterranean coast enjoys warmer weather. The Black Sea region is temperate and rainy year round. The interior has a semi-continental climate with hot, dry summers and cold, snowy winters. The climate is coldest in eastern Anatolia, where temperatures can fall as low as -23°

-40°C. The hottest summers occur in southeast Anatolia, where the temperature reaches as high as 40°C.

Turkey is divided into seven geographical regions: Mediterranean, Aegean Sea, Marmara, Black Sea, central Anatolia, eastern Anatolia, and southeast Anatolia. The highest mountain is the biblical Mount Ararat, with an altitude of 5,165 meters. Kackar (altitude 3,923 meters), and Erciyes (3,917 meters) are other notable mountains. The Euphrates, Kizilirmak, Sakarya, and Tigris are the country's longest rivers.

People

Turkey's population is relatively young, with a dependency ratio of 64.68 percent. In 2001 the population growth rate was estimated at 1.24 percent. Population density per square kilometer was 79. Most

of the population is concentrated in the western part of the country, with two-thirds of the population living in cities. Istanbul, with a population of more than 9 million, is one of the largest cities in the world.

The rights of non-Muslim minorities, namely, Greeks, Armenians, and Jews, were regulated by the Treaty of Lausanne in 1923. Officially there are no ethnic minorities in the Muslim population of Turkey. While the ethnic origins of the Turks vary, they are united by their shared Turkish identity. The Kurds, the second-largest ethnic group in Turkey, were long denied an independent ethnic identity and were labeled "mountain Turks." Although the exact number of Kurds in Turkey is not known, there are estimated to be between 10 and 20 million. Other minorities include Arabs, the Laz, Tatars, Circassians, and Syrians.

Turkey is a secular state without an official religion, but more than 98 percent of the population is Muslim. Most follow the Hanafi school of Sunni Islam. There is a substantial minority of Alevi (a subdivision of the Shi'a sect). Although the exact number is not known, the Alevi population is estimated at around 10 to 15 percent of the Muslim population in Turkey. Non-Muslims, including Armenian Orthodox Christians, Greek Orthodox Christians, Roman Catholics, and Jews, constitute the remaining 2 percent of the population. The official language of the country is Turkish. Various dialects of Kurdish, Arabic, and Armenian are some of the other languages spoken in the

country. Although a ban on the use of the Kurdish language was lifted in 1991, there are still some restrictions on education and public broadcasting in Kurdish.

Political History

The Republic of Turkey was established in 29 October 1923 as a unitary state and was ruled by the single-party regime of the Republican People's Party for more than two decades. The first president of the republic was Mustafa Kemal Atatürk, who held the post between 1923 and 1938, followed by President İsmet İnönü (served 1938–1950). Since 1946 the country has been a multiparty parliamentary democracy, but Turkey's experiment in democracy suffered major setbacks because of interventions by Turkey's military in 1960, 1971, and 1980. The army's role in politics was institutionalized in the 1961 constitution, with the creation of the National Security Council (NSC). The NSC's role was expanded under the 1982 constitution.

The Turkish government structure is based on the principle of the separation of powers, although this principle is not always realized in practice. The executive body consists of the president, the prime minister, and the Council of Ministers. (Ahmet Necdet Sezer was elected president in 2000, the tenth president in the history of the Turkish republic.) The president is the head of state and is elected by the Turkish Grand National Assembly (TGNA) for seven years; the president in turn appoints the prime minister, who

is the head of the government, and, on the recommendation of the prime minister, the Council of Ministers, or cabinet. The post of prime minister is usually offered to the leader of the majority party in parliament. According to the 1982 constitution, the legislative body, the TGNA, is unicameral and consists of 550 deputies elected for five years in a general election. The election system is based on proportional representation (that is, the number of seats a party has in parliament is proportional to the percentage of the popular vote that the party received), with a 10 percent national threshold. The voting age is 18.

The judicial system is composed of civilian courts, the constitutional court, and state security courts. Civilian courts include peace courts, criminal courts, and commercial courts. State security courts deal with crimes against the state, whereas the constitutional court decides the constitutionality of legislation. An independent court system is guaranteed under the constitution.

After the 1999 general elections political parties represented in the TGNA were the Motherland Party (ANAP), the Republican People's Party (CHP), the True Path Party, the Virtue Party, the Democratic Leftist Party (DSP), and the Nationalist Action Party (MHP). Bulent Ecevit, the leader of the DSP, is the prime minister of the fifty-seventh cabinet, formed on 4 June 1999.

Administratively, Turkey is divided into eighty provinces, each under a provincial governor appointed by the Council of Ministers. The provinces are headed by appointed junior governors. Provinces are also organized as municipalities, of which there were 3,126 in 2000.

The Turkish army is responsible for defending the republic against internal and external enemies. According to the internal service code of the armed forces, the army is the guardian of the Kemalist state. The Turkish military is one of the largest in the world, with total active personnel of 639,000 in 1998. In 1998, 11 percent of the budget was allocated for defense expenditure. Military service is obligatory for male Turkish citizens over the age of twenty; Turkey does not recognize conscientious objection.

Economy

Turkey is a free-market economy with a large public sector. The country is a customs union partner with the European Union and a member of the World Trade Organization. Although the annual growth rate is relatively high (3.9 percent in 1998), the Turkish economy is far from stable. In the 1990s it suffered from high in-

flation (99.1 percent in 1997), soaring unemployment, an expanding budgetary deficit, and an inefficient public sector, whose large deficits hamper the economy. The Turkish privatization board continues to make evaluations about privatizing the telecommunications, iron and steel, and banking sectors.

Turkey's gross domestic product (GDP), based on purchasing power parity calculations, was estimated at \$444 billion in 2000, with a GDP per capita of \$6,800. The official unemployment rate for 5.6 percent in 2000, but the unofficial estimates in the late 1990s indicated a rate as high as 30 percent, especially among urban youth. Turkey's budget deficit in 1998 was \$18.9 million, and the foreign debt at the end of 1998 reached \$79.8 million.

Although agriculture forms the largest sector of the Turkish economy, employing 46 percent of the economically active population in 1998, its contribution to the GNP was only 17.6 percent. In 1998 only 34 percent of arable land was used for agriculture. Wheat, sugar beets, barley, potatoes, fruits, corn, cotton, tea, tobacco, hazelnuts, and olives are the main agricultural products. Turkey's mineral natural resources include coal, iron ore, copper, chrome, manganese, borax, and bauxite. In 1998 the mining sector employed 0.8 percent of the economically active population and represented 1 percent of GDP.

Major industries in Turkey include textiles, food processing, iron and steel, and cement production. The industrial sector accounted for 22 percent of employment and 26 percent of GDP in 1998. The service sector made the biggest contribution to GDP, at 57 percent. The fastest-growing sector is tourism: in 1998, 9.5 million visitors came to Turkey and produced a revenue of \$7.2 million.

Turkey's principal exports include clothing and textiles, iron, steel, metals, vegetables, and fruits. In 2000 exports totaled \$26.9 million. Principal imports, including machinery, minerals, metals, and petroleum products, totaled an estimated \$55.7 million in 2000. Turkey's main trade partners are Germany, the United States, Italy, the United Kingdom, Saudi Arabia, Libya, and Iran.

Turkey's total energy production is insufficient to meet anticipated requirements, which are growing by approximately 10 percent a year. The electrical energy demand for 2000 was projected at 130 billion kilowatt hours (kWh), whereas current hydroelectric potential was only 120 billion kWh. The government plans to fill the gap by encouraging private-sector investments in the power-generation and distribution sectors through a build-operate-transfer system, by which

Turks wave flags as they climb the steps of the Ataturk mausoleum in Ankara on 29 October 1998 in celebration of the 75th anniversary of the proclamation of the Turkish Republic. (AFP/CORBIS)

public services and infrastructures are financed and managed privately for a set period of time, at the end of which they are transferred to the government. Currently, energy is derived from thermal power plants using lignite, coal, and hydroelectric power.

The transportation network consists of 320,600 kilometers of provincial roads and highways (only 59,842 kilometers of which are highways). Railroads, long neglected, are operated by the State Railways, a state economic enterprise. Turkey has thirty-eight airports: the largest is Istanbul Ataturk Airport. Istanbul, Izmir, Trabzon, Mersin, and Iskenderun are major seaports.

Culture

Turkey is a land of contrasts. The country's rich historical heritage and its location as a bridge between East and West produce a unique cultural mosaic. The old and the new, secular and Islamic, modern and traditional live side-by-side and influence architecture, music, and lifestyles. Although modern Turkey is a secular, Western-oriented state, Islamic values play a significant role in people's lives. The relative strength of Islamic and secular values in daily life varies between rural and urban populations and between regions and social classes.

During the last few decades Turkey has experienced rapid social change. Population growth and migration to the big cities accompanied high inflation, unem-

ployment, and uneven distribution of wealth. As a result, social tensions have increased. Urbanization and economic necessities have changed traditionally defined gender roles and family life: large patrilineal families have been replaced by nuclear families with an average household size of four persons. Nevertheless, the family is still an important institution in Turkey. The country has one of the lowest divorce rates in the world: 0.5 percent per 1,000 population. Although serious steps have been taken to improve women's rights (polygamy was abolished in 1925; laws were amended to offer women equal rights of divorce and inheritance; women's suffrage was granted in 1934) and to promote gender equality, the emancipation of women depends on their level of education and their social class. There have been women politicians and members of parliament, cabinet members, as well as a female prime minister (Tansu Ciller, served 1993–1996). There is no gender discrimination in legal and educational systems.

Traditional cultural expressions, which had been ignored by the early republican regimes, have been revived during the last few decades, including folk dancing and singing. Turkish folk music is sung by *asiklar* (troubadours), playing traditional instruments such as the stringed *saz*. The mystical music of the whirling dervishes is another traditional music form.

Efforts to Westernize Turkish society are evident in the nation's flourishing arts, drama, and classical

and contemporary music. State-supported cultural activities encompass a national network of theaters, orchestras, opera and ballet companies, and various conservatories.

After a massive literacy program in the 1980s, the literacy rate rose to 85 percent by 2000. In 1998 elementary school enrollment was 9,581,180. Compulsory elementary education was increased to eight years to weaken the importance of religious high schools.

Turkey has colorful media: major newspapers include *Cumhuriyet*, *Hurriyet*, *Sabah*, *Milliyet*, *Star*, *Yeni Yuzyil*, *Zaman*, *Turkiye*, *Radikal*, and *Turkish Daily News*. Newspaper circulation is constantly supported by promotions. Aside from national papers, there are more than 700 local newspapers. The circulation of each national magazine varies between 10,000 and 50,000. The state monopoly on broadcasting was ended in the early 1990s, and, in addition to the TRT (Turkish Radio and Television Corporation), there are privately owned national stations such as ATV, Show TV, KanalD, Star TV, Bayrak TV, and more than one thousand private radio stations.

Current Issues

At the end of the second millennium Turkey faced serious economic, social, and political problems. Democratization and human rights abuses are among the most important issues, as are the Kurdish problem and Islamic fundamentalism. Corruption, uneven distribution of wealth, and chronic inflation plague the country's economy.

TURKEY—ECONOMIC SYSTEM The Republic of Turkey was founded in 1923 as the last nation-state that emerged when the Ottoman empire disintegrated after World War I (1914–1918). World War I and the War of Independence (1919–1922) against foreign occupation of the Anatolian Peninsula

had a devastating impact on the new nation's economy. Following independence, the nationalist elites founded a single-party system (1924–1946) in which the Republican People's Party (RPP) undertook modernization of Turkey's social, political, and economic structure.

The Izmir Economic Congress of 1923 formally recognized private enterprise as an essential economic actor but gave the state the means to protect private enterprise because it was too weak to undertake massive infrastructure investments alone. In desperate need of capital, the state adopted policies to support private enterprise and encourage foreign investments. The economic environment for foreign capital investments was favorable because the 1923 Lausanne Treaty, by which Turkey was recognized as an independent state, precluded the new regime from imposing a protective customs regime until 1929.

To create the capital necessary for financing its ambitious modernization project, the state prioritized agriculture. Its policies contributed to an 87 percent increase in agricultural output between 1923 and 1926. After passage of the Law for the Encouragement of Industry in 1927, the state introduced policies to provide indirect support, such as subsidies and trade concessions to local infant industries. State banks and credit institutions were also used to raise financial support for local industries.

Although the state was partially successful in creating infant industries that accounted for 14 percent of the national product in 1929, agriculture remained the basis of the economy. Thus, the decline in agricultural product prices after the Great Depression of 1929 hurt Turkish exports and foreign currency earnings. Turkey began to experience a mounting economic crisis with the depreciation both of its lira currency and its balance of trade position. Also in 1929, the restrictive customs terms of the Treaty of Lausanne expired, and the Turkish state had the opportunity to take comprehensive protectionist measures. A new era began.

Etatism

To legitimize state intervention in the economy the RPP devised the approach known as etatism, which it interpreted as an instrumental policy to initiate a state-led industrialization effort. The etatist policies further involved the state in the economy, giving it a new role as a protector, producer, and planner. In its role as protector, the state first erected a protectionist customs regime and used the specialized state banks, such as the Agricultural Bank and the People's Bank, to generate direct credits for agriculture and commerce. As

a producer, the state founded state economic enterprises (SEEs). These giant companies, owned or controlled by the state, produced intermediate and consumer goods in sectors such as textiles, mining and extraction works, paper, chemicals, and pottery. As a planner, the state began to draw up five-year industrial plans to coordinate public and private efforts for development. The first plan was launched in 1934, but the second one (launched in 1938) became obsolete with the outbreak of World War II. Further state expansion in the economy was accelerated by the nationalization of foreign firms between 1931 and 1939. The state-led industrialization model not only restored the state as a principal actor but also instigated an increase in the private sector's contribution to the national product from 14 percent in 1929 to 19 percent in 1939 by placing the private sector under pervasive state protection. Protectionism was expanded in agriculture after 1938, when the Soil Products Office was founded to determine subsidy levels for wheat. This subsidization policy was later broadened to include other agricultural products. The legacy of the 1930s was the fact that state intervention in the economy created a mixed economy in which the public and private sectors operated as adversaries governed by different rules.

Although Turkey remained neutral when World War II broke out in 1939, wartime developments halted its industrialization attempts. The National Protection Law of 1940 tightened state control over the economy by giving the government absolute power in determining general price and production levels. The government also devised new fiscal policies to mobilize public and private resources for military objectives, causing a 5.6 percent decrease in industrial output. Agricultural output declined by 7.2 percent, causing food shortages. Deterioration of the living standards was coupled with growing income inequalities. In the prewar period (1933–1939), the share of industry and agriculture in national income had increased steadily. Wartime developments (1939–1945), however, caused a temporary stagnation in these sectors but a boom in the service sector, whose contribution to national income reached almost 50 percent. The wartime economy also generated a new problem—inflation—and the increase in the general price level posed a threat to the nation's balance-of-trade position.

From 1945 to the 1970s

The first priority of the postwar Turkish governments was to improve the competitiveness of Turkish exports, whose prices had risen above the world average. To this end, the Turkish lira (TL) was devalu-

ated by almost 54 percent in 1946. The RPP government in 1947 also launched the Economic Development Plan, which loosened etatist policies. It was trying to cope with the liberal challenge posed by the new opposition party, the Democratic Party (DP), founded in 1946.

Reacting to wartime economic constraints and the deterioration of living conditions, urban and rural classes realigned their political loyalties, and the DP won the 1950 elections. The party promised to liberalize the economy and broaden the scope of the state's support to the private sector. In conjunction with new trends in the Cold War period, Turkey began to integrate more with the Western alliance system against the Soviet Union and began to receive more foreign aid. The new DP government was able to allocate more public funds to support industry and agriculture.

The mechanization of agriculture, elimination of some taxes, and massive public investments in infrastructure coincided with favorable weather conditions and caused an annual growth rate of 11.5 percent in agriculture between 1950 and 1953. Turkey experienced an economic boom in the first half of the 1950s with an annual growth rate exceeding 10 percent. Industrial expansion was achieved mostly in the subsectors producing consumer goods and intermediate industrial goods such as cement, chemicals, construction material, and rubber and plastics.

Economic policies between 1954 and 1957 were designed on an as-needed basis to reverse inflation and solve the balance-of-payments difficulties by relying more on foreign debt. The National Protection Law was, however, reenacted to restore government control over price increases. These measures helped reduce the foreign trade deficit but failed to restore price stability and could not prevent a shortage of goods and the emergence of a black market. In 1958, the government introduced the nation's first comprehensive austerity program, which included standard stabilization measures such as devaluation, reduction of budget spending, price increases on SEE products, restraints on public spending, and rescheduling of foreign debt. The adverse effects of the deterioration of price stability and the restrictive economic program enforced by the DP since 1957—felt most severely by those groups with fixed incomes, such as the civil and military bureaucracies—paved the way for the first military takeover on 27 May 1960.

With the return to civilian rule in 1961 and a new constitution, the state introduced the policy of inward-looking, import-substitution industrialization (ISI). The aim was to create a capital-intensive industrial

base in a mixed economy through centrally planned five-year development plans. ISI was followed until 1980 with the goal of stimulating domestic-capital accumulation by protecting private or public infant industries through restrictive customs tariffs. In the first phase of ISI, which lasted through the 1960s, primary industries requiring low technologies, such as textiles, developed rapidly. In this phase, infant private and public industries took advantage of state protection in the form of incentives, import permits, and subsidies, and industry's share of GDP was 22.6 percent by the end of the decade.

During this time, economic development could be sustained as long as intermediate industrial goods and raw materials used by domestic industry could be imported. Some 95 percent of all imports were used by domestic industry. Yet, the by-product of the protectionist policies was an overvalued currency that hurt exports. By the end of the 1960s, Turkey began to re-experience the balance-of-payments difficulties that had dogged the economy since the mid-1950s. As an immediate remedy, the TL was devaluated by 66 percent in 1970.

From 1971 to the Twenty-First Century

When the military intervened on 12 March 1971, the nation was trapped in the vicious cycle of growing imbalances of payments, mounting foreign debts, and public deficits. The interim civilian governments between 1971 and 1973 imposed stabilization policies and temporarily achieved their goal by taking advantage of the stimulating impact of the 1970 devaluation on exports. Moreover, emigrant workers' remittances had become a major source for restoring the balance of payments. Turkey had exported labor to Europe, especially Germany, in the 1960s, and these workers' remittances, which amounted to only 2 percent of export earnings in the 1960s, soared to 50 percent in 1970–1971 and 90 percent in 1973. The stabilization measures and workers' remittances combined to provide a temporary solution to the balance-of-payments problems and created a surplus in current accounts in 1971 and 1972.

In the first half of the 1970s, Turkey entered the second phase of the ISI model, characterized by growth in those industrial sectors that required use of semiadvanced technology, such as chemicals, automobiles, electrics and electronics, and consumer durables. An increase in the volume of foreign investments was partially responsible for the dynamism in these sectors. The decline of the share of agriculture in national income from 36 percent in 1936 to 24 percent in 1973

Cranes at work in the Golden Horn shipyard in Istanbul in c. 1997. (DAVE BARTRUFF/CORBIS)

was an indicator of the economy's shift from agriculture to industry, a process that intensified after 1980. In 1983, agriculture accounted for only 17 percent of the national income.

With the first oil crisis in 1973–1974 the economy began to deteriorate because policymakers responded by subsidizing the rising world oil prices rather than restructuring Turkey's energy production and consumption policies. Moreover, the economic slowdown in Europe resulted in a decline in export earnings; thus, the nation's balance-of-trade position worsened, experiencing an average growth rate of 0.3 between 1977 and 1980. Declining emigrant workers' remittances complicated the economic crisis. Coupled with accelerated public deficits that boosted inflation to triple-digit levels by the end of the 1970s, declining remittances caused the economy to overheat. Public-sector deficits were financed by short-term external borrowing, which amounted to 66 percent of the nation's total foreign debts in 1977—debts on which Turkey could not repay even the interest in 1978. Then came the second oil crisis, in 1979.

On 24 January 1980, one of the most comprehensive structural adjustment programs toward the institutionalization of a market-oriented growth strategy was announced by the minority government of the Justice Party, which had been founded in 1961 as an heir to the DP. This program had four basic objectives: reduction of the external deficit and inflation, deregulation of the financial system, liberalization of the trade regime, and institutionalization of a market-oriented growth model. Like previous austerity programs, this program included standard stabilization measures such as devaluating the TL, abandoning the fixed exchange rate policy, eliminating most subsidies, freeing the prices of SEE products, reorganizing the taxation system, and encouraging foreign investments.

A girl in Izmir, Turkey, weaving a carpet c. 1997. (RICHARD T. NOWITZ/CORBIS)

On 12 September 1980, the military intervened. A new constitution was submitted to popular approval in 1982. Between 1980 and 1983, civilian-technician governments uncompromisingly imposed the stabilization program. In 1983, elections were held for the transition to civilian rule. The first civilian government was formed by the Motherland Party (MP), founded in 1983, and it further developed the export-oriented growth strategy between 1983 and 1987. These measures increased the share of manufactured goods in exports while decreasing the share of agricultural products, a trend that continued throughout the 1990s. Gradual abandonment of quantitative restrictions in the customs regime, continuous devaluations, export credits, export tax rebates, and sectoral incentives, as in the case of tourism, aimed to increase Turkey's export earnings to overcome the chronic balance-of-payments problem. The post-1983 governments also launched build-operate-transfer (BOT) schemes in the energy and infrastructure construction sectors. Under the BOT system, the government contracts out major infrastructure projects to private companies that build and operate a project for a fixed term prior to the transfer of the project to the public sector. Moreover, a program for privatization was initiated in 1986 to serve both as an alternative and a complement to the government's plan for stimulating foreign capital inflow.

The MP governments focused on deregulation of the financial sector, and the new Banking Law of 1985 transformed it into one of the most dynamically developed sectors. The opening of the Istanbul Stock Exchange Market in 1986 was another critical step for the integration of the Turkish economy with the international financial system, and it began to serve as a gateway for the inflow of international capital. Finan-

cial liberalization transformed the dynamics of the Turkish economy completely. Prior to 1980, Turkey's economic crises emerged due to foreign debt problems; after 1983, economic crises emerged due to the deflation policies that aimed to protect the competitiveness of Turkey's export sector.

In 1987, a referendum was held, and the exclusion of some political leaders, imposed after the 1980 military intervention, was ended. This was bad news for the Turkish economy because stiff political competition drove the ruling MP to adopt monetary expansion to finance growing public spending, which boosted inflation. Growing public spending on massive investments in infrastructure, transportation, and public construction works contributed to inflation rising to 55 percent in 1987 from 48.3 percent in 1984. By the end of the 1980s, economic growth had slowed, and Turkey entered a new period of recession. Restrictive monetary policies that the government tried to impose to contract domestic demand in the short run could not control inflation, which reached 70 percent in 1988. Inflationary pressure posed a real threat to the stability of an economy experiencing chronic budget deficits and suffering from foreign and domestic debt problems. To stimulate free exchange of TL for other currencies and to encourage the inflow of foreign capital, convertibility was adopted in August 1989.

The 1991 Gulf War hit the stagnant economy hard because Turkey abided by the U.N. blockade of Iraq, thereby cutting all its trade ties with that nation. In domestic politics, the adverse effects of the export-oriented growth strategy, which relied on the reallocation of national income in favor of the export sector, and the monetary policies of the MP governments, which hit fixed-income groups the hardest, worsened income distribution inequalities. Consequently, the MP lost the 1991 elections, and Turkey entered a new decade of government by coalitions. The post-1991 governments loosened the restrictive monetary policies by reactivating subsidies and price support policies in agriculture and by boosting public deficits.

These policies were designed to stimulate domestic demand but resulted in weakening the current account balance, causing a financial crisis in 1994. In response, that same year the government launched a new austerity program, the goal of which was to bring short-term stability to the financial sector. It also included standard austerity measures promising reductions in inflation and public deficits and improvements in balance payments. To these ends, the TL was devalued by 56.2 percent in April 1994, at the peak of the crisis. The austerity program required strict mon-

etary policies that political considerations made the government reluctant to impose. Still, at least temporarily, the government achieved its goals of suppressing domestic demand and reducing public expenditures at the cost of slowing down the economy. Although the program was unsuccessful in solving chronic inflation, the economy began to recover in 1995–1996, and Turkey's entrance into the Customs Union with the European Union in 1996 brought a new dynamism in some sectors—industry, trade, and communications—although its effects on the whole economy remain ambiguous.

The financial sector benefited most from the liberalization attempts in the post-1980 period. Yet, the lack of complex legal-administrative regulations further limited government control over the financial sector. The difficulties of the free-for-all game in the financial sector surfaced when the government, in cooperation with the International Monetary Fund (IMF), introduced a fixed exchange rate policy within the framework of a general deflationary economic program in 1999 to control inflation and restore the balance of payments. The financial sector found it increasingly difficult to adapt to the changing rules of the game because since 1994 it had made most of its profits from the government's policy of financing public deficits from short-term loans and by manipulating the nation's high inflation and foreign exchange rate policy. The widening gap between the inflation rate and the foreign currency exchange rate and the overvalued TL made the government's policies obsolete. In November 2000 and February 2001, Turkey experienced one of its worst financial crises, losing almost one-third of its foreign currency reserve in a week when a dispute between the prime minister and the president triggered a crisis of confidence that resulted in the outflow of foreign capital. In response, the government adopted a new restructuring program. It revised its foreign currency regime and abandoned the fixed exchange rate policy (the pillar of the IMF's anti-inflationary program) in favor of a fluctuating exchange rate policy. It also received a massive amount of foreign aid from the IMF and adopted a new structural reform program requiring wide-ranging privatization in the banking, telecommunications, and energy sectors as well as a series of austerity measures for curbing government spending and reducing inflation.

TURKEY—EDUCATION SYSTEM Education has been a consistent barometer of political and social trends in the late Ottoman empire and the Turkish Republic. Due to its importance for successive Ottoman and Republican governments, education has come to symbolize the direction in which society is intended to move. Together with the military, education has obtained an emblematic quality that ensures its central role in Turkish society. Due to this centrality, the ways in which the history of education in Turkey has been written reflect an ongoing debate about the desired blend of the secular and the religious.

Like most premodern societies, the Ottoman empire had a tradition of restricted state involvement in education. The government's provision of education extended only to training soldiers or the small number of scribes who ran the empire. In the absence of major state initiative, most education was religious: It was largely scriptural in content, usually imparted in or close to a place of worship, and taught by men of religious learning. Those who received education, always a small minority of the population and well under 10 percent until the empire's last decades, did so at the hands of the ulama (the learned men of Islam), priests, or rabbis, depending on their faith.

With the advent of Western-style military reform in the late eighteenth century, the Ottoman state embarked on a radical process of enlargement that had direct consequences for education. Fielding a standing

army based on drill and centralized command required schools for officers as well as specialized branches, such as artillery and medical units. Creating a modern army was extremely expensive and therefore necessitated finding new ways of extracting revenues from the land and its people. In short, this meant expanding the bureaucracy on a massive scale. Whereas once an estimated two thousand scribes ran the empire, over the course of the nineteenth century this number ballooned to over thirty-five thousand. Because all of these bureaucrats had to be able to read and write, educating them properly became a priority.

Tanzimat Reforms

In 1839, the first year of the Tanzimat period of reforms (1839–1876) under Sultan Mahmud II, the Ottoman government issued the first in a long series of memoranda dedicated to education reform. The thrust of these early attempts was to incorporate the existing schools, mostly the Qur'an schools, and to use them as the basis for an imperial system. The overriding objective was to train loyal and capable bureaucrats, it being understood that adopting the religious and moral approach of the Muslim schools was the only possible way forward. This piecemeal approach continued until 1869, when, under strong, centralizing French influence the empire adopted the Education Regulation, which would guide education developments for the rest of the empire's life and for many of its successor states, including the Turkish Republic.

Although decreed in the final years of the Tanzimat period, the Education Regulation was largely implemented only from the 1880s onward, during the reign of Sultan Abdulhamid II (reigned 1876–1909), who strongly believed in the necessity of a modern education system that would combine the latest in European content, such as chemistry and French, with the religious and historical material suitable to Ottoman and Islamic tradition. Expanding both horizontally among the provinces and vertically from primary to higher levels, including a university in Istanbul from 1900, the new system would be altered by successive regimes, acting as a vehicle for an increasingly Turkist political agenda, first haltingly during the Young Turk period (1908–1918) and then much more forcefully in the smaller Turkish Republic (1923–present).

Ataturk's Reforms

The earlier years of the Republic demonstrated that the new government of Mustafa Kemal (1881–1938, later Ataturk, or Father of the Turks), although inheriting the core of the Ottoman system, was bent on a radical reorientation of society, toward the West and

away from its Islamic past. Among the many ruptures was the abolition of the *medrese* (Islamic seminary) system run by the ulama. But in many ways Republican education only intensified existing trends in education. Freed from the pressure of the Great Powers and with a much more homogeneous and smaller population to educate, the young Republic pursued its twin themes of tightening the restrictions on foreign schooling and making its own schools more nationalist in orientation. The Unity of Education Law of 1924 set the tone by insisting that all education institutions be regulated by the Ministry of National Education. Two years later, a regulation demanded that all teachers of such sensitive subjects as history, geography, and language be approved by the new capital in Ankara and had to be supportive of the concept of the Turkish nation. Schools were now obliged to display prominently portraits of Mustafa Kemal.

Meanwhile, Kemal was devising two highly symbolic policies that would literally reshape education in Turkey: changing the alphabet and engineering a radical reform of the Ottoman Turkish language, a rich combination of Arabic, Persian, and Turkish. The forced adoption of the Latin alphabet, and of Western numerals, in 1928 was backed by some sound linguistic arguments—the Arabic script was not well suited to render Turkish words—but was ultimately intended to sever ties with Turkey's Islamic heritage. The movement was spearheaded by Kemal himself, who now appeared around the nation, chalk in hand, as a sort of teacher in chief. The language reform, summarized by one scholar as a "catastrophic success," ensured that students in the Republic would learn a language that was increasingly unintelligible to their grandparents and, perhaps more to the point, would be cut off from the language of their elders.

The Resurgence in Religious Education

During the Single Party period (1923–1945), the government pressed ahead with its nationalist agenda in the schools while reaching out to the rural population. In order to combat high rates of illiteracy, it launched the Village Institute scheme designed to provide rural areas with teachers who would energize the literacy drive. A largely successful initiative, it was disbanded when the Democrat Party came to power in the watershed elections of 1950. In the run-up to the election, as the major parties began to court the conservative vote, the government began to offer more in the way of religious education, such as elective religious education, special training for preachers in the schools (1947), and the creation of a theological faculty at Ankara University (1949). After winning the elections

of 1950, the Democrat Party expanded religious education dramatically, thereby undermining the secularist principles of the Kemalist state. The return of the Republican People's Party, the party founded by Atatürk, to power after the military coup of 1960 produced only an increase in the attention paid to religious schools, indicating their broad support in Anatolia.

Education from the 1970s into the Twenty-First Century

During the 1970s, when Turkey entered a period of political turmoil, education was once again at the center of activity. Strikes, protest, and violence between the right and the left were often played out on university campuses, and numerous academics were fired for their views or resigned in protest of the government's policies. After the military coup of 1980, the government established the Higher Education Council, which has run university-level education in a strong-handed capacity ever since.

In recent years, the salient features of Turkish education have included the ongoing controversy over whether or not women are to be permitted to attend courses while wearing the headscarf, the question of overcrowding in schools, truancy due to child labor, and the mushrooming of private universities across the nation. Continuing a trend begun in late Ottoman times, the solutions that will emerge will doubtless reflect a struggle as much over ideology as resources.

TURKEY—HUMAN RIGHTS Turkey is the only democratic state with a predominately Muslim population. Its political leaders have created a constitutional republic with a democratically elected Parliament and an independent judiciary. Turkey has ratified a number of international human-rights conventions, including the European Convention for the Protection of Human Rights and Fundamental Freedoms (which includes the right of individual petition and the compulsory jurisdiction of the European Court of Human Rights). As part of its efforts to promote human rights, the government established the

Parliamentary Human Rights Commission in 1990 and the Human Rights Ministry in 1991.

Despite these achievements, domestic and international critics have faulted Turkey's human-rights practices. Critics have alleged: (1) torture and the suspicious deaths of prisoners while in detention; (2) disappearances and extrajudicial killings of opposition politicians, human-rights activists, journalists, and Kurdish nationalists; (3) government infringements on the freedoms of speech, press, and association; (4) denial of due process to persons under the jurisdiction of state security courts and in the state-of-emergency region; (5) the destruction of Kurdish villages in the southeast by the Turkish military; and (6) suppression of Kurdish cultural expression.

Some members of the nation's political elite, bureaucracy, and military claim that Turkey is threatened from within by "reactionaries" (Islamists) and "separatists" (Kurdish nationalists) and that they are willing to curb human rights to meet these threats.

Religious and Ethnic Minorities

Turkey's 1924 constitution establishes Turkey as a secular state and provides for freedom of worship. In accordance with the 1923 Lausanne Treaty, Greeks, Armenians, and Jews are permitted to maintain their own schools and to teach their religion and language. These small minorities report little discrimination in daily life.

Turkey has many other ethnic minorities who are not officially recognized as such. These include Laz, Circassians, Georgians, Kurds, and Arabs. Human-rights violations have been especially inflicted on the Kurds—the largest ethnic and linguistic minority, who may now represent one-fourth of the population (roughly 15 million people). There are no legal barriers to Kurds' participation in political and economic affairs, and many members of Parliament and senior officials and professionals are Kurds. However, the government has long denied the Kurds basic cultural and linguistic rights. Kurds who publicly assert their Kurdish identity or espouse speaking Kurdish in the public domain risk harassment or prosecution. Since 1991 private spoken and printed communications in Kurdish have been legal; however, the use of minority languages in television and radio broadcasts, by political parties, and in schools is restricted by a series of laws and constitutional articles that prosecutors invoke arbitrarily.

For over fifteen years, the military has fought the Kurdistan Workers Party (PKK), whose goal originally was the formation of a separate state of Kurdistan in

southeastern Turkey. A state of emergency, declared in 1987, has continued in those southeastern provinces that face substantial PKK terrorism. The state-of-emergency region's governor has exercised quasi martial-law powers, imposing restrictions on the press, removing from the region persons whose activities are deemed detrimental to public order, and ordering village evacuations.

Approximately 560,000 villagers were forcibly evacuated from their homes between 1987 and 1999. A parliamentary committee concluded in 1998 that the state was partly responsible for the displacements and that it had failed to adequately compensate villagers who had lost their homes and lands. The European Court of Human Rights has ruled in favor of villagers who sued over forcible evacuations and has ordered Turkey to pay damages.

Although the constitution provides for freedom of speech and press, the government has limited these freedoms on the basis of national security. The criminal code provides penalties for those who "insult the president, the parliament, and the army." Prosecutors also rely on other provisions in various laws restricting freedom of expression.

The state-of-emergency governor, courts, police, and the body overseeing state broadcasting have denied the Kurdish population in the southeast use of their language in election campaigning, education, broadcasting, and in some cultural activities, such as weddings. Printed material in Kurdish is legal; however, the police have commonly interfered with the distribution of Kurdish newspapers. Kurdish music recordings are widely available, but bans on certain songs and singers exist. Radio and television broadcasts in Kurdish are illegal.

A total of 114 intellectuals and human-rights activists were sentenced in April 1999 to a year in prison each, on charges of "separatist propaganda," for signing a 1993 declaration calling for a peaceful solution to the Kurdish conflict. In July 1999, the European Court of Human Rights ruled on thirteen Turkish cases involving freedom of expression in which the plaintiffs were jailed or fined for books, articles, or statements that they wrote or published on Kurdish issues. These plaintiffs were convicted either of "inciting ethnic hatred" or "disseminating propaganda against the indivisibility of the state" or for "revealing the identity of officials responsible for combating terrorism." The European court found that the Turkish government violated the plaintiffs' right to freedom of expression in eleven of these thirteen cases, denied plaintiffs in nine cases the right to have their cases

heard by an independent and impartial tribunal because of the presence of military judges on the state security courts, and in one case violated the prohibition against no punishment without law. But despite government restrictions, the media criticize government leaders and policies daily. Lively debates on human rights also occur.

Torture and Other Cruel Punishment

Security forces and police have tortured, beaten, and abused persons regularly. The lack of universal and immediate access to an attorney and long detention periods for those held for political crimes are major factors in torture. Despite the government's cooperation with unscheduled foreign inspection teams and public pledges by successive governments to end the practice, torture continues to be a serious human-rights problem. The Turkish Human Rights Foundation (HRF) estimated the number of credible reports of torture at its five national treatment centers at 700 in 1999, compared with 673 in 1998. But the HRF believed that these figures underrepresented the actual number of persons tortured while in detention or prison.

Human-rights monitors say that security officials increasingly use methods that do not leave physical traces, such as beating with weighted bags instead of clubs or fists. Commonly employed methods of torture reported by the HRF's treatment centers include administering electric shocks and systematic beatings; stripping and blindfolding; exposing to extreme cold or high-pressure cold water hoses; beating the soles of the feet (*falaka*) and genitalia; hanging by the arms; depriving of food and sleep; hanging heavy weights on the body; dripping water onto the head; burning; hanging sandbags on the neck; nearly suffocating by placing bags over the head; raping with truncheons and gun barrels; squeezing and twisting testicles; and other forms of sexual abuse. Female detainees often face sexual humiliation and, less often, more severe forms of sexual torture.

Government officials admit that torture occurs but deny that it is systematic. The U.N. special reporter for torture conducted investigations at the invitation of the government in late 1998. He reported that although torture was practiced systematically and on a large scale through the mid-1990s, there had been "notable improvements" since 1997.

Human-rights monitors have reported that government forces use excessive force, sometimes resulting in deaths, during raids on criminals or alleged terrorist and militant safe houses. Police and prison guards have also been accused of extrajudicial killings,

often resulting from torture. In 1999, at least thirty trials were under way because of such charges.

Right to a Fair Public Trial

The judicial system is composed of general law courts, military courts, state security courts (SSCs), and the Constitutional Court. The High Court of Appeals hears appeals for criminal cases, including from SSCs. Military courts, with their own appeals system, hear cases involving military law, members of the armed forces, and civilians who are accused of impugning the honor of the armed forces or undermining compliance with the draft.

SSCs have posed the main problem for due-process rights. These courts sit in eight cities and try defendants accused of crimes such as committing terrorism, committing gang-related crimes, smuggling drugs, belonging to illegal organizations, and espousing or disseminating ideas that are "damaging the indivisible unity of the state." These courts may hold closed hearings and may admit testimony obtained during police interrogation in the absence of counsel. Until mid-1999, the SSCs were composed of panels of five members: two civilian judges, one military judge, and two prosecutors. A 1998 ruling by the European Court of Human Rights found that the presence of a military justice on the SSCs was inconsistent with relevant European conventions. In June 1999 the government amended the Constitution and passed legislation replacing the military judge with a civilian judge.

Attorneys defending controversial clients have been subject to spurious legal charges, such as accusations that they are couriers for clients who are alleged terrorists. The government charged twenty-five lawyers in 1993 and 1994 with aiding and abetting the PKK or belonging to a terrorist organization. Sixteen of these defendants complained of torture and mistreatment while held incommunicado after their arrests.

Human Rights for Women

Women enjoy all political and educational rights. They work in all professions. Trafficking in women and girls to Turkey from eastern Europe for the purpose of forced prostitution has been a problem since the 1990s. The government in late 1998 issued a regulation prohibiting the traditional practice of "virginity testing" of women about to be married unless requested by the women themselves.

Government Attitude toward Human Rights

Security forces and prosecutors have commonly harassed, intimidated, indicted, and imprisoned human-

rights monitors, journalists, and lawyers for ideas that they expressed in public forums. The government has closed branches of human-rights organizations in the southeast. In 1999, prosecutors had former Human Rights Association president Akin Birdal jailed on charges of inciting hatred and enmity in nonviolent statements he made about the Kurdish problem and torture.

However, the government is publicly committed to improving human-rights practices. The state minister for human rights and the minister of justice have led government efforts to implement legislative and administrative reforms. The armed forces have instituted human-rights training for officers and noncommissioned officers. Human-rights education is mandatory in primary schools and elective in high schools.

In August 1999, Parliament passed legislation increasing sentences for persons convicted of torture from a maximum of five to eight years. Government officials have been in regular dialogue with the Council of Europe's Committee for the Prevention of Torture (CPT) and allow unannounced prison visits by the CPT.

TURKEY—POLITICAL SYSTEM The political life of the Republic of Turkey began with the first meeting of the Turkish Grand National Assembly (TGNA) in 1920. The TGNA sprang from the conventions of the Association for the Defense of the Rights of Anatolia and Rumelia, held in Erzurum and Sivas in 1919.

The TGNA was a *régime d'assemblée* where all authority was vested in the assembly itself; there was no head of state. The government, known as the government of the Grand National Assembly, had no control over the assembly. The assembly elected cabinet

members by direct vote from among its members. The first assembly had two groups of representatives: 92 deputies of the last Ottoman Parliament, which had terminated its last session in protest of the Allied occupation of Istanbul in 1920, and 349 members elected from each district under an indirect two-tier system (voters elected electors, who voted for assembly members) according to procedures defined by Mustafa Kemal (later Atatürk, 1881–1938).

The assembly was the result of a loose alliance of the urban middle class, the intelligentsia, army commanders, and bureaucrats, with local notables and landowners. Although the immediate aims of these groups were the same, there was an underlying conflict of interests when it came to the form and structure of the new state. One group, the supporters of Kemal, wanted to establish a secular state. Another group, created by the defenders of a constitutional monarchy, wanted to save the sultanate through reform.

To overcome the obstacles created by the assembly government system, Kemal proposed an amendment to the constitution. Under the new constitution Turkey would become a republic; the TGNA would elect the president from among its members; the president would appoint the prime minister, who would form the cabinet; and the cabinet would start work after the confidence vote of the assembly. Approval of this draft marked the victory of the first group and initiated the republican era.

The 1924 constitution established a unicameral legislature. Deputies were elected under the indirect two-tier election system. Because the candidates were defined by the party caucus; the election process was a symbolic approval of the Kemalist elite by the electorate. To be elected a deputy, candidates had to be literate and over thirty years of age. Once elected, deputies would become representatives of the nation, not of a specific district. Election districts were defined according to a ratio of one deputy to forty thousand voters. During the early years of the republic, the right to vote was limited to males over eighteen years. In 1934 the age limit was changed to twenty-two, and women were given the right to vote.

The One-Party Era

In 1923 Mustafa Kemal was elected the first president of the republic. He remained in that post until his death in 1938. Under his rule the Republican People's Party (RPP) became the official party of the country. He was not only the president of the republic but also leader of the RPP, chairperson of the party's Assembly Group Executive Committee, and chairperson

of the General Executive Committee of the party. In 1935 the RPP passed a resolution officially uniting party and state. The secretary-general of the party assumed the post of minister of interior affairs in the cabinet. Chairpersons of provincial organizations became governors of their provinces. In 1937 the six arrows of the RPP's party emblem (representing the six principles of Kemalism—republicanism, nationalism, populism, etatism, secularism, and reformism—were included in the constitution, which laid the basis for the ideological unification of the party and the state.

The death of Kemal and the election of İsmet İnönü (1884–1973) to the presidency did not change the political climate. At the party congress of 26 December 1938, İnönü was elected permanent chairperson of the party and given the title of national chief. The slogan "One party, one nation, one leader" was adopted. Although İnönü tried to create a broader consensus in the country, the policies of the World War II era increased discontent among various segments of society. Internal and external developments forced the RPP government to liberalize political life. In his speech on the opening day of the assembly in November 1945, İnönü announced the need for opposition parties for the well-being of the country and promised to achieve the necessary adjustments in the election system.

Transition to the Multiparty Period

In January 1946 a number of dissidents from the RPP formed the Democrat Party (DP). Although the programs of the two parties scarcely differed, popular discontent with the RPP provided support for the new party. The leaders of the DP emphasized the arbitrary character of a one-party state, an idea that attracted not only the bourgeoisie but the urban intelligentsia and the masses as well. As a measure against the unavoidable rise of the DP, the RPP decided to hold an early election in 1946 so that the Democrats would have little time to organize. The DP refused to take part in an election until the laws became more democratic. Consequently, the government amended the election law, replacing indirect election with direct elections. The election law went through further amendment before the 1950 election.

The new election system was a simple majority system. Ballots were cast secretly, and results were counted openly. Each province was organized as an electoral district. Under the winner-takes-all principle, the party receiving the majority of votes in a given province won all the seats in that province. The new election law made it possible for the DP to gain 83 percent of the seats (408 out of 487) with only 47 percent of the votes in the 1950 election.

THE PREAMBLE TO THE CONSTITUTION OF THE REPUBLIC OF TURKEY

Adopted 7 November 1982

Following the operation carried out on 12 September 1980 by the Turkish Armed Forces in response to a call from the Turkish Nation, of which they form an inseparable part, at a time when the approach of a separatist, destructive and bloody civil war unprecedented in the Republican era threatened the integrity of the eternal Turkish Nation and motherland and the existence of the sacred Turkish State.

This Constitution was prepared by the Consultative Assembly, given final form by the Council of National Security, which are the legitimate representatives of the Turkish Nation, and adopted, approved and directly enacted by the Turkish Nation,

And is entrusted for safekeeping by the Turkish Nation to the patriotism of its democracy-loving sons and daughters, in order that it may be understood to embody the ideas, beliefs and resolutions set forth below and be interpreted and implemented accordingly, commanding respect for, and absolute loyalty to, its letter and spirit:

- The direction of the concept of nationalism as outlined by Ataturk, the founder of the Republic of Turkey, its immortal leader and unrivalled hero; and in line with the reforms and principles introduced by him;
- The determination to safeguard the everlasting existence, prosperity and material and spiritual well-being of the Republic of Turkey, and to ensure that it attains the standards of contemporary civilisation, as a full and honourable member of the world family of nations;
- Recognition of the absolute supremacy of the will of the nation, and of the fact that sovereignty is vested fully and unconditionally in the Turkish Nation and that no individual or body empowered to exercise it on behalf of the nation shall deviate from democracy based on freedom, as set forth in the Constitution and

the rule of law instituted according to its requirements;

- The understanding that separation of powers does not imply an order of precedence among the organs of State, but reflects a civilised division of labour and mode of cooperation restricted to the exercise of specific State powers, and that supremacy is vested solely in the Constitution and the laws;
- The determination that no protection shall be afforded to thoughts or opinions contrary to Turkish National interests, the principle of the existence of Turkey as an indivisible entity with its State and territory, Turkish historical and moral values, or the nationalism, principles, reforms and modernism of Ataturk, and that as required by the principle of secularism, there shall be no interference whatsoever of sacred religious feelings in State affairs and politics;
- The understanding that it is the birthright of every Turkish citizen to lead an honourable life and develop his material and spiritual resources under the aegis of national culture, civilisation and the rule of law, through the exercise of the fundamental rights and freedoms set forth in this Constitution, in conformity with the requirements of equality and social justice;
- The recognition that all Turkish citizens are united in national honour and pride, in national joy and grief, in their rights and duties towards their existence as a nation, in blessings and in burdens, and in every manifestation of national life, and that they have the right to demand a peaceful life based on absolute respect for one another's rights and freedoms, mutual love and fellowship, and the desire for, and belief, in "Peace at home, peace in the world."

Kemal Ataturk, the founder of modern Turkey after World War I, remains of considerable symbolic importance in contemporary Turkey. Here, a wall of the Constitutional Court is adorned with a mask depicting Ataturk. (AFP/CORBIS)

The 1950 election was critical. Voter turnout was very high: more than 90 percent of registered voters voted in the election. The election also marked the beginning of new political alignments. The DP was supported by the relatively developed western regions, whereas the RPP relied on the traditional eastern provinces for support. The 1950 election marked the beginning of the era of machine politics in Turkey, with government services being provided in return for votes.

Multiparty politics in Turkey could not function with the institutions inherited from the one-party system. In the constitutional structure of the 1950s the only effective check on the government was the assembly, but the assembly was under the control of the DP, which saw itself as the representative of the national will and tolerated no opposition. The lack of effective checks and balances paved the way for the arbitrary rule of the DP and limitation of individual rights and freedoms. In an effort to limit opposition,

the DP government amended the election law so that pre-election coalitions between opposition parties were prohibited, and election campaigns were limited to forty-five days.

The Era of Military Interventions

The arbitrary rule of the DP and its antidemocratic measures led the army to attempt to overthrow the government. The 1960 military coup was in reaction to the DP's oppression and its violation of the constitution. Following this intervention, the military junta, calling itself the Committee of National Unity (CNU), dissolved the TGNA and banned the DP. Party leaders, including the prime minister and the president, were arrested; the prime minister and two of his cabinet ministers were executed. Within the first year of the intervention, a constitutional assembly was created to prepare a new constitution and election laws. In July 1961 a referendum was held to approve the new constitution, which was accepted by 60.4 percent of the voters.

The constitution was designed to prevent the hegemony of the governing party over the assembly. The general framework of the new system was a strong bicameral legislature, a weak executive, and an autonomous judiciary. The lower chamber of the TGNA was the National Assembly, which consisted of 450 members elected every four years. Deputies were elected under a proportional system known as the d'Hondt system. According to this system, the votes cast in each constituency were divided by the number of the seats. The quotient was then used to divide the vote cast for each party list or independent candidate.

The second chamber, the Senate, consisted of 150 members elected for a term of six years by straight majority vote, with one-third retiring every two years. The senators were required to have an advanced degree and to be over forty years of age. All the members of National Security Council (NSC), the body overseeing the military were made lifetime senators, and fifteen "contingent senators" were appointed by the president. Presidents would also become senators once their terms ended. The president was elected by a two-thirds majority from among the TGNA's members and served for seven years.

Before the 1961 election, the CNU made party leaders sign a declaration promising not to discuss or criticize the military intervention and its consequences. In a further compromise, the political parties accepted a protocol to elect as president General Gemal Gursel, head of the CNU, and not to seek amnesty for imprisoned Democrats.

In 1965 an amendment of the election law gave small parties, which represented newly mobilized social and economic forces, access to the political process. The new system was called the national remainder system (NRS). Under this system, votes for parties that had failed to meet the constituency quotas would be transferred to a national pool and later used to acquire available seats on the provincial level. The 1968 amendment of the election law by the ruling Justice Party (JP) abolished the NRS to prevent small parties from gaining weight in the assembly. The Turkish Workers Party challenged that amendment in the constitutional court; that action led to the abolishment of the quota system. The simple d'Hondt system was in effect between 1969 and 1980.

During the 1960s Turkey went through a socioeconomic transformation. Adoption of an import-substitution policy accelerated the expansion of a capitalist economy and made it difficult for small merchants and artisans to compete. As a reaction, these groups withdrew their support from the JP and inclined toward small parties on the right, which promised more nationalist economic policies and protection of moral values. The Nationalist Action Party and the National Order Party (NOP) were two such parties founded to attract lower-middle-class votes.

By 1971 Turkey was in a state of turmoil. Student protests turned violent; workers' demonstrations and strikes paralyzed industry. Bombings, kidnappings, and bank robberies became daily occurrences. The Justice Party government was unable to control the situation. On 12 March 1971 the Turkish army demanded the resignation of the cabinet. During a two-year interim, Turkey was ruled by party cabinets composed mostly of civilian technocrats. Individual rights and freedoms were curtailed, and leftist organizations were suppressed.

The 1973 election ended the interim period and brought new actors into the political arena. This election was another important milestone in Turkish political life. It reflected a new realignment in the political arena. The RPP, which had adjusted its policies in the late 1960s to the left of center, now moved further to the left under the leadership of Bulent Ecevit. The support base of the RPP moved from the tradition-oriented eastern provinces to the more developed and industrialized west. The Islamist National Salvation Party, which replaced the NOP, and the Nationalist Action Party, representing small businesspeople, merchants, artisans, and newly urbanized social groups, became key parties in the assembly.

In the 1970s the fragmentation and polarization of Turkish politics reached their peak. Since no single party received sufficient votes to form a government, a series of unsuccessful coalitions, headed by either Ecevit or Suleyman Demirel, of the JP, ruled the country. Increasing anarchy and chaos brought Turkey to the brink of a civil war. Partisan attitudes and ideological polarization affected every institution. Labor strikes, inflation, and shortages caused a deteriorating economic situation. The lack of compromise between political parties created parliamentary deadlocks. Deputies switching parties for political gain led to cabinet crises and weakened the government. Finally, the assembly's failure to elect a new president led the army to intervene into politics once more.

Post-1980 Developments

Following the 1980 military coup, the NSC dissolved the parliament, banned political parties, detained their leaders, and declared martial law throughout the country. In 1981 a consultative assembly, handpicked by the NSC, was ordered to draft a new constitution, new political-party laws, and election laws. The new constitution, which was approved by referendum in November 1982, aimed to reinstate a strong executive. Excessive powers were given to the president. Because the NSC was given the role of a consultative assembly in which to express opinions and advise governments on issues related to national security, the army was guaranteed a permanent role in the political process. Political parties were forced to cut their ties with trade unions and other civilian organizations. Civil servants and students were forbidden to join political parties.

The 1983 election law is also based on the d'Hondt system. It provides a single-chamber national assembly of 550 deputies. The members are elected through a weighted party-list system of proportional representation for a five-year term. Parties must obtain 10 percent of the popular vote before they can win representation in the assembly. The party receiving a majority of the vote wins an extra bonus of seats. The system does not favor small parties, which were held responsible for the weak governments of the 1970s. The president of the republic is elected by the assembly for a seven-year term.

A new multiparty system began in 1983 with the participation of three political parties approved by the NSC. In the general election of 1983, Turgut Ozal's Motherland Party gained a surprise victory. In 1989 Ozal was elected the eighth president of the republic. He increased the powers of the president, making the

presidential office an important decision-making center. Turkey's policies during the Persian Gulf War, for example, were largely defined by the president himself, which led to the resignation of a chief army commander.

The new constitution and the election law, however, did not solve the country's problems. In 2000, the country was still ruled by coalition governments. Economic and social problems loomed larger than ever. Interparty rivalry, corruption, and the rise of Islamic forces led to the NSC issuing an army memorandum, which resulted in the resignation of the Islamist-led Welfare Party and the True Path Party cabinet in 1997. Turkey is now ruled by a three-party coalition of the Democratic Left Party, the Motherland Party, and the extreme-rightist National Action Party. Although some steps have been taken to improve personal rights and freedoms, democratization is still an important goal to reach.

TURKEY, REPUBLIC OF The territory that is Turkey is at the crossroads of East and West, North and South, and its history up to the twentieth century is one of regional control by a succession of major empires.

Turkey is the location of Catal Huyuk, one of the world's oldest Neolithic settlements, dated to 7500 BCE. From 1900 to 1300 BCE the region was under the rule of the Hittites, and from the about 1200 to 700 BCE the Greeks established several kingdoms along the coast. In 546 BCE the Persians moved in, to be defeated in 334 by Alexander of Macedon. In 130 BCE the Romans made Anatolia (the Asian portion of present-day Turkey) a province and from 42 to 57 CE St. Paul spread Christianity across the region. With the establishment of Constantinople in the fourth century, the region became the center of the Byzantine empire. Under pressure from the Seljuk Turks in the east and the Crusaders from Europe, the Byzantine empire declined and was finally displaced by the Ottomans with the fall of Constantinople and in 1453. Following the reign (from 1520) of Suley-

man I (1494–1566), which marked its high point, the Ottoman empire declined over the centuries until what was left was dispatched in World War I.

During the twentieth century, Turkey was transformed from a pro-Islamic autocratic empire with a diverse population, inadequate defenses, and rebellious provinces in Europe into a compact, secular, and constitutional republic with a homogeneous population, massive armed forces, and a policy of integration with Europe. However, a civil society has been slow to develop. In general, the military, civil service, and politicians still do not respect or trust the common people; this is exemplified by the oppressive army, police, and bureaucracy, weak civil rights, political corruption, and inequitable wealth distribution.

End of Ottoman Turkey

In the nineteenth century, Turkey, the "sick man of Europe" (to quote Czar Nicholas I), blocked Russia's southern expansion into the Balkans and controlled its sea exit through the Bosphorus and Dardanelles Straits to the Mediterranean. Ottoman Egypt, with its new Suez Canal, controlled the link between Britain and her colony of India. Russia invaded Turkey three times, and Britain, while providing protection, occupied Egypt and Cyprus in 1882. Following Russia's incursion to the walls of Istanbul, in 1878 Britain and France, the Great Powers, insisted that Bulgaria, Serbia, and Romania become semi-independent rather than Russian satellites. So, after fifty years of Balkan and Black Sea wars, the rebellious Christian provinces of Turkey in Europe were abandoned in favor of an Asian Islamic state.

In 1900, the Ottoman empire consisted of Anatolian Turkey, Thrace, Albania, Macedonia, Syria, Palestine, Iraq, Arabia, Yemen, and Libya, ruled through a

NEMRUT DAG—WORLD HERITAGE SITE

Nemrut Dag, a mountain in Turkey, is the site of the mausoleum of Antiochus I. Designated a UNESCO World Heritage Site in 1987, the mausoleum demonstrates the cultural blending of the Greek and Persian empires into the kingdom of Commagene.

KEY EVENTS IN THE REPUBLIC OF TURKEY HISTORY

- 1908** Parliament meets and deposes the Ottoman ruler and establishes a constitutional government.
- 1913** Turkey's boundary in Europe is redrawn to the present-day line.
- 1918** The end of World War II leaves much former Ottoman territory in the hands of the British, Greeks, and French.
- 1920** Anatolia is portioned among Greece, France and Italy and Turkey reduced in size.
- 1920–1923** The period of the war of independence ends which ends with the Treaty of Lausanne and the establishment of the Republic of Turkey.
- 1924–1928** Ataturk is Turkey's first leader and institutes reforms toward secularization and ties with Europe.
- 1938** Ataturk dies.
- 1939–1945** Turkey remains officially neutral in World War II but joins the Allies in 1945.
- 1952** Turkey joins NATO.
- 1955** Most Greek residents of Istanbul flee the country.
- 1960** The military comes to power through a coup, leading to several decades of political instability and repression.
- 1978** The Kurd Partiya Karkaren Kurdistan is founded.
- 1980** The army establishes the National Security Council.
- 1982** Turgut Ozal is elected president.
- 1983** Turkey establishes an independent state in northern Cyprus.
- 1988–1999** Period of separatist conflict involving the Kurds.
- 1990–1991** Turkey supports the United States in the Persian Gulf War.
- 1995** The Islamic party does well in national elections
- 1996** The Susurluk scandal reveals political corruption
- 1997** The military intervenes to "safeguard secularism."
- 1999** Turkey is placed on the European Union candidate list.
- 2001** Turkey experiences a serious economic crisis.

network of governors and spies by the autocratic sultan Abdulhamid II (1842–1918). In reaction to Russian aggression and the self-seeking proselytizing of the Great Powers, the sultan had persecuted and then massacred thousands of his Armenian Christian subjects. Rebellious army officers in Macedonia, linked with political reformists of the Committee of Union and Progress (CUP) in Salonika (Thessalonica) and supported by the Islamic hierarchy (ulama), demanded restoration of the 1876 constitution, which only had been implemented for a few months before Sultan Abdulhamid used the new conflict with Russia as an excuse to suspend it. After a hiatus of thirty-two years, the parliament met in December 1908; the Third Army provided support to enable the parliament and the ulama to depose Abdulhamid II on charges of tyranny.

The Ottoman empire ended in a declaration of constitutional government under a titular head of state; the three young leaders of the CUP— Ismail Enver (1881–1922), Mehmet Talat (1874–1921), and Ahmed Cemal (1872–1922)—with the army chief of staff, Sevket Pasa, wielded real power, advocating a policy of Turkish nationalism, modernization, and social reform.

The CUP triumvirate could protect the empire no better than could the sultan. Italy occupied Libya in 1911; the Balkan states used the moment to embark on a liberation crusade, their blitzkrieg tactics soon forcing an armistice. Enver, returning from Libya, rejected peace; the province of Edirne (Adrianople) was soon lost, but victorious Bulgaria turned on its allies, and in the peace, Turkey's boundary in Europe was redrawn at the present line in 1913.

When Britain refused an alliance, Enver, as minister of war, secretly signed with Germany. Winston Churchill, as first lord of the British admiralty, confiscated two battleships ordered from British shipyards by the Turks; Enver, in retaliation, opened the Straits to two German battleships, which sailed northward under Turkish flags to attack Russian ports just before the start of World War I. Enver attacked Russia overland, losing 78,000 troops from cold and disease in the Caucasus. Turkish-Armenian rebels seized the eastern city of Van and handed it to the advancing Russians, but as the Turkish army reversed the tide and the Russians retreated, the rebels faced massive deportations; between 300,000 and 1 million people, up to half the Armenian population of Anatolia, perished during forced marches to Syria.

British destroyers attempted to force open the Straits for Britain's Russian allies; a predominately Australian expeditionary force was landed at Gallipoli in 1915 to extinguish the Turkish guns; General Mustafa Kemal (later Atatürk; 1881–1938) saved Istanbul at a loss of seventy thousand men. In 1917, the conquering Allies advanced from Egypt into Arabia, Palestine, and Syria, pushing back the Turkish Fourth Army until, as it reached Aleppo, the armistice of Mudros was signed in 1918. The triumvirate of Enver, the civilian Cevdet, and Talat fled, leaving the British in occupation of Istanbul and thus in control of the sultan, the Greeks in Izmir, and the French in Syria.

Independence War

In May 1919, Mustafa Kemal reached Samsun on the Black Sea and rallied war-weary nationalist groups into a fresh Turkish resistance. Linking with the Twentieth and Fifteenth Army Corps under Ali Fuat and Kazim Karabekir, he summoned local representatives to the councils of Erzurum and Sivas, where he formed a new nationalist parliament. In Istanbul, the British suppressed a newly elected assembly of the parliament and obtained the sultan's signature on the Treaty of Sèvres in 1920. That treaty partitioned Anatolia between Greece, France, and Italy; created an independent Armenia and Kurdistan; and allocated Turkey only part of the central Anatolian plateau, with no Mediterranean coastline and no capital. The Treaty of Sèvres, which still colors Turkish views of Europe, united opposition behind the nationalist government in Ankara in 1920. Nationalist forces repelled an Armenian offensive, dislodged the French from around Adana, and forced British withdrawal from Istanbul. In 1923, the Allies were forced to renegotiate terms in the Treaty of Lausanne, when Turkey, represented by Ismet Inonu (1884–1973), argued for the frontiers

as they are today, except for Hatay (returned in 1939) and the Dardanelles (which reverted to Turkish sovereignty in 1936).

Turkish forces finally drove the Greek army toward Izmir, where an Allied fleet rescued survivors of a terrible fire in 1922. The remaining Christian Greeks outside Istanbul were hastily exchanged with the Muslim population (both Greek and Turkish) of Thrace, thus aligning Turkish nationalism permanently with Islam. Since 1914, Turkey had lost 600,000 soldiers and 20 to 25 percent of its population, proportionately more than any other participant in World War I.

Ataturk's Reforms

Kemal immediately initiated reforms, including secularization of the state and abolition of the caliphate (1924), the change to Western attire (1925), a new European-style civil and penal code (1926), the change to a Latin alphabet and elimination of Arabic (1928), and a literacy campaign. Perpetuating Ottoman authoritarianism, he used a growing bureaucracy to impose these programs on conservative peasants. Trade, once the prerogative of Greeks and Armenians, had collapsed; state monopolies on basic foodstuffs (sugar, tobacco, animal feeds, and so forth)—plus nationalization of mines and shipping, intended to regenerate agricultural marketing and industry—faltered in the 1930s depression.

Mustafa Kemal, now known as Atatürk, died in 1938; his colleague, Inonu, who had become prime minister in 1923 and who was elected president upon Atatürk's death, continued with authoritarian but peaceful policies, making nonaggression treaties with Russia (1925), France and Britain (1939), and Germany (1941), accepting arms from Britain, then dealing in chrome for arms with Germany, all the time determined to remain neutral during World War II. Turkey accepted Jews fleeing Nazism but imposed a harsh, discriminatory wealth tax on Christians and small businesses in 1942. As World War II ended in 1945, Turkey joined the Allies, sent a contingent to Korea in 1952, and joined NATO's strategic southern flank also in 1952. American bases and political influence were the price of financial support and arms.

Postwar Coups

Adnan Menderes (1899–1961), a charismatic landowner, led the first opposition party, the Democratic Party, to a landslide victory in 1950. He revived Islam, borrowed abroad to invest in agriculture, and muzzled press opposition until a discontented military clique under Colonel Alp Aslan Turkes (1917–1997)

took power and imposed a liberal constitution in 1960. Menderes was tried and hanged. Unused to democracy, unstable coalitions under Suleyman Demirel (b. 1924), a goatherd turned civil engineer, and urban socialist Bulent Ecevit (b. 1925) attempted to rule, while nationalist extremists (led by Turkes) and revolutionary youth groups fought on the campuses. In 1971, the army, forcing Demirel to resign, temporarily imposed a nonpolitical technocrat government, martial law, and press restrictions, but Ecevit and Demirel resumed government alternately, spending irresponsibly in a time of rapid oil price rises. Crises with Greece over the status of the island of Cyprus and with Armenian nationalist movements in Soviet Armenia and in the diaspora over the assassination of several Turkish diplomats resulted in intercommunal violence, including fighting between Sunni and Alevi (Shi'ite) Muslims and factional street murders.

The army, with tacit American support, again intervened in 1980 and formed the National Security Council, which arrested politicians, closed trades unions, and placed universities under direct control.

A former World Bank economist, the charismatic Turgut Ozal (1927–1923), headed the center-right Motherland Party and won in the general elections in 1982, held under a new, restrictive constitution. He forced through liberalization of the economy with infrastructure development, attraction of foreign investment, convertibility of the lira, creation of a stock exchange, and international trade agreements. In contrast, education was repressively restructured, and the National Security Council maintained military control over politics. Gradually a few civil-rights restrictions were lifted; journalists tested the limits of the law but were often prosecuted.

Ozal gave asylum to 300,000 refugees fleeing repression in Bulgaria in 1989, a contrast to the poor treatment of Kurdish refugees from the Iraq-Iran War. In 1989, forcing through his own election to the presidency, which as prime minister he was able to accomplish by bending the election rules, he continued a pro-American policy, granting the Allies use of Turkish bases and airspace against Iraq's Saddam Hussein during the Persian Gulf War (1990–1991). President George H. W. Bush, visiting in 1991, failed to deliver the promised benefits to offset the cost of sanctions, loss of tourism, and refugee support.

After early elections in 1991, Demirel formed a coalition with the socialists; the Islamic Party under Necmettin Erbakan (b. 1925) also obtained record votes (17 percent). Ozal, as president, meddled in government until his death in 1993; he was succeeded by

Demirel, leaving American-sponsored Tansu Ciller (b. 1944) as Turkey's first woman prime minister. Initial optimism degenerated as corruption, inflation, and civil unrest were unchecked. In the town of Sivas, an Alevi group in conference was attacked by a fundamentalist Sunni mob; thirty-seven died. The major municipalities, now run by the Islamists, appeared progressive and graft-free, enabling Erbakan's party to obtain more votes in the 1995 elections. Ciller and Mesut Yilmaz (b. 1947, of Ozal's party) formed a minority coalition until Ciller, accused of corruption, allied with Erbakan to save herself. In 1996, an accident involving a car containing a Ciller politician, a police chief, a wanted assassin, a drug dealer, many weapons, and incriminating papers revealed political corruption and became known as the Susurluk scandal, named for the small town where the fatal accident occurred.

Controversially, the army, more worried by Islamism than corruption, demanded Erbakan's resignation and immediate implementation of eighteen measures to "safeguard secularism" in February 1997. Banned from politics, Erbakan delegated the re-formed party to Recai Kutan (b. 1928) but remained influential among Islamists. This "coup by proxy" delayed much necessary legislation and thus short-circuited Turkey's application for European Union membership.

A right-left minority coalition between Yilmaz and Ecevit was soon tainted by the Susurluk investigations and a tape recording of Yilmaz allegedly interfering in a privatization bid; government was handed to Ecevit alone. In the euphoria following the capture of Kurdish guerrilla leader Ocalan, elections in April 1999 gave Ecevit 22 percent, followed by the Nationalists at 18 percent and Islamists at 15 percent; Ciller and Yilmaz were sidelined.

Prospects for Europeanization

A coalition between Ecevit, Devlet Bahçeli (b. 1944), and Yilmaz rushed through an ambitious legislative program to deal with tax evasion, privatization, and social security, thus enabling Turkey to be added to the European Union candidate list. Economic revival was prevented by a downturn in tourism caused by threats from Kurdish nationalist guerrillas and a catastrophic earthquake, 7.0 on the Richter scale, which struck just south of Istanbul, killing eighteen thousand and damaging the industrial heartland in August 1999.

At the end of 1999, Turkey was placed on the European Union candidate list, albeit in last place. Entry depends on improvements in human rights, not

just fulfillment of economic criteria. The Turkish parliament, with much internal resistance, is implementing a program of constitutional amendments demanded by the Union as a price for membership.

Relations with Greece

During the 1950s, the Greek population of Istanbul became hostages in disputes between Turkey and Greece over the island of Cyprus, which was self-governing under the protection of Britain and which had large populations of both Greeks and Turks. Mobs in Istanbul were provoked to destroy Greek property, causing a rapid Greek exodus from that city in 1955; after incidents on Cyprus, a U.N. peacekeeping force was installed. In 1960, the island became independent. Several thousand Greek permanent residents of Turkey were summarily deported in 1963 as a result of renewed violence in Cyprus. Following a Greek attempt to annex the island in 1974, Turkey rapidly invaded and occupied the northern half, declaring it an independent republic in 1983.

Northern Cyprus remains a drain on mainland Turkish finances. Mutually threatening military maneuvers have been phased out as Greek-Turkish relations have entered a period of détente following sympathy engendered by earthquakes in Istanbul and Athens in 1999. Currently, leaders of the two communities on Cyprus are negotiating directly and urgently, as the European Union is likely to unilaterally admit Greek Cyprus if an agreement is not reached shortly.

The Kurdish Question and the Army

The Kurdish populations of Turkey, Iraq, and Iran almost achieved independence under the Treaty of Sèvres, but Atatürk subsequently denied their separate identity and culture. A Kurdish-language ban and the abolition of the caliphate led to Sheikh Said's Kurdish revolt in 1925, followed by revolts at Ararat in 1930 and Dersim (now Tunceli) in 1939; despite repression, the Kurdish tribal structure remained. In 1978, Abdullah Öcalan (b. 1953) formed the guerrilla group *Partiya Karkaren Kurdistan* (PKK, Kurdistan Workers' Party), based in and funded by Syria, and commenced a violent independence campaign in 1984. The Turkish army countered with cross-border attacks on Syria, imposition of martial law in twelve provinces, and news blackouts. Between 1988 and 1999, the army and PKK depopulated villages and killed thirty thousand, forcing mass migration to Istanbul and Europe. Özal attempted an economic solution; electricity generated at huge dams on the Euphrates River revived agriculture and industry along the border. In 1999, Syria, threatened with water

shortages and invasion, expelled Öcalan and closed PKK camps; violence was confined to the extreme east and funding to drug-smuggling operations. Öcalan was kidnapped in Kenya and returned to Turkey for trial; his death sentence was appealed to the European Court in 2000. The army now insists that politicians should implement a nonmilitary solution, but moderate Kurds are still not represented in parliament.

The end of the war in the southeast, rapprochement with Greece, the cowing of Syria, the American occupation of northern Iraq, and the end of the Cold War mean that the Turkish army is almost without opponents (real or imagined). Turkish military spending is officially 9 percent of Turkey's gross national product (without defense industries); the real figure is unknown, and the treasury in 2000 attempted to restrain new equipment purchases.

The twenty-first century started in an optimistic mood, with a united government pursuing a vigorous economic program, an apparently bureaucratic but clear route to Europe, a deescalation of tension with Greece, and a new president, Ahmet Sezer (b. 1941). Of the "old guard"—Erbakan, Demirel, Türkeş, and Ecevit—only the latter retained power; Yılmaz and Çiller, defiled by corruption, commanded a rump of followers, leaving a deficit in talented leaders for the new millennium.

However, in February 2001 a dispute over the constitution between Sezer and Ecevit (leading the coalition government) resulted in a complete loss of confidence in the World Bank–devised economic program that had pegged the Turkish lira against a currency basket. Private speculation and public panic forced the government to allow the lira to float; it lost half its value overnight. Unable to meet foreign-denominated debts, twenty-three collapsing banks were taken over by the treasury, and the government borrowed heavily from the World Bank as part of a drastic restructuring program. Civil unrest was, amazingly, avoided, and Turkey has now set out on a gradual path to economic recovery. The bitter effects of this crisis may not be forgotten at the next election; a new religious party as well as HADEP, the Kurdish socialist party, wait in the wings.

Dependence on the World Bank has been one factor in Turkish cooperation with U.S. "antiterrorist" aggressive action against their coreligionists; the Turkish people worry as their troops are sent to Afghanistan and the United States plots action against their neighbor Iraq.

TURKEY–RUSSIA RELATIONS In 1453, when the Ottoman Turkish sultan Mehmet (Muhammad) II (1432–1481) conquered Byzantium (Constantinople), the historic capital of the Eastern Roman empire, the Russian grand duke Ivan, whose wife was a niece of the last Byzantine emperor, laid claim to the symbolic imperial legacy by declaring Moscow to be the third Rome (Constantinople having been the second). In ensuing years, there was constant tension and rivalry between Russia and Ottoman Turkey. This rivalry was at once ideological, symbolic, and strategic.

Nineteenth-Century Relations

Ideologically and symbolically, Russia hoisted the banner of the Christian churches against the Muslim Turks, who were perceived as infidels in a continuing holy war. In the late eighteenth century, Russia annexed the Crimea and came to dominate the Black Sea from the Caucasus on the east to the mouth of the Danube River in the west. The next goal for expanding Russian power was the imperial city of Istanbul (the Turkish name for Constantinople) and the straits of the Bosphorus and the Dardanelles, connecting the Black Sea with the Aegean and Mediterranean Seas. Russian attempts to achieve this goal by military conquest and diplomatic maneuvering were one of the main issues in nineteenth-century European diplomacy. Russia sought access from the Black Sea to the Aegean and Mediterranean Seas for commercial purposes and to prevent foreign navies from entering the Black Sea and attacking its southern shore.

The expansion of Russian power in Eastern and Southeastern Europe alarmed the other European powers, especially Great Britain. Among other things, the British were worried about their lines of communication and trade with their Asian colonies, especially India. These lines ran through the Mediterranean Sea and Ottoman territories to the east and south, such as Egypt. Russian expansion into this region was seen as a great danger to British interests. Consequently,

throughout the nineteenth century, the British supported Ottoman Turkish resistance against Russia.

Relations in the First Part of the Twentieth Century

By the time of World War I (1914–1918), the Ottoman empire was so weak that Russia was on the verge of achieving its historic goal of controlling the Black Sea straits and the imperial city of Istanbul. The war drastically changed this situation, however. As Russia suffered major military setbacks at the hands of Germany, the Bolshevik Revolution overthrew the czarist monarchy and effectively ended the war in that part of the world. The Bolsheviks renounced traditional Russian imperialist policies, including those pertaining to the Ottoman empire and the Black Sea straits.

The Ottoman Turks, who were aligned with Germany and Austria-Hungary, also suffered major military defeats in World War I. By the end of the war, the once mighty Ottoman empire had been reduced to the territory of Asia Minor (Anatolia) and eastern Thrace. The victorious western Allies (particularly Britain and France) planned to divide those territories among themselves and to internationalize the straits and Istanbul. However, a nationalist uprising among the Turks and other Muslims of Anatolia thwarted these plans and led to the establishment of the nationalist and secularist Republic of Turkey.

The period between the two world wars saw an unusual friendship between Turkey and Russia (by then

This undated political cartoon shows Russia as a bear and Britain as a lion—both threatening Turkey. (BETTMANN/CORBIS)

the Soviet Union), as both sought to maintain independence from the West. Border disputes in the Caucasus region were resolved, and the Soviets supported Turkish control of the straits as a means of preventing foreign navies from entering the Black Sea and threatening the USSR. This newborn good will was formalized in a Treaty of Friendship.

But this amity was not to last. At the end of World War II in 1945, the Soviets, flush with victory, denounced the Friendship Treaty and reasserted the old Russian claims. At Yalta in February 1945, Joseph Stalin (1879–1953), the Soviet leader, indicated that he no longer trusted the Turks to defend Soviet interests in the Black Sea and the straits, declaring that Turkey held Russia by the throat.

A vigorous Soviet campaign of pressure and threats against Turkey followed. This was designed to force the Turks to agree to a Soviet naval base in the straits and to cede territory in the Caucasus region. The Turks feared that acquiescence would turn their country into a Soviet satellite and so sought the support of the West, particularly the United States. The United States and its allies responded positively. In 1947, President Harry S. Truman (1884–1972) proposed and Congress approved a massive program of aid to Greece and Turkey to bolster their resistance against Soviet threats; this came to be known as the Truman Doctrine.

Turkey thus became a frontline outpost in the Cold War and a close U.S. ally. In 1952, Turkey became a member of the North Atlantic Treaty Organization (NATO), the major anti-Soviet alliance. The United States helped to modernize and strengthen Turkish armed forces. Turkey was one of the few countries to send combat troops to support the U.S.-led campaign against the Communist North Korean regime during the Korean War (1950–1953).

A chain of electronic observation posts was established along Turkey's Black Sea coast, by means of which the United States monitored missile launchings from Soviet bases in Central Asia. Nuclear-armed Jupiter missiles aimed at the Soviet Union were deployed on Turkish soil, as were manned U.S. fighters, bombers, and reconnaissance planes, including high-altitude U-2 spy planes, one of which the Soviets shot down in 1960.

Throughout the Cold War, Russian-Turkish relations were a mirror image of Turkey's relations with the United States: when problems arose in the Turkish-U.S. relationship, relations with Russia tended to warm up. Thus, after President Lyndon Baines Johnson (1908–1973) warned the Turkish government in June 1964 that the United States might not defend

Turkey if it was attacked by the Soviet Union, the Turkish prime minister visited Moscow, and the Soviet prime minister visited Ankara, the Turkish capital, both unprecedented events. The two governments concluded economic and cultural-exchange agreements.

Later Twentieth-Century Relations

With the collapse of the Soviet Union and the end of the Cold War in 1991, relations between Turkey and Russia were altered once more. First, the two countries shared no common border for the first time in several centuries. The Caucasus republics of Georgia, Armenia, and Azerbaijan, which do have common borders with Turkey, became independent. Second, other former Soviet republics in Central Asia also became independent, and Turkey faced the temptation to revive dormant pan-Turkist sentiment to form a new block of Turkic states that could become a political platform.

Thus, rivalry for political influence and power in the Caucasus and Central Asia emerged between Turkey and Russia. Russia enjoyed inherent advantages as the result of strong infrastructural ties built up during the Soviet era, but was greatly weakened by the severe economic problems that accompanied the collapse of the Soviet Union and hence was no longer a direct threat to Turkey's security.

Russia-Turkey Relations in the Twenty-First Century

As a result of these profound political changes, the relationship between Russia and Turkey at the beginning of the twenty-first century was a complex web. Trade between the two countries expanded greatly. Russia supplied natural gas to Turkey, and Turkish firms landed extensive contracts in Russia, particularly in large construction projects. Competition between Russia and Turkey developed in other areas, particularly in the planning of pipelines to carry oil from new Caspian Sea sources to world markets via Turkish ports on the Mediterranean Sea, bypassing existing pipelines through Russia.

These Russian pipelines pass near Chechnya in the Caucasus, the scene of bloody uprisings against Russian rule. The Chechens are a Muslim people, and a significant minority of ethnic Chechens live in Turkey. Thus, Turkey opposed Russian campaigns in Chechnya. However, Turkey's ability to act on its sympathy for the Chechens was hamstrung by the danger that Russia could retaliate by more actively supporting the rebellious Kurdish minority in eastern Turkey. Russia had already disconcerted Turkey by signing a deal with the Greek Cypriot regime for the supply of modern

intermediate-range ballistic missiles (known as the S-300), which could reach deep into Turkish territory from bases in Cyprus, upsetting the military balance between Turkey and Greece. In the end, the missiles were to be based on the island of Crete, far removed from Turkey. But the potential for increased tension between Russia and Turkey clearly remains and could flare up anew at any time.

Turkey and Russia found themselves on the same side of the anti-terror campaign led by the United States after the attacks on American soil on 11 September 2001. Turkey volunteered to send troops to Afghanistan to assist in the fighting against Osama bin Laden and his supporters and showed a strong interest in assisting in the formation of a new government in Afghanistan after the apparent defeat of its Taliban government. Russia was also in a cooperative mode, as were the former Soviet republics in Central Asia that border on Afghanistan and whose cooperation was important for the United States–led campaign.

TURKEY–UNITED STATES RELATIONS

Government-to-government relations between the United States and Turkey did not assume serious proportions until World War I. Before then, the major symbols of Turkish-American relations had been a series of schools established by American Protestant missionaries

during the nineteenth century. Their main goal had been to proselytize, a fact that discouraged Muslim children from enrolling. The most prominent of these schools was Robert College, built on a commanding height overlooking the narrowest point in the Bosphorus, adjacent to the Rumeli Hisar fortress built by the Turks in 1453 to besiege the city of Byzantium. Today, this institution is known as Bosphorus University, one of the leading institutions of higher education in Turkey and now controlled by the Turkish government.

Relations after World War I

At the Versailles Peace Conference of 1919, which ended World War I, President Woodrow Wilson (1856–1924) set forth his Fourteen Points, including the right of self-determination for all nations and peoples. This principle was opposed to the plans of the other Allies, who wanted to divide the remaining Ottoman territories among themselves.

Despite American sentiment against Turks, which was fanned by U.S. citizens of Greek and Armenian extraction, some Turkish nationalists were tempted by the idea of an American mandate. This would frustrate Allied plans and prevent such ethnic communities as the Kurds and Armenians from creating states that could displace the Turkish population and foreclose hopes of retaining a Turkish state. American failure to ratify the Versailles Treaty and refusal to join the League of Nations sabotaged this proposal. The successful campaign of the Turkish nationalists under the leadership of Mustafa Kemal (Ataturk, 1881–1938) blocked the Allied plans for division of the remainder of the Ottoman empire and snuffed out Kurdish and Armenian hopes for statehood. The reformist nationalist and secular Republic of Turkey established in 1923 forced the American schools in that country to reconsider their missions. The minority populations that had formed most of their enrollments were much reduced in size. Religious proselytism was outlawed under the republic. Those schools that remained open thus began enrolling more Turkish Muslims and secularized their curricula, giving up their original proselytizing mission. Several of them, particularly Robert College, the Tarsus Boys' School, and schools in Izmir and Uskudar (a residential suburb of Istanbul) for girls, became highly prized institutions that trained members of the new political elite, including future members of parliament and at least one prime minister.

Relations after World War II

In general, however, Turkish-American relations remained minimal until the end of World War II. During that war, Turkey again proved its strategic

Presidents Bill Clinton of the United States and Suleyman Demirel of Turkey review an honor guard during Clinton's visit to Turkey in November 1999. (REUTERS NEWMEDIA INC./CORBIS)

importance by remaining neutral and allowing neither Nazi Germany nor the Western Allies and the Soviet Union the advantage of running supply lines through its territory, including the Black Sea straits. The Turks also steadfastly resisted pressure from the West to declare war on Nazi Germany until February 1945, when the outcome of the conflict was certain and the danger of Turkish territory becoming a battlefield had waned.

With the end of the war, Turkish-American relations were transformed. The United States responded positively to Turkish requests for support against aggressive Soviet demands for territorial and other concessions, which would have reduced the country to the status of a Soviet satellite. In 1946, the USS *Missouri*, then the largest battleship in the world, paid a courtesy call at Istanbul; in 1947, President Harry S. Truman (1884–1972) proposed the Truman Doctrine, a massive program of economic and military aid to Greece and Turkey, meant to bolster their resistance against Soviet expansionism. In 1950, Turkey's active participation in the Korean War helped cement the relationship with the United States; two years later, Turkey became a member of the North Atlantic Treaty Organization (NATO).

Turkey, by now a close U.S. ally, was a frontline state in the Cold War. A chain of electronic observation posts was established along the Black Sea coast to enable the United States to monitor Soviet missile launchings in Central Asia. Nuclear-armed Jupiter

missiles aimed at the Soviet Union were deployed on Turkish soil, as were manned U.S. fighters, bombers, and reconnaissance planes, including high-altitude U-2 spy planes, one of which the Soviets shot down in 1960. Turkish policy supported America in international politics, going so far as to allow the United States to use Turkish territory as a staging area for troops bound for Lebanon during the crisis in that country in 1958.

In the 1960s, the U.S.-Turkish relationship suffered several serious setbacks. The Soviet-American crisis of 1962, provoked by the Russians placing nuclear missiles in Cuba, was the first blow. Because the Soviets demanded the removal of Jupiter missiles from Turkey as a quid pro quo, it became evident that the United States could sacrifice Turkish interests without warning. In any event, the Jupiters were removed later on grounds of obsolescence, but the point hit home nonetheless.

A second and more serious problem erupted in 1964, when Turkey prepared to invade Cyprus to defend the Turkish minority on the island against the Greek majority. U.S. president Lyndon Baines Johnson (1908–1973) warned Turkey that he would not come to that country's aid if the Soviets supported Greece militarily. This letter undermined Turkish confidence in the United States and led to a major rethinking of Turkey's relations with the USSR, its neighbors, and the Third World in general. The Johnson letter also

had an explosive effect on Turkish public opinion, opening the way for widespread acceptance of leftist suspicions about the United States and turning the large-scale American military and diplomatic presence in the country into a public-relations liability. Relations hit a new low when the U.S. Congress (provoked, in Turkish eyes, by American Greek and Armenian ethnic lobbies) imposed an arms embargo in response to the Turkish occupation of northern Cyprus in 1974. Use of Turkish military bases for the staging of U.S. troops in a Middle Eastern crisis, as had occurred in 1958, could no longer be taken for granted.

During the 1990–1991 Persian Gulf War, for example, the chief of the Turkish general staff resigned in protest against the decision by President Turgut Ozal (1926–1993) to cooperate fully with the U.S.-led anti-Iraqi military coalition. Ozal sought to prove Turkey's continuing strategic value to the United States and the West—in the face of the collapse of the Soviet Union and the end of the Cold War—by shutting down the Iraqi oil pipeline that crossed Turkish territory, strictly observing the UN-imposed sanctions on Iraq, and allowing heavy use of air bases on Turkish soil for bombing sorties against Iraq.

The United States was more understanding than was the European Union, which Turkey aspired to join, with regard to alleged human-rights violations against the Kurds. The Turkish government had treated the Kurdish insurrection that broke out in 1984 with harsh military repression. On the other hand, Turkey was apprehensive about U.S.-sponsored material and political support for the Kurds of Iraq, just across the border from Turkey; these Kurds had established limited autonomy from the Iraqi government of Saddam Hussein (b. 1937) in the wake of the Persian Gulf War. Despite concern over Iraqi Kurdish support for the insurrection in Turkey, and despite Turkey's desire to resume trade relations with Iraq, Turkey allowed the continued use of bases on its soil for this operation, as well as for flights designed to prevent the Iraqi air force from entering the no-fly zone in northern Iraq.

Relations in the New Millennium

At the start of the twenty-first century, the United States supported Turkish efforts to finance the so-called Ceyhan project, which called for a pipeline connecting the newly developed Caspian Sea oil fields with world markets via a Turkish port on the Mediterranean. The common interest of the two governments stemmed from the political realm—the desire to by-

pass Russian pipelines. The oil industry was reluctant because of excessive costs and political instability in the Caucasus region through which the projected line would pass.

Finally, the late 1990s witnessed a change in Turkish foreign relations—a burgeoning informal alliance between Turkey and Israel, favored by the Turkish military. The initial trade-off involved access to Turkish air space for the Israeli air force (allowing Israeli planes to approach Iranian territory) in exchange for large-scale contracts with Israeli industry to modernize various Turkish weapons systems. Joint naval maneuvers were also conducted, and the military aspects of the new relationship spilled over into trade and academic exchanges. Since Turkey and Israel were major American allies in the Middle East, this development was strongly encouraged by the United States.

Survey of Asia's Regions and Nations

The *Encyclopedia of Modern Asia* covers thirty-three nations in depth and also the Caucasus and Siberia. We have divided Asia into five major subregions and assigned the thirty-three nations to each.

West and Southwest Asia

The West Asian nations covered in detail here are Turkey, Iran, and Iraq. Afghanistan and Pakistan form Southwest Asia, although in some classifications they are placed in Central and South Asia, respectively. Afghanistan, on the crossroads of civilizations for thousands of years, is especially difficult to classify and displays features typical of Central, West, and South Asia.

Despite diversity in language (Persian in Iran, Arabic in Iraq, Turkish in Turkey) form of government (theocracy in Iran, dictatorship in Iraq, and unstable democracy in Turkey) and international ties (Iran to the Islamic world, Iraq to the Arab Middle East, Turkey to the West), there are several sources of unity across West Asia. Perhaps the oldest is geographical location as the site of transportation routes between Europe and Central, East, and South Asia. Since ancient times, people, goods, wealth, and ideas have flowed across the region. In 2002 the flow of oil was most important, from the wells of Iran and Iraq through the pipelines of Turkey. Another source of unity is Sunni Islam, a major feature of life since the seventh century, although Iran is mainly the minority Shi'a tradition and there have long been Zoroastrian, Jewish, Christian, and Baha'i minorities in the region. Diversity is also evident in the fact that Turkey is a "secular" state while Iran is a theocracy, and in the conflict between fundamentalist and mainstream Islam in all the nations.

Another important common thread is the shared historical experience of being part of the Ottoman Empire and having to cope with British and Russian designs on their territory and, more recently, American influence. And, in the twentieth century, all three nations have sought to deal with the Kurdish minority and its demands for a Kurdish state to be established on land taken from all three nations.

Unity across Afghanistan and Pakistan is created by adherence to Sunni Islam (although there is a Shi'ite minority in Afghanistan) and the prominence of the Pash-tun ethnic group in each nation. Both nations also experienced British colonialism, although the long-term British influence is more notable in Pakistan, which had been

tied to India under British rule. West Asia is the only region in the world never colonized by Britain, although some experts argue that it did experience significant British cultural influence. In all nations resistance to external control—British, Russian, or United States—is another common historical experience.

Across the region (although less so in Afghanistan) is the stark contrast between the traditional culture and the modernity of liberation from imperial rule, still not complete across the region. This contrast is apparent in clothing styles, manners, architecture, recreation, marriage practices, and many elements of daily life.

In 2002 all the nations faced a water crisis of both too little water and water pollution. They all also faced issues of economic and social development, including reducing external debt, controlling inflation, reducing unemployment, improving education and health care, and continually reacting to the ongoing Arab-Israeli conflict, which exacerbates many of these problems. The governments also faced the difficult task of solving these problems while resisting Americanization and also while controlling internal political unrest. Political unrest is often tied to efforts at creating democratic governments and the persistence of elite collaboration with tyrannical governments.

Central Asia

Central Asia is known by many names, including Eurasia, Middle Asia, and Inner Asia. At its core, the region is composed of five states that became independent nations following the collapse of the Soviet Union in 1991: Kazakhstan, Kyrgyzstan, Tajikistan, Turkmenistan, and Uzbekistan. Scholars sometimes include Afghanistan, Mongolia and the Xinjiang province of China within the label Central Asia. For this project, Central Asia is restricted to the five former Soviet countries, while Afghanistan is classified in Southwest Asia, and Mongolia and Xinjiang as part of East Asia. These states have a shared landmass of 1.5 million square miles, about one-half the size of the United States.

The region's unity comes from a shared history and religion. Central Asia saw two cultural and economic traditions blossom and intermix along the famed Silk Road: nomadic and sedentary. Nomadic herdsman, organized into kinship groupings of clans, lived beside sedentary farmers and oasis city dwellers. Four of the countries share Turkic roots, while the Tajiks are of Indo-European descent, linguistically related to the Iranians. While still recognizable today, this shared heritage has developed into distinct ethnic communities.

The peoples of Central Asia have seen centuries of invasion, notably the legendary Mongol leader Genghis Khan in the thirteenth century, the Russians in the nineteenth and the Soviets in the twentieth century. For better or worse, each invader left behind markers of their presence: the Arabs introduced Islam in the seventh century. Today Islam is the predominant religion in the region, and most Central Asians are Sunni Muslims. The Russians brought the mixed legacy of modernism, including an educated populace, alarming infant mortality rates, strong economic and political participation by women, high agricultural development, and environmental disasters such as the shrinking of the Aral Sea. It was under Russian colonialism that distinct ethno-national boundaries were created to divide the people of the region. These divisions largely shape the contemporary Central Asian landscape.

Today the five Central Asian nations face similar challenges: building robust economies, developing stable, democratic governments, and integrating themselves into the regional and international communities as independent states. They come to these challenges with varied resources: Kazakhstan and Turkmenistan have rich oil reserves; several countries have extensive mineral deposits; and the Fergana Valley is but one example of the region's rich agricultural regions.

Finally, the tragic events of September 11, 2001, cast world attention on Afghanistan's neighbors in Central Asia. The "war on terrorism" forged new alliances and offered a mix of political pressure and economic support for the nations' leaders to suppress their countries' internal fundamentalist Muslim movements.

Southeast Asia

Southeast Asia is conventionally defined as that subregion of Asia consisting of the eleven nation-states of Brunei, Cambodia, East Timor, Indonesia, Laos, Malaysia, Myanmar, Philippines, Singapore, Thailand, and Vietnam. Myanmar is sometimes alternatively classified as part of South Asia and Vietnam as in East Asia. The region may be subdivided into Mainland Southeast Asia (Cambodia, Laos, Myanmar, Thailand, and Vietnam) and Insular Southeast Asia (Brunei, East Timor, Indonesia, Philippines, and Singapore). Malaysia is the one nation in the region that is located both on the mainland and islands, though ethnically it is more linked to the island nations of Indonesia, Brunei, and the Philippines.

Perhaps the key defining features for the region and those that are most widespread are the tropical monsoon climate, rich natural resources, and a way of life in rural areas based on cooperative wet-rice agriculture that goes back several thousand years. In the past unity was also created in various places by major civilizations, including those of Funan, Angkor, Pagan, Sukhothai, Majapahit, Srivijaya, Champa, Ayutthaya, and Melaka. Monarchies continue to be significant in several nation—Brunei, Cambodia, Malaysia, and Thailand—today. Subregional unity has also been created since ancient times by the continued use of written languages, including Vietnamese, Thai, Lao, Khmer and the rich literary traditions associated with those languages.

The region can also be defined as being located between China and India and has been influenced by both, with Indian influence generally broader, deeper, and longer lasting, especially on the mainland, except for Vietnam and Singapore, where influences from China have been more important. Islamic influence is also present in all eleven of the Southeast Asian nations. Culturally, Southeast Asia is notable for the central importance of the family, religion (mainly Buddhism and Islam), and aesthetics in daily life and national consciousness.

In the post–World War II Cold War era, there was a lack of regional unity. Some nations, such as Indonesia under Sukarno, were leaders of the nonaligned nations. Countries such as Thailand and the Philippines joined the U.S. side in the Cold War by being part of the Southeast Asia Treaty Organization (SEATO). A move toward greater unity was achieved with the establishment of the Association of Southeast Asian Nations (ASEAN) in 1967, with the founding members being Indonesia, Malaysia, the Philippines, Singapore, and Thailand. Subsequently other Southeast Asian nations joined ASEAN (Brunei, 1984; Laos, Myanmar, and Vietnam 1997; Cambodia 1999). As of 2002, communism was still the system in Laos and Vietnam and capitalism in Brunei, Cambodia, East Timor, the Philippines Thailand, Indonesia, Malaysia and Singapore. Political, economic, and cultural cooperation is fostered by the Association of Southeast Asian Nations (ASEAN), with headquarters in Jakarta, Indonesia. Economically, all the nations have attempted to move, although at different speeds and with different results, from a reliance on agriculture to an industrial or service-based economy. All nations also suffered in the Asian economic crisis beginning in July 1997.

Alongside these sources of similarity or unity that allow us to speak of Southeast Asia as a region is also considerable diversity. In the past religion, ethnicity, and diverse colonial experience (British, Dutch, French, American) were major sources of diversity. Today, the three major sources of diversity are religion, form of government, and level of economic development. Three nations (Indonesia, Malaysia,

Brunei) are predominately Islamic, five are mainly Buddhist (Vietnam, Laos, Cambodia, Thailand, Myanmar), two are mainly Christian (Philippines and East Timor), and Singapore is religiously heterogeneous. In addition, there is religious diversity within nations, as all these nations have sizeable and visible religious minorities and indigenous religions, in both traditional and syncretic forms, also remain important.

In terms of government, there is considerable variation: communism in Vietnam and Laos; state socialism in Myanmar; absolute monarchy in Brunei; evolving democracy in the Philippines, Thailand, Cambodia, and Indonesia; and authoritarian democracy in Malaysia and Singapore. The economic variation that exists among the nations and also across regions within nations is reflected in different levels of urbanization and economic development, with Singapore and Malaysia at one end of the spectrum and Laos and Cambodia at the other. Myanmar is economically underdeveloped, although it is urbanized, while Brunei is one of the wealthiest nations in the world but not very urbanized.

In 2002, Southeast Asia faced major environmental, political, economic, and health issues. All Southeast Asian nations suffer from serious environmental degradation, including water pollution, soil erosion, air pollution in and around cities, traffic congestion, and species extinctions. To a significant extent all these problems are the result of rapid industrial expansion and overexploitation of natural resources for international trade. The economic crisis has hampered efforts to address these issues and has threatened the economies of some nations, making them more dependent on international loans and assistance from nations such as Japan, Australia, and China. The persisting economic disparities between the rich and the poor are actually exacerbated by rapid economic growth. Related to poverty is the AIDS epidemic, which is especially serious in Cambodia, Myanmar, and Thailand and becoming more serious in Vietnam; in all these nations it associated with the commercial sex industry.

Politically, many Southeast Asian nations faced one or more threats to their stability. Political corruption, lack of transparency, and weak civic institutions are a problem to varying degrees in all the nations but are most severe in Indonesia, which faces threats to its sovereignty. Cambodia and Thailand face problems involving monarch succession, and several nations have had difficulty finding effective leaders. Myanmar's authoritarian rulers face a continual threat from the political opposition and from ethnic and religious separatists.

In addition, several nations faced continuing religious or ethnic-based conflicts that disrupt political stability and economic growth in some provinces. The major conflicts involve Muslim separatists in the southern Philippines, Muslims and Christians in some Indonesian islands and Aceh separatists in northern Sumatra, and Muslims and the Karen and other ethnic groups against the Burman government in Myanmar. Since the economic crisis of 1997, ethnic and religion-based conflict has intensified, as wealthier ethnic or religious minorities have increasingly been attacked by members of the dominant ethnic group. A related issue is the cultural and political future of indigenous peoples, including the so-called hill tribes of the mainland and horticulturalists and former hunter-gatherers of the islands.

In looking to the future, among the region's positive features are the following. First, there is Southeast Asia's strategic location between India and China, between Japan and Europe, and between Europe and Oceania. It stands in close proximity to the world's two most populous countries, China and India. Singapore, the centrally located port in Southeast Asia, is one of two major gateways to the dynamic Pacific Basin (the other is the Panama Canal). Second, there is the region's huge population and related economic market, with a total population approaching that of one half of China's. Indonesia is the world's fourth most populous nation. Third, there is enor-

mous tourist potential in sites and recreational locales such as Angkor Wat, Bali, Borobudur, Phuket, and Ha Long Bay. Fourth, there is the region's notable eclecticism in borrowing from the outside and resiliency in transcending tragedies such as experienced by Cambodia and Vietnam. Fifth, there is the region's significant economic potential: Southeast Asia may well have the world's highest-quality labor force relative to cost. And, sixth, there is the region's openness to new technologies and ideas, an important feature in the modern global community.

South Asia

South Asia is the easiest region to demarcate, as it is bounded by the Hindu Kush and Himalayan ranges to the north and the Bay of Bengal and Arabian Sea to the south. It contains the nation-states of Bangladesh, Bhutan, India, Nepal, and Sri Lanka and the more distant island nations of the Maldives and Mauritius. Myanmar and Pakistan, which are considered part of South Asia in some schemes, are here classified in Southeast Asia and Southwest Asia, respectively.

While the region is diverse economically, culturally, linguistically, and religiously, there is unity that, in some form, has existed for several thousand years. One source of unity is the historical influence of two major civilizations (Indus and Dravidian) and three major religions (Hinduism, Buddhism, and Islam). Regionally, Sikhism and Jainism have been of great importance. There is also considerable economic unity, as the majority of people continue to live by farming, with rice and especially wet-rice the primary crop. In addition, three-quarters of the people continue to live in rural, agricultural villages, although this has now become an important source of diversity, with clear distinctions between urban and rural life. A third source of unity is the caste system, which continues to define life for most people in the three mainland nations. Another source of unity is the nature and structure of society, which was heavily influenced by the several centuries of British rule. A final source of political unity in the twentieth century—although sometimes weakened by ethnic and religious differences—has been nationalism in each nation.

South Asia is diverse linguistically, ethnically, religiously, and economically. This diversity is most obvious in India, but exists in various forms in other nations, except for the isolated Maldives, which is the home of one ethnic group, the Divehi, who are Muslims and who have an economy based largely on tourism and fishing.

The dozens of languages of South Asia fall into four major families: Indo-European, Austroasiatic, Dravidian, and Tibeto-Burman and several cannot be classified at all. Because of its linguistic diversity, India is divided into "linguistic" states with Hindi and English serving as the national languages.

Hinduism is the dominant religion in South Asia, but India is the home also to Buddhism, Jainism, and Sikhism. India also has over 120 million Muslims and the world's largest Zoroastrian population (known in India as Parsis) and Bangladesh is a predominately Muslim nation. India also has about twenty-five million Christians and until recently India had several small but thriving Jewish communities. Nepal is mainly Hindu with a Buddhist minority, and Bhutan the reverse. Sri Lanka is mainly Theravada Buddhist with Hindu, Muslim, and Christian minorities. Mauritius, which has no indigenous population, is about 50 percent Hindu, with a large Christian and smaller Muslim and Buddhist minorities.

Linguistic and religious diversity is more than matched by social diversity. One classification suggests that the sociocultural groups of South Asia can be divided into four general and several subcategories: (1) castes (Hindu and Muslim); (2) modern urban classes (including laborers, non-Hindus, and the Westernized elite); (3) hill tribes of at least six types; and (4) peripatetics.

Economically, there are major distinctions between the rural poor and the urban middle class and elite, and also between the urban poor and urban middle class and elite. There are also significant wealth distinctions based on caste and gender, and a sizeable and wealthy Indian diaspora. There is political diversity as well, with India and Sri Lanka being democracies, Bangladesh shifting back and forth between Islamic democracy and military rule, the Maldives being an Islamic state, and Nepal and Bhutan being constitutional monarchies.

In 2002, South Asia faced several categories of issues. Among the most serious are the ongoing ethnic and religious conflicts between Muslims and Hindus in India, the conflict between the nations of Pakistan and India; the ethnic conflict between the Sinhalese and Sri Lankan Tamils in Sri Lanka; and the conflict between the Nepalese and Bhutanese in both nations. There are also various ethnic separatist movements in the region, as involving some Sikhs in India. The most threatening to order in the region and beyond is the conflict between India and Pakistan over the Kashmir region, as both have nuclear weapons and armies gathered at their respective borders.

A second serious issue is the host of related environmental problems, including pollution; limited water resources; overexploitation of natural resources; destruction and death caused by typhoons, flooding, and earthquakes; famine (less of a problem today), and epidemics of tropical and other diseases. The Maldives faces the unique problem of disappearing into the sea as global warming melts glaciers and raises the sea level. Coastal regions of Bangladesh could also suffer from this.

There are pressing social, economic, and political issues as well. Socially, there are wide and growing gaps between the rich and middle classes and the poor, who are disproportionately women and children and rural. Tribal peoples and untouchables still do not enjoy full civil rights, and women are often discriminated against, although India, Sri Lanka, and Bangladesh have all had women prime ministers. Economically, all the nations continue to wrestle with the issues involved in transforming themselves from mainly rural, agricultural nations to ones with strong industrial and service sectors. Politically, all still also struggle with the task of establishing strong, central governments that can control ethnic, religious, and region variation and provide services to the entire population. Despite these difficulties, there are also positive developments. India continues to benefit from the inflow of wealth earned by Indians outside India and is emerging as a major technological center. And, in Sri Lanka, an early 2002 cease-fire has led to the prospect of a series of peace negotiations in the near future..

East Asia

East Asia is defined here as the nations of Japan, South Korea, North Korea, China, Taiwan, and Mongolia. It should be noted that Taiwan is part of China although the People's Republic of China and the Republic of China (Taiwan) differ over whether it is a province or not. The inclusion of China in East Asia is not entirely geographically and culturally valid, as parts of southern China could be classified as Southeast Asian from a geographical and cultural standpoint, while western China could be classified as Central Asian. However, there is a long tradition of classifying China as part of East Asia, and that is the approach taken here. Likewise, Mongolia is sometimes classified in Central Asia. As noted above, Siberia can be considered as forming North and Northeast Asia.

Economic, political, ideological, and social similarity across China, Korea (North and South), and Japan is the result of several thousand years of Chinese influence (at times strong, at other times weak), which has created considerable similarity on a base of pre-existing Japanese and Korean cultures and civilizations. China's influence was

greatest before the modern period and Chinese culture thus in some ways forms the core of East Asian culture and society. At the same time, it must be stressed that Chinese cultural elements merged with existing and new Korean and Japanese ones in ways that produced the unique Japanese and Korean cultures and civilizations, which deserve consideration in their own right.

Among the major cultural elements brought from China were Buddhism and Confucianism, the written language, government bureaucracy, various techniques of rice agriculture, and a patrilineal kinship system based on male dominance and male control of family resources. All of these were shaped over the centuries to fit with existing or developing forms in Korea and Japan. For example, Buddhism coexists with Shinto in Japan. In Korea, it coexists with the indigenous shamanistic religion. In China and Korea traditional folk religion remains strong, while Japan has been the home to dozens of new indigenous religions over the past 150 years.

Diversity in the region has been largely a product of continuing efforts by the Japanese and Koreans to resist Chinese influence and develop and stress Japanese and Korean culture and civilization. In the twentieth century diversity was mainly political and economic. Japanese invasions and conquests of parts of China and all of Korea beginning in the late nineteenth century led to hostile relations that had not been completely overcome in 2002.

In the post-World War II era and after, Taiwan, Japan, and South Korea have been closely allied with the United States and the West; they have all developed powerful industrial and postindustrial economies. During the same period, China became a Communist state; significant ties to the West and economic development did not begin until the late 1980s. North Korea is also a Communist state; it lags behind the other nations in economic development and in recent years has not been able to produce enough food to feed its population. In 2002 China was the emerging economic power in the region, while Taiwan and South Korea hold on and Japan shows signs of serious and long-term economic decline, although it remains the second-largest (after the United States) economy in the world. Mongolia, freed from Soviet rule, is attempting to build its economy following a capitalist model.

Politically, China remains a Communist state despite significant moves toward market capitalism, North Korea is a Communist dictatorship, Japan a democracy, and South Korea and Taiwan in 1990s seem to have become relatively stable democracies following periods of authoritarian rule. Significant contact among the nations is mainly economic, as efforts at forging closer political ties remain stalled over past grievances. For example, in 2001, people in China and South Korea protested publicly about a new Japanese high school history textbook that they believed did not fully describe Japanese atrocities committed toward Chinese and Koreans before and during World War II. Japan has refused to revise the textbook. Similarly, tension remains between Mongolia and China over Mongolian fears about Chinese designs on Mongolian territory. Inner Mongolia is a province of China.

Major issues with regional and broader implications are the reunification of Taiwan and China and North and South Korea, and threat of war should reunification efforts go awry. Other major regional issues include environmental pollution, including air pollution from China that spreads east, and pollution of the Yellow Sea, Taiwan Strait, and South China Sea. A third issue is economic development and stability, and the role of each nation, and the region as a unit, in the growing global economy. A final major issue is the emergence of China as a major world political, economic, and military power at the expense of Taiwan, South Korea, and Japan, and the consequences for regional political relations and stability.

Overview

As the above survey indicates, Asia is a varied and dynamic construct. To some extent the notion of Asia, as well as regions within Asia, are artificial constructs imposed by outside observers to provide some structure to a place and subject matter that might otherwise be incomprehensible. The nations of Asia have rich and deep pasts that continue to inform and shape the present—and that play a significant role in relations with other nations and regions. The nations of Asia also face considerable issues—some unique to the region, others shared by nations around the world—as well as enormous potential for future growth and development. We expect that the next edition of this encyclopedia will portray a very different Asia than does this one, but still an Asia that is in many ways in harmony with its pasts.

David Levinson (with contributions from Virginia Aksan, Edward Beauchamp, Anthony and Rebecca Bichel, Linsun Cheng, Gerald Fry, Bruce Fulton, and Paul Hockings)

TURKIC LANGUAGES The Turkic languages are spoken across Eurasia from eastern Siberia to Iran and from China to Ukraine, but they are concentrated in Central Asia, where groups of two to twenty million are represented; the total number of speakers of Turkic languages exceeds 130 million. Turkish (approximately 57 million speakers) is the largest group. Despite their broad geographic reach, speakers of Turkic languages can usually understand each other. Turkic peoples lived in the paths of countless invasions of Eurasia, and they comprised a large part of the nominally Mongol army. This contact and mobility has rendered classification difficult.

Sound System

Most Turkic languages have eight basic vowels, which may be grouped according to backness (how far back in the mouth the tongue is when they are said), rounding (shape of the mouth), and height (how open the mouth is), such as in Kyrgyz. (See Table 1.)

Some languages have more distinctions (for example, Uighur and Azerbaijani also distinguish an open e [ɛ] and a closed e [e]), and some have fewer (for example, Uzbek and Salar. Yakut, Turkmen, and Khalaj have basic long vowels; many other languages have

long vowels in loanwords or from consonant contractions. Reduced vowels are found in Chuvash, Tatar, and Bashkir).

The combination of certain vowels with voiceless consonants have resulted in a “checked” sound (glottalization) in South Siberia (Tuva, Tofa *a*”t, meaning “horse”), and a related sound (preaspiration, or spirantization) in Inner Asia (Uighur *i*”kki, meaning “two”).

Syllables tend to have a consonant-vowel (plus optional consonant) shape, maximally CV(V)(C)(C), such as Yakut *küüs*, “force” (CVVC), or *türk*, “Turk” (CVCC, where the first consonant of CC must be a sonorant or fricative). Consonants such as *f*, *v*, *ž*, and *ts* are atypical, though they occur in many Turkic languages due to contact with other languages. Native initial nasals and liquids are not found, except for the interrogative *ne*, “what?”

The Turkic languages are also known for sound harmony: Native syllables have either all front vowels (*ä, e, i, ö, u*) and consonants (*k, g, ɣ*), or all back ones (*i, a, o, u, q*, etc.), as in *kel-*, “to come,” or *qal-*, “to remain.” There are many exceptions to this principle, however, and the Turkic languages vary widely in the extent of suffix harmony. Most suffixes match the stems in at least voicing and backness (palatal harmony). Some have roundness assimilation (labial harmony) as well, under more restricted conditions. Some languages have a weakened harmonic system, such as Uzbek, due to contact with Iranian.

Morphology and Syntax

Turkic has regular agglutinative suffixation, in which categories for person, number, tense and so on

TABLE 1

	Unrounded		Rounded	
	front	back	front	back
High	i	ĩ	ü	u
Not high	e	a	ö	o

are strung together in a strict order. For example: *Sarıg Yoghur bar-al-γe-mes-dro* is the root verb *go*, with potential-future-negative-third-person-definite endings added on to make “s/he cannot go.”

Nouns and verbs each take their own regular suffixes. Turkic nouns have neither gender nor dual number. Noun suffixes are almost uniformly ordered as follows: Uzbek *kitob-lar-im-da*, *book* plus plural-first-person-possessive-locative endings, to yield “in my books.” The plural is not marked in collective or numeral expressions. (So *horse* in the Kazakh phrase *at jaqsi* meaning “horse-good” or “Horses are good” is the same in *eki at*, meaning “two horses.”). Within the noun phrase, there is no case or number agreement between adjectives and their head nouns. Many particles have case-like functions: *üçün*, meaning “for” and *birle*, meaning “together with,” for example.

Nouns can generally function as substantives or adjectives (for example, Chuvash *śutǎ*, meaning both “brightness” and “bright”) and many suffixes can be added to both. Only adjectives have comparative forms: Tatar *yaxşı-raq*, “better.”

Personal pronouns lack a distinction between inclusive and exclusive; honorifics are often formed with plural pronouns, or with the reflexive pronoun in the third person. Demonstrative pronouns usually distinguish three kinds of distance, as with Kazakh *bul* “this (visible),” *sol* “that (invisible),” *osi* “that (further away).” Personal and demonstrative pronouns with genitive suffixes form possessives. Some demonstratives and interrogatives are formed from pronouns with suffixes.

Cardinal numerals are generally based on a decimal system; eleven to nineteen are additive: *on bir* “ten-one” yields “eleven.” Exceptions are Sarıg Yoghur and Old Turkic, in which *bir yigirmi* (“one-twenty”) yields “eleven” and *bir ohdis* (“one-thirty”) yields “twenty-one.” Normally sixty to ninety are multiplicative. Ordinals take a suffix.

Verbal expressions in Turkic comprise partly suffixing “be” verbs and regularly suffixing verbal phrases. In the third person, nonpast copulas are not usually marked (see, for example the Tuvan *ol suruqçi*, meaning “s/he is a student,” or the Kazakh *bul adam jaqsi*, meaning “this person is good,” to which can be compared *bul jaqsi adam*, meaning “This is a good person.” Negative and past copulas are always marked with particles, as in the Turkish *ben değil*, meaning “it isn’t me.”

Verbal morphology is extensive, with suffixes to express voice, mood, aspect, tense, and possibility or potentiality. Potentiality is often marked with a gram-

maticized *al-*, meaning “take” or *bil-*, meaning “know,” as in the Turkish *ver-e-bil-ir* “s/he can give.”

Verbs fall into two classes, finite and nonfinite. Finite verbs are conjugated, with markers for aspect, mood, and tense, and constitute independent utterances; nonfinite verbs do not carry such markers, and are dependant parts of a sentence (for example, they can be relative clauses). The manner in which an action is carried out is typically expressed by semantically-fused verbal phrases consisting of a nonfinite lexical verb and conjunctive followed by an auxiliary verb. Languages generally have one to two dozen of such grammaticalized combinations of tense, aspect, and modal suffixes.

One important feature of Turkic is inferentiality, which lets the speaker distinguish direct from indirect experience, as in the Uzbek *xatâ qıldım*, meaning “I made a mistake,” as opposed to *xatâ qilibman*, meaning “It seems I have made a mistake.” The indirective copulas *imiş* and *iken~eken* also exist.

Syntactic typology in Turkic is very consistent and economical. Modifiers always precede what they modify: Noun phrases precede the verb, and verbs come at sentence ends.

Diachronic Development

Before it diverged into distinct languages, a Common Turkic language unity is assumed; some scholars also posit an earlier Proto-Turkic language.

Old Turkic (the first attested) languages include East Old Turkic, Old Uighur, and Karakhanid. East Old Turkic is the oldest known Turkic, attested in runelike inscriptions on stone monuments in the Orkhon and Yenisey valleys in modern-day Mongolia from the second Turkic empire (eighth century); the language of the early Oghuz, Kipchak, and Uighur Turkic peoples was little differentiated at the time. Old Uighur flowered in the Tarim Basin Uighur dynasty under Manichaeism and Buddhism (ninth through thirteenth centuries); Karakhanid Turkic (eleventh through twelfth centuries), an Islamic literary language centered in Kashgar, was influenced lexically by Persian and Arabic and written in the Arabic script.

Middle Turkic reflects the increasing differentiation of the Turkic branches and the development of literary standards. In the east, Chagatay developed as the premier pan-Central Asian Turkic literary language, written in an Arabic script. In the west, Oghuz Turkic included Old Anatolian Turkish (from the thirteenth century onwards), its successor Ottoman Turkish, and literary Turkmen and Azerbaijani (from the

fourteenth and fifteenth centuries onwards, respectively); Kipchak Turkic is exemplified by the fourteenth-century *Codex Cumanicus*.

Modern Turkic comprises six branches, classified on the basis of both genetic and areal-typological features. Early on, Turkic languages in the west with *r* and *l* in some words (the so-called Oghur or Bulghar branch) split off from Turkic languages with *z* and *ʃ* (so-called Common Turkic). Khalaj, spoken today in Iran, represents a further early split. Common Turkic itself has four branches: Southwestern Turkic (Turkmen, Azerbaijani, Turkish, and Gagauz); Northwestern Turkic (Kazakh, Kyrgyz, Karakalpak, Noghay, Tatar, Bashkir); Northeastern (Tuvan, Khakas, Yakut), and Southeastern (Uighur, Uzbek).

Is Turkic Related to Mongolian?

A comparison of Turkic and Mongolian reveals an abundance of lexical cognates, as well as similar suffixation and phonology. Scholars disagree whether the relationship is one of genetic inheritance or borrowing. The former theory posits a common Altaic protolanguage, with three main families: Turkic, Mongolic, and Manchu-Tungusic. Altaicists pointed to regular sound correspondences, common suffixes and personal pronouns, and syntactic similarities. On the other hand, proponents of the now-dominant Turko-Mongolian hypothesis asserted that such similarities were due to borrowing, citing the lack of common numerals, and similarities between Chuvash and Mongolian. Mongolian's *r* corresponding to Old Turkic *z* may indicate that the Mongolian words were borrowed, likely very early on, from an *r*-type Turkic language like Chuvash. Altaicists call into question the claim of unidirectional borrowing from Turkic into Mongolic. Most all scholars agree that Mongolian and Turkic show evidence of heavy bidirectional copying at least since the intensive contact of the thirteenth-century Mongol empire.

The Mongolian influence was particularly strong in Yakut, Tuvan, and other Siberian Turkic languages. Other early loans include Indo-European, Uralic, and Sinitic. In addition, Yakut shows Tungusic and Samoyedic influence, and Salar, Chinese, and Tibetan elements. Uzbek, though a Southeastern Turkic language, shows the effects of contact with Tajik (Iranian) and Kipchak (Northwestern Turkic).

TURKMEN The Turkmen are a Sunni Muslim people whose language, Turkmen, belongs to the southwestern, or Oghuz, branch of the Turkic linguistic group. In 1997, about 3.6 million Turkmen lived in the Central Asian country of Turkmenistan, with smaller numbers residing in neighboring countries. About two-thirds of the Turkmen population reside in rural settlements. With the development of Turkmenistan's economy during the post-World War II Soviet period, many non-Turkmen skilled workers and managers immigrated to the republic. The population is distributed unevenly, with few people in the Kara-Kum desert and mountain regions, but large numbers in the oases.

Origins and Early History

The origins of the Turkmen may be traced back to the Oghuz confederation of nomadic pastoral tribes that lived in present-day Mongolia and around Lake Baikal in southern Siberia. The Turkmen probably entered Central Asia in the eleventh century CE and subsequently came under the rule of the Seljuk Turks and the Mongols. Turkmen tribesmen were an integral part of the Seljuk military forces. Turkmen migrated with their families and possessions on Seljuk campaigns into Azerbaijan and Anatolia, a process that began the Turkification of these areas. During this time, Turkmen also began to settle the area of present-day Turkmenistan.

Pre-Russian Social Structure and Livelihood

For centuries the Turkmen were divided into numerous tribes, the largest being the Tekke, Ersari, and Yomut. The Turkmen traditionally lacked paramount leaders and intertribal political unity. Each tribe's elder males formed a committee that discussed matters before embarking on any significant endeavor. They chose their leaders by consensus rather than genealogy.

Prior to the Russian conquest in the late nineteenth century, most Turkmen were pastoral nomads, though during the eighteenth and nineteenth centuries many had settled in the oases and become agriculturalists. The men had reputations as warriors, and many served as mounted mercenaries in various Central Asian and Persian armies. The Akhal-teke breed of horse, world renowned for its beauty and swiftness, is particular to the Turkmen.

Muslim Turkmen in traditional dress and hats praying in a mosque in 1991. (DAVID & PETER TURNLEY/CORBIS)

Prior to Soviet rule, the extended family was the basic and most important social and economic unit among the Turkmen. Small groups of Turkmen families camped together as pastoral nomads in their customary regions. Different camping groups consolidated only in times of war or special celebrations. Camping groups subsisted on their livestock and on agricultural products acquired in trade. In hard economic times, they had to raid sedentary people to survive.

Islam and Life-Cycle Rituals

Although the great majority of Turkmen readily identify themselves as Muslims and acknowledge Islam as an integral part of their cultural heritage, many are not devout practitioners. Most participate in religious traditions associated with life-cycle rituals, such as weddings, burials, and pilgrimages. Islam was spread to the Turkmen in the tenth and eleventh centuries, primarily by Sufi sheikhs rather than by strictly orthodox preachers. These sheikhs reconciled Islam with popular pre-Islamic customs. The people often adopted these Sufis as their "patron saints"—a practice contrary to strict Islam. Among the Turkmen, there developed special holy tribes, known as *ovlat*, which traced their ancestry to the Prophet Muhammad. In the eighteenth and nineteenth centuries, the *ovlat* tribes became dispersed. Their members attended and conferred blessings at important communal and life-cycle events and also acted as mediators between disputing tribes. The *ovlat* institution retains some authority today. Many of the Turkmen who are respected for their spiritual powers trace their descent from an *ovlat*, and it is not uncommon, especially in rural areas, for such individuals to grant blessings at life-cycle and other communal celebrations.

Unlike some Muslim women in the Middle East, Turkmen women never wore the veil or practiced strict seclusion. During the Soviet period, wives often

assumed what had been male responsibilities for certain Islamic rites so as to protect their husbands' careers. Many women entered the workforce out of economic necessity, a factor that disrupted some traditional family patterns. Educated urban women entered professional services and careers.

Turkmen place great value on marriage celebrations and life-cycle rituals. In rural areas especially, marriages are often arranged by special matchmakers (*sawcholar*), who seek potential spouses according to their social status, education, and other qualities. The bride's parents traditionally demanded a bride-wealth payment from the groom's family as part of the marriage contract. Turkmen rarely divorce.

Russian and Soviet Periods

In 1881, after conquering the Turkmen, the Russians created the Trans-Caspian oblast (province), which became part of the governorate-general of Turkistan in 1899. The Bolsheviks established control over the area in 1920. In October 1924, when Central Asia was divided into distinct political entities, the Transcaspian Territory and Turkmen Oblast of the Turkistan Autonomous Soviet Socialist Republic became the Turkmen Soviet Socialist Republic. Owing to forced collectivization during the first decades of Soviet rule, the Turkmen were transformed from pastoral nomads into sedentary farmers. They cultivated cotton and bred horses, camels, and karakul sheep. In the oasis strip along the middle Amu Dar'ya, they raised silkworms and grew cotton.

The Communist authorities suppressed religious expression and education. They closed most religious schools and mosques and banned religious observances. Some religious customs, such as Muslim burial and male circumcision, continued to be practiced throughout the Soviet period. Religious customs were preserved especially in rural areas.

Families continued to be close knit and often raised more than five children. It was common for married sons to remain with their parents, living together in an extended one-story clay structure with a courtyard and garden plot. In both rural and urban areas, respect for elders was great; Turkmen still consider grandparents sources of wisdom and spirituality.

The Soviet period dampened but did not suppress the expression of all Turkmen cultural traditions. Turkmen continued to produce their famous carpets; men continued to wear the high sheepskin hats, while women adorned themselves with distinctive Turkmen fabrics and jewelry. Turkmen also maintained their rich musical heritage and oral literature.

Independence

Turkmen leaders declared Turkmenistan's independence from the Soviet Union in 1991. The new government has made efforts to regain some of the cultural heritage lost under Soviet rule. It has ordered that basic Islamic principles be taught in public schools. Saudi Arabia and Kuwait have financed the opening of religious schools and mosques as well as instruction in Arabic, the Qur'an, and Islamic history. Courses on *edep*, or proper moral conduct according to traditional Turkmen and Islamic values, have been introduced in the public schools, and efforts are being made to contact Turkmen living outside Turkmenistan.

TURKMENABAT (1999 est. pop. 203,000). Turkmenabat (Chardzhou, Charjou, or Charjew before 1999) is a major river port in Central Asia, on the right bank of the lower Amu Dar'ya River, in the eastern part of the republic of Turkmenistan, a Central Asian state. It is the country's second largest city (after the capital Ashgabat) and the administrative center of Lebap Welayat (province). The city was founded in 1886 as a Russian military settlement named Novi Chardzhui (New Chardzhui), when Russia's Transcaspian Railroad, linking the Caspian Sea with the middle of Central Asia, reached the Amu Dar'ya. In 1940, the city was renamed Chardzhou and became the administrative center of the Chardzhou oblast (province) of the Turkmen Soviet Socialist Republic, part of the Soviet Union.

After the dissolution of the USSR in 1991, the city became the center of the Lebap province of the republic of Turkmenistan. In July 1999, it was renamed Turkmenabat (Turkmen City). At present, Turkmenabat is a major rail junction and the largest port on the Amu Dar'ya in Central Asia. The city has cotton-processing, silk-weaving, and chemical industries. It is also famous for its Astrakhan fur manufacturers.

TURKMENISTAN PROFILE (2001 est. pop. 4.6 million). The Republic of Turkmenistan is located in southwest Central Asia. The nation shares an eastern border with Afghanistan, a northern border with Uzbekistan, a northwestern border with Kazakhstan, a southern border with Iran, and a western border with the Caspian Sea.

Turkmenistan was annexed by Russia in the last part of the nineteenth century. On 27 October 1924, the Turkmenistan Soviet Socialist Republic was established. It became an autonomous republic of the Soviet Union in May 1925. Turkmenistan became an independent state on 27 October 1991, following the collapse of the Soviet Union.

Geography

Ninety percent of Turkmenistan's area of 488,100 square kilometers is consumed by the Kara-Kum and Kyzyl-Kum deserts, and is largely uninhabited. The Kara-Kum Canal carries water from the Amu Dar'ya westward across the desert to Mary and ultimately to Ashgabat, a distance of about 800 kilometers. The canal water permits irrigated agriculture and industry along the southern margin of the Kara-Kum desert. Temperatures tend toward extremes, with very cold winters and extremely hot, dry summers. Precipitation is low.

People

Turkmenistan had a 2001 estimated population of 4.6 million people. More than one-third of the population is under the age of fifteen. Ethnically, about 73 percent of the population is Turkmen, 9.8 percent is Russian, 9 percent are Uzbek, and 2 percent are Tatar. The population growth rate is high, about 2.1 percent in 2000. Life expectancy is about 61 years. Literacy rates are high, around 98 percent. About 89 percent of Turkmenistan's population practices Islam. Turkmen are traditionally Sunni Muslims. Another 9 percent of the population professes Eastern Orthodox Christianity. Sufi mysticism and shamanism are also visible.

In 1990 Turkmen was declared the official language. The Soviets replaced the traditional Arabic script with a Latin script in 1929, and later Cyrillic in 1940. Independent Turkmenistan has returned to a Latin script.

TURKMENISTAN

Country name: Turkmenistan
Area: 488,100 sq km
Population: 4,603,244 (July 2001 est.)
Population growth rate: 1.85% (2001 est.)
Birth rate: 28.55 births/1,000 population (2001 est.)
Death rate: 8.98 deaths/1,000 population (2001 est.)
Net migration rate: -1.04 migrant(s)/1,000 population (2001 est.)
Sex ratio: 0.98 male(s)/female (2001 est.)
Infant mortality rate: 73.25 deaths/1,000 live births (2001 est.)
Life expectancy at birth: 61 years, male: 57.43 years, female: 64.76 years (2001 est.)
Major religions: Muslim, Eastern Orthodox

Government

Turkmenistan is a republic with executive, legislative, and judicial branches of government, and a new constitution that was adopted on 18 May 1992.

Saparmurat Niyazov, who had been chairman of the Supreme Soviet, has served as Turkmenistan's president since 1991. In 2001, he announced he would retire by 2010, and open presidential elections are not planned until his retirement. Niyazov is often called Turkmenbashi, meaning "head of the Turkmen." Niyazov is the real source of power in the Turkmenistan government. There are two parliamentary bodies, a unicameral People's Council, or Halk Maslahaty, and a unicameral Assembly or Majlis. The constitution guarantees an independent judiciary.

Turkmenistan has five administrative regions (*welayats* or *welayatlar*): Ahal, Balkan Welayaty, Dash-

howuz, Lebap, and Mary. These five are subdivided into fifty *etrap*s, or districts. Ashgabat is the country's capital.

Economy

Turkmenistan is largely desert country with intensive agriculture in irrigated oases. One-half of its irrigated land is planted in cotton, making it the world's tenth-largest producer. Desertification and water pollution pose future concerns. The country has huge gas reserves (the fifth-largest reserves in the world) as well as oil resources. Other natural resources include coal, sulfur, and salt.

Until the end of 1993, Turkmenistan had experienced less economic disruption than other former Soviet states because its economy received a boost from higher prices for oil and gas and a sharp increase in

hard-currency earnings. This changed in 1994 as the fortunes of its customers in the former Soviet Union continued to decline. The government has been cautious in initiating economic reform measures, including privatization. A regional financial crisis prompted President Niyazov to issue a decree in late 1998 restructuring the banking sector and increasing government ownership.

Turkmenistan's telephone system is poorly developed, with only 363,000 telephone lines in use in 1997. Estimates for radios and televisions in 1997 were 1.225 million and 820,000 respectively. A 2000 estimate showed 2,000 Internet users in the country. There were seventy airports in the country in that same year; thirteen of those had paved runways. In 1989, official statistics showed sixty-six newspaper titles published in Turkmenistan.

About 58 percent of the population of Turkmenistan lived below the poverty line in 1999. Future prospects are uncertain.

TURKMENISTAN—ECONOMIC SYSTEM

The economy of Turkmenistan is dominated by agriculture and by public investment in export-oriented oil and gas. Turkmenistan's economic system is a highly administered, command-style economy, dominated by the government and the ruling political party. Structural market reforms, under way since Turkmenistan became independent upon disintegration of the USSR in October 1991, have proceeded slowly.

Background

Sandy deserts dominate Turkmenistan's terrain. Oases and river valleys have supported civilization

since ancient times, but Turkmenistan's inhospitable desert climate created barriers to the development of a modern state until the past century. The contemporary national frontiers of Turkmenistan are a product of the modern period.

Turkmenistan is a predominately Muslim nation in faith and culture. Roughly 90 percent of Turkmenistan's native population speak Turkic, and most speak an Oghuz Turkic variant that is easily understood by a modern Turkish speaker from Turkey. A small percentage of the population in the nation's four major urban areas (Ashgabat, Dashauz, Turkmenbashi, and Mary) are Soviet-era European migrants and post-Soviet-era foreign technical specialists, speaking mainly Russian and English.

Economic Activity during the Transition Period

Turkmenistan's economic activity in ancient times was restricted to oasis agriculture and animal husbandry. During the Soviet period, investment was concentrated in agricultural development and the gas and oil industries. Turkmenistan's agriculture emphasized cotton production. Given the nation's arid environment, expansion of the cotton-based agricultural economy required development of an extensive irrigation system. Diversion of the waters of the Amu Dar'ya River through Turkmenistan's Garagum (Karakum) Canal contributed to the desiccation of the Aral Sea and fueled disagreements among the Central Asian states regarding water use. The Soviet-era economy was organized on the principle of cooperative production, meaning that primary commodities such as raw cotton fiber, oil, and natural gas were transported to manufacturing centers, located primarily in the Russian areas of the USSR, for high-value secondary processing. As a consequence, Turkmenistan served as a supplier of primary commodities, while the associated processing and manufacturing took place in northern industrial centers.

Turkmenistan's Soviet-era economy depended on massive hidden subsidies. When Soviet subsidies ended, many industrial and agricultural enterprises immediately became insolvent. The government of Turkmenistan quickly sought to liberalize prices for external trade while maintaining price supports domestically. The government adopted a development strategy that stressed increasing foreign trade earnings while assuring domestic political stability under the policy of "positive neutrality." First, according to this policy, Turkmenistan sought to maintain as much distance as possible from Russia without giving up access to northern and European gas markets that, during at least the first few years of independence, would con-

tinue to be controlled by Russia by virtue of geography. Second, the policy of positive neutrality implied the expansion of trade with Turkmenistan's southern neighbors on the basis of self-interest. Third, it meant the nation would seek foreign investment to the extent possible to revitalize the gas-related industry and build a Kuwait-style emirate in Turkmenistan.

Economic Activity Today

The cornerstone of Turkmenistan's future economy is its energy wealth. With an estimated 2.7 trillion cubic meters in natural gas reserves and additional potential reserves estimated at 14 trillion cubic meters, Turkmenistan is the second-largest natural gas producer in the former Soviet Union and the fourth-largest producer in the world. Turkmenistan also has an estimated 1 billion metric tons of oil reserves and is the fourth-largest oil producer in the region.

Turkmenistan's hydrocarbon resources offer great potential for economic development but also imply certain developmental vulnerabilities. Turkmenistan was an early beneficiary of price liberalization after the disintegration of the USSR. This enabled Turkmenistan to charge world market prices for the gas it supplied to its former Soviet-era customers in Ukraine, Georgia, Russia, and other nations. On the other hand, Turkmenistan's landlocked position and limited transportation infrastructure made dependent upon customers in nations that were not in a position to pay. Accordingly, gas was supplied sporadically on credit, and a large proportion of Turkmenistan's gas sales was conducted on an inefficient barter basis. This led to serious problems of external arrears and a declining gas output. The total of arrears—mainly to Armenia, Azerbaijan, Georgia, and Ukraine—rose to \$1.2 billion, and the government of Turkmenistan interrupted some gas exports in 1997, greatly exacerbating political tensions in the region. Following complex negotiations involving trading partners, governments, commercial banks, and international organizations, many of the debts were rescheduled, and the government resumed gas exports.

In 1998, Turkmenistan produced 13.3 billion cubic meters of gas, down from 17.3 billion cubic meters in 1997. Turkmenistan produced 6,217 tons of oil in 1998, down from 4.4 million metric tons in 1997. Turkmenistan's gas industry is not limited by capacity. Turkmenistan can expand the output of natural gas with the turn of a valve. The constraints on production arise from the physical transport capacity. In late 1997, Turkmenistan began exporting gas to Iran through a newly completed pipeline. The government of Turkmenistan has also sought to develop new

pipelines for access to external gas markets. The government has lobbied hard for international cooperation in the construction of a gas pipeline across the Caspian, through Azerbaijan, Georgia, and through the Turkish port of Ceyhan to western consumers.

Although the oil and gas sectors account for a large proportion of foreign-currency earnings, they produce incomes that are restricted to a relatively small circle and form only a small portion of overall employment. Agriculture and animal husbandry, in contrast, account for about 20 percent of gross domestic product (GDP) and more than 60 percent of overall employment. Turkmenistan is among the top ten cotton producers worldwide. The production of cotton increased in 1999 was 1.2 metric tons, up from 700,000 metric tons in 1998 and from 624,000 metric tons in 1997. In an effort to establish food self-sufficiency, Turkmenistan subsidized wheat production, leading to an increase to 1.2 million metric tons, up from 648,000 metric tons in 1997.

Despite some economic gains in recent years, much of Turkmenistan's population (48 percent by World Bank estimates) lives below the poverty level. The government has adopted populist policies to support the social safety net. Since 1992 the government has subsidized housing and related utilities (for example, electricity, water, gas, sanitation, heating, and hot water), making them virtually free, and subsidized key consumer goods (for example, bread, flour, and baby food). According to social indicators, however, the safety net is far from sound. Local gas and water supplies, although without cost to consumers, are frequently interrupted. The nation's infant mortality rate (73.25 per 1,000 live births) is among the highest in the region, and life expectancy (61 years) is among the lowest among former Soviet republics. The 2000 GDP per capita was estimated at \$4,300.

The Government and the Economy

The government of Turkmenistan has been unwilling to enact serious post-Communist structural reform by reducing the dominance of the government, liberalizing the price structure, and monetarizing the economy to allow a true private sector to emerge. A weak financial and banking infrastructure continues to hobble economic growth. The government has sought to increase direct foreign investment but has pursued this goal primarily by wooing strategic investors with concessions rather than by establishing a level playing field for economic activity. The government's credit policy has been expansionary, based on "directed credit programs" and sweetheart deals. This has led to lax budget constraints and a predictably high number

of unperforming loans as credit is extended frequently not on the basis of financial merit but on the basis of access to influence and power.

The transfer of the state's most valuable assets to the private sector—privatization—has been slow and unsuccessful. Although small-scale trading and service operations have largely been privatized, the government of Turkmenistan has delayed transfer to the private sector of medium-sized and large-scale enterprises, preferring to hold these as state-managed trusts.

The government of Turkmenistan continues to play a highly interventionist role in the economy. All decisions affecting business involve some political considerations. The fusion of political and economic decision making requires that businesspeople "facilitate" necessary decisions to avoid capricious regulatory delays by offering inducements in the forms of bribes. Rather than create greater oversight, this form of control creates opportunities for corruption.

Faced with declining tax revenues from gas exports, the government has reduced budgetary spending by curtailing some expenditures (wages, pensions, stipends, and medicines are protected) in order to achieve fiscal balance. According to official figures, state budget deficits have not been large. The reported deficit was roughly 1.5 percent of GDP from 1994 to 1996, and a slight surplus was recorded in 1997 and 1998. But these figures are misleading. Turkmenistan's true budgetary picture is hard to assess because of a large number of extrabudgetary funds. A realistic estimate would put the real overall public sector deficit at 10 percent of GDP in 1999.

Future of the Turkmenistan Economy

Turkmenistan has sought to be an attractive partner, particularly for foreign enterprises interested in participating in the development of Turkmenistan's gas, oil, and agricultural sectors. However, the foundation of economic partnership in a market economy is the establishment of fair conditions for trade and commerce, not a system of favors and special treatment for preferred parties. International financial institutions such as the International Monetary Fund (IMF), the World Bank, and the European Bank for Reconstruction and Development (EBRD) have sought to assist Turkmenistan in the development of its economic institutions. Although the IMF has no formal lending program in Turkmenistan, it has provided technical assistance and policy advice. The World Bank has made major institution-building investments in privatization, modernization of the financial and banking sectors, joint-venture administration, training in the energy

sector, and improvement in water quality and urban transportation. The EBRD has provided significant investment in key institutional programs.

But by and large the international development community has not been satisfied with Turkmenistan's progress toward the adoption of international standards of policy and practice. In April 2000 the EBRD took the unprecedented step of suspending its public-sector lending programs to Turkmenistan on the basis of the government's unwillingness to implement agreed-upon structural reforms. Turkmenistan's future economic development rests upon the nation's ability to break away from excessive government controls and crony capitalism toward a modern economy based upon international standards.

TURKMENISTAN—EDUCATION SYSTEM Turkmenistan marked ten years of independence from the Union of Soviet Socialist Republics (USSR) on 27 October 2001. From 1924 to 1991, the Ministry of Education of the USSR provided centrally planned curricula and textbooks, determined enrollments, and required teaching in Russian. Since 1991,

many reforms have taken place in the educational system of Turkmenistan.

Structure of the Education System

The educational system of Turkmenistan consists of preschools, primary and secondary schools, vocational schools, and institutions of higher education. Preschools are available to children three years of age and older. Formal compulsory education in Turkmenistan begins at the age of seven. Students attend secondary schools for nine years. All secondary schools include elementary schools (grades one through three), where all classes are taught by the same teacher, and general schools (grades four through nine), where different subjects are taught by different teachers. Secondary schools enroll about 95 percent of the seven- to sixteen-year-old age group, evenly divided between girls and boys.

After graduating from secondary school, students may enter either a vocational school or an institution of higher education. The length of study in vocational schools varies according to the type of school, but on average ranges from one to eighteen months.

There are sixteen institutions of higher education in Turkmenistan: fifteen public and one private. The only private institution is the International Turkmen-Turkish University. Most classes at this university are taught in English, and students have to pay tuition to attend. However, attendance is free for those students who receive high scores on admission tests. The public institutions of higher education include one university, eleven institutes, one academy, one college, and one conservatory. The Ministry of Education of Turkmenistan coordinates the operation of all fifteen public institutions of higher education in the country, while the Ministry of Economy and Finances governs their budgets. All the public institutions provide education free of charge. The length of study is four to six years, depending on the specialization. In recent years, Turkmen has replaced Russian as the primary language of instruction.

Policy Making

The educational system of Turkmenistan remains highly centralized. Direction is provided mainly through decrees signed by the president of the country. The Ministry of Education, which plays a leading role in policy making, includes a minister and two assistant ministers.

Challenge for the Twenty-First Century

The major issue facing students and teachers in Turkmenistan is acquiring proficiency in the Turk-

men language. Instruction in 77 percent of secondary schools is provided in Turkmen, and in the very near future, Turkmen will be the exclusive language of instruction at all levels (it is already the only language of instruction at all institutions of higher education in the country). The government is preparing for this change by training teachers to teach in Turkmen.

The available statistics on what percentage of the population speaks Turkmen as a first language is highly misleading (all numbers are too high). The new language policy divides people into two camps: the first group feels that instruction in Turkmen is the right policy because Russian was forced on them many years ago; the other group (mostly those who do not speak Turkmen as a first language) feel that this change is unnecessary and unfair.

TURKMENISTAN-HISTORY (2000 est. pop. 4.5 million). Turkmenistan in Central Asia is home to most of the world's Turkmen, a Turkic people: hence the name, which means "land of the Turkmen," or Turkmenia in Russian. In 1924 the newly created Turkmen Soviet Socialist Republic was named Turkmenistan, and this name was retained when the republic first became a sovereign country in 1991 with the breakup of the Soviet Union.

Premodern Turkmen and Oghuz

Turkmen descend from the Oghuz Turks, a political union of Turkic peoples, who in the eighth cen-

tury migrated westward from the Gok-Turk empire, located in what is today Mongolia. They organized themselves under a *yabghu* (leader), and khans and *begs* oversaw the tribes and clans. By the tenth century the Oghuz were living in the vicinity of the Aral Sea and were one of the most numerous of the Turkic peoples, possessing extensive herds of sheep, camel, and horse.

By the eleventh century, the Turkic (Seljuk) state in Khorasan, in modern Iran, was Islamic. The name "Turkmen," previously used only as a political term, may have come to distinguish those Oghuz who adopted Islam and moved southward with the Seljuks in the eleventh century. Although they were Muslims, the Turkmen retained many aspects of their pre-Muslim beliefs and practices: shamanism, Zoroastrianism, the *Gok* or sky god (Tengri) belief system. Syncretism continues today but does not limit the Turkmen sense of Islamic heritage.

The Seljuk empire (1038–1157) had developed from the Oghuz federation of tribes. Seljuk and several Oghuz tribes moved southward to seek land and pasturage; recognizing the importance of Islam in the region, they converted. The Seljuk empire expanded into the Persian, Arab, and Byzantine lands. Its dominance over the Middle East carried Turkic traditions and customs throughout the region, advancing Persian and Turkish as administrative and cultural languages and diminishing the predominance of the Arabic language in the Muslim world.

The decline of the Seljuk empire led to the rise of principalities, most of which were overwhelmed by the Mongol invasion in the thirteenth century. The Mongol incursions into Turkmen regions pushed the Oghuz peoples farther westward into what is today Azerbaijan and Asia Minor (Turkey), whence the Ottoman empire partly grew.

During the next several centuries most Turkmen continued their traditional nomadic lifestyle, with some moving into Uzbek (another Turkic-speaking people)-dominated urban centers. While culturally and linguistically related to other Turks, the Turkmen saw themselves as distinct, even though they were not a united group. Although they recognized their Turkmen identity, tribal affiliation was even more pronounced and continues to be important. Khan leadership, regard for family genealogies, clan *tagma* (symbol), and oral traditions symbolized the primacy of clan and tribal membership.

Imperial Russia

Russia began military incursions into the Turkmen regions in the mid-nineteenth century. In 1879,

KEY EVENTS IN TURKMENISTAN HISTORY

- 8th century** Oguz Turks, ancestors of the modern Turkmen, migrate from Mongolia and settle in Central Asia.
- 1038** The Seljuk empire emerges in the region and Islam becomes the primary religion.
- 13th century** The region is conquered by the Mongols.
- 1881** The Russians defeat the Turkmen at the fortress of Gok-Tepe and incorporate the region into Russia.
- 1924** The region is incorporated into the Soviet Union as the Turkmen Soviet Socialist Republic and named Turkmenistan.
- 1928** The Soviet government represses Islam in Central Asia.
- 1954** Construction begins on the Kara-Kum Canal, which assists in the growth of agriculture but also causes long-term environmental damage.
- 1991** Turkmenistan declares political independence.
- 1992** Turkmenistan becomes a member of the United Nations.
- 1999** Saparmurad Niyazov is declared president for life.

several Turkmen tribes united to repulse the Russians, but the Russians returned in 1881 and on 12 January massacred eight thousand Turkmen at the fortress of Gok-Tepe, a battle that continues to haunt the Turkmen memory and that has been commemorated yearly since 1991. On 6 May 1881, the Turkmen region known in Russian as Transcaspia was named an "oblast" (region). By 1886 the Russian Imperial Transcaspian railroad stretched the length of the Turkmen lands, reinforcing Russian military and economic domination. In 1899 Transcaspia was incorporated into the governor-generalship of Russian Turkistan. In the Russian empire, the Turkmen were categorized as *inorodtsy* (alien) or *tuzemtsy* (native), which meant that they were exempt from military service to the czar and were allowed to preserve local custom, but these terms also belittled them for their non-Russianness.

The Soviet Era

In 1917 Turkmen regions were divided among the Khiva khanate, Bukharan emirate, and Transcaspia. Before the Bolsheviks could take control, they had to deal with the Social Revolutionary Transcaspian Provincial Government, the British in Iran to whom the Turkmen turned for assistance, and the Basmachi or Turkmen National Liberation Movement.

On 27 October 1924, the Turkmen Soviet Socialist Republic was created from the regions inhabited primarily by Turkmen, and Turkmen tribal identities

were subsumed under a new Soviet national identity. In the 1920s and early 1930s, efforts to bring Turkmen culture and infrastructure in line with the new Soviet society brought many reforms. Agriculture, industry, and the economy were radically reoriented toward Soviet goals, chief among which was continuing the czarist policy of using Turkmenistan as a mass producer of cotton. Turkmen resisted the Soviet program of collectivization, but the traditionally nomadic tribes were eventually forced to settle and work on collectives (*kholkhoz*) and state farms (*sovkhoz*). Women's lives began to change as educational and professional opportunities grew. In 1928 the Soviet government launched an antireligious campaign against Islam in which most mosques were destroyed and Islamic life was severely hampered. The policy of *korenizatsiia* (fostering indigenous culture) led to the creation of a standardized language and a broadly based educational and literacy campaign—all of which were designed to create a loyal Turkmen proletariat.

By the 1930s, however, Moscow's policies shifted, and *korenizatsiia* was denounced as "national chauvinism." In the 1940s, Soviet policy shifted again, this time away from ideas of internationalism and toward Russification; for example, in 1940 the Turkmen were required to adopt a Cyrillic alphabet. During the 1950s Russification increased, and supranational culture such as *dastans* (oral traditions) came under attack as a threat to Soviet culture. In 1954 construction began on the Kara-Kum Canal to bring water from the Amu Dar'ya

River to Ashgabat in Turkmenistan. The canal helped increase agricultural and cotton production, but the damage to the ecology was severe. The canal contributed to the draining of the Aral Sea and to the salinization of Turkmen lands.

Although the Soviet system deeply penetrated life in Turkmenistan, the Turkmen managed to retain many aspects of their distinct culture and values. Turkmen carpets continue to be of the highest quality and beauty. Stockbreeding remains an important sector of the economy and allows families to provide their own meat and milk products. Despite pressures, literature and poetry, especially the works of the poet Magtimguly and *dastans*, remain vital to Turkmen identity.

Post-Soviet Era

On 27 October 1991, Turkmenistan declared political independence. Saparmurad Niyazov, the former chairman of the Supreme Soviet, popularly known as *Turkmenbasy* (head of the Turkmen), became president in 1991, was re-elected in June 1992, and was declared president for life in December 1999. In March 1992 Turkmenistan became a member of the United Nations.

Today Turkmenistan is working to establish a national identity in the international sphere, to rebuild its culture, and to restore its history. After years of suppression, Islam is emerging both in private life and in the public sector. Turkmen culture continues to cultivate many aspects of its past. Mosques are being built and restored, national holidays include the old Zoroastrian springtime celebration of Navruz, and Turkmen women still wear camel-hair bracelets to ward off evil spirits.

TURKMENISTAN-POLITICAL SYSTEM

Although nominally a republic, Turkmenistan has a highly authoritarian political structure and culture. Turkmenistan's president, Sapamurat Niyazov (b. 1940), popularly known simply as Turkmenbashi, or "head of the Turkmen," leads Turkmenistan's only political party, the Turkmenistan National Democratic Party. During the latter Soviet period (December 1985–December 1991), Niyazov served as first secretary of the Communist Party of Turkmenistan, the highest political office in the country. Niyazov was elected chairman of the Turkmenistan Supreme Soviet in January 1990 and was elected president of the Soviet Socialist Republic of Turkmenistan on 27 October 1991, during the last stages of Gorbachev-era political reform.

After Turkmenistan gained independence in October 1991, Niyazov sought to improve his political legitimacy through popular elections. He was elected president of Turkmenistan for a five-year term in elections held on 21 June 1992, running without opposition. Niyazov's term was extended for an additional five years by a national referendum held on 15 January 1994. On 28 December 1999, Turkmenistan's parliament approved an amendment to the Turkmenistan Constitution allowing the president to remain in office for an unlimited period, effectively making Niyazov president for life.

Turkmenistan has recognized its president by naming numerous institutions, including cities, irrigation canals, schools, streets, and buildings, in his honor. Even the famed Lenin Kara-Kum Canal of Turkmenistan was renamed the Niyazov Kara-Kum Canal. A new medal of Turkmenistan National Distinction was introduced to honor extraordinary service to the Turkmenistan state, and President Niyazov became the first bearer of this new distinction.

Constitutional and Legal Framework

The postindependence Turkmenistan constitution was adopted in May 1992. According to the Turkmen political system, the president is the head of state and the government's chief executive officer. The government is managed on the top-down principle that accountability and responsiveness in Turkmenistan should be maintained not through the electoral process but through the paternalism of the head of state. The cabinet is composed of deputy chairpersons of the cabinet of ministers, usually eight in number, each with responsibilities in a broadly defined area. Beneath the level of the cabinet are the ministers leading ministries defined by functional areas. While the number of ministries varies from time to time, the list includes areas familiar from Soviet-era government administration, such as foreign affairs, defense, internal affairs, justice, finance, education, energy and industry, and oil and gas.

Other high officers of government include the chairpersons of the national parliament, or Mejlis, the members of the Supreme Court, the members of the Supreme Economic Court, and the prosecutor-general. The cabinet members and the other officers of government serve at the president's pleasure. The president appoints judges at all levels and has the power to disband local governing bodies and the Mejlis in the event that a no-confidence vote occurs twice within the Mejlis in eighteen months.

The legislative branch consists of the Khalk Maslkhaty, or People's Council. The Khalk Maslkhaty is meant to be a public information institution rather than a true deliberative assembly. In addition to its fifty elected members, the Khalk Maslkhaty includes the president, the high officers of government (including high court justices), fifty elected members of the Mejlis, from territorially defined single-voter districts, and certain other appointed local officials. In the Mejlis elections held in December 1994, the Central Electoral Commission reported a 99 percent voter turnout. In this election, fifty new Mejlis deputies were elected in noncompetitive, single-candidate districts.

All the candidates were registered members of the Turkmenistan National Democratic Party. In parliamentary elections held on 12 December 1999, the parliamentarians were elected in the same way, and all seats went to candidates of the Turkmenistan National Democratic Party.

The Turkmenistan constitution was the first legal document in any of the Central Asian states to explicitly endorse private property, by guaranteeing citizens the right to capital, land, and other material or intellectual property. However, the constitution had no provisions about the sources from which this private land was to come, nor was a land-holding fund created. A market for land emerged during the early years of independence, but the market has been dominated by local officials who set prices and determine availability, often on the basis of nonmarket factors.

Executive-Branch Functions

The Turkmenistan president is head of state and chief executive officer of the government. There is no vice president or prime minister. While the Turkmenistan constitution pays lip service to the principle of separation of powers, in fact no system of checks and balances functions in the country. Since declaring national independence, Turkmenistan has made only minimal progress in moving toward establishing an independent judiciary, promoting a truly deliberative legislature, conducting competitive elections, promoting institutions of democratic accountability, defending civil rights, and allowing freedom of association. The public and private sectors remain as closely interdependent today as they were during the period of state Communism. This fusion of political and economic decision making in Turkmenistan creates constraints on the normal operation of business and provides a fertile ground for petty economic corruption.

Competitive Politics, Elections, Parties, and Civil Rights

Turkmenistan has not succeeded in recognizing the importance of institutional pluralism in the modern period. Opposition political parties are outlawed, and the government security services deal harshly with small, unofficial parties and opposition movements. Fundamental freedoms of speech, press, assembly, movement, and confession are routinely subordinated by the state to the prevailing definition of the national interests as determined by the president. Only Islam and Russian Orthodox Christianity are registered religions. Authorities have intimidated, arrested, and otherwise persecuted individuals and groups outside these government-supervised structures.

The Turkmenistan government maintains that the country is "not ready" for openly functioning political parties openly debating values, ideals, and policies, as in most developed democratic countries. The government prefers to avoid social tensions, conflicts, and bloodshed by outlawing democratic institutions. The elections that have been held in Turkmenistan have been instruments designed to legitimize the existing power structures rather than expressions of the popular will. Turkmenistan does not pass the "election test"; that is, the situation in the country is not one in which, as Bernard Lewis says, "the government can be changed by elections as opposed to one where elections are changed by the government" (Lewis 1996: 53).

Transition to International Standards of Governance

International human rights organizations have been highly critical of Turkmenistan's political system, accusing it of failing to make sufficient progress toward international standards of acceptable governance. The U.S. government and other major world powers have been criticized for turning a blind eye to Turkmenistan's record and instead promoting the development of Turkmenistan's fabulous gas potential.

However, Turkmenistan's negative record is not without consequences. The European Bank for Reconstruction and Development (EBRD) suspended some of its lending programs to the Turkmenistan government in April 2000, claiming that the Turkmenistan government had failed to implement agreed-on structural reforms. The vice president of the EBRD, Charles R. Frank, noted that "the Bank has adopted a graduated approach, in which the scope of its involvement is tied to the progress these countries make in the application of universal democratic values" (Reuters 2000).

Turkmenistan's position in the international community may be determined not by its ability to make the transition to a higher standard of living but rather by its ability to offer its citizens a higher quality of life.

TURKS—WESTERN ASIA The word "Turk" refers to the members of the great linguistic and cultural family of Turkic peoples extending from China to Europe. Today there are two main groups of Turkic peoples: the western and the eastern. The eastern group is made up of the Turkic peoples inhabiting the areas of present-day Central Asia and the Uygur Autonomous Region of Xinjiang in China. The Turks of Turkey belong to the western group, which also includes the Turks of the Balkans, Anatolia, Cyprus, northern Iraq, and northwestern Iran and Azerbaijan. Almost nine-tenths of the population of Turkey claims Turkish as their first language. In present-day Turkey, however, the word implies not only ethnic, cultural, and linguistic aspects but also designates the politico-cultural group that includes everyone living in the territory of the Turkish state. According to the Turkish Constitution, Turkey is made up of all its citizens without distinction of race or religion.

Origins of Turkic Peoples

The primary ancestors of the Turks of Turkey are the Oguz Turks, who founded an empire in Central Asia in the sixth century CE. By the eighth century, nearly all the Oguz had adopted Islam, which is still the religion of most eastern and western Turks today. Around the tenth century, the Oguz migrated westward and settled southwest of the Caspian Sea, in Iran and Iraq. There the family of Oguz tribes known as Seljuks created an empire, which by the eleventh

century extended from the Indus River west to the Mediterranean Sea. In 1071, the Seljuk sultan Alp Arslan defeated the Byzantines at the Battle of Manzikert, and thereafter several million Oguz settled in Anatolia. These Turks came to constitute the majority of the population there and made it part of the Islamic world.

Ottoman Dynasty

An Oguz tribe led by Osman Beg founded the Ottoman dynasty in 1299. The empire reached its zenith during the reign of Suleyman the Magnificent (reigned 1520–1566) and controlled vast areas from northern Africa to southern Russia and from the borders of Austria to the Bay of Basra. Turks spread westward into the Balkans, and their descendants continued to inhabit that region for five hundred years. After the collapse of the empire, most of these Turks returned to Turkey.

European expansion into the Ottoman empire and the rise of nationalism among the ethnic and racial groups of the empire resulted in the Ottoman empire's dissolution in the early twentieth century. Nationalist feelings began to spread among the Turks, and Turkish elite began to call themselves Turks rather than Ottomans and began searching for Turkic origins.

Modern Turkey

Following the partition of the six hundred-year-old Ottoman empire after World War I, Turkish nationalists under the leadership of Ataturk (1881–1938) renounced the Ottoman heritage and founded the Republic of Turkey in 1923 within the borders of the empire's Turkish core—Anatolia and eastern Thrace. To Westernize Turkey, Ataturk launched a series of reforms affecting all aspects of life, from introducing a civil code to changing the alphabet from Arabic to Latin in 1928

A Turkish man with his two daughters in Kayseri, Turkey, c. 1997. (DAVE BARTRUFF/CORBIS)

and, in the 1930s, purifying the Turkish language by removing the foreign words. Ataturk's aim was to forge the identity of the modern Turks and to make them more like Europeans. Ataturk's reforms, based on secularism, nationalism, and modernization, constitute the ideological base of modern Turkey, called Kemalism.

In the process of modernization, the Ottoman structure of social relationships was greatly transformed. Women began to take their place in the public sphere along with men; the nuclear family replaced the extended family, although in most rural areas patrilineal ties and values are still dominant in determining social and kinship relations. Nearly two-thirds of the population live in urban areas and work in industrial and service sectors. The rate of population growth declined after the 1960s due to family-planning policies. Today approximately 3.5 million Turks live in various Western European countries.

Nearly all Turks are Muslim. Thus, while the Turkish state is secular, Islam has had a deep impact on family and social life, although this influence varies according to people's social and economic status. Two dominant sects of Islam, the Sunni majority and the Alevi, divide society vertically. The Alevi originated from Shi'ite Islam, but unlike their Iranian counterparts, are heterodox and have no formal clergy.

The culture of modern Turks has both modern and traditional elements, the latter of which are based on the rich Ottoman legacy apparent in carpet weaving, ceramics, music, architectural forms, and folk arts. Thanks to Ataturk's reforms, modern literature, fine arts, and classical and contemporary music flourish in Turkey. Today, theater, a growing film industry, and book and magazine publications play an important role in Turkish culture.

Most Turkish citizens are ethnically Turk, but very few if any are "pure" ethnic Turks. After the Turkic nomads came to Anatolia in the eleventh century, some settled peoples like the Greeks and the Armenians became Muslim and Turkish. Other Turkish citizens are descendants of those who came from the Balkans and the Caucasus as refugees in the late nineteenth and early twentieth centuries. This long history of intermixing explains the difference in physical appearance between the Turks of Turkey, who are akin to European peoples, and the eastern Turks, who have an East Asian appearance.

The Turkish language spoken by Turkey's Turks belongs to the Ural-Altai linguistic family and, with Gagauz, Azerbaijani, Turkmen, and Khorasan Turkic, forms the Oguz branch of the Turkic languages. Modern Turkish is also the language of Turkish minorities

living in north Cyprus, northern Iraq, Bulgaria, Greece, Macedonia, and Kosovo. Kurdish-speaking people, an estimated one-seventh of the population of Turkey, constitute another major linguistic group in that nation.

TURUGART PASS Turugart (Torugart) Pass is a mountain pass in the Tian Shan mountain range of Central Asia, connecting the Republic of Kyrgyzstan with Xinjiang Province in the far northwestern region of the People's Republic of China. A major highway runs through the pass, following one of the main routes of the ancient Silk Road between Europe and China. The road winds south through the smaller At-Bashi mountain range in the central part of the Tian Shan, which is oriented northeast and southwest, forming much of the Kyrgyz and Chinese border. Reaching a height of 3,752 meters at the pass, the road descends to the Chinese city of Kashgar on the edge of the vast Taklimakan Desert. A pristine mountain landscape and high mountain lakes such as Lake Chatyr Kul, virtually untouched by human hands, make the pass an area of environmental concern for the Kyrgyz government and people.

Near the pass, within Kyrgyzstan, sits the tenth-century Tash-Rabat caravanserai, or caravan rest stop, that gave shelter to caravans traveling along the Silk Route between Europe and China. The high mountain pass is growing in importance as a major economic and trading link between Kyrgyzstan and western China. The Kyrgyz form the majority of the population on both sides of the Turugart Pass.

TWELVE MUQAM The Twelve *Muqam* are considered the most prestigious music of the Uighur people of Xinjiang in northwest China. In terminol-

ogy, they are allied to the Arabo-Persian *maqam* system; *muqam* is the Turkic-language variant of this Arab term, and many names of individual suites are also drawn from Arabic. Musically, however, the *Muqam* are more closely related to Central Asian art-music traditions, like the Bukharan *Shashmaqam*. Unlike the Arabo-Persian traditions, which involve a degree of improvisation in performance, each of the Uighur Twelve *Muqam* is basically a tripartite suite made up of (1) *chong naghma* (great music)—a series of vocal and instrumental pieces beginning with a meditative unmetred *bash muqam* (introduction); (2) *dastan* (stories)—slower metered pieces; (3) *masbrap* (festival)—fast dance pieces.

The pieces are characterized by rhythmic formulas marked out by the hand-held *dap* (drum). Each of the Uighur Twelve *Muqam* is basically a fixed tripartite musical suite; each has a defining mood and pitch range, but modulation is so frequent that is hardly possible to link a *Muqam* to one mode, in contrast to the Arabo-Persian tradition.

The lyrics of the Twelve *Muqam* are attributed to the great Turkic and Persian poets or drawn from folk poetry; they are imbued with Sufi imagery and ideals. Said to originate in the fifteenth-century Kashgar court, their present form is more realistically traced back to the nineteenth century. *Muqam* may be performed by one singer with bowed or plucked lute (*satar* or *tanbur*) plus drum or with a small group of supporting voices and instruments. Men, women, beggars, and respected religious men may practice this tradition, for enjoyment or religious purposes. The Twelve *Muqam* hold an important place in Uighurs' affections and are often referred to in terms of spiritual necessity and moral authority.

TWELVER SHI'ISM There are two major branches of Islam. After the death of the prophet Muhammad (c. 632 CE), Muslims who followed Abu Bakr, 'Umar, and 'Uthman as the temporal and spiritual heads of Islam came to be known as Sunni Muslims. Those following 'Ali and his descendants came to be known as Shi'ite Muslims. Among the Shi'a, those believing in the twelve imams (spiritual heads of the Muslim faith), beginning with 'Ali and ending with the twelfth imam, are known as *Ithna 'ashariyah* or Twelver Shi'ite Muslims. This also contrasts with those who only believe in seven imams—the Ismailis. In both Sunni and Shi'ite Islam, there are traditions attributed to the prophet Muhammad about the day of judgment and the coming of the Mahdi (Rightly Guided One). In the Twelver Shi'a theology, the Mahdi and the twelfth imam are one and the same. It is thought that when recognized, the Mahdi will be named after the prophet Muhammad and will be a member of the house of the prophet, one who is a direct offspring of Muhammad.

The twelfth imam is the last imam of the Twelver Shi'ite tradition. Like many of the Shi'a imams, the eleventh imam, Hasan al-Askari (d. 874), was persecuted by the Sunni rulers of his time. The Abbasid caliph Mutamid had deported Imam al-Askari from Medina to Samarra (in present-day Iraq) and kept him as a prisoner for much of his short imamate. After Imam al-Askari's death, general confusion erupted among the Shi'ite community because no apparent successor had been appointed by him, nor was he known to have had any sons. As many as twenty factions were formed among the Shi'a, with each adhering to idiosyncratic beliefs. One faction continued to believe that Imam al-Askari was not dead but in a state of occultation (waiting to reappear to humanity). Similar ideas had risen after the death of the seventh imam, Musa al-Kazim (d. 799 CE). Others claimed that Imam al-Askari was childless. Yet others claimed that he had a son, who was the anticipated Mahdi and who has gone into occultation. They claimed that the five-year-old Mahdi was seen searching for his father near his dwelling place when he entered a cavern and was not seen again.

Although the myth or reality of the twelfth imam cannot be fully determined, the Twelver Shi'ism tradition considers him to have existed, to have been named Muhammad, and to have been a son of the eleventh imam, Hasan al-Askari. It is said that even

his mother was not aware of her own pregnancy. The twelfth imam is said to have been in danger of being killed by the Abbasids, who were the rulers of his time, because the Abbasids feared that the emergence of the Mahdi would end their tyrannical rule. In order to create dissent within the Shi'a ranks, the Abbasids had even supported one of Imam al-Askari's brothers by the name of Ja'far as the claimant to the office of the imamate.

It is also held that Imam al-Askari smuggled his son, Muhammad, from Samarra to Medina in 873. During his seven-year imamate, Hasan al-Askari lived in occasional imprisonment, hiding, and dissimulation (*taqiyya*), a practice of denying of one's faith used by the Shi'ites to protect themselves from the majority Sunni.

The twelfth imam lived in hiding for sixty-nine years, communicating with and guiding the Shi'a believers through four renowned followers. This period is known as the lesser occultation (874–941 CE). The concept of the *safir* (ambassador or agent) through whom imams communicated with their followers, had been established by earlier Shi'ite imams. After the death of the fourth ambassador, no other significant leader immediately claimed to be an ambassador or direct communicator with the twelfth imam. Another tradition has it that the fourth ambassador also gave the news of the bodily death of the imam to the believers.

The period from the supposed death of the twelfth imam until the day of his resurrection is known as the greater occultation. Many of the Shi'a believe that the twelfth imam is living among humanity but is invisible and that he will choose to reveal himself and rid the world of injustice when he deems it an appropriate time.

During the nineteenth century, several prominent figures are considered to have been the twelfth imam. The most prominent were Shaykh Ahmad al-Ahsa'i (1753–1826), Sayyid Kazem Rashti (d. 1844), and Mirza 'Ali Muhammad (1819–1850) of Shiraz, also known as the Bab ("the Gate"). The Bab announced his status in 1844, exactly one thousand lunar years from the lesser occultation of the twelfth imam (260 CE). Later, Mirza 'Ali Muhammad claimed to be the Mahdi and was eventually imprisoned and executed.

Unlike in the Sunni branch of Islam, in Shi'a clerics are considered more than religiously well-versed people who hold the same status as judges in secular courts. Many Shi'ite Muslims consider their religious figures to speak and deliver judgments in the name of

the twelfth imam. This has given substantial powers to Shi'ite clerics. The twelfth imam is also known as the *Muntazar* (the Expected One), the *Hujja* (the Proof), the *Qaim* (the Living), and the *Imam al-Zaman* (the Imam of Time). Today, the birth of the twelfth imam is celebrated throughout the Shi'a Muslim world.

TWENTY-SIX MARTYRS The twenty-six martyrs were Japanese and Western Christians crucified at Nishizaka Hill in Nagasaki on 5 February 1597. The twenty-six were ordered executed by Toyotomi Hideyoshi (1536/7–1598), Japan's paramount leader at the time, in response to developments surrounding the stranding of the Spanish galleon *San Felipe* the previous autumn off the island of Shikoku. Hideyoshi, who had long exhibited an erratic policy toward Christianity in Japan, had first banned the religion in 1587 but had not strictly enforced this proscription directed against the Jesuits. Originally, he also welcomed the Franciscans when they began their missionary work in the country in the 1590s, but when a pilot aboard the *San Felipe* boasted that Franciscan friars had in the past served as a vanguard of Spanish invasion forces in foreign territories, Hideyoshi moved quickly against the Franciscans in Japan.

In December 1596, six Western Franciscans from the Kyoto/Osaka area, fifteen Japanese followers of the Franciscan mission, and three Japanese Jesuits were arrested, tried, and condemned to death. The twenty-four were marched overland from Kyoto to Nagasaki for crucifixion. Two Japanese who followed the prisoners to look after their needs were also included among those executed. The deaths of the six foreign missionaries marked the first time that Westerners were executed in Japan for their faith.

The twenty-six were beatified by Pope Urban VIII in 1627 and canonized by Pope Pius IX in 1862. Three years later, to commemorate the martyrdom, French Catholic missionaries built Oura Church facing Nishizaka Hill in Nagasaki. A memorial to the martyrs was built at Nishizaka on the centennial of their canonization. In 1981 Pope John Paul II visited the memorial and paid tribute to the martyrs.

TYPHOONS Typhoons or cyclones are large, often destructive tropical storms similar to the western hemisphere's hurricanes. From Japan to India, millions of lives are at risk from typhoons, because of their high wind speeds, intense rainfall, and sea surges.

Since typhoons depend on heat and moisture to sustain them, these storms always form over warm oceans near the equator where sea-surface temperatures are at least 26°C. They originate in the western Pacific above the equator and follow several general tracks—westward across the central Philippines and into central and northern Vietnam, or curving northward to Hong Kong, Taiwan, Japan, and coastal areas of China. The most deadly and damaging of these storms originate in the warm water of the Bay of Bengal, where their northward track drives them into the low-lying and densely settled areas of Bangladesh. These storms occur before (April and May) or after (October–November) the southwest monsoon season and have been accompanied by winds in excess of 145 miles per hour. Although these winds can do great damage and release large amounts of rainfall, it is the storm surge or wall of water pushed ahead of the low pressure eye of the storm as it approaches the shoreline that is most devastating and accounts for most loss of life. The average annual frequency of typhoons in East and Southeast Asia is three or more per year. In the Indian Ocean and Bay of Bengal, where these storms are called cyclones, there may be one or more per year.

Residents with their personal belongings wade through the flooded streets of Nagoya, Japan, in September 2000 following a typhoon. (AFP/CORBIS)

The greatest damages from typhoons or cyclones have occurred in Bangladesh, the Philippines, and Japan. About 10 percent of all tropical cyclones form in the Bay of Bengal. Poverty and overpopulation worsen the devastating effects of cyclones on Bangladesh. Twenty million people live in vulnerable rural communities in the delta at the head of the Bay of Bengal, where much of the more productive rice land is located. In May 1985, a cyclone with a storm surge nine meters high caused more than eleven thousand deaths, although much higher death tolls have been recorded. For example, the storm of 29 April 1991 had an estimated death toll of 150,000–200,000 people and directly affected 15 million residents.

In isolated island groups such as the Philippines and Japan, typhoons can inflict large amounts of property damage, flooding, and loss of life. The concentration of built-up methods and agricultural activities in flood-prone lowlands and along coastlines means that high winds and heavy rainfall can cause damage to crops and buildings and threaten human life. The low-lying and narrow landmass of these island groups tends to intensify the impact of these forces. In 1970, four major typhoons swept central and north Luzon Island in the Philippines with over fifteen hundred lives lost. Typhoon Goring caused millions of pesos in crop damage in 1989.

Japan is hit by an average of four typhoons a year, which cause millions of dollars in property damage, primarily in the southern islands of Kyushu and Fukuoka. Typhoon Vera, which struck central Honshu in 1959, left five thousand dead and over forty thousand injured.

Efforts to mitigate the adverse impact of typhoons vary. Japan has enforced typhoon-resistant building practices in many of the most vulnerable urban areas in Kyushu and southern Honshu Islands and Fukuoka Prefecture for many years. Elsewhere in Asia, evacuation programs and early warning systems are less developed, although governments and international disaster-management agencies are working on developing them.

UCHIMURA KANZO (1861–1930), Japanese writer and religious figure. Uchimura Kanzo was born in Edo (present-day Tokyo) to the samurai class and educated in the English language at Sapporo Agricultural College (now Hokkaido University), where he converted to Christianity. In 1884, he traveled to the United States, studied at Amherst College and Hartford Theological Seminary, and worked at a mental hospital in Philadelphia. His spiritual autobiography, *How I Became a Christian* (1895), describes the racial prejudice, economic injustice, crime, and strident religious sectarianism he found in the United States, all of which he considered contrary to true Christianity. After returning to Japan in 1888, he became a schoolteacher, but was accused by his colleagues of showing disrespect toward the emperor. Unable to continue in education, he became a writer, editor, and religious leader, as well as a prominent pacifist. His *mukyokai* (nonchurch) doctrine sought to avoid reliance upon church buildings, professional ministers, and organizations in favor of more informal and democratic gatherings at individuals' homes. Although motivated in part by a resistance to the hegemony of Western religious institutionalism, his doctrine also emphasized Bible study in small groups, organized along the culturally familiar pattern of *sensei* (teacher or mentor) and *deshi* (student or disciple). While technically a fundamentalist, his beliefs are also seen as nationalistic in their advocacy of a Japanese-led reformation of Christianity.

UIGHURS Uighurs (or Uygurs) are the largest of the Turkic groups in Xinjiang Uygur Autonomous Region of China, with an estimated population in the region of 8 million in 1997. Uighurs account for 46.7 percent of the population of Xinjiang Uygur Autonomous Region, with Han Chinese accounting for 38.4 percent and members of other minority ethnicities accounting for the remaining 14.9 percent. For most of the past ten centuries, these people have lived under the control of the Mongolian peoples. The Uighurs make their living in the Tian Shan mountain range as nomads (though the nomadic population is decreasing), herding sheep, goats, cows, horses, and camels. In oases near the Taklimakan Desert, they engage in farming with the aid of irrigation canals or underground waterways to run meltwater. Wheat, corn, cotton, and fruit (grapes, watermelons, and muskmelons) are popular crops. Trading is actively carried out across borders in the southwestern cities, where people weave traditional carpets.

At present they are Sunni Muslims, but earlier in their history they inclined to Manichaeism (since the eighth century) and Buddhism (since the tenth century), and originally they adhered to shamanism and believed that Heaven (*tengri*) gave order, power, and wisdom to mankind. Fragments of many kinds of texts on Buddhism, Manichaeism, and Nestorian Christianity have been uncovered at archaeological sites in Uighur areas. Islam came to Uighur lands along the Silk Road, and almost all Uighurs had be-

come Muslims by the end of the fifteenth century. Since 1978, the Chinese government has maintained an appeasement policy with regard to religious expression, supporting the revival of religious activities, including reconstruction of mosques and religious school, as well as supporting publication of books in Uighur, in an effort to promote reform and an open-door policy. This is in an attempt to mend the damage done by the Cultural Revolution (1966–1976), in which much of the culture of the pre-Communist period was destroyed. Muslims are hopeful that these policies will lead to a resurgence of ethnic and religious autonomy, but their optimism is guarded. They are quite afraid that their ethnic and cultural sovereignty will be overwhelmed by the area's growing Han Chinese population. China, for its part, is very sensitive about matters affecting its sovereignty over the Xinjiang Uygur Autonomous Region.

Early History of the Uighur people

The term Uighur originated as the name of one of the Nine Tribes (Tokuz Oghuz), a confederation of Turkic nomads that first appears in the annals of Chinese historiography in the early seventh century. A clan of the Uighur tribe, the Yaghlakar, established a state (744–840 CE) in what is now Mongolia. This state's most notable contribution was the military rescue of the Chinese Tang dynasty (618–907 CE) from the crises caused by the rebellion of the general An Lushan (703–757). In return, the Chinese emperor bequeathed the Uighur state a large monetary award annually. The Uighurs strengthened their relationship with the Sogdian merchants (Sogdians were a people who lived in Transoxiana, now Uzbekistan) who had a profitable trade of horses from the Uighur state for silk from China. In 763, the Uighurs permitted the Sogdians' Manichaeon missionary work. The city Ordubalik ("Town of the Palace"), located on the Orkhon riverside and later named Karabalghasun, enjoyed its greatest flourishing during this time. The Sogdians engaged in commerce with their colonies along the Silk Road leading to China and the Uighur state.

The Uighur ruling classes attempted to strengthen social and economic relations with the Sogdians, which caused unrest among nomadic Uighurs, who were suffering from famine and pestilence, and, in 839, from heavy snowfalls. Probably seeing the opportunity to take advantage of the situation, a large number of Kyrgyz, a Turkic tribe in the upper Yenisey valley, allied with a discontented Uighur general and invaded and burned Ordubalik, bringing down the Uighur government in 840. Both Uighur nomads and nobles of the ruling classes emigrated, eventually settling in the area

from the Tian Shan to Gansu Province in northwestern China. Immigrant Uighurs founded at least two new states, the Uighur kingdom of Ganzhou (890–1028), and the West Uighur kingdom (early tenth century–1284). Descendants of the former Ganzhou Uighurs may be the Yugu in Gansu, traditionally known as the Yellow Uighurs (with a population of approximately 39,000 people in the Autonomous Sunan Yugu Prefecture in 1997).

Rule by the Kara Khitan and the Mongols

The Uighur kingdom of Ganzhou was absorbed by the Tangut people (herdsmen from the Ordos desert area of northern China) into their Xi Xia kingdom in 1028. The West Uighur kingdom fell under the control of the Kara Khitan in the 1130s. In 1209, unable to bear the tyranny of the local Kara Khitan magistrate, the king of the Uighurs had him killed. He was no doubt emboldened by the promise of protection from a new and more powerful overlord: Genghis Khan. The king surrendered the West Uighur kingdom to Genghis Khan in the same year; it survived as a Mongol vassal state until 1284. The Uighurs were originally supposed to provide military service for the Mongol empire but ended up occupying higher positions in various areas of the government.

A succession dispute among the Mongol khans turned the Uighur lands into a battlefield at the end of the thirteenth century, and by the early fourteenth century the castle towns in the Turfan basin were devastated by war. The Uighur royal family and their subordinates took refuge in Gansu in 1284, and the Uighur lands came to be ruled by the descendants of Chagatai Khan, son of Genghis Khan. When the Kashgar Khojas, Islamic nobles, gained power in the seventeenth and eighteenth century, Islam and Islamic culture, for example, the Naqshbandiya order of Sufi Islamic mystics, spread among the Uighur people. Galdan Khan (1645–1697), leader of the Oirats of western Mongolia, occupied the land of the Uighurs for seventy years following an invasion in 1679. In the first half of the eighteenth century, under Galdan's successors, many Uighur farmers (later called Taran-chis) of southern Xinjiang were forcibly relocated to the Ili Valley on the northern border.

Rule by China

In 1760, the Uighur lands were conquered by military expeditions of the Chinese Qing dynasty (1644–1912). Approximately forty-five thousand Uighurs moved to Semirechie in Kazakhstan in 1881. The Uighur people in the oases around the Taklimakan

desert came under Chinese rule when Xinjiang Province was established there in 1884. After the Uighur rebellion of 1931–1934, the Chinese government at last granted the Uighurs the status of a minority people.

The Uighurs, together with China's Kazakh minority, founded a state (the East Turkistan Republic) in northern Xinjiang in 1944–1949, but the newly established People's Republic of China absorbed it in October of 1949. In 1955 the Chinese set up an administrative office in the Xinjiang Uygur Autonomous Region of China at Urumchi. About sixty thousand people, including Uighurs and Kazakhs, emigrated to Kazakhstan (1962). Today, there are more than 200,000 Uighurs who are citizens of Kazakhstan.

ULAANBAATAR (2000 est. pop. 774,000). Ulaanbaatar (also Ulan Bator, Uрга, Niislel Huree), situated at an altitude of 1,350 meters in central Mongolia, is the capital of the Mongolian People's Republic and is the country's largest city. Mountains, including the prominent Bogd Uul Ridge (2,200 meters), surround the city, which lies in a long valley of the Tuul River.

The city began in 1639 as the itinerant court of an influential Mongolian prince. Over decades it gradually became a religious and political center for the region, and in the eighteenth century the court settled permanently on the current site of Ulaanbaatar. From this place, the *bogdo-gegen*, Mongolian Buddhism's highest lama, exercised religious and political authority across large areas of modern-day Mongolia. By 1900, as many as twenty thousand lamas were conducting services at more than one hundred temples in

Ulaanbaatar in 1983, while still under Soviet rule. The high-rises on the outskirts of the city were occupied by Russians and Eastern Europeans and contrast with the more traditional architecture of buildings in the foreground of the photo. (DEAN CONGER/CORBIS)

the city. In addition the city was home to six hundred foreign firms and several thousand merchants and craftsmen and prospered from trade between Russia and China.

The first half of the twentieth century was a turbulent time for the city. In 1911, when Outer Mongolia declared independence from China, the city was renamed Niislel Huree ("national capital"). During the following decade, it was variously occupied by Chinese and White Russian troops, and in 1921 a Mongolian militia commanded by Damdiny Suhbaatar captured the city with the aid of the Soviet Red Army. In 1924 leaders of the country's Communist revolution renamed the town Ulaanbaatar, which means "red hero." With Soviet aid, the city built museums, theaters, and several institutions of higher learning, including the National University of Mongolia. To accommodate the fast-growing population, block apartments replaced the traditional Mongolian *ger* (felt tent) and public transportation replaced horses. In 2000 the city produced more than 50 percent of the country's industrial output. Its architecture is an eclectic combination of Soviet-style block apartments, neoclassical public buildings, Tibetan Buddhist temples, and traditional *gers*. The Trans-Mongolian Railway and an international airport connect the capital to both Beijing and Moscow, and it is the political, cultural, and social center of the Mongolian People's Republic.

ULCHI MUNDOK (flourished 589–618), general of the Korean kingdom of Koguryo (37 BCE–668 CE). Ulchi Mundok was the hero of the Koguryo repulsion of the Sui Chinese invasion of 612. He is known, however, largely from one short passage in Kim Pu-shik's (1075–1151) *Samguk sagi* (History of the Three Kingdoms), which discusses his cunning defeat of the larger Chinese force. He lured the battle-weary Sui invaders deep into Koguryo territory by feigning defeat in several small skirmishes and sending a poem taunting the Chinese commander. He then trapped and slaughtered the Chinese troops at the Sal River (now Ch'ongch'on) and harassed them all the way back to Liaodong. Winning this great victory saved Koguryo from Chinese conquest. The poem and the Chinese version of story, from which Kim Pu-shik's account derives, are preserved in Wei Zheng's (580–643) *Sui shu* (History of the Sui).

Ulchi Mundok did not become a Korean national hero until the modern era. Traditionally, that honor was accorded to the Shilla kingdom's General Kim Yu-shin (595–673), an important figure in the unification of the Three Korean kingdoms (Koguryo, Shilla, and Paekche) in the 660s. However, nationalist historians have more recently argued that Ulchi Mundok was the real military hero of the period, because he protected Koguryo's ancient possessions in Manchuria and preserved Korea's political and cultural independence by not forming an alliance with Tang China as the Shilla leaders did. Because many present-day Koreans see Korea's historical and cultural roots in Koguryo, Ulchi Mundok has become a symbol of the Korean national spirit.

UMAR, TEUKU (1854–1898), Acehese war leader. Born in Meulaboh, Aceh, on the island of Sumatra, Indonesia, Teuku Umar (Teuku Oema) first rose to prominence as a military leader on the western coast of Aceh during the long military struggle against the Netherlands's annexation of the sultanate in 1874. In 1883 he was lured away from the resistance by Dutch promises of money and weapons as part of a policy to create a coalition of pro-Dutch Acehese forces but deserted them in 1884. He rejoined the Dutch in 1893 and deserted them again in 1896, taking many of their weapons and resuming the armed struggle against them. His action strengthened those among the Dutch arguing for more forceful action in Aceh. In 1898 Colonel J. B. van Heutsz was appointed head of the Dutch civil and military forces with the task of subjugating the region. Van Heutsz's wide-ranging military operations included an ambush at Meulaboh in which Umar was killed.

Although Umar is officially regarded as a hero of the anticolonial resistance, his willingness to collaborate with the Dutch presaged their successful strategy of co-opting *uleebalang* (war leaders) as allies against more radically anticolonial Muslim leaders.

UNGPYAKORN PUEY (1916–1999), Thai government official, economist, educator. Ungphakorn Puey was known as an honest government official, an economist and educator, a strong promoter of rural development, and an advocate for democracy in Thailand through nonviolent means. Born into a Sino-Thai family, he finished high school at Assumption College in 1933 and received his B.A. from the University of Moral and Political Sciences (Thammasat University) in 1937.

The Japanese occupation of Thailand in 1944 prompted Ungphakorn Puey to volunteer to work with the British Army Pioneer Corps. His main task was to contact leaders of the underground "Free-Thai" movement, and he risked his life by parachuting into Thailand, where he was nearly executed by the Thai police.

Puey received his Ph.D. from the London School of Economics in 1989, graduating with First Class honors, and began his career as an economist and senior government official. He held the post of governor of the Bank of Thailand from 1959 to 1971. While governor, he succeeded in keeping the bank largely free of political influence and thus enabled it to have a sound monetary policy. This allowed Thailand to avoid serious inflation and kept the Thai currency remarkably stable.

In 1964, he offered his resignation as bank governor to become dean of the Faculty of Economics at Thammasat University. A compromise was reached among bank and university officials, and he was allowed to keep both positions. His deanship at Thammasat University was from 1964 to 1972.

In 1972, continuing actions against democracy on the part of the military regime prompted Dr. Puey to write an open letter from Cambridge University, where he was a visiting fellow, to protest against the prime minister, General Kittikhachorn Thanom. The letter, together with a growing protest movement, led to the student uprising of 14 October 1973, and a brief period of freedom and democracy was instituted in Thailand from 14 October 1973 to 6 October 1976. Ungphakorn Puey returned to Thailand and was elected rector of Thammasat University in 1975.

The military regime returned to power on 6 October 1976, and Dr. Puey, because of his personal convictions, was forced into self-exile in England with his English wife, Margaret Smith. He continued with various nonviolent activities against the military regimes in Thailand until his death in London at the age of eighty-three, two years after Thailand's democratic constitution of 1997 was proclaimed.

UNIFICATION CHURCH Tongil-kyo (*tongil* is the Korean word for "unification"; *kyo* is Korean for "church": thus literally "Unification Church") is the most prominent of Korea's new religions that have Christian origins. Once formally known as the Holy Spirit Association for the Unification of World Christianity, in 1997 the full name of what is still popularly known as the Unification Church was changed to the Family Federation for World Peace and Unification in order to embrace all religions rather than focusing solely on Christianity. The Unification Church was founded in 1954 by Sun Myong Moon (b. 1920), an itinerant Christian preacher who had been imprisoned by Communist authorities in North Korea. Moon moved to South Korea when his prison was liberated during the Korean War. Soon afterwards, in 1954, he established the Unification Church in Seoul and began preaching a revision of traditional Christian theology based on revelations Moon proclaimed he had received.

According to *Divine Principle*, the record of those revelations, Adam and Eve were to be the true parents of mankind. However, Satan seduced Eve, ensuring that she and Adam would not be the sinless progenitors needed to ensure that human beings live in harmony with God's will. God later sent his only son Jesus to earth in another attempt to establish a sinless lineage and erect a heavenly kingdom on earth. However, humanity rejected Jesus, crucifying him before he could marry and father children. In the twentieth century, God allowed a man to be born without sin in order to complete the mission the savior Jesus had begun. That messiah would save the rest of humanity from Satan by marrying a woman equally sinless in order that human beings may finally have true parents who can restore them to the family of God.

In 1992, Moon and his wife Hak Ja Han, whom he had married in 1960, announced publicly that they are those true parents, and that under their stewardship humanity had left behind the New Testament age and embarked upon a new age in human history, the Completed Testament Era. Every year Unificationists celebrate the Moon's wedding anniversary as Parents Day, the date on which humanity began the return to the state of grace that prevailed before Eve's transgression with Satan.

Though the Unification Church is Korean in origin, it is no longer primarily a Korean church. Moon

moved to the United States in 1971. Even though a U.S. federal court convicted him of tax evasion in 1982, and he served thirteen months in prison on that charge, he continues to lead the Unification Church from its American headquarters in New York State. In 1999, church officials said that only 220,000 of a claimed 4.5 million members worldwide resided in Korea.

UNIFIED SHILLA KINGDOM On the Korean Peninsula, the Shilla kingdom (57 BCE–935 CE), with the Tang dynasty (618–907 CE) of China as its ally, was able to overpower the Paekche kingdom (18 BCE–663 CE) and then the Koguryo kingdom (37 BCE–668 CE) in the 660s. It soon became apparent, though, that Tang China had its eyes on this conquered territory for itself and did not recognize the Shilla kingdom's claim to the territory south of the Taedong River, south of Pyongyang (in present-day North Korea), until 676. This excluded much of the former Koguryo territory, and it was to this territory that many Koguryo people migrated and set up the Parhae kingdom (698–926 CE). The Shilla kingdom was thus able to unify most of the Korean Peninsula under its rule but less than half of the land ruled during the Three Kingdoms period of China (220–265 CE).

KOREAN KINGDOMS AND DYNASTIES

Koguryo kingdom (37 BCE–668 CE)
 Paekche kingdom (18 BCE –663 CE)
 Shilla kingdom (57 BCE –935 CE)
 Unified Shilla (668–935 CE)
 Koryo kingdom (dynasty) (918–1392)
 Choson dynasty or Yi dynasty (1392–1910)

The Unified Shilla kingdom (668–935 CE) reached its peak in the middle of the eighth century. With Buddhism already the state religion, the Unified Shilla kingdom attempted to establish the ideal Buddhist nation. To this end, splendid Buddhist temples and shrines were constructed. The most noted of these are the Pulguk Temple and Sokkuram Grotto, both located near the Shilla capital, present-day Kyongju. Extensive woodblock printing of Buddhist scriptures was also undertaken. These included the recently discovered imprint of the *Dharani Sutra*, probably printed in the first half of the eighth century. Overall, the arts and sciences flourished.

After unifying the peninsula, the Unified Shilla kingdom reorganized its administration after that of neighboring China and developed a complex bureaucracy. Most important, there was a growing authoritarianism in the power exercised by the king, which increased to the extent that opposition to the throne was virtually eliminated. The power of the throne was evidenced by changes in military organization. Members of the nation's ten garrisons and national army took oaths of loyalty to the throne and were under the king's direct authority. The Unified Shilla kingdom enjoyed an era of peace with Tang China. In return for being allowed to remain independent of the Tang in internal affairs, the Unified Shilla kingdom sent periodic tribute to the Tang emperor and recognized China's authority in Asian affairs.

As the nobility indulged in easy, luxurious lives, Buddhism as the state religion began to decline in the latter part of the eighth century. A new sect, Son (Zen), began to establish itself in remote mountainous areas. Corruption in the bureaucracy and factional strife in the government became rampant. Rulers became increasingly weak and immoral, and aristocrats abused their power. The situation deteriorated to one of near anarchy, leading to peasant revolts. Leaders of these revolts created rival states—the Later Paekche kingdom (892–936) and the Later Koguryo kingdom (901–918)—backed by strong armies. The Unified Shilla kingdom shrank to its preunification size. The Later Koguryo kingdom, renamed Koryo, gained control of the central part of the peninsula, and the Unified Shilla kingdom, being too weak to resist, handed over power to the Koryo kingdom. In 936, after fierce military resistance, the Koryo kingdom (918–1392) defeated the Later Paekche kingdom to reunify the Korean Peninsula.

UNION SOLIDARITY AND DEVELOPMENT ASSOCIATION-MYANMAR

In the absence of a political party popular among the masses, Myanmar's State Law and Order Restoration Council (SLORC) founded the Union Solidarity and Development Association (USDA) on 15 September 1993 as a mass movement to help unite Myanmar (Burma) under its sovereignty. Organized at all levels, from State and Division to village tract level, the SLORC declared the following five formal objectives: (a) non-disintegration of the union, (b) non-disintegration of the unity of the national races, (c) perpetuation of national sovereignty, (d) uplift of national prestige and patriotism, and (e) the emergence of a developed, peaceful, and modern state. Membership in the USDA affords promotion and special privileges, but also compels participation in denunciation of perceived threats, including against the National League for Democracy (NLD) and democratically elected political parties and their leaders. Though a membership in the millions is proclaimed by the authorities, the fact that it is conceived entirely as an instrument of state, and pressures people to join with intimidation, means that this organization is unlikely to play an enduring role if, and when, political reforms are initiated.

UNITED FRONT STRATEGY The United Front strategy grew from the belief of the Soviet Comintern, or international organization of Communist parties, that Communist groups in nations subject to foreign subjugation should form a united front with na-

tionals to gain their liberation before beginning their socialist revolutions. "Hostile classes," Lenin believed, "are united by a common interest in opposing foreign exploitation" (Schram 1969: 134). The strategy was first used in China and, after a successful start there, was also attempted in Korea. In the end, both attempts were unsuccessful, and the societal divisions that emerged remain in the divided Korean Peninsula and in the politically divided governments of China and Taiwan.

In China, until the Communist purge in 1927, the union of the Communists and Guomindang (Chinese Nationalist Party) led to the formation of a government with Communist participation; one Russian adviser even observed that members of the right-wing Guomindang were moving toward the left. This observation was premature with the brutal purge of the Communists by Chiang Kai-shek's (1887–1975) nationalist group, ending any hope of a strong united front to challenge Japanese imperialism in China.

In Korea, the United Front strategy was meant to create "a broad national revolutionary front that included handicraftsmen, the intelligentsia, and the petty and middle bourgeoisie along with the workers and peasants" (Scalapino and Lee 1972: 95). The structure for this front was the Korean National Party (KCP), formed in early 1926. This party was organized by Korean Communists in an attempt to form an alliance with Korean nationalists and thus placed Korean Communist Party members at its core. This attempt was weakened by the roundup of many KCP leaders by the Japanese after the funeral of former Emperor Sunjong in June 1926.

The formation of the Singanhoe (New Korean Society) in 1927 marked Korea's best opportunity to unify rival factions. The society, which accommodated a variety of groups ranging from the moderate to the radical, soon established a national network of 386 branches with more than seventy-five thousand members. The beginning of the end of the society came in 1929 when its leaders were rounded up by Japanese police and charged with lending support to the student riots in Kwangju in 1929. The society's subsequent move to the right caused many leftist members to quit, leading to its demise in 1931 and ending hope for a Korean united front against the Japanese.

These efforts by the Soviets to create united fronts in both China and Korea failed due to the political differences facing the leaders of the respective nationalist and conservative parties. These differences eventually erupted into civil wars in both nations, deepening divisions that persist in the twenty-first century.

UNITED NATIONS Created in 1945 from the ashes of the failed League of Nations (1920–1946), the United Nations (U.N.) is an international organization dedicated to promoting world peace and cooperation. Although some Asian countries, including Afghanistan, China, India, Thailand, and Japan (until 1935), were members of the League of Nations, the league focused on European problems rather than on Asia; by contrast much work of the United Nations has centered on Asia, where most of the world's population lives.

Political Foundations

When the United Nations Charter took effect on 24 October 1945, China was a permanent member of the Security Council; the only other Asian members of the organization were India, the Philippines, and Thailand; Afghanistan joined in 1946. Japan was not allowed to join until 1956, after the peace treaty of 1951 ended the Allied Occupation.

As decolonization proceeded in Asia, most countries in the region were admitted to membership, but with some anomalies. When members of the government of the Republic of China (ROC) fled to the island of Taiwan in 1949 in the wake of the Communist revolution that established the People's Republic of China (PRC), the ROC continued to occupy the U.N.'s China seat. Upset over the establishment of Malaysia from territories contiguous with Indonesia, President Achmed Sukarno (1901–1970) withdrew his country from the U.N. in 1965, but Indonesia rejoined in 1966 when Sukarno was overthrown. In 1971, the General Assembly voted to have the PRC replace the ROC. North Korea and South Korea were not admitted until 1991. In 1992 former Soviet republics in Central Asia (Kazakhstan, Kyrgyzstan, Tajikistan, Turkmenistan, and Uzbekistan) became the latest Asian countries to join. East Timor is expected to be the next Asian member.

After the United Nations was instituted in 1945, the world was engulfed in two major struggles: decol-

onization and the Cold War. While the struggle for decolonization united Asian countries, the Cold War, a conflict between Western nations and Communist states allied with the Soviet Union, shattered Asian solidarity. Revolutions brought Communist regimes to power in China, North Korea, and North Vietnam, while anti-Communist Asian states forged alliances with the United States.

When the Cold War conflict became heated in 1961, U. Thant (1909–1974) of neutral Burma (now Myanmar) became the first secretary-general named to the United Nations from outside Europe; he served until 1971.

U.N. Interventions in Asia

After 1946 many countries in transition from colonialism experienced conflicts, and the U.N. often intervened to help restore stability. India and Pakistan became independent in 1947, and cross-border violence erupted. The U.N. Commission for India and Pakistan was dispatched in 1948 to investigate and mediate; when the countries agreed to a cease-fire line in Kashmir in 1949, the U.N. Military Observer Group in India and Pakistan (Unmogip) was established to monitor the peace. Unmogip continues to function today.

The U.N. Temporary Commission on Korea was set up in 1947. Assigned to monitor the 1948 election in South Korea, the body continued in 1949 as the U.N. Commission on Korea. In 1950, while the Soviet Union was boycotting the U.N., war broke out between North Korea and South Korea. The Security Council authorized a U.N. Command (UNC) to help South Korea stop the aggression. The United States coordinated the UNC, with General Douglas MacArthur (1880–1964) commanding until 1951, when General Matthew B. Ridgway (1895–1993) took over. Troops from sixteen countries, including the Philippines and Thailand, fought until a cease-fire was declared in 1953; six countries, including India, sent medical units. To monitor the cease-fire, the UNC Military Armistice Commission was established. Because North Korea withdrew in 1994, only informal Commission meetings have been held.

Subsequently the U.N.'s operations in Asia have included actions involving Irian Jaya (former West New Guinea) (1962–1963), the India-Pakistan War (1965–1966), plebiscites in Sabah and Sarawak in Malaysia (1965), the war in Afghanistan (1988–1990), Cambodian refugees in Thailand (1982–1992), Cambodian elections (1991–1992), the Tajikistan civil war (1994–2000), and East Timor (1999–).

INDIA'S EARLY HOPES FOR THE UNITED NATIONS

The following resolution regarding the United Nations was passed at a session of the All-India Congress, held in Delhi, 18–19 October 1951. It outlines the hopes of India for an international organization that could serve as an effective forum for peace.

The United Nations Organization was formed to provide a common platform for all countries, even though they differed from each other in many ways, and was based on each country having freedom to develop in its own way and not interfering with another. If that basic policy of the U.N.O. is followed, the fear that grips the world today will gradually lessen and a peaceful consideration of problems will become easier. This Congress approves of the policy pursued by the Government of India in seeking friendly relations with all countries and in avoiding any entanglement in military or other alliances which tend to divide the world into rival groups and thus endanger world peace.

In particular, the Congress approved of the decision of the Government of India not to participate in the San Francisco Conference, which was held for the purpose of signing the Japanese Peace Treaty and instead to have a separate treaty with Japan. Peace in the Far East, which has been gravely disturbed by hostilities in Korea and subsequent developments, has to be based on the cooperation of the coun-

tries of the Far East and the other countries chiefly concerned. Any partial arrangement which does not include all these countries is likely to increase the tension and lessen the chances of a peaceful settlement.

This Congress hopes that the negotiations for a cease fire in Korea will meet with success and that this will be followed by a larger settlement in the Far East.

The colossal programmes of rearmament, which present-day conditions have led many countries to adopt, give rise international tension and cast a heavy burden on the people of those countries, which results in a lowering of their standards. The progress of the under-developed countries of the world is also impeded by these programmes of rearmament. If this vast expenditure on rearmament was diverted towards constructive purpose and to the advance of under-developed countries, that would be a surer guarantee of peace than preparations for war.

The Congress trusts that the United Nations Organization will devote itself to the furtherance of the aims so nobly set forth in its Charter and reorganise itself for this purpose, where this is considered necessary.

Economic Foundations

The polarization of the Cold War diverted attention from the poorest countries of the world. Accordingly India launched a third path, which came to be known as the Nonaligned Movement, among countries that believed that a primary agenda of the U.N. was to alleviate world poverty.

India and the nonaligned countries of Asia and Africa succeeded in directing the U.N.'s attention to economic issues, and several new technical organizations took their place alongside existing specialized U.N. agencies, such as the U.N. Development Pro-

gram and the U.N. Industrial Development Organization. Nevertheless U.N. headquarters and the specialized agencies were in New York and Western Europe, far from the realities of Asia.

Regionalization

In 1947 China pressed for establishment of a regional economic commission for Asia. Western countries at first opposed the idea, but changed their minds when they realized the advantages of an economic commission for Europe. Accordingly, the Economic Commission for Asia and the Far East (ECAFE) was

established in 1947 at Shanghai, but moved in 1949 to Bangkok. Initially the ECAFE region reached from Iran on the west to the Soviet Union on the north and Australia and New Zealand in the southeast. Since 1990, the region has included the nations of Central Asia. ECAFE nations included those U.N. members in the region as well as the colonial powers of France, Britain, the Netherlands (until 1950), and the United States. In 1974 ECAFE was renamed the Economic Commission for Asia and the Pacific (ESCAP), as newly decolonized countries of the South Pacific joined the U.N. and the scope of activities grew to include social concerns.

In 1959 U. Nyun (b. 1910) of Myanmar was appointed ESCAP executive secretary. Realizing that countries outside Asia were dominating discussions in the organization and dealing with Cold War issues, he formulated the principle of the Asian way, which asked countries of the region to do most of the talking, with decisions made by consensus rather than voting. Thus the nonregional powers began to listen to the needs of developing countries and funded worthwhile projects.

ESCAP focuses on development needs in communications, energy, environment, human and natural resources, population policies, rural and urban development, social development, statistics, trade, transportation, and tourism. The mission is carried out primarily by holding conferences that bring together bureaucrats and experts from member countries to formulate regional priorities. ESCAP then promotes projects approved by member countries. In some cases the organization has established the framework for non-U.N. bodies that have subsequently operated on their own. Notable among these spin-offs are the Asian Development Bank, the Mekong River Commission, and commodity organizations focusing on coconuts, jute, natural rubber, pepper, silk, and tin.

In addition to ESCAP, other specialized agencies established regional offices in Asia: the Food and Agriculture Organization (Bangkok) and the World Health Organization (Manila and New Delhi). Other U.N. agencies, particularly the U.N. Development Program, which coordinates technical assistance projects for specialized agencies and other aid sources have field offices in many other Asian countries.

The Future

Asia has been a major focus of attention throughout the history of the U.N. Politically the U.N. has helped to keep peace, though it has not been active in mediating between the PRC and the ROC, perhaps Asia's most serious conflict situation today. The U.N.

technical agencies are expected to continue to support economic development by helping poorer nations of the region to upgrade the quality of goods produced so that these nations will be more competitive in the global marketplace.

UNITED NATIONS IN EAST TIMOR The involvement of the United Nations (U.N.) in the conflict between East Timor and Indonesia, which invaded and annexed East Timor after East Timor became independent from Portugal in 1975, has taken different forms and been of varying degrees. The adoption of two U.N. resolutions in 1975 was decisive in guaranteeing the East Timorese the right to self-determination because it gave them international legitimacy. After two decades of stalemate between Indonesia and Portugal, when the U.N. was not of much use, the fall of Indonesia's president Suharto in 1998 opened a window of opportunity in which to solve the East Timor question.

Background

During the Portuguese transition to democracy in 1974–1976, the Portuguese government decided to allow the East Timorese to exercise their right to self-determination. Indonesia, whose territory includes contiguous West Timor, opposed that decision and invaded East Timor in December 1975. Portugal immediately appealed to the U.N. for a ruling on the Indonesian invasion. On 12 December 1975, the U.N. General Assembly passed Resolution 3485, and on 22 December 1975, the U.N. Security Council adopted Resolution 384, both demanding Indonesia's military withdrawal from East Timor.

From 1976 until 1982, the U.N. General Assembly passed a new resolution each year reaffirming its initial demand. Confronted with the gradual loss of support in the U.N. voting sessions, Portugal ceased to submit the issue of Indonesia's invasion of East Timor to the General Assembly after 1982.

Starting in 1983, the East Timor question was instead submitted to international dispute mediation by the secretary-general. Between 1983 and 1991, the secretary-general was not able to find a solution to the

question. In part, this reflected the refusal of Indonesia and Portugal to bow to each other's demands: Portugal wanted Indonesia to allow the East Timorese to exercise their right to self-determination, while Indonesia wanted Portugal to recognize its sovereignty over East Timor. Only with the Dili Massacre in 1991, when the Indonesian military killed dozens of East Timorese during a funeral while foreign journalists filmed the event, was Jakarta compelled to accept bilateral negotiations with Portugal under the auspices of the secretary-general. Between 1992 and 1996, eight rounds of ministerial negotiations took place under the auspices of the secretary-general.

The U.N. role became more significant under the U.N.'s seventh secretary-general, Kofi Annan, who took office 1 January 1997. During the first post-Suharto ministerial meeting between Indonesia and Portugal under the secretary-general's auspices, on 4–5 August 1998, it became obvious that Indonesia was prepared to discuss granting East Timor wide-ranging autonomy that would fall short of actual independence. On 6–8 October, delegations of both nations met again and discussed U.N. proposals for autonomy. On 8–9 February 1999, Portugal and Indonesia agreed on the overall terms for the wide-ranging autonomy proposal, but they were unable to agree on how to hold a popular consultation (referendum). At last on 11 March Indonesia accepted a direct, secret, and universal ballot. The tripartite agreements were finalized on 23 April and signed on 5 May 1999. According to the agreements, the East Timorese were to accept or reject continued Indonesian rule with wide-ranging autonomy. Before and after the popular consultation, Indonesia would be responsible for maintaining peace and security in East Timor.

United Nations Mission in East Timor

On 11 June 1999, the Security Council adopted Resolution 1246 establishing the United Nations Mission in East Timor (UNAMET). This mission would be responsible for organizing and conducting the popular consultation on East Timor's future status. Despite two delays in conducting the ballot and repeated episodes of violence by East Timorese militias that favored the continued tie with Indonesia, the U.N. gave the green light for the popular consultation to be held on 30 August 1999. On 3 September, Kofi Annan reported to the Security Council that 344,580 voters (78.5 percent of the votes cast) had rejected the special autonomy proposal. This overwhelming defeat triggered a scorched-earth policy by Indonesia-backed East Timorese militia groups that had supported the proposal. At least fifteen hundred East Timorese lost

their lives, and the territory's infrastructure was almost totally destroyed.

InterFET

In the days after announcement of the ballot results, it became clear that Indonesia's police and military lacked the ability and will to provide peace and security in East Timor. After several days of intense political pressure, on 12 September 1999 Indonesia accepted a proposal establishing in East Timor a multinational force under U.N. authority. On 15 September, the Security Council adopted Resolution 1264 authorizing the establishment of the multinational force under a unified command structure. Its mission was to restore peace and security in East Timor, to protect and support UNAMET, and to facilitate humanitarian operations in the territory. There was considerable concern that International Force East Timor (InterFET) would face military opposition from East Timorese militia groups. This opposition did not materialize, and InterFET easily fulfilled its goals.

United Nations Transitional Administration in East Timor

The next step in U.N. involvement in the East Timor question came on 25 October 1999, when the Security Council adopted Resolution 1272, which established the United Nations Transitional Administration in East Timor (UNTAET). UNTAET was endowed with overall responsibility for the administration of East Timor and empowered to exercise all legislative and executive authority, including the administration of justice. In other words, UNTAET took responsibility for preparing East Timor for independence. This has not been a small task. Since its establishment, it has had to provide security and maintain law and order; establish an effective administration; assist in the development of civil and social services; ensure the coordination and delivery of humanitarian assistance, rehabilitation, and development assistance; support capacity-building for self-government; and assist in the establishment of conditions for sustainable development. Bearing this in mind, since October 1999, the territory's transitional administration has introduced dozens of regulations.

On 20 May 2002, East Timor becomes an independent state. The U.N. involvement has been important not only to guarantee that the East Timorese could exercise their right of self-determination, but also to create a new sovereign state. In reaching both

goals, the U.N. has not always been as effective as it might have been.

UNITED NATIONS TRANSITIONAL AUTHORITY IN CAMBODIA The United Nations Transitional Authority in Cambodia (UNTAC) was formed following the signing of peace agreements by Cambodia's four warring factions at Paris in October 1991. UNTAC's primary function was to facilitate the creation of a neutral political environment through which "free and fair" elections could be conducted, a constituent assembly elected, a government formed, and a new constitution promulgated. At the time of its creation, UNTAC was the most ambitious peacekeeping operation ever embarked upon by the United Nations. It was composed of seven components (civil administration, civilian police, electoral, human rights, military, rehabilitation, and repatriation), the largest being the multinational military force of sixteen thousand soldiers under the command of the Australian lieutenant general John Sanderson. The UNTAC operation cost the international community more than \$2 billion.

The degree to which UNTAC succeeded continues to be debated by scholars and analysts of Cambodian and international affairs. On one side are those who claim that while it was imperfect, UNTAC delivered to the Cambodian people a democratically elected coalition government and provided the cata-

lyst to end the civil conflict that had undermined Cambodia's development for more than two decades. Critics point out that by failing to disarm the warring factions, as its mandate dictated, UNTAC failed to provide the environment for the conduct of free and fair elections. These critics point to UNTAC's slow deployment, its acquiescence to the Khmer Rouge, and its failure to deal adequately with intimidation of electoral candidates and their supporters as evidence that the United Nations mission was far from successful.

UNITED PARTY OF MONGOLIA The United Party of Mongolia was officially founded in February 1992 by Sanjaasurengiyn Zorig, the leader of the democratic movement in Mongolia who brought down seventy years of Communist rule in 1990. The United Party (UP) developed from a merger of the Republican and Free Labor Parties and a wing of the Mongolian Democratic Party (MDP) in time to compete in the 1992 first democratic parliamentary elections. The UP was officially registered with the government on 2 April 1992. It allied itself for the June 1992 parliamentary elections with the MDP and Mongolian National Progress Party. Zorig was the only candidate who won a UP seat in that vote. In October 1992 the UP merged with three other small democratic parties to form the present Mongolian National Democratic Party (MNDP).

UNITED STATES MILITARY BASES—JAPAN As part of the 1951 U.S.-Japan Security Treaty and related Administrative Agreement signed on 28 February 1952, the United States was granted the right to establish military bases in post-peace treaty Japan. This right continued following the revision of the security treaty in 1960 (Article 6) and the signing of the Status of Forces Agreement regarding the use

of bases in Japan. In the early 2000s, there are ninety U.S. exclusive-use facilities in Japan, including thirty-seven in Okinawa. The main bases include Misawa, Yokota, Yokusuka, Zama, Iwakuni, Sasebo, Kadena, and Futenma.

In the 1950s, the United States began scaling down its military presence in mainland Japan due to budgetary considerations and friction, crimes, and accidents involving the bases. Several of these units were moved to Okinawa, which was under U.S. administrative control at the time and thus were not subjected to the same restrictions that existed in mainland Japan under the Security Treaty. Following Okinawa's reversion to Japan in 1972, bases (land area) were reduced some 60 percent in mainland Japan, with a 15 percent reduction in Okinawa. At present, approximately 75 percent (land area) of U.S. bases in Japan are located in Okinawa, which has led citizens in Okinawa to protest the disproportionate share of bases in their prefecture.

UNITED STATES-JAPAN SECURITY TREATY The United States-Japan Security Treaty, officially known as the Treaty of Mutual Cooperation and Security Between Japan and United States of America, was signed on 19 January 1960 and went into effect on 23 June of that year. It replaced the earlier Security Treaty Between Japan and the United States, signed on 8 September 1951 in San Francisco, two hours after the signing of the Treaty of Peace with Japan. Due to the perception that the 1951 Security Treaty was no more than a continuing of the Occupation by the U.S. military and gave America rights thought to infringe on Japanese sovereignty, criticism within Japan grew and demands for its revision became increasingly strong. In 1957 the Japanese government officially requested revisions to be made, and a joint committee was established, leading to the revised treaty of 1960, which has continued without amendments or revisions since then. Made up of ten articles, the new treaty obliges the United States to defend Japan (Article 5) and Japan to provide bases to

the United States for "contributing to the security of Japan and the maintenance of international peace and security in the Far East" (Article 6). A separate Status of Forces Agreement was also signed regarding the use of facilities in Japan to replace the earlier Administrative Agreement.

UNITED WA STATE PARTY The United Wa State Party (UWSP) is the largest of the armed ethnic forces formed in 1989 during mass mutinies that led to the fall of the Communist Party of Burma (CPB). A Mon-Khmer people once feared for their headhunting, the Wa inhabit the mountains along the Shan State frontier with China. Few of these areas have ever been brought under the control of any central government.

The Wa substates became a major war zone after 1968, when the CPB launched an invasion from China. In the next two decades, tens of thousands of Wa were killed. Some villagers joined the CPB's People's Army, others were forced to flee their homes, while still others enlisted in rival insurgent forces. In April 1989, resentment broke out into the open. Wa mutineers, led by Kyauk Ni Lai (b. 1938), seized control of the CPB's headquarters at Panghsang and its well-stocked arsenals. Shortly afterward, the UWSP was formed and a cease-fire agreed with the ruling State Law and Order Restoration Council.

Promised a Wa autonomous region, during the 1990s the UWSP embarked on various development programs in an area designated as Shan State Special Region 2. Its twenty-thousand-strong army also fought battles with the Mong Tai Army of Khun Sa before the MTA's demise and began settling more than fifty thousand villagers along the Thai border, where it was accused of financing its activities through narcotics trafficking. Particular controversy followed the activities of the UWSP's southern leader in the Mong Yawn area, Wei Hsueh-kang (an ethnic Chinese), who was named by international antinarcotic organizations as a principal figure in the illicit opium and methamphetamine trades. In response, despite widespread international skepticism, in 2001 the UWSP

pledged to make its territories narcotics-free within five years.

UNIVERSITI BRUNEI DARUSSALAM Universiti Brunei Darussalam was established in October 1985 with an inaugural class of 176 students. It is the only university in Brunei Darussalam. Its emergence can be traced to a review of the sultanate's higher education program in 1976. Nevertheless, it was not until 1984–1985 that active planning began when Sultan Hassanal Bolkiah called for the establishment of a local university in the interest of national development and nation building.

While awaiting the completion of its permanent campus at Gadong, the university utilized a renovated building complex on the outskirts of Bandar Seri Begawan. The Ministry of Education Committee on the Establishment of the University worked in partnership with universities in Malaysia and the United Kingdom to develop the curriculum and programs for a bachelor of arts in both English- and Malay-language courses. Academic and administrative personnel were recruited from Malaysia, Singapore, and the United Kingdom. In 1989 the Sultan Hassanal Bolkiah Institute of Education was added as a division, in addition to Arts and Social Sciences, Science, Management and Administrative Studies, Islamic Studies, and Academy of Brunei Studies.

Universiti Brunei Darussalam has 1,500 students and 300 faculty members and seeks to produce quality graduates who can contribute to nation building. Applied research that is consistent with the nation's interests is promoted. The university also expects that the knowledge and skills of faculty members will be utilized to serve the wider society.

UNIVERSITI SAINS MALAYSIA Universiti Sains Malaysia (University of Science, Malaysia), the second-oldest university in Malaysia, received its first students (fifty-seven in number) on 9 June 1969. Since then, the student population has increased to more than 20,000, and an expanding pool of academic staff numbered more than 1,500 for the 1999–2000 academic session. The idea for another tertiary institution in Malaysia was discussed as early as the 1950s, but it was another two decades before Penang University officially came into existence. The pioneer group of students commenced studies at the Malayan Teachers' College, Gelugor, where only the Schools of Biological Sciences, Chemical Science, and Physics and Mathematics were functioning then. In May 1971, the university moved into its present premises at Minden. In line with Malaysia's emphasis on science education, Penang University became the University of Science, Malaysia (Universiti Sains Malaysia) in April 1972.

From its inception, it was organized to promote an interdisciplinary approach. Currently the university has more than twenty schools, including several in non-science-based fields like humanities, management, the arts, and education. There are also more than twenty institutes, centers, and research units covering diverse fields, from drug research to computer-aided translation. A branch campus at Kubang Kerian, Kelantan state, houses the School of Medical Sciences, while the School of Engineering is at Tronoh, Perak state. By the mid-1990s, Universiti Sains Malaysia emerged as the country's largest university in terms of academic programs, student enrollment, and infrastructure facilities.

UNIVERSITY OF INDONESIA The University of Indonesia (Universitas Indonesia—UI) was established in Jakarta on 2 February 1950, shortly after Indonesia gained its independence from the

Netherlands. Notwithstanding its legacy as a colonial education institution of higher learning, the UI also fulfills the need for a national institute of higher education in a newly independent state.

Four of the university's five original campuses at Bogor, Bandung, Surabaya, and Makassar have become independent universities. The UI teachers' training and education center in Jakarta, established in 1962, became the Institute for Teachers' Training and Education (Institut Keguruan dan Ilmu Pendidikan), and more recently Universitas Jakarta. UI now has two campuses and prides itself on a progressive curriculum that is responsive to the needs of a developing country.

As a national university, UI is under the jurisdiction of the Ministry of National Education. The university employs over three thousand faculty members and enrolls around 40,000 students. Its faculties include medicine, dentistry, mathematics and natural sciences, law, social sciences, political science, economics, letters, psychology, public health, computer science, and nursing. It has a graduate program and a polytechnic. Recognized as a leading Indonesian university, UI celebrated its golden anniversary in the year 2000.

Andi Faisal Bakti

UNIVERSITY OF MALAYA Situated on the southwest outskirts of Kuala Lumpur, Malaysia, the 750-acre University of Malaya (UM) campus is the premier university in the country. The university came into being in 1949 as a result of the merger of two older educational institutions based in Singapore: King Edward VII (founded in 1905 for medicine) and Raffles College (founded in 1928 for education).

The merger had been proposed ten years earlier by the MacLean commission. With political independence from Britain imminent, and as a result of the Aitken commission, a branch of the university was set up in Kuala Lumpur. In 1962, legislative changes to the constitution saw the installation of the first Malaysian chancellor, Tunku Abdul Rahman Putra al-Haj (1903–1990), also the first prime minister of the country. The Singapore branch became the National University of Singapore in 1965.

The early 1970s were tumultuous years for the university. The charged political climate saw the enactment of the Universities and University Colleges Act (Amended) in 1975, which sought to stifle student activism. The university also assumed an important role in the government's restructuring programs of the new

economic policy. A differential ethnic quota system for entry was implemented in an attempt to remedy the economic and ethnic imbalance between Malays and Chinese in the country, and the medium of instruction changed from English to Malay.

In early 1997, UM was corporatized. Currently, it has eleven faculties, two academies, an Institute of Postgraduate Studies and Research, and a University Hospital. The university motto is Ilmu Punca Kemanjuran ("Knowledge is the key to success").

Yeoh, Seng-Guan

UNTOUCHABILITY Untouchability is an Indian phenomenon based on degrees of pollution and purity probably unrelated to race. Sometime around the fifth century CE castes evolved that were ranked below the fourfold *varna* (caste) system of Brahman (priest), Kshatriya (warrior and king), Vaishya (merchant), and Sudra (laborer or craftsman). In earlier texts the term *chandala* referred to the attendants of the burning ghats, who were despised as unclean because they handled the dead. The range of castes who work with leather or rope, clean night soil, play drums, or attend death sites developed later. Specific names indicate specific, large untouchable castes. *Bhangis* or *valmikis* are scavengers; *camars* or *chamarkars* work with leather; pariahs were traditional drummers; and

An elderly "untouchable" man and children in Mysore, India, in 1929. (E. O. HOPPE/CORBIS)

RITUAL IMPURITY AND UNTOUCHABILITY

The segregation and low status experienced by untouchable castes in India is based on the notion of ritual impurity. Because they work with polluting materials and perform polluting work, they must keep apart from the higher castes, as is the case with the Nadars and other untouchable castes in South India described below.

The Nadars were defiled by their ritually impure calling as toddy-tappers. They were forbidden entry into Hindu temples, and their use of public wells was strictly prohibited. Although the Nadars, unlike the Pallan and Paraiyan untouchables, had access to the streets of the Brahmin quarter, the *agraharam*, they did share with them the prohibitions of spatial distance. As a "half-polluting" caste, in villages where they numbered only a small minority the Nadars lived in separate habitations just outside the main village, though not in so remote a site as the untouchables' *cheri*. As their middling position was spatially represented in the location of their house sites, so the Nadars were, by traditions, forbidden to approach nearer than a specified number of paces to a man of higher caste, though they might come closer than the Paraiyan or Pallan.

Source: Robert L. Hardgrave, Jr. (1969) *The Nadars of Tamilnadu: The Political Culture of a Community in Change*. Berkeley and Los Angeles: University of California Press, 22

mahars were all-around servants of the village. Approximately 12 percent of the population of India belong to one of the Scheduled Castes (former untouchables), and over four hundred such castes exist, each usually limited to one language area.

Names Denoting Untouchability

The titles of untouchables as a group indicate the history of the phenomenon. *Avarna* (without caste) was a traditional name. In a speech in 1908 the maharaja Sayajirao (1875–1939) of Broda, India, was the first to use the term "untouchable" in this context. The phrase "depressed classes" came into use when reform began in the early part of the twentieth century. Mohandas K. Gandhi (1869–1948) coined the word "harijan" (people of god) in the early 1930s to indicate his concern, but Bhimrao Ramji Ambedkar (1891–1956) a *mabar* and the chief organizer of untouchables, rejected that term as patronizing and unrealistic. "Scheduled Castes" came into use in 1935, when the government of India created a schedule or list to indicate which castes were eligible for benefits and for reserved places in parlia-

mentary bodies. "Dalit" (downtrodden, ground down), a proud term indicating that external oppression rather than any polluting quality is responsible for the inferior status of untouchables, has gained currency since 1970. Some cultural developments have incorporated the term, such as the Dalit Panthers, a militant group in Maharashtra and Tamil Nadu, and Dalit literature, a burgeoning field of poetry, prose, and drama. The use of the term "Dalit" usually suggests a politically awakened group of untouchables or writing by others that recognizes that awakening. "Harijan" remains in use, especially among Gandhians and some groups of rural untouchables in the south of India. The nineteenth-century word "outcaste" is inaccurate, since untouchables are within castes even though they are outside the classical Hindu *varna* system.

Discrimination and Political Activism

Restrictions on untouchables have included exclusion from Hindu temples, homes, and Brahman rituals; prohibitions against using the village well or studying in the village school; and a prohibition against

touching any Hindu or any material or food that could convey the untouchables' supposed pollution. In some areas untouchables could not own land, although in other areas some castes held some land as part of their village contract. They were generally confined to traditional occupations and agricultural labor.

The first voices of untouchables came from the bhakti (devotional religion) movement, which brought Nandanar of the Tamil Vaishnava movement into a circle of saints in the seventh century CE and Tirupan Alvar into the Shaivite legends of piety a little later. Cokhamela, of the Marathi-speaking area, and his entire family are featured in hundreds of songs performed by the devotees of the god Vithoba in Maharashtra. Their fourteenth-century voices contain notes of distress and protest as well as joyous devotion. In the fifteenth century Ravidas, who lived in the Hindi-speaking area of the north, told of his low-status leather work as well as his faith. The British brought some change in terms of servant positions in British homes, recruitment into the army, and later new kinds of work on the railways, in the mills, and on the docks. Social reform, however, did not begin until the end of the nineteenth century. When army recruitment stopped and pensioned soldiers pleaded for readmission, efforts at education and social betterment were made within the untouchable *mahar* caste itself and among such high-caste Hindu religious reform groups as the Brahmo Samaj in Bengal, the Arya Samaj in the Punjab and the United Provinces (now Uttar Pradesh), and the Depressed Classes Mission in the former province of Bombay. A Buddhist movement among untouchables in Tamil Nadu in south India became an awakening force, and beginning with Ambedkar in 1956, conversion was widespread.

A number of untouchable leaders appeared in the second quarter of the twentieth century, and Ambedkar was chief among them. His voice for political representation in all government institutions, educational opportunities, and a general awakening initiated massive changes. India reserves places for Scheduled Castes in all elected bodies, in government institutions, in educational institutions, and on the teaching staffs of colleges and universities run by the government. Among the important untouchable political parties is the Bahujan Samaj Party (BSP or the party of the majority) founded by Kanshi Ram (b. 1934), an untouchable Sikh from the Punjab. With Mayavati (b. 1956), a *camar* woman, as its chief voice, that party is very powerful in Uttar Pradesh. The Republican Party founded by Ambedkar just before his death in 1956 holds some power on the local level in Maharashtra

and a few state and national seats when it combines with other political parties. Tamil Nadu also has a strong political movement. As untouchables become politically and socially active, however, they frequently face violence. A report by Human Rights Watch in 1999 entitled *Broken People* indicates that acts of rape, arson, and murder committed against untouchables have increased since independence. If one Dalit oversteps what is expected, runs off with a caste Hindu girl, or challenges higher castes economically, the entire Dalit section of the village may suffer revenge. Another persistent show of anger at Dalit actions is attacking the ubiquitous statues of Ambedkar found everywhere in untouchable quarters and, in recognition of his importance, in city centers. Nevertheless, the progress among Dalits in some areas is remarkable, and because of the reservation system, a sizable literate middle class has emerged.

UPANISHADS The Upanishads constitute the fourth and final stratum of the corpus of Vedic literature (early Hindu sacred writings), traditionally held to be *shruti*, or the revealed and eternal divine word. The Upanishads are chiefly concerned with metaphysical speculations about the nature of reality and the destiny of the human soul. The term is normally understood to mean a dozen or so esoteric and speculative texts, in prose and in verse, that are associated with the four great Vedic textual traditions or schools and are thought to date, in the main, from the sixth century BCE to perhaps the first centuries CE. These texts come chronologically at the end of the Vedic corpus and they represent, broadly speaking, the culmination of the de-

velopment of Vedic thought from a relatively straightforward ritualism to an interiorization of the ritual and speculation on the underlying principle of the cosmos. For these reasons they are sometimes referred to collectively as the Vedanta or end (*anta*) of the Veda. The term *Upanishad* is, like many words in the later Vedic texts, subject to a variety of etymological interpretations. However, scholars generally understand it to derive from a verbal root meaning "to sit down near" and to convey the sense of disciples seating themselves at the feet of a master to imbibe the esoteric doctrines that characterize these texts.

Such is the power and influence of these and other Vedic texts that (like the name Veda itself) the term *Upanishad* has been extended to a variety of post-Vedic texts such as the Sannyasa Upanishads, which lay down the rules of conduct for religious renunciants, while other important religious texts such as the *Bhagavad Gita* are sometimes also considered to be Upanishads.

The original Upanishads vary in length and are diverse in character, consisting of a variety of materials including dialogues of a spiritual or metaphysical character, genealogies of spiritual teachers and disciples, narratives involving gods, demons, men, and, in some cases talking animals, and rituals and spells for the acquisition of power, long life, wealth, sex, and progeny.

Atmavada Doctrine in the Upanishads

Deriving as they do from the various Vedic schools, each with their particular interests and preserving a broad diachronic spectrum of legendary, ritual, philosophical, theological, physiological, and psychological materials, the Upanishads do not put forward a single, consistent set of principles or doctrines.

Nonetheless, the single most dominant and most frequently articulated philosophical focus of the Upanishads is the so-called Atmavada or Brahnavada, the doctrine of the universal world Self or Soul. Simply stated, this doctrine holds that there exists only one, single, limitless, irreducible, and unchanging real entity. This is called the Atman, or Self, the Paramatman, or Supreme Self, or Brahman. This entity which is pure existence (*sat*), pure consciousness (*cit*) and pure bliss (*ananda*) is the innermost essence of all things. Indeed the apparent diversity of the universe and indeed the real existence of any of its apparent constituents is illusory and arises as a result of a kind of cosmic illusion (*maya*) and is perpetuated by our ignorance (*avidya*, *ajnana*) of the true nature of things. True knowledge (*vidya*, *jnana*) consists in the profound inner realization that all apparent individuation, in-

cluding the all but universal perception that we are separate autonomous entities, is false. This realization is in effect a profound inner understanding of the esoteric correspondences that link the Vedic ritual, the human body, and the phenomenal universe. It is to be accomplished through the cultivation of detachment from the world of the senses. In this the Atmavada is similar, although far from identical, to many of the early brahmanical and nonbrahmanical religious systems of early India.

This rigorously nondualist philosophy forms the underlying principle around which was developed the major philosophical school of Advaita (nondual) Vedanta most closely associated with its greatest exponent Sankaracarya (c. 788–820 CE), among whose most seminal works is his magisterial *Upanishadbhashya*, or collection of commentaries on the principal Upanishads. This school, although it is just one of many different religious and philosophical schools to have been developed in ancient India, has often come to be seen and represented in more modern times as the dominant and most characteristic, if not the only strand of Indian philosophy. This attitude has enhanced the prestige of the Upanishads as the foundational scripture of Hinduism.

Although the Upanishads constitute a diverse body of often obscure and highly esoteric late Vedic belief and speculation, they have come, by virtue of their promulgation of the important doctrine of the Atman and its realization as the unique path of spiritual liberation, to be canonized as one of the principal fonts of Hindu thought and practice.

URALIC LANGUAGES The Uralic languages, including both the Finno-Ugrian and the Samoyedic groups, constitute a large family of languages of Europe and Northern Eurasia. Finno-Ugrian languages are spoken mostly in Europe; three of them, Finnish, Estonian, and Hungarian, are major literary and na-

tional languages of independent states. All other Finno-Ugrian languages are spoken by people in Russia. Mari (or Cheremis), Mordvin, Udmurt (or Votyak), and Komi (or Zyryene) are spoken by numerous peoples who live between the river Volga and the Ural Mountains.

The closest relatives of Hungarian, however, the Ob'-Ugrian languages, are spoken in the Asiatic part of Russia, east of the Ural Mountains, in the basin of the river Ob'. The two languages of this group are Khanty (or Ostiak) and Mansi (or Vogul). Nowadays Khanty is spoken by about 13,000 people; Mansi has approximately 3,000 speakers. Khanty and Mansi are the titular nationalities of the semiautonomous National Territory of the Khanty and Mansi, which forms part of the 'Tiumen'skaia Oblast' (province) of Western Siberia.

All Samoyedic languages are spoken by people living in Siberia. This group is commonly subdivided into a Northern and a Southern subgroup. Northern Samoyedic languages are Nganasan (Tawgy-Samoyed), spoken by around 1,000 members of the northernmost nationality of Russia, in fact of all of Asia, on the Taymyr Peninsula; Nenets (Yurak-Samoyed) has around 30,000 speakers north of the Arctic Circle to the west and east of the Ural Mountains, and the obsolescent Enets (Yenisey-Samoyed) is spoken by less than 100 people in a few villages on the bank of the river Yenisey. Southern Samoyed is today represented only by Sel'kup (Ostiak-Samoyed; 1,500 speakers); other Southern Samoyed languages, now extinct, were recorded in the eighteenth and nineteenth centuries as far south as the Sayan Mountains (Mator, Koibal, Kamass).

The genetic relationship of the Finno-Ugrian languages was established as early as the eighteenth century; the Samoyedic languages were added to the Uralic family by the mid-nineteenth century.

Uralic languages, especially the eastern members of the family, show a marked typological similarity to Altaic languages (e.g., verb-final word order, vowel harmony, lack of word-initial consonant clusters) in the nineteenth century this similarity gave rise to the so-called Ural-Altaic hypothesis, which tried to describe Uralic, together with Turkic, Mongolian, and Tungus, as members of one great family of languages. Because more accurate descriptions of these languages became available, and the methods of comparative linguistics were improved, specialists had largely abandoned this view during the twentieth century.

URDANETA, ANDRES DE (1498–1568), Spanish Augustinian friar and navigator. Andres de Urdaneta was born in 1498 in the Basque region of Spain. At seventeen he became a sailor and served as a page to Garcia Jofre de Loaysa's expedition to the Moluccas. He spent eight years in Malaka (Moluccas), where he figured in several encounters with the Portuguese, Spain's rivals in colonizing Malaka, until the members of the expedition surrendered and were later repatriated to Spain via Lisbon in 1536.

In 1553 Urdaneta joined the Augustinian order in Mexico after a long, distinguished military career following his return to Spain. In 1559, King Philip II, interested in the Philippine Islands, which were named after him by the Villalobos expedition, sought out Urdaneta's services. Since his priestly status forbade him to command an expedition, Urdaneta recommended that the king appoint Miguel Lopez de Legazpi, a distinguished official in Mexico, to command the expedition. The expedition left Navidad, Mexico, in 1564 and, through Urdaneta's guidance, it reached Philippine shores in February 1565. After establishing a settlement, Legazpi sent Urdaneta back to Mexico to deliver samples of Philippine spices discovered and to find a more expedient route. Urdaneta sailed far north near Japan before turning east, where the winds were favorable. He reached Acapulco after sailing for four months. The passage he discovered was later called the Urdaneta Passage. Years later the galleons of the Manila-Acapulco trade followed this route.

When his mission was over, Urdaneta returned to his Augustinian order in Mexico. Although he expressed a desire to return to the Philippines to undertake missionary work, his superior did not grant him permission to do so due to his old age. He died on 3 June 1568 in Mexico at the age of sixty.

URFA (2002 est pop. of province 1.5 million). Urfa, a province and a city (1995 pop. approximately 365,000) in southeastern Turkey, was known as Edessa in antiquity; its Arabic name was al-Ruha. Under the republic of Turkey it became known as Sanliurfa ("glorious Urfa"), the capital of the province of the same name.

The city was occupied as early as 3500 BCE by the Hurrians and then successively by the Hittites, Assyrians, Seleucids, Romans, and Byzantines. In the third century the city adopted Christianity, and by the early fourth century it was a center of Syriac Christianity. The city surrendered to the Arabs in c. 639 and subsequently lost its political and religious importance. The town was attacked by the Byzantines in 959–960; by the Turks in 1065–1066 and 1066–1067, and by the Seljuk sultan Alp Arslan for 50 days in 1070. After the battle of Manzikert (1071), the city was supposed to be handed over to the Seljuks, but instead it remained under Constantinople's control until 1086–1087, when it was given to the Seljuk sultan Melikshah.

Urfa was ruled by various dynasties in the following centuries until it was conquered by Sultan Selim I, probably in 1517. In the sixteenth century it became part of the province of Diyarbakır. During this time it was located on a caravan route to Aleppo and was a transit point for goods traveling from Anatolia to Persia and Iraq. Urfa was occupied by the French in 1919–1920 and officially became part of the Turkish Republic under the Treaty of Lausanne (1923). Today Urfa is largely an agricultural city producing wheat, barley, and beans. A college of the Dicle University in Diyarbakır is located here.

URGENCH Urgench was an ancient city that was an important trade center and the capital of Khwarizm

until its destruction by the Mongols in the thirteenth century. It was rebuilt only to be again destroyed by Timur in the fourteenth century; for most of the sixteenth century it was the capital of the khanate of Khiva (1511–1920). It was abandoned later in the century after the Uzbeks conquered the area. Today the town of Kunya-Urgench (or Konye-Urgench) in modern-day Turkmenistan rests on the site. Visitors can see the Kutlug Temir minaret, which is the largest minaret in Central Asia, mausoleums, and other ancient ruins.

Today, there is another Urgench, the capital city of the Khorezm oblast of Uzbekistan. It had an estimated population of 169,000 in 2002, is situated on the Amu Dar'ya River and the Shavat Canal, and houses cotton and food processing industries. Kunya-Urgench in Turkmenistan is about 140 kilometers northwest of Urgench, Uzbekistan.

USTYURT PLATEAU The Ustyurt Plateau is a 160,600-square-kilometer (62,000-square-mile) desert plateau in Central Asia between the Caspian Sea to the west and the Aral Sea to the east. It lies mostly in the southern part of Kazakhstan and the northern part of the Karakalpak Republic and Turkmenistan. The plateau's elevation ranges from 150 to 365 meters (490 to 1,200 feet), with an average elevation of 200 meters (656 feet), and it drops steeply to the Aral Sea and surrounding plains. A largely uniform desert landscape, the plateau provides little pasture for the sheep, goats, and camels raised by its small seminomadic human population. Transport networks are poor due to both natural conditions and long-term neglect.

Oil and natural gas deposits are located in the western portion of the plateau. It is estimated that there are more than 4 billion tons of hydrocarbons in the region. Exploration and production is set to continue as the region increases its contribution to the world supply of hydrocarbons. Mining activities are likely to improve air links across the Caspian Sea and stimulate further regional economic development.

USUBALIEV, TURDAKUN USUBALIEVICH (b. 1919), Kyrgyz politician. Turdakun Usubalievich Usubaliev led the Kyrgyzstan Soviet Socialist Republic from 1961 to 1985 as the first secretary of the Communist Party. Born in Naryn (a remote eastern province of the republic) in 1919, he spent his entire career in the Communist Party apparatus, becoming one of the republic's most influential politicians for almost three decades in the late Soviet era. From 1955 to 1956 he worked as editor of the leading national newspaper, *Sovetnyk Kyrgyzstan*, and later held various party posts before assuming leadership in the republic. He viewed Soviet policy (reflected in his writing) as an important mode of modernization of a traditional "backward" country and measured it purely in the terms of economic development and state-led industrialization. These views largely shaped Kyrgyzstan's political and economic setting in the 1960s and 1970s.

Usubaliev belonged to the cohort of Central Asian leaders who were most loyal to the Soviet political system and to Moscow's leadership. As Kyrgyzstan's leader he contributed to the vigorous implementation of the policies of Russification and "internationalism." However, it was his success in attracting huge investment in the industrialization of the republic that won him nationwide recognition and respect.

In 1985, with the introduction of Gorbachev's policy of glasnost, Usubaliev was forced to leave his post and was charged with patronage, corruption, and mismanagement; however, these accusations have never been brought to court. Turdakun Usubaliev remains one of the most popular politicians in post-Soviet Kyrgyzstan and a prolific writer (mainly memoirs). In 1992 he returned to the political arena as a member of the Jogorku Kenesh (Parliament), supporting moderate nationalism and remaining highly critical of the Westernization of Kyrgyz society.

UTAI *Utai* (also called *yokyoku*) is the vocal music of the Japanese classical theater form called Noh. It is monophonic music influenced by Buddhist chant, especially of the *shomyo* tradition of the Tendai and Shin-

gon esoteric sects that came to Japan from China in the Heian period (794–1185). Notation called *gomafu* or *gomaten* (literally, "sesame seed marking," from the way the notation marks look) developed from this same tradition and was consolidated in the Edo period (1600/1603–1868), with each mark having a slightly different form and a definite meaning for each of the Noh schools. Although the language and sometimes pronunciation, too, are classical and not always easily understood, the performance of *utai* is studied by amateurs of all ages as well as by professionals.

A Noh text develops through the progression of combinations of units of prose and of poetry in a 7/5-syllable meter. An actor speaks prose lines in *kotoba* (inflected speech) or chants lines solo or in exchanges with other characters. The chorus (*ji-utai*) expresses a character's speech or thoughts as well as describes a scene or narrates action during mimed sections.

Utai as chant is characterized by rhythm, pitch, and mode. The rhythm (*nori*) of Noh can be divided into *hyoshi-awazu* (incongruent) and *hyoshi-au* (congruent) chant to the drum patterns in an eight-beat system. *Hyoshi-awazu* chant may be found in short poetic sections. There are three kinds of *hyoshi-au* (congruent) chant. *Hira-nori*, the most common form, distributes the twelve syllables of the 7/5 meter over eight beats, with the syllables on the upbeat of the first, third, and fifth beats held. *Chu-nori*, also called *shura-nori* as it is often used in descriptive passages in *shura-mono* (warrior plays), distributes sixteen syllables of text over eight beats and is characterized by stress on every second beat. *O-nori* places one syllable per beat and is often used when the *taiko* (stick drum) is played for a strong or dynamic effect. Variations of syllables in lines in each of these styles create interesting syncopation. The pitch of *utai* goes through three centers: *jo* (high), *chu* (center), and *ge* (low), each a perfect fourth apart, following conventions of movement and embellishment for each section of the text. The chorus follows the pitch set by its leader, the *ji-gashira*. The two modes of *utai* express a wide range of emotions: *yowa-gin*, a weak or melodic mode for lyric passages, and *tsuyo-gin*, a strong, dynamic mode that uses microtonal pitch changes.

UTTAR PRADESH (2001 est. pop. 166.1 million). Uttar Pradesh is located centrally in the Indo-Gangetic Plain southeast of New Delhi. The area measures 243,286 square kilometers. It has been under one administration, at first as part of Bengal Presidency, since 1877, and in 1902 became known as the United Provinces of Agra and Oudh. This became, simply, United Provinces in 1935, a name translated into Hindi as Uttar Pradesh after Independence in 1947. This state was made up of the former United Provinces and the princely states of Benares, Tehri-Garhwal, and Rampur. The capital is Lucknow (or Laknau). Not only was this area the center of the army uprising known as the Indian Mutiny (1857); Lucknow also was the focal point of the movement for an independent Pakistan. In 2000 the new state of Uttaranchal was carved out of Uttar Pradesh.

Uttar Pradesh is governed by a legislative council and a legislative assembly. The state has a mixed, mostly rural, population of Hindus and Muslims, who speak Hindi, Urdu, and English; the official language is Hindi. Traversed by several rivers and canals, especially the Ganges and Jumna, the fertile state is the largest producer of food grains in India. In addition, sugar and edible oils are important farm produce. There is considerable industrialization—among goods produced in Uttar Pradesh are paper, chemicals, glass, distilled spirits, farm implements, leather and footwear, textiles, copper, coal, limestone, bauxite, silica, phosphorite, and pyrophyllite.

UTTARANCHAL (2001 est. pop. 8.5 million). Uttaranchal is an Indian state that was created in 2000 from the northern quarter of Uttar Pradesh. It consists of thirteen hill districts bordering on Nepal to the east, with the lower Himalayas in the north, and the states of Haryana and Himachal Pradesh to the west and northwest respectively. It has an area of 51,125 square kilometers.

Dehra Dun is the state capital, and the population of the individual districts is primarily tribal. The state is home to four of the most revered Hindu sites in India: Badrinath, Kedarnath, Gangotri, and Yamunotri. All attract thousands of pilgrims every month. In the pre-Independence period, the numerous districts of present Uttaranchal were ruled over by several petty hill princes, who owed their formal allegiance to the British. Among the prominent nationalist figures who came from this region is the Congress leader Dr. Govind Ballabh Pant (1887–1961). (The town of Pantnagar in Nainital district has been named after him.) Since the 1980s, the region has been at the forefront of the Indian environmental movement, spearheaded by the Chipko Movement of Sunderlal Bahuguna and Chandi Prasad Bhatt. There also has been vocal opposition to the proposed Tehri Dam in the district of Tehri Garhwal, a construction that threatens to wipe away entire villages.

UZBEKISTAN PROFILE (2001 est. pop. 25.1 million). Uzbekistan is the most populous former Soviet state in Central Asia and the third most populous of all former Soviet states, after Russia and the Ukraine. It declared its independence on 1 September 1991 and is officially called the Republic of Uzbekistan.

Geography

With an area of 449,601 square kilometers, Uzbekistan is almost 42 percent desert. In North Central Uzbekistan lies the vast Kyzyl Kum desert, 297,850 square kilometers in size. Spurs of the Tian Shan and Pamir Mountains rise to the east and northeast; the highest elevation in Uzbekistan is 4,643 meters, and earthquakes are common.

Because rainfall is scarce except on the mountain sides, agriculture elsewhere in the country is possible only with irrigation. In mountainous areas live snow leopards; desert monitors, lizards that can grow longer than 1.5 meters, inhabit the desert. The two main rivers—the Amu Dar'ya (Oxus) and Syr Dar'ya (Jakartes), which flow into the Aral Sea—as well as the Zarafshon River and the Fergana Valley form the core of the relatively limited populated areas.

The country is divided into twelve *wiloyatlar* (regions), one city (Tashkent, the capital), and the Karakal Autonomous Republic, located in northwestern Uzbekistan. These entities are further divided into smaller units; at each level elected and appointed officials have constitutional responsibility, but most power rests in the central state apparatus.

Population

Almost 3 million people live in the capital city of Tashkent, which is the largest city in Central Asia and the fourth largest among former Soviet cities. The country has over one hundred nationalities, although almost 80 percent are ethnic Uzbeks, a Turkic-speaking Muslim people. Other significant ethnic groups include Russians, Tajiks, Kazakhs, Karakalpaks, Turkmen, and Tatars. The Russians are the largest minority, but their numbers decreased after independence, when many moved to Russia and other countries.

History

Uzbekistan has a rich and long history, and Uzbeks lived in the Central Asian region for many hundreds of years, but until 1925 there was no political entity

named "Uzbekistan." Known as the ancient Persian province of Sogdiana, the region was conquered by Alexander of Macedon in the fourth century BCE. Arabs conquered it in the eighth century as did the Mongol empire in the thirteenth century; Timur (Tamerlane) developed his "local" Mongol empire in the fourteenth and fifteenth centuries; Shaibani Khan introduced Uzbek authority to the region in the sixteenth century.

The final conquerors—the Russians—appeared only in the nineteenth century and consolidated their power by the 1860s and 1870s. In the face of stiff guerrilla resistance, the Soviets took over in the 1920s and eventually formed new political entities, parceling out the territory according to ethnic groups. The delimitation of 1925 saw Uzbekistan appear as a Soviet Socialist Republic. In 1929 the Tajik Socialist Soviet Republic was formed from a portion of Uzbekistan; the Karakalpak Autonomous Republic became part of Uzbekistan in 1936.

The Soviet period was particularly difficult; despite advances in education, health care, and treatment of women, the Uzbeks suffered during the purges and collectivization campaigns of the 1930s, and cultural

UZBEKISTAN

Country name: Republic of Uzbekistan
Area: 447,400 sq km
Population: 25,155,064 (July 2001 est.)
Population growth rate: 1.6% (2001 est.)
Birth rate: 26.1 births/1,000 population (2001 est.)
Death rate: 8 deaths/1,000 population (2001 est.)
Net migration rate: -2.06 migrant(s)/1,000 population (2001 est.)
Sex ratio: 0.98 male(s)/female (2001 est.)
Infant mortality rate: 71.92 deaths/1,000 live births (2001 est.)
Life expectancy at birth—total population: 63.81 years, male: 60.24 years, female: 67.56 years (2001 est.)
Major religions: Muslim (mostly Sunnis), Eastern Orthodox
Major languages: Uzbek, Russian, Tajik
Literacy—total population: 99%, male: 99%, female: 99% (year-end 1996)
Government type: republic; effectively authoritarian presidential rule, with little power outside the executive branch
Capital: Tashkent (Toshkent)
Administrative divisions: 12 wiloyatlar, 1 autonomous republic, and 1 city
Independence: 1 September 1991 (from Soviet Union)
National holiday: Independence Day, 1 September (1991)
Suffrage: 18 years of age; universal
GDP—real growth rate: 2.1% (2000 est.)
GDP—per capita (purchasing power parity): \$2,400 (2000 est.)
Population below poverty line: not available
Exports: \$2.9 billion (f.o.b., 2000 est.)
Imports: \$2.6 billion (f.o.b., 2000 est.)
Currency: Uzbekistani sum (UZS)

identity was often suppressed. Not until the 1980s could Uzbeks openly discuss their own non-Soviet history and Muslim identity. Ironically these issues are still problematic in post-Soviet Uzbekistan.

Politics

Islam Karimov was president even before independence, having been elected on 24 March 1990. Constitutionally he is afforded a wide range of powers and can legislate by decree. He has successfully curtailed potential rivals' efforts by constantly shuffling regional leadership and removing key individuals from office, including his former vice president, Shukhrulla Mirsaidov. Karimov was reelected in January 2000 with an overwhelming majority (even the token opposition candidate voted for Karimov).

Uzbekistan's 250-member legislature, the Oliy Majlis, is a relatively weak entity that has never challenged the presidential authority. The court system and regional governments are also fairly compliant. The country is technically multiparty, and four parties are registered. Each, especially the dominant People's Democratic Party, swears allegiance to President Karimov and acts simply as an advocate for a specific constituency in Uzbek society.

Opposition—secular and religious—is severely curtailed. Most opposition leaders have fled the country, as was the case with the leaders of the opposition movements Birlik (Unity) and Erk (Will) in the 1980s and 1990s. The religious-based opposition parties, Adolat (Justice) and the Islamic Renaissance Party, were never even allowed to register. These and other

movements have been prohibited from becoming legal entities since 1992. As a result they either remain underground or maintain a base in exile. In the summer of 1999, a relatively new movement—the Islamic Movement of Uzbekistan (IMU), under the leadership of Jumaboi Namangani—emerged as a threat to the Karimov regime. In that summer and in the summer of 2000, IMU units attacked positions in Kyrgyzstan and southern Uzbekistan. It is feared that in subsequent years this movement will increase its activities in Uzbekistan and could become a long-term problem for President Karimov.

Economy

Uzbekistan's economy is based largely on cotton (which was introduced in imperial Russian times despite Uzbek protests about resulting food shortages and loss of land) and on agriculture in general. Although only 31 percent of the country's gross domestic product (GDP) comes from agriculture, over 40 percent of all working-age Uzbekistan citizens are employed in this sector. Uzbekistan is the largest cotton exporter in the world, but because agriculture is concentrated in cotton, the country must import much of its food. The industrial and service sectors are slowly developing, with the latter now responsible for 42 percent of the country's GDP.

The major obstacles to economic growth are geography, infrastructure, and program execution. Because Uzbekistan is landlocked, it must often transit goods across international borders—a serious problem because customs duties and procedures are not consistently enforced in Central Asia. The infrastructure is in the process of moving from the Soviet-era system that was in place, although the pace of development has not kept up with the deterioration of the old infrastructure. Last, the opaque maze of regulations and the lack of openness have made it difficult for local, joint-venture, and foreign-owned businesses to establish themselves and to develop effectively. The weak currency is also a detriment to economic growth. Finally, corruption has become a deterrent to the successful creation of new companies.

Foreign Policy

Because of its geography, Uzbekistan is a key actor in the geopolitics of Central Asia. Sitting among the other Central Asian states of Kyrgyzstan, Kazakhstan, Turkmenistan, and Tajikistan, as well as Afghanistan to the south, Uzbekistan is a key transportation and communications hub. As a strategic country, it has been involved in peace processes in Tajikistan and

Afghanistan. In an effort to strengthen its position as an independent state, Uzbekistan has joined a range of associations and organizations. Ties with Russia are still important and have slowed the emergence of a free market in the country. Uzbekistan's abysmal human-rights record is often noted as a cause for U.S. concern and has been a point of contention between the two countries.

The national prospects for Uzbekistan are tied to President Islam Karimov. In his early sixties, Karimov is fit and appears poised to continue as president for the foreseeable future. The lack of a successor, of strong political actors and parties, and of a politically active population suggests that Uzbekistan's political system will not develop into a democracy any time soon. In addition to suffering from continuing economic problems, the IMU insurgency of the past two years persists unabated. While Uzbekistan has the benefits of resource wealth and an educated population, problems loom over the horizon. How Uzbekistan addresses these problems will shape the future success or failure of the country.

UZBEKISTAN—ECONOMIC SYSTEM

Uzbekistan, the most populous and best developed of the newly independent states in Central Asia, occupies the dominant geographical, political, and cultural position in the region. It is home to Central Asia's most

productive agricultural oases, river valleys, and irrigated lowlands.

Uzbekistan is a landlocked country, and each bordering country is itself a landlocked state. The southern border with Turkmenistan is partly defined by the watercourse of the Amu Dar'ya River, one of Central Asia's most important natural resources. To the north the country's border with Kazakhstan is defined by the watercourse of the Syr Dar'ya River. In the northwest the Aral Sea, dying from overuse of the region's water resources, defines the country's border. The Fergana Valley, lying in the protected eastern part of the country between Kyrgyzstan and Tajikistan, is one of the most productive agricultural regions in the world. The oases and river valleys of Bukhara and Samarqand have supported civilization and agriculture since ancient times.

Postindependence Economic Functioning

Uzbekistan's population is well educated and technically trained. The country is rich in a variety of natural resources, including coal, copper, gold, natural gas, oil, silver, and uranium. Primary commodities, together with cotton fiber, account for about 75 percent of merchandise exports, with cotton alone accounting for about 40 percent. Uzbekistan's 1998 gross national product was estimated at \$870 per person, placing it among lower-middle-income economies.

At the time of independence the Uzbek economy was more diversified than the economies of the other four Central Asian states and included agriculture, light and heavy industry, and important branches in primary commodities. Following the disintegration of the Soviet Union, Uzbekistan's economy was insulated from much of the economic decline that afflicted other former Soviet states, due to its labor-intensive economy based on agriculture and mineral extraction. Rapid growth in 1992–1995 in oil and gas production allowed Uzbekistan to eliminate oil imports and increase gas exports. Additionally, Uzbekistan shifted some of its crop acreage from cotton to grains to boost food self-sufficiency. While these were positive outcomes, they resulted in delaying the structural reforms that Uzbekistan's neighbors, particularly Kazakhstan and Kyrgyzstan, implemented.

Economic Policy of Stabilization

The Uzbekistan government, under the leadership of President Islam Karimov, quickly embraced the idea of market-based commercial relations. Uzbekistan announced that it was "pro-business," and the Soviet system was immediately rejected. Replacing it, however,

was an indigenous, state-controlled economy with many structural parallels to the Soviet system, except on a smaller, regional scale.

The Uzbekistan government has stressed a gradual, step-by-step approach to macroeconomic and market-oriented structural reforms. This conservative transition strategy has emphasized establishing self-sufficiency in energy and food grains, exporting primary commodities, particularly cotton and gold, and creating an internally oriented services market. In the early years of independence the government approached questions of structural reform cautiously and relied on administrative measures and controls to soften the shock of the interruption of Soviet-era commerce.

More recently the Uzbekistan government has made limited progress in implementing structural reforms in some areas, including privatization and the financial sector. In late 1998 the government announced an accelerated program for the case-by-case privatization of large strategic enterprises. At the same time it announced that restructuring and subsequent privatization of banks were to be undertaken. Yet fundamental agricultural reforms such as farm restructuring, land registration, changes in state procurement policies, and export-marketing arrangements continued to be delayed.

Reform Process and Currency Convertibility

In September 1996 in connection with a shortfall in foreign reserves, the Uzbekistan Ministry of Finance imposed a system of import contract registration. The goal of the system was to ensure that scarce foreign currency was used primarily to import capital rather than to buy consumer goods, particularly luxury goods. In practice, however, the system severely limited the availability of foreign exchange for all sectors of the economy and retarded economic activity. In subsequent years the Ministry of Finance periodically acted to make the system yet more rigorous as foreign currency reserves continued to dwindle. In 1998 the number of importers given convertibility quotas was cut by one-third of the number two years before. The remaining importers saw their quotas slashed in half.

Foreign companies in Uzbekistan reported that the currency restrictions constituted the most serious obstacle to doing business in the country. Foreign companies or foreign joint ventures importing capital goods with their own funds held outside Uzbekistan have also in effect been subject to the import registration system, although a 1998 presidential decree exempted joint ventures from the registration requirement. Nev-

ertheless foreign businesses have continued to experience bureaucratic hurdles with payments and settlements. In addition customs clearance remains a tedious and capricious bureaucratic process. Capital equipment imports for U.S.-Uzbek joint ventures have been subject to substantial processing delays and often remain in customs for months at a time. Delays can be substantial and expensive, and no procedure has been established for releasing goods under bond.

In May 2000 the government devalued the official exchange rate for government transactions by about 50 percent to bring it into line with the commercial exchange rate. But the economy remains hampered by adherence to these bureaucratic constraints.

The Future of the Uzbekistan Economy

An overvalued currency tends to channel trade into narrow and easily managed sectors and thus may appear to offer a solution to capital flight, but it is also associated with great efficiency losses. Financial transactions must be strictly regulated, which imposes a heavy burden of monitoring and sanctions. Well-connected parties with access to cheap, government-financed foreign exchange and import licenses benefit greatly from this situation. These parties can be expected to lobby to maintain the situation, despite the efficiency losses and corresponding damage to the public interest.

The bureaucratic burden of maintaining strict currency controls can be expensive and unavoidably creates an unfavorable climate for trade. A policy of overvaluation provides a rationale for extending police sanctions even to the extent of replacing the goal of public safety with that of regulating private behavior. Such a policy can produce an incentive structure in which private parties have an interest in avoiding or evading the legal framework through various forms of side payments and inducements. An overvalued currency can also lead to the depletion of foreign reserves, which, in turn, can bring about pressures for severe import restrictions and, eventually, the collapse of the free-trade policy.

Stressing economic self-sufficiency and state-sponsored welfare programs, the Uzbekistan government has resisted counsel from international organizations and economic specialists to liberalize prices, abandon government subsidies, adopt a tradable currency, and open its borders to trade. Instead Uzbekistan has maintained restrictions on trade and currency movement, closed its borders with war-torn Tajikistan, established government-controlled trading com-

panies, and developed an elaborate system of subsidies and price supports for industry and agriculture.

There are indications that Uzbekistan's foreign economic policies are changing. In June 2001, President Islam Karimov signed a decree designed to liberalize the currency market, modernize the republic's monetary system, and strengthen the banking system. The Afghanistan war drew a considerable amount of attention from foreign governments and international organizations. Faced with the potential for dramatic economic modernization spurred by international assistance, the Uzbekistan government redoubled its efforts after the beginning of the antiterror campaign in Afghanistan to bring its currency and macroeconomic policies into line with international standards.

UZBEKISTAN-EDUCATION SYSTEM

Uzbekistan has a comprehensive system of education that embraces the entire population. Although the lands that now constitute Uzbekistan have been centers of higher learning for centuries, the system of education as it exists today has its roots in the Soviet era and thus follows the modern European model of state-based, free, compulsory, universal, and secular instruction.

Traditional Uzbek Education

Before the Soviet era, every residential neighborhood in Central Asia had a *maktab* (primary school),

where a teacher, usually the imam of the mosque, taught basic texts to neighborhood boys. The purpose of the *maktab* was to inculcate culturally accepted norms of behavior and to have students memorize certain basic texts of the area's Islamic tradition. The teacher received gifts from the parents of the boys he taught. Girls were usually taught at home. Beyond the *maktab*, education took place in practical contexts of apprenticeships or in *madrasabs* (religious schools). Those who aspired to work in the nexus of administration, justice, and religion entered the *madrasab*, where they could learn the art of textual interpretation from a recognized master in a system that had marked similarities to apprenticeship. *Madrasabs* were funded by income from endowments (*waqf*) established by various individuals. Bukhara's *madrasabs* were renowned and drew students from as far away as Tatarstan (a region on both sides of the Volga River) and India. This pattern of traditional education survived the Russian conquest of the 1860s and 1870s. A network of Russian schools emerged, but it attracted few local students.

After the turn of the twentieth century the *maktab* and the *madrasab* came under intense attack from a new group of modernist intellectuals, the Jadids, who accused them of not meeting the needs of the age. The Jadids advocated a new method of education, in which the *maktab* would focus on imparting functional literacy and a basic knowledge of arithmetic, history, geography, and hygiene. For higher education, the Jadids advocated a curriculum of technical and vocational education to equip future generations with the skills necessary for survival in the vastly new circumstances introduced by the Russian conquest. Lack of material resources and hostility from both the state and conservative elements in local society meant, however, that "new-method" schools remained few in number before the Russian Revolution of 1917.

Uzbek Education under the Soviets, 1917-1991

Real change came during the Soviet period. The Bolsheviks who took power after the Russian Revolution shared the Jadids' critique of traditional Central Asian education, although their agenda was far more radical. For the Bolsheviks, economic backwardness—in Russia as much as in Central Asia—could be overcome only through combating cultural backwardness. They therefore expended substantial energies on campaigns against illiteracy and for the establishment of a ramified system of educational institutions. Crash courses to train primary teachers and to abolish illiteracy among adults began with the advent of Soviet power. A network of Soviet primary schools offering

a basic modern education faced substantial difficulties, however, and did not become a reality until late in the 1920s. Only in 1930 did education become universal and compulsory. The Soviet commitment to universal education meant that girls were brought into the educational system. By the 1930s, coeducation was the norm in Uzbek schools.

Education was the key to the remaking of society and culture, in the Bolshevik view. One of the first Soviet decrees concerned the separation of church and school. The Soviets saw religion as an ideological cloak that prevented the full realization of human reason; religious elites were also potential political opponents. This notion was applied in Central Asia as well, although *maktab*s were tolerated for much of the 1920s until enough Soviet schools could be built. The triumph of the Soviet school spelled the end of traditional Islamic education in Uzbekistan. Soviet primary schools replaced the *maktab*, while *madrasabs* were destroyed by the early 1930s through the nationalization of their *waqf* property, which was given over to the use of new state-run schools. Traditional Islamic education was pushed underground by the mid-1930s. In 1941, a *madrasab* with a radically transformed curriculum and modern pedagogical methods was opened to train small numbers of officially sanctioned clergy; a second one followed in 1970.

Soviet policy called for provision of education in the vernacular for all nationalities. The new schools operated in the Uzbek language, with Russian taught as a second language. In the cities with substantial Russian populations, Russian-language schools were also built. These were open to non-Russians, and since a knowledge of Russian was a vital skill, many ambitious Uzbek parents sent their children to Russian schools. Higher education, especially in technical fields, operated only in Russian, and after World War II the Uzbek regime emphasized the importance of Russian as the lingua franca of the USSR. Moreover Uzbekistan's higher education was closely linked with Soviet networks, with the most prestigious institutions being those in Moscow.

Higher education evolved along parallel tracks of teaching and research. The Central Asian Communist University (called Tashkent State University since 1960), established in Tashkent in 1920, was the first institution of modern higher learning in Uzbekistan. Over time, universities were established in Samarqand, Bukhara, and Nukus. A number of specialized institutes, teacher-training colleges, and vocational schools existed alongside the universities. Research-oriented education was based in the Uzbekistan Academy of

Sciences (established 1943), with numerous affiliated institutes. Access to higher education was through university entrance examinations.

Soviet education achieved nearly universal literacy by the 1970s. In other indicators, Uzbekistan lagged behind all-Soviet levels, at least partly because of relatively low levels of urbanization. According to the last Soviet census (1989), Uzbekistan had 817 "specialists" per 10,000 population, as compared with the USSR average of 1,271. These figures are nevertheless impressive.

Uzbek Education after Independence, 1991

The basic structure of Uzbekistan's education system survived the breakup of the USSR. After nine years of compulsory education, students continue in vocational or academic streams, on the basis of their examination results. The infrastructure of primary and secondary education remains in place. Five million children study at school, and more than a million are enrolled at kindergarten level. (See Table 1.) In other ways, however, there have been drastic changes.

The end of central planning has necessitated new ways of funding education, and such resources have not always been forthcoming. Material difficulties, such as poor physical plants, shortages of textbooks and supplies, and low salaries for teachers, pose the largest threat to the system. Other problems arise from the disruption of contacts with academic institutions in the former USSR, which have not always been replaced by new ones. The government has also sought to downplay the public visibility of Russian, while emphasizing Uzbek-language education. Nevertheless Russian remains the only foreign language most people know. Russian schools continue to exist, and Russian remains a compulsory subject in non-Russian schools. Although the government would like to replace Russian with English as the means of communication with the outside world, such a switch remains

highly unlikely given the shortages of teachers. Higher education has suffered from brain drain as well as from shortages.

Another significant feature of the period since independence has been the reemergence of Islamic education. The government acknowledges Islam as part of the spiritual heritage of the nation, but it is also wary of political challenges from a religious opposition. It therefore keeps tight control over religious education. Only schools under the supervision of the Muslim Religious Board of Uzbekistan, a government department, are allowed to operate, and their curricula meet basic requirements set by the Ministry of Education. State schools remain resolutely secular, with no religious instruction whatsoever.

UZBEKISTAN-HISTORY Uzbekistan is a former Soviet republic and now a member of the Commonwealth of Independent States (CIS). Its official name is the Republic of Uzbekistan. The history of Uzbekistan covers more than 2.5 millennia. During this period, various ancient states rose and fell in Central Asia, such as Bactria, Khorezm, Sogdiana, and Parthia.

The Ancient Period

From the sixth century to the fourth century BCE the territory belonged to the Iranian Achaemenid empire founded by Cyrus the Great (c. 585–c. 529 BCE). Alexander of Macedon (356–323 BCE) invaded Central Asia in 334 BCE and destroyed the Achaemenid empire. Inhabitants of the territory tried in vain to defeat him; a revolt under the leadership of Spitamen was one of the great battles.

After the death of Alexander in 323 BCE his empire was divided. Between the third and the second centuries BCE, the Graeco-Bactrian state, becoming independent from Alexander's empire, incorporated the

KEY EVENTS IN UZBEKISTAN'S HISTORY

- 6th–4th centuries BCE** The region is under the control of Persia.
- 3rd–2nd centuries BCE** The region is under the control of Graeco-Bactrian state.
- 1st–4th centuries CE** The region is ruled by the Kushan empire.
- 552–745** The Turks rule Central Asia.
- 7th century** Muslim Arabs conquer the region.
- 819–1001** The region is ruled by the Samanid dynasty.
- 1000** The Ghaznavid and Karakhanid dynasties begin to displace the Samanid dynasty in the region.
- 1097** The Anushtegin dynasty emerges in western Uzbekistan.
- 13th century** The Mongols conquer the region.
- 14th century** Timur displaces the Mongol rulers and establishes a capital at Samarqand.
- 16th–18th centuries** Various Uzbek dynasties compete for power in the region.
- 1860** The Russians invade and then conquer Central Asia.
- 1924** The Soviet Socialist Republic of Uzbekistan is founded.
- 1991** Uzbekistan becomes an independent nation.

greater part of present-day Uzbekistan. From the first to the fourth century CE, the territory of Uzbekistan was under the control of the Kushan empire, which also controlled present-day Afghanistan, northern India, and part of Pakistan.

The Turks ruled Central Asia between 552 and 745 CE and played a great role in consolidating nomadic tribes in the Central Asian steppes and oases. By the end of the sixth century, due to local wars their empire was divided into two parts: the Eastern and Western Kaganates.

Before Arab conquests of Central Asia, there were several small states in the territory. Then, in the seventh century CE, Arabs conquered Central Asia under the leadership of Qutaybah ibn Muslim (d. 715) and brought Islam with them. The territory between the Amu Dar'ya (Oxus) and Syr Dar'ya (Jaxartes) Rivers was named Mawaraannahr (Transoxiana) by the Arabs and included in the Arab caliphate. Under the Abbasid caliphs of Baghdad, Islamic influence became domi-

nant in the cities of Central Asia. Arab conquest played a positive role in the development of Mawaraannahr.

The Samanid and Karakhanid Dynasties

At the beginning of the ninth century, the caliphate's power began to wane, and local dynasties ruled in provinces. The Samanid dynasty ruled Mawaraannahr from 819 to 1001. This period in Central Asian history was marked by a great upsurge in economy and culture. Cities and some rural areas turned into great commercial and cultural centers. For instance, Samarqand was renowned even outside of Central Asia for the production of high-quality glass and paper. Famous scholars such as the astronomer al-Biruni (973–1048), the mathematician Khorezmi (c. 780–850), the physician Ibn Sina (Avicenna; 980–1037), and many others lived at this time.

In 999, the Karakhanid dynasty began to supplant the Samanids in Samarqand and Bukhara. The new rulers even pushed south of the Amu Dar'ya, but Mahmud of Ghazna (971–1030) stopped them, and the river became the dividing line between Khorasan and Mawaraannahr. Thus, by the end of the tenth century the territory of the Samanids was occupied by the Karakhanid and Ghaznavid dynasties.

In Khwarizm, in the western part of present-day Uzbekistan, a new Muslim dynasty was founded in 1097 CE by Qutb al-Din Muhammad bin Anushtegin. This Turkic dynasty, which was called the Anushtegins (Khorezmshahs) in historical sources, gradually attained great power and became independent from another Turkic tribe, the Seljuks, in 1127. The Anushtegins were able to control the huge territory of Central Asia. During their rule, culture, economy, and science flourished.

The Mongol Era and the Reign of Timur

Mongols conquered Central Asia between 1219 and 1221 under the leadership of Genghis Khan (c. 1162–1227), and his second son, Chagatai (d. 1241), ruled the region. Mongols destroyed many cities and killed and enslaved thousands of peasants and craftsmen. In 1238, a great revolt against the Mongols started in Bukhara under the leadership of Mahmud Tarabi. However, it was suppressed.

In the middle of the fourteenth century, a battle against the Mongol empire began in Mawaraannahr under the leadership of Timur (1336–1405), who had once fought with Chagatai. Timur created a great kingdom from India to the Volga River and from the Tian Shan Mountains to Bosporus. Timur chose

Samarqand, one of the oldest cities in Central Asia, as the capital and built many great mosques and gardens. His rule and the rule of his descendants were marked by the development of irrigation, arts and crafts, trade, literature, science, and art in Samarqand and Mawaraannahr. Timur was a cruel conqueror. He slaughtered thousands of inhabitants of the cities that rebelled against him, especially at Delhi.

The Sixteenth to Eighteenth Centuries

At the beginning of the sixteenth century, nomadic Uzbeks, the Shaybanids, conquered most of Central Asia and ruled until the Ashtarkhanids, the group from the ruling house of Astrakhan (the town near of the mouth of the Volga), came to power in 1601. In 1753, the dynasty of the Mangits, an Uzbek tribe that was dominant in the central regions of Mawaraannahr, came to power in Bukhara and ruled until 1920.

At the beginning of the eighteenth century, Fergana became independent from Bukhara, and there the khanate of Quqon was founded. In the first quarter of the nineteenth century, it possessed Tashkent and the region of Syr Dar'ya. In 1511, the khanate of Khorezm was founded at the northwestern part of present-day Uzbekistan, and by the end of the century Khiva was chosen as its capital. Thus, there were three states in Central Asia before the Russian conquest: the Bukhara, Quqon, and Khiva khanates.

Nineteenth-Century British-Russian Rivalry

In the nineteenth century, Central Asia became an object of rivalry between Russia and Britain. Czarist Russia strove to capture Central Asia's raw materials and to prevent British penetration into the territory. In 1860, Russia invaded Central Asia and conquered it by the end of the nineteenth century. In 1876, the Russians dissolved the khanate of Quqon but allowed the khanates of Khiva and Bukhara to remain as protectorates. The Russians created the province of Turkestan, with its center at Tashkent. It was ruled by a governor-general.

On 30 April 1918, the Turkestan Autonomous Republic under the Russian federation was founded. In February 1920, Soviet power came to Khorezm, and the Khorezm People's Soviet Republic was established. In September of that year, the Bukhara People's Soviet Republic was also proclaimed.

In October 1924, following the establishment of the Union of Soviet Socialist Republics, the Soviet Socialist Republic of Uzbekistan (SSRU) was founded. It included Samarqand, Syr Dar'ya, the Fergana regions,

and the territories of Bukhara and the Khorezm People's Soviet Republic. Tajikistan was a part of the SSRU until 1929, when it became an autonomous republic. In 1936, the Karakalpak Autonomous SSR was joined with Uzbekistan. In 1956 and 1963, the Mirzachul Steppes were transferred in portions from Kazakhstan to Uzbekistan. Some of the area was returned in 1971.

During the Soviet period, Russia exploited Uzbekistan for its tremendous productivity in cotton and for its other natural resources. Moscow controlled Uzbekistan's economic and political contacts with the rest of the world. The Republic of Uzbekistan became independent on 1 September 1991, following the collapse of the Soviet Union. On 2 March 1992, Uzbekistan joined the United Nations.

UZBEKISTAN-POLITICAL SYSTEM Uzbekistan is home to the Uzbek nation, a Turkic-speaking people with a proud history and rich culture. While Uzbekistan's multinational population includes Kyrgyz, Tajiks, Turkmen, Kazakhs, Karakalpaks, Slavs, and many other groups, Uzbek national identity has undergone a significant revival since national independence in 1991. In December, 1998 Uzbekistan symbolically celebrated the re-creation of its past by awarding the country's highest honor, the Order of Emir Timur, to Uzbekistan's president, Islam Karimov (b. 1938). The award was intended to mark the country's achievements in creating a sovereign state, increasing respect for Uzbekistan around the world, strengthening civil peace and national accord, and promoting Uzbek cultural values.

Islam Karimov, while rhetorically championing democratic values and market reform, has steered a

course toward concentration of executive powers. A financial specialist and former head of the Uzbek republic's Communist Party during the Soviet period, Karimov established himself as the strongman of Central Asia in the first period of Uzbekistan's independence. In 1983, Karimov was named minister of finance. In 1986, he was named vice chairman of the Council of Ministers and chairman of the State Planning Committee. In June 1989, he was appointed first secretary of the Uzbekistan Communist Party Central Committee. In March 1990, he was elected president of the republic by the Supreme Soviet (a legislative appointment—not a popular election). In December 1991, he was elected by popular vote. Karimov's supporters see his rule as reinforcing "Central Asian values"; critics view his leadership as reinforcing authoritarianism and despotism. Karimov justifies the severe paternalism of his government in his book *Uzbekistan on the Threshold of the Twenty-First Century*.

Constitutional and Legal Framework

The preamble of Uzbekistan's constitution (adopted 8 December 1992) states that one of the principal goals of the people of Uzbekistan is to "create a humane and democratic rule of law." The constitution guarantees the rights of freedom of speech, assembly, and religion, as well as the right to express one's national heritage.

The constitution specifies a branch system of government with a division of powers. The president directs the executive branch. The legislature is the Oliy Majlis (Supreme Council). Uzbekistan's three-tiered judiciary system is composed of the Constitutional Court, the Supreme Court, and the Arbitrazh Court (Commercial Court). There are local courts as well as the municipal level.

In theory the judiciary is independent, but in practice its capacity to function as an independent branch of government is limited. While the constitution describes the legislature as the highest organ of power, in fact the country has a unitary presidential form of government. Furthermore the branches are not co-equal or balanced; the executive branch is dominant in virtually all matters. The president acts as the head of state and executive authority in the republic, and there are no meaningful lower tiers of independent authority (for instance, no federal divisions).

Executive-Branch Functions

The president's executive powers are extensive: he has the right to form a government; direct the government; appoint and dismiss the prime minister and

cabinet ministers; appoint and recall diplomats; establish and dissolve ministries; appoint and dismiss the procurator-general and his or her deputies; nominate appointees to the Constitutional Court, Supreme Court, and board of the Central Bank; appoint and dismiss judges of regional, district, city, and arbitration courts; appoint and dismiss *bakims* (governors or mayors) for violations of the law; suspend or repeal acts of *bakims*; sign all laws of the Oliy Majlis or return them for reconsideration; declare a state of emergency; serve as commander-in-chief of the armed forces; declare war; award orders and medals; rule on matters of citizenship; issue amnesties and pardons; and appoint and dismiss heads of the national security service.

The president is elected by direct, secret, but not necessarily competitive, election for a term of five years. According to the constitution, a president can hold office for no more than two terms. After state service, the president becomes a lifetime member of the Constitutional Court. Islam Karimov was elected president in March 1990 by Uzbekistan's Soviet-era parliament. He was reelected in December 1991 in a popular election, running opposed and winning 86 percent of the votes. A March 1995 referendum extended the president's term of office to January 2000, matching the terms of the Oliy Majlis deputies (parliamentarians) and allowing Karimov to stand again for election. In December 2001, the Oliy Majlis adopted a resolution calling for a presidential election. If the resolution is implemented in 2002, a referendum may be held allowing Karimov to remain in office until 2007.

The three-tiered judicial system is subordinated to the Ministry of Justice. The court system is funded from the state budget. To avoid partisanship, no judge may be a member of any political party. The procurator's office represents the prosecutorial arm of the justice system and is responsible for public observance of the laws. Procurators are appointed by the president and are restricted from belonging to any political party or participating in party activity during their period of service. Local and neighborhood conflict-resolution committees—the Mahalla—are reported to function effectively on a local level in many areas, particularly rural areas.

In Uzbekistan, the parliament, the Oliy Majlis, serves as an advisory and legitimating instrument, not as a deliberative body. The core of Uzbekistan's government is not the parliament or the courts, but the system of administration that relies on the twelve *veliatlar* (former oblasts or regions) headed by *bakims*. Of

the *bakim* appointments announced in March 1994, all were ethnic Uzbeks; all had previously been oblast-level Communist Party committee secretaries, and all were members of the People's Democratic Party of Uzbekistan, the party headed by Karimov. The system is prefectorial. Each *bakim* administers his or her territory as representative, or prefect, of the president.

Competitive Politics, Elections, Parties, and Civil Rights

Politics is not pluralistic in Uzbekistan: the political process is carefully monitored and controlled. The Central Electoral Commission (CEC) is a fourteen-member board established by the Oliy Majlis on the advice of the president. The CEC is responsible for oversight of the nomination process and of campaigning and for the organization of the election. Campaign financing and campaign publicity are also managed by the CEC. According to an election law passed in December 1993, the right to nominate candidates is reserved to registered political parties, the *veliat* legislative councils, and the Karakalpakstan parliament in the Karakalpak Autonomous Republic in Uzbekistan. Political parties must also satisfy the additional condition of having been registered with the ministry of justice no less than six months before the election, and they must have collected fifty thousand voters' signatures supporting the party's participation in the election. These and other restrictions on the nomination process make it possible for the government to exercise a determinative influence on the preselection of candidates.

The People's Democratic Party (PDP), the successor to the Communist Party, is the dominant party and explicitly supports the president and the government. Other political parties include the Fatherland Progress Party, the Adolat Social Democratic Party, the Democratic National Rebirth Party, and the Self-Sacrificers Party (Fidoskorlar). In 1996 Karimov withdrew from the PDP, claiming that the president should be above partisan politics.

In Uzbekistan, as in many authoritarian contexts, personalities play a more significant role than do principles. When independence occurred—not as part of an organic internal development but as the outcome of a deal brokered by the disintegrating Communist Party of the Soviet Union—the existing power structures reconstituted themselves as an independent government.

A political opposition did emerge on independence, but the leading faction of the beneficiaries of the old Soviet system used their established influence to brush

the opposition aside. Uzbekistan embarked on a course of national consolidation that emphasized the state as the leading and guiding force of society. The constitution adopted in December 1992 merely institutionalized the existing political system. The government publicly emphasized the Central Asian tradition of strong but benign leadership. In private the government relied on and even refined Soviet-style techniques of manipulation and intimidation.

The Uzbekistan government's record on human rights is considered poor by most international human-rights organizations. Rights of speech, assembly, and religion routinely are circumscribed by government agencies that identify social stability and security as the principal goal. In numerous documented cases the security forces have arbitrarily arrested or detained human-rights activists, religious activists, and ethnic-group activists on false charges, by allegedly planting narcotics, weapons, or forbidden literature on them. Prison conditions are poor, and detention can be prolonged. Police routinely infringe on citizens' rights, and officials responsible for documented abuses are rarely punished. After five terrorist bombs exploded near government targets in Tashkent on 16 February 1999, Uzbekistan security forces launched a campaign of arrests and intimidation against many seen as opposing the government. Also arrested were members of the secular opposition, human rights activists, and Muslim believers.

President Karimov has argued that economic development, not European-style civil rights, is the true fruit of national independence. Uzbekistan, stressing welfare authoritarianism, has resisted counsel from international organizations to embrace democratic principles and processes.

UZBEKS The Uzbeks are a Central Asiatic people who speak a language belonging to the Chagatay branch of the Turkic language subfamily. In 1998, an estimated 18 million Uzbeks lived in the independent republic of Uzbekistan, located mainly between the Syr Dar'ya and Amu Dar'ya Rivers in Central Asia. Uzbekistan has an area of 447,400 square kilometers. Its estimated 1998 population was 24.1 million, of whom approximately 76 percent were Uzbek, 6 percent other Turkic, 6 percent Russian and Ukrainian, 5 percent Tajik, and 7 percent other. Smaller num-

A Uzbek grandmother holds her grandchild outside their dwelling in the desert. (BUDDY MAYS/COPRIBIS)

bers of Uzbeks also inhabit Afghanistan, other Central Asiatic Turkic republics, and Russia.

Most Uzbeks are devout Sunni Muslims. They are the least Russified of the Turkic peoples formerly under Soviet rule, and virtually all of them still claim Uzbek as their primary language. Parents typically give their children Uzbek rather than Russian names. The majority of Uzbeks live in rural areas, where extended family households are common. Only two-fifths of the population of Uzbekistan live in urban areas, and a disproportionately high number of these urbanites are Slavic peoples. In the late 1980s and early 1990s, many Russians and Jews emigrated from Uzbekistan, thereby changing the country's ethnic composition and opening up more technical and management jobs for Uzbeks.

Uzbekistan's population is youthful. Uzbeks have a high birth rate and large families. Of all the former Soviet republics, Uzbekistan has the greatest number of mothers with ten or more living children under the age of twenty years. In 2001, life expectancy at birth was estimated to be sixty-four years.

The Early Uzbeks

The Turkic-Mongol tribes known as Uzbeks originated in Siberia and entered the land of present-day Uzbekistan in the fourteenth century. They may have adopted the name "Uzbek" from the Muslim ruler of the Golden Horde, Oz Beg (Uzbek) Khan (reigned 1312–1341). The Uzbeks entered Central Asia under the leadership of Abu al-Khayr Khan, a descendant of the great Mongol leader Genghis Khan. Abu al-Khayr Khan led the Uzbek tribes southeastward to the north bank of the Syr Dar'ya.

In the late fifteenth century, the Uzbeks conquered key portions of Transoxania (the region between the Amu Dar'ya and Syr Dar'ya Rivers) and occupied the major cities of Bukhara, Khiva, Samarqand, and Khujand. Uzbek khans gained wide recognition for their Sunni religious orthodoxy and cultured patronage of the arts. They sponsored the construction of architectural monuments, such as mosques, Islamic seminaries, palaces, and bridges.

Over the centuries, the territory of what is now Uzbekistan produced great scholars, poets, and writers. In the fifteenth century, the astronomer and mathematician Ulugh Beg founded a famous observatory in Samarqand, and the scholar, poet, and writer 'Ali Shir Nava'i greatly advanced Turkic-language literature.

During the reign of 'Abd Allah Khan II (1557–1598), Uzbek rule was expanded in Balkh, Samarqand,

Tashkent, and Fergana. Uzbek hegemony extended eastward as far as Badakhshan in present-day Afghanistan and East Turkistan (roughly today's Xinjiang Uygur in northwestern China) and westward to Khorasan and Khwarizm in present-day northern Iran. Thereafter Uzbek power and influence declined, reaching a low point by the mid-1700s, with military defeats by the Iranian ruler Nadir Shah. Three Uzbek-dominated polities, known as khanates, emerged in the eighteenth century at Quqon in eastern Uzbekistan, Bukhara in southern Uzbekistan, and Khiva on the lower Amu Dar'ya.

Russian and Soviet Rule

Czarist Russian forces advanced southward, conquering Bukhara in 1868, Khiva in 1873, and Quqon in 1875. The Russians incorporated the Uzbek lands into the province of Turkistan and linked it to the rest of the empire via telegraph, telephone, and the press. Railroads reached Samarqand and Tashkent by 1905. Despite being ruled by czarist colonial administrators, the Uzbek intelligentsia and clergy of Bukhara and Khiva resisted the influence of Russian educational, religious, economic, and governmental institutions. At the same time, however, a group of reformers known as Jadids worked with the support of Russian governors to prepare a number of young urban intellectuals for change in their economy and society. The Jadid era (1900–1920) produced a number of modern poets and writers, who produced many of the first indigenous plays, stories, and novels of Central Asia.

The Russian Revolution of 1917 caused instability and conflict in Turkistan, as Muslim resistance and attempts to establish an autonomous government were defeated by the Red Army. By 1921, Communist-dominated politicians held power. In 1924–1925, they designated the region of Central Asia with an Uzbek population majority as Uzbekistan and incorporated it into the Union of Soviet Socialist Republics. The authorities soon granted Uzbekistan the formal status of constituent republic of the USSR. Uzbeks constituted a minority in the capital city of Tashkent and were underrepresented in the Soviet bureaucracy and administration; Slavic peoples—Russians, Ukrainians, and Belorussians—constituted the majority.

The Communist political purges of the 1930s exacted heavy casualties, especially among Uzbekistan's relatively small class of intelligentsia and leaders. World War II brought major demographic changes, as the Soviet authorities moved thousands of Russian,

Polish, and Jewish technicians, managers, and teachers to the towns and villages of Uzbekistan.

During the 1980s, Islamic religious practice surged, transforming many aspects of Uzbek life, especially in the towns of the Fergana Valley and other concentrations of Muslim believers. This resurgence affected the republic's cultural life through the increased activities of religious schools, neighborhood mosques, religious orders, and religious publishing ventures and through the Islamic Renaissance Party.

Throughout most of the Russian and Soviet eras, the Uzbeks maintained significant portions of their cultural traditions. In athletics, wrestling, horse riding, and team competitions continued to be popular. In rural areas, both men and women continued to wear distinctive Uzbek dress. For their homes, Uzbeks continued to prefer simple, one-story structures, like those of the past, built around courtyards planted with fruit trees and gardens open to the skies but closed off from the streets.

At the same time, many Uzbeks acquired Russian as a second language, and compulsory school attendance raised the literacy rate for both males and females to above 90 percent. Until the 1980s, most Soviet Uzbek authors produced tendentious novels, plays, and verse in line with official Communist Party themes. Since the 1990s, however, younger Uzbek poets and authors have broken away from the sloganeering characteristic of Soviet Socialist Realism. Attempts are also being made to revive classical Uzbek musical forms.

Postindependence

Uzbek political leaders declared Uzbekistan's independence from the Soviet Union in 1991. However, the Uzbek Communists retained political power and prohibited opposition parties from participating in the 1991 and 1994 elections. The government's human rights record has drawn international criticism, although the government has promoted the reclamation, renovation, and reconsecration of many smaller old mosques. Communist authorities had relegated these to serve as garages, storehouses, shops, slaughterhouses, or museums. Muslim artisans have accurately reconstructed these damaged buildings as part of a comprehensive drive to recreate the Islamic life suppressed by the Communists between 1920 and 1990.

VALIKHANOV, CHOKAN (1835–1865), nineteenth-century Kazakh explorer and scholar. Regarded by many scholars as the first Kazakh intellectual, Chokan Valikhanov was born in 1865. A grandson of Ablai Khan (1711–1781), the last great khan of the Kazakh Middle Horde, Valikhanov (also known as Mukhammed Khanafii) was initially educated at home, and in 1847 he entered the newly opened Omsk Kadet Korpus as the first Kazakh admitted to the institution. While there he studied history, geography, mathematics, and classics of Russian and Western literature. Graduating in 1853, he worked for the office of the governor-general of Western Siberia, where he became a close friend of the Russian novelist Fyodor Dostoyevsky (1821–1881), recently released from internal exile in Siberia and assigned to serve five years in a disciplinary battalion, and Petr Semonov-Tian-Shanskii (1827–1914). In 1856 he participated in an expedition to Semirechye province, where he became the first person to write down parts of the great Kirgiz oral epic *Manas*. Two years later he undertook a clandestine journey to Kashgar in Xinjiang, where he gathered economic and political information for the Russian government. His reports were published in the journal of the Russian Geographic Society and translated into German and English. Honored for his accomplishments, in 1860 he was assigned to the Asiatic department of the ministry of foreign affairs in the capital, St. Petersburg. His health weakened by the arduous journey to Kashgar, he returned to the Kazakh steppe to recuperate from complications due to tuberculosis. He died near present-day Almaty in April 1865. In 1904 an edited volume of his collected works was published by the Ethnographic Section of the Russian Geographic Society.

VAN (2002 est. province pop. 851,000). The city of Van (estimated 2002 pop. 253,000), the capital of the province of Van, is located in eastern Turkey on the eastern shore of Lake Van; the population is now largely Kurdish. The city, with an altitude of 1750 meters, is in the valley of the Nemrut and Suphan mountains. During the thirteenth through seventh centuries BCE the Urartean empire flourished in this area, and Van was its capital in the eighth century BCE.

After Nineveh, capital of the Assyrian empire, fell in 612 BCE, the city was successively occupied by the Medes, Persians, and kings of Pontus in northeastern Asia Minor. During the first century BCE it was part of the kingdom of the Armenian king Tigranes I (c. 140–c. 55 BCE). The Romans, Sasanids, and Arabs all sought to conquer Van in the seventh century CE; it fell to the Arabs.

During the eighth century the region came under the rule of the Armenian Bagratid dynasty, and the city later became the capital of Vaspurkan, an independent Armenian state. The city of Van was occupied by the Byzantines in 1021 and then fell to the Seljuks after the battle of Manzikert (1071). The Ottoman sultan Süleyman I conquered Van in 1543, and the city remained under Ottoman control until the Russians occupied it from 1915 to 1917, during World War I. The

years 1896 and 1913 were times of terrible massacres and deportations of Armenians in this area.

Remnants of Armenian churches, Seljuk and Ottoman mosques, and the citadel still exist. North of the city lies the site of Toprakkale, an ancient Urartean city that has been excavated.

Lake Van is the largest body of water in Turkey and the second largest in the Middle East. Its natural beauty has recently begun to attract tourism. The economy of the province of Van is based on the production of fruits, vegetables, skins, and grains.

T. Isikozlu-E. F. Isikozlu

VARANASI (2001 est. pop. 1.1 million). Varanasi (also Banaras, Benares, or Kasi) is for Hindus the most sacred city in India. Located at a bend of the River Ganges, it lies on the left bank, near the eastern border of Uttar Pradesh State, and nearly 700 kilometers east-southeast of Delhi. Although the devout commonly equate its extreme sanctity with extreme antiquity, dubbing it "the oldest city on earth," archaeology shows that it had its origins during the Iron Age, in the eighth century BCE.

The biggest attraction in the city, for pilgrims and tourists alike, is the celebrated ghats, broad steps that lead down to the river and that feature a constant commerce in ritual bathing, religious teaching, cremation of the dead, or—for very poor families—launching of corpses into the river current. Of all the ghats, the Manikarnika Ghat is considered the most sacred and is consequently the one most pictured. It is one of five celebrated places of pilgrimage within the city. Buildings of note within Varanasi include hundreds of temples and shrines, preeminently the Durga Temple

Hindus bathe in the Ganges River in the holy city of Varanasi. (ALISON WRIGHT/CORBIS)

(miscalled by Europeans the Monkey Temple) and Benares Hindu University. The city has a wide range of handicrafts and is especially noted for its brasswork, silks, shawls, and embroidery. Because of the thousands of pilgrims and so many old people who come here in the expectation of dying, the city does a brisk business in cheap hotels and hospices.

Just outside the city (7 kilometers) is the site of Sarnath, where Buddha preached his first sermon in about 530 BCE. Its Deer Park is still maintained as an important archaeological site.

VEDDA The Vedda (also Vadda, Veddah, Veddha, Vaddo) are an indigenous people of Sri Lanka. They are divided into three groups: The Bintenne Veddas, the Anuradhapura Veddas, and the Coast Veddas. The Bintenne Veddas live in an area in the southeastern region of the island, the Anuradhapura Veddas live in North Central Province, and the Coast Veddas live on the central coast. The Vedda population is small, though an accurate number has yet to be recorded. A 1970 census counted more than 6,600 Anuradhapura Veddas. Bintenne and Coast Vedda populations are probably significantly smaller.

Until recently, many Vedda maintained a way of life based on hunting and gathering and shifting agriculture. The increase in the population of Sri Lanka and the modern importance of cash cropping rather than trade and reciprocity has changed Vedda subsistence activities a great deal. The Anuradhapura Vedda, traditionally shifting agriculturists, now obtain most of their income as agricultural wage laborers outside their own villages. The Coast Veddas fish, practice some shifting agriculture, and also work as casual wage laborers. The Bintenne Veddas still maintain hunting and gathering as a way of life. In recent years, they have asked for land to be set aside on Sri Lanka as a Vedda reservation. The government has provided assistance by way of agricultural cooperatives and development societies.

Traditional villages consisted of huts of wattle and daub or plaited palm with packed earth floors. Recently, the government has begun subsidizing the con-

struction of tin-roofed brick houses with concrete floors. Within the villages, kinship provides the major social structure. Vedda caste specialization, hunting, and spirit mediumship are important in interaction with the Tamil and Sinhalese.

Vedda religious beliefs, like their language, have been strongly influenced by their Tamil and Sinhalese neighbors. Vedda groups located near the Tamil tend toward Hinduism, while those located near the Sinhalese tend toward Buddhism. All three groups use some form of religious or ritual medicine, although the state also provides free access to Western medicine.

VEENA In classical texts on Indian music, the term veena refers to almost any string instrument, and at least forty different types of veena are listed. Today, the term refers to a particular type of stringed instrument, of which about two or three closely related variants are in existence. Like other stringed instruments in Indian classical music, the veena consists of a large round wooden base and a narrower and longer body also made of wood. On this body are attached brass or silver frets, usually enough in number to cover two octaves. There are about seven strings, of which at least three exist to create a drone. Usually, only two of the main strings are played on, by plucking. The veena is held either horizontally across the player's knees or slanting against the shoulders. While these broad features characterize a number of string instruments in India, the veena group stands out in details of construction, position of the main string, richness of sound, antiquity, and association with vocal music. Of all stringed instruments, the veena has been the closest to vocal music traditions; its repertoire has had much in common with that of vocal music, and the veena has often been played and taught by great singers themselves.

VELEYET-E FAQIH *Veleyet-e faqih* literally means "the authority or governance of the jurist" in Arabic and "rule of the religious jurisprudent" ("jurisprudent" referring to one who is learned in law) in Persian. In essence, it is the belief that an ideal government is one that is run by Islamic clergy who are well versed in Islamic law, history, and theology. It is a doctrine whose origins date back to 939 CE at the beginning of the Twelfth Imam's major occultation or absence from earth. It was determined that scholars of Shi'a Islam were the most qualified to conduct government services during the Twelfth Imam's occultation, which continues to the present.

Theoretically, *veleyet-e faqih* was contemplated in the nineteenth century as a definite legal consideration, but it became a political reality in Iran only under Ayatollah Khomeini after the Iranian Revolution in 1979. The ayatollah originally began developing this concept in his first work titled *Kashf al-Asrar* in 1944 when he asserted the right and duty of Shi'a scholars to lead. During his exile in Iraq, he worked out the details more fully in lectures, which were eventually published as *Hokumat-e Eslami (Islamic Government)*. When Ayatollah Khomeini rose to power in 1979, an Assembly of Experts was assigned to take on the task of making his ideas into a viable political structure. The result was a government structure headed by the *faqih*, who would be an Islamic theologian overseeing the executive, legislative, and judiciary branches of government. Ayatollah Khomeini was Iran's first *faqih*, followed by the 2000 *faqih*, Ayatollah Khameni.

VIENTIANE (2000 pop. 233,000). The city of Vientiane (or Viangchan, in Lao) is the capital of Laos and central to the cultural, commercial, and political life of Laos. It is situated in central Laos, along the

Mekong River, and covers about 180 square kilometers. Archaeological findings in the area have included Mon artifacts related to the practice of Theravada Buddhism. The earliest known settlement near present-day Vientiane was Chandapuri (City of Sandalwood). The Mon lived in the area until about 1006. The Vientiane region became a part of Cambodia during Khmer rule (802–1431). King Xetthathirat (flourished 1540s) made the city of Vientiane the capital of Lan Xang, transferring the capital there from its previous capital, Luang Prabang, and constructed the famous shrines of Vat Phra Kaeo (1565) and That Luang (1566), the latter being the national symbol of Laos.

The city remained the capital of Lan Xang through the Lao-Siamese wars (1779 and 1826–1828). Following Siam's victory and the destruction of the city, Laotian residents were forcibly relocated to Siam, and the city became a ghost town. In March 1867, French explorers found only a few residents, including monks who were living in ruined monasteries.

The French made the city the capital of French Laos. The city is comparable to Saigon in its colonial French architecture. The French, in addition to providing their rulers and armies with accommodation, erected monasteries and restored the ancient temples. Under French rule, the population was largely Vietnamese. The Japanese briefly assumed control of the city during World War II; the French reassumed control in April 1946, and the nation was taken into the French Union.

Laos gained independence in October 1953. It soon had its own troubles, including war and civil unrest. Vientiane was, like much of Laos, bombed throughout both the war with France (French, or First, Indochina War, 1946–1954) and the Vietnam War (Second Indochina War, 1954–1975). The Pathet Lao, a Communist revolutionary group, seized power in 1975 and retained Vientiane as the capital of the Lao People's Democratic Republic.

Tourism has flourished at traditional architectural sites, such as Buddhist monasteries and monuments. These include That Luang; Patousai (1958), a monument patterned on the Arc de Triomphe; and Vat Sisaket, the only temple to survive the Siamese sacking of the city in 1828 and Laos's oldest surviving temple.

VIETNAM PROFILE (2001 est. pop. 79.9 million). Vietnam occupies the eastern portion of the Indochinese peninsula, bordered on the north by China, on the west by Laos and Cambodia, and on the east by the South China Sea. The area of the country is slightly smaller (329,560 square kilometers) than the state of California, although, in terms of people, for every one Californian there are about two and a half Vietnamese.

Geography

All Vietnamese children are taught in school that their country takes the form of an elongated letter S,

VIETNAM

Country name: Socialist Republic of Vietnam
Area: 329,560 sq km
Population: 79,939,014 (July 2001 est.)
Population growth rate: 1.45% (2001 est.)
Birth rate: 21.23 births/1,000 population (2001 est.)
Death rate: 6.22 deaths/1,000 population (2001 est.)
Net migration rate: -0.49 migrant(s)/1,000 population (2001 est.)
Sex ratio: 0.97 male(s)/female (2001 est.)
Infant mortality rate: 30.24 deaths/1,000 live births (2001 est.)
Life expectancy at birth—total population: 69.56 years, male: 67.12 years, female: 72.19 years (2001 est.)
Major religions: Buddhist, Hoa Hao, Cao Dai, Christian (predominantly Roman Catholic, some Protestant), indigenous beliefs, Muslim
Major languages: Vietnamese (official), English (increasingly favored as a second language), some French, Chinese, and Khmer; mountain area languages (Mon-Khmer and Malayo-Polynesian)
Literacy—total population: 93.7%, male: 96.5%, female: 91.2% (1995 est.)
Government type: Communist state
Capital: Hanoi
Administrative divisions: 58 provinces and 3 municipalities
Independence: 2 September 1945 (from France)
National holiday: Independence Day, 2 September (1945)
Suffrage: 18 years of age; universal
GDP—real growth rate: 5.5% (2000 est.)
GDP—per capita (purchasing power parity): \$1,950 (2000 est.)
Population below poverty line: 37% (1998 est.)
Exports: \$ 14.3 billion (f.o.b., 2000 est.)
Imports: \$ 15.2 billion (f.o.b., 2000 est.)
Currency: dong (VND)

its two enlarged extremities filled by the fertile deltas of the Red River in the north and the Mekong River in the south. Central Vietnam is constituted by very narrow stretches of coastal plains that are hemmed in on one side by the elongated chain of mountains called the Long Mountains (Truong Son) and on the other side by the Pacific Ocean. The stylized profile of the country as it is drawn on maps evokes the image of the long bamboo pole with two baskets suspended at both ends that is carried by peasants on their way to and from the market.

The two main rivers of Vietnam are the Red and the Mekong, which is called the Nine Dragons River. The Red River owes its name to the red dirt that it

carries over its course all the way from the southern Chinese province of Yunnan to the Gulf of Tonkin. The Mekong is a long river, linking together all five countries of mainland Southeast Asia: Myanmar (Burma), Laos, Thailand, Cambodia, and Vietnam. The soil of the two deltas is fertile from the presence of rich alluvium; in the rest of the country, principally in the highlands, the soil is rather poor, because nutrients are leached out by a combination of rushing rain water and scorching sun. Only about one-third of the Vietnamese land is good for farming.

The mountains of Vietnam are not high. In general their elevation ranges from 600 to 1,500 meters, with the exception of the Fan Si Pan, situated in the

northwest, which rises up to approximately 3,060 meters. Rain forests, shielding a great variety of species of trees, some of which are hardwood such as teak and mahogany, cover virtually the entire mountainous region. These forests fit well the definition of the word "jungle," if they are complemented with their exotic fauna: monkeys, tigers, and elephants.

Rain, more than extremes of temperature, defines the seasons, although the north sees a temperature range from the high thirties (Celsius) in the summer to about 10° or 5°C in the winter months of January and February. Elsewhere, a moist and hot 30°C plus endures pretty much the whole year round, except on the slopes of mountains and possibly during the months of December and January, when the atmosphere seems somewhat less oppressive. That discrepancy is due to the influence of seasonal winds called monsoons, which regulate the dry-cold and rainy-hot portions of the year. The northeast monsoon that brings cold and dry air from the Asian continent weakens as it reaches the Hai Van Pass in central Vietnam. Consequently, the southern half of Vietnam has a more equally distributed, fresher weather through roughly six months of the year. The other six months, from about April or May to September or October, a hot and humid wind blows from the ocean around the equator toward the peninsula, bringing with it both heat and rain.

People

Many different ethnic groups share the land of Vietnam. The official census divides them into two general categories: the "plains" people and the ethnic minorities who generally occupy the highlands (with the exception of the Cham, Chinese, and Khmer minorities). There are up to sixty different groups, speaking as many different languages. The plains people consist of the Vietnamese who, from north to south, the speak one common tongue. Vietnamese is an Austroasiatic language that does not belong to the same linguistic family as Chinese, although 70 to 80 percent of its vocabulary is derived from Chinese words.

Traditionally, the Vietnamese were essentially a small-agriculture, rural people. Villages constituted their primary social units. Usually three elements figure in every village: a communal house, a pagoda, and a pond. The communal house, called *dinh*, serves as a meeting place for all activities common to all the villagers: administration, justice, police, jail. It is also a place of worship in honor of the protecting genie, who generally was an inhabitant of that village who accomplished some illustrious feat benefiting the coun-

try: a general, a writer, an artist, a person of virtue. The presence of the pagoda testifies less to the number of Buddhist followers than to the patrons of past dynasties, who manifested their devotion by erecting shrines in almost every village of the realm. Although the majority of the villagers may claim to be Buddhists or may go to the pagoda on the first and the fifteenth of the lunar month, they all practice the cult of ancestors mixed with a tinge of Taoism and Confucianism. In the past fifty years, a fourth component surfaced in almost every village: a cemetery-memorial to bury and honor the villagers who have sacrificed their lives for the country.

Since the majority of villagers are peasants, life in the countryside centers around the agricultural cycle, which starts about a month before the first monsoonal rains and ends with the drying of the unhusked rice. In certain areas, the weather and the fertility of the land permitting, that cycle repeats itself once or even twice. Rural people can afford few days of rest. All celebrate the three days of Tet, the lunar New Year. Another two or three days' rest occurs on the birth or death day of the deity who is worshipped in the *dinh*; in celebration, games, competitions, races, and theatrical performances are organized.

Cities, such as Hanoi, the present capital, and Hue, that of the Nguyen dynasty in the nineteenth century, were rare phenomena in the past. Many of the more modern cities, like Ho Chi Minh City (Saigon), Da Nang, and Can Tho are products of the modernization process that took place during the French colonial period.

Economy

Vietnam is classified as a developing country, and the average annual income of its citizens remains among the lowest in the world (\$333 in 1998). The economic development of Vietnam suffers from three serious impediments. During the time they controlled Vietnam, the French developed only those economic sectors that brought profit to the French themselves; long wars have marred recent history; and a decade of unfortunate postwar socialist experimentation with a centralized economy has left deep scars. Since 1986 the government has adopted a new policy called *doi moi* (renovation), which replaced a planned economy with a market economy, allowed private ownership of the means of production, and encouraged private investments from all sources. Since then, Vietnam has become an exporter of rice, and the economic growth stood for many years at around 10 percent until it was drastically reduced by the Asian economic crisis of the mid-1990s.

The Future

Due to the tight control the government exercises over foreign investments, Vietnam suffered only mildly from that crisis. By 1998, the situation had remarkably improved, with an increase in the production of crude oil and some agricultural products such as rice, pepper, and coffee. A bilateral trade agreement with the United States that took effect in 2001 will facilitate the importation of Vietnamese goods into the huge American market and thereby ease the pains of a growing economy in the time of globalization.

VIETNAM-ECONOMIC SYSTEM Vietnam is a poor, densely populated country, whose economy is based on agriculture—primarily wet rice cultivation. More than 80 percent of the country's 80 million people are engaged in farming. There have been numerous attempts to industrialize, but the country's infrastructure was devastated after decades of war, while aid was wasted due to poor economic planning.

Post-World War II

In 1945, Vietnam inherited an economy from the French that was poor, underdeveloped with a weak infrastructure, woefully exploited, and geared to serving the colonial regime. The French, who had colonized Vietnam from the 1860s, had changed landholding patterns, creating millions of landless peasants and day laborers who worked on French-owned plantations, and had imposed taxes and corvée duty that kept the peasantry in a cycle of indebtedness. State monopolies and limited attempts to industrialize also distorted the economy, which was then shattered by nine years of anticolonial war between 1946 and 1954.

Following the 1954 Geneva Peace Accords that saw Vietnam divided into two halves at the seventeenth parallel, the two competing regimes implemented substantially different economic policies. In North Vietnam, the Communist regime under the Lao Dong Party (LDP) began to socialize the economy rapidly. In the countryside, the LDP implemented a two-phase land reform program to radically redistribute land and abolish landlordism. The implementation of this policy was marked by mass violence as class labels were applied. After two years, massive peasant unrest caused the party to slow down the implementation of land reform. Despite an increase in the amount of collectivized land, per-capita agricultural output actually fell. The state monopolized the harvest and marketing of the rice, paying the peasantry below-market prices for their crops, so that the urban proletariat could receive subsidized food.

The urban economy of the north was also socialized through a strategy of Stalinist industrialization. Private enterprise was abolished, trade was monopolized by the state, and the north began a process of heavy industrialization with massive amounts of Chinese and Soviet aid. Between 1955 and 1965, North Vietnam received \$457 million and \$364 million in Chinese and Soviet aid, respectively. Central economic planning was adopted and the country was put on Soviet-style five-year plans. The fact that all economic resources were directed to the war against U.S.-backed South Vietnam, especially after 1963, caused terrible economic dislocations and massive shortages.

In South Vietnam, the economy was a quasi-capitalist system. Unlike North Vietnam, land in South Vietnam was inequitably distributed, which infuriated the peasants who supported the communist-backed Viet Cong National Liberation Front (NLF), which promised land reform. The South Vietnamese regime's base of support came from the landlord class, which resisted land reform, and the peasants suffered under absentee landlordism, high rates of landlessness, and high taxation.

The South Vietnamese regime was increasingly dependent on U.S. economic aid, which by 1963 amounted to more than \$1 billion. But unlike North Vietnam, South Vietnam invested little of that aid in industrialization; the economy remained overwhelmingly agrarian. As in the North, the war caused massive dislocations. The government became increasingly dependent on U.S. aid, having lost much of its own revenue. The economy was also racked by inflation and smuggling, and was dominated by an enormous black market.

Much of Vietnam's farming still relies on human labor and manual tools. In 2000, two women irrigate their rice field with water transferred from a canal with a wooden paddle irrigator. (AFP/CORBIS)

Reunification of the Two Vietnams

Following reunification under North Vietnam in 1976, Hanoi decided to socialize the southern economy rapidly: private enterprise was abolished; land was collectivized; and wholesale, retail, and foreign trade were nationalized. The ethnic Chinese, who dominated the South Vietnamese commercial sector, were persecuted and fled en masse. Additionally, radical currency reform wiped out capital holdings. There was a postwar economic malaise following the loss of Chinese aid in 1978, the imposition of an international trade embargo after Vietnam's December 1978 invasion of Cambodia, and the huge domestic expenditures (amounting to one-third of Vietnam's budget) for the Cambodian occupation.

Although Vietnam joined the Soviet-led trade block, the Council for Mutual Economic Assistance (CMEA), in 1978 and received approximately \$1 billion in Soviet economic aid annually during the 1980s, much of the aid was wasted, and the country suffered huge trade deficits. The leadership believed that the collectivization of agriculture in the South would lead to net gains in output, but there were food shortages, as output could not keep pace with the postwar baby boom. In 1982 agriculture in the South was decollectivized, and Hanoi began to experiment with Chinese-style agricultural production contracts. In 1986 the country was wracked by triple-digit inflation and food shortages.

The sixth party congress of December 1986 adopted an economic reform program known as *doi moi*, or renovation. Agriculture was completely decollectivized, and fifteen-year contracts for individual production units were granted. As a result, Vietnam went from a net importer of rice to the world's third

largest exporter within two years, between 1986–1988. Vietnam also became the world's second largest producer of coffee robusta. Market forces were introduced and central planning was eliminated for all but essential commodities. Vietnam rejected a model of heavy industrialization in favor of sectors in which its economy had a comparative advantage: agricultural commodities (rice, coffee, rubber), natural resource (oil and natural gas) exploitation, and labor-intensive manufacturing. The labor market was freed up. Foreign investment was courted, and the government began to market the country as an offshore center for manufacturing. Currency reform eliminated the inflationary forces caused by an overvalued currency and the black market. Having withdrawn from Cambodia in 1989, Hanoi began to renew ties with the international community. Embargoes were eased, and bilateral and multilateral lending and development assistance resumed. This was essential, because Hanoi lost all Soviet aid and subsidies by 1991.

The Vietnamese economy slowed down by the mid-1990s, hampered by its half-capitalist, half-socialist system. Vietnamese authorities slowed implementation of the structural reforms needed to revitalize the economy and produce more competitive, export-driven industries. Although the government had embarked on reforming woefully inefficient state-owned enterprises (SOEs) and had pledged to shut some down, eliminate subsidies, and equitize other SOEs, it failed to implement a comprehensive solution. Although there are now only 5,300 SOEs, down from 12,000, they remain a terrible burden on the economy. Privatization of state enterprises remains bogged down in political controversy, while the country's dynamic private sector is denied both financing and access to markets. There is concern over high rates of unemployment. Complicating SOE reforms is a banking crisis, brought on by triangular debts and nonperforming loans. In addition, the revenue base remains small and tax collection sporadic.

The Asian Economic Crisis that began in August 1997 was a serious blow to the Vietnamese economy. Some 60 percent of Vietnam's exports went to Asian states, but with the sharp decline in the currencies of neighboring countries, Vietnam faced greater competition from its neighbors. Its gross domestic product (GDP), which grew by 8.5 percent in 1997, fell to 4 percent in 1998 and rose slightly to an estimated 4.8 percent in 1999.

Refusal to liberalize trade has led to smuggling and huge trade deficits. In October 2000 Vietnam signed a bilateral trade agreement with the United States that greatly liberalizes the Vietnamese trade regime, ends

state subsidies, and paves the way for Hanoi's entry into the World Trade Organization.

The initial reforms that decollectivized agriculture greatly improved the standard of living in the countryside; beginning in the late 1990s, however, there was widespread unrest as a result of corruption, inequitable distribution of land, and the many new taxes and fees. Despite the early gains of the reform program that saw a rise in agricultural production and incomes, these gains have leveled off, and the country is now confronted with a rapidly rising urban-rural income gap. As a result, there is both increased tension as well as a rapid rise in urban migration. Although the economy grew at an average 6.7 percent annually in the 1990s, Vietnam remains one of the least developed countries in the world.

VIETNAM-EDUCATION SYSTEM Since Vietnam was occupied by China between 111 BCE and 939 CE, the Vietnamese education system was initially developed resembling the Chinese hierarchic Confucian examination system. This system mainly served for the recruitment of loyal civil servants, who were trained according to Confucian morals and ethics. The main educational content of the system was taken from the Chinese Five Classics (*Yi jing*, or Classic of Changes; *Shu jing*, or Classic of History; *Li ji*, or Book of Rites; *Shi jing*, or Classic of Poetry; and *Chunqiu*, or Spring and Autumn Annals), and the Confucian Four Books (*Da xue*, or Great Teaching; *Zhong yong*, or Doctrine of the Mean; the Analects, and *Mengzi*, or Mencius.) However, Mahayana Buddhism also had some important influence on the system.

Because the Vietnamese language originally lacked its own script, the civil-service examination system used Chinese characters as a teaching and learning medium. During the thirteenth century, Vietnamese scholars developed the first national script system (*nom*), which, while based on Chinese characters, was

built around the Vietnamese pronunciation of words. However, this script did not spread among the common population, because it demanded extensive knowledge of written Chinese. In the sixteenth century, Christian Portuguese and French missionaries arrived in Vietnam and later developed the currently used *quoc ngu* script, which uses Latin alphabet with diacritical signs. During colonial occupation, the French proclaimed Vietnamese, written in *quoc ngu*, and French the two official languages.

Education in the Colonial Period

After several changes, the colonial education system eventually comprised three years of elementary school (*certificat d'études élémentaire indigène*), three years of primary school (*certificat d'études primaires franco-indigène*), four years of complementary primary school (*diplôme d'études primaires supérieurs franco-indigène*), and three years of secondary school (*baccalauréat local*). Serving the extensive needs of the colonial government for low-paid civil servants, the colonial education system focused on practical training and on the acquisition of the French language. In addition, although the final official Confucian examinations were held in 1918, during most of the colonial period traditional Confucian instruction continued to exist, as did Buddhist education, provided for future monks.

Education in the Two Vietnams

During the separation of the country between 1954 and 1975, two different education systems developed. In the North, President Ho Chi Minh (1890–1969) launched large literacy campaigns that were highly successful. Educational reforms were aimed at establishing a socialist education system, modeled on the Soviet model. The school system was composed of nine (later ten) years of schooling in total (4-3-2, later 4-3-3). Various vocational secondary schools and training centers developed that provided personnel for lower-level careers in the state sector. Higher education was provided by highly specialized, small-enrollment universities, polytechnical universities, and colleges. Postgraduate education was mainly conducted in the Soviet Union, East Germany, Poland, and Czechoslovakia. Education was organized by five- and one-year state plans and served the national demand for qualified labor. After graduation, students were directly transferred to diverse positions in the state sector.

In the South, a twelve-year system was promoted by the government. Vocational secondary schools, vocational training centers, and on-the-job training

opportunities were established to serve the labor market. Universities such as the universities of Saigon and Can Tho, as well as colleges, developed on the American model.

Education after Reunification

Vietnam was reunified in 1975, and the third education reform was initiated in 1979. Efforts were undertaken to unify the two different school systems and to establish a national education system according to the principles of free education for all, polytechnical education following the socialist model, and priority for socialist ideology and practical work in all teaching curricula. This brought about the closing of approximately 2,500 private educational establishments in the South. Higher-education students were selected according to their personal curriculum vitae and social origin, and student exchange programs were almost exclusively organized with countries from Eastern Europe and the Soviet Union. Foreign-language teaching focused on Russian and German.

Since the official promulgation of the *doi moi* ("renovation") reform policy program in 1986 the national education system has adapted to new circumstances. Today it is composed of the following components: public kindergarten establishments, which serve children from three months to four years, public preschools for children of at least five years of age, public primary schools for children between six and ten (five years' duration), public lower secondary schools for children between eleven and fourteen (four years' duration), vocational training centers at lower secondary level (under one year's duration), upper secondary schools for students between fifteen and seventeen, secondary vocational schools at the upper secondary level (three to four years' duration), secondary technical schools at upper secondary level (three to four years' duration), and vocational training centers at upper secondary level (one to two years' duration). In addition, different opportunities for on-the-job training courses are offered by the labor market. Higher education is composed of universities (three to six years' duration) and colleges (two to four years' duration). Written and oral examinations are held to transfer pupils from one level to the next, and final examinations after grade 12 are followed by entrance examinations to universities and colleges. Postgraduate education consists of master and doctoral programs.

When the Sixth Party Congress of the Vietnamese Communist Party liberalized the economy and proclaimed more market-oriented reform measures, one of the immediate consequences was a decline in education

at all levels. Income-raising opportunities forced people to decide between children's contribution to the family income or education. In addition, there were educational reform measures, which reflected the overall transition to a multisector economy. The reform measures can be grouped into five categories: the diversification of financial resources, efforts to internationalize the education system through reform of the structural organization of higher education, the withdrawal of the state-promoted plans for the decentralization of decision making in Vietnamese education, an overall increase in legal documents accompanying the transformation and culminating in the promulgation of the first national education law in 1999, and methods of encouraging the development of educational elites, which resulted in the reestablishment of schools and classes for especially gifted students.

These transformation processes were paralleled by trends among the general public. The trends include making extensive efforts and investment to gain additional instruction and preparation for their offspring to improve their chances for a future career (including sacrifices to allow their children to study overseas in other Southeast Asian nations, Australia, the United States, and Europe); educational stratification resulting from the overall differentiation of income structures, especially between urban and rural areas; reorientation of students in their choices of disciplines (preferences for English, Chinese, communication technology, computer sciences, law, economics, public administration, and so forth); a change in values and increased popularity of diplomas and certificates; and brain drain from higher education toward higher-paying jobs in the developing market economy.

VIETNAM-HISTORY The creation myth of the Vietnamese people places their founding in the northern sector of the Indochinese peninsula. Lac Long Quan (the Dragon) and Au Co (the Immortal) were said to have engendered the founders of the Vietnamese nation in the form of the eighteen Hung kings of the Hong Bang dynasty, which reigned over Van Lang (Vietnam) from 2879 to 258 BCE. The rule of this dynasty stretched from the end of the Neolithic period through the civilization of Dong Son, with its famously decorated bronze drums, down to the Iron Age.

In 258 BCE, the legendary King An Duong was able to overthrow the last Hung king because he used

weapons—mainly arrowheads—made of bronze and iron. The effectiveness of these weapons was said to have been increased a thousand times by a magic claw given to King An Duong by a local deity, the Golden Turtle, and his country, now renamed Au Lac, became impregnable.

Chinese Influence

According to legend, Qin Shi Huang Di (c.259–210 BCE), the emperor who unified China, sent one of his generals, Zhao Tuo, to invade Au Lac toward the end of the third century BCE. Zhao Tuo, however, remained powerless against the magic claw held by

KEY EVENTS IN VIETNAM'S HISTORY

- 2879-258 BCE** The Hong Bang dynasty rules Van Lang Vietnam.
- 258 BCE** Legendary King An Duong overthrows the last Hung king and establishes the state of Au Lac.
- 207 BCE** The Sino-Vietnamese kingdom of Nam Viet (in Chinese, Nan Yueh) is formed in the north.
- 111 BCE** Nan Viet is annexed by the Chinese Han dynasty.
- 939 CE** Vietnam regain its independence from China.
- 13th century** Parts of Vietnam come under Mongol control, although Mongol influence is limited.
- 15th century** China annexes Vietnam.
- 1427** Le Loi expels the Chinese and founds the Le dynasty, which presides over Vietnam at least in name until 1791.
- 1771** The leaders of Tay Son (southern Vietnam) initiate a popular uprising against the north and take control of the nation.
- 1861** The French seize Saigon and by 1883 occupy all of Vietnam.
- 1941** The Communist Party and other political organizations form the Viet Minh, a guerrilla force whose aim is to expel both the French and Japanese from Vietnam.
- 1945** The Viet Minh launches the August Revolution, seizes power throughout Vietnam, and founds the Democratic Republic of Vietnam.
- 1946-1954** The French Indochina War which ends with French withdrawal from the region.
- 1955** The Republic of Vietnam (South Vietnam) is created and Vietnam is drawn into the Cold War, with the Soviet Union supporting the north and the United States the south.
- 1960** Opponents of the Republic of Vietnam form the National Front of Liberation (NLF) of South Vietnam, whose aim is the overthrow the RVN government.
- c.1965-1973** The United States conducts the Vietnam War which ends with the withdrawal of U.S. troops.
- 1975** The Vietnam War ends in Vietnam when the south surrenders to the north and the nation is unified in 1976 as the Socialist Republic of Vietnam.
- 1986** The government adopts the *doi moi* (renovation) policy which establishes a market economy that welcomes foreign investments.

FRANCE TAKES CONTROL IN VIETNAM

The Treaty of Alliance and Peace of 15 March 1874 extracted below formalized French control of much of mainland Southeast Asia including Vietnam.

Article 2. His Excellency, the President of the French Republic, recognizing the sovereignty of the King of Annam and his complete independence in regard to any foreign power whatsoever, promises him aid and assistance and engages to give him, on request and freely, the support necessary to maintain order and tranquility in his States, to defend himself against all attacks, and to destroy the piracy which desolates a part of the coasts of the Kingdom.

Article 3. In acknowledgement of this protection, His Majesty the King of Annam engages to make his foreign policy conform to that of France and to change nothing in his present diplomatic relations.

This political engagement does not extend to commercial treaties. But in any case, His Majesty the King of Annam cannot make with any nation whatsoever a commercial treaty in disagreement with that concluded between France and the Kingdom of Annam, and without having informed the French government beforehand.

Article 5. His Majesty the King of Annam recognizes the full and complete sovereignty of France over all the territory currently occupied by France and including the following frontiers:

To the east, the China Sea and the Kingdom of Annam (Binh-Thuan Province);

To the west, the Gulf of Siam;

To the south, the China Sea;

To the north, the Kingdom of Cambodia and the Kingdom of Annam (Binh-Thuan Province) . . .

King An Dong until he married his son to one of King An Duong's daughters. The son-in-law quickly stole the device, and Zhao Tuo easily defeated King An Duong. Zhao Tuo then combined Au Lac with his own territory to form the kingdom of Nam Viet (in Chinese, Nan Yue) in 207 BCE. Subsequently, the rulers of the Han dynasty (206 BCE–220 CE) annexed Zhao's kingdom into the Chinese empire in 111 BCE. Vietnam was not to regain its independence until 939 CE.

Throughout the thousand years of Chinese rule, there were frequent independence struggles; some were successful for short periods, others resulted in ut-

ter failure. The decisive battles against China's colonial control began in the beginning of the tenth century; they were fought by Vietnamese local officials. The struggle culminated in 938 with the naval victory on the Bach Dang River scored by Ngo Quyen over the fleet of the Nan Han Kingdom of southern China, which was the then suzerain of Vietnam. In the following year, Ngo Quyen proclaimed himself king and thereby inaugurated the monarchical tradition for a newly established kingdom that was independent from China. From then on, Vietnamese leaders endeavored to differentiate themselves from the Chinese and to nurture a culture that, although deeply influenced by

China, was Vietnamese. They wanted the Chinese authorities to renounce their conviction that Vietnam was an integral part of China's national territory.

In the eleventh century, while fighting the invading armies of the Chinese Song dynasty (960–1267), which sought to reincorporate Vietnam into the Chinese empire, a Vietnamese general of the Ly dynasty (1010–1225) fired up the emotions of his troops by reciting to them a song that, while establishing a separate destiny for Vietnam, asked also the fateful question: "How dare those foreigners come to invade our country?" In the thirteenth century, Mongol armies came to occupy parts of Vietnam. A harmonious relationship between the Tran monarchy (1225–1400), the army, and the people allowed Vietnam to successfully repel repeated attacks by the invader. In the beginning of the fifteenth century, the Chinese, now under the Ming dynasty (1368–1644), once again annexed Vietnam. In 1427, after ten years of resistance, Le Loi (d.1443) expelled all Chinese occupiers to inaugurate the Le dynasty, which presided over the destinies of Vietnam, at least in name, until 1791.

Internal Factionalism

The decline of the Le began with the sixteenth century. The Trinh and Nguyen families gained increasing ascendancy over the Le emperor, who finally became a mere puppet. The two factions soon confronted each other; weaker, the Nguyen petitioned the emperor in 1558 to be sent to govern the southern part of Vietnam. In 1627, the Trinh-*Nguyen* rivalry broke out into open warfare, and after fifty years of indecisive battles, they resigned themselves to coexistence on opposite sides of the Gianh River, approximately at the seventeenth parallel.

From the village of Tay Son, southern Vietnam, three brothers, Nguyen Nhac, Nguyen Hue and Nguyen Lu, set in motion one of the mightiest popular uprisings, starting around 1771. After overpowering the ruling *Nguyen* family faction, they turned their weapons against the *Trinh*. The Le emperor fled to China, and, on the pretext of reinstating him on his throne, the emperor of the Qing dynasty (1644–1912) ordered the invasion of Vietnam. In 1789, the Tay Son army took Hanoi by surprise and routed the Chinese expeditionary corps, which it found still blithely indulging in the New Year festivities. The Tay Son reign was not to be a long dynasty, however. The sole survivor of the former *Nguyen* lords of the south regained rapid control of Vietnam, and in 1802 he founded the last dynasty and transferred his capital to Hue.

European Colonialism

The *Nguyen* came to power at a time when European colonialism was experiencing a revival of interest in Asia. In 1861, the French seized Saigon. In 1882, they took Hanoi, and from there they spread out to occupy all of Vietnam a year later.

As with the Chinese period, the French colonial times were fraught with uprisings and rebellions. The pre-1930 anti-French struggles all ended in failures. Finally, the Vietnam Nationalist Party (*Viet Nam Quoc Dan Dang*, commonly referred to as the *VNQDD*), organized along the same principles as Sun Yat Sen's Nationalist Party in China and composed mainly of the new western-educated middle class, and the *Dong Duong Cong San Dang*, or Indochinese Communist Party (ICP), which counted among its members a great number of peasants and workers, discovered that they had to organize far more thoroughly before they could hope to threaten the colonial master.

During World War II, the colonial administration in Indochina managed to keep its authority while accommodating a small contingent of Japanese occupation troops in Indochina for five years. In the meantime, in 1941 the ICP led various national organizations in the formation in southern China of the *Viet Minh*, a guerrilla force whose aim was to expel both the French and Japanese from Vietnam. Two days after the Japanese surrender on 15 August 1945, the *Viet Minh* launched the August Revolution, which allowed it, less than a fortnight later, to seize power throughout Vietnam. On 2 September 1945 in Hanoi, Ho Chi Minh (1890–1969), the leader of the ICP and of the *Viet Minh*, proclaimed the independence of his country and the founding of the Democratic Republic of Vietnam (DRV)

The government set up by the *Viet Minh* was not to enjoy independence for long. The French were determined to reconquer their Indochinese colonial empire, and war broke out in December 1946, to end only in 1954 with the signing of the Geneva Accords that divided Vietnam into two temporary zones.

In violation of the Geneva Accords, elections were not held in 1956 for the reunification of the two zones, which had meanwhile become embroiled in the global Cold War between the Soviet Union, which supported the DRV, and the anti-Communist bloc led by the United States, which buttressed the Republic of Vietnam (RVN) it helped to create in 1955. The RVN quickly spawned a totalitarian, corrupt government. In December 1960, opponents of the RVN gathered together to form, with the active cooperation of the

VIETNAM HISTORY

In August 1945 the Viet Minh launched the August Revolution to free Vietnam from French and Japanese rule. That September, Ho Chi Minh declared Vietnam's independence in a formal Declaration of Independence, extracts of which are provided below.

For more than eighty years the French imperialists, abusing their "liberty, equality, and fraternity," have violated the land of our ancestors and oppressed our countrymen. Their acts are contrary to the ideals of humanity and justice.

In the political domain, they have deprived us of all our liberties. . . .

In the economic domain, they have exploited us without respite, reduced our people to the blackest misery and pitilessly looted our country. . . .

In the autumn of 1940 when the Japanese Fascists, with a view to fighting the Allies, invaded Indochina to organize new war bases, the French imperialists, on their knees, surrendered our country. . . .

For these reasons we, members of the Provisional Government, representing the entire population of Viet Nam, declare that we shall henceforth have no relations with imperialist France, that we cancel all treaties which France has signed on the subject of Viet Nam, that we abolish all the privileges which the French have arrogated to themselves in our territory. . . .

Viet Nam has the right to be free and independent and is, in fact, free and independent. All the people of Viet Nam are determined to mobilize all their spiritual and material strength, to sacrifice their lives and property, to safeguard their right to liberty and independence.

Hanoi

Signed: Ho Chi Minh, President

DRV, the National Front of Liberation (NLF) of South Vietnam, whose aim was to overthrow the RVN government. The NLF soon launched armed attacks against the government, and the movement grew rapidly to present a formidable challenge. After the failure of massive economic, technical, and military aid, the United States came to the aid of the RVN with more than half a million of its own troops. The United States thereby made itself a party in what, in the view of many, had been essentially a civil war and, by the same token, gave the people who fought against

the RVN an age-old incentive, that of a struggle against foreign intervention.

Unification

The war ended in 1973 for the United States when it signed a treaty with the DRV committing itself to withdraw its troops from Vietnam. For Vietnam, the war ended only in 1975 when troops of the NLF and the DRV entered Saigon to receive the RVN's surrender from the hands of its last president. In 1976,

the National Assembly, composed of newly elected representatives, voted to unify the country, now called the Socialist Republic of Vietnam and placed under the firm control of the Communist Party of Vietnam.

The building of socialism did not succeed because the economic situation went from bad to worse, until the government decided, in 1986, to apply the policy of *doi moi* (renovation). *Doi moi* did away with the planned and supposedly self-sufficient economy in which all enterprises had been under the control of the state and established in its place a market economy that welcomed foreign investments and allowed the formation of private enterprises, with the aim of eradicating poverty and backwardness. Many problems still beset the development of the country, and today, after more than sixteen years under the renovation regime, Vietnam remains one of the poorest countries in the world.

VIETNAM—INTERNAL MIGRATION

The emperors of Vietnam's Nguyen dynasty (1802–1955) used resettlement policies to secure both population and territory. The French colonial authorities, whose presence in Vietnam lasted from 1859 to 1954, tried and failed to do so. After independence (1954), the government of the Democratic Republic of Vietnam (DRV) established a migration program, extending it to the south after the country's reunification (1975). Over four decades, 5 million inhabitants of the plains were relocated into highland and border areas. One million people moved from the cities of the south after 1975. The program has transformed the highlands and influenced the pace of urban development.

Internal Migration under the Nguyen Dynasty

The emperors of the Nguyen dynasty realized ambitious resettlement policies. Prisoners and vagabonds were exiled to the south and to Cambodia, where they joined soldiers and migrant farmers on military farms, clearing land, founding villages, and guarding the frontier. These policies predated the Nguyen rulers by many centuries: the Ly (1010–1225), Tran (1225–

1400/1414) and Le (1428–1788) emperors consolidated their conquests of Champa and Cambodia by promoting migration. The present shape of Vietnam, formed from one thousand years of southward expansion, owes much to these policies.

Internal Migration under the French

The expansion of settlement continued under the French colonial administration after 1859. Construction of canals attracted spontaneous settlers to the western Mekong Delta. Programs of organized migration provided labor for economic development. Laborers moved to build railways in the north and work plantations in the south and Cambodia. Land grants were made to settlers in the northern hills. Yet owing to competing objectives in the colonial administration, few of these initiatives enjoyed sustained success, and the independence war (1946–1954) ended them. The Geneva Agreement (1954) divided the country in two, confronting Vietnamese with the choice between residence in the north, under Communist rule, or the south, which became the Republic of Vietnam (RVN). This agreement created the largest internal migration in Vietnam's history. One million people opted to go south, and about 140,000 moved north.

There was little policy continuity between colonial and postcolonial administrations. After independence, the RVN's resettlement policy was led by the imperatives of nationalism and war, while the DRV's program was modeled on Soviet experiences of collective farming and drew from the lessons of the precolonial past.

Under the DRV, resettlement was organized in two directions. Lowlanders headed to the hills, to develop sparsely populated regions. Urban folk headed to the countryside, in implementation of the socialist model of limited urban development. Planned economic development was one purpose of the program. With the country divided, national security also became an important objective of resettlement policy. The highlands were filled with "loyal" lowlanders, while potentially turbulent cities were restricted in their growth. Both policies were extended after U.S. bombing started (1965), as the population's security depended on dispersal. The policies persisted after reunification, as the borders were attacked from Cambodia and China, and internal security was threatened by ethnic insurgency in the Central Highlands and dissatisfaction in southern cities.

Development of the Settlement Model

The settlement model evolved gradually. From 1954, plantations became state farms. These large-scale

collective enterprises were used widely in agriculture and forestry, sometimes run by the army in a model reminiscent of precolonial military farms. From 1960, lowland villagers established cooperatives in the hills. From 1968, ethnic-minority highlanders were persuaded to abandon slash-and-burn farming, which required large areas of land for extensive cultivation. The policy, known as sedentarization (*dinh canh dinh cu*), aimed to bring the minorities under closer state control while making space for the newcomers. In the 1970s, district towns became a focus for local government and economic activity. Areas in which this four-prong model were used came to be known as New Economic Zones (NEZs). An NEZ consisted of migrant cooperatives, settled minority villages, and a district town, under the leadership of a state farm or forestry enterprise. The NEZ model transformed the Central Highlands after reunification, replacing the land development and strategic hamlet policies initiated in the 1950s by the RVN and disrupted by the war.

The migrants formed two communities, by their origin and the method of their recruitment. On the one hand, mobilization teams motivated village migrants with talk of patriotism and economic progress. On the other, inhabitants of the southern cities were required, under post-reunification policy, to return to their villages or move to NEZs, with very little choice in the matter. Recruitment in both contexts was enforced by a system of household registration, whereby essential goods and services were available only in a registered place of residence. Cutting registration created an incentive for departure, but could not ensure settlement on arrival. More than 50 percent of migrants abandoned their NEZ, moving back to the village or city from which they had come, drifting elsewhere, or joining the boat people exodus of the 1980s.

Internal Migration in the Reform Era

Economic reform in the 1980s changed the dynamics of migration. The resettlement program remained, but people's economic survival no longer depended on their household registration. Free migrants headed to the cities (in search of work) and the highlands (in search of land). While registration requirements in the cities limited urban growth, there were no restrictions in the hills. Settlers planted coffee and other commercial crops, which now found markets within Vietnam and abroad. By creating networks between previous migrants and inhabitants of the plains, the resettlement program facilitated a new, uncontrolled movement of spontaneous migration, especially to the Central Highlands, where people could

take advantage of market reforms to grow and sell coffee and other cash crops.

Results of Internal Migration

Population resettlement has changed both the cities and the highlands. Vietnam's urban population remains low, and neither Hanoi nor Ho Chi Minh City may be compared with the metropolis cities of Bangkok, Manila, or Jakarta. Meanwhile, the highland population has grown rapidly. Networks of roads and towns now service a population of migrants from the plains. Forests have given way to farms. In the northern highlands, environmental stress caused by population pressure (itself caused by previous decades' resettlement programs) has provoked migration to the Central Highlands, which will experience environmental difficulties in the years to come. And the highlanders, now minorities in their own provinces, have responded by joining the national economy, retreating to remote regions, converting to Protestantism, or organizing peaceful protests against the loss of their land. All four reactions are the signs of the migration program's achievement of its long-term objectives. Intended to transform these forested havens of insurgency and underdevelopment, resettlement has brought about widespread economic, social, and landscape change in the highlands. As a result, and in spite of the strains, these outlying regions are now integrating into the Vietnamese nation.

VIETNAM—POLITICAL SYSTEM In order to put Vietnam's current political system in perspective, it is helpful to consider briefly the political systems that were in use prior to Vietnam's reunification in 1975. The political system of the Republic of Vietnam (South Vietnam, 1955–1975) was quite different from that of the Democratic Republic of Vietnam (North Vietnam, 1945–1975).

Republic of Vietnam (1955–1975)

After French colonial forces were defeated in the First Indochina War (1946–1954), Vietnam was partitioned along the seventeenth parallel, the north under the control of Ho Chi Minh (1890–1969) and the Communists, the south under the U.S.-supported Ngo Dinh Diem, an intellectual Christian who was appointed president of South Vietnam in October 1955. He was considered a nationalist intent on eradicating the Communists in the North. Diem won initial respect from the public and the United States by subduing the South's various military factions and religious sects that were threatening to overthrow the government. His 1959 land reform policy was seen as inequitable, however, and he soon lost his popularity.

Furthermore, Diem's government was characterized by nepotism. His eldest brother, Ngo Dinh Thuc, was a Roman Catholic bishop, and as such wielded considerable power. Another brother, Ngo Dinh Nhu, became Diem's special adviser. The youngest brother, Ngo Dinh Can, exercised political control in central Vietnam. Moreover, Nhu's wife, Le Xuan, was also involved in political and social activities. As Diem and his family used military power to suppress political and religious protests, the United States began losing interest in supporting him.

On 1 November 1963, Diem and Nhu were killed in a conspiracy led by General Duong Van Minh.

Minh was not capable of maintaining his paramount position for long, however, and was succeeded by Nguyen Khanh in January 1964. The military regime that General Minh set up was more compliant with U.S. interests, but faced protest from religious groups, interest groups, and political activists, and Minh lost control over South Vietnam in less than a year. General Nguyen Cao Ky and his comrade General Nguyen Van Thieu seized power in February 1965, and maintained military rule over the South until 1975.

Democratic Republic of Vietnam (1945)

The political situation in the North was equally chaotic. On 25 August 1945, Bao Dai (1913–1997), the last Emperor of Vietnam, reluctantly handed over the

The mausoleum of Vietnamese leader Ho Chi Minh in Hanoi. His body is preserved in a glass sarcophagus inside. (STEVE RAYMER/CORBIS)

imperial seal and symbolic golden sword to the National Liberation Committee headed by the Communists. On 2 September 1945, Ho Chi Minh declared Vietnam's independence and announced the birth of the Democratic Republic of Vietnam. Not many countries recognized it, however, and Ho failed to gain support from the United States and other Western countries. He was forced to fight the French, who wanted to reassert their colonial authority. Although he defeated them at the battle of Dien Bien Phu (1954), he failed to gain control of the South.

Socialist Republic of Vietnam (from 1975)

On 30 April 1975, North Vietnamese forces took control of Saigon. With reunification, the South came under the rule of the central government. Since then, Vietnam's politics have been dominated by the Vietnamese Communist Party (VCP), whose ideology closely follows Marxist-Leninist doctrines and Ho Chi Minh's thoughts.

PREAMBLE TO THE CONSTITUTION OF VIETNAM

Adopted 2 July 1976 (revised 1992)

In the course of their millennia-old history, the Vietnamese people, working diligently, creatively, and fighting courageously to build their country and defend it, have forged a tradition of unity, humanity, uprightness, perseverance and indomitableness for their nation and have created Vietnamese civilisation and culture.

Starting in 1930, under the leadership of the Communist Party of Vietnam formed and trained by President Ho Chi Minh, they waged a protracted revolutionary struggle full of hardships and sacrifices, resulting in the triumph of the August Revolution. On 2 September 1945, President Ho Chi Minh read the Declaration of Independence and the Democratic Republic of Vietnam came into existence. In the following decades, the people of all nationalities in our country conducted an uninterrupted struggle with the precious assistance of friends throughout the world, especially the socialist countries and the neighbouring countries, achieved resounding exploits, the most outstanding ones being the historic Dien Bien Phu and Ho Chi Minh campaigns, defeated the two wars of aggression by the colonialists and the imperialists, liberated the country, reunified the motherland, and brought to completion the people's national democratic revolution. On 2 July 1976, the National Assembly of reunified Vietnam decided to change the country's name to the Socialist Republic of Vietnam; the country entered a period of transition to socialism, strove for national construction, and unyieldingly defended its frontiers while fulfilling its internationalist duty.

In successive periods of resistance war and national construction, our country adopted the 1946, 1959, and 1980 Constitutions.

Starting in 1986, a comprehensive national renewal advocated by the 6th Congress of the Communist Party of Vietnam has achieved very important initial results. The National Assembly has decided to revise the 1980 Constitution in response to the requirements of the new situation and tasks.

This Constitution establishes our political regime economic system, social and cultural institutions; it deals with our national defence and security, the fundamental rights and duties of the citizen, the structure and principles regarding the organisation and activity of State organs; it institutionalises the relationship between the Party as leader, the people as master, and the State as administrator.

In the light of Marxism-Leninism and Ho Chi Minh's thought, carrying into effect the Programme of national construction in the period of transition to socialism, the Vietnamese people vow to unite millions as one, uphold the spirit of self-reliance in building the country, carry out a foreign policy of independence, sovereignty, peace, friendship and cooperation with all nations, strictly abide by the Constitution, and win ever greater successes in their effort to renovate, build and defend their motherland.

Source: Government of Vietnam. Retrieved 8 March 2002, from: <http://home.vnn.vn/english/government/constitution/preamble.html>

The new Constitution of Vietnam was issued on 15 April 1992. All people eighteen years of age or older have the right to vote, with the exception of criminals. Elections are held every five years at national, provincial, and local levels. Vietnam's government has three branches: legislative, executive, and judiciary. The Communist Party is effectively a "fourth branch," involved in all activities of the government.

Legislative Branch The unicameral National Assembly consists of 450 delegates elected in the general

election. It is the highest organ of the state and possesses both constitutional and legislative powers. It makes all decisions on domestic and foreign policies, sets socioeconomic goals, and deals with national defense and security issues.

Previously, only members of the Communist Party were qualified to stand for the election. However, since 1997 independent candidates have been eligible. In the latest election, in 1997, about 92 percent of the seats in the parliament were occupied by Communist

TABLE 1

The Cabinet in 1997	
Position	Name
Prime Minister	Phan Van Khai
First Deputy Prime Minister	Nguyen Tan Dung
Deputy Prime Minister	Nguyen Cong Tan
Deputy Prime Minister	Ngo Xuan Loc
Deputy Prime Minister	Nguyen Manh Cam
Deputy Prime Minister	Pham Gia Khiem
Other Ministers	(24 others)

Party members, with independent candidates holding the rest.

The National Assembly's Standing Committee is permanent and consists of the chairman (in 1999, Nong Duc Manh), the vice chairman, and members who are determined by the National Assembly. A member of the Standing Committee cannot occupy another position in the government.

The president of the National Assembly is elected by its members and serves a five-year term. As head of state, the president represents Vietnam both at home and in foreign countries. Tran Duc Luong was elected president on 25 September 1997. From 1992, the vice president has been Nguyen Thi Binh.

Executive Branch Vietnam has a parliamentary system in which a prime minister heads the cabinet. In actual fact, however, the general secretary of the Communist Party holds greater power, due to the nature of one-party government.

The president appoints the prime minister from among the members of the National Assembly. The prime minister then appoints the deputy prime ministers and other ministers.

Judicial Branch The legal system is based on the French civil law and consists of the Supreme People's Court, the Provincial Courts and the District People's Courts. The chief justice is nominated by the president and voted on by the National Assembly. Trinh Hong Duong has been the presiding judge since 1997. His term is for five years.

In addition, there is the Supreme People's Procuracy, which supervises and controls law enforcement at all levels of society, from the central government down to the individual citizen.

The one-party political system has been stable for a long time, though some fragmentation exists. With economic reform and Vietnam's integration into re-

gional and international organizations such as the Association of Southeast Asian Nations (ASEAN) and the Asia-Pacific Economic Cooperation Forum (APEC), the political system is expected to become more open, transparent, and accountable.

VIETNAM COMMUNIST PARTY The origins of the Vietnam Communist Party (VCP) date back to 1925 when Comintern official and Vietnamese nationalist leader Ho Chi Minh (1890-1969) founded the Revolutionary Youth League in southern China. Hobbled by factionalism, the group was defunct by May 1929. After uniting feuding Communist groups operating in southern China, Ho founded the Indochina Communist Party (ICP) in 1930. The group operated clandestinely, because French colonial authorities imprisoned many of its leaders. The ICP grew, however, into the preeminent anticolonial force in Indochina.

To widen the party's appeal, Ho created a broad nationalist united front, known as the Viet Minh, under the ICP's leadership in 1941. Viet Minh troops

waged a guerrilla war against the Japanese and Vichy French troops. Following Japan's surrender, Ho's Viet Minh marched into Hanoi and declared the founding of the Democratic Republic of Vietnam (DRV) on 2 September 1945. To assuage fears that Communist forces would not dominate the new coalition government, Ho dissolved the ICP. With the return of French colonial forces and the breakdown of a series of negotiations in 1946, the Viet Minh began a guerrilla war, culminating in the 1954 defeat of French forces at Dien Bien Phu. Materially aided by the People's Republic of China after April 1950, the Viet Minh leadership was encouraged to restore the Communist Party. In February 1951, the Lao Dong Party (LDP) was founded.

Under Chinese, Soviet, and French pressure, the DRV accepted the temporary division of Vietnam at the 17th parallel as part of the Geneva Accords and anticipated winning nationwide elections in 1956–1957. The LDP was the sole political force in the north and began to implement a Communist political and economic system. The LDP's land reform program, implemented in two phases between 1954 and 1960, was particularly brutal and had a negative effect on production. At the advice of Chinese advisers, "people's courts" were established and "class labels" were applied to all members of society to aid identification and liquidation of the landlord class. Wide-scale violence and peasant unrest led the LDP to sack its general secretary and revise its policies. The LDP also imposed a strict system of control over its writers and artists, beginning in 1954.

In May 1959 the LDP Politburo authorized support for southern revolutionaries to defeat the regime of Ngo Dinh Diem (1901–1963). In 1963, the LDP ordered the infiltration of North Vietnamese troops into the south of the country. The LDP continued its policy to take over the south following Ho's death in 1969 and eventually negotiated peace with the United States in 1973. In 1974, the Politburo again ordered the use of force to take over the south. Formal reunification occurred in October 1976, at which point the LDP changed its name to the Vietnam Communist Party.

From 1976 to 1986, the VCP consolidated its rule but led the country into an economic malaise and diplomatic isolation, following the December 1978 intervention into Cambodia. In 1986 the party embarked on a radical course of economic reform, known as *doi moi*, or renovation, that had a positive impact on the economy. The decollectivization of agriculture caused Vietnam to go from being a net importer of rice to the world's third largest exporter of rice by 1988. Likewise, per capita GDP doubled in the first fifteen years

of the reform program. The VCP remains the sole legal party in Vietnam today. It is ruled by an 18-person Politburo and a 170-member central committee.

VIETNAM WAR From 1954 to 1975, America fought its longest and costliest war. The Vietnam War created massive disruption to Southeast Asia and massive turmoil in American society.

The Human Cost of War

The major product of war is the number of casualties: the killed, wounded, or missing in action (MIA). Although the numbers are tainted by exaggeration or error, the estimated total of military casualties from 1954 to 1975 was 1.75 million killed and at least 3 million wounded. By the end of the war, there were 10,173 captured and missing in action. Total civilian casualties for Vietnam, Laos, and Cambodia numbered well over 500,000. In addition, after the war thousands of Vietnamese died trying to flee Communist rule, and nearly 2 million Cambodians were killed by the Communist Khmer Rouge led by Pol Pot (c. 1925–1998).

American forces suffered 47,382 killed in action, 10,811 noncombatant deaths, 153,303 wounded in action (some 74,000 survived as amputees), and about 3,000 MIAs. (In April 1995 the U.S. Department of Defense listed 1,621 Americans missing in Vietnam and 2,207 for all of Southeast Asia.)

The greatest causes of deaths in the U.S. Army were small-arms fire (51 percent) and artillery shells, mor-

tar, and grenade fragments (35 percent). Twelve generals and eight women were killed in action. Seventy percent of all American enlisted casualties were twenty-one years of age or younger. African Americans and Hispanics suffered more casualties per enlistee than whites did.

Casualties for the Viet Minh (Communist irregulars) are undocumented. Allegedly, during the period of French control, 300,000 lost their lives in combat. The U.S. Central Intelligence Agency's (CIA) Phoenix program (1967–1972), which identified and eliminated the Viet Cong infrastructure in South Vietnam, claimed official responsibility for "neutralizing" 81,740 Communist cadres, of whom 26,369 were executed. General Vo Nguyen Giap (b. 1911), general and commander of the People's Army of Vietnam (PAVN) from 1946 to 1972, estimated that 500,000 soldiers died in battles with Americans during the years from 1964 to 1969. The combined forces of the army of North Vietnam (the NVA) and the Viet Minh of South Vietnam in the Easter Offensive of March 1972 lost over 100,000 lives. The Americans estimated that 50,000 of these soldiers were killed by saturation bombing. Moreover, tens of thousands of Laos's Pathet Lao Communists and Cambodia's Khmer Rouge were killed in the secret bombings that began in 1969 and intensified in the joint South Vietnamese-American incursions into their territories in the early 1970s.

Background to the War

French colonization of Indochina—consisting of Vietnam, Cambodia, and Laos—began in 1859 with the capture of the city of Saigon, although the first French campaign (at Tourane/Danang) began in 1858. The termination of World War II introduced a worldwide period of anticolonial movements and wars. During the final months of the Pacific war, Japan occupied Indochina and turned it into a protectorate, ousting the French, who had still ruled it throughout most of the war. Upon Japan's surrender in August 1945, Indochina's independence became a geopolitical problem. On 25 September, Ho Chi Minh (1890–1969), a leader of the Indochinese independence movement, proclaimed the creation of the Democratic Republic of Vietnam (DRV). The United States and its allies agreed to send British troops to disarm the Japanese and obtain control of southern Vietnam and to send Chinese and French troops to administer postwar programs in the city of Hanoi. Soon the French were allowed to negotiate full control of Vietnam. In March 1946, the French declared Vietnam an independent state within the French union. In November 1946, with the French naval bombardment of

the seaport of Haiphong, the French challenged the authority of the DRV under the vague framework of the March agreement. This engagement launched the First Indochina War (1946–1954).

Ho Chi Minh and his Viet Minh troops retreated from Hanoi and launched a guerrilla war. Finally, in 1950, the anticolonial movement became integrated into the Cold War: The Soviet Union and the People's Republic of China recognized Ho Chi Minh, and the United States and Britain recognized the French-sustained state of Vietnam. The United States reluctantly provided military and economic aid for the French pacification effort. President Eisenhower endorsed the Domino Theory, which predicted that the fall of one nation to Communism would result in the fall of other nations. The French made it clear that their support and participation in the North Atlantic Treaty Organization depended on Washington's support of France in Indochina. Consequently, France received 85 percent of its Indochinese budget from the United States.

In May 1954, the Vietnamese Communist forces decisively defeated the French at the Battle of Dien Bien Phu. To resolve the issue of control over Indochina, an international conference met in Geneva in the summer of 1954. After much disagreement about the issues of French withdrawal and who was the rightful representative of the government of South Vietnam, Russia, China, France, and Hanoi signed the Geneva Agreements, which partitioned Vietnam at the seventeenth parallel pending a national referendum within two years. The agreements' legitimacy was challenged when the South Vietnamese and American representatives refused to sign.

The Communist Revolution and the Pursuit of National Independence

The leaders of the Communist revolution in Vietnam were Ho Chi Minh, Vo Nguyen Giap, and Truong Chinh (1907–1988). They developed Hanoi's unique method of fighting the wars against the French and the Americans. "Uncle" Ho combined a fervid loyalty to Vietnam's independence and nationalism with a Marxist-Leninist commitment to class struggle, land reform, social revolution, and socialist economics. Depending on the political context, he could charismatically organize policies of allegiance to seemingly contradictory goals. Some scholars argue that his power and ideology were solidified with his 1941 announcement of the formation of a united front called the League for the Independence of Vietnam (Viet Minh). This front tried to unite the moderate elements of all social classes to

promote land reform and anti-imperialism—against both the French and the Japanese.

The Viet Minh organization was the predecessor of the National Liberation Front for the Liberation of South Vietnam (NLF). This term designates groups in South Vietnam who were disaffected by the rule of President Ngo Dinh Diem (1901–1963). Diem became prime minister of southern Vietnam in 1954 and, with the help of the U.S. government, established the independent state of South Vietnam and declared himself president. Diem's power base relied on Catholic refugees from northern Vietnam, wealthy and powerful landlords and merchants, and foreigners. His aloofness and familial authoritarianism estranged him from the nationalists, peasants, and Buddhists. The National Liberation Front had organized professionals such as lawyers and physicians, as well as peasants, urban workers, and Buddhists to resist Diem's rule. Mass demonstrations in the summer of 1963 fueled a coup against him. He fled from the Presidential Palace but was caught and murdered by his South Vietnamese bodyguard on 2 November 1963.

The NLF also organized a military arm, the People's Liberation Armed Forces (technically the PLAF but commonly called the Viet Cong). During the late 1950s and early 1960s, Ho Chi Minh became identified with the classical military approach to the war—conventional forces, armed confrontations, and great patriotic sacrifices. His conventional approach resulted in horrendous carnage and loss of life. After the war, many survivors suffered psychologically from this approach.

Vo Nguyen Giap, general and commander of the war, promoted the ideology of "people's war" advocated by China's Mao Zedong (1893–1976). Tactically, this ideology viewed the revolutionary war in terms of mobilization and coordination of the nation's military, psychological, diplomatic, and economic resources. The war was not to be limited to the battlefield. Giap's greatest success was the 1968 Tet Offensive. Although the offensive was a military disaster for the Communists, its psychological impact convinced the United States that the war could not be won.

Truong Chinh ranked second only to Ho Chi Minh in the political structure. An adherent of Mao's harsh revolutionary programs, he advocated vigorous policies of class struggle that ultimately led to a disastrous land reform campaign. He remained a true believer in the guerrilla strategy of people's war, even when a more conventional approach was more suitable.

The conflicting approaches of the leadership led to many bitter arguments, but by focusing primarily on the war itself and making use of multiple strategies,

they strengthened their chances of victory despite their contradictory policies. The emphasis on people's war was a costly but effective way to mobilize the Vietnamese military and civilians against the Saigon government. Neither conventional nor guerrilla warfare alone could force the United States to succumb militarily, however. After the United States withdrew its military support in 1973, Hanoi's tactics changed from a guerrilla war that stressed mobilization to a conventional war of massive troop movements that stressed destroying South Vietnam's military and seizing the government in Saigon.

U.S. "Soft" Intervention: 1954–1964

President Eisenhower manifested his support for Saigon's anti-Communist Ngo Dinh Diem by publicly praising him and providing military and economic assistance. In September 1954, Eisenhower's secretary of state, John Foster Dulles, completed the establishment of the Southeast Asia Treaty Organization (SEATO), whose major function was to support Saigon. In October, the French military left Vietnam, and the United States took over the job of creating a strong southern government. In 1955, Diem rejected the Geneva Agreements, refused to call nationwide elections, and declared the establishment of the sovereign Republic of Vietnam.

Washington established economic support and sent military advisers to help Diem's forces train and modernize. Economic aid was so immense that Diem, no longer dependent solely on tax collection for his finances, did not need to appeal to the populace and therefore did not engage in meaningful land reforms or industrial development. His *agrovillage* (a strategic hamlet) campaign of 1959 forcibly relocated entire rural villages into fortified settlements, depleted the rural economy and destroyed the cohesiveness of peasant families and villages. The result was the beginning of vast migration to cities, where peasants increased the rolls of the unemployed.

From 1960 to 1963, Diem's rule became more dictatorial and repressive. His National Assembly Law allowed police to arrest and execute (by a portable guillotine) suspected Communists or anti-French nationalists. Intellectuals and professional groups petitioned Diem to step down or democratize his rule. An unsuccessful coup in 1960 made Diem even more repressive. At the beginning of 1963, the poor performance of the South Vietnamese army against the local Communist guerrillas at the Battle of Ap Bac revealed the incompetence and low morale of the South Vietnamese fighting forces and the need to change course. Soon after this battle, Buddhist demonstrations grew

in number and vehemence, forcing Diem to use military force to squelch them. In June, the first of seven Buddhist monks committed self-immolation to protest Diem's policies. The most vivid expression of the public's hostility to Diem's rule occurred after the protest suicide of Nguyen Tuong Tam on 7 July. Tam, born in 1906, was one of the greatest modern writers in Vietnam and an anti-Communist, nationalistic advocate of a greater Vietnam. His funeral was accompanied by the largest demonstration ever held in Saigon. Within weeks, Vietnamese military leaders plotted to end Diem's rule with the tacit approval of the U.S. government. On 2 November 1963, just weeks before John F. Kennedy's assassination, Diem and his brother Ngo Dinh Nhu were shot to death while trying to escape from Saigon.

The year 1964 was the turning point for America's commitment in Vietnam. In June, General William C. Westmoreland replaced General Paul D. Harkins (1904–1984) as commander of American armed forces in Indochina. In August, President Lyndon Johnson informed Congress that North Vietnamese patrol boats had attacked American ships in the international waters of the Gulf of Tonkin. Decades later, the reports of these incidents were revealed as having been questionable at best and shams at worst. Nevertheless, Congress was convinced that the president should be given full authority to challenge North Vietnam and to support South Vietnam by any means. The Gulf of Tonkin Resolution (August 1964) legitimized America's decision to engage in military activities in Indochina. The resolution served as an unofficial declaration of war. The U.S. Air Force began raids on North Vietnam's facilities, and U.S. ground troops pursued Viet Cong attacking U.S. bases.

Search and Destroy: 1965–1968

President Johnson's war quickly ratcheted the level of violence but without sufficient Vietnamese support and interaction. Relying on the managerial expertise of Secretary of Defense Robert McNamara, the narrow military mind of General William Westmoreland, and the diplomatic arrogance of Ambassadors Henry Cabot Lodge and Ellsworth Bunker, Johnson disallowed any serious criticism of his policies. Westmoreland's strategy was to destroy the enemy, its logistical support in production and transportation areas, and its reliance on agricultural supplies and protection in local villages. After the costly battle in the Ia Drang Valley in the summer of 1965, Westmoreland announced his policies of attrition: (1) to destroy the enemy in such numbers that it could not replace or resupply sufficient men or materiel to fight the war

and (2) to establish a favorable ratio of killing—more enemy and fewer U.S. soldiers. Quantitative measures of success were provided by body counts, destroyed supply depots, destruction of protective ground cover, and removal of populations who supported enemy activity. Westmoreland knew that the South Vietnamese army could not win the war by itself or with its own equipment. His strategy called for the first use of B-52s for tactical support of U.S. troops and massive search-and-destroy missions against enemy targets. During this period, helicopters equipped with rapid-fire machine guns and rockets became key to fighting the war as well as transporting troops and picking up the wounded and stranded.

Johnson sent the first combat troops into Vietnam in March 1965. By 1968, there were over five hundred thousand troops in Vietnam, and Westmoreland was calling for more. Johnson's military strategy was hobbled by his domestic initiatives. Increased budget requests for the Great Society were dented by requests for huge amounts of money to fight the war. Johnson also was aware that tax increases to support the war would be denied or would be unpopular because his opponents would accuse him of feathering the Great Society programs at the expense of the war. To avoid a clear run into the war, Johnson implemented a strategy of "graduated response." He and his advisers believed that at some point when the price was too great, the north would relinquish its attempt to reunify the south. His refusal to use taxation to fund the war led to borrowing strategies that resulted in an increase in the Consumer Price Index, a growing international trade deficit, and eventually a high rate of inflation and unemployment.

Westmoreland, McNamara, and Secretary of State Dean Rusk predicted that the war would soon come to an end. It was thus a psychological shock to the American public when, in January 1968, the Communists initiated a nationwide uprising in South Vietnam. After months of hard fighting and tremendous destruction, General Westmoreland claimed a military victory yet asked for two hundred thousand more soldiers. The destruction of the imperial city of Hue, the burning of villages, and the slaughter of Vietnamese civilians had been seen on American television (the My Lai massacre had occurred right after the first Tet Offensive but was not publicized until November 1970). The Tet uprising had clearly been a great psychological victory for the Communists. President Johnson declared he would not run for a second term, announced the cessation of bombing of North Vietnam, appointed McNamara to direct the World Bank, and replaced Westmoreland with General Creighton Abrams.

Pacification and Vietnamization: 1969–1971

Richard Nixon was elected president in November 1968 on the promise that he had a secret plan to end the war. Nixon won election during a year of great domestic and international turmoil: in April, Martin Luther King, Jr., was assassinated; in May, while American diplomats were negotiating in Paris with Hanoi, the Communists launched a second Tet Offensive; in June, Robert F. Kennedy was assassinated, and the military outpost of Khe Sanh, the centerpiece of Westmoreland's strategy of massive destruction and attrition of enemy soldiers, was abandoned; in August, the riotous Democratic National Convention was held in Chicago while the Communists staged their third Tet Offensive. Clearly, policies in Vietnam and the United States were exacerbating military and civil unrest.

Nixon's Vietnamization of the war strategy (that is, his turning over of control of the war to the Vietnamese) installed a new core of leaders: Ambassador Ellsworth Bunker, General Creighton Abrams, and William Colby guided political, military, and pacification programs. Nixon's "plan" gave full military control over to the Vietnamese army. The Americans began to withdraw troops—150,000 in 1970 and an additional 100,000 in 1971. The United States provided economic, technical, and material assistance to the government of South Vietnam but would not direct the war or engage in undue combat. Colby's pacification programs (including the notorious Phoenix program) concentrated on quietly destroying the infrastructure of the Communists and their influence in South Vietnam by rooting out Communist cadres and spies and imprisoning or executing them. American and Vietnamese civic action teams, particularly in the Mekong Delta, improved the quality of agricultural yields, health programs, and local defense.

American support missions were focused on destroying the caches of supplies that the Communists stored up for future battles and support. Nixon's illegal bombings of and incursions into Cambodia (April 1970) and Laos (January 1971) were an attempt to destroy Hanoi's ability to wage war and to give time to Saigon to build its military strength and morale.

True, the intensive training and support increased the South Vietnamese army's expertise, but the emphasis on self-reliance hindered its logistical and communication ability to engage in complex maneuvers and to coordinate its battle plans with American forces. These problems were evident during the poorly coordinated South Vietnamese attack in Laos in January 1971. This was the last time that a significant number

of American ground personnel helped the South Vietnamese army. Aware of the South's inadequacies, in March 1972, the North Vietnamese army launched a threefold attack on targets in South Vietnam. Although General Abrams credited the Vietnamese with fighting a good battle, in truth, the North Vietnamese were repelled by the massive B-52 bombing of the battlefield.

Nixon's plan to Vietnamize the war actually increased the number of American casualties. The American public was traumatized by media coverage of the death and destruction. Domestically, the antiwar movement grew to immense proportions, destabilizing American society. Moratorium antiwar protests began in early 1970 with mass demonstrations in Washington, D.C., in April. On 4 May, opposition to the Cambodian incursion caused nationwide demonstrations and resulted in four deaths and nine wounded by the Ohio National Guard at Kent State University in Ohio. The November trial of Lieutenant William Calley for the 1968 massacre at My Lai lasted five months and provided even more reason for demonstrations and antiwar activity. Congress felt the pressure and in December 1970 repealed the Gulf of Tonkin Resolution.

The year 1971 brought even greater protests. In June of that year, the *New York Times* began publishing the "Pentagon Papers," which provided an insider's account of how decisions were made to fight the war. The evidence of deception coupled with the administration's attempt to censor the account resulted in widespread antiwar sentiment. Nixon finally withdrew all U.S. ground troops in August 1972 and won reelection in November. In January 1973, the draft ended.

The year 1972 witnessed the dismal results of Nixon's strategy of Vietnamization. As the responsibility of fighting the war was turned over to the Saigon regime, the Communist troops became more confident of winning the war. As the United States continued to withdraw troops and limit direct military cooperation with the South Vietnamese army, its room to maneuver or affect the talks became more limited. A snag in the talks in the autumn of 1972 raised the level of frustration. On 18 December, unable to redeploy troops to Vietnam, Nixon ordered the most concentrated B-52 bombing campaign of the war on North Vietnam. This two-week so-called Christmas bombing forced the North Vietnamese to resume peace talks. By 23 January, a peace agreement was initialed by Henry Kissinger and Le Duc Tho (1910–1990), founder of the Indo-Chinese Communist Party and chief negotiator at the Paris talks, along with representatives from the Republic of Vietnam

(Saigon) and the Provisional Revolutionary (Communist) government in South Vietnam. In 1973, the Nobel Prize Committee in Sweden declared that Le Duc Tho and Kissinger should receive the Nobel Peace Prize. However, Le Duc Tho refused to accept the award because the war had not yet ended in Vietnam.

In the last years of the war, Nixon changed the war goals from rescuing South Vietnam from the Communists to ending the war honorably. This meant that the new focus was on getting American POWs back and discovering the whereabouts of MIAs. In February 1973, the Communists released 588 POWs; a month later the last U.S. military personnel left Vietnam; and in April, the last POWs were released. After the war ended, the U.S. government claimed that not all U.S. servicemen were accounted for. Hanoi was instructed to provide detailed information on MIAs and possible POWs. Without full disclosure, diplomatic recognition and normalization of relations would not be possible.

"The Decent Interval": 1971-1973

By 1971, President Nixon had realized that a victory in South Vietnam was not possible. He and Henry Kissinger devised the plan to provide Saigon with enough strength in 1973 to stand on its own against the North Vietnamese. Between the time that American troops would leave South Vietnam and the time that Saigon would fall to the North or would establish a form of accommodation, there would be a "decent interval." Saigon would bear the responsibility for its political future, and the United States would not be blamed for "losing" Vietnam, like it had been blamed for losing China.

The specific scenario for this plan was to pressure Hanoi militarily and politically to give Saigon freedom of maneuver. South Vietnam could strengthen its military forces, organize its economy, and create popular policies in rural areas—especially in the Mekong River delta south of Saigon. The "decent interval" was never achieved. Soon after America's withdrawal, North Vietnam ordered its divisions to march south in conventional military offensives, complete with tanks and artillery attacks on towns and civilians. Once American air power was halted, Saigon's army could not repel Hanoi's offensive. Furthermore, Saigon was unable to reform itself—rampant corruption, military defection, and uncontrollable dissent shattered any hopes for its continued existence against enemy threats.

Congress and public opinion choked off Nixon's strategic policies and options. Congress reduced Vietnam's economic aid package from \$2.3 billion to \$1

billion. In 1973, Congress cut off all funding for further U.S. air operations and for any further military operations in Southeast Asia. By 1974, the Pentagon could no longer authorize or budget replacement of Vietnam's military equipment. Congress belligerently overrode the president's veto of the War Powers Act, which limited the president's prerogative to declare war or to send troops abroad for more than sixty days without congressional approval.

Following Cambodia's surrender to the Khmer Rouge on 16 April 1975, Saigon surrendered to Hanoi's troops on 30 April. In the last few days of April, U.S. Ambassador Graham Martin remained publicly optimistic in order to prevent panic. Thus, there was no preparation for the evacuation of the many Vietnamese personnel who had sided with the American forces. The television news coverage showed the chaotic retreat by helicopter of American personnel from the roof of the U.S. embassy. The war was over.

Controversies Surrounding the War

The most common reason given for American commitment to South Vietnam is that the United States was obsessed with anti-Communist ideology. The aggression of the Soviet Union in Eastern Europe and the Korean War, the successful Communist revolution in China, and the nuclear arsenal of Moscow forced the United States to conclude that the whole globe was in danger of Communist domination. The battle for Vietnam was a proxy for the war between the West and Communism—between the United States and the Soviet Union and China.

Domestically, the American public engaged in energetic efforts to cleanse the nation of Communism. On 19 June 1953, just thirteen months before the fall of Dien Bien Phu, Julius and Ethel Rosenberg were executed for high treason against the United States. Their crime was providing the Soviet Union with secrets to produce an atomic bomb. Senators Joseph McCarthy and Pat McCarran held years of public hearings that denounced Communists in government, the foreign service, universities, labor unions, and Hollywood. Many of the accused lost their jobs or went into exile abroad; a few committed suicide. The disruption to American society was felt for decades.

An apologetic view of why the United States maintained the war is that the United States had entered a quagmire and could not get out. Author David Halberstam advanced this view after reporting on the Battle of Ap Bac (January 1963). Essentially, American pride, faith in technology, ignorance of Vietnamese culture, and refusal to develop a noncorrupt and com-

People travel on the Ho Ci Minh Trail in November 2000. During the Vietnam War, the trail was an important supply route for the North Vietnamese. (REUTERS NEWMEDIA INC./CORBIS)

pentent ruling force shoved U.S. forces more deeply into the morass of Vietnam.

In the 1970s, Vietnam veterans and critics of the war felt that the government had lied to them about the war. The radical left and the leaders of the antiwar movement criticized American capitalism and imperialism for profiting from the war and crushing the Third World's aspirations to, and sacrifices for, liberation and revolution. These groups aligned themselves with foreign anti-imperialist leadership. They also criticized the U.S. government for creating a national security bureaucracy and an international investment program that attacked dissent at home and impoverished farmers and workers abroad. The most authoritative criticism was voiced by the Committee of Concerned Asian Scholars. Organized by graduate students and professors who specialized in Asian history, the committee's *Bulletin of Concerned Asian Scholars* provided the most thorough criticism of the war in Indochina.

Why Did Hanoi Win?

The United States lost the war mostly because politicians controlled the strategy of the war. The war could have been won if the Pentagon had been given freedom to bomb where, when, and as much as it wanted. Rather than slowly escalating the war, as Johnson did, maximum firepower should have been used immediately against North Vietnam and the Communist-held areas of South Vietnam. The devastating Christmas bombing of 1972 proved that overwhelming force could bring Hanoi to its knees. But it was too late. The final rout of South Vietnam's forces in the spring of 1975 could have been reversed if Congress had released funds for the war effort and had not

declared that all U.S. bombing and military support must end.

The rebuttal to this argument is that such tactics in the mid-1960s would have brought retaliation from China or the Soviet Union. The memory of China's entrance into the Korean War was still a vital force in the strategic decision-making process. The South Vietnamese government was too corrupt, the military too incompetent, and the populace too disloyal to expect that a military victory alone would solve the problems of Vietnam. The thorough destruction of North Vietnam would have sparked uncontrollable anger in the population and would have brought demands that the United States colonize the area with troops and administrators for an unlimited time.

In 1995, twenty years after the war, Robert S. McNamara, secretary of defense under Kennedy and Johnson, pinpointed eleven failures that led to defeat. Among them were that the United States (1) misunderstood the enemy and exaggerated the dangers of the Cold War, (2) misjudged the strengths and weaknesses of its allies, (3) relied too much on the promises of high technology, and (4) failed to organize the executive branch to deal with the political and military issues in an open and critical manner. Even in the twenty-first century, the Vietnam War is still affecting lives in the United States and in Southeast Asia.

VIETNAM-UNITED STATES RELATIONS Communism, Containment, the Vietnam War, the end of the Cold War, and globalization have shaped the relations between Vietnam and the United States since 1945. Opinion within the United States

and throughout the world was sharply divided as the Vietnam War escalated in the 1960s, and the consequences of this war still linger on.

1945–1956

The Viet Minh, the organization lead by Ho Chi Minh (1890–1969) that was devoted to securing Vietnam's independence from France, controlled Hanoi and six provinces of Vietnam during the Japanese occupation and cooperated with the United States in the common fight against the Japanese. Ho Chi Minh proclaimed the Democratic Republic of Vietnam in September 1945, but the cause of Vietnamese independence was foiled by the Allies at Potsdam in July 1945. The French regained control of their former colony, and the First Indochina War began from 1946. The United States was alarmed by the expansion of Communism in the Cold War period, and in response, Containment became the hallmark of American policy. The United States supported the French, and by 1954 it was bearing 80 percent of the colonial war burden. In 1949 the French had set up the rival Republic of Vietnam (South Vietnam) under Emperor Bao Dai (1913–1997), and the United States recognized it.

With the humiliating defeat of the French at Dien Bien Phu on 7 May 1954, colonial rule was over. The already-convened Geneva Conference partitioned the country at the seventeenth parallel. The question of reunification was to be decided by election two years later. South Vietnam, Laos, and Cambodia were designated as associate states under the protective umbrella of SEATO (Southeast Asia Treaty Organization), which was formed in September 1954. Within a year, U.S. advisers arrived to help President Ngo Dinh Diem (1901–1963) of South Vietnam. The administration of President Dwight D. Eisenhower (served 1952–1960) blocked elections in 1956.

1956–1963

The United States mistakenly believed that Diem was a nationalist alternative to Ho Chi Minh. Eisenhower wrote in his memoirs that 80 percent of the people would have voted for Ho in 1956. Diem was becoming unpopular by alienating all major sections of the population. The Viet Cong, a Communist guerrilla force seeking to reunify the two halves of Vietnam, set up the National Liberation Front (NLF) in December 1960 from the Communist cadres of South Vietnam. From the American viewpoint, the situation was becoming alarming, and the new president, John F. Kennedy (served 1961–1963), picked up where his predecessor had left off. The U.S. administration

made an all-out effort to check Communist expansion in South Vietnam. The two countries signed a treaty resulting in arrival of American support troops, and the U.S. Military Assistance Command was set up.

American aid to South Vietnam from 1955 to 1961 had amounted to \$1.8 billion; for the 1962–1963 year alone, it was \$700 million. The United States was underwriting half of South Vietnam's government budget, including the full salary of its armed forces. U.S. military advisers numbered 17,000. The NLF increased its strength, and the situation deteriorated in South Vietnam. The Viet Cong controlled about two-thirds of the rural areas. After Diem's assassination, a succession of military generals ruled in South Vietnam. The political instability worsened. The new U.S. president, Lyndon Baines Johnson (served 1963–1968), also believed in what was known as the Domino Theory. If South Vietnam fell to Communism, the reasoning went, so would the rest of Southeast Asia.

1964–1968

The covert operation against North Vietnam, code-named Operational Plan 34A, began in February 1964 with U-2 spy plane missions and commando raids. The U.S. Congress gave sweeping powers to the president in August 1964 after a U.S. naval vessel reportedly was fired upon in the Gulf of Tonkin. North Vietnam saw the United States as the main obstacle to reunification of Vietnam. The United States began bombing North Vietnam in February 1965 in what later was to become a regular feature under Operation Rolling Thunder. U.S. fighter-bombers dropped a total of about 8 million tons of bombs, flown in about 3 million sorties, during the Vietnam War. The Ho Chi Minh Trail, the main supply route to the Viet Cong, came under severe bombing, as did Hanoi and Haiphong Harbor. By 1967 the number of U.S. troops in South Vietnam rose to half a million. The Tet Offensive of January 1968 produced a military stalemate. In March President Johnson announced that he would not be seeking reelection and ordered a partial halt to bombing over North Vietnam. The My Lai massacre of 300 Vietnamese on 16 March 1968 outraged world opinion, and the pictures of carnage from the massacre haunted generations of Americans. Domestic dissent increased in the United States, and the antiwar movement spread among students, liberal clergy, journalists, U.S. senators, and intellectuals. In October a complete bombing halt was declared. About 30,000 American soldiers had lost their lives by 1968. In spite of heavy bombing over the Ho Chi Minh Trail area, 150,000 North Vietnamese soldiers had infiltrated South Vietnam, and supply convoys went on.

HO CHI MINH'S NATIONAL DAY SPEECH

On 2 September 1957 Ho Chi Minh delivered a speech marking the twelfth anniversary of the founding of the Democratic Republic of Vietnam. In the speech he outlined national progress and noted the threat posed by the United States.

Dear compatriots . . .

During the past three years, our people in the north have made great efforts to overcome difficulties and to carry out production through labor. They have recorded great successes in healing the wounds of war, restoring economy, and starting the development of culture, thereby lessening difficulties in the life of the popular masses and gradually improving their living standards, in the delta regions as well as in the mountainous areas. Land reform has fundamentally been completed, the correction of errors committed and the work of developing the success obtained during that reform have been fruitfully carried out in many localities. Agriculture has visibly surpassed the prewar level. In industry, old factories have been restored and new ones built. Order and security have been ensured and national defence strengthened. On behalf of the Party and Government, I congratulate the personnel of branches at all levels for their ardour in serving the people and in building up the fatherland.

Our task for this year is to further increase production and the practice of economy, to strive to fulfill the State Plan, to restore basically North Vietnam's economy, thereby progressively improve the living conditions of our people, and prepare conditions for us to advance in 1958 toward building the north under a long-term plan.

While the north of our country is becoming stronger and stronger, in the south, the American imperialists are intensifying their intervention, increasing their military personnel, catching hold of the South Vietnam economy. Together with the southern authorities, they have been sabotaging the Geneva agreements and the peace and unity of our country. They have resorted to all means of terror and repression with the aim of quenching the patriotism and the will for reunification of our southern compatriots. However the latter, always heroic, have unceasingly broadened their solidarity and struggle for the improvement of their standard of living, for democratic liberties, and for the peaceful reunification of their fatherland. Our government has recently proposed once again to the southern authorities contacts between the two zones and the re-establishment of normal north-south relations with a view to reaching a consultative conference on general elections to reunify the country. However, the southern authorities have obdurately persisted in their refusal, thus going counter to the deep aspirations of the entire people.

1968–1975

Although the Paris peace talks began on 25 January 1969, the Vietnamization program of President Richard Milhous Nixon (served 1969–1974) continued to wage war, using South Vietnamese ground forces and U.S. air power without U.S. ground troops. The Vietnam War became a truly pan-Indochina war when Laos and Cambodia became involved. The publication of the Pentagon Papers in 1971 revealed the covert operation of the secret war in Vietnam, Laos, and Cambodia. The Paris talks made very slow progress, and North Vietnam began the March 1972 Easter Offensive to conquer South Vietnam. The mining of North Vietnam's harbors and the bombing of roads and bridges in May 1972 brought vehement international criticism and renewed antiwar protests in the United States.

In January 1973 the U.S. negotiator Henry Kissinger and North Vietnam's Le Duc Tho resumed stalled negotiations, and the major differences between the opposing sides were solved. On 27 January the United States, North and South Vietnam, and the Provisional Revolutionary Government (PRG), representing the Viet Cong, signed the Paris Peace Accords. Major provisions of the agreement included withdrawal of American troops, a cease-fire, return of prisoners of war, and unification of the North and South. This provided a temporary respite for the corrupt and repressive regime of South Vietnam. On 30 April 1975 Saigon fell, and Vietnamese unification took place in July 1976. The casualty figures in the Vietnam War included 50,000 Americans, 400,000 South Vietnamese, and 900,000 Communists.

1975–Present

Postwar relations between Vietnam and the United States have revolved around the prisoners of war/missing in action (POW/MIA) issue, the establishment of diplomatic relations, American aid for reconstruction of Vietnam, and the refugee problem. Vietnamese premier Pham Van Dong (1906–2000) called for normalization of relations with the United States and requested payment of \$3.3 billion for reconstruction as secretly promised by President Nixon after signing the Paris agreement. The United States declined and put forth its own condition of full accounting of the MIAs. Two years later, the United States relaxed its stand to a good-faith attempt at accounting and sent a mission to Hanoi. The prospects of bilateral relations improved in 1978, when Hanoi did not put forth a precondition of economic assistance. The Vietnamese invasion of Cambodia and the Chinese invasion of Vietnam complicated the matter. In 1985 Vietnam

permitted the excavation of a B-52 crash site and began to return the remains of dead American soldiers. A presidential envoy, General John W. Vessey, visited Hanoi in August 1987; Vietnam agreed to cooperate on the MIA issue, and the United States officially agreed to provide humanitarian assistance.

Vietnam's domestic and foreign policies saw a marked change in late 1980s and early 1990s, which paved the way for a better relationship with the United States. The process of economic liberalization, Vietnam's withdrawal from Cambodia, and Vietnam's gain of access to regional and international organizations facilitated normalization of Vietnamese-U.S. relations. POW/MIA accounting, resettlement for Vietnamese boat people, human rights, and religious freedom were key issues. In 1993 the United States supported international bodies helping Vietnam and lifted its economic embargo of the nation. A liaison office was opened in Hanoi in 1994. The United States announced establishment of diplomatic relations on 11 July 1995. Pete Peterson, a former U.S. congressman and POW, became the U.S. ambassador to Vietnam. In January 1997 Vietnam and the United States reached agreement on the resettlement of Vietnamese refugees from countries of first asylum like Thailand and Hong Kong. Bilateral trade agreement negotiations commenced in 1996. Vietnam joined the Asia Pacific Economic Cooperation forum (APEC) in 1998.

Vietnam also sought integration into the world economy and initiated sweeping economic reforms. Trade between Vietnam and the United States amounted to \$750 and \$900 million respectively in 1998 and 1999. Limited military contact was established along with a program of colonel-level exchange visits. In September 1999 the secretary of state visited Vietnam. A new phase of Vietnamese-U.S. relations was marked with a bilateral trade agreement signed on 13 July 2000. This agreement provided greater mutual market access for Vietnamese and U.S. companies, recognition of and respect for intellectual property rights, and protection of U.S. investment. The transparency clause of the agreement made Vietnamese laws in areas concerning the agreement public, and it included the right of appeal by U.S. citizens. Vietnam insisted on retaining control over telecommunications, not allowing foreign investors more than a 50 percent stake in any investment project.

The first visit by a U.S. president to Hanoi took place in November 2000 and was marked by cordiality. President William Jefferson Clinton (served 1993–2001) had discussions with Vietnamese president Tran Duc Luong (b. 1937) and prime minister Phan Van Khai (b. 1933) regarding mutual concerns. The president paid

warm tribute to the Vietnamese people and urged opening of a new era in U.S.-Vietnamese relations. The United States promised \$2 million each year over the next three years to help Vietnam implement the trade agreement of July 2000. The United States opened a consulate in Ho Chi Minh City (Saigon).

The election of the conservative Republican U.S. president George W. Bush in 2001 came without Congress having ratified the July 2000 trade pact, however. The U.S. Commission on International Religious Freedom suggested that the trade pact be linked to human rights. Pending ratification of the July 2000 trade pact, Hanoi had waived the 50 percent surcharge on U.S. products, but it has threatened to reimpose it.

Vietnam is slowly moving away from authoritarian control, which would help it in establishing close bilateral relations with the United States. The government has made progress toward allowing religious freedom, recognizing the Vietnam Buddhist Church, the Vietnam Catholic Church, the General Council of Protestant Churches of the South, and other religious organizations. The International Labor Organization has opened an office in Hanoi, and Vietnam has ratified three labor conventions. The authorities are tolerating critical public expression, which was unheard earlier. Nong Duc Manh of the Tay ethnic minority was appointed to the top post of secretary-general of the Communist Party in April. National Assembly members are openly criticizing some of the policies of the government. Not all in the National Assembly are members of the Communist Party, and a former South Vietnamese military officer has been elected to that body.

In spite of lingering Vietnamese and American grievances, the Vietnamese Foundation Act of 2000 had attracted more Vietnamese students to study in American universities. Both countries have moved forward in the process of normalizing relations. The hard-liners in Vietnam and the United States may be skeptical of close relations, but the mutual perception is changing.

VIETNAMESE With a population of more than 79.9 million (2001 est.), Vietnam ranks as the fourteenth most populous country in the world. In Vietnam's 1999 census, the population was found to be 23.5 percent urban and 76.5 percent rural. Many people still earn their living from agriculture. Over 10 percent of the people (and almost one-third of the urban population) live in either Ho Chi Minh City, formerly Saigon (with a population of over 5 million), or in Hanoi (with a population of almost 3 million). Over 86 percent of the population is ethnic Vietnamese, now known as Kinh.

The non-Kinh population of Vietnam was more than 10.5 million in 1999. There are officially fifty-four ethnic groups in Vietnam, including the Kinh majority. Four of these groups have over a million people: the Tay (once called the Tho), the Thai, the Muong, and the Khmer. Four other groups have well over half a million people: the Chinese (officially known as the Hoa), the Nung, the Hmong (formerly known as the Meo), and the Dao (or Dzao or Yao). Other groups are small in size. Twelve groups have populations under five thousand. Some (such as the Ro-Man, the O Du, and the Brau) number only a few hundred.

Vietnam's population is very diverse. The fifty-four ethnic groups belong to five language families: Austroasiatic, Austronesian (Malayo-Polynesian), Thai-Kadai, Sino-Tibetan, and Hmong-Dao. The Kinh majority and many other groups speak languages within the Austroasiatic family. A cluster of groups speaking Austronesian (Malayo-Polynesian) languages and having matrilineal kinship, the Ede (Rhade), Gia Lai (Jarai), Cham, Raglai, and Chu-ru (Chru), live mainly in and around the central highlands. Some small groups speaking Sino-Tibetan languages are found along the Chinese border in the northern uplands. Only four of these fifty-four groups have historically lived in the lowlands: The Khmer (mainly in the lower Mekong Delta), the Cham (mostly in the central coastal plain), the Chinese (mainly in urban areas), and the majority Kinh population.

Traditionally, ethnic Vietnamese lived in lowland areas and lived mainly by growing rice in paddy fields. Very few Vietnamese lived in the uplands. Lack of paddy fields, fear of malaria and other dangerous diseases, the presence of sometimes-unfriendly tribal groups, and the periodic appearance of bandit gangs made Vietnamese very reluctant to live in upland areas.

But with population pressure rising, modern medicine available, and the security provided by the modern nation-state, in the past fifty years over 4 (perhaps 5) million Kinh have, often under state-organized programs, moved into upland areas previously inhabited only by non-Kinh groups; many of the immigrant Kinh live in urban areas, along main highways, or in and around state farms and forest enterprises. Population movement continues, especially from rural to urban areas, from north to south, and from lowlands to uplands. There is also some spontaneous migration of non-Kinh ethnic households (that is, Nung and Tay) from portions of the northern mountain region (that is, Cao Bang) to the central highlands (especially Dak Lak and Lam Dong Provinces). The rest have traditionally lived in upland areas.

Characteristics of the Vietnamese (Kinh) Majority

The Vietnamese family has long been the most important and most stable part of Vietnamese society. Descent through the male line (patrilineal descent) is very important. Even today, some families still gather to celebrate the death anniversaries (*ngay gio*) of shared male ancestors, especially fathers and grandfathers. These are not usually sad occasions, but happy times in which people remember their shared roots and build solidarity among living family members.

Children are raised to appreciate the tremendous importance of the family as the primary and most reliable source of identity, emotional support, and help in time of need. As children learn to speak, they are taught about family relationships and the proper terms of address and self-reference that accompany them. Vietnamese have no general term equivalent to the English "you," and they rarely use the word for "I" or "me." Instead Vietnamese children address other people in the family as "mother" or "father" or "father's older brother" or "father's younger brother" or "mother's brother" or "father's sister" and so on. They refer to themselves not as "I," but as "child" or "niece" or "nephew." They call older siblings "older brother" or "older sister" and refer to themselves as "younger sibling."

As children grow up, go to school, and meet a wider range of people, they call most other people by kin terms much of the time, as if all of society were one big family. Choice of which kin term to use with which person is guided by gender, relative age and status, degree of intimacy or friendship, and the nature of the occasion. What a Vietnamese calls someone and the way he or she refers to himself or herself influences the way the two people will behave toward each other and what they can expect from each other.

A Vietnamese girl on her moped in Hanoi in 1995. (CATHERINE KARNOW/CORBIS)

This way of talking with each other is an important part of being Vietnamese. Vietnamese often seem to be less concerned about their own individual feelings and desires than many other people. But they may also be somewhat less concerned with universal principles and with people in general. What they are greatly concerned with is a very particular set of interpersonal relationships with specific people. Their identity and sense of self-worth are intimately connected to their relationships with parents, family, neighbors, teachers, classmates, colleagues, and coworkers.

Within this complex web of relationships people must perform many roles, always adjusting their behavior to fit the particular position they are in within a specific social context. Vietnamese society is hierarchical. One is expected to defer to those who are older or who have higher status, and to nurture and to instruct those younger or of lower status. These significant other people in one's life are always evaluating the way one performs one's various social roles. The acceptance, approval, and admiration of these people

are very important to most Vietnamese and many people often gladly modify their behavior to achieve this kind of social recognition.

Over the past fifty years or so a number of mass organizations have been created and many (but far from all) people belong to one or more of them. There are organizations for women, for farmers, for youth, for the elderly, for veterans. These organizations extend from the national level down to the village. They are guided and coordinated by the Fatherland Front, an umbrella organization that in turn receives guidance from the Communist Party and includes senior party officials in its leadership as well as representatives of a variety of religious and ethnic groups. To a large extent these organizations, in addition to government structures and Communist Party organization, incorporate all of Vietnam's ethnic groups and regions into one national society.

Characteristics of Non-Kinh Ethnic Groups

More than 10.5 million citizens of Vietnam, nearly 14 percent of the population, are categorized as non-Kinh persons. The official set of fifty-three ethnic categories other than Kinh seems to lump together some groups that may well be considered to be separate ethnic groups. In any case, however these groups are categorized and labeled, the reality is that there are hundreds of relatively small local groups with somewhat distinctive dialects and ways of life. Although some of these groups may have similar cultures and share a common ethnic identity, the extent to which they form a meaningful social unit is problematic.

The three non-Kinh ethnic groups who live mainly in the lowlands are distinctive. The Khmer, who lived in the Mekong Delta long before the arrival of the Kinh, number over a million and are Vietnam's fifth-largest ethnic group. Most still live in the lower half of the Mekong Delta. Most Khmer follow a form of Buddhism similar to that found in Cambodia, Laos, Thailand, and Myanmar called Theravada or Hinayana Buddhism. This is in contrast to the Mahayana Buddhism that is predominant among Kinh Buddhists. The Buddhist pagoda is usually the center of Khmer community life, and monks often are highly influential and respected community leaders.

The Chinese (Hoa), who number about 870,000, making them Vietnam's sixth-largest ethnic population, are among Vietnam's most highly urbanized groups. They have levels of income, life expectancy, and education that are comparable to those of the Kinh majority. There is a large ethnic Chinese population in Ho Chi Minh City.

The Cham, of whom there are only a little over 130,000, live mostly in villages along the central coast, especially in Ninh Thuan and Binh Thuan, although there is a Cham community in the Mekong Delta near the Cambodian border. The Cham have a matrilineal kinship system, tracing descent through the female line, and a young married couple usually lives with or near the bride's parents rather than those of the groom. Cham religion contains combinations of Hindu (Brahman) and Islamic influences that survive from earlier periods and veneration of indigenous spirits.

The remaining forty-nine ethnic non-Kinh groups in Vietnam have traditionally lived in upland areas, and the vast majority of them still do. It is difficult to generalize about them because both within and between groups there are many differences in economic levels, social organization, health status, ecological conditions, religion, and ways of life. And almost everywhere change is occurring at a rapid pace. In fact, one might say that the two most important characteristics of ethnic non-Kinh upland areas now are diversity and change.

The great majority of upland ethnic nationalities live in one of two big areas. The first is the northern mountain region, extending along the border with Laos from about Vinh and along the border with Laos and then China all the way back to the sea. The second area is usually called the central highlands in English and Tay Nguyen (Western Plateau) by the Vietnamese. It is composed of upland areas along the border with Cambodia. Between Hue and Vinh the ethnic minority population is very small because the terrain is highly broken and mountain slopes are very steep, while the flat plain is densely populated by Kinh. Fifty or sixty years ago most of the uplands were densely forested and most people lived there much as they had for centuries.

Family, kin, and community still make up the meaningful social worlds of most ethnic minorities. Most of these people traditionally lived in relatively small villages, made up of sometimes only four or five houses and rarely as many as a hundred. Most houses were built on stilts with wooden beams, bamboo walls, and thatch roofs.

The majority of upland people lived by cutting down and burning small patches of forest and then planting in the ashes, a practice often called *swidden*, or "slash and burn," agriculture. A cleared field would typically be used for two to four years and then abandoned for five to twenty years. Although sometimes erroneously called nomads, most people moved only from spot to spot within a fixed area. These upland

fields were usually planted with rice or corn, interplanted with a variety of beans as well as gourds and other crops. Pigs and chickens were commonly raised, but in small numbers. Other domesticated animals commonly found in upland areas were oxen, water buffalo, ducks, goats, and dogs. The particular mix in the way each group earned a living was determined by local conditions. Some groups who lived in valleys cultivated wet rice in paddy fields. In some places, people created terraced fields on hillsides. Farming was supplemented by hunting, fishing, and gathering wild vegetables and tubers from the forest.

The forest not only provided much of people's food, but also was a source of medicine, building materials, fuel, and water. Few if any villages were completely isolated. There was always some trade, but more were relatively self-sufficient. Life was difficult in some ways, but very satisfying in others.

Over recent decades, however, change has been taking place at an accelerating rate. These changes have disrupted familiar ways of life, causing problems and providing benefits. Access to modern medicine and other innovations (such as mosquito nets and iodized salt) has reduced infant mortality rates and increased life expectancy. Access to education has increased significantly. Many people now have electricity in their homes. Many own radios, flashlights, raincoats, kitchen utensils, and other consumer goods that make life more convenient. Quite a few have bicycles, and some have television sets, and even VCRs and motorcycles. Upland ethnic minorities are still poorer than the average Vietnamese, but they are better off in many ways than they once were.

At the same time, population density is much higher than before, because of both in-migration and natural increase in population. The forests have been reduced both in size and in quality. Biodiversity has plummeted. It is much more difficult for people to hunt and fish and gather wild food. Water and decent agricultural land are in short supply in many places. There is little room to increase wet rice paddies, and in swidden fields the yields are declining because the fragile upland soils are overworked.

The uplands contain many opportunities and many challenges. People do not always agree on how much change they want, at what rate, or how to achieve it. But it is difficult for members of an ethnic group, or even for uplanders as a whole, including Kinh, to work together to devise common solutions to shared problems. Throughout much of the uplands, but especially in the northern mountain region, ethnic groups are scattered across different districts and provinces.

Villages are grouped to form a commune, the lowest administrative unit in Vietnam, and communes are combined to form a district, which is like a county. Out of 109 districts, 59 contain 10 or more different ethnic groups, and 8 contain 15 or more ethnic groups. And in the northern mountain region 97 percent of all communes contain more than one ethnic group. Since people are scattered in villages that are within different communes and districts, even provinces, with dozens of other ethnic groups, also scattered, living around them, their meaningful social world is usually still limited to family, kin, and village. The basic model of social structure in the uplands is one of hundreds of rather tightly knit local groups, unevenly overlaid with national institutions that reach out from Hanoi.

Religion in Vietnam

It is difficult to say how many Vietnamese follow any particular religion. The religious beliefs and practices of most Vietnamese do not fit neatly into any single category. And this does not bother them. Estimates of how many people in Vietnam "follow" a particular religion vary widely, depending on how terms are defined.

The 1999 census reported that over 80 percent of the population of Vietnam had "no religion." This estimate counted only those who are formal, practicing members of an officially recognized religious organization and can be misleading. Other estimates, however, are often rather high, usually based upon a very loose definition of "religion" and without any sound empirical basis.

Buddhism is by far the largest organized religion in Vietnam. Although the 1999 census counted only a little over 7 million Buddhists, other estimates go above 20 million. Mahayana Buddhism is predominant among the Kinh, whereas over a million people (mostly in the Mekong Delta and mostly Khmer) follow Theravada Buddhism. Most Vietnamese have been influenced by Buddhist thought, however, and it is difficult to draw a line between Buddhists and non-Buddhists.

The second-largest organized religion in Vietnam is Christianity, which gained a foothold in the seventeenth century. There may be as many as 8 to 10 million Catholics in Vietnam, although the 1999 census counted only a little over 5 million. Protestantism came to Vietnam much later, but it has experienced rapid growth since the late 1980s, especially among upland ethnic minority groups. The 1999 census counted only 261,000 Protestants, but by some estimates there are as many as 2 million.

The 1999 census counted only 63,000 Muslims. Other estimates, which range up to 1 million, seem high. There seem to be few, if any, Kinh who follow Islam. Most Muslims in Vietnam are Cham, Khmer, or expatriates from Islamic countries.

Hoa Hao, a reformed Buddhist sect stressing simplicity of worship, is sometimes estimated to have as many as 2 million followers. The 1999 census counted about 1.2 million Hoa Hao. Most Hoa Hao are concentrated in the western portion of the Mekong Delta, mainly in and around the city of Long Xuyen in An Giang Province.

Cao Dai is an eclectic religion, drawing on Buddhism, Christianity, and Vietnamese tradition. It probably has 1 to 2 million followers, mainly in Tay Ninh Province and in the Mekong Delta.

Vietnamese in the Twenty-First Century

Vietnam is still a poor country. Its growing population is already stressing its environment and will continue to do so in coming decades. Under these conditions, the Vietnamese are aspiring to achieve rapid economic growth that is both equitable and sustainable and simultaneously to attain more democracy and greater rule by law. Such aspirations not only require changes in laws and policies, which are already taking place, but also ultimately will require changes in institutions, in behavior, and in ways of looking at the world.

At the same time, there is a strong desire to preserve a distinctive Vietnamese identity that retains the best elements of Vietnamese culture and tradition. This ambitious agenda will pose an immense challenge to the Vietnamese people in the twenty-first century. But they have made progress in recent years and are determined to continue to move forward.

VIETNAMESE LANGUAGE The origins and affinities of the Vietnamese language are complex and have long been debated by scholars. The language now appears to have developed from the Mon Khmer family within the larger Austroasiatic language group. There are indications of influence from Tai languages, especially the use of tones. It also seems to exhibit some Austronesian influence, perhaps from ancient relatives of the Cham and Ede (Rhade) in prehistoric times.

In historical times there has been a very strong Chinese influence, especially in vocabulary. The word *Viet* comes from the Chinese word *yue*, which was used broadly to refer to non-Chinese ethnic groups south of the Chang (Yangtze) River. *Nam*, or *nan* in Chinese, means "south" or "southern." Some terms have been thoroughly Vietnamized and now are no longer perceived as foreign terms. Examples would include the word for "citizen," which is *cong dan*, and the word for "virtue" or "morality," which is *dao duc*. But other terms and phrases are still considered to be Sino-Vietnamese. These expressions are still heard, but not as much as they used to be.

More recently some French words have come into common use, with some of them becoming what now seem to be purely Vietnamese words. For example, the Vietnamese word for "station," *ga*, comes from the French *gare*. Similarly, the word for "doll," *búp bê* comes from the French *poupée*. The word for "pump" (*bom*) comes from *pompe*; the word for "chocolate" (*so co la*) from *chocolat*. English vocabulary has even more recently been entering the language, but to a much lesser extent than Chinese or even French words. Many English-language words have appeared quite recently and have not yet been Vietnamized. One occasionally sees in Vietnam today words like *club*, or *computer*, or *video*, even though Vietnamese already has words that mean exactly or much the same thing.

Because each syllable is written separately and usually has a meaning (as in Viet Nam), Vietnamese seems

to be, and is often called, a monosyllabic language. But compound and pseudocompound words are quite common. The words for "citizen," "virtue," and "Viet Nam" are compound words in Vietnamese. The Vietnamese word for "airplane," for example, is *may bay*. *May* means "machine" and *bay* means "to fly."

Vietnamese is also uninflected. There are no endings to distinguish tense or number or gender, subject from object, and so on. But future tense can be indicated by adding *se* in front of the verb. Thus "will fly" would be *se bay*. The past tense of "fly," "flew," would be *da bay*. Vietnamese speakers, however, use *se* and *da* sparingly, usually adding them only when necessary to avoid misunderstanding. Whether some action has already happened or will happen in the future is usually quite clear from context.

Vietnamese is also a tonal language. There are six distinct tones in the north and five in the south. In the example given above, the syllable *may*, which with a high rising tone means "to fly," would mean "eyebrow" with a low falling tone, or "lucky" with a level tone. The tone is thus an integral part of the word.

For many centuries, Vietnamese used the Chinese writing system. Classical Chinese was the official language of government and a common vehicle for literary expression. A system of writing called *Nom*, which recombined elements of Chinese characters to represent Vietnamese words, gradually evolved. By the thirteenth century it had begun to take shape as a useful system of writing and by the fifteenth century it had become a respectable and thoroughly adequate means of writing prose and poetry of the highest order. In the seventeenth century, Christian missionaries developed a phonetic, Romanized alphabet for writing Vietnamese. Early in the twentieth century this alphabet came into popular use. It soon replaced both *Nom* and Chinese characters. This writing system is now known as the "national language" (*quoc ngu*). Very few Vietnamese can now read Chinese characters and *Nom* can now be read only by a few dozen professional scholars.

In Vietnamese a person's family name (*ho*) comes first, and one's given name (what is often called the "first name" in English) comes last. Vietnamese are known mainly by their given names rather than by their family name. Let us take, for example, a Mr. Nguyen Van Ba. Nguyen would be his family name, Van his middle name, and Ba his given name. He would typically introduce himself and be addressed and referred to by others as "Mr. Ba" (*Ong Ba*). One reason for this may be that some family names (like Nguyen) are so common that most people would know many men with the family name of Nguyen but far fewer with the given name of Ba.

A final aspect of the language worth noting is the way Vietnamese address and refer to others and refer to themselves. The first person singular pronoun, "I" or "me" in English, *toi* in Vietnamese, is not often used in daily speech by native speakers of Vietnamese. There is not even a single word like the all-purpose pronoun "you" to use to address the person to whom one is speaking in Vietnamese. Instead of using somewhat neutral and impersonal pronouns like "I" or "me" or "you," Vietnamese usually use terms of kinship that express a relationship they have to the person to whom they are speaking.

In English, a child will address his or her mother as "mother." A Vietnamese child will not only do this, but will also refer to himself or herself (replacing both "I" and "me") as "child" (*con*). Even when speaking with people who are not relatives, kin terms are normally used, both for address and for self-reference. For example, older men are often addressed by one of several terms Vietnamese have for what we call "uncle." Depending on relative age, status, and degree of intimacy, a young Vietnamese may address an older man as "father's older brother" (*bac*) or "father's younger brother" (*chu*). He or she would then refer to himself or herself as *chau*, which can mean "niece" or "nephew" or "grandchild." Other common forms of address that take the place of "you" are "older brother" (*anh*), "older sister" (*chi*), and "father's sister" (*co*). The speaker would refer to himself or herself as *em* (meaning "younger sibling") or *chau*. Children are taught to make fine distinctions when using such terms with a wide variety of people as they are learning to talk.

As these examples clearly show, there are different terms for mother's relatives and father's relatives, and for older and younger siblings in the speaker's generation and his parents' generation. People also always take account of the relative age and status of the people to whom they are speaking. The Vietnamese language is thus hierarchical in nature. The English terms "I" and "you" imply a relationship of relative independence and equality, while Vietnamese speak in ways that express inequality and relationship. For some time, the Communist Party in Vietnam tried to introduce the use of the word "comrade" (*dong chi*) to reduce the sense of hierarchy in Vietnamese interpersonal relationships, but today the word is hardly ever spoken outside of party circles.

Herbert, Patricia, and Anthony Milner. (1989) *South-East Asia Languages and Literatures: A Select Guide*. Honolulu, HI: University of Hawaii Press.

VIETNAMESE, OVERSEAS In the early part of the twentieth century, the *Viet Kieu* (Vietnamese sojourners abroad) living in small settlements around the Indochina peninsula could be counted in thousands of families. By the century's end, they numbered 3 million in approximately seventy countries around the world.

Precolonial and Colonial *Viet Kieu*

Before French colonization (1859–1954), most *Viet Kieu* lived in Laos, Cambodia, Thailand, and southern China. While short-distance moves were usually made for economic reasons, long journeys often had a political or religious dimension. Diplomats and artisans traveled to China, while many Vietnamese in Siam (now Thailand) were refugees from nineteenth-century religious persecutions. With the exception of Vietnamese Catholic villages along the Mekong River in Thailand, few traces remain of these precolonial movements. Today's Vietnamese diaspora is made up of twentieth-century migrants.

Their first community was formed as a result of French colonialism. Ocean travel opened emigration to destinations beyond the Indochina peninsula. The French transported prisoners to New Caledonia and the New Hebrides, followed in later years by plantation and mine workers. During the two World Wars, workers were sent to French factories in Europe. Between the wars, students were sent to universities in France. And a small number of Vietnamese simply traveled to France. Among these was the man later known as Ho Chi Minh (1892–1969), who learned his Communism in Paris (1910s), returned home with it (1940s), and led an independence war that ended with the French withdrawal (1954). On independence, some Vietnamese associated with the colonial power went to France. Traditions of study in Paris persisted

during the war against the United States, as some families sought to spare their children from military conscription. By the end of the war (1975), France was home to over fifty thousand *Viet Kieu*.

Prior to independence, other political dissenters also chose the route of emigration. Intellectuals joined Phan Boi Chau (1867–1940) in Japan (1905–1909). Independence activists worked in southern China and Thailand. Existing communities of Vietnamese in Thailand were later joined by fifty thousand *Viet Kieu* from Laos, who fled the French army's violent reoccupation of Laos (1946), crossing the Mekong into Thailand. However, the refugees' support for Ho Chi Minh and Thailand's alliance with the United States made their presence there increasingly awkward. Some returned to North Vietnam (1960–1964). Others were subject to restrictions on their civil rights, becoming eligible for Thai nationality only after Vietnam's 1995 entry into the Association of Southeast Asian Nations.

Postcolonial *Viet Kieu*

A second community was formed in the wake of the Vietnam War. At the end of the war, 140,000 Vietnamese fled with the U.S. forces. They formed the nucleus of today's population of more than 1 million Vietnamese in the United States. Later refugees also went to Australia, Canada, China, France, Great Britain, and West Germany. They traveled by boat, via refugee camps in Southeast Asia, by land into China and Cambodia, and by airplane in a program designed to stem the flow of boat people. Yet the flow continued for twenty years. At first, most refugees were people associated with the old regime in South Vietnam. In the late 1970s, they were ethnic Chinese, expelled as a result of Vietnam's conflict with China (1979). By the 1980s, many boat people were northerners, tired of the failures of Communism and attracted by dreams of "paradise" in the West.

Resettlement policies varied. In China, the 300,000 refugees were sent to state farms near the border. Western countries, however, attempted to disperse them. Inhabitants of towns throughout North America, Australia, and Europe remember the arrival of a few Vietnamese families during the boat-people crisis. They also remember their departure, as they moved on to California (Orange county's Little Saigon), Sydney (the suburb of Cabramatta), and Paris (the thirteenth arrondissement). But many *Viet Kieu* are now reluctant to stay in Vietnamese suburbs. Socioeconomic success, acquired through commerce and education, is expressed in a move away and integration into a local middle class. For many, the Little Saigons have now become places to shop rather than live. They

HOI AN—WORLD HERITAGE SITE

A UNESCO World Heritage Site since 1999, the Vietnamese port city of Hoi An is a colorful demonstration of the divergent cultural influences on Vietnam between the fifteenth and nineteenth centuries.

A Vietnamese grocery store in Garden Grove, California, in 1986. (JOSEPH SOHM; CHROMOSOHM INC./CORBIS)

are places, too, from where the *Viet Kieu* send remittances to their relatives in Vietnam, which since the early 1980s have had an important impact on the country's economy.

Gradual integration also characterized the political outlook of the *Viet Kieu*. On arrival, many sought to hasten their return home, forming organizations dedicated to the overthrow of the Communist government. In Vietnam, the term *Viet Kieu* became associated with anti-Communism. In the 1990s, however, many *Viet Kieu* returned to Vietnam, holding Western passports stamped with tourist or business visas issued by the Vietnamese government. Sentiments of anti-Communism are now expressions of community membership more often than strong political beliefs.

A third *Viet Kieu* community was formed beginning in 1980, through Vietnam's repayment of its national debt to the Soviet Union with the labor of 300,000 workers in the factories of the Soviet Union, Czechoslovakia, and East Germany. After the collapse of European Communism, many stayed behind. Leaving the factories, they established trading businesses and played an influential role in Central Europe's underground economies. Many retain Vietnamese passports and—untainted by anti-Communism—they are not known as *Viet Kieu*. The current term *nguai Viet Nam o nuoc ngoai* ("Vietnamese living abroad") includes this "loyal" population in a broader category, distinguishing them from politicized communities.

Overseas Vietnamese in the Twenty-First Century

The overseas Vietnamese make up three communities, formed as a result of Vietnam's relations with its former colonial ruler (France) and the Cold War

superpowers (the United States, the Soviet Union, and China). These relations, of collaboration or opposition, molded the attitudes of the expatriate community toward Vietnam. But in the twenty-first century, as their socioeconomic integration proceeds and memories of the Cold War fade, the depoliticization of these communities is underway. Meanwhile, new overseas migrations are taking place, with journeys of marital union and family reunion. Contract workers travel to Taiwan, Korea, Laos, and Samoa, and prostitutes seek lucrative markets in Cambodia, Malaysia, Singapore, and Hong Kong. The overseas Vietnamese used to resemble the Cubans in Florida, defined by their opposition to Communism. Vietnam's twenty-first-century emigrants may better be compared to those of other Southeast Asian countries. Most are contract workers, illegal immigrants, and businesspeople.

VIJAYANAGARA EMPIRE Vijayanagara, the "City of Victory," the greatest of all medieval Hindu capitals, was founded in 1336 CE by Hukka and Bukka, two princes of a local family, the Sangama. This dynasty rapidly extended its control over the whole of

southern India. The power vacuum left in this region after the disruption caused by the Muslim invaders in the early years of the fourteenth century created the ideal political situation for the emergence of a new ruling house.

The Vijayanagara empire, until 1565, the year of its fall, was ruled by three dynasties, the Sangama (1336–1485), the Saluva (1485–1505), and the Tuluva (1505–1570). The most distinguished king, not only in Vijayanagara history but also in the history of medieval India, was Krishnadevaraya (1509–1529). His campaigns against both the sultans of the Deccan in the north and the Gajapati dynasty of Orissa in the east were successful. At the same time, he maintained good relations with the Portuguese on the west coast. Krishnadevaraya was an accomplished scholar and poet in Sanskrit and Telugu, and his reign saw arts, architecture, engineering, and learning flourish. He renovated and built temples throughout the empire to which he gave generous gifts; he also endowed religious institutions.

Krishnadevaraya's half-brother Achyutaraya (1529–1542) succeeded him and continued the same enlightened policy. However, in the power struggle following his death, the faction led by Ramaraya, Krishnadevaraya's son-in-law, triumphed, and Sadashiva, Krishnadevaraya's nephew, was placed on the throne with Ramaraya as regent. The regent became involved in rivalries among the Deccan sultans with fatal consequences. At the end of a long series of alliances and wars, resulting in territorial gains and increased political power for Vijayanagara, the Deccan sultans buried their differences and in a joint action defeated Ramaraya in a decisive battle at Talikota (now in northern Karnataka) in January 1565. The invading armies of the sultans occupied, sacked, and torched the capital for six months. The Vijayanagara state never fully recovered, and Vijayanagara ceased to be the capital. Two years later, tigers were reportedly roaming through the ruins.

It has often been stated that Vijayanagara was founded in an attempt to establish a new political and moral order based on traditional Hindu cultural values. Although the wars against the sultans of the Deccan were frequent, their cause was more political and economical than religious. On the one hand, the victims of Vijayanagara expansion were not always Muslim, but often were minor Hindu dynasties. On the other hand, a strong contingent of Muslim troops was crucial for the successes of the Vijayanagara army. The Vijayanagara power, however, limited the expansion of the Muslim power in the Deccan for over two cen-

turies and created the conditions for the flourishing of Hindu culture and institutions.

VINDHYA MOUNTAINS The Vindhya Mountains, an east-west range in central India, divide the subcontinent into two major geographical zones, the Indo-Gangetic Plain to the north and the Deccan Plateau to the south. The range reaches heights of 500–1,500 meters, and forms the northern edge of the Narmada Valley. Uniting the Eastern and Western Ghats at its two extremities, the range forms one side of the triangle known as the Deccan Plateau. The Vindhyas contain some of the oldest rocks in India—granites, schists, and marbles—and are geologically the northern front of Gondwanaland where it abuts the Himalayas. The Indo-Gangetic Plain is the infilling of a trough between the two.

The Vindhyas have been of crucial importance in the historical geography of India because they were sufficiently high to dissuade most invading groups from pushing further south into the Deccan Plateau, instead deflecting invaders eastward along the Gangetic Plain. The Vindhyas are largely inhabited by such important Scheduled Tribes as the Bhils.

Paul Hockings

VISAYAN ISLANDS (2000 est. pop. 15.5 million). Surrounded by the Visayan Sea and the Philippine Sea, the Visayan Islands lie in the central part of the Philippine archipelago, between Luzon and Mindanao Islands. The group includes several major islands: Bohol (land area 3,865 square kilometers), Cebu (land area 4,422 square kilometers), Leyte (land area 7,214 square kilometers), Negros (land area 12,705 square kilometers), Panay (land area 11,515 square kilometers), Samar (land area 13,080 square kilometers), and Masbate (land area 3,269 square kilometers). There are also hundreds of small islands in the group.

The Visayas are traditionally divided into three geographic areas: the Eastern Visayas (Samar and Leyte) with a population of 3,610,355 (2000 census); the Western Visayas (Negros and Panay) with a population of 6,208,733 (2000 census); and the Central Visayas (Bohol and Cebu) with a population of 5,701,064 (2000 census).

The Eastern Visayas are the least-developed and least-populated islands in this group, due to frequent typhoons during the wet season; because they act as a buffer, the other Visayas enjoy a mild climate suitable to intensive agriculture. The population in the Eastern Visayas relies largely on fishing and agriculture (abaca or Manila hemp, a fiber from the banana leaf-stalk; coconuts; rice; and corn). Copper mining, deforestation, and industrial development have caused serious ecological problems on Samar Island.

Better developed due to the mild climate, the Western Visayas are important commercial and agricultural centers for the Philippine economy and produce sugar (both for internal consumption and for export), abaca, coconuts, corn, tobacco, minerals, and timber.

The Central Visayas are among most developed and most densely populated regions in the Philippines. Cebu, the first capital of the Philippines, is situated here. The Central Visayas host many industries, including textiles, footwear, mining (coal, copper, limestone, silver), food processing, and furniture. This area is also a major tourist attraction.

For centuries before European colonization, Malays from the Malay Peninsula and Borneo Island successfully traded with the Philippine Archipelago and often settled there. The modern history of the Visayas began on 7 April 1521, when Ferdinand Magellan (c. 1480–1521), the Portuguese explorer, landed on Cebu Island. Almost half a century later, the Spanish, led by Miguel Lopez de Legazpi (c. 1510–1572), established a settlement and a Catholic mission on Cebu Island on 27 April 1565, making Cebu City a major center for the further colonization of the archipelago.

VISHAKHAPATNAM (2001 est. pop. 1.1 million). Vishakhapatnam (Vizagapatam, or Vizag) is an important industrial city and seaport on the east coast of India, and the headquarters of Vishakhapatnam District in the northeast corner of Andhra Pradesh state. The city lies on a small bay 600 kilometers northeast of Madras and includes the old resort of Waltair, reputed to have the finest beach in India. The population was 752,000 in 1991, having grown eighteenfold since the beginning of the century. Vishakhapatnam has a large oil refinery and a shipbuilding industry. Mangane ore, rice, and sugar are also produced in the area.

A British factory, established in Vishakhapatnam, early in the seventeenth century, was captured by the French in 1757, but was recovered within a few months. There was a minor sepoy revolt in 1780; otherwise, the town has been remarkably peaceful and prosperous in modern times. Sixteen kilometers north of the city is the thirteenth-century sanctuary of Simhachalam, with a stupa and monastery secluded in the wooded Kailasa Hills. The monastery remains a popular site of Hindu worship.

VIVEKANANDA, SWAMI (1863–1902), Indian philosopher and religious leader. Swami Vivekananda (meaning "the bliss of spiritual discrimination") is the monastic name of Narendranath Datta. He was a major philosopher, author, social reformer, and religious and intellectual leader of India and the world. He brought back its original universalism to Hinduism, made it available to India and the world, and included service to humanity as an integral element of personal salvation.

Narendranath Datta was born in an affluent Westernized Bengali family in 1863. He received his bachelor's degree from Calcutta University in 1884. He was an accomplished classical musician and singer and knew Bengali, English, Sanskrit, Hindi, and French well. A member of the Brahmo sect, a vigorous monistic reformed version of Hinduism, Datta came in contact with Ramakrishna Paramhansa (1836–1886) in 1881. Ramakrishna was not formally learned but had an immense knowledge of all religions and accepted their validity as paths for personal salvation, though he was mainly a worshiper of the Omnipresent in the form of the goddess Kali. After much conflict, personal and with Ramakrishna, Datta finally accepted Ramakrishna as his spiritual adviser (guru) in 1885. He renounced the world, became a Sannyasi (Hindu monk), and commenced an intense study of philosophy and religion.

From 1890 to 1893, Vivekananda traversed all of India on foot and met people of all classes of society. He was moved by the poverty, ignorance, and ill health he saw. With the encouragement and support of the raja of Khettry, Vivekananda traveled to the United States to attend in September 1893 the World Parliament of Religions held in Chicago. His initial speech overwhelmed the audience. Through his many speaking engagements and his dynamic personality, he attracted many followers in the United States and later in Britain when he visited that country. Vedanta centers, or societies, were established in the West, and on his return to India, he established both a monastic order (the Ramakrishna Math) and a missionary society (Ramakrishna Mission), which manages hospitals, schools, colleges, and so forth, and which sends monks and devotees to disaster-stricken areas. Currently there are seventy such organizations in India, nineteen in the United States, and fourteen in other countries. Vivekananda's unique blend of Hindu universalism, personal salvation, and service to humanity form the philosophic backbone of these organizations.

VO NGUYEN GIAP (b. 1911), general and commander of the People's Army of Vietnam. Vo Nguyen Giap is best known as the general and commander of the People's Army of Vietnam (PAVN) during the Vietnamese resistance against France and the United States between 1946 and 1973. Giap is widely recognized as an expert in military science and particularly in logistics, tactics, and strategy. His personal style of conducting war, crafted from a wide array of sources and field experiences, enabled the Vietnamese armies under his command to oust both the French and U.S. military forces from his country.

Giap was born in Quan Binh Province in 1911 to a poor family that was fervently anti-French. After reading the writings of Ho Chi Minh (1890–1969), he joined the underground Communist Party in his teens and, because of his anti-French activities, was imprisoned by the French at the age of sixteen. After he was released, he entered the National University in Hanoi and earned a Bachelor of Law degree. After graduation, Giap became a public member of the Communist Party in 1937, coauthored the influential study

Retired General Vo Nguyen Giap in 1991. (VITTORIANO RASTELLI/CORBIS)

The Peasant Problem with Truong Chinh (1907–1988) in 1938, and in 1939 published *The Question of National Liberation in Indochina*, which stressed the importance of protracted warfare for defeating a foreign military adversary. He professed that revolutionary warfare passed through three stages: guerrilla warfare, strategic defensive, and counteroffensive, and worked later to follow this process against the French and the United States.

In 1940 he fled to China after the French banned the Communist Party. There he began a long relationship with Ho Chi Minh. Ho appointed Giap head of the anti-French guerrilla forces, later to be known as the Viet Minh, and ordered Giap to the mountainous region in northern Vietnam, where he successfully recruited and trained hill tribes and lowland Vietnamese for the anti-French cause. Giap's forces made their first attacks against French installations in December 1944 and later, after learning of the Japanese surrender in August 1945, marched his troops into Hanoi. The Viet Minh was able to claim control from the Red River to the Mekong Delta between 19 and 30 August, which enabled Ho to proclaim the new Democratic Republic of Vietnam (DRV) in September 1945. Giap became

the minister of the interior in the new government and later was promoted to the rank of full general and commander of all Viet Minh military forces.

During the ensuing Vietnamese-French war beginning in 1946, Giap shaped the new People's Army of Vietnam (PAVN) into a strong and motivated fighting force with rigorous military training and a program of political indoctrination and education. He depicted Vietnam's war for independence as a political war first and a military one second, a people's war that involved total commitment from the population. His victory at Dien Bien Phu against the French in 1954 ensured his international recognition. After the French ouster from Indochina, Giap led the DRV forces against the Republic of Vietnam and the United States during the 1960s and 1970s. After Ho's death in 1969, Giap shared power in Hanoi with Le Duan (1908–1986) and Pham Van Dong (b. 1906). In 1972, after the failed Easter Offensive, Giap was replaced as commander of DRV forces but retained his position of minister of defense, which he held until 1980. In 1982 he lost his seat on the Politburo but remained very popular with the Vietnamese public. He spent the next years making trips to other Communist countries and in 1992 was awarded the Gold Star Order, Vietnam's highest decoration.

VO VAN KIET (b. 1922), Vietnamese prime minister. Vo Van Kiet, considered a leading reformer, was born in 1922 in the city of Can Tho in southern Vietnam. He became involved in anticolonial and revolutionary activities in the 1940s. Following the August Revolution of 1945, Vo Van Kiet became an important member of the Vietnam Communist Party in southern Vietnam. In the early 1970s, he served as secretary of the Saigon Municipal Party Committee. After reunification in 1975, he was named chairman of

Ho Chi Minh City's People's Committee and in 1976 replaced Nguyen Van Linh as chairman of the Ho Chi Minh City Party Committee, a position he held until 1982. During this time, Vo Van Kiet established more liberal trade and commercial policies, which later became part of Vietnam's *doi moi* period. He became a member of the Politburo in 1982. He was named acting prime minister following the death of Pham Hung (1912–1988) but was defeated in an election for that post later that year. He was vice premier and chairman of the State Planning Commission in 1986 and then served as prime minister from 1992 to 1997. In 1997 he chose not to run for office and was replaced by Phan Van Khai (b. 1933).

VOLCANOES Of the more than 1,500 potentially active volcanoes in the world, eight to ten are erupting at any given moment. On the bottom of the seabed circling the Pacific basin lies a series of volcanic arcs and oceanic trenches coinciding with the edges of one of Earth's main tectonic plates. This zone is called the Ring of Fire, because of its frequent earthquakes and volcanic eruptions. About 80 percent of these volcanoes are located in countries in Pacific Asia. The most volcanically active country in Asia is Indonesia, which has seventy-six historically active volcanoes, four-fifths of which erupted in the last century. Ten have erupted since 1990.

Volcanoes form when a break in Earth's crust allows magma (molten rock) and hot gas to reach the surface under pressure, resulting in dangerous eruptions. The main threats in the immediate area of these eruptions are high-speed, superheated toxic gases and debris (pyroclastic flows), blast effects, lava flows, volcanic earthquakes, landslides, and lahars (mudflows). Ash clouds or deposits and tsunamis (tidal waves) can be hazardous over a greater distance. Volcanoes can cause immense destruction to crops, forests, roads, and entire towns, resulting in many evacuees who must be sheltered, fed, and resettled.

While Japan's cone-shaped Mount Fuji presents an image of a volcano's majestic beauty, the volcanoes of the Philippines have earned the reputation of being the most deadly and costly in the world. On average

UJUANG KULON NATIONAL PARK-WORLD HERITAGE SITE

A UNESCO World Heritage Site since 1991, Ujung Kulon National Park is located on the southwest tip of the Indonesian island of Java. Ujung Kulon is home to a treasure trove of rare species and spectacular inland volcanoes.

over 13 percent of volcanic eruptions cause fatalities and 22 percent cause damage. The 1991 eruptions of Mount Pinatubo, for example, caused an estimated US\$260 million in damage. The series of eruptions lasted for months, producing the largest cloud of climate-modifying gases since mighty Krakatau erupted in Indonesia in 1883. Scientists estimated that Pinatubo's eruption added more aerosols (light gases and particles) than all human activity since the industrial revolution. The cooling effect of these particles on the atmosphere lasted for two years and temporarily more than offset any global-warming effect.

Many Asian countries have increased their volcano research and monitoring, to provide greater warning time of likely eruptions and to broaden natural-hazard management programs. Although these efforts help to mitigate the impacts of volcanic eruptions on humans and property, volcanic eruptions will persist as a significant natural hazard throughout countries located in Asia's Ring of Fire.

VOLKSRAAD From the 1870s until the first half of the twentieth century, concern was expressed in the Netherlands over people's welfare in the Dutch East Indies (now Indonesia). There were also calls within

the Indies itself for greater self-government. This gave rise to the Ethical Policy, whereby the Netherlands tried, among others, to bring indigenous elements into the colonial service, provide education, develop agriculture, establish health programs, and decentralize authority. This last objective saw the establishment of a Volksraad (People's Council), a single-chamber debating forum that lasted from 1918 to 1942.

Established on 18 May 1918, the Volksraad comprised both elected and appointed officials. Apart from being a place to voice ideas and criticisms, the council had no official powers, merely functioning in an advisory capacity. Dutch authorities were able to dominate the council through appointment of sympathetic elements and Dutch settlers. However, indigenous members (under 50 percent of the representatives) were able to communicate their desire for self-determination at this body, notably through insisting that Bahasa Melayu (Malay) be used alongside Dutch as a working language. In the year of the Volksraad's establishment, Dutch colonial authorities vaguely promised self-government in the "November Promise," which gave moderates hope of an evolutionary path to independence.

After its first decades, the council was strongly influenced by the political wing of Budi Utomo, an organization prepared to work within Dutch rule to achieve independence. However the failure of emergent political parties, such as Budi Utomo, to effect real change working within the Dutch administration lent greater credence to those, like Sukarno (Indonesia's founding president in 1945), who chose non-cooperation. In 1936, council member Sutardjo proposed self rule within ten years, but the proposal was obfuscated and dropped, disappointing those who favored working within the colonial administration. From then on the Volksraad was a dead letter.

The Volksraad had little impact on Dutch rule, as the Netherlands continued to solidify its grip on the archipelago, increasingly interfering in the everyday lives of the people. However the Volksraad was a factor in the emergence of a "pan-Indonesian" consciousness among the diverse peoples of the archipelago.

WAHID, ABDURRAHMAN (b. 1940), president of Indonesia. Born in East Java in 1940, educated (although without formal degrees) in the Middle East and Europe, and heir to Muslim elite, Abdurrahman Wahid became the head of Nahdatul Ulama, Indonesia's largest Islamic organization, gained broad national respect for leadership and candor in criticizing the dictator Suharto in the 1990s, and finally established the National Awakening Party (PKB) to compete in 1999 in Indonesia's first relatively open parliamentary election in forty-four years.

Urbane, multilingual, courageous, and ecumenical, Abdurrahman Wahid (commonly called Gus Dur) was elected president of Indonesia in October 1999 by the

President Wahid at a press conference in Jakarta in November 1999. (AFP/CORBIS)

National Assembly (MPR), which also forced him from office less than two years later. Initially he was widely heralded as the perfect reformer and balm to deep national wounds from decades of autocracy, oppression, and corruption. In reality he faced crippling obstacles.

Voting irregularities and confusion in the constitutional process raised serious questions of legitimacy in Wahid's election. Military supremacy in actual governmental authority (the legacy of decades of dictatorship), pervasive institutional corruption, general economic implosion, and the marginality of his own electoral and political party base fatally constrained his presidential authority and influenced selection of his cabinet. Physical (and, reportedly, psychological) problems from recent strokes left him with sharply diminished motor coordination and energy, as well as near blindness. Soon, despite whirlwinds of international travel, jocularly effective cultivation of media and domestic publics, cheerleading about Indonesia's future, and a few reformist flourishes, Wahid proved incapable of governing. Erratic behavior, scapegoat-ism, and allegations of corruption accumulated quickly and led to his ouster by the MPR and replacement by his vice president, Megawati Sukarnoputri.

Roger Paget

WAKAYAMA (2002 est. pop. 1.2 million). Japan's Wakayama Prefecture is situated in the central part of the island of Honshu. Its 4,723 square kilometers encompass the almost completely mountainous terrain of the western Kii Peninsula. Wakayama is bordered by the Pacific Ocean, Kumano Sea, and Kii Channel,

and by Osaka, Nara, and Mie prefectures. Once known as Kii Province, it assumed its present name and borders in 1871.

The prefecture's capital is Wakayama, which grew up around a castle erected in 1585 by Toyotomi Hideyoshi (1536–1598), one of Japan's three national unifiers. The prefecture has long been the home of the Koyasan Buddhist monastic complex and the Shinto Kumano Sanzan shrines. It was ruled through the Edo period (1600/1603–1868) by a branch of the Tokugawa family. The prefecture's other important cities are Tanabe, Kainan, and Singu.

The prefecture produces rice and mandarin oranges, and supports fishing and forestry. When the Hanshin Industrial Zone was extended southward from Osaka, it brought chemical, steel, and electrical equipment plants to supplement Wakayama's traditional spinning, and furniture-making and papermaking industries. Visitors are drawn to the area's coastal scenic attractions and to sacred Nachi Falls, one of the nation's highest.

"Wakayama Prefecture." (1993) *Japan: An Illustrated Encyclopedia*. Tokyo: Kodansha.

WAKHAN Wakhan is a high, narrow valley in the Pamir Mountains of northeastern Afghanistan, between Tajikistan and Pakistan. It is located in northeastern Badakhshan Province around the Wakhan River and extends from Ishkashim in the west to China in the east. The Great Silk Road passed through Wakhan, and Marco Polo is said to have stopped there on his way to China.

In 1896, the Anglo-Russian Boundary Commission awarded this area to Afghanistan in order to create a buffer zone between British India and Russia; thereafter, the area became known as the Wakhan Corridor. Previously, it had been an autonomous region ruled by an independent emir (prince) until 1882, when it came under the administrative control of the governor of Badakhshan.

The region is known for its biodiversity. It has an alpine fauna, which provides a good habitat for the famous Marco Polo sheep, ibex, snow leopard, and brown bear. The area is also rich in lapis lazuli, the rare, bright blue semiprecious stone much prized in antiquity.

Its inhabitants are the Wakhis and Tajik, who live along the upper reaches of the Panj River and who

speak an Indo-Aryan language. The main occupations are farming (wheat, barley, and legumes), and herding (cattle, sheep, and goats). As well, there are Kyrgyz herders, who have domesticated the yak. Both the yak and the two-humped Bactrian camel are important beasts of burden in the region.

Before the Marxist coup in 1978 (known as the Saur Revolt), the Corridor attracted hunters who came for the Marco Polo sheep, as well mountain climbers. Few outsiders currently venture into the area, but this may change as the region stabilizes.

WALI ALLAH, SHAH (1703–1762), Indian theologian. Shah Wali Allah Dihlawi, a leading Muslim theologian and intellectual of India, was born in Delhi to an important family at the court of the Mughal emperors. An exceptional student, in 1719 Wali Allah succeeded his father as head of the religious college, Madrasah Rahimiyya, in Delhi. In 1731 he made the pilgrimage to Mecca, where he remained for fourteen months before returning to Delhi. During his stay in Arabia he studied Islamic law, hadith (narratives of Muhammad's life), and mysticism with eminent scholars who influenced his religious beliefs.

During the next thirty years he dedicated himself to teaching and writing on hadith traditions and Islamic law, in Arabic and Persian. Wali Allah is considered the father of Indian Islamic modernism and a major figure in the Islamic intellectual revival. He used a systematic historical approach to try to renovate traditional religious thought organized around the doctrine of *tatbiq* (conciliation)—a method for mitigating the conflict between Sufi mystical doctrines and theological dogmatism.

In his analyses Wali Allah underlined the importance of social and economic welfare, linking the degeneration of Islamic thought and practices to the economic and social decadence of Indian Muslims. His ideas influenced several religious and political revolutionary movements in the Indian subcontinent in the eighteenth and early nineteenth centuries.

WAN AHMAD (d. 1914), ruler of the Malay state of Pahang. Wan Ahmad was the all-powerful *bendahara* (1863–1887) and first sultan (1887–1914) of the peninsular Malay state of Pahang, who for two decades resisted British influence. Born into the hereditary line of *bendahara* (prime ministers), Wan Ahmad was the son of Bendahara Tun Ali (1806–1857). He had to struggle in a bitter, devastating six-year civil war (1858–1863) against his half-brother, Tun Mutahir. He prevailed in May 1863 and having assumed the title of *bendahara*, ruled Pahang with an iron fist.

The rumored potential economic resources of Pahang and the fear that other European powers (notably France and Germany) might gain a foothold there made it imperative for the British to pressure Wan Ahmad to accept the Residential system. Through the efforts of Hugh Clifford, Wan Ahmad signed a treaty in October 1887 to accept a British Agent; the British in turn recognized him as sultan of Pahang. Although some quarters perceived Wan Ahmad to be kind and generous, others, including Clifford, saw him as ruthless.

In 1888, Wan Ahmad bowed to British pressure and agreed to receive a British Resident. Theoretically the British Resident served as an adviser to the sultan on all matters excluding those relating to Malay customs and the Islamic faith. In practice, however, the Resident exercised executive power. After 1889, Wan Ahmad, who detested the new regime, withdrew to the background, but lent his tacit support to disaffected Pahang Malay chiefs, whose dissatisfaction with the British system of governance erupted in an anti-British resistance in the 1890s.

WANDERING SOULS In Vietnam obsequies customarily have been performed to ward against the

possibility of the deceased's becoming an errant, malevolent being, or "wandering soul." The Vietnamese have traditionally believed that the souls of those who have died have influence over, and can be influenced by, actions and events in the world of the living. It is thought that when they die, the departed want and need ritual support from the living. For almost everyone, this support is provided by their family. Vietnamese understand "family" to extend across many generations, including both the living and the dead.

A series of rituals are held for the deceased. The full set, now often simplified by many people, would include rituals held immediately after death, at the funeral, at burial (sometimes reburial), at weekly intervals for seven weeks, and finally after one hundred days. Additionally, ritual celebrations are still held for departed family members on the anniversary of their death, and rituals are organized on New Year's Eve to welcome the ancestors who, it is believed, come to share in this big family celebration. Important events are reported to the ancestors.

Under ideal circumstances, the deceased remain participating members of the family—contented, happy, quiet, invisible. They are often thought to provide their descendants with advice, warning of danger, or good luck. But those unfortunate people who die without descendants, or violently, or far from home, or for any reason lack the necessary assistance of incense and offerings may become errant spirits, or wandering souls. These spirits are believed to be miserable, discontented, and sometimes dangerous to the living. Vietnamese have always had some means of guarding against these spirits and of helping them to find peace.

Well into the twentieth century, on the outskirts of many Vietnamese villages, a plot of land was set aside as a burial ground. Beside the burial ground there was often a modest building known as the "temple of wandering souls" (*am chung simb*). Such temples were simply a place to make sacrifices to wandering souls. Often, an older woman, sometimes a shaman, lived at or near the temple and made periodic offerings to wandering souls. Village groups or individual households put out rice gruel and made other ritual offerings to the souls, especially on the fifteenth day of the seventh lunar month. On this day, in various ways, individually and in groups, villages commemorated wandering souls and tried to placate them and even help them find peace. Some of these practices have become rare in recent decades, or have been greatly simplified.

Even now, on this day, exactly the middle of the lunar year, a special ceremony, usually the most important of the year, is organized in Buddhist pagodas

throughout Vietnam. Many Vietnamese associate this day and this Buddhist tradition with the tale of Mu Lien, a Buddhist monk who went into hell to plead successfully for the release of his mother. But in this case, offerings are made to plead for the salvation of all discontented spirits, including those in hell, in the Buddhist spirit of charity.

WANG JINGWEI (1883–1944), leader of China's Nationalist Party. Wang Jingwei was an early leader of China's Nationalist Party (Guomindang), whose fierce rivalry with Chiang Kai-shek (1887–1975) led him to collaborate with the Japanese during World War II. Born in Guangzhou (Canton), Wang won a government scholarship to study in Japan, where he received a degree from Tokyo Law College in 1906. While in Tokyo, he joined Sun Yat-sen's (1866–1925) National Revolutionary Alliance (Tongmenghui) in 1905. Wang, who demonstrated considerable writing and speaking skills, quickly rose to a prominent position in the movement. Imprisoned for participation in a plot to assassinate the Qing regent Prince Chun in 1910, Wang was released after the fall of the Manchus, or Qing dynasty (1644–1912).

Although Wang was hailed as a hero for his revolutionary activities, he left China in 1912 after the assumption of power by the militarist Yuan Shikai (1859–1916). Returning in 1917, Wang rejoined Sun in Guangzhou, where they worked to reorganize the Nationalist Party (Guomindang, as the Tongmenghui had been renamed) and build an army with the ultimate goal of reunifying China. Sun's death in 1925 left Wang seemingly positioned to take control of the Party, but his path was blocked by a new rival, Chiang Kai-shek. Although Chiang was a relative newcomer to the Nationalists and lacked Wang's revolutionary credentials, he did control the army. This would prove decisive in the coming power struggle.

As the Nationalists and their allies (including the nascent Chinese Communist Party) embarked on the

Northern Expedition to reunify China, Wang emerged as the leader of the left wing of the Party (favoring the alliance with the Communists), while Chiang headed the right wing, which opposed the alliance. This dispute led briefly to the formation of separate Nationalist governments headed by Wang in Wuhan and Chiang in Nanjing. Wang later broke with the Communists and mended fences with Chiang in a show of unity following the Japanese invasion of 1931.

As titular head of the Nationalist government in Nanjing from 1932 to 1935, Wang was forced to appease the Japanese, while Chiang led the army in a campaign to exterminate the Communists. To recover from an assassination attempt, the disillusioned Wang resigned and left China in 1935. He returned after the outbreak of the Sino-Japanese War in 1937 and pessimistic about China's military prospects, attempted to persuade Chiang to make peace with Japan. After escaping another assassination attempt by Nationalist agents, Wang fled to occupied China, where the Japanese Army installed him as head of the puppet "Reorganized Nationalist Government" in Nanjing in March 1940. Wang's hopes of presenting himself as a credible alternative to Chiang, however, were dashed by the harsh reality of Japanese military domination. Wang died on 10 November 1944, while undergoing medical treatment in Nagoya, Japan.

WANG KON (877–943), founder of the Koryo dynasty, Korea. Wang Kon, posthumously known as T'aejo, was born in Songak (modern Kaesong, North Korea). He came from a prominent merchant family that had built up its wealth in the China trade. At the start of the tenth century, Wang Kon became a major lieutenant to a regional lord, Kungye (d. 918). Under him, Wang Kon proved to be both an able soldier on land and a skilled commander at sea. In 918, wearied by Kungye's tyrannical acts, Wang Kon overthrew Kungye and founded a new dynasty called Koryo (918–1392).

From his capital at Songak, Wang Kon struggled to unify the Korean peninsula. In 935, the former

Shilla kingdom (57 BCE–935 CE) peacefully surrendered to Koryo, and then in 936 Wang Kon forced the other rival state, Later Paekche (18 BCE–663 CE), to submit. With the kingdom unified, Wang Kon spent the remainder of his reign stabilizing the dynasty. He married twenty-nine women from various parts of the peninsula, used both indigenous techniques and political institutions modeled on Chinese practices, and turned to Buddhism as ways to unify the country. Before he died, he issued Ten Injunctions instructing his descendants how to govern so as to ensure the success of the dynasty. These Ten Injunctions serve as an excellent political and intellectual statement of the era. Three of Wang Kon's sons succeeded him as monarchs.

WANG YITING (1867–1938), painter and businessperson. Wang Yiting was born in Shanghai and began life as an apprentice in a picture-mounting shop, later becoming a comprador for a Japanese company. He was extremely successful in his business career and served as chairperson of the Shanghai Chamber of Commerce.

Wang Yiting was also a generous supporter of artists and helped to found many important art societies in Shanghai. He was proficient in painting historical figures, folk legends, birds with flowers, animals, and landscapes and was particularly renowned for his Buddhist figures and dragons. In later life, Wang became a devout Buddhist and once served as the president of the Chinese Buddhist Association.

WANGCHUCK, JIGME SINGYE (b. 1955), King of Bhutan. Fourth of the Wangchuck dynasty founded by Ugyen Wangchuck in 1907, King Jigme Singye Wangchuck was born in Dechenchholing Palace, Thimphu (the capital of Bhutan), on 11 November 1955 and was educated in Bhutan and in England. He ascended the throne in 1972, following the premature death of his father, Jigme Dorje Wangchuck. He was crowned in 1974, the coronation allowing the outside world a rare glimpse of the remote Himalayan kingdom. The Wangchuck family claims descent from the most famous Bhutanese saint, Pema Lingpa (1450–1521). In 1988 the king married four sisters related, according to tradition, to an incarnation of the founder of the Bhutanese state, Shabdrung Ngawang Namgyal (1594–c. 1651). The crown prince is the king's eldest son, Jigme Khesar Namgyal (b. 1980).

The king maintains a policy of balancing modernization with tradition, called Gross National Happiness. He believes that as a small, landlocked, and undeveloped country, Bhutan must promote national unity based on the Bhutanese cultural heritage, including environmental awareness, while expanding its international role in the U.N., South Asian Association for Regional Cooperation, or SAARC (which includes

King Jigme Singye Wangchuck. (ALAIN LE GARSMEUR/CORBIS)

India, Pakistan, Sri Lanka, Maldives, Bhutan, Bangladesh, and Nepal), and other bodies.

Although a proactive ruler, the king has gradually yielded more power to his ministers. Since 1998 a rotating chairman of the Council of Ministers functions as head of government. The king has also reduced the powers of the civil service, privatized many state enterprises, and devolved decision making to the local level. He has also pledged to make himself personally responsible for the solution of the so-called southern problem of Bhutanese refugees in Nepal and has toured the country repeatedly requesting southern Bhutanese not to leave.

WARRING STATES PERIOD-CHINA

The name "Warring States" (*Zhanguo*) refers to a period of Chinese history ending with the unification of China under the first emperor of the Qin dynasty in 221 BCE. While there is universal agreement that the Warring States period ended in 221, the date of its beginning is a matter of convention: some place it in 481, when the chronicle known as *Chunqiu* (Springs and Autumns) draws to a close; others in 453, when the state of Jin was divided into three territories; still others in 403, when each of these three new states was formally recognized by the Zhou king. For the purposes of this book, the Warring States period begins in 475 BCE, the first year of the reign of Viscount Xiang of Zhao, one of the three states that supplanted Jin. The Warring States period constitutes the second half of the Eastern Zhou dynasty (770–221 BCE), while the first half of the Eastern Zhou dynasty is known as the Spring and Autumn period (770–476) BCE, after the chronicle of the same name.

The Eastern Zhou kings were recognized as the Heaven-ordained rulers of the terrestrial world, but they were forced over the centuries to cede more and more power to the feudal lords occupying the lands around them. During this time, the most powerful of the semi-independent statelets gradually conquered and annexed their neighbors, so that by the Warring States period, only eight contenders remained: Zhou, Qin, Qi, Chu, Zhao, Wei, Han, and Yan. In 256 BCE, the last Zhou king, who was by this time nothing more than a figurehead, was finally deposed,

and the Chinese world awaited the final victory of the state of Qin.

Political Changes in Warring States Times

The political landscape of the Warring States period was determined by the intensification of several interrelated geopolitical processes that began in the Spring and Autumn period: the ongoing decline of centralized power, the rise of warlike and expansionist states with their own domestic and foreign policies, and the continual diminution in the number of autonomous states as the weakest were annihilated by the strongest. By Warring States times, these underlying historical forces had brought about pervasive political, economic, social, and intellectual changes that radically transformed the character of Chinese life.

"Agriculture and war" became a popular slogan, as states recognized the substantial benefits of a healthy economy and a mighty army. As the stakes of battle rose, the conception of war necessarily changed from a ritualized competition between educated aristocrats (as in the Spring and Autumn period) to a lawless and bloody struggle between infantry armies as large as could be mustered.

The logistical problems associated with raising, training, and supplying a massive army induced rulers to rethink their approach to governing their territories. Those rulers who could most fully exploit their resources gained a sizable advantage in the theater of war. Thus the demands of battle led to the restructuring of the state as a vast production ground of people and munitions, maintained by an efficient and organized administration and serving a single king, to whom the entire population owed unquestioning allegiance. Kinship ties, ritual obligations, and traditional practice, which had been significant considerations guiding human action in earlier times, were now subordinated to the material requirements of the "warring state." In this manner, the imperial model of Chinese statecraft was being forged even before the establishment of the empire itself. The governments of the Qin and Han dynasties were largely based on the precedents of the Warring States.

Birth of Chinese Philosophy

The Warring States period is celebrated as the foundational era of Chinese philosophy. Historians sometimes ask why such a tumultuous and perilous time provided the context for some of the most sophisticated philosophers in Chinese history, but the reasons for this intellectual burgeoning are not obscure. The competing lords valued any resource that

might aid them in their quest for world dominion, and so they were willing to listen to new ideas. The old ways, after all, were leading the Zhou dynasty to assured extinction. The demand for original thinkers resulted in the growth of a new profession: "wandering persuaders" (*youshui*), who traveled freely from state to state in search of landed patrons, earning their bread alongside diplomats, generals, diviners, and other educated specialists.

The two foremost philosophical schools in Warring States times were those of the Confucians and the Mohists. The former were followers of the ethical worldview laid down by Confucius (Kong Qiu, 551–479 BCE); the latter group was founded by Mozi, or Master Mo (Mo Di, c. 480–c. 390 BCE), who preached a philosophy of "universal love" (*jian'ai*). The Confucians and Mohists were irreconcilable enemies—Confucians could never accept the Mohist tenet that one should love the father of one's neighbor as one loves one's own father—but they were alike in that their doctrines did not always coincide with the desires of the lords whom they served. Confucians, for example, believed that loyal advisers should remon-

strate (*jian*) with their lord when he was in error, and their outspoken criticism often alienated their superiors. Mohists, for their part, believed that human acquisitiveness was at the root of all suffering in the world, and they actively disrupted campaigns of conquest in the hope of deterring warlords from preying on their neighbors.

Other philosophical orientations were more amenable to the aspirations of rulers. Political philosophers such as Shan Buhai (flourished 354–340 BCE), Shen Dao (b. c. 360 BCE), and Han Fei (d. 233 BCE) formulated an ideal of statecraft (often misleadingly called "legalism") that relied on standardized laws, protobureaucratic administrative systems, and unfailing adherence to the protocols of reward and punishment. The political aspect of philosophy was so important that even the *Laozi* (or *Daode jing*), a text whose primary purpose is to elucidate the benign cosmological notion of "the Way" (*dao*), takes pains to point out the political applications of its teachings.

WAT XIENG KHOUAN Wat Xieng Khouan or the Buddha Park is a cement sculpture garden of religious, mythological, and secular beings located approximately 20 kilometers south of Viengchan by the Mekong River in Laos. The creator of the sculpture garden, Luang Pou Bounluea Salithat (1920?–1996), studied both Buddhism and Hinduism but never completed his ordination into Buddhist monkhood. Based on his prophetic dreams and meditation practice, he developed a religious community of Lao, Thai, and foreign laypeople.

In the late 1950s, he oversaw the creation of the images for the park—phantasmic imagery that includes the Buddha in different postures, other gods in the Hindu and Buddhist pantheons, mythological animals

such as the *naga* or serpent god, and humans who were prominent religious figures. One unique sculpture is a life-size pumpkin containing three levels. The lower level is hell; the middle level is the earth; and the upper level is heaven.

Wat Xieng Khouan was never a Buddhist temple, but received its name from all the religious images it contains. The socialist government presently runs Wat Xieng Khouan as a public park and a tourist attraction.

After the Communist takeover in 1975, Luang Pou Bounluea left Laos and went to live across the border in Nongkhai, Thailand. He then commenced to create a second sculpture park on the Mekong River bank in Thailand, opposite the original park.

WATER ISSUES For the people who live in Asia, daily life depends on the freshwater that reaches their fields, serves their households, and provides means of transportation. Agriculture consumes 70 percent of freshwater available around the world. Water scarcity and quality have emerged to threaten public health, economic productivity, and even food security in parts of the continent.

Water has become an increasingly critical natural resource for many Asian states' residents, technicians, and leaders. The continent's greatest challenge is to ensure sustainable access to freshwater resources. The specific water issues discussed here bear witness to the vulnerability of ecosystems to change in the domestic and international political environments.

Governance entails management of water resources at the regional, national, and local levels. Water governance refers to a range of economic, political, and administrative systems put in place to develop and manage water resources, as well as to provide water services. Water governance draws on issues in the public sphere, invoking the interventions of state and, increasingly, multilateral parastatal institutions.

Throughout the second half of the twentieth century in particular, public and multinational officials sought to promote economic and social development through intervention in water distribution for use in agriculture and industry. Interventions dedicated to the storage and seasonal management of Asia's fresh-

water—ranging from hydroelectric dams to forestry and intensive agriculture programs—are the topic of public discussions among Asian political communities. Modernist visions for quality of life include access to potable water and services as well as intensive agricultural cultivation. Considered in the light of water governance, these interventions generated water-management issues specific to Central Asia.

Urban Drinking Water, Sanitation, and Material Quality-of-Life Indicators

Water issues are central to the expansion of modern infrastructure serving Asia's residents. Officials argue the value of such interventions in raising the quality of life for Asia's residents, citing that of the 3.5 billion people living in Asia in 1995, 830 million lacked access to treated drinking water, and 2 billion had no access to sanitary waste disposal.

Demographers note that Asia's population growth is increasingly concentrated in large cities, as a result of population growth and rural-urban migration. It is projected that following the year 2020, the developing world's population growth will occur mainly in urban areas. By the middle of the twenty-first century, villages will cease to exist in many countries—including in Asia—and poverty will have been transferred to urban areas.

In Asia's modern states, water systems are centralized, depending on public investment and transfers of resources from central governments. Yet the large cities of Asia are characterized by permanent, informal settlements with restricted access to modern facilities. Consequently, residents are less likely to have access to potable water and private toilets than are people in smaller towns and even villages.

Data from many developing-states' cities suggest that the substantial progress in improving water and sanitation in recent decades is now being reversed. For this reason, analysts suggest that future water and sanitation policies and strategies be directed to urban areas, particularly to periurban areas and satellite towns where the most disadvantaged people live.

Decreasing Volume of Available Water Resources

There is a drastic decrease in the amount of water available in the Aral Sea basin, located between Uzbekistan and Kazakhstan. Kazakhstan's western area, along the Syr Dar'ya River to the Aral Sea, is relatively unpopulated, with large stretches of uncultivated desert landscape; the concentration on few commodi-

ties has resulted in common water issues shared among Central Asian communities.

In 1960, the Aral Sea was the world's fourth-largest sea. Since that time, its volume has decreased by 75 percent and its surface area by 50 percent, so that it is currently ranked eighth largest. A closed hydrological system, it receives water from two tributaries (the Amu Dar'ya entering from the south and the Syr Dar'ya from the east). Until the 1960s, the Syr Dar'ya and Amu Dar'ya Rivers' combined outflow into the Aral Sea totaled about 6 cubic kilometers per year. During the next twenty years, the sea came to release more water than it received, via perennial irrigation networks, seepage, and evaporation.

In opening up new lands for cultivation, Turkmenistan's navigable Kara-Kum Canal contributed to the drying up of the Aral Sea. The canal, under construction between 1954 and 1988, diverted a significant amount of the Amu Dar'ya's waters along its 1,100-kilometer length through and into the Kara-Kum Desert in Turkmenistan and through and beyond the republic's capital of Ashkhabad. The canal's primitive design allows almost 50 percent of its water to escape via seepage and evaporation.

The amount of water available to the Aral Sea's hydrological system has decreased as a direct result of the expansion of irrigation drawing on the Aral Sea basin's freshwater resources between the 1960s and the 1980s. Increased water usage for agriculture in the Aral Sea basin caused the amount of water reaching the sea to drop by as much as 90 percent over this period. Consequently, by 1989, 28,000 square kilometers of the Aral Sea floor had dried up, exposing salt beds. At present, the sea contains less than half the amount of water that it did in 1960.

As the inland sea shrinks, salt-laden dust from the exposed seabed blows to locations more than 300 kilometers distant, ruining the soil and killing plants wherever it lands. The sea's salinity has increased to the destruction of a once-thriving local fishing industry. The drying of the Aral Sea has negatively affected well water used by residents along its shores. Also, the loss of the sea's water mass, which once moderated temperatures by absorbing heat in the summer and releasing it in the winter, has affected the local climate.

Decrease in the Quality of Water Resources

While industrial demands for single-crop cultivation increased during the second half of the twentieth century, the contamination of the Aral Sea serves Central Asian states as a negative patrimony from the Soviet Union. Agricultural-industrial monocultures took

A traditional irrigation well in a field in central Turkey in the 1990s. (CHRIS HELLIER/CORBIS)

on a qualitative transformation during the last quarter of the century, marked by the mechanical and chemical invasive forms of cultivation required by the Green Revolution, which in turn affected water quality.

Kazakhstan harvested 23.1 thousand metric tons of rice in 1967, increasing to 654 thousand metric tons by 1987. Cotton was sown on 1,450 thousand hectares of Uzbek land in 1960, which increased to 2,108 thousand hectares by 1987—making Uzbekistan the world's fifth-largest cotton producer.

In keeping with the technical requirements of modern agriculture, petroleum-based fertilizers, chemical pesticides, and artificial defoliant were poured onto cotton fields. In Uzbekistan, an average of 146.8 kilograms of chemical fertilizers was distributed over each hectare of agricultural land in 1965, increasing to 238.3 kilograms by 1975, and doubling to 305.6 kilograms in 1987.

These rates can be compared with only 122.1 kilograms per hectare for the whole Soviet Union (1987).

Central Asian cultivators applied fertilizers at much lower rates following the end of Soviet agricultural chemical subsidies in 1991 and the consequent upward spiral in the price of fertilizers and other additives. However, the earlier period of widespread use of fertilizers in cotton and rice cultivation led to an increase in traces of contaminants of fertilizer origin in irrigation water and field runoff, eventually compromising the quality of the Aral Sea's contents.

Fertilizer contaminants were not the only threat to the quality of the Central Asian water supply. Industrial pesticides and herbicides were also dumped onto Uzbekistan's cotton fields. During the late 1970s, the average hectare of Uzbekistan's cultivated land received between 30 and 35 kilograms of insecticides and defoliants. This high rate of application was unique to Central Asia and can be contrasted with the rest of the Soviet Union. While Soviet centralized planning required industrial-agricultural methods, Uzbekistan's insecticide- and defoliant-application rates were just short of thirty times higher than the average used in the rest of the Soviet Union during the same period.

Leading them was the chlorinated organic insecticide DDT, as well as the lindane insecticide benzene hexachloride. These were supplemented by the insecticides octamethyl and gamma benzene hexachloride. Pesticides included methyl mercaptans, phosphide pesticides, miticide (known under the trade name Milbex), Lenacil, Aldrin (also referred to as Aldrex, Aldrite, and Octalene), and molinate (also known as Hydram, Ordram, and Yalan). Herbicides and defoliants included butifos and the cycloate herbicide ronit (also known by the registered trade name Ro-Neet). Phosalone was used as an insecticide and acaricide, and sodium trichloroacetate was used as both pesticide and herbicide.

Contaminants originating in fertilizers, pesticides, defoliants, and insecticides entered the Aral Sea by leaching off fields into drainage canals, then emptying into the sea's tributary rivers. Thus, the closed hydrological system of the Aral Sea basin was under a double stress: at the same time as the sea's outlet was increased for monocrop irrigation, its two tributaries entered heavily laden with pollutants. The end result was to concentrate contaminants in the sea's decreasing volume.

Declining Quantity and Quality of Water Resources Threaten Residents' Health

The adverse effects of intensive monocrop cultivation were identified in the declining health of Central Asia's residents. Central Asian infant mortality became the highest among the former Soviet republics. High rates of disease prevalence were attributed to the en-

vironmental degradation caused by cotton cultivation. Those living in Kazakhstan's Qyzylorda subdivision, closest to the sea, experienced a rapid deterioration in living standards as the Aral Sea shrank. Salts and pesticides contaminated the region's water and soil and affected the health of the population.

Health professionals attest that local populations are characterized by remarkably high rates of throat and lung cancers, kidney disease, hepatitis, asthma, bronchitis, gastrointestinal ailments, infant mortality, birth defects, anemia, and tuberculosis. During the 1970s and 1980s, Kazakhstan showed a 3.29-fold rise in total morbidity due to various infectious and somatic diseases associated with the drastic worsening of the ecological situation in the Aral Sea region. At the same time, child and maternal mortality rates increased significantly.

The Aral Sea crisis has come to threaten local residents' food security, as well as their long-term health. Investigations at the Institute for Regional Nutritional Problems of the Soviet Academy of Medical Sciences showed that pesticides, mineral fertilizers, and various microorganisms and their toxic metabolites were major pollutants of food products in all regions of Kazakhstan. It is alleged that discharge of agricultural chemicals into the water environment accumulates toxins in local fish.

In addition, since early 2000, regions surrounding the Aral Sea basin, including the Karakalpak Autonomous Republic in Uzbekistan and Khorezm, a subdivision in the same country, have undergone the worst droughts in recent memory. Local authorities report substantial losses to rice, cotton, and other crops, as well as a severe impact on animal husbandry, affecting 1 million residents' access to food. Drastically decreased rains during 2000 meant that Uzbekistan farmers produced just 3 million tons of grain, against an expected harvest of 4.89 million tons.

Neighboring States Share Water Issues

A second water issue encountered in the post-Soviet Central Asian states, in addition to the degradation and diminution of freshwater resources, is a shared dependence on common sources of water. Between 1967 and 1987, Uzbekistan, Kazakhstan, and Tajikistan used water resources located in Kyrgyzstan. Their mutual membership in the Union of Soviet Socialist Republics exempted them from any requirement for formal remuneration. The emergence of new states after the collapse of the Soviet Union in 1991 requires the renegotiating of preexisting water-management mechanisms.

Soviet authorities built seven large hydroelectric and irrigation facilities to serve the four republics of Uzbekistan, Kazakhstan, Tajikistan, and Kyrgyzstan. These provided access to primary water resources, such as irrigation, as well as secondary water resources, like electrical power and transport. These installations enabled the direct, perennial irrigation of 400 thousand hectares. In addition, these facilities augmented rainfall on an additional 918,000 hectares across the four then-Union republics.

While providing regional benefits, agricultural productivity through perennial and seasonal irrigation was incurred at the expense of Kyrgyzstan. Among the seven installations, the Toktogulsk hydro knot alone removed 12,000 hectares of Kyrgyz agricultural land from use, drowned under its reservoir. Likewise, industrial productivity in the surrounding republics was incurred at Kyrgyz expense. While the hydro knot's dams served local needs for electrical power, 2.4 million kilowatt-hours of energy were used outside the republic.

Political developments upset the region's means of distributing water resources. As a result of the dissolution of the Soviet Union in 1991, remuneration for water use emerged as an international political issue. Central Asian states had to develop new means to recompense water transactions. Kyrgyzstan demanded compensation for maintaining reservoirs on the Syr Dar'ya River complex during 2001, for the first time pressuring neighboring Kazakhstan to conclude a barter deal exchanging fuel for water.

Asia's Water Issues and Parastatal Organizations

The United Nations Development Programme (UNDP) and similar parastatal organizations have emerged as advocates for implementation of integrated water-resources management (IWRM) in Asia. Rather than depending on technological advances or identifying new sources of freshwater supply, the IWRM approach advocates innovation in water-resources governance. According to parastatal organizations, the participation of users in water-resource management and use will result in the creation of appropriate policy frameworks to allocate and manage water among competing users.

Parastatals' policies emphasize public accountability, focusing on the political process of achieving effective water governance. In particular, parastatals call for adequate institutional capacity and accountability within regulatory and management institutions as necessary for sustainable development and management of water resources. Appropriate tariff struc-

tures for water use, in particular, will both raise the revenues necessary to provide services and will extend participation to economically unempowered countries and regions.

The UNDP, the International Council for the Environment (ICLEI), and the Global Water Partnership (GWP) particularly seek to address the politics of water management through governance dialogue. The institutionalized discussion is intended to facilitate communication between political decision makers, water technicians, and users in different nations, to highlight real processes and actual cases, and to identify the next steps culminating in the governors' meeting of the Inter-American Development Bank in South America in March 2002, the World Summit on Sustainable Development in September 2002, and the Third World Water Forum in Japan during March 2003.

WAYANG BEBER *Wayang beber* is one variety of Javanese puppet shadow play (*wayang*). Painted pictures on a long strip of leather, bark, paper, or cloth are rolled from one supporting pole to another. The size of the strip varies, but it is usually around 20 centimeters wide and 12 meters long. Each spool contains sixteen scenes.

As the storyteller unrolls the spool scene by scene, he narrates the story accompanied by Javanese traditional music orchestra or gamelan. Traditional *wayang beber* tales include *Panji* stories or a story based on the mythical Javanese Jenggala Kingdom, or the *Mababharata* and *Ramayana* epics. Gamelan orchestration is allowed only if the performance is held at the court compound. Outside the court a rebab (a kind of violin) was the traditional accompaniment. *Wayang beber* is performed very rarely because of the sacred nature of the performance. It was only performed at specific occasions following some rituals to ward off evil and epidemics. Some scholars argue that *wayang beber* is the oldest variety of *wayang* and has been performed since the early twelfth century. However, this kind of performance is rare, and the art form is near extinction. Some original scrolls are preserved at Wonosari, Yogyakarta; Mangkunagaran museum; and Pacitan. In 1986, it was reported that only two painters of *wayang beber* were still active.

WAYANG GOLEK *Wayang golek* refers to two main genres of puppet theater in West Java, Indonesia, both of which use wooden rod puppets. One genre, *wayang golek cepak*, was created in the north coast region of Cirebon, West Java, in the late sixteenth century and is thought to have been used to convert people to Islam. *Wayang golek cepak* (also called *wayang golek menak* or *wayang bendo*) is still performed in the Cirebon Javanese language, and its repertoire includes stories about Amir Hamza (Muhammad's uncle, who brought Islam to the Arab world), the Islamic conversion of Java, and the history of legendary Javanese kingdoms.

The other genre, *wayang golek purwa*, is performed in the Sundanese language and is thought to be based on a type of *wayang kulit* (shadow-puppet play) practiced in the area of Tegal on the north coast of central Java. This *wayang golek* was brought to the Sundanese city of Bandung to entertain Sundanese aristocrats in the early to mid-nineteenth century. The main repertoire of tales is based on the *Mababharata* and the *Ramayana*. Puppets range from 15 to 30 inches in height. The head, body, and arms are carved from soft wood and painted in a wide variety of colors. The costumes are made of velvet and other colored fabrics, batik cloth, and sequins. About sixty puppets are used in a single performance. Puppets are organized into four groups, including refined aristocrats, warriors and demon-kings, clowns, and ogres.

In both types of puppetry, the main performer is the *dalang* or puppeteer, who manipulates the puppets, nar-

Wayang golek puppets in Solo, Indonesia, in the 1990s. (LINDSAY HEBBERD/CORBIS)

rates the tale, sings many of the songs, and directs a troupe of musicians who play the instruments of the gamelan (Indonesian percussion instruments). *Wayang golek* blends puppetry, narrative, dialogue, song, instrumental music, movement, and dance. Performances are all-night affairs that play a central role in Sundanese cultural and civic life. A *wayang golek* performance coincides with a *bajat*, a ritual feast in which food is served, prayers are recited, and spirits are asked to bless the feast's host. The most common *bajat* are weddings and circumcisions. Performances are also held for ritual purification ceremonies (*ruatan*). *Wayang golek* performances are opportunities for people to gather and reflect on issues that affect their everyday lives.

WAYANG KULIT A *wayang kulit* performance features puppets made from parchment-like buffalo skin and horn. Such performances belong to the cultural tradition of various ethnic groups in the Indonesian archipelago. The puppeteer sits behind the cotton cloth screen, which is fixed in a wooden frame with a banana-trunk base; he or she manipulates the skillfully painted puppets that cast their shadows onto the screen in the light of an oil lamp. Most famous and sophisticated are those of the Central-Javanese courts and those on Bali, dating back to the period of the ancient Hindu-Javanese kingdoms (tenth–sixteenth centuries). They dramatize stories from the Old Javanese adaptations of the ancient Indian epics *Ramayana* and *Mababharata* and are staged mostly in a ceremonial context (especially during life-cycle rituals). In Bali, the audience sits in front of the screen; in Java, only the women watch from the front, while the men enjoy the colorful puppets and the large gamelan (Indonesian percussion instruments) orchestra directed by the puppeteer from behind. The vast aesthetic and spiritual knowledge, obtained in years of study, makes the puppeteer a highly revered member of traditional society. His advice and comments on local affairs, which are put into the mouths of the clown-servant puppets, are enjoyed as well as feared.

WAYANG TOPENG *Wayang topeng* is a classical Javanese dance-drama genre, in which dancers use elaborately carved and painted masks to perform stories from the romantic Panji cycle. These stories, which relate the adventures of the handsome mythical prince Panji and his fiancée, Princess Candra, are thought to have occurred during the last Hindu-Javanese kingdom, the Majapahit (thirteenth to fifteenth centuries).

Tradition has it that *wayang topeng* was created in the sixteenth century by Sunan Kalijaga, one of the nine

legendary Muslim saints who converted Java to Islam by using the highly popular performing arts of the destroyed Hindu-Javanese courts to attract people to their sermons. Following the model of a *wayang kulit* (shadow-puppet play) enacting the Panji romance, Sunan Kalijaga is said to have created masks for nine dancers who were directed, as was also the case for the shadow-puppet play, by a *dalang*, or puppeteer.

Nowadays, the performers include a large number of dancers who are accompanied by a huge gamelan (Indonesian percussion instrument) orchestra. Their appearance onstage is introduced and commented on by the *dalang* in speech and song. Clowns entertain the audience with their jokes and mockeries in interludes between the acts. *Wayang topeng* has incorporated elements from other classical dance genres like the Serimpi or the Kiprah mask-dance, revered classical Javanese dances, whose origins might date to the time of the Majapahit kingdom. The Serimpi is danced by four girls, usually princesses; the Kiprah is a lively courting dance in which a male dancer impersonates a king. *Wayang topeng* has been preserved in the court tradition of Surakarta in central Java until today.

WAYANG WONG *Wayang wong* is a classical dance-drama genre in Java and Bali, in which stories from the Old Javanese versions of the ancient Indian epics *Ramayana* and *Mahabharata* are performed, for entertainment as well as in ritual contexts. The earliest record of *wayang wong* occurs in a central Javanese inscription dating to 930. This ancient form either developed from or evolved at the same time as the *wayang kulit*, the shadow-puppet play, replacing the puppets with human dancers.

The contemporary Javanese *wayang wong*, however, was created in 1755 at the courts of Yogyakarta and Surakarta in Java, with the intention of continuing an ancient Javanese tradition. Stories from both the *Mahabharata* and the *Ramayana* are dramatized. The elaborate dance movements of the actors, who wear elaborate makeup, are accompanied by a large gamelan (Indonesian percussion instrument) orchestra.

The Balinese version of *wayang wong* was created at the end of the eighteenth century at the royal court of Klungkung on the east coast of south Bali, using ancient masks from the sacred heirlooms of the family of the Dewa Agung and drawing on the dance movements of the classical Gambuh dance drama. According to indigenous sources, the Gambuh is the oldest court dance-drama of Bali; it features stories from the Panji cycle, the adventures of the handsome mythical prince Panji and his fiancée Princess Candra, which supposedly occurred during the last Hindu-Javanese kingdom, the Majapahit (thirteenth to fifteenth centuries). Dramatizing only stories from the *Ramayana*, the Balinese *wayang wong* is accompanied by a special music ensemble, the gamelan *Batel* (probably "of warriors"), consisting of metallophones, gongs, cymbals, and drums.

WAZIRI The Waziris are a tribe living on the border of Afghanistan and Pakistan. Although they have their own tribal affiliation, the Waziris of Afghanistan are a subgroup of the larger Ghilzai (or Ghiljai in Farsi) branch of the Pashtun tribe. Their language is Pashtu, and they practice Pashtunwali or the Code of Conduct for Pashtun tribal members. The terrain in which they live is so remote that it is difficult to meet a Waziri outside of his or her home. Some Waziris live in tents along the Khyber Pass, and others live as pastoral nomads herding sheep throughout the mountains. Historically, the Waziris' homeland was referred to as Wana. However, after the British mandate to separate Pakistan, India, and Afghanistan, this area has been referred to as South Waziristan.

Because their tribe is spread out across the border of Afghanistan and Pakistan, the Waziris also have much in common with their Pakistani neighbors.

Their tribe is much larger on the Pakistani side. Waziris are divided into two subgroups: the Darwesh Khel (Darwish Khal) and the Mahsuds (Mahsoods). In the early 1900s, it was these two groups who led the largest and most difficult resistance against British rule in Afghanistan, which was called the Third Afghan War. Many joined with the Taliban after the post-Soviet civil war in Afghanistan.

WELD, FREDERICK (1823–1891), British colonial administrator. Sir Frederick Aloysius Weld was born in 1823 in England and immigrated to New Zealand in 1843, joining his cousins as a sheep farmer. Entering politics in 1848 when he joined the Wellington Settlers' Constitutional Association, he was elected in 1853 from Wairau to the House of Representatives. In 1860–1861, he served as minister for native affairs and in 1864–1865 as premier. In 1867, he returned to England, but in December 1868, he was appointed governor of Western Australia (1869–1874), after which he became governor of Tasmania (1875–1879). In 1880, he went to Singapore, where he was governor of the Straits Settlements from 1880 until his retirement in 1887. During his term of office his stated ambition was to extend British control as far as possible over the peninsula south of Siam (Thailand). His successful expansionist policy was carried out by a group of ambitious young men, the most notable of whom was Sir Frank Swettenham (1851–1946). Weld's dispatch on education in 1882 initiated the growth of a Malay vernacular educational system in the Protected Malay States. In 1883, he coined the term "British Malaya" as a geographical and political expression for the peninsular states. Weld died in England on 20 July 1891.

WEST PAPUA. See **Irian Jaya**.

WESTERN GHATS The Western Ghats, (or Sahyadri in Sanskrit), are a chain of mountains forming the rim of western India, and running parallel to the coast of the Arabian Sea. Their length is about 1,600 kilometers. Their northern end is in Rajasthan, and the southern limit Cape Comorin (Kanyakumari), and in most places the Ghats are within sight of the coast. They thus form the western perimeter of the Dekkan Plateau, and average 800 to 1,000 meters in elevation. The geological formation is trap in the northern parts and gneiss in the more southern. This range is the source of nearly all the rivers in the Indian peninsula. Unlike the Eastern Ghats, the Western are a continuous chain, with only one significant break, the 40-kilometer-wide Palghat Gap, through which trains and roads connect Cochin with Coimbatore and Madras. Just to the north of this gap the Eastern Ghats fuse with the Western in the Precambrian formation of the Nilgiri Hills. Anai Mudi Peak (2,695 meters), the highest point along the Western Ghats, lies nearby, in the Cardamom Hills of Kerala. The entire range is subject to intense rainstorms during the southwesterly monsoon, June through August each year. Consequently, much of the range is still covered with dense tropical forests, which, however, are being rapidly depleted by loggers.

WESTERNIZATION—CENTRAL ASIA

There was little evidence of Western—that is, European—cultural concepts and values penetrating into either Central Asian nomadic or sedentary societies in the aftermath of the Russian conquest in the mid- to late nineteenth century. The exception was the small handful of Central Asian intellectuals who became Russified. In some cases—Kazakh thinkers such as the writers Shokan Valikhanov and Abai Qonanbaev were a case in point—they sought closer acquaintance with Russian culture so as take from it those things that

would benefit Central Asians while preventing the destruction of their own traditional cultures.

The other means by which a degree of Westernization penetrated Central Asia was through the activities of the Jadidists, the primarily Tatar educators and journalists who sought to spread their Western-oriented educational philosophy through the Muslim regions of the Russian empire.

Westernization under the Soviet Union

The effects of pre-Soviet efforts at Westernization in the Central Asian parts of the Russian empire were largely lost through the destruction of the Central Asian intelligentsia during Stalin's purges of the 1930s. But at the same time, the Soviet regime undertook active efforts to create a "New Soviet Man" in Central Asia, through massive forced culture change. This had the effect of bringing a degree of Europeanization to the region, albeit filtered through Soviet ideology and Russian culture. Central Asians living in urban areas, particularly members of the intellectual and political elites, were under continual pressure to adopt Russian cultural values and to replace their own languages with Russian. By state policy, the non-Russian nationalities of the Soviet Union were expected to receive world culture through the Russian language. This was in fact the case due to lack of direct contact with the outside world as well as lack of knowledge of foreign languages other than Russian.

The degree of pressure on Central Asians to become Russified varied and was particularly intense in the later years of the Brezhnev era (1964–1982). The result was an intellectual class that had assimilated a Western orientation, while developing some degree of sentiment for their own history and traditional cultural heritage. The growth of national consciousness in Central Asia was at least partly in reaction to most Russians' view of Central Asian cultures as primitive and backward.

Residents of rural settlements were much less affected by the Russification campaigns, not least of all due to a lack of resources, including an adequate supply of teachers of Russian. Some acquaintance with Western-style culture seems to have penetrated the rural parts of Central Asia more extensively with the spread of radio and television. According to Soviet sources, however, some of the remoter areas of Central Asia were unable to receive broadcasts until the late 1980s.

Postindependence Western Influences

When the Soviet Union disintegrated in 1991 and the Soviet Central Asian republics became independent,

the new countries' first instinct was to turn toward Europe for recognition and assistance—somewhat to the surprise of the international community. Later the Central Asian states also sought to establish ties with the Muslim world, following the model of Turkey, which is both Muslim and Western. In the immediate postindependence period, the United States and some European countries actively urged the Turkish model on the Central Asians. Their response was to accept politely Turkish economic assistance and then to inform the Turks that the new countries had no desire to exchange one "Big Brother"—Russia—for another. But the Turkish connection was to prove fruitful for the new Central Asian states, not only as a source of economic aid and investment, but also of assistance in the development of education, military training, transport, and communications. At the same time, the Turkish connection provided—as the West had hoped—an indirect channel for Western ideas and values to reach Central Asia.

The Central Asian postindependence orientation toward Europe and North America was based partly on economic realism—these countries were seen as the most reliable sources of aid and investment. But it was also based on instincts developed during the Soviet era. Though the Soviet Union was marginal to Europe, it still belonged in the general European cultural sphere. A European commissioner was astonished to be asked in 1992 by Kazakhstan's President Nursultan Nazarbaev how his country should go about getting itself on the list for membership in the European Economic Community. It was pointed out to the commissioner that Turkey was being given serious consideration as a potential member of the European Community, and more of Kazakhstan is geographically part of Europe than is the case with Turkey.

Security was another attraction the Western world held for the new states of Central Asia. Europe and the United States were viewed as potential guarantors of the countries' independence. Initially dependent on the Russian Federation for help in creating their own military establishments and border-guard forces, most Central Asian countries eventually looked to the West as a counterbalance to the Russian desire to restore hegemony over the region. Starting with Turkmenistan, all the Central Asian states except Tajikistan joined the NATO-sponsored Partnership for Peace (PfP). Consideration of Tajikistan's membership was delayed until the civil war had been resolved, and the country was admitted to the PfP program in May 2001. Some Central Asian states, in particular Uzbekistan and Kyrgyzstan, considered even closer security ties with the West, not only as a counterweight to Russia and China but as a source of assistance in countering

terrorist groups based in Afghanistan. In the wake of the events of 11 September 2001 in New York, Uzbekistan, Kyrgyzstan, and Tajikistan agreed to a U.S. and European military presence in their territories, to the distress of some Russian political figures and commentators who believed that these countries were being drawn into the Western world.

Western cultural influence, which had become well established with urban young people in the last years of the Soviet era, developed even more rapidly after independence as domestic radio and television stations broadcast Western music and films, and increasing numbers of Central Asian youths had opportunities to travel and study abroad.

Central Asian membership in the primarily European Organization for Security and Cooperation in Europe (OSCE) exposed the ruling elites and intellectuals in the region to Western political values and human-rights standards, especially after the establishment of a permanent OSCE presence in each Central Asian state. The European Bank for Reconstruction and Development, the European Union's Technical Assistance to the CIS (TACIS) program, and the U.S. Agency for International Development through its network of contractors, as well as other Western assistance groups both large and small, were instrumental in promoting familiarity with and acceptance of Western political and social standards. The agencies of the United Nations sought to promote acceptance of universal human-rights standards, which were identical with Western standards. Most Central Asian leaders asserted that they aspired to achieve Western standards though they sometimes protested that they were really Asians and so needed time to assimilate European values.

The Westernization of Central Asia—in the sense of the adoption of a Western cultural orientation—may be expected to continue as the countries of the Central Asian region intensify their contacts with Europe and North America. Western tastes and attitudes adopted by the urban population are likely to spread as rural young people make their way to the cities in search of work. Western political values are likely to take longer to become rooted in the region, as is the case in most former Soviet possessions.

WESTERNIZATION—EAST ASIA Westernization in Asia has been defined as the broad interaction between Asian values and behaviors and the external influences of Western colonial or national powers, such as Great Britain, France, Germany, Portugal, the Netherlands, and the United States, that have exercised control, partial or otherwise, over Asian societies. Western influences have permanently altered practically all the societies in Asia. This process of Westernization in Asia began in the final years of the fifteenth century and continued to grow in terms of vigor and strength well into the twentieth century. The historical process of Westernization ended just after World War II with the assertion of independent nationhood by many Asian societies. Because modernization in many ways overlaps with the processes of Westernization, much of the historical influence of the West has continued with markedly expanding effects.

Western impact varied with the geographical proximity of the different Asian societies to the major areas of Western power. The nations of East Asia—China, Japan, and Korea—supposedly have had less exposure to the impact of Western influences and power than India because they are farther from Europe than is India. Two major processes have been identified through which Western power was asserted in Asia: colonization and the imposition of unequal treaties.

Colonization of Hong Kong and Macau

Early colonization by Western powers such as Portugal and Spain, who first colonized parts of India, the Philippines, Burma, and Malaya, had little impact on Asian culture because the colonizers had little contact with the indigenous people. The second wave of colonization was spurred on by rapid industrialization in the West during the early nineteenth century. British and Dutch colonial influences started, for example, in the coastal areas of India, Malaya, and Indonesia before spreading inland. A growing market for new food products, such as tea, coffee, and sugar, as well as the expanding demand for raw materials, such as rubber, tin, and oil, encouraged the Netherlands and Great Britain to extend their colonial control in Malaya, Indonesia, and Burma. The drive for raw materials and markets for Western manufactured goods stimulated Dutch and British interest in China and Japan.

The façade of a McDonald's fast food outlet in Beijing in the 1990s. (EYE UBIQUITOUS/CORBIS)

As Western colonialism spread, competition among the Western powers sometimes prevented one or another from achieving its goals, as was the case for the Germans in China. The Germans obtained a sphere of influence in the Shandong Peninsula, but their attempts to expand it were blocked by Russia, Great Britain, and the United States.

Colonial administrations in Asia favored the introduction of Western languages for instruction in educational establishments. Colonial economic policies also left permanent fixtures in the Asian landscape, including ports, highways, railroads, water-control projects, research facilities, and bridges. While often built with revenues generated in the colonies themselves and for the benefit of the colonial economy, the ports and other facilities became the infrastructure upon which the independent Asian nation-states depended in their early years of independence. Colonial social policies attempted to impose Western values on Asian societies.

An important dimension of Westernization in Asia was the education of the Asian indigenous elite in Western liberal and scientific thought. While the main colonial purpose was to train enough indigenous personnel to staff administrative and commercial positions, this elite also spread Western values and modes of behavior to broader segments of the local population. Some colonial governments, such as France in relation to Vietnam, reserved places in the universities for local people who were fluent in the Western languages of instruction and who were sympathetic to colonial rule.

Unequal Treaties

Some Asian countries, such as Japan and China, staved off actual colonialization by accepting unequal treaties that granted special concessions to Western powers. This made possible, for example, the spheres of influence different Western powers maintained in portions of Chinese territory. Western enclaves on Chinese soil were established by treaties, and their occupants remained outside the jurisdiction of the Chinese government. Each Western concession imposed its own laws on the residents living within its authorized territory.

Western norms in China were communicated by the large numbers of Western nationals in advisory positions in the Chinese government and engaged in trade and missionary activity. At the same time, Western political and legal institutions served as models for political and legal modernization. Although the Western powers did not have a unified program of Westernization, their actions were often synergistic. For example, the United States led the negotiations to open Japan to Western influence and interactions, and then Great Britain provided naval vessels for the modernization of Japan's fleet and British technicians to act as advisers in newly created Japanese industries. Similarly, France cooperated with Great Britain and the United States in reorganizing the Chinese customs services in the 1850s, and the French led the expansion of Western cultural influences in China by obtaining extraterritorial rights for foreign missionaries to work in the interior of the country.

Educational Systems

Educational systems were often vehicles of Westernization. Prior to the West's intrusion into China, indigenous Chinese higher education consisted of Confucian academies and specialized schools to train Confucian scholars. Following the arrival of the West, until the Nationalist regime established a few universities in China in the late 1920s, many Chinese youth attended the secondary schools and universities run by

Christian missionaries in China or pursued education in Europe or the United States. East Asian scholars returned from their sojourns in the West having mastered a Western language and having internalized Western values, and many of these overseas-trained elite spearheaded the nationalist movements in East Asia and led the drives to modernize their respective countries. Education in the West has continued to bring Western influences into East Asia.

Backlash

In many instances modern East Asian societies have reacted against Western behavioral norms and values. People have decried the fact that continuing exposure to stimuli from the West, with its technological superiority and its wealth, has eroded traditional ways of life and traditional virtues, such as respect for authority, a sense of familial duty, and individual sacrifice for the larger common good, whether that be the good of the family or even the nation. Nevertheless, the lure of wealth and technological advancement have continued to entice the East Asian populace, assuring the continued health of Westernization.

WESTERNIZATION-SOUTH ASIA The term "Westernization" alludes to more than just the social effects that Western civilization has produced in non-Western societies. In the South Asian context

it also tacitly admits the hegemony of Western paradigms of thought and practice. Hence, some sensitive scholars and social thinkers in South Asia vigorously oppose Westernization. Yet opposing Westernization is an uphill task, if not an altogether futile exercise. Nirad Chaudhuri, an Indian writer in English and a self-proclaimed admirer of the British empire, dramatically highlights the tacit Indian acceptance of Western hegemony by recounting Robert Clive's victory procession in Murshidabad after he won the Battle of Plassey in 1757. He notes that if each of the gathered native onlookers had hurled a stone at the procession, Clive and his entire army would have been submerged under a mountain of stones! Anthropologists prefer to view such acquiescence as a reflection of the Indian genius for adaptation. This view glosses over the altered social and cultural framework within which such adaptation occurs. It also hides the fundamental change in the mental outlook of the people; in fact, the urge to oppose Westernizing trends is itself a Westernized response to Westernization.

In this article, the focus will be mainly on the Indian experience because the colonial penetration was deeper and more widespread in India than in the other countries of the region. The experience of other South Asian countries will be used to point to divergences from the central tendencies.

Values and Ideologies

The values and ideologies of the Western civilization have made a deep and long-lasting impression on the people of South Asia, particularly on those exposed to Western knowledge and education. These values and ideologies of liberty, individual freedom, equality, citizenship, and democracy stood in stark contrast to the holistic and hierarchical values of the South Asian cultures and triggered indigenous impulses toward social reforms. Of course, the lofty ideals that Western civilization cherished could not justify colonial rule. As Nirad Chaudhuri noted in his dedication to his book *Autobiography of an Unknown Indian*, the British denied Indians the status of British citizenship and considered them as mere British subjects. To justify such differential treatment and their rule of India they evolved the credo of the civilizing mission and of the White Man's Burden. Guided by such dual value schemes, British rule generated mixed and ambiguous responses from its subjects. The constant reminder of subjugation in everyday life tempered their admiration for Western culture.

According to French anthropologist Louis Dumont, the ideology that distinguishes Western civilization is individualism. The interests of the individual gain

priority over the interests of the group or community to which he or she belongs. The individual is free to pursue his own interests and inclinations so long as he does not abridge the interests of others in doing so. The other important ideas associated with the West, such as liberty, equality, citizenship, democracy, separation of the secular realm from that of the sacred, and rationality are all derived from the importance accorded to the individual. Individualism is the bedrock of capitalism, which has institutionalized private property and free labor.

Several Indians who acquired Western education were profoundly influenced by the works of Enlightenment thinkers. Such men as Raja Ram Mohan Roy, Jotiba Phule, Mahatma Gandhi, E. V. Ramaswamy Naicker, and Dr. B. R. Ambedkar were the more prominent Indians who launched vigorous campaigns to rid society of its superstitious practices and institutions. As is well known, the seeds of nationalist struggles and movements for the establishment of democratic regimes owe much to the lessons that the people in South Asia learned from the West.

Some scholars point out that many of the Western ideals that created social stirrings in India were not new to the country; indeed, historical evidence suggests that many profoundly liberating and universal ideals originated in India. Yet these ideals remained secondary to the ethos of hierarchy and authoritarianism. The failure of several bhakti (devotional) sects in fighting the evil of caste discrimination and hierarchy and their own subsequent conversion into castes testifies to the dominance of hierarchy in India.

It is necessary to point out that the South Asian societies have not been as favorably disposed to the ideology of individualism as they have been to the ideology of equality. Even Ambedkar, who as chairman of the drafting committee of the 1949 Indian Constitution incorporated individual liberty in the constitution's section on fundamental rights, realized the need to qualify the rights of individuals to serve the collective interests of certain oppressed castes and tribes. He believed that liberty would be meaningless to members of the oppressed castes unless their interests were protected through special constitutional provisions. Hence, the Scheduled Castes and Scheduled Tribes were given special privileges in India's constitution. Individualism is looked upon with suspicion in Islam, which is after all a communitarian religion. There is the general apprehension in South Asia that the Western concept of individual freedom encourages individuals to question the authority of traditional institutions and customs and promotes a culture of decadence and hedonism. By adopting an Islamic con-

stitution, Pakistan chose to oppose individualism at the ideological level. Yet a major dilemma confronting Pakistan as well as other South Asian societies is the inability to reverse trends toward individualization that are inherent in market-oriented models of development adopted by all the countries in the region.

The ideology of equality has had profound effects on India despite the fact that British rule in actual practice strengthened authoritarian and hierarchical values and institutions in India. The credo of the civilizing mission not only helped the British to justify their rule in India but also it allowed them to slip easily into the patron-client or *mai-baap* relationship with the local population. In effect, the Westerners simply replaced the nawabs they had earlier overthrown. The new form of authoritarianism tended to take on racial overtones, as was blatantly visible in the whites-only clubs that sprouted in urban centers and hill stations in India. In the tea plantations of Bengal, and in the indigo plantations of Champaran in Bihar, the patronage system gave rise to repressive labor practices. While the British rule did promote modern industrialization to a limited extent, the colonial government favored and protected European investors in India, resulting in discrimination against local Indian entrepreneurs. Such glaring inequities fueled the nationalist movement.

British rule reinforced the consciousness of caste by generating the politics of caste. The decision to enumerate castes in the Indian censuses heightened the awareness of customs and markers of social status that differentiate castes. It also promoted a new sense of solidarity among castes sharing similar social or occupational traits, even when there was no social interaction among them. More important is the caste politics generated by caste enumeration. Castes competed with each other to be ranked as superior castes. Later, educated and politically conscious members of underprivileged castes launched movements demanding reservations in educational institutions and the government so that their members could overcome their social disabilities.

For administrative convenience, the British used certain stereotypes about castes and communities. For instance, because certain tribal communities that were displaced from their habitats due to government policies resorted to petty theft and robbery for their survival, they were categorized as criminal tribes and an officially sponsored folklore about their ruthlessness and innate criminal tendencies was constructed. The stereotype colored the attitude of the police as well as of the mainstream society, thereby further alienating and isolating the members of these unfortunate communities. Similarly, the decision to declare certain communities as martial and favor recruitment of their

members in the army resulted in the dominance of particular communities in the army. The Muslim weavers of the United Provinces belonging to the Julaha caste who lost their livelihoods because of cheap British imports of machine-made cotton cloth were administratively classified as "bigoted" because their economic vulnerability was exploited by vested interests to incite them to violence against the Hindus. A by-product of such state-sponsored stereotyping was the reinforcement of caste and community sentiments and corresponding constriction of the scope for individualism.

The work of various European scholars, missionaries, and administrators considerably shaped the self-image of South Asians, just as it kindled the Western romance with exotic India. The Orientalists learned Sanskrit and other ancient Indian languages, which tended to highlight the greatness of ancient India and its long history. Several European scholars and travelers wrote about the unique features of the Indian village and the caste system. European missionaries learned Indian languages and wrote authoritative dictionaries that gave birth to new literary trends in these languages. Orientalist scholarship nurtured by the Europeans aroused the consciousness of educated Indians about their rich cultural heritage. The translation of several rare manuscripts written in Sanskrit and Pali, archaeological discoveries at Harappa and Mohenjo Daro, and the unearthing of numerous Buddhist relics scattered all over the country deeply affected educated Indians. These discoveries provided the Indians with the raw materials to construct a new national identity. Nationalists used the Europeans' scholarly contributions to redefine Hinduism as a great and tolerant religion so that they could forge a semblance of unity across the divisions of caste, religion, ethnicity, and language. The works of European philologists who traced links between Sanskrit and European languages and speculated about the Aryan-Dravidian division in India also fueled the powerful Dravidian movement in the south, with its separatist overtones. Several revivalist and anti-Western movements were also kindled by Oriental studies initiated by Western scholars, along with the notion that reconstructing the glorious past necessitated a rejection of the Western influence that only bred inferiority complexes and sapped creative energies.

Institutions and Interactions

The British evolved a mammoth and stable administration in India that made possible the large-scale mobilization of human and material resources to collect revenue and maintain law and order. Administrative decisions became more predictable and provided greater social stability. The introduction of modern

A young woman reads a Western fashion magazine on a street in New Delhi, India, in 1990. (ARVIND GARG/CORBIS)

systems of transport and communications, the systems of modern medical care, Western education, law and justice, and the establishment of a modern bureaucracy provided benefits to the people. The system of Western medicine and health care provided cures for several diseases and stemmed epidemics that used to take a huge toll of life. The Western system of education in English unlocked the doors to knowledge of modern science, technology, Western literature, and philosophy and opened up employment opportunities for the educated. These visible benefits camouflaged the effects of colonial exploitation so well that the British rule even acquired considerable legitimacy in the eyes of numerous Indians. The "backward classes" and the depressed castes viewed British rule as delivering them from the age-old oppression of the caste system and hence were reluctant to join the freedom struggle.

After Independence

After India gained independence, the influence of Britain gradually waned while the influence of the United States and the Soviet Union increased dra-

matically. The influence of the Soviet Union was pronounced at the ideological and policy levels. The Soviet Union's experiment with socialism and with economic planning provided the template for India's development. The government of India set up the National Planning Commission to prepare five-year plans to steer the Indian economy firmly toward the socialist pattern. The socialist strategy, with its accent on equity, enlarged the bureaucracy and invested it with considerable discretionary power. One consequence of these policies was that socialist ideals and ideas of equality became firmly entrenched in the Indian political firmament. Socialism became the rhetoric of party politics, with different political parties espousing their own versions. As it evolved through the politics of India, socialism took on the idiom of caste; the theme of social justice for the socially and educationally deprived castes and communities gained prominence on the political agenda. Politics of caste reinforced caste identities, instead of diluting them as was fondly hoped by several socialist ideologues.

It could be inferred that Westernization in both the colonial and postcolonial contexts strengthened caste and community solidarities. This seeming continuity, however, hides the qualitative change that has occurred in the nature of caste society. In the colonial era, competition between castes was mainly over relative ranking in the status hierarchy. The census officials of the colonial era confronted representatives of castes who brought with them documentary evidence substantiating their claims to superior ranking vis-à-vis other proximate castes. After independence, castes competed with each other for the special privileges provided by the government to the deprived castes, ostensibly to abolish caste hierarchy itself. In contemporary India, the talk of one caste being superior to another is not part of politically appropriate speech. Notions of caste hierarchy surface mainly in private spheres and in informal conversations.

Although the Soviet Union was the officially sponsored model for independent India, the United States proved to be the popular model of Westernization. While the leading politicians and government officials in India were espousing the merits of socialist, indigenous models of self-reliant development and were even sharply critical of the policies of the United States, their children were forming long lines at the U.S. embassy and its consulates in India for visas to study or work in the United States. The preference for green-card holders (persons who are officially granted the status of resident aliens by the federal government of the United States) and NRIs (nonresident Indians) settled in the United States expressed in mat-

rimonial advertisements in prominent Indian newspapers reflect the fascination of the Indian middle class with the American way of life.

Fashion, like all other elements of culture, is also a site of controversy. In this context, it is important to note that some of the American fashion trends that have shaped the culture of the Indian youth in urban elite families are in fact derived from the African-American trends that mock and debunk the culture of the white elite in America. By adopting some of the Western dress codes, young women from urban middle classes have been able to break free of the repressive dress codes that kept their mothers secluded from public life. Western styles also made it possible for members of marginalized castes to erase humiliating markers of their low social status. Defiance is more sharply articulated in American pop songs that have influenced the tastes of urban Indian youth. In India, television channels such as MTV and VTV, which play pop music, have even developed Indian versions of pop culture that pungently and wittily expose the hypocrisy of the mainstream traditional culture.

The influence of television on the youth and the consequent weakening of indigenous traditions have triggered strong reactions from conservative sections of society. Such strong reactions have given birth to militant movements attacking the Western way of life as decadent, hedonistic, and morally repugnant. Some of these movements resort to the use of force to wipe out corrupting Western influences and conserve traditional values and practices. In recent years, beauty contests, films allegedly portraying Indian women in a negative light, and the celebration of Valentine's Day have been targeted by organizations ostensibly seeking to defend traditional Indian culture and values.

The British rule also had a liberating impact on women in India. It was during the British rule that the practice of suttee or immolation of the widow in the funeral pyre of her dead husband was abolished. Western values inspired several educated Indians to launch movements against child marriage and to actively promote widow remarriage and women's education. The constitution of independent India by adopting adult franchise and by making special provisions for the welfare of women sought to promote the idea of gender equality. Yet, during the early years of independence a woman's sphere of influence continued to be mainly within the household. Women were encouraged to go to schools and colleges and even take up jobs outside the family, but these extramural roles only complemented their main role, which was the care of their families.

The impact of postcolonial Westernization on women has been complex and uneven. While the Western ideas of feminism and gender equality have encouraged some urban middle-class women to become educated and compete with men in various professions, Indian women face new obstacles in their quest for gender equality. In urban middle-class families, young men were encouraged to pursue prestigious careers in the government bureaucracy or as high-salaried professionals in various public-sector and private-sector concerns or, better still, migrate abroad, preferably to the United States, for lucrative jobs. They were sent to prestigious English schools and professional colleges and institutes to prepare them for successful careers. Although their sisters were encouraged to study and go to English schools and convents, the main objective was to make them attractive and eligible brides for successful grooms. For women, career was only a secondary option. Further, as a family consisting of unmarried young women loses its social status, parents of young women became anxious to find grooms for their daughters as soon as they came of age. Under the circumstances, the institution of dowry—previously confined to certain upper castes—became almost universal in India. Dowry even spread to those castes that had traditionally required grooms to pay a bride-price. As the institution of dowry gained in popularity, dowry demands also started mounting. Parents of eligible young men perched in a successful career could demand huge amounts of money and other gifts from parents desperate to marry off their daughters. Reports of dowry deaths, invariably involving the avaricious groom and his parents forcibly setting the woman on fire, appeared so frequently in newspapers and magazines that the government passed an act banning the practice of dowry and changed the rules regarding the registration of evidence to ensure that the accused parties will not escape prosecution owing to procedural technicalities. Linked with the issue of dowry is the practice of female feticide and infanticide that is taking new forms. For instance, sex determination tests using ultrasound techniques are extensively used, despite a legal ban on conducting such tests, so that female fetuses can be aborted. Demographers point out that the persistence of an adverse female-male sex ratio in the Indian population even after more than five decades of attaining independence does not augur well for gender equality.

The trend of rising dowry demands compelled parents to encourage their daughters to study and become eligible for jobs so that they could help in accumulating the dowry fund. Also as "working girls" are now

preferred to "homely brides," a trend that began in the 1970s, marriage prospects for women holding jobs improve considerably. As women go out of their homes to study and work, they get opportunities to mix freely with other men and become autonomous enough to contract love marriages that violate the rules of caste endogamy. Such marriages may not be acceptable to the parents of the couple, but in urban India the popularity of commercial Hindi films that celebrate love marriage has ensured the social acceptability of such unions. Recent newspaper reports mention incidents of love marriages violating rules of caste endogamy and hierarchy from rural areas. These reports also describe the hostile reaction of caste *panchayats* (traditional institutions governing caste affairs) to such marriages. The offending couple are punished with banishment from the village, a ban on social interaction, or even a death sentence carried out without legal sanction.

The feminist movement in India that arose in the 1970s had indigenous roots, but the rise of feminist ideology in the West provided inspiration for Indian intellectuals to investigate the condition of women in India. They launched campaigns to bring to light the plight of women in India and sensitize the public about gender issues. Indian feminists viewed women's oppression as a societal problem and focused their attention on ways of overcoming the constraints imposed by patriarchal traditions by creating a general social awareness of women's problems (in marked contrast to the strategy of confrontation with men that several Western feminists advocated). Despite this strategy, the feminists have been unable to reverse the adverse trends in gender relations. For instance, despite vigorous campaigns to reserve seats for women in the Indian Parliament, and despite the express commitment of the ruling government and the leading opposition party to have the constitution amended suitably for the purpose, the Parliament has been unable to take up the relevant bill for discussion. A prominent male Member of Parliament who had vigorously supported the policy of reservations for the "backward classes" opposed the introduction of the bill on the ground that it only promoted the cause of women who had bobbed their hair—a pejorative reference to Westernized women. The statement of this Member of Parliament only reflected his antagonism to the Westernization that has encouraged Indian women to reject traditional restraints on their sexuality by adopting the liberal views of Western women. It is true that several revivalist groups and movements strongly oppose Westernization because they are convinced that it corrodes traditional morality, values, and

institutions. What is more significant is that this view is tacitly endorsed by even some of the progressive political parties and intellectuals.

Westernization Outgrown?

It is clear that it is not possible to trace linear trends of Westernization in South Asia. Considering that the Western encounter has been deeply felt for over two centuries, contradictory trends and processes generated by Westernization are bound to be encountered. Westernization has not succeeded if we assess the phenomenon in terms of English writer Thomas Macaulay's dream of converting Indians into Englishmen in tastes and habits. Western culture has been consciously resisted, and there have been several instances of sharp backlash against Westernization. Individualism has not been able to cut through the dense tangle of bonds of family and kinship, caste, religion, and language. A dissonance has emerged between the ideology of equality and its practice. In practice, measures taken to reduce social inequality have often proved to be counterproductive. This change in discourse is nevertheless radical; hierarchy that was only a few decades ago accepted as an inevitable feature of society in India has now been displaced by the principle of equality.

Some recent trends in globalization are now challenging the ideology of individualism. Western societies are increasingly attracting migrants from non-Western societies to bolster their economies. The presence of these immigrants and their growing political importance have compelled the major political parties in Western countries to pay special attention to the problem of immigrant minorities. The migrants' rights as citizens and their rights to preserve their cultural identity have now become vital political issues. Consequently, the discourse of individual rights and rights of citizenship around which law and order is structured is increasingly proving to be inadequate to guide political governance. Further, as the cultural interaction between the native Westerners and the immigrants intensify and as the ethos of multiculturalism spreads, Western culture is itself caught in the vortex of radical transformation. The usefulness of the concept of Westernization cannot any longer be taken for granted.

WESTERNIZATION-SOUTHEAST ASIA

In reflecting on the Westernization of Southeast Asia, it is first important to define carefully the term itself. By "Westernization" is meant specific economic, sociocultural, and political influences on the region emanating from the West (that is, Europe, the United States, and Australia and New Zealand). The earliest external influences on the region (pre-sixteenth century) were not from the West, but from India, China, and the Islamic world. These influences were primarily in religion, culture, art, and political systems.

The first Western contact with Southeast Asia was through European exploration such as that by the Dutch and Portuguese. In 1511, the Portuguese captured Melaka and had arrived in the Moluccas. The explorers were followed by missionaries who were active throughout the region. These early contacts paved the way for colonization of the entire region, except for Siam (Thailand). Dutch trader Gerritt van Wuysthoff traveled up the Mekong River in 1641–1642 to the Lao capital, Vientiane. The French mistakenly anticipated that the Mekong River would be a navigational gateway to the riches of China, and this partially explained their interest in colonizing Vietnam, Laos, and Cambodia. Among famous explorers of the region who often left detailed records of their travels and observations were Ferdinand Magellan (who died in the Philippines), Stamford Raffles (founder of Singapore), Francis Garnier (who explored the Mekong River), Joseph-Fernand Grenard, Henri Mouhot, August Pavie, and David Livingston. Among important missionaries who were active in the region were Father da Cruz, Henri Langenois, Dan Beach Bradley, Alexander de Rhodes (who developed a system, *quoc ngu*, for romanizing the Vietnamese language, 1624–1630), and Samuel McFarland. A number of Western novelists such as Joseph Conrad, Somerset Maugham, Pierre Loti, and in more recent decades Graham Greene, Eugene Burdick, Marguerite Duras, Anthony Burgess, C. J. Koch, Blanche d'Alpuget, and Robert Drewe were inspired by their experiences in the region. They left powerful Westernized and often distorted images of the region. Their literary works, however, provide rich insights into the complex nature of the Westerners' encounters with Southeast Asia.

TABLE 1

Colonization				
Nation (current name)	Former colonial name	Date colonized	Colonizing country	Date of independence
Brunei	Brunei	1888	Protectorate of the United Kingdom	1984
Cambodia	Cambodge; formerly part of French Indochina	1863 (French protectorate established)	France	1953
East Timor		1860, 1893, 1914	Portugal	1975 (from Portugal); 1999 (from Indonesia)
Indonesia	Dutch East Indies	End of seventeenth century	The Netherlands	1949*
Laos	Formerly part of French Indochina	1893	France	1949
Malaysia	Straits Settlements; Malaya	1867	United Kingdom	1957
Myanmar	Burma; also formerly part of Greater India	1885	United Kingdom	1948
The Philippines (name derives from the name of a Spanish king)	The Philippines	Late sixteenth century; 1898 (United States)	Spain and then United States	1946
Singapore	Formerly part of Straits Settlements; Malaysia	1819	United Kingdom	1963 (joined independent Malaysia); 1965 (from Malaysia)
Vietnam	Part of French Indochina	1884; French Indochina established in 1887	France	1945, 1954,* 1975*

*Independence involved violent struggle.

Western Colonization of Southeast Asia

Competition was intense among the Western colonialists for Southeast Asian territories. (See Table 1.) In mainland Southeast Asia, the primary competitors were the British coming from the west (Burma and India) and the French coming from the east (coastal Vietnam). In insular Southeast Asia, the competition was primarily among the Dutch, British, and Portuguese. The United States replaced Spain as the colonial power in the Philippines as a result of the Spanish-American War. In so doing, the United States thwarted an indigenous Filipino revolution fighting for independence.

Siam

Siam represents a fascinating case of selective Westernization without colonization. Siam was the only nation in the region not to be colonized. The Siamese kings of the nineteenth century evolved astute diplomatic strategies for avoiding colonization and playing the British and French off against each other by becoming a buffer state between the two colonial powers. In a major act of compromise, the Siamese ceded important territories in what are now Laos and Cambodia to the French. The Siamese historically were also open to outsiders, and prominent Dutch, Greeks, and

Portuguese were allowed to play important roles in the Siamese court. Later in the nineteenth and twentieth centuries, various Westerners contributed to the modernization of Siam. Missionaries such as Dan Beach Bradley contributed to the development of the Siamese printing industry and modern health practices. Missionaries also contributed to the establishment of excellent schools, which are still prominent to this day. Germans were invited in to help develop a modern rail system; British advisers helped with the development of modern financial institutions. The basic strategy was to make Siam sufficiently open to Westerners that there would be no need to colonize it.

Westernization after Independence

The Asia-Pacific theater of World War II, in which the Japanese invaded and took control of much of Southeast Asia, helped awaken powerful forces of local nationalism. The Japanese demonstrated to the Southeast Asians the possibility of opposing the West successfully. Thus, within the first two decades after World War II, all the nations of Southeast Asia had received their independence, except for East Timor, a colony of Portugal that was later absorbed by Indonesia, and Brunei, which remained a protectorate of the United Kingdom until 1984.

Political Westernization Despite achieving political independence, the Southeast Asian nations continued to feel the force of Westernization in various domains. In the political arena, Southeast Asia became a battleground of the Cold War, with the USSR, China, and the United States fighting for influence among Southeast Asian nations. Communist insurgencies supported by the Marxist-Leninist USSR emerged in the Philippines, Malaya, Thailand, Vietnam, Cambodia, and Laos. Indonesia at one point also had a very large communist party, the PKI. The West intervened politically in these areas to try to stop the spread of communism, ironically itself a Western influence. Communism failed in the Philippines, Malaya, Singapore, Indonesia, and Thailand, but it succeeded in Cambodia, Laos, and Vietnam. Politically, the United States continues to support actively the development of democracy and civil society in the major nations of the region.

Cultural Westernization Southeast Asian culture also continues to feel the effect of Westernization. Popular Western dress, music, film, and fast food permeate the urban areas of most parts of Southeast Asia. The powerful forces of transnational corporations and advertising have also contributed to a growing materialism. Reflective of this new value placed on material goods is the common pattern of evaluating people's status based on their possession of those goods. In the early 1960s, U.S. advisers called for Bangkok, Thailand, to become an automobile city. Many canals were replaced by highways, and the "Venice of the East" became a highly urbanized, congested, and polluted city. Possession of automobiles, and importance attached to the prestige of the type of vehicle owned, has become an integral part of the growing materialistic culture.

Throughout much of the region there is the pervasive influence of modern transnational corporations such as IBM, Coca-Cola, KFC (Kentucky Fried Chicken), McDonald's, Nike, and Philip Morris (Marlboro cigarettes, especially prominent in Cambodia, which has a large potential youth market). Nike has outsourced significant production to subcontractors in Indonesia, Thailand, and Vietnam, with a presence also in Cambodia and Laos. Sometimes Brunei is referred to as the Shell-fare state, given the prominence of the Royal Dutch/Shell Group in that nation.

A prominent building in old Bangkok is the headquarters of the East Asiatic Company, a major Scandinavian trading company, which has been active in the region for many decades. Thailand is becoming the "Detroit of Southeast Asia" with the major pres-

ence of Western automobile manufacturers such as General Motors.

Technological influences from the West are also pervasive, especially in modern urban areas. Personal cell phones (many Nokia or Motorola) are ubiquitous in the cities of Southeast Asia. Cable television and Internet services have dramatically expanded, especially in urban areas. Southeast Asians appear extremely open to the adoption of new Western technologies in all arenas of life.

The physical infrastructure of Southeast Asian nations shows Western influence in the buildings that survive from colonial days. Laos, Cambodia, and Vietnam are all noteworthy for their colonial French architecture. In fact, the policy of Laos is the total preservation of such distinctive cream-colored architecture as an important and unique historical legacy.

The British colonies of Singapore and Malaysia also benefited from important physical and human infrastructure (modern bureaucratic structures) as a legacy of British rule. Even in Yangon (formerly Rangoon), the capital of Myanmar, there is evidence of an important physical infrastructure left behind by the British colonial masters.

The growth of the tourism industry is another by-product of Westernization. Among major attractions are Bali in Indonesia; Thailand, with its many famous beaches and excellent tourist infrastructure; and Angkor Wat temple in Cambodia, the world's largest religious monument. Vietnam also has excellent tourism potential. Tourism represents in the region a major earner of foreign exchange from the West.

Educational and Economic Westernization Two important interrelated areas of Western influence are economic aid and international education. Many Southeast Asian young people educated in the West returned to play leading roles in overturning traditional political systems. Examples of such individuals are Ho Chi Minh, Pol Pot, Pridi Banomyong, and Pibul Songkram. During the post-World War II period, many educated youth from the region have aspired to study in the West. Apart from skills learned, study in the West brings great prestige and status. Many leading intellectuals, technocrats, and some politicians in the region were educated in the West. Among prominent political leaders educated in the West are Thaksin Shinawatra, prime minister of Thailand; Corazon Aquino, former president of the Philippines; President Gloria Macapagal Arroyo of the Philippines; and Lee Kuan Yew, former leader of Singapore. Universities in the West are active in

recruiting students from the region, and some are offering education in the region itself with offshore programs.

Because Southeast Asia is a region primarily of developing nations, nearly all nations (except wealthy Brunei and Singapore) have been major recipients of international development assistance from the West. Currently, transitional economies such as those of Cambodia, Laos, and Vietnam are also receiving significant economic assistance from the West.

These postcolonial Western influences, especially materialism, have given rise to the growth of anti-Western movements. Several key intellectuals in the region, including Sulak Sivaraksa in Thailand, Renato Constantino in the Philippines, and Syed Hussein Alatas in Malaysia, have been highly critical of the pervasive influence of Western materialism. Sulak, for example, calls for a return to core traditional Buddhist values. Despite the prolific writings and the social activism of those opposing Westernization and globalization, they have had little impact in stemming the tide of rising Western materialism and modern popular culture and their growing influence throughout the region.

WESTERNIZATION—WEST ASIA The nations of West Asia (Turkey, Iran, and Iraq) are considered part of the Middle East, the home of Islam, and they have a distinct history, culture, and civilization. There is a close nexus between religious authority and society. Of the three West Asian nations of the Middle East, Turkey is among the most secular and Westernized, whereas Iran and Iraq are less so, though they are almost as different from each other as they are from Turkey. Contradictions in the regime structures, political ideologies, and institutional goals of these nations have provided a fertile ground for the growth of radicalism. The state has turned out to be a most powerful institution, the final arbiter in matters of politics and societal structure.

Over the centuries, conservative and radical Arab nationalism has been a mainstream influence on state, social, and political institutions in the Middle East. By pushing people toward Islamic fundamentalism, Arab nationalism has restricted the development of a progressive outlook.

The process of Westernization in the Middle East, insofar as it has occurred, has been gradual, complex, and painful, carried out over decades to bring about transformation in patriarchal, feudal, and conservative societies. In Iran, the regime (1921–1941) of Reza Shah Pahlavi (1878–1944) in Iran began the modernization process under which he diverted major resources to expanding and strengthening the military apparatus to ensure the continuation of the absolute monarchy. To this end, he modernized military apparatus, built roads, improved the transportation system, and invested oil-based revenues in defense. The process opened up Iran's oil-based economy to Great Britain and the United States.

The inroads Reza Shah made in modernizing Iran did not extend to Westernizing it, however. In fact, his regime imposed strict censorship on the press and limited freedom of speech and expression. He deployed secret police to eliminate progressive-minded political leaders. His autocratic policies failed to create a cohesive socioeconomic base to bring about attitudinal changes among masses, and his style of autocratic regime was incompatible with liberal and democratic values.

It is paradoxical that Westernization and radical Arab nationalism have coexisted. For Middle Eastern nations, the admirable aspects of Western society are modern political concepts such as legitimacy, adult franchise, and gender equality. The Middle East's intellectuals and educated citizenry have not been so accepting what they perceive as an excessive focus on

An Iranian family drinks Coca-Cola outside a cold drink shop in Bam, Iran, in 1997. (EARL & NAZIMA KOWALL/ CORBIS)

individualism and materialism. The ruling elites in the oil-rich Middle East are also affected by the impact of science and information technology, globalization, and the opportunities presented by trade and investment. Some recognize that economic reforms, political moderation, and social change can bring economic growth, employment, and an improved standard of living for their populace.

Turkey

Turkey, with a population of 61.8 million (1997 census), is a democratic and secular country. The Turks constitute approximately 80 percent of the population; of them, 66 percent are Sunni Muslims and 33 percent are Alevi (Shi'ite) Muslims. Agriculture provides 50 percent of the nation's jobs. Early on, Mustafa Kemal Atatürk (1881–1938) championed Westernization. He ordered the adoption of Western clothing, replaced the Arabic alphabet with the Roman alphabet, and emphasized a secular state. By and

large, the nation has followed that path ever since, although in the 1990s Islamists came to have a stronger voice of opposition.

As a result of modernization programs launched by the government, Turkey's economy is being steadily liberalized. Transportation and communication facilities are fast expanding. Industrial growth contributes more than 30 percent of GDP, and 33 percent of employment in the labor sector. More significantly, the Turkish government has abolished Sufi orders and closed down *madrasabs* (Islamic religious schools), which are associated with radical Islam. The fast expansion of basic education has brought the country's literacy rate to more than 81 percent. Cumulatively speaking, Turkey has become an ideal model of a progressive and modern state in the Middle East, although its human-rights record still leaves much to be desired. The people of Turkey do not consider themselves Westernized in the strict liberal sense of the term, however.

Iran

The Constitutional Revolution (1906), the nationalist movement of 1951–1953, and the Islamic Revolution of 1978–1979 were Iran's three major political movements during the twentieth century. They opposed the unjust and illiberal monarchy, and granted Western-style individual freedom and rights within the framework of Islamic ideology. In March 1979, the Islamic Republic proposed by Ayatollah Khomeini (1900–1989) was overwhelmingly endorsed by the people (98.2 percent) in a referendum. But the Islamization measures undertaken under the Khomeini's regime were anti-Western, aimed at reversing liberal reforms, social progress, and women's rights. Socio-culturally and psychologically, Westernization was seen as antithetical to Islamic ideology.

In the 1990s, after the death of Khomeini, a process of political reform started. Iranian people favored individual freedom and rights. Reformists launched a political campaign to promote democratic values. Hashemi Rafsanjani (b. 1934), a champion of modernization and political reform, was elected as president in July 1989. He made efforts to revamp the economy and emphasized the necessity for liberal education in schools and colleges. The 1997 election of his successor, Muhammad Khatami (b. 1943), proved beyond doubt that the people were not in favor of conservatives and radicals. The government has demonstrated that it is not opposed to the new sources of legitimacy. In 1999, three hundred women out of a total of five thousand women candidates won local elections. Like men, women are entitled to vote at the age

of fifteen. Women continue to face discrimination in employment and the social sector, however.

The new regime in Iran today is keen to introduce secular values. Nevertheless, radical forces are still very active in Iran; these forces question the legitimacy of Western values, which they think are antithetical to Islamic ideology. In addition, there is the difficult task of blending modernity with social justice.

Iraq

Iraq has been under a long spell of the presidential dictatorship. It has suffered a lot almost on all fronts under the regime of Saddam Hussein (b. 1937), who came to power in 1968. He is opposed to Western values tooth and nail, and considers the West, especially the United States, to be the enemy of Islam. The people in Iraq have virtually no individual freedom or rights. Nor is there gender equality. The press is fully under the control of the government. All these have contributed to the reversal of the Westernization program of the 1950s and the 1960s. Economically, Iraq has suffered as a result of the Persian Gulf War (1990–1991). Unemployment is estimated at 50 percent.

When applying the yardstick of Westernization in terms of broad social and cultural outlook, expansion of education, economic development, growth of technology and mass media, and improved living and health standards, West Asia can hardly be described as Westernized. It is still hamstrung by conservatism, feudalism, and religious radicalism, which prevent people from imbibing the liberal democratic values of human freedom and dignity. Traditionally, the impact of Islamic beliefs and practices is so strong as to make it extremely difficult for people to change. There is still a long road to liberal democracy and secularism in the Middle East. Many regimes are not prepared to grant political freedom and rights. However, the acceleration of the process of economic reform and privatization, along with increased foreign investment, may make possible gradual political openness, economic development, and inter- and intrareligious tolerance.

WHALING-JAPAN Japan has a long history (dating back to 10,000 BCE) of whaling. Whalebones have been found in ruins from the Jomon period (10,000—300 BCE). A description of whales appeared first in the *Kojiki*, the oldest Japanese written record (712 CE). Whale meat was in supply from the Muro-machi period (1333–1573).

Whaling became a prosperous endeavor in the middle of the Edo period (1600/1603–1868), and whale meat continued to be eaten. During this period, the main whaling stations were in Taiji, Koza (Wakayama Prefecture), Tsuru, Fubotsu (Kochi), Ikitsuki, Waniura, Tsushima (Nagasaki), and Awa (Chiba). Harpooning by hand was the method used. Toward the end of the seventeenth century, techniques of net whaling were developed in Taiji and continued to dominate until the end of the nineteenth century. In 1662, whaling ships were painted, and fifteen-member crews used eight sets of oars. The whales caught were grays, rights, humpbacks, fins, and probably some minke. Temples and shrines were built to commemorate the souls of whales drowned in nets.

By 1900, through Russian whaling, the Norwegian method of using a motorized fleet was introduced to Japan. This led to the development of modern coastal whaling. Whaling traditions spread from southern Japan to the northern coast of Hokkaido, and whaling took place not only along the coast but also in the open seas of the North Pacific and Antarctic. After World War II, the people of Japan became more and more dependent on whale meat because of a food crisis and the lack of other sources of protein. In 1951, Japan signed the International Convention for the Regulation of Whaling of 1946. Japan gave up commercial whaling following the international moratorium in 1986 but has engaged in research, such as a whaling program to study southern ocean minke whales and the Antarctic ecosystem since 1987. The Institute of

Cetacean Research, created in 1987, is implementing this program with the Japan Whaling Association. Conservationists view this institute's activities, through its whaling research program, as a cover for commercial whalers. In 1993, Japan hosted the Forty-Fifth Annual Meeting of the International Whaling Commission (established in 1948) in Kyoto. The meeting resolved to work to alleviate distress to Japanese coastal whaling communities resulting from the moratorium. Today, there are four Japanese whaling communities, Taiji (population 3,900), Wada (population 6,000), Ayukawa (population 4,000), and Abashiri (population 44,000).

WHITE RAJAS The White Rajas of Sarawak were British adventurers who ruled as enlightened paternal despots for more than a century, from 1841 to 1946. Three generations of the Brooke family maintained Sarawak as a multiethnic, agrarian state until they turned it over to Great Britain following World War II. The Brookes worked with the leaders from the native and immigrant populations to protect the region's traditional way of life.

The History of the White Rajas

The rule of the White Rajas began in 1841, when James Brooke (1803–1868) was granted the territory of Sarawak, then covering the Lundu, Sarawak, and Sadong River basins, by Sultan Omar Ali Saifuddin II of Brunei, as a reward for putting down a revolt staged by the Malays and Bidayus (Land Dayaks) of the area.

By the time that Brooke died in London, he had extended the boundaries of Sarawak eastward to the Bintulu River (1861). His nephew, Charles (1829–1917), succeeded him, and during his long reign from 1868 until his demise in 1917, Sarawak assumed its present-day configuration through acquisitions from Brunei of the Baram (1881), the Trusan (1885), the Limbang (1890), and the Lawas (1905) Rivers. Charles, together with his son and successor, Vyner (1874–1963), molded Sarawak into a semblance of a modern state, despite its isolation.

Following World War II, it was deemed financially burdensome and beyond the means for the modestly

endowed Brooke government to undertake rehabilitation and reconstruction. Vyner decided that the practical option was the cession of Sarawak to the British government. In June 1946, Sarawak became a British Crown colony.

Characteristics of the Brookes

While James Brooke was courageous, charming, and charismatic, at ease with royalty as well as common people, his successor Charles was remote, reserved, uneasy, and lacking social graces in the company of high society. Unlike Charles, who was a consummate hands-on administrator, extremely thrifty and almost parsimonious, James Brooke had been a poor administrator and an even poorer financier. Vyner Brooke was shy and introverted; he disliked public appearances and pomp and ceremony. He was indecisive and had an aversion for day-to-day administration, but at the same time he was unable to delegate authority effectively. Vyner's younger brother, Bertram (1876–1965), who shared the rajaship in accordance with the will of Charles Brooke, was deferential and cautious about not upstaging Vyner. Bertram displayed no personal ambition and undertook his role as a matter of duty.

The Brookes' Principles of Governance

All the Brookes were steadfast to the principles of governance laid down by James Brooke, which became enshrined as the traditions of the White Rajas of Sarawak. These traditions emphasized the principles of trusteeship whereby Sarawak belonged to the indigenous peoples and the Brookes administered the territory on their behalf. The maintenance of the status quo in all spheres—political, economic, sociocultural—was emphasized. Change was discouraged, particularly radical transformation; if necessary or inevitable, the process of change was to be gradual and was not to affect adversely the way of life of the indigenous inhabitants.

Although the White Raja was an absolute monarch, he ruled through consultation with native chiefs, namely the Malay *datu* (nonroyal chieftains). This practice was institutionalized in 1855 with the establishment of the Supreme Council. If the raja consulted the *datu*, his European officers in the outstations relied on their respective native officers, drawn from the *perabangan* (sons of *datu*), for advice and discussion. Moreover officers at the district level were expected to seek advice and guidance from, and consult with, local native leaders. The advice and views given were not binding; nonetheless the act of consultation served the purpose of gaining the native perspective on is-

sues. Despite being basically a public relations exercise, the General Council (instituted in 1867), a triennial gathering of native chiefs and Brookes officers with the raja, represented the formal aspect of personal rule.

The raja also consulted with Chinese communal leaders from the various dialect groups (Hokkien, Teochew, Cantonese) on matters pertaining to the Chinese community. In the Chinese court, established in 1912, Chinese communal leaders presided as magistrates to deal with civil cases involving Chinese customs, traditions, and practices.

In the economic sphere, the development of trade and commercial activities and exploitation of natural resources were to be carried out without unduly disrupting the traditional pattern of native subsistence and way of life. The indigenous peoples were to be shielded from exploitation by outsiders—European and Chinese—particularly on the issue of land. Raja Charles Brooke equated land with *darab daging* (flesh and blood) of the natives. Under no circumstances were the natives to part with this heritage. Moreover the backbone of the economy, the Brookes insisted, was to be the tilling of the land. Agriculture was the means of improving native welfare. Ideally, as Raja Charles envisioned, family-owned and family-managed smallholdings of food crops (rice) and some commercial crops (rubber, pepper, tropical fruits) were to be established. The sago-producing coastal Melanau districts were to maintain their traditional way of life.

European capital investment and Chinese labor and entrepreneurial skills, if cautiously applied, would gradually develop the resources of Sarawak. The Chinese were allowed to engage in gold mining and in trade and commerce; subsequently they dominated the country's retail trade. The Chinese also developed commercial agriculture (pepper, gambier, rubber) on a smallholding scale. The limited number of European enterprises was confined to the extractive industries (gold, oil) and plantation agriculture (rubber).

The Brookes eliminated traditional abusive practices such as *serab dagang* (forced trade), bondage, all forms of slavery, and headhunting. Although they had mixed feelings about the effects of Western-style education on the native peoples, the Brookes provided government-sponsored Malay schools and allowed Christian missionaries to establish urban English-medium and rural vernacular schools. The Brookes were dubious about the influence of Christian missions on the indigenous peoples and forbade proselytizing among the Muslims (Malays, some Melanau, Kedayans).

After a century of White Raja rule, Sarawak was a thinly populated, tranquil, virgin country, barely touched by influences from without. The multiethnic native population remained largely in rural-based subsistence farming communities. There were also Chinese-managed commercial smallholdings of pepper, gambier, and rubber. The Chinese dominated trade and commerce. Aside from the extractive industry (oil and gold), there was a conspicuous absence of European large-scale capitalist enterprise. Equally nonexistent were native landlessness and indebtedness.

The White Rajas fostered a form of enlightened paternal despotism that jealously protected the interests of the native inhabitants and the preservation of their traditional ways of life. Consequently, economic development was sluggish, and there was no apparent significant improvement in the livelihood of the indigenous population. The provision of education and public health care barely touched the vast majority of native inhabitants. Infrastructure development was minimal.

Nonetheless, the indigenous peoples and the Chinese inhabitants revered the Brooke regime that maintained a stable administration and a peaceful country. However, heightened nationalistic feelings consequent of the brief but significant Japanese military occupation (1941–1945) of Sarawak and the changing postwar geopolitical situation made Brooke paternal rule an anachronism. When Sarawak was ceded to the British government and became a crown colony (1946–1963), a small sector of the Malay community opposed it; the majority of the population, however, viewed cession favorably. British rule brought some improvement particularly in the development of infrastructure and in the social services, such as education and public health.

WHITE TERROR "White terror" was the name given to the terror regime established by the Chinese Nationalist Party (CNP, or Guomindang) after its capture of Shanghai in 1927. The violence, which drove a permanent wedge between the Nationalists (the white party) and the Communists (the red party), was directed at the labor unions and their leaders but later turned into extortion of Shanghai's privileged classes.

Background

From the time of the collapse of China's last imperial dynasty in 1911 and the establishment of the Republic of China in 1912, China's political landscape had been fragmented; by the early 1920s Sun Yat-sen (1866–1925) led the CNP from its principal base in Guangzhou (Canton), while the Chinese Communist Party (CCP) was founded in Shanghai in 1921 by Chen Duxiu (1879–1942). In 1923 Sun Yat-sen's favorable impression of the Bolshevik revolution in Russia and the communist belief that a socialist revolution would follow a nationalist revolution led to the Communists and the Nationalists forming an uneasy alliance against the local warlords who held large parts of China. Michael Borodin (originally named Mikhail Gruzenberg, 1884–1951), who was a Comintern agent in China from 1923 to 1927 and who was one of the architects of the alliance between the CCP and CNP, became one of Sun Yat-sen's special advisers. At a CNP conference in January 1924, Communist delegates accounted for fewer than 20 percent of those present, but already in January 1926, Communists and their supporters in the CNP constituted the majority of the delegates at a conference held in Guangzhou. Following the death of Sun Yat-sen in 1925, Chiang Kai-shek (1887–1975), commander of the Whampoa Military Academy south of Guangzhou, soon emerged as the new leader of the CNP.

Although Guangzhou had become a Communist stronghold, powerful anti-Communist factions of the CNP existed all over China, and under the new CNP leadership, the pro-Soviet line was abandoned. The tensions between the CCP and the CNP surfaced in March 1926 when Chiang Kai-shek felt provoked by the presence of a gunboat commanded by a Communist and imposed martial law in Guangzhou. Soviet advisers were arrested, and workers and Communists were disarmed. After some days, martial law was lifted, and after negotiations involving Borodin, the CNP-CCP alliance continued, but with a weakened Communist position. By the end of 1926, the armies controlled by the CNP and Chiang Kai-shek had conquered most of southern China and established headquarters in Nanchang, while the CCP and its supporters were based in Wuhan.

Shanghai 1927

In the 1920s the central part of Shanghai was divided into a number of foreign settlements surrounded by Chinese neighborhoods. The foreign concessions were legislatively and administratively independent of China, and they could even overrule the legal system of the Chinese government. The city was a booming center of industry and trade, and Communist leaders had been very successful in organizing workers on the docks and in the factories in labor unions. In May 1925 strikes involving several hundreds of thousands of workers in Shanghai spread to the rest of China, and the riots were stopped only when Japanese and British troops opened fire and killed numerous Chinese workers.

In February 1927, at the same time Chiang Kai-shek was contemplating a move on Shanghai, the Communist leaders in the city, Zhou Enlai (1899–1976) and Li Lisan (1899–1967), organized a general strike that paralyzed the busy port and the industry. Again, numerous workers were arrested and executed, but in March the strike turned into an armed rebellion against the CNP and the authorities in the Chinese part of Shanghai, and police stations and other key buildings in the city were occupied. Chiang Kai-shek delayed his advance on Shanghai in the hope that foreign troops or Shanghai's local Chinese commander would crush the Communists, but when that failed to happen, the CNP armies arrived on 26 March.

White Terror

One of Chiang Kai-shek's main motives for taking over the rich city of Shanghai was to secure financial support for his campaign to conquer the northern provinces, which at that time were controlled by independent warlords. At the same time, he wanted to curb the influence of the CCP headquarters in Wuhan and the strong Communist organization in Shanghai. The city's industrial leaders, powerful businessman, foreign concessions, and underworld entrepreneurs occupied with gambling, prostitution, kidnapping, and opium trade shared Chiang's opposition to the CCP. The illegal activities in Shanghai were controlled by a secret society known as the Green Gang (Qingbang), led by Huang Jinrong, a senior officer in the French police. The nature of Chiang Kai-shek's connection with the Green Gang remains undisclosed, but it is generally agreed that an alliance was formed between the Nationalist occupying forces and the secret society to strike against labor unions and Communists.

At 4:00 A.M. on 12 April, while Chiang was away to set up his capital in Nanjing, a well-orchestrated attack on union headquarters around Shanghai was carried out

by a militia led by associates of Huang. The militia, which consisted of approximately one thousand men, was heavily armed and wore plain blue clothes and white armbands with the Chinese character for labor (*gong*). In several instances, they were assisted by Nationalist troops, and they were allowed to pass freely through the foreign settlements. Hundreds of leading labor unionists and Communists were shot or arrested and turned over to the Nationalist troops, who executed them. A few leaders, among them Zhou Enlai, narrowly escaped. The next day, the labor unions responded with huge strikes and demonstrations that were dispersed with machine guns, bayonets, and swords.

The white terror spread to other cities held by the CNP, and several Communist attempts to establish city communes were suppressed. Having put an end to Communist activities in Shanghai, Chiang Kai-shek began to collect payment from the privileged classes for his services. Assisted by criminals of the Green Gang, the CNP forced the rich to donate money or extend "loans" to finance its armies. Those who refused were imprisoned and only released in return for huge sums of money or had their property confiscated or their children kidnapped.

The white terror in Shanghai and other urban Communist strongholds had a crucial influence on the further development of Communist strategy in China. Having lost its influence in the cities, the CCP concentrated its focus on the large and richly populated rural areas and based its revolution on the peasants rather than the industrial workers.

WIJAYA, PUTU (b. 1943), Indonesian playwright, film director, writer. Born in Bali in 1943, Putu Wijaya has developed a style that blends traditional Balinese influences with elements drawn from Antonin Artaud (1869–1948) and avant-garde Western theatre. His stage works often use a very Balinese blend of music, choreography, and dramatic action to present plots that leave a very Western impression of disturbing uncertainty. His theatrical works mostly have one word

titles, such as: *Edan* (Mad), *Aduh* (Ouch), *Awas* (Beware), *Aib* (Dishonor), and *Dor* (Bang). Putu Wijaya works mostly with his own theater company, Teater Mandiri (Independent Theater). His novels and short stories are best-sellers in Indonesia and are written to confront and shock readers and thereby grab their attention. Among his popular works are *Blok* and *Prrototes*. His plays are also performed outside Indonesia as a leading example of modern Indonesian drama.

WOMEN IN CENTRAL ASIA Central Asian women represent more than twenty different ethnic groups, speak variations of the Turkic and Tajik languages, and live in five countries: Kazakhstan, Kyrgyzstan, Tajikistan, Turkmenistan, and Uzbekistan. Nevertheless, they share many common characteristics. Most Central Asian women are Muslims of the Sunni sect. They were raised under Soviet ideals of gender equality; they share high literacy rates, maintain close ties to their extended families, and are navigating the immense economic and social upheaval of the post-Soviet era.

Pre-Soviet Society

Little is recorded about Central Asian women prior to the Soviet period. Sparse descriptions in travel journals note that women of the nomadic Kazakh and Kyrgyz groups rarely were veiled. In comparison, their more sedentary agricultural neighbors, the Uzbeks, practiced female seclusion and adhered to the custom of *parandzha*, face and body veiling. Women of nomadic tribes wore male apparel since girls and women were expected to perform tasks as competently as their male counterparts, whether horseback riding, hunting, or herding. Such expectations stemmed from the seasonal cycle of nomadism, which required that men and women live separately for months at a time. While men grazed cattle on the highest pastures, women were the de facto masters of the lower-altitude camps,

performing all the duties that men performed when they were there. Since the nomadic groups of Central Asia were not Islamized until the 1800s, these women had few restrictions on their daily lives. Nevertheless, both nomadic and sedentary women had few opportunities to be educated, little freedom in choosing a mate, and few property rights.

The Soviet Period

Beginning in 1926 the Soviets initiated a campaign of female emancipation in Central Asia called (in Uzbek) *bujum* or assault. This campaign advocated that, for the good of the young Soviet nation, Muslim women become the equals of men, be allowed to work, and be educated outside the home. One of the most radical steps in the campaign was to do away with the custom of veiling. The Soviets organized large assemblies so thousands of women could "unveil" at the same time. For the Russians the veil symbolized oppression and ignorance, but for Central Asians the veil was an integral part of their lives. In urban settings it provided protection from the desert heat and dust; it also represented the definitive divide between the spaces accorded to men and women. Men were the public face of the family, and women remained secluded in their homes with their children.

Over the course of a decade Central Asians slowly shed the veil. They were given an education, and, as a first step toward employment outside the home, the Soviets established female cooperatives for textile and agricultural training. It became understood during the Soviet period that education and employment were not only their right but also their duty to their country.

In spite of Soviet norms and restrictions, many traditional customs survived. Central Asian women in many ways lived dualistic lives. They performed their duties as Soviet citizens in public while privately attending to the numerous traditions and rituals that reflected the central role of family in their society. Perhaps only in the realm of childbearing did the Soviet agenda and Central Asian traditionalism overlap. In Central Asian society children are considered a family's wealth; a woman who bears many children is regarded highly. During World War II, the Soviets encouraged reproduction, presenting medals of honor to women bearing more than five children. Central Asian women were by far the most decorated "mother heroines," even as they continued to work outside the home and boosted literacy rates to 98 percent.

Post-Soviet Dilemmas

With the dissolution of the Soviet Union in August 1991, five new states emerged from the former Soviet

republics. "Democracy" and "market economy" became code words for the transition away from socialism. Instead of ushering in a new era of freedom and opportunity, as hoped, the last decade of the twentieth century was particularly arduous for women. Many of the state enterprises and collective farms, which had previously employed a large percentage of women, were privatized or eliminated. Official and unofficial unemployment have become rampant. Further, many preschools and medical supports for the aged were curtailed because of limited governmental funds. Without state provisions for child care, elder care, and other benefits, women become primary caregivers for their extended families. At the end of the twentieth century, Central Asian women also played a pivotal role in non-governmental organizations. In lieu of formal employment, they were active in the informal marketplace, especially in buying and selling goods at local bazaars.

In summary, the ethnic diversity of Central Asian women is mitigated by the fact that they share the customs of Islam. Likewise, the common experience of seventy years under Soviet rule gave women the opportunity to be educated and to work outside the home. Nevertheless, women continue to be expected to maintain family traditions. The economic woes resulting from the independence of the Central Asian countries placed an unusually heavy burden on women, since they were primarily responsible for the physical and social well-being of the family and for supplying an income.

WOMEN IN CHINA Women figure significantly in Chinese history and had a unique status for two reasons. First, the orthodox system of Confucianism that ordered the Chinese imperium from its

earliest dynasties until the twentieth century considered the family to be the basic political unit. Women's roles as wives, household managers, and educators of the young thus served not only the family but also the state. Second, although Confucius (551–479 BCE) emphasized the hierarchical relationships between ruler and subject, father and son, and husband and wife, he also taught the reciprocal responsibilities of each. Thus, while a wife was bound to obey and serve her husband, he was equally bound to treat her with dignity and respect. Through the complex interweaving of official and private lives, Chinese women had opportunities to exercise informal power not known to women in other patriarchal societies.

Women's Roles in Early China

Confucianism ordered the lives of women from their birth to their death through three sets of principles. The earliest was penned by the great woman scholar Ban Zhao in *Lessons for Women* during the Han dynasty (206 BCE–220 CE). Ban Zhao instructed women to be guided by womanly virtue, correct speech, proper deportment, and womanly work. These were known collectively as the "four womanly virtues." Also central was the concept of the "three obediences"—obeying one's father when young, one's husband when married, and one's son when widowed. Finally, there was the principle of *bie* or separateness. Men and women each had their own spheres. For elite men, this was the world of study, civil-service examinations, and official careers. For peasants, it was the field. The home was a woman's sphere whether she was rich or poor. The separate spheres of men and women in China, however, must not be confused with similar concepts in the West. Because the family was the basic political unit in the Confucian system, the state had a vested interest in the lives of women. Thus, although women led private lives, their lives were a public matter.

Although Confucian China was a patriarchal society, its moral code applied equally to men and women. One of the five basic Confucian relationships was that between husband and wife. While husbands were placed over their wives, the principle of reciprocity required that husbands treat their wives with respect if they expected to be served well in return. The principle of filial piety also elevated a woman's position. From boyhood sons were bound to their mothers through both maternal ties and the Confucian principle of filial piety, which required them to honor and serve both parents throughout their lives and after their deaths. Practical aspects of the Confucian bureaucracy also provided elite women with unusual status and power in the family. The arduous task of studying for

the examinations that led to officialdom occupied men, from their youth often through middle age. Because Chinese statesmen could not hold office in their home province, after they won official appointment they could be sent away from home for years at a time. Wives bore the responsibility of managing the household itself and often the entire family estate as well.

Because Confucianism bolstered the patriarchal state and endorsed, at least in theory, women's subservient position to the men in the household, it provided little solace for women. To find spiritual satisfaction and harmony, women turned to Buddhism and Taoism, both considered "heterodox" religions because they ran counter to the orthodox system of beliefs in Confucianism. They studied Buddhist sutras and Taoist writings and made pilgrimages to local shrines. Older women and widows might hand over control of their households to their oldest daughter-in-law and retire into seclusion to pray and meditate. The fact that women traveled on pilgrimages testifies to the hold on the public imagination of heterodox religions as well as the toleration of Confucianism. The fact that a family matriarch could withdraw from daily responsibilities and devote herself to prayer if she wished speaks to the importance of hierarchical relationships within the family and the respect given to family elders.

Certain female practices, however, lay outside the domain of the dominant Confucian culture. The custom of foot binding, the painful practice of binding a young girl's feet so that they did not grow but took on the form of a lotus flower is often offered as evidence of Chinese women's extreme subjugation. Yet while widely accepted, foot binding was not condoned in orthodox Confucian literature. A patriarchal society may have approved of the fact that women with bound feet were more easily controlled, and men may have regarded women's tiny feet as erotic, but in actuality foot binding was part of the female culture.

Foot binding began as a courtesan fashion during the Song dynasty (960–1279) and was soon imitated in court circles. The practice evolved slowly into a status marker in elite society, and a woman's beauty and desirability were judged by how tiny her feet were. Because it was the custom in China for men to marry women of lower social standing, foot binding eventually spread to peasants, where it was a means of upward mobility for daughters. Foot binding was a private female ritual: mothers bound the feet of their daughters. Young girls embroidered intricate slippers as part of their trousseau and wrote poems about their tiny feet. Bathing and rebinding feet became a lifelong part of women's daily toilet. Except for her husband, no man ever saw a woman's feet, and even he never saw his

INFORMAL SOURCES OF POWER AMONG CHINESE WOMEN

Although men have more power than do women in China, women certainly do exercise power. However, their power tends to be informal and to be most obvious in the family and in the community, as indicated by this description of women in a community in Taiwan.

The power young women wield as they build their uterine families and attempt to manipulate their husbands is of a peculiar kind. It consists in subverting and disrupting the family form that most Chinese men hold dear—the family that grows from generation to generation without interruption and without division. Sons, their wives, and their children should live in harmony under the guidance of the eldest male. The goals and desires of young married women conflict with this ideal, and it is largely their machinations that prevent its attainment. The *power* women have is their capacity to alter a family's form by adding members to it, dividing it, and disturbing male authority; the *danger* they pose is their capacity to break up what men consider the ideal family

We once asked a male friend in Peihotien just what "having face" amounted to. He replied, "When no one is talking about a family, you can say it has face." This is precisely where women wield their power. When a man behaves in a way they consider wrong, they talk about him—not only among themselves, but to their sons and husbands. No one "tells him how to mind his own business," but it becomes abundantly clear that he is losing face and by continuing in this manner may bring shame to the family of his ancestors and descendants. Few men will risk that.

wife's feet unbound. As with other cultural rituals no longer practiced, it is difficult to unravel its meaning and importance in the lives of women, but the practice of foot binding belonged to the female sphere.

Women as Producers and Reproducers in Later China

While patriarchal systems legitimized male power over women, they also defined male and female roles in relation to what was necessary for the state and society to prosper. In China the adage "Men till, women weave" was more than a statement of gender roles. In early imperial China, taxes were paid in rice and woven cotton cloth. Because women contributed a portion of the annual tax levy, both elite and peasant

women gained status as economic producers. Reforms in the tax system and the commercialization of weaving at the beginning of the late imperial period altered women's status. From the Song to the Qing dynasties, technological advances in loom design, the introduction of silk and silk damasks, and the increasing demand for more intricately patterned cloth resulted in the decline of weaving as a cottage industry and its growth as a commercial enterprise. While domestic weaving was marginalized in the economy, culturally the adage "Men till, women weave" emphasized the importance of work over leisure, even for women in elite households.

Arguably, the downward spiral of women's social status in late imperial China, especially from the Ming

dynasty onward—which was also reflected in changes in the legal code and in the increasing cultural importance of foot binding to both men and women—started with women’s loss of economic power vis-à-vis the family and the state. This shift led women to find new, informal means of exercising power. One way was through motherhood.

Being indentured as servants, sold into slavery or prostitution, or abandoned at nunneries was a possible fate for peasant girls and even girls from elite households that were gradually descending into poverty, but most women married. Producing children, although valued in all traditional societies, had certain special implications in Chinese society. Sons were desired because they would care for their parents in their old age. In elite households sons were also prized because they could bring honor, prestige, and wealth to their families if they were successful in the civil-service examinations and fortunate in their careers.

From earliest childhood girls were groomed for their future roles as wives, mothers, and daughters-in-law. They were taught to read and write, some becoming proficient enough to write poetry. They were schooled in womanly virtues and taught all the practical aspects of household management. Marriage was a social contract, arranged between families. A bride and groom never saw each other before the wedding, and the hooded bridal gown prevented them from seeing each other even during the ceremony. A bride’s primary relationship was with her mother-in-law. Many tales of the cruelty of mothers-in-law to their daughters-in-law have come down in popular Chinese literature, much like stories of evil stepmothers in fairy tales in the West. How true these stories were is impossible to tell. What is certain, however, is that relations among the many women in an extended family compound were complicated. Hierarchy among women was dictated by age and marital status. A woman’s position was also determined by her beauty, talent, and virtue, or by her skill in compensating for the lack of such attributes. The great social novel *Dream of the Red Chamber* (*Hunglou meng*, 1792) provides the classic example of how much intrigue as well as genuine friendship there was among women in the extended Chinese family.

One complication in the Chinese household that has no direct counterpart in the West was concubinage. A concubine was a second or third wife who had no legal standing as a wife. The practice was officially condoned as long as a man’s first wife produced no male heir. Among the affluent, the practice of taking more than one concubine as a mark of wealth became

prevalent. Not only did a concubine have no legal standing as a wife, but also she could not even consider her children to be her own. Even if she was fortunate enough to produce the desired male heir, the first wife was considered the child’s mother.

Thus motherhood and the status motherhood brought with it were conferred only on the legitimate, first wife. The child owed filial obedience only to his or her socially recognized mother. The gain for some women and the loss for others in this social arrangement cannot be overstated. As the mothers of successful bureaucrats, elite women were able to reestablish a link between themselves and the state. By the Ming dynasty, no longer important as producers, they gained importance and honor as Confucian mothers.

Women’s Modern Transformation

After the Opium Wars of the mid-nineteenth century, Western powers forced themselves on China. From 1840 to 1949 China was a country in transformation, and women were caught up in it. The late nineteenth century saw the beginning of serious attempts to reform society. Every aspect of Chinese life came under challenge, including the limited social, political, and economic roles of women.

Western missionaries led the way in educating Chinese girls, one of their true contributions to Chinese society. Even before universal education was established in 1907, many gentry families had opened Western-style schools for girls or sent their daughters overseas to receive higher educations.

CHAIRMAN MAO ON WOMEN

"In order to build a great socialist society, it is of the utmost importance to arouse the broad masses of women to join in productive activity. Men and women must receive equal pay for equal work in production. Genuine equality between the sexes can only be realized in the process of the socialist transformation of society as a whole."

Source: Mao Zedong. (1976). *Quotations from Chairman Mao Tsetung*. Beijing: Foreign Language Press, 297.

With its large population a major economic resource, China has work teams that are continually building and maintaining public resources throughout the country. Here, three women working on a new water main from Miyun to Beijing take a rest. (DEAN CONGER/CORBIS)

Education was the key to women's transformation. The first generation of Chinese feminists received their higher educations abroad. With the introduction of higher education in China, first through Christian union colleges for women, founded between 1905 and 1915, and then through universities, later female leaders were more likely to have been educated entirely in China. It was not only those with advanced educations who played a pivotal role in women's struggle for a share of China's progress. Many more women with middle-school educations entered the teaching ranks than did college-educated women.

Other professions were slow to open up for women. In the 1920s women worked as doctors and educators. Gradually women entered government service. Political rights were even more elusive. Both the Nationalist and the Communist Parties were essentially patriarchal. The New Life Movement, an ideological campaign launched by General Chiang Kai-shek in the early 1930s, actually emphasized the four womanly virtues and sought to curtail women's public roles by promoting domesticity. However, in the 1930s, a civil law code was finally passed that granted women many civil rights, such as the right to divorce and hold property.

Much of the progress women made in the first half of the twentieth century affected only women in urban centers. In the rural countryside that made up most of China, life changed more slowly. Foreign wars, internal revolts, devastating famines and floods, and a spiraling population plunged the majority of Chinese women into unimaginable poverty. Infanti-

cide and the selling of little girls into various forms of bondage was prevalent. Young girls became part of the trade in labor for mills in industrializing coastal cities. Not until the Communists won the civil war in 1949 did many of these practices end.

At the time of the Communist victory, a core of women from various women's organizations formed the All-China Women's Federation (ACWF). Quasi official in nature, the ACWF provided women with their first collective voice in their own affairs and those of their country. Although ideologically bound to the Communist Party, the ACWF was and still is exclusively a women's forum that monitors women's lives, lobbies the government on their behalf, and helps enforce government policy at regional and local levels. The organization represents a step forward for women still bound in large part by patriarchal principles.

The past twenty years have brought significant changes to the lives of women in urban China, but again less so to women in rural villages. Education and economic security are still key to women's progress and, as more and more women gain both, their status and power in society should improve.

For years, all that was known about the lives of women in China came from the writings of men. Historians now realize that such writings cannot be interpreted literally because they represented only the male view of how society should function, rather than the lived experiences of women. The discovery of thousands of poems written by women finally furnished scholars with a female perspective and furthered the study of women in China.

Primary among the results of the significant new findings that have transformed the previous superficial understanding of women's lives and shattered many long-standing stereotypes is that historians and other social scientists now realize that they cannot assume that all traditional patriarchal societies are the same. Confucianism, while fundamentally patriarchal, provided certain protections for women not found in other parts of the world. The question is no longer "Who had power?" but "How did people, especially women, use the types of power available to them?" Scholars also realize that other universal categories, like motherhood, need to be carefully situated in the context of specific cultures and periods of history. When studying the lives of women, it is just as important to understand the relations between women themselves as it is to understand the relations between women and men.

WOMEN IN JAPAN This entry focuses on the situation of women in the period from 1945. Under the political system of Imperial Japan (from 1890 to 1945) women's and men's situations were determined by their status as gendered subjects of the emperor.

Under the feudal system which was in place until the late nineteenth century, men and women's lives were primarily determined by their place in the feudal hierarchy of the imperial family, samurai, peasants, artisans, merchants and outcasts. Japanese women and men now enjoy the highest life expectancy rates in the world. High life expectancy rates and low birth rates have led to the development of distinctive life-cycle patterns in Japan's highly prosperous postwar society. Women in Japan also enjoy a legal environment that guarantees them basic political and civil rights, although they are still campaigning for social change on several fronts. The low birth rate and the steadily decreasing numbers of people of working age have been linked with problems in the delivery of care and welfare benefits to the aged.

Although women in Japan have relatively high rates of participation in the labor force, they are concentrated in part-time and casual labor rather than full-time permanent positions. Labor force participation rates show a distinctive M-shaped curve, with highest participation rates in the twenties and late forties. The curve dips in the years when women are most likely to be engaged in childbirth and childcare. In recent years, however, the M-shaped curve has been flattening.

The age of marriage for both men and women is steadily increasing. In 1975 the average age of first marriage was 24.7 for females and 27 for males. In 1998 the average age had risen to 26.7 for females and 28.6 for males. Since the postwar baby boom of 1947 (33.8 births per 1,000 population), birth rates have declined. Between 1955 and 1975, the birth rate fluctuated between 17.1 and 18.8, but has steadily declined since, reaching 11.9 in 1985. Falling birth rates and a trend toward nuclear households have resulted in a steady decline in household size, from 4.97 in 1955 to 3.17 in 1985. Later marriage and lower birth rates mean that women are spending fewer years engaged in full-time childcare.

Women have been able to vote and stand for public office since April 1946. The revised constitution of 1947 includes a clause outlawing discrimination on the grounds of sex, status, or religion, and the Civil Code was revised in 1947 in line with the new constitution. The Labor Standards Law of 1947 included the principle of equal pay for equal work. Marriage, divorce, and inheritance laws were also revised on more egalitarian lines, unlike prewar family law, which had been based on patriarchy (the rule of the father) and primogeniture (inheritance by the eldest son).

Equal-opportunity legislation was passed in 1985 and became effective in 1986, with revisions taking place in 1997. In response to Japan's ratification of the Convention on the Elimination of All Forms of Discrimination Against Women (CEDAW) and recognition of the Beijing Platform of Action, recent years

**GIRLS' LIVES: REAL AND IDEAL**

This poem dating to the 1930s points out the contradictions in girls' lives in Japan. Girls learned English in schools, but the only use they could make of it was to write love letters.

High-school girl, beautiful as a flower bud,
Before her parents writes a love letter in English.
The two parents, not knowing it to be a love letter,
Praise her for studying so much.

Source: John F. Embree. ([1939] 1979) *Suye Mura: A Japanese Village*. Chicago: The University of Chicago Press, 195.

Japan's Naoko Takahashi leads the field in the women's marathon at the 2000 Summer Olympics in Sydney. Takahashi won the race with a time of 2:23:14.

have seen further legislation directed at creating a more equitable society. In 1994 the Headquarters for the Promotion of Gender Equality was organized within the prime minister's office. This developed into the Office for Gender Equality and the Council for Gender Equality. In 1996 the latter submitted a report, *Vision of Gender Equality—Creating New Values for the Twenty-first Century* to the prime minister. In June 1999 the Basic Law for a Gender-Equal Society was passed by Japan's legislature, the Diet, and became effective on 23 June 1999.

Recent years have also seen important legislation concerning the conditions of working women, the harmonization of family and working life, and the provision of care for the elderly. Nevertheless, women have campaigned for over a century for improvement in their situation, and feminist campaigns have continued into the twenty-first century.

Women's Movements for Change

Feminist thought and activism in Japan dates back to the late nineteenth century. As part of a more general development of notions of human rights, women's rights (*joken*) were debated beginning in the 1880s. Socialist thinkers also debated the "woman question" (*fujin mondai*) in the first decades of the twentieth century. The feminist literary journal, *Seito* (Blue-stocking), edited first by Hiratsuka Raicho and then Ito Noe, appeared from 1911 to 1916. Until 1922, Article Five of the Public Peace Police Law prevented women from attending, holding, or speaking at political meetings or belonging to political organizations. After the modification of Article Five in 1922 it became possible for women to form organizations to lobby for suffrage. The League for the Attainment of Women's Suffrage was formed in 1924, led by Ichikawa Fusae. Bills for women's suffrage passed the lower house of the Diet in 1930 and 1931 but failed in the House of Peers. Autonomous women's organizations were gradually co-opted under the total national mobilization system during World War II.

In postwar Japan, women were initially active in such organizations as the Hahaoya Taikai (Mothers' Convention), consumer groups, pacifist organizations, and the Shufuren (Housewives' Association). In the 1970s, women's organizations took on a more explicitly feminist character. Some women participated in the New Left and student left organizations that protested the renewal of the U.S.-Japan Security Treaty in 1960, and which brought universities to a standstill in 1968 and 1969. Women, however, became disillusioned with the sexism of the men in leftist organizations, and formed their own women's liberation groups in the 1970s to explore issues of sexuality, reproductive control, and identity, and to oppose moves to amend Japan's relatively liberal abortion law.

International Women's Year in 1975 and the subsequent United Nations Decade for Women provided a focus for reformist activities. After Japan's ratification of CEDAW, there was reform of the Nationality Law, so that both women and men could pass on Japanese nationality to their children. There was also enactment of legislation to promote equal employment opportunities, and reform of the education system so that there would be no subjects solely for boys or solely for girls.

Current issues involve the consideration of the relationships between men and women in Japan and men and women in other Asian countries, prompted by an interest in the situation of immigrant workers in Japan and workers in the tourism industry and multinational factories in Southeast Asia.

Women's Studies and Women's History

The current wave of women's studies in Japan can be traced to the women's liberation movements that grew out of the activism of the 1970s, and to broader reformist feminist movements. Although there are now several women's studies associations and several academic journals devoted to women's studies, most teachers in the field are on the fringes of the academy, reflecting the already marginal place of women in most colleges and universities. As in many other countries, courses on women's studies survive thanks to the dedication of groups of feminist researchers who find solidarity in networks that cross institutions and bring together academics, activists, journalists, and other professionals. In addition to women's studies based in the academy, there is also a range of community-based, grassroots women's studies activity, which often takes the form of newsletters, journals, or monographs produced on a collaborative basis. Women's history, in particular, has developed such grassroots, community-based ways of writing history, while other community-based research is tied to specific issues such as sexual harassment, domestic violence, the situation of part-time and immigrant workers, or support for claims for compensation by women forced into military prostitution during World War II. Local women's centers, established during the International Women's Decade, host adult education classes on women's studies and women's history, and provide a focus for local study groups.

WOMEN IN KOREA Women have enjoyed considerable freedoms throughout much of premodern Korean history. Confucianism, however, hindered women's status from the sixteenth century onward. Today, Korean women continue to be restricted by traditional mores and social structures, but they are

closer to gaining equal opportunities in education, employment, and law.

Premodern Korea

Social rank was of utmost importance in the Shilla kingdom (57 BCE–935 CE). The bone-rank system divided all people into one of the following ranks: royal hallowed bones (*songgol*), aristocratic true bones (*chim'gol*), and headranks six to one. One's hereditary social class was based on both parents' positions, with the offspring taking the lower parent's status. The hallowed-bone class declined in number due to this hereditary rigidity. As the last two members of the hallowed-bone rank, two queens (Sondok, ?–647, and Chindok, ?–654) ruled in their own right before the throne passed to true bones. Chinsong (?–897), a third *yowang* ("queen in her own right"), reigned 887–897. The strictness of the hereditary social status is cited as one of the reasons for the eventual decline of the Shilla kingdom. Married women in Shilla often lived with their natal families for some time before moving to their in-laws' homes.

In the Koryo dynasty (918–1392), as in Shilla, women generally did not have public roles, but daughters shared equally in inheritance or division of property because of siblings' collective responsibilities in

CRIMINALIZING ADULTERY IN KOREA

According to *AsiaWeek*, South Korea, along with Greece, Switzerland, Taiwan, and Austria are the only non-Muslim nations that criminalize adultery, with Criminal Law Article 241 allowing imprisonment for up to two years. In 2001, the Constitutional Court upheld the law by an 8 to 1 vote, although it did allow that the government should consider abolishing the law in view of changing Korean attitudes about sexual behavior. Those who support the law claim that it protects married women and sets a moral standard for Korean society. Opponents, including most women's groups, argue that it has little effect on sexual behavior and is an infringement on personal privacy.

SECOND-CLASS CITIZENS

The following extract from a mid-twentieth century anthropological report on Korea indicates that at that time women enjoyed few of the freedoms enjoyed by men. That situation has changed over the past fifty years, especially in cities and among educated women.

Women do not have names. It is true that most girls receive some surname by which older relatives and friends of the family designate them during childhood. But as soon as they reach the age of puberty, only their parents may use this name, and other members of the family, as well as strangers, employ paraphrases such as daughter of so-and-so, or sister of so-and-so. After marriage a woman no longer has any name. Her own parents usually designate her by the name of the district where she was married, and her husband's parents by the name of the district where she lived before she was married. Sometimes she is called simply the house of so-and-so (the husband's name). When she has sons, convention requires that one use the designation mother of so-and-so. When a woman is forced to appear before the courts, the mandarin officially imposes a name on her for the duration of the case in order to facilitate debate.

cares for older family members and performing ancestor rituals. Koryo women had considerable freedom, with rights to marry, divorce, and remarry at will. Married women of Koryo had close ties with their natal families, even when they lived with their in-laws.

Although early Choson society was largely similar to Koryo society, the Choson dynasty (1392–1910) is characterized by the Neo-Confucian transformation of society that began in the sixteenth century. Neo-Confucian social restructuring had a strong impact on women's status. According to Neo-Confucian social rules, a woman's identity came from her place in hierarchical and patriarchal relationships within the family. A woman was also bound by "The Three Followings"—she had to obey her father during childhood, her husband after marriage, and her son in her old age. Married women had limited ties with their natal families.

Choson women lost most of their inheritance rights and were not permitted to participate in ancestor rituals. There was also a stigma against remarried widows and their sons. Other Choson marriage restrictions included bans on endogamy (marriage between

people of the same surname and same clan seat) and marriage between matrilineal cousins.

Although the Neo-Confucian transformation seems stifling to women, it improved women's status in certain ways. With the increased stratification of the inner quarters, primary wives and mothers of sons became more powerful. Aristocratic (*yangban*) men were also duty bound to treat their wives with respect. Concubines or secondary wives, however, had a precarious position in society and were denied the rights accorded primary wives. For example, a man could acquire or discard secondary wives at will, whereas he could divorce his primary wife only in certain situations. Children born of *yangban* fathers by secondary wives were considered illegitimate and faced social discrimination for most of the Choson period. A separate social class of *chungin* ("middle people"), just below *yangban*, was formed largely of *soja* (descendants by secondary wives) and limited to specific clerical positions. Women who had public roles were at the bottom of the social status system in Choson. *Kisaeng* (courtesans) and shamans were part of the lowest social order, ranking only above slaves.

Yangban homes had separate inner quarters for women and outer quarters for men. Due to practical considerations, commoners did not have to maintain the same degree of separation between the sexes, since their houses were smaller and women had to work in the fields alongside the men.

The promulgation of the *Hunmin chongum* (hangul) writing system in 1432 enabled more *yangban* women to be literate because the new writing system was easier to learn than literary Chinese, which required years to master. Women were denied formal education, but they were indoctrinated in Confucian morality through informal, family-centered education and books for women such as *Naebun* (Inner Teachings) and *Samgang haengsilto* (The Three Followings).

Modern Korea

Formal education for women began with the arrival of Christian missionaries, who established Christian schools in the late nineteenth century. Enlightenment thinkers of the late nineteenth century, who had been influenced by Western society as well as Japanese and Chinese modernization paradigms, also advocated women's rights. The Japanese-engineered *Kabo* reforms of 1894–1895 abolished social-class distinctions and allowed sons by secondary wives to succeed their fathers.

Korean women were influenced by women's movements in Japan and the West. Both women and men saw education as an important means to modernization. But gender discrimination continued under Japanese colonialism (1910–1945). Among Koreans, women's issues were generally subjugated to the larger issue of nationalism. Korean women made a noticeable difference in anticolonial efforts, including the March First Independence Movement of 1919. Yu Kwan-sun (1904–1920), a student at Ewha Haktang ("academy"), a women's school, took part in March First demonstrations in Seoul and in her hometown in Ch'ungch'ong Province. She became a symbol of the nationalist movement when she was arrested and killed by police.

The World War II "Comfort Women" issue is one of the most controversial, unresolved aspects of Japanese colonialism. In the final years of the colonial period, some 200,000 women, most of them Korean, were "conscripted" into sexual slavery for the "Comfort Corps" (Chongsindae) to provide sexual services to the Japanese military. Korea and Japan have yet to settle issues of responsibility and reparations.

Industrialization also changed women's roles. From the early twentieth century, women entered the modern workforce by working in factories. Women educated in Korea, Japan, and the West also became

In the 1990s, several South Korean women emerged as leading players on the women's professional golf tour. Here Se Ri Pak tees off at the 1999 women's U.S. Open in West Point, Mississippi, in defense of her 1998 title. (AFP/CORBIS)

pioneers in fields such as education, medicine, and journalism during the early twentieth century.

North Korea

With the end of World War II in 1945, Korea was divided into North and South under Soviet and American occupations, respectively. The Democratic People's Republic of Korea (North Korea) and the Republic of Korea (South Korea) were established in 1948.

Although women are guaranteed full equal rights under the North Korean Communist system, men still dominate society, and gender discrimination is commonplace. Women and men may compete equally for low- and middle-level jobs, but women are generally scarce in high-level jobs and politics. Women are further burdened by the triple duty of full-time work, their roles as wives and mothers, and volunteer work for the Korean Communist Party.

South Korea

In South Korea as well, women have access to higher education, but discrimination continues to

In Pyongyang, North Korea, in 1979, a female police officer controls traffic on a main thoroughfare. (BETTMANN/CORBIS)

prevail because of patriarchal practices in the family, workplace, and society.

The post-1970 economic surge opened up many new jobs for women and men, but such jobs usually entailed low wages and difficult conditions. The Equal Employment Act of 1987 and its 1989 revision protect women's equal rights in the workplace and provide penalties for violation of the law, but the law is not strictly enforced. Wage differentials, sexual harassment, and inequalities in the workplace continue to hinder women. Women are generally expected to stay at home to raise children, and women who do pursue careers receive lower pay and are the first to be laid off. In recent years, rural communities have seen an exodus of young men who go to cities in search of work. This has left women to fill the void in farming.

Long-term efforts to revise the Korean Family Law in 1992 brought about legal revisions granting women the right to sue for divorce, gain custody of children, and inherit equally. There is also considerable effort by women's nongovernmental organizations to establish hot lines and shelters for female victims of domestic and sexual violence.

Despite lingering discrimination, women have been making strides toward gender equality through legal changes, greater social awareness, and combined efforts by women's groups. Women's Studies is a growing academic discipline, and there have been recent efforts to increase pan-Asian and other international cooperation among feminists.

WOMEN IN PAKISTAN Two perceptions describe the basic understanding of gender relations in Pakistan: Women are subordinate to men, and a man's honor resides in the actions of the women of his family. Social life in Pakistan revolves around family, and social status revolves around the honor of a family's women. As in other orthodox Muslim societies, women are responsible for adhering to respectable norms of conduct and for limiting contact between the sexes and thereby ensuring a family's honor. To ensure women's proper behavior, society limits their mobility and restricts their acceptable behavior and activities.

Space is allocated to and used differently by men and women in Pakistan. Traditionally, a woman was regarded as needing protection from the outside world, where her respectability—and therefore that of her family—was at risk. Women in many parts of the country still live under traditional constraints associated with purdah (seclusion; literally curtain), which necessitate the separation of women's activities from those of men, both physically and symbolically.

Thus male and female spheres are differentiated: most women (except for those of the urban upper classes) spend most their lives physically within their homes; they go outside only when there is a substantive purpose. Life outside the home generally revolves around the actions of men. In most parts of the country—with the exception of Islamabad, Karachi, and wealthier parts of a few other cities—people consider a woman (and by extension, her family) to be shameless when no restrictions are placed on her mobility.

Traditional Context

Purdah is practiced in various ways, depending on family traditions. The most extreme forms are found in remote parts of the North-West Frontier Province (NWFP) and Baluchistan, where a woman essentially never leaves her home except at the time of her marriage and never meets with unrelated men. While gender relations are somewhat more relaxed among most people in Punjab and Sind, nowhere (traditionally) do unrelated men and women mix freely. Poor urban women in close-knit communities, such as the old

cities of Lahore and Rawalpindi, generally observe some form of purdah and wear either a *burqa* (fitted body veil) or a chador (loosely draped cotton cloth) when they leave their homes. This practice becomes less compelling in rural areas, though rural women still take care to dress modestly.

Two important factors differentiate the degree to which women's mobility is restricted: class and rural versus urban residence. Poor rural women in Punjab and Sind have traditionally enjoyed a great degree of mobility if for no other reason than sheer necessity. These women characteristically are responsible for transplanting rice seedlings and weeding crops and are often involved in activities such as raising chickens (and selling eggs) and stuffing wool or cotton into local blankets. When a family's level of prosperity rises and it begins to aspire to a higher status, often the first social change is that its women put on veils and are placed into some form of purdah.

The common perception that women are to remain confined within their homes so that neighbors do not gossip about their respectability has important implications for women's productive activities. Rural women are generally engaged in production for exchange at the subsistence level and do not earn a countable wage. In both urban and rural contexts, women's economic contributions are often included as part of the total family's labor, with government data crediting women's contributions to the male earners.

There is less of an urban-rural divide among purdah practices of wealthier classes. Rather, family traditions have more to do with whether women observe purdah and, if they do, the kind of veil they wear. In some cases, women simply observe "eye purdah," in which they tend not to mix with men, and when they do, they avert their eyes when interacting with them. Bazaars in wealthier areas of cities in Punjab differ from those in poorer areas by virtue of the greater proportion of unveiled women shopping in them. Bazaars in cities throughout NWFP, Baluchistan, and the interior of Sind are markedly devoid of women in general; when a woman does venture out into a bazaar in these areas, she always wears some sort of veil.

Political Challenges and Responses by Women

The women's movement in Pakistan has done much to raise public awareness about the conditions confronting women, as well as playing an important advocacy role in lobbying the government to change laws that discriminate against women. In Pakistan's first three decades, the most significant legal success was the 1961 Muslim Family Law, which regulated mar-

riage, divorce, and polygamy. There were marked increases in female literacy, labor-force participation, and political activities prior to the coup by Mohammad Zia-ul-Haq (1924–1988) in July 1977. Following this, however, in 1979, Zia's military regime promulgated a series of controversial laws, which, it claimed, were based on Islamic law. Women protesting against the 1979 Enforcement of *Hudood* (Islamic Laws) Ordinances focused on its lack of distinction between adultery (*zina*) and rape (*zina-bil-jabr*) and claimed that enforcing the law discriminated against women. Four years later, they protested against the promulgation of the proposed 1983 Law of Evidence, which did not give equal weight to men's and women's legal testimony. While this has been applied only to matters pertaining to economic transactions, the resultant effect is that women are not equal economic actors with men in the eyes of the law.

The issue of evidence became central to the concern for women's status, and matters such as mandatory dress codes for women and whether females can participate in international sports competitions underscored the reality that Zia's Islamization program was having a comprehensive effect on women's lives. The traditional concept of the gendered division of space continues to be perpetuated in broadcast media. Women's subservience is consistently shown on television and in films, while popular television dramas raise controversial issues such as women working, seeking divorce, or even having a say in family politics. What is often depicted, however, is the image that when a woman strays from traditional norms, she faces insurmountable problems and becomes alienated from her family. Indeed, families provide a virtually complete package of economic and social support, provided that members abide by its norms. If a man violates a social norm, it may raise some concern, but

Pakistani women carry torches during a ceremony marking Women's Day in Islamabad on 8 March 2001. (AFP/CORBIS)

if a woman violates virtually any social norm, it becomes a calamitous event for her family, with disastrous results for the woman's future.

Since the restoration of democracy in 1988, nearly all political parties in Pakistan have embraced the rhetoric of women's empowerment. While women today actively participate in the economy, less progress has occurred in the political arena. Pakistan became a state party to the U.N. Convention on the Elimination of All Forms of Discrimination Against Women (CEDAW) in 1996, yet none of the discriminatory laws promulgated under Zia's Islamization program have yet been reversed.

WOMEN IN SOUTH ASIA In the late twentieth century, South Asian women launched a struggle for social reform against millennia of strict patriarchal control. Traditionally a woman had few rights. She was always under the control of her father, her husband, or if a widow, her sons. Even women who took Buddhist or Jain vows were subordinate to the males of the order. A growing body of evidence, however, demonstrates that the lives of women were not always severely restricted and that early civilizations on the subcontinent accorded some women social freedom and spiritual status that were curtailed at a later time.

The Early Pre-Vedic Period

Archaeological remains of the earliest urban culture of the region, the Indus Valley, or Harappan civilization (3000-1800 BCE), include numerous terra-cotta images of females, perhaps mother goddesses. Female figures wearing the horns of a water buffalo on various steatite seals have been identified as a goddess who may have been the precursor of one of the forms of the great goddess of later Hinduism. Because the

Harappan civilization was an agrarian-based culture, it seems logical that the Harappans accorded an earth goddess paramount importance. It was typical in early farming cultures that the fertility of the earth was linked with feminine fecundity. The goddess gave birth to the world, and the mystery of creation was mirrored in the creative capacity of women. Such fertility cults were concerned with sexuality, birth, and the larger realm of increase. Some historians hypothesize that the Harappan culture was matrilineal and endogamous and that women may have served a goddess as priestesses. Archaeological finds suggest that women enjoyed high status and that the culture experienced neither an imbalance between the sexes nor social stratification into distinct classes. Indus skeletons and teeth show no differences among the diets of any of the inhabitants, suggesting that food distribution did not favor any particular group.

The Vedic Period (c. 1500-600 BCE)

The Harappans were succeeded by the so-called Indo-Aryans, whose religious and social milieu was significantly different. Archaeological evidence suggests that the Aryans, a warrior people who formulated the caste system to consolidate their superior social and religious position, introduced warfare to the subcontinent. The Harappan religion of the goddess was supplanted by the patriarchal religion of the Aryan Vedas. Despite patriarchal notions, the early Vedic culture accorded women a degree of freedom and religious distinction. Some twenty female seers and authors were cited as having composed sections of the Vedas. Viewed as an integral part of a hierogamy in which marriage was a requirement for both sexes, wives and husbands were partners in religious rites. Women also participated in theological discussions. Many women were educated, and some women were teachers (*brahmavadinis*) of philosophy and theology. Gargi (c. ninth century BCE) was a particularly well-known female theologian who engaged in a pivotal debate recorded in the *Bribadaranyaka Upanishad* (c. 600 BCE). The Vedas also record that men and women of any age interacted with relative freedom.

Sometime in the middle of the first millennium BCE, however, the position of women diminished so drastically that in subsequent ages they were regarded as unfit for exposure to the sacred Vedas and equivalent in status to the lowest caste, regardless of their caste at birth. The classical law text known as *Manusmriti* (c. 200 CE) unequivocally declared the inferiority of women and the necessity for controlling their thoughts, choices, and movements. Although a woman had limited rights to property, her husband controlled

it. Discouraged from religious life, women's functions were limited to caring for her husband and his family and children. Women had no power outside of marriage. Brahman priests' concerns regarding ritual purity caused them to stigmatize women as polluting and dangerous because of their menses. Ritual taboos began to influence the secular world, and women ultimately were viewed as corrupting and debilitating.

Historians have proposed various reasons for the usurpation of women's freedom and authority in the latter part of the first millennium BCE. Developing notions of reincarnation and karma (fate) in the late Vedic age may have been a key component. Religious leaders faced mounting pressures to find a resolution for the soul enduring an endless cycle of births, deaths, and rebirths. Renunciation was viewed as a way to end the cycle, and as such it was a process of closing out and closing down, of decreasing. The ontological opposite of the indigenous fertility cults, renunciation stressed the avoidance of family ties, emotional bonds, and sexuality, all of which were associated with women. As a result women, as the agents of birth, came to be viewed as mentally, morally, hygienically, and biologically inferior.

Under Hinduism (c. First Century CE–Present)

While strong religious assertions promoted the efficacy of renunciation, by the first century CE non-Vedic indigenous cults, particularly fertility cults, reasserted themselves with vigor and merged with Vedic religion to form the pantheon of Hindu deities. A great goddess, Devi, emerged into prominence. She took various forms, including mother, warrior, and one who grants blessings, children, and enlightenment. Coeval with the emergence of the goddesses was the notion of Shakti, female power that animates all things in the universe. While the mythic model could have affected the status of women and led to increasing authority and improved status, such did not end up to be the case. For Hindu women the goddess has served mainly as a model of virtue. The most important mythical model was Sita (literally furrow), the ideal wife, who was meek, obedient, and saintly. In the *Ramayana*, the great Hindu epic (c. 300 BCE), Sita follows her husband into exile and endures a brutal kidnapping, only to have her fidelity and chastity disputed upon her release. She survives trial by fire again and again as proof of her innocence. While many literary passages extol the virtues of wives and mothers and propose that they should be regarded with honor and esteem, great discrepancies existed between the stated textual ideal and women's lot in daily life.

As is expected in a patriarchal society, female children were not welcomed as were males, who were val-

Women in Madurai, India, carrying food in baskets on their heads to workers. (ENZO & PAOLO RAGAZZINI/CORBIS)

ued as an economic asset. Caste was passed only through the male line of descent. Males also were required to perform for the father the funerary rites that guaranteed his ascent to heaven. The partiality ultimately led to female infanticide in some sectors of Hindu society, particularly from the medieval period (c. 900–1600 CE) until the nineteenth century.

Marriage in Hinduism In early times girls married around the age of fifteen or sixteen, but by the fourth century BCE the standard age for girls to marry was between six and ten. In addition to ensuring their virginity, the young age meant that the girls were too young to have formed strong personalities, opinions, or desires and thus were easily controlled by the husband and his family. The prevalence of child marriages coincided with restrictions on the remarriage of widows. Because young girls married older males, widowhood and child widows were widespread.

During the first century CE the plight of widows became severe. Shunned by society, a widow was regarded as bad luck for her husband's family. Denied the opportunity of remarriage, a widow was expected to lead an ascetic life, to remove all ornaments, to shave her head, to sleep on the floor, and to consume a restricted diet consisting of one meal per day. She spent her time in prayer and observing rituals. The only alternative to such a circumscribed existence was sati (immolation on her husband's funeral pyre). Sati was regarded as an auspicious act benefiting the family and the community, though it was practiced only

in sectors of society that considered female labor of no great value.

The dowry custom apparently was not a standardized social convention in early or classical India. The literature recommends that the bride be given suitable ornaments for her wedding, but the precise nature of the gift was left to the discretion of the father. The dowry was connected with ancient notions of gift giving, in which the bride was accompanied by a gift to the groom's family. In the medieval period the dowry system began to assume extraordinary proportions. Changes resulting from industrialization under the British particularly led to competition to obtain well-educated husbands of social standing and steady incomes. Thus the sizes of dowries escalated.

Notable Hindu Women in History Only privileged Hindu women received educations. Nonetheless, some gifted women made contributions in various fields. Among the more renowned female poets were Shila-bhattarika of Kanauj, who in the ninth century was honored as the equal of the famous classical poet Bana (flourished seventh century); Rupamati of Malwa (sixteenth century CE), who was an accomplished poet and musician; and Molla (sixteenth century CE), who wrote a moving version of the epic *Ramayana*. A number of famous female mystics were known for their profound devotional hymns. Karaikkal Ammaiyar (c. sixth century CE), Kodai Andal (c. ninth century CE), Lalla (late fourteenth century CE), and the deeply inspired Mira Bai (c. 1450–1547) were all passionate devotees of the divine. Many women were patrons of religion and art, such as the tenth-century queen Sembiyān Mahadevi, who raised countless temples throughout the southern Chola empire.

Among the accounts of heroic Hindu women, the most famous is the Rajput queen Padmini (d. 1303), who along with ten thousand female subjects endured self-immolation rather than be taken prisoner by enemy forces. Rani Lakshmi Bai (d. 1858), the famous queen of Jhansi, inspired fierce rebel fighting against British control in the Indian Mutiny of 1857. Fighting alongside her men, she finally was killed in battle.

Under Jainism

In Jainism women had more freedom than in Hinduism. Jain texts suggest that women with spiritual commitment and aptitude far outnumbered men with similar inclinations and abilities. Historically in Jainism the number of women taking vows outnumbered men by more than two to one. Jainism emphasized renunciation, and both men and women formed monastic orders. The founder of the religion, Mahavira (c. 599–527

BCE), was considered the twenty-fourth Jina or Tirthankara, an enlightened being. Mythological references point to at least two female Jains who attained enlightenment long before the time of Mahavira: Marudevi, the mother of the Tirthankara Rishabha, and the Jina Malli, the nineteenth Tirthankara.

Chandana (c. sixth century BCE) was Mahavira's first female disciple and the first head of an order of Jain nuns. Yakini Mahattara (eighth century CE) was renowned for defeating in debate the boastful Brahman scholiast Haribhadra Suri, one of the most esteemed minds of his day. Haribhadra was so impressed with Yakini's reasoning and mental skill that he eventually converted to Jainism.

While early Jainism accorded women freedom of choice and movement, nuns eventually became dependent on male authority, and regulations eventually restricted all aspects of their lives. The liberalism toward females that had characterized the early centuries was eventually influenced by the pan-Indian prejudices against women. A schism produced two sects, the Digambaras and the Svetambaras. The Svetambaras allowed the possibility of female enlightenment and endorsed the female Jina Malli. The Digambaras, on the other hand, claimed that women lacked the adamant body necessary for spiritual liberation and refuted the story of Malli altogether.

Under Buddhism

The Buddha (c. 563–483 BCE) initially did not permit the ordination of women. He accepted monks but not nuns, a surprising fact given that his first spiritual teacher was a woman: His aunt, Mahaprajapati Gotami, insisted on forming a women's order. Submitting to social pressures, the Buddha finally allowed women to renounce their earthly ties and become nuns. Generally nuns, no matter what their level of accomplishment, were expected to defer to monks of all ranks. Women of the order were enjoined to bow to all monks. Under no circumstances were nuns allowed to admonish monks, although monks were free to upbraid nuns. Nuns endured far stricter requirements than their male counterparts. The rules for nuns numbered 311, compared with only 227 for monks. Some inviolable rules applied to both sexes, such as avoidance of killing, stealing, and sexual indulgence.

Buddhist women and men received the same education on the principles of Buddhism. Buddhist women generally were literate. One remarkable literary work, the *Theragatha*, is a collection of verses composed within five hundred years of the life of the

IMPROVING THE LIVES OF SOUTH ASIAN WOMEN THROUGH POLITICAL REFORM

Mohandas Gandhi, the leader of the Indian independence movement, was a strong supporter of women's rights, and the Indian National Congress political party advocated for reforms to afford women rights and to protect women's rights. The following resolution from the sixtieth meeting of the Congress at Avadi in 1955 summarizes their position.

1. This Congress is strongly of the opinion that all social and legal disabilities as well as reactionary customs and usages to which women are at present subject and which retard their development and prevent them from taking their rightful place in the various activities of the nation should be removed and ended. The history of India contains numerous examples of women who have shown their greatness in many fields of activity. In the struggle for freedom, women took an active and effective part. It is, therefore, not only desirable but essential in the national interest that they should have full opportunities of growth and service and should also have rights of inheritance so that they might not suffer from any legal or social disability.
2. The welfare of children is of paramount importance and should be given first place in the plans for national development.
3. The Congress appreciates the efforts made by the various governments in India for the welfare of women and children and urges them to pay even greater attention to them. In particular, the Congress welcomes the Hindu Law Reform Bills at present before Parliament, and trusts that they will be enacted at an early date.

Buddha by several nuns of the earliest order who attained nirvana. The contributions are songs stemming from the hearts of women who discovered ultimate bliss. The more liberal attitudes of the early period were abandoned eventually, and women were pushed into the background. The lack of later literature composed by Buddhist women attests to their great anonymity, and in time Buddhist theologians became equivocal on the subject of female enlightenment. It was written that being born a woman was considered a cause for special suffering; for a woman to be reborn as a man was considered the greatest merit. Occasional records document that later Buddhist women achieved enlightenment, but given their obstacles, the nuns are impressive in their demonstrations of devotion.

Under Islam

Islam, a faith imported from Arabia, brought with it severe laws regarding women set down in the seventh century by the Prophet Muhammad. The Qur'an endorses polygamy and insists on a woman's obedience to her husband. A woman's distinction was based solely on her childbearing abilities. Generally, from puberty until death, Islamic women in most parts of South Asia wore veils (*parda*) and were screened from the sight of all males except close family members. Families arranged marriages, and women spent their lives in strict confinement. Islamic law allowed a woman to have and control her own property, however, and she could inherit from her parents and her husband.

Members of the All India Democratic Women's Association protest in New Delhi for legislation that would reserve one-third of seats in parliament for women. (AFP/CORBIS)

Muslim women received little education if any. Their immobility and anonymity provided scant record of their individual lives. Women in households of the ruling class generally were literate, and a few notable women even held political influence. For example, Raziya Sultan (d. 1240), the daughter of the Slave king Iltutmish, was named by her father to succeed him. In 1236 she cast off her veil and ruled until rebels, discontented with a woman as their ruler, killed her. Gulbadan Begum (early sixteenth century CE), daughter of the first Mughal ruler, Babur (1483–1530), left a history of her father and her brother, the next emperor, Humayun, in the *Humayun-nameh* (sixteenth century CE). Nur Jahan (d. 1645), the wife of the emperor Jahangir (1569–1627), was the de facto ruler of the Mughal empire (1526–1857) for years. A more able administrator than her husband, who was primarily concerned with art and alcohol, she issued *firman*s (official orders) under her own seal. Jahan Ara Begum (seventeenth century), the daughter of Shah Jahan (1592–1666), served as an adviser to her father in his last years. One courageous female, Rokeya Sekhawat Hossain (1880–1932), a severe critic of Muslim patriarchy, spearheaded a movement at the beginning of the twentieth century for education and liberal treatment of Muslim women.

The Modern Period

The progressive leader Mohandas (Mahatma) Gandhi (1869–1948) was extremely critical of the traditional treatment of women and encouraged them to join the independence movement. In his book *Women and Social Injustice* (1942), he declared women superior to men and championed the abolition of child marriages, cruel treatment of widows, and prostitution. Encouraging full equal rights for women, he was in-

strumental, along with the feminist activist Sarojini Naidu (1879–1949), in developing a comprehensive plan for female advancement, and they argued for equal rights guarantees in the constitution. At the time of independence from Britain in 1947, India, West Pakistan (now Pakistan), and East Pakistan (now Bangladesh) granted adult women full suffrage.

While a number of early reformers worked for constitutional equity, beginning in the 1970s women's unions and organizations coordinated at all levels of society to ensure that women were not barred from practicing their rights. Women's activism affected various sectors of the populations of India, Sri Lanka, Nepal, Bangladesh, and Pakistan. Generally, more women began to receive some education, and a greater number of women earned professional degrees in all fields. In India and Sri Lanka large numbers of women entered the workplace, many in white-collar positions. Wider access to social contacts through the workplace encouraged more marriages of choice and fewer arranged marriages. Family planning also allowed women more freedom. Nonetheless, the prevailing attitude remained that a woman's status depends on motherhood. Islamic South Asian women in particular have been less visible in the workforce, with only a slight increase in the late twentieth century.

In addition to gaining constitutional protections, women in the late twentieth century battled the more insidious forms of control exerted by communal social pressures. For example, divorce was an option for few women because of its social stigma. In the late twentieth century, however, more women extricated themselves from abusive situations, though leaving was still difficult for them in many areas, especially Pakistan. Women of South Asia also became active in politics, and both India and Bangladesh reserve a share of the parliamentary seats for women. Six women became the political leaders of their nations in the twentieth century: Sirimavo Bandaranaike (b. 1916) of Sri Lanka was the world's first woman prime minister, and her daughter subsequently became prime minister. In addition Indira Gandhi (1917–1984) of India, Benazir Bhutto (b. 1953) of Pakistan, and Begum Khaleda Zia-ur-Rahman (b. 1945) and Sheikh Hasina Wajed (b. 1947) of Bangladesh served their nations as prime ministers.

WOMEN IN SOUTHEAST ASIA The position of women in Southeast Asia is often cited as evidence that women are not universally subjugated to men. Women's high status in the region is said to derive from their important role in agriculture; it is reflected in the bilateral kinship systems which predominate and in which male and female descent lines are equally followed in determining ancestry; the widespread phenomenon of land inheritance by women; control of household finances by women; and so on. Even amongst Chinese groups and the Vietnamese (or *kinh*), whose societies are traditionally patriarchal, women in Southeast Asia are in many ways strikingly more highly valued than women in many other parts of the world. However, in recent times, with the increased pace of urbanization and industrialization, women do not seem to be benefiting from development to the same extent as men.

Traditional Roles

The position of women in Southeast Asia in relation to men has often been described as one of complementarity: in traditional societies the roles of men and women are generally seen as equal in importance and mutually supportive. This idea reflects a symbolic dualism in the conceptualization of the world. Origin myths as well as the division of labor in such societies often demonstrate this principle. Thus creation myths often oppose textile equipment with weapons, magic, or writing, with women being defined by the former and men the latter. Among groups such as the Nagas (located in India and adjacent sections of Myanmar), in which men traditionally proved their maturity through headhunting, women may gain adult status through proving themselves as accomplished weavers.

In Buddhist societies in which maturity is achieved for a man through being a monk, motherhood and accomplishment in weaving were also the traditional ways to express a woman's maturity. This is not to say that the two spheres were always separate, and a degree of cooperation in some activities is also found, in gathering in the rice harvest, for example. Men who are for some reason without a wife may happily perform "female" tasks.

The high status held by women often derives from their symbolic importance as a source of fertility, and women often have a special role to play in relation to rice cultivation. In traditional methods of agriculture, although men may prepare the land to receive the seed, women often do the actual planting. Similarly, in many societies only women may enter the rice granary. In both mainland and maritime Southeast Asia this symbolic association of women with fertility often seems to apply also in the field of human reproduction, so that even in patrilineal societies such as the Bataks of northern Sumatra, the lineage of a bride is regarded as superior to that of the husband, since it is the woman who brings greater life force to the marriage.

In many Southeast Asian societies women have traditionally held positions of some power. Thus among the Minangkabau of West Sumatra, although legal and administrative power may be held by men, land and clan membership pass down the female line. In other societies, in which clan membership relates to male descent groups and ancestral lands are held in common following a patrilineal pattern of kinship, women's positions were in many ways less strong. In most Southeast Asian societies, however, kinship is reckoned along both male and female lines, and there is a degree of inheritance on both sides.

Postmarital residence is another factor that may affect a woman's position. Where a young bride must move in with her husband's parents, the possibility of exploitation of her labor exists; where a man traditionally lives with his parents-in-law it is he who may be subservient to his wife's family. In most but not all Southeast Asian societies, the practice is for the newly married couple to move in with the parents of the wife. When they do set up a home of their own, it is often near the wife's mother's house, and clusters of related women form strong networks in many of the villages of Southeast Asia.

In contemporary Southeast Asia many of these traditional patterns are changing, though the legacy of these perceptions often means that attitudes towards women are respectful, especially within the home, which throughout the region is regarded as the woman's

domain. Changes brought about by colonization and later through administrative arrangements under independence have often failed to recognize such traditional roles. Land that was once owned by women was in many cases registered in the names of their husbands; household censuses listed the senior male as head of the household, and in some cases village headmen were appointed in places where villages had in the past been run by councils consisting of household heads, both male and female. The declining importance of women as textile producers in the face of industrialization has also tended to diminish the status of women, though where ritual textiles are still regarded as necessary for rites of passage, this symbolic importance remains.

Religion

The introduction of world religions into the region has also affected the role of women. Where Buddhism is the main religion—in Thailand, Cambodia, Laos, and Myanmar—the chief way for a man to make merit and thus earn respect is through ordination as a monk. In some areas, women do serve as nuns, but they cannot achieve the same status as the monks in the Buddhist priesthood; nor do they receive the same training in the scriptures. However, outside the monastery, women are able to make a considerable contribution to Buddhist society. It is the women who prepare and present gifts of food and textiles to the monks, and they also attend services and observe the precepts. All these activities provide women with the means of making merit both for themselves as individuals and for their families. Women are also responsible for the care of tutelary spirits in the home and for other essential lay duties. The ability to make merit gives women access to a degree of social mobility.

There is a fundamental difference, however, between the spheres in which women and men make merit. Men's involvement in the priesthood removes them from the material world and from relationships with their families, and this removal from the world of desire is associated with a higher plane of religious experience. A woman's route to merit making strengthens her link with the world of material things and with her role as a mother. For her, the major act of merit making is providing a son for ordination as a monk. Women are thus more likely to be involved in trade and financial matters than men, who are more distanced from their families and from the material world.

Islam has affected the position of women in Southeast Asia to a lesser degree than is the case in some Middle Eastern countries, but where Islamic law is called on, for example in settling disputes over inheritance, women receive less equal treatment than they

enjoyed under traditional law, or *adat*, as it is known in the Indo-Malay archipelago. However, Islam as practiced in Southeast Asia does not discriminate against women in terms of their religious status or worth. Women, like men, pray five times a day, and both follow the five pillars of Islam. While men attend Friday prayers at the mosque, women may belong to a Qur'an reading group that meets at a member's house. Although men are more frequently prayer leaders than women, a woman may occasionally take on this role if she is the best qualified to do so in terms of her knowledge of the teachings of Islam. Literacy has always been an important element in Islamic societies, and although in the past boys were more likely to receive a formal education than girls, national education policies in Brunei, Malaysia, and Indonesia, the countries with the greatest percentage of Muslims in the region, have gone a long way towards their aim of giving boys and girls equal access to education.

In areas where Christianity achieved dominance, the position of women was also affected. In precolonial times, the status of men and women in the Philippines was probably for the most part equal and complementary. The male-centered Spanish regime, however, placed a great many constraints on women. This had greater consequences for women in lower socioeconomic groups than it did for those belonging to the upper classes. Among the better off, precolonial domestic patterns proved relatively resilient and many women took advantage of the opportunities presented by the economic developments of the postcolonial era. Thus they have been fairly well represented in professional, clerical, and administrative occupations.

Education

Everywhere in Southeast Asia, adult literacy levels are higher for males than for females, though the discrepancy varies from country to country. The greatest discrepancies are in Cambodia and Laos; the least discrepancy is found in the Philippines, which has a very high literacy rate.

Girls' participation in schooling in Southeast Asia is high in comparison with developing countries in other parts of the world. In Malaysia, Brunei, Myanmar, and Indonesia there is very little difference at all between participation rates for boys and girls at primary level, though the picture is less good in Cambodia and Laos. In the latter two countries female participation is lower at secondary level than at primary level, as is the case in Indonesia. In Myanmar, Malaysia, and Brunei the rate of enrollment for males and females is roughly comparable at secondary level.

In Malaysia, equal rights to education for boys and girls are written into the law, but in practice girls' education lags behind that of boys.

Politics

In recent times, a number of notable women have reached the top level of political office in Southeast Asia. However, their achievement has nearly always resulted from a family connection (that is, they have either been the wife or daughter of a prominent male politician). Men dominate the political arena everywhere, although the picture does vary from country to country. In Thailand, women have had the right to vote and to be elected to political office since 1932, but the percentage of women in the cabinet is still very low. In all other countries in Southeast Asia apart from Brunei, women gained the right to vote at or soon after independence. Only in the Philippines, however, are a substantial number of women involved in government. It was also in the Philippines that the first woman was elected to parliament, in 1941.

However, this is not to say that women do not have an important influence on political life in Southeast Asia. In Thailand and the Philippines in recent years, women from the urban elite have become increasingly active in the political arena. Furthermore, although women are much less numerous than men in formal political institutions, they are very active politically in a broader sense. There are many women's organizations in Southeast Asia that provide a vehicle for the expression of opinion, and women have become adept at organizing and finding a voice for themselves, albeit in a restricted sphere. In Indonesia, women's organizations are active in the area of welfare and income generation at the grassroots level. In the Philippines, many professional women's associations have emerged, and in Thailand women's nongovernmental organizations have been invited to participate in decision making and policy making by the government and by U.N. agencies in areas of life that are seen to relate specifically to women.

In Vietnam, women played an important role in the struggle for independence, and this seems to have led to a recognition that women have a contribution to make in the political arena. There was a steady growth in the number of women in the National Assembly between 1946 and 1975. After this date, however, both the number of women representatives and their percentage of the total fell. The fact that the decline coincided with the period of unification has led to the suggestion that the decline resulted from the relatively strong influence of feudal thinking in the South. A similar pattern occurred also at provincial, district, and

village levels. Despite this fall, women in Vietnam play an active role in political life, with 118 women deputies in the National Assembly as compared with 332 men.

Economy

Generally in Southeast Asia, motherhood and care of the family are assumed to be the first responsibility of women. However, women are not prevented from engaging in economic activity as well, and their traditional participation in agricultural work alongside men means that the division of labor is not as clear cut as in many other developing countries. Everywhere in Southeast Asia, the proportion of earned income contributed by women is lower than that contributed by men. In Cambodia the proportion earned by men and women is most closely comparable; in Brunei there is the greatest disparity. Despite these earning disparities, women occupy high-status positions throughout Southeast Asia. They compete successfully with men in entrepreneurial roles as well as in the armed forces, the ranks of the police and civil servants, and in the academic world. There are highly educated women who are professionals and who occupy executive and administrative positions in both the public and the private sector, but in all cases they are in the minority.

Women form a large proportion of migrant workers in Southeast Asia, traveling both within the region and outside it. Industrial development in the cities, particularly medium-sized or large-scale domestic or multinational operations, attracts young unmarried women and girls from the countryside, especially in Cambodia and Thailand. Few women who have worked for any length of time in the city return to the countryside, and many find husbands in the city. Out of a sense of duty and obligation towards their parents, most young women who work in the city send money home to their families, who may be unaware of or turn a blind eye to the fact that their daughters may be involved in prostitution. For girls who have found work in Bangkok, it is quite easy to find evening classes to further their education, and this is an added attraction for girls from rural areas. The trappings of modern city life are also an attraction. In Indonesia, it is chiefly Javanese girls who leave home, often to work in the domestic sphere in wealthier households within Indonesia or overseas. Philippine migrant workers also include a high proportion of women, many of them in domestic service overseas.

Although young women's wages are not high, their ability to contribute to household income in a modernizing economy has had an effect on intrahousehold relations in many cases. As they grow older and are able to find employment, unmarried daughters often

begin to expect their views to be heard, especially in relation to their own employment. The traditional pattern of deference of younger to older, woman to man in these cases is beginning to be challenged.

WOMEN IN WEST ASIA Women in West Asia constitute a diverse population. Notwithstanding stereotypes concerning the status and roles of the predominately Muslim and Arab women of West Asia, women's social positions within and across nations vary by social class, ethnicity, age, education, and location (urban or rural). Other important factors are a nation's social structure and stage of development, as well as the nature of the nation and its economic, social, and cultural policies. These sociodemographic and structural factors shape the opportunities available to women, their legal status, and the structure of gender relations in any given society in West Asia.

Despite this diversity, however, there are some common characteristics that are particularly noticeable when comparisons are made with women in other regions. These common characteristics are relatively high (although declining) fertility rates, gender gaps in liter-

acy so that women have lower literacy rates than men, relatively limited access to paid employment (except in Israel), and underrepresentation in the political system. Moreover, women in nearly all the nations of West Asia experience second-class citizenship due to certain provisions in Muslim family law and to patriarchal cultural practices and norms. The persistence of a patriarchal system that favors men is itself partly the result of the influence of Islamist movements in recent decades. To address these problems, women in West Asia have formed a dynamic women's movement that seeks to challenge patriarchal gender arrangements; expand women's civil, political, and social rights; and empower women economically and politically.

Women constitute about half of the population of the nations in West Asia, whether in the small Persian Gulf sheikhdoms such as Bahrain, Kuwait, and the United Arab Emirates or the large nations such as Iran

THE POET FORUGH FARROKHZAD ON WOMEN'S RIGHTS

Iranian poet Forugh Farrokhzad uses poetry to speak out for women's rights and independence. In her poem "Mechanical Doll," she describes and condemns the lives of women who enjoy the luxury provided by their wealthy husbands.

You can cry out
In a voice utterly false and strange
"I love..."
You can, in the overpowering arms of a man
Be a wholesome and beautiful female
with a body like a chamois spread
with large firm breasts
You can, in the bed of a drunk, a vagrant, a fool
defile the chastity of love.
You can be just a mechanical doll
And view your world with two glass eyes
You can sleep in a cloth-lined box for years
with a body stuffed with straw
in the folds of a net and spangles
You can cry out for no reason at all
with every lascivious squeeze of a hand:
Ah, how lucky I am.

WOMEN AND MEN-SEPARATE LIVES

This extract of text from an ethnographic study of a farming village in central Turkey describes a pattern typical of husband-wife relations in rural West Asia, in which there is little contact except in family financial and sexual matters.

Women do not look to their husbands for companionship; still less do the men look to their wives. It is taken for granted that there is no common ground for conversation. A man must never show affection for his wife in front of anyone else. When a soldier returned to the village after years of absence, his kin and neighbours gathered round him to welcome and embrace him. The ceremony often lasted for hours, as one person after another heard the news and hastened to the guest room. His greeting for his wife was left over till bedtime—she could not even see him until all the others had finished with him. When men left Elbasi on their way to Mecca, their sisters and mothers embraced them publicly and histrionically at the boarding of the lorry—but not their wives. Within the household, before close kin, the taboo on public affection is even stronger. Nobody talks about ‘love’ except occasionally in cases of adultery and elopement. The relationship is limited to economic co-operation and to sexual intimacy. Women frequently said to my wife that they did not love their husbands—not only in specific cases, but as a general description of village life. Men spoke very little of their relationship to their wives, and when they did, it was of the common bed, of their prowess therein, and of their large families that they boasted. More than once, men remarked to me in jest: "We love our wives at night."

and Turkey, although in some countries the existence of an adverse sex ratio is a cause for concern. A growing number of countries in the region are now predominantly urbanized, but there remain sizable rural populations in countries such as Jordan, Turkey, and Iran. The marriage rate remains high in the region, and the fertility rate of women in West Asia tends to be higher than in other nations at similar stages of development. Fertility rates correlate with a mother's educational attainment and employment status—themselves a function of social class and location—but they also reflect the nation's stage of development and the government's family-planning policy. And in many nations, a woman's age at marriage has been rising, a result of both economic pressures and rising educational attainment. Thus fertility rates range from lows of 2.2–2.7 births per woman in Iran, Turkey, Lebanon, and Israel to highs of about 6 births per woman in

Saudi Arabia, Yemen, and Palestine (the West Bank and Gaza)—where adolescent fertility rates are also very high.

Gains in Education

Educational attainment is growing among women in West Asia, and the gender gaps are narrowing. Although illiteracy is common among women in the older age groups, and universal schooling has yet to be achieved in some of the poorer nations (notably Yemen), enrollment rates for girls in primary and secondary schools are rising and nearly at a par with those for boys. Some nations have made tremendous progress in the past two decades. For example, in 1980 the expected number of years of schooling for girls in Oman and Saudi Arabia was only two and five years, respectively, but by 1997 it had increased to nine years, according to World Bank figures. In Iran and the

United Arab Emirates, girls can expect to complete at least eleven years of schooling. Iran has had a tremendous increase in the population of educated urban and rural females, and about half of university students are now women. In Bahrain, Qatar, and the United Arab Emirates, the majority of university students are female. Less is known about the quality of education that women receive, although some research shows that government cutbacks have resulted in crowded classrooms, fewer qualified teachers, and poor instructional materials in the state-owned schools.

Women in the Workforce

Rising educational attainment, as well as declining household budgets after the oil boom era, has led to growing involvement by women in the formal and informal sectors of the economy, and their share of the labor force increased significantly between 1980 and 1997. This is particularly true in nations such as Jordan, Kuwait, Oman, Saudi Arabia, and the United Arab Emirates, where women's participation in the labor force was previously negligible and the economies relied on foreign contract labor. In the 1990s, women's employment increased in Turkey and Iran, largely in the teaching and health professions, to a lesser extent in sales and services. Improved methods of counting the range of women's economic activities have also yielded higher percentages of women in agriculture as well as in urban informal occupations. In Jordan, Iran, and Turkey, businesses owned by women are a grow-

ing trend. As elsewhere in the world, however, much of the work available to working-class women is irregular and ill paid, and even middle-class women in the civil service have seen the real value of their salaries deteriorate considerably. An elite corps of professional women may be found in both public and private sectors, but their numbers in the highest administrative and managerial categories are small.

Women in Politics

Women in West Asia have always been involved in political movements (for example, independence, national liberation, socialist, and feminist movements), but their involvement in formal political structures (in political parties or as elected officials) has been more recent and remains limited. In contrast to Turkey, where women were given the right to vote in 1930, other nations granted women voting rights in the 1950s (Lebanon, Syria), the 1960s (Iran), or the 1980s (Iraq). This has partly to do with the relative novelty of elections, partly with the experience of colonialism, and partly with the patriarchal gender system.

Although women are found in the rank-and-file and leadership of political parties (for example, in Turkey, which also had a woman prime minister), nowhere have they reached a critical mass (30 percent), and their appointment to party or government positions is largely a form of tokenism. Women are certainly elected to parliament, but their share of parliamentary seats in 1999

Filling a traditional women's role, women in Turkey collect water for their households. (ED KASHI/CORBIS)

Iranian women performing at the opening ceremony of Iran's women's sports championships in Tehran in August 2000. (AFP/CROBIS)

ranged from zero in Jordan to 10 percent in Syria; Israel's share of women was 12 percent. The female share of parliamentary seats in Egypt and Lebanon was 2 percent, in Turkey 4 percent, in Iran 5 percent, and in Iraq 6 percent. (By contrast, women in Vietnam and Argentina had a 27 percent share.) Women's organizations have been keen to increase women's political participation by encouraging women to run in national elections, supporting women's involvement in local elections, and insisting that more women be appointed to ministerial and subministerial positions. They hope that women politicians will be more likely to draft or support legislation that would improve the status of women in family law and labor law. But barriers to women's participation in formal politics remain formidable.

Women's Organizations

Partly because of women's underrepresentation in government and political parties, women have formed their own organizations to lobby and advocate for women; to conduct research on women, gender, and social issues; or to deliver services to poor women and their children. There has been a veritable explosion of women's organizations in West Asia; these include feminist or women's rights organizations, professional associations, nongovernmental organizations focusing on women in development, charities run by women that cater to women, institutes and research centers devoted to women's studies, and associations of women workers. These organizations have their own agendas, constituencies, and modes of operation, and their strength

or weakness varies depending on the country, but they may be said to constitute a growing women's movement throughout West Asia. The movement has many voices, but the major goals of organized women in West Asia may be summarized as follows: (1) the modernization of family law to attain gender equality in marriage, divorce, child custody, and inheritance; (2) nationality rights for women so that they may retain their own nationality or pass it on to their children; (3) the criminalization of violence against women, including domestic violence, so-called honor crimes (killing a female relative for a real or imagined sexual or cultural transgression), and the public harassment of women by men; and (4) an increase in women's economic opportunities and their participation in political decision making. In addition to the preceding, Muslim women are reclaiming their religion, questioning traditional (or patriarchal) interpretations of the Qur'an and hadith, and emphasizing the egalitarian or emancipatory messages of the holy texts. This is especially true of "Islamic feminists" in Iran. In Israel, women are heavily involved in the peace movement and are engaged in a feminist rereading of the Torah and of Jewish history. And in Turkey, feminists' organizations have confronted and worked against the growing influence of Islamist movements and political parties.

Women in West Asia are divided politically and ideologically as well as socially and economically. Some are more aligned with their governments and regimes, whereas others are critical; some women prefer the separation of religion from politics and the legal

framework, whereas others prefer that religion continue to have a strong presence in society. All of them would probably agree, however, that women's status and roles are in need of advancement.

WOODWORKING-CENTRAL ASIA

A significant sector of the economies of Central Asian countries, woodworking produces a variety of products, the most important of which are round logs, lumber, wood-based panels, paper and paperboard, wood pulp, and furniture.

Forest and other wooded land in Central Asia account for 5 percent of the total land area, and constitutes less than 1 percent of the world's forest cover. Turkmenistan has the highest percentage of forest cover (8.0 percent) while Tajikistan has the lowest percentage (2.8 percent); all of the latter's forests are classified as not available for wood supply. To a great extent the demand for forest products in Central Asia is met by imports, mainly from the Russian Federation.

Kazakhstan has the biggest woodworking establishments and accounts for most of the region's production. The forest and woodworking industry plays a significant role in its industrial complex, especially in East Kazakhstan, which is rich in forests. Most of the country's woodworking plants are concentrated in the north and northeast, in Semey, Astana, Petropavl, and Aktobe; a big furniture factory is located in Ust-Kamenogorsk. In south central Kazakhstan, the most important woodworking centers are Chymkent, Almaty, and Zhambyl. In the other Central Asian countries the most important woodworking centers are Ashkhabad, Mary, and Sarakhs in Turkmenistan; Tashkent, Kokand, Andizan, Bukhara, Samarkand, and Karshi in Uzbekistan; Bishkek, Naryn, and Osh in Kyrgyzstan; and Namangan and Dushanbe in Tajikistan.

Forestry practice in Central Asia has remained relatively small-scale and less technologically advanced than

in Western Europe. This has been highly beneficial in preserving species diversity. At the same time, most of the indigenous forests in Central Asia disappeared long ago as a result of human activities. The process began during the early Middle Ages in connection with the mining industry and has continued until the present. The effects of deforestation are apparent in the intensification of erosion, higher incidence of avalanches, more arid conditions, air pollution by dust, and melting of the glaciers. In some parts of the Central Asian region, rural poverty causes wood to be used as a primary source of energy, which leads to local deforestation.

WORKERS' PARTY-SINGAPORE

The Workers' Party is a major opposition party in Singapore, where the People's Action Party (PAP) has won every majority since 1965. The Workers' Party was formed in November 1957 by David Marshall (1908–1995), a lawyer and the first chief minister of Singapore. The party's guiding principles of *Merdeka* (independence) are democracy, socialism, and improving the conditions of workers.

Since its inception, the party has been plagued by intraparty differences, which ultimately led to Marshall's resignation in 1963. The party machinery was small and ineffective until Joshua Benjamin Jeyaretnam (b. 1926), a dynamic lawyer, injected life into it in 1971. Jeyaretnam broke the PAP's parliamentary monopoly by winning the 1971 Anson by-election, gaining 7,012 votes, or 51.93 percent of the total valid votes.

In the 1999 general elections, the Workers' Party's Low Thia Khiang was returned as member of parliament for Hougang for a second time. In the Cheng San Group Representative Constituency, the Workers' Party team won 45.2 percent of the valid votes, but lost to the PAP team. Since the Workers' Party candidates obtained the highest percentage of votes among all the unelected opposition candidates, they became eligible to take up the nonconstituency member-of-parliament seat. The Workers' Party team elected the party's secretary-general, J. B. Jeyaretnam, to take up the seat.

Workers' Party officeholders have been repeatedly threatened with defamation suits by the PAP government. Many observers perceive both the Workers' Party officeholders and Jeyaretnam as political victims of the PAP's vindictive course of action.

WORLD BANK IN ASIA The World Bank is an internationally funded development lender, a specialized agency of the United Nations. The Bank was a product of the 1944 Bretton Woods Conference, at which the imminently victorious allies—notably the United States and Great Britain—sought to lay the basis for postwar reconstruction of the world's monetary system. Since the 1960s, it has been a prime lender to the newly industrializing countries (NICs) of Asia.

Founding and Early Years of the World Bank

When discussions were under way at Bretton Woods for the creation of the World Bank, U.S. distaste for the "beggar-thy-neighbor" protectionism of the 1930s that had contributed to the worldwide economic depression and subsequent rise of totalitarianism had a large influence. The United States, possessing a flourishing and ultracompetitive industrial plant, championed free trade, monetary stability, and elimination of tariff barriers. Great Britain, the other leading western industrial power at war's end, was not as unreservedly in favor of free trade, having adopted an Imperial Preference scheme a few years earlier at the Westminster Conference in order to protect Empire and Commonwealth markets. U.S. economic predominance meant, though, that its vision would prevail.

The Bank eventually evolved into five major components, each of which had its own function in promoting international economic development. These units are the International Bank for Reconstruction and Development; the International Development Association; the International Finance Corporation; the Multilateral Investment Guaranty Agency; and the International Centre for Settlement of Investment Disputes.

The Bank's immediate postwar task was to assist with the reconstruction of Europe. By the mid-1950s, Eu-

rope had fully recovered and the Bank turned its developmental interest elsewhere. Its interest was global, but Asia received special attention. Asian countries were just emerging from colonial status and now assumed full responsibility for their own economic development. This, naturally, prompted an urgent need for development capital and financial expertise. In addition, this same era saw the end of American occupation of Japan, and that country, already a major economic power, faced the task of full and peaceful integration into the postwar economic order. Also, the communist takeover of China prompted concern in Western capitals that the newly independent Asian countries have an alternative model for economic progress. The mission of the Bank in Asia was to act as a catalyst for economic development among the Asian NICs, many of which were newly independent. However, it differed from commercial lenders in that its goal was not simply profit but rather to help develop institutions and industries that would, in turn, further the long-term maturation of local economies. In this sense, the Bank provided "seed money" for future growth.

From Project-Oriented Policy to Structural Change

During the 1960s and into the 1970s, the Bank was essentially project-oriented. Typical ventures were a series of dams constructed in Asia. These dams were not conceived of as profit-making entities and, as such, would have held little attraction for investors looking for an immediate return. They did, however, offer the potential to control flooding and enhance agriculture, as well as generating electric power that might fuel industrial development. Such projects were well in line with the Bank's vision of investing in projects that would generate long-term wealth. Examples in Asia include the 1960s Phasom Dam Project in Thailand and the Tarbela Dam Project in Pakistan. The increase in agricultural production derived from these efforts caused a rise in rural living standards, while electrification made possible a considerable expansion of industry. Besides money, the Bank provided technical expertise and experienced personnel.

A change in the Bank's *modus operandi* occurred during the late 1970s and into the following decade as it increasingly concentrated on structural change in Asian economies. Whereas, in an earlier period, the obstacles to economic growth were seen as chiefly material—lack of electrical generation or flood control, for example—attention now focused on government policies that impeded capital formation and its effective utilization. A government that shielded inefficient industries through subsidies or tariffs, and thus impeded the more efficient

use of capital, was seen as at least as great an impediment to economic growth as a material lack. This shift occurred at a time when economic theory in Western nations moved away from Keynesian government "pump-priming," in vogue during the immediate post-war era, toward monetarist policy that emphasized profound economic reform, not individual projects underwritten by government.

The new orientation of the Bank put it in conflict with local Asian economies. For instance, from independence India had adopted a socialist economic model that stressed extensive government ownership of key industries and state-directed economic growth. Foreign investment was discouraged and import substitution was selected as a growth mechanism, which meant protective tariffs. For the favored industries, this approach produced pockets of prosperity along with stable employment. Such local stability was, however, more than offset by sluggish overall economic performance at the national level.

Bank economists became convinced that project lending was of relatively little good if financed within a national economy made stagnant by inefficient industries that were kept afloat only by wasteful government subsidies, nationalist import-substitution strategies, protective tariffs, and overvalued currencies. The emphasis of the Bank thus changed to "structural reform," by which was meant an end to statism in economic planning, the elimination of state subsidies to inefficient industries, lowering of protective tariffs, and revaluation of national currencies at realistic levels. Such restructuring might be painful in the short term but, it was believed, would open the Asian nations to broad and sustained future growth and further their integration into the world economy.

Structural Reform and Its Consequences

As part of structural reform, the Bank stressed export-oriented industrial growth, privatization of industry, curtailment of state economic planning, and currency devaluation. It was hoped that these changes would encourage exports, halt wasteful subsidizing of weak import-substitution industries, lessen bureaucratic interference, and increase international demand for local products through depreciated currencies.

This program was so in line with the economic interests of the developed countries, the United States in particular, that some charged that the Bank ignored indigenous Asian needs in favor of the creation of a world economic order that simply slotted Asian economies into western capitalism. Local effects of this restructuring, in some instances, were devastating. Currency

devaluation made essential imports hugely expensive and contributed to inflation. Local industries lost their umbrella of tariff protection, failed, and threw thousands out of jobs. The mild global slowdown of the 1980s left the new export industries without markets. One academic observer dealing with the Philippines, wrote in 1988, "Structural adjustment has also been . . . a disaster for the majority of the Third World, that is, for most workers, peasants, and small entrepreneurs producing for the domestic market" (Broad 1988: xviii).

These charges were amplified when the Asian economies were hammered during the late 1990s by the so-called Asian financial crisis. Some have noted that Malaysia's prime minister, Matahir Mohamad, refused to follow many of the Bank's prescriptions and that his nation's economy was spared some of the worst hardships.

Nevertheless, the general restructuring sought by the Bank has generally occurred. India, formerly a quasi-socialist, protectionist economy, moved toward an open-market economy with overall positive results. In the long run, it may be that the undoubted pain brought about by the Bank's change in philosophy enabled the Asian NICs to become competitive in the new global economy.

WORLD WAR I The main theater of World War I was in Europe and no major battles were fought in Asia; nevertheless, Turkey, Japan, China, and the Asian colonies of the imperial powers were involved in the conflict, and its impact was immense in unleashing forces of nationalism and self-determination.

East Asian Region

East Asia was connected not with the immediate causes of World War I, but with such tertiary factors as militarism and nationalism. Japan saw the war as a chance to occupy the German settlements in the Pa-

JAPAN DECLARES WAR ON GERMANY

"We, by the Grace of Heaven, Emperor of Japan, on the throne occupied by the same Dynasty from time immemorial, do hereby make the following proclamation to all Our loyal and brave subjects.

"We, hereby, declare war against Germany and We command Our Army and Navy to carry on hostilities against that Empire with all their strength, and We also command all Our competent authorities to make every effort in pursuance of their respective duties to attain the national aim within the limit of the law of nations.

"Since the outbreak of the present war in Europe, the calamitous effect of which We view with grave concern, We, on our part, have entertained hopes of preserving the peace of the Far East by the maintenance of strict neutrality but the action of Germany has at length compelled Great Britain, Our Ally, to open hostilities against that country, and Germany is at Kiaochau, its leased territory in China, busy with warlike preparations, while her armed vessels, cruising the seas of Eastern Asia, are threatening Our commerce and that of Our Ally. The peace of the Far East is thus in jeopardy.

"Accordingly, Our Government, and that of His Britannic Majesty, after a full and frank communication with each other, agreed to take such measure as may be necessary for the protection of the general interests contemplated in the Agreement of Alliance, and We on Our part, being desirous to attain that object by peaceful means, commanded Our Government to offer, with sincerity, an advice to the Imperial German Government. By the last day appointed for that purpose, however, Our Government failed to receive an answer accepting their advice.

"It is with profound regret that We, in spite of Our ardent devotion to the cause of peace, are thus compelled to declare war, especially at this early period of Our reign and while we are still in mourning for Our lamented Mother.

"It is Our earnest wish, that, by the loyalty and valour of Our faithful subjects, peace may soon be restored and the glory of the Empire be enhanced."

cific and in China. The Anglo-Japanese alliance of 1904 did not include any obligation that Japan join the Allied powers (Britain, France, Serbia, Russia, Japan, the United States, and China). Japan joined the war to increase its international prestige. On 23 August, Japan declared war on the Central powers (Germany, Austria-

Hungary, Bulgaria, and Turkey) and entered the Chinese port of Qingdao (Tsingtao). The German settlements in China were occupied, and Japan established itself on the Shandong peninsula. Japan's navy, along with the British, occupied such German islands as the Marianas, Carolines, and Marshalls in the Pacific.

The city of Constantinople ablaze in 1916. (HULTON-DEUTSCH COLLECTION/CORBIS)

China joined the war in 1917 and sent labor forces to France, West Asia, and Africa. China was disappointed with the results of war and refused to sign the treaty of Versailles that ended it. The Chinese government and people refused to recognize the Shangdong provisions, which granted Japan special rights on the peninsula, and large-scale demonstrations were held.

Japan had already obtained pledges from the Allied powers for its claim to Shandong and the German islands in the Pacific. Japan had hoped for parity with the Western Allies as a reward for joining the war, but its demand for a basic principle of racial equality was not included in the covenant of the League of Nations. Although the Japanese claim of racial equality among nations was not granted by the Western powers, the end of war saw a tremendous increase in Japan's power and prestige. The country benefited economically: cotton exports trebled, and the merchant-fleet tonnage doubled. Japan's trade with Asian countries also increased. Japan was able to establish hegemony in East Asia and to have its claims to special rights in Manchuria and its annexation of Korea recognized by the major powers.

West Asian Region

In West Asia, the Turkish Ottoman empire sided with Germany, and the Arabs, having been given a vague promise of freedom from colonization, were

persuaded to join the Allies. Turkey joined the war in November 1914 and posed a threat to the oil fields in the Persian Gulf region. The British landed at Gallipoli but were repulsed by Turkish troops. British Indian troops occupied Basra and marched along the Tigris River to Baghdad. The British forces surrendered in April 1916 to the Turkish troops. However, these initial Turkish victories did not save the Ottoman empire.

The Turks could not take the Suez Canal, and the British exploited the Arab dislike for the Turks to British advantage. Colonel T. H. Lawrence (known as Lawrence of Arabia) led a series of desert campaigns in Western Asia. By the end of 1917, the British had taken Baghdad and Jerusalem; Edmund Allenby, the British general, entered Jerusalem on 8 December. He was helped by reinforcements from India and by Arab revolts. After the British offensive in Palestine, Turkey concluded an armistice on 30 September 1918.

The British, along with the French, played devious diplomacy. Publicly they supported the Arabs in their drive for independence. However, as a result of the Sykes-Picot Agreement of 9 May 1916, which decided the spoils of war, Britain gained control over Palestine, Transjordan (present-day Jordan), and Iraq, while the French were established in Syria and Lebanon. To gain the support of the Jews, the Balfour Declaration of November 1917, which was issued

by the British secretary of state, promised creation of a national homeland for them.

The war was over, but its impact was momentous in changing the history of West Asia. The Turkish empire was in tatters after the loss of Palestine, Arabia, Transjordan, Iraq, and Syria. The cotton plantations and oil fields were gone. Nevertheless, a national state for the Turks was emerging under the leadership of Kemal Ataturk (1881–1938). The Jews felt disillusioned, as Palestine was to be a mandated territory rather than an independent Jewish state. As for the Arabs, they found they had achieved liberation from the Turks only to come under the yoke of the British and French. Arab nationalism took a new turn, and the Arabs set out on the path to independence.

South and Southeast Asia

The military action of the war in South and Southeast Asia was confined to Madras, India, and Penang, in what was then Malaya (now Malaysia). However, it brought about a crucial change in the political life and socioeconomic condition of the colonial people of the region.

The president of the Thai foreign ministry, Prince Dewawongse, saw the end of the war as an opportune moment to further Thai interests. The motive was to prevent Anglo-French occupation (French and British colonial possessions surrounded Thailand) and to abolish German extraterritorial rights. When the tiny Thai forces returned from France after the war, they were full of new ideas and experiences.

The same was true of the 150,000 Vietnamese who had participated in the war as laborers and soldiers. Nguyen Ali Quoc (Ho Chi Minh, 1890–1969) pleaded in vain for self-determination for Indochina (Vietnam, Cambodia, and Laos). Vietnamese nationalism took a new turn with active resistance to French rule. The British colony of Malaya felt the impact of war economically. Rice exports had been disrupted because of wartime shipping shortages, and this led to agricultural discontent in present-day Myanmar (Burma), which was being administered as part of India.

The nationalist leaders of India had initially supported the war efforts of the British government in the mistaken belief that the colonial rulers would be grateful for their loyalty. As the war went on, however, attitudes changed. The Congress Party passed a resolution of self-government on December 1916. This was a period of Hindu-Muslim unity, and the Congress Party accepted the principle of a separate electorate for the Muslims. The entry of Turkey into the war had generated anti-British feelings in the Muslim commu-

nity, which was sympathetic to the plight of fellow Muslims. Indian politics received a new zest after Annie Besant, an English theosophist who emigrated to India, set up the Home Rule League demanding home rule. Revolutionary and terrorist activities surged.

Price rises and scarcity of agricultural products brought untold misery upon the Indian people. Meanwhile, about 120,000 men from British India were fighting in West Asia and Eastern Africa, which caused hardship for their families at home. Britain also had to depend on Indian industries to help meet its wartime needs; the jute and textile industries, in particular, flourished during this period. Britain thus felt the necessity to grant some concession to the colony, and in August 1917 the announcement was made that there would be gradual development of self-governing institutions. War brought agitation for constitutional reforms in Sri Lanka, and the Ceylon National Congress was set up.

Postwar Rise of Asian Consciousness

The end of World War I on 11 November 1918 and the defeat of the Central powers formed a watershed in Asian history. The prestige of the Western powers suffered drastically. The mutual bickering and fratricidal struggle among European powers convinced the Asian countries that the Western nations were not at all superior. A new Asian self-consciousness developed. Arabs, Jews, Indians, Vietnamese, and others felt deceived by the double-dealing of the colonial powers. With renewed zeal, they strove hard to oust the imperial powers. The Fourteen Points of the U.S. president Woodrow Wilson, particularly the principle of self-determination, had raised high hopes. However, these ideas were applied in Eastern Europe only. Another important development was the proliferation of new industries in Asia at the expense of Europe, whose economy had been directed to war purposes. A change in economic relations between Asia and Europe occurred. An exhausted Europe was losing self-confidence, and the new ideas and experiences that Asia had gained changed the course of world history in the postwar period.

WORLD WAR II World War II in Asia was very different from the war in Europe. The Asian experience included Japanese colonial expansion into the Asian mainland, which preceded the involvement of European and North American nations, as well as the civil war in China. For some Asian nations, the worldwide aspect of the war was secondary to their own conflicts with Japan.

The war came at a time when some nations were involved either in the war in Europe or in other demographic upheavals, such as the Soviet Union's relocation of ethnic Koreans (who had fled from Japanese-occupied Korea into eastern Siberia) to Uzbekistan. In this instance, some 190,000 Koreans were moved west. Although many ethnic Russians had also been relocated to the Central Asian republics from the 1880s on as a means to counter growing Islamic influence there, such relocations were not part of Soviet wartime relocation policy.

Japanese Expansionism

The "War in the Pacific," as the conflict is known in many Asian countries, took place from 1939 to 1945. However, the military actions and colonial efforts that set the stage for this period began with the termination of World War I. At the end of that war, Japan had acquired territories in China and the Pacific formerly held by Germany. (Japan's expansionist policy had begun even before World War I, with the acquisition of Taiwan following Japan's victory in the Sino-Japanese War of 1894–1895 and the annexation of Korea in 1910.) Japan's aim was one of strategic security, a "Greater East Asia Coprosperity Sphere" stretching some 1,600 kilometers from the Japanese islands, which would remove the Western powers from Asia. Western imperialism had undermined China, and by the mid-1930s, Japan had begun to remove Western influence there by dividing China through the establishment of a puppet government in Manchuria. However, open armed conflict in China escalated in 1937.

In July of that year, Japanese forces attacked Peiping (modern Beijing); they attacked Shanghai in August. At that time, Japan was fighting the forces of the Nationalist government of China; the Nationalists leaned more toward the West in matters of trade and foreign policy than did the Chinese Communists, the Nationalists' adversaries. Unable to stop the Japanese, the Nationalists retreated westward to the city of Nanking (modern Nanjing), where in December Japanese forces captured the city and massacred some 300,000 civilian residents. The "Rape of Nanking,"

more than any event, brought about international condemnation of Japan's expansion into Asia and shaped the policies of Japan's opponents.

In Southern Asia, the war came to India as a consequence of British rule there. When Great Britain declared war on Germany, the Indian viceroy did the same, but the Indian Congress did not support him. While war raged in East Asia and Europe, India was at first little more than a source of men for the African front and for the British in Singapore as well as a supply base for operations in the Middle East.

India's situation changed with the Japanese attacks in the Pacific and on the Asian mainland. Indian soldiers who had been sent to reinforce British territories in East Asia were killed or captured by the Japanese once fighting began, leading India to return to British allegiance, at least in the short term.

U.S. Entry

At this time, the United States was still formally neutral and was selling Japan steel and oil, materials Japan needed for its military expansion. America had accepted Japan's annexation of the Korean peninsula, and in the United States, ethnic Koreans were considered to be Japanese. The American focus was on the growing conflict in Europe, not Asia. While the United States provided some assistance to the Nationalist Chinese, the Soviet Union actually provided China more operational support with Soviet aircraft and pilots until 1939, when those assets were recalled to fight Germany. The major U.S. support to China after that was the effort to construct the Burma Road from Lashio, Burma (present-day Myanmar), to Kunming, China, begun in 1938 to provide a western route into China for military supplies. U.S. policy at the time was to avoid conflict in the Pacific, because conflict there would divert assets from the Atlantic. Only in 1940, in response to further Japanese expansion in China, did the United States institute an economic embargo of oil and steel against Japan. This was expanded in mid-1941 to a complete end to all trade with Japan; Japan then had to seize the sources of materials necessary for its strategic survival.

In Southeast Asia, Japan had continued its program of replacing Western influence with its own. The French colonial government in Indochina (Vietnam, Laos, and Cambodia) capitulated to Japan in 1940, after France fell to Germany. Thailand accepted Japan's presence in the region as a means of reacquiring territory lost to Cambodia, Laos, and Malaya. The outbreak of armed conflict with Western forces in December 1941 led to the occupation of Malaya

CREATING THE AXIS POWERS

The Mutual Assistance Pact signed by Japan, Germany, and Italy in Berlin on 27 September 1940 created the so-called Axis Powers and ceded control of Asia to Japan.

The Governments of Japan, Germany, and Italy, considering it as the condition precedent of any lasting peace that all nations of the world be given each its own proper place, have decided to stand by and co-operate with one another in regard to their efforts in Greater East Asia and the regions of Europe respectively wherein it is their prime purpose to establish and maintain a new order of things calculated to promote mutual prosperity and welfare of the people concerned.

Furthermore, it is the desire of the three Governments to extend co-operation to such nations in other spheres of the world as may be inclined to put forth endeavors along lines similar to their own, in order that their ultimate aspirations for world peace may thus be realized. Accordingly, the Governments of Japan, Germany and Italy have agreed as follows:

Article I. Japan recognizes and respects the leadership of Germany and Italy in the establishment of a new order in Europe.

Article II. Germany and Italy recognize and respect the leadership of Japan in the establishment of a new order in Greater East Asia.

Article III. Japan, Germany and Italy agree to co-operate in their efforts on the aforesaid lines. They further undertake to assist one another with all political, economic and military means when one of the three Contracting Parties is attacked by a power at present not involved in the European War or in the Sino-Japanese Conflict.

Article IV. With a view to implementing the present Pact, joint Technical Commissions the members of which are to be appointed by the respective Governments of Japan, Germany and Italy will meet without delay.

Article V. Japan, Germany and Italy affirm that the aforesaid terms do not in any way affect the political status which exists at present as between each of the three Contracting Parties and Soviet Russia.

Article VI. The present Pact shall come into effect immediately upon signature and shall remain in force for ten years from the date of its coming into force.

At proper time before the expiration of the said term the High Contracting Parties shall, at the request of any one of them, enter into negotiations for its renewal.

Source: Far East Year Book. (1941) Tokyo: Far East Yearbook, 93–94.

(modern Malaysia), Burma, and the Dutch East Indies (present-day Indonesia) and began the conquest of the Philippines.

While the Japanese attack on Pearl Harbor on 7 December 1941 is viewed by most Americans as the beginning of World War II in Asia, this event came thirty-one years after the annexation of Korea, ten years after the establishment of Japanese rule in northern China, four years after the massacre at Nanking (Nanjing), and a year after much of Southeast Asia had come under Japanese domination. To Japan, however, the initiation of armed conflict against the United States was in response to an undeclared war that the United States had initiated with its embargo of critical materials.

Early Japanese Successes

Japan's attack on Western holdings in Asia and the Pacific resulted in tremendous early successes. American military power in Hawaii was blunted, Hong Kong fell, Burma and the Philippines were taken, and at the far reaches of Japanese power, islands in Alaska's Aleutian chain, the Solomon Islands, and the Gilbert Islands were captured. The Solomon and the Gilbert Islands consolidated Japan's holdings acquired by League of Nations mandate after World War I. By mid-1942, the Western powers were close to defeat in Asia and the Pacific. However, the same technological forces that had permitted Japan's rapid military expansion began to work in favor of the Allied forces, due in part to what must be considered a stroke of luck that took place before the attack on Pearl Harbor.

Change in U.S. Naval Strategy

Before December 1941, U.S. naval strategy had been based on the use of battleships in naval combat, but after Pearl Harbor, the aircraft carrier became the linchpin of U.S. naval strategy. The aircraft carrier was an untested experiment until it was used with tremendous success by the Japanese navy. At the time of the Japanese attack, the U.S. Navy's three aircraft carriers were out of port, but its battleships were at Pearl Harbor, where they were destroyed. This forced the United States to adopt a naval strategy based on the aircraft carrier for the Pacific theater of operations, because the primary focus of the war effort was still Europe and replacements for its battleships would not be available for some time. The new strategy would have to counter the advances Japan had already made in the Pacific and would rely on America's industrial capacity (once mobilized), technological advantage, and innovative tactics.

Japan's strategy, however, had been one of quick successes that would give it the advantage in establishing dominance over East Asia before the United States and the Western powers could retaliate. Japan's prime minister, General Tojo Hideki (1884–1948), had no misperceptions regarding America's capacity; even he recognized that a long conflict would work against Japan's long-term goals. As the Allied forces became able to maintain their holdings and then to advance toward the Japanese home islands, the resources available to the Allies (and denied to the Japanese), technology, and tactics swung in favor of the Allies.

Battle for China

On the Asian mainland, however, Japan was still the dominant force. In China, the Nationalists under Chiang Kai-shek (1887–1975) and the Communists under Mao Zedong (1893–1976) had been at odds since 1926, and this competition at times undermined Chinese efforts to defeat the Japanese. While Chinese forces avoided complete defeat at Shanghai in 1932, Japan was able to establish a puppet government in Manchuria (called Manchuguo). Chiang spent the next five years building up his Nationalist army, while the Communists withdrew to northwest China on the Long March (1934–1935) from Jiangxi province to Shaanxi province, covering approximately 9,600 kilometers. Mao rebuilt his forces over the next year and sought a united effort of both Communists and Nationalists against the Japanese. Chiang, however, sought to defeat the Communists first, then deal with the Japanese. In late 1936, Chiang was kidnapped by one of his own generals while on a visit to Xi'an, and as a condition of his release he had to agree to work with the Communists to fight the Japanese. Subsequently, Japanese forces dramatically increased their efforts, leading to the Nanking Massacre and to victories at Wuhan and Guangzhou (Canton) in 1938.

Even as both Chinese factions worked against the Japanese, their efforts were seen as a means for each to dominate the other. Chiang believed that the Japanese would wear down the Communists so that he would be able to deal with them after the Japanese were defeated, and Mao viewed Nationalist action against the Japanese as an opportunity for his Communist forces to rest. Both sides expanded their forces in preparation for a civil war once the Japanese were defeated.

U.S. support for China began only after years of fighting by Chinese forces, but in March 1941 the Lend-Lease Program (which had been used to support European nations fighting against Hitler since 1939) was extended to China. This and other aid were sig-

JAPAN AND THE SOVIET UNION NEUTRALITY PACT

On 13 April 1941 Japan and the Soviet Union signed the Neutrality Pact between Japan and the Union of Soviet Socialist Republics. For the Japanese the benefit of Soviet neutrality was a reduced threat to their holdings in China and Korea.

The Presidium of the Supreme Soviet of the Union of Soviet Socialist Republics and His Majesty the Emperor of Japan, guided by a desire to strengthen peaceful and friendly relations between the two countries, decided to conclude a pact of neutrality, for the purpose of which they appointed as their representatives:

For the Presidium of the Supreme Soviet of the Union of Soviet Socialist Republics, Vyacheslav Molotov, Chairman of the Council of People's Commissars and People's Commissar for Foreign Affairs.

For His Majesty the Emperor of Japan, Yosuke Matsuoka, Minister of Foreign Affairs, Ju San Min, Cavalier of the Order of the Sacred Treasure, First Class; and Yoshitsugu Tatekawa, Ambassador Extraordinary and Plenipotentiary in the Union of Soviet Socialist Republics, Lieut. Gen., Ju San Min, Cavalier of the Order of the Rising Sun, First Class, and the Order of the Golden Kite, Fourth Class.

Who, after the exchange of their credentials, which were found in due and proper form, agreed on the following:

Article I. Both Contracting Parties undertake to maintain peaceful and friendly relations between them and mutually respect the territor-

ial integrity and inviolability of the other Contracting Party.

Article II. Should one of the Contracting Parties become the object of hostilities on the part of one or several third Powers, the other Contracting Party will observe neutrality throughout the duration of the conflict.

Article III. The present Pact comes into force from the day of its ratification by both Contracting Parties and remains valid for five years. In case neither of the Contracting Parties denounces the Pact one year before the expiration of the term, it will be considered automatically prolonged for the next five years.

Article IV. The present Pact is subject to ratification as soon as possible. Instruments of ratifications shall be exchanged in Tokyo as soon as possible.

In confirmation whereof the above-named representatives signed the present Pact in two copies, drawn up in the Russian and Japanese languages, and affixed thereto their seals.

Done in Moscow, April 13, 1941, which corresponds to the 13th day of the 4th month of the 16th year of Showa.

nificantly expanded after the Japanese attack on Pearl Harbor eight months later.

Broadening of the War

The attack on the U.S. base in Hawaii dramatically changed the war for Japan. Despite its early successes in late 1941 and 1942, Japan lacked the resources necessary for a long war. An early attack on Tokyo made by American bombers launched from an aircraft carrier in April 1942 unnerved Japan. This raid, led by Lieu-

tenant-Colonel James Doolittle, was launched primarily for psychological reasons. For the United States, it provided some good news after a succession of defeats; for Japan, it showed that not even Tokyo was safe.

The new aircraft carrier-based U.S. strategy, instead of being oriented solely against Japanese naval forces, used "island-hopping" as a means of advancing on the Japanese home islands. After the United States defeated Japanese naval forces at the battle of Midway and at Guadalcanal in 1942, Allied forces moved

THE YALTA AGREEMENT

On 4–11 February 1945 Winston Churchill of Great Britain, Franklin Roosevelt of the United States, and Josef Stalin of the Soviet Union met at Yalta in the Crimea to discuss post–World War II Europe. They also agreed secretly that the Soviet Union would attack Japan and would regain territory taken by Japan as detailed below.

The leaders of the three Great Powers—the Soviet Union, the United States of America and Great Britain—have agreed that in two or three months after Germany has surrendered and the war in Europe has terminated the Soviet Union shall enter into the war against Japan on the side of the Allies on the condition that:

1. The *status quo* in Outer Mongolia (The Mongolian People's Republic) shall be preserved;

2. The former rights of Russia violated by the treacherous attack of Japan in 1904 shall be restored, viz:

(a) the southern part of Sakhalin as well as all the islands adjacent to it shall be returned to the Soviet Union.

(b) the commercial part of Dairen shall be internationalized, the preeminent interests of the Soviet Union in this port being safeguarded and the lease of Port Arthur as a naval base of the USSR be restored.

(c) the Chinese Eastern Railroad and the South Manchurian Railroad which provides an outlet to Dairen shall be jointly operated by the establishment of a joint Soviet-Chinese Company, it being understood that the preeminent interests of the Soviet Union shall be safeguarded and that China shall retain full sovereignty in Mongolia;

3. The Kuril Islands shall be handed over to the Soviet Union.

It is understood that the agreement concerning Outer Mongolia and the ports and railroads referred to above will require concurrence of Generalissimo Chiang Kai-shek. The President will take measures in order to obtain this concurrence on advice from Marshal Stalin.

The heads of the three Great Powers have agreed that these claims of the Soviet Union shall be unquestionably fulfilled after Japan has been defeated.

For its part the Soviet Union expresses its readiness to conclude with the National Government of China a pact of friendship and alliance between the USSR and China in order to render assistance to China with its armed forces for the purpose of liberating China from the Japanese yoke.

through the Gilbert Islands and New Guinea in 1943, then on to the Marianas Islands and the Philippines in 1944. By attacking Japanese strong points that might threaten Allied operations and seizing those islands necessary for operations while bypassing others, the Allied forces were able to prepare for what would have been the final assault on Japan in 1945.

Farther west, the Japanese imperial army had opened a front to invade Burma to counter American and British activities there. This expanded in mid-1944 to an effort to defeat the British and Indian forces in east India, resulting in the overextension of Japanese supply lines and the eventual destruction of the Japanese Fifteenth Army.

Also in 1944, a volunteer corps of American fliers in China, known as the "Flying Tigers," began to attack Japanese forces there. Although the Flying Tigers diverted Japanese attention away from the fight with Chinese forces, Chiang Kai-shek did not capitalize on the diversion, much to the irritation and anger of the senior American in China, Brigadier General Joseph Stillwell. The friction between Chiang and Stillwell soon caused President Franklin D. Roosevelt (1882–1945) to recall Stillwell to the United States.

By 1945, a campaign of strategic bombing of Japanese cities was being waged from island bases in the Pacific. Massed attacks by the U.S. Air Force targeted both Japanese military forces and cities and resulted in tens

of thousands of civilian casualties and massive destruction (as had the Allied attacks against German cities). The firebombing of Tokyo on the evening of 9 March 1945, for example, killed up to 120,000 Japanese. The U.S. doctrine at the time was one of "total war" against the Japanese population, in preparation for a final Allied push against Japan, which was to be a massive amphibious assault against the islands of Kyushu (Operation Olympic) in December 1945 and Honshu (Operation Coronet) in March 1946. These assaults were to use forces made available by the defeat of Germany, forces that, in many cases, already were in transit to the Pacific region. As many as 5 million soldiers, primarily American, would have been involved. The Soviet Union would also take part in the invasion of Japan.

Planning for Operation Olympic had begun in 1944 as Allied forces moved toward Japan. By early 1945 it was estimated that approximately 300,000 Japanese soldiers were on the Japanese islands; by August this estimate had risen to over a half million, including a significant number of combat units. The U.S. experience in attacking islands held by the Japanese was that Japanese soldiers and civilians would fight to the death to avoid capture, resulting in very heavy casualties inflicted on U.S. forces. Estimates for the invasion were as high as 1 million Allied casualties and possibly three times that number of Japanese. The losses for Japan would include both military and civilian personnel and might well have resulted in the end of Japan as a nation.

End of the War

Discussions regarding the Allied focus on Japan were held by the leaders of the United States, the Soviet Union, and Great Britain in February 1945 at Yalta in the Crimea. This conference resulted in an agreement that the Soviet Union would enter the war against Japan once Germany was defeated, and that upon Japan's defeat, those areas in China formerly held by Russia but captured by Japan in 1904 would be turned over to the Soviet Union. President Roosevelt kept the agreement secret from even Vice President Harry Truman (1884–1972) on his return from Yalta, but Roosevelt died within two months. The decision to proceed with the plans made earlier then fell on Truman.

Truman met with the British prime minister Winston Churchill (1875–1975) and the Soviet premier Joseph Stalin (1879–1953) at Potsdam, Germany, in July 1945 to discuss further the treatment and disarmament of Japan once it had been defeated. While at Potsdam, Truman learned of the successful test of a new weapon that might shorten the war. That weapon was the atomic bomb. He informed Churchill of the weapon, but not Stalin.

The atomic bomb used against Japan eliminated the need for the invasion. On 6 August 1945 a single aircraft dropped a single ten-thousand-pound bomb on the Japanese city of Hiroshima, resulting in an explosion equal to twenty thousand tons of conventional explosives. Hiroshima had been chosen because it was an industrial target that had not been damaged by earlier attacks, which would permit estimations of the bomb's effectiveness. The bomb instantly killed some 130,000 people, injured as many, and destroyed four-fifths of the buildings in the city. Three days later, a second atomic bomb was dropped on the Japanese city of Nagasaki. By that time, the Soviet Union had declared war on Japan and invaded Manchuria.

Although the two weapons used on Hiroshima and Nagasaki instantly killed approximately 200,000 people and thousands subsequently died from injuries and radiation poisoning, these attacks had not been as damaging as the combined earlier attacks on other major cities. For President Truman, the atomic bomb was simply a weapon of war, not an element of a greater strategy. Its use worked; on 14 August, the Japanese government accepted the guidelines of the Potsdam Declaration. The Soviets refused to accept the Japanese proposal, because it did not contain an order to the Japanese military to surrender; only the official signing of the documents on 2 September 1945 was accepted by the Soviet Union.

The War in the Pacific cost over 11 million Chinese and 2.5 million Japanese lives, plus countless others in the occupied nations of the region. Casualties among the Allied forces—the United States, Great Britain, Australia, New Zealand, India, and Canada—were comparatively light; approximately 200,000 were killed in Asia, the majority of whom were American.

WRAPPING CLOTHS. See Pojagi.

WU An estimated 85 million people, living predominantly in the provincial-level municipality of Shanghai as well as in the Zhejiang and Jiangsu Provinces in China, speak the various dialects of Wu. The Wu speakers in Jiangsu Province live primarily south of the Chang (Yangtze) River. A few enclaves of Wu speakers are located at the north of the mouth of this river.

The Wu region is different in a variety of ways from the other regions in which the major Sinitic sublanguages hold sway. In the Wu region, there are several culture centers, whereas in the other sublanguage groups, there is one major "local" capital. This is a population center that sets the cultural as well as linguistic pattern for the rest of the group. For example, the Yue have Guangzhou, while the Minnan of Fujian Province have Xiamen. The scattered Hakka also look to Meixian as their geographic, cultural, and linguistic center.

In comparison, the Wu people are far more diverse. Shanghai, the sublanguage's largest population center, does not really play the role of the center for the Wu people, because it is a new city, relatively speaking, and is subject to Western influences. Furthermore, the population in Shanghai has come from various Wu-speaking districts as well as from Nanjing and beyond. Centers such as Suzhou, Hangzhou, and Shaoxing have all played major roles in the history of the Wu, but none can truly be said to be its center.

The Wu people are also different from other Chinese in that they would not usually describe their subethnic identities in terms of their province of origin. This is because only the southern third of Jiangsu Province is Wu speaking. There is great diversity in

Zhejiang Province itself and the people are not all Wu speakers. So the Wu people of Zhejiang have tended to identify themselves by their native prefectures, which are subprovincial political units. Unlike the Yue, Hakka, and Min people to the south, the Wu people did not join the modern migration of Chinese abroad on any major scale, and Wu speakers have only a minor representation in the overseas Chinese population.

The Wu language had its origin in Suzhou—one of the cultural centers of the imperial period. The sociolinguistic evolution of the Wu region, however, is not well established. From the center of its origins, the language spread to regions south of the lower Chang River. It is a language that has gained importance because of the rise of Shanghai as a metropolitan center and one of the treaty ports that was ceded to the Western powers—Britain, France, and Germany.

Origins of Wu

The Chinese character for *wu* was possibly first applied to people living around the mouth of the Chang River who spoke a non-Sinitic language that was largely incomprehensible to those speaking the various Sinitic sublanguages. The other meaning given to the word *wu*, and rarely so, is "clamorous" or "yelling." This might be a reference to the rather loud and emphatic nature of the Wu people's way of speaking. To many early Han Chinese, the language might have also sounded strident. The mention of the kingdom of Wu first appeared in Chinese annals around the seventh century BCE. Historical linguists have been uncertain how to classify the ancient Wu dialect, which could not yet be considered a Sinitic sublanguage at that time. There is a widespread assumption that the language is related to the Tai languages. But the probability is that it is more of a Sino-Tibetan language. The kingdom of Wu started to adopt aspects of the evolving Chinese culture during the Zhou dynasty (1045–256 BCE). Subsequent warfare led to the complete incorporation of the kingdom into the Sinitic political world.

Sinitic Wu culture is thought to have reached its highest point during the Southern Song period (1126–1279). This would have been the period when the Wu region was at the geographical core of what has been considered to be the most highly cultured state in China, if not in the world. The Wu-speaking people left a major legacy for human civilization. The Southern Song, with its capital at present-day Hangzhou, played an important role in transmitting Buddhism and other cultural and artistic values to neighboring countries such as Japan.

Distinguishing Features of the Wu Sublanguage

Many of the archaic features to be found in the Wu sublanguage help distinguish it sharply from modern Mandarin. Principal among these is the continuing use in the sublanguage of the series of voiced initial consonants that have been lost in other Sinitic sublanguages. Most forms of Wu will have *b*, *d*, *dz*, *g*, *p*, and *z* as initials. Another feature is a special voiced *b* (a bit like the guttural German *r*), which is contrasted in Wu with the normal, or unvoiced, *b*, according to Leo Moser.

There are fewer diphthongs in Wu than in most other Sinitic sublanguages, and the phonetics are deemed to be somewhat closer to the Old Xiang, or *Laoxianghua*, of Hunan. Wu is different from other sublanguages like the Yue, Minnan, Gan, and Hakka, particularly in the simplified endings of its syllables. While Mandarin has also simplified its endings, it has done this differently from those of Wu, with varying results. Hence, the ancient final syllables such as, *p*, *t*, and *k* appear in neither Mandarin nor Wu.

Final consonants of Wu dialects typically include only one or two nasal endings with perhaps the glottal stop. It is a pattern that more closely resembles the dialects of Minbei and some forms of Eastern Mandarin. The Wu vernaculars are characterized by complex patterns of tone sandhi in which the tone of one syllable is modified in speaking by that of the syllable that falls next to it. ("Sandhi" is a linguistic term meaning the modification of the sound of a morpheme in certain phonetic situations or contexts.) While tone sandhi in the Min-speaking areas has been deemed to be complex, it is even more so among the Wu dialects.

Wu also differs from other Sinitic sublanguages in grammatical and structural ways. In particular, the Wu dialects differ from Mandarin by putting the direct object before the indirect object when both appear in a sentence. That characteristic makes Wu similar to Cantonese, but different from the intervening Min vernacular tongues, which tend to have an ordering that resembles more that of Mandarin.

The Wu dialect tends to vary by stages over the larger region mainly as a consequence of the pluralism of standards in the sublanguage. The isoglosses (geographical boundaries that delimit the area within which a linguistic feature is found) overlap in what has been found to be a complex pattern. In spite of such variations within the region of Wu-speaking peoples, however, there is generally intercomprehensibility among the so-called Shanghai dialects, of which Suzhou Wu is one example.

One exception to the intercomprehensibility of the Wu dialects is the dialect spoken in the port city of

Wenzhou, located in the south of Zhejiang. This Wenzhou dialect and some of the dialects spoken by people living inland from the port are considered extremely different from other Wu dialects. This has led some linguists to suggest that the Wenzhou dialect should be treated and recognized as a Sinitic language that is separate from the rest of Wu.

The vernacular of Shanghai represents a fusion of various forms of Northern Wu and other dialectal influences, including even Eastern Mandarin. Other Wu speakers have traditionally treated the Shanghai vernacular somewhat contemptuously as a mixture of Suzhou and Ningbo dialects. Shanghainese have been portrayed as strategic, smart thinkers, interested in new ideas, and in new words to add to their language. Yet the Shanghainese people have long resisted the Communist government's efforts to make them speak the universally accepted Mandarin dialect.

WU CHANGSHI (1844–1927), innovative early-twentieth-century Chinese painter and calligrapher. The career of Wu Changshi represents the process of evolution from the artistic patterns of late imperial China to those of the modern era. Born into a declining scholarly family in Anji, Zhejiang, he moved to Shanghai and became a professional painter. Wu was best known for his calligraphy in the *zhuan* (seal) and *shigu* (stone drum) scripts. His calligraphy and painting were famed for their *jinsbiqui*, or antiquarian epigrapher's taste.

In his youth, Wu studied briefly with Ren Yi (1840–1895), but was mostly self-taught as a painter. Although his favorite themes were usually flowers and rocks, Wu's pictures are to be seen not as images from nature but as arrangements of plants and rocks in an

abstract space. Conventions of calligraphy and painting were brought together in his loosely brushed artwork. Thus, despite his commercial market, the ultimate ideal of literati painting—to combine poetry, calligraphy, and painting—was realized in his work.

WU ZETIAN (625–705), Chinese emperor. Wu Zetian was the only woman to rule in China as an emperor in name. She entered the Chinese imperial court at the age of thirteen as a lowly ranked concubine to Emperor Taizong (reigned 626–649) of the Tang dynasty (618–907 CE), but when he died she became concubine and later empress to her stepson, Emperor Gaozong (reigned 650–683). When Gaozong died, she declared herself emperor after deposing her sons and attempting to found her own dynasty. She turned to the Buddhist establishment and invented about a dozen characters with a new script to legitimize her position as emperor.

Her overall rule did not result in a radical break from Tang domestic prosperity and foreign prestige. But she changed the composition of the ruling class by removing the entrenched aristocrats from the court and gradually expanding the civil service examination to recruit men of merit to serve in the government. Although she gave political clout to some women such as her capable secretary, she did not go as far as to challenge the Confucian tradition of excluding women from participating in the civil service examinations. Already in 674, she had drafted twelve policy directives ranging from encouraging agriculture to formulating social rules of conduct. She maintained a stable economy and a moderate taxation for the peasantry. Her reign witnessed a healthy growth in the population; when she died in 705 her centralized bureaucracy regulated the social life and economic well-being of the 60 million people in the empire.

Overall, Wu Zetian was a decisive, capable ruler in the roles of empress, empress dowager, and emperor. She was allegedly cruel in her personal life, murdering two sons, a daughter, and other relatives who opposed her. As a woman ruler, she challenged the

traditional patriarchal dominance of power, state, sovereignty, monarchy, and political ideology. Her experience reflected a reversal of the gender roles and restrictions that her society and government had constructed for her as appropriate to women. While surviving in the male-ruled and power-focused domain, she showed strengths usually attributed to men, including political ambition, long-range vision, talented organization, and hard work. Later historians have been hostile to her, describing her as a despotic usurper of the throne. According to these historians, the reign of Wu Zetian ended in corruption, drinking, and the elderly ruler delighting in sexual relations with young men who enjoyed all imaginable favors and honors. In 705, she was forced to abdicate, her son Zhongzong was again enthroned, and the Tang was restored.

WUDANG SHAN Wudang Shan (Mount Wudang) is located in northwest Hubei province, central eastern China, near the city of Shiyan. It is also known as Taihe Mountain. The highest peak, Tianzhu Feng (Heaven-Supporting Pillar), rises 1,612 meters above sea level, and the mountain includes seventy-two peaks, cliffs, ravines, caves, and water pools. One of

WUDANG SHAN—WORLD HERITAGE SITE

Designated by UNESCO as a World Heritage Site in 1994, Wudang is a complex of ancient palaces and temples in China. First begun in the Ming dynasty, the site demonstrates the highest artistic and architectural craft from the Ming, Yuan, and Qing dynasties.

the most sacred places in Taoism, the mountain is famous for its complex of palaces and temples, which date from the Yuan, Ming, and Qing dynasties. The oldest of the Taoist temples, Wulong (Five Dragon Temple), dates from the early Tang dynasty (618–907). The Ming emperor Cheng Zu, a Taoist, began the construction of thirty-three halls and monasteries in 1412. The temple complex covers more than 1.6 million square meters. Wudang is also known as the birthplace of Wudang shadow boxing, or *wudang taiyi wuxing*. This martial art, known as Tai Chi in the West, was most likely developed by the Wudang Taoist Zhang Sanfeng (1391?–1458?). The palace and temple complex on Wudang was inscribed on the World Heritage List in 1994.

WULINGYUAN Wulingyuan, known as "China's Yellowstone," is a spectacular karst landscape near Dayong City in western Hunan Province. Its designated Scenic Area covers 265 square kilometers and incorporates China's first national park, Zhangjiajie, as well as the Tianzishan and Suoxiyu nature reserves. The impressive scenery includes more than 3,000 quartzite sandstone pillars, many over 200 meters high, as well as ravines, gorges, streams, pools, waterfalls, caves, and natural bridges. The Zhoutian Dong cavern is thought to be the largest in Asia, and the Tianqia Shengkong natural bridge, the world's highest. Wulingyuan has both subtropical and temperate vegetation and contains numerous endangered plants and animals, including dove trees (*Davidia*), Chinese giant salamanders, Chinese water deer, Asiatic black bears, Asiatic wild dogs, and clouded leopards. Wulingyuan was inscribed on the World Heritage List in 1992.

WUSHU *Wushu* is the generic label for all indigenous martial arts in China. In the West, kung fu is often used as a synonym, although in China it refers to the time and effort given to an activity and can be applied to any activity, not just martial arts. Martial arts forms emerged in China several thousand years ago and have continued to appear and develop ever since. There are now hundreds of different martial arts in China. They are typically classified by region (Northern/Southern), religion (Buddhist/Daoist), or place of origin. Chinese martial arts have also influenced the development of martial arts in other Asian nations such as Japan, Korea, and Indonesia. In the twentieth century they have also become popular in the West. Martial arts using both body parts and weapons developed initially as forms of defense and offense. In the twentieth century, they have become more specialized and are used as forms of exercise and relaxation, in military training, in drama, and as a form of competitive sport.

WUYI, MOUNT Mount Wuyi looms at the northern end of China's Fujian Province, bordering Jiangxi Province. The magnificence of the landscape has inspired poets, painters, philosophers, and geologists for centuries. Its tree-covered granite mountains and caves of various shapes, its bustling waterfalls and tranquil mountain streams, and its abundance of plant, flower, animal, bird, and fish species caught the attention of a Chinese emperor in the eighth century CE, who ordered the area to be protected. A visitor to Mount Wuyi today can flow down the 9,500-meter-long Nine-Bend Stream on a bamboo raft, for a spiritual or therapeutic experience. Wuyi Yan Cha (Wuyi Rock Tea) has a distinctive taste of sunburned mountain rocks, which has captivated emperors and common folk alike.

Rich in cultural history, Mount Wuyi saw human activity as early as 2100 BCE. The Min Yue people built a city here 2,300 years ago. Cedar coffins of this ancient people, placed on seemingly inaccessible cliffs, still keep researchers wondering. The Neo-Confucian scholar Zhu Xi (1130–1200) lived and taught in Wuyi

for about five decades. More than 100 pieces of writing by Zhu Xi during his residency at Mount Wuyi established him as a master of Neo-Confucianism, which has had a fundamental influence on China to the pre-

sent day. Mount Wuyi was listed as both a natural and cultural UNESCO World Heritage Site in 1999.

Jian-Zhong Lin

XAYABURY (2000 pop. 333,000). The mountainous province of Xayabury, with an area of 16,389 square kilometers, is situated in the northwestern part of Laos. It shares borders with the Vientiane and Luang Prabang Provinces in the east and six provinces of Thailand in the west. Xayabury was under the empire of Lan Xang before it disintegrated into three kingdoms in 1713. Xayabury then became a part of the Luang Prabang kingdom and was handed over to the French by Thailand under the Franco-Siamese settlement of 1907. France surrendered it to Thailand in January 1941, which caused resentment in Laos.

The province's capital is Sayabouri, located on the banks of river Nam Hung. Annual rainfall is 100–150 millimeters. Rice, watermelons, cabbages, and sugarcane are produced in the fertile regions of Ban Fainamtan, Ban Nakhem, and Ban Nampoui.

Buddhist monuments such as Wat Ban Thin, Wat Ban Phapoon, and Wat Natomoy are situated in the province. A paradise for nature lovers, the province is dotted with thick forests, beautiful meadows, scenic waterfalls, and magnificent peaks. An important tourist attraction is the 1,150-square-kilometer sanctuary Nam Phoun National Biodiversity Conservation Area, which is inhabited by the Asiatic black bear, elephant, guar, gibbon, Malaya sun bear, and Sumatran rhino.

XI'AN (2002 est. pop. 2.7 million). Xi'an is the provincial capital of Shaanxi Province in central China. The city, which is the largest in the province, is situated in the central part of Shaanxi in the Wei River

The Lesser Wild Goose Pagoda in Xi'an. (KEREN SU/CORBIS)

valley north of the Qinling Range. The area around Xi'an has been inhabited for thousands of years; the remains of a stable village from around 5,000 BCE has been found at Banpo. The Xi'an area was also chosen as the capital of the first empire, the Qin dynasty (221–206 BCE), as well as of the Han (206 BCE–220 CE) and the Tang dynasties (618–907 CE). The city was then known as Chang'an. The site of the famous terra-cotta soldiers of the First Emperor of the Qin (Qin Shi Huangdi) is located about thirty kilometers east of the city, and many other archaeological sites dot the area.

For hundreds of years, Xi'an was the gateway to the Silk Route to Central Asia, and during the Tang dynasty it was the largest and most cosmopolitan city in the world. The Big Goose Pagoda, which was completed in 709, still stands sixty-four meters tall, and the old part of Xi'an, with a drum tower, a bell tower, and a magnificent mosque dating to the eighteenth century, is surrounded by one of the best-preserved city walls in China. The walls date to the fourteenth century and were originally fourteen kilometers long and measured twelve meters in height and eighteen meters in width. The modern city has a major textile industry and some electrical industries, and important food processing factories are located in a rich agricultural region in the river valley. Tourism is a major source of income. Xi'an also has important universities and colleges.

XI'AN INCIDENT The Xi'an Incident, an important event in modern Chinese history, temporarily ended open hostility between the Communist and Nationalist movements and enabled China to present a unified opposition to Japanese aggression.

The incident emerged in 1935, in the aftermath of the Long March of 1934, when the Communists, now located in Yenan province in the northwest, urged all Chinese factions to unite to resist Japanese aggression. Chiang Kai-shek (Jiang Jieshi, 1887–1975), the Nationalist leader, wanted to continue his anti-Communist campaign and to destroy that threat before dealing with the Japanese.

The Communist call for a united front appealed to many Chinese, including General Zhang Xueliang (1901?–2001) and his army, who longed to return to

their homes in Manchuria, now occupied by the Japanese. Chiang ordered Zhang and General Yang Hucheng and their armies to attack the Yenan redoubt of Mao Zedong (1893–1976), but neither the generals nor their troops showed much cooperation.

On 3 December 1936, Chiang flew to Zhang's and Yang's headquarters in Xi'an to put pressure on them to launch a military offensive. Nine days later, Zhang arrested Chiang and presented eight demands that centered on a united front against Japan and a halt to the anti-Communist campaign. The crisis worsened when Nationalist generals in Nanjing threatened to attack the two generals in Xi'an and then perhaps launch an all-out offensive against the Communists. It appeared to many that China might break down into chaos.

At this point, the Communist leader Zhou Enlai (1898–1976) offered to negotiate, for the Communists had decided that the threat of civil breakdown was worse than Chiang's continuing in power. Zhang agreed to restore Chiang to power, and Chiang nominally agreed to pursue a united front. Zhang then accompanied Chiang to Nanjing to explain the situation and perhaps to apologize for his actions, but Zhang was arrested, tried, and eventually sentenced to house arrest that lasted until 1962. Zhang later moved to the United States, where he died.

XIANG The term "Xiang" refers to the people and the local sublanguage used in Hunan, a province in southeast-central China; Xiang is derived from the older literary name of Hunan. It is estimated that more than 25 million Chinese (most of them living in Hunan Province) speak Xiang today. Several early leaders of the Chinese Communist Party came from Hunan, and the linguistic influence of people thinking in Xiang or in Xiang-accented Mandarin appears to have affected the forms selected to simplify the characters used in the Chinese language.

The Xiang are one of the three subgroups of Han Chinese (the other two are the Gan and the Wannan) who settled south of the Mandarin-speaking people in China but not on the coast. The sublanguage spoken

by the Xiang has not been considered as significant as the Mandarin forms spoken in the north, and the Xiang have not contributed in a major way to Chinese migration overseas. The Xiang, like the Gan and Wanan, have generally been considered to be Chinese who speak Mandarin, but pronounce it very badly.

Xiang is a complex language with numerous dialects. While it has similarities with Mandarin, it differs from other sublanguages of Han Chinese mainly because of the way the dialects and subdialects relate to each other. The dialects that have similarities with Mandarin are grouped together as the New Xiang or the Xinxianhua. Local histories suggest that the complexity of the Xiang sublanguage arose in part because most of the population now living in Hunan Province originated in other provinces. Migration has thus contributed greatly to the complex pattern of subgroups in Hunan Province.

Linguists find it easier to divide the sublanguage in terms of time into New Xiang and Old Xiang, rather than describing the geographical distribution of the various forms. Old Xiang, or Laoxianghua, has been described as a conservative form of the Xiang sublanguage and hence much closer to the Middle Chinese of the Tang dynasty (618–907) than is new Xiang. Some linguists have suggested that there are ties between Old Xiang and the Wu dialects of the region around Shanghai. It is not surprising that Old Xiang is spoken only in rural districts and some of the smaller cities of central Hunan Province. New Xiang, on the other hand, is spoken mainly in most of the larger cities and towns.

New Xiang

Linguists consider that New Xiang has evolved much further from the Middle Chinese norm than has Old Xiang. The development of New Xiang has generally paralleled that of southwestern Mandarin. Indeed, this form of Mandarin is supposed to have been the strongest influence on New Xiang, partly because southwestern Mandarin is spoken in Hubei Province, located directly to the north of Hunan Province. New Xiang is therefore phonetically much closer to Standard Mandarin than is Old Xiang. Yet both Old and New Xiang have been in use together and coexist in many towns. Complicating the geographical distribution of the speakers of Old and New Xiang are the divisions seen generationally: elderly speakers usually speak Old Xiang, and their younger family members speak New Xiang.

New Xiang that is spoken in Changsha, the capital of Hunan Province, has generally lost the voicing of the initials *b-*, *d-*, *dz-*, *dzb-*, and *gb-*, like the other sur-

TABLE 1

Corresponding Terms in English, Standard Chinese, and New Xiang (Changsha)

English	Standard Chinese	New Xiang (Changsha)
Tomorrow	<i>Mingtian</i>	<i>min-zi</i>
This year	<i>Jinnian</i>	<i>chin-nie</i>
We	<i>Women</i>	<i>ngo-men</i>
This	<i>Zhege</i>	<i>ko-ko</i>
What	<i>Shenme</i>	<i>mo-tsi</i>
Cold	<i>Leng</i>	<i>Len</i>
Person	<i>Ren</i>	<i>Zen</i>

SOURCE: Moser (1985)

rounding forms of Han Chinese. These initials have been retained in the Old Xiang spoken in the smaller city of Shuangfeng. Therefore, linguists consider Old Xiang an island of linguistic conservatism. New Xiang is expected to change Old Xiang in time, bringing it more into conformity with Standard Mandarin and Mandarin-like speech forms.

The nature of spoken New Xiang can be seen in the list of words used in the provincial capital of Changsha. In new Xiang subdialects, the personal pronouns used are similar to those used in Mandarin. Hence, him or he, *t'a*, is similarly pronounced in New Xiang and Mandarin. Similarly, you, *ni*, is pronounced in the same way in New Xiang and Mandarin. According to scholar Leo Moser, the Changsha vernacular as described in the *Hanyu Fangyan Cibui* has, compared with Standard Mandarin, first of all, no retroflex series of consonants. Second, there are no words ending in *-ng*, although some people in Changsha do use retroflex consonants as well as some syllables ending in *-ng*. Third, there are words beginning with *ng-* and *z-*. Fourth, there are six tones rather than four. Fifth, there are nasalized vowels and, sixth, there is a pattern of consonant liaison that may modify medial sounds in two-syllable phrases. Finally, there are different grammatical particles somewhat differently employed. Words in the Changsha subdialect can also start with an *b-* and an *f-*. These characteristics make the Changsha dialect different from most forms of Xiang. (See Table 1.)

In northern Hunan Province, the Yiyang subdialect is another form of New Xiang. It shares many characteristics with the Changsha subdialect but has five tones and words ending in *ng-*. The subdialect has also developed a pattern of inserting *l*-like sounds in many words.

Linguists have observed that the Xiang sublanguage differs from most other Sinitic sublanguages. Hunanese do not appear to take pride in their local dialect, since

TABLE 2

Corresponding Pronouns in English, Standard Chinese, Old and New Xiang		
English (and Standard Chinese)	Old Xiang (Shuangfeng)	New Xiang (Changsha)
I, me (<i>wo</i>)	<i>Ang</i>	<i>Ngo</i>
we, us (<i>wo-men</i>)	<i>ang-nga</i>	<i>ngo-men</i>
he, him (<i>ta</i>)	<i>To</i>	<i>Ta</i>

SOURCE: Moser (1985)

there does not seem to be uniform pronunciation of, say, Changsha, even within the city itself.

Old Xiang

Linguists consider Shuangfeng dialect a good example of Laoxianghua, or Old Xiang. The vernacular of Shuangfeng lacks the *f*- and the initial *j*-, although there are the initial consonants *n*-, *ng*-, and the voiced *b* or *gb*-. According to Wade-Giles Standard Chinese, the word "*liang*" ("two," or "a couple") is *niang* in Shuangfeng, while *jou* (meat) becomes *niu*. The tendency to conserve old forms with voiced consonants and other ancient language habits has led to the comparison of Old Xiang and the Wu dialects.

Pronouns in Shuangfeng differ widely from Standard Chinese in both sound and formation. Several pronouns do not share the pluralizing element, *men*, of Standard Chinese. (See Table 2.)

In the far south of Hunan Province, a zone of eleven counties, the Southern Xiang, or Xiangnan, dialect is spoken. Some have assumed that this dialect was influenced by Cantonese, the sublanguage spoken south of the border, but in fact the pronunciation shows a heavy influence of southwestern Mandarin.

XINJIANG (2002 pop. 19.0 million). Located in northwestern China, the Uighur Autonomous Region of Xinjiang is bordered by Mongolia to the northeast; the Chinese provinces of Qinghai and Gansu to the east; the Tibetan Autonomous Region to the south-east; India and Afghanistan to the south and south-west; Kazakstan, Kyrgyzstan, and Tajikistan to the west; and Russia to the north. Xinjiang is the largest political unit in the People's Republic of China, covering an area of 1.6 million square kilometers (617,800 square miles). Despite its size, it is one of the least populated regions of China: in 1997 it had a total registered population of only 17.18 million. Xinjiang's climate and geography help explain its low population density. Much of the southern half of the region is covered by the great Taklamakan Desert, while the center is dominated by the uninhabitable Tian Shan mountain range.

Xinjiang has long served as China's gateway to Central Asia. As far back as the Han (206 BCE–220 CE) and Tang (618–907) dynasties, the oasis towns that are scattered throughout this region formed the backbone of the great Silk Road, a highway over which merchants brought luxury goods from the Chinese empire to the kingdoms of Central Asia and the Arab empires of the Middle East. Despite its strategic location, Xinjiang retained a great deal of independence for much of its history. The region's current name, which in Chinese translates as "New Frontier," can be traced to the conquest of the area by the Manchu armies of the Qing dynasty in the mid-eighteenth century. But even after 250 years of Chinese control, Xinjiang retains a lot of its traditional culture. The largest ethnic group in the region continues to be the Muslim Uighurs, while several other minority nationalities, including Kazakhs, Uzbeks, and Tajiks are also present in sizable numbers. In 1997, the "minority" population of Xinjiang was recorded to be 10.58 million, or 61.6 percent of the region's total population. This figure is all the more remarkable because, since 1949 when the Chinese Communist Party arrived to take over the governing of Xinjiang, the central authorities have followed a policy of settling large numbers of Han (ethnic Chinese) in the territory in an effort to solidify their rule.

Since the mid-1980s, this official policy, combined with arrival of hundreds of thousands of Chinese economic migrants from the eastern provinces and the rise of Islamic fundamentalism in Central Asia, has resulted in the development of a separatist movement among Xinjiang's Muslim. During the 1990s movement extremists launched a terrorist campaign against the local authorities in the region's capital city of

Urumqi, and against symbols of the Chinese "occupation" throughout the territory. In an effort to prevent the separatists from obtaining external support, during the late 1990s the Chinese government negotiated a number of treaties and agreements with neighboring states to jointly develop the region's natural resources and to promote trade. The authorities in Beijing hoped to curtail support for the Uighur nationalists by promising economic prosperity to the Islamic nations of Central Asia. The region is to be a central element of China's "Developing the West" program announced by Premier Jiang Zemin in 2000.

XIQU Shamanic and court rituals, song and dance folk forms, and entertainments such as story-telling and the presentation of simple skits have existed in China for many centuries. Various aspects of each of these activities evolved over time into the classical theater forms known as *xiqu* (Chinese opera).

The folk culture of presenting song and dance, telling stories, and enacting skits began in unknown ages in China. Certainly shamanic exorcisms and spirit-courting dances were practiced in the Shang dynasty (1766–1045 BCE), if not earlier. Chinese ministries to oversee song and dance performances in the courts of the Eastern Zhou dynasty (770–221 BCE) rigidly enforced the development of presentational traditions according to philosophical beliefs that performances combining music, dance, props, and costumes had a powerful influence over human behavior.

The royal courts continued to sponsor entertainments and ritual performances during the Qin (221–206 BCE) and Han (206 BCE–220 CE) dynasties, set-

ting up a *yuefu* (performance bureau) to recruit and supervise musicians and dancers for state functions. During the following centuries, music, dance, and variety-show acts from throughout China and allied regions were documented and incorporated into courtly events.

By the Tang dynasty (618–907 CE), the Li Yuan (Pear Garden Academy) was established to train musicians and dancers, and *jiaofang* (instructional institutes) were organized at central and regional courts to supervise presentations of theatrical skits and other song-dance activities, as well as to stage shamanic exorcisms. By this time, many elements that would eventually combine to produce Chinese opera were evident in song-dance forms and in ever more complex theatrical sketches involving song and dance. Also, non-court performances flourished during this period. Early monks began to preach the Buddhist religion to musical accompaniment, and thereafter the genre evolved into a source of entertainment; variety acts were popular in the marketplace and also featured in the private banquets of the wealthy.

Growth of Traditional Forms

During the Song dynasty (960–1279), urban performances of theatrical entertainments, most featuring music and dance and presented on mat-covered stages, attracted crowds in the metropolitan communities surrounding the courts. *Zaju* (assorted drama), composed primarily of plays narrated through song and accompanied by dance, comic bits, acrobatics, and a musical finale, was popular in the Northern Song (960–1126) capital.

Zaju evolved further after the Jurchen Tartars usurped control in 1126; it flowered fully under the Mongol Yuan emperors (1279–1368), when it became the preferred entertainment of the court and a popular pastime of Han (that is, ethnic Chinese) literati, who wrote increasingly complex dramas. *Nanxi* (southern theater) emerged during the Southern Song dynasty (1127–1279) out of the folk songs and ballads of Zhejiang Province and declined during the Yuan dynasty. Soon after, another southern form, *chuanqi* (marvel tales), moved into the limelight. By the end of the Ming dynasty (1368–1644), a form called *kunqu* (Kun opera) was attaining prominence in the south. Although *zaju* continued to develop during the Ming dynasty, it was overshadowed by southern theater forms in the final century of this dynasty, subsequently dwindled, and finally disappeared around the start of the Qing dynasty (1644–1912). *Kunqu*, however, persisted and had a significant impact on subsequent theatrical development.

Chinese Opera (*Xiqu*)

Kunqu is one of the oldest extant styles of *xiqu*. Arising when *zaju* was melded with traditional songs and music of Jiangsu and Zhejiang provinces, it characteristically displayed elegant movement sequences; involved plots featuring poetic dialogue and lyrics; and had a marked vocal style. Considered an art form of the elite, *kunqu* continued to be recognized as China's most popular operatic genre until Beijing opera usurped its place in the late eighteenth century.

During the Ming and Qing eras, many forms of regional *xiqu* (modeled after the Kun opera since the sixteenth century) evolved to share Yuan and Ming plays and other classical novels as repertoire. Performance features common to *xiqu* include the dividing of actor technique into the four areas of song, speech, dance-acting, and stage combat. Although drawing generally on three important musical systems, the various ways of using these systems and combining them with local tune styles serve as the primary means of differentiating the many regional forms. Common to all is the bringing together of song, musical accompaniment, dance, acting, use of costumes and props, and storytelling. Another common feature is the conventionalized use of costuming, properties, scenic items, and performer movement to impart dramatic information to spectators.

The dramas and actor role-types are usually aesthetically classified as either *wen* (civil) or *wu* (military) genres. These two basic genres were initially used to distinguish dance performance style in the Zhou dynasty (1045–256 BCE), at first indicating the duality of ruling through diplomacy and martial means, but by the Yuan dynasty they were being used to identify both performing skills (*wen* actors specialize in song, speech, and dance-acting, whereas *wu* actors specialize in stage combat and to a lesser degree in speech and dance-acting) and dramatic style (*wen* plays are usually about romantic intrigues, whereas *wu* plays are usually about historic or legendary military heroes). Dramatic characters in *xiqu* are divided into role-types (called either *hangdang* or *jiaose*) and based on *wen* and *wu* classification; the four primary *hangdang* common to many *xiqu* forms are *sheng* (male), *dan* (woman), *jing* (warrior or deity), and *chou* (clown). Furthermore, *hangdang* are subdivided into multiple categories, each of which has even more precise requirements of performance skill; for example, the *dan* role-type, among its many subdivisions in any given regional form, might include the subcategories of *wudan* (a woman warrior specializing in combat skills) and *qingyi* (literally, "blue-green clothing," a virtuous young heroine who specializes in singing and dance-acting). The methodology of divid-

ing training and performance according to *hangdang* allows for the highly specialized display of song, speech, dance-acting, and acrobatics present in *xiqu*.

Today there are close to four hundred types of Chinese opera. After the establishment of the People's Republic of China in 1949, the government attempted to eradicate "feudal" aspects from *xiqu* dramas, resulting in the creation of newly arranged historical operas depicting the proletarian struggles. During the Cultural Revolution (1966–1976), historical dramas were banned in favor of a handful of operatic plays collectively known as *yangbanxi* (model-dramas), which blended modern dress and revolutionary content with classical song and movement techniques. However, *xiqu* was reinstated in the late 1970s, and recently many of the traditional dramas have been restored, with new plays even being created around ancient Chinese legends.

Contemporary Forms

As in neighboring Asian nations, *buaju* (spoken, realistic drama) was introduced in China during the early years of the twentieth century; in China, *buaju* arrived via Chinese scholars who brought the form from Japan. By the 1920s, realistic drama had established a stronghold in urban areas, and by the 1930s the works of modern Chinese dramatists such as Cao Yu and Lao She were being staged in front of audiences who also frequented foreign plays in translation.

New forms of dance also developed during the last half of the twentieth century. The most important indigenous form has been *wuju* (dance-drama), combining Chinese folk dance, Chinese opera dance-acting, and modern ballet in classical as well as modern revolutionary story lines. Western-style ballet companies have been established in the larger cities since the 1980s, and modern dance companies were organized in the 1990s.

XU BEIHONG (1895–1953), founding father of modern Chinese painting. Born in Yixing, Jiangsu Province, China, in 1895, Xu Beihong began drawing at an early age and by 1915 was discovered selling cheap fan paintings in Shanghai and sent by a sponsor to Japan to study art. From 1919 to 1927 Xu again studied abroad, this time in Paris and Berlin, immersing himself in European Classical and Renaissance art while disdaining the post-Impressionists. He would later argue against the influence of these art forms in China.

Xu himself excelled at figure drawing and painting, and he attempted with mixed results to meld Chinese and Western styles of art. In particular, Xu adopted the French academic mode to portray well-known Chinese historical scenes, such as in *Tian Heng and His 500 Retainers* (1928). His signature work, however, became realistic paintings of galloping horses done in Chinese brush and ink.

A lifelong educator, Xu acted as the director of the Central Art Academy in Beijing from 1946 until his death in 1953. The Xu Beihong Memorial Museum was established in Beijing in 1954 to house his extensive art collection, which his family donated to the state.

XU GUANGQI (1562–1633), Chinese official and scholar. Born in Shanghai, China, in 1562, Xu Guangqi was baptized by Jesuit missionary Matteo Ricci in 1603 and took the name Paul. He spent the next three years collaborating with Ricci in translating Western texts on mathematics, astronomy, and geography into Chinese. Their most famous translation was Euclid's *Elements*, which exerted a great influence on Chinese mathematics. Xu also wrote original works on trigonometry and agriculture, notably the *Book of Agriculture*, which advocated the adoption of Western agricultural practices, such as surveying, mapping, and irrigation. His interest in practical subjects marked a departure from the dominance of neo-Confucian thought. After he became a high official in the Ming court, Xu sponsored the Jesuit missionaries in China.

Xu believed that Western scholarship, particularly geometry, could complement Confucianism and replace Buddhism by undermining the tendency toward vague speculation. In 1629 Xu demonstrated the use of Western science for predicting solar eclipses and other astrological events. When the Manchus invaded China in 1630, he convinced the emperor to use Western armaments to defend the capital.

XU ZHIMO (1897–1931), modern Chinese poet. Born in Zhejiang Province, Xu Zhimo studied law at Beijing University in 1917 before attending Columbia University in the United States and then Cambridge University in England. During his stay in England, he began to write poems under the influence of English Romantic poetry. After he came back to China in 1922, he formed a cultural organization called the Crescent Society with writer and reformist Hu Shi, scholar Zhang Junmai, and others in 1923. Their society was the origin of the Crescent poetry school, which was one of the most important literary schools of China in the twentieth century.

Deeply influenced by English Romantic poetry, Xu developed his own unique writing style. His poems are bright, graceful, and full of musicality, reflecting his love of nature with great enthusiasm. As a Romantic poet, he pursued beauty and love and dreamed of a poetic life. Xu also made a great contribution to modern Chinese poetry by developing a new poetic form. During the early decades of the twentieth century, modern Chinese poets made a persistent effort to break away from the shackles of the traditional poetic mode. In their eagerness to experiment with new forms and to achieve free expression, the new poets often disregarded meaning and formal beauty. Xu Zhimo and his colleagues corrected this. He paid much attention to the arrangement of the lines and to meter and rhyme. He and other poets of the Crescent school pursued regularity of form and harmony of rhyme. And they found the importance of poetic meter in modern Chinese poetry. Because of their effort in developing new

forms of Chinese poetry, they had a wide influence in modern Chinese literature. Xu published three collections of poetry during his lifetime: *Zhimo's Poems*, *One Night in Florence*, and *The Fierce Tiger*. Many of his poems have become classics, such as "Farewell to Cambridge Again" and "Farewell to a Japanese Girl." In 1931, Xu died in an airplane crash when he was flying from Nanjing to Beijing.

XUNZI (c. 298–c. 230 BCE), Chinese philosopher. Although often overlooked by Western scholars, Xunzi (Hsun-tzu) was an important systematizer of pre-Qin (before 221 BCE) philosophy and considered to rank third after Confucius (Kong Qiu, 551–479 BCE) and Mencius (Mengzi, c. 371–c. 289 BCE). Commonly known as Minister Xun or Xun Qing, Xunzi was born in the state of Zhao. The traditional dates for his life may be incorrect, if evidence showing that he lived well into his nineties is accurate. He may have lived from 310 to 213 BCE.

Xunzi began his career at the Jixia academy in the state of Qi when he was fifteen years old. The syncretic approach employed at the academy left a lasting impression on him, as he mastered rhetoric, argumentation, and teachings of the various masters. In his early works, Xunzi critiqued the Jixia scholars and ideas associated with Zhuangzi, Huizi, Shen Dao, Shen Buhai, and others. After Qi was attacked in 284 BCE, Xunzi fled to Chu. There he came in contact with Mohist logic (developed by Mozi, 470?–391? BCE, who used rationalism to evaluate the truth) and sharpened his own skills.

His growing notoriety gained him invitations to other states. Xunzi was the teacher of Lisi (280?–208 BCE) and Han Feizi (d. 233 BCE). Lisi went to Qin in 247, and Han Feizi may have left Xunzi shortly thereafter. Han Feizi became the systematizer of Legalism (*fajia*), which emphasized the authority of rulers and

the state's power, while Lisi assisted the state of Qin in the unification of the empire, becoming a high minister and then chancellor under the first emperor.

Between 246 and 240 BCE, Xunzi was caught up in court intrigue and dismissed, then reappointed. When his sponsor was assassinated in 238 BCE, he was again dismissed. His disillusionment with the world is vividly expressed in his poetry. Although Xunzi continued to adhere to the Confucian approach, his later thought turned to the more practicable art of rulership, emphasizing methods and laws, fixed standards for punishments, and control of expenditures, ideas usually associated with Legalism. When Lisi came to power, he offered his aged teacher a minor post. In his wisdom, Xunzi foresaw coming disaster and refused.

Xunzi proposed that human nature is basically bad or socially deviant. Xunzi's position was a direct attack on the view of Mencius that people are basically good. Xunzi's overall position, however, may not be all that distant from Mencius's. Mencius claimed that human nature is basically good but that a "lost mind" leads people to do wrong. Xunzi, on the other hand, argued that people are basically bad but that a properly trained mind leads people to do good. Mencius emphasized the goodness of human nature, and Xunzi stressed the goodness of the human mind. Both Mencius and Xunzi emphasized the need for education and ritual action to develop moral goodness.

Xunzi is noted for his realistic, down-to-earth philosophy. He advocated naturalism and argued against supernaturalism, superstitions, and belief in spirits and demons. He used Mohist argumentative techniques to refute the Taoists and logicians of his day. His syncretic approach including Legalist ideas influenced Confucianism as it developed in the Han (206 BCE–220 CE) dynasty.

YAK Yak (female, *nik*; *bos grunniens*) is a species of bovid native to the high Tibetan Plateau. Though vanishing in the wild, where it usually does not descend below 4,300 meters, it is much domesticated and so is widely used as a beast of burden in Tibet, Nepal, Kashmir, Ladakh, and Sikkim, in the Himalayan Mountain area, normally between 4,270 and 6,100 meters. It also served as a pack, draft, and saddle animal.

The wild yak is very dark brown all over, with some white around the muzzle; but the domesticated variety is often piebald or dun-colored. The adult bull stands 170 centimeters high at the withers, and weighs up to 545 kilograms. Both sexes grow horns that sweep upwards to a length of 75 centimeters. Because of the cold plateau climate, the body is covered in very long, silky hair, which hangs down almost to the ground. Even the tails are hairy, and are used as fly-whisks in the lamaseries. The yak is also adapted to desert conditions, being able to survive on sparse grass and thorn bushes, and eating snow when there is no water. Wild yaks live in small herds, and are very shy. They rely for protection on a strongly developed sense of smell rather than on their eyesight. The rutting season is in late autumn, with calving in April after a nine-month gestation.

The animal was domesticated in prehistoric times and, aside from some color change, it is chiefly distinguishable from the wild variety by shorter horns. The *nik's* milk and butter are crucial in the Tibetan diet; domestic yaks are used for both milk and beef. The yak's hide is made into leather, and the dried dung of the yak is the only fuel on the high plateau.

There are also smaller domestic cattle called *zbo* or *zomo*, which are a hybrid between female yaks and

domestic cattle or zebu. Like the yak, these are generally used as pack animals and so are important economically; the male *zbo* is sterile.

YAKUSHIMA ISLAND (1994 est. pop. 14,000).

Yakushima Island is sixty kilometers south of Osumi Peninsula in Kagoshima Prefecture in southern Kyushu. The island is 500 square kilometers in size. Yakushima is characterized by a hot and humid climate and has the heaviest precipitation in Japan, with an annual rainfall of 400 centimeters in the coastal regions and 1,000 centimeters in the mountains. This rainfall has promoted the use of waterpower to produce electricity.

Yakushima Island is a mountainous island. Miyounouradake (1,935 meters) in the central part is the highest peak in Kyushu. Forestry makes up a major portion of the economy. However, 80 percent of the forests became assets of the Japanese national government at the beginning of the Meiji period (1868–1912). The Japanese cedar (*Yakusugi*) tree grows here and many of them are over one thousand years old. The variety of plants growing in any given locale on the island changes with the altitude and ranges from species indigenous to subtropical zones to those of cold temperature zones. Agricultural products are sugarcane, sweet potatoes, and Ponkan oranges (*Citrus reticulata*). One-third of the

YAKUSHIMA ISLAND— WORLD HERITAGE SITE

A UNESCO World Heritage Site since 1993, Yakushima counts exceedingly rare lichens, ancient Japanese cedar trees, and the last Japanese remnant of warm-temperate forest among its varied vegetation.

island forms the principal part of the Kirishima-Yaku National Park, which contains twenty-three volcanic peaks. In 1993 Yakushima became the first place in Japan to be designated as a World Heritage Site, and 196,500 tourists visit annually.

YAMAGATA (2002 est. pop. 1.2 million). Yamagata Prefecture is situated in the northeast of Japan's island of Honshu. Covering 9,326 square kilometers, its primary geographical features are the Ou, Dewa, and Asahi mountain ranges, with level areas located along the Mogami River (Mogamigawa). Yamagata is bordered by the Sea of Japan and by Akita, Miyagi, Fukushima, and Niigata prefectures. Once part of Dewa Province, it assumed its present name and borders in 1876.

The prefecture's capital is Yamagata city, which flourished during the Edo period (1600/1603–1868) as a castle town and post station known for producing *beni*, a precious crimson safflower dye used to color handspun silk fabric. Today the city is home to Yamagata University. The prefecture's other important cities are Yonezawa, Tsuruoka, Sakata, and Tendo.

Once the land of the aboriginal Ezo people, the region was ruled by the northern Fujiwara family beginning in the Heian period (794–1185) and then by a series of warlords who controlled smaller domains. Still comparatively rural, Yamagata is one of Japan's greatest rice producers and its many orchards grow cherries and other fruit. The main industries include sake brewing, food processing, textiles, woodworking, cast-iron goods, small machines, and chemicals. Visi-

tors are drawn to the prefecture's Zaozan skiing area, scenic mountain parks, and many hot spring resorts.

YAMAGATA ARITOMO (1838–1922), Japanese soldier and politician. Yamagata Aritomo was a military man and politician from the feudal domain of Choshu (modern Yamaguchi Prefecture). He is not only considered the principal architect of Japan's modern military, but was also one of the most influential figures in Japanese politics during the Meiji (1868–1912) and Taisho (1912–1926) eras.

Yamagata was born on 14 June 1838 into a low-ranking samurai family in Hagi, the castle town of Choshu. He became one of the leaders of the radical loyalist movement to overthrow the Tokugawa shogunate and commanded the Kiheitai, a semimodern mili-

General Yamagata c. 1905. (HULTON-DEUTSCH COLLECTION/CORBIS)

tia unit, in the civil wars of 1867–1868. After the Meiji Restoration of 1868 he went abroad to study European military systems. Upon his return in 1873, he assumed leadership of the Army Ministry. He became the driving force behind the introduction of conscription and the reorganization of the army along Prussian-German lines.

In the 1880s, Yamagata started an astonishing political career. He served as home minister from 1883 to 1889, during which time he reorganized the ministry, the police, and local government systems. He also served as prime minister from 1889 to 1890 and again from 1898 to 1900.

In his later years, Yamagata retired from active politics but remained a major force behind the scene as the most influential "elder statesman" (*genro*), the nominal president of the influential Privy Council, and head of a strong political faction including Katsura Taro (1848–1913), Terauchi Masatake (1852–1919), Tanaka Giichi (1863–1929), and others. Yamagata died on 1 February 1922.

YAMAGUCHI (2002 est. pop. 1.5 million). Yamaguchi Prefecture is situated in the west of the Japanese island of Honshu. Occupying an area of 6,108 square kilometers, Yamaguchi is bordered by the Sea of Japan, the Inland Sea, and the Hibiki Sea and by Shimane and Hiroshima prefectures. The terrain is low but mountainous and is intersected by plateaus and by Japan's largest limestone tableland, Akiyoshidai, the site of one of the world's vastest limestone caverns. Yamaguchi's rugged coastline is frequently swept by typhoons. Once divided into Suo and Nagato provinces, then combined into the domain of Choshu, the prefecture assumed its present name and borders in 1871.

The prefecture's capital is Yamaguchi city, which was founded in the fourteenth century as a castle town by the territorial warlord Ouichi Hiroyo (d. 1380),

who was awarded lands in western Honshu as payment for service to the Ashikaga shogunate (military government of Japan from 1333 to 1573). It developed into a splendid provincial capital made wealthy by trade with China. During the Onin War (1467–1477), many Kyoto imperial court aristocrats took refuge there. In 1550, the Jesuit missionary Francis Xavier preached Christian doctrine in the streets of Yamaguchi. Soon after, the Ouchi overlords were overthrown, and the capital was moved to Hagi, but in 1863, Yamaguchi again became the capital. The prefecture's other important cities are Shimonoseki, Ube, Tokuyama, Iwakuni, and Hofu.

The prefecture is the site of numerous Yayoi-period (300 BCE–300 CE) burials and artifacts. In ancient times, it was among the first regions to develop, influenced by close trade ties to the Korean peninsula. The powerful Mori warrior clan ruled Choshu throughout the Edo period (1600/1603–1868). Rebellious against the Tokugawa shogunate, Choshu samurai led the movement to return power to the emperor in the Meiji Restoration (1868).

Economically, Yamaguchi relies on rice and fruit production and on heavy and chemical industries in the southern industrial zone. Visitors are drawn to the area's coastal scenery and to its hot spring resorts.

YAMAMOTO ISOROKU (1884–1943), Japan's foremost World War II naval officer. Born in Niigata Prefecture, Yamamoto Isoroku graduated from the Japanese Naval Academy in time to see service in the Russo-Japanese War and was severely wounded at the Battle of Tsushima in 1905. In 1919 Yamamoto was sent to the United States for graduate study, which was followed by a year of service at the Japanese embassy in Washington, D.C. He returned to the United States in 1926 for a two-year tour of duty as naval attaché in Washington.

As international tensions mounted in the 1930s, Yamamoto criticized Japan's alliance with Nazi Germany, fearing that it would lead to hostilities with the United States. Nevertheless, he was appointed commander in chief of the Combined Fleet in 1939, and in that capacity he oversaw preparations for war. With a keen appreciation of American industrial might, Yamamoto

proposed launching a surprise attack on the U.S. Pacific Fleet based at Pearl Harbor in an effort to avoid a protracted war. Although the attack in December of 1941 was successful, Yamamoto's hope for a quick peace settlement was in vain, and his bid for a decisive victory at Midway failed disastrously in June 1942. Yamamoto was killed in the Solomon Islands on 18 April 1943 when American fighter pilots shot down his plane.

YAMANASHI (2002 est. pop. 898,000). Yamanashi Prefecture is situated in the central region of Japan's island of Honshu. Occupying an area of 4463 square kilometers, the prefecture has several mountain ranges, including Kanto, Misaka, and Akaishi, with Mount Fuji, the nation's highest peak, bordering Shizuoka Prefecture on the southeast. On Fuji's northern slopes are the Fuji Five Lakes: Yamanakako, Kawaguchiko, Saiko, Shojiko, and Motosuko, all created by lava flows. The rivers Fuefukigawa and Kamanashigawa form the central Kofu Basin. Yamanashi is surrounded by Tokyo, Kanagawa, Shizuoka, Nagano, and Saitama prefectures. Once known as Kai Province, it assumed its present name and borders in 1871.

The prefecture's capital city is Kofu, which grew as the castle town of the ruling Takeda family in the sixteenth century and flourished in the Edo period (1600/1603–1868). The prefecture's other important cities are Otsuki, Tsuru, and Fuji Yoshida; a smaller city named Yamanashi lies in the central area.

During feudal times, the province was ruled by a series of military families, including the Kai Minamoto, Takeda, and Asano. In the Edo period, the Tokugawa shogunate (military government) took over its administration.

Today the nation's premier grape-growing and wine-producing prefecture, Yamanashi also raises large crops of rice, vegetables, and other fruit, including peaches. Long the fabricator of crystal ware and textiles, it now also produces precision instruments, electrical goods, and machinery. Many visitors are drawn from nearby Tokyo, especially to Mount Fuji and the Five Lakes. Other attractions are the prefec-

ture's three national parks, its various hot spring resorts, and the Minobusan Buddhist temple, headquarters to the Buddhist Nichiren sect.

YAMATO DAMASHII *Yamato damashii* refers to the essential and inexplicable nature of being Japanese that is at the core of beliefs in Japan's uniqueness. The term appears in several contexts, most of them of nationalistic origin, and had its greatest impact during the years of Japanese imperialism, especially in the decades leading up to and during World War II.

In premodern Japan, *wakon* (Japanese native spiritual essence) was ideally complemented by *kansai* (Chinese learning). This evolved, during the period of Japanese nationalism starting in the late eighteenth century, into an idealization of the "Japanese spirit." Japanese intellectuals have historically extolled the special nature and characteristics of Japan's inner spirit. While rarely clearly defined, the idea is prevalent in the theories of premodern intellectuals (for example, Kitabatake Chikafusa and Motoori Norinaga), as well as in the writings of twentieth-century scholars such as Suzuki Daisetz and Umesao Tadao.

Since World War II, *Yamato damashii* has often been viewed as related to the principle of *seishin* (self-cultivation), implying that it is a spiritual, internal, and subjective experience. Before and during the war, it was more closely associated with *bushido* (way of the warrior), a martial philosophy first formally expressed in the Edo period (1600/1603–1868), but elaborated upon and publicized outside Japan by Meiji-period (1868–1912) writers and ideologists. During World War II, Japanese ideologists emphasized that, notwithstanding Japan's material inferiority to the West, and particularly the United States, it could triumph by virtue of its superior *Yamato damashii*.

The nature of *Yamato damashii* is difficult to define precisely, since its expression is nonverbal and opaque to non-Japanese people, and the characterizations vary from writer to writer. The key to understanding *Yamato damashii* lies in the linguistic understanding of *Yamato kotoba*, that is, Japanese words as distinct from *gairaigo* (loanwords from Chinese and other languages) that have become part of spoken and written Japanese language. Most Japanese exponents of *Yam-*

ato damashii believe that this key is inherently inaccessible to people who are not Japanese.

YANGBAN *Yangban* were the elite of Choson Korea (1392–1910), with characteristics of a hereditary aristocracy. The term originated in the Koryo dynasty (918–1392) and indicated the two ranks of officials, civil (*tongban*) and military (*soban*). Later it came to denote officeholders and their families and, thus, to indicate social status.

Only about 10 percent of the population, *yangban* monopolized the political process, economic wealth, and Confucian learning. This learning played a central part in *yangban* culture, as did government position, but since *yangban* status was not legally defined, a clear delineation is difficult. However, basic criteria were: a clear line of descent documented through a genealogy (*chokpo*), a distinguished ancestor, a clear geographic area within which such a status was recognized, close marriage ties with other persons of reputable lineage, and a special way of life.

As *yangban* were exempted from corvée labor and military service, the late Choson period, especially the nineteenth century, saw an increase in people claiming *yangban* status. This period also saw an erosion of local *yangban* authority and a clear distinction between nationally powerful lineages (*polyol*), local lineages without government positions (*hyangban*), and ruined *yangban* (*chanban*).

Even though *yangban* today have lost their political and economic monopoly through educational and land reforms, modernization, and urbanization, in South Korea there is still a strong awareness of *yangban* ancestry, and descendants of respected families exert a strong influence, especially locally.

YANGGANG PROVINCE (2002 est. pop. 805,000). Yanggang (also Ryanggang) Province (Yanggangdo or Ryanggangdo), with an area of 13,888 square kilometers, is located inland along the Yalu (Amnok) and Tumen (Tuman) Rivers in North Korea (Democratic People's Republic of Korea). The province takes its name ("both rivers") from the two rivers that form the border between North Korea and China (People's Republic of China). The province was established in October 1954 with the division of Hamgyong Province into Yanggang and North and South Hamyong Provinces. In addition to Hyesan, the province's capital and only city, there are eleven counties (*kun*).

Yanggang has been called Korea's "rooftop" because of its high mountains, ranges, and plateaus. The highest peak is Mount Paektu (2,750 meters), straddling both Yanggang province and China. Kaema Plateau, with an average elevation of 1,339 meters, is located in central and western Yanggang, northwestern South Hamgyong, and eastern Chagang provinces. Measuring 14,300 square kilometers, it is the largest plateau on the Korean peninsula. There are also numerous other rivers and tributaries.

The region has much indigenous vegetation, such as conifers and grasses, and is also amenable to agriculture, particularly potatoes, cabbage, radishes, apricots, and ginseng. The province is also abundant in minerals such as iron, copper, tungsten, and gold.

YANGON (2002 est. pop. 4 million). Yangon is the capital of the Union of Myanmar (Burma) and of Yangon Division (2002 est. pop. 5.7 million). Located on the Yangon River, some 30 kilometers (21 miles) from its mouth on the Gulf of Martaban, Yangon is Myanmar's largest city and principal seaport, with Mingaladon airport its main international entry point.

Yangon was originally an ancient Mon settlement known latterly as Dagon (derived from an ancient Pali

term meaning "three pots"), a name commemorated in that of Burma's famed Buddhist temple, the Shwedagon, which has stood for centuries on Singutara Hill. Dagon was renamed Yangon (meaning "end of strife") by King Alaungpaya (reigned 1752–1760), who conquered Lower Burma in 1755. Under British colonial rule, Yangon—its name anglicized to Rangoon—developed rapidly as a major seaport and cosmopolitan commercial center. In the 1850s the British constructed a new city on a grid plan on delta land, bounded to the east by the Pazundaung Creek and to the south and west by the Yangon River. By the 1890s Yangon's increasing population and commerce necessitated land reclamation work at its riverine boundaries, while prosperous residential suburbs developed to the north of the royal lakes (Kan-daw-gyi) and the Shwedagon. Colonial Yangon, with its spacious parks and lakes and mix of modern buildings and traditional wooden architecture, was known as "the garden city of the East." Before World War II, almost half of Yangon's population was Indian.

Yangon suffered heavy damage in World War II and, in the decades since Burma regained independence (1948), the city has expanded and changed in character. Satellite towns were built to create a Maha Yangon (Greater Yangon) and names of streets and parks were changed from old colonial appellations to more patriotic nationalist names. The greatest transformation occurred in the 1990s, following both the military government's adoption of an open-door market economy under strong state control and an influx of investment. Many colonial-period buildings were demolished to make way for multistory hotels, office buildings, and shopping developments, and some inner-city inhabitants relocated to new satellite towns. Major road- and bridge-building programs were undertaken, including construction of a bridge across the river to Syriam (Thanlyin) and its industrial hinterland.

The 99.4-meter-high (326-foot-high) golden Shwedagon is the city's major landmark, and the country's largest and most revered Buddhist shrine. Legend links its foundation to the time of the Buddha, and for centuries it has been the focus of state as well as private patronage and devotion. Other temples are the waterfront Botataung (destroyed in 1943, but rebuilt as an exact replica) and the octagonal Sule in the heart of Yangon. Notable twentieth-century temples include the Kaba Aye (World Peace), completed under U Nu's government in 1952; the six-story Kyauk-htat-gyi, containing a huge reclining Buddha; the Melamu; and the Maha Wizaya (Great Victory), completed in 1986. The Azani Beikman (Martyrs' Mausoleum), containing the tombs of Burma's independence hero Aung

San and six cabinet colleagues (assassinated 19 July 1947), is an important national monument.

YANGON DIVISION (2002 est. pop. 5.7 million). The Yangon Division (formerly Rangoon Division) is dominated by the national capital of Myanmar (Burma), Yangon, which is located at its center. The division measures 10,171 square kilometers in area. The Irrawaddy (Ayeyarwady) Division lies to the west, the Gulf of Martaban to the south, and the Pegu (Bago) Division to the east and north. The Pegu Yoma range slightly protrudes into the north of the Yangon Division, but most of the territory is lowland plain, watered by a number of rivers and tributaries.

The majority of the population are Burmans, but there are also more than 230,000 Karens, 50,000 Rakhines, and 500,000 inhabitants of other nationalities, including Chinese and Indians. More than half the inhabitants live in Yangon, Insein, Syriam (Thanlyin), and surrounding urban areas. Other towns include Hlegu and Twante as well as the satellite new towns of Hlaingthayar and Dagon, which the State Law and Order Restoration Council attempted to develop during the 1990s.

Reflecting its strategic position, the Yangon Division is the most developed region of Myanmar. It is Myanmar's main communications center as well as international gateway for air and sea traffic. Numerous light industries are located around the Yangon city area, which was targeted for major economic expansion in the twenty-first century. The division is also important for agriculture. Consisting of 39 townships and 1,444 wards or village tracts, it remains one of the major paddy-producing areas in Myanmar. Other important crops include jute, pulses, rubber, sugarcane, and groundnut.

YANGTZE RIVER. See **Chang River**.

YAO The Yao are a minority people living in southern and southwestern China, mostly in the mountainous regions of Guangxi, Hunan, Yunnan, Guangdong, Guizhou, and Jiangxi Provinces. The Yao total 2.1 million people (1990 census) and rank as the thirteenth most populous of China's fifty-five minority nationalities. The majority of the Yao, more than 1.2 million, live in Guangxi; fewer than 1,000 live in Jiangxi. The Yao groups are scattered in many areas; their communities, usually small in size, consist exclusively of Yao. Before the founding of the People's Republic of China in 1949, the Yao groups identified themselves by over thirty names. But in the 1950s, the central government redefined all Yao groups and named them all "Yao."

History

The origin of the Yao is debated. Most Western, Chinese, and Yao scholars believe that the Yao became an ethnic group during the Tang dynasty (618–907 CE) when the term *mo yao* (not subject to corvée) was first used to refer to the upland people living in the mountains of Hunan and northern Guangdong and Guangxi. The central government allowed these people to search for arable land free from obligations—taxes and in particular corvée—to the imperial regime. After the identifier *mo* ("not") was dropped in later dynasties, the term *yao* gradually became associated more with the groups of upland people who traced their origins to an ancestral king, Pan Hu, than with a political category defining the people who were not subject to corvée.

It is conceivable that the Yao people did not become a distinct ethnic group until the Song dynasty (960–1279). During the Song and after, the central government ruled the Yao areas by *jimi* ("loose reins") policy and the *tusi* ("local chiefs") system, allowing the Yao chiefs to have autonomous power to govern their realms but requiring them to pledge loyalty to the imperial regime. By the early Ming dynasty (1368–1644), the central government replaced *jimi* and *tusi* with the policy of *gaitu guiliu* ("replacing locals with officials"), sending Han Chinese (the Chinese majority ethnicity) officials to rule the Yao areas; the Qing dynasty

(1644–1912) continued the policy. The process of replacing locals, along with policies of ethnic discrimination during the Ming and Qing dynasties (for example, prohibiting the Yao from engaging in the salt trade) inspired tenacious resistance among the Yao.

During the Song dynasty and earlier, the Yao lived mainly in communes, in which families worked together and shared equally. Apart from a small portion who moved to valleys and plains and engaged in agriculture, most of the Yao lived in the mountains, basing their life on hunting, fishing, and slash-and-burn cultivation on hillsides. To flee the Mongol invasion and encroaching Chinese immigration from the north, in the early years of the Yuan dynasty (1279–1368), the Yao began to migrate southward. By the early Ming dynasty, the majority of the Yao had settled in Guangxi, and smaller portions had settled in other provinces. The migration changed the geographic distribution of the Yao population, a distribution that remains today. The migration also changed the economic life of many Yao. A large portion of them adopted agricultural production, although those who remained in the deep mountains preserved their traditional way of life.

Modern Era

In modern times, the Yao maintained their tradition of resistance against the penetration of the Chinese central authority. Uprisings continued; many Yao people joined the Taiping Rebellion (1850–1864) that originated in Guangxi. The Nationalists (Guomindang) adopted a policy of assimilation, attempting to promote Yao economy and culture. However, the Yao resisted and the assimilation attempts failed.

During the first two years after the founding of the People's Republic of China (1949), the government defined the Yao as a discrete nationality. Beginning with the establishment of the Longsheng Yao Autonomous County in Guangxi in 1951, the government in the next two decades established twelve Yao autonomous counties and over two thousand Yao autonomous towns or administrative villages. Under a policy of equality for all nationalities, the government trained many Yao cadres and extended its political administration to the Yao areas through these cadres. The Yao people in the deep mountains also began to give up slash-and-burn cultivation. During the Cultural Revolution (1966–1976), the government's minority work was halted when some Yao youths organized the Red Guards organizations to rebel against local authorities, who consisted of both Han and Yao officials; religious rituals and traditional festivals were prohibited.

In 1979, the government reassured the Yao of their rights and privileges as a minority nationality and promoted their equality more in the light of economic development. Since then Yao communities have experienced progress in agriculture, education, and health care. Reservoirs and hydroelectric power plants have been built; indigo, anise, and spices have been planted and are now important economic products; and the Yao mountainous regions have been developed for the timber industry and tourism. With more autonomous power under the government's reform policy, the Yao have also revived their traditions. But despite these developments, Yao communities are still poor in economic terms and far behind those of the Han Chinese.

Culture

Half the Yao speak the Yao language, a branch of the Sino-Tibetan language, but their dialects vary so significantly that Yao from different areas can hardly communicate with each other. The rest speak mainly Miao and Dong languages—the Sino-Tibetan languages of two other minority nationalities. Because of their long tradition of migration and association with the Han and Zhuang people in history, many Yao can also speak Han and Zhuang languages. The Yao write using Chinese characters. Although they have a long history of living with other nationalities, the Yao people usually marry only other Yao.

The Yao have a long tradition of oral literature, mostly legendary stories about their ancestors. Most of the Yao practice Taoism and ancestor worship, and the Taoist rituals and ancestor worship ceremonies, except during the Cultural Revolution, have always been practiced with great respect. The Yao also have many festivals, of which the most famous is the King Pan Festival to remember Pan Hu, celebrated by all Yao communities. The Yao are known for their unique ways of dressing, in particularly their men's turbans and women's clothes, which are very colorful. In the past, many of the Yao subgroups were actually named after their turbans and dresses, such as the "white-trouser Yao," "flowery Yao," "flat-turban Yao," and "red-turban Yao."

For most of their history, Yao economic and social development has been uneven, determined by their locations. Although the government defines them as one minority nationality, establishing a cohesive ethnic identity is still difficult, given the people's wide dispersion, the barrier of dialects, and the uneven socioeconomic development of their communities.

YAP AH LOY (1837–1885), Chinese leader in Malaysia. Yap Ah Loy was born in Guangdong Province, China, on 14 March 1837, the son of a peasant. He arrived in Melaka, Malaysia, about 1854 and became Malaysia's most famous Kapitan Cina (a Malay word meaning "Chinese captain"). He also was head of the Hai San secret society in the state of Selangor and rose to fame by siding with Sultan Abdul Samad in the succession war in that state during the 1860s.

The title of Kapitan Cina acknowledged Yap Ah Loy and wealthy Chinese merchants like him as spokesmen or leaders of the Chinese immigrants then living in British Malaya. Through the appointment of the Kapitan Cina, the British recognized the separateness of the Chinese and their ability to govern themselves. In the first few decades of colonial rule, the British continued to rely on the Kapitan Cina–secret-society leadership system to administer revenue farms for opium, spirits, and gambling, develop the tin and plantation industries, and keep peace among the fractious Chinese dialect groups. Under Yap Ah Loy's stewardship, tin mining and other commercial activities in the Kuala Lumpur area developed rapidly. These activities transformed the previously backwater area into the nation's leading center of commerce and industry as well as the nation's capital city. He also contributed to the development of the city by supporting the building of schools, hospitals, churches, and facilities for the aged.

YASUKUNI SHRINE Yasukuni Shrine is a major Shinto shrine in Japan honoring the dead of the Imperial Japanese Army from the Sino-Japanese War (1899) to World War II. Established in 1869 in Kudanshita in Tokyo, the shrine encompasses gardens, a shrine, and a museum of the Imperial Army. It is marked by a giant torii (ceremonial gate), one of the largest in

Japan. The shrine's major festival, Mitama Matsuri, is celebrated around mid-July. The shrine was initially established to commemorate and venerate the dead of the Boshin Civil War, in which the new Imperial Army defeated rebellious feudal *han* (clans) during the Meiji Restoration (1868–1912). It is controversial largely because of its association with the militaristic period of the Japanese imperial past. The shrine is not supported by public funds because of constitutional prohibitions. Many conservative Japanese feel in consequence that their war dead are not properly honored. Moreover, the clause separating state from church in the constitution can be interpreted, and has been interpreted, to mean that national political figures, such as the prime minister, are forbidden from attending rituals at Yasukuni Shrine in their official capacity. As a result, ministers have attended Yasukuni memorial rituals only in their capacity as private citizens.

YASUKUNI SHRINE CONTROVERSY

The Yasukuni Shrine has been a source of antiwar sentiment in East Asia because of its association with the Shinto *bushido* warrior code. Yasukuni has been visited routinely by members of the royal family, but civil politicians have been criticized for visiting the shrine because the remains of Japanese soldiers convicted of war crimes are placed there. Controversy began in 1978 when the remains of General Tojo Hideki were brought to Yasukuni thirty years after he was executed. The placement of his remains there deified him. Prime Minister Fukuda Takeo was the first prime minister to visit Yasukuni since 1945. In 1985, Prime Minister Nakasone Yasuhiro made an official visit to the shrine.

Japan's Supreme Court ruled in 1997 that using public funds for ritual offerings violated the constitution. Nevertheless, annual visits by politicians on the anniversary of the end of the war (August 15) continue to be a point of contention with Japan's neighbors. In 1997, the Japanese prime minister chose not to attend Yasukuni prior to visiting China. Three years later, however, China cancelled a scheduled visit of Japan's Transportation Minister, who was to have presented his bid for Japanese construction of a high-speed rail line in China, two days after he had visited Yasukuni.

YAYOI PERIOD The Yayoi period (c. 300 BCE to 300 CE) saw the introduction of a full-scale agricultural economy into the islands of Japan. This economy was initially associated with immigration from the Korean Peninsula. Population growth among early Yayoi farmers then led to the rapid expansion of Yayoi culture as far as northern Honshu. By the end of the Yayoi period, chiefdom-type societies had developed in Japan, laying the foundation for Japan's first early states.

The Jomon period (c. 14,500 BCE–300 BCE) that preceded the Yayoi had seen some small-scale plant cultivation but such practices seem to have had little influence on the organization of Jomon society. In contrast, the full-scale farming of the Yayoi period marked a very different intensive and expansionary economic system. A variety of studies within biological anthropology have shown that the people of the Yayoi period were physically quite different from the Jomon peoples but very similar to the inhabitants of mainland Japan in historical times. Currently the most widely accepted interpretation of this evidence is that continental rice farmers spread to Japan from the Korean Peninsula at the beginning of the Yayoi period. It has been argued that the Japanese language also spread to the archipelago at this time.

As well as rice farming, a variety of other items and technologies were introduced from Korea in the Yayoi.

JAPAN HISTORICAL PERIODS

Jomon period (14,500–300 BCE)
 Yayoi period (300 BCE–300 CE)
 Yamato state (300–552 CE)
 Kofun period (300–710 CE)
 Nara period (710–794 CE)
 Heian period (794–1185)
 Kamakura period (Kamakura Shogunate)
 (1185–1333)
 Muromachi period (1333–1573)
 Momoyama period (1573–1600)
 Tokugawa or Edo period (Tokugawa Shogunate)
 (1600/1603–1868)
 Meiji period (1868–1912)
 Taisho period (1912–1926)
 Showa period (1926–1989)
 Allied Occupation (1945–1952)
 Heisei period (1989–present)

These include the use of bronze and iron, domesticated pigs, wooden and stone agricultural tools, megalithic burials, and certain types of pottery. The actual context of many of these finds, however, suggests close interaction between the native Jomon and immigrant Yayoi peoples, at least in the early stages of the Yayoi period.

Yayoi Cultural Expansion

During the Early Yayoi phase (c. 300–175 BCE), Yayoi culture spread rapidly through western Japan, with outlying sites in eastern Honshu as far north as Sunazawa in Aomori Prefecture. Some Yayoi pottery is known in Okinawa, but agriculture did not develop in the Ryukyu Islands until at least the eighth century CE. Hokkaido also lay outside the area of Yayoi culture, although the Epi-Jomon people of that island engaged in trade for iron and shell bracelets with their Yayoi neighbors.

The expansion of Yayoi culture is known from the excavation of over a hundred rice-paddy field sites dating to that period. Without doubt rice was an important crop during the Yayoi, but barley, millet, and other cultivated plants were also consumed in large quantities. Domesticated pigs and, more rarely, chickens are known from Yayoi contexts, but it is not clear how important these animals were as food sources. The hunting of deer and wild boar, practiced during the Jomon period, certainly continued through the Yayoi, as did river and marine fishing.

Bronze and iron appear to have been introduced simultaneously into Yayoi Japan. Iron was mainly used for agricultural and other tools, whereas ritual and ceremonial artifacts were mainly made of bronze. Some casting of bronze and iron began in Japan by about 100 BCE, but the raw materials for both metals were introduced from Korea and China. Han-dynasty (206 BCE–220 CE) bronze mirrors were the most important prestige items imported from China. Bronze mirrors were also cast in Japan, as were a variety of other ritual objects unknown on the continent. Bronze weapons and bells both evolved from practical tools to ornate, ceremonial artifacts. In northern Kyushu, bronze weapons are found as grave goods in elite burials at sites such as Yoshinogari, but elsewhere weapons and bells are usually discovered as isolated hoards buried away from settlements. At Kojindani in Shimane Prefecture, 6 bells, 16 spearheads and 358 swords were found on an isolated hillside. Such hoards are often interpreted as resulting from community-based agricultural rituals.

Although written records are unknown in Japan itself until the seventh century CE, Chinese dynastic histories make some mention of the Wa people, who are

thought to be the Yayoi Japanese. The Chinese *History of the Wei Dynasty* (*Wei shu* or *Wei zhi*) was compiled in 280 CE and contains a short description of the economy and society of the Wa people and of the diplomatic relations between the Wei dynasty and the Wa polity of Yamatai and its queen, Pimiko. This text has long been a subject of great controversy. The location of Yamatai is unclear from the text itself; northern Kyushu and the Kinai region have been suggested as the two main possible locations but the *Wei shu* suggests Yamatai controlled most of western Japan in the third century CE. The archaeological record does not support such a degree of political unification until the late Kofun period (c. 300–710 CE).

Yayoi Polities

Archaeologists have proposed the existence of several chiefdom-type polities in western Japan in the Yayoi period. These were regional polities based on a large, central settlement with populations of perhaps several thousand people. Such polities may correspond to the "countries" (Chinese *guo*) described in the *Wei shu* but their political control did not extend beyond their particular basin or river valley. The site of Yoshinogari in Saga Prefecture was probably the center of one of these chiefdoms. Defensive ditches with watchtowers enclose an area of 25 hectares. The rulers of this settlement appear to have lived in a central residential precinct and to have been buried in a 40-by-26-meter burial mound.

Many of the Yayoi chiefdoms of western Japan were engaged in conflicts with neighboring groups to gain access to water and other resources and to extend their power. Such conflicts are mentioned in the *Wei shu* and are evidenced archaeologically by defended settlements, the widespread presence of weapons, and discoveries of human skeletons with war-related injuries. Over 150 Yayoi-period skeletons have been found with embedded arrowheads, cut marks, or decapitated skulls. Through warfare, trade, and alliance building, the chiefdoms of the Kinai region had considerably extended their power by the end of the Yayoi period. By the second half of the third century CE, the mound burials of the Yayoi period had developed into the huge, standardized, keyhole-shaped tombs of the Kofun period. Yoshiro Kondo has argued that the standardization of these tombs signifies not political unification but rather the creation of ties of fictitious kinship among powerful Yayoi chiefs. The Yayoi period is distinguished from the Kofun on the basis of these standardized tombs, but the underlying political processes straddle both periods.

YELLOW SEA The Yellow Sea (Huang Hai), the shallow gulf between China and Korea, is 870 kilometers long from the south to the north and 556 kilometers wide from the east to the west and covers an area of 378,600 square kilometers. The northern part comprises the inlet of Bohai Bay in the northwest, which is almost enclosed by the Liaodong Peninsula in the northeast, the Shandong Peninsula in the south, and the Korea Bay in the northeast. The southern part of the Yellow Sea borders on the Shandong Peninsula in the north and the Chinese mainland in the west and meets the East China Sea where the Chang (Yangtze) River flows into the sea. In the east, it borders on Korea and the Korea Strait. The Yellow Sea, which has received its name from the yellowish silt deposited mainly by the Huang (Yellow) River, has a warm temperate climate. With an average depth of about forty meters, it is one of China's best fishing grounds.

The entire Yellow Sea, and especially its coastal regions, is presently being overexploited by Chinese, Vietnamese, Korean, and Japanese fishing vessels, and the environmental problems are critical. Important ports and fishing bases on the Chinese coast are Qingdao and Yantai in Shandong Province and Dalian on the Liaodong Peninsula in Liaoning Province. Bohai Bay in the northwest has been the traditional location for salt-works. Large offshore petroleum deposits have been discovered there, and a number of oil refineries have been set up.

YEN, Y. C. JAMES (1890–1990) Chinese reformer. Born in the mountains of China's Sichuan Province in 1890, the young Y. C. James Yen (Yan Yangchu) was sent to mission schools, where he became, in his later words, not a "Christian" (implying membership in a foreign institution) but "a follower of Christ." After studying at Hong Kong University, Yen graduated in 1918 from Yale University and worked under the International Young Men's Christian Association (YMCA) with the Chinese Labor Corps in France. While there, he wrote a widely copied literacy primer that used one thousand basic Chinese characters.

Yen returned to China in 1921 to head a national mass literacy campaign under the Chinese National YMCA and to marry Alice Huie, an American-born Chinese with whom he had three sons and two daughters. He adapted the publicity and organization techniques of the YMCA's science education campaigns and combined them with the traditional village-school concepts of nonprofessionalized teachers, neighborhood classes, and flexible schedules to produce a campaign (*yundong*) model used in hundreds of localities that attracted more than five million students. In 1923, Yen and other leading intellectuals formed the National Association of Mass Education Movements (MEM).

Still, most illiterates lived in villages; nor was literacy their fundamental problem. In 1926, the MEM set up a village campaign in Ding Xian, a county some two hundred miles south of Beijing. Rejecting the radical approach, Yen saw "farmers," not "peasants," in need of education and support, not class war. In 1928, Yen received an honorary graduate degree from Yale, raised a substantial endowment in the United States, and then enlisted socially conscious specialists to develop a fourfold program in rural reconstruction. The Ting Hsien (Ding Xian) Experiment used people's schools to coordinate innovations ranging from hybrid pigs and economic cooperatives to village drama and village health workers. By 1931, these successes excited nationwide public and government interest. Yen joined Liang Shuming and other independent reformers to form a National Rural Reconstruction Movement comprising hundreds of organizations. The 1937 Japanese invasion drove MEM operations first to Hunan, then to Sichuan, but Yen spent much

of the war in Washington, D.C. After 1945, Yen found himself increasingly at odds with the Nationalist government's military preoccupation; in 1948 he persuaded the U.S. Congress to fund an independent Joint Commission on Rural Reconstruction, of which he became one of the commissioners. After 1949, Yen led the Philippines Rural Reconstruction Movement and founded the International Rural Reconstruction Movement, which he headed until his death in New York City in the fall of 1990.

YEREVAN (2002 pop. 1.3 million). Yerevan is the capital and the largest city of Armenia, as well as its largest cultural, scientific, and industrial center (producing electronics, chemicals, textiles, and food products). The site was fortified as early as the eighth century BCE, when a ruler of the ancient kingdom of Urartu (thirteenth–seventh centuries BCE) established a fortress there in 782 BCE. In the sixth century BCE, Yerevan was the capital of Armenia when the region was under Achaemenid Persian rule.

Because of its strategic location on the trade route through the Caucasus, Armenia was overrun through the centuries by various powers, including the Romans, Parthians, Arabs, and Mongols. Between 1513 and 1735, it was repeatedly devastated by Persian and Turkish forces. The Russians conquered Yerevan in 1827; under the Treaty of Turkmanchai (1828), the city, together with east Armenia, became part of the Russian empire.

After a short-lived period of independence between 1918 and 1920, Yerevan became the capital of the Armenian Socialist Soviet Republic within the Soviet Union. Since 1991, it has been the capital of the independent Republic of Armenia.

Architectural monuments include the Katoghike Church (thirteenth century), the Church of Zoravar (1691–1705), and a sixteenth-century Ottoman fortress. In the 1930s–1950s, the city was completely redesigned in accordance with plans developed by A. I. Tamanian. Yerevan boasts a state university founded in 1919, several other institutions of higher education,

research institutions, and the Academy of Sciences. Cultural institutions include the opera house, several theaters, museums such as the National Museum of Armenia, art galleries, and the Matenadaran, a library with a large collection of Armenian manuscripts.

Pavel Dolukhanov

YESILIRMAK RIVER The Yesilirmak (from Turkish *Yesil*—green; known in antiquity as the Iris), a river in Turkey, has a course of approximately 418 kilometers. The area of its basin is around 20,000 square kilometers. The river rises in the mountains of northeast Turkey, flows northwest through narrow fertile valleys, and ends in the Black Sea, near the city of Samsun. The river's highest flow is from March to July, as snow melts in the mountains of Turkey, and its lowest flow is in November and December.

The Yesilirmak River is an important source of drinking and irrigation water for northern Turkey, and since ancient times its cities flourished along its course. The area along the river basin is known for its historical treasures and numerous architectural monuments from pre-Hellenic, ancient Greek, and Roman eras, as well as from the early Ottoman empire. This region has been inhabited since prehistoric times by various civilizations, including the Hittites (second millennium BCE) and Phrygians (early first millennium BCE), and was once part of Pontus, a kingdom bordering the Black Sea, which flourished from the fourth century BCE until it became part of the Roman empire in 63 BCE.

Several ancient cities in Asia Minor lie on the Yesilirmak River, including Amasia, the capital of Pontus, and Samsun, ancient Amisus, at the mouth of the river. Amasia was the birthplace of Strabo (64 or 63 BCE–after 23 CE), a Greek geographer who traveled over the known world and described it in his *Geographical Sketches*. Samsun, located on the Silk Road, flourished as a commercial center in medieval times.

In the modern era, the area along the Yesilirmak River has become an important agricultural and tourist region of Turkey. In 1980 Turkey built the Hasan Ugurlu dam on the river, which at the height of 175 meters was then one of the world's highest dams. The dam holds an estimated 1 billion cubic meters of water. In the 1990s, the government of Turkey became concerned about pollution, due to the overapplication of fertilizers and pesticides and the disposal of animal manure and wastes along the river's basin.

YI The Yi people live in southwest China, in the mountainous regions of Yunnan, Sichuan, Guizhou, and Guangxi provinces. With 6.6 million people (1990 census), the Yi are the fourth largest minority nationality in China in terms of population. Yi groups in various areas described themselves with a variety of names until the 1950s, when the Chinese government redefined all Yi groups and named all of them Yi.

History

Scholars have different views about the origins of the Yi. Some believe that the Yi originated from the ancient nomadic Qiang peoples who had lived in northwestern China; others argue that the Yi people developed from the original inhabitants in Yunnan, as early as ten thousand years ago. In either case, scholars agree that starting from the early second millennium BCE, the people in central Yunnan, whether they were the original inhabitants or Qiang immigrants, migrated out of their homeland and mixed with the Han Chinese (the ethnic Chinese majority) and other minority groups. As a result, the Yi are a mixed group with diverse origins.

Their migration extended along the watersheds of the six rivers in the Sichuan-Yunnan region and the Yunnan-Guizhou plateau and divided the Yi into six branches. These six branches are the origins of the six branches of the modern Yi nationality: Southern Nisu Yi, Southeastern Sani Yi, Eastern Nasu Yi, Northern Nuosu Yi, Central Yi, and Western Yi. According to a Yi legend, the Yi people originated from an ancient ceremony of tribal division, the division of six ancestors (*liu zu*).

During the Han dynasty (206 BCE–220 CE), the ethnic minority peoples inhabiting the mountainous border region of Yunnan, Sichuan, and Guizhou were first referred to as *yi* (barbarians) in Chinese records; the Yi people were part of this group. The Han government established an administrative prefecture in the region and appointed a Yi chief to rule the region with the title King of Dian. During and after this time, large clans emerged in the Yi tribes; a caste system, which not only established various social statuses in the Yi communities but also defined a large number of common people as slaves, started to dominate the Yi societies.

From the Sui (581–618) to the Song dynasty (960–1279), the Yi people were generally referred to in the Chinese records as *wuman* (black barbarians) and *baiman* (white barbarians). While the former exclusively designated the Yi groups in central Yunnan, the latter referred to the minority groups inhabiting the border region of Yunnan, Sichuan, and Guizhou,

including some of the Yi tribes. During these centuries, two independent kingdoms, Nanzhao (739–902) and Dali (902–1253), ruled Yunnan, organized by the Yi and other minority peoples. Under the reign of these authorities, a distinct Yi culture, including music, dance, ancestral worship, and architectural, culinary, and sartorial practices, began to develop from Yi tribal traditions and from contact with the cultures of neighboring minority groups.

In 1253, the Mongols invaded southern China and destroyed the Dali kingdom. After conquering the region, the Mongol Yuan dynasty (1279–1368) extended its administration to the Yi areas through a system of *tusi* (local chiefs). By pledging loyalty to the central government, the Yi local chiefs gained autonomy to govern their realms. During the Mongol period, the Yi people were referred to as *luoluo* (barbarians). Malaria and other epidemic diseases spread to the Yi areas and led to a loss of population and a setback to Yi socioeconomic development.

To consolidate its political control of Yunnan, the Ming dynasty (1368–1644) in the late fifteenth century decided to substitute for the *tusi* system a new policy whereby locals were replaced by Han Chinese officials. The process of replacing locals was not completed until the 1730s during the reign of the emperor Yongzheng of the Qing dynasty (1644–1912), and in most areas the Yi chiefs were powerful enough to maintain their rule and defy the penetration of the Chinese central government at least until the end of Republican China (1927).

The Modern Era

During the early period of the People's Republic of China (1949–), the government made efforts to redefine Yi nationality. After bringing the six branches of the Yi peoples together, the government changed their name from the barbarian term *yi* to "Yi," a different Chinese word, with connotations of respect. Beginning with the founding of the Liangshan Yi Autonomous Prefecture in 1952, the government established a total of fifteen Yi autonomous prefectures and counties. Viewing the Yi as the only existing slave society in the world, the government conducted a democratic reform of the Yi areas between 1956 and 1958 and abolished slavery. Under the policy of the equality of all nationalities, the government trained many Yi cadres and extended its political administration into the Yi areas through these cadres. However, the Cultural Revolution (1966–1976) brought chaos to all the Yi communities; the traditional Yi customs and religion became the targets of political campaigns, and former local chiefs and priests were scorned or even prosecuted.

With the beginning of reform in 1979, the government reassured the Yi of their rights and privileges as a minority nationality and promoted their equality more in terms of economic development. Since then, the Yi communities have made progress in agricultural economy, education, and health care, and many of the Yi people have become modern workers employed in the tin and coal mines in Yunnan and Guizhou. Yi trade with the outside world has developed, and modern railroads, highways, and communications have been extended through the Yi areas. Despite these developments, the Yi societies, disadvantaged by their geographic locations in remote mountains, are still poor in economic terms and are far behind the Han Chinese areas.

Culture

The Yi have a long and rich cultural history. Much traditional literature is written in the distinctive script used for the Old Yi language. Folk tales, epics, and songs have also been passed down orally. Yi traditional medicine has a rich variety of resources; *baiyao*, a white medical powder with a special efficacy for treating hemorrhage, wounds, bruises, and the like, is widely used by all Chinese. Yi religion, based on ancestor worship and a belief in many gods, has been revived in recent years after its practices were prohibited in the 1960s and 1970s.

Yi people speak the Yi language, a linguistic branch of the Chinese-Tibetan language family, which has six sets of major dialects and many more local dialects which are not always mutually intelligible. One million members of the Yi nationality do not speak the Yi language at all. In 1975, the Chinese government attempted to formalize a unified Yi language by defining 819 standard Yi words, but the effort has not been as successful as hoped, as isolation and language barriers have prevented the Yi from establishing a commonly shared ethnic identity. The development of their autonomous power and the modernization of their economy and society have yet to occur.

YI HA-UNG (1821–1898), Korean statesman. Yi Ha-ung, also known as the Taewon'gun, served as the

de facto regent of the Yi (Choson) dynasty (1392–1910) from the time his twelve-year-old son, Kojong, assumed the throne in 1864 until 1873 when he relinquished power to his son. During his tenure as regent, the Taewon'gun set about restoring the power and prestige of the Yi dynasty by inaugurating far-reaching reforms. He appointed officials to the bureaucracy on the basis of merit, regardless of clan or regional affiliation. In order to restore the financial stability of the monarchy, he closed the large, tax-exempt Confucian academies known as *sowon* and imposed taxes on *Yangban* (hereditary aristocracy) and commoners alike. The Taewon'gun succeeded in restoring financial stability, even though he undertook the rebuilding of Kyongbok Palace, destroyed two centuries earlier in the Hideyoshi Invasion.

Diplomatically, the Taewon'gun pursued a policy of isolation with regard to Japan as well as the West. He modernized the army and upgraded defensive installations along the Korean coastline, thus repelling military incursions by the French, Russians, Americans, and Chinese. Domestically, the Taewon'gun suppressed Catholicism, which he perceived as a threat. Eventually, Yi was forced to relinquish power to his son by Confucian officials and the family of Queen Min.

YI I (1536–1584), Korean philosopher and statesman. Yi I, whose honorific is Yulgok, forms with Yi Hwang (1501–1570) the most famous pair in the intellectual history of the Choson dynasty (1392–1910). Yi I was educated in his youth by his mother, Shin Saimdang, who is as famous as her son in Korea and is regarded as the paragon of Korean motherhood. Yi became famous by placing first in the civil service examination nine times. After entering officialdom, he was engaged in a wide scope of activities, from historian to diplomat.

However, Yi is mainly remembered for his contributions to Neo-Confucian thought. He participated in what was known as "Four-Seven Debate," arguing for the position that *li* and *ki*, ("principle" and "material force"—a pair of key terms in Neo-Confucian

metaphysics) were ultimately inseparable. His position has often been interpreted as reflecting the practical character of his thinking, for Yi was also actively engaged in the effort to reform governmental institutions and strengthen the military system.

YI KYU-BO (1168–1241), Korean poet. Yi Kyu-bo, pen name Paegunkosa (White Cloud Hermit), lived during a very turbulent period of Korean history: Koryo was threatened to the north by barbarian tribes and from within by the struggle for power between the civil and the military factions in the bureaucracy. A child prodigy, Yi Kyu-bo had a penchant for wine, which accounts for his repeated failures in the civil service examination before finally passing in 1189. A chance meeting with General Choe Chung-hon, the most powerful figure in Koryo at the time, led to the recognition of his ability. Thereafter he had a long and distinguished public career, which culminated in his appointment as head of the Chancellery of State Affairs.

A Korean poet writing Chinese poetry attempts the equivalent of a Chinese poet writing classical Latin verse. Small wonder that many of the Korean *hanshi* poets (Korean poets writing in Chinese) did not meet a high standard; the wonder of Yi Kyu-bo is that he did. A prolific writer, he has more than two thousand poems to his credit, including the celebrated epic *The Lay of King Tongmyong*. His collected poems are in *Tongguk isangguk chonjip* (Collected works of Minister Yi of Korea). He was the greatest poet of the age and arguably the greatest poet in Korean history. His poems are vibrantly alive, rooted in the concerns of everyday life, redolent of the spirit of China's Tang (618–907 CE) and Song (960–1279) dynasties. They focus on an emotion, offering brief but brilliant illuminations of the heart. Yi Kyu-bo also left substantial prose writings.

YI MUN-YOL (b. 1948), Korean novelist. Since he made his debut in 1977 with a short story in a Daegu newspaper, Yi Mun-yol (Lee Mun-yol) has published prolifically, producing novels dealing with a wide range of subjects, from experience of military service to serious religious and philosophical questions to traditional Korean cultural heroes. In his novels—most particularly in his two masterpieces, *Yongung shidae* (1984, An Age of Heroes) and *Pyongyang* (1989, The Outskirts/Borderlands)—he reveals himself to be a sensitive witness to the twists and turns of modern Korean history. He has received numerous Korean literary prizes: his *Hwangje rul wihayo* (1985; trans. 1986, *Hail to the Emperor!*) was awarded the Republic of Korea Literary Prize, and *Saram ui adul* (1979, Son of Man) received the Today's Writer Prize.

Yi is one of the most controversial literary figures in the contemporary Korean cultural arena. His conservative stance on political and gender issues (the latter motivated by his reappraisal of traditional Confucian values) has been severely criticized by many left-leaning intellectuals and feminists. His conservative stance toward Korean politics has sometimes been interpreted as reflecting his plight as the son of a communist who defected to North Korea during the Korean War.

YI SONG-GYE (1335–1408), Koryo general; founder of Choson dynasty. A prominent general serving the Koryo kingdom (918–1392), Yi Song-gye (later King T'aejo) eventually founded the Choson dynasty (sometimes referred to as the Yi dynasty), which would rule Korea from 1392 to 1910. He rose to prominence as a general defending the later Koryo dynasty from increasingly potent attacks by Japanese marauders and China-based brigands.

In 1388, the king of Koryo opted to oppose Ming China's incursions in the north by launching a counterattack. Despite Yi Song-gye's strong opposition to

an anti-Ming policy, he joined in the military campaign, ostensibly as a deputy commander. Not long after setting out, however, Yi marched his army back toward the Koryo court and bloodlessly drove his rivals, including the Koryo king, from power. Yi and his supporters then set about an ambitious land reform program, and it soon became apparent that de facto power rested with Yi Song-gye rather than with the Koryo king. In 1392 he took the formal step of forcing the abdication of Koryo's last king, Kong'yang (1345–1394) and establishing himself as the first ruler of the Choson kingdom (whose name harkens back to an ancient kingdom of the peninsula), moving the capital from Kaesong to Seoul.

YI T'AE-YONG (1914–1998), Korean women's rights activist. Yi T'ae-yong (Tai-Young Lee) was born in North P'yongan Province in what is the present-day Democratic People's Republic of Korea (North Korea). Although her father died when she was only a year old, Yi grew up in a loving family with strong Christian values.

After graduating from Ewha Woman's College in 1936, Yi married Dr. Chong Il-hyong (Chyung Yil-Hyung), a Methodist pastor and Korean nationalist. After the end of World War II, Chong encouraged his wife to pursue her childhood dream of becoming a lawyer. At the age of thirty-two, she became the first female student at Seoul National University (SNU) College of Law. She graduated in 1949 and passed the National Judicial Examination in 1952.

In 1956 Yi founded the Women's Legal Counseling Center, which in 1966 became the Korea Legal Aid Center for Family Relations. Yi was also dean of Ewha's College of Law and Political Science from 1963 to 1971. While dean, she earned a doctorate in law from SNU in 1969.

Yi was a famous champion of women's legal rights in Korea. For her work, she earned the Ramon Mag-saysay Award for Community Leadership, as well as

numerous other international accolades. Lee and her legal aid centers in twenty-nine Korean and twelve U.S. cities assisted countless women. Her advocacy helped effect revisions of the Korean family law in the areas of divorce, custody, and inheritance.

YOGA *Yoga*, or Western-style painting, emerged in Japan in 1855 as a result of efforts by the Japanese government to establish a bureau (Bansho Shirabesho) for the study of Western documents. The Western paintings that formed one part of this bureau were studied not for their aesthetic value, but rather for the insights they might yield in understanding Western technology through the study of styles and materials.

Takahashi Yuichi (1828–1894) was a central figure at this time. He entered the Bansho Shirabesho and became the first artist to consider the Western concept of objective and subjective interpretations. He later studied Western painting techniques under Charles Wirgman, of the *Illustrated London News*, and was important in founding *Kokka*, Japan's first scholarly art journal, in 1889.

The establishment of the Technical Fine Arts School (Kobu Bijutsu Gakko) in 1877 enabled the Japanese to study under Italian artists. The school was interested in providing training in drafting and cartography; however, the Westerners who taught at Kobu Bijutsu Gakko had a strong impact on the development of *yoga*. One such painter was Antonio Fontanesi (1818–1881). A follower of the Barbizon school, for whom the dominant colors were browns and golds, Fontanesi was teacher to the artists Yamamoto Hosui (1850–1906) and Asai Chu (1856–1907).

The popularity of Western-style painting declined in the 1880s in favor of Japanese-style work. As a result, the Meiji Art Society was established in 1889 to promote Western-style art through its annual exhibitions, which led, in the 1890s, to a revival of popular interest in *yoga*. However, in the first half of the 1890s, a rivalry developed between the artists trained by masters of the Barbizon school and those who had been strongly influenced by the light colors of the French Impressionists. Kuroda Seiki (1866–1924), who spent ten years in France, influenced other Japanese artists

who painted in the Western style. By 1896 the strained relationship between the two approaches led Kuroda and others to separate from the Meiji Art Society and form the White Horse Society. It was through the exhibitions of these societies that Western-style painting was promoted, creating an appreciation and interest in *yoga* that would influence later generations of artists in Japan.

YOGYAKARTA (2002 est. pop. 418,000). The city of Yogyakarta (pronounced "Jogjakarta")—known as the Javanese cultural heartland—is located in the Yogyakarta Special Territory (2002 est. pop. 3 million), surrounded on three sides by the province of Central Java. The city lies 27 kilometers north of the Indian Ocean and the sacred beach of Parangtritis, and a similar distance south of the active volcano Mount Merapi (2,900 meters). It is near such important ancient religious sites as Borobudur (constructed by the Sailendra kingdom between 778 and 842 CE) and Prambanan (constructed by the Mataram kingdom c. 900 CE).

The current Hamengkubuwono sultanate of Yogyakarta is descended from the Mataram kingdom of the sixteenth century. In 1755 Yogyakarta was founded when Mataram was divided into two, a related sultanate being established in nearby Surakarta (or Solo). Yogyakarta was invaded briefly by British forces in 1812 and was the center of an anti-Dutch rebellion (1825–1830) led by Prince Diponegoro. In recognition of the city's, and the royal family's, role in the Indonesian struggle for independence, Yogyakarta and its territory were granted special status as a province to allow its sultan to occupy the position of governor, a position currently held by Sultan Hamengkubuwono X. The principality of Pakualaman (founded 1812) is also situated in the city. Yogyakarta is also home to one of Indonesia's premier tertiary educational institutions, Gadjah Mada University.

Anthony L Smith

YOSHIDA SHIGERU (1878–1967), prime minister of Japan. Yoshida Shigeru served as Japan's prime minister from May 1946 to May 1947, and again from October 1948 until December 1954. After that, he continued to exercise influence as an elder statesman through his many disciples, including prime ministers Ikeda Hayato and Sato Eisaku. As prime minister, Yoshida guided Japan through the turbulent early postwar years, sometimes working with—and sometimes against—Occupation authorities to preserve Japan's *amour-propre*. His biggest accomplishments were the peace settlement signed in San Francisco in September 1951, which restored Japan's sovereignty, and the U.S.-Japan security treaty, which formed the basis of Japan's postwar foreign policy. At the same time, Yoshida resisted strong calls by the United States to rearm, forming one of the three tenets of what has been called the "Yoshida Doctrine": focus on the economy, light rearmament, and alignment with the United States and the West.

Shigeru was born in Yokosuka near Tokyo and adopted by a wealthy friend of his father, taking the family name Yoshida. In 1906, at the age of thirty-four, he entered the Foreign Ministry, and in 1909, he married Yukiko, the daughter of a prominent diplomat, Makino Nobuaki, and granddaughter of the Meiji statesman Okubo Toshimichi. Yoshida served as ambassador to Italy and England in the 1930s and foreign minister in the Shidehara Kijuro cabinet (October 1945–May 1946) before becoming premier.

YOSHIDA SHOIN (1830–1859), Japanese nationalist. Yoshida Shoin was born Yoshida Norikaka in the castle town of Hagi in Choshu. He was adopted by his uncle. At the age of eighteen he began a series of long journeys for the purpose of learning about the country and studying coastal defenses, traveling as far as Kyushu, Edo, and Mito, often without the travel documents then required by the shogunal government. Through his travels and readings of *kokugaku* (national learning), he developed strongly

pro-emperor beliefs, as expressed by the slogan *sonno joi* ("revere the emperor; expel the barbarians").

Convinced that Japan's defenses needed to be strengthened immediately to protect it from incursions by the West, and believing that to accomplish this he had to see how such defenses were built in the West, he attempted to stow away on board the U.S.S. Powhatan, flagship of Commodore Matthew Perry, in 1854. Unsuccessful, he found himself in prison for a short time before his punishment was reduced to house detention in Choshu. He eventually received special permission to accept students at his private school, the Shoka Sonjuku, where his dedication and passion greatly influenced his students, among whom were some who would become cabinet ministers of the Meiji government.

Constantly inciting his students to take direct action, he himself became involved in a plot to assassinate a high shogunal official, Manabe Akikatsu. The plot was uncovered and Shoin was executed, but his ideals lived on in his students, who helped to bring about the Meiji Restoration in 1868.

YU KWAN SUN (1904–1920), Korean independence fighter. Born 29 March 1904 in Pyongch'on, a small farming village outside the city of Ch'onan, South Ch'ungch'ong Province, Yu was sent to study at Ewha Girls' School in Seoul at the age of twelve. At this time nationalist resentment against the Japanese occupation of Korea was rising, and in 1919 this would lead to widespread resistance. Yu took part in the most memorable uprising, the Samil-undong uprising, which occurred in Seoul on 1 March of that year.

With her school closed by the Japanese, Yu continued to rally Koreans in outlying areas to continue the resistance; because of her young age and fervor, she is called by many the Korean Joan of Arc. With fellow students, Yu organized a mass demonstration in her province for 1 April. The signal to begin the uprising was to be a bonfire lit on a mountain near Ch'onan. Yu lit the fire herself, but the subsequent demonstrations resulted in the death of her parents and her own imprisonment. She died in prison more than a year

later, on 12 October 1920. She is among the few women who were independence leaders in Korea.

YUAN DYNASTY The Yuan dynasty (1272–1368; as rulers of all China 1279–1368) marked the first instance in which Central Asian invaders succeeded in conquering all of China. Mongolian tribes, reorganized into military units by the famed conqueror Genghis Khan (whose name is more accurately transliterated from the Mongolian as Chinggis Khan, 1162–1227), descended upon China in repeated campaigns from the early years of the thirteenth century until the conquest process ended with the collapse of the Southern Song dynasty (1127–1279) under Genghis Khan's grandson, Khubilai Khan (1215–1294). North China had been ruled by other invaders from the north (first Kitans, then Jurchens) from 916 to 1234, but the Mongols were the first outsiders to conquer and reunify all of China.

After Genghis Khan's death, his heirs carved out separate imperial domains (khanates) that, while connected by trade and diplomacy, evolved into independent geopolitical units. In addition to the Yuan dynasty in China, these units consisted of the Il-Khan dynasty in Persia, the Golden Horde in Russia, and the Chagatai khanate in Central Asia. The Yuan dynasty in China was directly ruled by a branch of Genghis Khan's descendants who were based in the Yuan capital city of Daidu (modern Beijing). As such, the Yuan dynasty was an independent polity that was governed quite differently from the other Mongolian-ruled polities in Eurasia.

The Mongols as Rulers of China

Rulers of China after the fall of the Yuan dynasty castigated the Mongols for their inattention to the welfare of the people and for their abuses of privilege. The Mongols in fact did rule China in a manner different from that of previous dynasties. As a pastoral nomadic people, they relied on their traditional emphasis on military values and hereditary transmission of office. Yet, the Mongols also adapted many preexisting Chinese institutions to facilitate their rule. The structure of the Yuan civilian bureaucracy was very much in the traditional Chinese mold, but the fact that Mongols and Western and Central Asians (Turks, Uighurs, Persians, and others) held the higher-level

positions meant that many Chinese scholars, accustomed to government service as a mark of status, felt disenfranchised.

The Yuan rulers did not allow the traditional Chinese examination system, which had determined entry into the civilian bureaucracy in previous centuries, to function until 1315; even then it was a minor source of recruitment. The Mongolian emphasis on heredity and the primacy given to the military sphere over the civilian sphere made government service less accessible and even unpalatable for many Chinese.

Yet, the Chinese viewed the Yuan dynasty as a legitimate dynasty that had won the Mandate of Heaven and reunified the empire. Khubilai Khan was largely responsible for winning Chinese acceptance of Mongolian rule. In 1272, Khubilai gave the dynasty its Chinese name, Yuan, and employed several prominent Chinese scholars as advisers at his court in Daidu. It was Khubilai also who selected the site of modern-day Beijing in 1260 as the dynasty's capital, thereby moving the symbolic center of Mongolian rule from Mongolia into China proper.

Khubilai also employed Tibetan Buddhist monks and Central Asian Muslim financiers as his court advisers. A multiethnic, multilingual entourage gave the Yuan court a cosmopolitan aura. Yet, from the point of view of contemporary Chinese observers, the Tibetans at the Yuan court were seen as arrogantly interfering with the administration of justice and claiming privileged status for themselves; Muslim financial advisers were criticized for imposing too severe a tax burden on the Chinese people and were accused of usury and embezzlement. While such criticisms may have been exacerbated by the factions at the Yuan court, it is true that the Tibetans and Central Asians rarely displayed any philosophical interest in Confucianism and its values of frugality and loyal, selfless service to one's ruler. Tensions ran high among the different ethnic groups that served the Yuan court during Khubilai's reign and in later Yuan times.

Culture and Society in the Yuan

Blocked from government service and alienated from their Mongolian rulers, some Chinese literati turned to the arts as an outlet for their untapped energies and talents. Popular drama, a genre that had existed in China for at least two centuries prior to the Mongolian invasion, benefited from elite participation in the writing of new plays. At least 160 Yuan plays are extant. The Yuan era also produced many great Chinese painters, some of whom, like Zhao Mengfu (1254–1322), served the Yuan court in official capacities.

 Republican China (1912–1927)
 People's Republic of China (1949–present)
 Republic of China (1949–present)
 Cultural Revolution (1966–1976)

While Confucianism as a philosophy and as a way of life was never directly threatened with suppression by the Mongolian rulers of China, competing ways of thought were encouraged in the Yuan period. Uighurs reintroduced Islam, Tibetans promoted Buddhism, and Central Asian monks revived Nestorian Christianity. The Mongol rulers practiced religious toleration in China as elsewhere throughout Eurasia; they exempted the clergy of all religions from taxation and from military conscription. As long as clerics did not foment or support anti-Mongolian sentiments, their churches, temples, and mosques were left untouched. In spite of the coexistence of a variety of religions in China in the thirteenth and fourteenth centuries, however, the Chinese elite remained bonded to their own Confucian tradition. The Chinese lack of interest in foreign cultures was testimony to the strength of Confucianism.

Trade, Transport, and the Economy

The Mongols, like other pastoral nomadic peoples of Eurasia, saw trade with neighboring sedentary peoples as an acceptable method to obtain needed goods to supplement the products of their own economy.

MONEY OF THE YUAN DYNASTY

Marco Polo, the Venetian merchant who spent twenty years in China at the court of Khubilai Khan, described in great detail the manufacture and distribution of paper money, which in the thirteenth century was unknown in Europe.

It is in this city of Khan-balik [Daidu] that the Great Khan has his mint; and it is so organized that you might well say that he has mastered the art of alchemy. I will demonstrate this to you here and now. You must know that he has money made for him by the following process, out of the bark of trees—to be precise, from mulberry trees (the same whose leaves furnish food for silkworms). The fine bast between the bark and the wood of the tree is stripped off. Then it is crumbled and pounded and flattened out with the aid of glue into sheets like sheets of cotton paper, which are all black. When made, they are cut up into rectangles of various sizes, longer than they are broad. . . . And all these papers are sealed with the seal of the Great Khan. The procedure of issue is as formal and as authoritative as if they were made of pure gold or silver.

Source: Ronald Latham, trans. (1980) *The Travels of Marco Polo*. New York: Penguin, 147.

Trade and raids coexisted in the frontier history of China and Central Asia. Genghis Khan had employed Muslim merchants in long-distance trading ventures as early as 1218 in western Central Asia. By the generation of his grandson, Khubilai, the Yuan imperial family was experienced in world trade. Investing silver in Central Asian Muslim merchant companies that financed trade caravans to distant lands and loaned funds within China at usurious rates, Khubilai and his successors reaped enormous profits. Maritime trade also flourished in Yuan times, and the government treasury was enriched by trade taxes.

Within China itself, trade and communications were facilitated by the more than 1,400 government postal stations that allowed authorized officials and merchants to cover great distances in a short span of time with fresh mounts supplied at each station. With the use of some 3 million conscripted laborers and an enormous expenditure of government funds, Khubilai Khan extended the Grand Canal so that grain from the Chang (Yangtze) River region could be shipped north to the Yuan capital at Daidu. Both land and inland waterway transport routes were improved in Yuan times.

Paper currency had been in circulation to varying degrees in China before the Yuan dynasty, but during Khubilai Khan's reign it was used more widely than

ever before. Taxes were paid in paper money, and merchants saw the advantages of the new currency. The Yuan court, however, never completely resisted the temptation to print more money when revenue demands generated by military campaigns of expansion and by fiscal mismanagement arose. Inflation was ultimately one of the economic factors contributing to the collapse of the dynasty in 1368.

Decline of the Yuan

During Khubilai's reign, the Mongols continued their campaigns outward from China, successfully subjugating Korea. They met defeat, however, in their naval attacks upon Japan in 1274 and 1281. Mongolian military expeditions into Southeast Asia in the 1270s and 1280s also met stiff resistance. After Khubilai's reign, the Yuan rulers abandoned further expansionist campaigns. The dynasty fell into decline during the course of the thirteenth century, as the once powerful military could not suppress widespread popular revolts in the 1350s–1360s. The last decades of the Yuan dynasty were marred by major floods, droughts, and epidemics, creating a confluence of natural disasters that would have undermined any dynasty, whether of foreign or Chinese origins. The Mongols fled their capital city of Daidu and returned

to Mongolia in 1368, escaping before the arrival of the armies of Zhu Yuanzhang, a rebel leader who founded the Ming Dynasty (1368–1644).

YUAN SHIKAI (1859–1916), first president of the Chinese Republic. Yuan Shikai was born in Xi-angcheng, Henan Province, in 1859 and became an adopted son. In 1880 he joined the Qing army and was Chinese commissioner of commerce in Korea from 1885 to 1894. In 1899 he was appointed governor of Shandong Province, where he suppressed the rising tide of Boxers. He was made governor-general of Zhili Province and the high commissioner for the Northern Ocean (Beiyang Dachen) in 1901, in which position he was in charge of foreign and military affairs in North China. From 1901 to 1908 he directed various reform programs, including the establishment of a modern army, the creation of military schools, the organization of the police system, and the inauguration of modern industry.

With the outbreak of the revolution in 1911, Yuan was placed in charge of the imperial troops and negotiations with the revolutionaries. He used his immense military power to promote his own interests by clever manipulation of the negotiations. As a result, he was designated as the president of the first Chinese Republic by both the Qing court and the provisional government of the Chinese Republic in February 1912. He assumed the formal presidency in 1913, and in the next two years he outlawed the Nationalist Party, dissolved parliament, and assumed dictatorial control. Finally, in late 1915, he began preparations to assume the title of emperor. He announced that his imperial title, Hong Xian, would be used beginning 1 January 1916. Rebellion in the southern provinces against this monarchic scheme, however, forced him to revoke plans for his enthronement. He died on 6 June 1916.

YUE Speakers of Yue, or Cantonese, include Chinese speakers in Guangdong and Guangxi provinces and in many overseas Chinese communities. Cantonese is the most common form of the Chinese language or dialect heard in Chinatowns around the world. Hong Kong continued to use the dialect as a medium of instruction during British colonial rule. Yue is very different from Mandarin (*putonghua*; "standard" Chinese). Yuehua, or "Yue speech," is a more formal name given by linguists to the Cantonese language, particularly when they are referring to all of the many related subdialects and not just to the standard Cantonese that is centered on the cities of Guangzhou and Hong Kong. The speakers of Yuehua are among the most populous of Chinese people.

Guangdong and Guangxi are often referred to as the *liang guang*, or the "two Guangs"; as *liang yue*, the "two yue"; or as *Lingnan*, which means "south of the mountain range." Strictly speaking, the term Cantonese refers only to one subdialect of Yuehua, the vernacular spoken in the city of Guangzhou (Canton). The forms of Yuehua are actually diverse. Even in Guangzhou and the surrounding area, there are sharp subdialectal differences. Seven dialect areas have been identified in Guangdong, most of them in the Zhu (Pearl) River Delta and western Guangdong—Guangfu (the speech of Canton), Yongxun, Gaoyang, Siyi (four districts), Goulou, Wuhua, and Qinlan. These are spoken around specific geographical areas.

Origins of Yue

Sinitic people moved across the Nan Ling mountains, which run east to west, and into the Lingnan, or what subsequently became the provinces of Guangdong and Guangxi. A variety of indigenous people who were already living in the Lingnan were incorporated into new Sinicized cultural groups. The various Yue-speaking people originated in this way. The basic ideograph *yue* means "to exceed, go beyond." It has been extended to mean "frontier," or "beyond the borderland."

Being separated from the rest of China by the high Nan Ling range, the people in Guangdong and Guangxi have usually considered themselves different from other Sinitic peoples. The Yue speakers are more

likely to identify themselves as *Tong yen* (Yue) or *Tang ren* (Mandarin), that is, "Tang persons," rather than as *Han ren*, or "Han persons," which is how most Chinese identify themselves. This is mainly because it was during the Tang period (618–907 CE) that the homeland of the Yue people became part of the Chinese cultural realm. In addition, the Cantonese have traditionally spoken of classical written Chinese as *Tong man* or *Tang wen*, that is, the Tang language. Yue is closer to ancient Chinese than Mandarin is.

Characteristics of Yue

The standard Cantonese that is spoken in Guangzhou and Hong Kong demonstrates the phonetic features that set Yuehua apart from other Sinitic sublanguages. Among these phonetic features are the following: First, Yuehua retains the ancient final consonants that have been lost in the north. These include *-m*, *-p*, *-t* and *-k*. Second, the retroflex consonants that characterize Northern Mandarin are absent. Third, Yuehua has syllables that begin in *ng-*. Fourth, there are nine tones, five more than the four of standard Chinese. Fifth, Yuehua lacks any phonetic distinction between *s-* and *sh-*, *ts-* and *ch-*, and *ts'-* and *ch'-*. Finally, there is a separate series of long and short vowels.

Yue and Mandarin also differ in terms of written Chinese characters. This is in part because new characters have been added to stand for the words that are apparently exclusive to Yuehua. In some instances, characters that are no longer in use among Mandarin speakers have been used to transcribe words in Yue. This means that there can be written texts that are uniquely Cantonese, and that would be difficult for someone from northern China to read without special study of Cantonese.

Yue also differs from standard Chinese in grammar. One such difference is the ordering of the indirect and direct object in a sentence. In Mandarin the ordering is similar to that in English: the sentence "give me something" would have the same sequencing in both Mandarin and English. For standard Cantonese, the ordering is more like "give something me."

It is generally assumed that the region in which Yue is spoken has been heavily influenced by the phonetic principles of the Tai peoples who lived there before the coming of Sinitic peoples. This influence is apparent in Yue's word order and grammar. In Tai-related languages, as in Yue, the adjective follows the noun. In English and standard Chinese, by contrast, the adjective precedes the noun. This is why many two-character terms in Yuehua appear to readers of standard Chinese to have been put together in backward

sequence. The pattern is evident in subdialects of Yuehua, particularly in the southwest of Guangzhou.

Additional vowel sounds and the final consonants in standard Cantonese mean that Yuehua has practically twice the number of syllables that standard Chinese has. Because the language is so flexible, Yue has been able to absorb many foreign words, including English ones. Examples include "salad" (*sab-lud*), "bus" (*baa-see*), and "taxi" (*dik-see*).

The Yue sublanguage, unlike many of the other southern sublanguages, has little tone sandhi (modification due to context). It has none of the unaccented, toneless "neutral" syllables that form parts of compounds and other connected utterances in standard Mandarin. There is a pattern in Yue, however, in which a change in a word's tone can be used to modify it to mean a related term. One example is the word for tobacco, which is a tonal variant of the word for "smoke."

The number of tones in Yue varies from form to form. In Zhongshan County, which is located between Guangzhou and Sze-yap, there are only six tones, whereas in other counties, there are ten or even more tones. The Yue vernacular has also not borrowed as much from northern Chinese as, for instance, the Wu or Min dialects.

Yue Speakers

The best-known and most populous of the speakers of Yuehua are the Cantonese of Guangzhou and Hong Kong. The language form that these people speak is composed of many subdialects, known to linguists as the Yuehai dialect of Yuehua. The most influential subdialect is standard Cantonese. Linguistically, the Yuehai subregion is rather fragmented, but the core is the so-called Three Districts (Sam-yap in the vernacular). This would include the area around the city of Guangzhou. The districts are Namhoi, Punyu, and Shuntak.

Other well-known speakers of Yuehua are people of the Four Districts, or Sze-yap (Siyi in Mandarin). The Sze-yap dialect has many features that mark it from standard Cantonese so that speakers of the two would find it difficult to understand each other. Both the tonal pattern and vowels are different.

Guinan is the name usually given to the Yue subdialects of the interior of Guangxi. Among the Guinan subdialects are Wuzhou, Guixian, Cangwu, Guiping, and Tengxian. Many of these Guinan vernaculars include a sound shift that leads to pronunciations that are not at all characteristic of other Yuehua subdi-

alects. There are initial consonants like *b-* and *d-* that might not be found in Yuehua.

The general impression among the Chinese is that, with the exception of speakers of standard Cantonese, Yue speakers haven't played much of a role in the cultural development of China. Consequently, the Guangxi part of the Yue region has been treated more as a cultural backwater even by other Yue speakers, especially Cantonese speakers or those living around Guangzhou.

YULGOK. See **Yi I.**

YUN SUN-DO (1587–1671), Korean poet. Yun Sun-do, another in the long list of Korean poet-ministers who had turbulent political careers, passed the civil-service examination at the age of twenty-six, but did not serve under the tyrant Kwanghaegun (1556–1622). In 1616 he presented a memorial to the king remonstrating against corruption in the court, for which he was exiled to Kyonwon, where he is said to have written his earliest poems. He was recalled in 1623 when Injo (1595–1649) succeeded to the throne. In 1628, he was appointed personal tutor to the two young princes, Pongnim and Inp'yong. In trouble again during the Manchu invasion of 1636 for failing to attend on the king, he was sent into exile to Yongdok but soon released. Over the next number of years his memorials to the king kept him at the center of controversy. The final embroilment occurred over the length of the mourning period that was judged appropriate for the mother of King Hyojong (1619–1659). Again Yun Sun-do's opponents carried the day, and the poet was banished to Samsu, where he remained until his release in 1668.

Yun Sun-do is regarded by most Korean commentators as the master of the *sbijo*, Korea's traditional

short lyric poetry genre. His most celebrated work, *The Fisherman's Calendar*, is a cycle of forty poems describing the four seasons in one of the poet's favorite retreats. The fisherman is a time-honored symbol of the wise man who lives simply in nature. Yun Sun-do was inspired to write his poem when reworking the earlier "Fisherman's Song" by Yi Hyon-bo, which in turn was a reworking into nine verses of an anonymous poem from Koryo. Yun Sun-do was also a considerable poet in Chinese. He died in 1671.

YUNNAN (2002 est. pop. 43.2 million). The southeastern China province of Yunnan (Yün-nan, "the cloudy south") borders in the west on Burma and Tibet, in the north on Sichuan, in the east on Guizhou and Guangxi, and in the south on Vietnam and Laos. The province covers an area of 394,000 square kilometers of mountains and plateaus. The northwestern part features the Hengduan mountain range, traversed by several big rivers and with peaks reaching over 4,000 meters. The eastern and southeastern part forms a lower plateau. The diversity of Yunnan's topography means there are three climate zones: temperate in the mountains and subtropic and tropic to the south. The rainy season between May and October accounts for about 80 percent of the annual precipitation, which averages over 1,000 millimeters.

Yunnan has a population of 43.2 million, of which about a third belong to twenty-two officially recognized minority peoples, the Yi being the largest. The Han Chinese, who constitute about 70 percent of the population, are mainly concentrated on the eastern plateau, which is also where the capital, Kunming (2002 est. pop. 871,000 million), is situated.

Yunnan was loosely incorporated into the Chinese empire during the Han dynasty (206 BCE–220 CE). It was the center of the independent Nanzhao and Dali kingdoms from the eighth to the thirteenth centuries and was reincorporated as a Chinese frontier area under the Yuan dynasty (1279–1368). During the Ming dynasty (1368–1644), the Chinese government encouraged Chinese immigration into Yunnan, and

during the Qing dynasty (1644–1912), the province was repeatedly the seat of rebellion against the Manchu government. In the nineteenth century, the British and French colonial powers in Southeast Asia extended their activities into Yunnan, and the French built a railway connecting Kunming with Vietnam. During the Japanese occupation of eastern China, the Chinese Nationalist party (Guomindang) moved the government and various industries to the western provinces of Sichuan and Yunnan, and Yunnan became a stronghold against further Japanese advance.

Kunming developed into an important industrial center in the southwest, a position it still retains. Yunnan has one of the largest reserves of tin in the world, and the principal industries are tin and copper mining. Heavy industry such as iron and steel works are concentrated in the area around Kunming. The province is an important manufacturer of textiles, chemicals, processed foods, and light-industry products, and a major producer of tea, cigarettes, and sugar.

YURT The yurt is the traditional dwelling of nomadic Mongols and Turkic peoples in Siberia, Mongolia, China, and Central Asia. Although the yurt is no longer as common as in the past, there are still regions in Kazakhstan, western China, and Mongolia where the yurt is the primary form of dwelling, especially in summer months. In Buryiat Mongolian the word for yurt is *ger* (also *gber*), meaning "home" or "dwelling." Yurt, the more common term, is from the Russian *yurta*.

Like dwellings used by nomadic peoples around the world, the yurt is circular in shape and easy to assemble and transport. The major components are a collapsible, wooden latticework framework for the walls, wooden roof poles, a wooden tension smoke ring, large

pieces of felt (usually from sheep fleece) for the siding, tension ropes, a wooden door, and a white cloth covering. A more permanent wooden *ger* is used by more sedentary peoples in Mongolia and Siberia. These are eight-sided rather than circular. The entire yurt can be carried on one or two pack animals, a cart, or a truck.

In accord with Mongol and Turkic conceptions of the universe, the yurt is always set up with the opening facing south. The interior is divided into men's and women's areas, with a fire pit in the center over which a three-legged cooking frame is set. The north or northwest side is reserved for the family shrine, and all sacred objects are placed there. The floor is covered with felt carpets and bedding. The space opposite the door is reserved for important visitors or the male head of the household.

Yurts have become very popular in the West, and numerous companies provide modified yurt kits for home or vacation use. Why they are popular is not clear, although their association with a nomadic lifestyle and shamanism and the association of the circular shape with "symbolic circles" may be factors.

YUSHIN South Korean President Park Chung Hee (1917–1979) set forth the idea of *yushin* ("revitalization" or "reform") in October 1972 when he suspended the national constitution and dissolved the national assembly. *Yushin*, as an idea, policy, and set of actions, included the inculcation of values supporting the new authoritarian regime as well as institutions designed to repress political opposition and the labor movement.

Promulgation of the *Yushin* Constitution

Park, who came to power through a military coup in 1961, enjoyed relatively high popular approval as a result of his active role in driving South Korea's rapid economic development during the 1960s. This popularity, however, made him more politically ambitious, and he attempted to revise the constitution in 1969 to extend his presidency from two to three four-year terms. After having faced a strong challenge from the prominent opposition candidate Kim Dae Jung (b. 1925) in the 1971 election, Park drafted the *Yushin* Constitution of the Fourth Republic in 1972, explain-

ing his actions as a national effort to achieve peaceful unification of the divided Korea. The Yushin Constitution was promulgated in December 1972, whereupon the Fourth Republic was inaugurated.

Through economic development, Park attempted to rationalize his past performance and his plans for the future. When he introduced *yushin*, Park restructured the industrial sectors to promote heavy and chemical industry. In this respect, the importance placed on economic development was a reflection of Park's strong commitment to strengthening industrialization and expanding national prosperity.

Consolidation of Power

To realize the values of *yushin*, Park designed formal and informal authority structures that guaranteed enormous power for the officeholders of his administration.

First, the authority structure provided Park with unprecedented power. The president as the top leader of the executive dominated not only the administration but also the legislature and the courts. According to the Yushin Constitution, the president had the right to dissolve the legislature, that is, the National Assembly, and to declare a presidential emergency measure (PEM) on internal and foreign affairs and national defense, economy, finance, and judicial affairs. Moreover, the president was not elected by the National Assembly nor the constituency but rather by a non-partisan rubber-stamp organization, the National Conference for Unification (NCU), without any limitation in the number of terms.

Second, the role of political parties was severely undermined, and even the ruling party was not an exception. Neither the ruling party nor the opposition party had any chance of obtaining a majority in the National Assembly. This was so because the Yujonghoe political group, one-third of the National Assembly members, was elected by the NCU based on the recommendation of the president. Furthermore, the political parties lost one of their major functions, that is, nomination of presidential candidates, after the NCU was established. However, it is noteworthy that the authority structure ensured that the ruling camp, composed of the Democratic Republican Party and Yujonghoe, was always able to form an absolute majority in the legislature.

Third, civil rights were extremely vulnerable to infringement under the *yushin* regime. The PEM suspended the freedoms of speech, press, assembly, and association, and the labor law substantially restricted labor rights. These legal arrangements were effectively used to repress the opposition and labor forces. The notorious PEM No. 9, promulgated in May 1975, forbade civil activities such as denial of the Yushin Constitution or petition for its repeal; criticism of the PEM itself; and broadcasting of news about instances of violation of the PEM. The labor law, revised in 1973 and 1974, decentralized the union structure, weakening the role of seventeen overarching industrial sector unions. The law also provided for a cushion organization, the Labor-Management Council, to minimize the impact of erupting demands for better working conditions and human rights, protecting enterprises that pursued a goal corresponding to one of the *yushin* regime's values—economic development.

Opposition to *Yushin*

Opposition by students and churches undermined the legitimacy of the *yushin* regime. From the beginning, they conducted a campaign for revision of the Yushin Constitution and denounced the values of national security and economic development. In particular, they argued that restoration of civil rights and democracy were a precondition for national security on the ground that only democratic citizens voluntarily fight for their nation. Furthermore, they encouraged and supported labor's politicization, which meant not only the expansion of the magnitude of the opposition but also a serious threat to economic development. Eventually, the alliance among student, church, and labor groups and opposition parties to confront the harsh repression under the *yushin* regime resulted in violent clashes, such as the Y. H. Incident and the Pusan-Masan Uprising in 1979, which were followed by an internal conflict in the ruling bloc and the assassination of Park on 26 October 1979.

ZAGROS MOUNTAINS The Zagros Mountains, in western Iran, lie along and across the border between Iraq and Iran. Consisting of a series of ridges running parallel to the Persian Gulf and northward along portions of Iran's borders with Turkey and Iraq, the range is characterized by sheer, high cliffs and steep-walled canyons. Several of the highest peaks rise over 4,000 meters, with the highest, Zardeh Kuh, reaching 4,548 meters.

The range's rugged topography and high altitudes have made it virtually impassable, especially during winter months when heavy snows fall across the region. Throughout history, the Zagros have thus buffered the neighboring Iranian Plateau from invasions from the west. Iran's ethnic minority group, the Kurds, also found refuge in the Zagros, which form an important part of the larger but politically unrecognized Kurdistan region that occupies part of northern Iran, Iraq, and Turkey.

Archeologists estimate that the Zagros Mountains also served as one of the world's earliest cultural hearths for both plant and livestock domestication some 10,000 years ago. Today, sheep, goat, and cattle herding remain important industries, with herders seasonally moving their animals between high-altitude summer and lower-altitude winter pastures. Millennia of intensive human use, however, have led to the destruction of many of the region's native oak and juniper forests.

ZAHIR SHAH (b. 1914), king of Afghanistan. Zahir Shah was the king of Afghanistan from 1933 to 1973. Born in Kabul, he received his initial schooling at the Habibia and Istiqlal schools. Later, Zahir studied in France when his father, Mohammad Nadir Khan, moved there as a result of political pressure following a falling-out with King Amanullah. Zahir's father returned to Afghanistan soon after Amanullah was deposed and took the throne on 15 October 1929, establishing the Musahiban dynasty. One year later, Zahir returned to Kabul and enrolled in the Infantry Officers School. At a young age, Zahir held several government positions, such as assistant minister of war and minister of education, before assuming the throne on 8 November 1933 following his father's assassination. Although Zahir was king, two uncles and a cousin actually wielded power as prime ministers during much of his reign. When his cousin resigned after a disagreement, Zahir in 1963 appointed, for the first time, a non-family member as prime minister. For the next ten years, Zahir instituted an experimental program called *Demokrasi-I Now* (New Democracy), which allowed free elections and promoted democratic ideals such as a free press and freedom of association in addition to a constitution. Zahir was overthrown in 1973 by his cousin, Daud Khan, and witnessed Afghanistan's shift to communism, a Soviet invasion, and the Afghan civil war. He is currently in exile in Italy. Although some support his return to power, Zahir Shah has made no major overtures in that direction.

ZAMBALES MOUNTAINS The Zambales Mountains in the Philippines stretch from the northern part of Zambales Province to the northern edge of Bataan Province. This range comprises nearly the whole province of Zambales. There are eight named mountains in the range. Its highest peak is High Peak (2,037 meters). It also includes Mount Pinatubo, which erupted in 1991.

The mountains are sparsely populated, given their rugged topography, but are home to the Negritos or Aetas, an indigenous people known for their Negroid features. They live primarily by hunting and foraging. It is rich in natural and mineral resources, particularly bauxite deposits. The Zambales Mountains were formed by the shift of tectonic plates, which pushed the land upward during prehistoric times.

ZAMBOANGA (2000 pop. 603,000). Located at the tip of the Zamboanga Peninsula in the Mindanao Island group in the Philippines, the City of Zamboanga is a chartered city independent of the province of Zamboanga del Sur in terms of funding, administration, and so on. The early Malay settlers known as Subanons ("people of the river") named the place Jambangan or Tambangan ("land of flowers"), and the city is still known for its many species of flowers, especially orchids. The Samal and Badjao ethnic groups who came to the city in their *vintas* or native boats called it Samboangan, referring to the wood poles they used to dock their boats.

The Spanish established a small garrison on the site in 1596, but they failed to hold it in the face of repeated attacks by the Moros, various Muslim ethnic groups of Malay descent who had dominated the area from the 1400s. In 1636, the Spanish reestablished themselves in what is now known as Fort Pilar, which

remained the center of Spanish rule in the southern Philippines for three hundred years. A testimony to this long Spanish presence is the use of Chavacano, the chief local dialect, which is based on Spanish.

When the Americans came in 1898, the city became the capital of Moro province, which encompassed all of Mindanao and Sulu Islands. Zamboanga City attained its cityhood status on 12 October 1936 under Commonwealth Act 9 and was formally inaugurated as the City of Zamboanga on 26 February 1937. The city became a headquarters for the Japanese during World War II but was retaken by U.S. troops in March 1945.

Today the city is a trade center and port for the southern Philippine products of copra, hemp, timber, and fish. It is also a center for Moro brass and bronze ware and a collection point for the many varieties of shells found locally. In terms of religious background, the population of Zamboanga City is 75 percent Christian and 25 percent Muslim. It is considered a Christian enclave in the heart of the Muslim region of the Philippines.

ZEBU Zebu, or brahminy cattle (*Bos indicus*; sometimes called humped oxen or Brahman), are a species of domesticated livestock native to India. According to some, they are the same species as common cattle (*Bos taurus*), but others think that the two are separate species. Zebu are usually white or gray, with a large hump over the shoulders, a deep undulating dewlap, and hanging ears. They do not bellow but give a short grunt.

Zebu are thought to have evolved from the wild ox of Java and Borneo and to have been domesticated in South Asia as early as the ninth millennium BCE. They were depicted on seals of the Indus Valley civilization (2700–1500 BCE). Today, zebu are the preeminent

draft animals in Indian farming (though camels are used in some areas), and along with water buffalo they are used as beasts of burden in Africa as well. Some breeds of *Bos indicus* were selected for their milk-producing ability and serve as dairy animals in India. Their cooked flesh is abhorred by Hindus and Buddhists alike, but their leather forms the basis of a major industry in South Asia.

In some Hindu sects, white zebu are "sacred cows," the most sacred of all animals, because they are associated iconographically with the god Siva. Since the Kushan era (78–200 CE), they have been known as Nandi, the sacred mount or vehicle of Siva, and Siva temples have a figure of a white zebu facing the entrance to the shrine. In sacred cities like Varanasi (Benares), some zebu bulls are branded with Siva's insignia as a sign that they belong to the god, and are permitted to roam the streets. For this reason, the species has come to be known as "Brahman" outside India.

Zebu are resistant to extreme heat and to many of the insects that attack other cattle species, and thus are suited for the hot climates of their ancestral home areas. For this reason, cattle breeders in the southern United States and Latin America have imported them since the mid-nineteenth century to breed with native beef cattle and have produced hardy crosses such as the Santa Gertrudis (Brahman and Shorthorn), Charbray (Brahman and Charolais), and Brangus (Brahman and Angus).

ZENG GUOFAN (1811–1872), Confucian scholar and official. A leading Confucian scholar and high official in the late Qing dynasty (1644–1912), Zeng Guofan was born into a peasant family in Hunan Province. Zeng received his degree and served in various positions in the central government. Typical of the scholar-official ideal, he preferred to support a foreign dynasty—the Qing—who respected Chinese norms than support an indigenous rebellion that threatened the social and political order in which he believed. When the Taiping Rebellion (1851–1864) threatened the Qing dynasty, he accepted an appointment to raise an army first to regain control over Hunan and later to suppress the rebellion. He sponsored various projects of China's Self-Strengthening Movement (an effort by

the Qing dynasty to restore power to resist Western encroachments, especially after the Second Opium War) and tried to increase China's military and economic power by learning from Western nations.

Zeng was very successful. He demanded that his troops conduct themselves according to proper Confucian principles. Zeng recruited members of the local scholar-gentry class as officers who were loyal to him and then recruited troops from Hunan. They embodied such Confucian ideals as respect for superiors, concern for their fellow Chinese, and moral behavior. Zeng's very success helped pave the way for a devolution of power from the Qing government in Beijing and began the rise of regional authorities, leading, ultimately, to the period of warlordism in the 1920s and 1930s. He died in 1872.

ZERAFSHAN RIVER With a length of 877 kilometers and a drainage basin of 17,100 square kilometers, the Zerafshan, or "Golden," River is one of the most important of Central Asia, providing water for irrigation to some of the region's most famous cities, among them Bukhara and Samarqand. Known as the Matcha in its upper reaches, the Zerafshan has its source in the Zerafshan Glacier at an altitude of 2,800 meters in Tajikistan's Koxsu range of mountains. For its first 300 kilometers, the river flows through a narrow valley that opens out near the city of Penjikent. Below this point the river has no tributaries. Near Samarqand the river divides into two main branches known as the Akdarya (White River) to the north and the Karadarya (Black River) to the south. As it approaches the Bukhara oasis the river becomes known as the Karakul Dar'ya.

The river's flow is entirely used for irrigation, particularly of cotton, which has been grown in the region since ancient times. As a result, it dries before reaching the Amu Dar'ya, which in recent times it has attained only in 1874 and 1921. Its lower reaches are, however, fed by the Amu-Bukhara Canal, one of several major irrigation works that also include the Kattakurgan Canal. More than three-quarters of the river's flow occurs between May and September, peaking in July with

a rate of 250–690 cubic meters per second. Average flow is 162 cubic meters per second, and the lowest rate is 28–60 cubic meters per second, occurring in March.

Will Myer

ZHANG YIMOU (b. 1951), Chinese film director. Zhang Yimou is currently China's best-known film director. Born in Xi'an, Sichuan Province, he began his film career in the early 1980s as a cinematographer. A leader among China's "Fifth-Generation" of film directors, he is credited with giving modern Chinese cinema an international profile. Since winning the Golden Bear Award (Best Picture) at the 1988 Berlin Film Festival for his debut film, *Red Sorghum* (1987), Zhang has garnered many awards at prominent international film festivals, including those at Venice and Cannes, while also achieving commercial success across the globe.

His film career can be divided thematically into two periods. In such early films as *Red Sorghum*, *Ju Dou* (1990), and *Raise the Red Lantern* (1991), his work takes on the quality of the historical epic. In *The Story of Qiu Ju* (1992), *To Live* (1994), *Keep Cool* (1997), *Not One Less* (1998), and *The Road Home* (1999), he shifts his cinematic focus to the realistic depiction of modern Chinese life. Throughout his career, Zhang has been troubled by censorship in China. Outside China, his films, ironically, have often been criticized as contributing to the Chinese government's overseas public relations activities.

ZHANG ZHIDONG (1837–1909), Chinese Confucian scholar-official. Zhang Zhidong (Chang Chih-tung), born in Nanpi, Zhili Province, was prominently associated with the "self-strengthening movement" in China. His distinguished career as an official in the Qing dynasty (1644–1912) (Manchu) imperial administration began in 1863 when he passed the highest-level civil service examination and was awarded the prestigious *jinsbi*, or "presented scholar," degree. From 1867 to 1877 he held a variety of supervisory posts related to education and the Confucian examination system in Zhejiang, Hubei, and Sichuan provinces. During this time, he achieved renown for his energetic promotion of scholarship and exemplary rectitude in administrative affairs. In 1879 Zhang was inducted into the Imperial Academy, where he earned a reputation as an astute commentator on Chinese foreign relations and political reform.

In 1882 Zhang was promoted to the governorship of Shanxi Province, the first in a long series of administrative posts that would eventually include an eighteen-year tenure as governor-general of Hunan and Hubei Provinces. During this period, he gained the reputation as a modernizer and political reformer even while retaining a conservative devotion to Confucianism and the Qing dynastic order. The abbreviated formula as-

ZHAO ZIYANG (b. 1919), Chinese Communist Party leader and economic reformer. Zhao Ziyang was born as Zhao Xiusheng in Huaxian County, Henan Province, in 1919. He joined the Chinese Communist Party (CCP) in 1938. After the establishment of the People's Republic of China (PRC), Zhao served in numerous positions in Guangdong Province, where he played an instrumental role in consolidating CCP control and implementing land reform policies.

After being denounced and exiled during the Cultural Revolution, Zhao was rehabilitated by Zhou Enlai (1899–1976) and assigned as provincial first party secretary in Guangdong in 1971 and then in Sichuan in 1976. His market-oriented reforms there brought substantial progress to the economy and became a showpiece of the reforms of paramount leader Deng Xiaoping (1904–1997).

A strong supporter of Deng's economic reforms, Zhao became a member of the CCP Politburo in 1979, premier in 1980, and party secretary-general in 1987. He continued to advocate market-style reforms as well as ambitious plans to streamline the bloated PRC bureaucracy. While many of his reforms were praised, his economic liberalization program was blamed for the rising inflation of the late 1980s.

Zhao's most important moment and his political downfall came with the student protests in Tiananmen Square in May and June of 1989. Zhao openly sided with the student demonstrators and was ousted in the aftermath of the bloody crackdown on protests in Beijing. He remains a member of the CCP but has become almost completely absent from public life.

ZHEJIANG (2001 pop. 47 million). One of the most fertile and wealthiest provinces in China, Zhejiang lies on China's southeastern coast just south of the Chang (Yangtze) river delta and China's largest city, Shanghai. It is bordered on the north by Jiangsu province, on the west by Anhui and Jiangxi, and on the south by Fujian. It covers 101,800 square kilometers, including 3,061 offshore islands. About one-third of the province consists of plains, rivers, and lakes, while the other two-thirds is mountainous.

The province's capital is Hangzhou, China's capital during the Southern Song dynasty (1127–1279 CE) and a city described by Marco Polo in his travels as "beyond dispute the finest and noblest city" in the world. The province has 41 counties, 23 cities, and 23 county-level towns. The total population in 2001 was about 47 million, of which 300,000 are categorized as ethnic minorities. The largest of these minorities are the She and Hui nationalities.

Historically, Zhejiang has been in the forefront of China's economic and cultural development since the early Han dynasty (206 BCE–220 CE). Its emergence as a major producer of grain resulted in the extension of the Grand Canal to Hangzhou in the seventh century. Since the tenth century, the province has been a leading producer of grain, silk, tea, porcelain, and paper, and a center of trade and commerce. When the Southern Song dynasty established its capital in Hangzhou in 1127, Zhejiang also became China's political and cultural center. The province continues to be home to many of China's intellectual and political elite. Two of China's greatest modern writers, Lu Xun and Mao Dun, were from Zhejiang, as are nearly a fifth of the current members of the Chinese Academy of Sciences. The province also produced two of China's best-known contemporary leaders: Zhou Enlai, the premier of the People's Republic of China from 1949 to 1976, and Chiang Kai-shek, president of the Republic of China on Taiwan from 1949 to 1975.

Zhejiang has been a prime beneficiary of China's present economic reforms. Since 1978 the province's economy has grown faster than the national average,

thanks in part to the rapid growth of collective and private firms. Currently the province is the fourth wealthiest in China behind such economic powerhouses as Guangdong and Shanghai. In addition to its traditional industries, the province has concentrated on the development of its machinery, electronics, chemicals, and pharmaceutical industries. Foreign trade, investment, and tourism have also flourished, especially in the coastal cities of Hangzhou, Ningbo, and Wenzhou.

ZHOU DYNASTY The era popularly known as the Zhou dynasty covers two time periods: the Western Zhou period (1045–771 BCE) and the Eastern Zhou period (770–221 BCE). During the Western Zhou period, the Zhou lineage ruled from the capital, Zongzhou, located near their ancestral burial grounds (near modern-day Xi'an in Shaanxi Province). In 771 BCE the Zhou elite fled east to the city of Chengzhou (located near modern-day Luoyang in Henan Province). During the Eastern Zhou period, former Zhou tribute states vied for power under the guise of upholding traditional Zhou moral authority. The Zhou royal descendants were themselves puppets of neighboring states.

Origins of Zhou

The original Zhou nation rose up in the Wei River valley in Shaanxi. Shang-dynasty (1766–1045 BCE) oracle-bone records dating from 1200 to 1000 BCE suggest that the Shang considered the Zhou group alternately as an enemy and as a tribute-paying subject. By the middle of the eleventh century BCE, the Zhou had built a coalition of partners, including former Shang subjects in northern Henan, and destroyed Shang hegemony. In texts compiled centuries later, this shift in power was attributed to the will of Heaven and called the Mandate of Heaven (*tianming*). In contemporary Zhou bronze texts, the term refers to the will of ancestral spirits, perhaps manifested as astral phenomena. By the Eastern Zhou period, however, the event was mythologized as a heroic military conquest commanded by Heaven and carried out by King Wu

(who represented "martial" reckoning against immoral leaders), the son of the founder of the Zhou nation, King Wen (who represented "humane" treatment of inferiors and a system of utopian agrarian government). By the Han period (206 BCE–220 CE), the Mandate of Heaven clearly represented shifts in a system of natural forces, much closer to the five phases system (*wuxing*) popular by the third century BCE. The Mandate of Heaven theory became a permanent part of Chinese political thought, used by later Chinese reformers to frighten recalcitrant rulers as well as by those who took up arms against the government to justify their rebellion.

After the shift of hegemony from the Shang in the east to the Zhou in the west, the Zhou rulers spent the next two centuries consolidating their power through military coercion and trade. They focused on control over resources essential to their economic system of gift giving and award, a system inherited from the Shang and intimately tied to the spread of the worship of Zhou ancestral spirits. Cowries, bronze, and jade—all valuables in Shang religion and all requiring trade links with distant regions—continued to be important to the Zhou. Although the Zhou initially worshiped the Shang spirits, by the mid-tenth century BCE, their own ancestors had clearly become national icons. Nation building became a form of ancestor worship. The Zhou rewarded subjects with sacrificial vessels, ritual clothing, wines, and agricultural lands (for food production) to further the Zhou ritual system. Gift recipients used these items to present mortuary feasts to the ancestral spirits, often including the names of their Zhou benefactors and their ancestors in the inscribed prayers. The sophistication of Zhou bronze vessels, carved jades, and musical instruments attests to control over resources and production in regions outside the Zhou homeland. At the peak of Zhou hegemony, during the late tenth to the late ninth centuries BCE, they controlled a network that reached west into Gansu Province, southwest into Sichuan Province, northeast to Beijing, east into Shandong Province, and south into Hubei Province and beyond the Chang (Yangtze) River.

Eastern Zhou Period

The Eastern Zhou period is subdivided into the Spring and Autumn period (770–476 BCE) and the Warring States period (475–221 BCE). The names for both periods derive from chronicles of tales collected about each period that detail conflicts and alliances between former subject states of the Zhou. The entire Eastern Zhou era is characterized by larger states annexing smaller states, so that by the third century BCE,

only a few large states remained. During the Spring and Autumn period, the Zhou ruler was alternately a puppet of the states Jin, to the north; Zheng, to the south; and Qi, to the east—each of which took turns as "hegemon protectors" (*ba*). States that were on the fringes of the Zhou world earlier rose to power and challenged the exclusionary protector system.

By the time of the Warring States period, powerful new players included the states of Qin, located to the west in the old Zhou homeland; Chu, spreading south and east out of the Han River valley in modern Hubei Province; Yue, spreading north into the lower Huai River valley from the southeastern coastal region; and Yan, in the northeast near modern-day Beijing. Jin (a powerful state that rose up in southern Shanxi not far from the Zhou administrative city of Chengzhou) in the meantime divided into territories run by the large lineage groups Wei, Zhao, and Han. Zheng was taken over by Han, but other states survived simply by allying themselves strategically with different, larger groups. Examples include Lu, the birthplace of Confucius (551–479 BCE), and nearby Song, birthplace of the anti-Confucian thinker Mozi (470?–391? BCE).

The art of strategic alliances, known as the Theory of Horizontal or Vertical Alliances, was promulgated by peripatetic "guests" (*ke*), members of disenfranchised elite and artisan families who had studied under masters of military, ritual, and technical arts. By the Warring States period, literacy and text production, as well as technical or occult expertise, spread with the guest masters and their disciples from one site of patronage to another. The myriad new text types and ritual items discovered in Warring States tombs, particularly those associated with the southern state of Chu, attest to a cross-fertilization of ideas and practices over vast geographical distances. This was no doubt perpetuated not only by the roving guests, but also by the migrations of peoples, states, and armies. These guests took the cultural fabric, once identified as Zhou and rewove it, introducing new ideologies that better fit the cultural and economic realities of their far-flung patron rulers. During this time, they used tales about former Zhou-period rulers to warn and cajole regional leaders. Founder kings Wen and Wu were cast as paragons of honest humility and—most important to enhancing the precarious position of these guest advisers—the wise minister Zhou Gong (regent for Wu's son and cult founder of the state of Lu) was cast as essential to the foundation of a strong Zhou state. He took the helm while the king was weak, gave speeches about morality, quelled remnant Shang rebels, set up an administration, and politely retired when the king came of age.

Social and Economic Changes

Comparison of the Warring States and early Western Zhou economies reveals drastic social changes. The economic network expanded by the Zhou from the eleventh through the ninth centuries BCE collapsed under its own ideological weight (a collapse that continued through the Spring and Autumn period). The rigid link to Zhou kinship through mortuary ritual and a gift-giving system was unsustainable. By contrast, the major states during the Warring States period developed their own monetary systems as well as individualized religious systems that incorporated both local practices and elements of the archaic but prestigious Zhou rhetoric. Smaller states participated in the expanded networks of larger states. Markets were commonplace in every city. The export of mass-produced trade goods and the import of exotic goods flourished. The network of interstate relationships was often multilateral, involving trade, marriage, warfare, and political covenants. Until the Qin dynasty (221–206 BCE) conquered the entire region and attempted unification, early China was a complex social web of competing philosophies, mingled social classes, and peoples from

different cultural backgrounds. In the face of this cultural fluidity, individual states promoted their own calendar systems, script styles, musical styles, artistic styles, and occult practices. The Warring States period represented the end of Bronze Age Zhou culture. Writers and philosophers of this and later periods would commonly use an increasingly idealized vision of Zhou ritual and government as a rhetorical foil against which to criticize the political chaos of their own times.

ZHOU ENLAI (1898–1976), Chinese revolutionary. Zhou Enlai was one of the most important leaders of the Chinese Communist Party (CCP) and the government of the People's Republic of China (PRC, 1949–). He was born in 1898 in Jiangsu Province in a family native to Shaoxing in Zhejiang Province, with a family history typical of that locality, long noted for producing the educated aides who provided indispensable services to appointed officials in imperial times. Zhou's radical political career began with his participation in the May Fourth Movement in the city of Tianjin in 1919. This led to his arrest and imprisonment for several months, after which he traveled to Europe as a student and clandestine radical activist. Active mainly in France from 1920 to 1924, Zhou lived for shorter periods in Germany and Britain as well. He joined the Chinese Communist Party in 1921 and was the leading founder of the Paris-based Chinese Communist Youth Group. Returning to China in 1924, Zhou married Deng Yingchao, another former student activist with whom he had corresponded regularly for four years, and joined the work of the CCP in its new alliance with the Guomindang (Nationalist Party) of Sun Yat-sen (1866–1925), then based in Guangzhou (Canton). In preparation for the "Nationalist Revolution" to reunite China, Zhou served as deputy director of the Whampoa Military Academy, where Chiang Kai-shek (1887–1975) was commandant. During the Northern Expedition (1926–1927),

which was undertaken to combat warlords in the north, Zhou organized labor and directed a general strike in Shanghai, facilitating the Nationalist takeover of China's most important city. Chiang's subsequent crackdown on Communism drove Zhou and his comrades into hiding. After that, Zhou organized the Nanchang uprising and became one of the founders and leaders of the Red Army. Zhou began to work closely with Mao Zedong (1893–1976) after the Communist regime in Jiangxi was destroyed by the Nationalist government. During the Long March (the Communists' flight from Jiangxi to Shaanxi), Zhou's support of Mao decisively helped Mao in his rise to dominance in the CCP. From that time on, Zhou served as Mao's right-hand man until his death. While Mao formulated doctrine, Zhou translated doctrine into practical policies. His organizational talents featured a notable ability to maintain discipline and cohesion within the CCP. During the Xian Incident of 1936, when Chiang Kai-shek's generals held Chiang captive until he would agree to postpone fighting the Communists until after the Japanese were defeated, Zhou helped to negotiate a partial rapprochement between the Communists and Nationalists and as chief liaison officer maintained relations between the two until the end of the war against Japan. During the decisive struggle against the Nationalists during the civil war of 1946–1949, Zhou directed political indoctrination programs that induced captured Nationalist soldiers to fight on the Communist side. From the inauguration of the People's Republic of China until his death, Zhou was head of state (premier of the State Council) and was a popular paternal figure among the Chinese people. Zhou also served as foreign minister from 1949 to 1958 and was respected abroad as a skilful, urbane, and dignified diplomat. One of Zhou's leadership techniques was to acknowledge personal responsibility for problems faced by the CCP. For example, following the tragic failure of the Great Leap Forward (1958–1960), Mao's attempt to industrialize at the village level, Zhou was able to diffuse responsibility for the disaster and deflect blame from Mao. During the Cultural Revolution (1966–1976), Zhou used his political influence and skills to limit the chaotic effects of the campaign and protect some of the victims of leftist excesses. Before becoming ill during the 1970s, he played an important role in the emergence of the PRC from isolation and the adoption of a program of economic reform. Chinese leader Deng Xiaoping (1904–1997) was a protégé and close associate whose Four Modernizations program announced in 1978 was a continuation of Zhou's earlier work.

Following Zhou Enlai's death on 9 January 1976, preceding Mao's by precisely nine months, the Chinese

people responded with an outpouring of grief. In April 1976, on the occasion of an annual festival honoring the dead, they gathered to mourn their loss in public. In Beijing, as crowds of citizens paying their respects to Zhou swelled tremendously in size, authorities became alarmed about their oblique expression of antigovernment sentiment and forcibly dispersed the crowds in an event known as the Tiananmen Incident of 1976.

ZHU DE (1886–1976), founder of the Chinese Communist army. Zhu De (Chu Teh), founder of the Chinese Communist army, was born on 30 November 1886, the son of a poor tenant farmer. After graduating from the Yunnan Military Academy in 1911, Zhu became active in anti-Manchu activities in Yunnan and Sichuan Provinces between 1912 and 1916. In 1922, on a work-study program, he left for Europe, where he participated in Communist Party activities. In 1926, Zhu returned to China and became involved in the Nationalist Guomindang army. After the failed Nanchang Uprising (1927), Zhu led his troops to Hunan Province, where he joined up with Communist Party leader Mao Zedong (1893–1976). In Hunan they formed an effective military force that would later become the Red Army. Under Zhu's command, the Red Army defended the Jiangxi Soviet and undertook the 6,000-mile Long March to Shaanxi Province.

During the war with Japan, Zhu commanded the Red Army's northern forces. Following Japan's surrender, Zhu served as the commander of the People's Liberation Army until 1955, when he became a marshal of the People's Liberation Army. He would later become the chairman of the National People's Congress Standing Committee and continually was listed in many high official positions, although he was not actively involved in Chinese politics after 1954.

ZHU RONGJI (b. 1928), Chinese premier. Following the end of Li Peng's term as premier of the Chinese Communist Party in 1998, Zhu Rongji was named premier. Zhu was born on 20 October 1928 in Changsha, Hunan Province. While an electrical engineering student at Qinghua University, Zhu joined the Chinese Communist Party and, following graduation in 1951, held a variety of posts within the State Planning Commission (SPC). While working at the SPC, Zhu was labeled as a rightist during the Hundred Flowers Movement of 1957.

Following the Cultural Revolution, Zhu became the director of the Industrial Economics Institute of the Chinese Academy of Science. He would later move to the State Economic Commission (SEC), where he was associated with the formation of economic reform policies. From there, Zhu's star began to rise. He was named a vice minister of the SEC and later a director at the China International Trust and Investment Corporation.

Zhu then became mayor of Shanghai following the elevation of Jiang Zemin to the Politburo following the June 4 Incident (when army tanks rolled into Tiananmen Square in 1989 killing civilians in their path). While the mayor of Shanghai, Zhu gained a reputation as a no-nonsense reformer who got things done. Zhu was then appointed to the post of vice premier where he worked to limit money supply while implementing fiscal and financial reforms.

ZHU XI (1130–1200), Chinese synthesizer of neo-Confucianism. Zhu Xi (Chu Hsi) was born in Youzi in Fukien province; he is perhaps the greatest neo-Confucian philosopher. He developed and clarified the metaphysics of two earlier philosophers, Cheng Yi (1033–1107) and his brother Cheng Hao (1032–1085). According to their view, everything in the universe has two aspects, *li* (principle) and *qi*. *Li* is a structuring principle that accounts for both the way a thing is and the way it ought to be. Although the *li* is present in each and every thing, things are distinguished by having different endowments of *qi*. *Qi* is a

ZHU XI ON THE HEART

"The intelligence of the human heart never fails to have some knowledge, and the things of the world never fail to have principle (*li*). It is only due to the fact that principle is not exhausted that knowledge is not completed. Consequently, when the school of Greater Learning begins its teaching, it must direct students, in regard to all the things of the world that they encounter, to never fail to follow the principle that they already know and exhaust it, seeking to arrive at the limit. One day, after they have exerted effort for a long time, they will suddenly penetrate it, and then there will be nothing in the multitude of things—external or within, fine or coarse—that they do not reach. Then there will be nothing in the complete substance and great functioning of our heart that is not illuminated!"

Source: Zhu Xi. *Collected Commentaries on the Greater Learning*. Translated by Bryan Van Norden.

sort of self-moving ethereal substance, which has varying degrees of turbidity or clarity. Inanimate objects have the most turbid *qi*, with plants, animals, and humans having increasingly clearer *qi*.

Since the *li* is one, everything is part of a potentially harmonious whole. Consequently, a good person has concern for everything that exists. Because the *qi* differentiates things, people have greater obligations to those tied to them by particular bonds such as the five relations. The clearer one's endowment of *qi*, the easier it is to appreciate one's obligations.

Relying on one's own moral sense without education is dangerous, because selfish desires obscure the *li* within people. Instead, people should study the classic texts under a wise teacher, because the texts provide partial abstractions of the *li* from its particular embodiments in *qi*.

Prior to Zhu Xi, Confucian education emphasized the Five Classics: the Odes, the Documents, the Spring and Autumn Annals, the Record of Rites, and the Yi Jing. These works had been central to Confucian education since the Han dynasty (206 BCE–220 CE). Zhu Xi proposed a new curriculum, based on what came to be known as the Four Books. His *Collected Commentaries on the Four Books*, which gives a synthetic

interpretation of these texts in the light of neo-Confucian metaphysics, became the basis of the Chinese civil service examinations in 1315 and was committed to memory by generations of scholars until the examinations were abolished in 1905. In the early twenty-first century, the views of the majority of Confucians in East Asian communities, including the "New Confucian" philosophers, are deeply influenced by Zhu Xi's interpretations.

ZHUANG The Zhuang are a minority people living in south and southwest China, mostly in the mountainous areas of the Guangxi Zhuang Autonomous Region and the Wenshan Zhuang-Miao Autonomous Prefecture of Yunan province. A number of Zhuang communities are also scattered in Guangdong, Hunan, Guizhou, and Sichuan provinces. With 15.5 million people (1990 census), the Zhunag are the largest of all Chinese minority nationalities in terms of population.

Before 1949, Zhuang groups described themselves with more than twenty different names. In the 1950s the government redefined all Zhuang groups and in 1965 it renamed all of them Zhuang.

History

The origin of the Zhuang is debated even by the Zhuang people themselves. Scholars generally believe that the Zhuang either migrated from outside the Guangxi area, developed from the original inhabitants of the area, or evolved from intermarriage between local and outside people.

It is conceivable that the Zhuang originated partially from the ancient peoples known as Baiyue ("Hundred Yues"), who were indigenous to Lingnan, a geographic region encompassing modern Guangxi and Guangdong. With the warm weather and rich water resources of Lingnan, the Baiyue had long engaged in rice agriculture.

In 214 BCE, the Qin dynasty (221–206 BCE) conquered Lingnan, moved people from the central plains to the Lingnan region, and built the Lingqu Canal to

connect the Chang (Yangtze) and Zhu (Pearl) Rivers. These policies brought together the Baiyue and immigrant populations and established political, economic, and cultural ties between Lingnan and central China. On the collapse of the Qin dynasty, a general named Zhao Tuo founded Nanyue as an independent kingdom in Lingnan. In 111 CE, the emperor Wudi of the Han dynasty (206 BCE–220 CE) destroyed Nanyue and organized an administration in Lingnan that included the eastern portion of Guangxi. It was during the Han that some native groups in Lingnan were first referred to as Zhuang.

Rulers of the Tang (618–907) and Song (960–1279) dynasties administered the Lingnan region loosely. The central government appointed Zhuang local chiefs as magistrates and allowed them to hold their positions hereditarily, but the chiefs were required to renounce independent statehood. This indirect rule permitted the Zhuang local chiefs to become autocratic on the local level, and their autonomy grew to the point that they resisted the central state. Starting in the early Ming dynasty (1368–1644), the central government decided to rule the Zhuang areas directly, but the Zhuang strongly resisted. Between 1492 and 1571, Zhuang uprisings forced the Ming government to mobilize over 140,000 troops. The Qing dynasty (1644–1912) and the Republic of China (1912–1949) maintained a policy of replacing local leaders until 1929, when the central state held overall authority.

Concurrent with increasing Chinese control was a migration of Han Chinese (the ethnic group of the majority of the Chinese population) to the Zhuang areas. During the Ming and Qing dynasties, large numbers of Han people immigrated into Guangxi and other Zhuang regions to escape the warfare and famine in northern and central China and to look for agricultural land. By the end of the nineteenth century, Han Chinese represented 50 percent of the total population of Guangxi, whereas they had represented less than 20 percent of the population in the mid-sixteenth century. The continuing arrival of Han people brought advanced agricultural technology to the Zhuang communities and formed a social base for the central government to extend its authority, but it also sometimes led to ethnic conflicts between the Han and Zhuang.

The Modern Era

In modern times, the Zhuang people increased their resistance to the central government. In 1952, the government of Communist China founded the Western Guangxi Zhuang Autonomous Prefecture, the first step toward redefining all Zhuang groups and creating the Guangxi Zhuang Autonomous Regions in

1958. Though many Zhuang were trained and promoted to official positions, Zhuang communities suffered severely from the government's forced assimilation policy.

After China's reform in 1979, the government guaranteed the Zhuang people their rights and privileges as a minority nationality and began promoting their equality more in terms of economic development. Since then, various modern industries have begun to grow in the Zhuang areas, and the Zhuang economy has shifted from a self-sufficient agricultural base toward a more interdependent one through developments in trade, roads, and modern communication technology. Although the Zhuang economy still lags far behind that of the Han Chinese areas, it is the most advanced among the economies of China's minority nationalities.

Culture

The Zhuang have a rich cultural heritage; their traditional mountain songs and Zhuang brocade are famous. The third day of the third month of each lunar year is the most important Zhuang festival, when in each area people dance and sing before large audiences. Liu Sanjie, a Zhuang woman singer of the Tang dynasty, is considered Zhuang's music goddess (*ge xian*), known to all Chinese because of her beautiful voice and the lyrics of her songs. Zhuang brocade, originating in Tang times and woven in beautiful designs with cotton warp and dyed velour weft in five colors, is popular in China and is exported to foreign countries.

Zhuang people speak the Zhuang language, a linguistic branch of the Sino-Tibetan language family, although various distinct dialects remain in Zhuang communities. Zhuang culture has also been influenced by the Han culture because of the long interaction between the two peoples. Zhuang's old written language, the square Zhuang characters, developed from Chinese characters during the Tang dynasty, and throughout history a few Zhuang scholars passed imperial China's state examination and earned scholarly degrees.

To promote education among all the Zhuang people, the Chinese government in 1955 reformed the Zhuang language based on the Latin alphabet and then revised the alphabet system in 1982. The promotion of the Zhuang ethnic language has helped to elevate education among the Zhuang people; it has also helped to create a common Zhuang ethnic identity that was nearly nonexistent before the People's Republic.

ZIA, KHALEDA (b. 1945), prime minister of Bangladesh. Khaleda Zia, the widow of former Bangladesh president Ziaur Rahman Zia (1936–1981), was born in Jalpaiguri (now in West Bengal, India), although her family was from the Feni district in Bangladesh. After her husband Zia's assassination in 1981, his party, the Bangladesh Nationalist Party (BNP), was without a leader and selected Khaleda as chairperson on 10 March 1984. As such, she was a leader of the opposition to the military regime of Hussain Muhammad Ershad along with Sheikh Hasina Wajid of the Awami League. The two frequently clashed with each other as well as with Ershad, but in late 1990 they united and brought about Ershad's fall. Following the election in February 1991, Khaleda became prime minister on 20 March 1991, an office she

Khaleda Zia appears before the media in Dhaka on 2 October 2001 when it became clear that the election would make her the next prime minister of Bangladesh. (REUTERS NEWMEDIA/CORBIS)

held until March 1996. In the June 1996 election, the BNP finished behind the Awami League and Khaleda became leader of the opposition. The enmity since 1991 between the BNP and Awami League has impeded the governance of Bangladesh. In 1999 the BNP formed an alliance with the Jatiya Party faction headed by Ershad and the Jama'at-e-Islami, an Islamic fundamentalist party, to attempt to destroy the Awami League government and prepare for the October 2001 parliamentary election. The alliance subsequently won by a substantial majority in the election.

ZIA-UL-HAQ, MOHAMMAD (1924–1988), president of Pakistan. Zia was born on 12 August 1924 in Jalandhar in Punjab. He graduated from the Indian Military Academy, Dehra Dun, in 1945, and served with the British army in Southeast Asia. Upon India's independence from Britain and the partition of the Indian subcontinent, Zia chose to live in Pakistan. He became a major general in 1972 and four years afterwards was made army chief of staff by Zulfikar Ali Bhutto (1928–1979), who was at that time prime minister. Next year Zia deposed Bhutto and became Pakistan's chief martial-law administrator.

Zia became president in 1978 and had Bhutto executed the following year, despite international appeals. Zia banned all political parties and imposed censorship of the press. Norms of *shari'a* (Islamic law) were strictly adhered to; the Islamic Ahmadiya sect, regarded as heterodox by the Islamic mainstream, was suppressed. The Soviet invasion of Afghanistan strengthened his position, and he collaborated with the United States administration fully in its opposition to the Soviets. In return, he received generous financial and military assistance from the United States. Under Zia there was no sign of substantial improvement of ties with India, and Zia launched Operation Topac in Kashmir. The operation was an attempt to stir up anti-Indian sentiment with a view to ultimately wresting Kashmir from Indian control. Ghulam Ishaq Khan (b. 1915) succeeded Zia after the latter died in a plane crash near Bahawalpur on 17 August 1988.

ZIKIR A *zikir* is a litany formula that usually follows an Islamic prayer, but which can also be practiced at other times. The Arabic word *dhikr*, which literally means "mention," "remembrance," "evocation," or "recollection," is part of the Malay-Indonesian vocabulary, sometimes written as *dzikir*. This concept and meditation tool is commonly linked with Sufi practices. Certain words or names of God are repeated as litanies after prayer, in accordance with the Prophet Muhammad's tradition, or the teachings of Sufi orders. The most common *zikir* formulas are "God is holy" (*Subhanallah*), "All praise to God" (*Al-hamdulillah*), "God is most great" (*Allahuakbar*), and "There is no god but God" (*Lailaha-illallah*), repeated in either a low or a high voice.

The purpose of this practice is to increase piety. Since in Islam God is considered unimaginable and unthinkable, the *zikir* plays an important role in bringing one closer to or into union with God. Some *zikir* formulas also involve body movement and special breathing patterns, performed while counting beads. Correct practice is achieved when the practitioner consciously feels comfortable and at peace, which is sometimes inaccurately analogized with a state of trance. To be performed effectively, the *zikir* must be learned under the guidance of a teacher who can explain, among other things, the doctrines behind the words and the difference between the nature and essence of God.

ZODIAC SYSTEM—EAST ASIA The zodiac system popular in China, Vietnam, Korea, and Japan

has its origins in ancient East Asian cosmology, which developed during the centuries before the present era. It posits two basic complementary principles or primordial forces: yin and yang. They produce what are commonly known as the five elements: wood, earth, fire, metal, and water.

In its simplest and most familiar form, this zodiac consists of twelve signs, each represented by a different animal. The elements for which the animals serve as symbols are understood to be the twelve "earth branches." Thus, the first earth branch is symbolized by the rat (or mouse). The second is symbolized variously by the ox, the cow, or (in Vietnam) the water buffalo. The third is symbolized by the tiger. The fourth earth branch is symbolized by the rabbit in most places, but by the cat in Vietnam. The fifth earth branch is usually symbolized by the dragon, but as the system exists in Thailand the symbol is often a *naga*, a mythical aquatic beast with a more Southeast Asian ancestry. The sixth earth branch is symbolized by the snake; the seventh, by the horse; the eighth, by the goat or sheep; the ninth, by the monkey; the tenth, by the rooster; the eleventh, by the dog; and the twelfth by the pig.

A System of Symbols

But this twelve-part cycle is just one part of a larger system. These twelve earth branches operate in conjunction with ten heavenly stems. The full total cycle of twelve earth branches and ten heavenly stems provides a total of sixty units: six cycles of heavenly stems and five cycles of earth branches. (If each of the two cycles, one of ten and the other of twelve, lasts one year, the same combination [one earth branch, one heavenly stem] occurs every sixty years.)

Most people in the West think of the animals that symbolize the twelve earth branches as a means of designating years: the year of the dragon, the year of the pig, and so on. People in East Asia do this too; but they also can and do apply the entire system of categories to months, days, and even minutes for astrological and other purposes. These units are at the same time often categorized in terms of yin and yang and the five elements.

For example, all earth branches with odd numbers (represented by the rat, tiger, dragon, horse, monkey, and dog) are yang. Those with even numbers are yin. Also, the first and twelfth earth branches are associated with water; the third and fourth with wood, and so on. The five elements create and destroy each other in an eternal process. Wood produces fire, which produces earth, and so on; wood also destroys earth, which

destroys water, which destroys fire, which destroys metal. Words like "create" and "destroy" are in some sense metaphors for a wide range of relationships between "elements" that are compatible or incompatible, mutually supporting or in opposition. The five elements, like yin and yang and the signs of the zodiac themselves, are primarily systems of symbols. "Water," for example, is not necessarily and not only water. It represents a category (of actions, things, segments of time and space) that is in a predictable relationship with other similar categories that are represented by other elements or signs.

Influence in Daily Life

The earth branches and heavenly stems, coded in terms of yin and yang and the five elements, can be related to (or used to represent) stars, directions, seasons of the year, landscape features, foods, flavors, parts of the body, and many other things. The zodiac is thus linked to astrology, geomancy, health, diet, selection of a marriage partner, and the best or worst time to travel, begin building a house, or perform certain religious rituals. Thus amid all the economic growth and development of modern science and technology in East Asia, the zodiac and the ancient concepts of yin and yang are still a vital part of many people's ways of life and thought.

ZONGULDAK (2002 est. city pop 119,000). The city of Zonguldak is the capital of the province (estimated population in 2002 of 684,000) of the same name. It is located on the Black Sea coast of northwestern Turkey in the country's main coal district. The city has been inhabited since 1200 BCE. The Lydians came into power in 6 BCE, followed by the Persians around 546 BCE. Alexander of Macedon defeated the Persians in 334 BCE. Zipoetes ruled the kingdom of Bitinia around Zonguldak from 326 BCE until the Roman conquest in 74 BCE. When the Roman empire was divided into two in 395 CE, Zonguldak fell into the eastern half. Following their victory at Manzikert, the Seljuks temporarily occupied the area, but it reverted to Byzantine rule in 1086. When the fourth Crusaders conquered Constantinople in 1204, Zonguldak became part of the Nicaean kingdom until the

Byzantines reconquered it and gave it to the Genoese. Ottoman Sultan Mehmed II (1432–1481) conquered the whole area in 1461, and Zonguldak has been under Turkish rule ever since.

The city lost its economic importance during Ottoman rule and remained a small village until the discovery of coal in the second half of the nineteenth century. In 1939 after the official openings of the steel and iron plant in Karabük and the electricity-generating plant in Çatalağzı, the province of Zonguldak regained its importance. The city of Zonguldak has one of the largest ports in Turkey and houses the Technical School of Mining.

T. Isikozlu-E. F. Isikozlu

ZOPFAN ZOPFAN, the Zone of Peace, Freedom, and Neutrality, originated in a 1970 proposal by Malaysia for neutralizing Southeast Asia. The idea for such a zone has been attributed to Tunku Abdul Rahman Putra al-Haj (1903–1990), who was then a parliamentary backbencher (rank-and-file member of parliament) but later became the deputy prime minister of Malaysia. Calling for a neutrality system, the proposal had two levels of implementation. The first level specified that Southeast Asian nation-states adopt and practice nonaggression principles based on mutual respect for sovereignty and territorial integrity, as well as finding different ways and means to ensure peace and security among themselves. For the second level of implementation, the major superpowers at the time, the United States, China, and the Soviet Union, were singled out as prospective guarantors for ensuring that the Southeast Asian region would not become an arena for conflict among these major countries. Furthermore, the superpowers were also called on to implement supervisory means to ensure the neutrality of Southeast Asia. The declaration emphasized regional cooperation in economic, social, and cultural matters, as well as support for strengthening the economic and social stability of the region to ensure peaceful and progressive national development.

The Malaysian government drove the process of gaining support for ZOPFAN by first broaching the proposal at the Non-Aligned Summit in Lusaka in September 1970. In 1971, the proposal was again raised at the Commonwealth Conference held in Singapore. The Zone of Peace, Freedom, and Neutrality Declaration, Malaysia, was signed by the foreign ministers of Indonesia, Malaysia, the Philippines, and Singapore, and by the special envoy of the National Executive Council of Thailand on 27 November 1971.

The proposal and subsequent declaration by the foreign ministers, however, received only limited support from the superpowers as well as from Malaysia's fellow member states of the Association of Southeast Asian Nations (ASEAN, which in 1976 included Singapore, the Philippines, Indonesia, and Thailand, in addition to Malaysia; Brunei became part of ASEAN in 1984). Nevertheless, Malaysian officials pushed for two accords when the ASEAN member states met in Bali in 1976. These were the Declaration of ASEAN Concord and the Treaty of Amity and Cooperation signed at Bali. The two documents fell short of neutralizing the ASEAN states and the region as a whole.

Yet the second document, the Treaty of Amity and Cooperation, which is open to accession by other Southeast Asian states, was couched along lines that had been the basis of the proposal or plan for peace first mooted by Tunku Abdul Rahman Putra al-Haj. In the Treaty of Amity and Cooperation, the signatory countries agreed to be guided by the following principles in Article 2 of the treaty: mutual respect for the independence, sovereignty, equality, territorial integrity, and national identity of all nations; the right of every state to exist free of external interference, subversion, or coercion; noninterference in one another's internal affairs; settlement of differences or disputes by peaceful means; renunciation of the threat or use of force; effective cooperation among themselves.

In Chapter 4 of the Treaty of Amity and Concord, there is provision for peaceful settlement of conflict through a high council of ministerial-level representatives, which would include the parties to a dispute. The treaty has been considered a significant inter-governmental effort at initiating and achieving a Southeast Asian pact on security cooperation.

ZOPFAN has not progressed very much beyond the conceptual beginnings and terms set down during the Bali meeting in 1976. ZOPFAN remains an intra-ASEAN policy, but over the years, the principles of the proposal and the subsequent Treaty of Amity and Concord have been contravened by non-ASEAN states.

In the 1990s, there has been a call for the revival and review of ZOPFAN. Such a review, according to some analysts, should recognize that while regional cooperation on security must be promoted, the emphasis on national sovereignty severely limits the realization of ZOPFAN, which needs states to submit to a supranational authority. Furthermore, the concept of ZOPFAN seems increasingly irrelevant in the post-Cold War era. ZOPFAN is extremely limited in

the contribution it can make toward the shaping or formulation of security arrangements and other such forms of regional cooperation among the member states of ASEAN.

ZOROASTRIANISM Zoroastrianism (or Mazdaism) was born of a set of reforms attributed to the prophet Zarathushtra (in Greek, Zoroaster; traditional dates 628–551 BCE). A new ritual system gradually developed, revolving around a sacred fire, with a theology that envisions the world as an ongoing contest between good and evil. The religion originated around 1000 BCE in a pastoral society inhabiting what is now eastern Iran and Afghanistan, growing from archaic Indo-Iranian priestly ritual tradition, in which offerings of food and an invigorating plant juice (called soma in Old Indo-Iranian and Sanskrit; *haoma* in Avestan), directed to celestial divinities, were made in a ritual fire accompanied by poetic recitations. The religion survives in Iran and South Asia, with the total number of Zoroastrians worldwide at about 150,000. It is passed on mainly through family tradition; conversions are uncommon and are not sought.

Sources

Extant sources include the Avesta, compiled between the fourth and sixth centuries CE by priests, and recorded in the Avestan language by using a specially devised script based on the Aramaic script. The Old Avesta principally encompasses the *Gathas*, hymns traditionally ascribed to Zarathushtra himself and praising a supreme god, Ahura Mazda (Wise Lord; in Pahlavi, Hormazd). In language and meter they closely resemble the hymns of the Rig Veda of India, and many ideals of the Vedic religion appear in them. However in the Avesta the old Indo-Iranian gods (*daevas*) are relegated to the status of demons and are supplanted by a new class of divine entities who personify key Zoroastrian virtues. The Younger Avesta

Iranian Zoroastrian religious leader Jahangir Osheidari with Iranian president Mohammad Khatami in Tehran in October 2000. (AFP/CORBIS)

includes the *Yasbts* (hymns praising the divine entities), the *Vendidad* (a purity code), and several liturgical compilations of prayers. Only a small fraction of the original Avesta is thought to have survived.

Later but equally important are the Pahlavi texts written around the ninth and tenth centuries in the province of Fars in Persia. Notable among these are the *Zand*, a compendium of exegesis of the Avesta; the *Bundabishn*, presenting Zoroastrian cosmology and eschatology; the *Denkard* (Acts of Religion); and examples of didactic and catechistic teachings by eminent priests of the period, including the *Shkand-gumanig Vizar* (Teaching That Destroys Doubt), which demonstrates Zoroastrianism's superiority to Islam, Judaism, Christianity, and Manichaeism. In more recent centuries, collections of *Rivayat* (scholarly opinions on doctrinal, liturgical, and legal questions) have played an important role in adapting the tradition to changing times and in linking disparate communities of Zoroastrians.

The Old Persian inscriptions of the Achaemenid (sixth to fourth centuries BCE) and Sasanid (third to seventh centuries CE) dynasties provide invaluable information on the history of the tradition. Particularly important are the inscriptions of Kartir, high priest under the Sasanids, who helped establish Zoroastrianism as the state religion in the third century, and urged the vigorous suppression of other religions, such as Judaism, Nestorian Christianity, Buddhism, Manichaeism, and the Mandaean movement.

Theology and Cosmology

In the Zoroastrian religion the world is the scene of a continual struggle between truth (*asha*) and deceit (*druj*), forces personified in Spenta Mainyu (Benefi-

cent Spirit) and Angra Mainyu (Hostile Spirit; in Pahlavi, Ahriman), the children of Ahura Mazda. Alongside Spenta Mainyu are the six other Amesha Spentas (Beneficent Immortals), distinct entities embodying virtues: Vohu Manah (Good Thought), Asha Vahishta (Best Truth), Khshathra Vairya (Desirable Dominion), Spenta Armaiti (Beneficent Devotion), Haurvatat (Wholeness), and Ameretat (Immortality). Besides these, other "venerable beings" (*yazatas*) to whom *yasbts* are dedicated include Anahita, Mithra, Sraosha, and Rashnu, who sit in judgment over the soul after death; Verethraghna, who represents victory; and personifications of the sun, the moon, the star Sirius (called Tishtrya and associated with rain), and the wind.

After the soul is judged at death, it may tumble into hell, be relegated to "the region of the mixed" (limbo), or ascend via the stars, the moon, and the sun to heaven. Three days after death, the virtuous encounter their *daena*, a spiritual alter ego in the form of a girl. A final judgment is also envisioned in which a river of fire separates the good from the wicked, the world is transfigured, and the dead are revived and endowed with incorruptible bodies by means of a special offering to be performed by Saoshyant (the future savior).

Observances

Humanity, constantly faced with the choice between good and bad, true and untrue, can follow the *asha*, or truth, by adhering to the Zoroastrian purity code (canonized in the *Vendidad*) and by sponsoring performances of the fire-service (*yasna*), the central liturgy performed in the fire-temples (*atesh-gah*). The *haoma* drink, the offering itself, is prepared in the *paragra* rite. Then it is offered up while the *zot* priest recites the *yasna* chapters of the Avesta and the *raspi* priest fuels the fire.

Other important rites include the *naojot* (or *nozud*, "new birth"), the initiation of the seven- or ten-year-old child into religious responsibilities, symbolized by the putting on of a shirt (*sadre*) and waist-cord (*kusti*); *patet*, a penitential confession of sins; marriage; various purifications; and *zobr-i atash*, a funeral ceremony performed in the *dakhma* ("tower of silence"), where corpses are exposed to the elements. This latter rite involves pouring a libation of animal fat into the fire and is believed to release the soul of the deceased from the power of *druj* (implicit in bodily decay) and to send him or her along the path to heaven. The modern priestly hierarchy comprises the *mobed*, assisted by the *herbad*; major fire-temples are presided over by a *dastur*.

History

The tradition in the Younger Avesta developed under the Achaemenid empire's patronage of the priestly clan of the Magi, recorded in inscriptions of the Persian kings. In this cosmopolitan imperial setting Zoroastrianism was established more widely in Persia, in the regions of Fars and Media, and became the basis for a royal ideology, including the adoption in 441 BCE of the Zoroastrian calendar.

This period ended with Alexander of Macedon's conquest of Iran (323 BCE). In the following Seleucid period (312–246 BCE), when Alexander's generals ruled over large areas of his former empire, Hellenistic culture was an important influence in Zoroastrian circles, and Zoroastrian ideas were carried westward. They took the form of the mystery religion of Mithras in Greece and played a role in the development of dualistic Jewish and Christian doctrines. In the east Zoroastrianism interacted with Buddhism.

In the early third century CE Zoroastrianism was reestablished as the state religion of the Sasanid dynasty in Iran. After the Arab conquest of the seventh century, this period was remembered as a golden age, before Islam became the dominant religion. Despite the loss of many faithful to Islam, Zoroastrian culture remained vibrant, yielding a prolific literature in Pahlavi.

Attempts at revolt against Arab hegemony, however, led to repression, and from the tenth century, many Zoroastrians began an exodus to India, settling mainly along the western coast. These Parsis ("Persians"), as they are known in India, prospered and became the primary caretakers of the tradition. Toward the end of the fifteenth century formal contacts (in the form of *rivayat*) were forged between the Parsis and the remaining Zoroastrian communities in the regions of Yazd and Kerman in Iran.

Under British colonial rule in India the Parsis had a privileged position, and many became prosperous merchants and financiers. At the same time, the tradition was confronted with a welter of religious practices and theologies, leading to disputes between reformists and conservatives. The study of the Avesta by Western philologists beginning in the eighteenth century also gave rise to doctrinal disputes.

In 1947 with the partition of British India, the Parsis found themselves further separated into a small Pakistani community in Karachi and Lahore and the more numerous groups in India, with the largest concentration in Mumbai (Bombay). International conferences of Zoroastrians began to be held in 1960, as

the Zoroastrian community found itself becoming further dispersed internationally. Today the tradition continues its efforts to sustain the priesthood and adapt its traditions to new circumstances.

ZUO ZONGTANG (1812–1885), Chinese military leader and statesman. Born into a scholarly family in Hunan Province in 1812, Zuo Zongtang studied works in the fields of history, classics, geography, and agriculture in his early years. He participated in military affairs in 1852 in the campaign against the Taiping Rebellion and soon displayed his military ability and sagacity. In 1863 he was promoted to governor-general of Fujian and Zhejiang Provinces and remained in this position until 1866. During this period, Zuo founded China's first modern dockyard and naval school in Fuzhou. In 1866 Zuo was appointed governor-general of Shaanxi and Gansu Provinces to suppress the Muslim rebels there. Between 1868 and 1880, Zuo suppressed Nian rebels in Shandong Province and Muslim rebels in northwestern China and consolidated China's northwestern frontier. He militarily sustained China's negotiation with Russia in recovering Yili, a Chinese territory occupied by Russia during the Muslim rebellion. He also carried out several important economic reforms, including the encouragement of the cotton industry in Xinjiang and mobilizing soldiers to farm unused land. In 1881 Zuo was appointed to serve in the Grand Council of the central government. Later, in 1884, he was once again

put in charge of all military affairs of China during the Sino-French War (1884–1885). After a settlement between China and France was reached, Zuo Zongtang died on 5 September 1885.
