- 1137 Geoffrey of Monmouth writes the *History of the Kings of Britain*, which includes the first major literary treatment of legendary King Arthur.
- c. 1150 Alan of Lille writes *The Complaint of Nature*, a Latin philosophical dream vision that influences medieval writers such as Jean de Meun and Chaucer.
- c. 1150–c. 1179 Hildegard of Bingen, the German abbess of a convent on the Rhine, writes medical treatises, lapidary books, accounts of her mystical visions, *Scivias*, and lyrical hymns.
- c. 1155 The Norman chronicler Wace incorporates inventive embellishments such as King Arthur's "Round Table" and the sword "Excalibur" into his verse narrative, *Le Roman de Brut*.
- c. 1160–c. 1180 Marie de France, the earliest known secular medieval female author, composes her *Lais* (a collection of twelve short story-poems based on traditional Breton tales).
- c. 1170–c. 1190 German minnesingers (lyrical poets) such as Walter von der Vogelweide begin to write lyric love poetry in the manner of the French troubadours.
- c. 1170–c. 1185 Chrétien de Troyes, the father of medieval romance, writes a series of long verse narratives on Arthurian subjects.
- c. 1185 Under the patronage of Marie of Champagne, Andreas Capellanus writes the *Art of Courty Love*, which influenced the depiction of love in romances and lyric poetry.

- 1200–1235 Robert de Borron and other French writers contribute to the *Vulgate Cycle* of Arthurian romances, incorporating new details about Lancelot and Guinevere and the Grail Quest.
- c. 1200 In France, short, clever, and generally bawdy narratives known as *fabliaux* are first composed, preparing for the bourgeois realism of Chaucer in the *Canterbury Tales*.
- c. 1201–  
c. 1207 The Spanish heroic poem *El Cid* is composed in written form from Latin chronicles and the oral songs of *jongleurs* on the pilgrimage route to Santiago de Compostela.
- c. 1201 Layamon retranslates Wace’s *Roman de Brut* into Middle English alliterative poetry, introducing the motif of Arthur’s prophetic dream before Mordred’s treachery.
- c. 1220–  
c. 1230 The German writer Wolfram von Eschenbach “translates” *Aliscans*, a twelfth-century French *chanson de geste*, into the hybrid heroic romance *Willehalm*.
- c. 1230–  
c. 1235 Guillaume de Lorris writes the first 4,000 lines of the dream vision *Romance of the Rose*.
- c. 1275 Jean de Meun adds almost 18,000 lines to Guillaume de Lorris’s allegorical *Romance of the Rose*, adopting a more satirical tone and adding philosophical and social commentary.
- c. 1280 *Njáls Saga*, the most complex of all the Icelandic family sagas, portrays a violent blood feud and documents the transition of Iceland from pagan Germanic beliefs to Christianity.
- c. 1292–  
c. 1295 Dante Alighieri writes the *Vita Nuova*, a collection of love lyrics to his muse Beatrice.
- c. 1314–  
c. 1320 Dante Alighieri writes the *Divine Comedy*, an epic allegory portraying a visionary journey through *Inferno* (“Hell”), *Purgatorio* (“Purgatory”), and *Paradiso* (“Heaven”).
- c. 1330 The so-called “Harley Lyrics,” a collection of Middle English political, devotional, and love poems, are recorded in the Harley manuscript (British Library MS Harley 2253).
- c. 1341 Giovanni Boccaccio writes two important texts in Italian about characters from Greek history, *Il Teseide* about Theseus and *Il Filostrato* about the Trojan War, which become the sources for Chaucer’s *Knight’s Tale* and *Troilus and Criseyde*.
- 1350 In England, the alliterative Middle English dream visions *Winner and Waster* and the *Parliament of Three Ages* address the pressing post-plague economic issues.
- c. 1350 In Spain, Juan Ruiz writes the *Book of Good Love*, a story collection incorporating various genres, loosely connected by the theme of sacred and profane love.
- c. 1351 Giovanni Boccaccio’s *Decameron* records the ravages of the Black Death, which furnishes him with the premise of his framed story collection.
- c. 1360 The anonymous *Alliterative Morte Arthure*, a poem describing King Arthur’s death, is composed as part of the Middle English “Alliterative Revival.”
- c. 1365 William Langland writes the A Text of *Piers Plowman*, focusing on the everyday political and economic life of man in society. It will be revised and expanded into the B Text (1377) and the C Text (1380s), with more emphasis on the quest for spiritual perfection.
- c. 1375 An anonymous author composes the Middle English alliterative romance *Sir Gawain and the Green Knight* and the allegorical dream vision *Pearl*.
- c. 1380 Geoffrey Chaucer adapts *Troilus and Criseyde* from Boccaccio’s *Il Filostrato*, heightening courtly love elements and incorporating Boethian passages about fate and predestination.
- c. 1385–  
c. 1400 Geoffrey Chaucer, the “father” of English poetry, assembles the *Canterbury Tales*, a

- framed story collection illustrating most late medieval literary genres.
- c. 1390– John Gower writes *Confessio Amantis*, a
  - c. 1393 Middle English story collection of biblical, classical, legendary and popular narratives, employing the frame device of a lover confessing to his priest sins committed against love.
  - c. 1404– Christine de Pizan, the first professional
  - c. 1405 female writer in Europe, composes *The Book of the City of Ladies*, an allegorical
- vision including stories about exemplary women.
- c. 1455 Johannes Gutenberg invents the moveable type printing press, essentially replacing hand-copied manuscripts with cheaper and more plentiful books, now available to a broad popular audience.
  - c. 1469– Sir Thomas Malory composes a prose
  - c. 1470 version of the corpus of Arthurian legends, which will be edited and published in 1485 by the early printer William Caxton.

## OVERVIEW of Literature

**TRIBES INTO NATIONS.** Medieval literature must be understood in relation to its Roman heritage. When the Germanic peoples (Goths and Vandals, among others) coming from eastern Europe overthrew the Roman Empire in the fifth century C.E., they also destroyed the idea of political identity, because during the period of the empire all persons had been citizens of Rome. With the breakdown of Roman rule and order came a new system of tribal alliances in which small bands were commanded by warrior leaders. These warrior groups did not imagine themselves as members of a single large geographic entity, and their history was that of a tribe, not a nation. Accordingly, the concept of French or English or Italian states, each with a national literature, does not really appear until about 1100. From the establishment of the Frankish Empire under Charlemagne in the ninth century through the end of the period in the fifteenth century, medieval “Europe” represents less a group of separate national cultures than a single international cultural network within which individual developing nations mutually borrowed, imitated, and reworked their respective literary and artistic forms, which evolved sometimes directly from, and sometimes independent of, their Roman heritage.

**THE MONASTIC CONTRIBUTION.** With the loss of the Roman social system in the fifth century, culture and the language arts were largely preserved by Christian monasteries from the sixth century onward; culture then was associated with Latin, the language of the Western church. Monasteries copied and preserved manuscripts that they loaned to other monasteries so that classical texts and contemporary religious works, such as lives of the saints and writings of the church fathers, multiplied. Indeed, the Rule of St. Benedict, which gave guidelines for the organization and daily practice of monastic life, specified that monks should engage in the copying of books. The fostering of Latin among both educated secular people and those in religious life meant that ancient writing, such as the poetry of the Roman authors Ovid and Vergil, and the prose of Cicero, was the object of study and im-

itation in whatever new writing was done. Often these new compositions were not attributed to the persons who had actually done them, and many works passed under the names of Ovid and Vergil that were clearly medieval in date. In the cathedral schools established in the ninth century throughout Charlemagne’s empire, students learned to read and write Latin by studying Roman authors; thus, the literary forms and language of the Roman world took on great authority. Writings about law, theology, medicine, politics, philosophy, and literature, ranging in date from Boethius’ *Consolation of Philosophy* (c. 520) to Alan of Lille’s *Complaint of Nature* (c. 1150), were all written in Latin, which became the universal language of the literate minority of the population.

**ORIGINS OF VERNACULAR LITERATURE.** Around the tenth century, the first vernacular literatures—that is, literatures in developing regional languages like French, English, German, and Italian—began to appear out of an oral rather than a written culture. The two earliest extensive literary works in Old French, *La Chanson de Roland*, and in Old English, *Beowulf*, with surviving manuscripts dating from about the year 1000 (though the events they describe occurred several centuries earlier) evidently were performed for audiences gathered perhaps after dinner to hear of stirring adventures at courts of the nobility. Both of these works are examples of one of the most popular genres or literary types in the earlier Middle Ages: the *chanson de geste* or heroic poem, recounting the military deeds of a national hero like Charlemagne or some of his knights like Roland, or *Beowulf*’s combats with supernatural creatures intent on destroying the tribes in the poem of that name.

**ORAL POETRY.** These early poems were preserved in the oral tradition through memorization by entertainers, such as the *scop* or minstrel mentioned in *Beowulf*, who recited and perhaps even performed them. Thus, oral forms of composition and performance became part of early medieval popular writing, and “literature” tended to be the province of storytelling entertainers rather than of writers working on their own in private. This communal, oral culture valued collective experience and the description of external events over inward or meditative analysis of personal feelings. Rather, in the early Middle Ages, when people listened to stories—recited from memory or read to them from a prepared text—they liked to hear accounts of the marvelous or the fantastic or exotic on the one hand and the didactic and morally improving on the other. So a poem like the Old English *Beowulf* mixes stories of dragons with speeches about the ethical conduct the ruler owed to his followers, and the Old French *Song of Roland* mixes descriptions of exotic

Moors (strange largely because they are not Christians) with a story of God's raising of the hero Roland to heaven after he has fallen in combat. Even late in the Middle Ages, when reading became more commonplace, ordinary people as well as the nobility often retained "lectors" to read aloud to them, either because they could not or preferred not to read for themselves. Also, since the organization of living space in medieval castles or houses afforded little privacy, there was little private reading.

**THE ROLE OF AUTHORITY.** The study of ancient authors in schools and religious foundations and the rise of popular oral poetry together had another effect on the development of national literatures in Europe. The authorial originality modern readers have come to take for granted—the experimentation with plots and situations, with the sounds and meanings of words, and the creation of new characters and forms in verse and prose—was very late in occurring. Nothing is known of the "authors" of either the *Song of Roland* or of *Beowulf*. Indeed, even their dates of composition are uncertain. Medieval writers and readers typically favored reworked rather than "original" plots, situations, and genres. Instead of authorial originality, medieval literary culture emphasized the concept of authority—in Latin *auctoritas* (a word expressing "origination," responsibility, support, and power)—of the literary texts and authors who came before them. A common metaphor was that medieval writers thought of themselves as dwarves standing on the shoulders of the Roman "giants" who had preceded them. Thus, for the Italian Dante Alighieri (1265–1321), the greatest author and authority was his Latin predecessor and literary model Vergil, the writer of the classical epic the *Aeneid*. Dante designated Vergil (spelled "Virgilio" in the Italian text and "Virgil" in English translations) as his guide through the circles of Hell in *The Divine Comedy*, a lengthy narrative allegorical poem describing the adventures of a "pilgrim" as he travels through Hell, Purgatory, and Heaven in search of salvation and spiritual understanding. Similarly, for Guillaume de Lorris and Jean de Meun, the authors of the Old French thirteenth-century allegorical poem *The Romance of the Rose*, the great authority was Ovid, especially his *Art of Love*. The English poet Geoffrey Chaucer (1342–1400) took over many plots and stories from earlier Latin and vernacular literature, translated *The Romance of the Rose* into Middle English, and saw several earlier writers—some French like Guillaume de Machaut (1300–1377), some Italian like Dante and Giovanni Boccaccio (1313–1375)—as his masters or "auctours" while writing his *Canterbury Tales*, a collection of stories purportedly told by a group of pilgrims riding together to the shrine of St. Thomas Becket at Canterbury.

**THE COMING OF ROMANCE.** Two strains of literature develop side by side, then: one in the non-Latin or vernacular languages—those spoken in French, English, Italian, German, Scandinavian, or Spanish regions—and one in Latin. The latter included both the irreverent and comic "Goliardic" poems of learned wandering students and the serious and philosophical poetry of more established clerical authors, often teachers of rhetoric. In time, however, with the rise in literacy and feelings of regional identity among all classes, vernacular literatures came to eclipse those in Latin. Literary types like the short formal lyric, for example, which had earlier been composed in Latin, merged with an oral tradition of popular songs to create vernacular lyrics and even an unusual combination called the macaronic lyric, in which lines alternated among as many as three languages (usually French, Latin, and English). One of the first assaults on the primacy of Latin as a literary language came with the spread of French after the Norman Conquest of 1066. When the Normans—Scandinavian Vikings who had settled in Normandy (now northern France) in 911—conquered England in 1066, their French, called Anglo-Norman, displaced Anglo-Saxon, or Old English, as the language of educated people and the governmental elite. Thus the people of England, as well as those in France, were able to appreciate the extensive body of French literature that was developing, reaching its high point in the courtly romance, a genre that celebrated the values of the more centralized aristocratic system that had replaced earlier tribal social organization. These poems are associated especially with the Continental French writer Chrétien de Troyes (1165–1191), but they spread quickly as a popular form in England where the aristocracy was eager to reinforce its sense of historical legitimacy. Such romances tell stories of chivalry dealing with great heroes of the Crusades, knights of Arthur's Round Table, or such characters from classical antiquity as Alexander the Great. This form was like the modern novel, and it remained perhaps the most widespread literary genre from the late twelfth century through the fifteenth.

**ANONYMITY AND FAME.** That Chrétien de Troyes' name was connected to his romances is unusual in the history of medieval literature, much of which is anonymous. Indeed, aside from Chrétien, the Anglo-Norman Marie de France (fl. 1160–1210), and some poets writing in Celtic languages, such as the Welsh Rhirid Flaidd (c. 1160), very few names can be attached to works in the early medieval period. There are several causes for this anonymity. One, of course, is the tradition of "authority" that made it desirable to claim to be retelling a story from a reputable source. Another is the fact that texts and

documents were preserved only in laboriously hand-copied manuscripts, carefully written on parchment made of the skins of sheep and goats. In order to be copied, a document had to be considered worthy of this extremely expensive and time-consuming process, which, during the earlier Middle Ages, was almost entirely under the control of the scriptoria in monasteries. Clerical writers would have been discouraged from the vanity of attaching names to their works, and monastic scribes, in general, were not very interested in preserving the identities of secular authors. Somewhat later, when orders for manuscripts came from aristocratic courts, there was often more incentive to preserve the name of the patron who sponsored the work than that of the author who wrote it. It was not until after 1300 that the idea of the “author” as we understand it—particularly in the sense of a self-conscious first-person narrator who seems to have some existence in the real world—became common. When Dante (1265–1321) writes about his love for Beatrice in his collection of lyric poems the *Vita Nuova*, it is clear that these are new poems written from the experience of a particular individual living in Florence and loving a real woman, however idealized she may be in the poems. Likewise, when Boccaccio (1313–1375) joins together one hundred tales supposedly told by a group of young people who have fled the city to avoid the plague, the stories are clearly a fictional work from the hand of a single author, who has planned his manuscript and expects it to enter history in the form in which he conceived it. The French poets Guillaume de Machaut (1300–1377) and Jean Froissart (1337–1404?) are known to have personally planned and supervised the production of manuscripts of their works, and, by the end of the century, Geoffrey Chaucer (1340?–1400) wrote short poems complaining of errors in spelling and meter made by his scribe. Near the end of his life Chaucer even wrote a retraction apologizing for the over-worldly poetry of his youth, taking for granted the fact that he will have a permanent reputation. This public self-consciousness and awareness of oneself as a poet with an audience marks the beginning of the modern era in literature.

## TOPICS in Literature

### IDENTITY AND AUTHORITY

**FOUNDING HEROES.** When the term “Middle Ages” was first used in the eighteenth century, it was in-

Men in 15th-century dress illustrate a classical text. *Le Livre de Valerius Maximus*, London, British Library MS, 1479. © THE BRITISH LIBRARY/HIP-TOPHAM/THE IMAGE WORKS.

tended to refer negatively to the long period of European history between the fall of the great civilization of classical (Roman) antiquity in the fifth century and the “rebirth” of cultural greatness in the Italian Renaissance of the early fifteenth century. What this terminology acknowledges is the fact that in the period immediately preceding the Middle Ages, a void had been created by the disintegration of the centralized government of the Romans, leaving most of Europe under the control of tribal peoples with no written literature and no continuity of tradition in a geographically or culturally identifiable location. Thus, the early history of literature in the Middle Ages is in many ways the story of people seeking to define and justify their cultural identity. As the peoples of each region became conscious of themselves as a group distinct from others, they transmitted myths of origin involving a founding hero, passing them on orally within the areas of shared language that would eventually be recognized as countries. In some cases this figure was adapted from classical Greek stories, Homeric and Vergilian accounts of the fall of Troy where the Trojan heroes were dispersed throughout the world; the word “Britain,” for example, comes from the name “Brutus” and “France” from “Francus.” In other cases, the heroes were homegrown, such as Britain’s Arthur and France’s Roland. As their stories began to be organized

## TECHNICAL Terms in Medieval Literature

**Alliterative Revival:** Use of the Anglo-Saxon alliterative poetic line, featuring three to four repetitions of words having the same initial consonant or vowel per line, in fourteenth-century Middle English poems, such as *Sir Gawain and the Green Knight* and *Piers Plowman*.

**Comitatus:** The early medieval heroic code practiced by male members of a communal group, defined by a reciprocal relationship in which the lord offered material rewards and a social identity in return for his thanes' military and political allegiance.

**Contrapasso:** The method used by Dante in the *Divine Comedy* to allocate appropriate punishment for sin, where the punishment suits the sin by being its ironic opposite.

**Courtly love:** The term coined by Gaston Paris in the nineteenth century to describe *fin'amors* (refined love), the extremes of devotion and psychological suffering experienced by male protagonists for their ladies in medieval romances and lyrics, as codified by twelfth-century writer Andreas Capellanus in his *Art of Courtly Love*.

**Dolce stil nuovo:** The "sweet new style" of Italian love lyrics in the thirteenth century, mirroring the themes of the troubadours of Provence, used by poets such as Dante and Guido Cavalcanti.

**Fortune's Wheel:** The popular medieval allegorical construct to explain cyclical human misfortune, caused by the turning of a wheel by blindfolded Lady Fortune, on whose "Wheel of Fortune" all men are situated, rising high upon or being cast off of the wheel (regardless of their merits or evil actions) according to their current state of luck.

**Four-fold medieval allegory:** Four levels of medieval allegorical interpretation: 1) the literal level, 2) the allegorical level, 3) the tropological or "moral" level, 4) the anagogical or eschatological level, about the afterlife.

**Kenning:** An oral-formulaic phrase used in Anglo-Saxon poetry that employs juxtaposed words as metaphors to imagine familiar objects in a new way, such as "whale-road" (the sea), "earth's candle" (the sun), and "ring-giver" (king).

**Laissez similaires ("similar stanzas"):** Repeated verse stanzas used to emphasize important and dramatic scenes in French *chansons de geste* and other heroic narratives.

**Litotes:** The rhetorical device of ironic understatement employed in northern European literature of the Middle Ages, especially in *Beowulf* and other Anglo-Saxon poems and the Icelandic Sagas.

**Locus amoenus:** Literally the "beautiful place," the locale of most medieval romances, the opening of dream visions, and the troubadours' *chansons d'amour*, featuring soft spring breezes, flowing water, blooming flowers, budding greenery, and the songs of birds.

and then written down in a cultural climate that honored the "authority" of the past (both classical and biblical), they served as the nucleus for thematic clusters known as "matters," the chief examples being the matter of France, the matter of Britain, and the matter of Rome or antiquity.

**THE MATTER OF FRANCE.** The matter (*matière*) of France provided the plots of many Old French *chansons de geste* (heroic poetry), such as the *Song of Roland*, a poem composed around 1100 which contributed immeasurably to the developing consciousness of what it meant to be French. Based on an historical episode in 778 in which Charlemagne's nephew Roland was killed in an ambush as he was returning home from an unsuccessful campaign against the Saracens (Islamic Moors) in Spain, the poem recounts the heroic defense of a pass in the Pyrenees Mountains by the small French rearguard (with 20,000 men) against the overwhelming Saracen forces (400,000). With its tales of such originary figures as Roland, Charlemagne, and William of Orange, the

matter of France not only created the substance of French literature of the early Middle Ages, but also was imported by other national cultures. For example, by the thirteenth century, many of the tales of Charlemagne and his Twelve Peers (or companions) were translated into prose in the Old Norse *Karlamagnus Saga* (Charlemagne's Saga), while Wolfram von Eschenbach similarly adapted for a German audience the cycle of *chansons de geste* about William of Orange in his *Willehalm*.

**STORIES OF KING ARTHUR.** The "matter of Britain" made King Arthur first a national hero in England, the equal of Charlemagne in French culture, and later a literary figure of international stature. In his twelfth-century *History of the Kings of Britain*, Geoffrey of Monmouth built upon and embellished earlier fragments of texts documenting a sixth-century Saxon warrior named Arthur, who achieved success in battles against the Romans and other neighboring tribes. Geoffrey created a full biography of the reign of the now familiar King Arthur, complete with some of this matter's

**Matter of Britain:** Stories about King Arthur and the Knights of the Round Table, which contributed to the development of romance and made Arthur first a national hero in England and later a literary figure of international stature.

**Matter of France:** Tales of such originary figures in the development of French national culture as Roland, Charlemagne, and William of Orange, contributing especially to the genre of *chanson de geste*.

**Matter of Rome the Great and Antiquity:** The broad category of plots about classical antiquity in Greece, Troy, Rome, or Northern Africa, retold in medieval vernacular romances such as the French *Roman de Thebes* and Boccaccio's *Teseide*.

**Minnesingers (German: *Minnesänger*):** Singers about *Minne*, which means "love," such as Walter von der Vogelweide; the German equivalents of the French troubadours and trouvères, who developed the themes of *fin'amors* in German lyrics.

**Oral-formulaic tropes:** Poetic stock phrases that could be recalled easily or recombined to invent new lines if the *scop* (the Anglo-Saxon minstrel) forgot a line during performance or needed to fill out the meter in a new passage.

**Reverdie:** A term in Middle English meaning "re-greening," celebrating the reappearance of spring after a long winter, employed to start a lyric poem or song, or to open a love poem or dream vision.

**Sapientia and Fortitudo:** "Wisdom and fortitude," a combination of discretion and cleverness with physi-

cal strength and bravery, which contributed to successful lordship or heroism in early medieval literature.

**Seven Deadly Sins:** The Roman Church's designation of the seven most serious sins—Pride, Wrath, Avarice, Envy, Gluttony, Lust, Sloth—used by medieval writers to organize sections of their literary works.

**Story collections:** Anthologies of various separate stories that circulated together in a reasonably coherent form, organized around a theme or involving a framing device.

**Translatio studii:** Reflecting the Latin root of "translate," meaning "to carry across," the transfer of the plot and characters of a tale produced for the audience of one national culture in an earlier period to that of another culture in a later period by medieval writers, involving significant changes in the plot and original roles of the characters as well as the very genre that the model text represented.

**Troubadour or Trouvère:** Poets, respectively from southern and northern France, attached to particular courts and patrons or wandering from court to court, who composed a new style of lyric love poetry with complex stanzas and rhyme patterns, especially the *chansons de croisade* and the *chansons d'amour* from the twelfth century onwards.

**Vernacular:** The language of a national culture of medieval Europe—French, English, Spanish, Italian, German, Norse—as distinguished from the language of learning and the medieval Roman Church, Latin.

most memorable characters, including Uther Pendragon, Merlin (the magician and sage counselor of Arthur), and Morgan le Faye (Arthur's antagonistic half sister). Among his accounts of other authentically historical British monarchs, Geoffrey placed the largely fictive story of King Arthur. Already in twelfth-century France, in the earliest examples of the romance genre (a type of long, episodic narrative poem), Chrétien de Troyes created narratives about Arthur and his knights of the Round Table. Indeed, stories of this "matter of Britain" were retold and amplified by romance writers in France, England, Germany, and elsewhere in Europe throughout the Middle Ages, as well as during the Arthurian revival (called "medievalism") of the late eighteenth and nineteenth centuries.

**THE MATTER OF ROME THE GREAT.** Although in modern times writers are often praised for the originality or the novelty of their plots and characterizations, these qualities were not much valued in the Middle Ages since it was believed that truth lay in stories and situa-

tions that had been tested and refined through the passage of time and filtered through tradition. Thus, the "matter of Rome the great" was not exclusively the early history of the region that would eventually become Italy. Rather, this broader category of plot source generally comprised various stories about classical antiquity in Greece, Troy, Rome, or Northern Africa. One of the most popular bodies of material concerned the heroes of the ancient Theban dynasties, whose tragic history was told first in Latin in Statius' *Thebaid* (c. 91 C.E.), then later retold in medieval vernacular (non-Latin) poetry such as the French *Roman de Thebes* (1152) and the Italian poet Giovanni Boccaccio's epic about the war between Athens and Thebes, the *Teseide* (The Tale of Theseus; late 1339–1341), the source story for the English writer Chaucer's *The Knight's Tale* (early 1380s). Another large subject that belonged to the matter of antiquity was the Trojan War and its aftermath, originating in Vergil's *Aeneid*, passed on in Latin versions of Homer, and then portrayed respectively in the French

## LITERARY Genres in the Middle Ages

**Allegory:** A narrative mode in which abstract ideas are presented either through personifications (that is, characters who embody ideas like Truth or Justice) or through concrete, realistic characters and situations that have an additional layer or layers of symbolic meaning, even though they operate within a literal plot that makes sense in and of itself.

**Aubade or Aube or Alba:** Literally a “dawn song,” a type of troubadour lyric in which lovers lament the coming of the dawn because they must part after a night of clandestine lovemaking.

**Breton lay:** A short verse narrative, exemplified by the *Lais* of Anglo-Norman poet Marie de France, which were originally performed orally in the Breton language and were transformed into written narratives from the twelfth-century onward, featuring rash promises, erotic entanglements, an ambivalent code of ethics, and a strong supernatural strain.

**Chanson d’amour:** A troubadour love song in which the vocabulary expressing the roles of the lover and the beloved echoes the terminology of lordship so that the beloved lady plays the role of the haughty “domna” (female “lord”) to the poet, her vassal.

**Chanson de geste:** Literally “song of deeds or exploits,” a type of French heroic verse narrative of the eleventh through thirteenth centuries, based on earlier oral accounts, recounting heroic deeds in warfare, often connected with the Crusades.

**Dream vision:** A medieval poetic genre consisting of a narrator’s account of his unusual dream, provoked by his physical surroundings or bedtime reading matter, in which he is often visited by a male or female authority figure who issues guidance or advice. These narratives treated such themes as love, philosophical and spiritual issues, and contemporary mores, often from a satirical perspective.

**Eddic Poetry:** Heroic and mythological lays composed in medieval Scandinavia in freeform or varying meters, based on Germanic legends and mythology about the pagan northern gods.

**Fable (Animal)** A story in prose or verse in which animals speak and act as people, with an attached moralization. The fox, called “Reynard,” was the most popular medieval fable character.

**Fabliau:** A brief tale, most often in French, set in the present-day world, populated by stock bourgeois characters, employing clever, complicated plots (often love triangles) about humankind’s most basic functions, especially sex.

**Goliardic poetry:** The irreverent and comic poems of learned wandering students, and the serious and philosophical poetry of more established clerical authors, often teachers of rhetoric.

**Icelandic family sagas:** Tightly structured, complexly plotted thirteenth-century heroic prose narratives composed from earlier oral accounts, depicting the blood feuds and other events that happened during the settlement of Iceland as a colony of Norway in the tenth and eleventh centuries.

**Marian lyrics:** Medieval religious lyric poetry written especially in France, Italy, and England devoted to veneration of the Virgin Mary, featuring some of the same tropes used to honor the courtly lady in the *chansons d’amour* of the troubadours and other medieval lyric poets.

**Pastourelle:** Literally, a “song about a shepherdess,” a short, dialogue-filled, narrative account in verse about a courtly knight’s attempt to seduce an innocent, but clever shepherdess.

**Romance:** Episodic narratives composed in verse or prose throughout Europe from the twelfth through fifteenth centuries, whose plots derive from the various “Matters” of France, Britain, Rome, or antiquity and involve a high degree of fantasy and sometimes the attainment of love in a search or quest, as well as the testing of the prowess or morality of their knightly heroes. Romances explored the emotions of their protagonists in a way that heroic narratives avoided.

**Saint’s life:** A medieval narrative about the life of a saint or virtuous person; also known as hagiography.

**Skaldic poetry:** Verse composed in medieval Scandinavia that employed an erudite, specialized vocabulary in a highly complicated syntax.

*Roman d’Eneas* (1160), Boccaccio’s *Philostrato* (The One Laid Low by Love; late 1330s), and Geoffrey Chaucer’s *Troilus and Criseyde* (early 1380s). The matter of antiquity similarly informed the plots and characters of many individual romances about the exploits of Alexander the Great, Queen Dido of Carthage, and other figures or events of Greco-Roman or North African history.

## HEROIC NARRATIVE

**WAR AND REPUTATION.** Throughout the Middle Ages, but especially in the earlier centuries, literary texts composed in poetry and prose and produced in the British Isles, Scandinavia, and throughout Continental Europe reflected both the dominant warrior culture and the emerging ideals of personal reputation and honor. Such literary works typically celebrated the exploits of larger-than-life, hyper-masculine legendary heroes who fought monsters, battled the enemies of Christianity, and often died tragic martyr-like deaths. In heroic tales and in a variation on the genre in French culture, the *chansons de geste* (songs of deeds), the establishment and maintenance of the hero's reputation (the hero's *los* or *pris* in French) was the driving force inspiring the extraordinary feats and physical exploits by which the male protagonists earned their heroic credentials. Such heroes were expected to display a balance of *fortitudo* (physical courage) and *sapientia* (discretion and wisdom). The tragic downfall of the hero often occurred because of an imbalance of these epic virtues, when his discretion waned and he displayed overweening pride in his physical prowess. In the *Song of Roland*, for example, Roland does not heed the cautions of his companion Oliver and delays calling for help until it is too late. Except for emphasis on such single character traits, however, the usually anonymous authors of heroic narratives paid little attention to the psychological motivations of their male protagonists, who demonstrated less emotional interiority and soul-searching than did their later chivalric romance counterparts. Nor were these heroes' exploits literally spurred by an interest in wooing a fair damsel or saving her from distress. Indeed, in these early heroic narratives love and the softening presence of women were almost completely absent. Typically, little to no information was provided about wives, sweethearts, or other emotional entanglements that might distract from the heroic imperative to perform mightily against almost impossibly dangerous foes, often in the interests of preserving physical security or in defense of their Christian faith.

**THE HEROIC NARRATIVE IN ENGLAND: BEOWULF.** The harsh conditions of early medieval life placed a premium on small tribal units of warriors and an overlord who repelled the raids of neighboring groups and made frequent forays of their own. Early heroic literature celebrated their exploits and memorialized their deeds for later audiences in what has been called "the tale of the tribe." Social conditions, then, led to the rise of a literature peculiarly fitted to immortalizing the heroes of such social units. In English, the first of these heroic narratives was the Anglo-Saxon alliterative poem

*Beowulf*, which is preserved in only one manuscript (now at the British Library), a miscellany (anthology) of stories of monsters, marvels, exotic locales, and fantastic creatures of huge size. Although it is the earliest major literary text produced in England, this story is actually set in Denmark and other Scandinavian locales. Before it was copied into the manuscript in its present form, the poem now known as *Beowulf* underwent many oral and possibly written revisions during a period from about the seventh to the eleventh century. *Beowulf* celebrates the heroic exploits of its title-hero, who is endowed with youth and superhuman strength, especially a mighty grip. These attributes enable Beowulf to rescue the court of the aged Danish king Hrothgar from the ravages of the semi-human monster Grendel, whose ancestry is traced to the biblical character Cain, Adam's "bad" son. Grendel has terrorized and gruesomely killed Hrothgar's retainers, called *thanes*, who nevertheless remain loyal to their chief despite decades of Grendel's murderous, nightly raids on their residence in Hrothgar's mead hall Heorot. The interior of the hearth-lit Heorot represents a haven of social solidarity, physical safety, and celebratory male bonding that contrasts with the brutally harsh winter landscape outdoors. The thanes' life-risking loyalty was part of the early medieval heroic code practiced by male members of a communal group known as the *comitatus*. In the *comitatus* the thanes were bound to their overlord in a special reciprocal relationship in which the lord offered material rewards and a social identity in return for his thanes' military and political allegiance.

**REPETITIONS AND REINFORCEMENTS.** The structure of *Beowulf* reflects not only the simple social life of raiding, distributing booty, and feasting, but also the recurring need for the social values of bravery and measured judgment. The poem has three episodes recounting the hero's contests against three increasingly ferocious monsters. After slaying Grendel, Beowulf and the overconfident Danes are startled out of their victorious complacency by an even more brutal retaliatory attack by Grendel's mother, who kills one of Hrothgar's most valued thanes. Beowulf follows Grendel's mother to an underwater cavern, clearly a monstrous parallel to Hrothgar's Heorot. After defeating this grotesque female in her lair and beheading Grendel, a more difficult struggle than his first monster fight, Beowulf returns a hero to his homeland, the kingdom of the Geats, which is ruled by another king named Hygelac. The hero eventually succeeds Hygelac on the Geatish throne. Following fifty years of successful rule, Beowulf finds himself in a similar position to that of Hrothgar at the poem's beginning when the Geats are attacked by a fire-breathing dragon. Instead of following Hrothgar's example of

## THE Tradition of Alliterative Poetry

The literature of the Old English period, lasting roughly until about 1100, had certain distinguishing characteristics, one of the most important of which was the use of alliteration, instead of rhyme, to organize poetic lines. Early medieval verse was presented orally, and sound was as important as sense, so alliteration, the repetition of an initial consonant or vowel in a succession of several words, was an effective technique that was common not only in Old English (a Germanic language that had been brought to Britain by the Angles, Saxons, and other invading tribes beginning in the middle of the fifth century), but also in French and Spanish poetry of this period. *Beowulf* was composed in the Anglo-Saxon alliterative line with three stressed words per line beginning with the same initial sound, and alliteration continued to be used sporadically in English poetry even as the language evolved into Middle English (highly influenced by the French spoken by the ruling class) after the Norman Conquest in 1066. An example from this period is Lawman's thirteenth-century Arthurian poem, *The Brut*. The tradition of alliterative verse became hugely popular again in the second half of the fourteenth century in what some scholars refer to as the "Alliterative Revival" when some of the most beautiful sounding, as well as intellectually challenging, poems in various genres were rendered in alliterative verse. Prominent examples from romance are *The Alliterative Morte Arthur* and *Sir Gawain and the Green Knight*, in which a description of Gawain's travels over cliffs in strange countries, far from his friends, illustrates the power of the alliterative line:

Mony klyf he overclumbe in contrayez straunge,  
Fer floten from his frendez fremedly [as a stranger] he  
rydez. (713–714)

Dream visions in alliterative verse include *Pearl* and *Piers Plowman*, while allegorical and philosophical poems include *Winner and Waster* and the *Parliament of Three Ages*.

admitting his limitations, elderly Beowulf insists on fighting the dragon alone when his loyal retainer Wiglaf—a version of himself in his heroic youth—offers to oppose the dragon's venomous flames on his behalf. The old hero succumbs to the monster's venom as young Wiglaf ultimately slays the dragon. The poem ends with

a fiery Viking funeral as Beowulf's now leaderless and vulnerable subjects mourn their king's passing. If Beowulf's attempt to brave the dragon against impossible odds was motivated by pride, his behavior was nevertheless consistent with the heroic ideal. It may, however, be significant that the poem does not eulogize its title hero with the trope "That was a good king!" which had been repeated several times throughout the poem to characterize successful, praiseworthy kings such as the Dane Scyld Scefing. Another ambiguity of the poem's thematic meaning is its use of Old Testament biblical references (for example, the mention of Cain), which are intermingled with pagan values in a way that suggests contact with, but not full conversion to, Christianity.

**LITERARY AND HISTORICAL SIGNIFICANCE.** Often considered the first great poem in English literature, *Beowulf* is important not only for the story it tells but for its literary qualities as well. Composed and later written down in the language of the Anglo-Saxon tribes who had begun settling in England in the middle of the fifth century, the poem makes skillful use of the distinctive qualities of this Germanic dialect (commonly called Old English), which had a strong stress accent on the first syllable of most words and a tendency to express new ideas through compounding. As the poem was recited, perhaps to the accompaniment of a harp, listeners gathered in a hall would hear the insistent repetition of initial sounds (known as alliteration), which drew attention to key words (usually three to a line). Alliteration also helped the poet to remember the text (3,182 lines in its final form), which was probably passed on, in its early stages, only through memorization. The success of *Beowulf* lies, to a great degree, in its skillful use of oral-formulaic phrases called *kennings* like "whale-road" (the sea) and "ring-giver" (king), which are often concealed metaphors which cast a sharp light on a familiar subject or allow the listener to imagine it in a new way. Thus, the ship travels on the sea just as the whale swims on a "path." Or, when Beowulf speaks, he "unlocks his wordhoard" to give out words just as the lord gives out to his followers rings or other gifts. This diction, then, expresses the values of the society.

## HEROIC LITERATURE IN MEDIEVAL SCANDINAVIA

**CULTURAL TRADITIONS OF THE VIKINGS.** During the ninth and tenth centuries, migrating northern tribes, now referred to as the Vikings, sailing in lightweight but sturdy and swift longships, invaded almost all regions of Europe, including Russia (named for the rus', the red-haired Scandinavians who settled there), northern France (named Normandy for the "northmen" who settled there), England, Scotland, and Ireland. These Norsemen traded as far east as Byzantium and also forayed westward, to Iceland, Greenland, and as far as North America. The threat of the Vikings unified the formerly disorganized group of competing tribes and small kingdoms of Britain under Alfred the Great (871–899), king of Wessex, who successfully resisted the Viking incursions with military force in 878 and created a fleet of ships, the foundation of the British navy, to defend southern England against the seafaring might of the northern invaders. Eventually, an uneasy peace was reached, with the Norsemen controlling the eastern half of England and Alfred and future Anglo-Saxon kings dominating the rest of the country. The extent of Norse influence on England's literary and linguistic development is measured by the fact that the first major literary work, *Beowulf*, is about Scandinavian tribes, not the original inhabitants of Britain, and there are many Scandinavian loan words in Old English. However, the Vikings did not participate in the mutual imitation of literary forms that took place in other areas of Europe throughout the period. In fact, the literature produced far to the north of central Europe on the remote Scandinavian Peninsula does not parallel whatsoever most of the other medieval genres produced in England and on the Continent. Although some works originated on mainland Scandinavia, the majority of the greatest literary works were produced in Norway's tiny, even more remote, westerly island colony of Iceland, which was settled about 870. By 1000, Iceland had adopted Christianity as its official religion, which had a profound influence on the content of the literary texts produced.

**SCANDINAVIAN LYRIC POETRY.** Like the very early literary works of many other nations, such as those of ancient Greece, some early Scandinavian lyric poems reflected their culture by incorporating polytheistic theological explanations of the world, involving the exploits of gods who were like men, while others tended to emphasize formal concerns, including the intricacies of language itself. Whereas the rest of Europe developed lyric poetry that celebrated courtly love or devotion to the Virgin Mary, the earliest surviving texts in verse written

in the Old Norse language are poems of two distinct types: Eddic and Skaldic poetry. Eddic poems, composed in freeform or varying meters, were heroic and mythological lays (songs) based on Germanic legends and mythology about the pagan northern gods. The Eddic poems incorporating these myths and legends include two major works: *Völuspá* (Sibyl's Prophecy), the history of the world predicted by a sibyl, from creation to Ragnarök, the end of the world when the sun turns black, fire engulfs an earth declining into total darkness, and the gods fall; and *Hávamál* (Words of the High One), a didactic poem wherein Odin instructs mankind about correct social conduct and interaction between the sexes and explains about runes (mystical sayings inscribed using ancient Germanic script) and magic. Composed before the settlement of Iceland, the *Hávamál* as well as these other Eddic poems were handed down orally until they were recorded later in Iceland. This process parallels the development of heroic literature in England and on the Continent where oral versions of the Beowulf story or Roland's tragic stand against the Saracens circulated for sometimes hundreds of years before the texts known to modern readers were established in manuscript form. Unlike the less formal Eddic poetry, Skaldic poetry was much stricter in its poetic technique, employing an erudite, specialized vocabulary in a highly complicated syntax. The most talented skald was Egil Skallagrímsson, whose life was celebrated in *Egil's Saga* (c. 1230), one of the finest Icelandic or family sagas. As recounted in *Egil's Saga*, good poetry could be literally lifesaving. One of this Viking-poet's most successful poems was *Head Ransom*, composed around 948, when Egil was imprisoned awaiting execution by King Erik Bloodaxe, who then ruled in York. The night before the execution, this skald composed a poem honoring Bloodaxe which so pleased his captor that he granted him his head as a reward, hence the poem's title. Although they may have been written on the Scandinavian Peninsula, Eddic and Skaldic poems are nevertheless preserved only in manuscripts found in Iceland.

**DEVELOPMENT OF PROSE GENRES IN MEDIEVAL SCANDINAVIA.** In addition to poetry, prose genres developed in medieval Scandinavia to a greater degree and earlier than they did on the Continent or in England, apparently out of a desire to record significant historical events, especially accounts of the settlement of Iceland and the reigns of Norwegian kings. For example, the *Landnámabók* (Book of Settlements) details the history of the settlement of Iceland, while *Heimskringla* (Orb of the World), written by Snorri Sturluson (1179–1241), recounts the history of the kings of Norway up to 1184. This writer also composed the *Prose Edda*, a handbook

on the use of literary language, which is an important source of heroic tales of Germanic pagan gods and the human heroes of northern legend. However, the most distinctive literary form that developed in Scandinavia was the saga, a unique kind of prose narrative invented in Iceland (hence they are often referred to as “Icelandic” sagas) during the twelfth through fourteenth centuries. The Old Norse word *saga* literally means “something said,” an indication of the ultimate oral origins of most of the narratives that comprise the body of the sagas. As in other national cultures in Europe in the period, accounts of the exploits of noteworthy men or events have always supplied subject matter for orally delivered entertainment or instruction. From such oral narratives, which were amplified, embellished, and transmitted by skilled tale-tellers over the course of several centuries, the written saga evolved.

**THE INFLUENCE OF CHRISTIANITY.** With the coming of Christian missionaries to Scandinavia, the more advanced Latin culture provided the tools for further development of indigenous literary forms. Although “runnic letters” (from a Teutonic alphabet of characters composed of straight lines suitable for inscriptions in stone, metal, or wood) had been employed to convey information in Scandinavia from very early times, runes had not been used to record any lengthy story or even poem since this mode of writing was too cumbersome for communicating anything of considerable length in a manuscript. This situation changed, however, when, after some initial resistance by those favoring the old pagan Germanic faith, Christianity was legally adopted as the state religion of Iceland in 1000, bringing with it the Latin alphabet and manuscript tradition. Following conversion, the clerkly culture, featuring the use of Latin, the language of the medieval Christian church, was introduced into Iceland. Inhabitants of Iceland quickly absorbed the newly adopted ecclesiastical and secular literature. Aided by the far-flung travels of the Vikings, the newly literate Icelandic writers were further exposed to literary genres practiced and themes depicted in other vernacular languages of Europe. The new learning did not eliminate interest in the old largely heroic saga-themes; rather, elements from Continental romance, hagiography (accounts of the lives of the saints), and other forms were grafted onto the traditional saga-lore. Even the pre-Christian mythology, which earlier had been an essential ingredient of the work of Icelandic poets, was not entirely replaced by the imagery of the new religion. Although the Icelandic sagas effectively superimposed Continental Christian influences upon traditional local subject matters, there was always a tension between the pre- and post-Christian materials.

**THE ICELANDIC SAGAS.** If the sagas, which are the crowning literary achievement of medieval Scandinavia, shared some elements with other medieval heroic texts, their style and content nevertheless stood apart from any other heroic literature produced in medieval Europe. Sagas give the impression of being reliable historical or biographical accounts. However, fact and fiction often are seamlessly blended in these prose narratives, and many sagas resemble modern historical novels more than any expected medieval genre. Moreover, exploiting a variety of influences from abroad, saga style was quite elastic, making possible the development of various sub-genres. Kings’ sagas present imaginatively constructed biographies of medieval Norwegian monarchs. “Sagas of Ancient Times,” such as the *Saga of the Volsungs*, recreated in prose the kinds of traditional heroic legends from mainland Norway that had been treated by the Eddic poets and the Skalds. Exposure to Continental genres resulted in new hybrids: sagas inspired by characters from the *chansons de geste*, such as *Charlemagne’s Saga*; sagas influenced by romances about Arthurian characters like Tristan and Isold, such as *Tristan’s Saga*; and Ecclesiastical sagas, inspired by Continental religious writings and hagiography, that deal with the conversion of Iceland to Christianity and the biographies of various Scandinavian bishops.

**THE ICELANDIC FAMILY SAGA.** The sub-genre for which the sagas are best appreciated and most famed is the “family” saga. These largely thirteenth-century narratives skillfully shaped the traditional oral accounts of the social, legal, and religious practices of Icelandic clans (who had originally settled Iceland in the tenth and eleventh centuries) into tightly structured, complexly orchestrated written texts. In general, saga style is plain and terse. Sentences are short, vocabulary is limited, syntax is simple, the plot moves quickly, and the expected repetitive embellishments of other European medieval heroic narratives are noticeably absent. With little extraneous depiction of places or people, the use of descriptive adjectives is quite sparing. Yet character development is typically vivid, relying on revealing statements made by the individuals themselves in the sagas’ extensive use of dialogue, on the actions of the characters, and on brief but pointed summary characterizations made by the usually disinterested narrator. Even these instructive pieces of dialogue, used solely to further the action, are themselves characteristically and disarmingly pithy, exemplifying the literary figure of *litotes* (ironic understatement). A good example of this stylistic feature is the statement made in *Njáls Saga* by Skarp-Hedin when he is about to be burned to death by his enemies and admits casually that his “eyes are smart-

*a PRIMARY SOURCE document***AN ICELANDIC BLOOD FEUD**

**INTRODUCTION:** This passage reveals the complex chain of violence provoked in Icelandic blood feuds, the wry, ironic understatement [litotes] employed in the discourse of saga heroes like Skarp-Hedin, and the impact of Christianity on both the history of Iceland and the content of the sagas.

[Flosi said], "There are only two courses open to us, neither of them good: we must either abandon the attack, which would cost us our own lives, or we must set fire to the house and burn them to death, which is a grave responsibility before God, since we are Christian men ourselves. But that is what we must do."

Then they kindled a fire and made a great blaze in front of the doors. Skarp-Hedin [Njal's son] said, "So you're making a fire now, lads! Are you thinking of doing some cooking?"—"Yes," said Grani, "and you won't need it any hotter for roasting."—"So this is your way," said Skarp-Hedin, "of repaying me for avenging your father, the only way you know; you value more highly the obligation that has less claim on you."...

[B]efore those inside knew what was happening, the ceiling of the room was ablaze from end to end. Flosi's men also lit huge fires in front of all the doors. At this the womenfolk began to panic.

Njal said to them, "Be of good heart and speak no words of fear, for this is just a passing storm and it will be long before another like it comes. Put your faith in the mercy of God, for he will not let us burn both in this world and in the next." Such were the words of comfort

he brought them, and others more rousing than these. Now the whole house began to blaze. [Njal negotiates for the release of women, children, and servants from the blazing house. He, his wife Bergthora, and their grandchild lie down on their bed beneath an ox hide and are not heard again. Skarp-Hedin climbs along the wall, looking for an escape.]

Gunnar Lambason jumped up on to the wall and saw Skarp-Hedin. "Are you crying now, Skarp-Hedin?" he said. "No," said Skarp-Hedin, "but it is true that my eyes are smarting. Am I right in thinking that you are laughing?" "I certainly am," said Gunnar, "and for the first time since you killed [my uncle] Thrain."—"Then here is something to remind you of it," said Skarp-Hedin. He took from his purse the jaw-tooth he had hacked out of Thrain, and hurled it straight at Gunnar's eye; the eye was gouged from its socket up to the cheek, and Gunnar toppled off the wall.... [T]hen, with a great crash, the whole roof fell in. Skarp-Hedin was pinned between roof and gable, and could not move an inch.

[The next morning, upon learning that one man, Kari Solmundarson, had escaped from the burning building, Flosi, the leader of the burners, speaks:] "What you have told us," said Flosi, "gives us little hope of being left in peace, for the man who escaped is the one who comes nearest to being the equal of Gunnar of Hlidarend in everything. You had better realize, you Sigfussons, and all the rest of our men, that this Burning will have such consequences that many of us will lie lifeless and others will forfeit all their wealth."

ing." In sagas, the mundane details of daily life are never extraneous, but always anticipate some important event or the climax of the plot, which is almost always gruesomely violent. The sagas feature extremes in behavior and emotional range. Plots rarely recount great, history-changing events. Rather, they create moving tragedy out of the petty banalities of everyday life—breaches of loyalty and friendship that result in family feuds and ensuing vengeance, which in turn lead to the tragic destiny of one of the protagonists. Characters either intensely love or hate one another, with little neutral feeling in-between. By showing how ordinary events can unwittingly be pushed to an extreme that provokes significant consequences, sagas express marked sympathy for and understanding of human tragedy.

**THE SCANDINAVIAN BLOOD FEUD.** What perhaps renders sagas most unique compared to heroic literature in the rest of medieval Europe is that their plots are punctuated by a phenomenon endemic to Scandinavian culture: the blood feud. This social practice requires that a slain character's kin either retaliate against a family member of the offending clan—the new victim must be of equal rank to their lost member—or collect substantial financial remuneration for their loss. The blood feud motivates a degree of physical violence that is extreme even for the medieval romances and *chansons de geste* that were familiar in the rest of Europe, whose audiences were accustomed to exaggerated numbers of anonymous knights being slain on the battlefield. Indeed, sometimes this "eye for an eye" mentality triggers ever-escalating waves

of deadly retaliation. In some sagas, this acceleration of violence culminates in a killing that not only exceeds the legal “rules” of blood feud, but also so shocks the local community by its savagery that it is declared “murder.” Technically the worst conceivable violent crime in a close-knit community tightly bound by kinship bonds, murder merits a penalty even worse than death—the social ostracizing of the perpetrator as a declared “outlaw.” This plot line characterizes some of the best family sagas, such as *Grettir’s Saga*, about the outlaw Grettir the Strong, an analogue of *Beowulf*; *Laxdaela Saga*, a romance-influenced multi-generational tragedy whose female protagonist Gudrun is one of the toughest, most desirable, and most vividly realized women in medieval literature; and *Egil’s Saga*, the biography of the cantankerous Viking-skald Egill Skallagrímsson.

**NJÁL’S SAGA: A NEW CHRISTIAN SENSIBILITY.** Both the traditional influence of the blood feud and the impact of European missionary activity can be seen in the longest Icelandic family saga, *Njál’s Saga* (1280), which is now also generally considered the greatest example of the genre. Judging from its survival in 24 manuscripts—the largest number of any of the sagas—this work was also appreciated as a masterpiece in its own age. Its plot revolves around the enduring friendship between two great heroes: Gunnar, a valorous, yet somewhat naive youth, and Njál, a wise older man, highly respected as a community leader, who possesses prophetic gifts. Eventually both of them die heroically. The saga’s first third introduces Gunnar of Hlíðarend and his courtship and disastrous marriage to the beautiful but proud and fiercely vindictive woman Hallgerd, whose initiation of a series of retaliatory killings between the two friends’ households threatens to provoke a breach in the friendship between Gunnar and Njál. However, through their self-restraint and mutual loyalty, the friendship, though extremely strained, never falters. After Gunnar’s death, Hallgerd continues to fuel the families’ blood feud by provoking her son, son-in-law, and lover to continue to harass and goad Njál’s clan. Escalating tensions climax in the intentional burning of Njál’s house while he and all his family members, including his wife, adult sons, and little children, are inside it. Since the saga includes an account of Iceland’s conversion to Christianity and miracles that occur at the battle waged by the Vikings against the Irish at Clontarf (1029?), the voluntary fiery death of the priest-like Njál suggests the Christian martyrdom characteristic of the medieval saint’s life elsewhere in Europe. Indeed, Njál’s son, Skarp-hedin—in most respects a Beowulf-like figure—brands crosses into his flesh while he endures the burning, thus introducing Christological motifs into the

saga. Ultimately, the deaths of Njál and his family were probably interpreted by contemporary audiences as either a kind of Christian martyrdom, expiation for sins of violence endemic to the old culture, or as the irrational acts of doomed and perhaps despairing heroes. Among the sagas, *Njál’s Saga* is preeminent for its masterly characterization, tight plot structuring, and such memorable scenes as Gunnar’s last heroic defense in his house at Hlíðarend and the burning of Njál’s homestead. These attest to the saga-writer’s skill at creating effective fiction. On the other hand, this work can also be appreciated for its presentation of important moments in Icelandic history and its accurate treatment of the development of Icelandic law.

#### THE HEROIC NARRATIVE IN FRANCE

**A NEW HISTORICAL CONTEXT.** The concern for history illustrated in the Icelandic sagas takes a somewhat different form in France, where a new political and economic system was evolving. Three centuries after the disintegration of the Roman Empire, a system of centralized rule re-emerged in the area of Western Europe now known as France when a dynasty of successful kings, the Carolingians (named after founder Charles Martel, whose Latin name was Carolus), capitalized on remaining links to Roman civilization through alliances with the popes of Rome and churchmen in England and created new political institutions. Culturally, the most important innovation was a system of social, political, and economic relationships of mutual dependency between the kings and their *fideles* (“faithful men”) known as *comitatus*. By the tenth century, this system of dependency involved the rulers and their *vassalli* (“vassals”) or *homines* (“men”), retainers who exchanged military service for political protection and social benefits conferred by their temporal lords within the complex social-political-economic hierarchy. These *homines* or retainers paid *homage* to their

lords by providing military service in exchange for an estate of land or property, the *feodum* (“fief”) from which some historians termed this mutual hierarchical relationship “feudalism.” As in Anglo-Saxon literature, where narratives illustrated the virtues of *comitatus*, the emerging literary forms of France demonstrated the values of their social system through the heroic behaviors of characters who participated in this arrangement. The poems often centered on Charles Martel’s grandson, the illustrious Charlemagne (768–814) or *Carolus Magnus* (Charles the Great; *le-magne* means “the Great” in Old French).

**MODELS OF LEADERSHIP.** The key to Charlemagne’s “greatness” was his ability to put into practice the heroic formula for successful lordship: *sapientia* and *fortitudo* (wisdom and fortitude). He achieved a reputation for *sapientia* by his encouragement of letters and the arts, an overall program continued by subsequent Carolingian kings (sometimes called the “Carolingian renaissance”). He demonstrated his *fortitudo* by successfully waging warfare for conquest and plunder on many fronts, especially against Saxons in England and the Avars in the southeast. Even if Charlemagne’s war against the Spanish Muslims in Andalusia was not a military success, the adventures of his vassals in this campaign provided the raw material for the creation of the quintessential heroic literary form of medieval France, the *chanson de geste* (song of deeds or exploits). Although some of these “songs of deeds” stemmed from oral accounts about major heroic figures like Charlemagne, most were devoted to the exploits of less famous figures like William of Orange, about whom a series of these heroic poems eventually were written (the *William of Orange Cycle*, the most important of which is *Aliscans*). However, the subject of the primary exemplar of the genre was a relatively minor figure, Charlemagne’s nephew Roland, who led the rearguard in an otherwise historically insignificant skirmish, the battle of Roncesvalles in 778, an event which Einhard, a scholar in residence at Charlemagne’s palace school, mentions only briefly in his biography of the emperor.

**THE CHANSON DE ROLAND (THE SONG OF ROLAND).** The extraordinary appeal of the *chanson de geste* entitled the *Chanson de Roland* probably arose in part from its connections with two major movements of the tenth and eleventh centuries: the Crusades against the Muslim Arabs in the Holy Land and the popularity of pilgrimage to the shrine of St. James of Compostela. The entrapment of Charlemagne’s nephew Roland in a mountain pass in the Pyrenees range dividing southern France from Spain was a minor incident within the con-

Jongleurs dancing on wooden stilts. London, British Library MS Additional 11695, folio 223, 12th century. © TOPHAM/THE IMAGE WORKS.

text of an ongoing, several-centuries-old animosity between the Christian Franks of France and the “Saracens,” North African Muslims who had colonized Spain. In some sense this story reflects microcosmically the cultural and religious clash between European Christians and Muslim Arabs that was to be played out on a large scale in Jerusalem with the calling of the First Crusade in 1095. As it happened, the story underwent two centuries of oral development before this event, in large part because the same mountain pass in which Roland’s battle against the Saracen emir Marsile took place was part of the on-land pilgrimage route to the shrine of St. James in Compostela, one of the most popular pilgrimage destinations in medieval Europe. For the entertainment of the steady stream of penitents traveling to Compostela beginning in the tenth century, oral tales concerning Roland’s tragically heroic defense in a nearby locale, which was now a part of local folklore, circulated and were performed by *jongleurs* (entertainers) along the pilgrim routes. Thus, by the time the poem was written down around 1100, it was both well known and rhetorically polished, offering a perfect vehicle for Crusading propaganda. Pope Urban II’s request in 1095 to European kings for military support for a holy war initiated

a chain of obligation-fulfillment between lords and vassals that soon had many members of the knightly class traveling to Jerusalem to wage war on the Muslim “infidels.” With its Christo-centric pronouncement, “The pagans are wrong; the Christians are right,” the *Chanson de Roland* supplied in literary form the kind of propaganda that was necessary to help inflame Crusading zeal and to galvanize and popularize the war effort that temporarily united a previously divided Europe against a common enemy.

**POLITICS AND TREASON.** Even with its political appropriateness and folkloric appeal, the *Chanson de Roland* would not, of course, have been able to fulfill its role of inspiring greatness if it did not illustrate the kinds of troubling situations and complex moral issues that challenged contemporary warriors. In this sense, then, the term “songs of deeds” can be somewhat misleading. To be sure, the *Chanson de Roland* contains numerous “deeds”—the mutual “slashing and bashing” of evenly matched warriors and many almost mindlessly repetitive scenes deployed in *laissez similaires* (“similar stanzas” like those also found in Spain’s *El Cid*), that depict Christian Frankish combatants pitted against sometimes outrageously exoticized Saracen warriors, who mutually exchange brutal physical blows. But, more importantly, in the *Chanson de Roland* one also finds interesting scenes that not only reveal the politics of medieval lordship in action, but also depict the homosocial comradeship that bound medieval warriors to one another through their mutual obligations of fealty. This is similar to the *comitatus* ideal described between Beowulf and his retainers or between Beowulf and Hrothgar in the English heroic poem *Beowulf*. The subtleties of medieval politics are exemplified in *Roland* in the complex machinations that occur at the council held by Charlemagne in the poem’s opening. Here the Franks argue about continuing their seven-year-long (and thus far unsuccessful) campaign against the Emir Marsile of Saragossa. Roland, one of the youngest at the council, speaks rashly out of turn, urging their continued effort and, after being denied the mission himself (he is deemed too brash for the delicate diplomacy necessary to the negotiation), he nominates his stepfather Ganelon to serve as Charlemagne’s envoy to the Saracen camp. Suspecting his nephew’s motives, for this has the possibility of being a death mission, Ganelon becomes enraged and vows revenge. Ganelon misrepresents Charlemagne’s terms to the Saracen emir, betrays the Franks to Marsile for financial gain, and ensures his nephew’s defeat in the narrow pass of Roncevalles by nominating him for rear-guard duty in a military trap planned in collusion with the Saracens. This aspect of the story, then, is an *exem-*

*plum* of a failure of loyalty, where a retainer allows his personal antipathy to outweigh his duty to his overlord and to a comrade in battle. The scenes of Roland’s defeat reinforce the listener’s sense of horror at Ganelon’s crime, and the ending of the story provides a lesson in justice. After being tried for treason—the worst crime in the fellowship-oriented ethos of the *chanson de geste* genre—Ganelon is hanged, drawn, and quartered.

**COMRADESHIP AND LOYALTY.** The positive values of comradeship are also present in the poem. The loyalty between men at arms is exemplified in the intense friendship between the hero Roland and his friend, Oliver. This relationship anticipates the chivalric relations between Arthur and his Roundtable knights depicted in the romance genre that was invented in France in the twelfth-century narratives of Chrétien de Troyes. In a dichotomy similar to the simplistic one that distinguished between pagans and Christians, the Roland-poet characterized the two comrades thus: “Roland is brave; Oliver is wise”—a variation on the heroic “sapientia and fortitudo” ideal. Roland may be courageous, but his valor entails a good degree of proud folly when, as it becomes obvious that his army cannot prevail against the Saracen troops, he refuses to heed Oliver’s “sage” advice to sound his horn for help from Charlemagne. Later, when his depleted troops number only seventy and Roland rethinks his position about seeking help, Oliver scorns Roland’s plan. Distinguishing between “prudent valor” and “recklessness,” Oliver claims that if they called for aid now they would lose “los” (renew), the driving force that motivates not only the vassals in the *chansons de geste*, but also the Roundtable knights in the soon-to-be-developed Arthurian romances. Admitting that Oliver is right, in a series of moving *laissez similaires*, Roland nevertheless blows the horn so hard that he bursts the veins of his temples. In the ensuing attack of the Saracens, when Oliver is severely wounded, the blood running into his eyes blinds him and he strikes inadvertently at the weakening Roland. Oliver dies in his comrade Roland’s arms and when the French are outnumbered 40,000 to 3, Roland again feebly sounds his horn. After breaking his beloved sword Durendal so that the enemy cannot confiscate it, Roland dies extending his right hand toward Heaven. Angels bear Roland to Paradise, the promised reward for all loyal Crusaders.

**PASSION AND THE GRAND GESTURE.** As full of “deeds” and broadly drawn differences as their plots are, these heroic poems are also characterized by a depiction of human passions and motives that is intriguing but somewhat baffling, conveying well the inscrutable and perhaps ultimately unknowable causes of their protagon-

nists' behavior. What triggered the evident but unexplained animosity between Roland and Ganelon? Why does Ganelon betray kin and country? What personal hubris (pride) prevents Roland from sounding the horn? The poet leaves these motives unexplored and ultimately elusive. This opaque mode of characterization would change with the advent of romance, which intimately explores the inner workings of the knightly protagonists' minds and the sentiments of their hearts. But the *Chanson de Roland* is a poem full of grand and, if not subtle, then unforgettable gestures: Ganelon's flinging of his cloak and backing up against a pine tree; white-haired, silver-bearded, 200-year-old Charlemagne's brooding, almost mythic stroking of his long beard; Roland's pathetically overdue sounding of the horn. It is also marked by touching moments between two male heroes, Roland and Oliver, whose friendship and mutual loyalty ultimately outweigh any differences of opinion they have about military strategy—the same homosocial affinity that saved the strained friendship of Gunnar and Njál in *Njál's Saga*. Although little is made of the relationship in the poem, Ganelon's sister Aude had been betrothed to Roland, and upon hearing of his death, Aude herself dies. One of the greatest changes in the literary treatment of the chivalric knightly ethos that occurs with the rise of the romance genre is the new prominence given to love relations between men and women. Given this same plot, Chrétien de Troyes would have made much more of the Roland-Aude courtship than the Roland-poet could ever care about.

## THE HEROIC NARRATIVE IN SPAIN

**THE MULTICULTURAL INFLUENCE IN MEDIEVAL SPAIN.** While the emphasis on group deliberation and the successful trial of Ganelon in the *Chanson de Roland*

suggests a move towards universal law that supersedes the blood feud of the Scandinavian sagas, the heroic narrative in Spain even more clearly shows an intense interest in the development of a legal system, one of a number of literary themes that arose from the area's unique blend of Eastern and Western cultures. From the mid-eighth century—when a renegade from the Abbāsīd dynasty in Persia, Abd al-Rahman I, brought an army to Spain, took possession of Córdoba, and proclaimed himself “emir” (commander) of al-Andalus—Muslim influence became firmly established in the Iberian Peninsula. The Muslim conquest of Spain was accompanied by the transmission to that region of the cultural flowering that had occurred in the eighth through ninth centuries under the Abbasids in Persia, when a widespread effort to translate the great advances in science, medicine, mathematics, astronomy, and philosophy from Greek and Indian sources was undertaken. Great strides were also made in the development of legal treatises and commentaries on laws regarding taxation, religious practices, and rules of warfare. Under the Islamic emirs, medieval Spain was a rich cultural and ethnic mix of Muslims, Christians, and Jews, with over seventy-five percent of the population in al-Andalus (which took in most of the peninsula except for the small Christian kingdoms in the north) being non-Islamic. Resistance to the emirate began with the Christian king Alfonso II of Asturias (791–842), who modeled his reign on that of Charlemagne to the north. Alfonso's descendents, particularly Alfonso VI (1065–1109), moved the capital of his kingdom from Oviedo to León where they erected churches, endowed monasteries, and encouraged literature and the arts to flourish. Moreover, after centuries of isolation from the rest of Europe, starting in the tenth century and continuing throughout the Middle Ages, northern Spain became the destination of pilgrims from all corners of Europe who journeyed there to visit the shrine of St. James at Compostela, contributing further to the rich cultural mix that characterized medieval Spain. Along the pilgrim routes that extended through France over the Pyrenees, the *chansons de geste* were performed orally by French and Spanish jongleurs (entertainers). The reign of Alfonso VI coincided with the period of the First Crusade, when Christian knights were under the obligation as vassals to fight for the pope against Muslim possession of the Holy Land. This constellation of influences—the free intermixing of Christians and Muslims in Spain, the themes of the literary works performed along the pilgrim route, the longtime tradition of caliphate encouragement of interest in laws and legal practices—were uniquely melded into a historical figure who would become the hero of Spain in its national epic.

## HEROIC Literature in Ireland and Wales

Just as early medieval literary audiences in England, on the Continent, and on the Scandinavian peninsula (and its colony Iceland) favored long heroic narratives, the same pattern predominated in medieval Ireland and Wales, two remote areas having few direct connections to English and Continental literature. These regions, whose cultural roots lay in the mythology of the Celtic tribes that had colonized these areas centuries earlier, produced works in the heroic mode that later were incorporated into developing Arthurian romances. For example, in Ireland, the great cycle of saga-like stories about such Celtic heroes as the “Hound of Ulster,” Cúchulain—involving cattle-raiding, chariot-fighting, and beheading enemies—comprised a collection now generally referred to as the *Táin*. Like its Anglo-Saxon, Continental, and Scandinavian parallels, the *Táin* evolved out of oral celebrations of regional mythology from six centuries earlier and was collected in written form starting in the twelfth century in *The Book of the Dun Cow*. One of the *Táin*’s heroic tales, *Bricriu’s Feast*, may have contributed the beheading motif to *Sir Gawain and the Green Knight*. In medieval Wales, the equally ancient Celtic oral tales of the *Four Branches of the Mabinogi*, involving interactions between the human world and that of Celtic faery, began to be written down in the eleventh century in a work that has come to be called the *Mabinogi*. Some parts of this collection were clearly sources for Chrétien de Troyes’s romances, *Erec and Enide* and *Yvain*.

**THE CAREER OF “EL CID.”** Rodrigo Díaz de Vivar, whose exploits won him the title *Mio Cid* or “My Lord,” was banished twice as an outlaw (from 1081–1087 and from 1089–1092) by Alfonso VI, king of León. In many respects, true to the traditional profile of career outlaws, Rodrigo hired himself out as a mercenary knight for both Christian and Muslim sides in the various wars that occurred during Alfonso’s reign. In the first exile, Rodrigo served the Moorish emir Mu’taman of Saragossa in wars against his brother and the count of Barcelona. In the second banishment, Rodrigo captured the count of Barcelona and besieged the Moorish city of Valencia, taking possession of it in 1094 and dying there in 1099. After Rodrigo’s widow Jimena Díaz

buried him in the monastery of San Pedro de Cardena near Burgos, Valencia fell again to the Muslims. Out of these rather mundane threads of an outlaw’s life was spun a rich literary tapestry and the greatest heroic narrative of medieval Spain.

**THE POEM OF EL CID.** Although it is liberally embellished with fictional elements, the oldest nearly complete medieval epic of Spain, *The Poem of El Cid*, like its literary relation the *chanson de geste*, is deeply rooted in historical fact. However, the mode of development of the work, from oral narrative to written epic, resembles the pattern of the *Roland* and the more folkloric, supernatural *Beowulf*. From a few bare facts the poetic treatment of El Cid’s career as an outlaw warrior developed in Latin chronicles and songs delivered by *jongleurs* (entertainers) to amuse visitors to Rodrigo’s tomb. Sometime between 1201–1207, a century after the events which it portrays, the poem as it is known by modern scholars was most likely composed by a monk at the abbey at Cardena, who may have been exposed to French heroic poems such as *The Song of Roland* and the William of Orange Cycle, which were performed for entertainment along the enormously popular pilgrimage route to the shrine of Saint James at Compostela. Blurring the historical facts through the lens of fiction, the Spanish poet invents several pivotal characters who enliven his plot either by befriending the hero—his right-hand man Álvar Fáñez—or by providing conflict for the protagonist—two obscure and cowardly Leónese minor nobles, known in the poem simply as the Infantes of Carrión. These villains marry El Cid’s daughters and later brutally dishonor them by stripping them of their outer clothes and leaving them in a forest; thus the Infantes provoke the delayed vengeance of their father-in-law, a highlight of the poem.

**THE STRUCTURE OF EL CID.** From the outset, one of the distinctive cultural features of *El Cid* is its setting in a society with a highly developed “court” system where many people serve as the king’s advisors, seeking to be among his favorites and thus receive lands and benefits. The poem’s overlapping double plot, structured over three divisions or *cantars* (songs) which may have been orally performed on three separate occasions, concentrates chiefly on El Cid’s second term of exile, purportedly instigated by false accusations about him made by jealous courtiers. The first plot depicts the hero’s dishonorable exile and his gradual political rehabilitation, achieved by his strategic cunning, his display of physical prowess, and the favor of his Christian God towards him in a series of successful military campaigns against the Moors in the first *cantar*. In an epic exag-

generation the Christian Cid loses only fifteen followers while the enemy Moors suffer thirteen hundred fatalities, yet the defeated Moors respect him so much that they are sorry to see him leave. In the second *cantar*, El Cid vindicates his personal honor, achieving a royal pardon for his triumphant capture of Valencia and, yielding to the king's will, marrying his daughters to the Infantes of Carrión, even though he knows that these alliances will lead to trouble in the future. The importance of the theme of courage as the distinguishing characteristic of the hero is emphasized at the beginning of the third *cantar*, which opens with an invented but powerfully effective episode in which the cowering Infantes physically disgrace themselves at the sudden appearance of an escaped lion. When El Cid so intimidates the lion that he is able single-handedly to recapture and cage the beast, he thus increases his own already considerable fame while disgracing his cowardly sons-in-law. The Infantes subsequently avenge their shame by abducting their wives, stripping them of their outer clothing, beating them brutally, and leaving them for dead in the wild oak forest. El Cid's nephew returns the hero's daughters to their grateful father, who brings a lawsuit against his sons-in-law in the king's court. Here the heritage of the caliphate interest in legal issues reflected in a major section of the plot can be seen. Because the king had arranged the marriage between the Infantes and El Cid's daughters, he shares the dishonor of his vassals. The trial culminates in a judicial combat between three of El Cid's followers, who successfully champion his suit against the Infantes and their family, defeating them in the field. In addition to receiving financial compensation from the Infantes, the hero is further honored at the story's end when the king arranges for El Cid's daughters' marriage to the princes of Navarre and Aragon. The poem's structure well displays in Rodrigo's behavior the hero's possession of *fortitudo* (physical courage) in the conquest of Valencia and the lion episode. El Cid exhibits *sapientia* (wisdom, discretion) in the self-restraint he shows in electing to prosecute rather than physically attack the Infantes, which causes them to lose more honor. The trial, a highlight of the text for the original audience, reflects the cultural inheritance of Muslim learning.

## ORIGINS, DEFINITIONS, AND CATEGORIES OF ROMANCE

**THE NEW-FOUND POWER OF WOMEN.** The invention of the romance genre occurred because of a confluence of historical events, cultural developments, and shifts of literary taste and audience. When Pope Urban II called for the first Crusade in 1095, the lords of hundreds of demesnes (manorial lands) throughout Europe answered the request of their religious lord and marched or sailed to the Middle East to spend years in military combat. These aristocrats and their followers were exposed to Eastern and Arabic cultural and literary influences, as well as opportunities for economic exploitation and importation of the luxury goods, spices, and exquisite fabrics from the region. Literary forms of the first half of the twelfth century, such as the *chanson de geste*, not only reflected the heroic warrior ethic of European Crusaders, but also provided textual vehicles for Crusading propaganda. While these male members of the aristocracy were absent from their courts and manors, life and business went on at home in Europe, chiefly through the management of these estates by their wives and mothers. This trend is reflected in the transitional work, Wolfram von Eschenbach's *Willehalm*, in which the hero Willehalm leaves his citadel in Orange in the capable hands of his wife Gyburc, who not only runs the estate, but also literally defends its ramparts against invading armies of Moors. Two royal women in such circumstances—Eleanor of Aquitaine (1122–1204) and eventually her daughter, Marie—had a particular influence on the development of romance. Duchess of the largest duchy in France, extending from the Poitou to the Pyrenees Mountains near the border of Spain, Eleanor was first married to the king of France, Louis VII, whom she accompanied to the Second Crusade, where according to one chronicler, she paraded herself to the troops dressed as an Amazon queen. When, after fifteen years of marriage, she failed to produce male heirs, Louis divorced her in 1152, and shortly thereafter Eleanor made an even more lucrative marriage to Henry II, Plantagenet king of England.

**FEMALE LITERARY INFLUENCE.** Eleanor brought to the English court her interests in poetry, music, and the arts, all of which were cultivated at the court of Aquitaine where she was raised by her grandfather William IX of Aquitaine (1071–1127), a Crusader and also the first known troubadour poet. In the vernacular narratives now seen as early “romances” that may have been written for and/or dedicated to Eleanor, an emphasis on the sort of love relationship that is depicted in troubadour poetry, commonly known as “courtly love” (*fin'amors* in

Provençal, the language of troubadour poetry), can be found. In such relationships the female beloved is elevated to have extreme emotional power over her male lover, a supremacy that was probably a literary wish fulfillment fantasy of the female audiences of romances. Marie, Eleanor's daughter by Louis, also made an advantageous marriage by which she became duchess of Champagne, presiding over not only a political court, but also a "court of love," at which troubadour poets and writers of the newly emerging genre of romance, such as Chrétien de Troyes, were supported with her patronage and, at times, that of her mother. Another important writer at Marie's court was Andreas Capellanus, whose *Art of Courty Love*, a treatise on conducting relationships involving *fin'amors*, reflects the new examination of interior feelings and motives that characterize the heroes and heroines of the emerging romance genre. Thus, the new audience of powerful women who presided over the courts of France, England, and Germany influenced the subject matter of many of the narratives that were written in Europe in the second half of the twelfth century. It is no accident that the earliest romances, which were about the "Matter of Antiquity"—the history of Thebes, the Trojan War, and the settlement of Rome by Aeneas—featured female characters who were militarily powerful, such as Camille in the *Roman d'Eneas*, based on the Amazon warrior queen Camilla in Vergil's *Aeneid*, or the Amazon Penthesileia in the *Roman de Troie*, a romanticized version of the story of the Trojan War.

**NEW "MATTER" FOR ROMANCE.** Another factor that gave rise to the development of this new genre was the twelfth-century emergence and dissemination of Celtic legends, circulated by traveling *conteurs* (storytellers) and *jongleurs* (court entertainers) from Brittany. These oral tales of Breton folklore contributed such characteristic Celtic themes and motifs as magic, the supernatural, human to animal transformations, and a faery "otherworld" not only generally to the romance genre, but also particularly to its most famous product, Arthurian romance, which got its start in the mid-twelfth century when Geoffrey of Monmouth (1100–55) wrote about a semi-mythical king, Arthur, in his *History of the Kings of Britain*. Geoffrey established Arthur's conception and birth at Tintagel in Cornwall, his marriage to Guinevere, and his reliance on his sorcerer-like advisor Merlin. Geoffrey's chronicling of British royal history, which began with a "Matter of Antiquity," the foundation of Britain by Brutus (great-grandson of Aeneas), soon became disseminated in France when a Norman chronicler named Wace translated these British materials for a French audience in his verse narrative, *Brut* (1155), incorporating his own inventive embellishments to Geoffrey's themes such as the

"Round Table" and the sword "Excalibur." At the end of the twelfth century still another English writer, Layamon (or Lawman), retranslated Wace's French narrative into alliterative poetry in the Middle English *Brut*. This trans-Channel transfer of stories about Arthur rendered him and his Roundtable knights one of the most enduring subjects of medieval romance. When combined with the effects of the first Crusades and the beginnings of troubadour lyric poetry, the dissemination of Celtic and Arthurian motifs resulted in the development of romance, a genre that was to remain popular in nearly all areas of Europe throughout the Middle Ages.

**CONVENTIONS OF MEDIEVAL ROMANCE.** Medieval romances, which liberally took their plots from the various "matters" of France, Britain, and Rome (or Antiquity), comprised a very elastic form subject to much variation. In certain ways, romances duplicate some of the characteristics of heroic narratives. In fact, both genres are populated by knights who engage in elaborately described martial combat. Nevertheless, certain narrative conventions characteristic of romance help distinguish it from other heroic poetry. A romance is usually a long, loosely organized, episodic narrative, composed in verse or prose, whose plot involves a search or quest and the testing of the prowess or morality of its knightly hero, for whom events are often governed by chance, accident, fate, or supernatural intervention. The romance's handling of narrative time varies: in some cases, plot events are slowly protracted, almost suspended in time; in other cases, there are rapid jumps in narrative time. Observing artificial deadlines is part of the hero's test, as in Chrétien de Troyes's *Yvain*, when the protagonist fails to return to his wife Laudine within a promised year and, to make amends for this betrayal, must spend the second half of the romance in the service of distressed women.

**MALE AND FEMALE PROTAGONISTS.** The goal of the male protagonist—usually the bravest, most handsome specimen of courtly society—is to achieve self-realization through physical adventures, following a plot pattern of separation from the group (often the other Roundtable knights), disruption, testing, and ultimately a return to harmony, often, but not necessarily, gained through a romantic love interest. The focus of romance is the psychologically flawed and un-self-aware individual hero on a quest or journey away from the known to test his moral strength. It is usually not King Arthur himself, but rather one of his individual Roundtable knights who is the hero of Arthurian romances. The female characters of romance, almost always extraordinarily beautiful, are sometimes peripheral objects of exchange between men, sometimes the goal of the quest, sometimes catalysts to disaster as temptresses, and sometimes the ultimate rewards for the

*a PRIMARY SOURCE document***A KNIGHT SEARCHES FOR AN ADVENTURE**

**INTRODUCTION:** This passage from Chrétien de Troyes' *Yvain*, in which a knight consults with a churl on the question of where to go to find an opportunity to acquire reputation, illustrates the randomness of the concept of "adventure," the goal of knights on quests to find the self in medieval romance. It is comic that Calogrenant, something of a braggart, must consult with a bull-keeper who fits the medieval description of "ideal ugliness" (as the lady in *Lanval* represents ideal beauty) to fulfill his role as a knight. Calogrenant's assumption that this bull-keeper, probably a rustic who tends cattle for the local lord, is monstrous reveals the contempt the aristocracy had for the lowest class in the social hierarchy, the serfs. The rustic has no time for seeking "adventure," but he does send Calogrenant into a situation that challenges him suitably and disgraces him.

[Calogrenant narrates:] I had not put my lodging-place far behind me when, in a clearing, I came upon some wild, unruly bulls, all fighting together with such a din and displaying such haughty ferocity that, to tell you the truth, I drew back in fear ... Sitting on a tree-stump, with a great club in his hand I saw a churl, who looked like a Moor and was immensely huge and hideous: the great ugliness of the creature was quite indescribable. On approaching this fellow, I saw he had a head larger than that of a pack-horse or any other beast. His hair was tufted and his forehead, which was more than two spans wide, was bald. He had great mossy ears like an elephant's, heavy eyebrows and a flat face; with owl's eyes and a nose like a cat's, a mouth split like a wolf's, the sharp yellow teeth of a wild boar; a black beard and tangled moustache, a chin that ran into his chest, and a long spine that was twisted and hunched. He leant on his club wearing a most odd garment containing no linen or wool: instead he had, fastened on his neck,

the recently flayed hides of two bulls or oxen. The instant he saw me approach him, the churl leapt to his feet. Whether he wanted to touch me I don't know, nor what his intention was, but I prepared to defend myself until I saw him standing up quite still and quiet, having climbed onto a tree-trunk. He was a full seventeen feet tall. He looked at me without uttering a word, any more than a beast would have done. Then I assumed he was witless and unable to talk.

At all events, I plucked up my courage to say to him: "Pray tell me if you are a good creature or not!" And he replied: "I'm a man!"—"What sort of a man are you?"—"Such as you see: I'm never any different."—"What are you doing here?"—"I stay here, looking after these animals in this wood."—"Looking after them?.... I don't believe a wild beast can possibly be looked after in any plain or woodland or anywhere else unless it is tethered or penned in."—"I look after these and control them so well that they'll never leave this spot." [The Churl explains how he controls the bulls by brute force.] "That's how I am master of my beasts. Now it's your turn to tell me what kind of a man you are, and what you're looking for."—"I am, as you see, a knight looking for something I'm unable to find: I've sought long and can find nothing."—"And what do you want to find?"—"Some adventure, to put my prowess and courage to the proof. Now I beg and enquire and ask of you to give me advice, regarding some adventure or marvel, if you know of any."—"You'll not get any of that," says he. "I don't know anything about 'adventure' and never heard tell of it." [The Churl then directs Calogrenant to the spring of Broceliande, where he meets the defender of the spring, Sir Esclados, who defeats him and unhorses him.]

**SOURCE:** Chrétien de Troyes, *Yvain (The Knight With the Lion)*, in *Arthurian Romances*. Ed. and trans. D. D. R. Owen (London: Everyman, 1987): 284–285.

ennobling behavior they elicit from the knightly protagonist. Antagonists are either monsters—giants, mythical beasts, grotesque hybrids like the Green Knight of *Sir Gawain and the Green Knight*—or pathological versions of the self, as in Malory's fratricidal brothers, Balin and Balan. Romances are set in the exotic other world of faery, an "unofficial" or liminal fantasy world that is juxtaposed with the "official" court, from whose safety knights journey through the dark forest of *aventure* (what happens to you) on a quest to discover the self.

**CATEGORIES OF MEDIEVAL ROMANCE.** Although to modern audiences medieval romances can seem utterly fantastic, completely unconnected to the concerns

of reality, for their original audiences these narratives served not only to entertain but also to instruct. The predicaments in which the heroes of romances found themselves and the manner in which they met these challenges served as models of behavior for aristocratic auditors or readers. For example, in the *roman d'aventure* (romance of adventure) a knight achieves great feats of arms almost solely to enhance his reputation through a series of what appear to be random adventures. The similar "courtly" or "chivalric" romance serves as a vehicle for presenting and examining the chivalric ethic, where each in the progression of adventures demonstrates different things about the hero or represents different stages in his journey towards internal harmony. In the knight's

quest or search, the locales he traverses are meaningfully related to the knight's individual moral progress or expose some aspect of the aristocratic life to critical scrutiny. In this way, courtly romance is educative, proposing for the knight-protagonist (and for the romance's original medieval audience) models of courtly behavior or *courtoisie* (courtesy) in various areas such as combat, social relations, or the service of women and the oppressed. In long romances, the series of adventures becomes something like a fated and graduated test encouraging the knight to strive for personal perfection. Other secular romances follow the general pattern of adventure and quest, but combine these elements with another genre: the allegorical dream vision. For example, the narrator of the *Romance of the Rose*, a work that examines the spectrum of erotic love and satirizes aspects of courtly life, dreams that he undergoes a quest for a special rose (symbolizing the psyche of a young woman), resulting in a poem that, while called "romance," is really more closely related to moral or didactic literature.

**RELIGION AND ROMANCE.** Medieval romance was not only about the secular subjects of knightly combat, social niceties, and erotic attraction. A large component of many romances reflected the influence of Christianity and its teachings. In "religious romances" the allegorical and symbolic potential of the genre is exploited to direct the action from secular to religious goals. The knight's progress is turned to a narrower examination of the state of his soul; through the process of the quest, the hero arrives at spiritual revelation and, in the end, he rejects the physical world altogether. The romances about Galahad's achievement of the Grail Quest—where Lancelot's son Galahad concludes that he cannot achieve spiritual perfection *and* remain in the earthly world—and Gawain's humble acknowledgment of his flawed troth in *Sir Gawain and the Green Knight* illustrate this romance sub-type. Moreover, in "homiletic" or "didactic romances," the usual elements of romance are superimposed on a story told primarily for its moral significance according to the pattern of a saint's life as established in a narrative genre called "hagiography." In these "hagiographic romances," the central character suffers extreme hardships either as punishment for transgression or as a test of faith in a trial by ordeal rather than by adventure. The romance concludes not with the achievement of self-knowledge, but with the granting of grace or reprieve, as is illustrated by Chaucer's *Clerk's Tale* of Griselda and his *Man of Law's Tale* of Custance, where after seemingly losing children and family, the heroines have their losses restored to them at the end of the tale.

## COURTLY LOVE.

**"COURTLY LOVE" OR FIN'AMORS.** One of the most commonly held, and perhaps most misunderstood, modern notions about the Middle Ages is the type of romantic or erotic love believed to have been practiced in the period, popularly referred to as "courtly love." Courtly love is a cluster of related ideas and sensibilities characterizing an extreme expression of romantic passion that was demonstrated frequently by characters in medieval literature, especially in courtly romances and the love lyrics of the French troubadours and the German minnesingers. The term "courtly love" was never used in medieval texts, although medieval authors and poets did use the term *fin'amors* (refined love) to describe the extremes of emotion experienced, often suffered, by male protagonists in romances and by the lover singing love songs to his beloved in the lyric tradition. After observing the phenomenon depicted in various romances, the French literary historian Gaston Paris coined the term "courtly love" at the end of the nineteenth century to describe the devotion of knights for their ladies in medieval romances and love poetry, and the term took on a life of its own. Many general discussions of medieval literature now treat the "courtly love" experienced by various romance heroes—Chrétien's Lancelot, Chaucer's Troilus, or Dante's narrative persona in his ostensibly autobiographical lyric collection *La Vita Nuova*—as if the authors themselves used the term. In fact, although medieval authors never call what they are describing "courtly love," this particular construction of heterosexual love has a long literary history. It is not surprising that the Middle Ages would embrace a variety of love discourse that has such antique, and therefore authoritative, origins.

**THE ORIGINS OF COURTLY LOVE.** The origins of this form of extreme love can be traced to the Roman poet Ovid, one of the most highly regarded "authorities" in the Middle Ages, whose *Ars Amatoria* (Art of Love; 1 B.C.E.) contributed many of the tropes now fa-

miliar as “courtly love.” These include the idea of love as a kind of warfare between the sexes, in which every lover is a soldier in the army of love over which Cupid is the commander-in-chief, and the notion of the absolute power of women over men, who are afflicted by a form of madness because of which they undergo various hardships and physical sufferings and practice absurdly exaggerated behavior. Another likely literary source of more contemporary vintage was *The Dove’s Neck Ring*, produced in Muslim Spain (1022) by Ibn Hazm, who was influenced by Platonic ideals about love. Hazm’s contributions to the discourse of courtly love include the notion that man reveals and improves his character or good breeding by practicing a chaste (rather than sensual) love. This rarefied love produces an ennobling effect on the male lover, changing a man of humble birth to the equal of the noble lady to whom he aspires. According to Hazm’s version of neo-Platonism, true love is a reunion of parts of souls that were separated in the creation.

**CHARACTERISTICS OF COURTLY LOVE.** But what exactly was the late medieval European phenomenon known popularly as “courtly love”? This medieval pattern of erotic behavior was really a cult of frustrated longing. It involved the male lover’s unfulfilled sexual desire for a female love object—an unattainable, extremely beautiful and perfect courtly lady, whose very inaccessibility (because she is married to someone else, often the lover’s lord) makes her more attractive to the lover. Thus, for the male lover, the essence of the experience of love is a paradoxical combination of pleasure and pain. He experiences joy at the sight of the beloved whose proximity brings delight; at the same time he endures intense mental and physical suffering—a host of disorders including chills, fevers, aches, insomnia—experienced simultaneously with the pleasure. This paradoxical combination of pleasure and pain is caused illogically by the fact that despite her very nearness, the lover cannot have her. In this topsy-turvy situation, the courtly lady is the “physician” who is both the cause and the potential cure of the courtly lover’s painful frustration. Because they often involved marital infidelity on the part of at least one of the pair, courtly love relationships had to be conducted with the utmost secrecy. This necessitated clandestine meetings between the lovers, which ended at dawn, thus giving rise to the lyric genre of the *aubade* or “dawn song.” Secrecy and physical separation inspired acute bouts of jealousy in both parties, all part of the phenomenon’s allure. Because the attainment and practice of *courtoisie* (courtesy) was limited to the aristocracy, courtly love was only to be practiced by the most elite classes of medieval soci-

ety, the knights and ladies at the aristocratic courts. Indeed, when a knight was attracted to the beauty of a peasant woman, he was instructed simply to take her by force if she did not immediately succumb to his flatteries, a plot situation illustrated in the lyric genre of the *pastourelle*.

**REAL AND IMAGINED COURTLY LOVE.** Although no concrete evidence exists that the fantastic courtship known as courtly love was actually practiced during the medieval period, this erotic fantasy or game nevertheless had much literary currency from the twelfth century onwards, when the wife of King Louis VII of France, Eleanor of Aquitaine, and their daughter Marie reputedly set up “courts of love” respectively at their estates in Aquitaine and Champagne. Both Eleanor and Marie were literary patronesses of troubadour poets and romance writers, and, through their encouragement, the discourse of courtly love as we know it took shape. At Marie’s request, Chrétien de Troyes wrote the unfinished romance, *The Knight of the Cart*, about Lancelot’s courtly desire for Guinevere, and at her court another cleric,

*a PRIMARY SOURCE document***ANDREAS CAPELLANUS'S RULES FOR LOVE**

**INTRODUCTION:** In Book Two of *De arte honeste amandi* [*The Art of Courtly Love*], written in France under the patronage of Marie de Champagne in the late twelfth century, Andreas Capellanus (Andrew the Chaplin) enumerates rules for love that mix the cynicism of Ovid's *Art of Love* with the elevated or idealized love of the type called "courtly." This love is manifested by certain conditions such as the married state of the lady, and physical symptoms, such as fainting, palpitations of the heart, or changes of color on the part of the lover. How often these rules were applied in real life is uncertain, but they were highly influential in the development of medieval literature.

**Book Two: On the Rules of Love**

1. Marriage is no real excuse for not loving.
2. He who is not jealous cannot love.
3. No one can be bound by a double love.
4. It is well known that love is always increasing or decreasing.
5. That which a lover takes against the will of his beloved has no relish.
6. Boys do not love until they arrive at the age of maturity.
7. When one lover dies, a widowhood of two years is required of the survivor.
8. No one should be deprived of love without the very best of reasons.
9. No one can love unless he is impelled by the persuasion of love.
10. Love is always a stranger in the home of avarice.
11. It is not proper to love any woman whom one should be ashamed to seek to marry.
12. A true lover does not desire to embrace in love anyone except his beloved.
13. When made public, love rarely endures.
14. The easy attainment of love makes it of little value; difficulty of attainment makes it prized.
15. Every lover regularly turns pale in the presence of his beloved.
16. When a lover suddenly catches sight of his beloved, his heart palpitates.
17. A new love puts to flight an old one.
18. Good character alone makes any man worthy of love.
19. If love diminishes, it quickly fails and rarely revives.
20. A man in love is always apprehensive.
21. Real jealousy always increases the feeling of love.
22. Jealousy, and therefore love, are increased when one suspects his beloved.
23. He whom the thought of love vexes, eats and sleeps very little.
24. Every act of a lover ends with the thought of his beloved.
25. A true lover considers nothing good except what he thinks will please his beloved.
26. Love can deny nothing to love.
27. A lover can never have enough of the solaces of his beloved.
28. A slight presumption causes a lover to suspect his beloved.
29. A man who is vexed by too much passion usually does not love.
30. A true lover is constantly and without intermission possessed by the thought of his beloved.
31. Nothing forbids one woman being loved by two men or one man by two women.

**SOURCE:** Andreas Capellanus, *de arte honeste amandi* [*The Art of Courtly Love*]. Trans. J. J. Parry (New York: Norton, 1969): 184–186.

Andreas Capellanus, wrote his Ovid-influenced treatise *De Amore* (About Love) also titled *De Arte Honestae Amantiae* (About the Art of Frank Loving; 1180s), a three-part "guide" to conducting courtly love addressed to a young man named Walter. Andreas's first two books present the rules of the game—what rank the lovers must be and how they must conduct themselves. Ironically, his

third book, containing a vehement repudiation of secular love and a misogynistic attack on the vices of women, retracts all the advice offered previously. Placed on the proverbial "pedestal" above the reach of the courtly lover by his frustrated yearning for her, the courtly lady of the first two books enjoyed a position of power that few actual medieval women (except for queens and countesses

like Eleanor and Marie) ever experienced. And even queens, subject to the temporal power of their husbands, could be locked in towers, which happened to Eleanor herself when her second husband, Henry II grew tired of her meddling in his political affairs. Knocked off the “pedestal” of adulation, the courtly lady instead returned to being the object of medieval antifeminism more typical of the period’s attitudes toward women.

## ARTHURIAN ROMANCE

**THE HISTORICAL OR PRE-LITERARY ARTHUR.** King Arthur and his knights of the Round Table are to this day the most familiar and beloved medieval literary characters. They continue to fascinate audiences of contemporary novels, scores of cinematic treatments—from the serious John Boorman film *Excalibur* to the parodic farce, *Monty Python and the Holy Grail*—and even print and television advertising employing the Arthurian icons of the sword Excalibur, the ideal of Camelot, and the quest for the Holy Grail. Although the figure of King Arthur known to medieval and modern audiences first took shape in the twelfth century, the product of the accumulation of almost six centuries of legend building, there is some evidence (admittedly slender) for the actual existence of an “historical” Arthur. Contemporary archeological excavation contributes to the still ongoing search for the historical foundations of the King Arthur legend. A leader of the Welsh named “Arthur” who fought against the invading Anglo-Saxons apparently lived in late fifth- to early sixth-century Britain. The historian Gildas first mentioned the battle of Badon (c. 500), which the Welsh poem “Gododdin” (c. 600), in the earliest reference to Arthur’s name, later attributed as a triumph to someone named “Arthur.” The Welsh historian Nennius, in the *Historia Brittonum* (History of the Britons; c. 800), named this Arthur “Dux Bellorum” (leader of warriors). Two tenth-century Welsh chronicles,

cles, the *Spoils of Annwen*, and the *Annales Cambriae* (Annals of the Welsh) added to the growing legend the figure of Mordred, Arthur’s illegitimate son, who later kills his father. The tenth- to twelfth-century anthology of Welsh tales titled the *Mabinogion* added other Arthurian characters, including Yvain, whose character was amplified most extensively by Chrétien de Troyes in a romance about his adventures. In 1125, the historian William of Malmesbury wrote his *Gesta Regnum Anglorum* (Deeds of the English Kings), further establishing Arthur’s reputation as a British hero.

**LITERARY TREATMENTS OF THE ARTHUR LEGEND.** The six centuries of scattered historical fragments giving evidence of the existence of a warrior named Arthur coalesced into a coherent narrative of a heroic life in the mid-twelfth century. The version of King Arthur that has become familiar to post-medieval audiences was first compiled then by Geoffrey of Monmouth (1100–1155), whose Latin text, *Historia Regnum Britanniae* (History of the Kings of Britain; 1137), used the growing legend of Arthur as a unification myth for a Britain divided in civil war between loyalty to King Stephen or to Empress Matilda. Geoffrey introduced many of the features that would become standard Arthur lore—Merlin, the Mont-Saint-Michel giant, the prehistory of Arthur’s father Uther Pendragon, and Arthur’s

## THE Grail Quest

The “Holy Grail” has by now come to refer to almost anything that is highly desirable, much sought after, and ultimately elusive. This mysterious object is alluded to in modern poetry, most famously in T. S. Eliot’s “The Wasteland”; it figures as the goal of the main character in the classic Wagnerian opera, *Parsifal*; it plays a part in contemporary films like *Indiana Jones and the Last Crusade*, *Monty Python and the Holy Grail*, and *The Fisher King*; and it has been the subject of a bestselling novel, Dan Brown’s *The Da Vinci Code*. But the mythic resonance of the Holy Grail is rooted in the legends about the Grail that circulated in the Middle Ages and were explored in a series of quest romances composed by medieval authors.

The father of romance, Chrétien de Troyes, in the late twelfth century wrote an unfinished text about the search for the Grail titled *Perceval*, while in Germany Wolfram von Eschenbach translated Chrétien’s text into the thirteenth-century Middle High German romance, *Parzival*. In a parallel development, a significant segment of the thirteenth-century French *Vulgate Cycle* was *The Quest of the Holy Grail*, which was translated for a fifteenth-century English audience by Sir Thomas Malory in one of the books of his *Le Morte d’Arthur* devoted to the grail-quest. Indeed, in Malory’s estimation, the unsuccessful quest for the Grail signaled the failure of the utopian social experiment that King Arthur’s Camelot signified. In Malory’s version, out of a large group of Roundtable knights who set out, only a “remnant” return alive from years of questing for the Grail, and such otherwise noble knights as Gawain, Perceval, Bors, and Lancelot fail at the quest because of their sexual impurity and “spotted” Christian virtue. In fact, the only knight who successfully experienced a vision of the Grail was Galahad, Lancelot’s illegitimate son by Elaine, who was entitled to this privilege

because of his utter spiritual perfection, a perfection that was so extreme that upon experiencing the Grail, he was no longer capable of living in the compromised (but human) moral climate of Arthur’s Camelot. Like Roland in the *Song of Roland*, Galahad was wafted heavenward immediately after his mystical vision.

What was the Grail that medieval knights so avidly sought? Although the Grail is described in different terms in the various romances, it is often an object associated with the last moments of Jesus Christ’s life, sometimes a cup or bowl used by Joseph of Arimathea, the man who brought the crucified Christ down from the cross and who may have collected His blood in some vessel, after the Roman soldier Longinus pierced Christ’s side with a spear. The objects associated with the Grail are usually a spear or lance and a vessel, either a chalice or a bowl. Sometimes the Grail is associated with the chalice used by Christ at the Last Supper. However, some theorize that the symbols of the Grail, the male lance and the female vessel, originated in pre-Christian fertility myths that became associated with the Grail story through the myth of the “Fisher King,” who was wounded in his thigh with a lance and whose infirmity is analogous with the general decline in fertility of his kingdom (hence the “wasteland” motif). The Fisher King is healed through contact with a vessel containing blood, sometimes Christ’s blood, at other times the blood of a female virgin, which restores fertility to the land once again. In the Middle Ages, it was believed that at the time of Christ’s death, some of the figures associated with this event migrated to Europe: Joseph of Arimathea purportedly came to England and Mary Magdalene reputedly settled in Marseilles, France. Some sites long attached to the legend of King Arthur, like Glastonbury in Somerset, which is reputedly the Isle of Avalon, are also attached to the Grail legend. In fact, in Glastonbury today, one can drink water from the “Chalice Well,” a spring under which, local legend claims, Joseph of Arimathea buried the Holy Grail.

final voyage to Avalon. The Anglo-Norman writer, Wace (c. 1100–1175), “translated”—rewrote in Anglo-Norman French with considerable changes to suit his audiences—Geoffrey of Monmouth’s chronicle into *Le Roman de Brut* (1155), an originary romance featuring stories about Camelot and the knights of Arthur’s court, and inventing the Round Table. In the late twelfth century, Chrétien de Troyes (fl. 1160–1190) appropriated Arthurian knights to produce in Old French a series of long and complex verse romances separately dedicated to the individual stories of several members of Arthur’s court: *Yvain: the Knight of the Lion*, *Lancelot: the Knight*

*of the Cart*, and *Perceval*, who figured prominently in the Quest of the Holy Grail. At about the same time Chrétien was writing his Arthurian romances, Marie de France (1150–1200) also wrote a series of Breton *lais*, two of which feature the Arthurian court—*Lanval*, about an unknown young knight, and *Chevrefoil*, about Tristan and Iseult. Thus by the end of the twelfth century, the constellation of Arthurian characters had become familiar to French and English audiences. Across the English Channel, Lawman (also spelled “Layamon,” 1189–1207) translated Wace’s *Le Roman de Brut* into alliterative early Middle English in a poem titled *Brut*,

*a PRIMARY SOURCE document***WHAT GAWAIN LEARNED ABOUT HIMSELF**

**INTRODUCTION:** The delightful fourteenth-century Middle English romance, *Sir Gawain and the Green Knight*, illustrates both the secular and the spiritual concerns of romance narratives. In this passage, Gawain returns to Camelot after his adventure with the Green Knight at the Green Chapel, presenting the Green Girdle he accepted from Bertilak's lady and revealing to the court what his adventure, in which he broke his covenant with the Green Knight, taught him about his own moral limitations. The translation attempts to mimic the original alliterative poetic style of the Middle English poem in which the same consonant or vowel begins three words in each line.

"Lo, lord," said Sir Gawain, and lifted the lace,  
 "This belt caused the blemish I bear on my neck;  
 This is the damage and loss I have claimed  
 Through the cowardice and covetousness that I  
 acquired there;

This is the token of the untruth I was caught in,  
 And I must wear it while I still live.

A man may hide his misdeed, but never undo it,  
 For where once it's attached, it is latched on  
 forever."

The king comforts the knight, and all the court also  
 Laughs loudly about it, and courteously agrees  
 That the lords and the ladies who belong to the  
 Table,  
 Each guest at the gathering, should have such a belt,  
 A band of bright green circling slantwise about,  
 Of the same sort as Sir Gawain's and worn for his  
 sake. ...

*cle* (or *Lancelot-Grail Cycle*) and the later *Post-Vulgate Cycle* of romances, parts of which were translated into German, Dutch, Italian, Spanish, Irish, and Welsh, and were important sources for Sir Thomas Malory's late Middle English *Morte D'Arthur* in the fifteenth century. This vast interrelated but independently authored cycle of romances traced the entire career of the Arthurian cast of characters, including an extensive narrative about the life of Merlin (*The History of Merlin*); the enmity between Morgan le Faye and her half-sibling Arthur; her vengeful desire for Lancelot in order to thwart Guinevere; the knightly adventures of Lancelot as well as the adulterous love between Lancelot and Guinevere (*The Prose Lancelot*); the Grail Quest (*The History of the Holy Grail* and *The Quest for the Holy Grail*); and Arthur's death (*The Death of Arthur*). The *Vulgate Cycle's* authors expanded upon the personal lives of the Arthurian cast more than had ever been done previously and embellished the growing legend with a high degree of magic, mysticism, psychological complexity, and explicit sexuality. This French version of the Arthur story was perhaps the high point in the development of the medieval legend.

which introduced the motif of Arthur's prophetic dream before Mordred's treachery.

**LATE MEDIEVAL EXPANSION OF THE ARTHUR STORY IN FRANCE.** Although Arthur was the main figure in the "Matter" of Britain, his story was appropriated by all European medieval national literatures, but especially in France. By the thirteenth century, the stories about Arthur and his knights had accumulated to such a degree that between 1215 and 1235 several anonymous French writers contributed to the compilation of what has come to be called collectively the *Vulgate Cy-*

## THE Contours of the Literary Life of King Arthur

The poems and stories about King Arthur that were written over a period of several centuries during the Middle Ages do not all include the same amount of detail of his life. His presence as a figure in British history grew from a mere mention of the name of an actual person in the sixth century to a fairly well-developed legend by the twelfth. By the end of the medieval period, a complete outline had emerged in response to changing concepts of heroism, morality, and statehood.

Arthur began his life as the offspring of an illicit union between Uther Pendragon and Igraine of Cornwall, contrived through the shape-shifting magic of the sage, Merlin, who became Arthur's advisor in his early career. After Merlin took the child away from Uther, Arthur was raised in seclusion until the moment when he pulled the sword from the stone (an incident familiar to modern audiences from its inclusion in most Arthurian films), which established his claim to the throne of Britain. Arthur's lifelong sibling conflict with his half-sister Morgan le Faye ("the fairy") generated many episodes in the Arthurian ro-

mances in which Morgan tried to undermine his power, most notably in the *Vulgate Cycle*, *Sir Gawain and the Green Knight*, and Malory's *Works*. After marrying Guinevere, daughter of Lodgreaunce, Arthur established a Utopia-like court, Camelot, supported by the fellowship of the Knights of the Round Table. Most romances feature the fatal attraction between Guinevere and Arthur's best knight Sir Lancelot, the revelation of which led to internal strife in the kingdom, civil war between factions of the Roundtable Knights, and eventually the death of Arthur at the hands of his illegitimate son Mordred. The unsuccessful quest for the elusive and highly symbolic Holy Grail by Arthur's knights also contributed to the decline of Arthur's kingdom. Upon his death, Arthur's corpse was transported by the Lady of the Lake, Morgan, and Morgause, Arthur's other half-sister, to the Isle of Avalon where, according to some versions, he awaits his predicted return as the "Once and Future King." The cycle of stories about the Arthurian characters is vast, and most Arthurian romances feature as protagonist one of Arthur's Roundtable Knights, not Arthur himself. More often, Arthur has little part in the action, except to be present at the beginning and end of the story, as, for example, in Chrétien de Troyes' *Yvain* and in the Middle English *Sir Gawain and the Green Knight*, where the knights in the title are the focus of the adventure.

### THE "ENGLISHING" OF ARTHURIAN ROMANCE.

Arthur was not neglected by writers in his own Britain, especially in the last two centuries of the medieval era. In the fourteenth century, several important additions to the Arthurian literary corpus were produced in England. The *Alliterative Morte Arthure* (c. 1360), a Middle English poem about Arthur's death which may have been influenced by the *Vulgate Cycle* and later served as an important source for Thomas Malory in his own long collection of Arthurian narratives, is notable for using the Boethian symbol of the "wheel of fortune" (representing the concept of cyclical alternations between worldly prosperity and adversity) in its characterization of Arthur's developing enmity with his illegitimate son Mordred. Written in the last quarter of the fourteenth century, another poem that belongs to the so-called fourteenth-century "Alliterative Revival," *Sir Gawain and the Green Knight*, depicts the challenge brought to Camelot by a monstrous Green Knight, who is elaborately described as a hybrid of courtly elegance and primitive naturalism. With its intricate structure into four parts or "fitts," its employment of extensive number symbolism (the three correlating hunts and seductions at Castle Hautdesert and the highly symbolic pentangle

emblem on the shield carried by Gawain) and color signification (green and gold), and its incorporation of folklore motifs into a courtly romance (the exchange of blows game introduced by the Green Knight and the exchange of winnings game proposed by Bertilak), *Sir Gawain and the Green Knight* is one of the most literarily sophisticated romances in the Arthurian canon. At about the same time, in the *Canterbury Tales*, Geoffrey Chaucer assigned an Arthurian romance to be told by his female pilgrim, the Wife of Bath, in which an unnamed Arthurian knight (analogues suggest the knight was Gawain) rapes a maiden and to avoid execution quests to find out "what women want most."

**ROMANCE IN PRINT: MALORY'S ARTHUR.** Finally, between 1469 and 1470, Sir Thomas Malory composed a series of tales about Arthur and Camelot in late Middle English prose. Published and edited by the early printer William Caxton, the first printed edition of Malory's Arthurian tales was titled *Le Morte Arthure* by Caxton in 1485. Upon the discovery of the presumably earlier hand-written Winchester Manuscript in 1934, Eugène Vinaver re-edited Malory's romances as Malory's *Works*. Comparison of Malory's texts with earlier versions of the Arthur story reveal that, in addition to the

*Alliterative Morte*, Malory also drew heavily on the various parts of the French *Vulgate Cycle* for such details as the origins of Arthur, the role of Merlin, the treachery of Morgan le Faye, the affair between Lancelot and Guinevere, the Grail Quest, the extensive story of Tristram and Isolde, and the death of Arthur at the hands of Mordred. While many sections of Malory's version are immediately recognizable as deriving from the *Vulgate* source, Malory is far more reticent than his French authorities were about incorporating elements of magic and details of the sexual passions experienced by these Arthurian characters. Like his model, Geoffrey of Monmouth, whose twelfth-century audience was experiencing civil war between advocates of King Stephen and Empress Matilda, Malory, himself a prisoner when he wrote the book, used the story of Arthur as a unifying myth for a divided Britain. In Malory's hands, Arthur's legend, which culminated in internal strife because of the moral frailties of the inhabitants of Camelot, served as an *exemplum*, a story embodying a moral lesson, for his fifteenth-century English audience, who were now divided, as they had been by the Stephen-Matilda feud in Geoffrey's age, by the War of the Roses.

#### TRANSLATIO STUDII: SOURCES FOR ROMANCE

##### THE MEDIEVAL DEFINITION OF "TRANSLATION."

Reverence for the past and respect for the "authority" of previous authors and texts determined which plots and characters medieval writers selected to "translate" from a different language, either Latin or another vernacular language, into a new vernacular version for their immediate audience. This process, known as *translatio studii*,

was not the equivalent of the modern translator's earnest striving to reproduce with linguistic exactitude the ideas of a foreign language literary text; rather, it reflected the Latin root of "translate," meaning "to carry across." Thus, the medieval translator's goal was to transfer the plot and characters of a tale produced for the audience of one national culture or earlier period to that of another culture in a later period. This process was often accompanied by significant changes in the transfer. Often what got "lost in translation" was not only some of the plot and original roles of the characters, but also the very genre that the model text represented. In France, the twelfth century simultaneously saw a peaking of the popularity and production of *chansons de geste* (heroic poetry), exemplified by the large cycle of William of Orange poems, and the development of a new genre, courtly romance, in the works of Chrétien de Troyes. Given the reluctance of medieval writers to invent new plots, it is not surprising that many older works were "translated" to fulfill the demand for stories that could be reworked into this popular vernacular literary form.

##### TRANSLATIO STUDII FROM FRENCH TO GERMAN.

In the early thirteenth century, the German writer Wolfram von Eschenbach (d. 1220–1230) "translated" *Aliscans*, a twelfth-century French *chanson de geste* from the William of Orange cycle, for a new German-speaking audience. As a result, the genre of Wolfram's uncompleted *Willehalm* is virtually unclassifiable. This hybrid work exemplifies a significant trend in the development of medieval European literature: the transition in literary taste from the heroic mode to the romance. Wolfram's earlier *Parzival* had already translated Chrétien de Troyes's unfinished *Conte du Graal*, a courtly romance about the "Quest for the Holy Grail," proving him an adept practitioner of the new genre. In *Willehalm*, Wolfram maintains the basic *chanson de geste* plot conflict about the title character, a Frankish warrior, William, who must enlist aid from the reluctant French king Louis to defend the city of Orange against attack by armies of Moors attempting to recapture Willehalm's newly converted Christian bride, Gyburc. However, in importing this plot from the French heroic mode, the German author, a practiced romance writer, adds many romance elements to the received heroic plot. Leading the Moors are the father, former husband, and son of Gyburc, whose family is intent on returning her, dead or alive, to both her original home and her Muslim faith. However, in Wolfram's treatment, Gyburc's conversion results as much from her deep love for the Christian warrior Willehalm as from her altered religious convictions. This change reveals the obvious influence of the development of "Minne," the German concept of courtly love.

Initial from page of Chaucer's *Troilus and Criseyde*, New York, Pierpont Morgan Library MS M. 817, folio 1, 1400–1410.

**THE SHIFT TO ROMANCE.** Although the heroic literary tradition exoticized the Moors to the point of their seeming monstrously inhuman and therefore deserving slaughter by the Christian armies, Wolfram also shows a new tolerance for religious difference that replaces the rigid “The Christians are right, the Pagans are wrong” mentality that dominated the earlier heroic mode. He depicts the Moorish leaders as courtly knights who practice the same chivalry as their Christian counterparts. This shift is exemplified in his revised characterization of the giant wild-man-like Moor Renewart. In the epic exaggeration of the source text, this buffoonish character carries an uprooted tree with which he crushes anyone who causes him trouble. Wolfram’s character at first wields a large club, which he later replaces with the more civilized sword. Moreover, his substantial role in the French source is downplayed so as to give Wolfram’s hero Willehalm more prominence. On the other hand, Willehalm’s doomed nephew Vivianz, whose idealistic heroism reflects Roland’s stubborn self-sufficiency and whose saintly death reflects the wafting of Roland heavenward at the end of the *Song of Roland*, seems a throw-

back to the earlier mode. Wolfram’s revised treatment of Gyburc, the heroine, also illustrates his bridging of elements of both genres. This engaging and sympathetic female character is shown to be capable both of carrying out the “feminine” duties of the faithful wife and chatelaine of the castle, and of ingeniously defending the citadel of Orange (in Willehalm’s absence) against a protracted siege waged by armies of Moors that include her own father, former husband, and son. Whereas typical *chansons de geste* downplayed the role of women in the lives of heroic warriors such as Roland and Oliver, Gyburc is a substantial character in Wolfram’s reconceived plot and a major force in the hero’s successful defense of home, nation, and religion.

**TRANSLATIO STUDII FROM GREEK TO ITALIAN TO MIDDLE ENGLISH.** Another case of how *translatio studii* could significantly change the nature of a well-known story involves the transmission of narratives about the ancient Greeks into late medieval literature. Giovanni Boccaccio (1313–1375), an Italian writer more famous for his story collection the *Decameron*, also wrote two important texts about characters from Greek history—*Il Teseide* (The Story of Theseus; c. 1341) and *Il Filostrato* (The One Made Prostrate by Love; c. 1341)—both of which balance heroic and romance style. Geoffrey Chaucer translated these works into Middle English in the late fourteenth century, but significantly altered them, both in content and in genre, while doing so. Both Boccaccio’s *Filostrato* and Chaucer’s *Troilus and Criseyde* are set during the Trojan War and feature such famous classical characters as Troilus, Priam, Hector, and Cassandra. Although Boccaccio had already somewhat altered the Greek story for his medieval Italian audience in the *Filostrato*, Chaucer added to his own translation (written about forty years later) even more “medievalizing” of the costumes worn, religious faith practiced, and general socio-cultural outlook of the story’s characters. For example, Chaucer turned the political tragedy of fallen Troy into a backdrop for complicated interactions between the ill-fated lovers Troilus and Criseyde, their go-between Pandarus (now Criseyde’s uncle rather than her cousin as in Boccaccio), and a rival lover Diomedes. With its incorporation of courtly love elements such as the enforced secrecy between the lovers and Troilus’s protracted languishing in physical afflictions and emotional despair, Chaucer’s text more resembles a courtly romance than an epic. In a further example of *translatio studii*, Chaucer also assigned to his character Troilus many speeches about free will versus predestination taken almost verbatim from Boethius’s Latin *Consolation of Philosophy*, which Chaucer had himself translated from Latin to Middle English as the *Boece*. At the con-

## BOETHIUS and the Consolation of Philosophy

A prominent scholar who translated and harmonized the works of Plato and Aristotle and who wrote treatises on music, arithmetic, logic, and theology, Anicius Manlius Severinus Boethius (480–524) was most famous in the Middle Ages for a work he wrote while awaiting execution in prison, the *Consolation of Philosophy*. This work strongly influenced the visionary literature of the later Middle Ages, whose writers considered Boethius so authoritative that his prison memoir was the most widely copied work of secular literature in Europe. The structure of the Latin *Consolation* alternates between prose and verse sections, a form also used by other writers, such as Martianus Capella in *The Marriage of Mercury and Philology*; Bernard Silvester in *On the Whole World*; and Alain of Lille (Alan of the Island) in *The Complaint of Nature*. Moreover, the *Consolation* was translated into Old English by King Alfred in the ninth century, into Old French by Jean de Meun in the thirteenth century, into Middle English by Geoffrey Chaucer in the fourteenth century, and into Early Modern English by Queen Elizabeth I in the sixteenth century.

*The Consolation of Philosophy* consists of a dialogue between two characters, the narrative persona called “Boethius,” mirroring the author, who laments the series of misfortunes he feels he has undeservedly suffered, and his interlocutor, the majestic allegorical personification Lady Philosophy (Love of Wisdom), who appears to him in

his prison to console and enlighten him. Lady Philosophy teaches Boethius to find the insight to distinguish what is truly valuable and “good” from the transitory, valueless, “partial goods” he has been complaining about losing—possessions, honors, titles, even friends and family. Through a series of Socratic questions and answers, Lady Philosophy brings Boethius to recognize that the universe is a rationally ordered whole, a great “chain of love,” governed, if not by a benevolent God, at least by a neutral one who can “see” events, even adverse ones, providentially within the grand scheme of time, but whose providential vision of these events does not *cause* the events to happen since man exercises free will. On the other hand, humans only “see” these same events partially and imperfectly—as “fate,” not “providence.”

To explain how bad things can nevertheless happen to good people, Philosophy introduces the metaphoric construct of cyclical human misfortune, caused by the turning of a Wheel by another allegorical personification, blindfolded Lady Fortune, on whose “Wheel of Fortune” all men are situated, rising high upon or being cast off of the wheel (regardless of their merits or evil actions) according to their current state of luck. Thus Lady Fortune, not God, is responsible for alternations between worldly prosperity and adversity, and good fortune is actually more deceptive than bad, since good fortune deceives through raising false hopes while bad fortune warns man not to seek happiness in the false and temporary goods of fortune. The ultimate lesson Boethius learns from Philosophy is to avoid dependence on any external goods, relying instead on self-sufficiency.

clusion of the *Troilus*, Chaucer’s narrator also adopted a medieval Christian perspective that is at odds with his earlier pagan outlook, which had been indicated by invocations to the classical muses and overt references to the Greek pantheon.

**BOETHIAN ADDITIONS.** In the *Knight’s Tale*, the first of *The Canterbury Tales*, Chaucer performs a similar transformation from an epic or heroic mode to romance. He eliminates most of the material in his Italian source *Il Teseide* about Theseus’s war against the Amazons and renders Theseus less a tyrant and more a philosopher-king, thus moving the poem towards a consideration of universal order and earthly impermanence. Likewise, by enhancing the courtly love motif in the triangle between the rival lovers Palamoun and Arcite and their love object Emeleye, and eliminating any characteristics that would associate her with the war-like Amazons, he brings the trio into a thoroughly medieval world

that includes conventional beauty, love-sickness, jealousy, and the *demande d’amour* (a question of which of the two lovers is worse off, since the one the lady has not chosen can see her from his prison while the other has her love but is exiled). Chaucer also incorporates, as he did in the *Troilus*, significant passages from Boethius’s *Consolation* in the discourse between Palamoun and Arcite, whose imprisonment by Theseus in a tower resembles the situation of Boethius. In this way, Chaucer and other medieval authors took material from the past as well as texts of earlier authors and made them relevant to the cultural situation of their immediate audience. In doing so, they created literary works that straddle the genres of epic and romance.

**THE BRETON LAY IN FRENCH.** Although the transformation from heroic poetry to romance was among the most common kinds of “translation,” not all romances were long narratives with grand battles and episodic

AN

## Example of Translatio Studii: Boccaccio and Chaucer

Although both Giovanni Boccaccio and Geoffrey Chaucer wrote poems about the Trojan warrior Troilus that retold a tale from the matter of antiquity for their medieval audiences, Boccaccio's *Il Filostrato* (1351) is a more epic-like text that does not spend much time on Troilus's response to love. In rewriting Boccaccio's poem for an English audience some thirty years later, Chaucer, in his *Troilus and Criseyde*, adds more romance elements, dwelling on how literally smitten his Trojan hero is by the mere sight of Criseyde. This change reflects the incorporation of the discourse of courtly love into the English author's version of a story that is ultimately about Trojans and Greeks at the time of the Trojan War. Although Boccaccio already has medievalized the story somewhat, Chaucer completely recasts it for a fourteenth-century audience accustomed to the conventions of *fin'amors* in medieval romances. He heightens the Ovidian notion of love piercing the heart through the eye (also employed by Guillaume de Lorris in the Dreamer's being struck by the God of Love in *Romance of the Rose*). Numerous other changes and additions recall the conventions of *fin'amors*: Chaucer softens Troilus's jeering at love to a more light-hearted bemusement; adds Troilus's physical reaction to Criseyde's beauty, as if struck by a blow that stunned him; has Troilus address the God of Love; describes Troilus's lengthened and lingering gaze on the new object of his desire; and has him revert to his former joking demeanor in an attempt at secrecy. All of these features

make the poem more like a courtly romance than a heroic narrative.

### From Boccaccio's *Il Filostrato*:

Just then, while Troilus went up and down, jeering now at one and now at another and often looking now on this lady and now on that, it befell by chance that his roving eye pierced through the company to where charming Criseida stood, clad in black and under a white veil, apart from the other ladies at this most solemn festival.

### From Chaucer's *Troilus and Criseyde*:

Inside the temple Troilus went forth,  
Making light of every person in the room,  
Looking upon this lady, and now on that,  
Whether she came from Troy or from out of town;  
It happened that through a crowd of people  
Troilus's eye pierced, and his stare bore into them so  
deeply,  
Until it struck on Criseyde, and there his gaze stopped  
short.

And suddenly he was rendered stunned by the sight,  
And he began to observe her more carefully.  
"O mercy, God," thought he, "where have you lived,  
Who are so beautiful and good to look at?"  
Thereupon, his heart began to expand and rise,  
And softly he sighed, in case men might hear him,  
And he recaptured his original scoffing manner.

repetitions. Some examples were quite brief. In fact, the structural relationship between what is known as the "Breton lay" and a full-length romance is similar to that between the short story and the novel. During the twelfth century, traveling minstrels and *conteurs* (storytellers) spread a body of tales then originating in Brittany, whose plots reflected and incorporated aspects of Celtic folklore. These tales, originally in the Breton language, were performed orally until eventually a twelfth-century female writer, Marie de France (probably a native of France living in England), transformed her oral sources into formal Anglo-French "lays." Marie's sparsely written narratives feature settings in the magical Celtic Other World, rash promises, erotic entanglements between humans and the world of faery, an ambivalent almost amoral code of ethics guiding behavior, and a strong supernatural strain. Marie's *Lanval* exemplifies the genre's main characteris-

tics. This lay depicts the secret erotic relationship between an impoverished Arthurian knight Lanval and a ravishingly beautiful faery mistress, who brings him prosperity and fame in return for his promise not to tell anyone about their relationship. When the jealous Queen Guinevere accuses Lanval of homosexuality, he breaks his promise by praising his absent mistress's beauty, thus revealing her existence to Arthur's court. Although the protagonist is saved by the faery, she whisks him, perhaps ominously, to the Other World of Avalon at the tale's end. In another of the tales, the title-character Bisclavret, although a werewolf, nevertheless is portrayed as being ethically superior to his traitorous human wife, thus exemplifying the moral ambivalence of the genre. Similarly, Marie's *Laüstic*, meaning "Nightingale," tautly narrates the clandestine relationship between an unhappy wife and her lover in a house across the alley from

hers. The adulterous courtly love of these neighbors is symbolized by the title bird, whose evening song is the woman's excuse (to her jealous husband) for standing at the window to communicate with her lover. When the irate husband kills the bird, the lovers enshrine the nightingale—and their love—in a jeweled casket.

**THE BRETON LAY IN ENGLISH.** Some of the Anglo-Norman *lais* of Marie de France were translated into Middle English. For example, Marie's *Lanval* was rendered by an anonymous author as the fourteenth-century short romance, *Sir Launfel*. Other Middle English romances based on Breton lays include *Sir Orfeo*, retelling the legend of Orpheus and Euridice, *Sir Degaré*, and *Sir Gowther*, the last two of which involve magical transformations and shape-shifting. However, the most famous English example is the typical Breton lay that Geoffrey Chaucer wrote as one of his *Canterbury Tales*. *The Franklin's Tale*, which is set in Brittany, revolves around an intricate exchange of promises made by a husband Arveragus, his wife Dorigen, a neighboring squire Aurelius who is smitten with the wife, and a clerk from Orléans. The tale's crux involves the disappearance, magical or otherwise, of treacherous rocks along the coastline of Brittany, the removal of which Dorigen imposes on the squire as a condition of her love. *The Franklin's Tale* concludes with the ambiguity that is the hallmark of the genre of the Breton lay, an open-ended question asking the audience to choose—from the husband, the squire, or the clerk—whose behavior was the most "free." This key word "free," an adjective that means "generous" and "honest," also refers to the status of a non-noble landowner, the rank of the teller, the *Franklin* ("frank" = "free"), who is especially concerned with exhibiting virtues that will associate him with a higher class.

##### IDEAL FEMALE BEAUTY

**INTRODUCTION:** This passage from Marie de France's *Lais*, written in the twelfth century, depicts the idealized beauty of the typical romance heroine, the hero's faery mistress from the lay called *Lanval*. The order of the details—which are entirely conventional—reflects a descriptive method called *ordo effictiones* that was taught in medieval schools, suggesting that Marie had a clerical education of some kind. Often such descriptions worked from the top down, but in this case the author works from the horse up.

There was none more beautiful in the whole world. She was riding a white palfrey which carried her well and gently; its neck and head were well-formed and there was no finer animal on earth. The palfrey was richly equipped, for no count or king on earth could have paid for it save by selling or pledging his lands. The lady was dressed in a white tunic and shift, laced left and right so as to reveal her sides. Her body was comely, her hips low, her neck whiter than snow on a branch; her eyes were bright and her face white, her mouth fair and her nose well-placed; her eyebrows were brown and her brow fair, and her hair curly and rather blond. A golden thread does not shine as brightly as the rays reflected in the light from her hair. Her cloak was of dark silk and she had wrapped its skirts about her. She held a sparrowhawk on her wrist and behind her there followed a dog. There was no one in the town, humble or powerful, old or young, who did not watch her arrival, and no one jested about her beauty. She approached slowly and the judges who saw her thought it was a great wonder. No one who looked at her could have failed to be inspired with real joy.

#### THE NON-NARRATIVE LYRIC IMPULSE

**LYRIC DEVELOPMENT.** In addition to long heroic and romance narratives in verse and prose, short "lyric" poems, some intended for singing to musical accompaniment, were composed from the ninth through the fifteenth centuries throughout Europe. Their subject matter varied by region, reflecting local political, religious, and cultural developments. And as these issues changed throughout the European Middle Ages, the trends in what was "sung" or recited in these short poetic works

"Sumer is icumen in" round for two or four voices. London, British Library MS Harley 978, folio 11, 1250. THE GRANGER COLLECTION, NEW YORK.

shifted commensurately. Even so, as also occurred with the long heroic narrative and the romance, there was much mutual imitation of short poetic forms among European nations, especially on the Continent.

**THE LYRIC IN EARLY MEDIEVAL ENGLAND.** In the Anglo-Saxon period in England (ninth through eleventh centuries), lyric poetry had a distinctively nostalgic or elegiac tone. Although the poets could not have known the ancient Greek and Roman elegy lamenting the loss of a person, place, or thing, the brooding or gloomy tone of these poems reflects the harsh conditions of life for isolated tribal peoples who were often separated from their comrades or families by brutal weather, lengthy sea travel, or internecine warfare. Lyric poems produced during this era reflect many of the heroic themes of *Beowulf*, but at the same time sometimes give evidence of a shift in religious sensibility from belief in the old pagan Germanic divinities and myths to the formal adoption of Christianity. More than any poetry of the Continent, these verses resemble the Skaldic and Eddic poems of

early Scandinavian lyricism. These elegiac poems were set against a bleak, wintry seascape, a marked contrast to the spring-like setting of later medieval lyricism on the Continent. For example, the respective narrators of "The Wanderer" and "The Seafarer" are roaming almost aimlessly by ship, traversing the icy winter seas off the coast of England while lamenting the death of an earthly leader, who is sometimes allegorized as the Christian "Lord," indicating the often uneasy transformation of formerly pagan Britain to Christianity. In another elegy, "The Ruin," the narrator recalls with regret a once imposing feasting hall that is now a crumbling pile of stones battered by the elements. As in *Beowulf*, these poems employ the trope of "ubi sunt," a series of unanswered questions ("Where are the brave warriors?"), which underscores the absence either of missing or dead comrades from the *comitatus*, or of buildings demolished by the ravages of time and the harsh northern weather.

**A NEW ARAB INFLUENCE.** On the Continent, beginning in the eleventh century, a new style of lyric poetry developed, inspired, as in Britain, largely by political, religious, and cultural shifts. Charlemagne's campaigns against the Muslim inhabitants of Spain in the ninth century, illustrated in the *Song of Roland* and other *chansons de geste* (heroic poetry), anticipated the even more extreme anti-Muslim military expeditions to the Middle East called Crusades, which began in 1095. The Crusades changed the cultural life of Europe through the introduction by the returning crusaders of the Arabic music, poetry, and luxury goods to which they had been exposed while in the East. Coming to Europe through southern France, the returning knights brought back a new Arab-inspired approach to lyric poetry, featuring themes of erotic love. A prominent early crusader, William IX of Aquitaine (1071–1127), became one of the first practitioners of this new kind of lyricism. William was the grandfather of Eleanor of Aquitaine, queen of both France and England through her successive marriages to King Louis VII of France and King Henry II of England in the twelfth century. At their respective courts, Eleanor and her daughter by Louis, Marie of Champagne, became patronesses of this new style of French poetry, which reflected the discourse of courtly love described by Andreas Capellanus in his treatise, *De Arte Honeste Amandi*, which may have been commissioned by Eleanor's daughter, Marie of Champagne, at one of her "courts of love."

**THE TROUBADOURS IN FRANCE.** Paralleling the development of the idea of courtly love in the twelfth century, these Arab-inspired poems, some of which were written about the experience of going on Crusade, called

Troubadours, Bernart de Ventadorn, Jaufré Rudel, Perdigon, Marcabru, Monk of Montaudon, Pons de Chaptueil, Albertet. French manuscript, late 13th century. THE GRANGER COLLECTION.

*chansons de croisade* (“Crusade Songs”), were created first in Provence in southern France by the troubadours and later continued by the trouvères in the north of France. The terms *troubadour* and *trouvère* derived from the verb *trobar*, which meant “to find or make.” Although these poets could be attached permanently to a particular court and patron, often they moved about from court to court, seeking more powerful and lucrative patronage. Troubadours in the south include Cercamon (1130–1148), Marcabru (1130–1150), Bernart de Ventadorn (1140–1180), Bertrand de Born (1140–1214), Pierre Vidal (1170–1204), Arnaut Daniel (1170–1210), and even a female poet (female troubadours are known as *trobairitz*) the Countess of Dia (1150–1200). The northern trouvères included Richard the Lion-Hearted (1157–1199), Gace Brulé (1170–1212), the Châtelain de Coucy (d. 1203), and Adam de la Halle (1270–1288). In contrast to the chilly, elegiac mood of Anglo-Saxon lyrics, this Continental poetry, influenced by the Crusaders’ experiences in the exotic Middle East, celebrated a new poetic theme: romantic love for a woman—sometimes the lady of the

court to which the poet was attached, who was unattainable because married, and whose every whim controlled the singer of the *chanson d’amour* (love song). The vocabulary expressing the roles of the lover and the beloved of the troubadour songs echoed the terminology of lordship so that the beloved lady played the role of the haughty “domna” (female “lord”) to the poet, her vassal. If the poet/lover was successful, these songs were expressed joyously as in the fusion of identities between the human singer and the lark he sings about in Bernart de Ventadorn’s “Can Vei la lauzeta” (“When I see the lark”). If the lover was unsuccessful, he might sing mournfully, against the backdrop of a paradise-like setting, the *paradis d’amour* (“paradise of love”), an almost ubiquitous springtime landscape complete with bird-song, gentle breezes, and fragrant flowers that inspire the poet to sing about his love of the lady.

**NEW POETIC GENRES.** Although these French poets are best known for their crusade songs and songs of love, the poetic repertoire practiced by the troubadours

## BIRDS in Medieval Literature

Birds are among the most commonly encountered creatures in medieval poetry, perhaps because it is so easy to understand the analogy between the poet as *singer* of love “songs” and the bird whose only means of communication is singing. Various types of birds or “fowles” are used to represent many different moods and situations in both English and Continental poetry. The *chanson d’amour*, the lyric poem of love “sung” to the accompaniment of music by the troubadours in France, the *minnesingers* in Germany, and courtly love lyricists in England, nearly always begins with reference to the singing of birds—larks, nightingales, or other woodland birds. In poems such as these, birds evoke the mood of the springtime *reverdie* (“regreening”), and the courtly lover expresses or “sings” his feelings of joy at success or sorrow at disappointment in his love pursuit, as in this example by the troubadour Bernart de Ventadorn, who wrote between 1150 and 1180:

When I see the lark moving  
Its wings with joy against the sunlight,  
Till he forgets and lets himself fall  
For the sweetness that has come into his heart,  
Alas! such great envy comes over me  
For all those whom I see rejoicing,  
I am amazed that my heart—right then—  
Does not melt with desire.

So tired! I thought I knew so much  
About love, and I really know so little,  
For I cannot keep myself from loving  
A lady from whom I will get no reward.  
She has my whole heart, my whole self,  
And herself and the whole world besides;  
And when she departed, she left me nothing  
But desire and a hungry heart. ...

Dream Visions, such as the *Romance of the Rose* and Chaucer’s *Book of the Duchess*, use birds and their song

to awaken the dream-narrator from sleep and to beckon the dreamer into the narrative of his dream. But other literary birds are more verbal in their depiction. Chaucer’s *Nun’s Priest’s Tale* is a delightful beast fable about a rooster, Chauntecleer, and a hen, Pertelote, who are married and who debate over whether or not the rooster’s nightmare about being captured by a fox is meaningful. The narrator reminds the audience that although his tale is of a “cock,” they must decide what in the tale is “wheat” and what is “chaff,” the standard metaphor for the possibilities of simultaneous literal and figurative meanings in allegory. Chaucer’s other bird poem, the *Parliament of Fowls*, features a dream in which various species of birds argue with one another about the issue of which aristocratic avian suitor the noble peregrine falcon should choose for her mate. This situation is reminiscent of the many arguments about which rank of suitor is appropriate for which rank of courtly lady in Andreas Capellanus’s twelfth-century *Art of Courtly Love*. Chaucer’s use of debating birds follows another earlier poem, the thirteenth-century *The Owl and the Nightingale*, in which the two title birds debate such issues as predestination, natural character, and carnal sin. Marie de France’s Breton Lay *Nightingale* features a bird whose singing is the occasion for the secret meetings of a married lady and her lover, but which eventually becomes a symbol reminiscent of the nightingale in Ovid’s *Metamorphoses*, in which the raped Philomela is transformed into the melodic bird. Chaucer includes this myth of a woman whose tongue is cut out to keep her from telling the story of her attack as one of the tales about tragic females in his *Legend of Good Women*. Although, at first glance, the birds of medieval poetry may appear to be mere background for the immediate plot situation, birds were favored vehicles by which poets expressed ideas about love, the creation of art, and the human voice and its silencing.

**SOURCE:** Bernart de Ventadorn, “Can vei la lauzeta mover,” translated from the Provençal by Kristen M. Figg.

and trouvères included a number of different types reflecting both cultural life and social conditions. Among these were the *jeu parti* (a game-like debate poem reflecting the competition between poets to produce the best lyric poetry); the *chanson d’aventure* (song of adventure) about an unusual encounter experienced by a knight errant; and the *aubade* or *aube*, or *alba* (dawn song), a lyric in which lovers lament the coming of the dawn because they must part after a night of clandestine lovemaking. Troubadours also produced the *planh* (complaint) about unsuccessful love or oppressive political or

economic situations; the *pastourelle* (song about shepherdess), a short, dialogue-filled, narrative account of a courtly knight’s attempt to seduce an innocent, but clever shepherdess; the *chanson de toile* (working song), a song voiced by female workers spinning cloth or doing other chores; and the *chanson de mal mariée* (a woman’s song about being badly married), a complaint about marital problems often stemming from the practice of arranged marriages. By the fourteenth century, the emphasis shifted from genres based on theme to genres based on form, as French poets like Guillaume de

## THE Cult of the Virgin Mary in Medieval Literature

Modern readers may be surprised by the number of medieval lyric poems that focus on the Virgin Mary not only in her role as intercessor or sorrowing mother of Jesus, but also as a type of idealized woman to be addressed with the language of love. Indeed, Dante's decision to depict the highest reaches of heaven as a celestial rose in which the Virgin Mary is the central petal reflects a medieval devotional practice, the "Cult of Mary," that began in the twelfth century and attracted Christian devotees throughout medieval Europe for centuries to come. This form of intense Marian devotion echoed the language of Courtly Love, with the Virgin metaphorically cast in the role of the chaste and sometimes demanding courtly "domna" (literally the Ma-donna) of a male supplicant. Also about this time, the Cistercian monk Bernard of Clairvaux, who purportedly was permitted to suckle from Mary's breast in an ecstatic vision, promoted special reverence for the Virgin, highlighting Mary's role as Christ's mother, and emphasizing the nutritive function of her breasts in her role as the "nurse" of God. Bernard's *Commentary on The Song of Songs* provided many new poetic images to be applied to the Virgin in lyric poetry. Samples of Mary's milk, brought back from the Holy Land by Crusaders, became highly prized relics to be venerated at various shrines to the Virgin throughout Europe, including the

English shrine in Walsingham in East Anglia, which attracted thousands of pilgrims from both England and abroad in the fourteenth and fifteenth centuries.

On the Continent, veneration of the Virgin increased during the fifteenth century through the promotion of the rosary, especially by members of the Dominican Order, as part of the Counter Reformation. The rosary as an aid to Marian devotion consisted of a strand of beads used for counting prayers, called "Aves," as in the prayer "Hail Mary." Increasing numbers of lay confraternities (organizations focused on a religious figure or shrine) devoted to the recitation of the rosary endorsed the rosary's efficacy at attaining from the Virgin both her Son's intercession on behalf of the supplicant, and her defense against physical injury. Mary's protection of supplicants was implied in popular visual images of the monumentally proportioned Virgin who shelters diminutive petitioners, and even whole cities, under her mantle. The belief in her ability to protect her supplicants was so great that, in the fifteenth century, another petition was added to the conclusion of the "Ave," asking Mary in turn to pray for the sinner both immediately and eventually at the hour of death. Also in the fifteenth century, woodcuts or paintings promoting the rosary often represented the "Fifteen Joyful, Sorrowful, and Glorious Mysteries" of Mary and her Son. The Sorrowful Mysteries, which directed the supplicant's attention to Mary's presence at Christ's crucifixion and death, contributed powerful imagery to lyric poems about Christ's Passion, and to Mary's role as "Mater Dolorosa" (sorrowful mother).

Machaut and Jean Froissart perfected "fixed form" lyrics with complicated patterns of rhyme and meter—genres such as the *ballade*, the *rondeau*, and the *virelais*, which at first were matched to complicated new musical forms, but later circulated independently. These challenging genres emphasizing the elevated language that corresponds to refined love were the precursors of the most famous Renaissance lyric form: the sonnet.

**THE INFLUENCE OF THE TROUBADOURS IN GERMANY.** Eventually, most of these French models were imitated all over the Continent. In Germany, the *minnesingers* (singers about *mine* which means "love"), such as Walter von der Vogelweide (1170–1280), continued to develop the themes of *fin'amors* (refined or distilled love), but the Germans addressed their love poetry to ladies who offered less *daunger* (resistance), and consummation was more realistically attainable in German courtly love poetry than in the French models. On the other hand, the sequences and hymns composed by the

polymath Hildegard of Bingen (1098–1179), the abbess of a convent of nuns located on the Rhine and the author of both medical treatises and accounts of her mystical visions, exemplify how secular and religious poetic themes could be fused. Like troubadour lyrics, Hildegard's hymns combine celebrations of the re-greening of nature in springtime with awed praise for God's creations and for the role of the Virgin Mary's paradoxical chaste fertility in the Incarnation. For example, Hildegard's hymn, "O viridissima virga" ("O greenest branch/virgin") develops complex wordplay between conventional springtime tropes about re-greening branches, Mary's role as a metaphoric "branch" on the family tree of Jesse (Christ's genealogical lineage), and her giving birth to Christ, which helped endow the earth's flora and fauna with new life and brought mankind into identification with the human/divine Redeemer, her son.

**THE INFLUENCE OF THE TROUBADOURS IN ITALY.** In Italy, the poets of the *dolce stil nuovo* ("the sweet new

## THE Spiritual and the Erotic in the Middle English “Foweles in the frith”

Foweles in the frith,  
The fisses in the flod,  
And I mon waxe wod.  
Mulch sorw I walke with  
For beste of bon and blod.

### A modernization of the Middle English text follows:

Birds in the wood,  
The fish in the river,  
And I must go mad.  
I live in great sorrow  
For the best of bone and blood.

“Foweles in the frith” (modernized from Oxford, Bodleian Library MS Douce 139, folio 5, thirteenth century) is one of the simplest and yet one of the most enigmatic of Middle English lyrics. With its terse placement of the birds in the woodlands and fish in the river, it opens with an extremely abbreviated evocation of the landscape of springtime, the traditional opening of many *chansons d’amour*. This traditional start abruptly precedes a statement that the speaker “must” go mad. Is the speaker envious of the birds and fish, who are in their proper element while he “walks” aimlessly in “much sorrow” to the point of madness?

The mysterious source of this extreme feeling of passion is revealed in the next and final two lines: the speaker is sorrowful because he has lost the “best” creature made of bone and blood, that is, the best human ever created. With no other clues as to the meaning of the five lines, one must consider what spring means in the medieval calendar. Spring brings the time of vernal rejuvenation in the natural world, a time when humans feel, like Chaucer’s “little birds” in the opening lines of the General Prologue of the *Canterbury Tales*, “pricked by nature” to answer their physical urges. In this sense, the poem seems a spare song of thwarted passion, in which the speaker, wracked by pangs of traditional courtly love, explains how he has become crazed after losing the “best” female made of bone and blood, his lost beloved. In the exaggerated diction of Courtly Love poetry, the male lover’s beloved is always the best lady of all women. However, springtime also suggests the season of Lent in the liturgical calendar, a sorrowful time of meditation on the Passion of Christ, leading up to the Resurrection at Easter. In this sense, the poem may also be the lament of a devoted Christian expressed about the loss of the “best of bone and blood,” the Godhead in His human incarnation as Christ, who suffered death at the time of year when birds are in the wood and fish are in the river. Whatever the interpretation, this tiny poem packs a great deal of possible meaning in five seemingly simple lines of verse.

*Middle English modernized by Lorraine K. Stock.*

style”) mirrored the themes of the southern French troubadours, many of whom had traveled—wandering from court to court in search of better patronage—from nearby Provence and Aquitaine to Italy. Notably, Dante Alighieri, the author of the *Divine Comedy*, wrote independent love poems and also incorporated songs and sonnets about Beatrice Portinari in his early autobiography *La Vita Nuova* (The New Life). These anticipate his veneration of Beatrice almost as if she were a saint in the *Divine Comedy*, placing her in the highest circles of Heaven with other saints and the Virgin Mary. The troubadour term “ma domna” for the courtly beloved resonated linguistically with *Madonna*, the Italian epithet for the Virgin Mary, encouraging association between the model of divine femininity and the courtly love object. In Italy, late in the medieval period, the humanist scholar and poet Francesco Petrarch (1304–1374) developed the sonnet, a formal fourteen-line poem, in a famous sequence of sonnets, the *canzoniere* (songs) honoring an idealized courtly lady, Laura. This

popular lyric form, which had probably been invented by Giacomo da Lentini in the Sicilian court in the mid-thirteenth century, was revived in England in the sixteenth century as the “Petrarchan” or “Italian” sonnet, used to great effect in the hands of Sir Thomas Wyatt, the earl of Surrey, and, of course, Shakespeare.

**LYRIC POETRY IN ENGLAND IN THE LATER MIDDLE AGES.** After the Norman Conquest (1066) in England, lyric poets also borrowed or absorbed many motifs from the Continental *chansons d’amour*, such as the conventional *natureingang* (“nature-entrance”), also known in Middle English as the *reverdrie* (“re-greening”), a song celebrating the reappearance of spring after a long winter. Many *chansons d’amour*, *chansons d’aventure*, and Crusaders’ songs begin with an evocative celebration of the glories of the re-greening of nature in April or May, and Hildegard of Bingen had used the idea to great spiritual effect in her hymns. This lyric motif clearly influenced and contributed to the *reverdrie*-like openings of dream visions such as the *Romance of the Rose* and the

famous opening sentence of the General Prologue of Chaucer's *Canterbury Tales*, which describes how the sweet showers of April, the tender shoots of plant life, the birds making melody, and the spring breezes inspire sundry folk from all over England to make a pilgrimage to the shrine of Thomas Becket at Canterbury Cathedral. The love professed by the Middle English lyric singer for flesh-and-blood courtly ladies—for example in the Harley Lyrics' "Alysoun"—was less intense and more playful than that of his passionate French counterpart, more like the German minnesingers. As in the case of Hildegard and the Italian practitioners of the *dolce stil nuovo* (sweet new style) of the late thirteenth century, Middle English poets also imaginatively developed the conventional devices and motifs of the Continental courtly love lyric by applying them not to a worldly female love object, but to the Virgin Mary, who became the spiritual "domna" revered by the lyric singer. In fact, Middle English poets wrote various sub-genres of religious lyric poetry devoted to such themes as veneration of the Virgin Mary, *contemptus mundi* (contempt for worldly things), the mutability of earthly life and the permanence of salvation, lamentation for the crucifixion of Christ, and the effect of the Fall of mankind on the human condition. In many Middle English lyrics, genres are combined paradoxically and provocatively, as in the brief lyric "Foweles in the frith," which fuses the spiritual and the erotic in a *reverdie* that can be interpreted as being both about unsuccessful love and about the tragedy of Christ's crucifixion. Perhaps harking back to the earlier dark, brooding Anglo-Saxon elegies at the close of the fourteenth century, Middle English poets like Geoffrey Chaucer also incorporated serious philosophical ideas and political sentiments in lyrics such as "The Former Age," "Truth," and "Gentillesse," which were inspired by passages in Boethius's philosophical treatise *Consolation of Philosophy*. Other Middle English poets used the lyric form to comment on contemporary political acrimony and social dissent that reflected such socioeconomic movements as the "Peasants' Revolt of 1381" in which the lower classes protested against the nobility, the clerical orders, and the legal courts because of heavy taxation and denial of their demands for higher wages and freedom of mobility.

## MEDIEVAL ALLEGORY AND PHILOSOPHICAL TEXTS

### RELIGION AND MEDIEVAL ARTISTIC EXPRESSION.

The Christian church was the most influential cultural institution in medieval Europe, having far more influence over every facet of life—including response to and production of texts—than any temporal or secular political or economic organizing system. From its earliest inception, the ecclesiastical establishment controlled the dissemination and interpretation of its foundational text, the Bible, accounting for any apparent inconsistencies through an elaborate system of reading that attributed multiple levels of meaning to the Scriptures as well as finding connections between events in the Old Testament and the history of Christ's ministry in the New Testament. This mode of interpretation was invented and disseminated by the early church fathers. Most prominent among these were Augustine of Hippo (354–430), whose autobiography *The Confessions* and treatise *The City of God* exemplify fourfold-interpretation of the Bible, and Pope Gregory the Great (590–604) whose *Moralia in Job* (Moralizing of the Book of Job) took every verse of that Old Testament book and found four different ways of understanding them. These modes of interpreting Scripture not only influenced the expression of spiritual ideas and sentiments in the Middle Ages, but also had significant impact on the visual arts and on literature. When applied to literary texts, this pervasive mode of thinking was known as allegory. In addition to literary

works like *Piers Plowman* or the *Romance of the Rose* which were completely allegorical, many works of medieval literature—even those associated with “realism”—incorporated some limited allegorical aspects in their overall scheme.

**MEDIEVAL ALLEGORY DEFINED: THE LETTER AND THE SPIRIT.** Allegory, which sometimes employs an extended metaphor, is a narrative mode in which a series of abstract ideas are presented through concrete, realistic characters and situations operating within a literal plot that makes sense in and of itself. Allegorical literature is typically encountered in two distinct forms. In the older type, called personification allegory (the most famous example of which is *The Romance of the Rose*) characters personify abstractions like Jealousy or Friendship, but these characters have no existence in the real world and do not “symbolize” anything more than their name implies. The narrative then dramatizes the encounter between abstractions made visual. In the second type of allegory, called symbol allegory (of which the *Divine Comedy* is the most famous example), the characters are real people who exist, or once existed in the real world, who “stand for” or symbolize something beyond themselves. This literal plot is meant also to convey an extra level or, in the most complicated types of allegory, several levels of moral, religious, political, or philosophical meaning. To medieval readers of allegory, the difference between the literal and the “figural” or allegorical level reflected Saint Paul’s pronouncement in 2 Cor. 3:6, that “The letter kills, . . . but the spirit gives life.” The early church father Saint Augustine of Hippo interpreted this to mean that the “letter” or literal level of a text covers and conceals the “spirit” just as the chaff covers the grain, or, in a more familiar comparison, the “nutshell” conceals the “kernel” of the nut.

**THE FOUR-FOLD METHOD OF MEDIEVAL ALLEGORIZATION.** In interpreting Scripture, the church fathers recognized the potential for up to four levels of allegorical or “exegetical” interpretation:

1. the literal level, the thing as it really stands in the text;
2. the allegorical level, which refers to the Church or something standing for a universal truth;
3. the tropological or “moral” level, which pertains to the spiritual life of individuals, teaching how they should behave; and
4. the anagogical or eschatological level, which stands for something pertaining to the hereafter.

In short, the literal level teaches things; the allegorical level tells what should be believed; the tropological or

moral level tells what should be done; and the anagogical level explains where a person goes after death. Although this complex system was seldom used directly in the creation of literature, it was important as a mode of thinking and occasionally appears in some of the more self-consciously religious allegorical texts. In the late fourteenth-century poem that modern editors call *Pearl*, a touching story of a father struggling with the death of his young daughter, the poet meditates on the meaning of the word which has become the poem’s title in ways very similar to the “fourfold scheme.” The major symbol of the “pearl” is, literally, a lost gem or the dead daughter; allegorically it represents primal innocence before the fall or the state of a baptized infant; tropologically it emphasizes one’s duty to regain innocence; and anagogically it points to a beatific vision in the heavenly paradise. Much more common than this complex fourfold allegory was a type of narrative built entirely on personifications, which allowed writers to explore directly the interactions between abstract moral qualities (often characterized as vices and virtues) fighting for control of the human will.

**ROMANCE OF THE ROSE.** Surviving in over 300 extant manuscripts and translated into nearly every medieval language, the thirteenth-century allegory *Romance of the Rose* was the single most influential secular literary work written in the Middle Ages and a key text in the development of the medieval genres of dream vision, allegory, and romance quest. The text is divided into a pair of opposing but complementary parts, composed by two different thirteenth-century French authors. Guillaume de Lorris wrote the first 4,000 lines of this seminal dream vision in 1230–1235. The dreamer’s quest for the rose remained uncompleted until Jean de Meun added almost 18,000 lines, continuing Guillaume’s allegorical plot, but adopting a more satirical tone; he completed the work in 1275. This pair of authors exemplifies the medieval reverence for past authorities; both are heavily indebted to Ovid’s works in their conception of love. Jean also incorporated the re-discovery of Aristotelian and Platonic texts that had recently become part of the curriculum at the University at Paris.

**GUILLAUME DE LORRIS’S ROMANCE OF THE ROSE.** Guillaume’s section of the poem opens in typical dream vision fashion, set in a May time *locus amoenus* (literally a “beautiful place”) in which the narrator, who eventually is identified as *Amant* (lover), dreams that he discovers an enclosed garden. The garden’s exterior walls are decorated with images of allegorical figures representing social groups and human types who exemplify the “vices” of

courtly society (such as hatred, felony, covetousness, envy, poverty, hypocrisy) or who are superficially unacceptable for elite membership in the garden of *Deduit* (mirth or diversion). Escorted into the garden by its gatekeeper, Idleness, the dreamer encounters allegorical abstractions representing the qualities of the leisured existence enjoyed by *Deduit* and the aristocratic inhabitants of his garden, a microcosm of courtly society: Beauty, Wealth, Generosity, Openness, Courtesy, and Youth. Proceeding through the garden, the dreamer encounters the fountain of Narcissus, whose myth literally reflects the self-absorption experienced by lovers. Gazing into the waters of Narcissus's fountain, the dreamer sees a reflected rose and is infatuated by the rosebud's surface beauty. The process of being "smitten" becomes literal and concrete as he is stalked by the God of Love, who shoots into the eyes and heart of the dreamer five allegorical arrows—beauty, simplicity, courtesy, company, and fair seeming—all catalysts to the psychological experience of love.

**ALLEGORY IN ROMANCE OF THE ROSE.** As personification allegory, Guillaume's Rose represents a courtly lady confronted with the dilemma of erotic desire as it comes into conflict with the need for *mesure* ("restraint," "rational control"), which will protect her reputation. The God of Love instructs the dreamer about how to pursue the goal of a single kiss from his beloved Rose and outlines what he can expect from the experience of love. Guillaume's text here illustrates one especially common aspect of courtly love, whose victims are afflicted with an array of physical discomforts (chills, heat, pangs, sighs, lost appetite and strength, insomnia) and emotional torments (jealousy, despair) that are gladly suffered by the lover for the moral self-improvement conferred by love. Despite her attraction to the nameless young man, called "Amant" or "Lover" in the poem, the Rose is protected from the dreamer's too avid pursuit by a court of attendants (mirroring actual court life), including Shame, Fear, Chastity, and Resistance (depicted as a churlish Wild Man). These abstractions are all allegorized aspects of her own attempt to maintain rational control over her honor. The attributes of the Rose representing her caution are balanced by others indicating her openness to the experience of love—Generosity, Pity, and Fair Welcoming—who encourage Amant to kiss the Rose. As soon as he does so, Jealousy imprisons the Rose and her Fair Welcome in a tower, where *La Vieille* (Old Woman), a cynical bawd experienced in the ways of sex, guards them. The first part of the poem breaks off with the dreamer's pursuit of the Rose at an impasse, when Guillaume de Lorris apparently died before completing his story.

**JEAN DE MEUN'S PHILOSOPHICAL CONTINUATION OF ROMANCE OF THE ROSE.** In 1275 Jean de Meun more than tripled the length of Guillaume's unfinished text with a continuation of the courtly adventure of Amant's quest to possess the Rose, to which he added new themes and many lengthy digressions from Guillaume's original simple narrative. Jean expands the concept of love from Guillaume's narrow and artificial focus on the emotional satisfaction of love to a more universal concept of fruitful cosmic love presided over by a personification called *Natura*. Whereas Guillaume strove for simplicity and innocence in both content and poetic style, the well-read Jean imbued his section of text not only with the cynical treatments of romantic love and marriage found in popular story collections and misogynistic satires like *The Fifteen Joys of Marriage*, but also the philosophical writings that he had come in contact with at the university. These included Plato and Aristotle, Aristotle's later commentators, and the writings of the Platonists of the twelfth-century School of Chartres such as Bernard Silvestris and Alan of Lille, whose conception of Nature in the *Complaint of Nature* Jean adopted. With lengthy and didactic speeches issuing from their mouths, Jean's allegorical characters resemble masters in medieval universities lecturing their students. Treating the subjects of the purpose of man's existence on earth and his role in the cosmos, these talking abstractions use *exempla* (narrative examples), the "colors" or figures of rhetoric, and classical quotations to illustrate their orations. As Jean continues the plot of the dreamer's erotic quest, Amant is advised by a new set of allegorical characters including Reason, representing the dreamer's own good sense, who "reasons" with him and tries to dissuade him from pursuing love.

**JEAN DE MEUN'S SATIRICAL REPUDIATION OF COURTLY LOVE.** Abandoned by Reason, Amant seeks the help of Friend, who acts as his go-between to the Rose. *La Vieille* (Old Woman) also lectures the Rose's Fair Welcome about the ways of attracting men through flirtatious behavior, a swaying walk, good table manners, and the employment of eye-catching clothing and cosmetics. By concretizing his abstraction False Seeming as a hypocritical friar, Jean also anticipates the satire of the fourteenth-century clergy created by Chaucer and Langland. Finally, Amant gains entry into the Castle of Jealousy, in which the Rose is imprisoned. With the help of Venus the goddess of love, he wages a "war" against the chastity of the Rose. At this point Jean de Meun interpolates into the love-quest plot several digressive sections borrowed from the Christian-Platonist scholars of Chartres. In a passage heavily indebted to Alan of Lille's *Complaint of Nature*, Nature makes her "confession" to

her priest Genius, representing the generative principle. She complains about how mankind has abused nature by practicing the artifice of courtly love rather than propagating the race. Genius urges the practice of various types of fecundity and recommends taking refuge in a park, which features the Well of Life instead of the Fountain of Narcissus. Jean parallels the major myth that anchors Guillaume's garden, the myth of Narcissus, by using another myth to frame the dreamer's experience—the story of Pygmalion, an artist who fell in love with the sculpture he created to represent his idealized perfect woman.

**JEAN DE MEUN'S SATIRE OF MEDIEVAL PILGRIMAGE.** As *Romance of the Rose* draws to its climax, the dreamer's identity shifts to a pilgrim figure, allowing Jean de Meun to satirize the widespread medieval experience of pilgrimage. Accessorized with the typical staff and scrip of pilgrim "weeds" or costume, which in Jean's impudent satire represent Amant's genitalia, the dreamer assaults the architectural "aperture" of the Rose/castle into which he is attempting to gain entrance. The castle has now become a hallowed "shrine" to erotic love. Having broken the barricade, the dreamer literally and figuratively deflowers the Rose, following the laws promulgated by Genius and Nature. When Amant impregnates the Rose, the dream suddenly ends. By this time, with the extra layer of pilgrimage added to the many other strata of allegory, Guillaume's original concept of Amant's delicate courtly adulation for a perfect Rose/lady has been satirized to the point of near-blasphemy.

**LITERARY INFLUENCE OF THE ROMANCE OF THE ROSE.** The *Romance of the Rose* influenced many later medieval writers. Dante adopted this text's highly symbolic rose to other purposes in his *Paradiso*, in which his idealized female figure Beatrice is beatified alongside the Virgin Mary as a petal in the Celestial Rose, a metaphor for the highest reaches of Heaven. Chaucer, who translated Guillaume's text into the Middle English poem known as the *Romaunt of the Rose*, apparently also was familiar with Jean's continuation, for he echoes the arguments of Genius in his own dream vision, *Parliament of Fowls*. In the *Canterbury Tales*, Chaucer modeled the characterization of his pilgrim Pardoner on Jean de Meun's False Seeming, his hypocritical Friar, and *La Vieille* (Old Woman); Chaucer incorporated *La Vieille*'s advice about table manners into the portrait of his pilgrim Prioress Madame Eglantine, whose name means "briar rose." Chaucer also took *La Vieille*'s generally cynical comments about male-female relations and transformed them into the autobiographical discourse of the five-times-married Wife of Bath in her Prologue and her

tale. The *Romance of the Rose* continued to be both influential and controversial throughout the medieval period. In the fifteenth century, Jean Gerson and Christine de Pizan strenuously protested the dubious value of Jean de Meun's text by taking part in a major literary debate with Jean's supporters in the "Quarrel of the Rose." Christine especially took offense at Jean's blatant antifeminism, a far cry from the reverent adulation for the Rose practiced by Guillaume's Amant.

#### DANTE ALIGHIERI

**POLITICS AND POETRY.** While *The Romance of the Rose*, the most influential poem written in French in the thirteenth century, had combined elements of courtly love, allegory, and philosophy, the Italian poet Dante Alighieri chose an even more daring strategy to write, in Italian, the first truly epic poem since Vergil's *Aeneid*. Born in the city-state of Florence in 1265, Dante brought to his poetry the near photographic recall of an intensely political life and the love of his native language, while also having a vision of heaven, earth, and hell that surpassed all previous efforts at encompassing the vast range of human experience. A member of the Guelph party, which supported the power of the papacy against the Ghibbelines, who took the side of the Holy Roman Emperor, Dante attempted a career in politics, which was aborted when his own party split into two groups and the power fell into the hands of the opposing faction, who sentenced him to death. He lived in exile from his beloved Florence for the rest of his life, a circumstance that intensified his sense of the contrast between happiness and deprivation, and allowed him to make literary use of the characters and events of recent history from which he was forcibly distanced. As a man who so intensely defined himself as a Florentine, in an age distinguished by a new sense of civic identity and participation, Dante is significant for employing the vernacular, rather than Latin (the official language of learning), in his most important writings. In fact, he produced a manifesto ad-

vocating the use of vernacular dialects or the “vulgar” tongue to produce serious literature. This treatise, *De Vulgari Eloquentia* (On Eloquence in the Vernacular), is itself expressed in Latin, not Italian. Dante distinguished between natural language, *locutio prima*, that children learn at their mother’s breast, and a second artificial language, *locutio grammatica*, that they learn at school. Latin should be used only in technical works, such as the *De Vulgari*, while the first nobler, more natural language should be used to create art.

**A POETIC AUTOBIOGRAPHY.** Dante was a disciple of the poet Brunetto Latini, and with Latini, Guido Cavalcanti, and other poets early in his career he practiced the *dolce stil nuovo* (“sweet new style”), the expression of courtly love poetry (influenced by the troubadours) in various Italian dialects. Culminating Dante’s early attempts to be a lyric poet was his creation of the *Vita Nuova* (New Life; 1292–1295), a 42-chapter collection of these early love poems, which are linked with a prose framework written in Italian, commenting on the poems themselves as well as generally about how to write and interpret poetry. This poetic autobiography, which attests Dante’s fidelity to the ideals of the *dolce stil nuovo*, especially to the acceptance of the power of Love as an external force, also chronicles Dante’s love for a young Florentine woman, which produced in him a spiritual renewal (hence the title). Although Dante was married to Gemma di Manetto Donati, with whom he had several children, the woman in the poem is Bice di Folco Portinari, whom he refers to in his poetry as Beatrice or *Bea-Trice*, a symbolic name meaning “triple blessed.” Beatrice served as an artistic muse and spiritual inspiration to him throughout his writing career. Beginning with Dante’s initial encounter with nine-year-old Beatrice and their second encounter nine years later, when she becomes a subject of his love poetry, Dante recounts his prophetic visions about her early death and her ascent to heaven. Upon her actual death in 1290, Dante abandoned writing secular love poetry, for in his perception Beatrice had now gone beyond incarnating earthly love and had become a vehicle of God’s larger plan. In *The Divine Comedy*, Beatrice is nearly apotheosized. She not only guides Dante through Paradise towards the Godhead, but also takes her place near the Virgin Mary as a “petal” in the highly allegorical “Celestial Rose,” Dante’s metaphor for the most sublime reaches of Heaven.

**DANTE’S DIVINE NUMBERS.** Written over the span of 1314 to 1321, *The Divine Comedy* is a tripartite visionary pilgrimage to hell, purgatory, and heaven, a medieval masterpiece that is considered one of the greatest literary achievements of all time. The poem is a highly

structured work revealing Dante’s reliance on number symbolism, a favorite device of many medieval authors, including the poet who wrote the romance *Sir Gawain and the Green Knight* and the dream vision *Pearl*, who made repeated use of the numbers three, five, and twelve. The entire *Comedy* is comprised of three major parts: *Inferno* (Hell), *Purgatorio* (Purgatory), and *Paradiso* (Heaven). Each of the three parts, reflecting the sacred number associated with the Christian Trinity, is in turn divided into 33 cantos with one introductory canto in *Inferno* adding up to the sacred and mathematically perfect number of 100 cantos (songs) in all. At the beginning of the poem, after realizing he is lost in a dark allegorical wood of error, Dante envisions (significantly) *three* symbolic beasts—a leopard (lust), a lion (pride), and a she-wolf (greed/avarice)—that paralyze him with fear and prevent him from making further progress toward the hill of salvation, until another figure appears to prod the pilgrim into action. Even the verse form Dante invented for the *Comedy*, *terza rima* (“triple rhyme”), reflects his employment of the Trinitarian pattern to organize and unify the vast literary work in which his muse, triple-blessed Beatrice, leads him to the Beatific Vision at the end of the third part.

**THE SPIRITUAL JOURNEY OF THE SELF.** Although the *Comedy* is in many ways a very personal poem, its framework ensures that Beatrice and Dante’s other guide, whom he calls Virgil (spelled in Italian as “Virgilio” rather than as the Latin “Vergil”), does not lead *only* Dante to his goal. While on one level Dante’s mind-boggling experience constitutes his own spiritual autobiography, he is careful to include the reader as a participant on the journey he takes to Hell, Purgatory, and Heaven. In the famous opening lines of the poem, Dante admits, “When I had journeyed half of *our* life’s way, I found myself inside a dark wood, for I had lost the path that does not stray.” With his significant use of the plural possessive pronoun “our,” Dante ensures that his experience will have universal applications. Similar to the trip to the Underworld taken by Vergil’s Aeneas or St. Paul’s ascent to Heaven in the New Testament (he later compares himself to both figures), Dante’s allegorical journey begun in *Inferno*’s first canto builds on a literary tradition of journeys that will later appear in the works of other great poets of the period, including Geoffrey Chaucer and William Langland. Dante’s choice of Vergil, author of the *Aeneid*, as his guide in the first part of the poem is hardly random. Significantly, Vergil was the greatest Latin authority for medieval arts and letters, and his epic was also a narrative about the arduous journey of its protagonist Aeneas, the eventual founder of the Roman Empire.

Dante and Virgil with souls in ice. *Inferno*, Biblioteca Nazionale Marciana, Venice, Italy Cod. It. IX, 276 (=6902), 15th century. © ARCHIVO ICONOGRAFICO, S.A./CORBIS. REPRODUCED BY PERMISSION.

**SIN AND RETRIBUTION.** The funnel-shaped landscape of Hell through which the character Virgil leads Dante is organized by various sins—not the traditional Seven Deadly Sins, but Dante’s own personal ranking of sins that adversely affect mankind not only in the personal sphere of life, but in the public realm of the economic and political operation of the *polis* (“city”). Dante has the various sins and subdivisions of them represented by an assortment of figures that include historical personages, literary characters, mythological figures, and his own local Italian contemporaries, many of whom are now obscure to the modern reader. Dante observes how these sinners are punished for eternity. The principle behind the assignment of the specific punishments is known as *contrapasso* (“opposition”), in which the punishment suits the sin by being its ironic opposite. For example, the gluttons, who ate excessively in life, are punished by being pelted by hurricanes of excrement, the byproduct of their own overeating, raining down upon them for eternity.

**THE CIRCLE OF THE LUSTFUL.** In each circle Dante observes the sinners from afar, and then, in the most moving encounters, he actually converses with those being punished. For example, in *Inferno*’s Canto 5, devoted to the circle of the lustful, Dante is powerfully affected

by the punishment of a pair of near contemporaries, Paolo and Francesca, who, for succumbing to the “storms” of passion that drove them to commit adultery and cuckold her husband (who was also Paolo’s brother), are forever within each other’s sight, but swept from each other’s touch by gale-force winds that fling them airborne. Francesca explains to Dante that what first sexually attracted them, impelling them to commit adultery, was their shared reading of a romance about the adultery of the Arthurian characters Lancelot and Guinevere. The reading led to kissing and beyond, and her husband, catching them, killed both. Dante has a violent reaction to Francesca’s characterization of an Arthurian romance as their “go-between” or pimp; he falls into a swoon. Whether Dante’s swoon was provoked by his pity for their fate or stemmed from his own stricken culpability as a writer who produced erotic poetry in his earlier career is a matter of interpretation.

**TREACHERY, THE BOTTOM OF HELL.** Dante and Virgil continue through the circles of Hell, encountering representatives of the sins of gluttony, avarice, wrath, heresy, violence against others (tyrants and murderers), against the self (suicides), and against God (blasphemers, homosexuals, usurers), and fraud in many permutations. The worst sin, and the one punished in the deepest pocket of Hell, is treachery, whose various degrees culminate finally in a monstrous three-headed Lucifer, who betrayed God his creator. Lucifer is seen grinding an anti-Trinity of other traitors in his triple jaws: Judas, Brutus, and Cassius, who respectively betrayed Christ and Julius Caesar, representing Church and Empire. Closing *Inferno* with more “threes,” Dante here underscores his significant use of number symbolism in the *Comedy*. Climbing out of Hell, he and Virgil spiral their way up Mount Purgatory, now encountering another varied group of sinners expiating the traditional Seven Deadly Sins (pride, envy, wrath, sloth, avarice, gluttony, lust) with punishments again assigned on the principle of *contrapasso*.

**REUNION WITH BEATRICE.** Virgil, technically a pagan, is capable only of guiding Dante through the *bolgias* (“pockets”) of Hell and up the circular mountain of Purgatory to its pinnacle, the Earthly Paradise. Here he must yield his charge to an even higher authority, Dante’s long-lost Beatrice, who leads the pilgrim through the spheres of the planets, to the fixed stars, through the Empyrean to the heights of Paradise, where he has a vision of Beatrice joining the Virgin Mary and other saints in the Celestial Rose, a symbol that had been exploited in a secular way by the authors of the *Romance of the Rose*. In the last moments of *Paradiso*, Dante ex-

periences the light and love of God. In trying to convey his utter incapacity to render his vision into language commensurate with its significance, the great wordsmith compares himself to an infant babbling while suckling at his mother's breast. The poem, which started on a faltering note of moral paralysis, thus ends triumphantly with Dante restored to the primal innocence of a baby. In this way Dante's poem is justifiably called the *Comedy*, a title that, for his medieval audience, indicated its genre. As explained in the *Letter to Can Grande*, duke of Verona, traditionally believed to have been written by Dante himself, a "comedy" is a work with a fortuitous ending and is the opposite of a "tragedy," a story that ends badly for the protagonist. In those terms, Dante's poem is the greatest of all comedies because the plot concludes ultimately with the protagonist experiencing a vision of God in Heaven.

### THE MEDIEVAL DREAM VISION

**AUTHORITIES FOR THE SIGNIFICANCE OF DREAMS.** Although many people today associate the study of dreams mainly with Sigmund Freud and Karl Jung and the twentieth-century practice of psychoanalysis, these theorists were anticipated in their investigations by nearly eight centuries, for medieval people were intensely interested in dreams and their meanings. As with other medieval literary forms, the dream vision, a genre unique to the period, was securely founded upon the medieval reverence for classical and ancient authorities. First of all, the use of dreams or visions as a literary device was sanctioned by the highest textual authority, the Scriptures. The Old Testament narrates various dreams, purported visions, or apparitions experienced by Pharaoh, Joseph, Nebuchadnezzar, Ezekiel, and others, while the New Testament features in Corinthians 2:12 St. Paul's vision of being caught up in

Paradise, and in the Book of Revelation, the account of an apocalyptic vision on Patmos. Medieval dream poetry also was preceded and endorsed by classical texts such as Plato's allegory of the cave in *The Republic*, Vergil's account of Aeneas's vision of the underworld in the *Aeneid*, and Macrobius's *Commentary* on Scipio's dream. These early models authorized the creation of a coherent group of texts whose "plot," strictly speaking, consisted of the narrator recounting his or her unusual dream, experienced while literally asleep. Although medieval writers of these narratives never defined their texts by the term "dream vision"—they simply called them "books" or "poems" or "things"—literary historians have attached the term "dream vision" to this recognizable body of medieval texts. This genre, which overlaps with the categories of allegory and philosophical works, was one of the most distinctive and widely practiced literary forms of the Middle Ages.

**CHARACTERISTICS OF THE DREAM VISION.** Medieval dream visions or dream allegories share certain common features. First, dream poems often employ a prologue consisting of an account of the conditions leading up to the narrator's having the dream, which sometimes is provoked by the dreamer's surroundings in a natural setting such as the *locus amoenus* ("pleasant place") full of spring breezes, birdsong, a flowery grove, and the lulling sound of flowing water. Examples include the May opening of the thirteenth-century *Romance of the Rose* and similar beginnings of later French dream visions by Machaut and Froissart, the Middle English *Piers Plowman*, the Prologue to Chaucer's *Legend of Good Women*, and the fourteenth-century English alliterative poem *Pearl*. At other times the dream is provoked by the content of a book read by the dreamer just before going to sleep, which in turn influences the content of the dream. For example, Chaucer's *Parliament of Fowls* opens with the narrator reading Macrobius's *Commentary on the Dream of Scipio*, which classified and interpreted dreams according to five types. Second, the main "plot" of the poem consists of a dream report or an account of the events occurring in the dream itself. The scope of this "plot" ranges from a limited, self-contained event, such as the dreamer's encounter and dialogue with the pearl maiden in the fourteenth-century alliterative Middle English poem *Pearl*, to a broad, encyclopedic treatment of many political, social, and spiritual issues such as is found in Langland's enormous alliterative dream vision *Piers Plowman*. Third, many dream poems, whether waking or sleeping visions, include the appearance to the narrator of a male or female authority figure who informs the dreamer about some aspect of his life or teaches him

some spiritual or philosophical truth. For example, personified Nature appears to the narrator of Alan of Lille's *Complaint of Nature*, Lady Holychurch appears to Will in *Piers Plowman*, and Reason, Rectitude, and Justice appear to Christine de Pizan in *The Book of the City of Ladies*. Fourth, some dream visions feature a framing epilogue consisting of the dreamer's awakening from the dream and interpretative speculations about its meaning, as occurs in the end of Chaucer's *Book of the Duchess*. Occasionally, the dream simply ends without the closing frame of the dreamer's awakening. Such an absence of closure occurs in Chaucer's *House of Fame*, in which the dream breaks off abruptly with the appearance of an otherwise mysterious "man of great authority," perhaps Chaucer's playful reference to the authority figure convention of dream visions.

**CONTINENTAL MEDIEVAL DREAM VISIONS.** The dream vision became a favored literary form in the thirteenth century with the appearance of the seminal exemplar of the genre, *Romance of the Rose*, started by Guillaume de Lorris and completed forty years later by another author, Jean de Meun. In Jean's continuation of the work, he demonstrates the potential of the dream vision to break down the rational barriers of waking life and allow for the inclusion of an encyclopedic range of subjects that would seem too random for an account of lived experience. With hundreds of manuscripts of the *Romance of the Rose* in circulation, often elaborately illustrated, by the fourteenth century the taste for dream narratives reached its zenith, with many examples produced by French love poets influenced by the *Rose*. Guillaume de Machaut (1300–1377), well known for his musical compositions and development of the motet, wrote the *Dit dou Vergier* (poem of the garden) in which the lovesick narrator swoons in an April *locus amoenus* and sees a vision of the God of Love, who dispenses advice about how to conduct a courtly love affair, using secrecy and loyalty to the beloved, whereupon the narrator awakens and vows to be true to his lady forever. As one of his earliest works, Jean Froissart (1337–1410) wrote the *Paradys d'Amours* (The Paradise of Love; 1361–1362), in which a lovesick, insomniac narrator prays for relief to the God of Sleep and, in the dream that ensues, gains the God of Love's support in wooing his lady. When, as a more mature poet, Froissart revisits the genre in *Le Joli Buisson de Jonece* (The Fair Bush of Youth; 1373), he demonstrates the dream vision's potential for psychological complexity as the narrator uses his dream of rejection in the garden of love to resolve his mid-life crisis, leading him to abandon love poetry and move on to more responsible authorial pursuits.

**CURRENTS IN MEDIEVAL ENGLAND.** The earliest dream vision written in England, the anonymous Anglo-Saxon religious lyric "The Dream of the Rood," is not a part of the tradition initiated by the *Romance of the Rose* but rather is a more direct descendant of the apocryphal New Testament stories—very like the canonical Book of Revelation—elaborating events in the life, death, and afterlife of Jesus which are reported by a narrator transported outside himself in a vision. In this remarkable poem, the dreamer-narrator recounts a vision of the crucified Christ on the cross in which the anthropomorphized cross or "Rood" speaks of its anguished feelings when made to serve as the implement of Christ's torture at the Passion. The Rood describes its relation to Christ—who is not the suffering victim depicted in late medieval art, but rather a heroic warrior like Beowulf—as that of a thane to his lord in the *comitatus*. As English society changed with the arrival of the Norman French in 1066, there was no continuity of tradition from this early example. After a hiatus of several centuries, however, dream visions reappeared, in imitation of the French, particularly in the work of Geoffrey Chaucer, who produced several examples: *Book of the Duchess*, which is much indebted to the love poetry of Froissart and Machaut; *House of Fame*, which combines French elements with a motif of ascent reminiscent of Dante's *Divine Comedy*; and *Parliament of Fowls*, which owes its conception of Lady Nature to Alan of Lille's allegorical female authority figure in *Complaint of Nature*. Chaucer and his works had English and Scottish imitators as late as the sixteenth century.

**THE ENGLISH PHILOSOPHICAL DREAM VISION.** While Chaucer's dream poems dealt with love, personal bereavement, the common profit, and fame, his English contemporaries combined dream vision with allegory to treat more serious, philosophical subjects. During the fourteenth century, the high mortality rate from the Black Death had accelerated economic changes that led to abandonment of the countryside by agricultural workers, periods of famine, sudden growth of urban centers, and the appearance of a new, socially unsettling, mercantile class that blurred old boundaries between noble and commoner. Camouflaging social critique under cover of a narrative that was "only a dream," such works as *Winner and Waster*, the *Parliament of Three Ages*, and *Piers Plowman* responded to the enormous social, religious, and economic changes that occurred in England from about 1350 onwards. The anonymous poet of the unfinished *Winner and Waster* (1350), for example, addressed the pressing economic issues of the proper getting and spending of money, posing the question of how to use national wealth with social responsibility. As the

allegorical armies of Winner and Waster prepare for battle before King Edward III, the king deems that Winner should ally itself with the Church while Waster joins the merchants of London's Cheapside market district. Similar economic concerns dominate the *Parliament [Debate] of Three Ages* (1350), in which the dreamer is visited by three men, representing allegorized Youth, Middle Age, and Old Age. Youth is carefree and thinks little about anything except the immediate moment and his pleasures; Middle Age worries only about keeping what he has earned; Old Age rails against the vices of the previous two ages and reminds Youth and Middle Age about the evanescence of earthly life. Using illustrative *exempla* (parable-like stories of moral instruction), Old Age reminds them that all is vanity and only death is certain. When the dreamer awakens, he is so traumatized by the vision that he remains lodged in a tree house, unable to return to civilized life.

**A SPIRITUAL DREAM VISION.** One of the most exquisitely constructed poems in Middle English is the late fourteenth-century alliterative dream vision *Pearl*, composed by the same unknown writer who created *Sir Gawain and the Green Knight* and *Patience* (a retelling of the biblical story of Jonah and the whale). As in his Arthurian romance about Sir Gawain, this poet employs striking number and color symbolism in a technically brilliant and emotionally moving poem comprised of 1,212 lines complexly organized into a structure reminiscent of a pearl necklace, with stanzas that are linked by the appearance of a key word in the last line of a stanza and its repetition in the first line of the next. The first stanza group depicts the narrator, a "joyless jeweler," lamenting the loss of some literal object, person, or state of being identified as a "pearl." The poem begins in a garden-like setting that may be the grave of the narrator's deceased young daughter or the literal "spot" where he lost a valuable pearl. After swooning from emotional loss, the narrator has a vision of a landscape suggestive of the terrestrial paradise in which a young woman, the pearl maiden, appears to him as a female authority figure like Boethius's Lady Philosophy. The pearl maiden instructs the literal-minded dreamer how to cope with his loss, using two New Testament parables as *exempla*. When the stubborn dreamer refuses to accept the promotion of such a young girl to one of the "queens" of heaven, she uses the "Parable of the Vineyard," whose moral is that the last shall go first, to explain the democracy of heavenly reward. To console him for his bereavement, she uses another parable from the Gospels, the "Pearl of Great Price," in which a jeweler exchanges a valuable gem for the greater prize of salvation. In an instance of *translatio studii*, John's vision of Revelation

## MACROBIUS'S Classification of Dreams

Ambrosius Theodosius Macrobius (399–422 c.e.), a late Roman author, wrote the *Commentary on the Dream of Scipio* (circa 400 c.e.), a long treatise interpreting the *Somnium Scipionis* (Dream of Scipio), the closing section of Marcus Tullius Cicero's *De re publica* (54–51 b.c.e.). Macrobius was an important source for the transmission of Plato's thought for the twelfth century. His *Commentary*, sixteen times longer than Cicero's original text, treats number symbolism, astronomy, cosmography, geography, the classification of the virtues, the division between body and soul, and other subjects, but the section he was best known for was his classification of dreams, which was cited frequently by medieval writers of dream visions, including Guillaume de Lorris, Jean de Meun, and Chaucer. According to Macrobius, there are five types of dreams: 1) the *insomnium* (nightmare), caused by anxiety or physical or mental distress, which had no special meaning and was not considered prophetic; 2) the *visum* (apparition), which occurs in the half sleep state just before one falls in deep sleep, and which also was not considered prophetic; 3) the *oraculum* (oracular dream), in which an authority figure or parent appears in the dream and advises or prophesies to the dreamer; 4) the *visio* (prophetic vision), a prophecy that comes true; 5) the *somnium* (enigmatic dream), whose meaning is veiled and must be interpreted. Macrobius considered only the last three types of dreams significant. Chaucer mentions Macrobius's commentary in his *Book of the Duchess*, the *Parliament of Fowls*, and the *Nun's Priest's Tale*, in which his well-read rooster, Chauntecleer, quotes Macrobius on dreams.

about the procession of the Lamb (representing Christ) into the jeweled city of the New Jerusalem is incorporated almost verbatim into the dream vision. The white-attired maiden, adorned with a huge pearl, joins the procession of 144,000 virgins honoring the Lamb. Against her warnings that it was not his choice to make, the dreamer, who cannot resist trying to cross the river separating him from this scene, is abruptly awakened from his vision. In the final stanza group, he finds himself once again on the mound where he fainted, consoled by a new white, round symbol to replace the lost pearl, the Eucharist. The highly suggestive image of the pearl can be read according to the four levels of allegorical interpretation: literally as a lost gem or the dead daughter;

allegorically as primal innocence before the fall or the state of a baptized infant; tropologically as innocence, with emphasis on one's duty to regain innocence; and anagogically as possession of the beatific vision in the heavenly paradise.

**THE IMPORTANCE OF DREAMS TO MEDIEVAL SENSIBILITY.** Other medieval literary works that are not, strictly speaking, dream visions also allude to the importance of dreams and attest both their veracity and the possibility of accurately interpreting them. Chaucer's delightful animal fable, the *Nun's Priest's Tale* in the *Canterbury Tales*, features a well-read rooster and hen, Chauntecleer and Pertelote, who argue over the validity and possible significance of the cock's nightmare about capture by a fox, with the cock citing many of the above-mentioned biblical and classical dreams for authority, as well as referring directly to Macrobius. This tale combines dream vision and the animal epic, specifically the story of Reynard the Fox, the most famous example of which is the French *Roman de Renart* cycle, composed between 1174 and 1250 by a number of different authors. By using this important popular genre, where animals take on the roles of people (with the fox representing the voracious, aggressive, and overly clever part of man), Chaucer is able to reinforce a traditional theme about the similarities between animals and humans while at the same time exploring the issue of dreams satirically, drawing on the audience's familiarity with the cock's self-important attitude. Medieval dream visions are often, like this tale, self-referential, with many of them alluding to Macrobius's authoritative typology of dreams, as well as other early dream visions such as Alan of Lille's *Complaint of Nature*, and the *Romance of the Rose*.

## WILLIAM LANGLAND AND PIERS PLOWMAN

**WILLIAM LANGLAND AND THE ALLEGORICAL WILL.** The long philosophical dream vision—or series of dreams—that editors title *Piers Plowman* is perhaps the finest example of the use of the dream vision for social, political, and spiritual commentary. Composed in alliterative verse in a Northwest Midlands dialect of Middle English, the poem twice was revised and enlarged over the course of the second half of the fourteenth century. Authorship by William Langland is based on internal evidence in some of the more than fifty surviving manuscripts (approaching the number of extant manuscripts of Chaucer's *Canterbury Tales*) whose large number indicates both the high demand for copies of this long and difficult text and, thus, the high regard in which Langland's text was held in the fourteenth and fifteenth centuries. What little concrete evidence about the author's life and background is known comes from inside the text itself. Langland was probably born about 1331 in the region of the Malvern Hills. He was most likely some form of cleric educated at a Benedictine school in that region, judging from his extensive knowledge of, and allusions to, scriptural passages and his use of Latin quotations throughout the poem. Like his narrative persona, Langland seems to have spent much of his life wandering and making a living from offering prayers for the dead for fees. Langland also seems to know a lot about the workings of the royal court and contemporary politics in London, so it is likely that he also lived in London at about the same time that Chaucer was working and writing there, though there is no evidence that they knew one another. The poem's narrator is called "Will"—a pun referring to the author's first name as well as signifying the abstract "human will," rendering Will the Dreamer an Everyman figure. For convenience, modern editors divide the large sprawling allegorical plot into two major parts: the *Visio* and the *Vitae*. Langland subjected his first draft of the poem to two consecutive major re-writings and the three versions have been designated by modern editors the A, B, and C Texts, all of which are divided into chapters or parts called (in both singular and plural) *Passus* (paces or steps). These "steps" on the road to salvation are undertaken by Will through

an allegorical pilgrimage whose goal is attaining a life devoted to “Truth.”

**LANGLAND’S VISIO.** The A Text (1360s), the shortest version, includes only Passus 1–11, the *Visio* (vision) dreamed by Will about the everyday political and economic life of man in society. This section culminates in the appearance of the allegorical character Piers Plowman, an agricultural worker and pilgrim figure who leads Will on the pilgrimage to Truth throughout the remainder of the poem. All three texts begin on a May morning, typical of the dream vision, when the narrator, a wandering cleric named Will, falls asleep in the Malvern Hills and has a vision of a “fair field of folk,” a cross-section of the fourteenth-century English population similar to that achieved by Chaucer in the pilgrim portraits of the General Prologue to the *Canterbury Tales*. This initial dream, which merges into a political allegory on the subject of good kingship (presented as an animal fable in which rats and mice—the laboring and middle classes—attempt to bell the cat or king in order to limit his power) becomes highly abstract. Like Boethius and Lady Philosophy or Dante and Beatrice, Will is visited by a female authority figure Lady Holychurch, standing for the institutional Christian Church. To Will’s question, “How can I save my soul?” Holychurch replies cryptically, “When all treasure is tried, *truth* is best.” She warns him against the temptations of money and worldly goods by showing him a vision of the failed metaphoric wedding of “Conscience” to another female allegorical figure, Lady Meed (fee or payment), who represents all the possible beneficial or corrupting influences of money, whether offered as a just reward or as a bribe. The Lady Meed episode, structured around the metaphor of marriage, illustrates various fourteenth-century crises in language, the economy, politics, and interpersonal relations. Both Langland’s allegorical use of marriage metaphors and his designation of “Truth” as the eventual goal of the Visio’s pilgrimage can be read in typical patristic fourfold allegorical interpretation as

1. literal marriage between an individual and his spouse;
2. political harmony between an individual subject and his king;
3. social and economic harmony between the individual and the larger community of his fellow men; and
4. spiritual union between the individual’s soul and God.

**THE ALLEGORY OF THE SEVEN DEADLY SINS.** In his dream, Will then witnesses the confession of the

Seven Deadly Sins, a parade of allegorical personifications, illustrating various social types from medieval estates satire—also employed by Chaucer in his General Prologue to type his Canterbury pilgrims—that embody in their lifestyles the practice of pride, wrath, avarice, envy, sloth, gluttony, and lechery. This is one of the most allegorical and at the same time most “realistic” sections of Langland’s poem. Gluttony’s overindulgence and vomiting in the tavern, Pride’s preening in her fine apparel, the slothful priest’s ignorance of the words to his *Pater Noster* (the Lord’s Prayer) when he knows by heart the rhymes of Robin Hood, all give fascinating glimpses into daily life of fourteenth-century London. When the plowing of a half-acre of land is disrupted by the workers’ laziness (here Langland is seen incorporating aspects of the new post-Black Death economy), the allegorical figure Piers the Plowman suddenly appears, offering to guide the group on a pilgrimage to “Truth.” This multifaceted virtue represents the abstract ideal of what is right, especially through the keeping of promises or contracts. Overall, in its many concrete references to and images of social, political, and economic life, the *Visio* is more “realistic” than the *Vitae*.

**THE VITAE OF DO WELL, DO BETTER, DO BEST.**

The B Text (1370s), three times the length of A, adds to the *Visio* Passus 12–20 comprising the “lives” of the allegorical triad of Do-wel, Do-bet (Do Better), and Do-best (lives of doing well, doing better, and doing best), whose subject is less the reform of general society than an exploration of how the individual Christian (represented by the narrator Will) can strive for spiritual perfection by practicing (with emphasis on *do-ing*) the virtue of Charity. B incorporates many more forms of allegory than A, each of which becomes increasingly more abstract, including the allegorical representation of the frustrating search for spiritual improvement through clerical and academic study, represented in Will’s ultimately inconclusive engagement with various personifications of the intellectual faculties such as Wit, Dame Study, Thought, and Scripture. Will’s quest to learn how to practice a virtuous life is represented in his attendance at a satirical banquet shared by personifications such as Patience, Conscience, and Haukyn the breadmaker, who represents the Active Life. The *Vitae* speak provocatively about such late medieval social problems as the hypocritical lifestyle of friars, who live luxuriously despite the pervasive poverty in the general populace. Will’s dream vision turns nightmarish in the concluding *Passus*, in which the narrator witnesses an attack on the Church’s unity by Antichrist, who leads an army of the Seven Deadly Sins. Apprehensive about the imminent collapse of society, the collective Conscience undertakes another

## PILGRIMAGE in Medieval Literature

Making pilgrimages was a popular devotional practice that sometimes became more pastime than penance in the Middle Ages. Christians from all corners of Europe flocked to the major pilgrimage destinations to venerate relics of saints and to undergo spiritual renewal through self-denial. Pilgrims traveled to both nearby shrines and to far-flung destinations such as Compostela in northern Spain, Rome, and Jerusalem. The Wife of Bath in Chaucer's *Canterbury Tales* visited all these pilgrim sites and more. Her real-life counterpart, Margery Kempe, who had visions of a bleeding, crucified Christ while on pilgrimage, wrote *The Book of Margery Kempe*, an account of many of her travels and spiritual experiences.

Although shrines were dedicated to many different international and local saints, medieval devotion to the Virgin Mary was especially widespread. There was special interest in the Virgin in England starting from the Anglo-Saxon period when many cathedrals, monasteries, and convents were rededicated to Mary. The foremost site for veneration of the Virgin in England was a shrine established in 1131 by Richelme de Fervaques, a widow who, after being inspired by a series of visions, ordered the construction of a chapel to Our Lady in Walsingham, a town on the Norfolk coast. Walsingham became a popular local, national, and international pilgrimage destination in the thirteenth and fourteenth centuries, reaching its zenith in the fifteenth through sixteenth centuries, when visitation of Walsingham's shrine surpassed even that of Canterbury.

In the fourteenth century Walsingham became a shrine of national prominence, as indicated by William Langland, who, though he never once mentions Canterbury, describes the Walsingham pilgrimage experience several times in *Piers Plowman*, where Will observes, "A heap of hermits with hooked pilgrim staves/ Went to Walsingham with their wenches following them" and "They were clothed in pilgrim weeds to be distinguished from others" (Prologue: 53-54, 56; modernized by Lorraine K. Stock). Here Langland observes that pilgrims wore a distinctive costume to proclaim their penitent status. These lines also indicate that not all pilgrims practiced sexual abstinence during what was supposed to be a penitential exercise. During the peak of Walsingham's popularity, ordinary travelers as well as royalty stopped at the "Slipper Chapel" at Houghton (circa 1348), less than two miles from their destination, to remove their shoes and walk barefoot the rest of the way to the shrine. This degree of self-denial throws into sharp relief the much more comfortable situation of Chaucer's well-dressed and well-shod pilgrims on horseback to Canterbury. Like the crypt containing the remains of St. Thomas Becket in Canterbury Cathedral, Walsingham also displayed saintly tokens that pilgrims venerated. In addition to a famous statue of the Virgin and a pair of wells noted for their healing waters, the Walsingham shrine displayed a relic of Mary's milk, which was reputed to aid the lactation of mothers. Perhaps because of such superstitions, at the end of the fourteenth century the shrine was a target of the reforming Lollards, led by John Wyclif, who decried Walsingham's Virgin Mary as the "witch of Walsingham."

pilgrimage to find Piers Plowman (who had disappeared from the plot of the dream), thus reprising themes from the *Visio*. Will awakens abruptly in the last lines of the poem to the stricken sound of Conscience's perhaps unanswered cries for grace, leaving the conclusion of the quest for Truth uncertain.

**AGRICULTURAL IMAGERY AND PILGRIMAGE.** The longest version of *Piers Plowman*, the C Text (written in the late 1380s, about the same time Chaucer wrote the *Canterbury Tales*), is largely the same as B, except for a few details, such as the addition of purportedly autobiographical details about the author and the deletion of certain controversial segments. In both B and C, Langland unifies the disparate themes of his complex philosophical vision through a series of agricultural and organic images and tropes begun in the *Visio* with the "field" of folk, the plowing of the half-acre, and the figure of Piers the Plowman, and continuing in the *Vitae* with the organic

metaphor of the Tree of Charity, the plowing of the four Gospels, and the Universal Church imaged as a Barn called *Unitas* ("unity") at the poem's end. If this set of rural images reflects England's agricultural foundations, then another motif, that of pilgrimage, ties the poem to a more contemporary concern: the popularity of pilgrimages. Langland's selection of an allegorical "pilgrimage" to find Truth as his governing metaphor parallels Chaucer's far more secular employment of the theme of a literal pilgrimage to the shrine of Thomas Becket in Canterbury in the *Canterbury Tales*. Increasingly, as the Middle Ages drew to a close, the undertaking of pilgrimages became a thorny issue as the sometimes less-than-pious motives of pilgrims were questioned by reform movements such as the Wycliffites or Lollards, led by Oxford clergyman John Wyclif. Knowing that the practice was both widespread and controversial, both Langland and Chaucer used the pilgrimage theme to great (if dis-

similar) effect to illustrate some of the most compelling social and spiritual issues of their era.

### THE MEDIEVAL STORY COLLECTION

**RESISTANCE TO CATEGORIZATION.** A characteristically unique feature of medieval literature is its tendency to mix forms and styles. In the cases of the philosophical dream vision, the romance, and the allegory, individual medieval literary works often combine or incorporate several independently identifiable genres such as prose and verse, or comic and serious elements, within one work. This tendency makes it impossible to classify certain works in a single generic category. For example, the long, highly complex thirteenth-century poem *Romance of the Rose* combines dream vision, courtly romance, adventure quest, allegory, love poem, philosophical treatise, social satire, and more, within a vast plot that was begun by one author, Guillaume de Lorris, and completed a half century later by another writer of a completely different mindset, Jean de Meun. Similarly, *Piers Plowman* combines allegory, dream vision, philosophy, pilgrimage quest, social satire and other forms to such an extent that it is difficult to describe it by a more precise term than “dream vision.”

**MEDIEVAL MANUSCRIPT MISCELLANIES.** One of the more popular ways for medieval readers to obtain copies of literary works was to order manuscripts that collected a variety of kinds of genres and forms within the binding of a single book. Medieval audiences thus might receive a mixture of long romances, mid-length narratives, and short lyrics in manuscripts that were loosely organized “miscellanies” or anthologies containing a sampler of varied genres and modes. Paralleling this manuscript model of the “miscellany,” medieval writers themselves were inclined to create what were essentially anthologies of different stories that circulated together in a reasonably coherent form. Sometimes these “story collections” were organized around a theme that provided a reason for a compiler to collect the tales. This variety would include collections of saints’ lives like the enormously influential

mid-thirteenth-century *Legenda Aurea* (Golden Legend) by Jacob of Voragine; tales of remarkable people and events like the *Gesta Romanorum* (Deeds of the Romans); and the Breton *lais* and animal *fables* of Marie de France. However, the most formal and literarily self-conscious medieval story collections involved a framing device, a larger narrative that linked all the other stories through an author’s invented occasion at which stories and exempla were exchanged. In some cases the stories were chosen to illustrate either a moral principle or its violation. Other story-collecting frameworks involve a group of people telling tales to one another as a social exercise, a game, or a way of passing what would otherwise be tedious travel time. Such storytelling “frame” situations were employed to organize several important landmarks of medieval literary culture in Continental Europe and England.

**THE LATIN STORY COLLECTION IN ITALY.** The Italian writer Giovanni Boccaccio (1313–1375) compiled several story collections, both in Italian and in Latin, although in his own lifetime the Latin works were more popular than the vernacular ones. One Latin collection, *De casibus virorum illustrium* (Concerning the Fates of Illustrious Men; 1355), which was possibly a source for Chaucer’s *Monk’s Tale*, has no frame, and is almost exclusively didactic. It narrates the rise to fame and fall from fortune of various great men and several women in chronological order, starting with the biblical Adam and going to the middle of the fourteenth century. These tales, which seem overly similar to a modern audience, were enormously popular in Boccaccio’s time, and the *De casibus* was the work for which he was then best known, judging from over eighty surviving manuscripts and numerous French translations in luxury illuminated editions. Each narrative offers the same pattern—the turning of Boethius’s Wheel of Fortune, the foolishness of pride, and God’s humbling of the proud. Boccaccio also wrote a similar Latin collection on women, *De mulieribus claris* (Concerning Famous Women; 1361–1362), which recounts the lives of over 100 mythological and classical women who became famous or infamous for various reasons. This work anticipates Chaucer’s *Legend of Good Women*, which has an elaborate frame and prologue, and Christine de Pizan’s *Book of the City of Ladies*, a collection structured around the building of an allegorical city comprised of the biographies of illustrious women.

**THE DECAMERON.** The work for which Boccaccio is now most famous, *The Decameron* (One Hundred Stories), is an Italian anthology organized within

an elaborate fictive structural framework. It starts with a gruesomely graphic description of the physical symptoms of the Black Death, the pandemic outbreak of bubonic plague that swept across Europe in the middle of the fourteenth century, killing off between one-third to one-half of Europe's entire population. If for no other reason than the fact that its opening offers one of the only written eyewitness accounts of the ravages of the Black Death, Boccaccio's *Decameron* would be a landmark of medieval literature. However, additionally, like Chaucer's similarly framed Middle English *Canterbury Tales* and Juan Ruiz's Spanish *Book of Good Love*, this Italian collection of stories serves as a sampler of the variety of types of literary forms available in the late Middle Ages. Like Chaucer's host, who stipulates that the pilgrims' tales must combine "sentence and solas" (moral instruction and enjoyment), Boccaccio's narrator dedicates his collection to the edification and pleasure of "ladies in love" who, confined to their sewing rooms, do not have the freedom of their male counterparts to escape the distress of being in love through outdoor physical activities, hunting, and business affairs.

**STORYTELLING IN THE DECAMERON.** Boccaccio's fictive frame has ten young Florentines (seven ladies and three men) fleeing from plague-ridden Florence to various estates outside the city to escape infection in the more healthful air of the countryside. They agree to a story-telling game to pass their time pleasantly, with the rule that a queen or king is to be selected daily to determine the theme for that day's ten tales. The assigned themes include positive reversals of fortune; recovery of losses; unhappy love affairs; successful love affairs; clever verbal maneuvers; treachery of wives against their husbands; tricks played by both sexes; the performance of generous deeds; or free topics—in short, the full range of life experiences. After ten days of story telling, the participants return to Florence and go their separate ways. Unlike the other story collections Boccaccio wrote, this group foregoes didacticism for the sheer pleasure of telling and hearing tales. The possibility of complete disorder in so many stories is precluded by the announced themes, which help give the stories coherence. Here, as in Chaucer's *Canterbury Tales*, the sheer abundance and variety of tale-types—ranging from moral tales to romances, to bawdy *fabliaux* (for which Boccaccio is probably most famous)—ensure that all readers will find stories to amuse, provoke, and enlighten them. Moreover, as in Chaucer's *Canterbury* story collection, the delightful interplay between the tellers within the framework of the contest provides additional human interest.

#### A LITERARY MISCELLANY IN MEDIEVAL SPAIN.

One of the landmarks of literary culture in medieval Spain was the 1350 *Book of Good Love* by Juan Ruiz, otherwise identified as the "Archpriest" of Hita, a town north-east of Madrid. Although not a formally framed story collection like Boccaccio's *Decameron* or Chaucer's *Canterbury Tales*, Ruiz's *Book*, a meandering, episodic series of accounts of the Archpriest's fourteen attempted (and sporadically successful) adventures in love, incorporates many literary genres and a wide spectrum of tones, ranging from the academically serious and religiously pious to the satirical and nearly blasphemous. Narrated by a priest who in one episode woos a nun by means of a bawd-like go-between named Conventhopper, Ruiz offers a scathing treatment of contemporary clergy and religious life. Ruiz parodies the *pastourelle* in the narrator's encounters with the aggressive, ugly Wild Woman-like "mountain girls" who physically overpower the Archpriest, forcing him to have sex in exchange for dinner and a place by the fire. The Archpriest also creates an Ovidian "art of love" similar to Andreas Capellanus's *Art of Courty Love* in which Sir Love and Lady Venus teach the narrator how to court women. The many allegories include a mock joust between a personified Sir Carnival and the pilgrim-attired Lady Lent (using meat and sardines as cannon balls), an allegory of the seasons and months, an allegory of the arms of a Christian, and an allegory of the seven Vices of Love illustrated by beast fables. Ruiz includes a dream vision in which Sir Love appears to the Archpriest, *exempla*, fables, *fabliaux* exchanged between the nun and the go-between, and other genres.

**ALLEGORY AND AMBIGUITY IN RUIZ'S BOOK OF GOOD LOVE.** Whereas the intended meanings of other story collections are more obvious, the ultimate signification of Ruiz's complexly woven, tapestry-like collection is equivocal. He repeatedly reminds his audience of the metaphor of the "husk and the kernel," suggesting that the work (or parts of it) may be understood as an allegory meant to convey meaning(s) beyond its sometimes outrageous literal level. Like Boethius in the *Consolation of Philosophy*, the narrator's opening prayer indicates that he is writing from prison. But by "prison," does he mean a literal jail cell, the "prison" of corporeal flesh, or the "prison" of the experience of love? Even the work's title, which initially implies that its subject will be erotic love, proves to be ambivalent, for eventually Ruiz distinguishes between "good love" (defined as love of God and obedience to His Commandments) and "foolish love of *this* world," which many of the Archpriest's adventures illustrate, though it is uncertain whether anything is learned from

### DAME SIRITH

**INTRODUCTION:** *Dame Sirith* [Siriz] (from a manuscript made between 1272 and 1283) is the only known English fabliau besides several of Chaucer's *Canterbury Tales*. Probably Oriental in origin, the story of *Dame Sirith and the Weeping Bitch* offers an attack on bourgeois materialism, hypocrisy, and complacency. At the same time, it satirizes courtly love with masterful irony in a complex stanza form typical of popular romances. The story recounts the passion—complete with the pangs of love sickness—of a young clerk, Willikin (a diminutive of William), for a smug married woman, Margery. All of the protagonists are villagers of the lower middle class, but Willikin's language employs many of the conventions of aristocratic courtly love, which lend an improbable and comic note to the poem. The clerk one day visits the woman when her merchant husband has gone to a fair, revealing that he has loved her for many years and would like her to be his "leuemon" or beloved (a term from courtly love lyrics). But the lady rejects his advances, citing the respectability of her life and the virtues—and wealth—of her husband. Willikin then addresses himself to a go-between, Dame Sirith, a bawd on the order of the woman charmingly called "Convent Hopper" in Juan Ruiz's *Book of Good Love*. Through a clever trick, Dame Sirith convinces Margery to cooperate, and at the end of the tale, she brings Willikin back to Margery with the admonition that he "plow her well and stretch her thighs wide apart," which Willikin, with the now eager Margery, proceeds to do. In the passage modernized here, Dame Sirith prepares for her visit to Margery by feeding her small dog pepper and mustard until it weeps, then goes to see Margery with the weeping dog under her arm. Complaining to Margery of her poverty, she gets her sympathy and attention, as well as food and drink. Margery asks Dame Sirith what has brought her to this miserable condition. The following excerpt is her response.

[Dame Sirith]: "I have a daughter fair and free  
No man might find one fairer.  
She had a husband great and rich  
And generous as well.  
My daughter loved him all too much,  
Which is why I am so sad.  
On a certain day he was out of the house—  
Which is why my daughter is ruined.  
He had an errand out of town;  
A tonsured clerk came by

And offered my daughter his love.  
But she would not do as he said—  
He might not have his way with her,  
No matter how great his desire.  
Then the clerk began casting spells  
And turned my daughter into this bitch  
You see here in my arms.  
My heart breaks for her!  
See how her eyes run  
And how the tears flow down.  
Therefore, lady, it's no surprise  
That my heart is breaking in two.  
And any young housewife cares little for her life  
If she refuses a clerk her love,  
And doesn't give in to him."—  
"Oh my god," said Margery, "what should I do?  
The other day a clerk came to me  
And bade me love him in just this way,  
And I refused him. Now I fear  
He will transform me too.  
How can I escape?"—  
"May God Almighty keep you safe  
From becoming a bitch or a puppy!  
Dear lady, if any clerk offers his love,  
I think you should grant his wish  
And become his sweetie straightaway.  
And if you don't, a worse fate will befall you."—  
"Lord Christ, woe is me  
That that clerk went away  
Before he had won me.  
I wish more than anything  
That he had lain with me  
And done it right away!  
Dame Sirith, evermore I will be in your debt  
If you will fetch me Willikin,  
That clerk I'm speaking of—  
And I will give you gifts  
So that you will be better off  
Forever, by God's own bell.  
Unless you bring me Willikin,  
I will never laugh or sing  
Or be happy ever again."

**SOURCE:** *Dame Sirith and the Weeping Bitch*, in *Middle English Humorous Tales in Verse*. Ed. George H. McKnight (Boston and London: D. C. Heath, 1913): 16–18. Text modernized from the Middle English by John Block Friedman and Kristen Figg.

his described experiences. One thing is clear—in a period of extreme antifeminism, the narrator admires and philosophically supports women in all their infinite variety. If the Archpriest's persona remains flat and undeveloped, the characters of several of the eccentric

women he woos (or is wooed by) remain unforgettable: the physically grotesque and sexually voracious "mountain girls," the ever-present and ever-faithful "Convent-hopper," and the two women with whom the narrator has most success in love, the widow Lady Sloeberry and

the nun Garoça (with whom he enjoys a platonic relationship).

#### THE STORY COLLECTION IN ENGLAND: CHAUCER.

In addition to his more famous *Canterbury Tales*—within which is included another incomplete collection, the *Monk's Tale* (consisting of “tragedies” of men’s diminished fortunes)—Geoffrey Chaucer also wrote another unfinished collection, *The Legend of Good Women* (1389), his third-longest work, created shortly after *Troilus and Criseyde*. Like Christine de Pizan’s French allegory *Book of the City of Ladies* and Boccaccio’s Latin collection *Concerning Famous Women*, the Middle English *Legend* provides a story collection about various (sometimes questionably) “saintly” females who were victims of love. Chaucer’s female figures were selected from the annals of antiquity and classical myth, including Ariadne, Cleopatra, Medea, Dido, Lucretia, Philomela, and others. The *Legend’s* prologue sets the stories within the framework of a dream vision in which the narrator is harassed by Cupid, the God of Love, and his queen, the daisy-like Alceste, for writing literary works that defame women, such as the *Romaunt of the Rose* (Chaucer’s translation of the thirteenth-century French dream vision) and *Troilus and Criseyde*, in which Criseyde betrays her lover Troilus. To rectify this literary “sin” against the fair sex, the narrator of *Legend* is issued the “penance” of writing a collection of stories lauding the more than twenty thousand “good women” whose stories he has neglected. However, the legends that follow only tell of ten women. Whether Chaucer tired of this literary exercise and voluntarily abandoned the project or decided to express an ironic view of womanly virtue through the very brevity and inconclusiveness of the collection is impossible to tell.

**JOHN GOWER’S STORY COLLECTION, CONFESSIO AMANTIS.** In *Confessio Amantis* (Confession of the Lover; 1390–1393), containing over 30,000 lines of narrative verse, Chaucer’s English contemporary John Gower presents a collection of biblical, classical, legendary, and popular narratives, recounted by Genius, priest of Venus, as he hears the confession of *Amans* (“the lover”). The narrative voice represents John Gower, who poses as an elderly lover. The structure of *Confessio* is organized as if *Amans* confesses to his priest the various sins committed against love in seven books of stories organized according to the Seven Deadly Sins—Pride, Avarice, Envy, Wrath, Lechery, Gluttony, and Sloth—with one book assigned to each mortal sin. For Genius and the Lover, Gower obviously is indebted to the same figures in Jean de Meun’s continuation of the *Romance of the Rose* as well as Jean’s source, Alan of Lille’s *Complaint of Nature*. Before the

confessions proper start, there is a Prologue narrated by “John Gower” as well as another book summarizing Aristotelian lore at the lover’s request. Even though both Gower and Chaucer sometimes tell analogous stories—for example Gower narrates stories that parallel those of the *Man of Law’s Tale* of Constance and the *Wife of Bath’s Tale* of a rash promise to a loathly damsel—readers today generally favor the psychological complexity of Chaucer’s rendition over Gower’s more prosaic version. Gower, however, was a prolific writer, composing thousands of lines of verse in Latin, French, and Middle English, for which he had a large audience in his time.

**THE FABLIAU.** This brief type of tale, also known as the short *conte*, was predominantly a French form, the earliest examples dating from 1200. The term is the Old French diminutive for “little fable” and its plural is *fabliaux*; no equivalent name exists in Middle English. Unlike the romance, which often takes place in the far away and long ago Celtic Other World or in some idealized version of Camelot, the *fabliau* is set in the everyday world of the present. Its characters are bourgeois: peasants, clerks, lecherous clergy, oversexed wives, artisans, and cuckolded husbands. Despite its bourgeois or lower-class subject matter, the *fabliau* is not a bourgeois phenomenon, and, indeed, examples of the genre or texts in related forms occur alongside romances and in such important works as Chaucer’s *Canterbury Tales*, Boccaccio’s *Decameron*, and Juan Ruiz’s *Book of Good Love*. The genre may have been an aristocratic form that mocked middle- or lower-class pretensions or the lack thereof. Its clever, complicated plots, often love triangles, are concerned more with cunning and folly than with virtue and evil, and generally concern humankind’s most basic functions—mostly sex, sometimes excretion. Little descriptive detail is given and characterization is usually minimal, reducing people to stock character types: the stupid cuckold, the venal woman, and the lecherous clerk. Sometimes, as in an *exemplum* or fable, there is a moral, usually a satirical spoof of the character and his or her “sins.” Essentially, however, the whole point of the form is amorality. The *fabliau* expresses the non-official culture of carnal, almost carnival, irreverence, of those feelings suppressed by courtly politeness or religious asceticism.

## THE CANTERBURY TALES

**A CROSS-SECTION OF FOURTEENTH-CENTURY CHARACTER TYPES.** Begun about the late 1380s and still incomplete at Chaucer's death in 1400, the *Canterbury Tales* comprise the most famous story collection in medieval literature. Like the journey to escape the ravages of the plague in Boccaccio's *Decameron*, the frame that holds together this collection of tales is the purportedly random meeting of 29 individuals at the Tabard Inn in Southwark, southeast of the city of London. The common goal of this group of "sundry folk" is to make a pilgrimage to the shrine of St. Thomas Becket in Canterbury. In some ways, this pilgrim group presents a cross-section of late fourteenth-century English people and professions. At the top of the social hierarchy are an aristocratic knight and his entourage (his squire son and their attending yeoman). Also represented are various strata of the clerical class (an Oxford clerk and a lawyer) and assorted clergy and male and female religious persons (several nuns, a parson, a summoner, a friar, a monk, and a pardoner). Chaucer makes sure to also include representatives of the mercantile class from which he himself originated (a franklin, a merchant, some guildsmen, and a cloth-weaving female entrepreneur from Bath). In a parallel to Langland's agricultural laborers and his title character Piers Plowman, Chaucer went on to include members of the agricultural peasantry (a plowman, a miller, and a reeve), though how they could have afforded the time or the funds to travel on a pilgrimage is left to the reader to wonder about. Chaucer's treatment of the portraits of the pilgrims in

the General Prologue to the *Tales* features stock character types from the tradition of medieval estates satire, which assigned recognizably stereotypical traits and appearances to certain professions. To these expected stereotypes, Chaucer added individualizing personal touches, like the hairy wart on the Miller's nose, or the brooch proclaiming "Love conquers all" dangling from the Prioress's rosary, or the gold "love knot" that fastens the Monk's cloak. These details ultimately render the pilgrims vividly realized individuals rather than types.

**THE STORYTELLING CONTEST.** These pilgrims are gathered together in a common enterprise by the inn's host, Harry Bailly, who proposes a story-telling contest as a pastime to allay the tedium of days of travel on horseback. The promised prize is a free dinner (to be paid for by all the losers) at Harry's inn on the return trip. The winning tale must successfully combine moral instruction and amusement (*sentence* and *solas*). Harry, the self-appointed judge of the contest, rigs the game so that the first contestant, appropriately, is the Knight, the highest-ranking member of the entourage. This aristocrat tells a long, highly philosophical, Boethian-influenced tale about ancient Greek and Theban characters, based on Boccaccio's *Teseide* (Story of Theseus). Although Chaucer did not complete the *Canterbury Tales* (of the contracted two tales per each of the 29 pilgrims going to and returning from Canterbury, Chaucer did not even finish one set of tales apiece), what he did create is a sampler of the various literary genres popular at the time: an Arthurian romance by the Wife of Bath; a Breton lay by the Franklin; *fabliaux* told by the Miller, Reeve, Cook, and Shipman; *exempla* and moral fables offered by the Pardoner and Manciple; hagiographic romances narrated by the Man of Law and the Clerk; an allegory and a metrical romance volunteered by the pilgrim narrator; saints' lives told by the Prioress, Second Nun, and Physician; a beast fable offered by the Nun's Priest; and a treatise on the Seven Deadly Sins and remedial virtues by the Parson, which concludes the journey on the proper penitential note. This catalogue of genres gives little indication of how freely Chaucer intermixed elements of the various literary forms available to him to create new hybrid categories such as: *exempla* with *fabliau* elements by the Summoner and the Friar; a mixed romance-*fabliau* by the Merchant; and a mixed romance-epic by the Knight.

**THE PILGRIMS' CONTESTIVE SPIRIT.** Beyond the astonishing variety of the tales told by the pilgrims, what sets the *Canterbury Tales* apart from other story collections, such as those by Boccaccio and John Gower, is the dramatic interplay between the tellers, who often

*a PRIMARY SOURCE document***OPENING LINES OF CHAUCER'S GENERAL PROLOGUE TO THE CANTERBURY TALES**

**INTRODUCTION:** The General Prologue to Chaucer's *Canterbury Tales* serves to establish the genre and tone of the collection of stories that follows in much the same way that the opening shot of a movie gives a viewer information about the setting, time period, and mood of a film (comedy? tragedy? historical? modern day?). In this case, however, the message is quite complex, since the "high style" suggests a tone of seriousness, the references to astrological dating give it a sense of a universal or cosmic import, and the descriptions of birds and plants would seem to be leading towards a work focusing on love. At the same time, the passage is configured as one convoluted and extended sentence with a surprising climax about the travel plans of what turn out to be a group of rather ordinary, everyday people who represent almost all of the levels of society in England. This contemporary focus points towards a new kind of literature that addresses social questions and depicts a multitude of occupations—often bourgeois in character—quite out of keeping with the elevated or epic style. All in all, then, these opening lines (modernized from the original Middle English) let the audience know that their expectations are not likely always to be met.

When April with his sweet showers  
Has pierced to the root the drought of March,  
And bathed every plant's system in such liquor [liquid]

(By which virtue the flower is engendered);  
When Zephirus [god of the winds], with his sweet breath,  
Has blown life, in every wood and meadow,  
Into the tender plant shoots, and the young sun  
Has run halfway through his course in the sign of Aries;  
And small birds are making melody,  
That sleep all night with open eyes  
(Nature so excites them in their aroused spirits):  
Then people long to go on pilgrimages,  
And palmers [pilgrims to Jerusalem] want to seek out  
foreign shores,  
And faraway shrines, known in sundry lands;  
And especially, from the borders of every area in England,  
They go to Canterbury,  
To seek the holy blissful martyr [Thomas Becket],  
Who had helped to cure them when they were sick.  
It befell in that season one particular day,  
That in Southwerk, I stayed at the Tabard Inn,  
Ready to go on my pilgrimage  
To Canterbury with completely devout heart;  
That night there came into that hostelry,  
A company of twenty-nine people,  
Sundry folk, fallen together by chance  
In fellowship; and they were all pilgrims  
Riding toward Canterbury. ...

**SOURCE:** Geoffrey Chaucer, "General Prologue," *Canterbury Tales*. Text modernized by Lorraine K. Stock.

seem to be taking the contestive spirit of Harry Bailly's "game" a bit more personally than he had planned. Some pilgrims, like the Miller and Reeve, or the Summoner and Friar, tell thinly disguised tales about their antagonists. Others, like the Clerk, Wife of Bath, Merchant, and Franklin, seem to be playing their stories against the previous one in what amounts to a symposium on power relations between husbands and wives in medieval marriages. Many of the pilgrim narrators are also far more richly characterized than their counterparts in other collections. Most readers easily forget that the Wife of Bath is merely a collection of words on parchment. She seems to burst forth as a three-dimensional figure from off Chaucer's pages, divulging in her Prologue to her tale, which is much longer than the tale itself, many autobiographical details about her married life (since the age of twelve) with five different husbands. In some of her defenses of women, she anticipates Christine de Pizan's championing of womankind and even the arguments of twentieth-century feminists. Thus, the Prologues also often serve as "confessional" literature, revealing the personal and professional secrets of the tellers. The

Pardoner's Prologue reveals the teller's duplicity, hypocrisy, and greed, which ironically, is the very vice that his moral *exemplum* about trying to kill Death condemns.

**CHAUCER'S PILGRIM NARRATOR.** What also sets this collection apart from others of the period is the complex narrative voice of the pilgrim persona who may or may not be Geoffrey Chaucer. No mere omniscient voice-over, this narrator-character is at times a player in the contest, at other times a disinterested reporter of the appearance and actions of the pilgrims (he claims he is describing the 29 people "as they seemed to me"). However, his seemingly innocent comments, interjected in the otherwise objective reports of the pilgrims' clothing, physiognomy, and behavior, speak volumes about the inner character of his subjects. For example, in describing the Man of Law's busy-ness, the narrator slyly and revealingly interjects, "And yet he *seemed* busier than he was." Like some of Chaucer's earlier narrators in the dream visions or *Troilus and Criseyde*, this narrator is remarkably complex and a character in his own right in the literary work.

**THE GENERAL PROLOGUE'S OPENING.** This narrator also opens the work with probably some of the most wonderfully poetic and famous lines of verse in the English language. Chaucer's evocation of the re-greening of nature in April—the time of year when the seasonal rains and Zephyrus's winds encourage the reseeded and germinating of verdure and flowers, when birds sing love songs “pricked” by nature in their libidos—replicates the “spring opening” tropes of many of the love songs of medieval lyric poetry and the *reverdies* topos. The opening lines comprise one nineteen-line-long compound-complex sentence describing a series of causes and their single effect. Whereas the tradition of love poetry that preceded Chaucer would have prepared his audience—when they heard or read about breezes, April showers, May flowers, and birdsong—to expect that the succeeding text would in some way involve love, Chaucer stuns his audience with an unexpected effect of all these causes: he claims, *then* folk long to go on pilgrimages; especially in England, they long to go on pilgrimage to Canterbury to venerate the holy blissful martyr, Thomas Becket. In addition to being some of the most evocative nature poetry in English, these lines play a joke on the audience, who learn early on that Geoffrey Chaucer is always full of surprises.

#### CHRISTINE DE PIZAN

**MEDIEVAL FEMALE WRITERS.** Generally, female children in the Middle Ages were not educated as well as their male brothers were. That is not to say that all women were illiterate, but it was fairly uncommon for

women to write literary texts. To be sure, there were prominent exceptions throughout the 600 years of the period, and literary works to which no certain authorship can be ascribed and which seem to voice the female perspective may have been composed by women. In the corpus of Anglo-Saxon lyric poetry is an anonymous first-person narrated poem, “The Wife’s Lament,” that explores the sadness of a woman who is separated from her husband. It is ultimately impossible to know whether an actual woman wrote it. In twelfth-century France, Marie de France composed her *Fables* and Breton *lais* (lays), apparently enjoying some degree of fame in the English court, though little is known of her actual career. In the same century, a woman named Heloise (1098–1164) had a notorious affair, and later a secret marriage, with Peter Abelard (1079–1142), a prominent and brilliant theologian at the University of Paris. After they parted and she became the abbess of a convent of nuns, Heloise wrote a series of illuminating *Letters* to Abelard, which express her emotional feelings for her former lover as well as detail the running of the convent. But these letters are not what is usually thought of as “literature.” The female troubadour poets in the south of France, known as the *trobairitz*, did create lyric poems, but they were amateurs, not professional writers. Also in that century in Germany, Abbess Hildegard of Bingen (1098–1179) wrote prolific letters to various ecclesiasts, as well as treatises on medicine and gemstones, accounts of her visions, the *Scivias* (Ways of Knowing), and many hymns, though these works were intended for the education of other nuns rather than for a larger public. Female visionaries and mystics in late fourteenth- and fifteenth-century England, such as Dame Julian of Norwich and Margery Kempe, left records of their visions, respectively in Julian’s *Showings* and Margery’s *Book* of memoirs about her marriage, her travels on many pilgrimages, and her visions of a bleeding Christ while on pilgrimage in Jerusalem. However, both these works were dictated to male scribes and we cannot be sure to what extent the resulting text reflects the sensibility of their female “authors.” The only female writer to which none of these qualifications applies is a prolific author of the late Middle Ages, Christine de Pizan.

#### EUROPE'S FIRST PROFESSIONAL FEMALE WRITER.

Christine de Pizan (1364–c. 1431) was the first “professional” female writer in Europe. As she admits in her allegorical autobiography *The Book of Fortune’s Mutation* (1403), unfortunate circumstances in her life forced her metaphorically to “become a man” in order to achieve such a rare distinction. Christine was widowed young and left with three small children and other family

members for whom she had to provide. Rather than remarry or enter a convent as most women in her position might do, Christine instead supported herself by writing various popular literary forms such as collections of love lyrics, love debates, devotional texts, female conduct books, and *pastourelles* for aristocratic patrons. Like another unusual female writer three centuries earlier, Abbess Hildegard of Bingen, Christine was both prolific and multifaceted, mastering a dazzling variety of genres in both verse and prose, as well as involving herself not only in the composing, but also in the production and illustration of manuscripts of her works. She began her career at the court of Charles V of France, whose biography, *The Book of the Deeds and Good Conduct of the Wise King Charles V* (1404), she was later commissioned to write. The extraordinary range of her literary output includes examples of genres unexpected from a woman: a military treatise, *The Book of the Deeds of Arms and Chivalry* (1410); a political treatise, *The Book of the Body Politic* (1404–1407), a guide for the behavior of princes, knights, and lesser subjects; and a mythographic work in epistolary form, *The Letter of Othea* (1400), in which the

goddess of wisdom in the title teaches moral lessons to the Trojan prince Hector by using stories from mythology. Just as the twelfth-century female writer Marie de France wrote Ovidian-inspired fables and Breton lays, in *Othea* Christine reveals her knowledge of Ovid's *Metamorphoses*, one of medieval Europe's greatest literary authorities.

**CHRISTINE'S ALLEGORICAL WRITINGS.** Although she demonstrated skill at nearly all major medieval literary genres, Christine is best known for her allegorical works, which often incorporate autobiographical and political sentiments into the allegory, such as *The Path of Long Study* (1402–1403) and *The Book of Fortune's Mutation* (1403). Of special interest is *The Book of the City of Ladies* (1404–1405), for which she has become noteworthy as an early champion of women. In this allegory, Christine echoes the sentiments of Chaucer's Wife of Bath that female characters have suffered terrible treatment in the writings of male authors, and women would be depicted more positively if female writers had the opportunity to tell their stories. As in Boethius's *Consolation of Philosophy*, or Dante's *Divine Comedy*, Christine is visited in a vision by three allegorical female personifications—Reason, Rectitude, and Justice—who instruct her to create a new literary tradition about women by “constructing” a metaphorical “city” of ladies. In reality, this new tradition is really a story collection in the mode of Boccaccio's *Decameron*, Chaucer's *Canterbury Tales*, or John Gower's *Confessio Amantis*—each building block/story of which narrates the achievements of a praiseworthy, virtuous woman. In creating *City of Ladies*, Christine was responding (as was Chaucer's Wife of Bath) to misogynist collections of tales such as Boccaccio's *Concerning Famous Women*, whose female exemplars were more infamous than famous and more notorious than virtuous. Christine includes in her literary “City” women who excelled in secular fields (painting, poetry, science, farming, military arts) as well as saints. Christine continued to promote the interests of women until her death. The last poem attributed to her was *The Tale of Joan of Arc* (1429), one of the only contemporary literary treatments of the purportedly visionary female warrior who led French troops against the English in the Hundred Years' War. If Christine had lived to revise her text, Joan of Arc surely would have earned a place alongside other Amazon warriors such as Penthesilea in the *City of Ladies*.

**CHRISTINE AND THE ROMANCE OF THE ROSE.** Christine also demonstrated her advocacy of the female voice by participating in a heated literary debate that took place in 1401–1402. Both as a writer of visions,

Christine de Pizan presents her book to Queen Isabel of France in a bedroom of the Royal Palace, Paris. London, British Library MS Harley 4431 folio 3, late 15th century. © HISTORICAL PICTURE ARCHIVE/CORBIS. REPRODUCED BY PERMISSION.

such as the autobiographical *Vision of Christine* (1405), and as a literary critic, Christine figured importantly in the development of real-life female characters (not mere personifications) in the dream vision genre. In the “Quarrel over the Rose,” Christine sided with the theologian Jean Gerson against other male intellectuals such as Pierre and Gontier Col and Jean de Montreuil over the value of perhaps the most famous and widely read allegorical poem and dream vision of the medieval period, the *Romance of the Rose*. Christine strongly criticized *Rose*, especially the continuation by Jean de Meun, for its antifeminist sentiments. Having collected the letters and arguments of the major antagonists in the quarrel, she presented them to Queen Isabeau, wife of Charles VI. Her very public profile as a professional writer and controversialist prepared the way for literary women who would begin writing in the Renaissance, at

the same time that her literary range rivaled that of the great male writers of medieval Europe—Chaucer, Boccaccio, and Dante.

## SIGNIFICANT PEOPLE *in Literature*

---

### GIOVANNI BOCCACCIO

1313–1375

*Author*

**AN EDUCATION IN ARISTOCRATIC VALUES.** Giovanni Boccaccio was perhaps the greatest realistic story teller of the later Middle Ages and along with Chaucer did much to develop a vernacular literature of wit, sharp psychological observation, and tolerance for human foibles. He was born the illegitimate child of a merchant of Naples but was later legitimized. His father, a banker, gave him a good education and allowed him to follow a literary career. He claimed that his mother was French, though this, like other supposed “facts” in his biographical comments, may be pure self-construction. Another key element in his life, his love for a certain Fiammetta, may also have been somewhat fictionalized. Boccaccio went to work in Naples in his father’s counting house, but he soon left to study canon law at the University of Naples about 1331. All told, he spent some thirteen years in Naples, reading in the Royal Library, learning the life of the court and of the mercantile classes. Thus, books, business, and aristocratic love would all come to be later subjects of his work. It was also in Naples that he started to read Dante.

**LIFE IN MERCANTILE FLORENCE.** The second phase of Boccaccio’s life was in a totally different environment, in the mercantile city-state of Florence, where the nobility were forbidden to hold public office. Here money and political shrewdness were elevated above the virtues he had learned at Naples. In 1340 he became secretary to important Florentines, making a living serving the commune as a roving ambassador or as an emissary to the papal court at Avignon (in 1354 and again in 1365). It was in Florence that he became friendly with the famous poet Francesco Petrarch in about 1350, who helped him with his Latin. He also later learned Greek, though with difficulty. Thus Boccaccio was a man of two worlds: one of the Neapolitan culture of lords and vassals, watching tournaments and pageantry, and reading about aristocratic values and refined love; the other

of Florentine mercantilism, in a city dominated by a class struggle for political and social power, where money and opportunism were prized above all things.

**WRITING IN THE CLASSICAL STYLE.** Boccaccio’s early experiences were reflected in poems with mythological titles and classical subjects, like *Diana’s Hunt* (1334), the *Filostrato* (about the Troy legend, 1335), and the *Teseida* (c. 1340), about the Theban story of Theseus and the war against the Amazons. In all of these courtly love works, love rules all and knows no law. In his middle period there is evidence of his Florentine learning in works that still use classical materials and feature the power of love, but now more in an allegorical than a narrative mode. By the 1350s, Boccaccio turned from vernacular narrative poetry to Latin learned prose works, such as the *Praise of Famous Women*, *On the Fall of Famous Men*, and the *Genealogies of the Pagan Gods*, the last reflecting his newly acquired skill in classical Greek.

**THE DECAMERON.** In 1351, however, Boccaccio turned directly to the contemporary Florentine world with the *Decameron*, a work that has proven to have an enduring influence. In this collection of stories, ten young people—seven women and three men, all rich and cultivated—meet at the Church of Santa Maria Novella in Florence and plan to escape the plague decimating the city by going to a country house, where they will pass time by telling 100 tales—ten from each person. Based on Eastern story collections, classical sources, fables, Florentine gossip, and personal observation, these stories mark a shift from the world of refined erotic fancy illustrated in Boccaccio’s earlier writings to the land of things as they are, where calculation displaces illusion. The majority of the characters are middle class, including merchants or wives of merchants, peasants, laborers, and artisans. While Dante believed that only people of prominence could serve a didactic purpose, Boccaccio used people from every walk of life, including a larger proportion of female characters—and of women in important roles—than any other writer of his period. In contrast to earlier works like the *Song of Roland*, the *Decameron* represents a recognition of the triumph of wit over prowess in a world where values were less absolute and increasingly more relativistic.

**GEOFFREY CHAUCER**

c. 1340–1400

*Poet**Court administrator*

**A LIFE AT COURT.** Geoffrey Chaucer, arguably the greatest English writer before Shakespeare, was born in London in the early 1340s to a merchant family; the family name suggests the shoe trade, though there is some record of their having been wine merchants. He quickly made his way in the world, apparently acquiring some legal training at the Inns of Court, and by 1357 was in royal service. His wife, Philippa, was an attendant to the queen, and her sister, Katherine Swynford, was the mistress and later wife of John of Gaunt, one of the king's sons. Both through family connections and, most importantly, through his own abilities as an administrator, Chaucer quickly made his way in the royal household and traveled abroad on the king's business several times, holding the posts of controller of the customs and clerk of the king's works. It is chiefly through these positions and various grants and gifts in payment for his services that Chaucer's life is documented; there is no independent record of his activities as a poet. It is clear, however, that during his early years in royal service, Chaucer was reading deeply in French courtly poetry by such poets as Guillaume de Machaut and Jean Froissart (about 1368–1375), on whom he relied heavily in composing his own early works in dream narrative form. He also read Italian literature by Dante, Petrarch, and Boccaccio, the last of whom he resembles in using a framing narrative of tales told by a group of travelers.

**THE CANTERBURY TALES.** Judging from some of the story lines he sketched out in the 1370s and 1380s, Chaucer was already meditating the *Canterbury Tales*, his best known work, in which a variety of different stories, exemplifying a wide range of literary genres, are told by pilgrim travelers on their way to Canterbury to visit the shrine of Thomas Becket. Each pilgrim—including Chaucer, who pretends to be a pilgrim also—is supposed to tell two tales going to the cathedral and two coming back again, though this plan is interrupted. While Boccaccio had introduced the idea of using non-aristocratic characters in the tales told by his wealthy young Florentines, Chaucer goes a step further by including people from all walks of life among the pilgrim story-tellers themselves, ranging from a knight and his son to a physician, a lawyer, several nuns, a monk, a lower-middle-class widow, a miller, a sailor, and even a plowman. The work as a whole seems to have been put together about 1385 to 1395, but it was never actually finished. The different manuscripts reflect differing arrangements of the parts.

**RANGE AND INFLUENCE.** Chaucer's other greatest work was *Troilus and Criseyde* (c. 1380), a poem of some 8,000 lines in an elevated style, which relies on Boccaccio's *Filostrato* for its classical plot. Chaucer tells the story of how Criseyde, a widow in the besieged city of Troy, is loved by and then loves Troilus, but then gives him up to try to save herself through another man, Diomedes. In a wonderful mix of comic and tragic, aristocratic and bourgeois, this poem, though set in ancient Troy, reflects the changing world of late fourteenth-century England. In addition to other poems of his own, Chaucer did many translations of classic medieval works such as the *Romance of the Rose* and Boethius' *Consolation of Philosophy*, as well as a group of lyric poems. His use of English, rather than French, for courtly poetry is sometimes credited with helping to bring the dialect of London into prominence as the standard for all speakers of English.

**CHRÉTIEN DE TROYES**

c. 1130–1190

*Poet*

**A WRITER OF ROMANCE.** Chrétien de Troyes is the best known of the writers of Arthurian quest romances, especially those telling the love story of Lancelot and Queen Guinevere. He is one of the few early medieval authors whose name has independent corroboration. Nothing is known of his early life and connections, except that he mentions that Marie de Champagne, daughter of Eleanor of Aquitaine, was a patron who provided him with elements of the story of Lancelot and the Cart, and that the count of Flanders, Philippe d'Alsace, provided him with the narrative elements of his Grail story.

Chrétien was a popular author in his own time and after, with anywhere from seven manuscripts of his shorter romances to fifteen of his Grail story surviving, an unusually high number for a secular author.

**ARTHURIAN AND ANTIQUE SUBJECTS.** Chrétien's works include *Erec et Eneide*; possibly the "antique" *Philomena* from Ovid's *Metamorphoses* and some adaptations of Ovid's two treatises on love; *Cligès*, a romance with an Eastern or Byzantine theme; *Lancelot, Yvain* or the *Knight of the Lion*, and *Perceval* or the *Conte de Graal*. A work sometimes attributed to him was a saint's life called *Guillaume d'Angleterre*. As medieval romances go, most of Chrétien's works are relatively short at about 7,000 lines (the *Graal* is about 10,000 lines) and though episodic, have more shape than many examples of the genre. Chrétien's poems were adapted or translated by writers of later romances and serve as the genesis of the Arthurian romance down through its final phase in the work of the Englishman Sir Thomas Malory.

**CHIVALRIC VIRTUES.** Chrétien is one of the first medieval "self-conscious" authors, writing prologues for his romances in which he comments on his works in the style that is later associated with Dante's *Vita Nuova*. He often enters into the narratives, remarking on characters and actions as well, and even speaks of the structural elements of romance. His poems explore chivalric values, "mésure" (measure or balance in human behavior), and the inevitable conflict between love and the quest for *los* or *pris* (chivalric reputation). This is especially evident in the Arthurian romance *Yvain or the Knight of the Lion*, built on the motif of the "rash vow." Yvain kills Esclados the Red, the husband of Laudine de Landuc, in combat by a mysterious spring in the forest. Falling in love with the new widow, he wins her hand and marries her. But his companion Gawain persuades him to leave his new bride and go in search of adventure at tournaments. He vows to his wife he will return in one year but fails, and she repudiates him. He then goes mad in the forest, where he meets a helpful lion. Eventually, he wins Laudine back, but the poem points up well the difficulties and conflicts between domesticity with a beloved and the attractions of knight errantry.

---

## DANTE ALIGHIERI

1265–1321

Poet

**EARLY LIFE IN FLORENCE.** Dante Alighieri was born in Florence, a great commercial and banking center strategically located on a trade route between the Mediterranean and northern Europe. In Dante's lifetime the city was much involved in the controversy over the relative power of the pope and the Holy Roman Emperors. His father was perhaps a judge and a notary public, a lender of money and speculator in land. At this period the republic of Florence was split into two political factions, the Guelphs (supporters of the papacy) and Ghibbelines (supporters of the emperor), and the Alighieri family, as Guelphs, may have suffered exile at various times when their faction was out of power. Dante married Gemma di Manetto in 1283 and had with her three children, though when he himself was exiled from Florence (in 1301/02), he left without his family. At the age of nine, so the poet says, he had fallen in love with Beatrice Portinari, who served him as a muse. She died in 1290, and he memorialized her in his cycle of poems and prose commentaries *La Vita Nuova*, finished in 1295.

**POLITICAL STRIFE.** The political life of Florence was dominated by various guilds of artisans and merchants, and only through guild membership could one hold public office; thus, Dante joined the guild of physicians and apothecaries, though it is doubtful that he had any interest in these professions. From about 1295 through 1301 Dante held various public offices and served as an ambassador or emissary, but further political factionalisms were developing between two groups within the Guelph party, the "Whites" and the "Blacks." The latter of these two factions supported Pope Boniface VIII and Charles of Valois, while the whites, the faction Dante was allied with, were much opposed to both of these figures. While Dante was on an embassy to Rome, Pope Boniface VIII and Charles of Valois gained political control of Florence. Charles' forces killed or exiled the Whites, and Dante himself was banished in 1301/1302 for alleged financial misbehavior and for opposition to the political and ecclesiastical power. A second banishment on pain of death was pronounced in 1302. Dante wandered through Italy from 1302 ("eating another man's bread and climbing another man's stair," as he described it) until his death in 1321. Though he broke off his allegiance to the white party and indeed to politics altogether, he never returned to Florence, attaining instead some measure of security and fame in Ravenna.

**LEARNED AND LITERARY WORKS.** Dante wrote both in Latin and Italian and was the first poet to use the Italian language for a lengthy literary work in the high style, allowing it to compete in prestige with Greek and Latin. His Latin works, which demonstrate the range of his interests and knowledge, included *De Vulgari eloquentia* on the use of Italian as a literary language; *De Monarchia*, on temporal kingship and its relations to papal power; some letters and eclogues; and a scholastic scientific treatise *Questio de aqua et terra* on the levels of land and water on the surface of the earth. He is best known, however, for his Italian works. *La Vita Nuova* is a collection of lyric poems about Beatrice (centering on her death), interspersed with prose commentaries that develop a narrative and explain the poems. He also wrote other lyric poems, called *canzoni*, and a work called *Convivio* or *The Banquet*, a prose commentary on some of his *canzoni*. His three-part masterpiece *The Divine Comedy* appeared in 1314 (for the first part, *Inferno*), 1315 (for the *Purgatorio*), and 1320 (for the last part, the *Paradiso*). This monumental work combines in its three parts a number of important genres: the dream vision allegory of poems like *The Romance of the Rose*; the voyage to the other world, such as *Saint Patrick's Purgatory*; and the medieval encyclopedia, with its attempt to incorporate all human knowledge in a single book. It also made use of Dante's intimate knowledge of the political and social history of Florence, many of whose citizens Dante's narrator encounters on his journey from hell to heaven. A heavy reliance on trinitarian number symbolism, even down to the *terza rima* or three-rime verse structure, is another fascinating feature of the poem. Dante looks to the classical tradition of the *Aeneid* in his use of that work's author, Vergil, as a guide through hell in the first part of his imaginative journey. In the *Inferno* and the *Purgatorio* the poet examines human political and spiritual life, while in the *Paradiso* he considers the mystical union of the soul with the Divine in a beatific vision of God, the saints (including Beatrice), and the heavens.

## MARIE DE FRANCE

Mid-twelfth century–Early thirteenth century

Poet

**AN ANGLO-NORMAN FEMALE POET.** The poet known as Marie de France, who apparently wrote between 1160 and 1210, is unusual both for being the earliest known woman writer in French and for the fact that she identifies herself by name. In the epilogue to her *Fables* (a collection of 102 moralized stories about animals in the tradition of Aesop), she states that she is giving her name because she wishes to be remembered, and then she says, "Marie is my name" ("Marie ai num"), adding the final comment "and I am from France" ("si sui de France"). This last phrase has been taken to mean that she had settled in Britain, where the court spoke Anglo-Norman French, since it would be unnecessary for her to indicate that she was from France unless she was living elsewhere. She had perhaps come to England because of marriage or because she wished somehow to further her literary career, and her list of literary patrons and dedications (including one to the "noble king") suggests that she was well connected. Nonetheless, attempts to identify her with any known person have failed. She is believed to have written three surviving works, most likely composed in the following order: the *Lais*, the *Fables*, and the *Espurgatoire saint Patrice* (St. Patrick's Purgatory), a 2,300-line translation of the story of a knight's descent into the Underworld. Of these, her masterpiece is considered to be the *Lais*, a collection of twelve short story-poems based on traditional Breton tales but involving sophisticated crises in love relationships that allow her to explore both contemporary ideas of refined love (so-called "courtly love") and the social complexity of the lives of her often resourceful female characters.

**EDUCATION AND BACKGROUND.** What is known of Marie's life comes in part from the testimony of Denis Piramus, who, around 1180, mentions her in an Anglo-Norman poem called *The Life of King Edmund*, where he indicates that she is admired in the English court. She was obviously an educated lady of good background who knew Latin well enough to translate the *Purgatory* from Latin to French, perhaps an indication that she had been trained in a convent. References in her texts show that she was also familiar with several of the most popular French and Anglo-Norman works of her day, including Wace's *Brut* (1155) and the *Roman d'Enéas* (1160), but not the romances of Chrétien de Troyes, who wrote between 1165 and 1191.

**FABLES AND LAYS.** In modern times, until the later eighteenth century, Marie was known only for her fables,

which had been so popular in their day that they can still be found, in whole or in part, in 23 extant manuscripts. In these entertaining moral poems, she reveals a generally aristocratic point of view, with a concern for justice, a sense of outrage against the mistreatment of the poor, and a respect for the social hierarchy, which must be maintained for the sake of harmony. It is to the *Lais*, however, that Denis Piramus was referring when he said that Marie's poetry had garnered great praise and that both lords and ladies loved to have it read out loud again and again. It is important to understand that even though she drew on the "authority" of the Breton source and retained Breton words like "Laüistic" (nightingale) and "Bisclavret" (werewolf), she was not merely writing down a story she had heard, but rather was composing a carefully crafted poem in rhymed octosyllables where the broad outlines of each tale were reshaped to allow her to create individualized heroes and heroines who must deal with the difficulties of enforced separations, love triangles, and even magical transformations. Events in the lays lead to fundamental changes in the lives of the protagonists, in contrast to the slower pattern of development and fulfillment characteristic of romances. Although the *lais* survive in only five manuscripts, their influence established Marie as the initiator of a narrative genre that lasted into the late fourteenth century.

## DOCUMENTARY SOURCES *in Literature*

Andreas Capellanus, *Art of Courtly Love* (1185)—Written under the patronage of Marie of Champagne, this treatise on conducting relationships according to the rules of *fn'amors* influenced the depiction of love in medieval romances and lyric poetry.

*Beowulf* (c. 1000)—The earliest extensive literary work produced in England, this alliterative heroic narrative poem in Old English (Anglo-Saxon) tells the story of a hero with super-human strength who slays the monster Grendel and the monster's vengeful mother, and then, many years later, is killed in a confrontation with a fire-breathing dragon. The poem demonstrates the tribal heroic code of thanes and lords, and illustrates oral-formulaic style.

Giovanni Boccaccio, *Decameron* (c. 1351)—This Italian-language collection of "One Hundred Stories" uses a frame tale about ten young people fleeing the plague in Florence to take refuge in a country house where they tell stories illustrating a wide range of medieval genres and themes.

*Chanson de Roland* (c. 1101)—The most famous example of the French *chanson de geste*, this heroic poem, based on an historical episode in 778, recounts the defense of a pass in the Pyrenees Mountains by a small French rear-guard against the overwhelming Saracen forces. It portrays the tragic downfall of a hero who fails to maintain a balance between physical courage and good judgment.

Geoffrey Chaucer, *Canterbury Tales* (c. 1380s–1400)—In this most famous story collection in medieval literature, the descriptions and interactions of 29 pilgrim storytellers on their way to Canterbury presents a cross-section of late fourteenth-century English people and professions, while their stories offer a sampling of almost every available prose and verse genre, made new and original by the overall work's complex and often ironic tone.

Chrétien de Troyes, *Yvain* (c. 1170–1185)—This French-language poem by the "father of Arthurian romance" tells the story of a knight who goes off on an adventure with Gawain and suffers severe consequences when he fails to keep his promise (a rash vow) to return to his new wife within one year. This poem is one of several long verse narratives in which Chrétien expands the story of King Arthur and the knights of the Round Table into complex psychological and moral studies.

Christine de Pizan, *City of Ladies* (1404–1405)—In this dream vision, Christine, the first professional woman writer in medieval Europe, is visited in a vision by three allegorical female personifications—Reason, Rectitude, and Justice—who instruct her to create a new literary tradition about women by "constructing" a metaphorical "city" of ladies, a story collection in which each building block/story narrates the achievements of a praiseworthy, virtuous woman.

Dante, *The Divine Comedy* (c. 1314–1321)—This epic allegory in three parts, written in Italian, relates a visionary

pilgrimage to *Inferno* (Hell), *Purgatorio* (Purgatory), and *Paradiso* (Heaven), through which the narrator is guided first by the classical Latin author Vergil and then by his muse Beatrice. Most famous for its portrayal of the punishment of sins in the descending circles of the Inferno, the work combines a realistic treatment of contemporary Florentine politics with a spiritual voyage and the experience of reunion with God.

John Gower, *Confessio Amantis* (Confession of the Lover; 1390–1393)—Containing over 30,000 lines of narrative verse, this collection of biblical, classical, legendary and popular narratives is recounted by Genius, priest of Venus, to whom *Amans*, an elderly lover, confesses the various sins committed against love in seven books of stories organized according to the Seven Deadly Sins, with one book assigned to each mortal sin.

Jean de Meun, *Roman de la Rose* (1275)—This 18,000-line continuation of Guillaume de Lorris's allegorical love

poem about a dreamer's quest for a rose adopts a satirical tone and incorporates the rediscovery of Aristotelian and Platonic texts that had occurred in the twelfth century.

Marie de France, *Lais* (c. 1160–1180)—This collection of twelve short verse narratives by medieval Europe's first identifiable female writer (probably a native of France living in England) transforms stories from Celtic oral sources into formal Anglo-French courtly poetry. Marie's sparely written narratives feature settings in the magical Celtic Other World, rash promises, erotic entanglements between humans and fairies, and an ambivalent code of ethics.

Juan Ruiz, *The Book of Good Love* (1350)—This Spanish story collection presents a meandering, episodic series of accounts of the narrator's fourteen attempted (and sporadically successful) adventures in love, incorporating many literary genres and a wide spectrum of tones.

## IMPORTANT EVENTS *in Music*

- 600 St. Gregory the Great, pope from 590 to 604, begins to establish a standardized Christian liturgy, including the plainchant melodies (“Gregorian Chant”).
- Pope Gregory establishes the papal choir school (Schola Cantorum), which continues to the present day in Rome.
- 800 Charlemagne, king of the Franks and emperor of the Romans, continues the process, begun by Pope Gregory I, of regularizing the plainchant repertory.
- c. 814 Following earlier suggestions by Emperor Charlemagne, the clergy begin to dramatize some of the important stories in church history, an effort that eventually results in the first liturgical dramas that reenact, with sung dialog, the visit of the three Marys to the tomb of Christ.
- c. 850 An anonymous author writes *Musica enchiridis* (Music Handbook), a widely circulated treatise on music theory that is one of the earliest attempts to notate music. It includes the first written attempt at polyphony (music in more than one part).
- The earliest manuscripts containing music notation date from this time. The repertory is plainchant, music for the sacred services.
- c. 900 The music treatise *De harmonica institutione* (Melodic Instruction) is written by Hucbald, a monk at the Benedictine abbey (or monastery) of St. Amand in Flanders. It describes the modal scale system in detail and discusses the concept of polyphony.
- 900 Notker Balbulus, a monk at the Abbey of Saint-Gall in Switzerland, writes the *Liber Hymnorum* (Book of Hymns), a book of sequences for the Mass. Notker is the first composer known by name.
- c. 1000 Guido, a Benedictine monk in Arezzo, Italy, invents the scale syllables, the staff, and a way of teaching new music by pointing to the knuckles on his hand.
- c. 1050 The earliest practical examples of polyphonic music are included in the Winchester Troper, a manuscript from Winchester, England.
- 1098 Hildegard of Bingen, a Benedictine nun who founded a convent near Bingen, Germany, is born. She is the earliest known female composer.
- 1100 French and English manuscripts containing the earliest repertory of polyphonic organum begin to appear.
- Troubadours, trouvères, and trobairitz (poet-musicians) in France begin the tradition of composing courtly love songs.
- c. 1135 Master Leonin, a poet and composer at the Cathedral of Notre-Dame in Paris, is born. He will compose the first comprehensive body of polyphonic music.
- c. 1147 Bernart de Ventadorn, one of the most famous troubadours who worked in France and England, is born.
- c. 1150 Choir masters centered around the Monastery of Saint-Martial in Limoges (central France) begin extensive experiments with composed polyphony.
- c. 1150 Master Perotin, a singer and composer at the Cathedral of Notre-Dame in Paris, is born. Perotin will add to the repertory begun by Leonin.
- 1170 Walther von der Vogelweide is born. He later becomes the most famous minnesinger (a poet-composer who worked in the courts in Germany and Austria).
- c. 1200 A collection of polyphonic sacred music for the important feasts of the liturgical

year, the *Magnus liber organi*, is compiled. Originating in Paris and circulated throughout Europe, it contains the compositions of Leonin and Perotin.

- c. 1230 The Fleury Play Book (Orléans, Bibliothèque Municipale, Manuscript 201), the largest collection of extended liturgical dramas, appears.

- c. 1250 Motets (polyphonic compositions with different texts for the individual lines) are first created in and around Paris. They become the most important musical form of the late Middle Ages.

The Cantigas de Santa Maria, a collection of more than 400 songs from the court of Alfonso X “el Sabio,” king of Castile, appears.

- 1260 Franco of Cologne writes *Ars cantus mensurabilis* (The Art of Measured Song), a music treatise that assigns specific duration to each of the note shapes, setting the stage for further developments in notation.

- c. 1283 Trouvère Adam de la Halle writes *The Play of Robin and Marion*, a *bergerie* (shepherd poem) set to music.

- c. 1290 *Carmina Burana* (Songs of Benediktbeuern), a large collection of Latin songs from the south German monastery of Benediktbeuern, includes texts on serious religious subjects, love songs, and drinking songs, some of them in German.

- 1316 Gervais de Bus and Chaillou de Pesstain write the *Roman de Fauvel*, a long poem that contains numerous musical compositions including several motets that reflect the new French notation developed by Philippe de Vitry.

- 1318 Music theorist and composer Marchettus of Padua writes *Lucidarium in arte musicae planae* (Explanation of the Art of Unmeasured Music), followed two years

later by *Pomerium artis musicae mensuratae* (Orchard-Garden of the Art of Measured Music), two important treatises dealing with Italian notation and harmonic practices.

- c. 1320 Three important treatises on music—*Ars Nova* (The New Art) once credited to Philippe de Vitry, *Ars Novae Musicae* (The New Musical Art) by Johannes de Muris, and *Speculum Musicae* (Musical Reflection) by Jacques de Liège—deal with new trends in music composition involving refinements in notation.

- 1340 Guillaume de Machaut writes *Remede de Fortune*, a lengthy poem that contains a fanciful list of musical instruments at a festivity.

- 1364 Guillaume de Machaut writes *Messe de Nostre Dame*, one of the first polyphonic settings of six parts of the Mass Ordinary.

- 1420 The largest collection of late medieval English sacred music is gathered in the Old Hall manuscript.

A large collection of late medieval Italian music is gathered together in a beautifully illustrated manuscript known as The Squarcialupi Codex, which was once owned by the famous Florentine organist, Antonio Squarcialupi.

- 1436 Guillaume Dufay writes the motet *Nuper rosarum flores* for the dedication of the cathedral in Florence.

- c. 1440 *Missa Caput*, the earliest complete set (cycle) of Mass Ordinary movements, is composed in England (composer unknown) using the same phrase of chant for the tenor part in each movement.

- 1452 Guillaume Dufay composes *Missa Se la face ay pale* for the Savoy court. This is one of the earliest polyphonic mass settings to employ a secular theme as the central point of organization.

## OVERVIEW *of Music*

**THE IMPORTANCE OF MUSIC.** Music was a very important part of sacred and secular daily life in the Middle Ages. It was a major component of all religious services in which prayers were chanted, including the Mass services attended each week by all Christians and the canonical office hours observed several times each day by clergy and monks; it also served a less formal religious role in the devotional songs of the laity. Music for the sacred services, known as plainchant, is by far the largest surviving repertory of music from the period, consisting of thousands and thousands of compositions from all over Europe. The complexity of the music varies from simple settings that resemble heightened speech to extremely elaborate melodies with wide ranges. Some are for soloists, others for choir, and some for an alternation of choir and soloist.

**MUSIC FOR EVERYDAY LIFE.** Music in the secular (that is, non-religious) world took a number of forms, and included both professional and amateur musicians. Singing and playing instruments was an ever-present part of relaxation for peasants and nobles: music making took place in the village square, the castle and manor house, the local tavern, and the open air. It was part of the foreground and background entertainment on all social levels in a society where everyone sang and danced. Local amateurs provided music for peasant gatherings, while professional minstrels entertained at the banquets of the aristocracy, but on both occasions everyone would be welcome to join in. Although art and literature provide certain kinds of information about the quantity of music in the world of the peasant, nothing survives of their repertory. Much of the music they performed must have been improvised, and the remainder was known only from memory, handed down from generation to generation with no written record. Actual secular music from the late Middle Ages survives only for the upper classes, although from the similarity of the references concerning music at every social level, we can guess that there was a considerable amount of uniformity at least in terms

of melodic and rhythmic styles between the music of both classes.

**THE MUSIC OF MINSTRELS.** The earliest of the professional performers of the period were known as minstrels (*ménéstrels* or *jongleurs*), who were actually general entertainers and did not restrict themselves to music; many were also actors, jugglers, animal trainers, and so on. These were the wandering entertainers who moved from place to place in search of a paying audience. The music they performed included not only the usual mixture of love songs and dance songs, but also the *chanson de geste* (song of deeds), a long narrative poem that recounted historic accomplishments, the most famous of which is the French *Song of Roland*. Love songs, drinking songs, and dance music were an essential part of the relaxation of both nobles and peasants; moreover, the songs of minstrels were a major source for the transmission of myths, history, and current news. Musicians performed a variety of repertory in the streets, and groups of trumpets accompanied people of wealth and political power, announcing their daily arrivals and departures.

**FROM MONOPHONY TO POLYPHONY.** The type of music most frequently heard during the early Middle Ages can be described as monophonic—music with a single melodic line—which included the sacred plainchant heard in church services as well as the secular songs and music played on instruments. This use of a single line is a characteristic that European music has in common with the music of the rest of the world, a repertory that has evolved and grown slowly since antiquity. It was during the period of the late Middle Ages, however, that one of the most striking characteristics of Western music came into existence: the development of music in more than one part, called polyphony. In all cultures there exist performances that are not completely monophonic; the use of drones (continuous accompanying notes, like those produced by a bagpipe), for example, is widespread, as is the practice of parallel performance (singing or playing the same melody on two different pitches simultaneously), or performances that would seem to combine elements of both drone and parallel traditions. All of these embellishments can be considered a part of the tradition of improvisation since they are often produced spontaneously during performance. But although the additions and embellishments to monophonic music in the West undoubtedly began in the same way as in other cultures, the Europeans took it much further, developing a system in which individual parts of a polyphonic composition trace separate melodic and rhythmic profiles. This technique is exclusive to Western culture, and while popular or folk music continued to be mainly

monophonic, polyphony soon became a standard part of all European-based art music.

**THE INVENTION OF NOTATION.** The technical element that assisted the birth and development of polyphony was the invention of a written musical notation, which happened between the ninth and eleventh centuries. The original reason for the invention of notation was primarily a desire on the part of the Latin Church to standardize the details of the sung parts of the liturgy by exactly transmitting to all parts of Europe the correct notes and rhythms of the vast repertory of plainchant. A secondary motive was to speed the teaching of new repertory, which until then had been taught only by constant repetition and rote memorization, a relatively slow process that was susceptible to frequent error. In the first half of the eleventh century, an Italian monk, Guido of Arezzo, responded to both needs by inventing a notation system that incorporated exact pitch and duration into a code that could be read with ease—a system that became the basis of the notation still in use today. It is no surprise that the first experiments with composed polyphony developed almost immediately after this innovation.

**THE SPREAD OF POLYPHONY.** The earliest forms of composed polyphony were developed in the twelfth century at the Cathedral of Notre-Dame in Paris when new two-voice sections were composed to replace already existing sections of plainchant. The idea of new polyphonic substitute sections quickly spread to all parts of Europe, where additional local repertory was soon composed. Europeans were attracted to this kind of sound, and the techniques were quickly applied to nearly all forms of music, both sacred and secular. At first polyphony was thought of as little more than an interesting contrast to the most frequently heard type of music, monophony. Its earliest use was for the more lavish church events and celebrations of the wealthiest citizens. Little by little, however, it gained in popularity until by the fifteenth century it was the preferred repertory for the socially conscious art connoisseur. This also led to a class separation in which monophonic music was left to the lower social classes while the educated, aristocratic society adopted the new polyphony, the only exception being plainchant, which remained a major part of all sacred ceremonies. Even in sacred settings, however, polyphony was introduced for the most celebrated occasions, replacing some of the traditional chant.

**COMBINING THE SACRED AND SECULAR.** Initially the repertories of sacred and secular music were quite separate from one another and consisted of mutually exclusive material. The advent of polyphonic composition

and its application to so many areas of sacred and secular repertory helped to break down this distinction as composers began to combine the two. Most of the combinations were more or less innocent, but surprising exceptions can be found as early as the thirteenth century, such as a song based on a chant, with a sacred hymn in one part and a decidedly erotic text in another, all to be sung at the same time. In the early decades of the fifteenth century it became common practice for a composer to adopt secular music, including love songs, as the basic material in the composition of music for the sacred Mass. By the end of the period one of the largest repertories of polyphonic music consisted of settings of five movements for the Mass Ordinary (that is, the parts of the religious ceremony that do not vary throughout the year), all written by a single composer using a sacred or secular melody as a unifying musical theme throughout, and intended to be performed as a celebration of a very special event, such as a coronation, a wedding, or a military victory. The most obvious implication of this practice is that the secular world was increasingly intruding on the sacred. The mixture of secular elements into a sacred repertory that had previously been tightly controlled suggests a slackening of the former rigidity of the Church with regard to its services and ceremonies, as well as a more worldly orientation among those who wrote music for sacred performance. In short, these musical events can be seen as evidence of a general trend in Western history: the weakening of the power and influence of religious authority and the rise of the secular world, a tendency that became the dominant characteristic of the period to follow.

## TOPICS *in Music*

---

### MUSICAL PERFORMANCE

**MUSIC EVERYWHERE.** During the Carolingian era—that is, the age of the Frankish emperor Charlemagne and his dynasty (eighth to tenth century)—and continuing through the late Middle Ages, the sound of music was, quite literally, everywhere. Music was so much a basic part of everyday life that it would be difficult to discuss many significant daily events or activities without noting its presence. From the nobles at the highest level of society to the simple peasants who worked the land and the monks who lived in the isolation of monasteries, music, in its various forms, served as one of the

## MEDIEVAL Musical Terms

**Cyclic:** A composition of several movements that are related by the use of some of the same material.

**Harmony:** The result of two or more notes sounding at the same time.

**Isorhythm:** A rhythmic pattern that is imposed on a melody and repeated exactly throughout the length of the composition.

**Mensural signs:** Symbols that indicate tempo and rhythmic subdivisions.

**Monophony (mono = one; phony = sound):** Music of one part, either a solo song or a single melody performed by more than one person or instrument.

**Motet:** A polyphonic composition with more than one text.

**Motiv:** A short passage of music (as short as three notes) that is repeated.

**Organum:** An early, fairly simple type of polyphony. There are several different types, including one in which the voices sing the same melody at different pitches (known as “parallel organum”). Other varieties include the addition of an upper part over an already-existing melody (that is, a tenor). The upper part usually moves faster than the tenor.

**Polyphony (poly = several):** Music of more than one part, each musical line having a separate rhythmic and melodic profile.

**Substitute clausula:** A new section of polyphonic music intended to replace an old one.

**Tempo:** The speed of the composition.

**Tenor:** A melody borrowed from another composition and used as a guide for the structure of new polyphonic lines. Sometimes these notes are held as long notes (*tenere* = to hold).

stable elements in their lives. It rang in the banquet halls and private chambers of the palaces of the wealthy nobles, resounded through the monastic cloisters and in the churches, and echoed in the streets and taverns of the cities and villages. Music served to mark the presence of nobles in public, it accompanied the tasks of the workers in the field, and it was an inseparable part of the many hours each monk spent daily in the worship of God. And for everyone, the sound of songs and music for dance filled the leisure hours.

**LOST EVIDENCE.** What has survived over the centuries is only a pale reflection of the quantity and variety of music that flourished during the early centuries, and, unfortunately, this material represents only certain parts of the repertory—that is, the entire body of works available for performance. Almost completely lost is the music of the lower classes—the songs they sang in the fields, around the hearth, and in the village inns, as well as the dance tunes they sang and played. All of their repertory was learned by ear and passed on in the same manner; nothing was written down. Music of the upper classes—the nobles, and, later, the merchants, teachers, doctors, and lawyers in the developing middle class—fares a bit better since that level of society could read and write and could afford to have written copies made of their favorite repertory, although what remains is rather fragmentary and quite incomplete. Largest by far is the surviving music of the Christian church that comes down to us in thousands of manuscripts that preserve the music that accompanied the weekly Mass in the larger churches and the daily ceremonies in the many monasteries that dotted the landscape all over Europe. The Latin Church was highly organized and had a more or less uniform body of works that was written down and distributed throughout Europe and preserved in church archives through the centuries. For secular society there is a far smaller body of preserved evidence.

**THE WRITTEN RECORD.** The beginning of the Carolingian Era almost exactly coincides with the earliest written music, and therefore it is possible to obtain an actual sound image of some of the repertory that dates back to the very beginning of the period. But the earliest manuscripts are all from churches and monasteries, meaning that they record only sacred music; manuscripts containing secular music did not appear until the twelfth century. By supplementing the surviving music with information gained from literary accounts, archival documents, personal letters, diaries, and iconography, some of the missing pieces can be filled in, providing a general impression of how music functioned in late medieval society.

**A CULTURE OF SINGING.** A great variety of musical instruments—plucked, hammered, and blown—populated the medieval world, adding their sounds to most formal and informal occasions. There is little doubt, however, that the vast majority of music heard and performed during this period was vocal. Everyone sang, and most of the occasions for music involved singing, including music for dance. The daily activities of monks in the monasteries revolved around the chanting of prayers every few hours, and for those who lived

Choir of monks sing from the psalter of Stephen of Derby, Oxford, Bodleian Library MS Rawlinson G. 185, folio 81, 15th century. THE ART ARCHIVE/BODLEIAN LIBRARY, OXFORD.

outside of monasteries, singing was the most common form of entertainment and relaxation. The professional musicians also were mainly singers; the minstrels who entertained in the village squares, the inns, and the courts had vast repertoires of songs of all types. Even the narrator of heroic poetry, the teller of tales, often performed his verses by improvising a melody while accompanying himself with an instrument. In the later centuries of the Middle Ages the wealthier courts employed resident musicians who sang both the traditional chant and the new polyphonic music in the chapels, as well as entertaining their noble patrons with songs and instrumental music at dinnertime and on all festive occasions.

**VOICES AND INSTRUMENTS.** In striking contrast to modern practices, the combination of musical instruments

with voices was found in only certain circumstances. Solo singers often accompanied themselves, usually with a lute or a harp, and on extremely festive occasions, massed instruments and singers would march in procession through the city streets. Chant, however, was performed only vocally, and the common practice for the performance of polyphonic music—that is, music with multiple parts—was totally by instruments or totally by voices, but rarely a combination of the two. In church an organ would be used to play processions or devotional music, but it performed in alternation with the choir, never at the same time. Further, the choir as a whole usually was restricted to singing monophonic chant. Polyphonic music, no matter what the repertory, sacred or secular, was usually sung by an ensemble of soloists. Choir performance of polyphonic music, meaning several voices

on each musical part, was not part of the performance tradition during this period. A mixture of voices and instruments in a polyphonic performance did not become standard practice until the sixteenth century.

### MUSIC IN PRIVATE AND PUBLIC

**MUSIC FOR THE LOWER CLASSES.** Singing and playing musical instruments was one of the main forms of private entertainment, and the usual time for music making was in the evening, following dinner. Everyone sang, and from the literary accounts, it would seem that a large number also played musical instruments. For the lower levels of society—the peasants, small merchants, and artisans—most of this type of entertainment was home grown, meaning that they entertained one another. Professional instrumentalists would be hired only for special occasions such as weddings where, as images from manuscript illuminations and tapestries affirm, they played dance music.

**MUSIC IN WEALTHY HOUSEHOLDS.** The nobles and wealthier merchants also sang and played instruments, and it is clear that they too often performed for one another in a family setting after dinner. In addition, in contrast to the less affluent people, they often hired professional singers and instrumentalists who would entertain their dinner guests with songs and instrumental music during and after dinner. The distinction as to who performed on any given occasion, however, was not so finely drawn as in the modern world. The troubadour tradition that flourished between the eleventh and thirteenth centuries included noblemen as well as people of lower social levels, meaning that this highly demanding repertory of song was performed by both professionals and amateurs. Many of the wealthier aristocrats had a permanent staff of household musicians, but an evening's entertainment could just as easily include one of the nobles singing his own poetry while accompanying himself on a lute or harp. The duties of the palace and court musicians usually included teaching music to the children and, often, singing for daily Mass in the nobleman's private chapel, in addition to the performances of secular music at dinnertime.

**SINGING IN THE CLOISTERS.** Music within the monastery consisted of the daily celebration of the Mass and eight services spaced throughout each day known as the Office or the Hours. Most of these included the

singing of chant, meaning that on ordinary days all of the monks sang for a total of several hours. On special days—Sundays, or special holy days (e.g. Easter)—the chants were particularly elaborate, and everyone processed through the halls of the monastery while singing. The earliest written music was the sacred plainchant of the church, which is found in a few manuscripts that date from the middle of the ninth century (see Notation, below). This body of works, as well as the bulk of all recorded compositions throughout the entire period, consists of sacred music intended for the various services of the Christian church.

**MUSIC IN THE STREETS.** Music heard in the city streets took many forms. Songs and chants of the many daily sacred services wafted out of the churches that were located every few blocks. Many of the municipalities employed instrumental ensembles that provided music for the frequent civic ceremonial occasions that happened in public, and for public dancing as well as church celebrations. Wedding receptions included singing and dancing and often took place in a public square; minstrels played and sang in the plazas everywhere; and amateur and itinerant “vagabond” musicians were a common presence—and often a common nuisance—on the streets and in the taverns and barber shops of cities and villages in all regions. Laws imposing a curfew that limited the hours music could be made in public were established in most large communities. The frequency with which these prohibitions were reiterated, as well as the numerous judicial records of people fined for playing instruments such as a bagpipe or singing in the streets after curfew, suggests that the curfews were not always observed.

**THE CEREMONIAL TRUMPET.** One of the most frequently heard instruments in public places all during the late medieval period was the trumpet. Because of its volume it performed a number of different functions, accompanying ceremonial occasions, celebrations, and military advances in the field. Trumpets, usually in sets of two, were the symbol of power and authority, a tradition inherited from ancient times. In every locale the political leaders and other powerful, wealthy men employed trumpet players as heralds to precede them whenever they went out in public, announcing their presence. These trumpets would often be made of silver with banners suspended from them emblazoned with the coat of arms of the lord or of the community, and the trumpeters wore livery, colorful costumes identifying them as the retainers of civic entities or wealthy lords. Public events, such as jousts, horse races, mock naval battles, and athletic contests, also employed trumpets to heighten the excitement and to signal the beginning and end of various activities. Trumpets were also used by the

Jousting knights and trumpeters, women watching from above. Ivory casket, 1350. THE ART ARCHIVE/MUSEO DEL BARGELLO, FLORENCE/DAGLI ORTI.

town criers, who often played from horseback, traveling from one neighborhood to the next where they would sound their trumpets to call the citizens together to hear the latest pronouncements, banishments, or sentences of deaths. In many cities there were watchmen on the towers looking for signs of fire, curfew violations, or an advancing enemy, who signaled their messages with trumpet calls. Both trumpets and drums were a staple of the military where they served to frighten the foe with their loud noise and also to sound attacks and retreats because they could be heard over the din of battle.

### INSTRUMENTS AT A MINSTREL PERFORMANCE

**INTRODUCTION:** This fanciful scene from *Remede de Fortune* by Guillaume de Machaut (1340) names a number of instruments, including some that cannot be identified.

But you should have seen after the meal  
 The minstrels who entered in generous number,  
 With shining hair and simple dress!  
 They played many varied harmonies.  
 For I saw there all in a group  
 Fiddle, rebec and gittern,  
 Lutes, morache, micanon,  
 Citols, and a psalterion,  
 Harp, tabour, trumpets, nakers,  
 Organs, more than ten pair of trumpets,  
 Bagpipes, flutes, chevretes,  
 Douceinnes, cymbals, clocettes,  
 Tymbres, flutes from Brittany,  
 And the large German horn,  
 Flutes from Scens, panpipes, whistles,  
 Muse d'Aussay, small trumpets,  
 Ceremonial trumpets, eles,  
 and monocords with only a single string,  
 And muse de blef all together.  
 And certainly, it seemed to me  
 That never was such a melody seen nor heard,  
 For each of them, according to the tone  
 Of his instrument, without discord  
 Plays on vielle, gittern, citole  
 Harp, trumpet, horn, flageolet,  
 Pipe, bellows, bagpipe, nakers  
 Or tabor and every sound that one can make  
 With fingers, quill and bow  
 I heard and saw in that park.

each group having specific functions and repertoires; the two groups were rarely mixed together. The “loud” instruments were trumpets, bagpipes, shawms (double-reed instruments rather like the modern oboe), and drums. These instruments were assigned ceremonial functions, mostly out of doors, and were never found in the company of voices. The remaining “soft” instruments—bowed and plucked strings, woodwinds, and keyboard

Bagpiper and other instrumentalists with King David, Olomouc Bible, Olomouc University Library, Czech Republic, 1417. THE GRANGER COLLECTION, NEW YORK.

instruments—were played individually or in ensembles; some of them accompanied voices. The instruments that are described in this section are those most often seen in visual art and mentioned in literature.

**TRUMPETS.** Trumpets came in several sizes, shapes, and materials. Straight trumpets approximately six feet in length and often made of silver were the instruments usually associated with governmental authority. Military trumpets were approximately the same length and made of brass, but beginning in the fourteenth century they were, for practical reasons, folded (similar to a modern bugle). Another popular shape was one resembling an “S,” which was used for the smaller trumpets (approximately four feet of pipe) that are often depicted being played at indoor ceremonies such as banquets. All trumpets were without valves or keys, which restricted their notes to those of the natural acoustic overtone series, that is, something similar to the sounds of a modern bugle call. By 1400 a trumpet with a sliding pipe was invented to allow the players to access the complete scale. This was refined by 1480 to a double slide, which improved both speed and accuracy. The new instrument was called *trombone* in Italy, *sackbut* in England, and *saqbutte* in France.

**SHAWMS.** The shawm, also considered “loud,” is a double-reed instrument much like an oboe. It resembles similar instruments popular in the Arab countries and is

first depicted in Spanish sources of the late thirteenth century, suggesting that it had been introduced to Europe during the Arab or Moorish occupation of Spain. Since the shawm had a fairly large range and could play many of the chromatic notes, it was capable of performing all of the repertory of the period. By the mid-fourteenth century there were two sizes, the traditional alto range instrument and a newer one that played at a lower pitch (tenor range) called a *bombarde* because of its resemblance to a cannon. Instruments of these two sizes often performed in pairs. By the early fifteenth century an alto and tenor shawm were often depicted with a slide trumpet as a standard dance music ensemble.

**BAGPIPE.** The bagpipe is found throughout the Middle Ages in most areas of Asia and the Middle East as well as in Europe, with a heritage that goes back to ancient times. There are many different sizes and shapes, but what they all have in common is that the sound is made by squeezing a bag (originally the skin of a goat) and the melody is played on a chanter pipe with finger holes. Instruments could have one, two, or three drone pipes or even none, and there are examples of both one and two chanter pipes. The bagpipe is most often seen playing alone, mostly for dancers, and it is usually associated with rural or pastoral scenes.

**PERCUSSION.** The percussion instruments make up the final group in the “loud” category. The type most frequently depicted is *nakers*, a pair of small “kettle” drums, usually tied to the performer’s waist or over the neck of a horse; *tabor*, a larger barrel-shaped drum, often called a “side drum,” usually associated with the military; and *tambourine*, a hand-held instrument with jingles, which is usually depicted in conjunction with dancing.

**KEYBOARD.** The keyboard group, considered “soft” instruments, included organs, harpsichords, and clavichords. Two types of organs were in common use: a portable organ (i.e. small and portable), which was usually held on the lap of the player and played with one hand while the other hand worked the bellows; and a larger positive organ that was not portable and was usually found in church, some of which had multiple keyboards, pedals, and several ranks of pipes. Medieval harpsichords were similar to those in use today. The earliest evidence of their existence comes from the mid-fifteenth century. They had a single keyboard with one wire string for each note, and a sounding device that plucked the strings with a pick called a plectrum, which could be made of leather or quill. The clavichord (also called *exchequer* in England) appears as early as the fourteenth century. It differs from the harpsichord in several ways: it had a very soft volume; it made its sound by striking the strings with a metal

Drummers and trumpeters, Chrétien Legouais, *Ovide Moralisé*, Rouen, Bibliothèque Municipale MS 1044, folio 103, 14th century. GIRAUDON/ART RESOURCE, NY.

strip called a tangent; and some of its strings could make more than one pitch according to the amount of force applied to the key—that is, a stronger pressure would result in a higher pitch.

**WOODWINDS.** The woodwind group was quite small, including only the flute and the recorder. These instruments were similar to those of today, but without keys. Only the higher-pitched (soprano) members of these families existed until late in the fifteenth century. The flute is often depicted with drums in a military setting, while the recorder was used for domestic music making.

**BOWED STRINGS.** Bowed strings in the Middle Ages ranged from those that are obvious ancestors of modern instruments to some that are much less familiar. One of those that is less well known today was the hurdy-gurdy, which made its sound by the turning of a crank that

caused a wheel to scrape against two or three strings. A set of keys or levers could be pressed against one of the strings to change the pitch, while the other(s) provided a drone. By the late Middle Ages it was played by a single performer, usually in a lower-class setting, but an earlier version, known as an *organistrum* or *symphonia*, requiring two performers, can be found depicted in a sacred setting in the form of stone sculptures on Gothic churches. Other bowed instruments of the period were distinguished mainly by size and pitch. The rebec, a small three-string instrument, played in the soprano range, while the vielle (Italian viola, English fiddle) was a four- or five-string instrument with a range similar to a modern viola. In Italy the *lira da braccio* was used to accompany improvised song. It was a bit larger than a vielle/viola although it was still played while held against the shoulder. It had seven strings, five of which could be “stopped” (i.e. the player could change the pitch with the fingers

of his left hand, similar to a modern violin), and two more that were plucked by the thumb of the left hand, adding a strummed drone.

**PLUCKED STRINGS.** Lutes came in several sizes, with frets and four “courses” (paired sets) of strings and a fifth solo string called a *chantarelle*, used for playing melodies.

During this period it was usually plucked with a quill plectrum and played mostly single-line melodies with drones. It is clearly descended from the Arab instrument *oud*. The gittern, in contrast, was smaller and higher-pitched than the lute. It also had frets and was plucked with a plectrum and is depicted with three to five single strings. The final member of the group was the harp. Although harps existed in a variety of sizes and forms, the instrument most often depicted was a small portable harp with 24 or 25 strings.

**MUSIC FOR INSTRUMENTS.** Although musical instruments were present all through the period and were played at many different kinds of occasions, very little music intended solely for instruments has survived. The repertory of instrumentalists consisted mainly of improvised music and melodies that circulated aurally. The only materials recorded in written form were ornamented versions of some pieces originally written for voice and a small number of dances. It is clear that throughout the period instrumentalists often performed vocal music, but it was not until the period of the Renaissance, beginning at the very end of the fifteenth century, that we begin to find a sizable body of music specifically composed for instrumental performance.

## PLAINSONG AND THE MONOPHONIC TRADITION

**ORIGINS OF PLAINCHANT.** Music can be easily divided into two large categories according to how many parts are performed simultaneously—that is, monophony and polyphony. Monophonic music, which consists of a single line whether performed by a soloist or by many performers in unison, is the oldest tradition of European music and one shared with all other cultures. At the

## MUSIC

### Sources for Medieval Instrumental Performance

In the medieval music manuscripts that still exist today, there are very few examples of music intended for instrumental performance. The small amount of music written for instruments that has come down to us consists of the following:

The Robertsbridge Codex (English) from c. 1370: a total of six compositions consisting of two-part arrangements of dances, motets, and a hymn, possibly intended for keyboard performance.

The Faenza Codex (Italian) from c. 1430: approximately fifty, mostly two-part arrangements of secular songs, plus a few dances and sacred pieces. It may have been intended for keyboard or lute duets.

The Buxheimer manuscript (German) from c. 1470: over 250 two- and three-part pieces for keyboard, consisting of a few dances, some preludes, and many arrangements of sacred and secular pieces for organ.

A total of 45 pieces, mostly monophonic, known or suspected to be dances, and found in manuscripts from Italian, French, English, and Czech sources, including *estampies*, carols, and *saltarellos*.

beginning of the Carolingian period, the music of the Christian church was a monophonic type called plainchant, a style of music that was originally adopted in the first and second centuries from the traditions of a number of other religious sects—mainly, but not exclusively, Judaism. In the early centuries this repertory was passed on orally, growing and adapting as Christianity and its ceremonies gradually evolved. The name “Gregorian Chant” is often used for this music, based on the erroneous belief that it was composed by Pope Gregory the Great in the seventh century. It is true that some of the chant comes from his era, and Gregory probably had a hand in its organization and promotion. But chants continued to be composed throughout the later centuries of the Middle Ages, and therefore it has recently become the custom to refer to the entire corpus as plainchant (or chant). Chants range from the fairly simple, which involve only a few different pitches and assign a single note to each syllable, to elaborate melodies with large ranges

**SINGING OF PSALMS**

**INTRODUCTION:** Psalms were sung to formulas that allowed for expansion and contraction to accommodate the varied lengths of the verses. There was a different formula for each of the eight modes. The example below shows

the formula for Mode 1, where a = the opening phrase; b = the reciting tone; c = the internal phrase ending; and d = the closing phrase. The application of the formula, shown for the first verse of Psalm 125, "In convertendo Dominus," shows how each syllable of the psalm is matched to one note in the opening, internal, and closing musical phrases, while all the remaining syllables of the verse are chanted on a single reciting tone.

**Psalm Formula for Mode 1**

a = opening phrase; b = reciting tone; c = internal phrase ending; d = closing phrase

**"In convertendo Dominus"**

CREATED BY GGS INFORMATION SERVICES. GALE.

of notes and dozens of ornate melodic passages for a single syllable. Some chants are performed by a soloist, some by the entire chant choir (or the entire monastery), and some alternate between soloist and choir. They occur in several principal styles.

**PSALMS AND ANTIPHONS.** Psalms are sung to relatively elementary music with a single note for each syllable. This music usually involves no more than four or five different pitches, with the majority of each phrase of text chanted on a single note, known as the reciting

tone (see Modes). The remainder of the phrase, its beginning and ending words, are sung to simple formulae specified by the mode itself. Since the psalm verses are all in prose lines of different lengths, the reciting tone can easily be adjusted to the length of each verse. When performed during the daily office, the singing of a psalm involved the entire monastic choir divided into two groups, each group alternately singing one of the two balanced phrases that make up the dozens of verses in each psalm. Antiphons, on the other hand, are usually quite melodic, with a somewhat wider range and more

*a PRIMARY SOURCE document***AN EXAMPLE OF A RESPONSORY**

**INTRODUCTION:** Responsories are the most elaborate of all chants. They can be found in a number of the Office

Hours and were also composed for the Gradual and Alleluia in the Mass. The music is divided between a soloist and the choir, with highly ornate passages throughout, as shown in the example of the beginning section of a verse shown below.

**Gradual for Monday in Holy Week**

(continues)

CREATED BY GGS INFORMATION SERVICES. GALE.

frequent variation of pitch, reflecting their performance by the entire choir. They are found in a number of different places in the Mass and office liturgies, often framing (that is, preceding and following) a psalm verse. An introit (entrance song), for example, would repeat a single antiphon in alternation with a succession of psalm verses, resulting in a performance that could be graphed as: Antiphon; Psalm verse 1; Antiphon; Psalm Verse 2; Antiphon; etc.

**HYMNS AND RESPONSORIES.** Hymns involve poetic texts with regular meter. Their musical construction, therefore, involves matching words to musical phrases, which are composed to fit all of the lines of the first verse of text and intended to be repeated for all successive verses. They are melodic but not overly complex or ornate, and are sung by the entire choir. In contrast, responsories are the most elaborate of all chants, and their music is divided between a soloist and the choir, with highly ornate passages throughout. Responsories are used in a number of the Office Hours, and for the Gradual and Alleluia in the Mass. One responsorial chant, the Mass Alleluia, is a rather special case because it includes

a long, rhapsodic melodic section on the final “a” in Alleluia, sung by the choir. The extended melody is called the *jubulus*, and it was originally intended to be an expression of pure, wordless joy. After the ninth century the jubulus was frequently replaced by a new composition with a text, known as a Sequence (see Additions to the Sacred Repertory, below).

**MASS.** Central to the Christian demonstration of faith is the ceremony of the Mass, which includes the Communion service, a reenactment of the Last Supper. The ceremony itself evolved slowly over the centuries; various prayers and events were added, subtracted, and revised, reaching its present form only in the mid-sixteenth century following the Council of Trent. During the late Middle Ages the Mass included approximately twenty prayers and readings, half of which were spoken and half sung. The texts include some that remain the same throughout the year, known as the Ordinary items, others that change depending on the liturgical season (for example, Christmastime, Easter), and some, known as the Proper, that change each day and are particular to the saint being celebrated on that date (for example,

St. Stephen is celebrated on 26 December, St. John the Apostle on 27 December, and so on). Of the many sung parts of the Mass, it is to five parts of the Ordinary that composers devoted most of their attention during the late Middle Ages. In the order in which they occur in the service the items are:

Kyrie elieson—"Lord have mercy," a ninefold invocation for mercy;

Gloria—"Glory to God in the Highest," a celebration of the glory of God (omitted during the forty days of mourning preceding Easter);

Credo—"I believe in one God," a declaration of the essential beliefs of the Christian faith;

Sanctus—"Holy, Holy, Holy," the cry of the multitudes when Jesus entered Jerusalem;

Agnus Dei—"Lamb of God," a plea for personal peace.

**OFFICE HOURS.** In addition to the Mass, the clergy observe eight additional daily prayer rituals at various hours of each day, known as the Office or the Hours, beginning shortly after midnight and lasting until evening. In the monasteries, when it is time for each of the Hours, all of the monks stop whatever they are doing and gather in the Chapel to pray and chant together. Priests not part of a monastic community simply read the prayers to themselves. Most of the Hours have prayers that are sung, including antiphons, psalms, responsories, and hymns. An outline of Matins, the most important of the Hours, will provide an idea of the structure of the service and its contents:

Introduction: *Deus in adiutorium meum intende* (dialogue chant), Psalm 94 with antiphon, hymn

Nocturn I: three psalms with antiphons, three responsories.

Nocturn II: three psalms with antiphons, three responsories

Nocturn III: three psalms with antiphons, three responsories

Conclusion: *Te Deum* (hymn), *Benedicamus Domino* (dismissal)

All five sections in Matins involve the chanting of psalms: an introduction and conclusion, both of which remain the same each day, and three central sections known as Nocturns. The importance of the Psalms to the services is apparent from the fact that the services in monasteries are constructed so that all 150 can be sung each week.

Not all of the eight Offices are as elaborate as Matins, but it can be seen that a very large portion of a medieval monk's day was spent in singing.

#### ADDITIONS TO THE SACRED REPERTORY

**CONTINUAL CHANGE.** It is tempting to view something as old and formal as the sacred liturgy—the Mass and the Hours—as immutable, with a body of works and system of practice that has remained unchanged since it began. Nothing can be further from the truth. The entire liturgy, both its format and repertory, was in a constant state of flux throughout the period. New compositions and ceremonies were added, older items were revised and altered, and regional variants of all types arose and were suppressed all during those centuries. Discussed below are some of the major changes that came about during this period involving music, although there were also numerous changes to the prayers and the format of the ceremonies themselves. The inclusion of musical drama, the addition of new chant items and devotional works, and the application of polyphony to new and old repertory are evidence of a sacred ritual that was constantly under revision.

**LITURGICAL DRAMA.** During the reign of Charlemagne in the early ninth century, the church authorities at his principal residence in Aachen (northern Germany) decided to dramatize the most important event in the liturgical year, the Resurrection of Christ on Easter morning, by acting out the scene in which the three Marys (Mary the mother of James, Mary Salome, and Mary Jacobi) visit Christ's tomb and find it empty. Three monks were assigned to take the part of the Marys, impersonating women by raising their cowls over their heads, and another monk sang the part of the angel who tells the Marys that Christ has risen. Initially, the entire dialogue consisted of only three lines of text and music, sung during the procession on Easter morning and enframed by a number of processional antiphons. The idea of dramatizing the major celebrations of the Church spread quickly throughout all areas of Europe, where they became immediately popular and

**LINES FROM A SACRED PLAY**

**INTRODUCTION:** The earliest known sacred play with music was the recreation of Christ's Resurrection on Easter morning.

There were hundreds of different versions of this play, all of which contain the following basic lines and music.

**Liturgical Drama**  
Original three lines.

Quem quae - ri - tis in se - pul - chro - O Chris - ti - co - le?  
(whom do you seek, O followers of Christ?)

Je - sum Na - za - re - num cru - ci - fi - xum O ce - li - co - le.  
(Jesus of Nazareth who was crucified, O heavenly one.)

Non est hic sur - re - xit sic - ut pre - di - xe - rat; i - - - te nun - ti - a - te  
(He is not here, he is risen as he foretold; go announce that he had risen, saying:)

qui - a sur - re - xit:

CREATED BY GGS INFORMATION SERVICES. GALE.

attracted additional creative inspirations. In some places the drama was enlarged by the addition of other scenes from the biblical account of the Easter story: the seller of spices, pilgrims who passed by the grave, apostles who arrived later at the tomb. By the twelfth century the tradition of dramatizing the liturgy had grown in some monasteries to include church celebrations at other times of the year, including biblical events such as the Adoration of the Magi, the Slaughter of the Innocents, and the Raising of Lazarus. In some places the enactments were removed from their original setting within a liturgical ceremony and presented as independent musical plays lasting over an hour. The most elaborate set of plays is found in a manuscript known as the Fleury Play Book (named for the French monastery where it is believed the manuscript originated), written in the early thirteenth century. This source contains a total of eleven

grand plays, all set to music, on subjects such as the St. Nicholas legend, the Son of Getron, the Pilgrims, and the Conversion of St. Paul, as well as the original topic of the Resurrection.

**TROPES.** Tropes were additions of new text phrases and music inserted at the beginning and between the existing text phrases of antiphons for the Mass. The new phrases served as a commentary on the original text. In the example of the *Resurrexi* Antiphon With Trope, the original text is underlined. Just as the new text phrases amplified the original text, the new music was written to match the melodic style of the old. Tropes continued to be added to antiphons to the point that they were even collected in separate manuscripts, called Tropers, which would provide a singer with a choice of a number of different sets of tropes to add to specific antiphons.

*a PRIMARY SOURCE document***AN EASTER INTROIT**

**INTRODUCTION:** The following is an antiphon for Easter Introit with trope lines. The original antiphon, in italics, begins with "I am risen." The trope lines are added before the first line and following each phrase, ending with a final trope line. All of the trope lines and the first phrase of the antiphon are sung by a soloist. The choir sings the rest of the antiphon phrases, alternating with the solo performances of the trope lines. Following this, the soloist sings an antiphon verse, and that is followed by another troped performance of the antiphon.

Today there came forth a strong lion from the  
sepulchre on account of whose victory the heavenly  
ministers shall rejoice in God, and we rejoice singing

*I am risen*

The prince of hell having been vanquished, all doors  
are open.

*And yet I am with you, Alleluia*

from whom I never went away while I was lying in  
the flesh, dust

*You placed upon me*

whom you alone created, O God, before all time

*Your hand, Alleluia*

By your order death was tasted

*A wonderful thing has been done*

to one to whom no wisdom in the world can be  
equated

*Your knowledge, Alleluia*

That wish such a victory you laid low the boastful  
victor, Alleluia.

**SEQUENCES.** Sequences are additions for the end of the Alleluia, one of the chants for the Mass, as a replacement for the long, extended melodic rhapsody on the final syllable of "Alleluia." The name "sequence" refers to the texts, which are in paired lines all with the same syllable count, although not rhymed. The music is very melodic (as opposed to psalm-tone), but not elaborate in that only one note is assigned to each syllable, much in the style of a hymn. Thousands of sequences were composed beginning in the Carolingian era sometime around 850 and continuing until the twelfth century. One of the earliest sources was the music written by Notker Balbulus (c. 840–912), a monk at the Swiss monastery of Saint-Gall, who gathered his sequences into a book (*Liber Hymnorum*), thus becoming the first known composer. Tropes and sequences continued to be sung until the reforms of the Council of Trent in the

sixteenth century, when all tropes were eliminated from the liturgy, as well as all but four sequences.

**RHYMED OFFICE.** The largest repertory of new sacred material during the late Middle Ages was written for the Office. Over a thousand new saints were added to the liturgical calendar during this period, meaning that new chants had to be written for their services. Although the earliest of the new texts were written in prose, as the older texts had been, by the twelfth century it became the custom to write them as poetry, in strict meter and rhyme. The matching or coupling element of a rhymed text inspired the composers to write music with similarly matching phrases, resulting in new office chants that were quite different from those that preceded them. Since many of the new saints were venerated only in a particular region, this provided the opportunity for new composers in each area to contribute material to their local sacred observances.

**THE MONOPHONIC  
SECULAR TRADITION**

**REGIONAL STYLES.** At the same time plainchant was being sung in the churches and monasteries, there was a rich body of monophonic music developing for non-religious use. In contrast to the unified nature of chant, which was more or less standard throughout Europe, the music of the laymen varied by region. The entire Western Christian church was controlled centrally by an enormous, stable hierarchy in Rome that extended to all regions, with a single official language—Latin—all of which resulted in a single, uniform practice. The secular world, on the other hand, was divided into autonomous regions that were subject to sudden political change and maintained separate languages and customs. A discussion of secular music, therefore, takes on a geographical/national character, reflecting local cultures and preferences. There are a number of similar basic elements in all areas, but the differences are sufficiently large and striking to warrant a discussion by general regional types.

**LOST EVIDENCE.** Although we know that there was a thriving tradition of secular music in all areas, not all are well represented by surviving music. Very little secular monophony is preserved from England, for example, in spite of the fact that in the twelfth century Eleanor of Aquitaine was a patron of troubadours and trouvères, and literary sources such as the writings of Geoffrey Chaucer make it clear that there was a great quantity of secular music. The entire English monophonic repertory that has come down to us consists only of three sacred songs attributed to St. Godric, a Saxon hermit who died in 1170, and a handful of love songs. The surviving repertory from Spain is equally slim, although we do have the sacred *cantigas*, discussed below. Given the basic similarities of the social milieu in all parts of Europe, however, we can imagine that repertoires and musical practices existed in all of these areas, similar to those that have survived.

**TROUBADOURS IN THE COURTS.** Although much of the repertory of the minstrels was never recorded, we can catch a glimpse of it through one particular branch of the tradition that flourished in aristocratic circles: the courtly love songs written and performed by troubadours, and *trouvères* (men) and *trobairitz* (women). The name depended on where they lived and performed and the language in which they wrote: the troubadours mostly worked in southern France, northern Spain, and northern Italy, and wrote in the Occitan language (also called *langue d'oc* and Provençal), while the trouvères worked in northern France and wrote in a medieval version of French (Old French, *langue d'oïl*). The names come from the verb *trouver*, meaning “to find,” which suggests that they invented (“found”) their poetry and music. They were a talented group of professionals and amateurs that included nobles as well as members of the lower classes who lived and performed mostly in the courtly circles of France, England, and northern Italy (where they were known as *trovatori*) during the eleventh through the thirteenth centuries. In contrast to the other minstrels who led a somewhat insecure nomadic existence, these poets/composers were usually attached to a single location for long periods.

**COURTLY LOVE SONGS.** Much of our impression of courtly life of the period is taken from medieval song texts, although what they describe is often idealized—describing a perfect world—rather than factual. The subject matter of these poems is highly stylized, following a partially imaginary etiquette of courtly love and behavior that is both elaborate and complex. “Lancan vei la folha,” by the troubadour Bernart de Ventadorn is a good example of both the musical style of troubadour melodies and the convoluted and decorative language used in a

typical love song; the lover expresses his devotion in reverential terms, vowing eternal devotion in spite of the woman being unattainable (often because she is married to someone else). In contrast, Bernart’s musical setting is relatively simple: the melody that sets the first four lines of the stanza is repeated for the next four; a new contrasting melody is introduced for lines 9 and 10 (that is, it descends rather than ascends), and then the last half of the earlier melody returns for the final two lines. All of the stanzas are intended to be sung to the same melody, although the singer would be expected to insert different ornaments (embellishing notes, rhythms, or any number of other vocal expressive devices) for each stanza in order to add variety and support the text message.

**THE PASTOURELLE.** Another of the favorite formats in the troubadour/trouvère tradition was the pastourelle, which had as its theme the romantic pursuit of a shepherdess by a knight. Named after the French word for “shepherdess,” these poems usually told the story of a noble visitor to the countryside who catches sight of a pretty rustic girl, approaches her, and offers her gifts in exchange for her acceptance of his advances. Sometimes the nobleman forces his attentions on her, and other times she outwits him. A variant of this form, called the *bergerie*, changes the situation slightly. Now a hidden narrator overhears shepherds, or a shepherd and shepherdess, debating. The 1284 *Jeu de Robin et de Marion* (Play or Game of Robin and Marion), by the trouvère Adam de la Halle, is the most famous of these, and incorporates a number of charming songs for the two principal characters and a narrator who tells the story.

**THE CANTIMPANCA AND THE IMPROVISED TRADITION.** *Trovatori*, the Italian equivalent of French troubadours, flourished at the northern Italian courts during the twelfth and thirteenth centuries, producing a repertory similar to that of the troubadours. At the same time, outside of the court the centuries-old practice of the village bard survived in the person of the *cantimpanca* (singer on a platform), or *cantastoria* (singer of history), carrying on a tradition that lasted long after the trovatori died out. The cantimpanca was a poet and singer who improvised music while he sang verses about historical subjects, love, and any other topic that interested him. His verses often commented on current political events, and he accompanied himself with a lute or a lira da braccio. Some of these poet/musicians were quite famous and had regular followings; the Florentine cantimpanca Antonio di Guido, who performed on Sundays in the piazza in front of the Florentine Church of San Martino in the late fifteenth century, could count among his fans Lorenzo de’ Medici (Lorenzo the Magnificent), the great Florentine statesman and patron of the arts. Pietrobono de

**A TROUBADOUR SONG**

**INTRODUCTION:** “Lancan vei la folha,” written by troubadour Bernart de Ventadorn in the twelfth century, is a good example of the musical style of troubadour melodies. All of the stanzas, which illustrate the combination of total

loyalty and extreme suffering expected of a lover in the “courtly love” tradition, are intended to be sung to the same melody, although the singer would be expected to insert different ornaments for each stanza in order to add variety and to support the text message.

 des cuit m'a co - lha, on plus m'en de - ze - sper

I  
 When I see the leaves  
 Fall down from the trees  
 No matter if this brings pain or grief to anyone else,  
 To me it must bring pleasure.  
 Do not think that I want to see flowers or leaves,  
 For to me comes disdain  
 From the one I want most to have.  
 My heart tells me to leave her,  
 But I don't have the strength to do it,  
 For I always think that she might treat me with favor,  
 Even when I most despair of her.  
 [continued]

II  
 Unpleasant news  
 You may be hearing about me,  
 Who was accustomed to favor me,  
 She no longer calls to me  
 Nor summons me to her side.  
 My heart within my chest  
 Is about to break with grief.  
 May God, who rules the world,  
 Let me take pleasure in her, if it please Him,  
 For if she remains so hostile to me,  
 There remains nothing but to die.

CREATED BY GGS INFORMATION SERVICES. GALE.

Burzellis, who was located principally in Ferrara, was widely acclaimed both for his virtuosity as a lutenist and for his singing voice, as well as his ability as an improviser. Although some of the poetry of these popular entertainers still exists, not a note of the music has survived.

**MINNESINGERS.** The German counterpart to the courtly tradition of the troubadour and trouvère in France was the minnesinger (*Minne* = love), a singer of love songs, popular during the twelfth and thirteenth centuries. Originally the kinds of songs—the subject

**“Lancan vei la folha” [CONTINUED]**

III

I no longer have faith  
In augury or spells,  
For straightforward hoping  
Has destroyed and finished me,  
For the beautiful one whom I love strongly  
Casts me so far off,  
When I seek her love,  
As though I had done her wrong.  
I have so much distress from this  
That I am deeply afflicted;  
But I do not allow it to show  
For I go on singing and enjoying myself.

IV

I don't know what else to say,  
Except that I am acting very foolishly  
In loving and desiring  
The most beautiful one in the world.  
I really ought to kill  
The person who invented the mirror.  
When I think carefully about it,  
I have no worse adversary than this.  
On any day that she looks at her reflection  
And thinks about her worth,  
I shall surely possess  
Neither her nor her love.

V

She does not love me sensually,  
For that would not be suitable.  
But if it were to please her  
To show me any favor at all,  
I would swear to her,  
In her name and in the name of my faith,  
That any favor she might do me  
Would not be revealed by me.  
Let her will be done,  
For I am at her mercy.  
Let her kill me if it please her,  
For I am not complaining of anything.

VI

I have the right to complain  
If I lose through my own pride  
The pleasant company  
And the pleasure that I used to have.  
I gain little profit  
From the false bravery that I display,  
For the one I most love and desire  
Rebuffs me.  
Oh Pride! May God crush you,  
For now my eyes weep on your account.  
It is right that all joy should desert me,  
For I myself have driven it from me.

VII

As defence from the suffering  
And the pain that I endure,  
I have my constant habit  
Of thinking always about that place (where she is).  
Pride, folly  
And villainy will be committed  
By anyone who distracts my heart from her  
Or makes me think of anything else,  
For no better messenger  
Can I have in the whole world,  
And I send it (my heart) to her as hostage  
Until I return from here.

VIII (Envoy)

Lady, I send you my heart,  
The best friend that I have,  
As hostage,  
Until I return from here.

CREATED BY GGS INFORMATION SERVICES. GALE.

matter and the forms—were similar to those of the troubadours, but in the late thirteenth century many of the minnesingers began to write on more popular themes, including parodies of the idea of courtly love. Many of the songs in this later period are quite humorous and earthy. The tradition lasted into the fifteenth century in Germany, nearly one and a half centuries after it had died out in France. A notable minnesinger of the later period was Tannhäuser, who was involved in the Fifth Crusade (1217–1221), and whose life inspired one of Richard Wagner's operas in the nineteenth century. Tannhäuser's song (*minnelied*) *Est Hiut Ein Wunnliclicher Tac* (“Today Is A Wonderful Day”), written in four stanzas around the year 1250, is a song of penitence. Its narrow range and simple rhythms are typical of the genre.

The musical form is known as *Bar*, matching the form of the poetic stanzas. It consists of two unequal sections; the first section is shorter and is repeated immediately (setting the first eight lines of the text, 4+4), the second is longer (setting the last twelve lines) and includes material from the first section plus new melodic phrases. The tradition of the minnesinger gave rise to the highly organized guild of the Meistersingers in the Renaissance, another of Wagner's opera subjects.

**CARMINA BURANA.** Another repertory of German songs is found in a manuscript known as the *Carmina Burana*, dating from the end of the thirteenth century, which contains over 200 secular poems. The collection is from the Benedictine monastery of Benediktbeuern (south

Walther von der Vogelweide, Manesse manuscript, Heidelberg, Universitätsbibliothek, Cod. Pal. Germ 848, folio 124r., c. 1300. BETTMANN/CORBIS.

of Munich), and consists of a number of poems in Latin as well as some in German. The repertory is quite broad, including drinking songs and parodies of religious songs, as well as some with texts of love, many of which are related to the minnesinger repertory in terms of style and subject matter. In recent times the composer Carl Orff (1895–1982) used the poetry and some of the melodies as an inspiration for his *Carmina Burana*, a substantial work for orchestra, chorus, and soloists.

## RELIGIOUS MUSIC OF THE LAYMAN

**SONGS OF PERSONAL EXPRESSION.** Not all sacred music was for church or monastic services; laymen also participated actively in their faith by singing sacred songs. One of the uses of this repertory was the personal or familial expression of faith done at home, although there was also a widespread tradition of confraternities—societies of laymen who gathered together in a chapel or church to pray and sing devotional songs. These gatherings were not part of a liturgical service, and generally were not presided over by the clergy. The sacred songs of the different regions, sung in the vernacular language, differ from one another in several ways, including subject matter and style of melody.

**CANTIGAS DE SANTA MARIA.** One of the earliest and most interesting repertories of sacred song has been preserved in three elaborate Spanish manuscripts, dating from the thirteenth century during the time of Alfonso X “el Sabio” (The Wise), king of Castile and León (regions of what is now Spain) from 1252–1284. His reign was one of enormous contrasts. On the one hand, there was political unrest and civil war, but on the other there were great advances in culture, science, and literature. The *Cantigas de Santa Maria* (Songs of Holy Mary) includes more than 400 songs, all of which are devoted to the Virgin. The subject matter of the texts concerns everyday people in contemporary Iberian life (encompassing Spain and Portugal), all of whom are assisted by miracles performed by Mary. As in the cantiga illustrated here, each song is introduced by a narrative passage that sets the scene. The poems that follow are all in strophes (stanzas or groups of lines in a single metrical form), usually of six to eight lines of verse, with a four-line refrain. The music that sets each of the cantigas is therefore in two parts, reflecting the poetic form and rhyme scheme. The music is fairly simple, having a modest range, simple

*a PRIMARY SOURCE document*

**A CANTIGA TO THE VIRGIN MARY**

**INTRODUCTION:** "Aquela en que Deus" is one of over 400 songs devoted to the Virgin, known as the Cantigas de Santa

Maria (Songs of Holy Mary). They are all preserved in three elaborate Spanish manuscripts, dating from the thirteenth century, during the time of Alfonso X "el Sabio" (The Wise), king of Castile and León. The song in the example below explains how Holy Mary of Ribela does not allow any oil to be burned before her altar except olive oil, which is very clean and pure.

**REFRAIN:** That One in whom God took flesh and gave to us for light is always pleased by cleanliness, such is Her custom.

**VERSE 1:** The Holy Virgin Mary performed a great miracle in a church of Hers, as She does every day, in a village called Ribela where long ago there used to be a monastery.

**REFRAIN:** That One in whom God took flesh and gave to us for light is always pleased by cleanliness, such is Her custom.

**VERSE 2:** Now only the church remains of the Order of Saint Benedict, which was dedicated to the Virgin (may She be ever blessed), in which there are five altars, and where God sheds wondrous power on the altar consecrated to Her, for no light may burn there.

**REFRAIN:** [That One ...]

**VERSE 3:** [No light] of any oil except that of olives, very clean and pure. Although linseed oil may burn before the others, it is unthinkable that it should be burned before the Virgin's altar. This is proven many times during the year, and it has become the custom.

**REFRAIN:** [That One...]

**VERSE 4:** Knights, farmers, priests, monks, barefoot friars, and preachers often prove this to be true, for although they have tried to light other combustible oils there, they immediately went out and would not burn at all.

**REFRAIN:** [That One ...]

**VERSE 5:** Therefore, the people of that place do not dare to be so bold as to burn any other oil there, since they fail foolishly each time they try. For this reason they go back to burning olive oil in the lamps, as is the custom.

**REFRAIN:** [That One ...]

CREATED BY GGS INFORMATION SERVICES. GALE.

rhythms, and, for the most part, only one note per syllable of text; all of the settings are monophonic. In “Aquila en que Deus,” there are really only two different musical phrases for the entire cantiga. The Cantigas show a number of interesting relationships. The melodies and their form—verse, refrain—are quite similar to the troubadour repertory; they coincide with the end of the era in which troubadours were active on the other side of the Pyrenees Mountains in France, although their subject matter is unique to Iberia. The artistic styles and patterns of the illustrations in the cantiga manuscripts indicate an obvious influence from the Islamic world. The Arabs had been in Spain for several hundred years at that point, and some of the musical instruments in the cantiga manuscript illuminations are clearly modeled on Arab instruments. The rhyme scheme of most of the Cantigas, one that was popular at Alfonso’s court, is known as *zajal*, an Arabic form. All of this suggests that while the music seems to be related to the northern repertory, the texts probably were influenced by Arabic literature.

**ITALIAN LAUDE.** The small body of surviving Italian monophonic songs consists almost entirely of *laude spirituali* (spiritual praises), all of them in the vernacular language and on religious subjects. The laude were the repertory of the numerous religious confraternities (groups united for a common purpose such as the veneration of a saint or other figure) in many North Italian cities during the late Middle Ages. Citizens by the hundreds joined these societies, some joining several, which would meet regularly (sometimes weekly), and sing the laude in procession. Approximately 150 laude exist with music from before the mid-fourteenth century; most are fairly simple in terms of range and rhythms; nearly all of them are in stanza form with a verse and refrain, suggesting soloist-chorus performance.

## THE EARLIEST POLYPHONIC MUSIC

**ORIGINS AND DEVELOPMENT.** The most far-reaching addition to music during the Middle Ages was the invention of polyphony—music in more than one

part—an aspect of Western art that is not duplicated in any other culture. The idea itself undoubtedly originated centuries earlier than the earliest written evidence or even the first mention in theoretical treatises. In its simplest forms polyphony can easily be improvised as, for example, when two or more performers simultaneously sing the same song at different pitches, and it still exists in that form in a number of cultures. But the musicians of Europe took the idea quite a bit further, developing and refining the practice to a level of complexity that could not be extemporized, but required long thought-out and calculated written composition. Monophonic music, both chant and the secular compositions, continued to be performed throughout the Middle Ages and long after, but once invented, polyphony invaded all forms with dramatic consequences. It added an entire new body of works to sacred music, supplementing the chant and even replacing it on special occasions. The effect was somewhat different on secular music, where polyphonic music became the treasured repertory of the upper classes, creating a musical class distinction that had not existed previously.

**THE EARLIEST FORMS.** Instruction and information about polyphony is found in theoretical treatises from as early as the *De harmonica institutione* (Melodic Instruction), written by the monk Hucbald c. 900, and later expanded and developed in a number of treatises including *Micrologus* (Little Discussion), by Guido of Arezzo. The basis of the technique comes from parallel motion, which is described by Hucbald as the sound that results when a man and a boy sing the same melody simultaneously, each one in his own range. Extensions of this idea include refinements made by one of the voices varying from exact parallel at different times, creating different harmonies, or one voice moving slowly while the other moves quickly, filling in the gap with ornamental passages. All of these techniques are known as “organum,” and the earliest written examples of the technique can be found in eleventh- and twelfth-century manuscripts from England and France. By the twelfth century additional experiments revolving around the monastery of Saint-Martial in Limoges (central France) involved composing two lines of music with separate melodic profiles, which resulted in constantly changing harmonies between the two parts. It is at this point that we can mark the true beginning of composed polyphony, the most distinguishing mark of Western art music.

**NOTRE DAME ORGANUM AND THE SUBSTITUTE CLAUSULAE.** Along with the construction of the Gothic Cathedral of Notre-Dame in Paris in the twelfth century came distinctive and far-reaching experiments in composition of a new polyphonic repertory by two of the

cathedral's choirmasters: Master Leonin and Master Perotin. These compositions, called *organum*, consisted of a new added part above the traditional chant. Leonin (c. 1135–1201) is credited with originating the *Magnus liber organi* (Great Book of Organum), which contains several different kinds of innovative compositions, including organum sections for Graduals, Alleluias, and Responsories for the entire liturgical year. Leonin's organum compositions were intended to be substitutes for those phrases of plainchant usually sung by a soloist. When organum passages are applied to a chant, the result is an interruption of the monophonic performance with a section in which a rapid upper part is sung by a soloist against the long, sustained lower notes of the original chant, followed by a return to the unison chanting of the choir. The new sections are known as *substitute clausulae* because their purpose was to take the place of a phrase (clausula) already present in the chant.

**DISCANT.** Perotin, who followed Leonin as leader of the Notre-Dame cathedral choir, took the next step and added to the substitute repertory in the form of a new rhythmic organization of the original chant notes with a much lower ratio between the number of notes in the upper and lower parts. Perotin's style of composition, called *discant*, brings a heightened sense of rhythmic flow to the substitute sections. In performance, therefore, an Alleluia in which both organum and discant sections have been substituted would take on a format in which, for example, only three sections of plainchant performed by the whole choir might be alternated with six sections of organum or discant. The change from the original plainchant version of the Alleluia would be that the choir participation has been substantially reduced because both organum and discant sections are performed by two soloists, one of whom sings the original chant while the other adds the newly composed organum or discant melody above it.

## MOTETS AND CANONS

**THE MOTET: A NEW FAVORITE FORM.** The motet, which originated in the early thirteenth century, quickly grew to be one of the most important of the new polyphonic inventions. Through the final three centuries of the Middle Ages it became the form of choice for com-

posers who were looking to experiment with techniques, to extend the boundaries of form, harmony, and inter-relationship among the parts, and to try new ideas in notation. From its inception it was intended to mark a particular occasion, and this emphasis continued to grow, as did the size of the compositions themselves. The technique of motet writing itself came about as a natural extension of the substitute clausula practice. When composing a new upper part for the chant section, instead of duplicating the text of the lower voice part, the composer would add a new text for the new part. The name *motet* is a Latinized form of the French word "mot," meaning "word," referring to the additional set of words. In the earliest examples, the added text was related to the text of the original part, glossing or amplifying the sentiment. This can be seen as analogous to the trope tradition (see above), except that instead of interrupting the original text with the new commentary, it was sung simultaneously.

**MOTET FORMS AND VARIATIONS.** The most common format for a motet throughout the thirteenth and fourteenth centuries was three voice parts: two new upper melodies composed above a borrowed (that is, pre-existing) melody in the lowest voice. The lowest voice, the one borrowed from a chant (or later, from another composition) was referred to as the *tenor*, from the Latin *tenere* meaning "to hold," referring back to organum in which the chant notes were slowed down—that is, "held out" for a longer duration. The next voice was called alto, meaning "high," and the highest was the soprano, from the Italian *sopra*, meaning "above." Shortly after its invention in the early thirteenth century, composers began to experiment with the motet, and the form quickly took on a number of different genre and variations. From its rather humble and subservient beginning as an addition to a chant section, the motet quickly became a completely independent composition that could be substituted for chants in certain places within the liturgy, for example at the Communion. At first the lowest part, the tenor, was usually chosen from an existing sacred source, and the text of the added part was related to that of the tenor. But many motets were designed for performance outside of the liturgy, some obviously intended for a secular setting. In these, the tenor was not necessarily from a sacred source, nor were the added texts in Latin; the vernacular (that is, the language of the region) could also be used. And the subject matter of the new texts, even for those built on sacred tenors, is sometimes on decidedly earthy topics. This was music for an educated class who reveled in the sophistication of the subtle cross-references among the texts as well as their harmonic, melodic, and rhythmic interplay.

*a PRIMARY SOURCE document***A MUSICAL PUZZLE**

**INTRODUCTION:** A puzzle canon is an example of the kind of intellectual “games” that were often employed by composers during the late Middle Ages. In the example here, “Agnus dei” from the *Missa L’Homme armé*, the symbol at

the extreme left of the staff lines is a clef sign marking F on the middle line, and the vertical grouping of four symbols immediately before the beginning of the music on the top line corresponds to the four parts that will be sung. The musicians would “solve” the puzzle by following the markings at the beginning of the music, which direct them to sing the same melody at four different speeds and pitches, turning it into a four-part composition. The result for the opening section is transcribed on the facing page.

**Liber III.** 445

**Petri Platenfis III uocum fuga**  
**exunica ad Hypodorium.**

COURTESY OF JOHN FRIEDMAN.

**COMPLEXITIES AND PUZZLES.** The motet was usually singled out as a format for introducing complexities of melody, rhythm, and tempo into compositional structures. The initial idea of simultaneous sets of words that played on one another suggested to the composers that such intellectual “games” could be extended to the actual construction of the music as well. The most interesting and long lasting of these techniques is known as *isorhythm*, a device in which a particular rhythmic sequence is chosen more or less arbitrarily and the melody is then sung

in the chosen rhythmic sequence, repeating the rhythm exactly throughout the composition. Refinements and variations involve whether or not the rhythmic sequence coincides with the length of the melodic phrases, and how many voice parts of any one composition are set in isorhythm. One of the most spectacular displays of the isorhythmic technique can be found in the four-voice motet *Veni sancte Spiritus—Veni Creator Spiritus* by John Dunstaple. The composer writes all four voice parts in different isorhythmic patterns that do not coincide with

### A Puzzle Canon: "Agnus Dei"

Transcription of opening section.

The image shows a musical score for a four-part canon. The top staff is in treble clef with a common time signature (C) and a 2/4 time signature. The second staff is in treble clef with a common time signature (C) and a 3/4 time signature. The third staff is in bass clef with a 3/8 time signature and a common time signature (C). The bottom staff is in bass clef with a 2/4 time signature and a common time signature (C). Each staff begins with a mensural sign: a common time (C) for the first, a circle (O) for the second, a circle with a 3 (O3) for the third, and a common time (C) for the fourth. The notes are written in a medieval style with stems and flags.

CREATED BY GGS INFORMATION SERVICES. GALE.

the melodic material, and then further complicates the structure by speeding up the pace of each section of the piece by means of tempo signs based on a mathematical ratio. The imposition of such strict formal devices has the potential of stifling artistic creativity, but in the hands of a skillful composer like Dunstaple, the product is as much a musical triumph as it is a technical *tour-de-force*.

**CANON.** Another compositional device on the level of an intellectual game, applied to polyphonic music, was *canon* (canon = rule), which required the performers to solve a puzzle presented either in words or in symbols in order to perform the composition, only part of which was actually written down. The written form provided cryptic directions for deriving an added part from what was already on the page. "Cry without ceasing," for example, the only direction given on one such composition, results in the addition of a complete second part if one singer performs only the notes but not the rests, while another singer performs the line exactly as written, including its rests. On a similar level are the compositions written as only a single part with several different symbols indicating tempo (known as mensural signs), which will yield a polyphonic composition when the piece is performed simultaneously at different pitches

and speeds. In the "puzzle canon" illustration, the mensural signs indicate that the melody should be sung in the following manner (the first note is to begin where the sign itself is located).

The uppermost part  $\text{C}$  begins on high D, and proceeds in duple time.

The next part  $\text{O}$  begins on G, and proceeds in triple time.

The next part  $\text{O}3$  begins on lower D (the actual notated pitch), and proceeds in a faster triple time.

The bottom part  $\text{C}$  begins on low G, and proceeds in a slow duple time.

**ROUNDS AND CATCHES.** Other musical forms also employed the device of canon in performance, although not usually as complicated as those used in the motet. The most obvious of these is the "round" format, in which a single line of music is marked for successive beginnings in the manner of the well-known "Frère Jacques" or "Three Blind Mice." A variation of this is found in the fourteenth-century repertory of both France and Italy, known as *chace* (French), or *caccia* (Italian). The word literally refers to a hunt, but thinly veiled

beneath a superficially naive text, it always has an erotic double meaning. Because the second voice enters later than the first but starts at the beginning, the singers are always at different places in the same text and melody. The composer cleverly constructs the melodic line so that words from one line are interspersed among those of another, producing a completely new meaning, and one that cannot be seen by merely viewing the text itself. These are quite entertaining to hear, many of them containing onomatopoeic sounds such as dogs barking or trumpets sounding. The English “catch” of the seventeenth century is related to this form.

### POLYPHONIC SECULAR MUSIC AND NATIONAL STYLES

**FROM DANCE TO ART MUSIC.** Soon after its development, the new polyphonic technique was employed by composers to set non-religious songs, applying it to the different regional types that already existed as monophonic forms. Secular songs stemmed mostly from music intended for dancing, and, in their monophonic format, retained many of the characteristics of dance music, including regular rhythmic patterns and simple melodies with regular phrases. Once polyphony was adopted for this repertory, however, its relationship to dance became increasingly distant. Polyphony, with its potential for complex interrelationships among the parts, tempted the composers to experiment with refinements and sophistications on all levels. The result was a growing body of art music that set traditional poetic text forms, but was technically much more demanding than its monophonic predecessors. By the late fourteenth century the polyphonic secular repertory had replaced much of the monophonic in courtly circles, both in quantity and in prestige.

**COURT MUSICIANS.** The performance of these pieces required the ability to read music and therefore they were the domain of musically literate performers, both amateur and professional. The resident musicians

in the major courts adopted this new collection of compositions in their daily performances; kings, counts, dukes, the pope, and cardinals in all areas prided themselves on the quality of their court musicians, and vied with one another to hire the highest quality performers and composers and to commission manuscripts of the new repertory. Musical establishments such as those at the French court in Paris, the Sforza’s in Milan, and the papal court first in Avignon and later in Rome became havens for the finest musicians, but none reached the prestige of that of the duke of Burgundy, whose ensemble of vocal and instrumental musicians set the standards for all of Europe well into the fifteenth century.

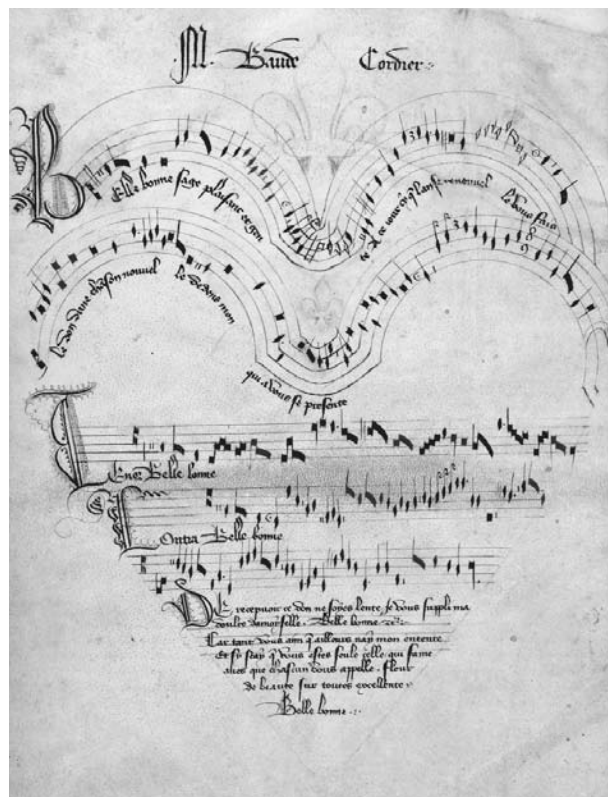

**BURGUNDIAN DOMINANCE.** Initially the styles and techniques of the polyphonic songs were as regional as the monophonic secular repertory, but that soon changed. By the end of the fourteenth century the most influential musical style was that of the area known as Burgundy, including much of what is now northeastern France as well as Belgium and the Netherlands. As the political power of Philip the Bold (duke of Burgundy 1364–1404) grew in the last decades of the fourteenth century, so too did his cultural influence, spreading his musical preferences throughout Europe. Franco-Netherlandish sacred and secular music influenced the writing of composers in all of Europe, especially in Italy where not only the northern repertory was imported, but also the composers and performers themselves. A single example of the influence of the Burgundian musical tastes can be seen in the area of dancing: the fifteenth-century choreographed dances in Italy, Spain, Germany, and England all were modeled on the Burgundian *basse danse*. Not only was the idea of choreographed dancing itself of Burgundian origin, but also the way in which the music was formally composed as only a single line of long notes that was to be expanded in performance into polyphonic form by the musicians themselves. Even the make-up of the usual dance band was copied from the ensemble at the Burgundian court: two shawms and a slide trumpet. There is very little surviving secular polyphony from the other European countries, owing to a combination of factors that include the ravages of time and war, and a preference for the improvisatory style. Whatever the reason, we do not have a significant body of secular polyphony representing England, Germany, or Spain until the very end of the fifteenth century.

**FRANCE AND THE CHANSON.** The French secular forms of the late Middle Ages were based on earlier dance music, all of which was built on a verse-refrain structure matching the construction of the poetry. The *chanson* (meaning “song”) repertory consisted of hundreds of

compositions in the forms well established from the time of the troubadours: *rondeau*, *ballade*, and *virelai*. By the time they became polyphonic, however, around the year 1300, it is doubtful that they still had a practical dance association; their structure and the subtle nature of their rhythmic flow would make them difficult to dance. All of the forms were in two melodic sections, differing from one another only in the way in which the repeat scheme works and whether or not the music for the refrain was also used for part of the verse. The existence of a refrain in each of them suggests a performance in which a soloist sings the verse and everyone else (the chorus) sings the refrain. Undoubtedly this was the performance practice in the earlier Middle Ages, but the later, more complex, polyphonic songs probably were completely sung by soloists. There is a special repertory of *chanson* from around the year 1400 that is full of notational complexities that make them extremely difficult to read and transcribe into modern notation. They are often referred to as *Ars subtilior* (the subtler art), and when performed have a slightly “jazzy” sound because of their rhythms.

**FRENCH FORMS.** The *rondeau* (round dance) is the most complex form because the standard two sections of music are both used as the performer sings first the refrain, then the verse, and then again the refrain. This is further complicated by the insertion of a half refrain in the middle of the verse, as opposed to all other forms, where the refrain is always sung in its entirety, either at the beginning or the end of the verse. (For an example of a monophonic *rondeau* see Dance Chapter, “Vocis Tripudio.”) A different complexity occurs in the *ballade* (which simply means “dance,” as in the modern English word *ball*). Although the music of a *ballade* is again in two sections, the relationship between the verse and refrain is unbalanced because the refrain is usually quite short and therefore occupies only a part of the second section of music. The third type, the *virelai* (twist) is more similar to the *rondeau*. In this case, the refrain both begins and ends the musical setting, although it is not inserted in the middle of the verse as is the *rondeau* refrain.

**BIRD-SONG.** The texts of all of the *chansons* were usually the same idealized love topics found in the courtly love poems from the time of the troubadours and trouvères, although by the fourteenth century the language was not quite so stylized. There is one unusual type of text occasionally employed in the *virelai*, in which birds and their calls are included in the words and the music in order to symbolize particular sentiments. The bird symbolism included the following: the eagle, suggesting power or royalty; the lark, indicating mourn-

A love song written in the shape of a heart. Baude Cordier, Polyphonic *chanson*, Chantilly, France, Musée Condé MS 1047, folio 11v., 15th century. GIRAUDON/ART RESOURCE NY.

ing or warning; the crow, a sign of craftiness or mockery; the cuckoo, referring to cuckoldry; the falcon, suggesting power and danger; the peacock, a sign of beauty and vanity; the nightingale, symbolizing night and erotic love; and the turtle dove, indicating fidelity. In some of the polyphonic bird-song *virelais*, the singer professes one message in words while the bird sounds in the accompanying parts suggest something completely different.

**POLYPHONIC MUSIC IN ITALY.** There is very little surviving secular polyphonic music from Italy until the mid-fourteenth century, owing to the prominence of improvisation. When we do find some written music, it is quite different from the French style in that the melodies are far more rhapsodic, often organized as elaborations of the notes in the scale in contrast to the French style of short rhythmic-melodic motifs with clear phrase shapes. The early Italian compositions appear to be rather close images of what must have been the free improvisatory style. The largest collection of Italian music from the fourteenth and early fifteenth centuries is contained in a beautifully illuminated manuscript that once belonged to Antonio Squarcialupi (1416–1480),

## STRUCTURE of Medieval Song Forms

Nearly all secular songs in the Middle Ages were composed of two musical sections, but, unlike many modern songs where there is generally one melody for the “verses” (units made of a number of lines, each of which is sung only once) and another for the “refrain” (a line or group of lines that is repeated at regular intervals), the two sections of music in medieval songs were matched in a number of different ways with lines of text. In fact, the main difference between medieval song forms is that they differ in the way in which the lines of the verses and the refrains are distributed between the musical sections.

### Modern Song Form

To understand how medieval song form worked, it is useful to look first at a simple modern verse and refrain pattern. In modern songs, including many church hymns and national anthems, verses usually alternate with refrains, either of which may include several musical lines. In some songs the verses may be long and the refrains short, while in others the pattern is reversed. The words of the verses change with each repetition of the verse melody, but the words of the refrain, set to a different melody, remain the same:

Musical Sections	A	B	
Text sections	1. verse	2. refrain	
	3. verse	2. refrain	
	5. verse	2. refrain	
	7. verse	2. refrain	
	etc.		

### Minnesinger Bar Form

In this German form, the singer sings text lines (or groups of lines) one and two to musical phrase A, then sings the third line (or group of lines) to musical phrase B. The first A setting, for example, might contain four lines of text; in this case, then, the second A section would be identical in music and number of text lines, though the words would be different. The B section would introduce another new set of words and music, and might have a different number of lines altogether.

Musical Phrases	A	B
Text lines	1	2
		3

### Cantiga Form

In a cantiga, a Spanish song form, the first section of music (A) acts as a setting for the refrain. Then, after two verses that are each sung to a new musical section (B), the first music (A, originally used for the refrain) reappears as a setting for an additional verse. The entire pattern can be repeated, beginning again with the refrain.

Musical Phrases	A	B
Text lines	1 refrain	2 verse
		3 verse
	4 verse	

### Rondeau Form

In this complex medieval form originating in France, the words of the refrain (which, in this version, is two

Florentine organist, composer, and friend of the powerful Medici family. The Squarcialupi Codex (Florence, Biblioteca Medicea-Laurenziana, MS Palatino 87) contains 354 compositions by twelve of the most important Italian composers of the late Middle Ages, preceding the collection of each composer’s works with a portrait. Most compositions are for two or three voices, and all are on secular subjects, written in three of the most important Italian musical/poetic forms: madrigal, ballata, and caccia. Composers represented in the manuscript are known to have worked in important north Italian courts such as Milan, Ferrara, Venice, and Florence.

**MADRIGAL.** Although the madrigal is one of the dominant musical/poetic forms in late medieval Italy, its origins and even the meaning of the word itself are

unclear. (The medieval madrigal should not be confused with the late Renaissance form.) Several theories have, however, been put forward. Its verse-refrain format suggests a possible relationship with dance forms, although what that might be is not certain. In any case its subject matter is usually a pastoral love theme, although there are some with strong political references. A typical madrigal format is in two musical sections—one for the verse and one for the refrain (ritornello).

**BALLATA.** The name *ballata*, from *ballare* (to dance), makes the original purpose of this form quite clear. In fact, one of the most striking images of the ballata in fourteenth-century Italian society can be found in Giovanni Boccaccio’s *Decameron*, a collection of 100 fictional tales told by ten young people assembled in a

lines in length) and verses (one line each) go back and forth between the two sections of music with three repetitions of the first tune in the middle of the song, so that the order is as follows: Music A (refrain line one), Music B (refrain line two), Music A (first verse), Music A (refrain line one), Music A (second verse), Music B (third verse), Music A (refrain line one), Music B (refrain line two):

Musical Sections	A	B	
Poetic lines	1. refrain	2. refrain	
	3. verse		
	1. refrain		
	5. verse	6. verse	
	1. refrain	2. refrain	

**Ballade Form**

Verses in the French ballade generally ranged from 4 to 6 lines in length; the refrain was shorter, so as to combine with a half-verse on the second singing of musical section B.

Musical Sections	A	B	
Poetic lines	1. verse		
	2. verse		
		3. verse	
		4. half-verse and refrain	

**Virelai Form**

In the virelai, another French form, the refrain, sung only to melody A, is sung at the beginning of the song and then again following the three verses of each stanza.

The first two verses are sung to the second melody (B), and the third verse uses the melody of the refrain (A).

Musical Sections	A	B	
Poetic lines	1. refrain		
			2. verse
			3. verse
			4. verse
			1. refrain

**Madrigal Form**

The format of a madrigal, an Italian form, is fairly simple: the two verses, which are similar in length, are sung to the A melody, and the ritornello, which usually has fewer lines of text, has its own melody (B).

Musical Sections	A	B	
Poetic lines	1. verse		
	2. verse		
			3. ritornello

**Ballata Form**

The Italian ballata form is exactly the same as the French virelai.

Musical Sections	A	B	
Poetic lines	1. refrain		
			2. verse
			3. verse
			4. verse
			5. refrain (same text as 1)

country home to avoid the plague. In the story, each of the refugees is called upon every evening after dinner to improvise a ballata while the others dance. The ballata is in the verse-refrain form with two musical sections and the subject matter is always love.

**CACCIA.** The *caccia* (hunt) is usually written as a single melodic line that becomes polyphonic when a second voice enters after the first, singing the same music (see “Complexities” above). A few of these compositions have a textless accompanying part, but the form in all of them is a single verse without a refrain. The texts, although superficially about hunting, fishing, market scenes, and fires, usually carry a double meaning that is revealed only when the words of one phrase are interspersed among those of another during performance.

**FRANCESCO LANDINI.** Because the Squarcialupi Codex is retrospective, it includes compositions in the older Italian style with long, flowing, elaborate passages, as well as those composed later in the century by Francesco Landini. These are written with shorter, less elaborate phrases, demonstrating the strong influence of the French style. By the mid-fifteenth century, French culture had made such strong inroads into Italy that Italian courts began to import northern composers, performers, and repertory in preference to employing native musicians. Italian performers and composers continued to be hired in Italian courts throughout the fifteenth century, but the most prestigious positions were given to the northerners. It is worth noting that the motets commissioned for some of the most significant people

Page from Squarcialupi Codex, 1320. THE GRANGER COLLECTION, NEW YORK.

and events in Italy were written by northerners, as, for example, by Johannes Ciconia for Michele Steno, Doge of Venice, in 1406; by Bertrand Feragut for Francesco Malpiero, Bishop of Vicenza, in 1433; and by Guillaume Dufay for the consecration of the Cathedral of Florence in 1436 (see below).

## DUFAY AND THE LATE MEDIEVAL CEREMONIAL MOTET

**MUSIC FOR SPECIAL OCCASIONS.** In addition to its role as the leading format for new and creative experiments, in the fourteenth century the motet expanded its prominence as the composition of choice for the most important occasions. From its origin it was written with a particular function in mind; the form had the flexibility of being appropriate in both sacred and secular settings, and, as the accepted vehicle for the most avant-garde experiments as well as the most sophisticated technical devices, it was suitably elegant to commemorate even the most special affair. From the mid-fourteenth century, a dedicatory or ceremonial motet was the logical form to be adopted by composers who were called upon to set texts celebrating events such as coronations of kings, weddings of nobles, elevation of cardinals, or other such monumental occasions, both sacred and secular.

**NUPER ROSARUM FLORES.** One such special occasion that called for a ceremonial motet was the dedication of one of the finest cathedrals in Italy. Guillaume Dufay's motet *Nuper rosarum flores* (Recently Roses Blossomed), written for the consecration of Santa Maria del Fiore, the cathedral in Florence, deservedly has become one of the most celebrated compositions of the late Middle Ages. It is a musical masterpiece and exhibits the kinds of sophisticated techniques that were employed by composers to mark such important ceremonies. New construction for the Cathedral of Florence was begun around the year 1300 as an expansion of the older and much smaller Church of Santa Reparata. Construction continued throughout the fourteenth century but could not be completed until the architect Filippo Brunelleschi was able to work out a design for the enormous dome. When this work was finally done, Pope Eugenius IV presided over the consecration of the cathedral on 25 March 1436, with Dufay, Brunelleschi, and numerous other dignitaries in attendance. Dufay's motet to honor the occasion is an excellent example of the kind of sophistication that was built into both the text and music in these symbolic works.

**TEXT AND MELODY.** The tenor of *Nuper rosarum* is appropriately chosen from the antiphon for the consecration of a church, *Terribilis est locus iste*—"Redoubtable is this place," referring to the unholiness of the edifice prior to its consecration to God. The text of the upper two voice parts is a Latin poem in four stanzas that was

written specifically for the occasion; it refers to the dedication of the cathedral and the city of Florence, mentions Pope Eugenius as the successor of Jesus Christ and Saint Peter, and makes allusions to the Temple of Jerusalem erected by King Solomon. The musical construction is for four voices in four sections that do not coincide with the text stanzas; each section moves at a different pace. The two upper voice parts—the only parts with text—have a continuous flow of melody without repetition. They trace separate rhythmic patterns and do not sing the same words at the same time except for the name of the pope, “Eugenius,” which is also set off from the surrounding material by sustained notes. The lower two parts are in strict isorhythm, having a single melody that is repeated for each of the four sections. These two parts—called “tenor I” and “tenor II”—have the same melody, but are performed at different pitches and do not begin or end at the same time. They are written out only once with the four different tempos indicated by mensural signs (see *canons* above).

**SYMBOLIC RATIOS.** The construction of the motet and its text also incorporates some complex symbolism involving references to the Temple of Solomon that are present in the text and represented in the proportions and ratios of the musical construction; Dufay’s tempos for the four sections of the motet are in the ratio 6:4:2:3, which match the dimensions of Solomon’s Temple, given in the Bible (I Kings 6:1–20) as 60 x 40 x 20 x 30. *Nuper rosarum flores* is a classic assembly of medieval motet techniques, incorporating the complex musical features as well as the sophisticated textual and symbolic ingredients that mark this form throughout the late Middle Ages.

### GUILLAUME DE MACHAUT’S MESSE DE NOSTRE DAME

**A UNIFIED MASS.** Sometime before 1365 the French poet and cleric Guillaume de Machaut composed a new work including the five sections of the Mass Ordinary—

Two composers Guillaume Dufay and Gilles Binchois. Martin Le Franc, *Le Champion des dames*, Paris, Bibliothèque nationale MS fr. 12476, 1451. THE ART ARCHIVE.

Kyrie, Gloria, Credo, Sanctus, Agnus—plus the dismissal, the *Ite Missa Est* (“Go, the Mass is done”). As a point of unification, the composer selected relevant chants for each section as the borrowed tenor of each movement (that is, a Kyrie chant for his Kyrie, and so on). Each of these came from chants that were assigned for feasts in honor of the Blessed Virgin. In doing this he created the earliest unified set of Mass Ordinary movements. What is unusual about this concept, in addition to the fact that there is no similar model on the level of the chant practices, is that in the celebration of the Mass, with the exception of the Kyrie and Gloria, the items of the Ordinary are separated from one another by a number of different prayers and chants, that is, they are not performed one after the other as in a modern-day concert performance, and therefore to think of these Mass items on the level of an artistic whole is to impose an abstract artistic idea on something that had never been considered from that point of view. The original intention for creating this rather unusual assembly of polyphonic movements was for use at the special mass

in honor of the Virgin Mary (the *Messe de Notre Dame* or “Mass of Our Lady”), which since 1341 had been celebrated on Saturdays in one of the chapels in Reims Cathedral, where Machaut was a canon (a member of the clergy on the permanent staff). Later, however, in conformity with the wills of both Guillaume and his brother Jean (who also was a canon at the cathedral), the mass was transformed into a memorial service for the two of them following their deaths (Jean in 1372, Guillaume in 1377).

**STYLE, FUNCTION, AND FORM.** The individual movements of the Mass of Notre Dame employ two distinctly separate structural models and styles, dictated at least in part by the function and form of the movement itself. For the four movements with relatively small amounts of text—Kyrie, Sanctus, Agnus Dei, and *Ite Missa Est*—Machaut chose the style he used in his elaborate motets: the upper lines proceed with more or less independent rhythmic motion and long rhapsodic (that is, somewhat irregular and richly decorative) melodic sections over a tenor set in isorhythm (see above, “Complexities”). Unlike his motets, however, there is only a single text in each movement, which is sung by all four voices. The texts of both Gloria and Credo are quite lengthy, and therefore Machaut set these movements in a style reminiscent of the earlier discant style (see above, “Notre Dame Organum”) having short phrases, similar rhythmic motion in all parts, and a low ratio of notes per syllable of text, both ending with long, rhapsodic sections for the final word, “Amen.” An additional feature of the Mass of Notre Dame was that it was for four voices rather than the more common three; Machaut added a voice called *contratenor* (meaning “against the tenor”) that moved in the same low range as the tenor part, sometimes replacing it as the lowest voice.

**INNOVATION AND INFLUENCE.** Machaut’s innovations, both the assembling of a complete set of Ordinary movements and the expansion to four-voice texture, became an important influence on sacred musical composition for the next several hundred years. One additional detail also was copied by most composers to follow him; in setting the phrase “Et incarnatus est” (“and He was made flesh”) in the Credo, Machaut abruptly stops the motion in all parts so that each syllable is sustained, and then returns to the previous pace, thus drawing attention to a key Christian belief. Although the techniques and styles have changed over the centuries, the concept that originated in the late Middle Ages of a single composer organizing all of the Ordinary movements of a mass into an artistic whole persists to the present day and includes such universally acclaimed contributions as Johann Sebastian Bach’s Mass in B Minor.

## THE CYCLIC MASS TRADITION: MISSA CAPUT

**SHARED MUSICAL MATERIAL.** The term “cyclic mass” refers to a mass in which all five movements have musical material in common. One of the earliest is the *Missa Caput* in which all movements are composed over the same section of chant—a long, rhapsodic passage on the word *caput* (head), the last word in the Holy Thursday chant *Venit ad Petrum*. The anonymous English composer of this work assigns the chant to the tenor part of each of the five movements, and further unifies the movements by beginning each of them with the same small melodic-rhythmic motif.

**THE CONTRATENOR BASSUS.** The Caput Mass also displays another technique that was more and more becoming the norm in all polyphonic composition: writing the fourth voice part below the tenor rather than above it, creating the *contratenor bassus* (“against the tenor but lower,” later known simply as the bass part). The technical implication of this change is substantial, since it is the lowest voice that governs the harmony. When the tenor voice was the lowest, it was the borrowed material that played a substantial role in determining the harmonic content of the composition. By adding a lower, newly composed voice part, the composer had far more control of the harmonic flow of the composition.

**ABSTRACT RELATIONSHIPS.** The *Missa Caput* probably was written in the 1440s, and it was immediately followed by many more cyclic masses, including two additional masses using the same borrowed tenor. It is interesting to note that while the *Missa Caput* is organized around a tenor melody borrowed from the liturgy, the relationship between the borrowed material and the use to which it is put is far more abstract than when the relationship is direct—that is, when a Kyrie chant is borrowed as the basis for a polyphonic Kyrie, as in the Machaut Mass (see above). The Caput chant, on the other hand, is not from any of the parts of the Ordinary, and therefore it is foreign to each of the sections where it is employed as a controlling and unifying device. Once the model had been set for this kind of abstract relationship, composers felt free to choose their

organizing material from any kind of sacred or even secular source: *Missa Ave maris stella* (“Hail, Star of the Sea”), based on a hymn, took its place next to *Missa L’Homme armé* (“The Armed Man”), on a popular tune, and Guillaume Dufay’s *Missa Se la face ay pale* (“If My Face Is Pale”), on a love song also written by Dufay.

### MISSA SE LA FACE AY PALE

#### SECULAR ELEMENTS IN THE SACRED REPERTORY.

In 1434–35, while Guillaume Dufay was first in the service of the duke of Savoy, he wrote a chanson, *Se la face ay pale*, thought to be in honor of Anne de Lusignan, who was the duchess of Savoy (part of the kingdom of Burgundy). Although his whereabouts prior to 1452 are unknown, it is clear that he lived in Savoy between 1452 and 1458, and among the many compositions he wrote for various occasions was a cyclic mass, the *Missa Se la face ay pale*, based on the tenor of the earlier chanson. One can only guess at what might have been the very special significance the earlier chanson had for the Savoy court.

**PUNNING RHYMES.** The text of the chanson is an unusual ballade because instead of the usual lines of eight or ten syllables, *Se la face ay pale* has only five, in a complicated format known as *équivoquée* (punning rhyme). Unfortunately, the numerous puns (pale/principale, amer/amer/la mer, voir/voir/avoir) in the text do not translate from French to English, but it is possible nonetheless to get an idea of the difficulty of this format from observing the range of meanings that are created from words with almost identical sounds.

Se la face ay pale  
 La cause est amer. [“amer”=love]  
 C’est la principale,  
 Et tant m’est amer [“amer”=bitter]  
 Amer, qu’en la mer [“amer”=to love, “la mer”=the sea]  
 Me voudroye voir. [“voir”=see]  
 Or scet bien de voir [“de voir”=truly]  
 La belle a qui suis  
 Que nul bien avoir [“avoir”=have]  
 Sans elle ne puis.  
 If my face is pale  
 the reason is love.

That is the main cause,  
 and love is so bitter  
 for me that I wish to  
 drown myself in the sea.  
 So she can truly know,  
 the fair one to whom I belong,  
 that I cannot have any joy  
 without her. [two more stanzas]

Dufay’s musical setting of the chanson text is also unusual in that he wrote a continuous single unit of music with short phrases rather than the usual format with two sections and longer melodic phrases.

**FAST AND SLOW.** In writing the *Missa Se la face ay pale*, Dufay borrows only the tenor line, which he places in the tenor voice in all five movements. In the shorter movements (Kyrie, Sanctus, and Agnus Dei), the chanson melody closely resembles the tenor part of earlier motets, moving at a much slower pace than the other three voices, thereby calling attention to itself. In both the Gloria and Credo, Dufay extends this idea by employing yet another motet-like technique: he repeats the chanson melody in the tenor at three speeds, beginning it three times slower than the other parts, then twice as slow, and finally at the same speed as the other voices. Borrowing a technique employed in the *Missa Caput*, Dufay further unites the movements of his mass by beginning each of the five movements with the same opening melodic-rhythmic motif.

### THE MECHANICS OF MUSIC: SCALES AND TREATISES

**THE MEDIEVAL SCALES.** The medieval musical scales were called modes, which were described by their ranges, the location of the half-steps, the important pitches used at the beginning and end of the composition, and the “reciting tone”—the pitch used for recitation in psalms (see Plainchant, Psalms). During the Middle Ages there were eight modes, grouped into four pairs (this was enlarged to six pairs in the sixteenth century, and reduced to two—the major and minor scales presently in use—in the eighteenth century). Each mode was known by its number and by a Greek name. The names chosen were those of ancient Greek tribes that

*a PRIMARY SOURCE document*

**AN EXAMPLE OF MUSICAL BORROWING**

**INTRODUCTION:** The love song “Se la face ay pale” (“If my face is pale ...”) was originally written by Guillaume Dufay for

the Savoy court in 1434–1435. Later he used the tenor line of the same song as the basis for an entire mass. The examples below show the opening section of the love song or *chanson*, followed by an excerpt from *Gloria* where the tenor line of the mass (third line down) is borrowed from the tenor line of the chanson (the line on the bottom).

were believed to have exemplified the emotional character of that mode. Although the system of modes was originally invented to describe and control monophonic music, it was also applied to the polyphonic repertory. In both techniques, modal considerations dictated many decisions concerning choices of notes and harmonies to be put in important structural places in the compositions. The importance of understanding the modes to a

medieval composer and performer can be seen in that a detailed discussion of modes constituted a major portion of most theory treatises of the period.

**THEORETICAL TREATISES.** Much of our understanding of the thinking of medieval musicians, especially composers, comes from the theoretical treatises, books of instruction that provide details about the practice of writing music. The treatises are by and large ret-

respective in that they usually report or explain current practice, rather than propose anything new. The theorists, many of them university professors and/or monks, observed the changes taking place as practices evolved over the centuries and attempted to explain them (or in some cases, condemn the changes). By looking at what issues absorbed their attention, we can follow the revisions in technique that underlay the various compositional practices.

**PRACTICAL VERSUS INTELLECTUAL THEORY.** When people in the Middle Ages discussed music in learned writings, they made a clear separation between the intellectual consideration of the art and the practical, with the practical (that is, music itself) left mostly to practitioners, and usually thought to be unworthy of intellectual discussion. Throughout the period, music was included as one of the seven liberal arts, placed in the *quadrivium* (four ways) alongside the mathematical arts of arithmetic, geometry, and astronomy, rather than in the *trivium* (three ways) with the verbal arts of grammar, rhetoric, and logic. Its placement indicates the way in which music was addressed: number, ratio, and proportion were actually what was considered under the subject-heading, based on the study of vibrating bodies (for

example, by dividing a vibrating string in the middle, it would vibrate at twice the speed, the ratio of 2:1). Later, these ratios influenced the consideration of perfect and imperfect intervals. Another, more philosophical or theological consideration of music was to divide it into three areas: *musica mundana*, *musica humana*, and *musica instrumentalis*. *Musica mundana* (music of the Spheres) referred to the harmony caused by the motion of heavenly bodies. *Musica humana* (music of humans) was the harmony within the human body, having to do with the balance of physical elements. *Musica instrumentalis* (instrumental music) referred to actual sounds, either sung or made by instruments. This division of music was discussed to some extent in most medieval treatises, ending in the late thirteenth century, when *mundana* and *humana* were finally dropped from the discussion following their rejection by Johannes Grocheio in his *De musica* (c. 1300), one of the earliest treatises to concentrate on the practical detail of music and the first to consider secular music, including dance.

**HARMONY AND INTERVALS.** Practical theorists during the Carolingian era (eighth to tenth centuries) were frequently concerned with the modes (see next page), attempting to regularize the practice and to explain

# MEDIEVAL Modes

The medieval method of describing a melody was to classify it according to the scale used—its distribution of

steps and half steps, its final, and its reciting tone. None of the medieval modes corresponds exactly to any of the major and minor scales used today. The sequence of steps and half-steps that differentiate the modes can be most easily described by relating them to the white notes of the piano keyboard.

**Modes: Medieval vs. Modern**

□ = the reciting tone  
 ○ = the most important note of the mode, known as its 'final,' since a composition in this mode ends on this pitch

MEDIEVAL MODES		MODERN SCALES

certain chants that did not exactly fit the system. By the late ninth century, treatises begin to discuss polyphony—explaining the way in which different notes can be sounded together in harmony, classifying intervals (the distance between the pitch of two notes) as more or less harmonious according to the mathematical ratios of their vibration speeds. Those intervals whose ratios could be expressed in simple numbers were referred to as “perfect” (octave [a distance of eight notes on the diatonic scale, as in C to C], 2:1; fifth [a distance of five notes, as in C to G], 3:2; and fourth [a distance of four notes, as in C to F] 4:3); all other combinations of notes were considered dissonant to varying degrees. The classifications continued to undergo revisions throughout the remainder of the Middle Ages, with the fourth losing its status as a preferred interval, while the imperfect third became more and more accepted. Throughout the period the treatises explored the ways in which harmonies can be used to shape and control compositions.

**THEORIES OF NOTATION.** Once polyphony was well established in the twelfth century, the next new issue to appear in the treatises was notation, a topic that continues to occupy theorists down to the present day. The earliest notation recognized only three actual values: short, long, and a long that was the value of both the other two notes combined. The system allowed some freedom in the assignment of values to these notes, causing certain situations to be somewhat ambiguous. One of the earliest theorists to tackle the problem of ambiguity was Franco of Cologne, who in 1260 wrote *Ars cantus mensurabilis* (“The Art of Measured Song”), which assigns specific duration to each of the note shapes. The next step along this line was to add new flexibility to the system by subdividing the existing notes, which is the major subject of three different treatises written in Paris at the beginning of the fourteenth century: *Ars nova* (“The New Art”) once credited to Philippe de Vitry, *Ars novae musicae* (“The New Musical Art”) by Johannes de Muris, and *Speculum musicae* (“Musical Reflection”) by Jacques de Liège. The systems they describe are highly sophisticated, allowing accurate notation of minute rhythmic variations and complicated combinations. At the same time as these changes were occurring in French music, Marchettus of Padua was explaining an Italian system that was quite different. In his two treatises from approximately 1320—*Lucidarium in arte musicae planae* (“Explanation of the Art of Unmeasured Music”) and *Pomerium artis musicae mensuratae* (“Orchard-Garden of the Art of Measured Music”)—Marchettus described a system of notation as well as a group of harmonic practices that set Italian notation and harmonies apart from the French. By the mid-fifteenth century, however, the

Italian composers had abandoned their own notation and adopted that of the French. Treatises from the end of the fifteenth century, such as those by Johannes Tinctoris, demonstrate that a single system of notation and harmonic practices was in use throughout Europe.

### SYSTEMS OF NOTATION

**NEUMES.** Before the invention of a system for notating music in the ninth century, music was passed on from one person to the next only by aural transmission—that is, melodies were carried only in the memory, and learned by repeated hearing. A new monk, for example, would spend hours every day for several years learning by rote memory all of the chant melodies for the entire liturgical cycle, taught by the *magister scholarum*—the director of music. The first system of notating music was developed sometime during the Carolingian era after 800 for the purpose of transmitting information about vocal performance, the nuances of a singing style. Although this led eventually to the notation system still in use today, it did not have the same purpose as modern notation, that of presenting the basic information about pitch and duration. The earliest notes, called *neumes*, required the reader to know the melody already—its pitches and its rhythms. The information provided by the neumes indicated performance details such as which sounds to separate and which to join together; when to sing a steady pitch and when to slide the voice. Although its appearance is quite startling to those of us acquainted with modern notes, the notation transmitted its message very clearly by graphically representing what the voice was to do:

a straight line / signified to sing the note with a steady voice.

a curve ∪ indicated which way the voice was to slide.

a jagged line ⇄ directed the singer to move his voice rapidly back and forth from a lower to a higher note.

**THE GUIDONIAN HAND.** The next step in the development of notation came in answer to a desire on the part of the church leaders to speed up the learning of new material as well as to transmit the melodies more accurately. Over the centuries, the tradition of aural transmission had inevitably resulted in errors and variations in some of the melodies, and church officials wanted to

Guidonian Hand. Venice, Italy, 1547. BETTMANN/CORBIS.

standardize the repertory. The result was the placement of the neumes on a graph in which lines and spaces represented the notes of the singing scale. The first such experiment was by a clever monk named Guido, a *magister scholarum* in a Benedictine monastery in Arezzo, a small town in northern Italy. Guido's first invention was to assign the notes of the scale (mode) to the knuckles of his hand, so that by pointing to a particular knuckle he could direct the choir boys to sing a certain pitch. The "Guidonian Hand" caught on very quickly and even after the development of the staff it remained one of the easiest ways to teach chant, staying in use for hundreds of years.

**LINES AND SPACES.** Guido's next invention was to mark two parallel lines on paper, representing the pitches "c" and "f" which provided two exact places where the singer could orient his voice, with the other notes located either above or below these lines, graphically representing their relationship to the two known pitches. It is this

system that evolved over the next several hundred years to the system of five lines and spaces currently in use. The notation of rhythm followed a somewhat different path. Rhythm in the earliest notation was controlled by the syllables of the text: one syllable was one unit of measure. If there was only a single note for a syllable, it received the entire unit of measure; two or more notes for a syllable all shared the single unit of time. Eventually a system was developed in which the shape of the note indicated its value:

- was long.
- was short.
- ◆ was shortest.

The basis of measure in this notation was its linkage to the heartbeat that was represented by the long note. The pace of the long note—its tempo—was declared to be the speed of the heartbeat of a healthy man at rest (approximately 60–80 beats per minute in modern terms). Although this system made it very easy to establish a basic tempo, in order to notate music that proceeded either slower or faster than the heartbeat required a complex set of neumes that were modified by stems, flags,

and colors, and a set of other symbols (mensural signs) that could reassign the heartbeat to a subdivision of the long note. This system was somewhat simplified after the fifteenth century, but remnants of it were still in use well into the time of the German composer J. S. Bach. It was eventually replaced by the modern system that developed after the invention of the metronome in the early nineteenth century.

### ADAM DE LA HALLE

c. 1240–c. 1285

*Performer*

*Poet*

*Composer*

**THE LAST OF THE TROUVÈRES.** Adam de la Halle (c. 1240–c. 1285) is considered to be the last of the trouvères, the poet-musicians of northern France who specialized in writing poems and songs of courtly love. He was born in Arras in northern France (Picardy) and later probably studied in Paris. Also known as “Adam le Bossu” (*bossu*= hunchback), he is known for having written one of the earliest recorded secular dramas in French, a 1,099-line satiric play (apparently intended for performance at a local festival) that ridicules character traits of some of the citizens of Arras. Manuscripts of this work include music since songs were a part of the play, which had little plot but was full of proverbs and puns. Sometime after 1276, Adam entered into the service of Robert II, the count of Artois, and accompanied him to Naples where he wrote a poem about Charles d’Anjou, king of Sicily. He was celebrated as a singer as well as a poet-composer, and may have performed at a royal feast in England. His compositions include works both in the traditional monophonic style of the trouvères and also in the newly emerging polyphonic style. He wrote a number of love songs and a 780-line work closely related to the pastourelle, the famous *Jeu de Robin et de Marion* (Play of Robin and of Marion).

### BERNART DE VENTADORN

1147–1180 or 1217

*Troubadour*

*Poet*

*Composer*

**A TROUBADOUR LOVER.** Bernart de Ventadorn (c. 1147–1180 or 1217) is one of the numerous troubadours whose biographies come to us in *vidas*, stories of the poet/composers’ lives that were included in the manuscripts along with their compositions. The accounts, which are known to be fanciful and are therefore highly suspect, record that Bernart was the son of servants in the castle of Eble II, viscount of Ventadorn (near Limoges). He fell in love with the lady of the castle about whom he wrote a number of songs, and was therefore banished from the castle. He next went to the Norman court of Eleanor of Aquitaine, again falling in love and composing songs in her honor until she left to become the wife of King Henry II of England. One theory is that at this point he stopped composing and joined a monastery. Another account suggests that he became abbot of the Benedictine monastery of Saint-Martin de Tulle and continued composing. Approximately forty of his poems survive, half of them with music.

---

### GUILLAUME DUFAY

1397–1474

*Poet*

*Composer*

**THE SACRED AND THE SECULAR.** Guillaume Dufay (1397–1474) was born near Cambrai in northern France, where he is first recorded as a member of the cathedral choir in 1409. He became a priest and received a degree in canon law from the University of Bologna. Throughout his career he traveled widely, being associated with the court of Burgundy, the Papal Chapel, the duke of Savoy, and the Malatesta family in the Italian towns of Pesaro and Rimini. He was appointed a canon

(a member of clergy on permanent staff) of the Cathedral of Cambrai by Pope Eugenius IV, and he returned there at the end of his life. Dufay's compositions are widely considered to be among the finest creations of his generation. His works include settings of the Ordinary and the Proper of the Mass, Latin motets and hymns, and secular songs in Latin, French, and Italian. His Mass for St. Anthony of Padua may have been written for the dedication of Donatello's great altar in the Church of St. Anthony in Padua in 1450. He was one of the earliest to write cyclic masses based on non-sacred material: his *Missa Se la face ay pale* (1452) is based on a love song he had written earlier. Of the many outstanding compositions by Dufay, two of his motets are especially significant in terms of their commemorations. His *Nuper rosarum flores* was written in 1436 for the consecration of Santa Maria del Fiore, the Florence cathedral, on the completion of the dome by Filippo Brunelleschi. *Lamentatio Sanctae Matris Ecclesiae* was written in 1454 on the occasion of the Banquet of the Feast of the Pheasant in Lille, in which Philip the Good, duke of Burgundy, pledged to recapture Constantinople and reunite the Holy Roman Empire. The borrowed tenor in this motet is from the Lamentations of Jeremiah in Latin, with a French text in the upper voices that glosses (that is, translates and explains) that of the tenor.

### GUIDO OF AREZZO

990–1040

*Monk*

*Music teacher*

*Music theorist*

**INVENTING WAYS OF WRITING MUSIC.** Guido of Arezzo (c. 990–1040), a Benedictine monk living in a monastery in Arezzo (northeastern Italy), devised novel ways of teaching music. In order to teach young monks new chants much more quickly, Guido first invented a set of syllables for names of the steps of the scale: do, re, mi, etc. (the system, known as *solfège*, is still in use). Then he assigned the scale steps to the knuckles of his hand, so that by pointing from one knuckle to the next the boys would know what note to sing, a teaching device that lasted well into the seventeenth century and is known as The Guidonian Hand. His next invention was to write musical notes (neumes) on a graph consisting of two parallel lines with space between them, which would allow the accurate placement of notes to indicate

exact pitches. This was soon expanded to become the present-day staff of five lines and spaces. These inventions so impressed Pope John XIX that he invited Guido to come to Rome to explain them to him. In addition, his book *Micrologus* (Little Discussion) is considered to contain the final formation of the modal scale system, as well as having one of the earliest detailed discussions of music in more than one part (polyphony).

### HILDEGARD OF BINGEN

1098–1179

*Abbess*

*Author*

*Composer*

**THE FIRST FEMALE COMPOSER.** Hildegard of Bingen (1098–1179) is the earliest known female composer, and possibly the most famous woman of her time. She was a member of a noble family near Spanheim in the Rhineland (modern Germany), and was educated at the Benedictine cloister of Disiboden. She was elected abbess in 1136, but in 1147 left Disiboden with eighteen other nuns and founded a convent at Rupertsberg in the Rhine valley near the town of Bingen. She was a prolific writer on subjects as diverse as science, medicine, and saints' lives, and during her own time was revered as a prophet and mystic. Her musical compositions include a number of sequences, antiphons, hymns, and other sacred forms for the feasts of women saints and the Blessed Virgin. She also is the author of the *Ordo Virtutum* (Play of Virtues), the earliest surviving morality play with music.

### FRANCESCO LANDINI

1325–1397

*Organist*

*Composer*

**AN EMINENT ORGANIST AND COMPOSER.** Francesco Landini (1325–1397) was the most renowned Italian composer of the fourteenth century. His father

was a painter and a member of Giotto's circle of artists in Florence. As the result of smallpox in his youth, Francesco was blind, an affliction that kept him from taking up the profession of his father but did not prevent him from pursuing a distinguished career as an organist, organ builder, singer, poet, and composer. He is described as poet, composer, and performer by Giovanni da Prato in his 1389 *Il Paradiso degli Alberti*: "He plays his love verses so sweetly that no one had ever heard such beautiful harmonies, and their hearts almost burst from their bosoms." Landini was buried in the Florentine Church of San Lorenzo, where his tombstone depicts him holding a portative organ, one of the symbols of a revered musician. He is similarly portrayed in a miniature illumination in the Squarcialupi Codex, one of the most important sources of late medieval Italian music. His compositions were all secular and almost all in a single form, the *ballata*, written for two and three voices. In addition to having written excellent musical compositions, Landini was influential in the adoption of the French compositional style by Italians.

### GUILLAUME DE MACHAUT

c. 1300–1377

*Cathedral canon*

*Poet*

*Composer*

**COURT AND CHURCH.** Guillaume de Machaut (c. 1300–1377) was the most famous and influential French composer and poet of the fourteenth century. As his name indicates, Guillaume was born in Machaut, a small town in northern France. He was educated in Rheims, entered the priesthood, and in 1323 was employed as secretary to King John of Bohemia, traveling with him to many parts of Europe. Following John's death in 1346, Guillaume served at some of the most influential courts in France, including those of Charles, king of Navarre; Jean, duke of Berry; and Charles, duke of Normandy (later King Charles V). He eventually retired to the position of canon (a member of the clergy on permanent staff) at Rheims Cathedral.

**MOTETS, DITS, AND POPULAR GENRES.** Machaut contributed significant poetry and musical compositions in nearly every genre of the period including the newest, most advanced forms as well as the most traditional. He

wrote music in both the monophonic and polyphonic styles, with compositions for sacred occasions as well as motets for secular ceremonies and love songs. Much of the subject matter of his secular work is heavily influenced by the *Roman de la Rose* (Romance of the Rose), the long allegorical poem from the thirteenth century by Guillaume de Lorris and Jean de Meun. His largest secular compositions (known as *dits*) are sets of poems and musical compositions that contain idealized characters, issues, and situations from the courtly love tradition. The longest of these, the *Livre dou voir dit* (True Story), thought to be somewhat autobiographical and written in his later years, concerns a love affair between a young girl, Péronne d'Armentières, and an aging poet. Another dit, the *Remede de Fortune*, includes seven musical compositions, each in a different form, probably intended to provide a model of each of the most popular genres of the period.

**AN INNOVATIVE MASS.** Machaut's *Messe de Nostre Dame* (Mass of Our Lady) is outstanding and unusual for a number of reasons: it is in four voice-parts throughout (at a time when three-part writing was far more common); the individual movements are much longer than comparable movements of other composers of the time; and it is the first known composition of the movements of the Mass Ordinary by a single composer intended to be performed intact, an idea that would become popular nearly 100 years later. At the end of his life Guillaume assembled all of his compositions into a set of manuscripts, grouping the compositions by formal type.

### NOTKER BALBULUS

840–912

*Monk*

*Historian*

*Composer*

**THE FIRST MEDIEVAL COMPOSER.** Notker Balbulus (c. 840–912), the earliest known composer, was a monk at the Benedictine Abby of Saint-Gall in Switzerland who wrote history and poetry. Notker (his name Balbulus means "the stutterer") wrote poems and accounts of the lives of a number of saints. His rather idealized history of the life of Charlemagne (*The Deeds of Charles the*

*Great*) is still consulted as an historical document. His most important contribution to music was the *Liber Hymnorum* (Book of Hymns) which contains a set of 33 sequences that he composed. These were some of the first of what became standard additions to the Alleluia chant in the Mass. According to Notker, his models were from an antiphoner (liturgical book containing antiphons and other items) that was brought to Saint-Gall in 860 by a monk fleeing from the monastery of Jumièges (in northwest France), which had been attacked by the Normans. Notker's sequences were sung throughout Europe until the sixteenth century.

### PHILIPPE DE VITRY

1291–1361

*Poet*

*Bishop*

*Royal advisor*

**THE NEW ART.** Philippe de Vitry (1291–1361) was a poet and composer who taught at the University of Paris, held administrative positions at the French royal court as advisor to kings Charles IV, Philip VI, and John II, and in his later years was Bishop of Meaux. He was once credited with authorship of the treatise *Ars Nova* (New Art), which provided new techniques for writing sophisticated rhythms, paving the way for far more complex musical structures that were soon explored in all of the polyphonic forms, especially in motets. Although Philippe probably did not write the treatise, he was highly influential in the development and teaching of its techniques, and it is likely that he invented the isorhythmic motet and contributed to the dominance of the chanson forms in fourteenth-century French secular music. He was highly regarded as a composer, teacher, and poet during the fourteenth and early fifteenth centuries. Only a few of Philippe's compositions have survived, two of which are musical insertions in the poem *Roman de Fauvel* by Gervais de Bus and Chaillou de Pestain.

---

### PIETROBONO DE BURZELLIS

1417–1497

*Musician*

*Poet*

**THE GREAT IMPROVISOR.** Pietrobono de Burzellis (1417–1497) was one of the earliest musicians to be recognized as a performer. His fame rested on his technical virtuosity as a lutenist, his beautiful singing voice, and his skill as an improviser. He was frequently referred to as Pietrobono del Chitarino, a reference to his improvised singing with the lute (a pear-shaped instrument related to the guitar), which was thought to be a modern version of the classical Greek musical practice of singing to the ancient kithera. He was praised by a number of humanist writers including Aurelio Brandolino Lippi, Battista Guarino, Filippo Beroaldo, Paolo Cortese, and Raffaello Maffei, and his image was immortalized on medals, an honor usually reserved for the nobility. He was a native of Ferrara and served at that court throughout the century, entertaining the most important heads of state. By mid-century his fame brought him numerous invitations to other courts; he is known to have visited the courts of Milan, Naples, and Mantua, and in the 1480s he spent time in the service of Beatrice d'Aragona, the queen of Hungary. In an elaborate tribute written in 1459, the poet, humanist, statesman, and dancing master Antonio Cornazano described his performances by comparing him to Apollo and Orpheus, and claiming that "his music rivals the heavenly harmonies, can revive the dead, turn rivers and stones, and even change people into statues." Because his artistic creations were improvised, nothing is preserved.

---

### WALTHER VON DER VOGELWEIDE

c. 1170–c. 1230

*Composer*

*Poet*

**A FAMOUS MINNESINGER.** Walther von der Vogelweide (c. 1170–c. 1230) was one of the most famous of the minnesingers. Most of what is known about him

comes from his own songs where he describes himself as having come from a minor aristocratic family in the area near Vienna. He worked for a number of different dukes, and for three emperors, including Frederick II. Most of his songs are on the usual topics that were popular in all courtly circles—love, politics, and nature—but he also wrote about proper behavior and etiquette. Near the end of his life he composed an elegy in which he looks back over his life, wondering where all the years had vanished and thinking that it was perhaps all a dream. He was immortalized in a manuscript miniature that depicts him as a poet deep in thought.

## DOCUMENTARY SOURCES *in Music*

*Ars Nova* or *The New Art* (1320)—This treatise, once thought to be written by Philippe de Vitry, is one of three important treatises on music (along with *Ars Nova Musicae* by Johannes de Muris, and *Speculum Musicae* by Jacques de Liège) that dealt with new trends in music composition involving refinements in notation.

*The Cantigas de Santa Maria* (c. 1250)—This collection contains more than 400 songs from the court of Alfonso X “el Sabio” (the Wise), king of Castile.

*Carmina Burana* or *Songs of Benediktbeuern* (c. 1290)—This large collection of Latin songs from the south German monastery of Benediktbeuern includes texts on serious religious subjects, love songs, and drinking songs, some of them in German.

Guillaume Dufay, *Nuper rosarum flores* (1436), *Missa Se la face ay pale* (1452)—The works of this composer, which are considered among the finest of his generation, include a motet that was written for the dedication of the cathedral in Florence upon completion of its dome and one of the earliest polyphonic mass settings to employ a secular theme as the central point of organization.

*The Fleury Play Book* (c. 1230)—Manuscript 201 in the Bibliothèque Municipale of Orléans, France, contains the largest known collection of extended liturgical dramas.

Franco of Cologne, *Ars cantus mensurabilis* or *The Art of Measured Song* (c. 1260)—This music treatise assigns specific duration to each of the note shapes, setting the stage for further developments in notation.

Gervais de Bus and Chaillou de Pesstain, *The Roman de Fauvel* (1316)—This long poem includes numerous musical compositions including several motets that reflect the new French notation.

Hucbald, *De harmonica institutione* or *Melodic Instruction* (900)—This music treatise, written by a monk at the Benedictine Monastery of Saint-Amand in Flanders, describes the modal scale system in detail and discusses the concept of polyphony.

Guillaume de Machaut, *Messe de Nostre Dame* (1364)—This work by the most famous and influential French composer and poet of the fourteenth century is one of the first polyphonic settings of six parts of the Mass Ordinary and the first known composition of the movements of the Mass Ordinary by a single composer intended to be performed intact, an idea that would become popular nearly 100 years later.

*Magnus liber organi* (c. 1200)—This collection of polyphonic sacred music for the important feasts of the liturgical year, which contains the compositions of Leonin and Perotin, was compiled in Paris and circulated throughout Europe.

Marchettus of Padua, *Lucidarium in arte musicae planae* or *the Explanation of the Art of Unmeasured Music* (1318), *Pomerium artis musicae mensuratae* or *The Orchard-Garden of the Art of Measured Music* (1320)—These two important treatises deal with Italian notation and harmonic practices.

*Missa Caput* (1440)—This earliest complete set (cycle) of Mass Ordinary movements was composed in England (composer unknown) using the same phrase of chant for the tenor part in each movement.

*Musica enchiriadis* or *Music Handbook* (c. 850)—This widely circulated treatise on music theory by an anonymous author is one of the earliest attempts to notate music. It includes the first written attempt at polyphony (music in more than one part).

Notker Balbulus, *Liber Hymnorum* or *Book of Hymns* (900)—This book of sequences for the Mass is the first to be written by a composer known by name.

- 1273 Thomas Aquinas stops writing the *Summa theologiae*, claiming it was like “straw.”
- 1274 Thomas Aquinas and Bonaventure, proponents of opposing views on the value of Aristotle, die.
- 1277 The Condemnation at Paris by the bishop of 219 mostly philosophical propositions brings to an end the Golden Age of medieval thought.
- 1280 St. Albert the Great, teacher of Thomas Aquinas, dies.
- 1284 Siger of Brabant, the Latin Averroist, dies.
- 1308 John Duns Scotus, the “Subtle Doctor,” dies in Cologne.
- 1328 William of Ockham, the “Venerable Inceptor,” whose critical thinking rocked the scholastic synthesis, flees the papal court at Avignon and places himself under the protection of Emperor Ludwig of Bavaria.
- 1329 Pope John XXII condemns as heretical some of the teachings of Meister Eckhart, who had died two years earlier.
- 1349–1350 The Black Death ravages Europe, hitting hardest in urban areas and decimating the universities. The plague will contribute to the end of medieval philosophy by claiming the lives of several philosophers.
- 1464 Cardinal Nicholas of Cusa, widely considered the last medieval philosopher, dies.

## OVERVIEW of Philosophy

**DEFINING MEDIEVAL PHILOSOPHY.** Philosophy is the discipline that inquires into the first causes and ultimate principles of things; in other words philosophers try to find the answer to the final “why”—why is there being, for example, rather than nothing? Representing the longest period in the long history of philosophy in the Western world, medieval philosophy is distinguished from speculative thought in other periods by more than mere chronology. Philosophers during this period were for the most part theologians who were attempting to integrate what their beliefs told them about God, about themselves, and about the world with what their reason told them.

**FAVORABLE CONDITIONS.** The story of philosophy in the Middle Ages also reveals two commonplace truths. First, the activity of rational inquiry requires a certain degree of economic and social well-being. Hunger and fear of violence render such an activity unimaginable. Hence, between the fall of the Western Roman Empire, or at least the death of the Roman philosopher Boethius in 524 or 525, and the relative peace and prosperity that resulted from the empire established by Charlemagne in the ninth century, there is virtually no written evidence of philosophical activity. Second, whenever the West came into contact with Greek thought in any of its many guises, philosophical activity flourished. There is an oral tradition in philosophy as in other disciplines, but for the most part the transmission of philosophical thought depends on the written word, and the written legacy left by the ancient world when Rome fell to Germanic tribes from the north was meager indeed: a Latin translation of part of Plato’s late and perplexing dialogue, the *Timaeus*, a couple of pieces of Aristotle’s *Logic* with commentaries, and some Seneca and Cicero.

**PROBLEMS SUGGESTED BY FAITH.** By the time philosophy reappeared, the context had changed. During the thousand-year period from approximately 500 to 1500, known by some historians as the Age of Faith, ultimate questions were now being asked by believers, and more specifically, believers in a sacred book, be it the

Bible for Christians, the Torah for Jews, or the Koran for Muslims. This new approach entailed first a change in motivation for philosophizing, which was now the understanding of faith; it also entailed new and hitherto unconsidered problems, problems suggested by the text that was regarded by its adherents as the word of God. Can one, for example, demonstrate rationally the existence of the God of religious faith? How does one understand a Being who is regarded as infinite in all respects, or the problems associated with creation, the coming-into-being out of nothing, which seemed to violate an axiom of ancient Greek philosophy: “out of nothing comes nothing”? What is the meaning of human existence, and do the categories of good and evil necessarily entail the power to choose freely? Is there life after death? Many other issues may be cited.

**RECONCILING FAITH AND REASON.** Though St. Paul was suspicious of, if not hostile towards, pagan philosophy (“Beware the seductions of the philosophers,” he tells the Colossians in one of his letters) and though a number of intellectuals in the early Christian Church were likewise opposed to the enterprise of reconciling faith and reason (“What has Athens to do with Jerusalem?” Tertullian asked rhetorically), it was the vision of the Christian philosopher Augustine that prevailed; as he writes in one of his dialogues: “To those who believed, [Jesus] said, ‘Seek and you shall find’; for what is believed without being known cannot be said to have been found.” With very few exceptions this subordination of reason to faith prevailed throughout the Middle Ages. Philosophy became, in the words of one twelfth-century writer, the *ancilla theologiae* (the serving girl of theology). There remained those who believed that faith alone gave one access to religious truth (known as “fideists” today), and even a few who preferred reason to faith (“rationalists” in modern jargon) and interpreted Scripture figuratively to fit their philosophical conclusions. The paradox, however, is that the best philosophy done during the Middle Ages was done by theologians, within a theological context, and for theological ends.

**THE AGE OF SCHOOLMEN.** There was another change of context that characterized the later Middle Ages, and that change necessitated a change of methodology. It was the age of the schoolmen—modern-day college professors—and for the first time in the history of philosophy they were producing textbooks as the favored mode of philosophical expression. As with most beginnings, the Age of the Schoolmen began modestly enough: the newly crowned Emperor Charlemagne (or Charles the Great) decreed that there should be a school attached to every cathedral in his realm. Three centuries

later, some of these schools, the one at Paris preeminently, began to evolve into what we know as universities, in large part because new organizational structures were needed to accommodate the thousands of students now flocking to cities like Paris.

**THE RECOVERY OF ARISTOTLE.** In the thirteenth century conditions conspired to create a Golden Age, one that has been compared with the Athens of Socrates, Plato, and Aristotle in the richness and breadth of its philosophical productivity. Through contacts with the Arabic world, not all of them friendly, Europeans gradually became aware of the wealth of Greek, Arabic, and Jewish philosophy and science of which they had heard only rumors, foremost among which was the complete corpus of Aristotle's writings. Once the translations were underway, the European mind was never to be the same again. It is an exaggeration to claim that the story of philosophy in the thirteenth century is the story of the Christian reaction to the natural philosophy of Aristotle, but it is not much of an exaggeration. The reintroduction of Aristotle to Western thought, moreover, came at precisely the same time that the universities were being shaped. When designing a curriculum, the first thing one has to decide on is a textbook; and in discipline after discipline there was a treatise on the very subject by that universal genius, Aristotle. Thus, just by being a university student in the High Middle Ages, one got a thorough indoctrination in Aristotelian philosophy.

**REACTIONS TO ARISTOTLE.** There were three distinct reactions to Aristotle's philosophy, which became the litmus test for the three schools that evolved during this period. There were those who learned Aristotle and used his terminology, but consciously opted for the traditional Christian-Neoplatonic synthesis worked out by St. Augustine. Historians refer to this group as "Augustinians." A second group believed that Aristotle was right on every count and that one could not go beyond Aristotle in matters touching on reason. This group was named after the foremost Muslim commentator on the writings of Aristotle, Ibn Rushd, or Averroës (c. 1126–1198), and thus they were referred to as "Latin Averroists." The third group saw in Aristotle a brilliant philosopher whose work provided a better underpinning for Christian theology than Plato's philosophy. These were the "Thomists," followers of St. Thomas Aquinas (c. 1224–1274). The free and untrammled pursuit of philosophical truth came to an abrupt halt in 1277, when those who saw in Aristotle and his Muslim commentators a threat to Christian truth prevailed. A condemnation of a number of philosophical teachings was issued at Paris and a pared-down version shortly thereafter at Oxford, which changed irrevocably

the course of medieval thought. The move thereafter was away from what was regarded as excessive rationalism and toward the absolute power of God: whatever God can do and it is fitting that He do, He does, whether it makes sense to human reason or not.

**PHILOSOPHY AND THEOLOGY DIVERGE.** The resulting breakdown in the medieval synthesis meant that the disciplines of philosophy and theology began to diverge. The latter, detached from its anchor in reason, moved in the direction of increased fideism, an unquestioning acceptance of the text of Scripture, the logical outcome of which was the Protestant Revolt; figures like Martin Luther railed against what he called punningly "Narristoteles" (fool-istotle). It is no accident that the fourteenth century has been seen as the Golden Age of Mysticism—suggested, for example, in the literary sphere by the mystical journey depicted in Dante Alighieri's *Divine Comedy*. What the mystics were saying, each in his or her unique way, is that God is beyond human understanding, and that the most people can do is empty themselves and wait for God to speak to them individually. Philosophy on the other hand headed off in the direction of increased skepticism and increased triviality, the latter in part because the philosophers were banned institutionally from discussing any doctrine that touched on the faith, such as questions concerning the soul. Skepticism extended to the very questioning of the ability of human reason to know, and the logical conclusion of this direction is Descartes (1596–1650) and his followers, who begin philosophy not with things, but with ideas.

**THE END OF MEDIEVAL PHILOSOPHY.** History intruded again with the bubonic plague, also known as the Black Death (1349–1350), which killed off about a third of the population of Europe, including many philosophers, among whom was possibly the great champion of nominalism, William of Ockham (c. 1290–1349). Etienne Gilson (1884–1978) once remarked that medieval philosophy did not die for want of issues, but for want of philosophers.

## TOPICS in Philosophy

---

### THE FOUNDATIONS: AUGUSTINE AND BOETHIUS

**THE AUGUSTINIAN MODEL.** Although Augustine (354–430) lived during the waning decades of the Roman

## MEDIEVAL Philosophical Terms

**Augustinianism:** The school of philosophy in the thirteenth century that adhered to the teachings of the pre-Aristotelian period, rallying around the name and authority of St. Augustine, and that strongly opposed Aristotelian and Thomistic views.

**Cause/Causality:** Responsibility of one being for some feature in another (the effect), such as its existence, essence, matter, accidents, or changes.

**Contingency:** (a) A state of affairs which may and also may not be; (b) a relation between events such that the second would not happen but for the first.

**Deism:** The view that while God is responsible for the existence of the world, He otherwise has no commerce with it.

**Dialectics:** (a) The science or art of logic; (b) a method of arguing and defending with probability open questions.

**Disputation:** A formal and structured dialogue between master and pupil, proposing questions and replies, difficulties to the teacher's reply and solution of these.

**Emanation:** Flowing forth from a source; the pantheistic view that all things arise necessarily out of the substance of God's being, intellect, etc.

**Essence:** In the broad sense, what a thing is, all its characteristics, as contrasted with its existence.

**Essentialism:** The metaphysical view that identifies being with essence or claims that the act of existing is always identified with the actual essence.

**Existence:** The actuality of an essence; that act by which something is.

**Fideism:** The thesis that religious belief is based on faith and not on either evidence or reasoning.

**Illumination:** In the Augustinian sense, the function of the divine light within a human intellect making truths or intellectual knowledge (as opposed to sense knowledge), especially of immaterial things, possible to the rational creature.

**Immanence:** (a) Presence in and operation within; indwelling: as God is immanent in all things; (b) Pantheistic sense: God's presence in the universe as a real part of it.

**Metaphysics:** The division of philosophy which studies being as such and the universal truths, laws, or principles of all beings; "the science of being as being" (Aristotle).

**Mysticism:** The religious theory that conceives of God as absolutely transcendent, beyond reason and all approaches of mind, placing emphasis on the negative way, that is, on what God is not.

**Neoplatonism:** The philosophical school, founded by Plotinus (205–270), which extended and built the philosophy of Plato into a system, focusing on the emanation of all things from the One (or Good) and their return thereto; a version of this philosophy, made compatible with Christian teachings, was forged by St. Augustine and became the most influential school in the Middle Ages.

**Nominalism:** The theory that universal terms like *horse* or *equality* are merely names, not real essences.

**Pantheism:** The doctrine that the world or nature in the widest sense is identical with God.

**Principle source:** That from which something proceeds.

**Quietism:** The attitude of passivity and receptivity before God, as opposed to activism (that is, the view that the human agent has some role to play in earning God's favor).

**Rationalism:** Any one of the views that attribute excessive importance to the human reason: for example, that all authority in matters of truth is subject to the scrutiny and approval of reason, without any duty of obedience or reverence for religious authority.

**Realism:** (a) The philosophical position that accepts the existence of things prior to and independent of human knowledge; or (b) in relation to the problem of universals, the epistemological view that man's direct universal concepts ordinarily represent natures that are objectively real and in some way fit to be represented as universal by the mind's activity.

**Skepticism:** The philosophical school that doubts or denies the possibility of any certain human knowledge; the skeptic is therefore enjoined to suspend all judgments in the speculative order.

**Transcendence:** Existence apart from and superior to the universe: opposed to immanence.

**Universal:** A term for a typical form that can be affirmed of or is attributed to many in a univocal and distributed sense; one name applied in exactly the same sense to many objects taken singly.

Empire in the West, his influence was crucial in the Middle Ages, for his work as a theologian trying to reconcile belief with reason defined a major problem that would be at the heart of philosophical pursuit for the

next thousand years. It was Augustine, the great bishop of Hippo in North Africa, who established the first successful synthesis between a school of Greek philosophy (namely, Neoplatonism) and the Christian religion. A

genius of the first rank, Augustine agonized over the pursuit of truth, falling prey to several positions that he eventually rejected as false, including skepticism. Finally, when in his thirties, he was lent a copy of the treatises of the Greek philosopher and disciple of Plato, Plotinus (205–270). A new world suddenly opened to him, and within the context of the other-worldly philosophy of Plotinus, the teachings of the Christians, previously rejected as primitive and unsophisticated, now made sense. “Far be it from us to suppose that God abhors in us that by which he has made us superior to the other animals [that is, the reason],” he wrote in one of his letters. Faith alone is not sufficient, as it was for Tertullian (c. 160–220), the greatest of the early Latin Christian theologians. Humans are rational creatures and crave to know, and this natural desire for knowledge cannot be quenched. As articulated by Augustine, this stance became the overriding theme of the medieval enterprise: faith in search of understanding. “Unless you believe,” wrote the prophet Isaiah, whom Augustine frequently quoted, “you shall not understand.” This adage became the motif of the succeeding age, which since the fifteenth century has been labeled the “Middle Ages.”

**BOETHIUS AS TRANSLATOR.** Exactly half a century after the death of Augustine, Anicius Manlius Severinus Boethius, the man sometimes called “The Last of the Romans,” was born in privileged circumstances, but privilege that coexisted with a new political reality. The Roman Empire in the West by the late fifth century had ceased to exist, and the Italian peninsula was ruled by the Ostrogoths. Notwithstanding, Boethius received the best philosophical education available. He studied at either Athens in Greece or Alexandria in Egypt, the latter the site of the greatest library of the ancient world, where among other things he mastered the Greek language. Rightly convinced that Greek was becoming a dead language in Western Europe, he undertook what he hoped would be his lifelong project—the translating of Plato’s and Aristotle’s complete works into Latin—in order to show the ultimate harmony of their thought. Unfortunately for later centuries, Boethius had not made much headway in his project—in fact he had translated only two of Aristotle’s six volumes on logic—when he came under suspicion of treason and was cast into prison under sentence of death. Nonetheless, the translations and commentaries he completed formed much of the basis for logical inquiry—what was called the “old logic”—until the recovery of the remaining works of Aristotle, which occurred in the twelfth and thirteenth centuries.

**THE CONSOLATION OF PHILOSOPHY.** While in prison, awaiting a cruel and, in his view, unjust execu-

Fortune spins her wheel while Boethius looks on. *Consolation of Philosophy*. PARIS, BIBLIOTHÈQUE NATIONALE MS FR. 809, FOLIO 40, C. 1460.

tion for treason, Boethius wrote his most famous and enduring work, a dialogue entitled *The Consolation of Philosophy*. Destined to become a “best seller” in the Middle Ages (a status determined by the number of Latin manuscript copies and vernacular translations), the work deals with the problem of evil in a very existential setting. Boethius asks why he, a good and virtuous man, lost everything—his power, his wealth, contact with his family, and, not least, his good name. He receives consolation in his troubled state from Lady Philosophy, who is a personification of Boethius’s better self. She tells him that happiness does not consist in the goods of fortune (a Stoic message) but rather in the unending possession of the Highest Good, which is God, a goal still within his grasp. The question of whether Boethius was a Christian used to be much debated, since he never made any explicit references to his religion in the *Consolation*. Ever since the discovery and authentication of his tractates on theological topics, however, the question has been laid to rest.

## RATIONALISM IN THE AGE OF CHARLEMAGNE

**THE SCHOOLMASTER ERIUGENA.** In the centuries separating Boethius and the Age of Charlemagne (who built the kingdom of the Franks into an empire in the ninth century) there was little philosophical activity. That was, however, soon to change. One of the most fruitful decrees of the newly crowned emperor was to establish a school at every cathedral in his realm, which extended throughout what is now France, Germany, northern Italy, and parts of the Low Countries. Intended for the education of the clergy, the focus in these schools was on basic grammatical and mathematical skills—in other words, the “three R’s.” The creation of schools, however, meant a need for teachers. It was thus that the Celtic monk from the remote West of Ireland, John Scotus Eriugena, was brought to the court of Charlemagne’s grandson, Charles the Bald. Eriugena was destined to become the greatest Irish philosopher of all time, and in a rare tribute his image until recently adorned the five-pound note issued by the Republic of Ireland.

**TRANSLATING DIONYSIUS.** The Irish monks of this time period, almost alone in the Latin West, had somehow preserved a knowledge of the Greek language. Hence, while serving at the court of Charles the Bald in the middle of the ninth century, Eriugena was asked to

translate from Greek the writings of Dionysius, called the pseudo-Areopagite (fl. c. 500). These writings, four in all, constitute the longest-lived forgery in Western history: they were signed “Dionysius, companion of St. Paul” and thus accorded enormous respect, until finally in the Renaissance they were discovered to have been written at least 400 years later than claimed. Working with primitive Greek-Latin glossaries and no knowledge of Greek paleography (unable, for example, to distinguish between “therefore” and “therefore not”), Eriugena produced a translation that was so flawed that the pope’s librarian complained that he had buried the meaning of Dionysius in a deep cavern where it must await a new translation. Notwithstanding, Eriugena’s translation was the basis for the study of Dionysius for 300 years.

**THE CONCEPT OF DIVISION.** Stimulated by Dionysius’s version of Platonic thought—which was purer than the synthesis achieved by Augustine—Eriugena produced the first *summa* (“summary treatment” of a discipline) in Western philosophy. The work, which he called *Periphyseon* (On the Division of Nature), deals with nature and the ways in which it encompasses the entire universe, both being and non-being. Eriugena divided the summary into four components: that which creates and is not created; that which is created and also creates; that which is created and does not create; and finally that which neither creates nor is created. He treated successively the Creator-God, the primordial causes emanating from Him (Plato’s Forms), the material universe, and God-as-End. He looked at creation as a process of division beginning with God, through the primordial causes to a multiplicity of things, and finally returning to God in a cosmic resolution.

**RECONCILING PLATONISM AND CHRISTIANITY.** Eriugena went further in trusting the powers of his reason than was to be the norm for Christian philosophers, occasionally forcing the biblical text to agree with what his Platonically-schooled reason dictated. One example was the issue of the human body. For Plato, the body was evil. But to a Christian philosopher, the human body was created by God and therefore must be something good. The resolution for Eriugena was that God created humans without bodies, and that the acquisition of bodies as well as sexual differentiation was a result of the Fall. The Genesis text recounting Adam and Eve making loincloths of fig leaves is to be interpreted allegorically, argued Eriugena—that is, that they were making for themselves bodies. Thus, Eriugena remained both a Christian and a Platonist at the same time. In this bold design, Eriugena went further in the direction of Platonism than any other Christian writer, and it is not sur-

prising that long after his death his work was condemned on three counts of heretical teaching early in the thirteenth century.

### ANSELM OF CANTERBURY

**THE BEGINNING OF THE MODERN AGE.** Whether or not the ending of the first millennium aroused the same apocalyptic fears as the year 2000 witnessed, a growing number of modern historians in fact see the year 1000 as marking the beginning of the modern age. The life of St. Anselm (1033–1109), who is commonly called Anselm of Canterbury, in many ways reflects this new era. Born in the Val d'Aosta area of northern Italy, he left home at an early age to seek an education (and to escape a repressive father). Significantly, he headed not south to Mediterranean countries but north to Normandy in the north of France, attracted to the monastery of Bec because of the reputation of its abbot, the learned Lanfranc. In those dark centuries whatever glimmer of culture and learning still existed was being preserved in these monastic centers. Among other activities at the monasteries that followed the Rule of St. Benedict, monks would copy whatever piece of writing came into their hands, not infrequently without being able to read what they were copying. It was in the quiet and seclusion of Bec that Anselm wrote his best philosophical works. Eventually he succeeded Lanfranc as abbot when the latter was made archbishop of Canterbury, following the Norman Conquest in 1066. Called by historians "the second Augustine," Anselm had an almost unbounded confidence in the power of reason. He even went so far as to seek what he called "necessary reasons" for the Incarnation, the central teaching of Christianity.

**PROOF OF GOD'S EXISTENCE.** The work of Anselm that is most familiar to contemporary philosophers, however, is a short treatise entitled *Proslogion*, which means an

#### *a PRIMARY SOURCE document*

#### ANSELM'S ARGUMENT FOR THE EXISTENCE OF GOD

**INTRODUCTION:** Anselm's famous argument for the existence of God in the *Proslogion* (or "Allocation"), which was requested by his monks, demonstrates not only that God exists in reality—not simply in the mind—but also that one cannot even think that God does not exist. How then can one explain the atheist, or "the Fool" in the language of the Psalms? In this passage Anselm attempts to explain how the atheist can think the unthinkable.

How indeed has [the Fool, that is, the atheist] "said in his heart" what he could not think; or how could he not think what he "said in his heart," since to "say in one's heart" and to "think" are the same? But if he really (indeed, since he really) both thought because he "said in his heart" and did not "say in his heart" because he could not think, there is not only one sense in which something is "said in one's heart" or thought. For in one sense a thing is thought when the word signifying it is thought; in another sense when the very object which the thing is is understood. In the first sense, then, God can be thought not to exist, but not at all in the second sense. No one, indeed, understanding what God is can think that God does not exist, even though he may say these words in his heart either without any [objective] signification or with some peculiar signification. For God is that-than-which-nothing-greater-can-be-thought. Whoever really understands this understands clearly that this same being so exists that not even in thought can it not exist. Thus whoever understands that God exists in such a way cannot think of Him as not existing.

**SOURCE:** Anselm of Canterbury, *St. Anselm's Proslogion*. Trans. Maxwell John Charlesworth (Oxford: Clarendon Press, 1965): chapter 4.

address or discourse. It is called this because it is addressed to God, and it asks God's help in proving not only God's existence but also everything else that has been taught about Him. It was a part of Anselm's belief as a Christian that God is something than which a greater cannot be thought. But to be in the mind and in reality is surely greater than to be in the mind alone. Therefore, to deny that God exists, as the atheist does, is to involve oneself in a contradiction: something than which a greater cannot be thought is the same as that than which a greater can be thought.

Anselm of Canterbury surrounded by saints, glazed terra cotta relief, school of Lucia della Robbia. Museo della Collegiata di Sant' Andrea, Empoli, Italy, 15th–16th centuries. SCALA/ART RESOURCE, NY.

**GAUNILON'S RESPONSE.** This philosophical argument, which was to receive more attention in future centuries than any other, already proved provocative in Anselm's own day. A monk by the name of Gaunilon, about whom nothing is known except his monastery (Marmoutier in the south of France), wrote a response, which he entitled *On Behalf of the Fool*. "Fool" is Scriptural language for the atheist, and Gaunilon, though a believer, did not think Anselm had proved anything to the man without faith. First, he did not believe this formula for God ("something than which nothing greater can be thought") was meaningful, and therefore it did not exist in the mind in any real way, that is, in any way different from non-real things. And second, even if it did, one could not conclude from this that God existed in reality, just as one could not conclude that the most perfect island that the mind can conjure must really exist; otherwise, any truly existing island, no matter how humble, would be greater.

**ANSELM'S REPLY.** The long-distance correspondence between Gaunilon and Anselm ended with Anselm's reply to the "fool": of course his way of thinking about God is meaningful to Gaunilon for it is part of his faith as a Christian. But even if his attacker were truly a godless man, Anselm showed how he might construct a meaningful concept of God from his experience

in a contingent world. Everyone has experience of beings that begin and end; is it not clear that beings that begin but never come to an end are greater—even if one has no experience of such beings? And so Anselm concluded that a being that has neither beginning nor end nor duration is greater than any other conceivable being, and therefore close to a being than whom a greater cannot be thought.

**THE ADVANTAGES OF DIALOGUE.** The "dialogue" between Anselm and Gaunilon shows clearly the great advantages to be gained by such exchanges. As Aristotle had said, philosophical dialogue "polishes" the truth. Though he has been called the "Father of Scholasticism," the fact is that Anselm was a monk, which entailed a retreat from the world to be "alone with the Alone," as Plotinus phrased it; hence the etymology of "monk" from *monos*, meaning "alone." A few decades after Anselm's death, the situation was to change dramatically; institutions were evolving that were to create the proper cultural climate for philosophical activity up to the end of the Middle Ages and beyond.

## THE PROBLEM OF UNIVERSALS

**CONCERNING GENUS AND SPECIES.** The question on which Peter Abelard (c. 1079–1142) originally made his name and indeed the question that engaged philosophers at the fledgling school at Paris was the so-called problem of universals (common terms like "animal" or "man"). Sparked by a casual remark by Boethius in one of his commentaries on Aristotle's logic ("concerning genus and species, whether they have real existence or are merely and solely creations of the mind ... on all this I make no pronouncement"), the debate raged for nearly half a century. John of Salisbury (c. 1120–1180), a Paris graduate, visited his *alma mater* twenty years after he had left for England and remarked that the Paris masters in the intervening years had made no progress in resolving the conundrum concerning universals.

**REALISM AND NOMINALISM.** The debate surrounding universals focused on the problem of whether

universals, essential to speech and communication, had any status outside of the mind. For instance, does “dogness” or “horseness” have any reality apart from one’s thinking? The question generated two extreme positions: realism—that the universal exists as such outside the mind, like the Forms of Plato—and nominalism—that the universal is only a word, from the Latin *nomen*, meaning “name.” According to Roscelin, a member of the latter school, the only reality possessed by the universal was the *flatus vocis*—“the breath made by the voice as it pronounced the word.” William of Champeaux (c. 1070–1121), a champion of the former view, believed that there was something that Socrates and Plato, for example, had in common, something by virtue of which each could be called human. When his student Abelard attacked his position, William retreated to a new position: namely, that although Socrates and Plato had nothing in common, each had an element that can be called “indifferently” the same. Abelard again demolished this position as well, and William, thoroughly humiliated, was driven into retirement. Notwithstanding his failure in the battles of academe, William was subsequently consecrated bishop of Châlons-sur-Marne.

**ABELARD’S “CONCEPTUALISM.”** Originally a student of Roscelin’s, Abelard himself moved away from his master’s position and, partly as a result of his debates with William, adopted a view known as conceptualism, which was close to what Aristotle’s would have been had he isolated the problem: that is, that the universal is present within the particular thing, but not as such; it needs to be abstracted by the mind and therefore stands as a mental representation of the nature of the thing, while remaining other than the particular thing itself.

**THE TRIUMPH OF NOMINALISM.** The harsh reality of a nominalist view is that if universals were only words, then no nature would have any reality. In other words, there would be no such thing as human nature or angelic nature or even divine nature; natural law would be left without a foundation. Only individuals exist; universals are simply a convenience of the human mind. While philosophical interest moved away from the problem by the end of the twelfth century, the nominalists reasserted themselves in the fourteenth century, at which point they triumphed over all other positions, and their victory spelled the effective end of the medieval synthesis. Foremost among the champions of this re-emergent nominalism was the Franciscan William of Ockham (c. 1290–1349), the central theme of whose philosophy was the individual thing. Each individual reality was so self-contained that it shared nothing with anything else. It was a philosophy, in other words, of the singular. For the

## THE Tragic Story of Abelard and Heloise

In the century that saw the introduction of the concept of courtly love into Europe, Abelard was the knight errant of dialectics, vanquishing all in his path. Oral arguments, “disputations” they were called, were more a part of the educational scene in the High Middle Ages than they are today. But students then, as today, love a good show, and Abelard obliged, his skills in logical debate destroying reputations and, in one case, driving his vanquished opponent into the seclusion of a monastery for the rest of his life. That is until he met Heloise. Hired to tutor the precocious teenager by her uncle, a canon of the cathedral, the forty-year-old Abelard was soon smitten, and the ensuing affair produced a son, who was given the name Astrolabe, meaning “fallen from the stars.” Though Abelard was canonically free to marry, since he was not at this time a priest, the tradition from Socrates onward was that the philosopher should be celibate, in order to devote himself more completely to his vocation. The ensuing attempt to cover up the disgrace enraged the uncle, who arranged for Abelard’s castration. Though today they are buried in the same grave in the Père Lachaise cemetery in Paris, Abelard and Heloise were separated for the rest of their days, each attached to a monastic center.

In the midst of Abelard’s misfortunes, recounted in a series of letters between the lovers, a member of a new and strict religious order, the Cistercians, and preacher of Crusades, Bernard of Clairvaux, launched an attack on Abelard’s orthodoxy and succeeded at the Council of Sens in having his works condemned. Among other charges, Bernard argued that Abelard was a rationalist, which meant setting the human reason above faith. In a work called *Sic et Non* (*Yes and No*) Abelard had pointed up the number of teachings on which the Fathers of the Church seemed to contradict themselves, but then with an appropriate distinction or bit of linguistic analysis the “contradiction” dissolved. Perhaps Abelard’s most important contribution to moral philosophy was his notion that the internal act called consent was what determined an act as good or evil, not the doing or not doing of the deed. For the rest, as with the fate of many a critical thinker before and since, his direct influence on subsequent thinkers was slight.

Abelard and Heloise debating. *Romance of the Rose*, Chantilly, France, Musée Condé MS 482/665, folio 60v, 15th century. GIRAUDON/ART RESOURCE, NY.

sake of communication and indeed convenience, words need to be used to represent these singular things, but these are no more than fictions (*ficta*), not reducible to the notion of a thing in the world. The word “man” does not adequately represent Socrates or any part of Socrates, but functions like a mental model. Ultimately, however, this fiction theory fell afoul of his “razor”—the principle of philosophical economy—and Ockham abandoned it in favor of a view that can be more adequately termed “conceptualism”: that is, a universal is simply an act of understanding whereby people are aware of things in terms of their more or less generalizable features.

## THE SCHOOLS OF THE TWELFTH CENTURY

**THE SCHOOL AT CHARTRES.** The ascendancy of Paris as the intellectual center not only of France but of all of Europe was by no means inevitable. In the first half of the twelfth century, in fact, Paris’s rival was the school at Chartres, some fifty miles to the south. The cathedral school there enjoyed a succession of first-rate masters, whose focus was the seven liberal arts: arithmetic, geometry, astronomy, music, grammar, rhetoric, and dialectics. These subjects of study assumed visible form, carved in stone over the main portal of the cathedral, dialectics being represented by a portrait of Aristotle. Notwithstanding their interest in Aristotle’s logic—mediated through the translations and commentaries of Boethius—the masters of Chartres were more at home with the philosophy of Plato. They worked mainly from the *Timaeus*, the only one of Plato’s dialogues available to them, and attempted to match up the Platonic myth of cosmogenesis (that is, the generation of the cosmos) with the story of creation in the book of Genesis.

**GILBERT OF POITIERS AND ESSENTIALISM.** Perhaps the most brilliant and creative of the Chartres masters was Gilbert of Poitiers (1076–1154), who repeated and refined the distinction Boethius made between “that which is” and “that by which a thing is what it is.” The individual “Socrates,” in short, is distinct from that which makes Socrates what he is—his humanity. These are the foundational principles of a metaphysical view known as essentialism: to be is to be a certain kind. To the extent that a thing changes, to that extent is it not completely what it is. Hence anything that has the ability to change is in flux and has no true identity at any point in time. It is change, finally, that distinguishes the creature from the Creator, who is completely self-identical and therefore completely changeless.

**JOHN OF SALISBURY AND THE POLICRATICUS.** Also counted by some among the notables of Chartres was the Englishman John of Salisbury (c. 1120–1180). Secretary to Thomas Becket (c. 1118–1170), archbishop of Canterbury, he joined his master in exile following Becket’s dispute with King Henry II (1133–1189). After Becket’s murder John was appointed bishop of Chartres, where he ended his days. The most influential of John’s writ-

ings was the *Policraticus*, whose aim was to demonstrate that secular as well as ecclesiastical courts must be ruled by philosophical wisdom in order to direct that polity to eternal happiness. Though influenced by Plato's political thinking, John expanded Plato's three classes of society into four, adding craftsmen to the ruling, military, and worker classes. The king, representing the King of kings on earth, is responsible for attaining and preserving the common good. The bad king becomes a tyrant, and John invested his subjects with the right, and even the duty, of protecting themselves against such a ruler. Unlike Aristotle's (and later Aquinas's) political philosophy, John's state rested on positive law, not natural law. A law is a law because the king declares it a law and has the power to enforce it. John had his own rather practical solution to the problem of universals: the mind is capable, he says, of contemplating the resemblances between individual things; these things are called by the name of genus or species; they are not, however, realities apart from the things, but merely fuzzy likenesses of them, reflected on the mirror of the mind. Finally, and perhaps most importantly, John's letters as well as his ecclesiastical history provide us with valuable insights into his times. His narrative, for example, of the trial of Gilbert of Poitiers, with whom John had studied and who was tried for heresy in 1148, is the only objective account of that event.

#### HUGH OF SAINT-VICTOR AND THE VICTORINES.

A third school may be mentioned as testimony to the breadth and richness of twelfth-century intellectual currents—namely, the Victorines. Chased out of the schools by the rapier wit of Abelard, William of Champeaux, master of the school of Notre-Dame in Paris and reputed to be the foremost logician of his day, retired to the Augustinian house of canons regular of Saint-Victor on the Left Bank, where he resumed his teaching. There followed a succession of gifted theologians, known collectively as the Victorines, among whom were Hugh of Saint-Victor (1096–1141) and his successor, Richard of Saint-Victor (d. 1173). Dismissed by many historians of philosophy as a mystic, Hugh was, in fact, a rigorous thinker who was nevertheless convinced that the pursuit of truth was inseparable from the pursuit of virtue. “Learn everything you can,” he writes, “you will find in time that nothing is wasted.” This statement set the tone for Hugh's vision of theology: namely, that the knowledge of all the sciences serves as an introduction to what had been styled the queen of the sciences; philosophy was theology's *ancilla*, its “serving girl.” It is this conception that in subsequent generations led to the most intense philosophizing of the Middle Ages—and possibly the most intense philosophizing the world has ever known.

Two of the Seven Liberal Arts, Music and Grammar, with Pythagoras below. Archivolte from right door of Royal Portal, Chartres Cathedral, France, 13th century. FOTO MARBURG/ART RESOURCE, NY.

**THE VICTORINE PROGRAM OF EDUCATION AND ITS AFTERMATH.** Hugh's educational program was laid out in a vast compilation entitled *Didascalicon*, which established in excruciating detail the curriculum to be undertaken by the budding theologian. He divided philosophy into four categories: theoretical, practical, mechanical, and logical. The first, theoretical, was subdivided into theology, physics, and mathematics; practical philosophy was subdivided into solitary, private, and public; mechanical—a Hugonian invention—into cloth-making, armament, trade, agriculture, hunting, medicine, and theater arts; and lastly, logic into grammar and disputation. It was this educational program that linked Hugh to the later Victorines. While it is not clear whether Richard of Saint-Victor was Hugh's personal student or not, he was certainly the latter's doctrinal disciple. Honored by the Italian poet Dante Alighieri (1265–1321) with a place in Paradise in his *Divine Comedy* as one who was “in contemplation more than a man,” Richard was a master of spirituality or mysticism.

In his *Benjamin Major* and *Benjamin Minor* Richard stressed love over knowledge, drawing principally from the tradition of Dionysius the pseudo-Areopagite; God is attained only fleetingly and in a “cloud of darkness,” a metaphor that was to have great currency in the succeeding centuries. It is a movement known as negative theology—the notion that the truest thing that can be said of God is that no one knows what God is.

**PETER LOMBARD AND THE BOOK OF THE SENTENCES.** Although there was no actual twelfth-century “school” associated with the teachings of Peter Lombard (c. 1100–1160), bishop of Paris, his contribution to theology in this period was profound: he was the author of what has been referred to as “one of the least read of the world’s great books.” Called the *Books of the Sentences*, Lombard’s great work not only attempts to reconcile seemingly contrary texts in the manner of Abelard’s *Sic et Non*, it also arranges the opinions (*sententiae* in Latin) of the church fathers, especially Augustine, into a system with a logical order of development. Canvassing as it does the whole of the discipline, it was an obvious choice for a textbook in theology, and from the end of the twelfth century until the sixteenth every candidate for a terminal degree in the sacred science was required to spend at least two years “commenting” on Lombard’s *Sentences*. Literally hundreds of these commentaries survive, most of them still in manuscript form.

## PHILOSOPHY AMONG THE MUSLIMS AND THE JEWS

**THE INFLUENCE OF ARISTOTLE.** While the Latin West was moving toward the triumph of scholasticism,

other important developments were occurring in the territories under Islamic rule. Within a century of the appearance of the Prophet Muhammad, his followers had conquered all of the Middle East, North Africa, and the Iberian Peninsula (consisting of modern Spain and Portugal), which they called al-Andalus. Along with other spoils of conquest, the entire corpus of Aristotle’s writings, minus the *Politics*, had fallen into their hands. Translated into Arabic with the help of Syrian Christians over a period of a century and a half (c. 750–900), Aristotle, virtually unknown at the time to the Latins, was to become, as it were, the “house philosopher” of the Muslim world. Philosophy for Muslim thinkers primarily consisted of comments on the writings of the pagan Aristotle. Sometimes these commentaries concentrated on explaining phrase by phrase the Aristotelian text. Sometimes the commentaries combined a literal explanation with a more expanded development of Aristotle’s teachings. The commentaries could also assume the form of parallel treatments of topics suggested by the Aristotelian text. The prominent Islamic philosopher Averroës, whom Latin-speaking thinkers called simply “Commentator” (The Commentor, as if there were no other) practiced all three kinds.

**ALKINDI AND ALFARABI.** The first important name in the tradition of commentators on Aristotle’s work was Alkindi, who lived most of his years in Persia and in 873 died in Baghdad. In his commentaries on Aristotle’s work on the soul, Alkindi elaborated on the philosopher’s distinction between the passive and active intellect. According to Alkindi the latter was a single superhuman intelligence active for all mankind; it performed the function of abstracting universals from particulars and depositing them in the particular passive intellects, much like a bee sucks nectar from a flower and deposits it in a hive. An equally original thinker was Alfarabi, who lived his entire adult life in Baghdad, dying there in 950. He was, most notably, the first to distinguish between essence (what a thing is) and existence (that by which a thing is real). With this distinction he was able to account in metaphysical terms for the absolute otherness of the Creator and at the same time for the utter contingency of the creature (creatures may possibly exist, but may possibly not exist; they are, in other words, not necessary). Existence, claimed Alfarabi, was merely an accident of the essence; it did not belong to the nature of anything (except God) to exist rather than not to exist. On the other hand, Alfarabi borrowed from Alkindi (and ultimately from the Neoplatonists) the concept of a single active intellect, which provides for all human minds the intelligibilities of things; ultimately God, and not the senses, is the sole adequate cause of our coming to know the truth about things.

Averroës conversing with the third-century philosopher Porphyry, *De Herbis et Plantis*, Paris, Bibliothèque nationale MS lat. 6823, folio 2v, 14th century. GIRAUDON/BRIDGEMAN ART LIBRARY.

**AVICENNA AND THE NECESSARY BEING.** A generation later there appeared on the scene the man who would become the most influential of all Muslim thinkers, the Persian Ibn Sina (980–1037) or Avicenna, as the Latins were to call him. He was a person of great learning; his *Canon* (meaning a “rule” or “measure”) on the theory and practice of medicine, for example, was the single most authoritative work on the subject between the great physician, Galen (c. 129–c. 200), and the Renaissance. Moreover, his interpretation of Aristotle’s thought—more faithful to the text than Alfarabi’s—was destined to reverberate in the Christian as well as in the Muslim tradition. Avicenna, for example, was the first to distinguish necessary from contingent or possible being, thus providing St. Thomas Aquinas with one of his arguments for God’s existence. The things that are encountered in the world exist, but they need not exist; they do not exist necessarily; there is nothing about their natures that demands that they exist rather than not. But if the universe were composed wholly of such beings, it

would have already ceased to exist, given the Aristotelian conviction that the universe has existed eternally. One is therefore compelled to conclude that there is in the universe of beings at least one necessary being, a being which cannot not-exist, a being whom Avicenna called “Allah” or God. Although Avicenna’s system had much to recommend it to Christian thinkers of the High Middle Ages, there were nonetheless elements of his teaching that could not be assimilated to medieval Christian theology, such as the eternal existence of the world and the necessary character of God’s governance. According to Avicenna, the divinity creates out of necessity and rules the universe through the mediation of a hierarchy of intelligences, which are superior orders of angels, and spheres. God knows the sub-lunar world, the world of humans, only in general terms and does not know particulars. This is, of course, implicitly a denial of divine providence and also of free choice of the will, a doctrine firmly established in the Christian tradition by St. Augustine.

*a PRIMARY SOURCE document***MAIMONIDES' "NEGATIVE THEOLOGY"**

**INTRODUCTION:** Moses Maimonides, in his greatest philosophical work, *The Guide for the Perplexed*, addresses himself to what is now referred to as God-talk, that is, the question of how we talk about God. His conclusion is that we are unable to affirm anything positive of God; we are capable only of negations. Even the metaphors employed by the Bible tell us only something of ourselves. This passage is an argument for what is termed "negative theology."

You must bear in mind, that by affirming anything of God, you are removed from Him in two respects; first, whatever you affirm, is only a perfection in relation to us; secondly, He does not possess anything superadded to this essence; His essence includes all His perfections, as we have shown. Since it is a well-known fact that even that knowledge of God which is accessible to man cannot be attained except by negations, and that negations do not convey a true idea of the being to which they refer, all people, both of past and present generations, declared that God cannot be the object of human comprehension, that none but Himself comprehends what He is, and that our knowledge consists in knowing that we are unable truly to comprehend Him. All philosophers say, "He has overpowered us by His grace, and is invisible to us through the intensity of His light," like the sun which cannot be perceived by eyes which are too weak to bear its rays.

**AVERROËS.** The only Muslim philosopher to challenge Avicenna's preeminence was a polymath (one versed in many fields of knowledge) from Córdoba, Spain—then a part of al-Andalus or Western Islam—Ibn Rushd (c. 1126–1198), known to Latin thinkers as Averroës. Trained in medicine and in law, Averroës was not the creative thinker that Avicenna was, but he did have tremendous critical powers and took on the task of commenting on all of Aristotle's works with the purpose of making them more accessible to the Muslims. In this project he was indefatigable, writing over thirty commentaries on the man known simply as the Philosopher,

sometimes as many as three different commentaries on the same work—an epitome or summary, a middle commentary, and a long commentary. Ultimately he fell out of favor with the religious leaders of the country, and by the time of his death in 1198 the Islamic world had begun to de-emphasize the philosophical system-building which had been inspired by Aristotle.

**AVERROËS AND THE "THEORY OF DOUBLE TRUTH."** Averroës himself can be seen as a rationalist, in much the same vein as Scotus Eriugena. There are three classes of people, he claimed in *The Decisive Treatise*: the simple uneducated workers, the moderately educated people, and, finally, the exclusive coterie of philosophers—a division no doubt reflecting Plato's division of society in the *Republic*. For members of the first class, only authoritative and emotional arguments are effective, and these simple and uneducated people have no choice but to interpret the Koran literally. Members of the second group are capable of probable or rhetorical arguments, and these people are called "theologians." Finally, the rare geniuses, the philosophers, are able to follow—and must follow—demonstrations in the strict sense, even though their conclusions may seem to contradict the teachings of the Koran. In such cases of conflict, says Averroës, they are to read the Koran figuratively, so that they agree finally with the findings of their reason. Here can be found the roots of what will later be dubbed the "theory of double truth."

**MOSES MAIMONIDES.** The greatest Jewish thinker of the Middle Ages, arguably the greatest Jewish thinker of all time, was also from Córdoba. His given name was Moses ben Maimon, but was known to the Latins as Maimonides or simply Rabbi Moses. Like the great Muslim thinkers, he was a polymath, and for much of his adult life was court physician to Saladin, the Muslim ruler of Egypt. As leader of the local Jewish community, he was also learned in Jewish law or *Torah* and wrote a voluminous legal codification known as the *Mishnah Torah*. The work, however, for which he is most widely known was written in Arabic and addressed to a young protégé named Joseph, *The Guide for the Perplexed*. There can be no conflict between faith and reason, Maimonides writes to Joseph, and any apparent conflict is the result either of misinterpreting the philosophers or misreading the Scriptures. The latter contain manifold metaphors, which are not to be taken literally; these predicates (words that affirm or deny something about the subject), in fact, tell us nothing about God, but only about God's influence on us. For example, to refer to God metaphorically as a mighty fortress, as the Psalmist

Statue of Moses Maimonides outside synagogue, Córdoba, Spain. 18th–19th century. ©STUART COHEN/THE IMAGE WORKS.

does, is merely to express the comfort and security the believer feels as a result of his faith.

**MAIMONIDES AND THE METAPHYSICS OF EXISTENCE.** On the thorny question of the eternity of the world, Maimonides reasons both that Aristotle’s arguments in favor thereof are not conclusive and that, in any case, his position is not incompatible with God’s creation: it is possible, given divine omnipotence, that God created the world eternally. God can create a world of any duration he wishes. It was an argument that was later to be taken up by St. Thomas Aquinas. Three of Maimonides’s arguments for God’s existence—from change, from efficient causality, and from contingency and necessity—were also to find echoes in Aquinas’s *Summa* of theology. But the most profound influence of the Jewish thinker upon the Christian was in the interpretation of the text in Scripture where God names Himself in response to Moses’s question. Written in four Hebrew letters and thus called the *Tetragrammaton* (meaning simply “four letters”), the name was never uttered, but Maimonides believed it to mean “existence it-

self.” In other words, God’s very nature is to exist whereas in all other things—following Avicenna—existence is merely an accident. This insight would later be at the heart of Aquinas’s metaphysics of existence.

## THE UNIVERSITIES, TEXTBOOKS, AND THE FLOWERING OF SCHOLASTICISM

**THE GOLDEN AGE OF SCHOLASTICISM.** Scholasticism is a term that was borrowed from the Greek word *scholē*, which means “leisure,” and came to mean the activity of a person of leisure or a *scholastikos*, a scholar. By the twelfth century the term “scholastic” had come to signify the system whereby knowledge was imparted in an organized fashion and with a specific methodology. At first, the term was only applied to those schools which taught a certain curriculum of the seven liberal arts, headed by a *scholasticus*, or master scholar. Yet as more specific forms of study began to appear, there was need to expand the term scholasticism to signify any type of formal learning that occurred between a teacher of great knowledge and a student. Hence, as universities came into existence during the course of the twelfth century, many historians have called the rise in the level of education the “Golden Age of Scholasticism” in reference to the great importance placed on organized knowledge during this period.

**THE RISE OF THE UNIVERSITY.** The emergence of the university, a medieval invention, is a complex phenomenon, and it happened slightly differently in different parts of Europe during the course of the twelfth century. There is still considerable debate concerning which was first—Paris, Oxford, Salamanca, and Bologna are all in the running—and the resolution hinges on various criteria. What is essential for a school to be a university? If a written charter is key, for example, then the first university was Paris.

Teacher lecturing to pupils, design by Andrea Pisano for Campanile, Florence, Italy, 1340. THE ART ARCHIVE/DUOMO FLORENCE/DAGLI ORTI.

**THE UNIVERSITY OF PARIS.** In the case of Paris, what started as a cathedral school on an island in the Seine simply outgrew its locale and its structure, owing to the thousands of students from all over Europe, drawn to Paris by charismatic teachers like Peter Abelard. New organizational structures were needed, and out of this need a new institution began to take shape. Nothing quite like it existed before, and in all of its essentials the medieval university was identical with its modern counterpart. These essentials include a group of learned scholars, in different disciplines, all gathered at one place; a fixed course of study, called a *curriculum*, whose original meaning in the Latin of the day was “a path” or “period of time;” and, at the end of the course of study, a degree, which, proclaimed that its bearer was learned. With this degree in hand (the earliest was descriptively called a *licentia ubique docendi*, “a license to teach everywhere”), the graduate could present himself at universities such as Oxford, Bologna, or Salamanca, and if there was a position available, he got the job.

**A LEGAL CORPORATION.** This new kind of institution’s standing before the law was crucial to its existence: universities were legal corporations, associations of teachers and students with collective legal rights, often guaranteed by charter, originally from a pope, emperor, or

king, and later issued by the town or the local prince or the resident prelate. One important aspect of the university’s legal standing was its exemption from the civil law. Membership in a university entailed exemption from military service, from taxation, and from trial in a court of civil law. An advantage of the last was that canon law—under whose jurisdiction fell all clerics—dealt out sentences that were more lenient, and never the death penalty. This system of two laws—one for clerics, including university folk, the other for townsfolk—led inevitably to what were called “town-gown” conflicts. Brawling students causing damage to a local tavern, for example, could not be tried by the local civic authorities; resentments were inevitable, as they are to this day.

**A STUDENT-CENTERED MODEL.** The other model of corporate organization was in force at Bologna in Italy. The university at Bologna was founded for the study of law, itself spurred by the West’s recovery in the late eleventh century of the Roman Law issued by Justinian in the sixth century, later called the *Codex Iuris Civilis*. At Bologna the corporation or guild (*universitas*, in medieval Latin) was composed not of faculty, but of students, who ran a tight ship. Faculty members wishing to leave town for any reason were obliged to seek permission of the students; likewise if they wished to marry. Missing classes subjected the truant teacher to a fine. It was also at Bologna that the first women were licensed as teachers, although initially one of them, at least, was obliged to lecture from behind a screen, lest her beauty prove a distraction to her students.

**THE FOCUS ON TEXTBOOKS.** Courses for either model of university were organized not around a subject, but a text. Since books were expensive and in short supply, masters, scribes, and perhaps even wealthier students rented sections or “pieces” of the books (*peciae*) from “stationers” (so-called from their locations along university streets) to take home and copy, then return to exchange for another. This new book-centered context of learning inevitably left its mark on the way theology and philosophy (and all other disciplines, for that matter) were presented. For the first time in the history of philosophy, philosophers found themselves writing not dialogues or treatises or meditations, but textbooks. A textbook, to be successful, has several requirements: it must be well organized, comprehensive (covering all the essential parts of the discipline), and economically expressed. There was no room or time for fat. The downside was that these works were not especially fun to read.

**THE REBIRTH OF ARISTOTLE.** In one of those rare coincidences of history, universities were taking shape at the same time that the philosophy of Aristotle was reach-

ing the West. The two occurrences are closely related. At the time when curricula were being established and authorities were looking about for textbooks, a freshly translated treatise from the pen of the pagan Aristotle appeared at hand as if bidden by the fates. Universal genius that he was, Aristotle had written on nearly every discipline known in antiquity. It was no surprise that Aristotle was quickly incorporated into the curriculum, making it impossible for a student at one of these universities, notwithstanding his philosophical prejudices, to ignore Aristotle.

## THE REDISCOVERY OF ARISTOTLE

**ARISTOTLE IN THE WEST AND THE EAST.** Owing to vagaries of history, the complete body of Aristotle’s writings was lost to the Latin West. The only bits and pieces available were a couple of treatises on logic, a discipline Aristotle invented, and some commentaries on those works: in particular, the *Categories* and the *On Interpretation* (the texts translated by Boethius, both collectively referred to as the “Old Logic”); the *Topics* of Cicero, and the *Topical Differences* of Boethius, together with the latter’s translation of Porphyry’s *Isagoge* (Introduction to the *Categories*) as well as his commentaries on the *Isagoge*, *Categories*, and *On Interpretation*. This is all that was known—directly and indirectly—of Aristotle’s enormous contribution until the twelfth century. The same was not the case in the Muslim world. As part of the plunder from their conquest of much of the Mediter-

ranean region, the Arabs fell heir to the Aristotelian corpus that had been recorded on scrolls that were in the hands of Nestorian Syrians (a heretical Christian sect). The Muslim conquerors quickly translated these works into Arabic. The pagan Aristotle subsequently became, as it were, the “house philosopher” of Muslim intellectuals, and it is not too much of an exaggeration to say that to philosophize for a Muslim between the ninth and the twelfth centuries was in large measure to comment on the works of the Philosopher (as he was called). The view that was widely held was that one could not go beyond Aristotle in matters of reason.

**RECOVERY THROUGH TRANSLATION.** The Muslim monopoly on Aristotle’s philosophy began to change radically in the twelfth century. Owing to contacts with the Muslim world—some friendly, most hostile—European Christians began the process of recovering the philosophy of Aristotle and translating it into their own language, Latin, sometimes through the intermediary of one of the vernaculars. There were several points of contact: the Middle East, especially the rich capital of Byzantium, Constantinople; Sicily, always a melting pot of cultures; and finally, and most especially, Andalusia (Spain). In the Spanish city of Toledo, for example, re-conquered from the Moors (as Muslims in Spain were called), Christian monks worked with Jewish rabbis to translate the Arabic text first into Spanish, and then into Latin—all without the benefit of dictionaries. Thus it was that many Arabic words entered the West and eventually the English language: words like *alcohol*, *algebra*, *coffee*, *zenith*, plus a word which did not exist in the Roman system of numbering, *zero*, essential for mathematical place-notation and hence for mathematics.

**PHILOSOPHICAL DIVISIONS.** It is difficult to exaggerate the impact Aristotle’s writings had on Western Europe. Here was a new and radically different view of nature, of the cosmos, and of the human person, a view that challenged long-held Christian philosophical understandings adapted from Neoplatonism. The reaction of Christian thinkers to this challenge is essentially the story of philosophy in the thirteenth century. For the first time in Christian history there arose different schools of philosophy, the litmus test being how one reacted to the natural philosophy of Aristotle. Those who thought that Aristotle was right on every count were called “Averroists”—or, better, “Latin Averroists” to distinguish them from their counterparts in the Muslim world. Those who preferred the tried and true synthesis of St. Augustine and rejected the innovations of the pagan Aristotle were known to historians as “Augustinians.” A third group that attempted to mediate between

these two radical positions were known as “orthodox Aristotelians” or “Thomists,” a name derived from St. Thomas Aquinas, who was responsible for building a masterful synthesis of Christian teachings and Aristotelian philosophy.

**ACCESS TO GREEK ORIGINALS.** By the middle of the thirteenth century the earliest translations of this Aristotelian material from the Arabic gave way to new translations from the Greek originals, which had been recovered in the meantime. Added to the list was the Greek version of Aristotle’s *Politics*, a work that the Arabs never possessed. It was to these new and improved translations that thinkers like Albert the Great and Thomas Aquinas had access, and one would have to have worked with the earlier Arabic-Latin versions to appreciate the improvement.

## OXFORD PHILOSOPHY

**OXFORD AND THE EMPIRICAL APPROACH.** While the University of Paris was earning its reputation as the premier school in the West for the study of theology—the *Parvens scientiarum* (“The Mother of all Knowledge”) as Pope Gregory IX (c. 1145–1241) put it—the University at Oxford in England was developing its own tradition and making its own unique contribution. Many Englishmen had been active in the translation process in

Astrolabe, yellow copper, Islamic, 14th century. THE ART ARCHIVE/NATIONAL MUSEUM, DAMASCUS, SYRIA/DAGLI ORTI.

Spain and returned to England with word of new concepts and instruments of which no one in Britain had heard. One example was the astrolabe, used to observe the position of celestial bodies. In response to the interest in these new ideas, the young university at Oxford adopted a decidedly empirical approach to knowledge, even to theological knowledge.

**ROBERT GROSSETESTE AND NATURAL PHILOSOPHY.** The person most responsible for harnessing and giving direction to these tendencies was the humbly born Robert Grosseteste (c. 1175–1253), “Robert of the large head” in Norman French. A master of arts as early as the last decades of the twelfth century, Grosseteste contributed a number of scientific treatises, displaying wide and original thinking. Perhaps the most important among these was a treatise entitled *De luce* (“On Light”), which was the only treatise on cosmogony (an account of the generation of the universe) between Plato and the Renaissance. In what one modern author has compared to a “big bang” theory, Grosseteste observed that a point of light immediately diffuses itself in all directions, in a spherical shape. Recalling that the Genesis story begins with God’s creation of light, Grosseteste found in its

properties a natural explanation for physical reality, which therefore could be explained mathematically.

**GROSSETESTE AS THEOLOGIAN AND BISHOP.** Well into his fifties, Grosseteste changed careers and became a theologian, accepting a post as the first lecturer to the Franciscans at Oxford, although he never joined the order. As theologian, Grosseteste insisted on the centrality of Scripture as opposed to the more speculative theology practiced by commentators on the *Sentences* at Paris. He also insisted on the importance of mastering the languages of the sacred text and showed the way by learning Greek himself. A third career ensued, that of the powerful bishopric of Lincoln, in whose diocese and jurisdiction lay the university at Oxford. Though Grosseteste took his pastoral duties seriously, he was ever aware of developments at his old university. At one point he wrote a letter to the Oxford masters enjoining them to keep the earliest and preferred lecturing times (the 6 A.M. shift) for Scripture, not the *Sentences*. The master guilty of the contrary practice was a young Dominican by the name of Richard Fishacre, and it took a letter from the pope himself in defense of the practice and of Fishacre's role before Grosseteste would desist.

**SCIENCE AS A TOOL FOR UNDERSTANDING.** The notion of employing natural philosophy—what moderns would simply call “science”—as a tool for the understanding of the sacred text, however, remained the permanent legacy of the man known as “Lincolniensis” (Grosseteste's sobriquet). A member of his “school,” Richard Fishacre, in the prologue to his *Commentary on the Sentences*—the first composed at Oxford—borrows the story of Abraham, Sarah, and Hagar to illustrate the relationship between the disciplines. According to Fishacre's interpretation of the Old Testament story, Abraham's elderly wife Sarah could not become pregnant until Abraham slept with her serving girl, Hagar. Once Abraham had done so, Sarah was able to conceive, and Hagar was banished from the camp. In like manner, before the aspiring theologian can bear fruit, he has to bed down with the sciences, the knowledge of which is a necessary preparation for theology. The aspiring theologian should not, however, linger for too long a time in the bedchamber of the serving girl, but hurry on to the queen of the sciences.

**A MODEL FOR ROGER BACON.** Grosseteste's approach became the model for the Christian theologian in the eyes of the contentious and outspoken Franciscan friar, Roger Bacon (c. 1214–1292), who praised Grosseteste's knowledge of languages and the experimental sciences. Bacon himself wrote Greek and Hebrew grammars and had some familiarity with Arabic; he also con-

**A METAPHYSICS OF LIGHT**

**INTRODUCTION:** In the first cosmogony (a theoretical account of the origin of the material universe) since Plato's *Timaeus*, the Oxford master and later bishop of Lincoln, Robert Grosseteste, speculates that the property of light is to propagate itself infinitely and instantaneously in all directions to form a sphere. This “metaphysics of light,” composed around 1225, is a bold and original attempt to explain how matter was generated from the initial creation of a point of light announced in the Genesis story.

The first corporeal form which some call corporeity is in my opinion light. For light of its very nature diffuses itself in every direction in such a way that a point of light will produce instantaneously a sphere of light of any size whatsoever, unless some opaque object stands in the way. Now the extension of matter in three dimensions is a necessary concomitant of corporeity, and this despite the fact that both corporeity and matter are in themselves simple substances lacking all dimension. But a form that is in itself simple, and without dimension could not introduce dimension in every direction into matter, which is likewise simple and without dimension, except by multiplying itself and diffusing itself instantaneously in every direction and thus extending matter in its own diffusion. For the form cannot desert matter, because it is inseparable from it, and matter itself cannot be deprived of form.

tributed to the science of optics (according to one legend he was the inventor of eyeglasses) and the rainbow. Never shy about promoting his own projects, Bacon addressed his *Opus maius*, literally the “Greater Work,” to Pope Clement IV (d. 1268), who, unfortunately, died before he could give a response.

## LATIN AVERROISM

**ARISTOTLE AND THE UNIVERSITY OF PARIS.** While the works of the Muslim commentators on Aristotle were certainly cited by the Oxford masters, it was only at Paris that a distinct school evolved that took its inspiration from one of these commentators. The movement was known as “Latin Averroism,” after the Spanish Islamic philosopher Averroës, the principal commentator on Aristotle’s work, and originated in the arts faculty in the course of the 1260s. With its concentration on philosophy in its many branches (including disciplines that would today be counted among the sciences, like botany and physics), the bachelor of arts degree was the first earned by a university student in the Middle Ages. The professors in the arts faculty were expected to “reign” for a respectable time and then move on to one of the higher faculties, such as theology, law, or medicine. *Non est senescendum in artibus*—“do not grow old in the arts”—was a well known and widely observed saying.

**PHILOSOPHY AS A SEPARATE DISCIPLINE.** It was, at any rate, among these philosophy professors that the conviction took hold that Aristotle represented the incarnation of the purest reason and that one could not go beyond the philosopher in matters of the human reason. Not only did they have a model in the great Aristotle, but masters were also gradually becoming more conscious of the value of philosophy as a discipline, a subject of study that could be pursued as an end in itself and not simply as a “handmaid” to theology. In other words, they wished to investigate what the philosophers had to say without concerning themselves about the implications for religious belief. The leaders of the movement, Siger of Brabant (c. 1240—between 1281 and 1284) and Boethius of Dacia (d. before 1277), saw their roles as ascertaining what the philosophers had

held on the subject of the soul, for example, “by seeking the mind of the philosophers rather than the truth, since we are proceeding philosophically.” In his earlier writings on the soul (before 1270) Siger maintained that the human intellect was eternally caused by God as Aristotle professed, a view which he regarded as more probable than Augustine’s view that God created the soul in time and upon the conception of the body. He later modified this view somewhat, and in a recently discovered treatise he is seen to hold a view that is quite orthodox. Whether orthodox or not, the stratagem adopted by Siger and his associates was that they were presenting views that were not necessarily their own, but rather the views of Aristotle.

**THE PROBLEM OF “DOUBLE TRUTH.”** Siger and Boethius and other Latin Averroists were clerics and hence bound in a kind of institutional way to uphold Christian teachings. So when some of these teachings contradicted positions argued by the pagan Aristotle, as was the case with the mortality of the rational soul and the eternal duration of the world, these philosophers were faced with the difficulty of reconciling their religious beliefs with their philosophical convictions. Although no textual evidence survives to support this, the claim was made by the Averroists’ enemies that they held a doctrine of “double truth”—that is, that one could hold one proposition as true according to one’s faith and its precise opposite as true according to one’s reason. In other words, it was possible for the same intellect to maintain that the soul was immortal (by faith) and yet not immortal (by reason).

**LASTING INFLUENCES.** This movement came under official condemnation by the bishop of Paris and the archbishop of Canterbury in 1277, but it managed to continue into the Renaissance as a viable school of philosophy. It found a welcome home in northern Italian universities such as Padua, and some say that even Dante, author of the *Divine Comedy*, was influenced by it. Curiously, he places one of its leading lights, Siger of Brabant, in his *Paradiso*, in the company of Aquinas, Bonaventure, Albert the Great, Boethius, Dionysius the pseudo-Areopagite, and a half dozen other saints and doctors.

## THOMISM

**CHALLENGING THE AVERROISTS.** St. Thomas of Aquino in Italy, more commonly called Thomas Aquinas (1224 or 1225–1274), represents for many the pinnacle and climax of medieval philosophy, and his study has been recommended by popes from Leo XIII to the present occupant of the chair of Peter. A man large in soul as well as in body, Thomas was generally magnanimous in his writings toward his doctrinal enemies: a man must love his enemies, because they help him come closer to the truth. But he reserved his harshest words for the *averroiste*, clerics who upheld the teachings of Aristotle even when they contradicted the Scriptures. Thomas believed that truth is one and cannot contradict itself; therefore the dual truth system of the Latin Averroists was unthinkable. Moreover, he challenged the Averroists to debate him openly and not simply to talk with young boys (a reference to the age of the arts students and the fact that philosophy was taught in the arts faculty) on street corners.

**ACKNOWLEDGING THE NATURAL WORLD.** Thomas, who as a student at Naples got an early grounding in the New Philosophy, discerned the value in Aristotle’s thinking precisely because of its naturalism, the view that there existed a natural explanation for all phenomena. For Aristotle, this world is the real world; reality is not elsewhere in some transcendent realm as in Plato’s thought. Christianity, moreover, is in its essence an “incarnational” religion, the foundational doctrine being that God became man. The Christian theologian therefore needs a philosophy that gives an accounting of the natural world, including the autonomy of the human person. A world in which creatures exercise their own proper causality, even while maintaining an existential dependence upon Being itself for their being, renders more glory to God in Thomas’s view. This is a radically different view than that taken by the Ash’arites, a group of Muslim theologians, who believed that it is God alone who is acting in all the causes appearing in the world. It is God causing the effect of heat in the presence of the fire or, in a modern rendering, it is God causing letters to appear on the computer screen, not the person entering the data.

### *a PRIMARY SOURCE document*

#### TRANSCENDENCE AND IMMANENCE

**INTRODUCTION:** Every believing Christian, as well as every believing Jew and Muslim, is obliged to hold that God is both transcendent (that is, totally other than the world) and immanent (that is, somehow present to it). To give a coherent account of this tension, however, requires a sophisticated metaphysics, indeed a metaphysics of existence. St. Thomas Aquinas, here in the eighth question of his masterpiece, the *Summa theologiae*, explains how God is present to the world without being a part of it, thus avoiding the extremes of deism on the one hand and pantheism on the other.

God exists in everything; not indeed as part of their substance or as an accident, but as an agent is present to that in which its action is taking place. For unless it act through intermediaries every agent must be connected with that upon which it acts, and be in causal contact with it: compare Aristotle’s proof that for one thing to move another the two must be in contact. Now since it is God’s nature to exist, he it must be who properly causes existence in creatures, just as it is fire itself sets other things on fire. And God is causing this effect in things not just when they begin to exist, but all the time they are maintained in existence, just as the sun is lighting up the atmosphere all the time the atmosphere remains lit. During the whole period of a thing’s existence, therefore, God must be present to it, and present in a way in keeping with the way in which the thing possesses its existence. Now existence is more intimately and profoundly interior to things than anything else, for everything as we said is potential when compared to existence. So God must exist and exist intimately in everything.

**BEING AS ACT.** To claim, therefore, that Thomas worked out a synthesis between Christianity and Aristotelianism is true as far as it goes, but it does not go far enough. It can also be claimed with some justification that Thomas goes beyond Aristotle, not simply because he had the benefit of Divine Revelation, but because he was a better philosopher. His core insight—that being is fundamentally an act, or, in other words,

Glorification of St. Thomas Aquinas, Benozzo De Lesse Gozzoli (1421–1497), 15th century. THE ART ARCHIVE/MUSEE DU LOUVRE, PARIS/DAGLI ORTI.

is that which makes any thing real—opens a dimension beyond Aristotle’s and, indeed, any predecessor’s metaphysics, just as Einstein’s fourth dimension goes beyond the speculations of any previous physicist. This being-as-act enabled Thomas to account not only for the absolute transcendence of God—that God is totally other than creation—but also for his immanence—that God is present to creation in some intimate way. Aquinas thus avoids pantheism on the one hand—the view that God is all things or is a part of all things—and deism on the other—the eighteenth-century notion that God is responsible for creating the universe, but that is the end of his involvement, like the clockmaker who winds up the clock and then walks away.

**AN AUTHENTIC EXISTENTIALISM.** The “concept” of existence is a slippery one—the tendency of the human mind is to think in terms of “things”—and it is little wonder that Thomas’s theories were not fully grasped until the twentieth century, spurred by the insights of the school known as Existentialism. Most philosophers in his own time identified Thomas’s naturalism with the heterodox Aristotelianism of the Latin Averroists, and when the bishop of Paris drew up his list of condemned teachings three years after Thomas’s death in 1274, some two dozen of Thomas’s teachings were included. Thus, paradoxically, the thinker who in time became virtually identified with Catholic orthodoxy was shortly after his death under a cloud of suspicion for heresy.

## A Rebellious Dominican

Not long after the death of St. Thomas Aquinas, members of his order rallied around his teachings and defended them against attacks from both the seculars and the Franciscans. He was, in short, the official Doctor of the Order of Preachers. There is always someone, however, who refuses to conform, and in this case it was the Dominican friar, Durandus of Saint-Pourçain. He seems to have been a personage of some note, since he was entrusted by Pope John XXII with an important diplomatic mission. For his success he was rewarded with the bishopric of Limoux (1317), a truly singular title since no one before him or after held the title. He soon abandoned that position to become bishop of Le Puy (1318), then of Meaux (1326), a post he held until his death in 1334.

His wrong in the eyes of his fellow Dominicans, however, was that he refused to become a Thomist. He believed that in everything that was not a matter of faith, one should rely upon reason rather than on the authority of any master, no matter how famous or revered. He ended up by writing three commentaries on Peter Lombard's *Sentences*, which is not unlike writing three doctoral dissertations on the same subject. For the first he received a warning from the order, eventually having 91 articles censured by a theological commission. His second version resulted in no fewer than 235 articles being condemned as deviating from St Thomas. His third attempt showed little amendment on his part, but by that time he was bishop (successively of three sees) and seemed no longer to care.

The reaction at his passing gives some sense of how strongly most Dominicans felt about remaining loyal to Thomas and his teachings. The epitaph of the wayward Dominican featured this piece of doggerel, inspired by the fact that the first syllable of Durandus' name is "dur," a Latin root meaning "hard":

Durus Durandus jacet hic sub marmore duro,  
An sit salvandus ego nescio, nec quoque curo.  
"Here lies the hard Durand beneath the hard  
tombstone,  
Whether he is saved or not, I don't know, nor do I  
care."

## THE CONSERVATIVE REACTION AND THE CONDEMNATION OF 1277

**BONAVENTURE AND THE "AUGUSTINIANS."** Even as Aristotle's naturalistic philosophy became foundational to university curricula, there was strong resistance to his ideas. Historians, with their penchant for labeling, have called this group "Augustinians," but in truth the term came to identify a whole complex set of teachings, not all the same. The most articulate of the group was Bonaventure (1217–1274), third successor of St. Francis as Minister General of the Friars Minor or, more popularly, the Franciscans. In the prologue to his major theological work, his *Commentary on the Sentences*, Bonaventure declares that he has no wish to be an innovator, that he wishes only to follow in the footsteps of the great St. Augustine, who not only is a valid guide for the things here below (the extent of Aristotle's competence) but is also master of the things above, sometimes called wisdom. In fact, he claimed that no question had ever been propounded by the masters whose solution may not be found in the works of Augustine. Bonaventure's own work relied heavily on that of Augustine; scholars have identified over three thousand citations of Augustine in the writings of Bonaventure. Like Augustine, moreover, Bonaventure insisted that theology must be rooted in faith; it is, in fact, faith in search of understanding, an idea that echoed St. Anselm's assertion in the eleventh century. He believed that there is an infinite distance between knowing Christ and knowing an axiom of Euclid. Theology cannot be a purely speculative science, but is rather a way of life. It is this emphasis on the affective as opposed to the intellectual that distinguished Bonaventure's thought from that of his contemporary and fellow countryman Thomas Aquinas.

**THE DOCTRINE OF DIVINE ILLUMINATION.** Central to Bonaventure's thought was the Augustinian

doctrine of divine illumination. According to this doctrine, the knowledge received from the senses cannot account for the certitude that man enjoys with respect to truth. The sole sufficient cause of this certitude has to come from within. The problem becomes where this certitude originated. Either man is born knowing these truths (as Plato claimed) or man is dependent upon God's light, which strengthens the mind to know the meanings of things. If the latter is the case—and Christian philosophers (in Bonaventure's view) could not hold the former—then man possesses a simultaneous awareness of the truth of God's existence in every truth that is known, in the same way that man is aware of the presence of light in the perception of color. Bonaventure invented a new word for this concept: *contuitio*, or "contuition"—that is, a "seeing-with" or concomitant realization. It is not that Bonaventure does not have arguments for God's existence; he holds the record—twenty-nine in all, including the shortest ever written: "If God is God, God is." But they are not rigorous and breathe an air of casualness. They are, in short, not demonstrations in the strict Aristotelian sense. Bonaventure himself calls them "exercises for the mind," exercises to make more explicit what one holds already in an implicit way. Bonaventure's certainty of God's existence was such that he claimed to doubt his own existence more easily than that of God. Indeed, he calls the proposition "God exists" a *verum indubitabile*—"a truth which cannot be doubted."

**REVELATION AND REASON.** Paradoxically, Bonaventure far exceeded Aquinas with respect to the confidence he placed in reason. In his *Quaestiones disputatae de mysterio Trinitatis* (Disputed Questions on the Mystery of the Trinity), Bonaventure maintained that it is possible to make intelligible this most mysterious truth of the Christian religion, namely the Trinity. Given the knowledge of the three Persons in the Godhead from revelation, it is possible for the reason to perceive the doctrine as logically necessary. Like Anselm, Bonaventure looked for "necessary reasons," a notion that Aquinas explicitly denied. Philosophically, Bonaventure's work can be seen as the extension of Augustine's, tempered however by the distinctive spirituality of St. Francis of Assisi. Some scholars, furthermore, have argued for the deep influence of Bonaventure's thought on contemporary philosophy: on hermeneutics, on process philosophy, and on German idealism. Within his own Order, however, he was within a short time supplanted by Scotism, the philosophical system of John Duns Scotus, which then became the quasi-official philosophy of the Franciscans.

**THE CONDEMNATION OF 1277.** It was the conservatives like Bonaventure who would triumph in the con-

flict with the radical Aristotelians—at least in the short run. The story is easily told, but more difficult to assess. Pope John XXI (c. 1210–1277), who in his earlier life had made a name for himself in logic (in fact, his book, the *Summa logicalis*, was the most widely used logic text in the thirteenth century), had heard rumors of suspicious teachings emanating from the University of Paris, the premier center for theological studies in the West. He ordered Stephen Tempier, the bishop of Paris, to investigate. Taking this papal letter as his warrant, Tempier hastily assembled a panel of theologians and in short order drew up a list of 219 propositions from the teachings of the Parisian masters that he condemned as heretical. Included in the list were approximately two dozen teachings of St. Thomas. The fact that the condemnation was issued three years to the day after Aquinas's death (7 March 1277) led some to suspect a personal insult to Thomas.

**THE ANTI-AVERROIST ATTACK.** The list itself was a hodgepodge. Condemned as heretical were a book on courtly love, one on geomancy (the art of foretelling the future by studying the patterns formed when earth is randomly thrown on the ground), and one on necromancy (the art of prophesying through communication with the dead). Condemned also were some teachings originally ascribed to Avicenna as well as to St. Thomas Aquinas (as, for example, the teaching that angels are "nowhere," that is, not in a place). But the focus of the document was the teachings of the Latin Averroists: for example, that there is no more excellent state than to study philosophy; that the only wise men in the world are the philosophers; that God does not know things other than himself; that God is eternal in acting and moving, just as he is eternal in existing, otherwise he would be determined by some other thing that would be prior to him, and so forth. In the prologue to this very harsh document the bishop became the first to ascribe to the Averroists (*averroiste*) the teaching by which they came to be known:

For they [the Latin Averroists] say that these things are true according to philosophy but not according to the Catholic faith, as if there were two contrary truths and as if the truth of Sacred Scripture were contradicted by the truth in the sayings of the accursed pagans ...

In other words, they held a theory of double truth.

**THE DIVORCE BETWEEN FAITH AND REASON.** If the principal aim was to wipe out the Averroist school, the condemnation was a failure. Its unintended effect, however, was wide-ranging: it created a new atmosphere, one in which theologians were more concerned with be-

ing right in the eyes of the Latin Church than they were in pursuing their insights to their logical conclusions. The greatest loss was to speculative theology, namely, a theology grounded in sound reason. In the new mood the trendy phrase became *potentia absoluta* “absolute power”: even though it makes no sense to human reason, God can do anything—even make it such that Caesar did not cross the Rubicon (when it is known that he did). It was the divorce between faith and reason and the beginning of the end of the golden age of medieval thought. Philosophy veered off into increased skepticism, doubting the very ability of the mind to know things, the logical conclusion of which was the universal and methodological doubt of Descartes in the seventeenth century, which most recent scholars consider the beginning of modern philosophy. Theology on the other hand headed in the direction of fideism, the view that religious belief is based solely on faith and not on evidence or reasoning, and private religious experience. The outcome of this tendency is to be seen in the flourishing of mysticism in the fourteenth century and ultimately in the Protestant Reformation.

## THE SCOTIST WAY

**THE SUBTLE DOCTOR.** The most powerful and certainly the most wily thinker of this new era was John Duns Scotus (c. 1266–1308), called the *Doctor Subtilis* or “the subtle doctor.” Born in the village of Duns in Scotland, Scotus, declared “Blessed” by the Roman Catholic Church, was educated at Oxford. Following his ordination to the priesthood in 1291 (one of the few solid dates from his life known to scholars), he “reigned” as master of theology at Oxford. He was subsequently sent to Paris, where he wrote a commentary on Peter Lombard’s *Sentences*. He occupied one of the chairs assigned to the Franciscans in 1305 and a short time later was sent by his superiors to Cologne, where he taught until his death in 1308. Given the fact that he died at the young age of 42, it is little wonder that much of his promise as a philosopher remained unfulfilled and much of the system he had outlined undeveloped. The fact that some of his works survive only in the form of a *reportatio*—a report taken down by a student—adds to the difficulty in understanding this complex thinker. Reflecting the new spirit of his age, Scotus defended the necessity of divine revelation against those rationalists who advanced the claims of reason alone. The philosophies of Aristotle and his Muslim commentators, by this time so integrated into Christian thinking, were powerless to explain the human condition with its innate sinfulness and need for grace and redemption.

**THE CONCEPT OF INFINITE BEING.** Unlike St. Thomas, Scotus had a univocal, not an analogous, concept of being; in other words “being” meant the same thing in all of its instances. Scotus’ concept of being was everything that is not nothing. Thus emptied of content, being has neither depth nor degrees; nor is there room for the distinction so crucial for Aquinas between essence and being. Thus conceived, being for Scotus eluded comprehension in this life. Given this radically novel metaphysics, Scotus was forced to find a new path to God. All of the beings known to man are finite beings; they therefore demand a cause that is infinite and necessary. If the concept of infinite being is reasonable and not self-contradictory, then it must include the perfection of existence. In other words, if an infinite being is possible, it is necessary.

**DIVINE LAW AND DIVINE NATURE.** God for Scotus was both completely rational and completely free. Nothing in the immutability of the divine nature demanded one course of action as opposed to another. The moral law was not the result of capriciousness on the part of the divine will, nor was it determined in any

Justus von Ghent, Flemish, panel painting of Duns Scotus, Italy, 1470. THE ART ARCHIVE/PALAZZO DUCALE, URBINO/DAGLI ORTI.

absolute sense by the divine essence. This meant that the divine law, which is the foundation of the moral law, was the product of the divine will, operating, however, in accord with the non-contradictory character of the divine nature. Thus God can change the rules of morality, according to Scotus, but he cannot contradict his own nature. He cannot, for example, command that he not be loved.

**KNOWLEDGE OF UNIQUENESS.** Scotus was the first among the Franciscan masters to break with St. Augustine on the question of knowledge; he did not believe that man needed a special divine illumination in order to know truth. On the other hand, he also distanced himself from Aristotle in one important detail. For Aristotle the paradox was that we know individuals but only in a universal way; one knows Callias, said Aristotle, as man (a universal), not as Callias (an individual). Scotus found this explanation wanting and proposed an additional form or entity that makes each individual the individual he or she is; he even invented a word for it: *haecceitas* or

“this-ness.” In addition to the formal realities we share in common, such as being embodied, living, sentient, and rational, there is an additional difference that is unique to each of us, and the mind is capable of knowing this uniqueness. The late nineteenth-century English poet Gerard Manley Hopkins, a great admirer of Scotus, called it “the dearest freshness deep down things.”

**COMPLEXITY AND DISTINCTIONS.** Like Augustine—and unlike Aquinas—Scotus gave primacy to the will over the intellect. True, desire is moved only by what is known, but the impetus toward the object comes from the will. The will is thus the higher faculty in that it moves the intellect to know what it knows. The complexity of his thought and the glut of distinctions (of which only a few have been suggested here) led his enemies to dub him the “Duns man,” which quickly evolved into the term of denigration that is with us to this day: *dunce*.

## THE MODERN WAY AND THE TRIUMPH OF NOMINALISM

**THE WAR OF THE WAYS.** The disintegration of the medieval synthesis played itself out in what Germans call *die Wegestreit*, the “war of the ways.” The situation was parallel to that which prevailed among Greek philosophers following the death of Aristotle: those with a philosophical bent would join one of the existing schools, learn its teachings, then do battle with the rival schools. The Dominicans had adopted the “Thomist way” after the teachings of Thomas Aquinas; its major challenger, favored by the Franciscans, was the “Scotist way” after the teachings of John Scotus. By mid-fourteenth century these were already seen as the old ways, and many embraced what was called the “modern way” (“modern” being a relative term), that is, the movement begun by William of Ockham (c. 1285–1347) and his followers.

*a PRIMARY SOURCE document***A PHILOSOPHICAL DEFINITION FROM  
OCKHAM**

**INTRODUCTION:** This passage from Ockham provides an example of the philosophical definition of a key term ("Universal") in scholastic philosophy. It also demonstrates the use of analogy to clarify discussion.

I maintain that a universal is not something real that exists in a subject [of inherence], either inside or outside the mind, but that it has being only as a thought-object in the mind. It is a kind of mental picture which as a thought-object has a being similar to that which the thing outside the mind has in its real existence. What I mean is this: the intellect, seeing a thing outside the mind, forms in the mind a picture resembling it, in such a way that if the mind had the power to produce as it has the power to picture, it would produce by this act a real outside thing which would be only numerically distinct from the former real thing. The case would be similar, analogously speaking, to the activity of an artist. For just as the artist who sees a house or a building outside the mind first pictures in the mind a similar house and later produces a similar house in reality which is only numerically distinct from the first, so in our case the picture in the mind that we get from seeing something outside would act as a pattern. For just as the imagined house would be a pattern for the architect, if he who imagines it had the power to produce it in reality, so likewise the other picture would be a pattern for him who forms it. And this can be called a universal, because it is a pattern and relates indifferently to all the singular things outside the mind. Because of the similarity between its being as a thought-object and the being of like things outside the mind, it can stand for such things. And in this way a universal is not the result of generation, but of abstraction, which is only a kind of mental picturing.

**SOURCE:** William of Ockham in *Philosophical Writings: A Selection*. Ed. and Trans. Philotheus Boehner (Indianapolis and N.Y.: Bobbs-Merrill, 1957): 44.

**OCKHAM'S RAZOR.** If distrust of the reasoning power is in evidence in the thought of Scotus, a skeptical attitude became a hallmark of the modern way. Whereas St. Thomas opened his *Summa* of theology with a discussion of theology as a science, Ockham refused to grant it such status, asserting that theology is based on

**THE  
Sword and Pen**

Although Ockham finished the requirement for his degree of Master of Theology, he never held the one chair that had been assigned to the Franciscans at Oxford; and because he had "incepted," that is, that he had merely begun his studies, he has been given the sobriquet "Venerable Inceptor." Before his turn came to occupy the chair, he was accused of heresy by John Lutterell, the chancellor of the university and a fanatical Thomist. Subsequently summoned to Avignon, the city to which the papacy had relocated, he waited from 1324 to 1328 at the papal court while a committee examined his writings for suspicious teachings. Before a verdict was rendered, however, he became enmeshed in a controversy over the extreme version of poverty practiced by a wing of the Franciscan Order called the "Spirituals." Convinced that the pope had fallen into heresy, he fled with the deposed General of the Order, Michael of Cessena.

Seeking the protection of the Holy Roman Emperor, Ludwig of Bavaria, whose election the pope had refused to ratify, Ockham and his companions journeyed south to Italy, where the emperor was engaged in a military campaign. One version of what ensued, which is probably apocryphal, is that Friar William knelt before Emperor Ludwig and said: "Protect me with your sword, and I will defend you with my pen." Whatever the accuracy of the incident, Ockham in truth spent his remaining years in Munich under the emperor's protection, where he engaged in political writing, all of it polemical in nature. It is now fairly certain that the sentence of excommunication that was imposed on him was never lifted, and in all probability he died of the plague that swept through Europe in 1348–1350. Today his final resting place is marked by a boss in the pavement at the entrance to an underground parking garage in downtown Munich.

faith, not on evidence. He likewise limited the scope of theology in positing that only those truths that lead to salvation are considered "theological." William's philosophical obsession was the individual, which for him was the sole reality. Scotus's multiplication of formal realities, like his *haecceitas* "this-ness," were pointless distinctions and mere subtleties that needed to be trimmed away. Ockham's relentless wielding of the principle of philosophical economy became known as his "razor."

**INTUITIVE KNOWLEDGE.** This abandonment of realism (“no universal is existent in any way whatsoever outside the mind of the knower,” he wrote) also entails for Ockham the abdication of abstractive knowledge. The latter can no more be shown to be real than the universals. According to Ockham, it is only possible to know individual things, and that knowledge is intuitive, not abstractive. For example, if a man has a pet, Buckfield, he attaches that knowledge to a sign, which in his language is “dog”; there is, however, no such thing as canine nature, either in reality or in the mind. Furthermore, what is intuited immediately is not the thing, but the sense image or “phantasm” of the thing. In this atomization of the knowing process, it is generally presumed that the image is caused by the thing, but of this there can be no certainty. The image may be an illusion, a dream, the result of a piece of bad meat; it may for that matter be caused by God, who after all possesses absolute power. For example, a point of light in the night sky is assumed to be a star. Was that image truly caused by the heavenly body so many light-years away? Ockham claimed that there was no way to be certain of this. In modern times, it is known that some of the lights in the night sky are stars that have long ago ceased to exist, but because of the vast distances their light is just now reaching our planet. Ockham would have been fascinated with this notion.

## THE RETREAT FROM REASON: MYSTICISM

**ESCAPE FROM A HARSH REALITY.** The fourteenth century was on many fronts a desperate age, an age of disintegration. The papacy had been weakened morally and militarily by generations of struggle against the powerful rulers of the Holy Roman Empire, a dynasty that traced its legitimacy to the time of Charlemagne in the ninth century and controlled both Germany and northern Italy. As a result of this and other political conflicts, the papacy had become virtually a captive of the French crown at Avignon. Later in the century there were si-

multaneously three different men claiming to be pope. The magnificent structure of scholastic theology, elaborated as no other system of theology in the history of the world, was crumbling, brought down by the assaults of the Ockhamists. The bubonic plague was ravaging Europe, killing off approximately a third of the population. Especially hard-hit were urban centers, in which the universities were located. We know of at least two philosophers who fell victim to the epidemic. Yet, paradoxically, amid the social and ecclesiastical chaos, the age also witnessed the flowering of mysticism. Perhaps it was in part an escape from realities that had become too harsh, or it represented a retreat from the rational. Whatever the case, it was the age of Dante, exiled from his native city of Florence, who wrote the greatest epic poem in the Italian language, perhaps in any language, detailing his mystic journey through hell, purgatory, and finally paradise.

**THE SPIRITUALITY OF MEISTER ECKHART.** Especially fertile in spiritual developments was the Rhineland area of Germany and the Low Countries. Of the impressive number of mystics from this area the greatest was the German, John Eckhart, who had earned his degree of Master of Theology at Paris (hence the honorific “Meister”), and who had even served in an important administrative post in the Dominican Order. His academic writings, composed in Latin, were rather traditional and certainly above suspicion. It was in his sermons preached in his native language, however, that Meister Eckhart gave full vent to the exuberance of his spirituality. His following among lay people, especially nuns, soon gained the attention of the archbishop of Cologne, and Eckhart was cited before the Inquisition. Journeying to Avignon to argue his case before the pope, Eckhart intended to defend himself with the claim that heresy was a matter of the will, not the intellect; if he were wrong, he asked for correction, but he did not will to place himself outside of orthodoxy.

**TOWARDS DIVINE UNION.** Unfortunately, Eckhart died before his hearing. Notwithstanding, two years after his death in 1327, 28 of his teachings were condemned, including the following: “there is in the soul something that is uncreated and uncreatable,” “all creatures are a pure nothingness,” and “God loves souls, not their external works.” Taken out of context, these statements seem to affirm pantheism, deny the reality of creation, and anticipate the German religious reformer Martin Luther’s rejection of good works in the early sixteenth century. Such statements were bold and paradoxical to be sure, shocking even, but Eckhart’s sermons, when allowances are made for figurative and imaginative language—especially for inspired hyperbole—become expressions of a profound spirituality. It is a spirituality, moreover, that is God-centered,

emphasizing the union of the soul with the divinity without intermediaries, without community, without sacrament. Eckhart urged his congregation to dismiss the agents of the soul—that is, the intellect and the will—and allow God to occupy the core of the soul, the *finklein*, or “little spark.” Eckhart did not believe that man could do anything to merit this divine union, believing that it was all God’s doing. Man’s efforts count for nothing.

**A TRADITION OF PASSIVE RECEPTIVITY.** Although they are subject to a Catholic interpretation, these teachings point in the direction of Protestantism, or at least to quietism, a religious attitude of passive receptivity. It was an attitude that drew more from Dionysius and Neoplatonism, and turned away from the relentless rationalism of High Scholasticism. It was an attitude, moreover, that found fertile soil in German-speaking lands, and several disciples followed in Eckhart’s footsteps: John Tauler (“the masters of Paris read big books . . . but these [the mystics] read the living book wherein everything lives”), Henry Suso, John Ruysbroeck, Gerard Groote, and Thomas à Kempis, the reputed author of *The Imitation of Christ*. The canonization process for Eckhart is currently underway after these many centuries, and it is a certitude that the condemned propositions will be reevaluated.

**NICHOLAS OF CUSA AND RHINELAND MYSTICISM.** The enterprise of medieval philosophy can with some justification be extended into the fifteenth century and comes to an end with the towering figure of Nicholas of Cusa (1401–1464). Nicholas, or Cusanus, studied with the Brothers of the Common Life, Gerard Groote’s foundation, which in turn was inspired by the Rhineland mystics. Cusanus was a prodigious and wealthy scholar; his personal library held over 300 manuscripts, including those authors most influential on his own thinking: Augustine, Proclus, Dionysius, Avicenna, and Eckhart.

**THE UNKNOWABILITY OF TRUTH.** The title of his major work, *On Learned Ignorance*, summarizes quite accurately his central insight. Reason not only is powerless to reach the infinite, it is likewise incapable of knowing the whole truth about anything. Knowledge is like a polygon inscribed within a circle: sides can be added to the polygon indefinitely, but the polygon will never be identical with the circle. No matter how close the human mind approaches to the truth, it will never completely conform to it. Indeed, as in the Socratic paradox, the more that is known, the more the extent of one’s ignorance is recognized. With dazzling originality, Cusanus faulted Aristotle and his logic for the divisions in the Roman Church and in philosophical circles. He instead advocated a logic that was made to unite. He made his own the teaching of the ancient Greek Anaxagoras:

*a PRIMARY SOURCE document*

**MEISTER ECKHART’S SERMON ON THE BIRTH OF CHRIST**

**INTRODUCTION:** Meister Eckhart, a member of the Order of Preachers, preached in both Latin and his native German (when he was addressing laypeople). It was the boldness and exuberance of the latter, however, that got him into trouble with the ecclesiastical authorities. Here, in a sermon on the birth of Christ, is a glimpse of the grounds for two of the charges: pantheism (that the core of the soul is one with God) and quietism (the view that our salvation requires no works on our part).

**SOURCE:** Raymond Bernard Blakney, trans., *Meister Eckhart: A Modern Translation* (New York: Harper & Row, 1969): Sermon 1.

“everything is in everything.” To create all things is for God to be all things. If this sounds dangerously like pantheism, one must remember Cusanus’s Neoplatonic roots that recognized that God is above being. Or, conversely, creation is but an explication or unfolding of God; since God is all, the creature is reduced to nothing.

**THE FUSION OF PHILOSOPHY AND THEOLOGY.** In his treatise *De li non aliud* (“Concerning the Not-other”), Cusanus argued that the absolute cannot stand in a relationship of otherness to any relative being; hence the

“Not-other,” or God, is both absolute in its causation and at the same time present to its effect in creation. Here Cusanus, a cardinal of the Catholic Church, proclaimed doctrines very similar to those that had been condemned as heretical a century earlier in Eckhart’s sermons. In a new century the assault on the rational structure of theology seems to have been rendered less unacceptable. But what actually happened in the waning of the Middle Ages is that the discipline of philosophy—which was distinct from, but clearly subordinate to, theology for the thinkers of the earlier medieval centuries—had, in the synthesis of Nicholas of Cusa, been assimilated into theology. The two disciplines are fused in Cusanus’s mystic vision. This fusion is quite at odds with the estrangement of philosophy and theology which otherwise prevailed in the late medieval period. In some ways Cusanus’s thought harkens back to an earlier golden age.

## SIGNIFICANT PEOPLE in Philosophy

### AVERROËS

1126–1198

*Spanish Islamic philosopher*

**THE LAST OF THE GREAT MUSLIM COMMENTATORS.** Ibn Rushd, known as Averroës to Latin-speaking peoples, was the last of the great Muslim commentators on Aristotle. Born in Córdoba in Spain (or al-Andalus, as the Arabs called it) in 1126 to a family of eminent jurists,

Averroës was educated in law, medicine, philosophy, and theology. In addition, he had a deep interest in and knowledge of the literature of the Arabs, a knowledge he exploited in his commentary on Aristotle’s *Poetics*.

**VALUABLE PATRONAGE.** A key moment in Averroës’s life was his introduction to the caliph of Marrakech. Although reticent at first, Averroës learned in the course of the conversation that the ruler, Abu Ya’qub Yusuf, was sympathetic to philosophers. Feeling free then to reveal his position on the sensitive topic of the world’s eternal duration—a view which Aristotle defended and which the Muslim clerics found sacrilegious—the young scholar revealed his Aristotelian sympathies. As a result of this fateful meeting, Averroës was not only appointed a judge in Seville but also commissioned to write a series of commentaries on the Arabic versions of the writings of Aristotle. With this patronage supporting him, Averroës began the task that was to occupy him for most of his life, writing more than thirty commentaries on Aristotle’s treatises. Sometimes, indeed, he wrote as many as three different commentaries on the same work: a long commentary, a “middle” commentary, and an epitome or summary. He did not shy away from controversy, as is evident in his defense of philosophy against the writings of al-Ghazali. A century earlier al-Ghazali had written a work entitled *Tahafut al-Falasifah* (The Incoherence of Philosophy), in which—like David Hume centuries later—he attacked the principle of causality in an attempt to preserve God’s infinite power. He argued that human beings do not in fact cause anything, but merely provide the occasion for God to act directly. Al-Ghazali’s reasoning thus strips secondary causes of any role in action and in turn renders philosophy a useless pursuit. Averroës answered this attack on philosophy in his work *Tahafut al-Tahafut* (The Incoherence of the Incoherence), pointing out succinctly but effectively the sophistries in al-Ghazali’s arguments:

Denial of cause implies the denial of knowledge, and the denial of knowledge implies that nothing in this world can be really known, and that what is supposed to be known is nothing but opinion, that neither proof nor definition exist, and that the essential attributes which compose definitions are void.

**THE SUPERIORITY OF PHILOSOPHY.** So unbounded was Averroës’ admiration for Aristotle that he penned the most exaggerated praise that one philosopher ever wrote of another.

I consider that that man [Aristotle] was a rule and exemplar which nature devised to show the final perfection of man ... the teaching of Aristotle is the supreme truth, because his mind was the final expression of the human mind. Wherefore it has

been well said that he was created and given to us by divine providence that we might know all there is to be known. Let us praise God ...

Averroës was at pains, moreover, to defend the vocation of philosophy, arguing that not only is the pursuit of wisdom not forbidden by the Koran, it is expressly commanded—for those, that is, who have the intellectual acumen. No conflict need arise between the small and exclusive class of philosophers and the common people or even the theologians, if only these classes would confine themselves to the mode of argument of which they are capable. Of the three modes of proof outlined by Aristotle in the *Rhetoric*—exhortations, dialectics, and rational demonstrations—the first was the only appropriate approach to truth for the uneducated masses; the theologians' capacity to understand probable arguments meant that dialectics was most suitable for them; and the philosophers were the only ones able to follow rational demonstrations. They were enjoined, however, not to lord it over the lower classes, but to pursue their studies with the conviction that they enjoyed the most direct road to the truth.

**THE END OF THE MUSLIM GOLDEN AGE.** Averroës' privileged status came to an abrupt end when his patron died and the patron's son, having decided that the philosophers blaspheme the true religion, sent him into exile. Three years later, in 1198, he was exonerated and allowed to live in Marrakech where he died a short time later at age 72. With the death of Averroës the Golden Age of Philosophy among the Muslims came to an end, a victim of religious fundamentalism. It is ironic that this greatest commentator on Aristotle enjoyed his most avid and attentive readership, not among his own people, but in the Latin West.

## ROGER BACON

c. 1214–1292

*Franciscan teacher*  
*Natural philosopher*

**FROM OXFORD TO PARIS.** Notwithstanding his subsequent notoriety, there are very few facts known with certainty about the life of Roger Bacon. Most of

the dates listed by scholars are reconstructed from indirect remarks made by Bacon in his *Opus tertium* or "Third Work" (c. 1267). According to one reading of this work, he was born in 1214 of a well-known family of landed gentry, one member of which was the first Dominican master at Oxford and the teacher of Richard Fishacre. He was (according to this same reading) educated at Oxford from 1228 to 1236, then taught as master in the Arts faculty at Paris from 1237 to 1247. There Bacon became one of the earliest Christian thinkers to lecture and to write commentaries on the newly translated natural philosophy of Aristotle. Owing to the discovery in the nineteenth century of a manuscript at Amiens, scholars now have a copy of these commentaries.

**PRIVATE RESEARCH.** Between the years 1248 and 1256, Bacon, now a Franciscan friar, retreated to what can only be described as private study (possibly at Oxford) and the instruction of others, using his family inheritance to support himself. These studies were to lay the foundation for the positions he passionately held for the rest of his life: the insistence on the practical orientation of theology, the importance of the study of languages (for which he praises the efforts of Robert Grosseteste), the significance of experimental science, and the centrality of the mathematical sciences. He argued for the development of new technologies for the betterment of human life, especially as regards health-care, military technologies, and warfare.

**A FLURRY OF PRODUCTIVITY.** Toward the end of this period Bacon was posted by his superiors back to Paris, where he was resident in the Franciscan house of studies from 1256 until 1280. Bacon soon came to regret his "conversion" to the Franciscan Rule, owing to the unwillingness of his superiors to assign him to the classroom. In desperation, he appealed to Cardinal Guy Le Gros Foulques, petitioning him for funds to begin a major research project. As fate would have it, his would-be patron was elected pope in 1265, taking the name Clement IV. In a letter of June 1266, the new pope ordered Bacon to send him a copy of his grand work. Since the book had not yet been written, Bacon set to work feverishly and in three years produced the *Opus maius* ("The Greater Work"), the *Opus minus* ("The Lesser Work"), the *Opus tertium* ("The Third Work"), the *De multiplicatione specierum* ("On the Multiplication of Species"), *De speculis comburentibus* ("On Burning Mirrors"), the *Communium naturalium* ("Common Account of Natural Things"), and the *Secretum secretorum* ("The Secret of Secrets").

**BACK TO OXFORD.** Tragically, not only did the pope not respond to this deluge of writings (it is unclear

whether he even read them), but now Bacon was in trouble with his superior. Bonaventure, the Minister General of the Franciscans, held strong views on such subjects as astrology and alchemy and regarded Bacon as flirting with dangerous ideas. Furthermore, Bacon seems to have had leanings toward more radical elements in the Franciscan Order, those namely that saw the Order as the fulfillment of the prophecies of the apocalyptic visionary, Joachim of Fiore. As a result he was put under a kind of house arrest. In 1280, Bacon was transferred to Oxford again, where he remained until his death in 1292. His old age did not seem to have mellowed him. He persisted in his outspoken manner to criticize theological education and single out those who were—falsely in his view—reputed as wise. Although he attacked by name Thomas Aquinas and Albert his teacher, noting that he was dubbed “The Great” even during his own lifetime, his primary target was a fellow Franciscan.

I knew well the worst and most foolish [author] of these errors, who was called Richard of Cornwall, a very famous one among the foolish multitude. But to those who knew, he was insane and [had been] reprov'd at Paris for the errors which he had invented [and] promulgated when lecturing solemnly on the Sentences there ...

Research continues on this figure who was seemingly out of step with his time, but whose attempt to integrate Muslim, Jewish, and Christian wisdom pointed the way to the future.

## MOSES MAIMONIDES

1138–1204

*Judge*  
*Physician*  
*Commentator*

**FROM SPAIN TO NORTH AFRICA.** Rabbi Moshe ben Maimon, more commonly referred to as Maimonides, was the most eminent Jewish philosopher of the me-

dieval period. He was born in 1138 in Córdoba (the birthplace also of the famous Islamic philosopher Ibn Rushd or Averroës), the court city of the Almoravid caliphate. He came from a long line of Talmudic scholars, including his father, Maimon, who was a rabbinic judge as well as a mathematician and astronomer. It is little wonder then that his earliest education was imparted in the home. Later he was sent to Arab masters for instruction in the natural sciences, medicine, and philosophy. The flourishing Jewish intellectual community into which Maimonides was born and raised, however, came suddenly under threat when the less tolerant Almohads conquered their region. Faced with persecution, the Maimon family fled to North Africa, eventually settling in the city of Fez. It is during this period, according to one account, that the family was offered refuge by Averroës.

**EARLY WORKS.** In the meantime, the precocious young Maimonides had at age sixteen produced his first philosophical work, a treatise on Arabic logic. Four years later he had also composed a mathematical and astronomical work on the Jewish calendar and commenced a ten-year project: a commentary designed to make the oral law of Judaism more accessible. He came to prominence in the Jewish community at this time, however, for his “Letter on Apostasy,” a passionate plea for his co-religionists to emigrate to countries where they would be permitted to practice their faith freely and also to forgive those who had been forced to abandon their observance of the Law.

**COMMERCE AND MEDICINE.** By 1165 Fez was also to prove inhospitable to the Maimon family. An inquisition was instituted to punish those who had relapsed from Islam (the family had earlier been forced to convert). Once again Maimonides and his family fled, first to Palestine, then to Cairo in Egypt, where he spent the remainder of his years. His livelihood at this time was derived from commerce, but when his beloved brother David died in a shipwreck, Maimonides abandoned the business world and turned to the practice and teaching of medicine. Eventually he became court physician to the great Saladin, Sultan of Egypt and victor over the Crusaders.

**FAITH AND PHILOSOPHY.** Fluent in both Hebrew and Arabic, Maimonides wrote in the former language when he was addressing the Jewish community, as for example in the *Mishneh Torah* (a clear and systematic exposition of the entire oral law), and in Arabic, the *lingua franca* of most of the Mediterranean world, when he wanted to reach a larger audience. Such was the case with his major philosophical work, the *Dalalat al-Ha'irin*, or

“The Guide of the Perplexed.” Addressed to a certain Joseph, a former student and, therefore, one considerably advanced in philosophical knowledge, Maimonides aimed in this lengthy work to clear up his pupil’s confusions over the apparent lack of correspondence between his religious faith and his philosophical convictions—to reconcile, in other words, Athens (personifying reason) and Jerusalem (personifying faith).

**INFLUENCE ON CHRISTIAN THINKERS.** Maimonides was recognized as an authority on the Jewish Law by diaspora communities throughout the Middle East and Mediterranean and his advice was frequently sought. After his death the translation of his *Guide* into Latin extended the influence of his philosophical accomplishments to Christian thinkers of the thirteenth century, where he was cited as an authority (“Rabbi Moses”) by such philosophers as Richard Fishacre, Albert the Great, and Thomas Aquinas.

## THOMAS AQUINAS

c. 1224–1274

*Dominican friar  
Philosopher*

**A LIFE IN THE CHURCH.** Thomas Aquinas, called the “Common Doctor” or (some centuries later) the “Angelic Doctor,” was born in the family castle of Roccasecca in the county of Aquino (hence his name), which was located in the Kingdom of Naples. The youngest son in a noble family of thirteen children, Thomas was undoubtedly destined by his father for service in the Church. Hence it was that he was packed off at the age of five to the nearby monastery of Monte Cassino as an oblate (a lay member of the religious community), possibly one day to be its abbot, a post befitting his aristocratic status. Thomas’s career path took a different turn, however, after his superior transferred him to nearby Naples to continue his studies at the newly founded university, the establishment of the emperor, Frederick II.

There Thomas was exposed, full bore, to the newly translated works of Aristotle. It was also there that he first encountered the religious order of begging preachers, founded by St. Dominic. Attracted to the mendicant way of life, young Thomas took the habit, much to the consternation of his mother. Sending his older brothers, both knights, to seize her youngest son, she had Thomas placed under “house arrest” in the family castle.

**A MASTER OF THEOLOGY.** A year’s captivity was not able to shake his resolve, however, and Thomas was allowed to continue his interrupted journey to Paris, where he came under the tutelage of Albert of Swabia, who was already being called Albertus Magnus, or “Albert the Great.” The teacher recognized the genius of his pupil; one time, on overhearing the nickname with which his fellow students had dubbed him, “the dumb ox,” he predicted that one day the bellowing of this dumb ox would fill the world. Following a period in Cologne, where he witnessed the laying of the cornerstone of the great cathedral, Thomas was sent back to Paris to study for the terminal degree in theology, the “master of the sacred page” (referring to Scripture). Owing to university politics, however, the degree was withheld, and it took a letter from the pope to the chancellor before Thomas and his fellow student Bonaventure (the future Minister General of the Franciscan Order) were admitted to the “university” of masters.

**THE BEGINNINGS OF THE SUMMA.** For three years Thomas held the chair assigned to the Dominicans at Paris, then was transferred to his native Italy for the next ten years. While teaching in the house of studies in Rome, Thomas conceived the idea of what was to become his masterpiece, the *Summa theologiae*, the “Summary of Theology,” which was written, as he said in the Prologue, for beginners in the discipline. In 1268 Thomas was transferred again to Paris, this time to do battle against the movement that had arisen in his absence, Latin Averroism. One detects in his writings from this period a dramatic change from his usual placid and tranquil demeanor, and Thomas used rather harsh language in challenging the professors who he was convinced were misinterpreting Aristotle and threatening his own project, which was to build a new synthesis of Christian theology on the foundations of Aristotle’s natural philosophy.

**A REMARKABLE OUTPUT.** Thomas left Paris after four years of incredibly intense activity, when in addition to his lectures on Scripture and his continuing work on the *Summa*, he had begun his own commentaries on the works of Aristotle. Although these commentaries were extracurricular for Thomas—that is, they did not

constitute part of his duties as a master of theology—they were written by him precisely to defend his use of Aristotle in theology in the face of the “Augustinians” who had accused him of Averroism. Back in Naples, exhausted by his Herculean efforts (he wrote or dictated fifty works in his forty-nine years), he suddenly stopped writing altogether, leaving the *Summa* incomplete. When questioned by his secretary, Reginald of Piperno, Thomas would only reply that after what had been revealed to him, he realized that he had not come close. The following spring, on his way north to attend the Council of Lyons to which he had been summoned, he fell from his horse and was taken to a nearby monastery, where some days later he died. He was officially recognized as a saint almost fifty years later, after several of his teachings which had been condemned in 1277 were subjected to a re-examination and found to be orthodox.

## WILLIAM OF OCKHAM

1285–1347

*Franciscan friar*

*Teacher*

*Political polemicist*

**THE VENERABLE INCEPTOR.** Few philosophers of the Middle Ages have proved to be as divisive in their own age or since as the Franciscan friar, William of Ockham. Born about 1285 in the town of Ockham in Surrey, a quiet shire south of London, William joined the Order of Friars Minor at the tender age of twelve. Following his novitiate and philosophical studies at the Franciscan convent in London, he began his study of theology at Oxford around 1306. His lectures on Peter Lombard's *Sentences* came in 1317–1319, at which time he was recognized as an “inceptor,” or bachelor of theology. With another two years of study he completed the requirements for the degree of Master and had even delivered his inaugural lecture. Owing to a restriction on the number of mendicants allowed to become masters, however, Ockham did not assume the chair in theology at this time, and circumstances later intervened so that

he never in fact lectured in theology as a master; his title thus became the Venerable Inceptor.

**A FORCIBLE STAY AT AVIGNON.** Instead Ockham was posted to the Franciscan house of studies in London where for the next several years he lectured and wrote extensively. It was writings from this period that make up the bulk of Ockham's philosophical output. In 1324, however, the chancellor of Oxford, John Lutterell, charged Ockham with heresy, and he was forced to travel to Avignon in France (where the pope had taken up residence) to defend himself. For four years the investigation into his teachings dragged on, but in the end none of the suspect teachings was formally condemned. Notwithstanding, his academic career was at an end. He would never hold a chair. While Ockham was biding his time in Avignon, however, he encountered his superior, Michael of Cessena, also summoned to Avignon because he had opposed the pope's condemnation of absolute poverty—that is, the surrender of any right to property both on the part of the individual friar and also on the part of the Order. The Minister General had given Ockham the charge of examining three papal documents and rendering a verdict. Ockham's judgment was clearly not tailored to endear him to the pope. The papal assertions were in his words, “heretical, erroneous, foolish, ridiculous, fantastic, senseless, defamatory, and equally contrary and obviously adverse to the orthodox faith, sound morality, natural reason, certain experience, and fraternal charity.” Burning their final bridges, Michael and William fled Avignon, taking a boat to Pisa, where they caught up with the Holy Roman Emperor, Ludwig of Bavaria. The story told about the meeting is probably apocryphal, but it is colorful: the friar knelt before the emperor and said, “Defend me with your sword and I will defend you with my pen.”

**IMPERIAL APOLOGIST.** Defend the emperor Ockham did, and for the final seventeen years of his life he abandoned philosophy and theology entirely and wrote polemical works exclusively, analyzing the nature of the Christian Church, the relationship between church and state, and the role of natural law. Death came in 1347, and he was buried in the Franciscan church in Munich. Today the Bavarian National Theater occupies that site. At the bottom of the stairs leading to the parking garage can be found a modest plaque marking the probable burial site of one of the most revolutionary thinkers of the medieval period.

## DOCUMENTARY SOURCES *in Philosophy*

Peter Abelard, *Sic et Non* (early 12th century)—Reflecting his age’s infatuation with dialectics, Abelard cleverly lines up apparently contradictory teachings on the part of the fathers of the church and shows through logical analysis that the contradictions are only superficial.

Anselm of Canterbury, *Proslogion* (mid 11th century)—Responding to a plea from his monks who wanted one single argument to prove not only God’s existence but everything else we believe about God, Anselm creates the most intriguing and most discussed argument of all time, the genius of which is to force the atheist into a contradiction if he continues in his denial of God.

Augustine (Aurelius Augustinus), *On the Free Choice of the Will* (c. 400) and *Confessions* (c. 397–400)—The first work, widely regarded as the best philosophical writing by this early Christian theologian, introduces to Western thought the notion that the human will freely makes choices. The *Confessions*, considered one of the great books of the Western world, is a “letter” to a fellow bishop recounting Augustine’s knotted journey to find the Beauty ever ancient and ever new. It is a unique work owing to the fact that we are let in on the workings of the mind of a philosopher.

Anicius Manlius Severinus Boethius, *The Consolation of Philosophy* (523–524)—A “best seller” all through the Middle Ages, the *Consolation* was written by a man facing

death and wrestling with the problem of evil and the secret of human happiness.

Bonaventure, *The Mind’s Journey into God* (mid-thirteenth century)—Guided by the metaphor of the six-winged seraph that had appeared to St. Francis of Assisi, Bonaventure in this spiritual masterpiece traces the journal of the pious soul from the sensible things of this world, through the soul, into the transcendent God.

Dionysius, the pseudo-Areopagite, *On the Divine Names* (c. 500)—This treatise on divine language—that is, the problem of how to talk about God—had an influence that lasted about a thousand years; the Italian humanist, Lorenzo Valla, finally exposed it as a forgery.

John Scotus Eriugena, *On the Division of Nature* (mid-9th century)—In this first “summa” of the Middle Ages, the Irish monk creatively divides nature into four parts: God as principle of all things, the divine (creative) ideas, creatures, and God as end and goal.

Moses Maimonides, *The Guide for the Perplexed* (late 12th century)—This classic of medieval Jewish thought was written for believers who also knew Greek philosophy and were confused as to how to reconcile faith and reason.

Nicholas of Cusa, *On Learned Ignorance* (mid-fifteenth century)—In a departure from Aristotle’s law of non-contradiction, Cusa argues in this most original masterpiece of the medieval period that in all entities, but especially in God, there is a “coincidence of opposites.”

John Duns Scotus, *Ordinatio* (1298–1302)—One of two commentaries which Scotus wrote on the *Sentences* of Peter Lombard, this work puts on display the subtle mind of the man awarded the epithet “Subtle Doctor” by his contemporaries.

Thomas Aquinas, *Summa theologiae* (1273)—Though written professedly for beginners in the discipline, this masterpiece of philosophical or speculative theology represents the high point of medieval thought.

## IMPORTANT EVENTS *in Religion*

- 800 Charlemagne is crowned emperor of the Romans by Pope Leo III, creating a linkage between spiritual and temporal powers.
- 813 Charlemagne requires all Christian altars to contain holy relics.
- 815 Byzantine iconoclastic policies (removal of sacred images from church decoration) are revived by Emperor Leo V.
- 843 The iconoclastic controversy in Byzantine Christianity comes to an end, and the use of icons is restored.
- 860 Russian ambassadors to the court of Constantinople embrace Christianity.
- 909 The founding of the famous Benedictine monastery of Cluny, France, occurs in this year.
- 945 A Christian church is built in the Russian city of Kiev.
- 962 The coronation of the German ruler Otto I as emperor of the Romans occurs in this year, reestablishing strong ties between spiritual and temporal powers.
- 990–1096 Local church councils address Peace of God and Truce of God legislation attempting to lessen medieval violence.
- c. 1000–1080 This is the early period of revival for women’s monastic life in Europe.
- 1027 The Danish king Canute makes a famous pilgrimage to Rome.
- 1054 Rome’s excommunication of the patriarch (a bishop in Eastern Orthodox sees) of Constantinople marks a significant early break between Latin and Greek Christian institutions.
- 1059–1080 The height of papal legislation concerning conflict between secular and religious authority (which historians often label as the “Investiture Controversy”) is reached. The contest over various influences and powers in society culminates in a disagreement between churchmen and powerful princes concerning the authority to invest new bishops with their symbols of office.
- c. 1075 The military religious order of Hospitallers begins its work in the Holy Land, providing comfort and assistance to pilgrims.
- 1080 Bruno of Cologne founds the Carthusian Order of hermits, combining the communal (cenobitic) lifestyle with solitary (eremitic) practice.
- 1095 The First Crusade, a Christian military expedition to free the Holy Land from Muslim domination, is promoted by Pope Urban II.
- 1098 The formation of the Cistercian Order attempts to reform the abuses of medieval monasticism and return it to a purer interpretation of the Benedictine Rule.
- 1110–1143 Persecution of the Bogomils, a religious movement holding that the earth was created by Satan, takes place in the Byzantine Empire.
- 1121 The Premonstratensian Order is founded. The order is unique in that it accepts both men and women and attempts to accommodate them in the same monastery.
- 1128 The Council of Troyes approves plans for the establishment of the Knights Templar, an order of knights which protected pilgrims and settlers in the Holy Land following the ousting of Muslim forces from the area during the Crusades.

- 1143 The Cathar movement begins in France. The Cathars desire to purify the church from worldly elements and the corruptions of the flesh.
- 1145 The Second Crusade, to rescue the city of Edessa in Greece from Muslim control, is preached by St. Bernard of Clairvaux, while simultaneous crusades are planned against European non-Christians (Bohemians, Wends, and Moors).
- 1170 Archbishop and former English chancellor Thomas Becket is murdered at Canterbury Cathedral following a conflict with the king over the rights and authority of the church.
- 1184 The papal bull *Ad Abolendam* condemns the teachings of the Waldensians (who preached against clerical corruption), Cathars (who rejected the bodily resurrection of Christ), and certain Humiliati (a lay order).
- 1189–1192 The Third Crusade is undertaken against the Muslim leader Saladin, and some coastal territory is recovered.
- 1199–1204 The Fourth Crusade, intended to fight Muslims in Egypt, goes off course and ends with the sacking of Constantinople and establishment of the Latin Empire, which lasts sixty years.
- 1200 Masters at the University of Paris receive royal charter, which will be approved in Rome in 1231.
- 1201 The lay spiritual Humiliati movement receives papal recognition.
- c. 1205 The lay women's movement of Béguines begins in Germany and the Lowlands.
- 1209 The Albigensian Crusade is launched against heretical Cathars, and is carried out over the next twenty years with great cruelty.
- 1210 Pope Innocent III grants Francis of Assisi permission to found an order of mendicants (later called Order of Friars Minor).
- 1215 The Fourth Lateran Council convenes and implements major reforms for secular clergy.
- The Poor Clares, a Franciscan order for women, is formed.
- 1217 The Dominican Order of Preachers receives papal confirmation.
- 1232 Pope Gregory IX grants the constitution for the foundation of Dominican nuns.
- 1249 Oxford University is founded in England. It later becomes one of the institutions where religious orders send their most talented brethren to teach and study.
- 1250 The Carmelites, who had been hermits in the Holy Land, are approved as an order of friars in European communities.
- 1265 Thomas Aquinas begins to write the *Summa Theologiae*, which organizes arguments reconciling faith and reason.
- 1298–1350 This period marks the height of the lay Humiliati movement.
- 1309 The pope, involved in struggles between religious and secular authority, begins to reside in Avignon, France, where the papacy would remain until 1377 (1408 including anti-popes).
- 1315–1317 Famine strikes Europe, triggering a heightening of spirituality.
- c. 1325 The Cistercian movement peaks in influence, with some 700 male abbeys and 900 women's houses.
- 1347 The advent of the Black Death (the bubonic plague) reinforces the idea that the world is transitory and only the spiritual life has true value.
- 1373 The mystical visions of the English anchoress Julian of Norwich begin.
- 1378 The Great Schism occurs over rival claims to the papacy, dividing Europe's allegiance

- between two (and at times even three) different popes.
- 1382 The teachings of the English reformer John Wyclif, who rejects transubstantiation and supports vernacular Bibles, are condemned.
- 1416 The Czech reformer Jan Hus, a follower of Wyclif's teachings who preached against clerical corruption, is burned as a heretic.
- 1417 The Great Schism comes to an end with the Council of Constance.
- 1453 The fall of Constantinople to the Ottomans diminishes the link between Eastern and Western Christianity.
- 1455 The Gutenberg Bible is first printed, beginning an era when ordinary people will be able to read and interpret scriptures for themselves.

## OVERVIEW *of Religion*

**A PERVASIVE PRESENCE.** The importance of religion in all facets of medieval life can hardly be overestimated. One of the reasons for the pervasive presence of religious ideology was that the dominant or most influential figures (often those in power) in Western European, Byzantine, and Muslim cultures each lived according to a revealed religion that reached deeply into every aspect of daily life. Many historians have attributed the early growth of such influences in northern Europe to the efforts of Christian missionaries, most of whom were members of monastic orders from the remnants of the western Roman Empire. In the Byzantine Empire (the former eastern part of the Roman Empire, centered in what is now Istanbul, Turkey) and areas dominated by Islam, organized religion was connected to the offices of both emperor and caliph (the spiritual and political head of Islam). The shaping of culture was clearly tied to the way each of these religions became a part of people's lives. Substantial support from the monarchies of northern Europe would not become the norm until the ninth century when the scope of secular administrative power became more widespread. Some of the northern European kings were profoundly affected by the Christian message, while others were mainly concerned with making alliances with church leaders who had significant authority, thus assisting the development of the prominent position of religion in the social and ideological landscape.

**THE CAROLINGIANS AND THE FRANKISH ROMAN EMPIRE.** The great rise of religious influence in northern Europe took hold during the Carolingian period in the late 700s and is often considered to have begun with the reign of the Frankish king Charlemagne (768–814). Charlemagne's successors and the legacy he left behind ensured the ongoing dominance of Christianity by bringing it to both the common people and the nobility. This was done in a variety of ways: through education, personal example of the secular rulers, and church leadership, as well as infusing Christianity into the system of

social obligations, particularly those associated with lordship. Fostering the growth of monasteries along with local secular churches ensured a more even distribution of religious program. Strong links to Latin (that is, Roman) Christianity were established by adopting many of the Roman traditions for religious ritual, but a political relationship with the papacy was also forged via the institution that was later called the Holy Roman Empire (a realm centered in the areas that are now France, Germany, Benelux countries, Switzerland, Austria, Bohemia, and northern Italy), whose heads of state, beginning with Charlemagne, were crowned by the pope himself.

**MEDIEVAL RELIGION OUTSIDE THE FRANKISH ROMAN EMPIRE.** During the tenth century, missionaries continued to facilitate the spread of Christianity outside of the Frankish Roman Empire, particularly in areas to the east of Germany. As bishoprics and their jurisdictions were created, they brought with them certain social structures (such as ecclesiastical courts) and official channels that encouraged the expansion and growth of new Christian states. At the same time, pervasive incursions, attempts at settlement, and large-scale invasions by polytheistic Vikings from Scandinavia and Magyar groups from what is now Hungary proved to be both an interruption to the progress of Christian development and an opportunity for further evangelization. Conversions of Danes, Swedes, Norse, and Magyars, both in their native regions and among those who settled in England, France, and Germany, were attempted with varying degrees of success between the ninth and twelfth centuries. Spain continued to be dominated by Islam at this time, although there were large numbers of Jews and Christians living in the Iberian Peninsula. Jews also had settled early on in the areas that are now Italy, northern France, and Germany, after being displaced from the Holy Land by Muslim invaders, and they remained an important, if marginalized, presence in most areas of Europe throughout the Middle Ages.

**BYZANTINE CHRISTIANITY.** While the heirs of the ancient Western Christian empire had suffered a period of social and political decline following the final fall of Rome in the fifth century, Eastern Christianity, centered in the capital city of Constantinople, had continued to develop in power, wealth, and influence. The stability of Eastern (Byzantine or Orthodox) Christianity was tested, however, in the ninth century when church authorities revisited the question of whether or not icons—that is, religious images such as wall paintings, panel paintings, and statues—should be allowed in churches. The controversy, essentially a question of what constituted idolatry, caused tension between the crown and the

monasteries, whose members were supporters of the icons. At the same time, theological disagreements between the Eastern (Greek) and Western (Latin) church over the relationship between Trinitarian elements (Father, Son, and Holy Spirit) reappeared and continued to be a source of division throughout the Middle Ages, contributing to the separation between the Roman Catholic and Orthodox Christians that continues today.

**EARLY RELIGIOUS AND SECULAR CONFLICTS.** Tensions between the Latin Christian religious and temporal authorities increased during the eleventh century, particularly in the growing German Empire and in England. Quite visibly, some of this struggle for control came to a head over the issue of powerful laity—lords and kings—insisting upon having the power to invest new bishops with their symbols of office. This particular conflict (known under the umbrella of “Investiture”) culminated in the debate over whether or not church leaders should swear oaths of loyalty to secular leaders. The relationship between temporal and spiritual powers, kings and popes, bishops and nobles, generally was not characterized by smooth cooperation. As both secular leaders and churchmen became more powerful, each attempted to come to terms with the problems and benefits of the system of lordship. In this system, advantages like wealth, power, and influence were tied to the ownership and management of land, particularly as it related to sources of income. But when sons and daughters of nobles became bishops, abbesses, abbots, cardinals, and popes, there was bound to be a complexity of ideological tension. During the tenth, eleventh, and twelfth centuries, the following basic questions would resurface in a variety of ways: Were church leaders superior because of their spiritual connection to God? Should “religious” nobles relinquish or diminish their hereditary stations, step aside, and allow secular leaders to guide and govern? How should church and state cooperate in the promotion of a better Christian society? What was to be done about the problem of violence between various factions of Christians?

**MEDIEVAL SPIRITUALITY, LITURGY, AND CHURCH LEADERSHIP.** Aspects of spirituality changed gradually during the tenth and eleventh centuries. The Benedictine Order, with its *Rule* for monastic life stressing a corporate existence of prayer, work, humility, and stability under the leadership of an abbot, grew tremendously and became quite popular. As monastic “franchises” such as the houses of Cluny and Gorze began to develop, greater attention was paid to proper practice and the material aspects of worship, including more extensive and elaborate and formulaic prayer, as well as the decoration and

enlargement of worship spaces and rubrics for their use. The secular churches underwent their own reforms, which were instituted from the top down (popes to bishops to local priests) to deal with moral and economic abuses. Among the improvements was a new emphasis on education, which was intended to broaden and deepen the clergy’s understanding of the sacraments and improve their ability to communicate this knowledge to others. Specialized liturgical books such as the *pontifical* (a comprehensive book of sacraments, ceremonies, and rites performed by bishops) and the *ordo* (a book of directives for the celebration of liturgies) reflected the desire to make Latin Christian worship more uniform throughout all of Europe. As the clergy became more and more elite, however, changes in the liturgy increasingly diminished the role of laity in communal celebration.

**MONASTIC REFORMS AND THE RISE OF THE FRIARS.** By the twelfth century, there were major attempts on the part of reform orders such as the Cistercians, Carthusians, and Premonstratensians to bring monasticism back to the model of simpler communities or even eremitical (hermit-like) roots. Existing orders, especially the Cluniacs, had grown rich in their control of lands and properties, and seemed to lack the spiritual dimensions intended by the Benedictine Rule. These new orders attracted large numbers of adherents, suggesting some degree of success in dealing with the problems, but by the early thirteenth century, a new major religious movement arose, taking Christian existence out of the formal monastic establishments altogether. Under the leadership of two charismatic preachers, later to be canonized as St. Dominic and St. Francis, these new orders, known as the Dominican and Franciscan friars, emphasized poverty and service to the world. Friars lived on the edges of cities, begged for their sustenance, and spent their time preaching and hearing confessions. While the Dominicans were later associated mainly with education, Franciscans became missionaries, expanding the scope of their activities as far as Mongolia. Among lay Christians, the Béguines sought to de-institutionalize Christian apostolic standards and took on many aspects of Christian discipline without joining formal monastic orders.

**RELICS, PILGRIMAGES, AND CRUSADES.** During the eleventh through thirteenth centuries, holy relics and the miracles associated with them inspired a great proliferation of pilgrimages within Europe and to the Holy Land. The veneration of the relics in altars contributed to the growing number of private masses in monasteries and churches where there were numerous priests and multiple altars. Popular piety and devotion toward relics

and pilgrimages also helped fuel the crusading movements, which promised to free the Holy Land from Muslim domination and keep it accessible to travelers. The appearance of military orders in the twelfth century primarily arose in response to perceived needs connected to both the Crusades and the Reconquista (Christian Reconquest) in Muslim Spain. Medieval Christianity was not very tolerant of divergent theological opinions. In addition to the struggle for control of the Levant (an area on the eastern shores of the Mediterranean, located between western Greece and western Egypt), Crusades were launched against Christian heretics such as the Cathars and pagan polytheists like the Wends. There were even localized persecutions of Jews, lepers, and homosexuals during this period. While Christians, Muslims, and Jews found it easier to coexist on a daily basis under Muslim rule in Spain, North Africa, and the Middle East, concerted conflict was bound to arise linked to the expansion of political and religious power structures.

**CRITICISMS OF CHURCH INSTITUTION AND HIERARCHY.** By the thirteenth century, the institutional factors that had contributed to the church's growth, wealth, and influence were being called into question by Christians from all walks of life. The emerging new universities began to pull away from strictly church-centered types of education to accommodate the study of law, rhetoric, medicine, and mathematics required by a more mobile and commercially vibrant Europe. By the thirteenth century theology had begun to emerge as one of the central disciplines within the realm of formal education. Scholastic approaches to philosophy and theology that developed as a result of university influences during the twelfth and thirteenth centuries continue to serve today as a hallmark of medieval intellectual activity. The twelfth and thirteenth centuries also marked a rich period for the development of Gothic architecture, a style in which soaring heights, open space, and increased light created a more inviting and invigorating place for the glorification of God. In addition to church and state struggles, the church in the fourteenth century now faced an ecclesiastical political crisis from within, as disputes over papal elections resulted in a schism or split between several factions who each claimed to have elected legitimate popes. The Avignon Papacy and Great Schism once again raised the issue of secular influences upon church elections, causing Christians to seriously reconsider the nature of papal power and supremacy.

**LATE MEDIEVAL RELIGIOUS DEVELOPMENTS.** The ravages of famine and plague (the Black Death) during the early and middle fourteenth century gave medieval Christians pause to reexamine the idea of the afterlife,

the worth of the human soul, and the fleeting nature of all things temporal. In such times of crisis, people turned to religion once again to provide comfort to the afflicted. In the wake of the plague, the penitent act of flagellation, the desire to seek a personal mystical experience with God, and the organization of groups expressing dissatisfaction with the "human" elements of Christian leadership all influenced the Protestant Reformation that was soon to come. While humanism—a secular cultural and intellectual movement stressing the artistic and philosophical achievements of the Greeks and Romans—flourished in Italy and was beginning to take hold in northern Europe, the papal schism was being healed. But reformers like John Wyclif (in England) and Jan Hus (in Bohemia) were tenacious in protesting the ongoing abuses and corruption of the clergy, and many of Hus's fifteenth-century followers paid with their lives for opposing hierarchical church control. These major movements and events, coupled with an improved economy and the invention of the printing press, eventually set the stage for the great Reformation ideals of sixteenth-century Latin Christendom. The mid-fifteenth century religious climate was imbued with complex and often contradictory attitudes of suspicion, desire to hold on to tradition, optimism, enthusiasm for education, and an impulse towards personal freedom, the combination of which led many to distrust ecclesiastical authority and seek a return to Christianity's earliest roots.

## TOPICS *in Religion*

---

### EARLY LATIN CHRISTIANITY IN NORTHERN EUROPE

**FOUNDATIONS OF CHRISTIANITY.** Although medieval Europe is often associated today with the dominance of Christianity, the beginning of the Middle Ages was a period of competing religions when many of the pre-Roman inhabitants and invading tribes who had helped bring about the end of the Roman Empire continued to practice polytheism. Latin Christianity had been established in parts of Western Europe outside of Italy during the time of the Roman occupation (especially from the second through fifth centuries C.E.), and centers of Christianity continued to exist in such cities as Lyon, Arles, Tours, Poitiers, Marseilles, Reims, and Provence (all in modern France); in Silchester, Dorchester, Water Newton, and St. Albans (in Britain); Trier,

Cologne, and Mainz (in modern Germany); and in Toledo, Córdoba, and Elvira (in modern Spain). The increasing presence on the part of bishops, theologians, and monastics fueled growing support for Christian ideas and practices throughout parts of northern Europe. Moreover, during the period of decline and deterioration of the Roman Empire, many members of the invading tribes—including the Visigoths, Ostrogoths, Huns, Franks, and Saxons—accepted Christianity in one form or another. However, the key to Christianizing the north seemed to be the conversion of the tribal leaders, as happened when the Merovingian (Frankish) king Clovis—who ruled over what is now Belgium, northern France, and parts of Germany—and some of his followers were baptized in the mid-490s. A century later, with Rome still serving as the center of Western Christianity, Pope Gregory the Great (590–604) sent monks from the relatively new Benedictine Order to function as missionaries, priests, bishops, and even ambassadors to parts of northern Europe. The influence of the Irish monk St. Columbanus (d. 615) spread more Eastern (Orthodox) traditions of Christian monasticism into centers like Bangor (in Ireland) and Whitby (in Northumberland), as well as Annegray, Fontaine, and Luxeuil (in France). St. Boniface and St. Willibrord had helped spread Christianity in the Germanic regions, while Patrick (d. circa 460), Augustine of Canterbury (d. before 610), Abbess Hilda of Whitby (d. 680) and Columba (d. circa 597) facilitated such growth in the British Isles. By the ninth century, Christianity began to proliferate in parts of France, Britain, Ireland, Germany, and Spain.

#### MEROVINGIAN AND CAROLINGIAN INFLUENCE.

An eighth-century alliance that was formed between the Frankish kings and the bishops of Rome did much to secure the place of Christianity within the circles of the ruling class as they expanded their territory in northern Europe. A forged document known as the *Donation of Constantine*, which asserted that in the fourth century Constantine himself had given the bishop of Rome authority to govern over all territories in the western empire, may have helped legitimize the series of agreements between the Roman pontiffs and the Franks to provide each other with mutual support. In any case, over the last several decades of the eighth century the Carolingian family—rivals of the Merovingians—used their military power to come to the defense of the papal territories in Italy. In return for such protection and support of the papacy, along with support for certain papal claims of jurisdiction, Rome continued to give its blessing to the Carolingians in their usurpation of the Frankish throne from the previous Merovingian line. This alliance (which some have viewed as morally suspect) went on to create

a period of stability that would foster the development of Christian education, ideas, and institutions in the Frankish kingdom. It also set a precedent later on for providing the church with military assistance from Christian kings who were seen as God’s representatives, ruling through “divine right.” In thanksgiving for the continued support, at a Christmas celebration during the year 800, Charlemagne, the king of the Franks (whose Latin name “Carolus” was the source of the term “Carolingian”), was given the title “Emperor of the Romans” by Pope Leo III. The title linked the Franks to the former Roman Empire in an idealization of the place formerly occupied by Constantine the Great and his important relationship with the Christian church. Within the next century this title would be passed to the German kings (later called “Ottonian”) who succeeded the Carolingian line.

**CONQUEST AND CONVERSION.** The coronation of Charlemagne as emperor of the Romans on Christmas

## MEDIEVAL Religion Terms

**Ascetic:** Devoted to solitude, contemplation, discipline, fasting, denying the body in order to derive spiritual benefits.

**Augustinian Rule:** A set of guidelines devised by St. Augustine of Hippo in the fourth century for the common life of religious and often used by the canons regular or Austin Friars.

**Benedictine Monasticism:** Western communal practice begun in the sixth century by Benedict, the abbot of Monte Cassino in Italy. *The Rule of Benedict* stressed a corporate life of prayer, work, humility, and stability under the leadership of an abbot.

**Benefice:** Certain church offices, such as the rectorship of a parish church, with particular duties for which one would be granted revenues.

**Canonical hours:** The Divine Offices or daily prayers usually sung or recited by religious (often seven times a day).

**Canon Law:** The body of church law imposed by the authority of councils and bishops, particularly pertaining to matters of belief, morals, and discipline of the Christian faithful.

**Cenobitic:** A communal monastic lifestyle.

**Chapter:** The assembly of a monastic community (often daily) where a chapter of their rule was read, official business was dealt with, and faults of the monks were addressed.

**Cloistered:** Enclosed in a monastery, literally in the cloister space that forms part of a monastery; not free to leave or have visitors due to one's monastic status.

**Crozier:** The staff of a bishop, abbot, or abbess, sometimes bearing their insignia, commonly depicted in the form of a shepherd's staff signifying pastoral powers.

**Diocese:** A geographic division or extent of a bishop's jurisdiction.

**Ecumenical:** Worldwide, as in a general synod or council called by bishops, church leaders, or a pope.

**Episcopal:** Having to do with a bishop.

**Eremitic:** Having to do with the life of a hermit or solitary.

**Eucharist:** The celebration or reenactment of the Lord's Supper using bread and wine consecrated by a priest.

**Excommunication:** Church censure imposed by an authority which excludes individuals from communion and deprives them of rights to certain sacraments.

**Filiations:** Daughter houses, often founded or adopted by the mother monastery. A group of daughter houses dependent upon a main house or linked together in a system.

**Filioque:** A Latin phrase (literally meaning "and the son") referring to an argument as to whether or not the Holy Spirit proceeded from the Father or emanates from both the Father and the Son. The Latin Church seems to have added the notion that the Holy Spirit can also proceed through Jesus as well as God the Father.

Day of 800 provides a watershed date for the development of a Christianity in northern Europe that had begun to be linked to the monarchy. This Latin Christianity, which was increasingly being embraced by European kings and lords, also began to be urged by the nobility upon the general populace. While Christianity had been firmly in place in northern Europe for several centuries, a majority of people in the areas of the British Isles, France, and Germany had still not embraced the faith. These cultures still retained a mix of polytheistic remnants from the pre-Roman era. Particularly along the border regions of the empire (north of Thuringia and in the east between the Rhine and Elbe Rivers of present-day Germany), groups like the Saxons were forcibly converted to the Christian faith. Saxons could be put to death for following their own traditions and ritualistic religious practices, such as cremation of the dead and human sacrifice, or even for the refusal to observe the Christian Lenten season. Many

who were unwilling to submit to Christian baptism or pay tithes (one tenth of their produce or income) to the church were also killed. One of the leading churchmen in Charlemagne's court, Alcuin of York, raised objections to the practice of forced conversion. He wrote:

Converts must be drawn to the faith and not forced. A person can be compelled to baptism and still not believe. The adult convert should profess a true belief and if he lies, he will not reach salvation.

During the conquest and conversion of the Avars in the southeastern marches of Bavaria and in lands such as Pannonia beyond the Danube River, Alcuin more carefully directed the prelates of the Carolingian realm:

Be preachers of piety and not exactors of tithes, slowly suckling souls with the sweet milk of apostolic gentleness, lest these new converts to the faith choke upon and vomit the Church's harsher teachings.

**Flagellation:** Whipping or beating oneself in punishment for sins, or to commiserate with the suffering of Christ.

**Host:** The consecrated bread at the Mass which medieval Christians believed was changed into the body of Christ in conjunction with the action of the celebrant.

**Iconoclast:** One who literally would smash religious statues and icons, based on the belief that they were idolatrous.

**Indulgence:** After the confession of sin, the substitution of penance by another act, such as almsgiving, pilgrimage, crusade, or financial contribution for the construction of a church.

**Inquisition:** The juridical persecution of heresy by special church courts.

**Investiture:** The investing or conferring of authority to a church official by a superior in a ceremony involving presentation of the symbols of office, including an exchange of homage before consecration.

**Laity:** Secular persons, not members of the clergy (monks, priests, canons, bishops, deacons, etc.).

**Limbo:** An abode of souls for those who, through no fault of their own, are barred from salvation because they were not baptized (as in the case of infants or people who lived before the time of Christ).

**Mass:** The liturgical rite of Christianity connected to the blessing or consecration of bread and wine along with the conventional prayers, songs and readings which accompany it.

**Mendicants:** Those religious, specifically friars, who depend upon begging for their support.

**Missal:** A book containing the complete rite of the Mass, with all prayers, readings, and chants.

**Office:** From Latin *officium* or duty, the prescribed daily round of prayers, mainly psalms, recited seven times a day in community, called for in the *Benedictine Rule*.

**Office of the Dead:** Prayers said on behalf of the deceased, often for individuals connected by membership or patronage to the monastery or community offering the prayer.

**Papal bull:** A written pronouncement or mandate from the pope. In the early days they were sealed with the stamp of the pope's ring (from the Latin *bullā* or seal).

**Penance:** The sacrament of forgiveness (that is, forgiveness by God through the action of a priest), which in the Middle Ages involved confession of sins followed by an act of restitution.

**Psalter:** A book of the psalms.

**See:** Literally, the official seat (from the Latin *sedes*) of a bishop, hence the place where the bishop sits or resides.

**Simony:** The sale or purchase of a church office.

**Stigmata:** Bearing the wounds of Christ.

**Transubstantiation:** Conversion of the substance of the bread and wine into the body and blood of Christ, with appearances of bread and wine remaining.

**Votive:** A liturgy or offering of prayer that is done with a particular intention in mind.

**SCHOOLS AND LAWS.** In developing a formal link with the papacy (the bishop of Rome who had authority over Western Christianity) and becoming a defender of the papal holdings of land and interests in northern Italy, Charlemagne and his Carolingian Dynasty, which ruled until the tenth century, united with the legacy of the old Roman Empire as well as the traditions and administration of Western Christianity. Taking this role seriously, Charlemagne sought to establish schools that would be located in the cathedral city centers and at monasteries where boys (mostly from the upper class) could be instructed in mathematics, grammar, and music, as well as in reading from church books such as gospels, psalters, and missals (if such manuscripts were available). Scholars such as Alcuin of York were brought into the kingdom from other lands to serve as teachers in the Frankish schools. Charlemagne also attempted to ensure that Sunday be observed as a holy day and kept

free from work. Activities like hunting, farming, construction, gathering for legal procedures, weaving, tailoring, and even doing laundry were discouraged. People throughout the new empire were urged to attend Mass on “the Lord’s Day.” During the services priests were encouraged by royal directives to teach the notion of the Trinity—made particularly visual in an image from an English book of hours from York—and introduce doctrines associated with judgment, salvation, hell, faith, hope, and charity, as well as the love of God and neighbor. As the influence of Christianity became more pervasive, it appears that a fusion of church traditions and the laws of the Carolingian realm began to intertwine. However, it is not clear as to the extent to which these laws were actually enforced, since a number of forged collections of laws from the period (among them the Pseudo-Isidorian *Decretals*) dominate those that have survived. While some of the false decretals, particularly

## THE Monastic Day

One part of the monastic rule required monks to sing the divine offices at specific times during the day and night. The schedule for this activity (which changed according to the time of year), as well as mealtimes and work periods, is given below with the names of the “canonical hours” of the day. Said privately, the prayers would take up a total of about one and a half hours, but sung in the choir, they would take much longer. “Lauds” are said at first light, “compline” at sunset, with the times for other services determined by dividing the hours of daylight into twelve, so that in summer each daylight hour is longer than each night hour, and vice versa in winter. The version here is based on the Rule of St. Benedict as observed by the Cistercians.

	June	December
Rising	1:45 a.m.	1:20 a.m.
Vigils	2:00–3:00 a.m.	1:30–2:50 a.m.

		[Reading]
Lauds	3:10 a.m.	7:15 a.m.
Prime (first hour)	4:00 a.m.	8:00 a.m.
		[9:20 a.m.–Terce]
Chapter	4:15 a.m.	9:35 a.m.
Manual labor	4:40–7:15 a.m.	9:55 a.m.
Terce (Third hour)	7:45 a.m.	
Sext (Sixth hour)	10:40 a.m.	11:20 a.m.
Dinner	10:50 a.m.	
	[Reading or sleep]	[11:35 –Manual labor]
None (Ninth hour)	2:00 p.m.	1:20 p.m.
		[1:35 p.m.–Dinner]
Manual labor	2:30 p.m.	
Vespers	6:00 p.m.	2:50 p.m.
Supper	6:45 p.m.	
Compline	7:50 p.m.	3:55 p.m.
Sleep	8:00 p.m.	4:05 p.m.

those that favored a strong papacy, were promulgated during this period, there was actually no one official and universally accepted body of canon law until the Decretals of Gregory IX in 1234.

**A RULE FOR MONKS.** Under the Carolingian kings there was an attempt to create a uniform rule for monks throughout the empire. Charlemagne favored the *Rule of Benedict*, which had been developed in Italy in the sixth century, and encouraged those monastic houses (especially those east of the Rhine River) that were not in compliance to consider seriously adopting this lifestyle of stability and obedience, lived out in a balanced daily spiritual experience of work, study, and prayer. However, it was not until the time of Charlemagne’s son Louis the Pious (778–840) that a reformed version of the Rule of Benedict was established. These revisions to the Benedictine lifestyle were introduced by a monk named Benedict of Aniane (750–821) and became universally adopted throughout the Frankish empire. Under these ninth-century monastic reforms additional prayers were included alongside the original sixth-century Benedictine Office. This kept the monks much busier in prayer, often too preoccupied with the Daily Offices to comply fully with the directives for manual labor that were an essential component of the earliest Benedictine Rule. The Frankish crown’s endorsement of the Monastic Capitulary of 817, which en-

sured enforcement of Benedict of Aniane’s revisions, is most likely responsible for the eventual standardization of the Benedictine Rule throughout Western Europe.

**THE MULTIPLICATION OF PRIVATE MASSES.** Interestingly, it was also during this time that the number of monks who were also priests (a minority in early monasticism) began steadily to grow. The shift to larger numbers of ordained priests encouraged a more formal liturgical emphasis in the monastic lifestyle, which increasingly attracted members of the nobility. This tendency for some monks to spend most of their time on liturgical duties also left the door open for the appearance of lay brothers (members of a lower class in society whose focus was predominantly on labor), as well as the use of peasants to work on monastic lands and estates. With the increase in monks who were also priests came the development of private masses, where priest-monks would celebrate liturgies ostensibly by themselves, but usually with a lone attendant such as an oblate or lay brother. In cathedrals and larger churches, the presence of multiple altars containing relics of saints requiring veneration on a regular basis also helped create the occasion for private masses. Eventually numerous requests for votive liturgies—those conducted with a particular intention in mind, usually at the behest of wealthy laity—gave rise to the multiplication of private masses

## ROLES and Occupations in the Latin (Western) Christian Church

**Acolyte:** A person in the beginning stages of the priesthood delegated to assisting priests and deacons in masses of the Latin Church.

**Anchoress (f.)/Anchorite (m.):** A solitary or hermit who pledges her or his life to prayer and contemplation. Anchoresses often lived in a small room attached or “anchored” to a church or public building. Visitors could come and speak with them and receive spiritual direction.

**Archdeacon:** The bishop’s principal assistant or officer.

**Bishop:** A senior cleric in charge of the spiritual life and administration of a region known as a diocese.

**Canon:** A member of the clergy following a rule like those followed by monks but often attached to a cathedral or large urban church; the canon is responsible for the daily running of the church and for educating the children of the nobility (sometimes called “canons regular” because they lived according to a rule and formed groups called “colleges”).

**Cardinal:** A member of the college of Roman princes who are the immediate counselors of the pope and rank second only to the pontiff in the church hierarchy. At various times they meet in conclave to elect new popes. There are also various local and episcopal offices, most in the city of Rome, to which the term “cardinal” is attached: cardinal deacons who took care of the poor in Rome, cardinal priests who were priests of the various Roman churches or parishes, and cardinal bishops (mostly outside of Rome) who were needed for service as the pope’s representatives.

**Chancellor:** A church officer in charge of a university.

**Conversi:** Lay brothers, or adult converts to religious life, as opposed to those oblates who were raised in the monastery as children.

**Deacon:** Literally, the servant of the bishop in early Christianity. The status of deacon was one of the early steps on the way to priestly ordination in the medieval period. The deacon could have specific liturgical functions associated with the Eucharist and dismissal at Mass.

**Friar:** A member of one of several religious orders who served as missionaries, teachers, and confessors; friars (brothers) did not live a cloistered life, but rather lived together in convents on the edges of cities.

**Lay brother:** A person associated with monastic life, but often of a lower social class than the other monks; lay brothers were commonly less educated or unable to recite in Latin, were not part of the choir, and spent much of their time in manual labor.

**Monk:** A member of an all-male religious order who follows a Rule requiring withdrawal from society and devotion to prayer, solitude, and contemplation.

**Nun:** A member of a religious community of women living a cloistered life of religious devotion in a convent or double monastery.

**Oblate:** A lay person who is part of a religious community. From the Latin word *oblatio*, meaning to offer, this term often refers to children who were “offered” by their families to the service of God in a monastery or convent, to be brought up as a monk or nun.

**Pope:** The head of the Roman Catholic Church. The pope, or pontiff, was also called the Bishop of Rome since he presided over the entire Latin Church due in part to his authority over the local Roman episcopal see.

**Postulant:** A person seeking admission to a religious order. Often he or she was allowed to try out monastic life for a brief time.

**Secular clergy:** Priests living in the world, as opposed to “regular” clergy, living under the rule of a religious order.

**Sub-deacon:** A minor order of cleric who could not administer sacraments (only sacramentals) and who prepared bread, wine, and vessels at Mass.

in the monasteries. Papal records during the ninth century indicate that certain priests celebrated the liturgy as many as nine times each day.

**THE GROWTH OF THE SECULAR CLERGY.** Alongside the growing monastic movements, a separate group of secular clergy (those living out in the world rather than in a cloister) ministered to the laity in local parish churches and in large urban cathedrals. The English called these secular churches “proprietary” while the Germans referred to them as *Eigenkirchen* (churches under

private control or ownership), since often the local lords helped support them and would commonly appoint the parish priests. The cathedrals—large, important churches, usually in urban areas—often had a number of priests who might reside in the household of the bishop, the senior official in charge of the region or diocese. Eventually the term *canon* was applied to the clerics who lived at the cathedrals because it was said that they were living according to the canons (traditions and laws) of the church. According to the rule developed by Chrodegang

Bishop performing exorcism, bas relief of font, Modena Cathedral, Museo Civico, Modena, Italy, 13th century. THE ART ARCHIVE/MUSEO CIVICO, MODENA/DAGLI ORTI.

of Metz, the canons, unlike monks, could own their own property and were not always required to live under the same roof with their fellow clergy. But like the cloistered monks (those who lived beyond the monastic *cloister*—that is, enclosed space—and took the Benedictine vow of stability), the canons assembled each day to hear a reading of a chapter of sacred scripture and thus were said to belong to a community or *chapter* of canons. Houses for canons began to become more popular by the mid-eleventh century. This communal arrangement worked well for urban dwellers but proved to be difficult for rural clerics. Customs seemed to differ from house to house. They would eventually come to prefer the Rule of Augustine by the twelfth century.

**THE DEVELOPMENT OF SACRAMENTARIES.** The Carolingian era was an important time for Western liturgical development. Books called *Sacramentaries* which contained prayers and guides for the celebration of Mass and other religious rites began to become common throughout France. However, there seemed to be little uniformity in the way each community used the liturgi-

cal prayer books. Alcuin of York, the primary teacher at Charlemagne's palace school and abbot at several monasteries, began the process of making revisions to the Roman Sacramentary sent to the Franks by Pope Hadrian I (772–795) as usages became refined in the Christian empire over the next two centuries. The Frankish version of the Sacramentary eventually became the standard throughout Europe (preferred even to the Roman text) and continued to be the basis for practice in the Western church right up until the mid-twentieth century.

## RELIGION IN SCANDINAVIA AND EASTERN EUROPE

**EARLY VIKINGS.** The term “Viking” has been used to refer to inhabitants of Scandinavia and the northern regions (Denmark, Norway, and Sweden). The native religion of these people was polytheistic (that is, involving worship of more than one deity) and revolved around a pantheon (a system of gods and goddesses) that was anthropomorphic—that is, featuring gods with human characteristics. Viking societies were also reputed to be polygamist, allowing multiple spouses within a family. Some scholars have gone so far as to attribute the invasions to the south and east, which began after 800, to a crisis of overpopulation linked to the polygamist practices of certain Scandinavian groups. Little is known about the actual religious practices of the Vikings before the thirteenth and fourteenth centuries. Most of the information on this era comes from Icelandic sagas that had long been removed from their earlier Scandinavian cultures and were perhaps even further affected by Christian ideas, since they were recorded in Icelandic societies that had long been educated and immersed in Christian tradition. The Saxon chronicler Widukind of Corvey, who wrote in the mid-tenth century, commented that although the Danes converted to Christianity they “continued to venerate idols according to their heathen customs.” From this time period in Denmark and Sweden, casting molds were discovered which simultaneously produced crosses for Christians and hammers for devotees of the thunder god Thor.

**GODS AND DOMAINS.** The Vikings’ religious practice helped orient them to the world around them, assisting them in understanding both the present and the past. They perceived the universe to be comprised of a number of worlds (heavens, hells, earth) numbering anywhere from three to nine, depending upon the cultures and particular historical time frame. The gods resided in a variety of these worlds and affected the daily lives of

humans. These divinities had certain domains for which each was responsible. For example, Odin (or Woden) was the god of war, the all-father, a middle-aged kingly figure who in later periods was seen as the god of the sky. He resided in Asgard, the heavenly home of the warrior gods. Odin rode an eight-legged horse named Sleipnir and was accompanied by two ravens (Hugin and Munin) who informed him on a daily basis of the deeds of the other gods, giants, dwarves, and, of course, humans. He was also attended by the Valkyries, female warriors who were said to be responsible for taking those who died bravely in battle to Valhalla, a great palace in the city of heaven close to where Odin resided. In Valhalla the dead war heroes spent eternity fighting by day and feasting at night. Among the more popular Viking gods was Thor. He was said to be tall, strong, determined, and good-hearted, but he was known to have a temper and was lacking in intelligence. The thunder god wielded a throwing hammer forged by dwarves that could, after its release, magically return to his hand at his bidding. Freyr, a nature deity associated with the sun, rain, and agriculture, was also the god of peace and goodness. His twin sister was Freya, the goddess of love and beauty. It was believed that she could turn herself into a bird by donning the skin of a falcon. Some members of the Viking pantheon, of course, reflected the “darker side.” Loki was the challenger of order and structure—the god of fire and a sort of “trickster” deity, the one deemed necessary to bring about change. His daughter was Hel, the goddess of death and the afterlife.

**RITEs AND CEREMONIES.** The Vikings believed it was necessary to establish close relationships with the gods as they looked after their families and their honor, as well as their tribes, villages, and kingdom. The gods helped the kings keep peace and looked favorably upon the harvests. The deities were both patrons and companions, to whom the people owed tribute and from whom they received many blessings. Priests functioned as intermediaries and would perform rites to the cults of various gods. However, they were not a professional caste. Chiefs and tribal leaders often functioned as priests, or a father would fulfill that function during family gatherings; however, the priest could often be killed or banished from society for improper or unfavorable mediation. The Scandinavian polytheists most often worshipped in open-air spaces where they could more appropriately connect with nature. There were communal ceremonies in open fields, meadows, and clearings, at gravesites and near massive stones. The dead were often buried with their possessions. At especially solemn feasts there could be blood sacrifice (*blot*). The eleventh-century chronicler Adam of Bremen described

a particular Viking religious ceremony that was supposedly celebrated only every ninth year, explaining that “nine heads were offered from every type of living male creature and the custom was to appease the gods with their blood.” Decapitated bodies were hung in a grove, which was considered sacred, as were the trees upon which the victims hung. In fact, the trees were by virtue of their role in the ceremony considered sacred in and of themselves. The details of the event were startling:

Dogs were hung with horses and men and a Christian told me that he had seen as many as 72 corpses hanging in rows. The blood was collected in a sacred vessel and sprinkled by the priests. The ritual was followed by a feast with offerings to the gods.

**THE SPREAD OF CHRISTIANITY.** Christian missionaries began to be sent to the Danes and Swedes in the early 800s, though it is unlikely that any of the kings in Scandinavia from that period underwent conversion. What is clear is that Vikings and Christians lived side by side and freely traded goods at stations such as York, Lincoln, Dublin, Fécamp, Rouen, Birka, Kaupang, Nov-

gorod, and Hedeby. Those Vikings who settled in predominantly Christian areas on the European mainland eventually assimilated Christian customs, lifestyle, and faith, and by the mid-1000s Christianity began to become more firmly established in Denmark and Norway, with Sweden following in the middle of the twelfth century. As these conversions took place, some of the pagan sacred sites in Scandinavia were taken over by Christians, and churches were built on or near these places. In Sweden at Gamle Uppsala there are remains of an early Christian church that stands beside a large Viking burial mound. Harold Bluetooth, the king of Denmark from 940 to 986, was quite successful in influencing his people to convert to Christianity. Christian images appear on Danish coinage from his reign and there are records of the establishment of bishoprics in major Danish cities. Christianity became even more pervasive in Denmark once Canute (1018–1035) became ruler of both England and the Danes in 1018. Influenced by the great English bishop Wulfstan of York (d. 1023), Canute became a patron of Christian institutions and a model king, rivaling his royal and noble contemporaries. After Canute’s famous pilgrimage to Rome in 1027, other nobles such as Robert of Normandy, Macbeth, Sihtric Silkbeard, Earl Thornfinn, and Earl Tostig all followed his example in undertaking journeys to holy sites. He attached a number of Danish bishops to his court and sent them out to establish churches throughout Scandinavia.

**LOOTING OF MONASTERIES.** From around the year 800 on, the Vikings engaged in a period of tremendous expansion, using their naval expertise first to engage in raiding and looting along the coastlines of Europe and later to undertake conquest and settlements in England, Ireland, northern France, and Russia, as well as places as far away as Iceland, Greenland, and Finland. During the age of Viking invasions, it was not uncommon for Christian monasteries in coastal regions of England, France, and Germany to endure a certain amount of looting—not, apparently, as a deliberate attempt by the invaders to destroy the system of Christian organization and faith, but for purely material reasons. Not only were the monasteries repositories of church treasure (including gold and silver vessels, jeweled reliquaries, lavishly decorated manuscripts—such as a French book of hours containing an ornate miniature of the Annunciation to the Virgin—and priestly vestments), but some of them acted as banks and safe depositories for the aristocracy. Monasteries located on rivers were also susceptible; for example in Normandy, along the Seine, there are records of displacements at Saint-Audoen and Saint-Filbert at Jumièges. It was also common to find certain breaks in

episcopal succession in areas that were prone to Viking invasion. For example at Avranches in Normandy there was no bishop from 862 to 990. In the British see of Galloway, records of episcopal activity vanish in the ninth century and do not reappear until the office was revived in 1128. Those Christian monasteries and bishoprics that were fairly poor did not seem to be disturbed as much by the Viking invasions.

**CONVERSIONS.** The period of competing religions in western Europe reached its end by around the beginning of the twelfth century. The story of the conversion of Norse settlers in Iceland, for example, is told in the *Landnamabok* (Book of Settlements). Bishops from the Isle of Iona (off the coast of Scotland), such as Patrick in the late ninth century (not to be confused with St. Patrick of Ireland) and Fothad (c. 960), sent native Scandinavian missionaries that they had trained to Iceland to build Christian churches. Intermarriages between Christian Scottish aristocrats and Scandinavian ruling families were common, and by the mid-1000s many of the Vikings who had settled in the northern British Isles had converted. (Conversions of the native British and Irish were much earlier, mostly during the sixth, seventh, and eighth centuries.) In Ireland more permanent coastal commercial centers of Viking traders were established during the ninth century, and certainly by the tenth and eleventh centuries there are records of conversions of leaders such as King Olaf Cuaran of Dublin and his son Sihtric, who made a pilgrimage to Rome in 1028, issued coins with Christian symbols, and founded Christ Church Cathedral in Dublin. Likewise, the conversion of tribes of the Rus' in eastern Europe (the area near modern Kiev, Russia) was a lengthy process. In the 860s Rus' ambassadors to the court at Constantinople had embraced Christian monotheism, and in the 870s a bishop was sent to live among them, but it is more likely the primary concern was ministry to those Christian merchants who routinely made journeys into the Russian territories, not ministry to the Rus' themselves. Indeed, in the early 900s the Muslim traveler Ibn Fadlan still relates tales of offerings made by the polytheistic Rus' to their gods for success in commercial endeavors. The Byzantine emperor Constantine Porphyrogenitus (913–959) wrote in his diplomatic manuals about the practice of sacrificial offerings made by Rus' merchants for safely navigating the rapids of the Dnieper river during their trade with the west. By 945 there was a Christian church in the city of Kiev, and Olga, the wife of Prince Igor, was baptized in 957 while on a visit to the city of Constantinople. Upon her return she built a church in Kiev dedicated to the *Hagia Sophia* (holy wisdom) in commemoration of her admiration for the fa-

mous cathedral of the same name in Constantinople. Olga's grandson Vladimir was baptized at Kiev in 988 and was married to Anna, the sister of the Byzantine emperor Basil II. Shortly after this, there were mass baptisms in Russia, followed by the establishment of more churches, bishoprics at Belgorod and Novgorod, and a school to educate clergy. In the eleventh century native Rus' such as Luke of Novgorod were elevated to episcopacies, the monasteries of St. George and St. Irene were built in Kiev, and Jaroslav the Wise (d. 1045) rebuilt Kiev's *Hagia Sophia* on an extraordinary scale. Additional monastic establishments followed.

## THE SPREAD OF ISLAM AND ITS RELATIONSHIP TO MEDIEVAL EUROPE

**GROWTH OF ISLAM.** When Islam first emerged in Arabia during the mid-seventh century, there was little indication that within 150 years the movement would come to dominate the entire Middle East, as well as northern Africa and Spain. The early spread of Islam was directly linked to the revelations and work of the Prophet Muhammad who preached religious and moral reform throughout Arabia between 610 and 632 C.E. However, the origins of the movement were fraught with struggle. Acceptance of the faith in the polytheistic city of Mecca along with much of the rest of Arabia was gradually accomplished after a series of military campaigns, treaties, and non-violent pilgrimages undertaken by the newly formed Ummah (the gathered community of believers). The earliest Muslims were scorned in the major trade center of Mecca and began assembling their community under the leadership of Muhammad at the more northerly city of Yathrib in the Arabian peninsula.

Several generations of the Prophet's successors (known as caliphs) during the eighth century spread the faith through both religious and political programs into North Africa, the Middle East, and even as far as Spain. Still, despite its widespread geographic success, until about the year 1000 Islam was more of an administrative presence than an ideology that had won over the majority of the populace. In many areas, the growth of converts was gradual, perhaps because (at least until the twelfth century) the Muslim conquerors seemed quite tolerant of other faiths. It has also been suggested that political, economic, and military control of strategic geographic locations was more important than converting entire populations. Forced conversion to Islam was not practiced in many non-pagan areas, especially where Jews and Christians were living in newly occupied Muslim territories. In fact, they were often referred to as the "People of the Book," since all three traditions shared common elements in their sacred scriptures and traced their heritage back to the figure of Abraham. While members of other faiths were often tolerated, they usually were not allowed to participate in government and had to pay special but not exorbitant taxes. The cultures and faiths affected by the early growth of Islam were quite diverse: not only the formerly polytheistic people of Arabia, but the Coptic Christians in North Africa, Eastern Orthodox in Palestine and Asia Minor, Roman Christians in Spain, Nestorian and Arian Christians in the Holy Land, polytheistic Berber tribes in North Africa, and Jews of various kinds throughout the Mediterranean and Middle East all became subjects of Muslim caliphates. By the year 1000 it is believed that nearly eighty percent of the population in the Dar-al-Islam (Islamic territory) had converted to faith in Allah as it had been revealed to the Prophet Muhammad in the seventh century and handed down through succeeding generations by way of the holy Koran (Qur'an).

**ELEMENTS OF ISLAMIC BELIEF.** Requirements for participation in the religion of Islam were not extreme compared to some Jewish and Christian practices. The Muslim theological notion that people tended to be "forgetful" of Allah (God) seemed to be reinforced by directives for prayer five times a day (*salat*) and a month-long season of fasting (*sawm*) during the season of Ramadan. However, the most important religious act was that of simple belief, reciting the creed or confession of faith (*shahadah*), that "there is no God but Allah, and Muhammad is His prophet." Almsgiving (*zakat*) was also expected of Muslims, charity both to the poor and in support of religious institutions. Although these were not practices all people readily desired to embrace, the potential for reward seemed not to be fraught with

as many of the complex and confusing doctrines or laws as existed in Christianity and Judaism. Those who followed without question the teaching of the Prophet and the will of Allah were assured eternal paradise. As time passed, the Islamic holy book, the Koran, began to be seen as an infallible scripture, the mother of all books, the literal word of Allah, sealed as the final revelation that humans will ever need. Islamic law (or *shari'a*) seems not to have been divided between separate religious and civil realms. By the ninth century, law began to be viewed as descending not only from the authority of God's scripture but also from the practices and sayings of the Prophet (*sunna*), which were handed down orally and eventually written into the *Hadith*. Added to this law was the *ijma* or traditions of historic Islamic communities. Later works like the ninth-century *Tafsir* became important commentaries on the Koran and formed the basis for Islamic theology.

**DYNASTIES AND RELIGIOUS DIVISIONS.** Islamic presence in Spain appeared at a very early juncture during the evolution of the major Muslim dynasties. The presence of the Umayyad Dynasty, which began in Damascus in the middle eighth century and continued in Spain until the eleventh century, put Muslim Spain (known as al-Andalus or Andalusia) into commercial contact with the North African coast, Palestine, and Syria. This led to the development of flourishing trade centers and a period of artistic and intellectual growth. Under the Umayyads, Jewish merchants enjoyed more tolerance than in Christian states, although persecution increased with the arrival of the Almoravids in the eleventh century and the Almohads in the twelfth, each of whom brought their own cultures and customs to the interpretation of Islam. There were also major religious divisions within Islam that began to emerge after 1000. The *Sunni* and *Shi'ite* positions, which go back to seventh-century disputes over the requirements for who might succeed the prophet Muhammad as caliph and still divide Islam today, became strongly linked to ideological and political separations dictating the way Islam would be practiced and perceived. The Sunni, who were in the majority, most often preferred to be directed by teachers, scholars, preachers, and government officials. They subscribed to interpretations of an eternal and uncreated Koran, the word of Allah, which was to be obeyed without question, but expressed concepts of an Allah that could not be completely known to humankind. The Shi'ites, making up roughly a fifth of medieval Muslims, had migrated toward stricter and even more literal interpretations of Islamic law and ideology, as well as relying upon religious leadership that was more charismatic. The mystical branch of Islam called *Sufism*, which be-

gan as more of a monastic movement in the eighth and ninth centuries, became popular among individuals who rejected the formalized trappings of Islamic religious life and were looking for more inward and personal expressions concerning their relationship with Allah.

**LAW AND PHILOSOPHY.** There were no priests with sacramental powers in Islam, as individuals were considered accountable directly to Allah and needed no spiritual intermediaries. Any devout Muslim could lead prayer, so that all were regarded as equal in the eyes of Allah. However, certain dynasties subscribed to the notion of a *mahdi* (that is, a divinely guided savior or messiah) who might bring justice and righteousness to the earth, restoring the true and proper message of Allah, if one would only follow his lead. The observance of religious law became most important, particularly as a variety of dynasties began to compete with each other for political control of Arabia, Persia, North Africa, Spain, and Asia Minor. As early as the eighth century, Muslim schools sprang up which were devoted to examining the roots of Muslim law. This process was called *ijtihad*, meaning a strenuous examination. Sunni schools of religious law called *madhhabs* began to emerge which would establish norms for Muslim practice. Four distinct schools came into being at the major centers of Damascus, Medina, Baghdad, and al-Andalus. The growth of learning centers and formalized education as well as interest in mathematics, astronomy, and philosophy began to create divisions in Islam and give rise to a host of theological debates. Unlike the Christian scholars, the organization of knowledge for medieval Muslims took in separate religious and non-religious categories. However, like Christian scholastics, there were prominent Muslim philosophers, such as Al-Ghazali (b. 1058) in Baghdad, Averroës (1126–1198) in Spain, and Avicenna (980–1037) in Persia, who struggled to reconcile the notions of faith and human reason. The numerous advances of Muslim thinkers had important influence on philosophers in the Christian West. Based upon the works of the Greek philosopher Aristotle, Islamic examination of natural and metaphysical truths attempted to link everything in the universe to Allah.

**CONFLICTS WITH CHRISTIANITY.** During the first several centuries of Muslim control over the Holy Land, Christian pilgrims were able to visit the sacred sites with relative freedom. Their overland route usually took them across southeastern Europe, through Hungarian territory, Greece, Anatolia (Turkey), and Syria. Those who traveled by sea landed in Egypt or directly in Palestine. The growing threat of the Muslim presence on the border of the Byzantine (Eastern Christian) Empire and the loss of Byzantine control over the Holy Land served as a pretext

for the Christians initiating the Crusades, which were in part due to religious ideological differences (Pope Urban II characterized the First Crusade as the will of God), but not completely driven by a desire to eradicate Islam. The factor most likely responsible for the early successes of the Christian invasions of the Holy Land was the internal disorder among the various Muslim dynasties, several of which were on the brink of controlling the area. Since the concept of the “Crusades” is something that developed from a European mindset, Muslims did not write their history about the wars for the Holy Land in the same way as Christians. These conflicts are more or less seen as any other wars with an invading enemy (most particularly in this case the French or “Franks”). The idea of *jihad*, struggling or fighting to maintain excellence (or striving for an ideal society in which Islam might flourish), is present almost from the beginning of Muslim thought, but not in terms of physical battle as much as a spiritual and a collective duty expected of all Muslims. Emphasis was upon the “greater jihad,” that is the struggle within oneself. The “lesser jihad” was connected to the idea of the physical struggles on the path to God. Endeavors connected to the “lesser jihad,” such as mission effort, good works, building mosques, even ideas such as physically overcoming the enemies of the faith, would not become significant to Muslim theology and ideology until the twelfth century. Those who lived in the part of the Islamic world that was spreading the faith were, for example, linked to the ongoing missionary activity in the *Dar al-harb* (the abode of conquest or expansion). Throughout its early history, Islam did carry out large-scale military conquest, but the term *jihad* as specifically connected to holy war only began to appear much later, at the time of the Second Crusade (1146–1148), in response to the Christian military threats.

## MEDIEVAL JUDAISM

**DIASPORA AND REESTABLISHMENT.** Judaism came to Europe as a result of a process known as *diaspora* (from the Greek “scattering”), which can refer to any number of migrations of Jewish communities when they were forced to leave their homes and live among Gentiles outside the Holy Land. Major diaspora occurred after the Babylonian exile in the sixth century B.C.E., after the destruction of the Second Temple in Jerusalem in the first century C.E., in the early medieval period following Muslim conquest of the Holy Land, and in the late medieval period linked to Christian inquisitions and persecutions. Medieval Jewish religious communities were quite diverse as the various diaspora movements resulted in pockets of settlement all over the Middle Eastern, Mediterranean, and European world. Those settling in Spain, known as the Sephardim, created a golden age of Jewish culture in Muslim Andalusia. Those who settled in Germany and eastern Europe following the diaspora of late antiquity and the early medieval period were known as Ashkenazim (from a word meaning “Germany”). These two groups came to be distinctive in their liturgy, religious customs, and pronunciation of Hebrew, but both revered the Torah, the scriptures which constitute the Jewish “Law,” identified by Christians as the first five books of the Old Testament: Genesis, Exodus, Leviticus, Numbers, and Deuteronomy. Both were also guided by rabbis, the teachers of classical Jewish tradition who, after the second diaspora in the first century C.E., came to serve as legal and spiritual leaders for the Jewish communities.

**TORAH AND TALMUD.** Among the various groups of Jews who settled in Europe, some chose to hold on to the traditions of the Talmud (from the Hebrew word for “study”), a collection of commentaries on the Hebrew scriptures that had begun as an “oral Torah” in the first century B.C.E. and was eventually codified by rabbis. Those inclined toward liberal education embraced more philosophical understandings of their traditions, while others adopted more decidedly mystical approaches to God. Centers of higher learning known as the yeshivah (*yeshivot*) began to arise in cities with significant Jewish populations. Among the more famous were Córdoba in Spain, al-Qayrawan in Tunisia, and Mainz in Germany. These schools began to produce scholars, rabbis, and poets who made rich contributions to medieval Jewish tradition. As early as the ninth century, a Jewish movement developed that saw the Talmud as a departure from the divinely revealed truth of the Torah, which was the supreme authority in matters of faith. This group, which drew ideological inspiration

from the eighth-century scholar Anan ben David of Baghdad, soon became known as the “Children of the Text” or the *Karaites* (*Qaraites*, literally, “readers”). The Karaites abstained from eating meat, seeking treatment from physicians, and using lights on the Sabbath. They practiced personal interpretation of the scriptures and challenged Orthodox Judaism’s juristic interpretations of God’s Law. In the midst of this awakening, a Babylonian scholar, Saadiah ben Joseph (882–942), rejected the more radical Karaite notion of completely eliminating Talmudic interpretation, but he did endorse the return to the Hebrew Scriptures themselves. In order to provide a fuller appreciation for the language and voice of the scriptures, he had the Hebrew texts translated into Arabic for Jews in Muslim-controlled areas. He also introduced the idea that the Creator may have had some purpose for giving humans a rational side, one that might lead them to a greater understanding of God’s purposes. Reflecting the Aristotelian naturalism and logic that were beginning to be introduced into Jewish thought through intellectual interaction with the Arabic culture, Saadiah’s most famous work, *The Book of Beliefs and Opinions* (*Sefer Emunot ve-De’ot*), carved the way for the tradition of rationalism in the rabbinic authority of Judaism. After this period, rabbis moved in two directions, either embracing or rejecting the role of philosophical reason in Jewish theology and practice, a pattern that would be repeated among Christian philosophers and theologians several centuries later when these same Aristotelian ideas began to form part of the European university curricula.

**THE JEWISH INTELLECTUAL MOVEMENT IN MUSLIM SPAIN.** As Arabic translations of the Greek philosophers were introduced to Jewish schools, reason and revelation began to be seen as working hand in hand to bring about a more balanced and enlightened system of Jewish thought. Many of the Babylonian scholars (in modern-day Iraq) who held such notions migrated to the Muslim-controlled portion of Spain (al-Andalus), where they founded universities such as the tenth-century Jewish Academy at Córdoba and encouraged new interpretations of Jewish tradition infused with the light of philosophical reason. One such scholar, Judah Halevi (1075–1141), argued that while philosophy might be compatible with the Torah’s depiction of the Almighty, the revelations in the Torah gave a much more complete rendering of the human relationship with God. Halevi’s view warned against too rigorous an incorporation of philosophy and supported the interpretive role of the rabbi in Jewish religious life. Other eleventh- and twelfth-century Spanish scholars, rabbis, and poets, such as Solomon ibn Gabirol, Bahya ben Joseph ibn Pakuda, and Abraham ben David Halevi ibn Daud, were quite

supportive of Neo-Platonic and Aristotelian philosophies. Out of this growing and diverse intellectual Jewish environment came Moses Maimonides (1135–1204), the most famous and influential Hebrew scholar and philosopher of the medieval period. When Maimonides and his family had to flee Córdoba and relocate in North Africa to escape Muslim persecution, Moses continued his education within a liberal Jewish philosophical and theological environment. His writings—based upon the scriptural traditions, the Mishnah (the authoritative legal tradition), Aristotelian principles, and some ideas of his own—emphasized a practical, ethical, rational, and balanced Jewish life. His greatest work, the *Guide for the Perplexed* (*Moreh Nevuchim*), sought to articulate Jewish belief in light of Torah revelation, faith, reason, science, and philosophy. Maimonides felt that faith must supplement human reason, which can only go so far. He also taught that miracles might be explained rationally, and scriptural accounts that defy reason might better be interpreted in a more allegorical fashion. Some of his realizations concerning God, the soul, and the place of humanity were written into the Thirteen Articles of Jewish Faith, which formed a creed that was used in later medieval Jewish worship.

**CHRISTIAN OPPOSITION.** As the general knowledge of the Hebrew language declined in northern Europe, European Jews began increasingly to rely upon interpretations of their tradition in the form of the Talmudic texts instead of a direct reading on their own of the collected Hebrew scriptures. Although medieval Christians accepted the entirety of the Hebrew canon as what they called the “Old Testament,” they harbored much suspicion concerning the Talmudic traditions. Certain writers such as Peter the Venerable (1092–1156), the abbot of Cluny, went so far as to suggest that these texts contained material that was blasphemous to Christian belief. (Scholars are not in complete agreement as to whether or not Peter actually read the Talmud.) In 1240 at the request of Pope Gregory IX, Jewish books were seized from synagogues throughout England, France, and Spain, and a trial at the city of Paris was conducted accusing Jews of being discontent with the “Old Law” of Moses and affirming another law, the Talmud. In France, rabbis were imprisoned and forced to defend their position in disputations with Christian scholars. In May of 1248 the Talmud was condemned at Paris by the Christian commission. Cartloads of the document had been burned, and the practice continued throughout Europe over the next few decades. However, Innocent IV had made certain provisions for some tolerance of the Talmudic traditions inasmuch as they were not harmful to Christian teaching and assisted Jews in com-

ing to the light of conversion, against their old ways. In the early fifteenth century, repeated condemnations of the Talmud under (the extremely anti-Jewish) Pope Benedict XIII continued, but many of these statutes were reversed by Pope Martin V in 1419 at the behest of a Jewish delegation to Rome.

**MYSTICISM IN THE KABBALAH AND ZOHAR.** The Jewish word *qabbalah* (tradition) is often equated with a movement toward medieval Jewish mysticism which has its roots in scriptural accounts of visions, such as the “visions of the chariot” in the text of the prophet Ezekiel or apocalyptic notions from the book of Daniel. Works of the philosopher Philo, ideas from the Talmud, and lost books like the *Sefer Adam* (Book of Adam) also contributed to these mystical ideas. The major texts of the Kabbalah (or Qabbalah) were composed or edited sometime in the late twelfth century, likely in Provence or Spain. Many scholars suggest that the development of the Kabbalah came as a reaction against the Jewish philosophical schools in Spain that emphasized a more rational approach to one’s faith. The Kabbalah was written in various chapters over many decades and is comprised of several strands of mystical thought from gnostic (“secret knowledge”) to theosophical (concerning intuition and perception of the spiritual or divine) and visionary. At the heart of the work was the notion of uncovering hidden symbolic meanings and secret wisdom by interpreting the arrangement of words and numbers in the Hebrew scriptures. The interplay of letters, numbers, and their ciphering was believed to yield speculative insights into the nature of Godhead, on the principal that one who searches to find God in the “beyond” comes to discover that what one is seeking actually lies within. The Kabbalah addresses such issues as how a perfect God might create an imperfect world. Did God compromise Himself by bringing forth the finite from His infinite splendor? Interpreters went so far as to think they might be able to use Kabbalistic ciphering to predict or identify the Messiah. Certain movements connected to Kabbalistic spirituality would go on to produce a series of false messiahs in central Europe, which proved to be of tremendous disappointment to the medieval adherents of this mystical path. The Zohar, a part of the body of the Kabbalistic literature touted to be the mystical work of an earlier Talmudic sage but later discovered to have been composed in the late thirteenth century by Moses de Leone, attacks those who would neglect the commandments or seek solace in the rationality of things philosophical, and seeks a deeper penetration into the mysteries of the Torah. The human body is seen as a composite soul, as a perfect balance of male-female, reflecting spiritual elements, those “holy forms” of God

that can be unified in humanity with the supernatural soul of God.

**THE MEDIEVAL HASIDIC MOVEMENT.** Ashkenazi Jews in Germany developed a form of *hasidic* (pious) practice between the twelfth and fourteenth centuries. Their focus seems to have been on the love of God, not the more prevalent legalistic notions of fear or punishment. They were strict and demanding of themselves, feeling they should provide an example to the world, but lenient toward those outside their immediate communities. The Hasidei Ashkenazim were concerned with educating people toward an ethical life. Their *Sefer Hasidim* provided a guide toward a moral conversion of the heart. It was their fear that the world of humanity was besieged by demons and spirits of evil. Some became attentive to the power contained in the names of God and were attracted to the Kabbalist literature. Others were interested in living lives of a more ascetic nature. These German Ashkenaz communities were often caught up in sporadic persecutions by Christians. It was said that the greatest expression of one's love for God could be shown by enduring a martyr's death. Stories of pious Ashkenazim, exhibiting acts of charity, love, and moral rectitude, continued to provide inspiration for European Jews for centuries beyond the Middle Ages. The medieval movement is distinct, however, from the Hasidic movement of the eighteenth and subsequent centuries, whose members, distinguished by conservative clothing and hairstyles, can still be found today in communities in Israel, Canada, New York City, and elsewhere.

**THE DEVELOPING SPIRITUAL AND LEGAL ROLES OF RABBIS.** In the period before there was widespread Jewish migration to Europe, the title *rav* (*rabbi*) had been given to one who had received a type of ordination based upon his ability to teach and judge the law or his mastery of the Talmud. It was not quite like sacramental Christian clerical ordination, but it was conferred by the Sanhedrin or leading teachers of the community. During the diaspora in the centuries following the destruction of the Second Temple, the title "rabbi" became one of respect but most generally was applied specifically to those who were experts regarding Jewish law, particularly those formally trained by other Talmudic scholars. By the Middle Ages, then, rabbis were scholars, teachers, judges (particularly in Muslim Spain), and preachers, but not necessarily clergymen. Among their responsibilities, medieval rabbis were charged with composing commentaries on the scriptures, Talmud, and Halakah (legal texts), as well as works on ethics. One of the most famous contributors to this body of commentary known as the Midrash was Solomon ben Isaac

(Rashi) who emphasized the notion of uncovering the "plain meaning" of texts, both scriptural and Talmudic. Also produced by the rabbis were the *responsa*, which were legal opinions, arguments, or precedents, some of which even became codified into medieval Jewish law. Examples of the *responsa* might include a discussion of the ethical questions faced by Jewish tailors employed to sew crosses on the clothing of crusaders, the issue of allowing candles to burn on the eve of the Sabbath in a Jewish home, or whether it was permissible for the windows on one's house to be constructed so that one could look out into the house of a neighbor. Medieval ethical treatises were composed by rabbis such as the Spaniard Jonah Gerundi and the German Judah Samuel, responsible for *Sefer Hasiydiyum*. Because of the variety of roles they performed, rabbis sometimes faced ethical problems themselves, since they were not, at least in theory, to receive payment or salaries for their rabbinical functions, even though many, for example, were expected to serve as judges for their people. Thought and practice regarding compensation of rabbis began to change during the fourteenth century, and, similar to the medieval Christian controversy over lay investiture, the issue of governmental interference in rabbinical appointment became a problem. Some Spanish rabbis were even required to pay the royal treasury certain fees for their appointment.

**THE SYNAGOGUE.** While it seems logical that synagogues might be the natural and most essential center of medieval Jewish religious life, this was not necessarily the case. Sites for other activities, such as the *miqveh* (a ritual bath for women) and schools for both younger and older children, far outweighed the importance of a formal house of prayer and worship. In medieval Judaism, individuals could pray wherever they liked, as long as the area was clean, and there was no obligation to attend services regularly at the synagogue. However, group prayer, by a *minyan* of ten or more adults, was encouraged under Jewish law and required for certain prayers or for the reading of the Torah. Because of this practice, and also because Jewish worship was so often officially proscribed in the medieval era, private homes were often used for these gatherings. In fact, in many Muslim cities, construction of a large synagogue was prohibited. In European Christian cities, according to canon law, Jewish congregations could maintain small synagogues, but new and enlarged buildings were not allowed. Although very few synagogues from the medieval period have survived (those that have were often converted into churches), descriptions have been pieced together from limited archaeological evidence and extant historical accounts. At the center of the worship space was usually located a large table on which the Torah

## THE Midrash

The Midrash was a body of folkloric commentary gathered by rabbis from the third through the twelfth centuries to explain difficult passages of the Hebrew Old Testament. Tracing its origins to Moses, who was believed to have received teachings directly from God and then begun a chain of oral transmission through subsequent generations (the "Oral Torah"), the Midrash was especially known for its clarifications of elements of the book of Genesis and the story of the Creation and Fall of man. Many of these midrashic explanations were of striking charm and originality, and they were often incorporated by Christians into their own retellings of Bible stories, probably first transmitted when social relationships developed between some medieval rabbis (or "Hebraei" as Christians called them) and Christian commentators interested in the original Hebrew text of scripture. They were also known through the *Historia Scholastica*, a glossed Bible abridgment by Peter Comestor, dean of the Cathedral at Troyes, France, written about 1170. This work served as the basis of popular Bibles as it was widely translated into vernacular languages, and its Latin text formed part of university study. Peter Comestor seems to have acquired a considerable amount of Hebrew learning through direct or indirect contacts with rabbis, most particularly the work of Rashi (1040–1105) in the Jewish community of Troyes.

The Midrash is especially important to the study of medieval art and literature because, in various forms, rabbinic explanations of scripture were used in Byzantine and Catalan painting. Particular representations of Moses in art, for example, are based on midrashic additions or

glosses to the story of Moses in the Book of Numbers, and images of a tall, upright serpent who has not yet lost his legs appear in representations of the Garden of Eden before the Fall. An example of one of these midrashic glosses—apparently known to the author of the Middle English poem *Patience*—attempts to solve a problem in the Old Testament book of Jonah. The difficulty, which is glossed in the work of Rashi, is the puzzling fact that, in the Hebrew text, the gender of the whale who swallows the reluctant prophet Jonah changes from masculine to feminine from one verse to the next. Actually, Rashi said, there were two whales, a male and a female. Jonah was first swallowed by a male whale, and finding his quarters pleasant, he was not penitent. Then God commanded him to be spat up and swallowed by a pregnant female whale. Jonah now found himself so crowded and squeezed on every side by baby whales that he called out to the Lord for mercy.

Such midrashic glosses so captured popular attention that church authorities were concerned lest they form a sort of parallel Bible, and, as a result, there was something of a campaign to discredit them. For example, a Dominican friar, Raymond Martini, who died in 1285, quotes in Hebrew from midrashic glosses and follows them up with Latin translations in his *Pugio fidei*, a controversial work directed against the Jews. Even more significant was the *Extractiones de Talmud*, which consists of charges made during the Dominican "trial" in 1240 of the Talmud for advancing positions contrary to Christian doctrine. The *Extractiones* mainly single out Rashi from among the French Jewish rabbinic commentators for condemnation, and a great deal of his writing is quoted very exactly by the compiler, Thibaut de Sezanne, who is thought perhaps to have been a Jewish convert to Christianity since he obviously was working directly from Hebrew manuscripts.

scrolls could be rolled out and read. In Spain the scrolls remained upright in containers from which the scripture text was then moved to the proper place and recited. To store the Torah scrolls, many worship spaces had arks, which ranged from chests large enough to hold several scrolls to decorative niches constructed in the walls. The more elaborately decorated synagogues had desks or stands where prayer leaders could be located and even elevated pulpits (*minbar*) for preaching. In some worship spaces there were seats, but in many medieval synagogues, as in most medieval churches, the congregations would stand. Participants would often face the minbar or ark, which was oriented in the direction of Jerusalem. One of the oldest surviving synagogues from the medieval period is at Worms in Germany, dating to the late

twelfth century. Its floor plan may have been borrowed from monastic chapter houses with two large intersecting halls. Wings of the structure possibly served as galleries for women who remained separate from men in some synagogues. The Worms synagogue had two exterior arched entrances with adjacent arched windows, and a ceiling that was vaulted in the style of Christian churches and supported by columns with decorative floral patterns. Building styles of this type endured and became a common architectural plan for synagogues throughout eastern and central Europe.

## EARLY MEDIEVAL CHRISTIANITY IN THE EAST

**THE PROBLEM OF ICONOCLASM.** Although Rome had remained the center of Western Christianity after the disintegration of the empire in the fifth century, the center of Eastern Christianity—that is, Christianity as it was practiced in Asia Minor, the Balkan peninsula, Greece, and certain other Mediterranean regions—was in Constantinople, the city that Constantine the Great had chosen in 330 to serve as the capital of the Roman Empire of the East. Known as Byzantium, this area maintained a high level of social organization at a time when conditions in Western Europe had seriously deteriorated, and thus the Byzantine church was highly influential in the development of not only Western (or Latin) Christianity, but Western art and architecture as well. One of the more pressing issues facing the early ninth-century medieval Eastern Christian church was the revival of iconoclastic practices—that is, the smashing of statues and icons—under the emperor Leo V (813–820). A number of opponents of the use of statues and images in the churches had returned to old eighth-century prohibitions against idol worship, which, at that time, had culminated in the practice of Christian icons being defaced and destroyed. It had been perceived by some—particularly those tied to the imperial court—that the extensive use of icons in Eastern Christian churches was one of the major obstacles to the conversion of Muslims and Jews throughout the Byzantine Empire. In 815, a council at Constantinople reiterated that the practice of venerating religious images was idolatrous. Probably the hardest hit by the iconoclastic movements were the monasteries where, in the previous centuries, Byzantine monks had ardently opposed the iconoclastic movement.

Many monasteries had become great repositories of religious artwork. Images in countless Eastern Christian monasteries and churches were once again destroyed by the iconoclasts.

**POWER STRUGGLES.** Because they were such strong supporters of the use of religious images and were not under the direct control of the bishops, monks became caught up in the emperor's struggle to become the highest authority in the Byzantine church. Byzantine emperors began to see the independence of the monasteries as a threat to their control over the church. What began as an eighth-century theological controversy developed into a power struggle between church leaders, who felt best equipped to direct religious practice, and a secular power that wished to exert control over the church through imperial policy. During the late eighth century, Theodore the Abbot of Studius at Constantinople led a resurgence of Greek monastic life. He was also on hand at Constantinople in 815 to protest the iconoclastic revival. Soon after, Theodore was sent into exile. Emperors Michael II and Theophilus continued to support the iconoclastic position. It would not be until the regency of the Empress Theodora (wife of Theophilus) in 843 and the elevation of Methodius as patriarch (a bishop in Eastern Orthodox sees) of Constantinople that icons would once again be allowed in the worship life of Byzantine Christians, a change that is celebrated in an excerpt from a homily at Hagia Sophia given by the patriarch of Constantinople two decades after the restoration of the icons. After 843, the monks were again viewed with greater respect as they regained their former influence. Some monks were even allowed to go on to serve the church as bishops. In 862 the emperor Michael sent Bishop Methodius and his brother Cyril to Moravia where they taught Christianity in the vernacular language. Cyril is credited with assembling a Slavic alphabet and producing a Slavonic translation of the scriptures. Missionary work continued on the eastern borders of the Byzantine Empire. Cyril and Methodius also went to Bulgaria where they converted and baptized the khan (ruler), Boris, in 865. As the Latin church also began to send missionaries to Bulgaria, the eastern borderlands became contested territories of potential conversion between East and West.

**THE PHOTIAN SCHISM.** The Moravian and Bulgarian churches continued to grow throughout the late ninth century but became the focus of a controversy when the lay bishop Photius of Constantinople attempted to exert his authority over these sees. The Latin church had protested the legitimacy of his election as patriarch of Constantinople, which allowed him to claim

*a PRIMARY SOURCE document***A HOMILY AT HAGIA SOPHIA**

**INTRODUCTION:** This homily was delivered by Photius, the Byzantine Patriarch, on Holy Saturday, March 29, 867, at the great basilica Hagia Sophia in Constantinople. It celebrates the gradual return of icons to the Byzantine churches and public spaces following the Iconoclastic Contest. Present at this service were the Emperors Michael III (of the Amorion Dynasty) and Basil I (of the Macedonian Dynasty).

But the cause of the celebration, whereby today's feast is conspicuously adorned, is, as we have already said, the following: splendid piety erecting trophies against belief hostile to Christ; impiety lying low, stripped of her very last hopes; and the ungodly ideas of those half-barbarous and bastard clans which had crept into the Roman government (who were an insult and a disgrace to the emperors) being exposed to everyone as an object of hatred and aversion. Yea, and as for us, beloved pair of pious Emperors, shining forth from the purple, connected with the dearest names of father and son, and not allowing the name to belie the relationship, but striving to set in all other aspects also an example of superhuman love, whose preoccupation is Orthodoxy rather than pride in the imperial diadem—it is in these things that the deed which is before our eyes instigates us to take pride. With such a welcome does the representation of the Virgin's form cheer us, inviting us to draw not from a bowl of wine, but from a fair spectacle,

by which the rational part of our soul, being watered through our bodily eyes, and given eyesight in its growth towards the divine love of Orthodoxy, puts forth in the way of fruit the most exact vision of truth. Thus, even in her images does the Virgin's grace delight, comfort and strengthen us! A virgin mother carrying in her pure arms, for the common salvation of our kind, the common Creator reclining as an infant—that great and ineffable mystery of Dispensation! A virgin mother, with a virgin's and a mother's gaze, diving in indivisible form her temperament between both capacities, yet belittling neither by its incompleteness. With such exactitude has the art of painting, which is a reflection of inspiration from above, set up a lifelike imitation. For, as it were, she fondly turns her eyes on her begotten Child in the affection of her heart, yet assumes the expression of a detached and imperturbable mood at the passionless and wondrous nature of her offspring, and composes her gaze accordingly. You might think her not incapable of speaking, even if one were to ask her, "How didst thou give birth and remainest a virgin?" To such an extent have the lips been made flesh by the colours, that they appear merely to be pressed together and stilled as in the mysteries, yet their silence is not at all inert, neither is the fairness of her form derivatory, but rather is it the real archetype.

**SOURCE:** Photius, "Homily xvii," in *The Homilies of Photius Patriarch of Constantinople*. Trans. Cyril Mango (Cambridge, Mass.: Harvard University Press, 1958); reprinted in *The Early Middle Ages 500–1000*. Ed. Robert Brentano (New York: Free Press of Glencoe, 1964): 281–282.

jurisdiction over the eastern border areas. Photius, an extremely learned scholar and theologian (but not a priest), was elected by the imperial administration to replace the rather conservative Bishop Ignatius in 858. Pope Nicholas I attempted to have Photius deposed in a bid to exert primacy—the idea that the bishop of Rome had a primary place over all other bishops—over Constantinople and Eastern Christianity. In 863 Photius was excommunicated by Rome. In a similar move, Photius attempted to excommunicate Nicholas for supporting what he believed was a heretical position on the doctrine of *filioque*, an argument as to whether or not the Holy Spirit proceeds from the Father or emanates from both the Father and the Son, which had been previously debated at the Council of Nicea (325). This medieval disagreement, sometimes called the Photian Schism, would signal continuing unrest between Eastern and Western Christianity over issues of doctrine and the primacy of bishops—controversies that have separated the churches up to the present day. As a compromise, Photius, for a

time, was forced by the new Byzantine emperor to relinquish his see at Constantinople, thus creating easier relations with the Latin church. The Photian Schism was finally healed by certain changes in imperial and papal administration and compromises at the Council of Constantinople in 870. Photius returned to power from 877 to 895. His *Treatise on the Holy Ghost*, which outlines the major Eastern objections to Latin *filioque* theology, remained an important work used by theologians throughout the Middle Ages to support the Eastern viewpoint on the relationship between the Holy Spirit and God the Father.

**EXTENSIONS OF EASTERN INFLUENCE.** Byzantine missionary efforts continued in the East as Bulgarian, Serbian, and Russian converts to Christianity continued to follow Greek practice. In 927 the Bulgarian church was even given its own patriarch. Vladimir, the prince of Russia, converted to Christianity in 988 when he married the princess of Byzantium, and bishops were sent to

## ROMAN

### Catholic and Eastern Orthodox: Some Modern Differences

The disputes between the Eastern (Byzantine) and Western (Roman) branches of Christianity in the Middle

#### Latin Catholic Christianity

Theology is more scholastic, philosophical, doctrinal

Emphasis is more juridical (influenced by medieval canon law)

Leadership is more monarchical (authoritative pope assisted by teaching tradition of church, cardinals, and bishops)

Clergy are celibate (influenced by medieval directives toward universal practice); more pronounced distinction between lay and clergy

Religious orders include many distinct orders of religious (Benedictine, Franciscan, Cistercian, etc.)

Seven distinct sacraments

Baptism by sprinkling/pouring

Still supports doctrine of purgatory

Fasting is much less significant (especially after Vatican II)

Divorce discouraged (no sacramental re-marriage without annulment)

Domed, cruciform, and contemporary worship spaces all in use

Rood screen removed after Middle Ages; communion rails removed after Vatican II

Statues, paintings, crucifixes (no restrictions)

Vernacular used in Mass (not Latin, as it was until the 1960s)

Less elaborate Mass since Vatican II (elaborate liturgy reserved for special occasions)

Daily Mass

Ages, including the Photian Schism of the ninth century and later tensions over the Latin Church's assertion of primacy, have kept the two churches under separate leadership for over a thousand years, allowing each to become distinctive in a number of different ways. Presented below is an overview of the modern remnants of the medieval East-West division in Christianity.

#### Greek Orthodox Christianity

Theology is more liturgized, spiritualized, monastic, and patristic (directed by the church fathers)

Emphasis is more mystical (influenced by monastic and Hesychastic traditions)

Leadership more conciliar and episcopal (relies on authority of councils and bishops)

Clergy are married (except bishops and monks)

No defined religious orders

No First Communion or Confirmation (communion and confirmation at Baptism)

Baptism by immersion

No purgatory

Rigorous fasting by both clergy and laity

Divorce allowed (up to three times)

Most churches (even the newer ones) follow traditional dome-shaped design

Iconostasis (icon screen) still persists, separating the sanctuary from the laity

Icons (mosaics and paintings) but no statues; religious art is two-dimensional

Greek, plus vernacular, used in liturgy

Longer, more dramatic Mass: many songs, much incense, use of bells

Daily Mass only in monasteries

Eucharist not consecrated every day

Russia from Constantinople to guide the development of Christianity in the region. By the eleventh century, Mount Athos in the northern part of Greece was becoming a major center of monastic spirituality. Orthodox Christians from the Greek mainland, Serbia, Bulgaria, Russia, and Georgia established communities

in this secluded area, located on a peninsula that juts into the Aegean Sea and ends on an imposing mountain. Access to the mountain was quite limited—indeed, visitors were raised up in baskets attached to a rope and windlass, and women were never allowed entry at all. Thus, the solitude of the monastic groups was ensured

in a system somewhat different from the Benedictine way of life as it developed in the West. Many Western monastic houses, although controlled by vows of stability and the rule of enclosure, began to develop limited ties with various secular entities that surrounded their communities, and so had connections to outside society that were more integral to their existence than those in the East.

**CONTINUING TENSIONS.** In 1053 a dispute between the patriarch of Constantinople, Michael Cerularius, and Pope Leo IX of Rome caused a schism which resulted in the East and West once again attempting to excommunicate one another. Cerularius wanted Constantinople to have equal status with Rome and to be able to operate independently in the Eastern sphere. To show his opposition to Rome's position, Michael closed all of the Latin rite churches in Constantinople. He also solicited other bishops to write letters in support of the traditional theological objections that had long divided the two rites. This time one of the major objections was the use of unleavened bread by the Armenian and Latin church. Churches in Russia, Serbia, and Bulgaria, and even the Melkites in Egypt, sided with the Greek church and initiated a break with Rome. Tensions were further exacerbated during the Crusades as Latin armies en route to the Holy Land pillaged the countryside in order to feed the troops. In 1204 Western crusaders even succeeded in taking military control of the city of Constantinople, which was followed by three days of looting. An attempt at reconciliation and reunification between the Greek and Latin churches was made at the Second Council of Lyon in 1274 by Pope Gregory X (1272–1276) and efforts continued throughout the following centuries. A rather unexpected concord came at an ecumenical council in 1439, with Greek acceptance of the Roman pontiff's primal place as successor to the apostle Peter as head of the Roman church. The most significant outcome of this agreement was the notion of the unity of faith and diversity of rite (ritualistic practice), a principle that is still respected between Eastern and Western Christians today.

## MEDIEVAL LITURGY

**BLENDED FORMS.** The development of the Christian liturgy in Europe—that is, the forms and arrangements of public worship—reflects shifts in political and cultural dominance throughout the medieval period. Roman liturgy (that form of Christian worship practiced in the city of Rome) began to find its way into northern Europe during the eighth century with encouragement from Charlemagne's father, Pepin the Short. As its use became more widespread, the Roman liturgy also assimilated many older uses that were native to Frankish Gaul. In circulation at this time were two major sacramentaries (books of prayers for sacramental services): the Gregorian (dating from the late sixth and early seventh centuries at Rome) and the Frankish-Gelasian (which had Gallic and Benedictine influences, parts of which dated from the early seventh through mid-eighth centuries). The earliest surviving medieval liturgical manuscripts, in fact, blend these Gallic and Roman types. During the reign of Charlemagne, the Hadrianum, a sacramentary sent by Pope Hadrian, further assisted in the promotion of Roman elements in the Frankish liturgy. This hybrid or "mixed" liturgy spread into Germany with renewed support from Rome during the tenth century. The Gallo-Roman liturgy actually found its way back to Rome during the tenth century and further added to the rich blend of medieval liturgical practices.

**MISSALS AND ORDINES.** Since the old-style sacramentary did not include all the information necessary for conducting a service, it eventually gave way to the missal (*Missalis Plenarius*), a type of book that included not only the aspects of former sacramentaries, but also epistles (letters of St. Paul in the New Testament), antiphons (chants used during the canonical hours), and directives for preaching. This change did not happen all at once, but the missal virtually replaced the sacramentary by the eleventh century. Not only did celebrants find it easier to use because all the components of the liturgical prayers, songs, and readings were in one volume, but the missal also included more specialized liturgical formulas for use in commemorative services like the private mass. To understand exactly what went on during the medieval liturgies, however, one must look not only at prayers, readings, and songs in the missals, sacramentaries, lectionaries, and antiphonaries, but more importantly to a book called the *ordo*, which gave directives for liturgical action or served as a guide for liturgical procedure. One problem, however, is that these books (called *ordines* in the plural) were constantly changing, and there did not seem to be much of a need to save those that had become outdated. Some of the directives

existed as individual manuscripts and actually had to be gathered in collections. Like the sacramentaries, antiphonaries, and lectionaries, the disparate directives of the *ordo* were eventually replaced by a more comprehensive single-volume work which later became known as the *pontifical*. Again, it took some time for the full transition of such usages to occur, depending upon local customs, between the tenth and twelfth centuries.

**THE SETTING OF THE EARLY MEDIEVAL MASS.** By looking at some of the early medieval ordines, scholars have been able to reconstruct aspects of the medieval mass. Particularly in the urban areas and especially in the cathedrals, there seems to have been a great deal of pomp and ceremony connected to these services. Indeed, medieval masses were quite extravagant affairs. The papal and episcopal liturgical directives from the eighth century still followed old Roman and Byzantine courtly rituals for the robing of participants in the sacristy (a room for keeping vessels, candles, and other ceremonial objects, near the front of the basilica). The vestments worn were very similar to those used today by Roman Catholic, Anglican, and Lutheran clergy. Deacons, subdeacons, and acolytes acted as ministers for the celebrant. In the cathedrals and at papal services, the bishops and presbyters (priests) sat near a throne in the apse (an addition at the eastern end of the church, usually near or connected to the altar area) awaiting the arrival of the main celebrant and his attendants. Lesser clergy and those in training sat in the choir near the front altar. Lay men and women of the congregation were seated in separated rows throughout the nave of the church, with members of the aristocracy always seated in the front.

**THE PROCESSION, PRAYERS, AND READINGS.** The service proceeded with Gospels being carried in by an acolyte, then placed reverently upon the altar by the subdeacon, a minor order of cleric. Candles were lit (there were often seven candle bearers), incense was employed, and an Introit (opening) antiphon was begun as the celebrant and his entourage processed to the altar of the church. Bread that had been consecrated (blessed) at the most recent mass was handed to the celebrant by the deacons. Once members of the procession reached the altar, they would bow, then make the sign of the cross, as the celebrant proceeded to give the attendants a kiss of peace. This was followed by the prayers *Gloria Patri* ("Glory to God the Father"), the kissing of the Gospels by the celebrant, and then his return to the throne. While facing east, the choir sang the litany *Kyrie Eleison* ("Lord Have Mercy"). This was followed by the hymn *Gloria in Excelsis Deo* ("Glory to God in the Highest") sung by the congregation. Afterward, the celebrant turned and

greeted the people with *pax vobiscum* (peace be with you) and began to pray the *Collect*. The celebrant then sat back on the throne, the congregation sat, and the subdeacon proceeded to a raised platform (the *ambo*) to read scriptures from the lectionary. A response to the readings (*gradual*) was sung by a cantor, and then the deacon who was appointed to read the Gospel proceeded to the throne to receive a blessing from the celebrant. If the pope was present, the reader was to first kiss his feet, a practice from an old Byzantine court ritual. The deacon then removed the Gospel book from the altar, first kissing it, then processed with two subdeacons carrying candles and incense to the ambo to read the Gospel. After the reading, the book was carried by the subdeacons to the places in the sanctuary where clergy were seated so that all might venerate the book of Gospels by kissing it. The book was then returned in its cover or *capsa* (which was usually decorated with ornate precious stones) to the main altar. During the eleventh century the creed or *Credo* (literally "I believe") was added after the reading of the scriptures.

**PREPARATION FOR THE EUCHARIST.** Following the service of the Word of God, there was an offertory procession, during which those lay participants at the liturgy would present the gifts that they had brought by coming forth toward the altar. The bishops and priests would receive the gifts, including the offerings of bread and wine for the eucharist (commemoration of the Last Supper of Christ). In large congregations this was quite a time-consuming process. The flasks of wine were poured into a large vessel (the *scyphus*) and the loaves of bread were placed in linens (called *sindones*). The celebrants and attendants would then wash their hands. Additional wine, brought by the celebrants, was then poured into the large common chalice (sometimes so big it had to have handles), and the celebrant also poured in a bit of water. While all of this was going on, the various hymns, antiphons, and psalms prescribed for the day would be sung. The next action involved the clergy taking positions around the altar in the sanctuary. They would be arranged according to rank, with priests and deacons closest to the altar, and subdeacons and acolytes closer to the nave. The celebrant would then sing a prayer of thanksgiving (later called the Preface) followed by the *Tersanctus* sung by the subdeacons. The lay community did not always take part in the singing.

**THE EUCHARIST.** Once all the elements were in place, the celebrant recited the Eucharistic prayers while those in the sanctuary bowed their heads. The chalice was lifted by one of the bishops or assistant celebrants for all to see, while the celebrant held the offering of bread on the edge of the chalice. Following this action, the celebrant recited or sang the Lord's Prayer ("Our Father"),

Monks sing in choir. Life of St. Nicholas, fresco, Pietro da Rimini, San Nicola basilica, Tolentino, Italy, 14th century. THE ART ARCHIVE/SAN NICOLA BASILICA, TOLENTINO/DAGLI ORTI.

deposited particles of consecrated bread both from that celebration and the previous day, and then returned to his throne to sit. The consecrated loaves of bread were next broken for distribution while the *Agnus Dei* (Lamb of God) was sung. The celebrant then broke his own bread and dropped a piece into his chalice of wine, to symbolize that both elements of bread and wine represented one true Lord. Bread and wine were then consumed by the celebrant. Once the bread was consecrated, fragments were carried by sub-deacons to local parish churches in order to connect them to the episcopal or papal service. Consecrated wine from the celebrant's chalice was poured into the larger common cup, and the clergy then received bread from the hands of the seated celebrant. Clergy went to the altar to drink wine from the smaller cups. The celebrant with bishops, priests, and deacons then brought the consecrated bread to the laity (which they handed to them) and filled smaller cups from the large scyphus, which were also presented to the congregation for consumption. It is likely that the bread and wine were brought whenever pos-

sible directly to the people instead of there being a procession to the altar area by the laity who elected to receive communion. It is quite clear that by the medieval period the sanctuary was off limits to the laity. By the eleventh century, a screen (made of wood or metal, sometimes called the rood screen) was erected in certain churches to separate the clergy and altar from the laity. These became more common in the abbey churches and larger cathedrals. During the reception of the bread and wine by the laity, songs and antiphons were sung, often by a choir. After the communion, the celebrant returned to the altar, faced east (toward the altar itself), and said a post-communion prayer; then the congregation was dismissed by the deacon. In the closing activity, the celebrant processed out of the church toward the sacristy with the acolytes, sub-deacons, and other attendants, blessing the congregation along the way.

**A DECLINE IN LAY PARTICIPATION.** While simpler liturgical forms likely took place in the smaller and rural

churches, the directives of the ordines clearly stated that celebrants were to try to stay as close to the urban and Roman rituals as possible. Some of the Frankish changes to the old Roman rite found their way back to Rome as early as the eleventh century. But the old Roman liturgy imported to France by Charlemagne underwent only minor changes in northern Europe during the following three centuries. One important trend that increasingly became more evident during the late eleventh century was that the members of the laity were losing their participatory voice in medieval liturgy. Prayers of the celebrant, once said aloud so that all in the congregation could hear, began to be whispered. The prayers of the laity began to be limited to short acclamations and then to fall into total disuse. Burchard of Worms (d. 1025) in his list of penitentials wrote that the growing failure of people to respond in church constituted “unbecoming” behavior. However, it might be said that the environment for participation was not especially inviting, since in most parts of medieval Europe the laity usually stood for the entire mass. There were no seats or pews, though there were stalls for the monks or canons of the choir. By the thirteenth century, the laity began to be instructed to kneel during the consecration. It was not until the fifteenth century in Germany that preachers began to direct the laity to sit for their sermons. Thus, the strong ties that once existed in early Christianity between the celebrant and people were being gradually loosened throughout the medieval period.

## CLUNY AND THE MONASTIC REFORMS OF THE TENTH AND ELEVENTH CENTURIES

**THE FLOWERING OF CLUNY.** As the pervasive presence and influence of Benedictine monasticism emerged from Carolingian reforms of the ninth century, a par-

ticularly powerful house at Cluny (in the Burgundy region of eastern France) became the embodiment of church leadership, independence, and success in Western Christianity. Through cooperation with its benefactor, Duke William the Pious of Aquitaine, the monastery (founded in 909) adopted an original charter that allowed the monks to choose their own succession of abbots without interference or intervention from outside secular or church authorities. The abbot and community were also to have complete control over all of the monastery's properties, being answerable only to the Apostolic See in Rome. A string of influential and creative abbots—Odo (926–944), Mayeul (965–994), Odilo (994–1048), and Hugh (1049–1109)—caused the house to become a major center of spirituality that quickly spread its influence over much of Europe. The notion that the present evil age was signaling the end of the world and that monastic life was the most perfect embodiment of the Christian vocation became cornerstones of Cluniac spirituality. The monks believed that if they renounced the world and undertook a life of silence and interior transformation they would experience God in the unceasing prayer of their community and the paradise of the cloister. Due to their high standards of observance, European houses as far away as Italy and Spain asked the Cluniacs for assistance with their own reforms. Although the community was poor at first, it did not take long for admirers of their lifestyle to become supporters and benefactors, creating a wealth of endowments. Secular estates and even entire monasteries were given over for Cluny to manage.

#### ARCHITECTURAL AND POLITICAL EXPANSIONS.

During the abbacy of Odilo, further exemptions from outside secular or episcopal influences were obtained, placing Cluny and all its daughter houses and dependencies under direct control of the pope. This was highly unusual for the time since local bishops and lords commonly exercised certain jurisdictions and rights of taxation over the monasteries. As the number of filiations grew, however, their care and management continued to be shouldered by the abbot of Cluny, the spiritual father of all Cluniacs throughout Europe and the one to whom postulants, novices, and newly professed monks from all the dependent houses took their vows. Portions of the incomes from these dependent houses also flowed into Cluny itself, financing a period of architectural expansion replete with elements of religious grandeur. Under Abbot Hugh, a 530-foot basilica with four transepts, fifteen towers, and five radiating chapels was constructed. After subsequent additions, Cluny boasted the largest Christian church that had ever been built in Europe up to this time. By the early twelfth century, Cluny had be-

come one of the wealthiest and most influential establishments in all of Christendom. Within the next fifty years, Cluniac dependencies numbered over one thousand. Many leaders of the Cluny organization were from the most significant noble families of Europe. Not only was there a close relationship between Cluny and Rome, but the abbey also forged strong links with the Holy Roman emperors. Abbot Hugh was the godfather of Emperor Henry IV, and he arranged for a marriage between his niece and King Alphonso VI of León and Castile. Pope Urban II was a former grand prior of Cluny, and a long list of monks to follow (from both Cluny and its filiations) went on to serve in the episcopal ranks.

**LITURGY AND LAY CONNECTIONS.** The liturgical practices at Cluny were rooted in the notion that the monastic life was the only sure way to salvation, and this idea applied not only to the monks themselves, but to members of the surrounding lay communities as well. The monks believed that the monastery should be a place where continuous prayer was lifted up to God. According to the order's *customals* (books containing instructions for monastic daily life), the monks extended the time for prayer well beyond the earlier Benedictine directives to the point where as many as eight hours of their day were dedicated to activity in the *choir*, the special seating area near the altar. In addition to the extra offices, two daily community masses were often celebrated. Extra psalms recited for benefactors, longer night offices on saints' days, and the chanting of the entire books of Genesis and Exodus prior to the Lenten season also served to lengthen the time of prayer. During Lent so many prayers were added that the offices became almost continuous. Those laity who could not make such an extreme commitment to the monastic lifestyle might share in the merits of the monks' work by associating themselves with the monasteries. This could be accomplished through donations, sending family members (sometimes child *oblates*) to the monasteries, being buried on the monastic property, or requesting the prayers of the monks during their various offices. One could even apply for confraternity, an arrangement by which the community chapter would vote to accept a person as an associate member of the house, sharing in the same spiritual benefits as the monks and even being remembered in the Office for the Dead like a regular member of the community. Lay members' names could also be written in the *Liber Vitae* (Book of Life), which occupied a place on the high altar during Mass. Much of the theology behind lay association with the monasteries was linked to the belief in petitionary prayer, which allowed individuals to direct specific requests to God.

**GERMAN REFORM MOVEMENTS.** Cluny was not the only major reform group from the tenth and eleventh centuries, nor did it offer the only new model for monastic organization and liturgy. In 933 the Abbey of Gorze (near Metz, Germany) began a revival of the community once formed by Chrodegang in the eighth century. During the ninth century it had been run by a series of lay abbots. With the help of German nobility and bishops, the new Gorze reform extended to Trier, Verdun, and Lorraine (now in France), as well as Hesse, Swabia, and Bavaria. The customal of Gorze soon began to be used by over fifty monasteries. Houses of women also took up the customs in Bavaria during the 900s. While Gorze followed the Benedictine traditions as introduced during the Carolingian era by Benedict of Aniane, there were a number of differences from the Cluniac foundations. Some of the early reform abbots (Arnold, John, and Immo) had placed themselves in positions of obligation to lay patrons, nobles, and bishops who had invited the Gorze reformers into their territories. Control of the Gorzer monasteries resided with the bishops. Also those German abbeys and daughter houses that embraced the Gorze reform were not dependent upon the motherhouse but operated in an autonomous fashion. There were a number of core monasteries connected to the reform that became the nucleus of a group of confraternal houses. The Gorze lectionary and liturgical ceremonies were also different from Cluny's. What turned out to be most significant were the liturgical enactments and performances that were linked to the seasonal celebrations such as Easter. These are said to have been the origins of the mystery plays that evolved into medieval drama.

**ENGLISH REFORM.** The English monasteries of the tenth and eleventh centuries were affected in various ways by both Gorzer and Cluniac reforms. As was the case at Cluny, carrying out the liturgy of the daily offices became the primary focus of the monastic life. However, more in keeping with the Gorzer model, connections between English monasteries and English monarchs were quite strong. In 970 abbots and abbesses from all over the realm attended a royal assembly at Winchester where an agreement of customs known as the *Regularis Concordia* was drawn up. The result of this convention was that the king became the overseer of a uniform set of monastic observances. Prayers for the king and queen were included in most of the daily offices. Monasteries were even given by the crown certain jurisdictions over secular matters, such as land management and the courts. Thus, a unique type of unity developed between the monasteries and the monarchy, one that was also linked with the English people themselves.

## RELICS, PILGRIMAGES, AND THE PEACE OF GOD

**INTEREST IN RELICS.** Much of the activity related to pilgrimages and holy sites in the Middle Ages can be connected to a renewed interest in relics that began in the ninth century in northern European Christendom. Any physical objects tied to famous saints or holy personages, such as body parts, bones, hair, fingernails, or even clothing worn during their lifetime, qualified as relics. In 801 and again in 813 the emperor Charlemagne revived a statute from the Council of Carthage (401) that required all altars to contain relics. The Carolingians went so far as to import relics from Italy and Spain. Pilgrimages to the tombs of saints were also encouraged. Charlemagne even suggested that important oaths were to be sworn upon relics. Not all relics were kept in churches, however. Charlemagne himself kept relics in his throne room for the occasion of oaths. There were even special decorative containers called *reliquaries* where these holy objects were kept for veneration on ceremonial occasions. In the tenth and eleventh centuries, nobles would swear peacekeeping oaths upon relics. Cults to the physical remains of saints did not take long to develop, an attraction that may have gone back to the practice of pre-Christian hero cults in Europe, and pictures of them were common in churches and religious manuscripts of all sorts, as illustrated in an English book of hours now in Oxford. For many ordinary Christians, sacred objects connected to the saints and particularly their remains were often thought to be conduits to the holy. Churches and monasteries that had such important relics in their possession would be considered prestigious. Places such as Dijon, Fulda, Vézelay, Verdun, Cologne, Bruges, Verona, Milan, Loreto, Trier, Conques, and Compostela attracted visitors due in part to their famous relics. This did much for the income and morale of congregations and communities. In theory, the objects were not to be worshipped in and of themselves.

Theologically it was argued that the relic allowed humans to come close to the spirit of the prescribed saint who then became an intercessor for humanity assisting in the transmission of God's grace. The relics would, of course, have only as much significance as a group of worshipers gave them. But they did provide a point of contact between their perception of the divine and their everyday mortal lives.

**PILGRIMAGES.** The Christian practice of making pilgrimages to holy sites dates back to the fourth century. The theology behind this was the notion of establishing a connection to places significant to the incarnate Christ. As early as the seventh century, Christians in northern Europe were making pilgrimages to Rome, where they wished to visit the supposed tombs of saints Peter and Paul, and by the eighth century such visitors could follow a written guide with an established itinerary. Around this time, the notion of remitting the public penance (assigned by a priest in confession) for one's sins through some sort of pilgrimage had become common. Thus, pilgrimages often became associated with the notion of penitence. By the tenth century pilgrimages began to be organized on a grander scale. Nobleswomen, dukes, bishops, abbots, and even those from lesser walks of life, from as far away as England, Normandy, Bavaria, and Swabia, sought to visit the Holy Land. With the conversion of the Hungarians in the late 900s, overland routes to the Levant (the area comprising modern-day Lebanon, Israel, and parts of Syria and Turkey) began to be developed through southeastern Europe. The monks of Cluny also assisted with the organization of the pilgrimages, particularly from France. Even when sites of Christian shrines were located in Muslim-controlled areas such as the Holy Land and Spain, Christians were traditionally allowed access since a deep respect for the notion of pilgrimage was a vital part of the Islamic faith. However, when these holy places became inaccessible, Christians believed that they were justified in attempts to secure these areas by force.

**POPULAR JOURNEYS.** Depending upon the balance of power in the Levant and the route of travel one chose, journeys to the Holy Land could be quite dangerous. Pilgrimages to sites in western Christendom such as Conques (southeastern France), Rome, and Santiago de Compostela (northwestern Spain), which were more associated with the relics of saints, could be much safer. By the twelfth century, sites such as the shrine of St. James at Compostela became tourist attractions and local economies flourished along their travel routes. Sites like Canterbury commemorated both relics and events, such as the twelfth-century murder of Thomas Becket

Portraits of various saints. Lacy Hours, Oxford, St. John's College MS 94, folios 4-4v, 1430-1434. BY PERMISSION OF THE PRESIDENT AND SCHOLARS OF SAINT JOHN BAPTIST COLLEGE IN THE UNIVERSITY OF OXFORD.

(chancellor of England and archbishop of Canterbury). Becket's grave as well as the spot upon which he was murdered in Canterbury Cathedral became a popular destination for both the pious and the curious. Miracles were recorded at Becket's tomb, and eventually his remains were moved to the choir of Trinity Chapel in 1220 where they stayed until the shrine was destroyed by Henry VIII in 1538. In effect, Becket became one of the first saints elevated by popular acclaim and enthusiastic devotion in medieval European tradition. Geoffrey Chaucer's *Canterbury Tales* (1390s) remind us of the Becket tradition and testify to the fact that these pilgrimages were not always somber affairs. Certainly, such expeditions contained elements of adventure and entertainment as well as spiritual satisfaction.

**TRUCE OF GOD AND PEACE OF GOD.** The experience of pilgrimage was made possible, in part, by attention to the issue of safety both for travelers and for the broader European society. Effective peacekeeping in

the early part of the Middle Ages was a major problem not only for secular rulers, but also for the church, as uncontrolled violence posed threats to both church property and those in religious life. Also caught up in these dangers were innocent lay people who would often find themselves at the mercy of armed local warriors. Without physically fighting back, the church found it necessary to create ways to disarm a society where violence seemed to have become an all too commonplace occurrence. Legislation at tenth- and eleventh-century assemblies known as *synods* began to reflect principles such as the Peace of God (*Pax Ecclesiae*) and the Truce of God (*Treuga Dei*). Between 990 and 1096 at least thirty church councils addressed the problem of unchecked martial activity in European society. At these synods the church promoted the cessation of unnecessary violence through the Truce of God and imposed penalties, under threat of excommunication, for carrying on warfare during certain holy seasons, on Sundays, and in certain

holy places. In an attempt to save the weak and innocent from the horrors of unjust physical abuse, the knightly order was obliged through the ideals of the Peace of God to protect unarmed poor, children, women, clerics, merchants, and pilgrims. This also extended to their property, merchandise, and even farm products, animals, and equipment.

**THE CONCEPT OF JUST WAR.** The idea of war which could be justified in the service of the church—a principal that was applied to the Crusades both in connection with protecting pilgrims and with maintaining access to holy places—may have been indirectly tied to notions of curbing the outright martial character of medieval society as a whole, although it certainly was rooted in the drive for the church to gain more control over secular affairs. During the eleventh century, the notion of “Christian” knighthood had begun to moralize the activities of a knight, turning him from full-time warrior to part peacekeeper, as would be encouraged by the Peace of God and Truce of God movements. Bishops even went so far as to impose spiritual sanctions on offenders who refused to put down their weapons. Soldiers fighting for the church on the advice of their bishops or in a war against heretics, on the other hand, could be forgiven without penance for their violent acts. In 1085 Anselm of Lucca published the *Collectio Canonum*, which assembled just war texts from St. Augustine to Gregory I (fifth through seventh centuries). This literature supported the ecclesiastical right actively to direct the *ius gladii* (literally: by right of the sword) in the service of the church. Actions like blessing the weapons of a knight for the service of justice and God came from a century earlier. The idea of the *militia Christi* (army of Christ) certainly precedes the Crusades, but it had been used more in a metaphorical sense by the Gregorian reform movement (beginning in 1059) to address the spiritual battles fought by the monks. As it began to be applied to the military during the time of the Crusades, it probably reflected the growing need of the church to justify protecting itself from secular powers or taking up a noble cause.

## GROWING CHURCH POWER AND SECULAR TENSIONS

**A PERIOD OF PAPAL WEAKNESS.** In the tenth century, as the Carolingian Empire started to break apart and the Germanic Empire rise, increasing tension developed between bishops, the pope, and secular rulers. Strong local nobility had begun to emerge during the age of the Viking invasions in Italy, France, Germany, and England, while the Roman bishops themselves were hardly in a position to wield significant political power at all. The last of the noteworthy early medieval popes was Nicholas I (858–867), after whom there would not be meaningful individual ecclesiastical authority directed from Rome until the eleventh century. In fact, the majority of the popes in the early Middle Ages functioned primarily as liturgical leaders and guardians of tradition (not political figures). While holy and accomplished Roman bishops such as Hadrian I, Nicholas I and John VIII did much to direct the positive course of early medieval Christianity, near the early part of the tenth century, a series of degenerate popes (John VIII, Formosus, Lambert, Stephen VI, Leo V, Christopher, and Sergius II) succeeded one another by each deposing his predecessor. These changes in leadership included a chain of nine successive pontiffs within the span of an eight-year period. Probably the most bizarre story connected to this era was that of Formosus (891–896), whose dead body was exhumed and put on trial by his rivals for a variety of offenses that he had committed while in office. After being found guilty, his corpse was defrocked of its vestments and his consecrated fingers (those used in blessing and holding the host, or consecrated bread, during Mass) were severed from his body. There was even a teenage pope (John XII) elevated in 955 whose father was the half-brother of a former pope (John XI). While abstinence from sexual activity among Western Christian clerics had begun to be legislated in the late 300s and several edicts in the 400s had imposed oaths of celibacy upon the clergy, there were still many who refused to comply. By the sixth century, only a small percentage of priests and bishops openly continued to have

### **PAPAL POWER: THE DICTATUS PAPAE (MARCH 1075)**

**INTRODUCTION:** This statement of papal authority was crafted during the first two years of Gregory VII's pontificate (1073–1085). It systematically sets forth the claim (likely for the first time) that the pope had the power to depose an emperor.

**SOURCE:** *Dictatus Papae* (March 1075), in *Church and State Through the Centuries*. Trans. S. Z. Ehler and J. B. Morrall (London: 1954): 43–44. Reprinted in Brian Tierney, *The Crisis of Church and State 1050–1300* (Toronto: University of Toronto Press, 1988): 49–50.

wives, but much larger numbers had *focariae* or mistresses. Violations of clerical celibacy defiantly continued through the eleventh century, particularly in the more rural areas. Pope John XII was himself openly sexually active (he is accused of turning the papal residence into a brothel) and was said to have died of a stroke while in bed with a married woman. However, historians remember John XII for breathing new life into the power of the western Christian Roman Empire. His coronation of the German em-

peror, Otto I, on Candlemas Day in 962 saw (through military means) the return of former Italian papal territories to the church. This also rekindled the strong ecclesiastical and secular relationship that had once existed between the Roman bishops and the powerful institutional western European kingdoms.

**THE INVESTITURE CONTROVERSY.** The Latin Church's dependence upon lay powers for support (both

economic and military) had allowed for the development of a practice during the ninth and tenth centuries where kings and princes reserved for themselves the power of investiture over bishops and abbots. That is, these secular powers, operating according to the patterns established in the broader society, literally would invest high-ranking clergy with the symbols of their office. In the case of bishops and abbots, this was the presentation of the ring and staff (*crozier*) that served as visible signs of ecclesiastical authority. In return, the bishop or abbot would pay homage to the king and swear an oath of *fealty* or loyalty, just as a vassal or land-tenant might. The kings and nobility who owned much land might grant *benefices* or tenure on the land for a particular number of years. Powerful secular leaders granted such lands to local churches or even would give over church-owned lands to laity as they saw fit. By the mid-eleventh century, church leaders began to condemn the practice, which resulted in a contest between church and state. The Investiture Controversy was sparked by church legislation initiated in 1059, 1075, 1076, 1078, and 1080 under Popes Nicholas II and Gregory VII. Humbert of Silva Candida published a work entitled *Three Books Against the Simoniacs* which not only was a polemic against simony (the sale or purchase of a church office), but supported the notions of clerical celibacy and papal primacy. Humbert's treatise was also an attack upon lay authority as it related to the power of the priesthood. According to Humbert, church authority came from God and was to be carried out through the electoral will of his people and priests, not the kings and nobility, whose power extended only to secular matters. These reforms attempted to purify the ordination process from selfish secular interests, first by placing the election of the pope in the hands of the cardinals, and later by ruling against lay influence in ecclesiastical elections and, eventually, lay investiture of any kind under any circumstance.

**AN AUTHORITY STRUGGLE.** Royal and noble compliance with these church directives was difficult to obtain, however. The distinctions between the spiritual office of the bishop and the material possessions or physical powers linked to the post were not clearly defined during the early years of the investiture contest. The issue came to a head with the authority struggle between Pope Gregory VII (1073–1085) and the German emperor Henry IV. Gregory was credited with issuing the famous decree *Dictatus Papae* which stated that the pope, not the emperor, was to be seen as the vicar of Christ. (It was the pope who was the successor of Constantine.) The pontiff alone could both depose and in-

stall princes, emperors, and bishops. The pope could be judged by no mortal man. He might also absolve individuals of their fealty to evil persons of power. While the struggles between the bishop of Rome and the German emperor were real, scholars now suggest that *Dictatus Papae* was later submitted into the register of documents for 1075 in order to bolster claims for papal power. It is likely that the term “paptus” was not even used until decades later, around the beginning of the twelfth century. In any case, Henry IV refused to recognize Gregory's authority, and the bitter struggle continued for some ten years. The crown attempted to depose the pope in 1076 and shortly thereafter the papacy declared the emperor excommunicated. Bishops and princes from all parts of Christendom intervened and took sides. The northern Italian and German bishops even went so far as to side with Henry and ratify the emperor's decision to depose the pontiff. Lay nobility who were plotting Henry's demise forced the emperor into reconciliation, and there appeared to be some change in the balance of power during the early part of 1077 when the penitent Henry appeared before Pope Gregory barefoot in the middle of winter at Canossa begging forgiveness for his immortal soul.

**THE REASSERTION OF THE CHRISTIAN ROMAN EMPIRE.** Henry's apparent sincerity demonstrated in the Canossa incident was short-lived. In fact, some historians have suggested that this entire act of penitence may have been a ploy on the part of Henry to buy the cooperation of German nobles. Several years after he had been forgiven, in 1080, the emperor managed to invade Italy and forcibly have Pope Gregory exiled and deposed. Henry elevated a new pope, Clement III, who officially restored Henry IV's place as emperor of the Romans. Henry IV renewed his quarrel with the papacy after the elevation of Urban II (1088–1099), whose organization of the First Crusade helped solidify the public view of the papacy as the visible head of the Roman Church in administrative, judicial, and military capacities. Urban eventually succeeded in rallying the bishops of Germany against lay investiture, but after Urban's death Henry IV again came into conflict with Pope Paschal, and the emperor was again excommunicated by Rome in 1102. The controversy between the German emperors and popes continued for another generation as each side gained and lost ground. Some of the difficulties between spiritual and temporal powers during these decades may have been tied up in disagreements over valid canonical election. Between 1059 and 1179 a series of some fourteen anti-popes served sporadically alongside or in conflict with the pontiffs now recognized by historians. With

*a PRIMARY SOURCE document***A RECONCILIATION AT CANOSSA**

**INTRODUCTION:** During the period of the Investiture Controversy, when lay rulers struggled with the papacy over the right to ordain or depose princes and bishops, one of the most dramatic confrontations was a ten-year struggle between Pope Gregory VII and Emperor Henry IV, who refused to follow church directives and even attempted to depose the pope. Finally, after the pope declared the emperor to be excommunicated and other princes began plotting against him, Henry was forced to attempt reconciliation, which he did by appearing barefoot outside the pope's residence at Canossa in the middle of winter. The following account (dated the end of January 1077), which relates the Canossa event, appears in a letter to the German princes written by Gregory:

Whereas for love of justice you have made common cause with us and taken the same risks in the warfare of Christian service, we have taken special care to send you this accurate account of the king's penitential humiliation, his absolution and the course of the whole affair from his entrance into Italy to the present time. According to the arrangements made with the legates sent to us by you we came to Lombardy about 20 days before the date at which some of your leaders were to meet us ... [and] we

received certain information that the king was on his way to us. Before he entered Italy he sent us word that he would make satisfaction to God and St. Peter and offer to amend his way of life and to continue obedient to us, provided only that he should obtain from us absolution and the apostolic blessing. For a long time we delayed our reply and held long consultations, reproaching him bitterly through messengers back and forth for his outrageous conduct, until finally, of his own accord and without any show of hostility or defiance, he came with a few followers to the fortress of Canossa where we were staying. There, on three successive days, standing before the castle gate, laying aside all royal insignia, barefoot and in coarse attire, he ceased not with many tears to beseech the apostolic help and comfort until all who were present or who had heard the story were so moved by pity and compassion that they pleaded his cause with prayers and tears ... At last overcome by his persistent show of penitence and the urgency of all present, we released him from the bonds of anathema and received him into the grace of Holy Mother Church, accepting from him the guarantees described ...

rival claimants to support, emperors, princes, and kings were not always in agreement over who represented the church's position and which religious leader the secular powers should choose to recognize. A compromise between German kings and bishops of Rome finally came at the Concordat of Worms in 1122 with an agreement executed by Pope Calixtus II and Henry V of Germany. A similar compromise had been struck in England during the early 1100s between Anselm, the archbishop of Canterbury, and King Henry I, who had agreed that secular leaders would still invest bishops but with the understanding that they were only granting the bishop earthly temporal authority. The church would also have its representative (usually a higher ranking bishop, pope, or cardinal) invest the bishop with symbols of priestly authority, namely the ring and staff. In some areas the king conferred power through the touch of his scepter. While the presence of the king or secular noble leaders was permitted at a bishop's elevation, it was by the authority of the leading local bishops that a candidate was placed in office. However, it is more likely that leaders in significant church positions (such as bishops, abbots, and even popes) had the blessing of both clergy and secular leaders.

**THE CRUSADES**

**MOTIVATIONS.** The Crusades were a series of military campaigns waged by Christian armies against Muslim-controlled areas in the Holy Land beginning in 1095 and continuing on an intermittent basis even as late as the sixteenth century. While the Crusading momentum seems to have begun with the justification of rescuing holy places from Muslim control, it is likely that the motivation for the First Crusade was a complex

mixture of religious emotion, individual ambition, and political programs. Pope Urban II's call to crusade was in response to the March 1095 request from the court of Byzantine emperor Alexius for military assistance against the Turks threatening to take control of much of Asia Minor. It is clear that Urban was concerned about the pressure Islam was exerting on the eastern frontiers of Christendom. He was also anxious to improve relations between the Greek and Latin Churches. At the Council of Clermont in November of 1095, Urban's call for pilgrims to respond to a war (that was God's will) to liberate the land of Jesus's birth from the Infidel (one who is "unfaithful to the true teaching," a terminology used by both Christians and Muslims to refer to each another) had decidedly religious overtones. It is no surprise that the first group to whom he presented this idea were predominantly clergy. Many of these clerics were sons of knights, hardly any were pacifists, and it appears there were few objections to this justification for war. Clearly, at the heart of his agenda was the desire to free the Greeks from Muslim oppression. However, the idea of the liberation of Jerusalem and its pilgrim routes seemed to be what was most ideologically appealing to Western Christians. The response to Urban's 1095 tour of preaching, beginning at Clermont, moving through various parts of France (Limoges, Toulouse, Angers, Le Mans, Nîmes, Tours) and ending in Italy, was impressive. The fact that the pope had made a personal and individual appeal to local people may have had a tremendous impact. An army of 70,000 to possibly 130,000 Christians (many of them French, probably fewer than ten percent from the nobility) followed bishops like Adhémar of Le Puy, preachers such as Peter the Hermit and Walter Sans-Avoir, and veteran knights like Raymond of Toulouse and Godfrey of Bouillon through strange territories they had never before seen, under the religious pretext of rescuing the Holy Places. Not all departed together or took the same routes. Many of them never reached the Holy Land and, clearly, fewer than a third returned. The successful response to the First Crusade may have been due to several factors: it was completely voluntary, it was proposed as an act of devotion, and it carried with it a means to ensure remission of sin. Indeed, while the initial indulgence proposed by Urban granted a remission from temporal penance, during later Crusades it would be modified to include punishments both in this life and the next.

**RELATED PERSECUTIONS.** Several of the armies from Germany began their crusade against infidels by unleashing violence upon Jews living in Europe. In 1096

at Worms, Mainz, Ratisbon, Neuss, Wevelinghofen, Xanten, and Prague, Jewish residents were massacred in the name of the Christian holy war, partially justified by the popular notion that it was the Jews who had killed Jesus. Such persecutions of non-Christians outside the Holy Land would not be limited to the First Crusade, but were tied to subsequent holy wars as well. They included not only Jews, but other ethnic and religious groups living throughout Europe. Muslims in Spain, Wends (Slavic people) on the German borderlands, multiple pagan groups in the Baltic, and the Cathars (a heretical Christian sect who believed that Satan ruled the earth) in France also suffered during the various Crusades.

**OUTCOMES OF THE FIRST CRUSADE.** The First Crusade was relatively successful despite the loss of large numbers of troops along the way, as well as some questionable pillaging by Latin crusaders in Hungarian and Byzantine cities. While only one-third of the initial contingent reached Jerusalem, they were able not only to free major Byzantine centers such as Nicea from Muslim control, but also to secure Christian settlements along the way, particularly on the western coast of the Mediterranean in the future Latin kingdoms of Edessa, Antioch, and Jerusalem. At the outset, a Latin principality at Edessa was established under Baldwin, the brother of Duke Godfrey of Bouillon, in 1198. This was followed by the siege of Antioch, which took over a year but resulted in Latin control of that fortress as well as the surrounding area. In the summer of 1099 Jerusalem was finally toppled. However, with the death of Bishop Adhémar of Le Puy at Antioch, there was no strong, rational voice of the church to stop the bloodbath in the city of Jerusalem following the siege. Soldiers, women, children, Muslims, Jews—indeed, most of the inhabitants of the city—were slaughtered by the crusading army. Shortly thereafter, the remnants of the army returned to Europe in triumph.

**THE CRUSADING KINGDOMS.** Subsequent establishment of the Latin Crusading Kingdoms would take place within the next few decades under a second generation of French campaigners, all with papal support. The Knights Templar set up headquarters in Jerusalem under Hugh de Payens to ensure that the Holy Places and Christian pilgrims remained protected. A continued military presence was required for the western Christians to maintain control of the region. An additional kingdom was established at Tripoli between Jerusalem and Antioch. Each Latin kingdom had its own rulers or princes, most of which were drawn from the French nobility who decided to settle and manage the area. Vassal

*a PRIMARY SOURCE document***SPIRITUAL PRIVILEGES GRANTED TO CRUSADERS**

**INTRODUCTION:** This is likely the first of two crusade encyclicals issued by Pope Eugenius III (one in December of 1145 and the other in March of 1146). *Quantum Praedecessores* was directed at the French nobility and it is likely that Eugenius would not have attempted to call for such an action if he did not have the support of the French king Louis VII. The bull emphasized the religious nature of the crusade and outlined spiritual privileges for participants.

---

**SOURCE:** Pope Eugenius III, *Quantum Praedecessores Nostri*, 1145, in *The First Crusade, The Chronicles of Fulcher of Chartres and Other Source Materials*. Ed. Edward Peters (Philadelphia: University of Pennsylvania Press, 1971): 239.

territories and Latin castles were established throughout the Levant. A small number of Westerners (possibly 2,000) acted as administrators and lords over numerous Muslim and Jewish subjects. Part of the task of the settlers, especially in Jerusalem, was to rebuild the shrines associated with the holy sites. During the twelfth century, once the territory was secure, large numbers of European pilgrims came to visit and venerate the sacred places. Schools, hostels, monasteries, and churches began to proliferate throughout Jerusalem. One of the great accomplishments of the early crusader period was the rebuilding of the Holy Sepulchre (the supposed location of the tomb of Christ) into one of the greatest Romanesque churches in Christendom. What the First Crusade actually accomplished was to establish Latin dominance in the Holy Land, creating wealth for many French noble families, and to set into motion the religious and political mechanisms for future defense and campaigns.

**THE FAILURE OF THE SECOND CRUSADE.** After the successes of the First Crusade, the concept of Holy War and the religious obligation of Christians to control the

Holy Land and purge society of non-believers was firmly entrenched. The Second Crusade was spurred by the fall of Edessa (then part of Syria, now Urfa in Turkey) on Christmas of 1144 to the Muslim leader Zengi. At stake for Western Christians was the impending threat to Jerusalem itself. There seemed to have been somewhat less enthusiasm for this second campaign, but Pope Eugenius III's papal bull *Quantum Praedecessores* spelled out for the first time specific spiritual privileges available to participating crusaders. The crusade proclamation was delivered by Eugenius at Vetralle and later recorded in Bishop Otto of Freising's *Gesta*. Assisted by the charismatic preaching of St. Bernard of Clairvaux and other Cistercians, the Second Crusade organization gained some momentum. Secular bishops like Henry of Olmütz were directed to preach the Bohemian Crusade, while there were simultaneous crusades launched against the Wends in northern Europe and the Moors in Spain. When the effort to recapture Edessa ultimately proved unsuccessful, the crusaders decided instead to journey on to Jerusalem (which was still secure) to do homage to the holy sites. At that point, the crusaders attempted a joint attack upon the city of Damascus. This military

*a PRIMARY SOURCE document***A CRITICAL LOOK AT THE CRUSADES**

**INTRODUCTION:** At the beginning, the Crusades were a popular movement, both because they reopened the Holy Land to pilgrimage travel and because they provided an opportunity for Christian service and reward. But eventually the Crusades began to draw increasing criticism. A number of church councils (beginning in 1149) were called to debate the merits of crusading or to discuss whether or not failed crusades should be revived. The following excerpt comes from a report by Humbert of Romans, fifth Master General of the Dominican Order, delivered at the Second Council of Lyon in 1274.

There are some of these critics who say that it is not in accordance with the Christian religion to shed blood in this way, even that of wicked infidels. For Christ did not act thus ...

There are others who say that although one ought not to spare Saracen blood one must, however, be sparing to Christian blood and deaths ... Is it wisdom to put at risk in this way so many and such great men of ours? ...

There are others who say that when our men go overseas to fight the Saracens the conditions of war are much worse for our side, for we are very few in comparison to their great numbers. We are, moreover, on alien

territory ... And so it looks as though we are putting God to the test ...

There are others who say that, although we have a duty to defend ourselves against the Saracens when they attack us, it does not seem that we ought to attack their lands or their persons when they leave us in peace ...

There are others who say that, if we ought to rid the world of Saracens, why do we not do the same to the Jews? ...

Other people are asking, what is the point of this attack on the Saracens? For they are not roused to conversion by it but rather are stirred up against the Christian faith ...

Others say that it does not appear to be God's will that Christians should proceed against the Saracens in this way, because of the misfortunes which God has allowed and is still allowing to happen to the Christians engaged in this business.

How could the Lord have allowed Saladin to retake the land won with so much Christian blood, the emperor Frederick to perish in shallow water and King Louis to be captured in Egypt ... if this kind of proceeding had been pleasing to him?

**SOURCE:** Humbert of Romans, "Humbert of Romans to the Second Council of Lyon, 1274," in *The Atlas of the Crusades*. Ed. Jonathan Riley-Smith (New York: Facts on File, 1991): 80.

effort proved to be a disaster, and the crusaders returned home shortly after. The failure of the Second Crusade was attributed to the sinfulness, pride, and bickering of the contestants who traveled to the Holy Land under the pretense of being pilgrims. Instead, they insulted God with their unworthiness. According to St. Bernard, it was God who allowed the bungled Christian attempt to fail, not merely due to the sins of the crusaders themselves, but the collective sinfulness of all of Christianity.

**SUCCESSSES AND DISASTERS.** It took some time after the failure of the Second Crusade for Christians to be able to legitimize another campaign. Christian presence in the Holy Land did not altogether disappear as Templar and Hospitaller strongholds dotted the landscape along the Mediterranean, where Latin Christians maintained control of the kingdoms at Antioch, Tripoli, and Jerusalem, sustaining a presence in an area some 100 miles long and 30 miles wide. However, the southern part of that territory around the city of Jerusalem was conquered in 1187 by the Muslim leader Saladin, resulting in a massive response of combined European

forces descending upon the port city of Acre over the next four years. By 1192 the Third Crusade succeeded in recovering some of the coastal territory along the Mediterranean, particularly around the cities of Tripoli, Antioch, and Jerusalem. The following Crusade, however, went seriously off course. While originally intended to fight Muslims in Egypt, the Fourth Crusade instead engaged itself with interventionary efforts in Christian cities. Departing from Venice in Italy during 1202, the crusaders first rescued the Croatian city of Zara, which had previously been lost to the Hungarians in 1186. Behind schedule and short on cash, they were convinced—by arguments ranging from Christian charity and a promise of permanent papal jurisdiction to a substantial monetary reward—to go to Constantinople in 1204 to assist in resolving a dispute between rival Byzantine factions. Having little to show for their previous efforts, the crusaders ended up engaging in a three-day sacking of the city that left all of the Byzantine Christian holy places, including Hagia Sophia, defiled and stripped of everything of value. While most crusaders simply went

home with their loot, some stayed to support the new Latin Kingdom that would last for fifty years.

**CONTINUING CAMPAIGNS.** Perhaps because the Crusades blended religious motivation with opportunities for political domination and enrichment, new campaigns continued throughout the Middle Ages. The Fifth Crusade of the early thirteenth century was intent upon rescuing Jerusalem, which was still under Muslim dominion. But it also targeted the power base of the Ayyubid dynasty in Egypt in an effort to stabilize Christian control of the Holy Land. After four years of effort, the Fifth Crusade inevitably failed. Crusades against the heretical Cathars and pagans in the Baltic during the early thirteenth century, as well as crusades to restore papal power in the late thirteenth century, were more successful. They were all attempted under the guise of similar crusade ideals—ridding the Western Christian world of threats to the orthodoxy of its belief system. The Crusades of St. Louis in the thirteenth century and the Popular Crusades (Children's in 1212, Shepherds' in 1251 and 1320, as well as the People's in 1309), all of noble intent, were highly influenced by the crusading propaganda of the time. Crusaders were convinced that righteous participants were the key to success in defeating the Infidel. St. Louis's initial crusade effort in 1248 is sometimes known as the Sixth Crusade, but, after this, historians seem to stop counting. There were a variety of smaller crusades that continued through the next several centuries linked to both religious and political agendas. At this point, all sorts of arguments were presented concerning the pros and cons of crusading, as illustrated in a report given to the Second Council of Lyon during 1274 by Humbert of Romans. Despite objections and the fall of Acre to the Islamic Mamluk dynasty in 1291, the idea of the crusade remained alive in Latin Christendom through the sixteenth century.

## THE MILITARY ORDERS

**RELIGIOUS CONGREGATIONS OF KNIGHTS.** One of the most distinctive developments of the period following the First Crusade (begun in 1095) was the creation of “military orders,” religious congregations of knights whose initial purpose was to protect pilgrims and maintain control of the “Crusader Kingdoms” established by the French in the Holy Land. Clearly the military religious orders began with the justification of Christian warfare during the First Crusade. The act of killing the enemies of Christ was not seen as a sin but rather as necessary and meritorious. Thus, if a Christian soldier died in such a war, it brought him the status of martyrdom. Also, the Crusades themselves had taken on the character of a special pilgrimage, and, like pilgrims, a participant in a Crusade could be granted an indulgence, or remission from temporal penances associated with his sins. As the size of pilgrim groups to the Holy Land increased, the church felt somewhat obliged to provide for their protection. While the First Crusade had temporarily eliminated the threat of Muslim control of the Holy Land, the area itself remained relatively unprotected since most knights returned home once the military campaigns ended. The population of Christian settlers in the Crusader Kingdoms around the city of Jerusalem and along the Palestinian coast of the Mediterranean was rather small and unable to provide pilgrims with adequate protection. A group of knights led by Hugh de Payens decided to make a vocation out of protecting pilgrims who were on their way to visit the holy places. They formed a religious group that resided in the city of Jerusalem and became known as the “Templars.”

**SOLDIER-MONKS.** Hugh envisioned the Templars as an army of soldier-monks whose martial duties contained a decidedly spiritual element. In a sense, they embodied the highest ideals of Christian knighthood. These Templars took vows of obedience and chastity, and they followed the spiritual lives of the canons that resided at the church of the Holy Sepulchre. They were called “Templars” or “Knights of the Temple” because they lived in an area of Jerusalem believed to be near the old Temple of Solomon. Their movement seems to have evolved out of the spirituality connected to Crusade ideology. The journey of a crusader to Jerusalem was justified as a penitential process, an ascetical exercise of self-denial, prayer, mortification, and fasting. All of these idealized crusader elements were incorporated into the Templar spirituality. When the plan for the group was first approved in 1128, they were not considered monks but fell into the category of “lay religious.” For a time this seems to have appeased critics who were in staunch

support of church directives against monks bearing arms. Templars wore their hair short, donned white robes, and avoided women. Sometime after 1132, the Cistercian abbot Bernard of Clairvaux was asked to write a treatise supporting the Templars. It may not have been so much a direct approval of their movement as an exposition on monastic life as the highest form of knighthood, or possibly an attempt to help reform the knighthood of Bernard's time. He wrote:

Thus in a wondrous and unique manner they appear gentler than lambs, yet fiercer than lions. I do not know if it would be more appropriate to refer to them as monks or as soldiers, unless it would perhaps be better to recognize them as being both. ... What can we say of this except that this had been done by the Lord, and it is marvelous in our eyes. These are the picked troops of God, whom he has recruited from all ends of the earth ...

**THE TEMPLAR RULE.** A rule was eventually composed for the Templar lifestyle which contained elements of the Benedictine Rule along with particular aspects of Cistercian spirituality and practice. The rule and the order were approved in 1139 by Pope Innocent II in his bull *Omne Datum Optimum*. The Templars were not under the control of local bishops but answered directly to the pope. About the time of the Second Crusade (1146), the Templars came to be seen as religious knights whose commitment to protecting the holy places was permanent. There were several levels to the order, which consisted of knights of noble birth, sergeants who were not nobles, chaplains who were clerics and not allowed to take up arms, and, in addition to all these, their servants. Only the knights took permanent vows. They continued to operate in the Holy Land until the fall of Acre (the main port of entry to Palestine) in 1291, but were eventually suppressed by Pope Clement V in 1312. The Templars also participated in campaigns in Spain and the Baltic area of Europe. While they became famous for their almsgiving, along the way the knights began to lose sight of some of their founding principles. After a century in the Holy Land, they had succeeded in amassing great wealth and had significant involvement with banking. Their massive fortifications functioned as depositories as they transported wealth to and from the East and brokered loans. Indeed, their wealth may have been their undoing. Despite the Templars' attempt to merge with the Hospitallers after the end of the Crusades, their assets were seized by the French king Philip the Fair and their leaders executed as heretics.

**THE HOSPITALLERS.** The Hospitallers (also known as the Knights of St. John) originated as a brotherhood that served poor or sick pilgrims in the city of Jerusalem.

About 25 years before the First Crusade, they began their work in a Benedictine monastery, St. Mary of the Latins, near the Holy Sepulchre. The hospice was staffed both by the Hospitaller brothers and by monks. All those who worked there followed the Benedictine lifestyle. Following the First Crusade, the Hospitallers were given additional lands in the Levant (an area on the eastern shores of the Mediterranean, located between western Greece and western Egypt) along the pilgrim routes on which to establish daughter houses. They also had establishments in the port cities of Italy and southern France, from which pilgrims would normally depart. In 1113 the Hospitallers were given a charter from Pope Paschal II establishing them as a unique order to be supervised by their own master and (like the Templars) answerable only to the pope. Initially they were a charitable order, not a military group, dedicated to the care of pilgrims and almsgiving, but in 1123 they added a military element due to the shortage of Christian knights in the Holy Land. They continued to protect and serve pilgrims as well as to provide military assistance to the local nobility against the Muslims. By the 1130s they had begun to construct and defend fortified castles throughout the Holy Land. Soon their order began to resemble the Templars with divisions of service for clerics, knights, sergeants, and laborers in the houses. And like the Templars they were considered lay religious and took vows of chastity, obedience, and poverty following whenever possible the daily monastic routine. The order also admitted women, who had separate accommodations. In 1141 they moved their headquarters to a castle called Krak des Chevaliers, situated on a high plateau in what is now Syria, and after 1187 they were forced to withdraw from Jerusalem. With the fall of Acre and the final destruction of the Latin Kingdoms in the Holy Land, they established themselves on Cyprus, and in 1309, after taking Rhodes from the Greeks, made a new headquarters there. The order still functions today as a charitable organization.

**OTHER CHIVALRIC ORDERS.** By the middle of the twelfth century other chivalric orders had begun to appear in Spain with the intention of assisting with the *Reconquista*, the reconquest of the Iberian peninsula from the Moors. Orders like Calatrava and Alcantara took their lead from the Templars. The Calatrava group began in 1158 when local monks allied themselves with knights to fight the Almohads, a Muslim dynasty that replaced the short-lived Almoravids. Eventually the knights of Calatrava went on to form their own order, but in 1164 they were attached to the Cistercians (a reform monastic movement that had begun in 1098) by Pope Alexander III. By the fourteenth century the order

was responsible for protecting some 350 towns in the area of Castile. Following the reconquest, the order became more of a political entity. Alcantara began functioning in 1156 to defend the towns of León. They received papal approval in 1177 and began to follow the Rule of Benedict. Eventually they became allied with the Calatrava knights in driving out the Muslims. The Knights of the Teutonic Order and the Order of Santiago functioned more on military and hospitality levels, although they strove to maintain the highest standards of Christian knighthood. Their groups were also composed of warriors, clerics, and brothers. The Teutonic Knights began in 1198 during the time of the Third Crusade and eventually returned to Germany in the thirteenth century to function in the campaigns against the pagans on the borderlands of Prussia, while the Order of Santiago was formed in the late twelfth century to protect pilgrims traveling to the shrine of St. James at Compostela. The Santiago knights ruled almost as lords protecting territories throughout reconquered parts of Spain. The order survived through the end of the *Reconquista*.

## TWELFTH- AND THIRTEENTH-CENTURY MONASTIC MOVEMENTS

**ANCHORITES AND HERMITS.** From the end of the eleventh and throughout the twelfth centuries, groups of religious began to react against the extravagant growth and development of monastic orders like that at Cluny. The desire for a return to primitive Christian experience was now reflected in monastic practices. New religious orders seeking quiet, solitude, poverty and simplicity began to appear, likely in reaction against the highly litur-

gized and richly endowed Benedictine monasteries. While some twelfth-century secular communities supported the hermit-like activity of anchorites who chose to live a spiritual existence in a cell that was often located outside the village or even attached to the structure of a church, some individual monks began leaving their communities to take up the solitary lives of hermits completely removed from the rest of society. In northern Italy during the early eleventh century, eremitic (solitary) monks like the Greek-speaking St. Nilus chose their own paths. St. Romuland organized huts for hermits in the hills of Camaldoli that attracted only the most serious monks, the contemplative elite. At Valombrosa, John Gaulberto also founded a cenobitic (communal) group who chose to persevere in the strictest observance of the Benedictine Rule. They lived in complete isolation, buffered from the world by professed lay brothers who were administrators of the monastery's secular affairs. The lay brothers were dedicated to keeping outsiders away.

**THE TEACHINGS OF PETER DAMIAN.** One of the most influential monastic figures of this period was Peter Damian (1007–1072), who received an education in the city schools of Italy. He abandoned formal learning for a time and joined a group of ascetics at Fonte Avelana in the Apennine hills. Peter denounced the pleasures of the flesh, producing marvelously mystical poetry. He also wrote a treatise for hermits entitled *Institutes for the Order of Hermits*. In this work he spelled out guidelines for brothers who wished to live under the strictest regimen. The monks were to occupy cells in pairs, living in a perpetual state of fasting, remaining barefoot in both summer and winter. While most of the Italian men who were attracted to these severely contemplative groups were drawn from among the wealthiest of the nobility, Peter was himself of humble origin. Peter Damian was particularly drawn to the practice of the mortification of his flesh through flagellation, that is, the practice of whipping oneself as punishment for sins or in commiseration with the suffering of Christ. When a community member died, the entire group would undergo a seven-day period of fasting, recite the entire psalter thirty times over on behalf of the deceased, and experience the whip seven times. Peter was also active in a campaign against simony (the buying and selling of clerical offices) and clerical marriage. In 1051 he wrote the *Book of Gomorrah (Liber Gratissimus)*, which was a polemic against sexual activity among the Italian clergy, including prohibitions against masturbation and homosexual conduct.

**CARTHUSIANS.** In 1080 Bruno of Cologne, a former master and chancellor of the cathedral school at

Reims, left teaching to become a hermit in the forest of Colan. He was credited with founding the Carthusians, an order that mixed both eremitical and cenobitic elements. The monks lived in a group hermitage where each member spent most of his time in the solitude of a private cell, except for communal prayer twice a day. Mass and chapter were held once a week. Monks took most of their meals alone and had a private garden, toilet, and area for study. At first they lived lives centered around deliberate simplicity. Their churches were unadorned, their clothing and bedding of the coarsest materials. The original Carthusian settlements were comprised of a series of huts, but by the twelfth century more elaborate stone structures took their place. Because of their strict rules, the Carthusians needed *conversi* (lay monks) to deal with the outside world, tend to the labor of the monastery, and function as go-betweens for the hermit

monks. The *conversi* were usually illiterate. They had their own dormitory, which was slightly removed from the community, and would sit silently while their procurator chanted the daily offices for them in an oratory quite separate from the hermits. Growth within the Carthusian Order was rather slow, but the establishments were deliberately small. Gradually, between 1178 and 1400 they added some nine houses in England. As Bruno of Cologne once wrote, “The sons of contemplation are slower than the sons of action.”

**THE FOUNDING OF THE CISTERCIANS.** One of the most explosive movements of the twelfth century was the Cistercian Order. It had been founded in 1098 by a group of former French Benedictines from Molesme who were dissatisfied with their observances. The Molesme community had originally lived as hermits in the forests of Burgundy. Eventually they came back to following the Benedictine Rule. The abbot, Robert of Molesme, set out one day in 1098 with 21 of his monks for a more remote site at Cîteaux (the Latin word for Cîteaux is *Cistercium*, meaning “a marshy place”). The Cistercian movement that began from the vision of Robert blossomed into one of the largest and fastest growing religious movements of the Middle Ages. The Cistercian Order was directed toward a reform of the perceived growing laxities within the French Benedictine system, especially among the Cluniacs. In the mode of the other reform orders, they were focused upon moving away from the “worldliness” that had crept into medieval monasticism. Like the hermits, they attempted to separate from secular society in a quest for solitude, a simpler life, and a renewed focus on connecting the scriptures to one’s spiritual and human nature. This reform community wished to continue the cenobitic existence in fidelity to the Rule of Benedict, along with greater independence from secular entanglements and obligations of vassalage, and a vision of poverty and self-sufficiency. The monastery began as a series of wooden huts that were built by the monks themselves. Their first decade at Cîteaux saw little growth, but in 1112 the charismatic St. Bernard of Clairvaux appeared at the gate of the monastery with thirty companions. From that point on, the order began to flourish. Cîteaux started sending out small groups to found daughter houses throughout France and eventually all of Europe. Bernard was made abbot of Clairvaux in 1115, and within the next twenty years engendered some twenty daughter houses of his own. During the order’s first fifty years, 339 houses were established, and by the middle of the thirteenth century the number had grown to 640. At its height in the fifteenth century, the order boasted close to 700 abbeys of men and 900 houses of women. The

development of the order was strongly influenced by charismatic leaders and spiritual writers, including William of St. Thierry (1085–1148) and Aelred of Rievaulx (1109–1167) among the men, and Mechtild of Hackenborn (1241–1299) and Gertrude of Hackenborn (1251–1292) among the women. Mechtild's allegory of how Anima or the Soul comes to the side wound of Christ and sees it as a cavern of burning flames and vapor is one of the great pieces of mystical writing of the period. The side wound with wounded heart within is vividly seen in a miniature from a devotional manuscript in Oxford. Often, such miniatures give evidence of being kissed and stroked by pious owners of the books over a long period of time.

**THE CISTERCIAN CONCEPT OF REFORM.** The original charter for the Cistercian Order was presented to Pope Calixtus II for approval in 1119. These documents provided for nurturing filial relationships (that is, relationships to daughter houses), annual chapters (assemblies) for all the order's abbots, uniformity in practice among the houses, fair treatment of the monks, elections of the abbots by their peers, checks on corruption in leadership, fair but limited dealings with outside secular interests, and, most importantly, the ability to change its own constitution. What is essential to an understanding of the Cistercian tradition is the concept of "reform." The reform that seems to be constantly ongoing within the Cistercian and other Benedictine-related traditions might be more simply understood as a "re-reading" of the Benedictine Rule. This re-reading is what happens each time a new generation picks up the Rule and begins to read it in light of their own time, in a way which seems to allow the greatest progress toward spiritual transformation and a vision of communal charity. The twelfth-century charter documents most clearly reflect the way the early Cistercians had devised a plan in which their vision of the Rule could be continually re-examined. The yearly meetings of the General Chapter of all Cistercian abbots allowed for an ongoing interpretation of the monastic tradition. These traditions were passed down to the monks on a daily basis through their reading, activities, and communal prayer, as well as through the abbot's chapter sessions. The Cistercians in general never really made much effort to focus upon the intellectual and philosophical dimensions of the faith, a fact that eventually made them less attractive to the nobility in the thirteenth and fourteenth centuries, when scholasticism and the work of the friars (who served as missionaries and teachers) began to take hold. Instead, they were known for their great spiritual reforms and return to the ideals of the early Benedictine experience. The simplicity

of their cloistered monastic life is what the Cistercians believed best led them to God.

**CISTERCIANS AND MEDIEVAL INDUSTRY.** The proliferation of Cistercian houses led to a great increase in their holdings of land. Granges (monastic farms) and large farm estates began to be managed or rented, and significant incomes began flowing into the Cistercian enterprises. Many houses even owned or controlled property in other countries. Unlike the Cluniacs, the Cistercians allowed each house and daughter to control its own finances directly. The drive toward self-sufficiency led the Cistercians to create independent industries at each monastery. Many chose sites near running water. They actually became known for their use of hydraulics. As a result there were numerous mills and waterwheels employed by the Cistercians. They sold items produced at the mills, and often would rent their grain mills to neighboring laity in order to facilitate the production of local food stuffs. As industrious as they were, and as prosperous as many of their houses became, one thing that can be said of the Cistercians is that they were adamant about charging fair prices for their products.

**CISTERCIANS AND THE LITURGY.** Cîteaux's second abbot, Alberic (1099–1108), sought to introduce a profound simplicity into the Cistercian liturgy. Benedictine choral chants of the daily offices were deemed too melodic. The second abbot, Stephen Harding (1108–1134), reformed the hymnal and antiphonaries by going back to the basics of the old Ambrosian hymns (of the fourth century) because they had been recommended by St. Benedict in the Rule. St. Bernard, abbot of Clairvaux from 1115 to 1153, sought to simplify melodies and eliminate repetitions in the chants, though some new texts and melodies were added to express devotion to the Blessed Virgin. The Cistercians chanted the entirety of their office (with the exception of the scriptural readings) in low, unembellished plainchant. Their offices contained only the very few psalms prescribed by the Rule of Benedict, so they spent much less time in the choir than many of their medieval counterparts. A twelfth-century Benedictine monk writing to Cistercians on behalf of Cluny once remarked that their prime alone (the office celebrating sunrise) was lengthier than the entire set of daily offices of the Cistercians. Fewer feast days were celebrated, and reception of communion by the monks was limited. Processions of any kind were prohibited. Cistercian liturgical directives of the General Chapter from the early twelfth to the thirteenth centuries echoed the sentiments of their foundational documents. The altar was to be completely unadorned, relics were not permitted in altars until 1185, and the use of

candles was extremely limited. The celebrant's vestments were not to be made of silk (except the stole and manipule) and all liturgical ornaments and vessels were to be made without silver, gold, or precious stones, except for the chalices for the wine and the fistula (a straw used to sip the wine), which could be gold or silver plated. There were no pictures or sculptures in the early worship spaces with the exception of painted wooden crosses. Window glass was to be plain, not stained or decorated. Genuflections (bending down on one knee) were discouraged and monks could not lie prostrate in prayer. In 1261 communion under both species (bread and wine) was suppressed for members of the community.

## WOMEN RELIGIOUS

### MONASTIC WOMEN IN THE EARLY MIDDLE AGES.

It is interesting to note that a substantial amount of information from the early Middle Ages about women's religious houses was written by male clerics from the period. Throughout much of the Middle Ages many of the women dwelling in monastic communities lived lives not that much different from individuals in the male houses. In fact, there is not even a specific medieval Latin term for a female monastic house. The term "nunnery" only comes into use in the late medieval period and the term "convent" (*conventus*) could actually have applied to houses for both men and women. As early as the sixth and seventh centuries, a large number of noble female saints emerged from monastic houses in Merovingian territories, such as Gandersheim and Quedlinburg. They espoused a form of spirituality that put less emphasis on virginity and asceticism than on compassionate leadership, performance of miracles, and service (both charity

and peacemaking) to the surrounding community. From the ninth through tenth centuries it appears there were very few women's monastic houses (likely fewer than forty in all of Europe) compared to the much larger numbers two centuries earlier. This is due in part to their destruction during the age of invasions and the reluctance to rebuild amid the insecurities of civil governments. Some of the early medieval convents and double houses (for both males and females) served as viable opportunities for women to devote themselves to spirituality during this period. Mixed houses in Germany, northern parts of Gaul, and Anglo-Saxon England were even run by abbesses instead of abbots.

**RETREATS AND RENEWED OPPORTUNITIES.** During the tenth through mid-eleventh centuries, women in Europe lost some of their independence as the male-dominated church, which was putting more emphasis on celibacy, began to stress the moral and intellectual weakness of women. At this time, some of the nunneries began to function more or less as secure places for the retirement of widows and daughters of the nobility, who often had little vocation for the spiritual lifestyle. Such houses tended to be well endowed and frequently rather exclusive. The Canonesses at Farmoniers (France) and Essen (Germany) provided such comfortable living for eleventh-century women. While the number of nunneries declined throughout the tenth and early eleventh centuries, there were a few significant communities operating in Germany such as Herford, Gandersheim, and Quedlinburg. All of these houses received patronage from Matilda, the mother of Emperor Otto I. Women's houses in France and England began to rebound after 1000 with new or transplanted communities being established in Picardy, Arles, Nîmes, and Marseille. Between 1000 and 1080 some 36 convents were founded or restored in France and England. They were present in the French cities of Beauvais, Angers, Evreux, Angoulême, Rennes, LeMans, Rouen, Tours, and Verdun, as well as English centers such as Canterbury, Chatteris, Elstow or those attached to men's houses at Bury St. Edmunds, Ely, St. Albans, and Evesham. When double monasteries began to reappear in the eleventh-century reform movements, it was rather uncommon for abbesses to have any control over the male elements of the community. The female houses associated with the Cluny movement, while they did have claustral prioresses, were answerable to the priors of affiliated males houses who were under the authority of the abbot of Cluny. But, by the end of the eleventh century, there appears to have been a rapid proliferation of women's houses.

**FEMALE ACHIEVEMENT.** Early medieval Germanic communities often allowed females to occupy a higher position than their counterparts in other cultures or countries, which may be the reason why there were more independent houses for women in the Anglo-Saxon territories. That the middle twelfth century offered good examples of the heights to which women's religious life extended can be seen in the case of Hildegard, the leader of the women's community at Bingen, just northwest of Mainz (1098–1179). Not only was she thought to be the spiritual equal to men of her day, but she left behind an immensely vivid body of literature that recounts the lives and thought of women within the cloister, along with their spiritual activities and the labors of their hands. Some of the twelfth-century mendicant orders of hermits had mixed houses associated with movements from places like Fontevrault (founded in 1101) and Prémontré (1115) in France. They attracted large numbers of women, and the fifteen Fontevrault communities all seemed to be female-centered, although they were clearly mixed houses; both the great patroness of courtly literature, Eleanor of Aquitaine, and her daughter, who ended her days as a nun, are buried there. At Prémontré the women occupied a less prominent place in the community, remaining strictly cloistered and tending to do much of the manual labor of the community. Double monasteries were also common in the Low Countries. Some of these double houses that felt it necessary to practice strict segregation gave way to allowing the nuns to run their own affairs and resulted in the eventual separation of these double communities when the women took up their own residences.

**THE BÉGUINES.** The appearance of the Béguines in the early 1200s had much to do with the growing sense of lay piety that had developed throughout the preceding century. In the beginning the movement was not very organized, but it seems that groups of urban lay women began to assemble together in parts of Germany and the Lowlands to attempt to live holy lives in a similar fashion. Many were inspired by the story of Marie d'Oignies, a Flemish noble and mystic who renounced her family's wealth and gained stature as a spiritual healer. Eventually some of these women sought to live together in community. The Béguines came from all walks of life and all social classes although the wealthier members tended to congregate together. Attitudes toward poverty varied. While many members rejected the wealth of their families and chose to live in deliberate austerity, the decision to embrace radical poverty or to retain possessions was individual. A few groups even formed their own little villages in areas that were near

Nun saying vows, *Decretals of Gratian*, Laon, Bibliothèque Municipale MS 372 folio 59v, 13th century. THE ART ARCHIVE/ BIBLIOTHÈQUE MUNICIPALE, LAON/DAGLI ORTI.

large cities. They supported themselves with the labor of their own hands: many undertook weaving, sewing, and embroidery, although some groups resorted to begging. The Béguines took no formal vows but were committed to living in chastity. Some eventually left the communities and went on to marry, and many of the non-communal members continued their connection with the order though married. Their male counterparts were the Beghards, who commonly worked as weavers, fullers, or dyers. The Beghards did not own property and spent much of their time engaged in charity work or spiritual contemplation.

**PATRONAGE AND PERSECUTION.** The Beghards' and Béguines' lifestyles were ascetical, but they rejected the formalism of some of the other orders of their time. The Béguines often attended Mass and the daily offices at their local churches. Gradually these movements gained widespread acceptance from both church and secular authorities. Hundreds of houses sprang up throughout northern European towns. By the end of the thirteenth century, there were 54 houses in the city of Cologne alone. While noble families' or members' fortunes tended to support these groups, chapels like those

of la Vigne were given over to Béguine communities for their use. Eventually church legislation of the thirteenth century forced the Béguines to confine themselves strictly to communal activities similar to those being practiced by contemporary convents. This did not stop outspoken Béguines like Marguerite Porete, who reproached the weakness of a male-dominated church and its outward signs, which served as a crutch to aid religion. Her book *The Mirror of Simple Souls* received much criticism, but remained immensely popular, even without the attribution of her authorship. She was eventually accused of heresy and burned at the stake in 1310. As hostility towards the Béguines grew in the church hierarchy, the movement suffered persecution in Germany, but it fared better in France, where it had the protection of powerful patrons.

#### CISTERCIANS, FRANCISCANS, AND DOMINICANS.

In the years that followed the ground-swell of lay initiatives, there are numerous accounts of women connected to the Cistercian, Franciscan, and Dominican movements, thus contributing significantly to the European monastic presence. Although the male Dominican movement that arose after 1217 was defined as an order of preachers (called friars), St. Dominic's first religious house, founded in 1207 at Prouille, was a convent established for former Cathar women (members of a heretical sect chiefly in southern France). Likewise, although St. Francis of Assisi's male order, based on the ideal of complete poverty, sent friars on preaching missions throughout the world, his conversion of a wealthy young woman named Clare led to the founding of a female order (later known as the Poor Clares) that required a strictly enclosed life of asceticism, fasting, and perpetual silence. By 1223 there was already significant opposition throughout the Dominican Order in regard to the admission of more nuns. Maintaining convents would require ordained resident Dominican men who would say Mass and serve as confessors. Some felt such duties compromised the early mission and ideal of the friar ministry. The Dominican General Chapter of 1228 discouraged the admission of additional convents. The Cistercians also came to a similar conclusion at their General Chapter the very same year. But after 1245, papal legislation allowed for the multiplication of Dominican convents, particularly in Germany. The Dominican nuns, quite unlike the friars, could not leave their convents to beg or minister. Instead, they remained strictly cloistered, encouraged to develop interior lives of humility, poverty, and simple spirituality. Male Dominicans had no idea how popular this movement would become for medieval women, as some 150 Dominican convents were organized by 1300. The Cistercians experienced

much greater growth with some 900 houses claiming to be Cistercian or Cistercian affiliates founded by 1325. Within less than a hundred years, however, the number of registered Cistercian convents dropped to somewhere around 211.

## MEDIEVAL EDUCATION AND THE ROLE OF THE CHURCH

**THE RISE OF EDUCATION.** During the twelfth and thirteenth centuries, the many social and economic changes which came about in European society helped create an increased interest in education. Burgeoning bureaucratization within both civil and church administration created the need for educated men with abilities in the area of law (both canon and civil). The universities also began to teach medicine. In cities like Bologna, the study of rhetoric and Roman law was useful for both canonists and those who drafted legal documents in secular society. Such a school or *studium* during the twelfth century drew such people as the great medieval canon lawyer Gratian, Thomas Becket, and Pope Innocent III. It was at this time, also, that the universities slowly began to separate themselves from the firm control of the church. However, as late as 1200, the majority of students were still ecclesiastics. For example, at Bologna, no one could be made a medical doctor without permission of the archdeacon.

Monks using a monastic library from a 14th-century French MS. THE GRANGER COLLECTION.

**MONASTIC AND CATHEDRAL SCHOOLS.** Prior to the age of the studium or of university scholars (through the mid-eleventh century), monastic schools had been the most stable force in education. Although the boys who were sent there were children of the nobility who may or may not have had an interest in clerical life, much of the schools' curriculum focused on teaching them to read and write Latin, and preparing them to join the ranks of the church. Monastic lives of prayer, silence, labor, and meditation were not, of course, always conducive to the free exchange of thought. However, these monasteries did become great repositories of knowledge, in that many of the books of the day (particularly religious texts) were copied by hand in monastic *scriptoria* and stored in their libraries, as shown in an illustration of monks using a monastic library from a French manuscript of the fourteenth century. On the secular side, some women, as well as young men of privilege, were instructed at court, learning to read and write Latin; but their education was rarely broad or extensive. Between 1050 and 1200 the cathedral schools (or bishop's schools) assumed the leading role in education. Bishops had traditionally been entrusted with providing for the

education of the secular clergy. Cathedral schools were often staffed by clerics who lived as canons, residing on the grounds of the bishop's estate or in the town nearby. These schools were rather flexible in their structure and invited learned men or "masters" to come and lecture to their students. The effectiveness of the system, however, was somewhat variable since the school's reputation depended on a single master and often, when he was gone, did not survive him. Thus, both masters and students traveled from cathedral town to cathedral town looking for the best environments in which to teach and learn. Eventually the cathedral schools insisted that the masters possess formal licenses to teach, which were issued by the chancellors (*licentia docendi*). These are actually the pre-cursors of modern academic degrees. Anyone attending a cathedral school at this time took minor church orders and held status as a cleric. This status gave them immunity from civil courts—that is, they were under the jurisdiction of canon (church) law and ecclesiastical courts, which usually gave milder sentences for serious crimes. This distinction in legal status applied also to the new universities and was at times a source of conflict between "town and gown."

**THE BIRTH OF UNIVERSITIES.** As the number of traveling students increased, some schools tried a new plan of keeping students in one place by engaging multiple masters, who then separated from the cathedral schools and took up residence in other parts of major cities. These new teachers were paid directly by the students, so, in effect, the least popular instructors often found themselves out of work. This competitive climate of intellectual revival brought about the appearance of the great universities in the 1200s and 1300s. To protect their interests, the students and scholars began to form guilds, from which the university structure eventually grew (*universitas* was a Latin word for corporation). The universities literally became independent legal entities. Masters in Paris received a royal charter around 1200 for their university. Some of the finest churchmen and independent clerical scholars came to Paris to teach. Originally they rented out halls for their classes on the left bank of the Seine River, which soon became known as the Latin Quarter because Latin was the language of learning. The guild received approval from Rome in 1231 and soon became a model for other European universities, although some cities, such as Oxford and Cambridge in England as well as Salerno and Reggio in Italy, had begun university-style systems of education even earlier, during the twelfth century. While these universities were growing in secular influence, they also became the place where religious orders like the friars sent their most talented brethren to teach and study. The curriculum was comprised of the *Trivium* (grammar, rhetoric, logic) and *Quadrivium* (arithmetic, astronomy, geometry, and music). There was master's level work offered at these universities in law, medicine, and theology, which took five to seven years to complete. Theology students had to be thirty years of age before they could undertake the degree. However, education which was once geared exclusively toward the clergy (although this is not completely true of the Italian schools) had now become much more liberal and was certainly not just for clerics. Most students were from the upper and lower nobility, some sons of knights, although offspring of the merchant class soon began to break into their ranks. The founding of hundreds of European universities continued through the thirteenth, fourteenth, and early fifteenth centuries. Over time, fewer than half of the students in these institutions were seeking education related to the service of the church. The advent of humanism saw a greater variety of other disciplines added to the curriculum.

**SCHOLASTIC INQUIRY IN THE MEDIEVAL UNIVERSITY.** While, strictly speaking, scholasticism was the intellectual tradition of logical inquiry practiced in medieval schools, it has come to be understood as the at-

tempt to use techniques of Aristotelian logical inquiry to link Christian revelation, church doctrine, and the mysteries of the natural universe in a deeper and more reasonable understanding of the Christian life. While the theoretical basis for scholasticism was introduced in the late Roman period by early philosopher-theologians like St. Augustine and Boethius, in the medieval period it appears in the ninth century in the work of John Scotus Eriugena who made the important distinction between reason and the revelation of sacred scripture. The scholastics drew upon the logical analysis of the Greek philosopher Aristotle, establishing a common method of inquiry by posing a question, following lines of thought presented by earlier authoritative scholars, and attempting to reason their way to a logical conclusion. Early scholastic problems dealt with attempts to explain the notion of Christ's presence in the Eucharist. A debate between the theologian Berengar of Tours (998–1088) and the Benedictine Lanfranc of Bec (1010–1089) during the mid-eleventh century resulted in the development of the doctrine of transubstantiation (conversion of the substance of the bread and wine into the body and blood of Christ, with appearances of bread and wine remaining). Anselm of Canterbury (1033–1109), a pupil of Lanfranc, employed a dialectical method (a form of debate marked by the dynamic of inner tension, conflict, and interconnectedness), and began to examine necessary truths of the Divine mysteries, attempting to postulate them in a logical argument. Anselm's famous proofs for the existence of God, while subsequently refuted, formed the departure point for problems of scholastic theological inquiry that preoccupied scholars for the rest of the Middle Ages.

**THE HEIGHT OF SCHOLASTICISM.** Around the middle of the thirteenth century, the scholastic tradition reached its peak with the work of Albertus Magnus (1200–1280), St. Thomas Aquinas (1225–1274), and St. Bonaventure (1215–1274). The establishment of the universities with their faculties of theology contributed greatly to the development of this scholarship, as did the promulgation of Aristotle's concept that all human thought originates with the senses. Western interest in Aristotle and other classical texts was revived in part due to contact with Eastern Christian and Muslim ideas during the time of the Crusades. European scholars eagerly began to translate Greek and Arabic works into Latin. Patristics (works of the early church fathers), classical philosophy (some of which included commentary by Muslim philosophers such as Avicenna and Averroës), and Jewish thought (such as that represented by Moses Maimonides) became sources of new learning in Western Europe. Most scholastic argumentation was driven

by the Aristotelian questions (sometimes described as the Four Causes) regarding the nature of things in the universe: What are these things made of? What shape do they take? How do they come to be? What were their purposes? The use of categories and the notion of causality led to attempts to place the existence of God and the mysteries of creation philosophically within the limits of human understanding.

## SECULAR CLERGY: REFORM AND REACTION

**SIMPLICITY AND CELIBACY.** The eleventh-century clerical reforms directed by the papacy called for a new discipline among secular priests. Proponents of reform stressed simplicity of lifestyle and singular dedication (including celibacy), as well as the need to break ties with secular interests and worldliness. The two most troublesome issues involving corruptions of the priesthood at this time were those related to simony (the buying or selling of church office) and clerical marriage. The momentum of reform also ushered in a rise in the number of individuals seeking the monastic life at places like Cluny. The character of priesthood was also an issue, but more importantly the social distinctions between the powers of the church and the laity were being clarified during this time. Pope Nicholas II's legislation of 1059 reflects Rome's awareness of the acute need for clerical reform at the most basic level. It is also a reminder of the growing power of organized religion and its competition with the laity for control of society.

**EDUCATION AND RESTRAINTS ON PERSONAL BEHAVIOR.** The need for more systematic clerical reform was the agenda of twelfth-century bishops. They were charged with personally controlling the quality of candidates for the priesthood as well as their instruction. Education of the clergy was a major issue since many

clerics in the more rural areas often had not received a thorough theological or scriptural orientation. The Third Lateran Council of 1179 decreed that each cathedral should have a master for the instruction of grammar and each major city a master of theology. They assisted the priests in their understanding of the scriptures and the nature of the sacraments. These teachers also ensured that the clergy not only had training in the implementation of ritual, but also knew something about the proper care of souls. An educated clergy also needed to combat the erroneous teachings of self-styled wandering preachers and zealots, who themselves quite often lacked formal religious education. At this time, control over localized preaching was a problem not only for local priests but bishops as well. Parochial jurisdictions seemed to be an important but often criticized aspect of clerical life. With the advent of the Crusades, the issue of whether or not clerics could bear arms or participate in an excursion of holy war came to public attention as well. Other behavioral issues, including excessive immoral public displays, such as drinking or concubinage, were also addressed by the councils. The more extreme monastic reform movements like Cistercians and Carthusians served as a gentle reminder that the secular clergy were certainly not living the most ideal or perfect Christian lives.

**AWARENESS OF INSTITUTIONAL PROBLEMS.** The thirteenth-century reforms of the secular clergy were spurred by the realization that the church in its domination of European culture had become more institutional than spiritual. The 1215 *Magna Carta*, an English document laying out the rights of free men, even included provisions for relief of the institutional church by the crown. Despite the power amassed by the church, however, it was the increasingly frequent development of lay spiritual movements and the establishment of four new mendicant orders that finally delivered the wake-up call to the hierarchy, who were inundated with requests for confirmation of new religious lifestyles. Canon 16, decreed by the Fourth Lateran Council, sheds some light on the problems of the day:

Clerics shall not hold secular office nor indulge in commerce, especially unseemly commerce. They shall not attend performances of mimes, jesters or plays and shall avoid taverns except only out of necessity while traveling. Nor shall they play with dice; they should not even be present at such games. They should wear the clerical tonsure and be zealous in the performance of their divine offices and in other responsibilities. Moreover, they shall wear their garments clasped and neither too short nor too long. And they shall eschew bright colors such

*a PRIMARY SOURCE document***CLERICAL REFORM: THE LEGISLATION OF 1059**

**INTRODUCTION:** Pope Nicholas II (1058–1061) was a leading figure in the eleventh-century drive toward clerical reform. He was significantly influenced by fellow reformers such as Humbert of Silva Candida, Peter Damian, and Hildebrand (later to become Gregory VII). At this time the church was rife with corruption. Particular concerns surrounded the inappropriate elevation of the hierarchy and the practice of simony as many unqualified candidates found their way into ecclesiastical office.

as red and green as well as ornamentation on their gloves and shoes. [Canon 16]

Another passage (Canon 17) suggests that even within the cloister, behavior was often inappropriate:

We regret that not only some clerics in minor orders but also some of the prelates of churches spend half of the night eating and talking, not to mention other things that they are doing, and get to sleep so late that they are scarcely wakened by the birds singing and they mumble their way hurriedly through morning prayers. There are some clerics who celebrate Mass only four times a year, what is worse, they disdain even attending Mass. And, if they happen to be present at Mass, they flee the silence of the choir to go outside to talk with laymen, preferring things frivolous to things divine. These and similar practices we totally forbid under penalty of suspension.

After the Fourth Lateran Council, the clergy were prohibited from having anything to do with the spilling of blood, including service as a soldier or a physician. Priests were not allowed to hunt or participate in fowling. The giving of a benefice (an ecclesiastical office to which an endowment is attached) to any unworthy cleric was also deemed an offense. In the late thirteenth century, the English bishop Robert Grosseteste wrote the *Templum Dei* (the Temple of God), a simple and clear guide for the performance of clerical duties including the distinctions among particular vices and virtues. Around the same time in France, Bishop William Durandus put together a work outlining priestly functions and the teaching mission of clergy.

**UNCLOISTERED RELIGIOUS LIFE.** An important outgrowth of the lay religious movements of the twelfth century was the notion of living an apostolic life outside

## THE Battle over Magna Carta

The significance of the thirteenth-century English document called *Magna Carta* (the Great Charter) is often thought of not in relation to religion, but in terms of its influence upon the evolving notion of constitutional liberties. King John of England (1199–1216) was forced to admit that, even as king and lord, he had certain contractual obligations to individuals at many levels of society. On 15 June 1215 at Runnymede, under mounting pressure from the barons of England (led by Stephen Langton, the archbishop of Canterbury), King John set his seal to the document, consenting to certain rights and freedoms for the church, as well as his barons, and granting relief from unjust legal, financial and tax-based statutes for subjects of the crown. Magna Carta's provisions for trials by jury, consent to taxation by common council, fishing and hunting rights, the imposition of an aristocratic king's council, and adjustments to standard legal procedures created precedent for a more participatory government and set the stage for the necessary developments of a representative parliamentary process. Over the centuries, the precedent and spirit resulting from these events would continually remind the English people that even the king, like those over whom he ruled, should be subject to the law. Rather than being just a single document, Magna Carta actually went through several drafts and a period of negotiation, and its implementation led to further developments of parliamentary and constitutional governance in England. These events then influenced other European constitutional monarchies, but most significantly fostered the representative, constitutional, and republican ideals that gave birth to the government of the United States.

What is most interesting is the role played by the Roman Church in the whole chain of events. Some of this had to do with the tenuous nature of John's power in England. A rift between King John and Pope Innocent III (1198–1216) went back to the disputed election of the archbishop of Canterbury in 1205. Despite English clerical opposition, John had favored his secretary, the bishop of Norwich, for elevation to the vacant post and forced the clergy to elect his candidate. Innocent, however, invalidated the election and persuaded the Canterbury clerics to support Stephen Langton, an English scholar who was teaching university students at the time in Paris. (Tradition

has suggested that Innocent and Stephen were friends while studying together at the University of Paris.) Despite the pope's consecration of Stephen as Canterbury's archbishop, King John would not allow Stephen to occupy that important ecclesiastical office. Langton remained in France for some six years until the pope forced John's hand in 1208 by excommunicating him and placing the entire English kingdom under interdict. John's response was an abusive taxation of church property, to which Innocent responded by authorizing the French king, Phillip Augustus, to depose John by force and take over England. John was eventually compelled to submit to the papacy and Stephen was placed in power. In addition, the kingdoms of England and Ireland were made subject to the papacy, and King John was only allowed to rule them as a vassal of Rome. This formal relationship of vassalage between England and the papacy continued for the next hundred years. (Events such as this leave little doubt as to why animosity persisted between the English monarchs and the papacy.)

Once at Canterbury, Langton quickly took the side of the barons in attempting to lessen the king's domination of the English people. It is quite clear that Stephen Langton, as archbishop, assisted the nobles in the drafting of Magna Carta, which included provisions to guard against excessive taxation of the church, even though this issue had been resolved long before the drafting of the document. In spite of this, Pope Innocent III, now symbolically entrusted with the care of England, was not in favor of many of the elements in the great charter. He particularly did not agree with the provisions in the document concerning the liberties of the barons. Powerful dukes and princes in Italy had caused much trouble for the church. In August of 1215, Innocent annulled Magna Carta. Some scholars have argued that the pope found the document too politically liberal. Others suggest that Innocent felt he needed John on his side in the implementation of the directives from the Fourth Lateran Council. Innocent called the king's "forced" concessions to the nobles which were set forth in the charter unjust, degrading, shameful and illegal. In fact, Langton was soon removed from his episcopal office by the pontiff. What is interesting to note is that this was a case in which the pope felt he not only had the authority to manipulate the running of a kingdom, but also the power to invalidate a secular legal document. After both Innocent and John died in 1216, Magna Carta was reissued, and Stephen Langton was eventually re-appointed as archbishop of Canterbury.

the cloister. The practices of preaching, teaching, ministry, and living in simplicity or poverty, as well as performing charitable work, became focal points for some

of the more socially oriented religious movements of the 1100s. One of the reasons behind such reform was the feeling that these were the very apostolic activities that

were somehow being neglected by the secular clergy. However, some of the lay spiritual movements that developed over the next several centuries, such as the Waldensians, Humiliati, Béguines, and Beghards, came under criticism from Rome or were even accused of heresy. Regardless, the laity throughout medieval Europe began to listen to these reforming voices for inspiration in their own spiritual lives. It was believed by many members of the church establishment that such loosely organized movements lacked the order, direction, and type of training or education necessary to carry out the orthodox mission of the church in a responsible way.

**THE ORIGINS OF THE FRIARS.** As interest in religious reform increased, the growing urban cultures were giving rise to greater commerce, more mobile populations, an increase in education, and a broader distribution of wealth. With this rising prosperity came sophistication, greed, skepticism, and a growing distrust of wealthy and powerful religious institutions. An outgrowth of this skepticism was the development within the church itself of a new form of religious life emphasizing a combination of poverty and preaching. The friars, as they came to be known, proved to be an answer to some of the tensions being experienced both within institutional Christianity and outside it. On the one hand, the friars belonged to organized and papally sanctioned orders, yet on the other, they were not obligated to the Benedictine vow of cloistered stability. The two major movements of friars, the Dominicans and the Franciscans, were substantially different, both in their origin and character. The Dominicans evolved from canons regular (clergymen belonging to a cathedral or collegiate church) while the Franciscans were more akin to the simple lay spiritual movements. Once established and accepted by Rome, these friars were free to minister to the poor as well as preach, teach, and counter the spread of heretical ideas, all within the authority of the institutional church. With the benefit of theological education, the sanctioned orthodox preaching of the Dominicans was quite befitting of their name, Order of Preachers (O.P.).

**SERMONS.** The friars targeted urban areas in their ministry, supporting themselves by begging in communities along the major European trade routes. In these cities, where medieval commerce was thriving, there were large numbers of people with a certain amount of disposable income. Members of this rising merchant class needed direct and practical spiritual guidance, and they were open to hearing the messages of educated preachers. The preaching of homilies by secular clergy at Mass in both local churches and cathedrals had all but disap-

peared by this time. Among the Dominicans and Franciscans, however, the sermon became an art form. Manuals for preaching such as *The Instruction of Preachers* by the Dominican Humbert of Romans or *The Art of Preaching* by Thomas Waleys became important tools for evangelization. *Exempla* (moralizing anecdotes drawn from the lives of saints, animal fables, or wise sayings about everyday life) were used as effective aids in the delivery of clever sermons, while biblical concordances (books where all the key words in the Bible are arranged so that they might be referenced or cross-referenced) helped bolster the preacher's arsenal of effective speech. The message the friars brought to the laity incorporated a theology that was reasonable, optimistic, human, accommodating, and directed toward living a fruitful life in this world. These qualities made the laity more willing to confess their sins to the friars. In fact, Dominican convents gave their brothers regular instruction in the theology of penance.

#### MEDIEVAL HERESY

**DEFINING LIMITS.** While the twelfth century was a great period of religious reform and revitalization, there were also harsh caveats that came from Rome regarding unworthy priests, schismatic groups, and, in their opinion, wrong-thinking leaders of movements. The same climate that fostered reform was also a breeding ground for ideas not in keeping with the basic doctrines of Christianity. It was actually Rome who decided which groups had gone too far. But they almost always allowed opportunities of forgiveness for the wayward to come back

to the fold. This made the heresies more a matter of disobedience, failure to accept correction, and open rejection of the church's official position than the adherence to a belief which brought with it permanent condemnation. The early heretics in Western Europe were not always theologians; rather, they were sometimes merely simple people who condemned worldliness and hierarchical church institutions in favor of evangelical simplicity. Rejection of institutional marriage, emphasis on chastity, disputing the authority of the Old Testament, questioning some of the sacraments, and, above all, denial of the Trinity were elements of the twelfth-century movements that were soon branded heretical in the West. Preachers like Tanchelm in the Low Countries, Henry of Lausanne in the south of France, Peter of Bruys in the Rhône Valley, Eudo in Brittany, and Arnold of Brescia in Rome were all accused of initiating popular heretical movements.

**BOGOMILS.** While the most actively persecuted group in the Western Christendom was the Cathars, a number of historians have attempted to trace their roots to a much earlier medieval heresy practiced by the Bogomils in the east. Bogomil was a tenth-century preacher in Macedonia who taught a life of prayer, penitence, wandering, and simplicity of worship. He rejected sacraments, church feasts, icons, liturgy, vestments, and veneration of the cross. His basic message was quasi-dualist in nature: he claimed the world was evil because it had been created by the Devil, the eldest son of God. Christ was seen as the youngest son of God who came to earth to redeem, but never fully became human. Bogomil and his followers saw the Devil as inferior to God (which actually makes for a sort of "uneven" dualism). The Bogomils espoused complete renunciation of the world. Consumption of meat and wine was forbidden, marriage was discouraged, and obedience to church hierarchy was seen as having no validity. Their scriptural focus was on the New Testament. For a time the group seemed to gain favor at the court of Constantinople. In this cosmopolitan Byzantine environment, Bogomilism was transformed into a more philosophical movement, even an academic religion. It appealed to the upper classes in the Byzantine Empire, and evolved from its former roots as a religion of the peasantry, deeply connected to New Testament ethics. After Bulgaria's conquest of parts of the Byzantine Empire in 1018, the Bogomils retreated into a more monastic existence, while persecutions in 1110 and 1143 at Constantinople forced them to move to Dalmatia and Bosnia. In later years, their worship became more ritualized. They baptized by laying hands on converts and holding the Gospel of John over their heads. In Bosnia and the Bulgarian Empire, Bogomilism

became the state religion after 1218. The Bogomils sent missionaries to Western Europe, and it is likely that by the middle of the twelfth century they were active in Germany and the Rhineland. Such dualist ideas—that is, beliefs emphasizing opposing elements, such as good and evil—were also carried by merchants and pilgrims who had come into contact with the Bogomils and other forms of dualism in the east.

**CATHARS.** It was out of the religious fervor of the mid-twelfth century that the Cathar movement came to light. It was reported to be present at Cologne as early as 1143 when Everwin of Steinfeld wrote to Bernard of Clairvaux about the practice. Soon after, it had quickly spread into Flanders. Cathar disdain for the corruption of the medieval clergy bred in them a desire to purify the church (thus the term *katharos*, meaning "pure"). They believed that the material world was impure and that the soul must strive to free itself from the evils of this existence. The Cathars were vegetarians; they fasted regularly, avoided sexual activity, and rejected material possessions. Like the Bogomils, they regarded Jesus not as God, but as more of a super-angelic being who came to lead people on the right path. They rejected the notion of the bodily resurrection of Jesus and suggested that true redemption comes from the teaching of Christ, not his redemptive act. Affirming a philosophy similar to that of the Docetists in early Christianity, Cathars questioned the actual physical sufferings of Christ, seeing them as apparent rather than real. The more serious adherents and leaders of the movement were known as *Perfects*. Their lives were basically ascetical in nature. In 1167, during a Cathar council at St. Felix de Caraman, a missionary named Nicetas pushed for a more absolute dualist position concerning the nature of the world. Most dualists in the Languedoc (southern) region of France began to follow his directive. Similar to the Bogomils, they believed that the earth was created and controlled by Satan. Human spirits, which are heavenly and connected to God, have been trapped in bodies created by Satan. The greatest of sins, the original sin, was that of procreation, which Adam and Eve began and which has generationally continued to entrap the good spirits that have fallen from heaven. Salvation can only come from *consolamentum*, which is the path of moral standards that all Perfects have begun, creating a dialogue of forgiveness from sin and restoration to relationship with God the Father. Baptism seems to have been a major step on one's way to perfection. It was at baptism that the Cathari entered into the state of *consolamentum*. Like the Bogomils, they employed the Gospel of John and laying on of hands in the ceremony. This was a baptism of Spirit, not of water. As such, John the Baptist was not seen as a saint.

**CATHAR BELIEFS AND INFLUENCE.** Both men and women were equally able to embrace the level of Perfect and thus engage in communal leadership. This notion seems to have been particularly appealing to many spiritually inclined women from the noble families of Languedoc, though they were not allowed to become bishops. The Cathars had a significant following of *credentes* (or believers) who supported the work of the Perfects and hoped that they too might be committed enough to accept baptism. The *credentes* were allowed to remain married, own property, eat meat, and even participate in the Roman church in the hopes that their conversion might someday be full. Cathars believed that the souls of those who died in an unconsolated state would be reincarnated and allowed to make further progress along the road to freedom from their sinful flesh. Someday, once purified, they could finally return to the heaven from which they had originally come. Cathars made their way into northern Italy between 1150 and 1160 as their numbers grew rapidly. They were given many names in Europe. One such group was called the Albigenses after the town of Albi in the southern part of France where the first Cathar bishopric was established. Often welcomed into the courts of the nobility, Cathar preachers on the streets attracted listeners and even had public debates with Catholic bishops as well as with the Waldensians. They organized their own church with its own clergy, liturgy, and doctrine. By 1190 Italian Cathars had split into six churches. In Languedoc some of the nobility embraced the Cathar heresy in order to overthrow powerful local Catholic bishops. At its height there were eleven Cathar bishoprics, six of which were in France, with the remainder in Italy. All of the bishops were seen as equals.

**WALDENSIANS.** Another popular movement of the time were the Waldensians or Poor of Lyon. They insisted upon living lives of poverty, reading the Gospels in the vernacular (language of the people), and encouraging lay people to preach. The group was founded in 1170 by Peter Waldo, a wealthy merchant who, after a powerful conversion experience, began giving away his possessions to the poor. Interest in the movement was fueled by a famine that struck the city of Lyon in 1176, creating a tremendous inequity in the distribution of resources. After expending a good deal of his personal assets on good works during the famine, Waldo adopted a mendicant lifestyle and went about the countryside preaching. The Waldensians had little tolerance for the kind of clerical corruption Waldo had witnessed at the church of Lyon, which was very powerful and strongly tied to the aristocracy. Waldo had reluctantly been granted approval from Pope Alexander III to form a

community based upon a lifestyle of poverty, but he was not given permission to preach. This may have had something to do with the fact that Waldo was not formally educated and had learned the Bible by committing parts of it to memory as it was translated to him in the vernacular. In 1184 the teachings of Peter and the Waldensians were condemned as heresy, and members were forced to stop preaching and leave the city of Lyon. Many of the group's members chose to capitulate. After a series of condemnations and reprimands, Waldo and his followers moved into Italy and the southern part of France. There they began attracting attention by preaching anti-clericalism, stirring up reaction against secular authority, and performing the sacraments without authorization. The movement later split between French and Italian groups, perhaps because they did not have a clearly defined theology. The Italian movement went so far as to condemn the sacraments that were dispensed by unworthy priests. Subgroups of the Waldensian movement, such as the Poor Lombards, eventually merged with the late twelfth-century Humiliati. A number of thirteenth-century Waldensians, including leaders like Durand of Huesca and Bernard Prim, were brought back into the church. Underground contingents continued to survive through the seventeenth century, when they eventually joined groups of Protestant reformers.

**POLITICS AND INQUISITION.** In 1184 Pope Lucius III issued the bull *Ad Abolendam* which prescribed penalties for heretical activity and condemned such groups as the Cathars, Patarines, Humiliati, Poor of Lyon, Arnoldents, and Josepheni. A system of inquisition led by the bishops was soon developed. In order to combat the spread of Cathar teaching, a number of religious orders were employed. At first, in the early part of the thirteenth century, the Cistercians attempted to convince the Cathars of their error. The Dominicans (Order of Preachers) were in part born out of a second wave of the missionary work to the Cathars. In 1209 the Albigensian Crusade, which lasted for some twenty years, began to be carried out with tremendous cruelty. It may have been spurred by the murder of a papal legate, Peter of Castelnau, in 1208. As a result, the papacy increasingly pressured the counts of southern France to help put an end to local heresies. Uncooperative nobles (such as Raymond, the count of Toulouse) found themselves at odds with Rome. Caught up in the military campaigns to root out the Cathars during this period was Peter, the king of Aragon. Not a Cathar himself, he chose to fight against the Albigensian crusade forces and to use the conflict in southern France to gain greater control of the region. Peter was soundly defeated and killed at the battle of Muret in 1213 by outnumbered crusader forces under Captain

Simon de Montfort. The crusade continued for a couple of decades as military force seemed more effective than counter-preaching at keeping the movement from growing. In 1233 Gregory IX launched an inquisition that was responsible for torturing, imprisoning, and burning at the stake thousands of unrepentant Cathars. The extermination of the Cathars came to an end after 1243 with the capture of the fortress at Montségur.

#### FRIARS

**PREACHING AMONG HERETICS.** The Dominican Order of Friars was founded by an Augustinian canon named Domingo (Dominic) de Guzman from the cathedral at Osma in Spain. Dominic left his duties at the cathedral when he developed an interest in doing missionary preaching among the heretical Cathars in Languedoc. During 1203, while traveling through Toulouse in the southeastern part of France with his companion Diego Acevedo, the bishop of Osma, Dominic first encountered the Cathars. Upon their return, the two clerics petitioned Rome for a commission to preach. It was Diego's idea that conversion might be accomplished by competing with the Cathar Perfects, living an austere apostolic life of self-denial with no concern for material goods. Depending upon others for their daily bread, they were able to move about the countryside freely, preaching and interacting with the Cathars. This plan met with some success. In 1207, Dominic and Diego established a nunnery for converted Cathar women at Prouille. During that year, Diego died and it was left up to Dominic to carry on the mission. With the help of Peter Seila, a wealthy benefactor from Toulouse, houses were donated for the work, and Dominic was given charge of a group of diocesan preachers to address the Cathar heresy. Dominic and his ministers went on foot to preach the word of God in evangelical poverty, living according to the Augustinian Rule and the usages of Prémontré. The preachers recited divine offices, had a daily chapter of faults (a community meeting to confess their failings or have their im-

perfections pointed out), and followed the penitential directives of the Premonstratensians. In 1217 Pope Honorius gave official confirmation to the Order of Friars Preachers (*fratres praedicatorum*), a name suggested by Honorius himself, but around the time of Dominic's death, the order began to be referred to more affectionately as the Dominicans. Later that year, preaching associates were sent to Paris, Bologna, Rome, and Madrid to study, preach, and found houses. They adopted a mendicant lifestyle (that is, they lived by begging) and did not own material possessions; they began to work among the urban poor. General Chapters (an assembly of all the heads of houses) were called during 1220 and 1221 in order to give some direction to the new movement. A Master General of the order was chosen for life to oversee the geographic provinces, which were each supervised by a provincial prior; individual houses also had their own local priors. Since Dominic had hoped that new recruits would receive solid theological education, headquarters were established in the great university towns of Bologna and Paris. When Dominic died in 1221, his successor Jordan of Saxony, began to target these university areas, seeking young educated recruits. By 1230 there were over fifty Dominican houses and twelve provinces, some as far away as Poland, Denmark, England, Hungary, and the Holy Land.

**DOMINICAN EXPANSION AND NEW DIRECTIONS.** After this, the order began to expand exponentially. In 1256 there were estimated to be some 13,000 Dominican friars, many located near university towns such as Paris, Bologna, Valencia, Cologne, and Montpellier. By the early 1300s, there were over 600 Dominican houses; about 150 of them were for women. While preaching remained the Dominican focus, teaching, writing, and combating heresy became their strengths. No friar was allowed to preach without at least three years of study with a trained theologian. The thirteenth century produced such great Dominican philosopher/theologians as Albertus Magnus and Thomas Aquinas. The fourteenth century was famous for the Dominican mystics Meister Eckhart and Johannes Tauler; the latter devoted himself completely to the spiritual care of the sick during the Black Death. Dominican struggle against heresy waned somewhat after the demise of the Cathars, but it did not completely end. The order continued to be involved in aspects of inquisition (juridical persecution of heresy by special church courts) during the fourteenth century. Figures like Bernard Gui made sure orthodox practice and teaching were preserved throughout institutional Christendom. Participation in rooting out heresy more vehemently resurfaced at the time of the Spanish Inquisition when Jewish and Muslim converts

to Christianity were suspected of having relapsed and were either directed back to the faith or to their death by infamous fifteenth-century Dominicans such as Tomas de Torquemada.

**THE EARLY CAREER OF ST. FRANCIS.** St. Francis of Assisi (1181–1226) was clearly the most important figure in the early development of the friars. A special place has been given to him in church tradition, some going so far as to call him the quintessential medieval model of Jesus, an example of love and humility to which all Christians should aspire. He was born Giovanni Bernardone in 1181, the son of a merchant family living in Assisi, above Italy's Spoleto Valley. His French-speaking father gave him the nickname Francesco, reminiscent of their heritage. Francis was probably not very well educated as a child. He lived the type of comfortable, carefree, enjoyable existence that his father's success as a cloth merchant afforded him. While he was drawn to luxury, he was also known to be extremely generous. Francis joined a military campaign in his early twenties, fighting a war in Perugia in Italy and spending almost a year in a military prison. Upon his return to Assisi he lived an unsettled existence. While on a pilgrimage to Rome, it is said he encountered two beggars. Francis exchanged clothes with one of them and went about experiencing what it was to live in poverty. In 1205 he again joined a military expedition to fight against the enemies of the pope. At that point, a dream influenced him to abandon his secular life, and he retreated to a hermitage. For the next several years he lived in relative seclusion, befriending lepers and the unfortunate, living in the ruins of the abandoned church of San Damiano outside of Assisi. When he attempted to use some of his father's wealth to rebuild an old church and assist the poor, his father had him dragged before the local magistrate. Shortly after this he completely renounced his heritage, removed his clothing and shoes, and took up living in a coarse garment with a rope for a belt, traveling about the countryside in absolute poverty, begging for his necessities, attempting to live an apostolic life.

**THE FOUNDING OF THE FRANCISCANS.** Soon other sons of the merchant class joined him, selling all they owned, becoming mendicants and preachers. In 1210 it is said that Francis walked barefoot to Rome to meet with the pope and petition for official approval of a group, though Pope Innocent III had reservations about such notions of radical poverty and itinerancy. Medieval monasticism had long been troubled by *gyrovagi*, wandering monks who moved from monastery to monastery in search of the best possible circumstances. Itinerant

preachers like Peter Waldo and members of the late twelfth-century lay spiritual movement called the Humiliati had been condemned less than thirty years earlier. Nonetheless, the group was given limited papal approval, and Francis returned to Assisi to begin his ministry. Their lives were extremely simple, not attached to property of any kind, and their daily routines were largely unregulated, save for a few offices they could pray when appropriate or convenient in the midst of ministry. Later popes (Honorius III and Gregory IX) gave formal approval to Franciscan rules, which became more detailed over time. The group called themselves *fratres minores* (brothers minor). They were given an old Benedictine church, the Portiuncula, outside of Assisi, which they restored and around which they began to build huts. In 1212, this growing brotherhood of mendicants grew to include sisters. The Poor Clares (or second order), who based their community at the restored church of San Damiano, were not allowed to beg or preach, but they did live out the ideal of poverty within their community. Soon Francis and his followers began to travel about southern France and Spain. By 1217 they had organized into provinces with superiors appointed over each area, and in 1221 Francis founded the Tertiaries (or third order), a lay movement that adapted Franciscan ideals to daily life. Francis' order of friars grew so rapidly that they were able to extend their ministry into Eastern Europe and North Africa, though their preaching in Muslim areas did not meet with great success. Francis himself accompanied the Fifth Crusade and even attempted to convert the Sultan al-Kamil. Of great benefit to the order was Francis' friendship with Cardinal Ugolino, who later became Pope Gregory IX. It is said that in 1224 Francis received the *stigmata* (gift of the wounds of Christ). He died two years later and was canonized (declared a saint) by Pope Gregory in 1228. Legends of Francis' life abound and have been used by Franciscans, as well as Christians in general, as a source of inspiration for their lives.

**THE PROBLEMS OF PROPERTY AND EDUCATION.** After Francis' death, the order was forced to deal with two growing problems: how to educate the brothers and whether or not the Franciscans would own their own houses, books, and trappings. The earliest Franciscans had gotten around the issue of ownership by entrusting all their possessions to Rome. While there were some friars who wished to share in the more radical vision of Francis, living in caves or huts and shunning formalized university education, many of the recruits to the Franciscan Order were from the literate and elite classes of society. This tension continued to be present in the order for the next several centuries. By the 1230s the uni-

## THREE

### Stories of St. Francis

One of the most fascinating legacies of St. Francis of Assisi (1181–1226) is the wealth of biographical information, anecdotes, stories, and legends connected to his life. Many of these stories were compiled in the thirteenth century during the decades following Francis' death by biographers such as Thomas of Celano. These accounts were written mainly by individuals who had contact with the saint during his life. Later thirteenth-century compilations, such as the work of St. Bonaventure (a second generation Franciscan and Minister General of the Order), reflected the earliest Francis traditions but were also linked to elements of the growing ideological debate over apostolic poverty. Numerous fourteenth-century documents and elaborations trace their roots to writings and oral traditions of Francis' disciples, such as those of Brother Leo who was the famous traveling companion of the saint. The *Little Flowers*, *Considerations on the Holy Stigmata* and the *Actus Beati Francisci* were fourteenth-century creations based upon a variety of earlier accounts.

Among the hundreds of tales he relates, Bonaventure (a spiritualist) was particularly fond of recounting stories he had gathered from individuals who had witnessed Francis' stigmata. In one of his sermons Bonaventure makes a point about the authority of those who had seen the wounds, comparing the many lay witnesses and more than a hundred clergymen who vouched for Francis to the "two or three" who were considered sufficient by Jesus to establish veracity (Matt. 18:16). The fact that the key witnesses were virtuous and holy men who swore under oath is provided as further evidence of the truth of Francis' holy status. Most notable in his account, however, is the description of the marks themselves, which he says are "contrary to the laws of nature"—first because he never wore a bandage, in spite of the fact that the wound in his side was continuously bleeding as he went about his work, and second because the wounds in his hands were not merely piercings that could easily have been counterfeited, since the nails "actually grew out of his flesh, with the head on one side and the point bent back on the other." Bonaventure concluded that such an "extraordinary" sight would convince any Christian that the stigmata were miraculous.

Tensions between the radically active, less austere, and spiritual elements of the fourteenth-century Franciscans are manifest in a particularly moving story from the *Little Flowers* which demonstrates both Francis' humility and sanctity. It was written by a friar of the Marches around 1330. In it he describes how Francis was praying and weeping aloud through the night until he was so exhausted that he could not walk the next day. His companions went to a local peasant to find a donkey for Francis, and, upon hearing that the animal was for this man who had a reputation for doing so much good, the peasant approached him with advice:

"Well then," said the peasant, "try to be as good as everyone thinks you are, because many people have great faith in you. So I urge you: never let there be anything in you different from what people expect of you." When Francis heard these words, he did not mind being admonished by a peasant, and he did not say to himself, as many proud fellows who wear cowls nowadays would say, "Who is this brute who admonishes me?" But he immediately got off the donkey and threw himself on his knees before the farmer and humbly kissed his feet, thanking him for having deigned to admonish him so charitably.

It may be safe to say that throughout the medieval period, there were few individuals whose legends attesting to their character had such an encompassing effect upon the spirit and development of Christianity. In yet another story, Francis is approached by a friar novice who has obtained his own copy of a book of Psalms, against the usual Franciscan policy of not owning personal possessions such as books. Concerned about this breach of conduct, he approaches Francis, who says to him:

"Once you have a psalter, you will want a breviary. And when you have a breviary, you will sit in a high chair like a great prelate and say to your brother, 'Bring me my breviary.'" As he spoke, blessed Francis in a great fervor of spirit took up a handful of ashes and placed them on his head, and rubbing his hand around his head as though he was washing it, he exclaimed, "I, a breviary, I, a breviary!" And he repeated this many times, passing his hand over his head. And the friar was amazed and ashamed.

versities of Paris, Padua, Bologna, and Oxford had become a breeding ground for Franciscan ideas. Franciscan scholars like Alexander of Hales, Robert Grosseteste, and Anthony of Padua were among the leading theologians of the day. After 1239, it was decided that all the

leaders within the order needed to be priests. When the great theologian and philosopher St. Bonaventure became minister general of the order (1257–1274), admission was limited to clerics who were educated or to lay persons of distinction (something of a contradiction,

since Francis himself had taken only the order of a deacon and had at best a working knowledge of Latin). During this period the order began to grow tremendously. While in 1250 there were fifty Franciscan houses in England and some several hundred in Italy, by the early fourteenth century the order had grown to 1,400 houses. With this growth, debates over the issue of radical poverty and the order's ownership of property intensified. Notions of a new age of religious orders who would come to reshape the world and usher in the final phase of a spiritual church had been predicted by the mystic Joachim of Fiore (1132–1202) in his apocalyptic writings. Members of the Spiritual Franciscans led by Gerard of Borgo San Donnino and various other Fraticelli (general and fringe mendicant groups) took these ideas to heart in the mid-thirteenth and early fourteenth centuries, attempting to bring Joachim's prophecies to fulfillment. Following the Black Death and a dwindling of numbers in the order, however, there was an increased laxity of practice and tolerance for material possessions. The issue of property and observance continued to agitate the Franciscan Order, and finally in 1415 and again in 1443 the Conventual (the more lax) and Observant (the more traditional) branches were granted separate provinces and eventually their own Vicar Generals. Not until 1517 would there be a formal division between the Conventualists (who felt that they were the real order) and the Observants.

**CARMELITE FRIARS.** Both the Carmelite and Augustinian (Austin) friars began as hermits who gradually adopted the practices of the mendicants. The real strength of these movements is that they were able to blend the ministerial ideals of the life of the apostles with the contemplative calling of the earliest Christian desert fathers. The Order of Our Lady of Mount Carmel originated in mid-twelfth century Palestine where hermits gathered in a community under a common rule at Mount Carmel near Haifa. The group had been founded by a pious crusader named Berthold of Cambria. Tracing their origins to the biblical Elijah, by the early 1200s they undertook a strict rule of asceticism, which was condoned by the Latin patriarch (bishop) of Jerusalem. The Carmelite hermits fasted regularly, avoided meat, and observed lengthy periods of quiet. With the fall of the Holy Land and the demise of the Latin Christian Kingdoms in the early part of the thirteenth century, the Mount Carmel community slowly began to break up into several groups that moved into Italy, Spain, Cyprus, Sicily, southern France, and England. Some Carmelites were said to have come back with troops returning from the Third and Fourth Crusades. At first the European Carmelites continued to live a cloistered existence, but

soon they became engaged in a more active life of preaching, poverty, and active study in the world, modeling their new way of life on the Dominicans. Corporate poverty, teaching, preaching, and mendicancy were the cornerstones of their movement. By 1300 there were at least a thousand Carmelites in England alone.

**AUSTIN FRIARS.** The origin of the Austin friars is much more documented than that of the Carmelites. They began with a group of hermits that were spread throughout Italy, particularly in the regions of Tuscany and Lombardy. St. John Buoni of Mantua had begun to organize the group in the mid-thirteenth century. In 1243 Pope Innocent IV prescribed the Rule of St. Augustine for these hermits and in 1255, under Pope Alexander, all hermits living in Italy were brought into one group called the Order of Hermits of St. Augustine. The following year they adopted a constitution similar to that of the Dominicans. Their lifestyle became more mendicant in nature, and they were given exemptions from the control of local bishops. Based upon the influences of the other friar orders, the Austins moved from their hermitages and took up residence in the cities where they began to minister and preach. They also became interested in university education, taking up the formalized study of theology, the scriptures, and the philosophy of St. Augustine. Toward the end of the thirteenth century, they began founding priories throughout Italy, Spain, France, Germany, and England. Gregory of Rimini, who taught at the University of Paris, was possibly their finest scholar. He later became general of the Austin Order in 1357. The most famous of the Augustinians is the sixteenth-century reformer Martin Luther, who first entered as a hermit in 1505.

**THE SECULAR-MENDICANT CONTROVERSY.** Conflicts between secular clergy and the new mendicant orders began to occur once the friars (who were not under permanent obligation to local bishops) came to urban areas to preach and hear confessions. As the friars moved in, they began to establish schools and build churches. Members of the laity were attracted to these educated friars who were living in poverty, and local secular clerics noticed that the flow of offerings and bequests to their churches was dwindling. The resources of lay nobility that once had gone to the benefices and holdings of the secular clergy were being diverted to build and decorate such magnificent centers of the preachers as Santa Croce in Florence. Around 1250, the Burgundian schoolmaster William of Saint-Amour, who taught in Paris, began to crusade against the rights of the friars to compete with secular clergy for pastoral ministry and even their right to monopolize the chairs at prestigious

*a PRIMARY SOURCE document***A LATE MEDIEVAL SATIRE ON FRIARS**

**INTRODUCTION:** Chaucer's *Summoner's Tale*, one of the stories in the *Canterbury Tales* from about 1390, indicates the poet's general distaste for friars and brings together many of the conventional charges against them. The Summoner, who was like a bailiff "summoning" or calling offenders to the Bishop's court, was the friar's natural professional enemy, since friars often tried to evade the bishop's control over his diocese when they came to a community to preach, hear confessions, and collect charitable donations, often leaving with monies which the parish priest felt were properly due him. In this excerpt from the Prologue to the Tale, the use of references to excrement and defecation in the treatment of the friar, while coarse, was not at all uncommon in late medieval religious controversy; indeed, many of the attacks over a hundred years later during the Reformation—both by the Lutherans and by those writing against them—employed scatological imagery of a very similar type.

This friar boasts that he knows all about hell—  
And God knows, that can hardly to be wondered at  
Since between friars and fiends there is little difference.  
You have often heard tell

How a friar was carried off to hell  
In the spirit in a vision,  
And as he was led up and down there  
By an angel, to show him the various torments,  
In the entire place he saw not one friar,  
Though he saw plenty of other people in misery and woe.  
Then the friar asked the angel,  
"Now sir, have friars such grace from God  
That not one of them comes to hell?"  
"Yes indeed," said the angel, "many millions do,"  
And he led him further down to where Satan dwelt  
Who had a tail broader than the sail on a barge.  
"Lift up your tail, Satan," the angel commanded.  
"Show your arse-hole and let this friar see  
Where the nest of all his fellow friars is found"—  
And before five minutes had passed,  
Just as bees swarm from the hive when troubled,  
So out of the devil's arse poured forth  
Some twenty thousand friars in a pack  
And swarmed all about hell,  
And then just as rapidly as they came out,  
Each crept back into Satan's arse.  
Satan then dropped his tail and lay still.

**SOURCE:** Geoffrey Chaucer *Summoner's Prologue*, in *Canterbury Tales* (c. 1390). Text modernized by John Block Friedman.

universities. These arguments spun into an ideological battle over *ecclesiology*, that is, whether secular priests or religious should hold authority over the teaching and preaching of the church. The friars were seen by some as extensions of lay orders—mendicant, and thus not completely devoted to either institution or rule. Notions of hierarchy, diocesan boundaries, and the rights of local churches were defended by the secularists. Friars such as St. Bonaventure wrote *apologia* for their orders, defending themselves by appeals to their papal commissions and authentic apostolic lifestyles. The old medieval power of clerics in isolated communities was giving way and being challenged by a European society that was open to mobility, education, competition, and diversity of opinions, all of which the friars brought to the church by way of emerging societal changes and conventions. The erosion of secular church authority continued when the Franciscan pope Martin IV (1281–1285) issued his *Ad Fructus Uberes* which allowed the friars to perform any pastoral duties they deemed necessary in any diocese where they were present without first seeking a license from the local bishop. A compromise was later struck by Boniface VIII in 1300 which limited the jurisdictions of the friars and returned to the bishops cer-

tain controls over them in their diocese. However, remnants of this dispute lingered on to the 1400s. Examples of this are the manuals of instruction for parish priests in England, which questioned whether or not absolution of a penitent by a friar was sufficient or whether it might be helpful and even necessary for the parish priest to re-hear the confession of their parishioner. Another good example is seen in the negative image of the friar described by the character of the Summoner in *The Canterbury Tales*, a description that illustrates Chaucer's dislike of the friars and support of the secular party in this ongoing conflict.

## THE LAITY AND POPULAR BELIEFS

### SEPARATIONS BETWEEN CLERICS AND LAITY.

Even though people today view the Middle Ages as a time of great religious faith, it is clear that the role of the laity within official medieval Christianity was relatively limited. By the thirteenth century, the majority of people who lived in Western Europe were nominally Christian. Most had received Christian baptism and professed to practice the faith, the exceptions being the minority of Jewish people scattered throughout various European cities and the Muslims who were still living in Spain. For those who were not part of the clerical world, however, it seems there was not much access to the richness of the Christian tradition. Nobles and royalty who had clerics living among them at court clearly had the advantage of daily contact. But since many others did not know how to read, and understood Latin (the language of most prayers) in only a limited way, contact for the laboring and commercial classes did not extend much beyond attending worship and interacting with local clergy. Lay experience of the holy was mostly visual and auditory, including encounters with religious art and the stories portrayed in these artworks, as well as the homilies of their priests (during the time periods that medieval liturgies incorporated preaching). Such religious art often showed biblical typology or foreshadowing of New Testament events in Old Testament stories; for example, David struggling with a bear foreshadows Christ's conquering of Satan in a miniature from the Winchester Bible of 1160–1175. During Christian feast days, they may have heard or seen enacted stories connected to the saints and the important events from the life of Christ. Members of the laity were not, however, encouraged to receive communion during the earlier medieval centuries. In fact, it was not until the Fourth Lateran Council in 1215 that they were required to go to confession and receive the eucharist at least once a year.

**LAY OBSERVANCE AT MASS.** In the absence of receiving communion, the only contact with the sacrament was visual, when the priest elevated the host and chalice. However, in churches with rood screens (wooden or metal par-view gates separating the altar area from the rest of the church), visual contact was often impaired. Mothers did teach their children statements of faith and prayers, particularly the *Credo*, *Pater Noster*, and *Ave Maria*. In urban areas where there were schools, clerics taught children to read Latin from the Bible or a psalter (a book containing the psalms). These city-dwellers received formal religious education from the clerics who taught them, and, in imitation of their teachers, might set aside certain times of the day to pray. If they were literate and wealthy enough to own psalters, they might recite the written prayers. Daily attendance at Mass for the laity was limited to those who had both the piety and leisure to comply. In most cases, these masses were held in small chapels and provided opportunity for greater contact with the clergy, although the priest's back was turned to the congregants for most of the liturgy. Again, it was not until the thirteenth-century Lateran Council that serious directives were issued in regard to weekly attendance at Mass. Some evidence of contemporary expectations for participation is offered by a twelfth-century book of instructions and devotion for laity called the *Lay Folk's Mass Book*, written by an archdeacon of York named Jeremiah. The instructions were originally written in French for Norman aristocrats, but only the late thirteenth-century English translation survives. A collection of directives that indicate the role of the worshipers and how they should be positioned, such as kneeling at the elevation of the consecrated elements, are contained in the work.

**THE SACRAMENT OF MARRIAGE.** The notion of marriage as a sacrament began to be connected in the Middle Ages to certain rituals and exchanges of consent that took place at the front door or on the porch of churches. Marriage did not become an official sacrament of the church until the Fourth Lateran Council (1215). Emphasis on assent and mutual giving, including consent of both partners along with the physical act of consummation, mark the canonical parameters of the essence of the union. While local customs and laws varied widely throughout Europe, the role of the church in witnessing and binding the union seems to have only been prevalent from the twelfth century onward. However, once it became a sacrament, the church also played an important role in the dissolution or annulment of marriage and the integrity of family life. All marriages from the early thirteenth century on were to be public. *Banns* (formal public announcements) were to be published, and pri-

vate or clandestine unions were forbidden (although, if secretly performed, these marriages were not invalid). Marriage of blood relatives (consanguinity) within the fourth degree of relationship and marriage within a spouse's family (affinity) within the third degree was forbidden. Later, the statute concerning affinity was revised to forbid only the first degree (marrying a dead spouse's parent or sibling). In many cases, marriage was certainly not even seen as an idealized or spiritualized form of love, but a contractual arrangement. The attitude towards marriage and love held by most celibate theologians was far removed from the ideal of courtly love espoused by Eleanor of Aquitaine, Christine de Pizan, Chrétien de Troyes, Gottfried von Strassburg, and Dante Alighieri in the literature that developed during this period.

**THE AFTERLIFE.** In medieval Christianity everyone believed in an afterlife where the good were rewarded and the evil were punished. But the idea of going directly to heaven or hell upon one's death was not firmly entrenched in the popular lay mentality. Sometimes souls were visualized being raised to God in a napkin as in a miniature from a book of hours from York, England. It was believed that souls lingered among the living (almost as ghosts), possibly to keep promises, solicit prayers, or even settle old accounts. Dances for the dead in cemeteries, some attempting to drive the deceased back to the spirit world, were banned by synods in the twelfth century. It was necessary for the church to affirm the doctrine of purgatory, a place where the distressed souls would be allowed to linger. It was not that people during this era had a greater fear of death than in other historical periods, but they did fear dying in a state of sin, without the comfort of the sacraments or forgiveness. People began leaving property to the church or to the poor so that their souls would be prayed for after their death. Even the most corrupt of princes and knights on their deathbeds sought to make reparations for their evil deeds. This may be the reason why many people in the final years of their lives would retire to monasteries and convents to be connected to God and the prayers of a community in death and be remembered in the community's masses for the deceased.

**MIRACLES.** The laity also believed in miracles and divine interventions, with saints often playing a major role. Indeed, at times it seems people were more interested in miracles and relics than in the accumulation of countless good deeds that might earn them a way into heaven. Pious lay persons could distinguish themselves through generosity, hospitality, and almsgiving. However, taken more seriously was the idea of penitence and making reparations for one's sins, even after absolution

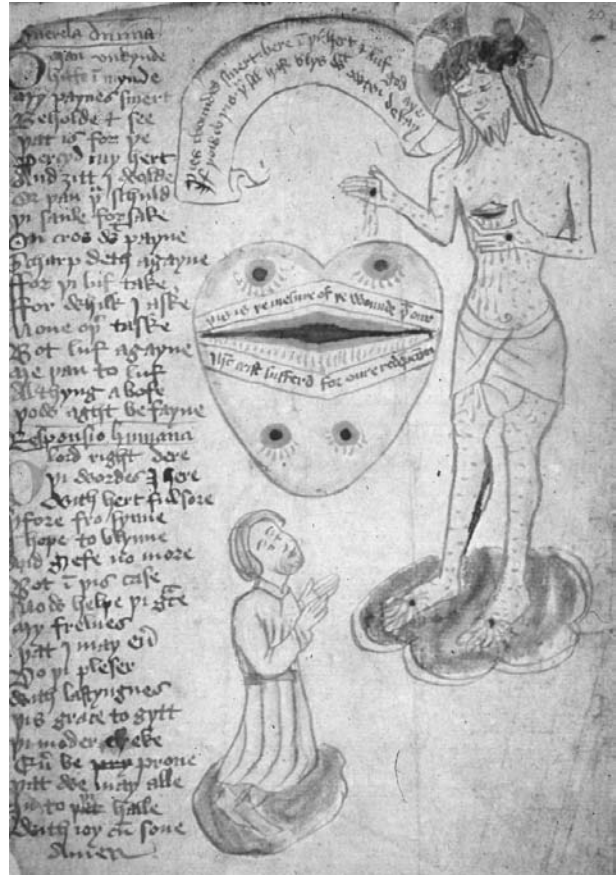

through a priest was given in confession. Piety found its expression most clearly in outward signs and rituals. *Sacramentals* (such as blessings, benedictions, exorcisms, stations of the cross, dubbing of a knight, coronations, ceremonies, receiving palms and ashes, and litanies) were often as important to the medieval laity as the *Sacraments* (Baptism, Eucharist, Confession, Confirmation, Marriage, Holy Orders, Anointing of the Sick). The church of the thirteenth century did a number of things to eliminate the power of popular piety by creating more rigid standards for the canonization of saints, rather than allowing the cults of these figures to develop from popular acclaim. The condemnation of practices such as trial by combat (in which the accused and the accuser of a crime engaged in physical combat with the belief that right would triumph over wrong) or trials by fire and water (in which a guilty person thrown into a body of water would float and one whose hand was burned would become infected) were included in the Fourth Lateran Council in order to allow church courts rather than miraculous intervention to rule the day. Priests were

forbidden to be present at the ordeals, thus discouraging the notion that these affairs might be orthodoxy.

**LAY SPIRITUAL MOVEMENTS.** Since the laity were in many ways excluded from active participation in the official life of the church, it is not surprising that lay spiritual movements began to flourish. One late twelfth-century movement developed into a group called the Humiliati, which actually evolved into an officially sanctioned lay order during the early thirteenth century. The Humiliati began in Lombardy and Milan around the time of the Waldensian controversy, which arose in the late 1170s when a rich merchant named Peter Waldo in Lyon, France, underwent a religious conversion and started a lay spiritual movement—unsanctioned by the church hierarchy—based on voluntary poverty, vernacular translation of the Scriptures, and public preaching. Some Humiliati were married and lived with their families. Others lived in community, almost like a religious order. They held meetings in common houses owned by the local groups. Most Humiliati were nobility or, at the least, educated people of some means. Their first obligation was to embrace apostolic simplicity. They wore simple clothing, lived simple lives and sought to stand at odds with enemies of the true Christian faith. Unlike the Waldensians, they found it distasteful to preach in public. Each group had a minister or lay leader but in general they did not abide by a rule.

**THE LIFE OF THE HUMILIATI.** While several popes like Lucius III and Alexander III tried to legislate against the Humiliati, other pontiffs wrote them letters calling on them to live lives of penitence, to be peaceful and forgiving, to act against usury (charging interest for loans), to keep their married state if already wed, and to prepare to enter the narrow gate of heaven. Some members recited the seven canonical hours, others fasted twice a week. They gave charity to all those in need and showed special concern for lepers. One of the things the group became famous for was the making of cotton cloth and inexpensive wools. During this period, producers of fine cloth often belonged to guilds that controlled prices, so there was a great need, especially among the lower classes, for inexpensive cloth. In a sense, the production of such cloth became part of their “ministry,” to the point where it even began to be asked for by the trademark of Humiliati. The lamb of God became their symbol. By 1216 there were 150 communities of Humiliati in the Diocese of Milan alone. In 1201 Pope Innocent III gave permission for the Humiliati to continue their work under two conditions: that they not own land that they themselves did not work with their own hands, and that their preaching be limited to the sharing of faith and exhort-

Christ with side wound and bleeding heart revered, *Desert of Religion*, London, The British Library MS Stowe 39, folio 20, c. 1420. © THE BRITISH LIBRARY.

ing of one another. Eventually the Humiliati fell into three orders: canons and canonesses, monks, and lay people. Like other European religious, Humiliati monks followed the Rule of Benedict, and their canons followed the Augustinian Rule. In 1246 they had grown large enough that Pope Innocent IV decreed that all the Humiliati orders take direction from one Master General for their group. By 1298 there were 389 houses of Humiliati of the second order in Italy. The third order of laity was, of course, immense and beyond calculation. The group began to decline in number after the fourteenth century but continued through the 1500s.

**DEVOTIONAL IMAGES.** Another effect of the increasing lay desire for direct participation in spiritual experience was the development, in the fourteenth and fifteenth centuries, of devotional art, with a distinctive emphasis on images of the Passion of Christ. While earlier lay Christians, particularly women in the upper class, had relied on beautifully illustrated texts called Books of Hours to guide and inspire their devotions, later worshippers focused specifically on the pictures themselves as

they appeared in wall paintings, stained glass, and scrolls, as well as amulets, charms, and individual parchment or paper broadsheets that could be owned even by people of modest means. Among the most popular images were the Holy Face—an image of Christ’s countenance supposedly imprinted on a cloth (*sudarium*) held by Saint Veronica when Christ used it to wipe his face—and the Sacred Heart bearing the evidence of the side wound Christ suffered at the crucifixion and showed to Doubting Thomas (John 20:27). Various meditational techniques were employed to make the Passion vivid, among which was a strong interest in the damage wrought to Christ’s body both before and after his crucifixion and the physiological changes it underwent on the cross. For example, Christ’s torment was often expressed in metaphors comparing the body to a book, or a scroll, or even a shield bearing a coat of arms whose “armorial bearings” were made of the tools and weapons—called the *arma Christi*—used in his torment. Thus, the words of Christ’s “book” are his deeds, suffering, and passion, and the letters are the five wounds of his hands, feet, and body. Often all of the wounds can be placed on a heart-shaped shield such as the one revered in a late medieval English devotional work called *The Desert of Religion*.

## CHILDREN AND MEDIEVAL CHRISTIANITY

**THE INNOCENCE OF CHILDREN.** The notion of the innocence and purity of children was a concept which became connected to a host of medieval religious images. Beginning in the ninth century, children were depicted nude in art to signify their purity. They were often

depicted as cherub-like or cupid-like angelic figures. Quite commonly, children were also connected to the notion of the infant Son of God. Many medieval monks claimed to have seen an infant in the consecrated bread during the liturgy at the moment of its ritual elevation by the priest. Familiar scripture quotations that supported the sacred role of children are still often cited: from Psalms 8:2–3 and Matthew 21:16, “out of the mouths of babes;” Psalms 85:12, “truth will spring from the ground;” and Mark 10:15 and Luke 18:17, “whoever does not receive the Kingdom of God as a little child.” These scriptural ideas supported the special place children occupied in the medieval religious consciousness. Very young children were often asked to open the Bible at any spot they would choose, and adults would interpret the verse that appeared as some sort of prophecy in a divinatory process called the *sortes biblicae*.

**INFANT BAPTISM.** In spite of the apparent purity of intention and deed in small children, the medieval church held that they were inherently tainted by the doctrine of Original Sin, a state of separation from God that all people were born into as a result of the disobedience of Adam and Eve. By the early Middle Ages, infant baptism was standard practice. In fact, during that period it was generally believed that children who died unbaptized went to hell. In 830 Jonas of Orléans wrote, regarding the children of Christian parents, that it was “necessary that they be presented without delay to receive the gift of baptism, even if they do not yet speak. We are right to do this as children are guilty of the sins of others (original sin).” Failure to baptize a child was a serious matter. Most unbaptized children were not even allowed Christian burials in the early medieval period. Parents who neglected to have infant children baptized before death could be required to do penance up to seven years. Cemetery records throughout France after the Carolingian baptismal legislation was enacted strongly support claims of adherence to the practice of early baptism. Hincmar of Reims expressed similar sentiments around 850 in a letter to Loup de Ferrières: “If they die after having receiving the gift of baptism, they are saved by the will of God; on the other hand, deprived by God’s judgment of this very gift of baptism, they are damned by the fault of hereditary sin.”

**CHANGING REGULATIONS.** Rules regarding baptism and confirmation of children changed gradually throughout the Middle Ages. The liturgist Amalarius of Metz commented in the ninth century that baptism should take place at the ninth hour of a child’s life, as it was during the ninth hour that Christ breathed his last on the cross. During the ninth century in England, both civil and religious regulations required baptism for Christian infants

before they reached one month of age. Following such guidelines would, however, be almost impossible in France after the ninth century, since most baptisms there were performed only at Easter and Pentecost. In the High Middle Ages (after 1200) there were more widespread canons that required children to be baptized before the age of three. Formal creedal confessions more appropriate to adult initiates gave way to rites of exorcism, signing of the cross, and prayers for the infant, to be followed by confirmation of the child's baptism (which consisted of the laying on of hands and the bishop's anointing of the child using blessed oils) once the child reached the age of reason (normally seven or older). This practice became more common between the tenth century and the twelfth, when the doctrine of *limbo puerorum* was promulgated, stating that children who died unbaptized went to a state in the afterlife that was slightly removed from the sight of God, but where they were outside the torments of hell. Thomas Aquinas in the thirteenth century went so far as to suggest that those in limbo actually enjoyed a type of natural happiness. The notion of limbo remained a matter of evolving theological opinion throughout much of the medieval period. In contrast to the debate over baptism, however, many medieval Christians were not particularly concerned with the sacrament of confirmation. In the early Middle Ages, the reception of communion and penance usually did not occur until adulthood or adolescence, and, in fact, the Council of Tours in 813 had discouraged communion for children unless there were special circumstances warranting it. It was not until the thirteenth century that the Fourth Lateran Council decreed that all children past the age of seven should confess their sins and receive communion at least once a year.

### PAPACY AND POLITICS IN THE LATE THIRTEENTH AND EARLY FOURTEENTH CENTURIES

**A PIOUS MONARCH.** Many of the developments within Christianity during the late thirteenth and early

fourteenth centuries were tied to the might of monarchies and the shifting of papal powers. When the goals of monarchs were consistent with the ideals of a Christian life, both ecclesiastical and political functions ran smoothly. In France, King Louis IX (1214–1270), for example, did much to advance the ideals of piety and the prominent place of the church within the European consciousness. He was noted for personal religious devotion, prayer, liturgical attendance, and even wearing the humble attire of Franciscan friars. Some 27 years after his death, he was canonized as Saint Louis. Not only did he personally lead two crusade campaigns (on one of which he was taken prisoner, and on the other of which he died of illness), but Louis was responsible for bringing peace among contentious nobles in Flanders, Aragon, and England. He endowed many religious foundations throughout his reign and supported the initiation of the Sorbonne theological college in 1257. His devotion extended to the building of Sainte-Chapelle in Paris (between 1245 and 1248) where he placed relics from what he believed to be the crown of thorns worn by Jesus (obtained from Baldwin II, the Latin emperor at Constantinople) and a piece of the true cross on which Christ was crucified. His biographer Jean de Joinville told stories of him washing the feet of the poor and going to the countryside in the summer to talk with the more lowly subjects of his kingdom.

**POLITICAL DOMINATION.** Many of the rulers and members of the religious hierarchy of the period did not, however, follow Louis' example. In the southern part of Italy and in Sicily, there was continual conflict between powerful noble families and the church. Charles of Anjou (the brother of Saint Louis) had been placed in control of the region by the church, after authority was wrested from the German Hohenstauffen monarchs. Charles' role became self-serving, however. He began allying himself with Italian political elements (powerful nobles and clergy) and even gained control of a number of cardinals—councilors to the pope who ranked second in power only to the pontiff himself. The result was years of political wrangling, stalled papal elections, and vacancies in the office of bishop of Rome. Indeed, as a result of the political conflicts in this region, there were nine popes from 1276 to 1295, with a total of 42 months in which there was no pope at all. A brief period of sanity came with Pope Boniface VIII (r. 1294–1303), who proclaimed 1300 a "jubilee year" and also promulgated a very responsible body of canon law (*Liber Sextus*) in 1298, which supplemented previous codes, particularly those of Gregory IX. Nonetheless, Boniface's tenure was tarnished by acrimonious disputes with the French king Philip the Fair (1268–1314), who was taxing church

properties to finance a war against England. The result of this was the papal bull of 1296, *Clericis Laicos*, condemning the unnamed laity (the kings of England and France) for unjust taxation supporting a war between Christians (prohibited without papal consent). It took several months and much political maneuvering before the taxations ceased. Boniface continued to have difficulties with Italian cardinals and nobles who allied themselves with Philip until, finally, the French plotted to have the pope's elevation nullified. In 1302, Boniface issued his famous *Unam Sanctam*, calling for the unity of the church under one pope, whose authority extended to the secular subjects because his spiritual power took precedence over secular powers. The bull sparked flaming invectives from both sides, including physical attacks upon the pope by agents of the French king. With Boniface's death in 1303, the vestiges of medieval papal power began to slip away. Philip soon succeeded in expelling most of the merchant Jews from the growing French realm and divesting the Knights Templar of their wealth and resources.

**THE AVIGNON PAPACY (1309–1377).** After the death of Pope Boniface VIII, Philip the Fair continued attempting to weaken the church in order to further his political aims. Popes Benedict XI (r. 1303–1304) and Clement V (r. 1305–1314), a Frenchman, proved ineffective at limiting royal authority. Following the deaths of Boniface and Benedict, bitter factions formed in Rome over the direction the papacy would take. Clement, who had been crowned in Lyon, was unable to occupy the papal residence in the city of Rome due to a variety of political complications. In 1309, during a prolonged illness, he finally decided to remain at Avignon, which was located in what is now southern France on the lower Rhône River. The location had for some time been under papal control connected to its vassals, the Angevin kings of Naples. Since Avignon bordered France, Philip the Fair was quite pleased to have the French pope much closer at hand. It was not unprecedented for a pope to reside outside Rome or spend extended periods of time outside the city, but in this case his decision had dire consequences.

**THE GROWTH OF SECULAR POWER.** Under Pope Clement, and Pope John XXII who followed him, the papacy was characterized by a mixture of valuable reforms and increasing assertions of secular power. Clement appointed nine French cardinals, four of whom were his nephews, and he was forced by the French king into some serious compromises of papal integrity. Some of his reforms proved productive, however. At the suggestion of the Catalan theologian and missionary Ray-

mond Lull, Clement began to encourage the development of chairs at the various leading universities (Bologna, Oxford, Paris, and Salamanca) for the study of Arabic, Hebrew, and Chaldaic, believing that knowledge of both scriptural and local languages would lead to success in the conversion of Muslims and Jews. Likewise, his successor, John XXII, might be admired for his personal simplicity, as well as a program of almsgiving (distribution of food, clothing, and medication to the poor). However, as the papacy continued to reside in Avignon, the desire for power and opulence became ever more apparent. The city of Avignon was virtually a military fortress with some three miles of walls surrounding the papal palace. Pope John XXII allowed for the securing of additional resources to decorate the palace and brought artists, artisans, and scholars to the city. During a dispute over control of the Holy Roman Empire (1316–1326), Pope John refused to recognize all three claimants to the position of emperor and asserted his right to administer the empire himself during the void in leadership, a move that elicited protest in many parts of European society. Treatises by writers like John of Paris, Marsilius of Padua (*Defensor Pacis*, 1324) and Dante Alighieri (*De Monarchia*, c. 1310) stressed the parallel and autonomous natures of papal and imperial powers. While such power came from God, one authority did not have the right to interfere in the other's domain. Marsilius, a philosopher and canonist, went so far as to suggest that it was the people who held the basis of power. He felt that all clergy were equal in status and that no human had the right to define Christian truth, or dispense interdicts and excommunications that would be deemed universal. Infallibility, according to Marsilius, could only come from the consensus of the faithful. The Italian poet Petrarch, in his *Book Without A Name*, railed against the abuses and scandal at Avignon, calling it a medieval Babylon.

**THE GREAT SCHISM.** The abuses of the Avignon papacy were so great that they eventually led the church to split into two, and even three, separate entities. One of the most abusive aspects of the Avignon regime was its policy of taxation. Due to the loss of revenues from the papal states, additional revenues had to be extracted. Church benefices began to be bought, sold, and traded, and such sales were supplemented by the *annates*, a tax amounting to approximately one year's income on all new appointments. Out of the seven Avignon popes, six were French. All continued to function as the bishop of Rome, although residing outside the city. (A vicar was appointed to attend to the necessary ministry there.) Many of the cardinals that had been appointed were

*a PRIMARY SOURCE document***UNAM SANCTAM: A PAPAL BULL**

**INTRODUCTION:** Following a series of bitter disputes with the French king Philip the Fair (1268–1314), who was taxing church properties to finance a war against England, Pope Boniface VIII went on to address the issue of the church's authority in the 1245 bull *Unam Sanctam*. King Philip IV of France, in reaction to the earlier *Clericis Laicos*, had prohibited the transfer of money outside of his realm and, as a result, had quite effectively reduced French support to Rome. Many of the French bishops had given in to pressures from the king and became less than supportive of the pontiff. The bull *Unam Sanctam* once again outlined papal claims of authority over God's people, with its spiritual exigencies exceeding those of the temporal judgments of the crown. Philip's outrage at the bull resulted in the ransacking of the papal palace and the brief imprisonment of Boniface.

French, and internal secular political strife that had besieged Italy continued. There was a brief return to Rome between 1367 and 1370 under Pope Urban V, but he reconvened his court at Avignon the following year. A general plea for returning the papacy to Rome came from many parts of Europe. Following the pontificate of Gregory XI in 1378, an Italian, Urban VI, was named pope, quite possibly under the pressure of demands from the Roman people. In less than a year, however, the curia was dissatisfied with Urban's leadership and asked the pope to step down. When Urban refused, Clement VII, a cardinal from Geneva who was a cousin of the French king, was elected to replace him. Clement was forced to withdraw from Rome and move the papal court back to Avignon. There were now two popes. This is the event that likely started the Great Schism (1378–1417). While it was certainly not historically unusual for there to be two rival claimants to the papacy (pope and anti-pope), this Rome-Avignon split caused a rift that lasted some forty years. The two courts existed side by side, with the

Avignon popes being recognized in France, Spain, Scotland, Naples, Sicily, and parts of Germany while the Roman popes were acknowledged throughout northern and central Italy, much of Germany, Bohemia, England, Poland, Hungary, and Scandinavia. Abuses of power continued and church-related taxation became overwhelming. There were now two sets of cardinals, each connected to a pope.

## FROM SCHISM TO REFORM

**REFORMING COUNCILS.** The need to resolve the Schism brought about new kinds of efforts to unify and reform the church. Dietrich von Neheim, a bishop from Verden in Germany, who had spent much of his life in the service of the papacy, proposed a reforming union that might be brought forth by an authoritative council superseding the voice of the popes, with the power to determine the general direction the church should take. In 1409, the first council, the Council of Pisa, met and began a series of general reforms. The council tried to deal with the problem of the schism by deposing the two rival popes and electing a new one, hoping this action would cause a merger of the two Cardinal Colleges. Unfortunately, the plan did not work, and now all three

continued in power. A second council was then called at Constance in the southern part of Germany in 1414 by the Holy Roman Emperor Sigismund to continue the reforms started at the Council of Pisa. Of the three schismatic popes, John the XXIII (supported by the Pisan group) presided as the dominant papal figure. The council took three and a half years to finish its work, holding some 45 sessions. Representatives from all of Christendom were present: bishops, university representatives, leaders of religious communities, and secular rulers (observers even came from the Eastern churches). Among the matters addressed were the ideas of reform through regularly scheduled councils, the superiority of a council over the pope, and certain heresies that were gaining ground among the common people.

**THE END OF THE SCHISM.** The theologian Pierre d'Ailly played a significant role in the direction of the council. He suggested that in addition to completing the reforming work of Pisa, they might attempt again to heal the schism. He asked John XXIII, by far the strongest

*a PRIMARY SOURCE document***THE CALL FOR A GENERAL COUNCIL**

**INTRODUCTION:** At the time of the Great Schism, when rival popes held power in Avignon and Rome, Dietrich von Nieheim, the bishop of Verden in northern Germany, strongly advocated the convocation of a council to heal the disorder within the Western Christian Church. He suggested that the council should be called by the collective authority of churchmen representing the interests of Christendom. But he also suggested that an emperor, in time of need, had the authority to convene a general council.

Now take the pope. He is a man of the earth, clay of clay, a sinner liable to sin, a mere two days ago the son of a poor peasant. Then he is raised to the papacy. Does such a man, without any repentance of sin, without confession, without inner contrition, become a pure angel, become a saint? Who has made him a saint? Not the Holy Spirit, because it is not as a rule the office which confers the Holy Spirit but only the grace and love of God; nor his place of authority which may come to both the good and the wicked. Therefore, since the pope can be no angel, the pope as a pope is a man, and being a man he thus is pope: and as pope, and as a man, he can err. For a good many of them, as you may read in the chronicles, were not very spiritual. ... It is absurd to say that one mortal man should claim the power to bind and to loose from sin in heaven and earth, even though he may be a son of perdition, a simoniac, miser, liar, oppressor, fornicator, a proud man and arrogant, one worse than the devil. Therefore human judgment neither can nor ought to assume one to be a saint who in that Seat, by his evil deeds, proclaims the contrary. ...

These various members [of the Church], however, stand diversely—higher and lower—in its mystical body. They must all be brought back to the unity of the Church in a double manner: by obedience as well as by withdrawal. That is to say, they must obey the one universal and undoubted vicar of Christ, and they must by common consent and with a single will withdraw their obedience from these two or three contenders for the papacy who are a scandal to the whole Church. This withdrawal, as I have said, is binding uniformly on all Christians under the pain of mortal sin. For supposing the Universal Church, whose head is Christ, have no pope, the faithful dying in charity shall yet be saved. For when two or more compete for the papacy and when the truth of the matter is not known to the Universal Church, it is neither an article of faith, nor a deduction from one, that this man or that must be accepted as pope, nor can any faithful Christian be obliged to believe so. ...

Now, since the General Council represents the Universal Church, I shall speak my mind about the assembling of this Council. I have said elsewhere that when the issue is the reconstruction of the Church and the matter of the pope—whether to get him to resign, or whether he should be deposed for his evil living and the scandal in the Church—it by no means belongs to the pope, however sole, universal and undoubted he be, to call a General Council. Nor is it his place to preside as a judge, or to lay down anything concerning the state of the Church; but the duty belongs in the first place to the bishops, cardinals, patriarchs, secular princes, communities and the rest of the faithful. In equity no man of ill-fame can or may be a judge, particularly in his own cause. ... I tell you, the prelates and princes of the world must, under pain of mortal sin, call and summon [a Council] as quickly as they can; they must cite to it this pope and those who strive with him for the papacy, and, if they will not obey, must depose and deprive them. ... But is then such a Council, in which the pope does not preside, above the pope? Indeed it is: superior in authority, superior in dignity, superior in competence. For even the pope must obey such a Council in all things. Such a Council can limit the pope's power because to it, representing the Universal Church, are granted the keys to bind and to loose. Such a Council can abrogate the papal decrees. From such a Council there is no appeal. Such a Council can elect, deprive and depose the pope. Such a Council can make new laws and repeal old and existing ones. The constitutions, statutes and regulations of such a Council are immutable and cannot be dispensed from by anyone inferior to the Council. The pope cannot, nor ever could, issue dispensations contrary to canons made in General Councils, unless the Council, for good reason, specifically empowered him to do so. Nor can the pope alter the decisions of the Council, or even interpret them or dispense from them, for they are like Christ's gospels from which there is no dispensing and over which the pope has no jurisdiction. Thus there will come to the members the unity of the Spirit in the bonds of peace; thus we shall live in the Spirit and shall walk in the Spirit. ...

Therefore, if a General Council, representing the Universal Church, is anxious to see an entire union and to repress schism, and if it wants to put an end to schism and exalt the Church, it must before all else, following the example of the holy fathers our predecessors, limit and terminate the coercive and usurped power of the pope.

**SOURCE:** Dietrich von Nieheim, *The Union and Reform of the Church by a General Council*, 1410, in *Renaissance and Reform 1300–1648*. 3rd ed. Ed. G. R. Elton (New York: The Macmillan Company, 1976): 16–18.

of the three schismatic popes, to step down and allow for the election of one pope. The voting blocks were divided into regions since it was feared that the Italian cardinals and bishops would easily dominate the election. John stepped down after considerable posturing on the part of his opponents and proponents. John's absence gave the council the opportunity to broach the issue of *conciliarism*, a supreme church authority which rested with the general council, not the pope. The decree *Haec Sancta* supported the authority of the council and all future general councils, demanding that all Christians (even the pope) adhere to its decisions. The council, in the name of the church, representing the interests of the church, would draw its authority from Christ. The council went on to depose the other two papal claimants, Gregory XII (almost ninety, who resigned) and Benedict XIII (who refused and died in exile). In November of 1417 the electorate, represented by 23 cardinals and delegates from the European nations, elected Martin V, to whom all would claim obedience. He presided over the remaining concordats and reform. Significant among the actions of the Council of Constance were the reforms on papal taxation, the ability as a body to call future councils with their own authority, and the resolution of the issue of transfer of bishops by Rome. There was also a condemnation of the heresies that had been propagated by the Englishman John Wyclif (who had died in 1384) and the Czech reformer Jan Hus.

**JOHN WYCLIF.** Although the Council of Constance resolved issues having to do with political power and the papacy, the concern over the preaching of John Wyclif was an indication that the public perception of church corruption ran much deeper. Wyclif had been a teacher at Oxford whose controversial theological views were condemned by the Blackfriars Council of 1382. Despite the fact that he himself held several absentee benefices (positions from which he received income by delegating the work to a curate), he had railed vehemently against clerical abuse. He felt that unrighteous church leaders had no religious authority whatsoever. In his work *On the Truth of the Holy Scriptures*, he wrote that scripture was the church's highest and truest authority. Wyclif had rejected the church's teaching on transubstantiation, calling it unscriptural, illogical, and unfaithful to the teaching of the early church. In 1380 he wrote his treatise *On the Eucharist*, which advanced a literal interpretation of the substances of bread and wine after consecration. He intimated that Christ was not corporeally present after the blessing, that the bread and wine remained physically unchanged. Wyclif also insisted that preaching was more important than the encounter of the sacraments. *On the Power of the Pope* claimed that the office of the

papacy was completely of human origin. Wyclif also did not believe in the existence of purgatory. Toward the end of his life he began producing a vernacular translation of the Bible so that individuals who did not have an opportunity to learn Latin could read the Bible in English, without the need for a clerical intermediary.

**LOLLARDRY.** After Wyclif's death in 1384, his followers, often called the Lollards (literally the mumblers), continued his attempts to reform the church. Most of the early Lollards were Wyclif's students from Oxford, but soon the movement began attracting individuals from the lower and middle classes. The term Lollard also was applied to the Béguines and Beghards in the Netherlands. In England, Lollard preachers, based upon their reading of the Bible, went about the countryside protesting the corruption, abuse, and excesses of the clergy. During the reign of Richard II (1377–1399) a number of Lollard preachers were imprisoned, but the movement continued to grow. Not only did they have disdain for clerical wealth and power, but their indictments extended to members of the lay nobility as well. They also opposed clerical celibacy and use of the Latin Bible, and some even espoused free love and pacifism. In 1401, under Henry IV, a statute was passed making heresy a crime punishable by death. Lollards were quickly branded as heretical and many were executed, some being burned at the stake. While the movement was eventually driven underground, it took root in northern England, where it was embraced in certain circles through the sixteenth century. Wyclif's ideas proved to provide a fertile base for the eventual success of Protestant reformers. So powerful was the fear of Wyclif's reforms that in 1428 the bishop of Lincoln had his body exhumed and burned, and his ashes thrown into the river.

**JAN HUS.** In 1382 Wyclif's teachings had found their way from England to Bohemia by way of a member of the household of the English queen Anne, who was the sister of the Bohemian king Wenceslas IV. It was at the University of Prague that Wyclif's ideas gained popularity among Czechs, and it was there that Jan Hus came under its influence. In 1407, some 23 years after Wyclif's death, his theology was being discussed at Prague's university. Soon after, the teaching was condemned by the archbishop of that city. Hus, who was rector of the University of Prague, embraced many of Wyclif's ideas, however. He especially appreciated Wyclif's arguments concerning church authority and the fact that it should be limited only to those who were righteous enough to treat it responsibly. Hus began to preach aggressively against simony (the buying and selling of clerical offices) and the greed of the clergy. He

also openly criticized the sale of indulgences and believed that the church should always accommodate itself to be at the disposal of the faithful. In 1410, while the works of Wyclif were being burned, Hus's theological viewpoints were being scrutinized by the church. Although attempts were made to silence him, Hus continued to preach and even succeeded in rousing an angry mob to storm the archbishop's residence, which led to the burning of Hus's theological writings and his eventual excommunication in 1411. Throughout the next year, Hus continued to stir up revolt and was forced to leave Prague. Further condemnation of Wyclif's teachings was launched by the Council of Pisa in 1413; but this did not stop Hus, who all along wished for a reform of the church, never a break with it. To make his point, he even appeared at the Council of Constance in 1414, arguing that the church was founded on Christ and that the church hierarchy was a creation of mankind. While the conciliarists were in agreement with some of Hus's ideas, they found the majority of his teachings far too radical. Some thirty errors were pointed out in Hus's *De Ecclesia* ("Concerning the Church"). Hus denied teaching these heretical ideas but never formally denounced them. He was condemned and burned by a group of secular officials. It was said that a paper hat with the word "heretic" was placed upon his head during the fiery execution.

**THE HUSSITE WARS.** Upon news of Hus's death, riots broke out in Prague, and his followers, who became known as the Hussites, continued to preach throughout Germany and the Czech territories with both a religious agenda and one that supported Czech nationalism. A persecution of the Hussites, sometimes referred to as the Hussite Wars, took place between 1419 and 1436. According to the provisions created at the Council of Constance, Pope Martin was obliged to call subsequent councils to steer the direction of the late medieval church, and at the one in Basel, in 1433, a group of 300 Hussites came to debate the issue of the church's condemnation of their beliefs. The council at Basel turned into more of an academic debate, but like the previous council at Siena, suffered poor attendance. It was not until 1437 that a compromise was reached which brought an end to the religious revolts in the Czech region.

## FAMINE, THE BLACK DEATH, AND THE AFTERLIFE

**FAMINE.** Despite the divisive fourteenth-century power struggles that shook the papacy and church hierarchy, there were other events which even more gravely affected the religious outlook of all Christians. A devastating famine that ravaged Europe between 1315 and 1317 delivered its most violent shocks throughout much of northern Europe. Weather patterns during those years that produced extremely cold winters and rainy summers resulted in crop failures that left many urban dwellers without food. Significant failure of wheat crops in France caused prices to double. In England it was much worse, and livestock were forced to go with little food. Fish and meat became scarce, as the fishing industry in Holland was affected by the imbalance of trade, and diseases began to kill the cattle in England that had survived the famine. Germany may have fared the worst. The toll on human lives may have reached twenty percent of the northern European population, affecting the wealthy as well as the poor. The monasteries and convents were particularly devastated. In addition to large numbers of religious succumbing to starvation and related disease, properties had to be sold off at greatly reduced rates. There are harrowing stories of religious going without food in order to save the lives of their tenant farmers and families. Such devastation was thought, in part, to be linked to God's wrath upon sinful humanity. Thus, both in popular consciousness and in church doctrine, notions relating to death, heaven, hell, and purgatory became the subject of speculation. The famine, as such, never became a subject of religious and popular literature, but it created conditions of psychic unease that planted the seeds for the proliferation of literature concerning sin, human destruction, and death that would burst on to the scene during the period of the bubonic plague (1347–1350).

**THE BLACK DEATH.** As northern Europe barely began to recover from the famine, the bubonic plague known as the "Black Death" plunged much of Europe

into a state of widespread contagion. Some estimate that as many as one-half of Europe's population perished (possibly thirty million lives). As with the famine, no social class, station, faith, or age group escaped the ravages, save those in a few isolated cities who had the luck or foresight to quarantine themselves (a practice invented in Venice around 1360). The clergy were particularly concerned with ministering to the dying and, of course, burial. Sacramental anointing of the dying, extreme unction, had been reduced in the thirteenth century to a much simpler formula of forgiveness that could be administered by one priest, usually at the time near death. Given the necessity of such contact with the infected, it is surprising that any priests survived. Due to the resulting shortage of priests in England, the bishop of Bath gave permission to the people to confess their sins to laity, men or women, if no priest was available. Canons were appointed to the parishes of dead secular priests. There are also French accounts of cowardly parish priests fleeing their stations, leaving members of the religious orders with the task of ministering to the dying. It has been suggested that the friars were the division of religious with the largest number of afflicted. The cloistered groups were particularly susceptible to the plague once it entered their community. Hundreds of monasteries and convents were completely wiped out.

**PERSECUTIONS.** In the midst of this devastation, attempts were made to determine its causes. Aside from the scientific theories of physicians, irrational blame began to be directed toward certain social groups: Muslims in Spain, strangers in small villages, pilgrims, ethnic minorities, those who spoke foreign languages, lepers, and, most virulently, Jews. Sporadic and spontaneous attacks upon Jewish people were common throughout the time of the plague. They were most often accused of poisoning the wells and drinking water of Christians. Punishments ranged from imprisonment to burning. Accounts of mass incineration are documented in the German cities of Worms, Dresden, Stuttgart, Erfurt, Memmingen, Freiburg, and Lindau. Other murders took place in Speyer, Cologne, and Mainz. Clement VI called for the excommunication of Christians who persisted in persecuting the Jews. Pedro IV of Aragon attempted to give protection to the Jews of his kingdom and prosecuted Christian assailants. Efforts at stemming the violence were also made at Cologne and in Austria. Despite such attempts, the attacks upon European Jews did not substantially subside until after the plague ended.

**THE FLAGELLANT MOVEMENT.** The religious fervor accompanying the Black Death could be seen in a most extreme form in the practice of flagellation, self-

administered whippings that were intended to punish the body as penance, both for personal sins and for the sins of mankind which were thought to have caused the plague. The flagellant movement had been going on for some time in the Middle Ages (dating to the twelfth century), when individuals punished their sinful flesh or brought it under control through the sting of the beatings. These inflictions were often done in public by groups connected to the movement, accompanied by procession and the singing of psalms. The earlier practices were condemned by church authorities, but during the bubonic plague they seem to have made a strong reappearance. Some believed the plague was signaling the end of the world, and groups of flagellants began to organize and march about Europe calling for general repentance. Processions of hundreds of flagellants are recorded, marching in twos, with crosses and purple banners (purple was seen as the color of penitence). The groups would often move into village squares, or to local churches, announced by the ringing of bells, strip off their outer hooded garments, lie upon the ground with outstretched arms (cruciform) and begin to take turns scourging one another, chanting as they proceeded. Their whips were made of leather thongs, and many brandished instruments with barbed metal tips. Spectators frequently were so moved by the emotional and disturbing scene that they themselves joined in the penance.

**THE CULT OF THE AFTERLIFE.** One outcome of the plague for most Europeans was a preoccupation with the afterlife. It was not an issue of whether or not there was an afterlife, since the need for hope amid daily experiences of loss assured the continuation of that expectation. But there were a number of different approaches to the question of how to maintain a spirit of hope and how to avoid dying without proper preparation of the soul. One development that occurred was the rise of treatises called *Ars moriendi* (literally "art of dying"), intended to prepare Christians for the act of death. These treatises taught *contemptus mundi*, the hatred of the goods of the world and an awareness of the transience of the flesh, illustrated in a form of popular poetry that asked the question *ubi sunt* ("Where are they?") of long lists of kings, queens, beautiful women, and heroes who are, inevitably, dead. Doctrines and popular notions of the world beyond included the notion of purgatory. Even in earliest medieval Christianity, prayers were regularly said on behalf of those who had died but whose souls were still awaiting eternal reward. Only a few heretical theologies dismissed the notion of purgatory: the Waldensian, the Cathar, and the Wycliffite. With so many people involved in some form of religious life, it was easy to see by contrast that spiritual perfection,

which must be the key to heaven, was not easy to attain. Hell was for the worst of sinners; purgatory was for the rest. The period of one's stay in purgatory depended upon the number of unrepentant venial sins that a person died with. If so many would be in the state of purgation from life's sins before entering heaven, there was need for prayers, devotions, and even strategies for making the stay less punishing. The theologian Peter Lombard in the twelfth century had addressed many of these issues, which were further considered by thirteenth-century philosophers and theologians such as William of Auvergne, Alexander of Hales, Bonaventure, Albertus Magnus, and Thomas Aquinas. A culminating statement came from the Council of Lyon in 1274, the year of Aquinas' death, and by the early fourteenth century, the beliefs were so widespread that they served as the basis for Dante Alighieri's *Divine Comedy* of heaven, hell, and purgatory. Thus, in the wake of the plague, prayers were said, masses were offered, and indulgences were earned or purchased to assist both self and loved ones with the arduous task of navigating the afterlife. Fraternal and guild organizations starting in the thirteenth century compiled lists of members needing prayer. Thousands of these confraternities existed throughout the thirteenth, fourteenth, and fifteenth centuries all over Europe. Protestant theologians during the sixteenth century would reject these beliefs.

#### MYSTICISM AND MODERN DEVOTION

**AN AGE OF PERSONAL PIETY.** The late Middle Ages witnessed a period of popular piety and mysticism that is quite unparalleled in Christian history. Ideas of service to others in the world combined with spirituality, which came on the heels of twelfth- and thirteenth-

century monastic and religious reforms and found itself deeply imbedded in the fourteenth- and early fifteenth-century religious mindset. The search for a direct and personal communication with God, whether it was through mystical experience or a life of quiet inner contemplation of images (such as the *arma Christi* or the implements used to torment Christ, as in a miniature from a book of hours now in Oxford, England), seemed to replace the notion of conformity to institutional rituals. Like the religious reformers in the centuries before them, however, the proponents of this new kind of spirituality were often seen as bordering on the edge of herodoxy—holding opinions at variance with established belief. Their desire for personal religious experience also prepared the way for the pre-reformation idea that the mediation of priests and sacraments was not the only way, and maybe not even the best way, for people to live meaningful Christian lives centered on a quest for spiritual perfection. Exactly what the mystics experienced is hard to grasp objectively. Their own writings report their personal ecstatic experiences which, whether real, imagined, or induced, have helped shape a broad tradition of spiritual understanding in the Latin Christian tradition.

**MEISTER ECKHART.** Germany seems to have been a center for mystical and spiritual activity in the late thirteenth and fourteenth centuries. Among those mystics whose ideas proved influential was Johannes “Meister” Eckhart (1260–1327). Eckhart was a leader in the Dominican Order whose studies of Thomas Aquinas and Albertus Magnus led him to reflect upon some of the more Neoplatonic elements of theology (relating back to the Greek philosopher Plato and his theories of the soul). Eckhart, during his later career, became absorbed in the notion of the soul’s relationship to God. This led him to adopt ideas of the indwelling “spark” or spirit of God that not only allowed people a glimpse of the divine but was what truly made them “one” with the divine. He felt the soul could literally experience the Word of God dwelling within, and become that Word, just as Jesus became the Incarnate Word. This transformational mystical experience, quite unlike what the great twelfth-century mystics like Bernard of Clairvaux wrote about, appeared to eliminate the distance between God and people. Bernard’s “affective” mysticism (focused on emotions rather than intellect) was grounded in humility and love, which is seen as the experience of God, since God is love itself. Bernard had believed that one came to know and love the self for the sake of God. But in Bernard’s opinion, the self did not become a realization of the divine, as Eckhart seems to imply. This is what brought Eckhart into conflict with church doctrine, resulting in the condemnation of some 28 of his propositions by Pope John XXII in 1329.

**MYSTICS IN GERMANY.** One of Eckhart’s disciples, another Dominican named Johannes Tauler (1300–1361), studied with Eckhart at Cologne and later became a preacher and spiritual advisor at Strasbourg and Basel. Like Eckhart, Tauler was also convinced that a “grounding” of God’s image existed in the soul, but he felt that it was something that came from God and was not intrinsic to humans. He believed the return of the soul to its source in God was an operation of grace where Christians absorb something of God into themselves. Another of the great German Dominican mystics was Henry Suso (1295–1366). Henry was also part of the Cologne school and defended Eckhart during his condemnation. Suso lived as an ascetic and later launched his career in preaching and ministry. His approach to the mystical experience was expressed in the idea of the uncreated and created wills of God and humans. He wrote treatises called the *Little Book of Truth* and the *Little Book of Eternal Wisdom*, meditations on Christ’s passion and guides to mystical questions which gained wide popularity. Some of his treatises were translated into other languages and were beautifully illustrated. All three of the preced-

Annunciation to the Virgin, Ambrogio Lorenzetti, Pinoteca Nazionale di Siena, Italy, 1340. THE ART ARCHIVE/PINACOTECA NAZIONALE DI SIENA/DAGLI ORTI.

ing German Dominican mystics were spiritual advisors to groups of Dominican nuns and Béguines. The particular brand of German mysticism that emerged from these groups was grounded in personal piety, vernacular preaching, and the care of souls. Eckhart and his disciples also wielded much influence over the religious and lay mystics of the Rhineland who called themselves “The Friends of God.” This group produced the late fourteenth-century work *Theologica Deuch* which had profound effects upon sixteenth-century reformers like Martin Luther, the Anabaptists, and the Spiritualists, including Caspar Schwenkfeld and, much later, the Quakers, who espoused a mystical form of Christianity which emphasized “following an inner light.”

**ENGLISH CONTEMPLATIVE MYSTICS.** England also produced its own brand of fourteenth-century mystics who were more inclined to the eremitical and contemplative lives, unconnected to religious orders, away from the world (quite different than the German Dominicans). Richard Rolle (1300–1349) became a hermit at the age of eighteen and began to write about his mystical experiences. His most distinctive writings, in a work called *Incendium amoris* (The Fire of Love), concern his physical sensations of spiritual union with God, what he refers to as heat (actual warmth in his body), sweetness, and song. He also wrote *De amore dei contra amatores mundi*, which compares the love of God with the transient pleasures of this world. One of Rolle’s followers,

Walter Hilton, who died in 1396, wrote *The Scale of Perfection*, which was not published until 1494. Hilton's work describes the restoration of the defaced image of God on our souls through faith and feelings, hindered by a mystical darkness and attachment to earthly things, aided by the spirit. Both Rolle and Hilton worked with religious communities at the very end of their lives—Rolle directing Cistercian nuns at Hampole, and Hilton living with Augustinian canons. Most likely one of the greatest women mystics of the Middle Ages, Julian of Norwich (1342–1416), also lived in England during this period. She took up the life of an anchoress outside the walls of St. Julian's Church in Norwich. On 8 May 1373, after taking ill and being near death, she reported receiving a series of fifteen revelations lasting almost five hours. Many of these were visions of the crucified Christ. She made a complete recovery in a little over a week. It was not until some twenty years later, reflecting upon these experiences, that she completed *Revelations of Divine Love*, also called *The Showings*. Much of her spirituality is intertwined with her visions of Christ's Passion and the Trinity. In God's love lay the answers to all of the world's difficulties, including the solution to the problem of evil. She felt that evil was linked to the human will and was the clear absence of the divine reality. Human ability to desire to glimpse the divine love was an indication of God's true mercy.

**AN ITALIAN MYSTIC.** St. Catherine of Siena (1347–1380), a Dominican tertiary, lived a different type of spiritual and mystical life. At an early age it is reported that she began mortifying her flesh, and at sixteen she entered a Third Order group of Dominicans. She spent most of her time in secluded contemplation at her family's home. A vision persuaded her to begin doing apostolic work in the world. Catherine assembled about her a devoted group of religious and began employing her gifts of infused prayer (emotional prayer over an extended period) to bring about a devotion to the Precious Blood and a greater understanding of the reconciliation of sinners. Her reputation as a mystic grew to the point that she was forced to defend her activities in front of a Dominican General Chapter in 1374, at which time she was cleared of suspicion of heresy. In 1376 Catherine made a journey to Avignon to plead for a return of the papacy to Rome. She is most famous for her series of letters and spiritual instructions, which were dictated to her scribes.

**DEVOTIO MODERNA.** One of the most expansive ideological developments in late medieval spirituality was initiated in the Netherlands by Gerard Groote (1340–1384) and one of his followers, Florentius Radewijns (1350–1400). This movement, later known

as the *Devotio Moderna* (modern devotion), was based upon the philosophy of Groote, a university master, who renounced his wealth, which had been derived from church benefices, to become a religious reformer living a life of piety and simplicity. Radewijns' and Groote's work strongly influenced three early reform communities: the Deventer groups of both Sisters and Brothers of the Common Life, and the community of Augustinian canons at Windesheim. The idea was for groups of Christians to live in common, not separating themselves from the secular world, carrying on shared religious observances, with no vows, hopefully preventing them from falling into the institutional traps that had snared the monastic reform movements. Many laypersons were attracted to this lifestyle, and branch communities began to spring up throughout western Germany. Some who desired an existence with more structure and monastic influences, yet grounded in Groote's philosophy, joined a tertiary Franciscan group that had formed a chapter at Utrecht. After Groote's death the groups were recognized by Pope Gregory XI and continued to spread their ideology throughout Germany and the Low Countries. Radewijns' Brothers of the Common Life were organized in his vicarage in Deventer where he was a parish priest. They spent time copying books, distributing pamphlets, and founding schools throughout the Netherlands, providing individuals with a general education that was free and of surprisingly good quality. Thomas à Kempis, Pope Hadrian VI, Erasmus, and Nicholas of Cusa were all famous products of this educational system. In 1387 a congregation adhering to the lifestyle of Augustinian canons was founded at Windesheim. Their constitution was approved by Pope Boniface IX in 1395, and three other Dutch monasteries soon joined them. The Windesheim canons soon became a full monastic order and developed into the most ardent proponents of the *Devotio Moderna*. They encouraged the laity toward frequent reception of the Eucharist as well as the devotion and veneration of the Blessed Sacrament. Thomas à Kempis, a member of one of the Windesheim daughter houses at Agnietenberg, is credited with writing the great spiritual work *Imitation of Christ*. In this work he suggests that all Christians are pilgrims in this life and are but on a journey to the next. *Imitation of Christ* appealed to people living simple lives in the world. It was soon translated into the vernacular (Dutch in 1420 and German in 1434). There were few other books from the fifteenth century that had such an impact upon lay spirituality.

## SIGNIFICANT PEOPLE *in Religion*

---

### THOMAS BECKET

1120–1170

*Archbishop of Canterbury*

*Diplomat*

*Martyr*

**COMPANION TO THE KING.** Thomas Becket was the son of Norman settlers who lived in the city of London. His father was a merchant who traveled among the circles of French-speaking Norman immigrants. The name "Becket" is likely a nickname, possibly meaning beak or nose, which was given to his father. As a boy, Thomas studied with the Augustinian canons at Merton Priory and later at the cathedral school of St. Paul. Some suggest that as a young man Becket studied in Paris under Thomas Melun. Around 1141 he came into the service of Theobald, the archbishop of Canterbury, whose household companions included several future bishops. Thomas was later sent to study law at Bologna and Auxerre, likely entering into minor clerical orders along the way, and eventually becoming a subdeacon. Theobald consecrated Thomas as an archdeacon at Canterbury in 1154, and he continued in the service of the bishop's household where he had been for nearly ten years prior. Soon after, the young king Henry II's backers chose

Thomas for the position of chancellor of the realm, which was essentially a secular position as royal counselor. While working in the English court, Becket developed an extremely close friendship with the king, accompanying him on hunting expeditions and even a successful military campaign in Aquitaine, where Thomas commanded an army of hundreds of knights and thousands of mercenary soldiers. Upon the death of Archbishop Theobald in 1162, Henry asked Thomas to take the position of archbishop of Canterbury. It may have been Henry's wish that his close friend hold both positions of chancellor and archbishop since the king then would be able to exert significant influence over the English church.

**A SURPRISING CONVERSION.** To Henry's surprise, upon his friend's ordination to the priesthood in June of 1161, and his elevation to the archbishopric one day later, Thomas resigned his post as chancellor. He quickly began to take his new office very seriously. It is said that he lived an almost ascetic lifestyle, rising early to pray, enduring humiliations like washing the feet of the poor, wearing a purposely uncomfortable hair shirt, scourging himself out of indifference to his flesh, studying the scriptures, and surrounding himself with learned churchmen. It was not long before he came into conflict with the king over the rights and authority of the church, as well as the notion of church taxation. One particularly distasteful battle took place over a document known as the Constitutions of Clarendon. Issued by Henry II near Salisbury in 1164, it reasserted the church-state customs and relationship conducted during the time of Henry's grandfather, Henry I (r. 1100–1135). Issues concerning the judgment and punishment of clerics by secular powers, freedom of the bishops to travel outside the realm without royal consent, the requirement that the church obtain the king's permission before excommunicating his tenants, and the crown's entitlement to income from vacated church lands were among the more vexing statutes. In essence, these propositions gave the king specific and, as Thomas saw it, excessive legal authority over the church. Henry demanded that the bishops swear oaths to the effect that they would uphold the Clarendon conditions. Thomas reluctantly did so, along with other bishops present. However, Thomas later regretted the decision when Pope Alexander III openly denounced the Constitutions of Clarendon. Thomas felt obliged to uphold the opinion of Rome and, after being found guilty at a public trial, escaped England and fled to France where he lived in exile for six years. His years living as a penitent monk in Cistercian and Benedictine houses were not comfortable, especially since he had little support from his fellow bishops or even from Pope Alexander,

who was distracted by the claims of an anti-pope. After several attempts at reconciliation and the threat of interdict issued by Alexander III, Thomas and Henry agreed to a “rhetorical” compromise, which in no way actually modified either man’s position. Becket returned to England in 1170 and resumed his role as archbishop of Canterbury. But less than a month after his arrival, disgruntled elements in the royal circle inflated issues related to Thomas’s excommunication of several bishops who had acted in defiance of Rome, on the king’s behalf, and were being punished by Thomas. Hearing Henry II’s displeasure over another confrontation with Thomas, four of the king’s knights took the initiative to rid the realm of the troublesome cleric for good. After an argumentative exchange in Thomas’s chambers, the knights followed the archbishop into Canterbury Cathedral, where they attacked and killed him.

**SAINTHOOD AND KINGLY PENANCE.** Upon news of Thomas Becket’s murder, Pope Alexander III went into mourning, then placed an interdict (exclusion from sacraments) upon King Henry II. At Sens, the French archbishop imposed interdict over the inhabitants of all the king’s lands on the European continent. Henry was eager to make peace with the church, and at Avranches in 1172 conceded to give in to the notion of appeals to Rome in all cases of church disputes. He also restored all property to the archbishopric of Canterbury and made a vow to go on a crusade to the Holy Land. Henry even agreed to the exemption of clerics from the jurisdiction of secular courts. In 1173, just two years after his death, Thomas was canonized as a saint of the church. The cathedral at Canterbury where he was murdered became a famous pilgrim site, one even visited by the penitent Henry II himself in July of 1174. It is said that he walked barefoot from the city gates to the tomb of his former friend, admitted his guilt in the archbishop’s death, and submitted himself to some 240 lashes administered by the monks from Canterbury Cathedral. As in the case of Henry IV of Germany during the investiture crisis (some 100 years earlier), a monarch’s act of penitence and humility, whether calculated or not, demonstrated the power of devotion that was held by Christians in Europe, even in the face of dominant secular authority.

1021–1085

### *Pope*

**A SKILLED ADMINISTRATOR.** Gregory VII served the church in Rome for many long and distinguished years before becoming pope in 1073. Consequently, he is more often than other popes referred to by his given name, which was Hildebrand. He was born to a poor family in Tuscany and came to Rome as a boy to be educated at the monastery of St. Mary on the Aventine Hill. Although it has been suggested that he spent his early days as a monk, scholars now think that unlikely. Hildebrand served under seven different popes before his own elevation. He was the chaplain of Pope Gregory VI and even accompanied him in exile to Germany during 1046 and 1047. Upon Gregory VI’s death, Hildebrand remained in Germany and worked with reform groups to create a more serious, committed, and spiritual outlook among European clergy. He returned to Rome in 1049 to work under Leo IX as an administrator of papal estates and properties (called the Patrimony of St. Peter). Hildebrand guided other papal successors through their pontificates (such as Nicholas II and Alexander II) and may even have been responsible for helping them get elected. There is little doubt Hildebrand came to influence a crafting of the legislation for the process by which cardinals eventually came to vote on papal successors. In 1059 he was given the title Archdeacon of the Roman church and also held the title of Chancellor of the Apostolic See. His election as pope in 1073 came as no surprise since he had held major administrative posts in Rome for some thirty years prior.

**A MAJOR REFORMER.** Upon his elevation to the Roman bishopric, Hildebrand began to work more aggressively to reform the morality of the church and clergy by issuing decrees against simony (the buying and selling of clerical offices), clerical participation in sexual activity, and lay investiture (conferring of authority to a church official by a secular prince or landowner). *Dic-tatus Papae*, which has been attributed to Gregory, declared Rome’s supreme authority in all religious matters. Monarchs reacted to these changing ideas of church authority in varying ways. In England, William the Conqueror saw to it that all of the Gregorian reforms, with the exception of rules against investiture, were rigorously carried out. In France, despite King Phillip I’s opposition, the bishops complied. Henry IV of Germany, however, posed a major stumbling block for Gregory’s vision, the most important results of which were to raise the

moral awareness of the clergy, create a more unified and powerful church governance, and establish an organized administrative system of papal legates. These changes set in place the ideology for the new reforming monastic movements beginning in the late eleventh century, the rebirth of Roman legalism linked to canon law, the condemnation of growing materialism in European society, and even the new theological and scholastic attitudes of the time. Moreover, he created an atmosphere of dialogue that eventually led to some measure of agreement on the vexed question of the existence of the “real presence” in the Eucharist (Christ’s actual presence in the elements of bread and wine). It was from the seeds of that resolution that the twelfth-century doctrinal view of transubstantiation would emerge. Although his effort to unite Eastern and Western Christianity were unsuccessful, only two other bishops of Rome, Gregory I (r. 590–604) and Innocent III (r. 1198–1216), could be said to have had as great an impact on the future of medieval Western Christianity.

### INNOCENT III

1160–1216

#### *Pope*

**SECULAR INTERVENTIONS.** Innocent III was born Lothario de Segni to a noble family and was educated at Paris and Bologna. As a young cleric, he rose through the ranks of the papal service, becoming a cardinal in 1190 and being elevated to the papacy in 1198 upon the death of Celestine III. It is interesting to note that Innocent was not yet ordained a priest at the time of his election. His strength lay in his ability to intervene effectively in secular affairs, and it has been suggested that no pope in the entire medieval era had a greater impact on the period in which he lived. Innocent reduced the size of the papal curia (the court or administrative body), wresting it from the grasp of Italian secular politics. He also was able to restore papal territories that had been lost over time to the Holy Roman Empire. Interventions in several conflicts over disputed succession to the Ger-

man throne were also among the accomplishments of Innocent. Examples of involvement in major European church and state politics include his interaction with the emerging kingdoms on the Iberian Peninsula, the struggle for the conversion of eastern Europe to Christianity, and settlement of political disputes involving Bosnia, Bulgaria, and Hungary. Above all, he sought to extend the powers of the bishop of Rome. Innocent was the first pope to employ the title “Vicar of Christ,” which implies the ability to act as Christ’s representative on earth. This is certainly a testament to the broad extent of his ecclesiastical jurisdiction.

**MAJOR ACHIEVEMENTS.** Another matter concerning spiritual and temporal powers which drew considerable attention during his reign was Innocent’s intervention in the issue of the succession of the archbishop of Canterbury in England. After declaring the election of 1205 invalid, Innocent placed his own candidate, Stephen Langton, in office after overriding separate decisions about candidacies by both the local bishops and King John. John’s failure to cooperate in the matter resulted in the entire kingdom of England being placed under an interdict which limited reception of the sacraments by all of the English people. Irreconcilable positions between crown and church resulted in the king’s excommunication (just prior to his capitulation in 1211). After a series of political twists involving Innocent’s revocation of Magna Carta, John finally took the position of accepting the pope as his overlord. Possibly the crowning achievement of Innocent’s pontificate was the fact that he presided over the Lateran Council of 1215. This massive gathering of clergy made major reforms to the medieval church, possibly marking it as the most important council of the entire Middle Ages. Nearly every bishop from the Catholic territories, some 25 churchmen from the Latin East (including Maronite bishops), representatives of canons from every cathedral chapter, the heads of the major religious orders, as well as secular representatives of the major kingdoms attended. Literally thousands of participants were summoned to the council. Most of the seventy or so decrees that were drafted by Innocent and his curia were not debated, but presented to the church. The majority of these decrees (or canons) involved pastoral care and the reform of the clergy, including their careful education by the bishops. There were also several crusades during his tenure, including the failed Third Crusade and the successful campaign against the Albigensian (Cathar) heretics. Innocent’s approval of the Franciscan and Dominican orders of friars proved to be of major significance to the growth of ministry and education for the church in the centuries to follow.

**MECHTHILD OF MAGDEBURG**

1212–1281

*Mystic*  
*Spiritual writer*

**A VISIONARY BÉGUINE.** Mechthild of Magdeburg was a German spiritual writer as well as a great mystic of the thirteenth century. She came from a noble Saxon family but rejected her heritage for an existence of simplicity and prayer. Mechthild joined a Béguine community at Magdeburg, devoting herself to a life filled with penance and humility. Like another of the great Béguine mystics, Hadewijch of Antwerp, she saw herself as a vessel of divine inspiration. Mechthild believed she had received the ability to speak, as inspired by God, directly from her visions of ecstasy, led by a charismatic spirit. One of her common themes was the notion that from weakness comes strength. Like other Béguines, she saw that a life lived in imitation of Christ was something open to all Christians, not just clerics and individuals in orders. Her prophetic calling was viewed as a transcendent communion with the love of God.

**A THREAT TO CHURCH AUTHORITY.** Like the Cistercian abbot Bernard of Clairvaux, Mechthild employed the image of bride and bridegroom from the Old Testament Song of Songs to convey her spiritual union. Because of her association with the secular world, it was also permissible for her to use the language of courtly love in her writings. Between 1250 and 1269 she produced a book about her visions entitled *Das Fließende Licht der Gottheit* (Outflowing Light of the Godhead). The work was written in bold poetic style and became quite influential on subsequent German medieval mystics. Mechthild, like Marie d'Oignies, was not afraid to point out the prevalent immoral activity of the clerics that she saw around her. She drew great criticism from

the male-dominated church, both for her freedom of expression and for her claims to receive direct divine communication. The period in which the Béguines operated was clearly a time when clerics were threatened by the profound piety of holy secular women, particularly when they admitted to having mystical experiences or direct illuminations. Not only did they undermine the authority of the hierarchy, but also it was felt that their lack of formal theological training might lead them into some type of heresy. The anti-mendicant Parisian master William of Saint-Amour once wrote that the laity stood in constant need of perfection through the ministry of the clergy. Since the Béguines were not under the authority of a religious order or secular clerics, the direction of their spiritual leadership and influence was seen as unregulated, uninformed, and unprofessional. Eventually, as with many other outspoken Béguines of the thirteenth and fourteenth centuries, Mechthild was pressured into retreating to a convent. At the age of 62, she entered the Cistercian house at Helfta, where she continued writing and added one more volume to her work.

**MARIE D'OIGNIES**

1177–1213

*Mystic*  
*Founding mother*

**A SPIRITUAL HEALER.** Marie was born into a noble Flemish family near Liège in the Low Countries and was one of the first women to be recognized as a Béguine. Although she was married at fourteen, she and her husband did not consummate their marriage, but rather worked together in the care of the sick. At thirty, she renounced her wealth and retired to a cell at an Augustinian monastery, devoting herself to an ascetic, Christ-centered life in which she experienced ecstasies and visions, even to the point of accomplishing a miraculous three-day feat of incessant chanting and scriptural exegesis (critical interpretation). She was particularly well known as a spiritual healer, and her reputation inspired the growing groups of urban laywomen who were beginning to assemble together in parts of Germany and

the Lowlands to attempt to live holy lives in austere communities, but without taking formal vows as required within the official structure of recognized convents and monasteries. She is thus recognized as a founding mother of the movement of spiritual women known as the Béguines.

**AN EXAMPLE OF A VIRTUOUS LIFE.** The story of the life of Marie d'Oignies was written by Jacques de Vitry, who had relayed stories of virtuous Béguines to the papal curia. Jacques de Vitry had begun his career as an Augustinian canon and for one year was a neighbor and confessor to Marie, along with being a disciple of her spirituality. His biography of Marie d'Oignies was written to show the heretics of Languedoc an example of what a truly holy woman's life should be. Jacques wrote of Marie's extreme piety, her disdain for her fleshly self, and the inspiration that he drew from her criticisms of his own life of spiritual inadequacy. When Jacques became bishop, he used his stories to help the Béguines gain from Rome some type of temporary recognition, although he could not get them formally approved as an order. Gregory IX's bull *Gloriam Virginalem* did later recognize these chaste virgin women of Germany and afford them papal protection.

## DOCUMENTARY SOURCES *in Religion*

Benedict of Nursia, *The Rule of St. Benedict* (early 6th century)—This set of guidelines for monastic living, written by the abbot of Monte Casino for his own monastery and possibly some neighboring houses, focuses on humility and obedience. Promoting stability and stressing the need to give up all personal property, it offers practical and moderate advice for a community of monks designed to function almost as a family under a fatherly abbot. This rule was the most widely adopted by monasteries throughout medieval Europe from the ninth century onward.

St. Bernard of Clairvaux, *Sermons on the Song of Songs* (c. 1153)—This unfinished work by the first leader of the Cistercian Order follows the medieval exegetical scheme of fourfold meaning of Scripture: literal, allegorical, moral, and mystical. Themes range from behavior of monks to the mystical union between the Bridegroom (Christ) and the Bride (the Church).

St. Bonaventure, *Itinerarium Mentis in Deum* (The Journey of the Mind into God, 1259)—This Franciscan theologian, philosopher, and leader of his order (born John of Fidanza, c. 1217–1274) took a more traditional view than Thomas Aquinas of the relationship between human reason and the mysteries of God. In this work he puts forth the notion that human wisdom meant nothing or was a waste of time when compared to the profound mystical understanding that could be imparted by God to those of His faithful who were receptive to such enlightenment.

Boniface VIII, *Unam Sanctam* (1302)—This papal bull, named after its opening statement, claimed that there was “One Holy, Catholic and Apostolic Church” outside of which eternal salvation did not exist. The pope was seen as supreme head of the church, and to reject his authority was to sever ties with the institution to which God had granted spiritual authority. In short, obedience to the pope was necessary to salvation. While this statement was not universally accepted by all Christians and it really was not a new dictum, it did represent a summation concerning the church's vision of papal authority.

St. Francis of Assisi, *Canticle of the Sun* (1225)—This work is a hymn of praise to God's creation and the revelations of the divine that are found in nature. Traditionally thought to have been composed at the Garden of the Poor Clares at San Damiano, the poem was not written in Latin but in the Umbrian dialect of the Italian people. Francis encouraged his friars to recite or sing it while they were out preaching, and it is often mentioned in medieval writings concerning Franciscan spirituality. Many scholars now think that the second part of the hymn, dealing with the notions of peace, pardon, and death, was composed during a later period, possibly before the death of Francis.

Gratian, *Decretum* or *Concord of Discordant Canons* (early twelfth century)—The man called “the father of the science of canon law” (now believed to be two separate people) wrote this work, which had as its purpose the reconciliation of diverse and often contradictory thought on church law through the application of dialectic. It is divided into a treatise on law, a series of hypothetical cases, a tract on penance, and a sacramental tract.

Gregory of Palamas, *Heihasmos* or *Triads in Defense of the Holy Hesychast* (c. 1338)—This theologian and monk of Mount Athos became immersed in the Hesychast tradition of mystical prayer. He wrote this famous treatise against Barlaam, a Greek Calabrian monk who supported the notion that God was unknowable. Gregory contended that it was possible for humans to experience the Divine Light. While he believed that God's essence might be unknowable, his energies—that is, the reality of God himself—are in all things and can be experienced and visualized by people in a direct sense through the workings of God's grace.

Hildegard of Bingen, *Scivias* (c. 1151)—One of the first medieval women to write about theology and Christian spirituality, Hildegard (1098–1179) became widely known during her own lifetime. Her prophecies and visions were written down in a three-volume Latin work, the *Scivias*, often translated as “Know the Ways.” The work includes some 26 visions, a number of which were composed in poetry or later set to music. Hildegard used images to express spiritual concepts and discussed a range of topics from the Fall of Humanity to depictions of the institutional church, as well as renderings of the end of the world.

Julian of Norwich, *The Showings* (c. 1373–1393)—This work consists of the recounting and interpretation of a series of ecstatic revelations of the Passion of Christ and the Holy Trinity received in 1373 by Julian, an anchoress of Norwich. She completed the work some twenty years after the revelations took place, recounting her lifelong meditation upon the experience. Julian's writing on the mystery of faith and the life of prayer became a classic, reprinted in numerous fifteenth-century devotional works, where it served to emphasize the central place of God's love as the root of spiritual growth, determination, and perseverance.

Peter Lombard, *Four Books of the Sentences* or *Quattuor libri sententiarum* (1155–1157)—This comprehensive work arranges the opinions (*sententiae* in Latin) of the church fathers, especially Augustine, into a system with a logical

order of development. It was legislated into the curriculum of all theology students at the University of Paris in 1215 and remained there until the sixteenth century.

*Summa Cartae Caritas* or *The Charter of Love* (twelfth century)—This important charter laid out the constitution of the Cistercian Order and expressed a departure from the relationship between houses in the Benedictine Order, particularly as practiced in the tradition of Cluny. The document was said to have first been presented to Pope Callixtus II in 1119, outlining the autonomy of Cistercian houses, their system of visitations by abbots of their motherhouses, and the call for yearly meetings or General Chapters, where monks would meet to decide collectively upon their order's legislation and governance. The document was subsequently revised during the early Cistercian period and may have reached a final form around the middle of the twelfth century.

Thomas Aquinas, *Summa Theologiae* (before 1273)—This massive statement of the whole of Christian theology is divided into three parts treating God, God's relations with humanity and humanity's relations with God, and Christ and the Sacraments. This work became the basis of medieval clerical education and is still recognized today for its system and clarity.

Thomas à Kempis, *Imitation of Christ* (c. 1418)—This manual of spiritual devotion was written by an ascetical monk from the reform house of Zwolle, a daughter house of Windesheim. Thomas was influenced by the tradition of the Brethren of the Common Life and directed this work toward achievement of a life of spiritual perfection based upon the Christ as its model.

Urban II, *Clermont Sermon* (27 November 1095)—This is the speech that Pope Urban gave in support of the First Crusade at the Council of Clermont. There are actually five surviving versions of the speech, all of which put forth the principles and justification for crusading that would set the theological tone relied upon by churchmen in their promotion of subsequent campaigns.

## IMPORTANT EVENTS *in Theater*

- 814 Emperor Charlemagne dies. Under his auspices, numerous innovative programs are undertaken that contribute, directly and indirectly, to the development of medieval theater and the preservation of ancient Roman plays.
- c. 825 Amalarius, bishop of Metz (778–850), expresses concern over the overtly dramatic nature of the Mass, indicating that he views the devotional practices of the medieval Christian Church as inherently theatrical.
- c. 850 Heroic poems in many European languages have already been written and performed, notably the Anglo-Saxon *Beowulf* and the Germanic poems that will later contribute to the *Nibelungenlied*.
- c. 900 Evidence shows that many European monasteries, like that of Saint-Gall in Switzerland, are developing new and dramatic approaches to worship.
- c. 950 Revivals and imitations of ancient Roman comedy are being performed.
- c. 960 King Edgar of England complains that the monasteries of his realm are so decadent they are being publicly mocked by professional actors.
- c. 975 Ethelwold, bishop of Winchester, promulgates the *Regularis Concordia* (A Harmony of the Rules) for use in the Benedictine monasteries of England, including instructions for the performance of liturgical drama.
- The Easter sequence built around the question *Quem queritis in sepulchro?* (“Whom do you seek in the sepulchre?”) is already central to the liturgical re-enactment of Christ’s Resurrection.
- c. 1002 Hrotsvit, a nun in the imperial abbey of Gandersheim (Germany), dies. Her Christian Latin comedies borrow the techniques of the Roman playwright Terence.
- 1066 Portions of the Old French heroic poem *The Song of Roland* are performed by a minstrel prior to the victory of William the Conqueror at the Battle of Hastings in England.
- c. 1080 William IX, duke of Aquitaine and one of the first troubadours, dies. His songs are composed in his native Occitan (southern French) dialect.
- c. 1090 The earliest liturgical drama to make use of the vernacular, a play called *Sponsus* (The Bridegroom), is recorded at the abbey of Saint-Martial at Limoges (France).
- c. 1100 *The Song of Roland* is written down for the first time.
- c. 1110 A French schoolmaster named Geoffrey de Gorran produces a play about the martyrdom of St. Catherine of Alexandria with the help of his students and some borrowed vestments from St. Albans Abbey in England.
- c. 1140 Numerous Latin comedies, among them *Pamphilus* and *Babio*, are being composed and performed in monasteries, cathedral schools, and princely courts.
- c. 1150 The liturgical plays that make up the manuscript known as the *Fleury Playbook* are put together at about this time; they are usually associated with the abbey of Saint-Benoît-sur-Loire in France.
- c. 1155 Hildegard of Bingen composes the *Ordo virtutum* (Service of the Virtues) for the nuns of her convent at Rupertsberg, one of many dramas mingling song, dance, and elaborate costumes to create special effects.

- 1160 The monks of Tegernsee Abbey compose and perform the *Play of Antichrist* in honor of Frederick Barbarossa, the Holy Roman Emperor.
- c. 1180 Two early vernacular plays based on the Bible, the *Service for Representing Adam* and the *Play of the Magi Kings*, are composed at about this time in Anglo-Norman French and Castilian Spanish.
- c. 1191 Following the conquest of Arras by King Philip II Augustus of France, Jehan Bodel composes the *Play of St. Nicholas*, the first non-biblical play written entirely in a vernacular language (Picard French).
- c. 1200 The monks of the Bavarian abbey of Benediktbeuern compose the songs and plays that will be collected as the *Carmina Burana*. Their Easter play makes use of the local German dialect.
- 1205 Henry of Livonia, a missionary to the people of Riga (in what is now Latvia), describes an unsuccessful production of an *ordo prophetarum* or “Play of the Prophets.”
- c. 1210 The young men and boys of the cathedral school at Beauvais, in northern France, preserve the script for their musical, *The Play of Daniel*.
- 1215 The Fourth Lateran Council calls for the recruitment of effective and charismatic preachers to minister to the newly urbanized population of Europe; they will have to compete with professional entertainers for the attention of the people.
- c. 1230 Bawdy verse tales known as *fabliaux* are being widely circulated; many were probably dramatized as plays, among them *Courtois of Arras*.
- c. 1250 Two manuscripts of a second play in Anglo-Norman French, *The Holy Resurrection*, are copied at about this time.
- c. 1267 The script for a comic French dialogue called *The Boy and the Blind Man* is written down.
- c. 1270 By this date, the aristocracy of Europe enjoys participating in elaborately staged tournaments, many of which involve dramatic recreations of popular Arthurian romances.
- c. 1276 Adam de la Halle, French playwright and poet, composes a second play set in contemporary Arras, the *Jeu de la feuillée* (The Play of the Bower); it may have been modeled on the earlier *Play of St. Nicholas* by Jehan Bodel of Arras.
- c. 1283 While in the service of Robert II, count of Artois, Adam de la Halle composes a musical comedy called *The Play of Robin and of Marion*.
- c. 1311 The Feast of Corpus Christi, originally established in 1264, is officially promulgated at the Council of Vienne. It will become the major occasion for community theatricals, most notably in England.
- 1339 In this year, the Parisian guild of goldsmiths and its religious confraternity begin sponsoring the annual performance of plays devoted to the miracles of the Blessed Virgin; forty of these survive in a single, deluxe manuscript.
- 1376 This year marks the first documented mention of the York Corpus Christi cycle.
- 1378 A play about the Crusades is performed at a banquet in Paris hosted by King Charles V of France, according to an illuminated manuscript.
- 1381 The English Peasants’ Revolt takes place on and around the Feast of Corpus Christi, replacing theatrical violence and public displays of civic harmony with real violence and civil unrest.
- c. 1400 By this date many major European cities are performing annual Passion plays or staging other types of civic spectacles on a grand scale.
- 1415 The *ordo paginarum* (“order of the pageants”) for the performance of the York cycle is written down at this time.

- The manuscript of the oldest Middle English play, *The Castle of Perseverance*, is copied around this date.
- c. 1450 A play celebrating the Assumption of the Blessed Virgin is being performed annually on August 15 in the Basque town of Elche by this date; its performance will continue into modern times.
- 1452 The invention of the printing press spurs the widespread dissemination of play scripts throughout Europe, especially the texts of morality plays and farces.
- c. 1465 The play *Mankind* is scripted for a troupe of traveling professional actors.
- 1468 The 43 plays that make up the *N-Town Cycle* (sometimes known as the *Ludus Coventriae*) are written down after this date.
- 1477 The 48 pageants of the York Cycle are committed to parchment around this time.
- c. 1480 Two ambitious English plays, one devoted to the life and deeds of Mary Magdalene and the other to the conversion of Saint Paul, are written down after this date.
- c. 1495 A Dutch morality play called *Elkerlyke* (Every soul) is in print; it is eventually translated into English as *Everyman* and made available in several editions.
- c. 1500 The so-called Towneley (or Wakefield) cycle of 32 English plays is copied into a manuscript at about this time.
- 1567 Matthew Hutton, the dean of York Minster cathedral, advises the mayor and council of York not to perform the *Creed Play* of the Corpus Christi cycle, on the grounds that it would be considered heretical by the Protestant authorities and Queen Elizabeth I.
- 1576 The Theater, the first modern purpose-built venue for the performance of plays, is constructed in London.
- 1579 The final performance of the Corpus Christi play of Coventry takes place in this year. The young William Shakespeare would have been able to see this and many other examples of medieval drama.
- 1634 The people of the village of Oberammergau (Germany) begin to perform their *Passion Play*; it becomes an ongoing devotional ritual and is still performed in modern times, at ten-year intervals.

## OVERVIEW *of Theater*

**THE ROLE OF MEDIEVAL THEATER.** During the Middle Ages, theater was both a part of daily life and a way of celebrating special occasions. It was not limited to scheduled presentations of formally composed and fully scripted plays, and performances were not confined to particular buildings, dependent on a caste of professional actors or a paying clientele. Rather, medieval theater was a means of communication within and between communities, from monasteries to parish churches to princely courts to urban marketplaces. There was a wide array of theatrical styles and genres: musical dramas performed as part of the liturgy of worship; bawdy Latin comedies written for the amusement of students and clerics; biblical dramas that translated sacred stories into familiar languages and scenarios; ballads and tales of heroic deeds chanted and dramatized by professional entertainers; obscene jokes and sketches for late-night entertainment after feasts; royal entries and pageants that made a dramatic spectacle of power; morality plays; farces; and civic rituals on a grand scale. Medieval theaters were not built, but rather made use of pre-existing locations such as the town square, the street, the inn yard, the lord's hall, and the church. Plays of a kind more familiar to modern readers thus shared the same spaces. They also shared the same audiences as other civic activities such as the preaching of sermons, the news of town criers, royal proclamations, public executions, and religious processions. Theater was woven into the very fabric of medieval life and was the most effective medium for entertainment, religious instruction, and political propaganda.

**SOURCES OF INFORMATION.** Evidence for the workings of theater within medieval culture must be traced through that dense fabric, like gold threads in a richly colored tapestry. The study of theater in the Middle Ages is not so much the study of individual plays and particular dramatic productions as the study of myriad interactions between performers, audiences, and the larger social context in which performers and audiences participated. These interactions were only loosely scripted, if they were written down at all. As a result, the sources

scholars would normally rely on for the history of theater—a group of documents identifiable as plays, whose circumstances of performance can also be documented—rarely exist for the Middle Ages. Either such information was not written down, or (if it was) these written records have disappeared. By contrast, the wealth of material that survives from the early-modern period (after 1500), and which makes the study of Renaissance drama so appealing, is partly owing to the development of an important new technology: the printing press. The people of the Middle Ages, like those of the ancient world, produced only handwritten records known as manuscripts (from the Latin *manuscripta*, “things written by hand”). In consequence, most of the texts that survive from these early eras, theatrical or otherwise, were not available in multiple copies and did not circulate widely. Many ancient and medieval sources have not survived at all. To take but the most famous example, the great library of Alexandria, founded by Ptolemy II (309–246 B.C.E.) to house the books of antiquity, was destroyed by fire sometime in the first century B.C.E.—and with it, most of the body of Greek drama. The few classical plays that are still read today—for example, the tragedies of Aeschylus, Sophocles, and Euripides, or the comedies of Aristophanes—have survived only because copies were made and kept in other places than the library at Alexandria. Hundreds more plays, by these and other Greek and Roman authors, have vanished. During the Middle Ages, and up to the present day, natural disasters, warfare, theft, arson, and ordinary wear and tear continue to diminish the number of theatrical artifacts available from this era. Fortunately, quite a few significant plays do survive, and what they communicate about this period can be supplemented by information gleaned from an array of other materials, including scholarly treatises, legal documents, church records, letters, and chronicles.

**THE CREATIVE PROCESS.** A medieval play generally came into being as the end result of a process quite the reverse of what modern readers would expect. In the twenty-first century, a play begins with the playwright, and the playwright's idea is then expressed in written form, in a script, which is then marketed to a theatrical producer, who then hires a director, finds a theater, casts the actors, and finally tries to capture the attention of an audience, who will in turn pay to see a certain performance in the theater at a fixed time. Throughout the Middle Ages, a play began with the community. Liturgical dramas embellished the rituals of the church, and used actors drawn from the monastery or cathedral churches—monks and nuns, students, and clerics. Plays performed in towns promoted the harmony of the community or celebrated their histories. Many were acted by members

of the newly emerging trade guilds, and became a source of solidarity and pride. The various entertainments of the princely court involved the aristocracy in performance, side by side with professional actors and minstrels. Rural communities all over Europe had their own local performance traditions for celebrating special feasts and important events like weddings and funerals. In all of these cases, it was the community's need—its ideas or message or conflict—that would shape the story that was eventually dramatized by actors engaged by, or chosen from among, the members of that community. The resulting play would then be performed in some space deemed appropriate to the material, at a time of the year and of the day that was also considered appropriate. Only at the very end of this process might someone decide that the play should be written down and saved for posterity; more often, the theatrical moment would pass unrecorded, or be revived from memory at another time, or freely adapted for another occasion or audience.

**THE VARIETY OF MEDIEVAL THEATER.** Medieval theater developed through a number of stages. In the earliest period, the theatrical legacy of ancient Rome was passed down and revived in the newly Christian world of early medieval Europe. Some classical plays continued to be copied and performed by educated men and women with a knowledge of Latin, while the timeless craft of professional entertainers found new audiences, occasions, and places for its expression. Alongside these established forms, a new and unique type of Christian theater emerged in church liturgy, which created numerous opportunities for the dramatization of significant events in the life and ministry of Jesus, and in the history of human salvation. By the twelfth and thirteenth centuries, significant surviving texts show that the drama of the medieval Christian Church was becoming a powerful theatrical genre in its own right, blending the Latin language of worship with the vernacular languages of daily life in order to communicate more directly with the growing populations of prosperous towns. Bible stories were updated in order to convey messages of contemporary importance, and plays also became a vehicle for serious social or political commentary. At the same time, plays independent of the liturgy addressed an ever wider array of topics and problems, and experimented with new performance venues and new types of engagement between actors and audiences.

**NEW OPPORTUNITIES.** The largest number of surviving plays, however, are those composed and performed during the fourteenth and fifteenth centuries. By this time nearly every sizable community in Europe developed and fostered a local theatrical tradition that promoted the growth of urban and regional identities, and

traveling troupes of professional actors were taking advantage of the new commercial opportunities afforded by the cultivated audiences of cosmopolitan centers and the sophisticated courts of the aristocracy. By the sixteenth century, the cultural heritage of the Middle Ages would prove indispensable to the playwrights and performers of the Renaissance, whose fascination with classical drama was grafted onto that tradition, producing a modern mixture of the ancient and the medieval.

**ORAL TRANSMISSION AND PATTERNS OF PRESERVATION.** Since performance traditions were usually passed down by word of mouth, only a tiny percentage of the entire theatrical legacy of the Middle Ages was preserved in writing; and even these scripts are often incomplete because they would have been accompanied by further oral instructions and improvisations. It is arguable, in fact, that the survival of a text is an indicator that the play recorded there was thought to be in danger of extinction, or even that it was marginal, about to be relegated to obscurity. Ironically then, the most popular performance pieces may never have been written down, for the very reason that everybody knew them so well and thought that they would never be forgotten. This is particularly true for the early medieval period, until about 1100. Thereafter, writing became more widespread, and more widely trusted, so that by 1300 the number of available plays is relatively large. Histories of medieval theater thus focus more attention on these later centuries, because more documents were produced—not because it was only at this late date that people began to participate broadly in theatrical activities. Furthermore, the predominance of religious drama among the surviving plays does not necessarily mean that the theater of the Middle Ages was always, or even primarily, dominated by religion. Prior to 1300, written records were mainly produced by men and women connected with the church, so, of course, most surviving early plays are in Latin, the language of learning and ritual, and were generally connected to major religious holidays and performed as part of the liturgy. These few scripted plays, however, represent only a tip of the iceberg.

**THE EMERGENCE OF NEW DRAMATIC FORMS.** The answer to the question “What is medieval theater?” depends on how one decides to read the historical record. Does the available evidence indicate that there was very little theatrical activity in Europe for over a thousand years? Some scholars have argued that this is so, and that the history of theater in the Middle Ages is tantamount to the history of the destruction of ancient dramatic traditions, which were replaced by a purely Christian series of “static” or boring ceremonies. In this formulation, drama must first “break free” from the “oppressive” rit-

uals of medieval religion before it can enter the modern age, ushered in by the Renaissance. Very recently, however, this argument has been challenged: it is now being shown that medieval people made use of classical models while at the same time developing their own unique theatrical practices, which eventually contributed to the emergence of the new dramatic forms associated with the Renaissance. In other words, modern scholars can interpret the evidence to mean that the theater of the Middle Ages was diverse and vibrant, that it had the immediacy and impact associated today with modern sketch comedy, street theater, or live television—as well as (depending on the occasion) the pageantry characteristic of grand opera, the beauty of a carefully choreographed dance, the solemnity of a state funeral, the festivity of a carnival, or the violence and eroticism of action films.

## TOPICS *in Theater*

---

### THE LEGACY OF ROME

**THEATER OR LITURGY?** The theater of ancient Rome was both challenged and enriched by the demands of the Christian religion, which rose to prominence during the early decades of the fourth century. On the eve of an important battle in the year 312, a Roman general called Constantine (c. 274–337) prayed to the Christian god to assist him in defeating his enemies, rival claimants to the leadership of the Roman Empire. According to his biographer, Eusebius of Cæsarea (c. 260–340), Constantine had a vision in which he saw the image of the cross, and was told that “under this sign” (*in hoc signum*, abbreviated IHS) he would be victorious. Painting crosses on his banners and the shields of his legions, he marched into battle. When he won, his loyalty to Christianity was assured, and the traditional monogram IHS that had stood for the Greek name of Jesus was now reinterpreted by historians of the church to refer to this event. A year later, Emperor Constantine issued the Edict of Milan, making Christianity a legal religion in the Roman Empire, and just over a decade later, in 325, Constantine would spur the rapid growth of Christianity as an institutional religion by convening the Council of Nicea (an ecumenical or official church gathering) in Asia Minor. Here, for the first time in the history of the young church, bishops and teachers from all over the Roman world could meet and compare their views on how that church should be organized, and what its official teachings should be. Once an official doctrine was in place, there arose other

pressing topics of debate for succeeding generations of Christians, one of which was the relationship between the theatrical spectacles of pagan Rome—many of which had a strong religious component—and the new Christian theater of worship: the liturgy. The prayers, chants, hymns, and ceremonies that made up the liturgy emphasized Christianity’s debt to the stories of the Old Testament and its commitment to the teachings of the New Testament. The liturgy also dramatized the life and ministry of Jesus through a series of powerful rituals. The most fundamental of these was the daily ritual of the Mass, a re-enactment of the Last Supper when Jesus had performed the highly-charged act of breaking bread and inviting his disciples to eat this potent symbol of his own flesh, at the same time bidding them to drink the wine representing the blood he would shed for them the following day, Good Friday. But the very theatricality of the Mass engendered controversy, and it continues to do so in modern times. Some scholars argue that the Mass, as well as the many festive rituals of the church calendar, should be considered an integral part of medieval theater history. Others insist that the liturgy should not be classified as a type of theater, and make careful distinctions between a religious service (Latin: *ordo*) that merely performs a set of symbolic actions, and a play (*ludus*) that attempts to represent events through the impersonation of the characters involved.

**THE THEATER OF WORSHIP.** This modern distinction between dramatic ceremony and “real” drama is not one that medieval audiences appear to have made. In fact, a contemporary (medieval) definition of theater offered by the respected teacher and biblical scholar Hugh of Saint-Victor (1096–1141) includes divine worship in an extensive catalogue of entertainments and leisure activities, listing it alongside plays, sporting competitions, gambling, puppet shows, public reading, dancing, instrumental music, singing, and other pastimes. Writing at about the same time, an influential theologian called Honorius of Regensburg (fl. 1106–1135) explicitly compared the celebration of the Mass to the performance of a classical tragedy.

It is known that those who used to recite tragedies in the theaters would perform, through their actions, a display of their struggles. In just this way does our own tragedian, Christ, perform his actions before the Christian people in the theater of the church, and impresses on them the victory of redemption.

A century later, a Latin sermon would echo these sentiments when preachers began to complain that the emotive power of the Mass needed to be emphasized even more convincingly, so that it could compete effectively with other types of entertainment—in this case, attractive

## MEDIEVAL Theater Terms

**Antiphon:** A style of liturgical chant in which the chanted verses constitute a conversation between two choirs, with solo interventions by a cantor.

**Apocrypha:** The non-canonical books of the Old and New Testaments. For theater the most important of these is the Acts of Pilate, more commonly called the Gospel of Nicodemus in the New Testament apocrypha, believed genuine in the Middle Ages. It details how Christ descends to the underworld after his death, struggles with Satan in Hell, binds him in chains, and leads the Patriarchs, like Adam and Eve, out of Hell up to heaven again.

**Corpus Christi:** Festival dedicated to the “body of Christ.” Instituted in 1311 by Pope Clement V, it became the occasion around which many of the mystery cycles and Passion plays of Europe were performed.

**Eucharist:** The consecration and communion of bread and wine which memorialize Christ’s death and resurrection in the liturgy of the Roman Catholic Church. A “miracle” play was performed in England by the bakers’ guild, whose bread became the body of Christ during their re-enactment of the first Eucharist.

**Feast:** A certain day in the liturgical calendar of the Roman Catholic Church devoted to the birthday or martyrdom of a particular saint or event of significance in the Christian year.

**Jongleur:** An Old French word associated with modern English “juggler,” used as a catch-all term to identify a person with the array of talents shared by the professional performers of the Middle Ages.

**Liturgy:** In the Roman Catholic Church, the forms of prayers, acts, and ceremonies used in public and official worship. The main parts of the liturgy are the offering of the Eucharistic sacrifice called the Mass, the singing of the divine office, and the administration of the sacraments. It was from elements of the Mass that the earliest medieval drama is thought to have developed.

**Ludus:** From the Latin word for a game, it later came to mean “play.” Thus the name *Ludus Coventriae* refers to the cycle of Coventry plays.

**Mass:** The official name of the Eucharistic sacrifice and associated ceremonies and rituals. The word seems

to have come from the words of dismissal that end the Mass—*ite missa est*— meaning “go, the mass is done.” It is a re-enactment of the Last Supper when Jesus had broken bread, asked his disciples to eat this symbol of his own flesh, and bid them to drink wine representing the blood he would shed for them the following day, Good Friday. Some scholars argue that the Mass, and the many festive rituals of the Latin Church, should be considered the source of medieval theater.

**Monasticism:** The way of life typical of monks or nuns who dwell together for life, living austere and sharing in common according to a rule; their lives are devoted to the service of God.

**Mystery:** The term has two meanings in medieval drama. First it means one of the “mysteries” of Christianity, a miraculous event which must be accepted on faith such as the idea of the Virgin birth of Jesus. Second, it means a play put on by a craft guild, a group who have trade secrets or mysteries.

**Office:** The prayers and ceremonies in the Roman Catholic Church for some particular purpose such as the Office for the Dead, or the church’s services in general, such as the Divine Office.

**Ordo:** The service for representing some aspect of the liturgy or of dramatic events.

**Pageant:** A separate event in a pageant cycle or large group of plays on Old and New Testament themes, such as a pageant of Christ’s nativity.

**Passion:** The events of Christ’s last hours, his torments, suffering, and crucifixion. The term also refers to Passion Sunday or the fifth Sunday in Lent as these are dramatized in Passion plays of the late Middle Ages.

**Rubric:** From the Latin word for red (*rubeo*), the larger script indicating a chapter heading or division in a manuscript and particularly the directions (often printed in red in missals and breviaries) for the conduct of church services and the carrying out of liturgical rites.

**Sequence:** A type of hymn, but not in a regular meter, said or sung between the gradual and the Gospel of certain masses.

**Trope:** An antiphon or verse interpolated into a liturgical text.

**Vernacular:** The popular or non-Latin language of a country, such as French or English.

street-corner performances of the Old French heroic poem *The Song of Roland*.

When in the voice of the jongleur, sitting in the public square, it is recited how those errant knights

of old, Roland and Olivier and the rest, were killed in war, the crowd standing around is moved to pity, and oftentimes to tears. But when in the voice of the Church the glorious wars of Christ are daily commemorated in sacrifice—that is to say, how He

## THE Festive Year

The liturgical calendar of the medieval Latin Church begins at Advent, four Sundays before Christmas (25 December). It consists of fixed feasts, whose dates (like that of Christmas) never change, and moveable feasts, whose dates depend on the dating of Easter, which in turn is dependent on the Paschal Moon, the first full moon of the Vernal Equinox (March 21). The following is a list of the principal feasts, many of which provided the occasion for the performance of plays and related festivities. Also included are some non-religious celebrations based on the change of seasons.

Event	Date(s)		
Advent	Season begins four Sundays before Christmas	Maundy (Holy) Thursday	The Thursday before Easter
St. Nicholas	6 December	Good Friday	The Friday before Easter
Conception of the Blessed Virgin	8 December	Holy Saturday	The Saturday before Easter
Nativity or Christmas	25 December	Easter	Falls between 21 March and 25 April
Holy Innocents or "Feast of Fools"	28 December	Annunciation of the Blessed Virgin	25 March
Presentation of Jesus or Circumcision	1 January	First day of the medieval summer	1 May
Epiphany ("Twelfth Day of Christmas")	6 January	Ascension Day	Fortieth day after Easter (a Thursday)
Purification of the Virgin or Candlemas	2 February	Pentecost Sunday or Whitsunday	Fiftieth day after Easter, 14 May–14 June
Lent, beginning Ash Wednesday	Season begins six weeks and four days before Easter	Holy Trinity	Sunday after Pentecost, 21 May–21 June
		Corpus Christi	Thursday after Trinity Sunday, 25 May–25 June
		"Midsummer night"	23 June (vigil of the feast of St. John the Baptist)
		Nativity of St. John the Baptist	24 June
		Visitation of Our Lady	2 July
		Assumption of the Blessed Virgin	15 August
		Nativity of the Blessed Virgin	8 September
		All Hallows' Eve	31 October (vigil of the feast of All Saints)
		All Saints Day	1 November
		All Souls Day	2 November

defeated death by dying, and triumphed over the vainglory of the enemy—where are those who are moved to pity?

However, the theatricality of the Mass was not an issue for the people of the Middle Ages. Put more strongly, the Mass was fundamental to the culture of medieval Christianity because it was "good theater." The priest, standing at the altar of the church, spoke the very same words that Jesus had spoken to his disciples on the night of his betrayal and arrest, and performed the same actions. He enacted the role of Christ and, when he did so, the bread he blessed and broke became the body of Christ. In short, this miraculous occurrence, crucial to the Christian faith, was achieved through dramatization

of the event. The many feasts that made up the liturgical calendar of the church's ritual year, which began at Advent and climaxed at Easter, were likewise valuable because they provided further opportunities for festive drama. (The word "festive" derives from the Latin for "feast," *festum*.) Those who performed these rites and those who participated in them understood that these rites were supposed to enlighten, inspire, even entertain. They were theatrical.

**PAGANS AND CHRISTIANS.** The testimonies of later medieval theologians represent the perspectives of medieval people who were far removed from Christianity's pagan past and, at the safe distance of several centuries, appear to have felt comfortable in making comparisons

*a PRIMARY SOURCE document***A MEDIEVAL DEFINITION OF THEATER**

**INTRODUCTION:** Hugh of Saint-Victor, an influential teacher and scholar of the Bible at the monastery of Saint-Victor, outside Paris, included the science of “theatrics” (*theatrica*) as one of the seven “Mechanical Arts” in Book Two of his encyclopedia, the *Didascalicon* (circa 1125). In this passage Hugh exhibits a familiarity with Roman spectacle.

The science of playing is called theatrics from the theatre, the place where people used to gather for entertainment—not because a theatre was the only place in which entertainment could be had, but because it was more well-known than the rest. Some types of play were indeed done in theatres, some in the entrances of buildings, some in gymnasia, some in circuses, some in arenas, some at feasts, some at shrines. In the theatre, deeds were related either in verse, or by characters, or by means of masked figures or puppets. In entrance halls, they held dances or processions; in gymnasia they wrestled; in the circuses they ran races on foot or on horseback or in chariots; in the arenas, boxers exercised their skill. At banquets, they made music with harmonious and rhythmic instruments, recited stories, and played at dice. And in the temples at solemn festivals they sang the praises of the gods. ... For since it is necessary for people to get together in some place for amusement, they decided that certain spaces for entertainment should be defined, rather than that there should be many different meeting-places where they could perform shameful acts and misdeeds.

**SOURCE:** Hugh of Saint-Victor, *Didascalicon* (circa 1125). Translation by Carol Symes.

between the tragedies of Greece and Rome and the Christian tragedy of the daily Mass. But in Constantine’s day, as in modern times, there was controversy over the overt theatricality of Christian worship. In the fourth and fifth centuries, Christianity was still a minority religion, newly legal and as yet unformed. The theologians who came of age in those heady days were among the first generation of Christians who were able to discuss the tenets of their faith openly, and many were eager to distinguish it from the other sects with which it competed for attention in the crowded religious marketplace of late antiquity. They were also eager to show that Christianity offered the conscientious citizen of the Roman Empire an opportunity to rise above the distractions and

vices of that empire. Even in the days before Constantine’s conversion, when Christians were still—literally—fighting for survival, some prominent Christians had been outspoken in their denunciations of Roman decadence, especially the decadence of its theater. The writings of the Christian apologist Tertullian (c. 155–c. 221) offer extended, biting critiques of Roman beliefs and morals, and explicitly contrast the bloodless symbolism of Christian worship with the bloody sacrifices of pagan religions and the blood sports of the amphitheater and the coliseum. Yet Tertullian’s views on theater were, in their day, a reactionary, minority opinion. They could not hope to prevail against the overwhelming power of the empire, or its attractive program of public entertainments.

**THE INGREDIENTS OF MEDIEVAL THEATER.** The opinions of St. Augustine (354–430), who ended his life as the bishop of Hippo Regis in the Roman province of North Africa, carried much more weight. A late convert to Christianity, Augustine was the chief doctrinal architect of the fledgling Roman Church, one of the devout men who came of age in the decades after Constantine’s establishment of Christianity as a viable state religion. It is through him that we can best trace the strand of anxiety that led to some of the most stringent denunciations of the corrupting dangers of Roman theater, and its potential influence on Christian worship. In many of his writings, notably his autobiographical *Confessions* and his Christian revision of history, *The City of God*, Augustine described the dangerous seductions of theater in all its forms. But these descriptions readily betray the source of his anxiety: his own youthful, dramatic passions, and his mature conviction that the devout Christian must turn his back on the worldly pleasures of Rome, the city of man, in order to attain salvation in the celestial City of God. It would therefore be a mistake to assume that Augustine’s Christian contemporaries shared a negative view of theater, or that—even if they did—such a view would lessen the attraction of traditional entertainments, or diminish the importance of pre-Christian Roman culture. They also had little negative effect on the way that a new Christian theatricality grew and flourished. It is actually rather ironic that Augustine’s own intellectual sparring-partner, St. Jerome (c. 340–420), would at the very same time be laboring to produce the greatest theatrical script of the Middle Ages. For it was Jerome’s Latin translation of the Hebrew and Greek scriptures that would form the Old and New Testaments of “the people’s Bible” (*Biblia vulgata*), which provided the raw material for the vast majority of medieval plays. At the same time, the order of service of the Mass and the fes-

tive calendar of the church began to take on their familiar forms, while the legacy of Roman theater continued to be passed down by professional entertainers and lovers of classical literature, both pagans and Christians. All of these elements would be woven together in the rich theatrical tapestry of medieval Europe.

### THE RENAISSANCE OF CHARLEMAGNE

**A NEW ROMAN EMPIRE.** Charles the Great, king of the Franks and emperor of the Romans (742–814), presided over a cultural revolution known as the Carolingian Renaissance. ("Carolingian" is the adjective derived from the Latin form of Charles, *Carolus*.) He would do more for the preservation of Roman plays and the promotion of medieval theater than any other person, before or since. Ruler of a territory that included much of present-day France, Belgium, Holland, Germany, Austria, and Italy, Charlemagne (as the French would call him) knew that governing his vast empire would be easier if the many different people who inhabited these lands had a common culture. In addition, therefore, to promoting peace within the empire's borders, he promulgated new laws and codified old ones, established procedures for the administration of justice, and encouraged the conversion of the many pagan tribes in his domain to Christianity. To aid in this task, he also embarked on a series of church reforms. The papacy of his time was weak, and it was Charlemagne's political and military power that provided the channels through which the doctrines and ideals of Christianity could be disseminated. This was the beginning of the politico-religious entity that would later be known as the Holy Roman Empire. And more than law or justice, more than the development of bureaucratic institutions, it was liturgy—the theater of worship—that would help to bring the disparate peoples of Europe together to form an entity known as Christendom.

### ST. AUGUSTINE CONFESSES HIS LOVE OF THEATER

**INTRODUCTION:** St. Augustine, bishop of Hippo (354–430), was the most important theologian of the early Christian Church. Born in the Roman colony of North Africa, in the small town of Thagaste, he was educated in Carthage and Rome, where he became a successful teacher of rhetoric. During a stay in Milan, he encountered its bishop, St. Ambrose (c. 339–397), under whose guidance he first began to investigate the claims of Christianity. He eventually converted, but not before living a full and varied life, described in his *Confessions*.

The spectacles of the theatre ravished me, for they were filled with representations of my own miseries and were the kindling that ignited my fires. Why is it that a person should want to suffer pain in such places, by watching sorrowful and tragic things—things which he himself would never wish to suffer? And yet he wants to suffer from them, to feel sorrow as a spectator, and let sorrow itself become his pleasure. What is this, but a strange madness? For the more anyone is excited by such things, the less capable he is of governing his emotions. For when he himself suffers it is misery, and when he is compassionate for others it should be called mercy; but what kind of mercy should there be for made-up characters and scenarios? The person in the audience is not called upon to relieve, but invited only to grieve; the more he sorrows, the more he approves the performance of the actors in these scenes. And if the misfortunes of these people, whether they are long dead or purely fictitious, happen to be acted in such a way that the spectator is not saddened by them, he walks out, disgusted and critical. But if he is forced to be sad, he stays attentive and weeps, rejoicing.

**SOURCE:** St. Augustine, *Confessions*, c. 390. Translation by Carol Symes.

**THE UNIFYING FORCE OF RELIGION.** Christendom was a spiritual empire whose borders coincided, roughly, with the secular empire of Rome, and whose unifying power is expressed in the name of the Roman Catholic Church, the "universal" church (from the Greek adjective *katholikos*) established in Rome. It was under Charlemagne's patronage that the many disparate rituals, prayers, ceremonies, and music developed by individual Christian communities throughout the Roman Empire

were eventually brought together to form a cohesive liturgy. Some of these rituals, like the solemn performance of the daily Mass, were almost as old as Christianity itself. Others, like the annual feasts commemorating significant episodes in the life of Christ (his Nativity at Christmas, his resurrection at Easter) or honoring the deeds of the saints, were later additions, often in response to the needs of recent converts. The observance of Christmas on 25 December, for example, was tied to that date in order to coincide with the winter solstice and the celebration of Yule, which was sacred among the pagan peoples of northern Europe because it marked the darkest day of the year and the subsequent return toward light; thus, the symbolism of Jesus' birth and the rebirth of the sun reinforced one another. By contrast, Easter continued to be a "moveable feast," whose date was not constant from year to year, but was instead tied to the dating of Passover, which was calculated according to the lunar calendar in use by the Jews, rather than the solar calendar that had governed the reckoning of time in the territories of the Roman Empire. Nevertheless, the English name of the most important feast in the Christian calendar, Easter, has nothing to do with Christ, but is the name of the Saxon fertility goddess, *Eastra*.

**THE CONTRIBUTIONS OF MONASTICISM.** In the sixth century, Pope Gregory the Great (540–604) had begun laying the groundwork for Charlemagne's later program of liturgical reforms. Under his direction, the musical sequences that accompanied the recitation of the Psalms and other biblical verses were brought together into a corpus of melodic material that is commonly called Gregorian chant. Like the Mass, many of these chants were very old. Others had been composed to support the expanded services of the newly legalized church in the fourth and fifth centuries, notably under Ambrose, bishop of Milan (c. 339–397), the mentor of St. Augustine. Still others were the artistic product of the monasteries that were being founded throughout Europe, and which would be the recipients of Charlemagne's generosity. The Rule of St. Benedict of Nursia (c. 480–543), which provided the basic guidelines for monastic life in much of Europe—and which is still in use in modern Benedictine monastic houses all over the world—had instituted an elaborate schedule of daily worship called the *opus Dei*, "the work of God." The phrase indicated that it was the special job of monks and nuns to pray continually for the welfare of Christendom. At seven intervals throughout the day, and once in the middle of the night, the monastic choir would perform the office (from the Latin word for "duty," *officium*), each segment of which involved the chanting of the Psalms, singing of hymns, recitation of prayers, and reading of Scripture.

This program of prayer was, in many respects, inherently dramatic; the selection of Bible passages, the choice of the music, the display of certain ornaments and colors, and the wearing of special vestments (ceremonial costumes) all contributed to the theatrical expression of devotion to God. The very calendar of the church was theatrical, turning the cycle of the seasons into a year-long drama which re-enacted the stages of Christ's mission on earth and showed the continual workings of God in the world by commemorating the deeds of holy men and women.

**CHARLEMAGNE'S ACHIEVEMENT.** Charlemagne's contribution to the theatrical innovations of the early Middle Ages was material, in several senses. By financing churches and monasteries throughout his domain, he helped to enrich the celebration of the liturgy and to make Christian worship an increasingly attractive interplay of music, light, color, and ceremony. But even more importantly, he ensured that the rituals and chants of the early church would not be forgotten, collecting the scattered manuscripts and oral traditions by which they had been conveyed and having them copied and disseminated throughout his realm. These new manuscripts, many of them beautifully decorated with colored inks and gold leaf (the brightness of their pages gives the impression that they are "illuminated") were written in a script that was also new. Called "Carolingian minuscule," it abandoned the laborious square capital letters that had been in use since antiquity in favor of a rounded hand that was easier to write and to read, the ancestor of modern typefaces like those in printed books. Finally, the scribes of Charlemagne's court developed a system of musical notation, which operated like a recording device, enabling the transmission of music through writing (rather than by word—or song—of mouth). In addition to preserving and augmenting the unique heritage of early medieval Christianity, the artists and intellectuals of Charlemagne's court devoted themselves to preserving and honoring the classical age, especially the legacy of Rome. The universal language of Western Europe was still Latin, the language of the Romans, but that language was rapidly becoming specialized, a language of scholarship and worship. It was no longer the language of conversation, prayer, or writing. It was only one of many European languages, some derived directly from Latin (the "romance" or Roman languages of French, Italian, Spanish, Catalan, Romanian, Portuguese, Occitan), others rooted in Germanic or Celtic dialects (Anglo-Saxon or Old English, Gaelic, Breton). These vernacular or "native" languages were much more widely spoken than Latin, and in the centuries after the death of Charle-

magne they would become literary languages in their own right.

**PRESERVING THE PAST FOR THE FUTURE.** The Carolingian Renaissance is so called, then, because it suggests a “rebirth” of interest in the past, and a desire to emulate the literary and artistic forms of that past. Not surprisingly, one of the most compelling aspects of the Roman past was its theater. In *scriptoria* (“workshops for writing”) throughout Charlemagne’s realm, scribes and illuminators turned out hundreds of lavishly illustrated manuscripts of Roman plays, especially the comedies of Terence (Publius Terentius Afer, c. 190–158 B.C.E.), which were among the entertainments that had made so indelible an impression on St. Augustine. Of course, Carolingian scribes also preserved other classical texts, not just plays: the poetry of Vergil, Catullus, Horace, and Ovid; the speeches and letters of Cicero; and the histories of Livy, Sallust, and Tacitus. Hence, most of what is known about Rome is known because of the work of the copyists who saved the endangered texts of antiquity from oblivion. The surviving knowledge of Greek drama, on the other hand, is attributed to the Greek-speaking heir of the Roman Empire, Byzantium, where Constantine had founded his new capital of Constantinople in 325. The knowledge of Greek was unavailable to the people of medieval Western Europe. Thus, it was not until Constantinople was captured by the Ottoman Turks in 1453 that the tragedies and comedies of the Greek dramatists became accessible to the West, helping to fuel the artistic endeavors of another Renaissance.

## THE DEVELOPMENT OF LITURGICAL DRAMA

**THE TRADITION OF THEATRICALITY.** The liturgy of the medieval church was essentially theatrical, as was the festive cycle of the Christian year. But at certain times

during that year, this theatricality took on a special character. At Easter, and on the days leading up to its celebration of Christ’s Passion (“suffering”) and Resurrection, and again at the Christmas season, churches throughout Europe provided the settings for musical dramatizations of scenes from the gospels. It is hard to know when these liturgical plays were first performed, because the oldest manuscripts that record them were copied after the Carolingian Renaissance had made the preservation of texts a high priority. Often, the late dates of manuscripts have been taken to indicate that medieval drama itself was a late invention—that in order for there to be a play, there must be a script. But this is obviously not the case: all that a play requires is a story, some performers, and an audience. And medieval people had a wealth of stories at their disposal, thanks to St. Jerome’s translation of the Bible, which was supplemented by a series of popular tales from the Apocrypha or “hidden” books of Hebrew scripture, among them the stories of Judith, Susannah, and Daniel. Surviving manuscripts, therefore, allow scholars to view only the skeletal remains of liturgical drama, giving some indication of how these stories were performed. Most of these plays are undetailed and would have existed long before the time of Charlemagne. For example, it is evident that elaborate processions commemorating the entry of Jesus into Jerusalem on Palm Sunday had been staged in that holy city for years, but the earliest record of them comes from the *Itinerarium* or travel journal of Egeria, a high-born lady or perhaps a nun from the Roman province of Galicia (Spain), written about 384. By the same token, the ceremony for the consecration of churches is surely older than its first ninth-century manuscripts, which show that it was loosely based on the story of the Harrowing of Hell presented in the apocryphal Gospel of Nicodemus, when Jesus, on the Saturday between the Crucifixion and the Resurrection, descended to the underworld and led out from it the souls of Adam and Eve and other Old Testament heroes and prophets, taking them with him to glory.

**BASIC COMPONENTS.** The many manuscripts which provide us with different versions of important Christmas and Easter plays are all of more recent date than the dramatic traditions to which they refer. These plays demonstrate that there were many ways to perform the story of Christ’s Birth and Resurrection, some highly creative. But all shared certain essential components. At Easter, the most important component was a vital question: *Quem queritis?* (“Whom do you seek?”). The question is that of the angel guarding the empty tomb on Easter Sunday morning, when the Three Marys (Mary, the mother of Jesus; Mary Magdalene; and the Mary

described in the gospel of Mark as “the mother of James and Salome”) approach with oils and incense to anoint the body of Jesus. But Jesus, unbeknownst to them, has risen from the dead, so the women are surprised to see the angel, and to be asked “Whom do you seek in the sepulchre, O followers of Christ?”. These fateful words, sung in Latin, have been used to describe the entire dramatic genre of Easter liturgies: they are often called *Quem queritis?* or *Visitatio sepulchri* tropes (traditional phrases inserted into the Mass) since they all make use of the same symbolic elements to dramatize “The Visit to the Sepulchre.” Their essential melodic dialogue consisted of an imaginative pastiche of words and phrases from the gospel accounts of the Resurrection, sung in the antiphonal or “call-and-response” style that was a feature of the monastic office, in which the chanted verses constitute a conversation between two choirs, with solo interventions by a cantor.

**THE INTEGRATION OF DRAMA AND WORSHIP.** It is worth noting that what made these musical dramatizations effective was not their separation from the theater of

worship, but their participation in it. One of the earliest manuscripts of the Easter play, the *Visitatio sepulchri* from Winchester in England, demonstrates this beautifully. Four members of the religious community are instructed to disguise themselves by dressing up in costumes taken from the monastery’s storehouse of liturgical vestments: an alb (white robe) for the angel, and copes (long hooded capes) for the three women—all of whom would be portrayed by men when this play was produced in a male monastic house. The props they carry are also items in use for daily worship: thuribles (censers, containers for holding aromatic spices and incense) representing the vessels of oil and myrrh carried by the Marys. The location of the tomb is not specified in the script, but here again the church space and its furnishings would be put to use. Perhaps the tomb was represented by the altar, or perhaps it was a real tomb in one of the church’s side chapels, or a “prop,” a special tomb erected expressly for the performance of this play. In any case, the symbolic significance of staging this sacred story using actors, props, and sets provided entirely by the resources of the community underscores the intimacy and immediacy of

*a PRIMARY SOURCE document***THE VISIT TO THE SEPULCHRE**

**INTRODUCTION:** Between the years 965 and 975, Bishop Ethelwold of Winchester promulgated a series of liturgical reforms which were crystallized in a collection called the *Regularis Concordia*, a "Concordance of the Rules" for worship and religious life among the monastic communities of England during the reign of King Edgar (959–975). These guidelines, similar in many respects to those circulated by Charlemagne nearly two centuries earlier, were one long-term result of an ambitious program of civil engineering and religious instruction introduced by King Alfred the Great (r. 871–900), whose leadership had united warring English tribes during the Viking invasions of the ninth century and who had strengthened that new political unity by promoting an idea of a shared Anglo-Saxon heritage. The guidelines quoted here contain numerous quotations from *The Visit to the Sepulchre*. When reading the texts of liturgical plays, it is important to bear in mind that all of the dialogue was sung, and would have been much more effective in performance than it appears.

While the third lesson is being read aloud, four of the brothers should dress themselves. One of them, wearing an alb, should come in as though intent on other business and go stealthily to the place of the sepulchre, and there he should sit quietly, holding a palm in his hand. Then, while the third response is being sung, the three remaining brothers, all of them wearing copes and carrying thuribles with incense in their hands, should walk slowly and haltingly, making their way to the place of the sepulchre as if they are seeking something. For these things are done in imitation of the angel seated on the tomb and of the women coming with perfumes to anoint the body of

Jesus. When, therefore, the one sitting there sees the three drawing near, who are still wandering about as though seeking something, he should begin to sing sweetly in a moderate voice: "Whom do you seek [in the sepulchre, O followers of Christ]?" When this has been sung through to the end, the three should answer together in one voice: "Jesus of Nazareth [who was crucified, O heavenly one]." He to them: "He is not here. He has risen as he predicted. Go, tell the news that he has risen from the dead." Heeding the call of this command, the three should turn toward the choir saying: "Alleluia. The Lord has risen, [today the mighty lion has risen, Christ the Son of God]." When this has been said, the seated one again should say the antiphon, as if calling them back: "Come and see the place [where the Lord was laid. Alleluia]." And then, having said these things, he should stand up and raise the veil, showing them the empty place where the Cross had been laid [i.e., during the liturgy of Good Friday], where there should be nothing but the linen bands in which the Cross had been wrapped. Seeing this, they should put down the thuribles which they have carried into the sepulchre, and taking up the linen cloths they should hold them out toward the assembled clergy, as though showing them that the Lord has risen and is now no longer wrapped in them; and they should sing this antiphon: "The Lord has risen from the tomb, [He who was hung upon the Cross. Alleluia]." And they should lay the linen cloths upon the altar. When the antiphon has ended, the prior should begin the hymn *Te Deum laudamus* ("We praise you, O God"), rejoicing at the triumph of our King, who was delivered from the conquest of death. When the hymn has begun, let all the bells peal in unison.

the play's message: it is as if Jesus has been resurrected in their own church, as if members of the monastic community are themselves going mournfully to anoint his body, only to be greeted by the angel's question, "Whom do you seek in the sepulchre?" and the joyful news of Christ's Resurrection. Whereas people today imagine the events of the Bible as taking place in the distant past, medieval people reminded themselves constantly of their proximity to those events. Their theater underscored the messages implicit in this proximity, year after year.

**THE EXPANSION OF CHRISTMAS THEATRICALS.** Some of the same dramatic techniques featured so prominently in the Easter liturgies were also put to use in the performance of plays at Christmastime. Even the important question *Quem queritis?* could be asked again, this

time of the shepherds who come to Bethlehem, seeking the birthplace of the child Jesus: "Whom do you seek in the manger, shepherds? Tell us!" But because Christmas was a less solemn feast than Easter, greater liberties were taken with the biblical text. In some places, by the eleventh century at the latest, Christmas theatricals had expanded to include not only the story of Jesus' birth, but of the angels' address to the shepherds, the journey of the Magi, their interview with Herod, Herod's violent response to their news, and the flight of the Holy Family into Egypt. Numerous extra characters were added: Mary has midwives to help her in the birthing of Jesus; Herod, as befits a great king, has men-at-arms, attendants, courtiers, ambassadors, diplomats, and ineffectual bureaucrats surrounding him; the Old Testament matriarch, Rachel, is brought on to witness Herod's massacre of the

Herod and the Innocents, Fresco, School of Giotto, Church of San Francesco, Assisi, Italy, 14th century. THE ART ARCHIVE/SAN FRANCESCO, ASSISI/DAGLI ORTI.

innocents, and mourns for the lost children of Israel. All of these people and events could scarcely be encompassed within a single morning's liturgy, and it became traditional to celebrate Christmas over a twelve-day period, beginning on 25 December and ending on the Feast of the Epiphany (from the Greek word for "manifestation") on 6 January, the holiday celebrating the arrival of the Magi in Bethlehem. The play commemorating Herod's Slaughter of the Innocents was usually performed on 28 December, which became the Feast of the Holy Innocents. Like the tragic episode that it commemorated, it occurred a few days after the Nativity. In many monasteries and cathedral schools throughout Europe, this feast was also called "the Feast of Fools," since the boys of these communities were allowed special privileges on that day, their festive misbehavior sanctioned in compensation for the cruel deaths meted out to the children of Judea. This was a time of carnival, one of several occa-

sions in the year when the "world turned upside down" and hierarchies of power, social status, and gender roles were reversed.

**THE LONG REIGN OF KING HEROD.** Not surprisingly, the Magi and King Herod were the stars of many Christmas plays, since these characters have always held a special fascination for audiences. During the Middle Ages, the Magi were intriguing because they were exotic, mysterious men from the fabled Orient, astronomers and astrologers who could read the stars and look into the future. Herod was fascinating because of his blustering, ranting manner and excessive cruelty, and it is for this reason that the part has been a perennial favorite among actors who like to play the villain. When Shakespeare's Hamlet complains that over-acting "out-Herods Herod," he is referring to an ongoing tradition that dates back to medieval liturgical drama, and which inspired

Shakespeare's own characterizations of Richard III and Iago. But Herod, because he was a king, also stood in for the ultimate tyrant, and in an age when monarchy was becoming a powerful political institution, the representation of bad lordship as exemplified in Herod could serve as a warning to real lords. So there was a political dimension to liturgical drama, as well as a religious one. In the two twelfth-century Christmas plays associated with the monastery of Saint-Benoît-sur-Loire, in France, Herod's central place in the Christmas story is evident from the title of the drama, which is called *The Service for Representing Herod*. Throughout the play, Herod's violent behavior, and that of his murderous soldiers, must have seemed to the audience to resemble that of real rulers and their henchmen. But there were elements of comedy as well. When the Magi tell Herod about the miraculous star they have seen, Herod sends for his own experts, to see whether they can corroborate the story. The monks playing the scribes are described in the rubrics (stage directions written in red ink) as bumbling idiots, carrying stacks of moldy books and wearing false beards; they have to "turn over the leaves of the books for a long time" before they finally find the correct prophecy.

**THE CHURCH AS PERFORMANCE SPACE.** The geography of the medieval church was vitally important to the staging of Christmas drama. At Easter, the sole stage setting could be "the place of the sepulchre," which was usually located at or near the altar. At Christmastime, the entire church became a theater, if only because so much of the action of these plays involved traveling: Mary and Joseph journey to Bethlehem, the Magi come "from the East" to Herod's court and from there to Bethlehem, Mary and Joseph flee to Egypt, the Magi return to their homes. Each of these trips provided an opportunity for the actors to process around the church and through the audience, who would be standing in the nave (the central hall). Since all medieval churches were oriented on an East-West axis, with the altar in the apse at the eastern end, it would be from this part of the church that the Magi would "come together, each one from his own corner as though from his own region," according to the rubrics of the play from Saint-Benoît. The star that guides them rises from behind the altar, also in the east, and then leads their procession around the church. The citizens of Jerusalem are the members of the choir, while the members of the congregation are the people of Bethlehem. When the shepherds find the baby Jesus in the manger, they worship him and then "they invite the people standing all around to worship the child." Through such simple, effective techniques, the staging of liturgical drama allowed the events of the

Bible to be mapped onto the church space, collapsing the distance between actors and audience, the past and the present, the local and the universal.

#### SERIOUS COMEDY

**ROMAN THEATER IN THE MIDDLE AGES.** The initiative of the artists and intellectuals who contributed to the Carolingian Renaissance provided the tools that would make the transmission of liturgical drama possible, but it also ensured the preservation of older theatrical traditions. Hundreds of manuscripts containing the Latin comedies of the popular Roman playwright Terence were made in the centuries between 800 and 1200. Many were lavishly illustrated and suggest that some medieval people knew a great deal about Roman comedy. These illustrations show lively, two-dimensional stagings of key scenes, in which actors are depicted wearing the masks and costumes typical of Roman performances. Their very gestures are meticulously rendered, contributing to the illusion that the viewer is looking at "snapshots" of Terence's comedies as they would have been presented around the time of Constantine or St. Augustine, in the fourth century C.E. It would have been easy for the medieval readers of these plays to reconstruct some of the circumstances of their performance, as they looked at the pictures and read aloud the various parts. However, the careful authenticity of the manuscripts' representations of ancient comedy also suggests that the copyists were striving to preserve information about an archaic art form: medieval audiences were not used to seeing masked actors, nor did they frequent the same types of theaters as the people of ancient Rome. When Hugh of Saint-Victor offered his definition of the "theatrical arts" in the early twelfth century, he was trying to capture the timeless diversity of human amusements and leisure activities; yet he was also aware that times had changed, that the theater "was the place people used

Masks from Terence, *Andria*, line drawing from an edition of Terence, 1736. BETTMANN/CORBIS.

to gather for entertainment”—employing the past tense, to emphasize that the pagan theater of ancient Rome was not the same as the theater of medieval Christendom. Hugh himself would have seen the remains of Roman theaters and other buildings (baths, temples, an amphitheater) on the Left Bank of the River Seine, nestled in the hills where the new University of Paris would be founded during the course of the twelfth century. And he knew that it had been a long time since those structures had been used for the purposes for which they were originally designed. But this did not stop other medieval writers from making constant—and knowing—references to Roman theater and its many attractions.

**COMIC REVIVALS.** If knowledge of Roman theater, the scripts of Roman plays, and even Roman theater buildings survived into the Middle Ages, why was medieval theater not more like the theater of that distant past? One reason is that the church had made an effort to promulgate a special type of Christian theater, the liturgy, and had also worked hard to modify the pagan festivals that had provided many of the occasions for the

performance of Roman plays. More to the point, though, is the fact that the Latin language of these plays was no longer a language readily understood by most people in Europe, so their popular appeal was largely lost. Still, there is plenty of evidence that new forms of medieval comedy continued to draw heavily on ancient traditions and techniques, retaining some of the same plots, gags, and characters regardless of the language in which the lines were spoken. Moreover, the plays of Terence were constantly revived and performed in venues where the love of Latin was continuously cultivated: in monasteries and cathedral schools, universities, royal courts, and any place where the performers could speak the language of Vergil, Cicero, and Ovid. In fact, Latin comedies would have been performed by many of the same amateur actors who also appeared in the Latin liturgical dramas. And because these plays made the learning of Latin fun, they were often used as teaching tools in medieval classrooms. They were also widely emulated by a new generation of playwrights; at the same time that the manuscripts of Roman plays were being copied, and the Easter and Christmas liturgies written down, there were men and women composing their own comedies in Latin, some with contemporary—even Christian—themes. The simultaneity of these different dramatic traditions and genres is one of the most intriguing aspects of medieval theater.

**THE PLAYS OF HROTSVIT.** One of the most famous playwrights of the Middle Ages embodies what might be considered some of the paradoxes of medieval drama. Her name was Hrotsvit (or Hroswitha), and she was a canoness (a member of a religious order) vowed to the religious life at the abbey of Gandersheim in Germany. But she was probably brought up and educated at the imperial court of Otto I (912–973) who ruled a large portion of Charlemagne’s former empire after 951. Moreover, Hrotsvit (c. 935–1002) is remembered today not only for her dramatic works, but for her skills as a mathematician and theologian. Together with her childhood friend Gerberga, who was the emperor’s niece and the future abbess of Gandersheim, Hrotsvit probably entered the convent when she was in her late teens or early twenties, and it is reasonable to speculate that she intended her seven comedies to be performed by her sister nuns, whose knowledge of Latin and of the Christian faith would have been strengthened at the same time, in a highly amusing manner. Among Hrotsvit’s achievements, therefore, is the invention of a distinctly Christian form of comedy, in which many comic devices as old as the comedies of Aristophanes (448–385 B.C.E.)—trickery, role-playing, delusion, love-sickness, youthful rebellion, pompous old age—are blended with the divine “comedy” of the ultimate sacrifice: death for one’s

Early medieval conception of a Roman theater performance. Rhabanus Maurus, *De universo*, Abbey of Montecassino MS 132, folio 489, Montecassino, Italy, tenth century. A. M. ROSATI/ART RESOURCE, NY.

faith, a death that cannot be viewed as tragic, since it earns the martyr the bliss of eternal life.

**TWO CHRISTIAN COMEDIES.** Hrotsvit's *Gallicanus* tells the story of the Roman general Gallicanus, a ruthless pagan whose command over the legions of the Emperor Constantine gives him great power. In the play, Gallicanus uses his clout to secure the hand of Constantine's daughter Constance, despite the fact that both father and daughter oppose the match because of their intense devotion to Christianity. But Constance advises her father to trick Gallicanus into thinking that she will marry him after he has successfully completed his military campaigns, cunningly sending two of her Christian advisors to help convert him to Christianity, while inviting Gallicanus' young daughters into her house, where they are quickly persuaded to join Constance in vows of

virginity. Meanwhile, in the heat of a losing battle, Gallicanus (like the historical Constantine before him) prays to the Christian God for assistance and sees a vision of Christ himself marching into battle, carrying the cross. He is immediately converted and, taking vows of celibacy, becomes a hermit. Years later, he suffers martyrdom under the pagan emperor Julian the Apostate, but when Julian's son is possessed by the devil as a punishment for his father's crimes, both father and son agree to be baptized. In another comedy, *Dulcinius*, Hrotsvit embroiders some of the same themes through a spicier plot set during the time of Great Persecution of the Roman emperor Diocletian (284–305). A lascivious Roman official, Dulcinius, schemes to deflower three beautiful Christian maidens who have been arrested for their faith, but their virginity is protected when Dulcinius falls victim to a delusion in which he believes the dirty pots and pans in

the girls' kitchen to be the bodies of his intended victims. He embraces them passionately and covers them with kisses, blackening himself with soot in the process and becoming a laughing-stock among his fellow pagans. Later on, when the evil executioner Sisinnius attempts to send one of the defiant virgins to a brothel, she is miraculously rescued from this fate, although she (like her two sisters) is eventually—but triumphantly—martyred.

**THE PERFORMANCE OF LATIN PLAYS.** Hrotsvit's plays are particularly sophisticated examples of what could be achieved through the creative blending of classical and medieval ideas of comedy, but they are not the only examples. A later group of about two dozen Latin comedies, composed by a variety of authors over the course of the late eleventh through early thirteenth centuries, take a more conventional approach to updating classical genres. Most are much shorter than Hrotsvit's, and many are anonymous, but like hers they are written in Latin verse and would have been performed by and for well-educated men and women in the service of the church or of the great secular rulers of Europe. Walter Map, a member of the entourage of King Henry II of England (r. 1154–1189), related that his clerks would often spend the evenings play-acting or making "jokes to take the weight off their minds." But so, it seems, did many other people, including monks, nuns, priests, schoolmasters, and their pupils. Froumund of Tegernsee (d. 1008), a prolific poet and dedicated teacher at the important Bavarian abbey of Tegernsee (a place well-known for its later contributions to medieval drama), complained good-naturedly that it was hard to engage his students' attention unless he indulged them with comic displays and other antics, anything "ridiculous, that cracks up all the boys." Geoffrey de Gorron (d. 1146), the abbot of St. Albans in England, began life as a schoolmaster whose enthusiasm for theatrical display led him to borrow valuable vestments from the monastery to use as costumes in a play about St. Catherine of Alexandria; when they were accidentally destroyed by fire, he himself became a monk to compensate for the loss. Writing at the end of the twelfth century, Reinerus of Liège revealed that classroom performance of Terence's comedies was a favorite exercise at his own monastery of Saint-Laurent, so much so that one over-zealous teacher was visited in a dream by the abbey's patron saint, who chastised him for behaving too much like a comedian.

**A LATIN SITUATION COMEDY.** Given that the plots of most medieval Latin comedies revolve around sex, it is easy to see why they might have been controversial when produced in an ecclesiastical setting. The play *Babio*, probably written in England during the mid-twelfth

century, was therefore heavily edited when it was adapted for performance by the choirboys at Lincoln Cathedral, to judge by the state of one surviving manuscript. A glance at the plot-summary added to another manuscript copy offers an explanation for this censorship:

Babio was a priest, Petula his wife, Fodius the household servant of Babio and Petula. Viola was the daughter of the latter, the daughter of the wife and not the daughter of Babio, but his step-daughter as it were, whom both Babio and Fodius love, unknown to one another. Croceus was a certain knight, lord of the town where the girl was, and he was the lord of Babio the priest. This Croceus loved the girl Viola and wished to have her, and the priest was upset about that. Fodius had an affair with the wife of the priest, that is with Petula, and his master, in other words Babio, didn't know it, even though he had his suspicions.

Add to this situation the humor of Babio's relationship with his dog (who makes a brief appearance early in the play), and it is easy to see why Latin comedies continued to be written and performed throughout the Middle Ages, even though they may have raised a few eyebrows. One of the most popular, the play known as *Pamphilus*, survives in so many manuscripts that it gave its name to the term *pamphlet*. Along with a number of other medieval Latin comedies—such as the *Geta* of Vitalis of Blois written in the twelfth century—it endured the test of time, appearing among the earliest printed books of the late fifteenth century and thereby influencing the work of countless Renaissance dramatists.

#### THE POPULAR BIBLE

**MEDIEVAL MASS MEDIA.** The Latin Bible in use throughout the Middle Ages had been translated from Greek and Hebrew by St. Jerome around the turn of the

fifth century, when Latin was still the mother tongue of the Roman Empire. This Bible was therefore called the “popular Bible” (*Biblia vulgata*) because it could be understood by those who could not read Hebrew or Greek. By the time of Charlemagne, however, Latin had ceased to be a language for everyday use, while the need to educate people about the Bible, and to instruct them in the tenets of the Christian faith, was greater than ever. The world was changing rapidly. By the end of the eleventh century, Western Europe was more culturally diverse and more densely populated than it had been since the power of the Roman Empire was at its height, nearly a thousand years before. Improvements in agricultural technology, the development of long-distance trading networks both by water and by land, and the flourishing of local economies during the twelfth century meant that people enjoyed greater freedom of mobility, both geographical and social. The availability of cathedral schools in major cities and the founding of the new universities in Paris, Bologna, Oxford, and Cambridge made it easier for young men from humble families to acquire an education, and thereby to fit themselves for careers in the church or in the increasingly powerful courts of secular rulers. Some of these men—those who preferred a more free-wheeling lifestyle—took what they had learned and applied it to the performing arts and to communication in the emerging vernacular literatures, which more and more people were able to read. Moreover, the fact that the population of Europe was increasingly concentrated in cities meant that it was possible to reach and to influence larger numbers of people at a time. This new urban audience was the focus of a renewed effort on the part of the church to make religious instruction available to all and, where possible, in the vernacular. Theater provided the perfect mass medium for conveying the message.

**THE COMING OF “THE BRIDEGROOM.”** This is not to suggest that only secular urban audiences were more comfortable with their own vernaculars than with Latin. In fact, the first surviving medieval play with a significant vernacular component comes not from a prosperous town but from a powerful monastery, the abbey of Saint-Martial in Limoges, France. The monks of Limoges would have learned Latin from an early age, and most probably spoke, wrote, and even thought in Latin during daily worship, study, and conversation. But no man or woman in Europe, no matter how well educated or intellectually inclined, would have learned Latin in the cradle; the language that would always be the most comforting, the most familiar, was the language of childhood. In Limoges, that language was known as Occitan, and indeed the whole southern and southwestern portion of

what constitutes modern-day France (from Provence to the Pyrenees) was really Occitania, a politically and culturally distinctive region where the people spoke Provençal or what was often called the *langue d’oc*, the language in which the word for “yes” is *oc* (as opposed to the language of northern France, the *langue d’oïl*, in which the word for “yes” is *oui*). One of the plays that used the vernacular Occitan, which was copied into a manuscript toward the end of the eleventh century, is about the *Sponsus*, or “the Bridegroom.” It is a musical dramatization of the Parable of the Wise and Foolish Virgins (Matthew 25:1–13), in which ten bridesmaids take lighted lamps and go out to wait for the arrival of the Bridegroom (in allegorical terms, they are Christian souls waiting for the Second Coming of Jesus Christ). When the Bridegroom’s coming is delayed, all of them fall asleep. But five of the maidens are wise and bring extra oil for their lamps; the other five are foolish and let their lamps go out. (Again, in allegorical terms, some souls remain vigilant and virtuous, while others become complacent and slack.) At midnight, when the Bridegroom finally arrives, the foolish maidens are left out of the triumphal procession because they cannot help to light him on his way. Running home, they try to buy more oil from merchants in the town, but this means that they are late to the wedding banquet, and are not admitted. The use of the vernacular in the *Sponsus* underscores the drama inherent in this story of human frailty and salvation. While most of the dialogue is sung in Latin, there is a plaintive refrain in Occitan after each exchange: “Sorrowing, sinners, alas we have slept too long!” Furthermore, the exchange between the foolish maidens and the oil merchants takes place entirely in the vernacular, emphasizing the worldliness and futility of their failed business transaction.

**THE CHRISTIAN MESSAGE IN TRANSLATION.** Although very few plays survive from the twelfth and thirteenth centuries, it is clear that the use of the vernacular to heighten the effects of liturgical drama was becoming widespread. In the important episcopal city of Toledo in Spain, the *Auto de los reyes magos* (an Epiphany play about the Three Magi) was composed in the Castilian Spanish of that region at about the same time that the great heroic poem the *Poema del Cid* was written down. Because Toledo was close to the border separating the Muslim territories of Spain from those held by Christians, it is possible that the play—about pagan kings doing homage to the Christ Child—also carried a strong political message. Far to the northeast, in the influential Bavarian abbey of Benediktbeuern, the Easter drama of Christ’s suffering and death—the events collectively known as the Passion—came to include a number of

significant vernacular elements. The characters most sympathetic to the German-speaking spectators of the play often talk directly to them in their own language. Mary Magdalene flirts with the young men in the audience in German, and also sings in German when she buys cosmetics from a merchant—foreshadowing the moment when she will buy ointments to anoint the dead body of Jesus in the sepulchre. The Virgin Mary, the mother of Jesus, wins special sympathy by expressing her sorrows in German. Longinus, the blind soldier who stabs the crucified Jesus with his lance, speaks German to reveal that the blood flowing from Christ's wounded side has restored his sight. Finally, Joseph of Arimathea and Pontius Pilate close the play with a dialogue conducted entirely in German. Similar popularizing techniques are used in a "Visit to the Sepulchre" liturgy from the convent of Origny-Sainte-Benoîte in northeastern France, which was sung almost entirely in French, and in a play called *Suscitio Lazari* (The Raising of Lazarus) written in the Anglo-Norman French dialect spoken in northern France (Normandy) as well as in England after the Norman Conquest of 1066.

**THE CELEBRATION OF YOUTH.** Perhaps the most famous musical drama of the Middle Ages, *Danielis ludus* (The Play of Daniel), is another play that intermingles Latin and the vernacular in effective ways. Based on stories about the youthful prophet Daniel (stories that form part of the non-canonical Apocrypha, or "hidden writings" of the Bible), it was written by and for the youths of Beauvais cathedral in France—for the young men and boys who sang in the cathedral choir and attended the choir's school. Copied into a deluxe manuscript around the year 1230, it proudly proclaims the authorship and provenance of the play in the opening song:

The play of Daniel we record:  
it was created in Beauvais  
the work of youth, in every way.

Daniel was a particularly attractive hero for these young performers, since his boyish curiosity, compassion, and wit were the qualities that allowed him to solve riddles, investigate puzzling crimes, and foil the evil designs of his elders. In the version of his story dramatized at Beauvais, the precocious sage is able to decipher the mysterious handwriting that appears on a palace wall of the pagan king Belshazzar. Later, when he is wrongfully imprisoned by Belshazzar's successor, Darius, he will make a miraculous escape from the lions' den. Finally, he astonishes everyone with his perspicacity, by prophesying the future birth of the Savior, Jesus. The use of French in the lyrics of this musical is not extensive, but it does add an especially festive element to a play already

rich in pageantry, humor, intrigue, and suspense. Performed annually on 1 January, *The Play of Daniel* was an integral part of the liturgy for the Feast of the Circumcision (also known as the Feast of the Presentation), one of several feasts that punctuated the Twelve Days of Christmas, from 25 December to the Feast of the Epiphany on 6 January (the first day of January was not celebrated as New Year's Day in northern France at this time). And, like the Feast of the Holy Innocents on 28 December, it compensates for the pain inflicted on the children of the gospel narrative (Herod's slaughtered innocents, or the circumcised baby Jesus) by allowing contemporary children a special license for revelry and misbehavior. Depending on the locale, any of these feasts could become a "Feast of Fools," when the traditional rituals of the church, including the Mass, were parodied and lampooned in ways that modern-day theologians might find shocking but which were widely accepted and greatly enjoyed during the Middle Ages.

**TELLING IT STRAIGHT.** Many of the religious-themed plays make use of the vernacular in conjunction with Latin in a form sometimes called "macaronic," and these would have been chanted and sung as part of the dramatic liturgies that highlighted the importance of certain feasts. But there is no reason to believe that these same stories were not also told in plain language, unadorned by music and unaccompanied by Latin. Surviving sources often mention the performance of biblical plays, or plays about the lives of saints, without specifying which language they used—Abbot Geoffrey's play about St. Catherine is one. Some may have been spoken entirely in the vernacular, but perhaps it scarcely mattered. After all, every man, woman, and child in Europe would have been intimately familiar with these stories; like the audiences of Greek tragedies, they knew what would happen before the play even began. They may not have needed to understand every word in order to participate in a satisfying theatrical experience. And many of these plays may never have been scripted to begin with; it would have been very easy for the performers to ad-lib their roles. However, we do have part of the written texts for two early biblical plays that were performed almost entirely in rhyming French couplets: *Ordo representationis Ade* (The Service for Representing Adam), sometimes called *Jeu d'Adam* (The Play of Adam), and *La sainte resurreccion* (The Holy Resurrection). Both may have been composed during the latter half of the twelfth century, and were probably originally intended for audiences in southeastern England and Normandy, since their dialect is the Anglo-Norman French of those regions. Both are incomplete, but appear to have been ambitious in scope. *The Play of Adam* is particularly well known,

and it is possible that it was designed to tell the entire story of human salvation, from the Fall of Man in Eden to the Last Judgment. But the sole surviving manuscript ends abruptly, with the Old Testament prophets foretelling the birth of Jesus (in a *processio prophetarum* or “procession of prophets,” similar in some respects to that which was probably performed at Riga, now the capital of modern Latvia). This play is also noteworthy for its careful instructions to the actors (written in Latin, to better distinguish them from the vernacular dialogue) with regard to costuming, set design, and the proper speaking of the verse. Most remarkable of all is the way that old stories are transformed when performed in modern dress—literally and figuratively. Here, Adam and Eve are a young, upwardly mobile couple; he’s hard-working and away from home a lot, while she’s ambitious but has too much time on her hands. They are perfect prey for a con-man like Satan. Later on, Cain and Abel’s quarrel over the offering of sacrifices becomes a controversy about the payment of church tithes, taxes levied on parishioners for the support of priests; Abel is resigned and pious, Cain is angry and frustrated that the fruits of his hard labor should go into someone else’s belly. This is serious social commentary, as well as sound religious doctrine.

#### PLAYS ON THE CUTTING EDGE

**AIRING DIFFICULT ISSUES.** Medieval theater could simultaneously instruct and challenge its audiences. It would be a mistake to assume that just because a play contained an important religious message, and may in fact have been performed as part of the liturgy, that it could not also be funny or “edgy.” Even liturgical dramas could be controversial, depending on how they chose to

##### THE INCIDENT AT RIGA

**INTRODUCTION:** In his chronicle history of the Baltic region, completed around the year 1225, a priest called Henry of Livonia described what happened when a play was performed for an audience that had no prior acquaintance with the conventions of medieval European theatre. In the excerpt below, Henry describes an incident that took place at Riga, on the coast of the Baltic Sea in what is now Latvia. He and his fellow German-speaking missionaries had been sent to convert the native peoples to Christianity, and they decided that putting on a play was the most effective way of doing this. However, the assembled audience did not understand that the violence in the play was not directed toward them; perhaps they were far too well acquainted with real violence to be able to grasp the meaning of theatrical violence.

##### Concerning the big play put on in Riga

That same winter [of 1205], an extremely well-produced play of the prophets was put on in the middle of Riga, in order that the folk might be taught the rudiments of the Christian faith as though through eye witness. The subject-matter of this play was most carefully explained to new converts, as well as to the pagans who came to see it, through an interpreter. However, at the place where Gideon’s soldiers were fighting with the Philistines, the pagans began to run away, fearing that they would be killed—and could only be coaxed back with some care. But finally, after a while, the congregation grew calm and quieted down. Indeed, this very play was like a prelude or foreshadowing of the future, for in the play there were wars, such as those of David, Gideon, Herod; and there was the teaching of the Old and New Testaments. And in fact, through the many wars that followed the folk were going to be converted, and through the teaching of the Old and New Testaments they were to be instructed in such a way so as to arrive at true peace-making and eternal life.

represent the power of kings, how much they emphasized the importance of the vernacular, or how they depicted the relationships between men and women, lords and servants, sinners and saints. King Herod’s tyrannical behavior is held up as a warning to contemporary rulers. The pagan wisdom of the Magi, which includes

*a PRIMARY SOURCE document***THE SERVICE FOR REPRESENTING ADAM**

**INTRODUCTION:** *The Service for Representing Adam* (1180), also known as *The Play of Adam*, is one of the earliest surviving dramas to have been written in a vernacular language—in this case, the French dialect known as “Anglo-Norman,” because it was spoken in Normandy (northern France) and in England after the Norman Conquest of 1066. Like other biblical plays in the vernacular, it was designed to “update” the stories of the Old and New Testaments, making them accessible and relevant to a contemporary audience using vivid, colloquial language and familiar situations. In this scene, the Devil has just failed to tempt Adam into eating the forbidden fruit of Paradise (a scene that is not in the original story, as told in Genesis 3), so he turns his attention to Eve. Note that while the play is in rhyming octosyllabic verse couplets (reproduced in this translation), the rapid-fire exchange of dialogue between the characters creates a very naturalistic effect.

**Devil:** Look, Eve, I’m here to talk with you.

**Eve:** Tell me, Satan, what you’re up to.

**Devil:** To do you good, that’s why I’m here

**Eve:** God grant it, then.

**Devil:** Oh, have no fear.

For many years, I’ve kept my eyes

On what goes on in Paradise.

Do you like secrets? Should I tell?

**Eve:** Yes, go ahead: I’ll listen well.

**Devil:** You hear me?

**Eve:** Yes, I said I do.

I’ll trust that what you say is true.

**Devil:** Then you’ll believe me?

**Eve:** By my faith!

**Devil:** And you’ll not tell?

**Eve:** The secret’s safe.

**Devil:** You’ve given me your guarantee;

That’s fine, that’s good enough for me.

**Eve:** Oh, you can trust me, as a rule.

**Devil:** You’ve clearly been to a good school!

But Adam, now: he’s pretty thick!

**Eve:** He’s a bit slow ...

**Devil:** You’ll make him quick.

Now, iron’s not as hard, or rock—

**Eve:** He’s noble.

**Devil:** He’s a laughing-stock!

That’s why he can’t take care of you.

He should do as you want him to.

You are so dainty (may I say?)

More lovely than a rose in May

As white as crystal, or as snow

That falls on icy streams below.

That was a bad day’s work for God

When he matched you with that big clod.

You’re soft, he’s hard; he’s dumb, you’re smart—

You have great courage in your heart.

detailed knowledge of mathematics and astronomy, is depicted as both glamorous and dangerous. Satan’s temptation of Eve, in *The Service for Representing Adam*, suggests that women can easily succumb to flattery and ambition, but it also acknowledges their intelligence and their influence over men. One of the liturgical dramas associated with the monastery of Saint-Benoît-sur-Loire in France, *The Service for Representing How St. Nicholas Freed the Son of Getron*, describes the capture of a beautiful Christian boy by the pagan king Marmorinus, who takes the boy into his household and treats him with great tenderness. When the child is miraculously restored to the care of his grieving parents, the play does not go on to show the punishment of the king, but instead leaves the viewer with a sense of his probable grief over the loss of his treasured companion (his last words to the boy are: “No one can take you away from me, so long as I do not wish to lose you”). A respected modern scholar of medieval theater has suggested that this play confronts the problem of homosexual desire within the closed community of the monastery.

**FAITH VERSUS REASON AT BENEDIKTBEUERN.** It is arguable that the Latin dramas developed and performed by monastic communities could be more explicit in their treatment of controversial issues precisely because these were close-knit communities. Theater provided an outlet for the discussion of disturbing ideas. At the monastery of Benediktbeuern, where the Passion play’s surprisingly extensive use of the vernacular suggests that it was geared toward the entertainment and edification of the local German-speaking population, the Christmas play is striking for a very different reason. It makes no use of the vernacular, and does not appear to have been designed primarily as a vehicle for popular piety. Rather, it addresses—at some length—the sophisticated intellectual concerns of well-educated churchmen who, by the end of the twelfth century, were trying to come to terms with Aristotelian philosophy, which had recently been re-introduced into the medieval West via increased contact with Jewish and Muslim scholars. In this context, the celebration of the event of Jesus’ birth is subordinated to the problem of believing in the Virgin Birth,

I knew we'd get along, we two.  
So now let's talk.

**Eve:** I'll listen well.

**Devil:** You'll tell no one?

**Eve:** Who would I tell?

**Devil:** Not even Adam?

**Eve:** Very well.

**Devil:** All right. Let me just take a glance  
To see that no one's come by chance—  
Save Adam, who's just over there.

**Eve:** Speak up, he'll never overhear.

**Devil:** There is a great conspiracy  
Against you in this garden, Eve.  
The fruit that God gives you for food  
Is not enough to do you good;  
But that on the forbidden tree  
Has powerful efficacy.  
If you eat that, you'll never die  
You'll have God's power, majesty,  
Know good and ill—eternally.

**Eve:** How does it taste?

**Devil:** Oh, heavenly!  
And with your body, and your face,  
You should be ruler of this place—  
Of all the world you'd be the queen,  
Surveying what no man has seen.  
You'd know what all the future brings,  
You'd be the master of all things.

**Eve:** Is that the fruit?

**Devil:** Yes. Go and see.

*Then Eve should very carefully consider the forbidden fruit and, after having admired it for a long time, say:*

**Eve:** Just looking at it pleases me.

**Devil:** And if you eat, what happens then?

**Eve:** How can I know?

**Devil:** Don't you listen?  
You take it first, and then Adam:  
That done, you'll wear the crown of heaven.  
You'll then be your Creator's peer,  
He'll have to share his powers here.  
The instant that you taste the fruit  
You'll be transformed; he'll follow suit.  
You will be gods in your own right,  
With equal graces, equal might.  
Come, taste the fruit.

**Eve:** I think I may—

**Devil:** Don't trust Adam—

**Eve:** —but not today.

**Devil:** When?

**Eve:** Let me be.  
When Adam is asleep, maybe.

**Devil:** Eat it right now! Are you afraid?  
You'll lose this, if it's long delayed.

a phenomenon that can only be accepted through arguments based on faith, rather than by rational proof. The spokesman for these new, disturbing arguments in the Christmas play from Benediktbeuern is a character called Archisynagogus, “the leader of the synagogue” or “the head Jew.” While Archisynagogus is described in some of the stage directions as a comic character, behaving in ways that a medieval Christian audience might have considered stereotypically “Jewish,” he is also the character who represents scientific truth and intellectual rigor—qualities very attractive to the community’s scholars. Initiating a debate over the Old Testament prophecies of the Virgin’s miraculous conception, Archisynagogus defeats all of his opponents single-handedly, confidently refuting the pious arguments of the prophets, the Boy Bishop (a choirboy appointed to preside over the Christmas festivities), and even St. Augustine. In the end, faith does triumph over reason—but only by virtue of superior numbers and the “proof” offered by the gospel story. Moreover, Archisynagogus is not vilified for his “great arrogance” but is brought back on stage toward the end

of the play to advise Herod in his dealing with the three Magi, speaking “with great wisdom and eloquence.” Even the shepherds in this play fall prey to doubts, and are nearly convinced by the devil that the angels’ glorious proclamation must be a lie. This is no simplistic re-enactment of the Christmas story, but a serious attempt to come to terms with the central problem of religious belief. The Middle English *Second Shepherds’ Play* provides another example of the degree to which medieval plays allowed audiences to express their doubts, and challenged them to think about their faith in new ways.

**THE JOURNEY OF A SOUL AT GANDERSHEIM.** A very different type of challenge is offered by another play from a German monastic community, composed and performed around the middle of the twelfth century. This is the *Ordo virtutum* (The Service of the Virtues) by Hildegard of Bingen (1098–1179), abbess of a convent that she herself founded at Rupertsberg on the Rhine river. Hildegard was famous in her own day for her scientific and medical knowledge, her preaching, her

*a PRIMARY SOURCE document***A SHEEP IN THE MANGER: THE SECOND SHEPHERDS' PAGEANT**

**INTRODUCTION:** *The Second Shepherds' Pageant* forms part of the Corpus Christi play known as the *Wakefield* cycle (from the Yorkshire village mentioned in the play) or as the *Towneley* cycle (the name of the family in whose private library the manuscript was preserved). It is literally the second of two pageants devoted to the Christmas story—or, more specifically, to the role of the shepherds in that story. The biblical shepherds were popular characters in northern England during the Middle Ages. Many of the local people would have made their living in similar ways, and would have identified with the shepherds' plight: their poverty and loneliness, the terrible wintry weather they endured, their fear and surprise on hearing the angels' greeting, their joy at the Christ Child's birth. They would also have enjoyed the shepherds' irreverent attitude toward authority in this pageant, which goes so far as to poke fun at the doctrine of the Virgin Birth by introducing a plot which parallels that of Jesus' Nativity. A pair of unsavory characters, Mak and his wife Gill (Jill), steal one of the shepherds' precious sheep and hide it in a cradle, pretending that Gill has just miraculously given birth. When the shepherds come to look for their lost property, they are fooled into thinking that the creature in the manger is really a baby—until one of them is overcome with sentimental feelings and returns, intending to give the child a gift. The sheep is discovered, and so is Mak and Gill's deception. This is the scene excerpted below. The language of this play is the Middle English of the North—the language of the poet Geoffrey Chaucer (c. 1343–1400), but with a strong Yorkshire accent. The verse is the work of an anonymous poet known as the "The Wakefield Master," who favored a distinctive nine-line stanza and complex rhyme scheme. Some words have been modernized, but for the most part the text is as it appears in the play's fifteenth-century manuscript.

**Shepherd 2:** Mak, friends will we be, for we all are one.

**Mak:** We? Now I hold for me—[*Aside*] For amends get I none.

Farewell all three!—[*Aside*] All glad were ye gone.

**Shepherd 3:** Fair words may there be, but love is there none

This year. [*The shepherds depart.*]

**Shepherd 1:** Gave ye the child anything?

**Shepherd 2:** I trow, not one farthing.

**Shepherd 3:** Fast again will I fling—  
Abide me ye here. [*He goes back in.*]

Mak, take it no grief if I come to thy bairn.

**Mak:** Nay, thou does me great reproof, and foul has thou fared.

**Shepherd 3:** The child it will not grieve, that little day-star.

Mak, with your leave, let me give your bairn

But six pence.

**Mak:** No, do way! He sleeps.

**Shepherd 3:** Methinks he peeps.

**Mak:** When he wakens, he weeps.

I pray you, go hence! [*The other shepherds enter.*]

**Shepherd 3:** Give me leave him to kiss, and lift up the clout. [*He lifts the cloth covering the sheep.*]

What the devil is this? He has a long snout!

**Shepherd 1:** He is markèd amiss. We wait ill about.

**Shepherd 2:** Ill-spun weft, I wis, aye comes foul out.

Aye, so! [*Suddenly, realization dawns.*]

He is like to our sheep!

**Shepherd 3:** How, Gib, may I peep?

**Shepherd 1:** I trow kin will creep

Where it may not go.

**Shepherd 2:** This was a quaint gaud and a far cast:  
It was a high fraud!

**Shepherd 3:** Yea, sirs, it was.

Let's burn this bawd and bind her fast.

[*Pointing to Gill.*]

A false scold hangs at the last.

So shall thou.

Will ye see how they swaddled

His four feet in the middle?

Saw I never in a cradle

A horned lad ere now.

**Mak:** Peace, bid I. What, let you be far!

I am he that him got, and yon woman him bore.

**Shepherd 1:** What devil [name] shall he have, Mak?

Lo, God, Mak's heir!

**Shepherd 2:** Let be all that. Now, God give him care,  
I saw—

**Wife:** A pretty child is he

As ere sat on a woman's knee

A dillydown, perdy,

To make a man laugh.

**SOURCE:** *The Second Shepherds' Pageant*, in *Medieval Drama*.  
Ed. David Bevington (Boston: Houghton Mifflin, 1975): 402–405.

tremendous literary and artistic productivity, her mystical visions, and her highly unconventional approach to worship. Visitors to the convent reported that her nuns

often wore elaborate costumes on special occasions and were encouraged to find new and creative outlets for the worship of God, celebrating the feasts of the church with

unusual songs and liturgies composed by Hildegard herself. *The Service of the Virtues* may have been intended to celebrate the dedication of the convent around 1151; it could also have been performed more frequently, to honor the monastic profession of a new postulant, or simply to commemorate the challenges and rewards of the monastic life as it was experienced by women. Anticipating the morality plays of the later Middle Ages, it tells the story of a single (female) soul, Anima, and her journey through life, beginning with her embodiment in the “beautiful garments” of the flesh and the happy innocence of her childhood. Early on, Anima is introduced to the (female) Virtues and, through them, is made aware of life’s temptations and difficulties. But living in God’s created world is delightful to her, and Anima unabashedly revels in the delights of her body—until her encounters with the Devil leave her bruised and terrified. Calling on the Virtues to rescue her, Anima flees from the evil influence of her sins and eventually succeeds in escaping from the embrace of the Devil, yet not before she is reminded of how difficult her chosen path will be and how many earthly joys she is missing, including the pleasures of sexual intercourse and the joys of motherhood. Although there are few stage directions, the language of Hildegard’s play is full of action verbs, sensuality, and violence. The virility and power of the Devil is underscored not only by the masculinity of the actor portraying him (the role was probably assigned to the convent’s chaplain or to Hildegard’s male secretary) but also by the fact that he is the only character who either cannot or does not sing. Instead of communicating through melody, like the female characters played by the nuns, he speaks or shouts his lines, by turns insinuating and threatening. It would be anachronistic to call this a “feminist” play, but it is certainly a play that does not shy away from dealing with the special concerns of women vowed to lives of celibacy, poverty, and domination by men.

**APOCALYPSE PLAYS.** Yet another Latin play created by a monastic community in twelfth-century Germany reveals that withdrawal from the temptations of the world did not necessarily imply a retreat from interest in worldly affairs. *The Play of Antichrist* from the imperial abbey of Tegernsee probably dates from the years around 1160, which marked important developments in the political career of Frederick II “Barbarossa” (c. 1123–1190), who had been elected emperor of the Romans in 1152. Nicknamed “red beard,” and as hot-tempered as he was redheaded, Frederick was extremely ambitious, and spent his long reign attempting to exercise control over a vast and diverse region, which included the principalities of Germany, the city-states of

northern Italy, and parts of Eastern Europe. Constantly in conflict with the pope, and jealous of the success of his contemporary, Henry II of England, Frederick saw himself as the rightful successor of Constantine and Charlemagne—and seemingly believed that he was also destined to unify Europe; in fact, it was Frederick who coined the term “Holy Roman Empire” to describe the loose configuration of territories that made up his domain. *The Play of Antichrist* dramatizes Frederick’s political pretensions, and may have been performed in his presence at Tegernsee. It draws upon Christian teachings about the Apocalypse—the second coming of Christ—suggesting that Frederick might well have seen himself in the role of the triumphant world leader whose restoration of Roman power would eventually bring about the coming of the Antichrist, thereby ushering in an era of fear, hypocrisy, and false miracles. But this time of uncertainty is a necessary precursor to the salvation of the human race, since the duplicity of the Antichrist is destined to be revealed by the prophets Enoch and Elijah, who will also succeed in bringing about the conversion of the Jews to Christianity, which is necessary to pave the way for the Second Coming of Christ, the Last Judgment, and the End of Days. This is hardly a comfortable subject for a play, and it is difficult for a modern reader to understand the messages that may have been conveyed in its performance. But the staging must have been a revelation in itself. Like the liturgical dramas devised for Christmas and Easter, *The Play of Antichrist* was designed for performance at various stations or sites, with some of the action taking place in several locations simultaneously. In this case, however, the relatively simple requirements of *The Visit to the Sepulchre*, or even the plays of Herod and the Magi, are replaced by the full-scale deployment of armies, the negotiations of ambassadors, and the ceremonious subjugation of kings; the stage directions in the manuscript reveal that *The Play of Antichrist* required seven “thrones” or scaffolds representing the major powers of the known world, each of which is vanquished by the emperor of the Romans and then reconquered by the Antichrist and his minions. The trickery of the Antichrist also calls for special effects of a more subtle kind, since it must be made evident to the audience that he is not the real Christ, and that his promises are lies. Accordingly, the actor performing this role is directed to wear armor that is only partly concealed by his outer garments, while the performer playing the part of a man whom Antichrist will pretend to raise from the dead is carefully instructed to make it clear that he is only “faking death.” But the very theatricality of the Antichrist’s “miracles” is itself disturbing and potentially subversive, since it brings to mind the overt theatricality

of the church's own performance of sacramental miracles, notably in the daily celebration of the Mass.

**ACTING LOCALLY IN ARRAS.** The surviving plays dating from the years prior to 1300 suggest that the theater of the Middle Ages was well equipped to address timely issues through the retelling of timeless stories. Even when performed in Latin, and as part of the liturgy, plays could contribute to ongoing debates within a community, or provide incisive commentary on the world outside. When performed in the vernacular, such plays worked even more powerfully, and could reach a wide audience. The thriving mercantile center of Arras in northeastern France provides scholars with the first vernacular plays written specifically for an urban population and developing plots that owe little to biblical models. The *Jeu de saint Nicolas* (The Play of St. Nicholas), composed after 1191 by Jehan Bodel (a professional entertainer and town clerk whose written works contributed new vocabulary to the language now called Old French), is based in part on stories of the saint's many miracles, but its real purpose is to describe a set of recent and momentous occurrences in the life of the town. In 1191, Arras became part of the expanding kingdom of Philip II "Augustus" (r. 1180–1223), the medieval architect of the modern French state; prior to that date, it had formed part of the independent county of Flanders. Jehan chose to tell the story of his town's changing political, cultural, and economic climate through the lens of saintly legend. In the play, a greedy pagan king wages war against a wealthy town, easily identifiable as Arras, and takes one of its official representatives captive. He also captures an icon of St. Nicholas, which the man from Arras tells him is capable not only of safeguarding treasure, but increasing it. Intrigued, the king places the icon in his treasury and advertises the fact that the money could easily be stolen. But when three thieves from a tavern in the marketplace of Arras try to make off with it, they are confronted by the angry St. Nicholas himself, who forces them to return the gold. When the king counts his money, he finds that there is more of it than ever before, so he converts to Christianity. Medieval Arras was renowned for its strong currency and its banking industry; Philip Augustus was famous for taking advantage of every opportunity that came his way, using the raw ingredients available to him, and Jehan created his own allegorical reading of the situation. About 75 years later, another famous son of Arras, the composer and poet Adam de la Halle, would imitate the artistry of Jehan Bodel in *Jeu de la feuillée* (The Play of the Bower), which would make even greater use of local settings, characters, and controversies. In fact, the humor of this later play is so specific to Arras around 1276 that

it is very difficult for modern readers to understand what it is really about, let alone to laugh at its jokes.

## PROFESSIONAL PERFORMERS

**THE MARK OF THE PROFESSIONAL.** Most often, the plot of a medieval play addressed the specific concerns of the community for which it was performed, while the actors performing the play represented the community at large. By the same token, the resources for a play's production were furnished by the community; audiences did not pay for the privilege of attending, nor were actors paid to perform. This begs the question of the existence of professional entertainers in the Middle Ages and their role in the development of medieval theater. It is a difficult question to answer, largely because the material that these professionals developed and performed was almost entirely improvised, or at least unscripted. The men and women who made a living through performance had to be ready to practice their crafts anywhere, at any time, for any audience. They prepared routines and gags, sketches and bits, tricks and acts; they did not, for the most part, memorize texts or preserve what they performed in writing. This occurred for many reasons. A professional performer's livelihood could be dependent on the originality of his or her approach to the material; publishing trade secrets would diminish their value. Also, most actors, singers, musicians, dancers, acrobats, and clowns learned their skills by watching and listening to one another; as they traveled and worked, on their own or in groups, they were constantly developing, devising, copying, changing, adapting, and inventing. Certainly, some could and did read; some could also write, a skill that (unlike reading) was rare in the Middle Ages. Thus only a very few would produce scripts or songs; Jehan Bodel and Adam de la Halle of Arras are unusual exceptions to the rule. In general, it was not until the late sixteenth century that performers came to depend on written scripts for their craft. Throughout the Middle

Ages, the mark of the true professional was the ability to work independently, relying on memory and skill.

**THE ROLE OF THE JONGLEUR.** Edmond Faral, one of the only scholars to attempt a systematic study of medieval entertainers, used the Old French word *jongleur* or “juggler” as a catch-all term to describe the array of talents and practices shared by the professional performers of the Middle Ages. His attempt to answer the question “What is a jongleur?” forms the opening paragraph of the book he first published in 1910:

A jongleur is a being of multiple personalities: a musician, poet, actor, mountebank; a sort of steward for the pleasures associated with the courts of kings and princes; a vagabond who wanders the roads and puts up shows in the villages; a hurdy-gurdy man who, at a resting-place, sings of glorious deeds for the pilgrims; a charlatan who amuses the crowd at the crossroads; an author and actor of plays played on feast-days outside the church; a lord of the dance who makes the young people caper and skip; a taborer, a blower of trumpet and horn who keeps time in processions; a teller of tales, a bard who enlivens the feast, the wedding, the watches of the night; a circus-rider who vaults onto the backs of horses; an acrobat who dances on his hands, who juggles with knives, who jumps through hoops, who eats fire, who bends himself back in two; a buffoon who struts and mimics; a clown who plays the fool and speaks blarney; a jongleur is all that, and more besides.

However, no single performer could be master of so many skills, or practice them all at once. Faral’s essential point is that the medieval entertainer was a jack-of-all-trades, since his livelihood depended on his willingness to be all things to all people, to turn his hand to anything. In fact, like most professional entertainers in modern times, the medieval jongleur also held a variety of “day jobs.” A jongleur often worked as a servant in the houses of the wealthy when he was not entertaining there, or acting as a herald, messenger, or secretary. He also worked for the town where he performed on street corners or in the market square, as a crier, clerk, schoolmaster, or craftsman. Many jongleurs, however, were vagrants, traveling from place to place, begging for food or doing odd jobs when they could not earn enough money passing the hat during performances. It was a hard life, and it often earned the performer a bad reputation. Medieval people respected stability and feared the unfamiliar. Men and women who were constantly on the move, constantly changing jobs, and perpetually versatile could be objects of mistrust as well as sources of delight. This is why so much of the anecdotal evidence relating to the status of performers in the Middle Ages is negative.

**ENTERTAINMENT AT COURT.** Most professional entertainers were wanderers, but a privileged few were able to find steady employment in the entourages of the rich and powerful. They provided their masters with theater on demand, and with the prestige derived from patronage of the arts; in return, they received food and shelter, clothing and occasional gifts, and sometimes a steady wage. Depending on their individual talents, these men and women would have been called by a variety of names. The term *jongleur* was sometimes used generically, but it usually applied more specifically to clowns or jesters, many of whom also called themselves “fools.” The (unnamed) Fool in *King Lear*, Feste the jester in *Twelfth Night*, and Touchstone the clown in *As You Like It* are a few of their Shakespearean offspring. Entertainers who specialized in music, vocal or instrumental, were often called minstrels, but this does not mean that they devoted themselves exclusively to music. Some were also capable of reciting tales of heroic deeds, like those described in the heroic poem *Song of Roland*; in Scandinavia, they helped to develop the intricate adventure narratives that would later come together to form the great Norse sagas; in Ireland, bards sang the exploits of the giant Cuchulain, and the cycle of stories that now make up the *Tain*; in England before the Conquest performers boasted of Beowulf, and other heroes of the Anglo-Saxon past. By the thirteenth century, all over Europe, the deeds of King Arthur and his knights eclipsed all of these, and were especially popular in courtly circles, where tournaments were often designed to resemble those described in story and song.

**THE POET-MUSICIANS.** There was also the special class of poet-musicians who composed and sang their own lyrics of love and longing in the new vernacular languages of Europe, and who were known as troubadours, trouvères, or minnesingers, depending on whether they were from northern or southern France, or Germany. They were the entertainment elite. In fact, some were not professional entertainers at all, but clerics or noblemen “moonlighting” as performers. Adam de la Halle of Arras, the author of *The Play of the Bower*, exemplifies the traits of this group. Well-educated, with perhaps some training at the university in Paris, he was active in the multifarious theatrical activities of his hometown but also appears to have been attached to the court of Count Robert II of Artois (1250–1302), for whom he may have written *The Play of Robin and of Marion*, a musical comedy with a romantic—and spicy—pastoral plot (one focusing on shepherds and shepherdesses). While it was almost certainly intended for performance at court, with a cast consisting of Robert’s household entertainers, its manuscript indicates that it was later revived for

Castle of Perseverance, Drawing of staging, Macro Manuscript, 15th–16th century. BY PERMISSION OF THE FOLGER SHAKESPEARE LIBRARY. V.A. 354, F. 191 VERSO.

performance in the very different urban milieu of Arras, another indication of medieval theater's versatility.

**FABLES AND FARCES.** While it has often been assumed that certain plays, jokes, or songs would have been more appropriate to a courtly setting than to an urban one, there is plenty of evidence to suggest that medieval performers and their audiences enjoyed a wide variety of entertainments, regardless of social class. Urban audiences wept when they heard the tale of noble Roland's death, and so did the knights who strove to emulate him. Rustic audiences laughed at the antics of clowns and the scatological humor of the short, salacious stories known as *fabliaux*, as did kings. The manuscript books that preserve the raw materials of the performers' repertoire as it had evolved by the thirteenth, fourteenth, and fifteenth centuries were obviously made for aristocratic or well-to-do collectors, but the materials themselves could have been adapted for performance in taverns or halls or market-squares, on streets or at fairs, after feasts or before campfires. The plays that survive from this era were not only adaptable to occasion and circumstance, but

also to the number of available performers. Two of the earliest examples come from the region around Arras: a dialogue called *The Boy and the Blind Man* and a retelling of the Parable of the Prodigal Son (Luke 15:11–32) called *The Courty Lad of Arras*. The extant manuscripts of these two short pieces indicate that both were performed many times over a period of several centuries, and they make use of some of the same plot-lines and devices that would later be recycled in the comic interludes or farces that were literally sandwiched in between longer or more serious plays in the fifteenth and sixteenth centuries (the French word *farce* means “stuffing,” while the Latin *interludium* means “a play between the plays or games”). Both consist of rhymed couplets (easily memorized) and both could have been performed in under an hour, perfect for any occasion. *The Boy and the Blind Man* uses the tried-and-true formula of the comic duo, one the mastermind (the Boy), the other the straight man and butt of the jokes (the Blind Man). The aim of the characters is the same as that of the performers—to entertain a crowd of people and con them out of as much money as possible. While it calls for two actors, it could probably be performed by a single jongleur with the help of his fool's “bauble,” the jester's puppet-on-a-stick. *The Courty Lad* could have been recited by a single performer as well, but it could also have been divided into parts. Its re-working of the biblical story provides a new parable for the fast-moving world of late medieval Europe, when hapless young men from the countryside were easily attracted to the pleasures of town life and often lost their money to gamblers and prostitutes. The fact that it could easily have been performed in a tavern is a constant reminder of the interaction between theater and public life in the Middle Ages.

**MIRACLES AND MORALITIES.** The plays performed by professional actors had to be as adaptable as the performers themselves, shrinking or expanding to fill any space, or to accommodate any cast. Because there were no permanent acting companies in Europe until the late sixteenth century, no troupe of actors could be sure that it would have unlimited resources, human or material, when it was time to perform. There were exceptions, of course. Occasionally, wealthy individuals and corporations hired professional actors to perform plays on festive occasions, or to supplement the talents of amateur actors. For example, a remarkable group of forty plays from Paris, each devoted to a miracle attributed to the intercession of the Blessed Virgin, survives in a deluxe manuscript copied in the last decades of the fourteenth century. These *Miracles de Notre Dame* were performed between 1339 and 1382 at the annual feasts of the Paris guild of goldsmiths (an association of craftsmen who

*a PRIMARY SOURCE document***STAGING THE CASTLE OF PERSEVERANCE**

*The Castle of Perseverance* may be the oldest play text in Middle English, dating from the first quarter of the fifteenth century (c. 1405–1425). It is certainly one of the most unusual. For one thing, it survives in a remarkable manuscript (now at the Folger Shakespeare Library in Washington, D.C.)—remarkable not only because of its length, but because it provides detailed instructions and a schematic plan to facilitate the staging of the play. Designed to be presented in the round, *The Castle of Perseverance* has thirty-five speaking parts and would have taken several hours to perform. It is often classified as a morality play, but unlike most morality plays it was probably not intended for production by a troupe of traveling players; instead, it may have been written for a cast that included professional and amateur actors. But like *Everyman* and *Mankind*, it tells the allegorical story of one human being's journey through life, from birth to death.

As the manuscript's stage plan indicates, *Humanum genus* or "Mankind" makes his entrance on the stage of the round world as a naked infant, "born" in a bed sheltered by the Castle of Perseverance. He is accompanied throughout the play by two Angels, one Good and one Bad, who offer constant advice and are always at odds with one another. As he grows to adulthood, Mankind is attracted to the empty promises of the World, the Flesh, and the Devil, each of which occupies a scaffold beyond the moat that encircles the Castle, to the west, south, and north. Goaded by Backbiter, the World's minion, Mankind is tempted by the vices of youth: Lust and Folly; Covetousness (Greed), Pride, Wrath, and Envy; Gluttony, Lechery, and Sloth. As he grows older, however, Mankind begins to repent with the help of Shrift (Confession) and Penance,

and is brought to the Castle of Perseverance, to be sheltered by the Virtues: Charity, Abstinence, Chastity, Industry, Generosity, and Humility. No sooner is he safely inside its stronghold, but the Castle is besieged by the Vices, who attempt to "rescue" Mankind with the help of his Bad Angel, and the combined forces of the World, the Flesh, and the Devil. But because Mankind is older and wiser, his Good Angel and the Virtues remain strong, and are able to vanquish the Vices—all but one, the special Vice of old age: Covetousness (Greed). Lured out of the Castle by Covetousness, leaving his Virtues behind, the unprotected Mankind quickly succumbs to Death. But as he dies, he cries for mercy, and this cry will be what saves the Soul that now issues from his body. For just as the Bad Angel is triumphantly leading the damned Soul to the Devil, the four daughters of God appear: Mercy, Righteousness (Justice), Truth, and Peace. Accompanied by the Good Angel, they lead the Soul to the throne of God in the east. There, the daughters of God sit in judgment on the past sins of Mankind, and in the end Mercy triumphs, pleading successfully for his Soul's salvation. So God pardons the Soul, and then speaks the closing lines of the play:

And they that well do in this world, here wealth shall awake:

In heaven they shall heightened be, in bounty and in bliss.

And they that evil do, they shall to hell-lake

In bitter bails to be burnt: my judgment it is.

My virtues in heaven then shall they quake;

There is no one in the world that may escape this.

All men example here then may take,

To maintain the good and mend what is amiss.

Thus endeth our games!

To save you from sinning,

Ever, at the beginning,

Think on your last ending!

Te Deum laudamus.

banded together to protect and regulate their trade), and they often call explicitly for the talents of professional musicians and possibly of dancers; since a new play appears to have been staged every year, it is not unlikely that professional actors were also called in. But usually when actors banded together to perform plays, they developed a limited repertoire and took the show on the road, moving from place to place and performing in taverns, inn yards, and private houses. One of the earliest scripts for a portable play of this kind is *Mankind*, a Middle English "morality play" written down between 1465 and 1470. Morality plays addressed the problems and temptations faced by ordinary people by following a representative human being through daily life. Because

they aimed to be accessible to everyone, they generalized common experiences through the use of allegory, a technique which relied on personifications of abstract qualities in characters with names like "Good Works" and "New Guise" (Trendy Fashion); and although the central message was religious, the dramatization of the allures of vice and the struggle for virtue was intended to be highly entertaining. The actors would go hungry if their play was boring, since the most common way of collecting money was to ask for donations during or after the performance. An interval for the collection of cash is actually written into *Mankind*, which is designed for performance by a cast of six actors, one playing the title character, four playing the pranksters who plague him—

aptly named Mischief, New-Guise, Nowadays, and Nought—and the sixth doubling the key roles of Mercy and Titivillus, the “All-Vile” chief devil. The pairing of these two very different roles is itself suggestive of the lead actor’s virtuosity, as well as of the playful quality of even the most moral of medieval morality plays. It was for precisely this reason that contemporary critics condemned their performance, no matter how religious the theme. *The Tretise of Miraclis Pleying*, written in England probably by a proponent of Lollardry (a pre-Protestant group hostile to the hierarchical nature of the Roman Church) several decades before *Mankind*, argues that the “playing” or performance of miracles and moralities “taketh away the dread of God.” But when plays and their performers are controversial, it is a good sign that both are doing their job.

#### COMMUNITY THEATERS

**URBAN CENTERS.** Toward the end of the twelfth century, a cleric called William FitzStephen included a lengthy description of the city of London in his biography of St. Thomas Becket (1118–1170), written to attract visitors to the new martyr’s shrine at Canterbury and to his birthplace nearby. Among the city’s attractions, William emphasized its opportunities for entertainment, listing an array of pleasurable pastimes that resembles the catalogue of theatrical activities outlined by Hugh of Saint-Victor.

I do not think that there is any city deserving greater approval for its customs, with regard to church-going, honoring divine ceremonies, the keeping of feast-days, the giving of alms, reception of strangers, confirmation of betrothals, making of marriages, celebration of weddings, preparation of banquets, welcoming of guests, and also in the observance of funeral rites and the burying of the dead.

He goes on to paint a tantalizing picture of “the sports of the city, since it is appropriate that a city be not only useful and important, but also a source of mirth and diversion.” Acknowledging that London, unlike ancient Rome, has no theater buildings in which plays can be seen, he assures his audience that it “has dramatic performances of a holier kind, plays wherein are shown either the miracles wrought by holy confessors or the sufferings which glorified the faith of the martyrs.” Moreover, he says, London has Carnival plays and games, tournaments and processions, mock naval battles, hunting and hawking, summer games showcasing feats of athletic skill, and winter sports like bear-baiting and ice-skating. In many ways, urban communities such as London showcased the quintessential community of medieval theater—which used the resources of the community to which it performed in order to deliver its message—more fully even than the closed community of the monastery. The city could be the theater when it provided the stage for theatrical activities mounted at different times and seasons of the year; or it could be an actor in great pageants of national significance when it arrayed itself in finery and put on parades and plays to welcome visiting kings and dignitaries. And sometimes it could represent the whole world, and the whole history of human salvation, when it staged the great cycle plays of the later Middle Ages.

**CHRISTMASTIDE AND CARNIVAL.** Like the drama of the church, the drama of the medieval town was governed by the liturgical calendar and the seasons of the year. Certain seasons were especially conducive to theatricality, either because they were times of comparative leisure and plenty, when the rhythms of sowing and harvest had slowed, or because they were times when people were drawn together by sociable impulses as old as humanity, as at the dark time of the winter solstice. While spring and summer offered numerous opportunities for the games, dances, and diversions described by William FitzStephen—played out in towns and villages all over Europe—Christmastide and Carnival were the major occasions for festive theater in most communities. The week after Christmas was a busy time in churches, and it is important to remember that the liturgical plays celebrating Jesus’ birth and the events leading up to the Epiphany of the Magi were in performance throughout the Middle Ages, and would have been extremely familiar to everyone. Supplementing these formal dramas were the revels associated with Christmas, which included a variety of small-scale dramatic productions often called “mumming plays.” These drew upon the same ancient inclinations that had prompted the church to attach the celebration of Christmas to the winter solstice in the first

Death of Herod, Performance of *Massacre of the Innocents*, University of Illinois, Urbana, Illinois, Spring 1983, produced by John Block Friedman. COURTESY OF JOHN BLOCK FRIEDMAN.

place. The birth of a marvelous child, the rekindling of light in a dark place, the miraculous recycling of the new year—the simple plays that dramatized these things reached deep into the primal mythology in which medieval Christianity was already firmly rooted. So did the revelry of Carnival, the season of license and conspicuous consumption that followed Epiphany and ended on “Fat Tuesday” (Mardi Gras), when Ash Wednesday ushered in the six weeks of fasting and penance that preceded Easter. Carnival, Lent, and Easter were also products of the natural cycle, since the meat from animals slaughtered in late autumn would not last through the winter and had to be eaten, thus providing for the feasting of Carnival; Lent, by contrast, institutionalized the basic necessity of rationing the remaining store of grains and legumes that had been put up at the autumn harvest and had to last until spring, when earth’s fertility would be renewed, just as Christ’s body was resurrected from the tomb. The theater of Carnival resembled the foods of Carnival: excessive, rich, and unlike the normal

fare of everyday life. Carnival plays, like the *Fastnachtspiele* of Germany, accordingly reveled in cross-dressing, the reversal of hierarchies, and the flouting of acceptable conventions. As at the Feasts of Fools during Christmastime, the world was turned upside down. The celebration of subversive behavior may seem strange to us, but in many ways it was the glue that held these communities together. Carnival allowed the people of Europe to use up excess energy, as well as excess food—both being commodities which, if stored too long and allowed to go bad, would be far more dangerous than a period of organized dissipation.

**PASSION AND MYSTERY.** The further development of towns in the later Middle Ages led to the growth of new identities within these communities, as well as to a growing sense of shared identity—local, regional, and even national. Theater became a medium for expressing these identities. In Italy, where towns had long been the fundamental units of political as well as economic organization, lay confraternities often took the lead in

An imagined performance of a fifteenth-century mystery play, engraving in a study by Thomas Sharp, early nineteenth century. THE GRANGER COLLECTION, NEW YORK.

displays of public religious fervor, competing with one another in the performance of *laudes*—songs and ritual processions staged in honor of the Blessed Virgin or the saints—which by the fifteenth century were accompanied by *sacra rappresentazioni*—theatrical presentations of events from sacred history performed on major feasts. In Spain and Catalonia, the Feast of the Assumption of the Virgin, celebrated on the 15th of August, became an especially important occasion for dramatic demonstrations of collective piety, and plays glorifying the life and miracles of the Virgin were performed annually; the *Misteri d'Elx* is still performed every year in the Basque town of Elche, the oldest European play in continuous production. Elsewhere on the Continent, community theater received its fullest expression in plays devoted to the life, ministry, death, and resurrection of Jesus. In some places—notably in the major cities of the Low Countries, Switzerland, France, and Germany—these Passion plays (plays dramatizing the suffering of Christ) came to be called “mystery” plays, not only because they delved into the mysteries of faith, but because they were produced by representatives of the various trade guilds, associations of craftsmen who banded together to protect and regulate the secrets or “mystery” of their trades. Depending on the size of the city, the number of its guilds, and the generosity of their budgets, these plays could be more or less elaborate. In some places, episodic plays chronicling the entire history of human salvation were performed on successive days in a cycle that could

last nearly a month. The geography of the town would often dictate where and how such plays were performed, whether in the round, using several scaffolds or platforms, or in procession at various stations throughout the city. Continental towns in northern Europe tended to have larger market squares that could accommodate large-scale spectacles and their audiences; in England and in Spain, by contrast, more constricted spaces favored the use of pageant wagons that were drawn through the narrow streets, stopping at certain pre-arranged sites for the performance of individual plays.

**A NEW OCCASION FOR THEATER.** It is clear that members of medieval communities eagerly sought opportunities to take part in dramatic productions. In *The Miller's Tale*, one of the stories in *The Canterbury Tales* by Geoffrey Chaucer (c. 1342–1400), a parish clerk called Absolon falls in love with Alison, the pretty young wife of a wealthy carpenter; but she is already infatuated with Nicholas, a student who lodges in her husband's house. Desperate to win her for himself, Absolon woos Alison with gifts and sweets, tender ballads, and proofs of his prowess. These include demonstrations of dramatic skill, when “to show his lightness and his mastery, / He playeth Herod upon a scaffold high.” Given the ubiquity of community-sponsored theater in late medieval Europe, young men with a penchant for acting had many opportunities to showcase their talents—especially in England, where the celebration of the Feast of Corpus Christi provided the opportunity for towns and guilds to advertise themselves and their piety, as well as to satisfy the histrionic ambitions of their members. This new feast, dedicated to the “Body of Christ,” was formally instituted in 1311 by Pope Clement V and became the occasion around which many of the mystery cycles and Passion plays of Europe were performed. This new focus on Christ's corporeality, his mystical body as well as his physical humanity, and on the manifestation of his miracles in the world, tied in beautifully with the conventions of medieval theater.

**THE CORPUS CHRISTI PLAY.** From the liturgical dramas of the early church to the moralities of the later Middle Ages, medieval performers and audiences had developed a shared vocabulary that used symbols, spatial orientation, and sophisticated storytelling techniques to convey meaning in direct, immediate, even visceral ways. Biblical events were not treated as part of the past, but as aspects of a continuous present that affected the actions of men and women in the here-and-now. The fact that an episodic staging of the gospel narrative might require dozens of actors playing the role of Christ is already a profound theological statement in the making (as Jesus himself had taught, all men and women should

*a PRIMARY SOURCE document***LIST OF PROPS, SETS, AND COSTUMES FOR THE LAST JUDGMENT AT YORK**

**INTRODUCTION:** One of the most elaborate pageants in the York Corpus Christi cycle was *The Last Judgment*, performed annually by the Guild of Mercers (cloth merchants). This was the finale of the day-long theatrical event, and was therefore expected to be particularly impressive—and to require significant expenditure on the part of the guild's members. The mercers therefore accumulated an impressive array of costumes, props, and set-pieces, which they inventoried in 1433. The list (given below) suggests that the pageant wagon represented the Earth, on which Christ and his apostles were enthroned as judges. It may also have featured trap doors for the graves out of which the righteous and the damned souls could have risen to receive their sentences. Heaven would have been situated on a higher scaffolding rigged out with moving mechanical angels, and the mouth of Hell on the street itself, in front of the wagon.

First a Pageant [wagon] with 4 wheels, Hell Mouth, 3 garments for 3 devils, 6 devils' faces in 3 Visors [i.e., masks], Array [i.e., costumes] for 2 evil souls, that is to say: 2 Shirts, 2 pairs of hose, 2 visors & 2 wigs, Array for 2 good souls, that is to say: 2 Shirts, 2 pairs of hose, 2 visors & 2 wigs, 2 pair of Angels' wings with iron in the ends, 2 trumpets of White plate, & 2 reeds, 4 Albs for 4

Apostles, 3 diadems with 3 visors for 3 Apostles, 4 diadems with 4 Wigs of yellow for 4 Apostles, A cloude and 2 pieces of rainbow [made] of timber, Array for God [i.e., Christ], that is to say: a Shirt wounded, a diadem, With a visor gilded, A great coster [i.e., hanging] of red damask painted for the back side of the Pageant, 2 other lesser costers for the 2 sides of the Pageant, 3 other costers of linen broadcloth for the sides of the Pageant. A little coster 4-squared to hang at the back of God. 4 Irons to bear up Heaven, 4 small cotter-pins & an Iron pin, a grate of Iron that God shall sit upon when he shall rise up to Heaven, With 4 ropes at 4 corners. A Heaven of Iron, with a hub of wood, 2 pieces of red clouds and stars of gold belonging to Heaven, 2 pieces of blue clouds painted on both sides, 3 pieces of red clouds, with sun beams of gold & stars for the highest of Heaven, with a long small border of the same Work. 7 great Angels holding the Passion of God [i.e., the symbols of Christ's Passion: crucifix, nails, crown of thorns, and so on], One of them has a vane of copper & a cross of Iron in his head, gilded. 4 smaller Angels, gilded, holding the Passion. 9 smaller Angels painted red to run about in the Heaven. A long small cord to make the Angels run about, 2 short rollers of wood to put forth the pageant.

**SOURCE:** "The Mercers' Indenture of 1433," in *Medieval Drama: An Anthology*. Ed. Greg Walker (Oxford: Basil Blackwell, 2000): 159. Text modernized by Carol Symes.

be treated as though they were Christ). These civic exhibitions of piety often began with the Creation and ended with the Last Judgment, and were produced over several days. In England, some communities attempted to perform this feat in a single day, beginning at dawn with the prehistory of mankind as described in Genesis, and ending late into the midsummer night with the bodily resurrection of the dead, the eternal damnation of sinners, and the salvation of the righteous. This was the case in the ancient city of York, where the pageant wagons carrying the actors and the scenery for individual plays followed a route that can be traced even today; each play would be performed several times at certain key locations. The props, costumes, and special effects were the jealously guarded property of the guilds that performed the plays, and particular roles may have been passed on from father to son over several generations. Moreover, the subject matter of a given play often said something about the guild, or its craft. At York, "The Last Supper" was performed by the bakers, whose bread became the body of Christ during their re-enactment of the first Eucharist; "The Crucifixion" was performed by

the pinners or nail-makers, samples of whose wares were on prominent display when Jesus was nailed to the cross.

## THE AFTERLIFE OF MEDIEVAL THEATER

**CIRCUMSCRIBING THE THEATER: ENCLOSURE, REGULATION, AND CENSORSHIP.** In 1598, John Stowe (1525–1605) published his *Survey of London*, a record of the city’s rich history, changing geography, and rapidly disappearing theatrical traditions. Among other things, he noted with regret the loss of traditional recreations, “which open pastimes in my youth, being now suppressed, worsor practices within doors are to be feared.” Citing William FitzStephen’s description of London, written four centuries earlier, Stowe devoted page after page to a description of the Christmas revels, Carnival celebrations, city festivals, athletic contests, religious processions, and plays which had been the focus of community life in the days before the Reformation. In one section in particular, he focuses on May games, describing first the pleasures of the “sweet meadows and green woods” and other pleasures of the season, and then providing detail about the nature of the celebrations themselves:

I find also, that in the month of May, the citizens of London of all estates, lightly in every parish, or sometimes two or three parishes joining together, had their several mayings, and did fetch in May-poles, with divers warlike shows, with good archers, morris dancers, and other devices, for pastime all day long; and toward the evening they had stage plays, and bonfires in the streets.

Some of those plays featured the exploits of Robin Hood and his men, who would entertain the company with “other pageants and pastimes.” These, despite the potential they afforded for stringent social commentary, continued to be popular in England. But other types of entertainment, particularly those plays associated with religious holidays like Corpus Christi, would be increasingly suppressed during the Reformation, when the Roman Catholic Church, with its emphasis on feast days, was being displaced by the new Church of England. By the end of the sixteenth century, the rulers of most Protestant countries were actively engaged in rooting out and destroying the theatrical traditions of the Middle Ages, which had become associated with “popish idolatry” and superstition. In Catholic countries, the Counter Reformation, a movement to suppress Protestant ideas, produced ironically similar results, as religious and secular authorities attempted to control and regulate plays that might potentially preach unsound doctrine or carry unsavory political messages. The advent of the printing press after 1450 also made it easier to control the reproduction and dissemination of texts; for although print made more and more plays available to a wider public,

Martyrdom of St. Apollonia reflecting dramatic staging. Jean Fouquet, Hours of Etienne Chevalier, Chantilly, Musée Condé MS 71 folio 39, 1445. GIRAUDON/ART RESOURCES.

this new technology also made effective censorship of these plays more efficient and more complete. These circumscriptions of medieval drama were matched by another new trend: the enclosure of theater itself, as plays were now confined to purpose-built structures that required the payment of admission. Not only was access to theater now limited to those who could pay, and performance of plays increasingly the province of a specialized acting profession, but the plays themselves had to be vetted and licensed by the authorities. Finally, the teachings of Renaissance humanism advocated a return to classical dramatic forms and the Aristotelian conventions of comedy and tragedy, which were now considered superior to the dramatic genres invented during the Middle Ages. Together, these modern innovations posed a threat to the continued survival of medieval theater.

**RECEPTION AND REVIVAL.** Yet varieties of medieval theater persisted, despite these strictures. Renaissance dramatists continued to use themes, characters, and devices borrowed from the plays they had grown up watching. William Shakespeare could well have witnessed the performance of a Corpus Christi cycle, possibly at Coventry, and would certainly have seen miracle and morality

*a PRIMARY SOURCE document***THE CENSORSHIP OF A MEDIEVAL PLAY**

**INTRODUCTION:** In 1567, the mayor and Council of York decided to seek expert advice. With the accession of Queen Elizabeth I in 1558, and the re-establishment of the Protestant faith in England, it was becoming increasingly dangerous to perform plays that might be construed as sympathetic to the Catholic Church. The most controversial of the Corpus Christi pageants was the “Creed Play,” and it was this pageant, in particular, that caused the men of York a great deal of anxiety. Therefore, they approached the dean of York Minster (cathedral), Matthew Hutton, and asked for his opinion as a theologian. He responded to them in a letter, excerpted below. Perhaps the best proof that the “Creed Play” was ultimately deemed too dangerous for public performance is the fact that it no longer survives: it appears that all extant copies were destroyed sometime after the receipt of this letter.

To the right honourable my Lord Mayor of York, and the Right worshipful his Brethren.

I have perused the books that your Lordship with your Brethren sent me, and as I find many things that I much like because of their antiquity, so see I many things that I can not allow, because they are Disagreeing from the sincerity of the Gospel, the which things, if they should be altogether cancelled or altered into other matter, the whole drift of the play should be altered, and therefore I dare not put my pen to it, because I want both skill and leisure to amend it, though in goodwill I assure you, if I were worthy to give your Lordship and your Right worshipful Brethren council, surely my advice should be that it should not be played. For though it was plausible forty years ago, and would now also of the ignorant sort be well liked, yet now in this happy time of the Gospel I know the learned will dislike it, and how the State will bear with it, I know not.

**SOURCE:** Matthew Hutton, Letter to the Mayor and Council of York, 1567, in *Medieval Drama: An Anthology*. Ed. Greg Walker (Oxford: Basil Blackwell, 2000): 206. Text adapted from Early Modern English by Carol Symes.

plays performed by troupes of traveling players. One such professional troupe performs “The Mousetrap” or play-within-the-play devised by Hamlet; a very different group of amateur performers stages “The most lamentable comedy and most cruel death of Pyramus and Thisbe” after Bottom the weaver recovers his senses (and loses his ass’s head) in *A Midsummer Night’s Dream*.

*a PRIMARY SOURCE document***MEDIEVAL THEATER IN THE NEW WORLD**

**INTRODUCTION:** After the Incident at Riga, it will come as no surprise that medieval drama was also used as a conversion tool to help complete the Spanish conquest of Mexico in the sixteenth century. Toward the end of that century, a native Aztec poet translated a Spanish sacred drama called *The Beacon of Our Salvation* into the indigenous Nahuatl language of his people, so that it could be performed by and for the new Mexican converts to Christianity. The Holy Week play is not only one of the oldest documents written in Nahuatl, it is the oldest surviving play in any Native American language. Like all translations, the resulting rendition demonstrates that it is not only words that must be translated, but entire concepts. In the excerpt below, Jesus says farewell to his mother, the Blessed Virgin Mary, explaining to her—and to the audience—why he must suffer crucifixion for the sins of mankind.

**SOURCE:** Louise M. Burkhart, *Holy Wednesday: A Nahuatl Drama from Early Mexico* (Philadelphia: University of Pennsylvania Press, 1996): 125.

The comedies of Molière, which still form the cornerstone of the repertoire of the Comédie Française, are essentially reworkings of medieval French farces. In Spain,

the Assumption play of Elche continues to be performed every year on 15 August. In the German village of Oberammergau, the entire population is required to perform the Passion Play staged every ten years since 1634. At York and Chester in England, and at Toronto in Canada, groups of performers drawn from local community theaters and universities regularly organize Corpus Christi pageants; in London, the National Theater of Great Britain has twice produced *The Mysteries*, a cycle of plays presented over the course of an entire day. Early music ensembles, beginning in 1958 with a landmark production of *The Play of Daniel* by New York Pro Musica, have found audiences increasingly receptive to medieval liturgical dramas; the works of Hildegard of Bingen have become perennial favorites, and her *Ordo virtutum* has been staged at the Cathedral of Notre-Dame in Paris and at the National Cathedral in Washington, D.C., among other venues. But medieval dramatic forms also influence modern theatrical genres, indirectly and directly. Mel Gibson's 2004 film *The Passion of the Christ* is one of the most obvious modern-day examples, but the "rock opera" *Jesus Christ, Superstar* by Andrew Lloyd Webber and Tim Rice is more closely based on medieval models. This is to say nothing of the ways that the humor, pageantry, cruelty, and humanity of medieval drama have contributed to the development of everything from television sit-coms to grand opera. In the end, medieval theater proved too elusive, too multi-dimensional, and too powerful to be eradicated by the more limited theatricality of the modern world.

## SIGNIFICANT PEOPLE *in Theater*

---

### GEOFFREY DE GORRON

c. 1080(?)–1146

*Schoolmaster*

*Abbot*

**FROM ACTOR TO ABBOT.** Geoffrey de Gorron (d. 1146), who in 1119 became abbot of one of the most

powerful monasteries in England, came to his religious career by a surprising turn of events. Born into an aristocratic family in Normandy (now part of northern France), Geoffrey appears to have been good-natured, somewhat accident-prone, and not especially ambitious. After working as a clerk and schoolmaster at the cathedral of Le Mans, he was eventually offered a job teaching in the new school founded by the abbey of St. Albans, across the channel in England. But he took his time getting there, and when he finally arrived at the monastery, he found that the job had been given to someone else. Undaunted, and probably too poor to afford the passage home to Normandy, Geoffrey opened his own school in the nearby village of Dunstable, and proceeded to indulge his real passion: theater. The chronicle history kept at St. Albans vividly describes what happened next.

While he was there, he put on a certain play about St. Catherine, the sort of play that we commonly call a "miracle play." And in order to enhance the production, he begged the sacristan of St. Albans to loan him some of the copes used by the abbey's choir, which he was allowed to borrow. And so he performed the play about St. Catherine. But it so happened that, the following night, the house of Master Geoffrey caught fire and was burned, and so were all his books, as well as the vestments he had borrowed. Not knowing how else to make amends for damage done to God's property, and that of St. Alban, he offered himself as a sacrifice to God, and assumed the habit of a monk at the monastery of St. Albans. And this is the reason why he always took so much care to compensate for the loss of the choir's copes, by making rich gifts to adorn the abbey in later years.

The chronicle goes on to say that, when Geoffrey was elected abbot some years later, he commemorated the events that had led him to the monastery by celebrating the anniversary of his ordination on the feast of St. Catherine, at which time he would treat the monks to a display of the new vestments he had commissioned for the abbey over the previous year.

**INSTRUCTIONAL THEATER.** Geoffrey's interest in theater and its instructional uses did not end when he was elected abbot. It was almost certainly Geoffrey who commissioned and designed the famous St. Albans Psalter, which contains, among other fascinating elements, the oldest copy of the dramatic Old French poem known as "The Song of St. Alexis" and the oldest script for a liturgical play performed, in many different versions, all over Europe. This is the *Peregrinus* play (The Play of the Pilgrim), based on the gospel story of two disciples' meeting with the resurrected Jesus on the road to Emmaus (Luke 24:13–29). The manuscript image

depicts the initial meeting of Luke and Cleophas with an unknown Pilgrim (they do not recognize Jesus) and uses some of the same stylized techniques as the manuscripts of Terence's comedies; however, the dialogue spoken among the characters seems to have been added as an afterthought, in alternating lines of red, blue, and green ink in the upper left-hand corner of the page. The following two pages in the Psalter complete the story in pictures, showing Jesus the Pilgrim sitting down to supper with the disciples and then his mysterious disappearance. No dialogue accompanies these images, since all of the important action takes place in silence.

### ARNOUL GRÉBAN

1420–1471

*Playwright*  
*Musician*

**A MYSTICAL DRAMATIST.** Arnoul Gréban, with his brother Simon, is one of the very few named authors of a medieval play of any sort and the first named author of a passion play. He wrote a *Mystère de la Passion* or *Mystery of the Passion of Christ*, a strongly visual, lyrical, and carefully structured work of some 35,000 lines containing music and involving a variety of literary styles such as the sermon form, the debate, and the lamentation; the play moves from comic to tragic in tone and back again. Passion plays of this kind were quite popular in France from the late thirteenth century (with the *Passion of Paulinus*) and were performed as late as 1549. More than 100 performances are recorded at French cities like Arras, Valenciennes, Angers, and Clermont-Ferrand in the Auvergne.

**A PLAYWRIGHT AND TEACHER.** Gréban was born in Le Mans in France, and seems to have been in religious orders, as he was a student of theology in the early 1450s at the University of Paris and a singer and a performer on the great organ of the Cathedral of Notre Dame at Paris. It was during this time as a teacher that he is believed to have composed the *Mystère de la Passion* in about 1451. Against a cosmic backdrop of a sort of Manichaean struggle—that is, a war between the principles of good and of evil—he set the passion of Jesus. The play is of great scope and takes in both Old and New Testament time, beginning with a Prologue describing the Creation and Lucifer's or Satan's rebellion against

God and his temptation of Adam and Eve through the serpent. The Trial in Heaven occupies Day 1 with sections on the Annunciation to the Virgin, the Nativity of Jesus, and his *enfance* or miracles of childhood (a very popular extra-biblical subject). Day 2 of the play concerns the preaching of John the Baptist, Jesus' public activities and ministry, his entry into Jerusalem on a donkey, and then his arrest by the Roman authorities. Day 3 is devoted to the earlier phases of the Crucifixion to the moment when guards are placed at the tomb. Day 4 is entirely occupied with the Resurrection and Christ's ascension to the heavens. Though the exact conditions of these performances are not known, there were at least three performances of Gréban's Passion before 1473 in Paris; it was adapted by a later French dramatist, Jean Michel, and was also performed in the 1490s in the city of Troyes. A lesser known play by Gréban concerns only the Nativity of Jesus, and with his brother Simon he seems to have written a *Mystère des Actes des Apôtres* in 62,000 lines treating the dispersion of the Apostles through many countries and with highly dramatic episodes of shipwrecks and martyrdoms. This last play was performed at Bourges and at Paris between 1536 and 1541.

**THE PASSION PLAY GENRE.** In addition to the stories of Jesus' passion recounted in the Gospels, passion plays were also based on a variety of extra-biblical materials such as the apocryphal Gospel of Nicodemus, the *Golden Legend* of Jacob of Voragine, and the *Meditations on the Blessed Mary*, as well as a popular French narrative poem of the late twelfth century called the *Passion des Jongleurs*. The early Passion plays, like the *Passion of Paulinus*, dramatize only the events of Holy Week, commencing the action with Jesus's entry into Jerusalem and concluding it with his resurrection and appearances to his followers, but later ones, such as Gréban's, could be much longer and more complex, forming part of what was called the Trial of Heaven, a sort of court proceeding in which God listens to testimony from personifications called Justice and Mercy about the deceptions of Satan on earth and finally agrees to send his son—through the incarnated Jesus—to ransom or redeem mankind. This Trial idea was codified and developed by the Passion dramatist Eustache Marcadé (d. 1440). The later Passion plays were very long, often requiring many days to perform, and Gréban's appears to have taken four days to complete. In smaller towns, the expanded forms of these plays in performance may have occupied the attentions of nearly all the adults of the community. As is true of medieval drama elsewhere, very few scripts contemporary with the Passion plays survive, as it appears they were memorized and only later written down. But

Gréban's *Mystère* exists in three complete manuscripts and several fragmentary texts.

## HILDEGARD OF BINGEN

1098–1179

Abbess

Composer

Playwright

**A MYSTICAL DRAMATIST.** Hildegard of Bingen (c. 1098–1179) is one of only a few of the men and women known by name who authored plays in the Middle Ages, and the only one about whom modern scholars have a substantial amount of information. Abbess Hildegard of Bingen, polymath and mystic, was the composer of the *Ordo virtutum* or “Service of the Virtues,” among many other works. Hildegard’s extraordinary life and achievements have attracted the attention of an extremely wide and varied audience—including medievalists, feminist critics, New Age spiritualists, historians of science, and fans of medieval music.

**AN ECLECTIC EDUCATION.** Hildegard was the tenth child born into an aristocratic family. She suffered from ill health throughout her life, and by the time she was eight years old her parents apparently decided that she should be dedicated to religion. She was entrusted to the care of a young anchoress called Jutta, who lived in seclusion in a cell attached to the Benedictine

monastery at Disibodenberg, near the German city of Speyer. There, Hildegard learned some Latin and also apparently received informal instruction in a wide and eclectic array of subjects, including medicine and the natural sciences. Above all, she learned the elements of musical composition, which she would later employ in her drama. At the same time, Hildegard began to experience the visions for which she would later become renowned. By the time Jutta died in 1136, Hildegard had acquired a secretary, the monk Volmar, to whom she dictated and described the visual and aural messages that came to her from God. In the ensuing decade, Hildegard attracted many young women to the tiny convent that had grown up around her, and by 1147 was actively in search of a new home for her burgeoning community.

**DRAMA IN THE CONVENT.** In the meantime, the fame of her visions and holiness had spread, and Hildegard began to preach in public, as well as to circulate her writings. These controversial activities brought her to the attention of the bishop of Mainz and also to that of Pope Eugenius III (r. 1145–1153), both of whom eventually declared her teachings to be divinely inspired and encouraged her to complete work on what is now recognized as one of the great mystical books of the Middle Ages, the *Liber Scivias*, roughly translated as “The Book on Knowing the Ways.” By 1150, Hildegard and her followers were established in a new and larger convent at Rupertsberg on the banks of the Rhine, near Bingen. It was here that Hildegard composed the *Ordo virtutum*, a drama about a female soul appropriately called “Anima” and her journey through life. This work is only one of many innovative liturgies, hymn sequences, and song-cycles intended for performance by her nuns. She also oversaw the copying of the books containing her writings and personally directed the production of the many manuscript images designed to illustrate these books and to capture the extraordinary visual qualities of her mystical communications with God. The color, vibrancy, and sensuality of these illuminations provide some indication of the qualities that must also have enriched the spectacle of performance in the convent.

**AN UNORTHODOX CAREER.** Hildegard died in 1179, and it was widely believed that she would be canonized as a saint. An official biography was produced, and a number of miracles were attributed to her. However, the late twelfth century was a time when the process of canonization was becoming highly politicized, and when control over this procedure had shifted from local authorities to the papal court. Official enquiries were conducted four times over the course of the next two

centuries but, on each of these occasions, objections to the orthodoxy of Hildegard's life and works were raised by various factions within the church. To this day, only a few religious communities acknowledge her sanctity and celebrate her feast on 18 September.

## DOCUMENTARY SOURCES in Theater

Adam de la Halle, *Jeu de la feuillée* or *The Play of the Bower* (c. 1276) and *The Play of Robin and of Marion* (1283)—The works of this dramatist and poet include a satiric drama set in contemporary Arras, naming and assigning recognizable traits to 49 citizens, and a musical comedy where spoken dialogue alternates with singing.

Jehan Bodel, *Play of St. Nicholas* (c. 1191)—This trouvère and minstrel composed the first non-biblical play written entirely in a vernacular language, Picard French. It is a dramatized miracle play celebrating the heroic victory of Christian forces over Moslems, called Saracens.

*The Castle of Perseverance* (1415)—This morality play, the oldest play text in Middle English, had 35 speaking parts and was designed to be performed in the round.

Hildegard of Bingen, *Ordo virtutum* or *Service of the Virtues* (1155)—The Abbess Hildegard composed this work for the nuns of her convent at Rupertsberg; it is one of many dramas she wrote mingling song, dance, and elaborate costumes to create special effects.

*Mankind* (1465)—One of the earliest scripts for a troupe of traveling professional actors, this morality play follows a representative human being through the problems and challenges of everyday life.

*N-Town Cycle* or *Ludus Coventriae* (1468)—This collection of 43 plays from the West Midlands region of England actually has no connection with the town of Coventry, after which the cycle was once named. Performed as early as the 1370s for the feast of Corpus Christi, sixty days after Easter, the plays portray the scope of Christian history from the fall of Lucifer to the Last Judgment.

*Pamphilus* (1140)—One of the most popular of the Latin comedies composed and performed in the monasteries, cathedral schools, and princely courts, this dramatic poem was copied so often that it gave its name to the word “pamphlet.”

*Play of Antichrist* (1160)—Composed and performed by the monks of Tegernsee Abbey, this play draws on the Christian teachings of the Apocalypse to dramatize the political career of Frederick Barbarossa, the Holy Roman Emperor.

*Sponsus* or *The Bridegroom* (1090)—This musical dramatization of the Parable of the Wise and Foolish Virgins (Matthew 25: 1–13), recorded at the abbey of Saint-Martial at Limoges (France), is the earliest liturgical drama in a vernacular language.

*The Towneley Cycle* (1500)—This collection of 32 English plays, which includes the excellent work of the so-called “Wakefield Master,” was copied into manuscript after 1500. These plays are considered among the most performable and “modern” in sensibility of all the English Cycle plays.

*The York Cycle* (1477)—Performed as early as 1376, the 48 pageants or separate episodes of this cycle were produced cooperatively between the City of York and its craft guilds. Since the city had no open spaces, the plays were performed as a procession of wagons stopped at designated stations.

## IMPORTANT EVENTS *in Visual Arts*

- 768 Charlemagne becomes king of the Franks, and the Carolingian era begins; cultural policy encourages opulent artistic production.
- c. 776 Abbot Beatus of Liébana in Spain begins writing an extended commentary to the biblical book of Revelations, which either in its original or in early copies incorporated a program of illustrations that was quickly reproduced.
- c. 780 Charlemagne's first book-painting workshop begins to produce illuminated manuscripts.
- c. 800 Vikings begin to invade England, Ireland, and the Continent. Their technically accomplished decorative metalwork will have an important impact on the visual arts.
- c. 870 The Lindau Gospels, with front cover of hammered gold, gems, and pearls, are created for Charles the Bald, whose death in 877 marked the end of the Carolingian era.
- 900 The Alfred Jewel, made of gold and enamel, is created for King Alfred of England.
- 908 The Victory Cross of Oviedo is presented to Oviedo Cathedral by King Alfonso III of León.
- 962 The German Imperial Crown is made for Otto I, who is crowned emperor by Pope John XII in Rome.
- 966 The New Minster Charter, the first illuminated manuscript of the Winchester school in England, is commissioned by Bishop Aethelwold.
- c. 985 A golden reliquary statue of St. Foy is newly decorated in south-central France.
- c. 998 A Gospel Book and the Lothair Cross are created for Emperor Otto III.
- 1016 The first Normans arrive in southern Italy, initiating a period of cross-cultural interaction in the visual arts.
- 1063 The Romanesque-style reliquary shrine of San Isidoro is installed to house relics newly transferred from Seville to León in Spain.
- c. 1080 The Bayeux Tapestry, commemorating and justifying the Norman invasion of England, is created.
- c. 1100 A marble relief of Abbot Durandus is installed in the cloister of the Cluniac abbey of Moissac, in Languedoc, France.
- 1111 Illuminated manuscripts of Gregory the Great's *Moralia in Job* are completed in three volumes for the Abbey of Cîteaux in France.
- c. 1133 An embroidered coronation mantle is created for the Norman king Roger II, crowned king of Sicily in 1130.
- c. 1135 A deluxe psalter (a collection of psalms) is illustrated for Queen Melisende of the Latin Kingdom of Jerusalem.
- c. 1140 Early Gothic style begins under patronage of Abbot Suger at Saint-Denis near Paris.
- c. 1156 The Stavelot Triptych is commissioned by Wibald, the Benedictine abbot of Stavelot (in modern-day Belgium).
- 1170 Abbess Herrad of Landsberg creates the *Garden of Delights* (*Hortus Deliciarum*), an encyclopedic work that includes some 636 illustrations.
- 1181 Nicholas of Verdun creates the Klosterneuberg altarpiece.
- 1210 The English natural scientist Roger Bacon, who will influence art through his interest in optics, is born.

- c. 1230 A *Bible moralisée*, an ambitious and lavishly decorated new kind of picture Bible, is made for Blanche of Castile and her son Louis IX of France.
- Villard de Honnecourt produces a sketchbook showing the influence of Aristotle and Aquinas in its use of basic geometry.
- 1252 The minting of the florin in Florence, Italy, introduces the first gold coinage of purely Western conception to Europe.
- 1260 Meister Eckhart, a German Dominican whose emphasis on Christ's suffering will influence devotional art, is born.
- 1280 The *Cantigas de Santa Maria* written for King Alfonso the Wise in Spain is a collection of some hundred songs in praise of the Virgin Mary, with narrative illustrations describing many of her miracles.
- c. 1295 Marco Polo returns to Italy from China and writes an account that is accompanied by images encouraging empirical knowledge of the world.
- 1307 Work begins on the tomb (Gloucester Cathedral) of Edward II of England.
- 1308 The Duccio *Maiestà* altarpiece in Siena, Italy, is commissioned.
- 1325–1328 Famous painter Jean Pucelle illuminates manuscript for Jeanne d'Evreux in France, introducing *grisaille* technique.
- 1330 The Röttgen Pietà, an example of the *vesperbildern* genre, is created in the Rhineland region of Germany.
- 1338 Ambrogio Lorenzetti begins painting a fresco, "The Effects [Allegory] of Good Government in the City and Country," for the Siena town hall.
- 1340 Altarpiece painting of St. Thomas Aquinas, an Italian Dominican theologian, is begun by artists in the circle of Simone Martini.
- 1349 Jean le Noir paints "The Three Living and the Three Dead" in the Psalter of Bonne of Luxembourg, France.
- 1356 The second decorative campaign of the papal palace begins at Avignon, France.
- 1364 Christine de Pizan, author and counselor to King Charles V of France, is born. Scenes from her books were important subjects for tapestry, manuscript illumination, and wall painting.
- André Beauneveu begins carving recumbent tomb figure of King Charles V of France.
- 1374 Geert Groote, a Flemish mystic, is converted. He will found the Brethren of the Common Life and promote the ideals of *Devotio Moderna*, which encourages meditation on the Passion of Christ and has a profound influence on devotional art.
- 1413 The Limbourg brothers begin painting the *Très Riches Heures* for Duke Jean de Berry of France.
- 1420 The illustrated *Book of Wonders* containing the travel accounts of John Mandeville and Marco Polo is created.
- The Master of Rohan paints the *Grandes Heures of Rohan* in France.
- 1423 An anonymous woodblock print of St. Christopher is produced in Germany.

## OVERVIEW *of Visual Arts*

**AN ERA OF RECONSTRUCTION.** The Roman Empire, which at its height encompassed most of Europe, disintegrated during the fourth and fifth centuries, and the culture of classical antiquity disintegrated along with it. The next thousand years, a period known as the Middle Ages, was an era of gradual reconstruction and original invention. During this time ambitious rulers consolidated former Roman and non-Roman territories into the various European states. Social and economic expansion accompanied this political process, and by the latter part of the Middle Ages, European civilization had reached a new height of cultural achievement, although in terms that were very different from those of ancient Rome. The visual art of this period is therefore, at its most fundamental, the art of a civilization rebuilding itself and redefining its social and political institutions. As the medieval economy expanded and developed, creating greater financial surpluses and more readily available resources, art became more abundant, more ambitious, and more technically refined.

**THE INFLUENCE OF CHRISTIANITY.** Also fundamental to medieval art is its predominantly Christian character. The Latin (western) and Greek (eastern) Christian churches emerged from their origins in the late Roman period to become the dominant religious and social institutions of medieval Europe. The word “Europe” was thought of in the Middle Ages not simply as an expanse of territory or a collection of kingdoms or states, but as Christendom, the realm of the Christian church. The visual arts, whether functioning in the service of the church or not, participated in a lively Christian culture and, more often than not, were formulated in expressly Christian terms.

**THE DEBATE OVER VISUAL IMAGES.** Church authorities continually sought to define the role of the visual arts in the Christian experience. In the early medieval period (850–1150) especially, heated debates over the proper use and significance of images were a testament to churchmen’s efforts to come to terms with a form of

visual expression that predated Christianity. Noting the pagan origins of the visual arts, some Fathers and Doctors of the church, like Tertullian (c. 160–225) and Augustine (354–430), condemned the use of visual imagery within the church as inappropriate and idolatrous. The most radical among them followed a policy of iconoclasm, the actual destruction of images. Others, such as Pope Gregory I (or “Gregory the Great,” c. 540–604) defended the value and significance of images and art objects within a Christian context, citing biblical precedents such as Solomon’s Temple, with its sumptuous and divinely sanctioned decoration. Variations on these two basic positions (for and against visual images) appeared in the writings of church leaders and reformers throughout the early Middle Ages, and such discussions provide important insight into medieval understandings of the visual arts. But regardless of the often theoretical debates of churchmen, the arts flourished, providing a visually stunning record of cultural achievement.

**POLITICS AND PATRONAGE.** During the early part of the Middle Ages, one of the most distinctive cultural phenomena was the influence of powerful rulers who acted as patrons seeking to express their ambitions and political ideals in visual terms. Unlike the works of later periods that were often created by artists who then hoped to sell them on the open market, early medieval art objects owe their existence to the beneficence of individuals who generally had something to gain by their patronage of the arts. The art itself, produced typically in royal or monastic workshops, stands as a record of the political agendas and cultural policies of those individuals.

**CULTURAL SYNTHESIS.** Early medieval art can also be viewed as a synthesis of the different cultural traditions that found expression in the visual arts and elsewhere. The Romans passed on to the early Middle Ages the remnants of a highly developed visual tradition which, together with the visual heritage of the various Germanic and Eastern peoples who settled in Europe, was transformed into something essentially new. But during these early centuries the art also retained more or less visible traces of the different visual traditions to which it was indebted. Only later, from about 1200 onward, did there emerge a European visual art that fully transcended its origins as a mixture of separate artistic legacies.

**THE BEGINNINGS OF THE “MODERN.”** By the end of the twelfth century, the rebuilding and reorganization of social and political institutions since the collapse of the Roman Empire was largely accomplished. The visual arts of this period demonstrate a new level of aesthetic confidence and technical mastery. They also manifest a transformation undergone in order to adapt to changing

conceptions of the state, of society, of God, of the physical world, and of the relationship of the individual to each of these. Many of the developments that we tend to think of as characterizing the Renaissance in European art and culture—the renewed interest in classical antiquity, the more scientific observation of nature, the pursuit of more naturalistic ways of depicting the world—in fact have their origins in the later Middle Ages. It would not be an overstatement to say that during the period from about 1050 to 1400, many “modern” institutions came into existence. The modern nation-state has its origins in the royal states consolidated under monarchs like King Philip Augustus of France (r. 1180–1223) and King John of England (r. 1199–1216). Representative government, international commerce and finance, university learning, vernacular literatures (that is, those in the newly developing non-Latin languages), exploration and colonization of distant lands, and many other practices and institutions familiar in the modern age can be traced to this dynamic period in the history of Europe.

**NEW SOCIAL AND INTELLECTUAL INFLUENCES.** In the visual arts, the later Middle Ages witnessed a significant “modernization” as well. Beginning in the thirteenth century, visual art could sometimes express a “national identity”—for example, writers of this period became conscious of “national” art, and the terms *opus francigenum* (French work) and *opus anglicanum* (English work) can be found in written sources from the period. The arts also reflect, in their attention to details of nature, the new Aristotelian learning of the twelfth and thirteenth centuries, and iconographic programs are often more complex and comprehensive. Philosophers like Thomas Aquinas and Albert the Great applied the rules of logic and rational analysis to the interpretation of Scripture and the natural world, and their methodology broke large categories of experience into many smaller ones. This approach allowed abstract subjects like theology to be subdivided into concrete elements that provided a virtual handbook of figures and ideas that artists could express in paint, glass, stone, wood, and other media. Art production itself, while still located in courtly workshops as it was during the early Middle Ages, increasingly leaves the monastic setting for the new, professional lay (non-religious) workshops located in towns and cities, often in particular areas of a city which became devoted to that craft through intermarriage among members of artisan families. There was a much more socially diverse audience for art than was the case in the early Middle Ages, and patrons of art also come from different segments of society: royal, aristocratic and middle class, lay and religious, urban and rural manorial, male and female.

**THE GOTHIC STYLE.** Although artistic styles varied greatly over time and from place to place, the term “Gothic” has been used for some 500 years in reference to the arts (and to the architecture as well) produced during the later Middle Ages and until the onset of the Renaissance. In fact, “Gothic” was an adjective first used by Renaissance humanists as a pejorative term for the late medieval style that was thought of as “monkish”—inferior and barbaric next to the new Renaissance classicism, essentially a revival of Greek and Roman rules of simplicity and clarity. (The Goths, as one of the migratory Teutonic tribes that settled in western Europe in the early medieval period, were blamed for the downfall of classical civilization, but they actually had nothing to do with the style that later took their name.) One of the principal characteristics of Gothic art, when compared to visual art of the earlier Middle Ages, is its greater and more consistent reliance upon nature as inspiration and model. This “naturalism” or “realism” has a connection to the rediscovery of ancient Greek philosophical texts treating the physical world, preserved over the centuries by Muslim scholars and newly translated from Arabic into Latin in the later twelfth century. The philosophical, logical, and scientific writings of Aristotle, in particular, spurred medieval scholars to examine the natural world more closely, and the arts expressed this newfound interest. Artists increasingly sought to visualize the world and human experience during the later Middle Ages, and there was less discussion—even among churchmen—about the legitimacy or appropriateness of visual images than was the case in earlier centuries. One could increasingly take for granted that the visual arts now had their place. Of course, to the medieval mind, which understood nature as God’s creation (and art as human invention), “naturalism” in art was always tempered with the authority of inherited artistic practices (a conservatism that helped ensure some measure of continuity over time) and the inevitability of ornament.

**A THEMATIC VIEW.** Because the explosion of art production in many centers, media, and social contexts makes a strictly chronological and geographical account of later medieval art impractical, it is perhaps most productive to discuss the art of the mid-twelfth through the mid-fifteenth centuries according to certain thematic categories having to do with the political, intellectual, social, and spiritual realms of human experience. Within each of these categories it is possible to consider a range of examples from the visual arts, and, indeed, most works can be discussed in terms of two, three, or even all four of these categories of experience, which suggest not only the many motivating circumstances that contribute to the production of art, but also its potential audiences and

## MEDIEVAL Art Terms

---

**Altarpiece:** A devotional, religious work (painting or sculpture) placed usually on or above a church altar (where the Mass is celebrated). It can depict one or several different scenes, the imagery usually referring to the doctrine of the Mass or to the saint to whom the church or chapel is dedicated. It can include one or multiple panels (can be a *diptych* with two panels; a *triptych* with three; or a *polyptych* with more).

**Arch:** An architectural formation that spans an opening in such a manner that the weight of the material is converted into outward thrusts, carried to the sides and then down along flanking columns, piers, or buttresses. The *rounded* arch was common in ancient Rome and in Romanesque Europe and is made from wedge-shaped blocks. The *Gothic* or *pointed* arch forms a central point above. The *Ogival* (or *Ogee*) arch is formed by double curved lines (like two S-curves mirroring each other) that meet at a point.

**Benedictine monastery:** Monastic house or community of monks adhering to the Rule of St. Benedict.

**Christendom:** The extent of Christianity on earth, often configured in the Middle Ages as a series of Christian states.

**Enamelwork:** The artistic use of enamel, a substance formed from colored glass particles that are melted and fused, usually to a metal surface. *Champlevé* enamel is a process whereby the substance is poured into grooves that are previously engraved into the metal surface, so that the hardened enamel is flush with the surface of the metal. In *cloisonné* enamel, the substance is poured into compartments formed by a network of metal bands such that the exposed tops of the bands serve to divide the areas of colored enamel.

**Filigree work:** Fine metalwork created using tiny beads or very fine threads of metal to create the effect of delicate, lacelike, openwork ornament.

**Grisaille:** Monochrome painting, usually in tones of gray, found especially in stained glass and painted altarpieces (and sometimes illuminated manuscripts, textiles, etc.) from the later Middle Ages.

**Iconic:** The quality of a visual image or object that is generally static, frontal, and non-narrative.

**Iconography:** The pictorial representation of a subject, especially when comparing the particular character of a represented subject to the complete visual record of that subject throughout the history of art; also the study of the meaning of the subject matter of visual images.

**Illuminated manuscript:** A manuscript (that is, handwritten book) with hand-painted decoration or illustrations, usually employing silver, gold, and different colored pigments.

**Lancet window:** A tall, narrow window usually ending in a sharply-pointed arch and found mainly in Gothic architecture.

**Niello:** A metalwork process whereby a design is engraved in a metal surface and then filled with a black alloy of sulfur with gold, silver, copper, or lead and then fused with heat.

**Pilgrimage:** A journey made usually for spiritual reasons, to reach a particular shrine or sacred place; a pilgrim is one who makes such a journey.

**Pinnacle:** A small, decorative turret or end of a spire, buttress, or other such architectural element, generally pointed, conical, or pyramidal in shape.

**Repoussé:** Relief (that is, raised) decoration on a metal surface produced by hammering from the underside.

**Rose Window:** A large, circular stained-glass window placed centrally above the portal(s) on the façade of a Gothic church.

**Scriptorium:** The workshop found especially in abbeys and monasteries where manuscripts are copied and decorated.

**Tracery:** Ornamental, openwork sculptural decoration, in wood or stone, found especially above Gothic windows and on screens or panels.

effects. Thus, while these themes do not refer to separate categories of works as they were understood by medieval people, collectively, the examples chosen will encompass the range of places (England, France, Spain, Flanders, Germany, and Italy), social contexts (royal, aristocratic, middle class, secular, religious, urban, manorial, male, female), and artistic media (wood, stone, ivory, metalwork, enamelwork, illuminated manuscripts, prints, tapestry, fresco, and panel painting) that together describe the world of the visual arts in the later Middle Ages.

## TOPICS in Visual Arts

---

### THE CAROLINGIAN RESTORATION OF ROMAN CULTURE

**CHARLEMAGNE AND THE RESTORATION OF EMPIRE.** The first enduring attempt at a restoration of

Roman culture since the fall of Rome was accomplished under the rule of Charles the Great (768–814), king of the Franks, known to history as Charlemagne (Carolus Magnus, in Latin; the “Carolingian” dynasty was named for Charlemagne and his grandfather, Charles Martel or Carolus Martellus). One of the many migrant Germanic tribes that came from the east to settle in early medieval Europe, the Franks were able to consolidate their power into a kingdom (more or less corresponding to present-day France, Germany, and the Benelux countries [or Belgium, the Netherlands, and Luxembourg]) of formidable size and strength. Charlemagne’s ambition was stated on his royal seal—*renovatio Romani imperii* (restoration of the Roman Empire)—and in the realm of politics as well as culture and the arts, he expressed the spirit of a classical revival, a trend that would continue into the following centuries with art objects such as the processional Lothair Cross (c. 1000, today in the Schatzkammer of the Aachen Dom), which features a cameo with a portrait bust of the emperor Augustus in the center of the cross’s triumphal side. Politically, Charlemagne sought to make his rule a continuation of the western empire of Rome and a counterpart to the great Byzantine Empire of Constantinople, the eastern part of the late Roman Empire and center for Greek Orthodox Christianity. He took a major step toward this goal when, on Christmas Day in the year 800, he had himself crowned emperor in Rome by Pope Leo III.

**DECORATED BOOKS.** Charlemagne and his successors, from their capitals in Aachen (in present-day Germany) and elsewhere, developed a cultural policy that depended upon the opulent and aristocratic artistic heritage of the Roman and Byzantine imperial courts. Books were an important part of the literary, intellectual, and religious culture of the Carolingians, and manuscripts that were beautifully illuminated (illustrated with colored and gilded pictures) and adorned (provided with richly decorated covers) represent the peak of achievement in the visual arts during this time. In Latin manuscripts—copied in a stately round, wide, and highly legible script called Carolingian minuscule and decorated in royal and monastic workshops—Carolingian notions of sacred kingship and courtly refinement were strongly expressed. Some of the most extravagant of these books—usually copies of the Gospels according to Matthew, Mark, Luke, and John, intended for use by the emperor—had covers made of gilt silver and precious stones or of ivory panels carved in relief in the Byzantine manner.

**THE LORSCH GOSPELS.** An excellent example of such a work of decorative art is the preserved back cover of the Lorsch Gospels, produced in about 810. It is composed of five ivory panels carved in relief and arranged

## THE Making of an Illuminated Manuscript

In the Middle Ages, each book, or *codex*, was made by hand through the collaboration of several skilled craftsmen under the direction of a designer who oversaw the whole work. The creation of an illuminated manuscript was time-consuming and expensive, and took place within a monastic *scriptorium* or a royal workshop in the earlier Middle Ages, or else a professional, lay workshop in a later medieval town. First, in the earlier period before paper was introduced (around 1350), the scribe must choose parchment or vellum made from animal skin (calf, goat, sheep) that has been prepared by cleaning, scraping and dipping in lime, then drying and stretching. The object was to create a smooth surface, free of blemish. The next step was cutting the parchment into double leaves (*folios*) of appropriate size and assembling the double leaves into *quires* or gatherings of a fixed number of pages that could be distributed to different artisans for the next stage of work. Next, a layout person would rule the pages and create spaces for pictures in which the designer would add brief notes to guide the scribe(s) and illuminator(s). At this point the scribe begins the copying of the text, usually working from a written exemplar, and he or another scribe, called a *rubricator* (from the Latin *rubeo*, meaning “red”) puts in the large red or blue letters that indicate divisions of the text. The decoration is carried out by one or more illuminators, who follow the designer’s explicit instructions as to subject matter of illustrations, type, and extent of decoration in initial letters, borders, margins, full-page illumination, etc. Different skilled artisans carry out different parts of the decoration, from the underdrawing to the illumination of figures and scenes, to the foliate (ivy or acanthus leaf) decoration, to the application and burnishing of gold foil. Sometimes a *colophon* is included at or near the end, with the completion date and the name of the scribe (and sometimes the names of the illuminators). Then the various gatherings are sewn together in the proper order and the manuscript is bound in thin boards with vellum or leather covering.

so that the Virgin and Child appear in the center flanked by the figures of Zacharias and John the Baptist, with a scene of the Nativity below and two angels supporting an image of Christ in Majesty above. The iconography

or image-types depicted, as well as the style of carving and the use of the luxury material ivory all suggest an interest in emulating the sumptuous art of the Byzantine imperial court. A full-page illumination depicting the evangelist John contained within a gospel book executed for Charlemagne around 800 demonstrates how the royal painting workshops very often depended upon classical Roman models. Not only does this image hark back to antiquity in its naturalistic treatment of the human figure, but it also adopts the antique motif of the author portrait in its representation of John as author of his gospel. Such artistic masterworks as these ivory panels and this manuscript painting showcase the abilities of Carolingian craftsmen and express a clear cultural policy of classical revival and courtly opulence.

**THE LINDAU GOSPELS.** Luxury book covers, executed in metal and precious stones, conveyed a similar sense of courtly magnificence and sacred kingship. The front cover of the Lindau Gospels is a prime example of such work. Both the central figure of the crucified Christ (the prototype of the “sacred king”) and the angels and mourners hovering above and below the arms of the cross were created by hammering designs into sheets of gold,

a technique known as *repoussé*. The rigid symmetry of the composition as well as the use of gems and pearls set within the gold cover are a fine example of how the sacred, royal art of the early Middle Ages was meant to communicate a particular idea in powerful and unambiguous terms. It was also meant to flatter the royal patron (in this case the Emperor Charles the Bald) and impress the members of his court, since it clearly encouraged imperial pretensions and implied that the ruler was worthy of such a magnificent object.

**THE MONASTIC INFLUENCE.** Benedictine monasteries had a particularly important role to play in the elaboration of the visual arts of the period, in no small part because of the royal support of Benedictine monastic houses within the Carolingian Empire and emphasis on the Rule of St. Benedict in preference to other monastic rules. This was true especially under the rule of the Carolingian king Louis the Pious (814–840), who endowed major monastic foundations at Reims, Metz, and Tours (all in present-day France), each of which produced some of the most important decorated manuscripts that have survived. The portrait of the evangelist St. Mark in the gospel book of Archbishop Ebbo of

## MONASTICISM and the Production of Medieval Art

Christian monasticism began with the hermit monks, individuals who left society behind to lead ascetic lives—that is, lives of self-denial—in the wilderness, devoted to prayer. Most influential were the Egyptian desert fathers of the late third and early fourth centuries, such as St. Anthony of Egypt and St. Paul the Hermit. Loose communities began to form around some of these figures, and established communities of monks were commonplace in the West by the fifth century. The monastic rule written by St. Benedict of Nursia in the sixth century for his monastery in Monte Cassino, Italy, became standard throughout the West. This Rule sought to regulate all aspects of monastic life and assigned to each monk his place, from the abbot on down to the novice. The production of visual art, especially in the form of manuscript illumination and metalwork, was among the types of manual labor practiced by the monks. In part because of the great success of Benedictine monasticism—especially after its institutionalization under Carolingian rule—many different religious figures began to take issue with the growing wealth and worldliness of the Benedictines, leading to various efforts at monastic reform.

The most important early reformed community was that of Cluny, founded in Burgundy in 910, although the

great wealth and power amassed by the Cluniacs during the eleventh century precipitated another wave of reforms, including that of the Carthusians, established in Cologne in 1084, and the Cistercians, founded in Burgundy around 1100. To a greater or lesser degree, such movements sought a more ascetic existence that was closer to the model of the early hermit monks. Debates over appropriate forms of Christian monasticism often focused on the “problem” of the sumptuous and highly refined art produced by some communities, which, it was argued, distracted the faithful and represented a misuse of needed funds. The major reform movement of the later Middle Ages was the creation of the mendicant orders, initially the Franciscans (1210) and Dominicans (1216). These friars and preachers renounced all worldly goods and dedicated themselves to serving society at large. Thus, they were not bound to particular monastic houses but circulated more freely and became integrated into society at all levels. Dominicans, for example, often served as royal confessors and took an active role in the struggles against heresy, and mendicants played an important role in the life of medieval universities and in the study of medieval theology, philosophy, and mysticism. Despite their vow of poverty and their commitment to live lives more in accordance with Christ’s own example, the mendicants were in fact not monks and the period of their rise in influence (and that of other non-monastic religious orders) coincided with the decline of more traditional monasticism in the medieval period.

Reims (816–835) shares with the portrait of St. John—from one of Charlemagne’s personal copies of the gospels—a dependence upon a classical formula, but the more dynamic and expressive style hints at the creative vigor of monastic artists of the period, especially in the strong lines of the garment folds. A similar linear dynamism and pictorial inventiveness can be seen in the illustrations to the famous Utrecht Psalter (a book of psalms used during the Liturgy of the Hours), also from the Reims school of manuscript decoration. Once again, the style of the drawings (like the minuscule script modeled on what the scribe imagined was “Roman” writing) are unmistakably classical in inspiration, though the images, which provide literal illustrations to the text of the psalms, are without precedent in late Roman wall and book painting. In a detail from Psalm 11, the figure of Christ literally rises up and steps out from the confines of his divine aureole (a circle of light around the head or body of a divine being) in illustration of the text: “For the oppression of the poor, for the sighing of the needy, now will I rise, said the Lord.” Below that, the wicked

actually “walk round about,” again in a playful and literal response to the text. These few examples from the visual art of the Carolingian period give a sense of the ingenuity of Carolingian artists; they point to the centrality of luxury books within the religious, intellectual, and political culture; and they represent the early medieval adaptation of artistic techniques (in metalwork, ivory carving, and manuscript painting) inherited from classical antiquity.

Portrait of King Alfred, The Alfred Jewel, probably intended to be the top of a royal scepter. England, 900. THE ART ARCHIVE/ASHMOLEAN MUSEUM, OXFORD/EILEEN TWEEDY.

## ENGLAND AND THE VIKINGS

**THE RISE OF ENGLISH UNITY.** The empire of the Carolingians began to decline after the monarchy of Louis the Pious (814–840), but its artistic influence was felt for centuries to come, often far outside its borders. England, settled by the Germanic tribes known as Angles and Saxons, developed a political model of sacred kingship that was based on Old Testament precedents and that was dependent upon the official sanction of Christian churchmen, just as Carolingian kingship had been. This early medieval notion of sacred kingship implied that the authority of the church was exercised through the person of the king or emperor, whose claim to both political and religious authority was based on the precedent of the Old Testament kings and, more recently, the Frankish (or Carolingian) emperors of Rome. It was an accommo-

modation between spiritual and temporal authority that served the interests of both, as each sought to gain legitimacy and power by association with the other. The “golden age” in early medieval English culture is usually associated with the reign of King Alfred the Great (871–899) of the royal house of Wessex, the unifier of the various Anglo-Saxon kingdoms in their defense against the invasions of the Vikings. A Scandinavian people not yet converted to Christianity, the Vikings raided and looted all over western Europe in the ninth century, destroying many wealthy monastic houses but invigorating interregional trade in early medieval Europe through their establishment of routes along which their precious booty (slaves as well as gold and silver) was exchanged for goods from the East. The Vikings, and in particular their technically accomplished and decorative metalwork, had an important impact upon the visual arts in Western Europe.

**THE ALFRED JEWEL.** The Alfred Jewel, made from gold and enamel and probably intended to be the top of a royal scepter, reveals quite a bit about the state of the visual arts in England around 900. First, there is the connection of this object to a king. The arts would not have flourished as they did in the early Middle Ages were it not for the sponsorship of rulers, who saw the propaganda value of art and often lavished great resources upon the royal and monastic workshops that produced all sorts of luxury objects. Second, an inscription around the edge of the Alfred Jewel reads “Alfred ordered me to be made,” an attribution that demonstrates the general anonymity of the early medieval artist in contrast to the all-importance of the (royal) patron. Additionally, the style and craftsmanship of the jewel shows the way that different cultural traditions were often combined in the creation of works of art: the goldwork resembles that of the Vikings, who specialized in small-scale portable objects in metal, stone, and wood and were especially known for detailed and decorative metalwork, while the half-length enameled figure of the ruler is based on earlier English indigenous traditions of semi-abstract figure drawing. The Carolingian (and more Roman) impact on the visual arts in England is not yet evident in the Alfred Jewel, but would appear soon in the illuminated manuscripts of the tenth century.

**MONASTIC CENTERS OF ILLUMINATION.** King Alfred presided over a flourishing and vibrant court culture, and in the manner of Charlemagne he invited scholars from all over the continent to come to his court and work under his patronage. Because monasteries were the preservers of the intellectual heritage and many of these had recently been destroyed or looted by the Vikings in the ninth century, Alfred and some of his successors helped to rebuild monastic libraries in England in the tenth and eleventh centuries. Illuminated manuscripts, therefore, constitute an important part of the artistic legacy from England in the early Middle Ages. Important schools of manuscript illumination sprang up in cathedral centers like those of Canterbury and Winchester, thanks to the efforts and patronage of church leaders like St. Dunstan (d. 988), the abbot of Glastonbury and later the archbishop of Canterbury, and St. Aethelwold (d. 984), a monk at Glastonbury who was made bishop of Winchester.

**THE NEW MINSTER CHARTER AND BENEDICTINAL OF AETHELWOLD.** The first known work of the new Winchester school of manuscript decoration shows the close relationship between pictorial imagery and accompanying text. The book called today the New Minster Charter was commissioned by Bishop Aethelwold in 966 to commemorate the introduction of Carolingian-style

King Edgar between the Virgin and St. Peter offering the Charter to Christ. Frontispiece, New Minster Charter, London, British Library MS Cotton Vespasian A. viii, fol. 2v, c. 966. BRIDGEMAN ART LIBRARY.

monastic reform (focused on eliminating “worldly” behavior) into a Winchester monastery. The frontispiece of the charter depicts King Edgar between the Virgin Mary and the Apostle Peter, the two patron saints of the abbey. Edgar is shown extending the charter—a document outlining and confirming the royally granted holdings and privileges of a monastery—up to the enthroned Christ, visualizing the royal donations made to the abbey by the king on this occasion. The accompanying text says, “Thus resides on his heavenly throne he who created the stars. The devout King Edgar humbly adores him. King Edgar issued this privilege to the new monastery and, with praise, granted gifts to the almighty Lord and his mother Mary.” Just as monastic reform was introduced to England from France, so too were later Carolingian traditions in manuscript illustration brought to England and adapted to local tastes, as shown by this image. In the 970s Aethelwold ordered a lavishly decorated benedictional (a book containing blessings spoken by the bishop during the Mass) in which each major feast is accompanied by a pair of full-page illustrations. The illustration

of the Baptism of Christ demonstrates further how Carolingian traditions in manuscript illumination found new life in the vibrant monastic houses of Anglo-Saxon England. The figures of Christ, John, and the angels, as well as some of the narrative details (like the water), are rendered in a linear style reminiscent of the French “Reims Cathedral” school, but the complex color scheme and the profusion of leafy ornament that literally bursts out of the frame indicate a rising interest in decorative embellishment and a new artistic complexity.

## SPANISH CULTURE AND THE MUSLIMS

**PROMOTING THE RECONQUISTA.** Like their counterparts in England, the tenth-century rulers of the Chris-

tian kingdoms of Spain were consolidating power in the face of enemy resistance and developing a visual culture of ornament and symbols to express their political aspirations. Muslim forces had crossed from northern Africa into Spain in the year 711 and proceeded to defeat the Visigoths, a Germanic people converted to Christianity who had ruled Spain until that time. After the Muslim conquest of most of Spain, the Christian territories occupied only the northernmost and northeastern parts of the Iberian Peninsula. Here, Christian rulers held their ground against Muslim incursions and gradually expanded the area of their control. Clinging to the hope that all of Spain would one day be united under Christian rule, as it was before the Muslim conquest, Christian rulers in Spain developed the notion of the Christian Reconquest of Spain (*Reconquista*), and they sponsored a program of visual arts to advance this notion. From liturgical objects (objects used in church services) created out of precious materials to illuminated manuscripts of Bibles and other religious texts, the arts of early medieval Christian Spain proclaimed Christian victory to be inevitable. In the Christian kingdoms of Asturias, León, Castile, and Navarre, these luxury arts combined established Visigothic visual traditions with Carolingian influences, as well as artistic motifs and styles derived from the neighboring Islamic culture.

**THE VICTORY CROSS OF OVIEDO.** The royal ideology of Christian Reconquest is clearly evident in the spectacular Victory Cross of Oviedo, donated in 908 by King Alfonso III of Asturias to the cathedral of Oviedo, and probably made a few years earlier. This fine object draws upon the tradition of the cross as an image of Christian victory, which originated in the fourth century with the Roman Emperor Constantine (who was told in a dream that he would defeat his enemies “under this sign”). As an object of richness and beauty, it perfectly showcases the artistic splendor and magnificence that in the early Middle Ages was the aesthetic counterpart to the Christian idea of worldly triumph in its figural embodiment. The iconography of this cross displays no humility or poverty, virtues often associated with Christianity in other contexts.

**APOCALYPTIC IMAGERY.** Monastic communities in Christian Spain, just as in Carolingian France and Germany, and Anglo-Saxon England, played a major role in the elaboration of the visual arts. As scribes and illuminators of decorated and illustrated manuscripts, Spanish monks developed a recognizable visual language that was the unique expression of their culture. An illustration from a manuscript produced around 950 is a fine example. The work is an illustrated commentary on the Book of Revelation, also known as the Apocalypse of St.

John in the modern New Testament. The text of this commentary was compiled before 800 by a Spanish monk known as Beatus of Liébana, and, as the idea of Christian Reconquest picked up momentum in the tenth century, it was expressed anew in the monastic houses of the Christian north through extensive programs of illustration. The apocalyptic theme of these books may have appealed to monks of the time, who imagined the Christian Reconquest of Spain as an apocalyptic battle between good and evil. An illustration from one manuscript of the Beatus Commentary, perhaps produced for the monastery of San Miguel de Escalada in the kingdom of León, shows the Heavenly Jerusalem, a mystical vision presented in highly schematized (rather abstract and diagrammatic) form. The visual language of intense color and ornamental flatness—for the image lacks any suggestion of naturalistic or three-dimensional space—hearkens back to some Visigothic precedents but may also be understood in relation to the very impressive and influential art of Islamic Spain. Islamic art is noted for its geometric patterns, its profusion of ornament, its rich colors, and its general avoidance of figuration because the Koran forbade the reproduction of human and animal forms in art as idolatrous. Of course, in such Beatus illustrations, the inclusion of human (and divine) figures indicates a specifically Christian point of view. The decorative and somewhat formulaic presentation provides an effective way to express in pictorial form a text that is full of mystical imagery.

**MOZARABIC INFLUENCE.** Also typically Spanish in such illustrations of the Heavenly Jerusalem is the “horseshoe” arch that often frames the figures arranged around the central square or circle. This is an architectural form common in Islamic Spain and certainly familiar to those Christians, known as “Mozarabs,” who had lived under Islamic rule before coming north to the Christian kingdoms in the tenth century. The Mozarabs brought their knowledge of Islamic culture and artistic traditions along with them, and the image of the Heavenly Jerusalem is an example of how those traditions were incorporated into the visual art of Christian monasteries in tenth-century Spain. Another example of Mozarabic influence can be found in a Beatus manuscript from about 970, made for the monastery of San Salvador at Tábara in the kingdom of León. The image on the colophon page (at the end of the manuscript where the scribe provides identifying information about his involvement in the production) shows the same architectural feature—the horseshoe arch—in the representation of the tower and scriptorium of the monastery. In this earliest surviving image of a medieval scriptorium (where manuscripts were copied by hand and sometimes deco-

Vision of the Lamb surrounded by 4 Evangelists and 12 Elders. Commentary on the Apocalypse of Beatus of Liébana, Pierpont Morgan Library MS M 644, folio 87, 950. THE PIERPOINT MORGAN LIBRARY/ART RESOURCE, NY.

rated), the scribes named “Emeterius” and “Senior” are hard at work. It is a testament to the cultural importance of monasteries such as this one that the likely creators of this illuminated manuscript are known to us by name.

**COMMON ELEMENTS.** The ongoing struggle between Christianity and Islam in medieval Spain clearly was (and continued to be) a significant factor in the development of unique and often hybrid artistic forms. Yet the visual art of early medieval Spain shares many commonalities with other artwork being produced outside of Spain during the same period: its undeniably Christian character; its royal and/or monastic context of production; its relationship to earlier and contemporary artistic traditions; and its ambitions, which at this early stage in the history of medieval Europe sometimes exceeded the level of technical ability or the availability of wealth and resources.

## REVIVAL OF EMPIRE IN GERMANY

**THE OTTONIANS.** Although the Carolingian Empire lasted hardly a hundred years, the mantle of empire was passed in the tenth century to a dynasty of rulers from Saxony, in Germany, known as the Ottonians (after “Otto,” the name used by three of them). These rulers styled themselves “Roman Emperors” and very self-consciously attempted to recapture the power and prestige of Rome and Constantinople for their reigns, just as Charlemagne had done. In the sumptuous production of the cathedral and monastic workshops (which were supported by imperial donations), precious metalwork objects, carved ivory panels, and deluxe manuscripts speak of the Ottonian reign as decreed by God, and, in particular, they show a strong debt to Byzantine artistic practices. Like Charlemagne, the Ottonian rulers were formally recognized by the Byzantine emperors and the two realms were soon connected by marriage ties. Byzantine visual arts and fashions of all kinds were imitated by Ottonian artists and court officials. This imperial art in the center of Europe, with its impressive synthesis of Carolingian, Byzantine, and other, especially Roman, traditions, would play a major role in the elaboration of the early Romanesque style by the mid-eleventh century.

**THE IMPERIAL CROWN.** In its material and symbolic richness, the German Imperial Crown fashioned for the coronation of Otto I as emperor in 962 (and used as well by subsequent German emperors) is a wonderful example of German imperial art of the early Middle Ages. Its eight arched golden plates form an octagon, in deliberate reference to the architecture of Charlemagne’s palace chapel in Aachen. The many gemstones and pearls arranged on the eight plates make explicit reference to the number and distribution of pearls and gems on the walls of the Heavenly Jerusalem as described in the biblical Book of Revelation. The symbolic schema applied to the construction of this crown therefore serves both to associate Otto’s rule with that of his famous Carolingian predecessor and also to lend biblical authority to that rule. The crown’s structure and arrangement of parts clearly demonstrate that monastic artists of the time could combine their masterful craftsmanship with their scriptural and theological knowledge. In this way a work of medieval art also becomes a document of medieval learning and culture in a broader sense.

**THE LOTHAIR CROSS.** The Lothair Cross, a work created around the year 1000 for processional use or for

## BYZANTINE Visual Arts

In the year 330 the Roman emperor Constantine founded a new capital at an ancient site in Asia Minor (modern-day Turkey) known as Byzantium. Here at this strategic location on the eastern frontier of the empire he set out to reconstitute the city of Rome, thus establishing a tradition of magnificence for his new capital, renamed after himself, “Constantinople” (modern Istanbul). When the Roman Empire split in 395 into a western half and an eastern half, Constantinople became the capital of the latter, a vast empire with borders that, by the sixth century, extended as far as North Africa and Italy in the west and the Caucasus and northern Mesopotamia (modern Syria and Iraq) in the east. After the fall of the Western Roman Empire in the late fifth century, it was the Eastern Roman Empire, known today as the Byzantine Empire, that would carry forward into the Middle Ages the memory and the traditions (especially legal and administrative) of Roman antiquity.

Byzantine civilization, however, was distinct from that of ancient Rome. Its language was not Latin, but Greek, and its unique form of government, elaborate court ceremonial, famous material refinement, and distinctive national church (Greek Orthodox, not Roman Catholic) all helped to keep the Byzantine Empire separate from, and alien to, the culture of Latin Christendom in Western Europe. The Byzantine visual arts—painted icons, silks, mosaics, enamels, and illuminated manuscripts—were celebrated in the medieval West for their beauty, richness, and high degree of technical development. The commercial supremacy of Byzantium insured that its luxury goods (especially silks, spices, and jewelry) would be known all over the world. For the less highly developed civilization of western Christendom, Byzantium was the standard of courtly sophistication and cultural achievement (as were the Islamic court cultures centered in Córdoba and Baghdad from the eighth century onward). The visual arts of Byzantium were therefore admired and emulated at various times throughout the western Middle Ages, and it was in particular the Byzantine emphasis on the human figure in art that made that civilization such an important link between the arts of classical antiquity and those of the Renaissance. When the empire finally fell to the Ottoman Turks in 1453 (over eleven hundred years after it was first established), it was the end of what had been the longest-lived state in medieval Europe.

display on the church altar during a mass before an imperial audience bears a clear relationship to earlier examples such as the Spanish Victory Cross of Oviedo. With its very different front and back configurations, however, the Lothair Cross expresses the dual, antithetical character of medieval Christianity. On the one side, a simple linear engraving of the dead Christ on a silver ground embodies the notion of the cross as an instrument of suffering and death. On the other side, an array of jewels upon a golden ground proclaims Christ's victory over death and recalls the magnificent, visionary images of the cross as an apocalyptic sign of Christian triumph. Early medieval art objects and images were very often designed in this way so as to negotiate between such antithetical concepts as luxury and austerity; biblical past and apocalyptic future; time-bound narrative and eternal symbol. The Roman cameo with its portrait bust of the emperor Augustus, set in the center of the cross's triumphal side, provided a worthy model for the imperial rule of the reigning emperor, Otto III (983–1002). It also illustrates the interrelationship between religion and politics that was crucial in the configuration of so much early medieval art.

Emperor Otto III enthroned and flanked by ecclesiastical and civil dignitaries. Dedication miniature, Gospel Book of Otto III. Munich, Bayerische Staatsbibliothek MS CLM 4453, folio 1, 997–1000. THE GRANGER COLLECTION.

**THE GOSPEL BOOK OF OTTO III.** Ottonian artists were equally accomplished in the field of manuscript illumination, and this pictorial medium was just as important as metalwork objects in expressing the ideals of the Ottonian emperors and bishops who commissioned particular manuscripts. The deluxe Gospel Book of Otto III is a case in point. Upon opening the jewel-encrusted golden cover, with its inset carved ivory panel, one finds a painted ceremonial portrait of the emperor and members of his court spread across two full pages. The very formal, frontal depiction of the larger-than-life emperor hearkens back to late Roman and early Christian ruler portraits. His large scale and central placement with respect to his attendants (bishops on his right, secular lords on his left) indicates his place at the top of the hierarchy and his sovereignty over both church and state. The four female figures that approach in homage on the facing page are personifications of the four provinces of the empire bearing tribute for the emperor. In early medieval painting as in metalwork or sculpture, any attempt at naturalism is generally subordinated to the symbolic or hieratic (traditional) expression of key ideas in unambiguous terms. Naturalism did exist in early medieval art, but not in any absolute sense, and always in tension with non-naturalistic modes of representation.

## THE CULT OF SAINTS AND THE RISE OF PILGRIMAGE

**AN INVESTMENT IN PILGRIMAGE ART.** Although the concept of Christian pilgrimage to a sacred site was almost as old as Christianity itself, pilgrimage as a social phenomenon in medieval Europe increased dramatically during the tenth and eleventh centuries as more people visited traditional shrines where saints' relics had long been venerated. A relic is what's left of a saint, either a part of the body (a tooth, an arm, a skull, some blood, etc.) or an article of clothing or other accessory (ranging from Christ's own Crown of Thorns to a shoe or garment belonging to the most minor of saints). Such holy objects, increasingly in the possession of churches, cathedrals, and abbeys all over Europe, were venerated by members of all social classes who attributed to them a divine power. Their custodians preserved and honored these relics by creating beautiful containers, known as reliquaries, to house them.

**THE IMPACT OF PILGRIMAGE.** The impact on European culture and visual art of this new flourishing of the cult of saints is difficult to overestimate. Whether pilgrims traveled to fulfill an oath, to seek a cure for an illness, to gain the favor of a particular saint, or as an act of penance, they spent money along their journeys and gave donations at local shrines. Recognizable by their large brimmed hats, walking sticks, and food bags called scrips, pilgrims collected small tokens or badges at shrines along the way, which they could bring home as souvenirs of their journey. Fundamentally a spiritual endeavor, pilgrimage also became a big business in the eleventh century, stimulating the economy and motivating secular rulers and monastic communities to invest heavily in the visual arts associated with the cult of saints. Thus, in addition to new and larger churches along the major pilgrimage routes designed to accommodate greater numbers of pilgrims, this period witnessed an explosion of metalwork and enamelwork reliquary containers for saints' relics; illustrated books narrating the lives and miracles of saints; other decorated religious books such as Bibles and psalters; and liturgi-

cal vestments and vessels used for the performance of the Mass before ever-larger crowds of Christian pilgrims. The powerful abbey of Cluny in Burgundy, France, promoted the growth of pilgrimage across Europe and profited immensely, while kings and bishops found political as well as economic advantage in supporting and endowing popular shrines with costly art objects.

**RELIQUARY SHRINE OF ST. FOY.** A wonderful example in many ways is the golden reliquary statue of St. Foy (or Foi), currently in the Cathedral Treasury of Conques, in south-central France. Foy was a martyr saint, a young girl executed by the Romans for her Christian beliefs. Her relics were brought to the abbey of Conques in the later ninth century. During the expansion of pilgrimage to Conques in the tenth century, the monks there actively promoted the cult of this saint and over time built for her relics a magnificent statue-like container (which was embellished further in the centuries afterward). Gold sheeting was laid over a wooden core, and a metal crown and throne were added along with the jewels, antique cameos, and gold filigree work that adorn the garment. The head is actually a late-Roman parade helmet, readapted for this new purpose. The resulting representation of the saint is a powerful object of

## PILGRIMAGE to Santiago de Compostela

Pilgrimages in the Middle Ages were such an important part of the general culture that they were represented in a wide range of art forms, including sculpture, jewelry, and manuscript illumination. One of the most famous pilgrimage sites in Europe was the shrine of St. James of Compostela in the mountains of what is now northwestern Spain. According to Christian legend, the apostle James the Greater evangelized Spain before his martyrdom in Asia Minor and his body was subsequently returned to Spain for burial. In the early ninth century, the hidden or forgotten grave was discovered at a site known as Compostela, and King Alfonso II of Asturias ordered the construction of a church at the site, designating it a cathedral. Almost immediately, pilgrims from other regions journeyed to the shrine, such was the importance of the cult of St. James, or Santiago. Within Spain, St. James came to stand for the ideal of a Spain made fully Christian again (since the Muslim conquest of most of the peninsula in 711). He became the patron saint of the Christian "Reconquest" of Spain. The traffic of pilgrims from all over Europe to the shrine of Santiago de Compostela increased dramatically over the next two centuries (in line with the general increase of pilgrimage activity in Europe) until by about 1100 the cathedral of Santiago was one of the three most important pilgrimage centers in Latin Christendom, along with St. Peter's in Rome (where the relics of St. Peter were preserved) and the Church of the Holy Sepulchre in Jerusalem (site of Christ's own—empty—tomb). The volume of pilgrims necessitated a bigger church, and a new Romanesque cathedral was erected over the early medieval church. A description of the new

structure can be found in the *Pilgrim's Guide to Santiago*, written before the middle of the twelfth century.

As was the case with pilgrimage routes elsewhere, commerce prospered with the increasing flow of pilgrims. Economic expansion due to pilgrimage brought about the growth of towns along the route and encouraged rulers and wealthy landowners along the way to capitalize on the traffic by promoting the cults of local saints and patronizing the arts associated with pilgrimage. Thus, the major routes through France and Spain to Santiago can be traced today from one pilgrimage church to another, through once-thriving town centers and along major monastic foundations. In the visual art of the Middle Ages, pilgrims can be recognized by the walking staffs and srips or food sacks that they carry with them. Pilgrims to Santiago also wear the signature scallop shell of St. James on their cloaks, hats, and bags. One of the most interesting phenomena associated with the shrine was the invention of the pilgrim souvenir, in the form of a pewter badge that pilgrims could take away with them as evidence that they had completed their pilgrimage. Decorated with the motif of the scallop shell, such badges were mass-produced in an effort to keep pilgrims from dismantling the shrines themselves, but they also served the purpose of identifying pilgrims who could then receive both safe passage through dangerous territories and the charity that aided their travel. The badges also became an important source of income for the shrine, and many people believed they had healing powers, especially when they were made of fine metals and embellished with gems. So familiar were these souvenirs that images of the badges were often painted in a highly realistic *trompe l'oeil* manner in the margins of Books of Hours to look as if the actual objects were attached to the page.

devotion, and as an image of sacred authority (following the ancient Roman visual tradition of seated authority figures), it was an effective visual aid in the abbey's campaign to solicit donations in gold from the surrounding region. Some of the donations were used in the creation of this exquisite reliquary, but most of the abbey's income from this campaign was used for trade and other projects. The St. Foy statue thus represents and visualizes the very straightforward economic power of the reinigorated cult of saints, just as it suggests how the devotional power of a relic could be enhanced by the creation of a work of visual beauty to contain it.

**ENAMELWORK RELIQUARIES.** Less magnificent and imposing but still very fine and much more abundant were the box- and casket-reliquaries composed of metal plates

(sometimes over a wooden core) decorated with enamel panels, such as a twelfth-century container for a fragment of the True Cross (the cross upon which Christ was crucified) that seems to have been made specifically for the church of Saint-Sernin in Toulouse, France. The figures decorating the box are labeled by name and tell the story of the relic's journey from the East to Saint-Sernin. On the lid is an image of Christ in glory. The beauty of the container with its fine craftsmanship and colorful surface suggests the importance and value of the relic within. The two main centers for the production of such small, portable enamelwork objects beginning in the twelfth century were Limoges, in central France (where the Saint-Sernin reliquary was produced), and the Mosan region in the Rhine and Meuse River valleys. The type of enamelwork seen in the Saint-Sernin reliquary is known as

*a PRIMARY SOURCE document***A RELIQUARY AND A CHALICE AT ST. ALBAN'S**

**INTRODUCTION:** Although there are not many written descriptions of art works during the Middle Ages, there were numerous records of the building of churches and cathedrals, some of which also included mention of the treasure of the church. The following passage from the chronicle of the abbey of St. Alban's in Hertfordshire, England, describes the origins, crafting, and purposes of a reliquary and a chalice, with some appreciation of how the shape and ornamentation were conceptualized, as well as a show of contemporary pride in their possession and display.

Abbot Simon [1167–1183] of pious memory started to collect from that time, zealously and with foresight and wisdom, a considerable treasure of gold and silver and precious stones, and to fashion the outside of the repository which we call a reliquary or *feretrum* (than which we have seen none finer at this time), undertaken by the hand of Master John, goldsmith and most excellent craftsman. He completed this most painstaking, costly, and artistic work most successfully within a few years. He placed it in a prominent position, namely above the main altar, facing the celebrant, so that anyone celebrating Mass at this altar would have before his eyes and in his heart the memory of the Martyr [Saint Alban]; thus facing the celebrant was portrayed the martyrdom, that is, the beheading. Moreover, around the reliquary, namely on the two sides, he had clearly depicted a series from the life of the Blessed Martyr, which consisted of his passion and the preparation for his passion, with raised figures of gold and silver, which is embossed work (commonly called relief). On the main side, which faced east, he reverently placed the image of the Crucified with the figures of Mary and John in a most

fitting arrangement of divers jewels. On the side facing west he portrayed the Blessed Virgin enthroned and holding her child on her lap, an outstanding work surrounded by gems and precious jewels. And thus, with a row of martyrs arranged on both sides of the lid, the reliquary rises to an elaborate and artistic crest; at the four corners it is beautifully and harmoniously shaped with windowed turrets covered by crystals. In this [reliquary] then, which is of extraordinary size, is appropriately enclosed the reliquary of the Martyr himself (being, as it were, his own chamber in which his severed bones are known to be contained), a fitting repository first commissioned by Abbot Geoffrey. ...

The same Abbot Simon also had made and bestowed to his everlasting renown, and to the glory of God and the church of the Blessed Martyr Saint Alban, a great golden chalice than which we have seen no finer in the kingdom of England. It is of the best and purest gold, encircled by precious stones appropriate to the material in such a work, made most subtle with a delicate and fine composition of interwoven flowers. This chalice was made by Master Baldwin, a preeminent goldsmith. He also had made by the hand of the same Baldwin a small vessel, worthy of special admiration, of standard yellow gold, with jewels of divers priceless kinds fitted and properly placed on it, in which "the artistry surpassed the material;" this work was to hold the Eucharist, to be hung over the main altar of the Martyr. When this became known to King Henry II, he sent with joy and devotion to the church of Saint Alban's a most splendid and precious cup in which was placed the repository immediately holding the body of Christ. ...

**SOURCE:** William Durandus, *The Symbolism of Churches and Church Ornaments: A Translation of the First Book of the Rationale Divinorum Officiorum*. Trans. and Eds. John Mason Neale and Benjamin Webb (Leeds, England: T. W. Green, 1843): 17–30.

*champlevé*, created by a process in which the desired forms and lines are engraved into the metal surface and filled with colored glass powder, which is then heated until it fuses, producing a glass-like surface. Such works were exported all over Europe, helping to promote the veneration of relics while contributing to a greater uniformity of style and iconography in the visual arts of the period.

**THE THRONE OF WISDOM.** Another important benchmark in the rise of European devotional culture is the increasing presence of sculpted representations of the Virgin Mary (or the Virgin and Child), usually on church altars. One striking twelfth-century example carved in wood illustrates a specialty of the Auvergne region in central France. With its rigid frontality and rather abstract ren-

dering of drapery and other details, this statue and others of its kind were meant to project an iconic presence and to convey a theological notion of the Virgin as "Throne of Wisdom" (*sedes sapientiae* in Latin). Such objects often doubled as reliquary containers, and they flourished in churches along the pilgrimage roads. The expression of stern authority and devotional intensity of this Virgin and Child is clearly related to that of the St. Foy statue. It is this period, in fact, that witnesses the return of monumental figurative sculpture which had been generally absent in European art since the fall of the Roman Empire.

## ROMANESQUE ART: AN INTERNATIONAL PHENOMENON

**AN AGE OF SURPLUS.** Until the eleventh century (and so, throughout the early medieval period), the visual arts in western Europe were an index of a young civilization's efforts to recapture a former grandeur and to express the ideals of the developing culture of Latin Christendom. Beginning around the end of the first Christian millennium (and certainly by the mid-eleventh century), European culture and the visual arts reached a new plateau and entered into a wonderfully rich and fertile period that we have come to call "Romanesque." The historical factors underlying this cultural development are well known. Improved agricultural technology helped to bring about an historic expansion of the European economy and society in the eleventh century. Old centers of production were revitalized, interregional trade increased (as did the use and circulation of gold and silver coinage), and populations grew. Unprecedented surpluses, controlled by the landed aristocracy, made possible the burst of building activity and art production that is associated with the Romanesque period, the beginning of what might be called the "High Middle Ages."

**THE ROMANESQUE STYLE.** The art-historical designation "Romanesque" was first used in the nineteenth century to describe the architecture of eleventh- and twelfth-century Europe, which, with its rounded arches, barrel vaults, and columns with decorative capitals, seemed derivative of ancient Roman architectural forms. Today the term Romanesque is used to describe the general style of the visual arts from the period. For the first time since ancient Rome, a genuinely international movement in the visual arts is apparent, united by common forms, subjects, and styles and stretching across the regions that now comprise England, France, Spain, Germany, and Italy. The arts reached a new level of coherence in the integration of Roman, Byzantine, Carolingian, Ottonian, and Islamic traditions. The imperial art of Germany was an especially important influence with its Byzantine connections and its powerful visual language, while the explosion of pilgrimage activity helped to establish pathways throughout Europe over which artistic styles and techniques could be spread.

God creating Adam detail from silver gilt relief reliquary shrine of San Isidoro, Spain, 1063. THE ART ARCHIVE/REAL COLLEGIATA SAN ISIDORO, LEÓN/DAGLI ORTI.

While the renaissance of Charlemagne in the Frankish Empire around 800, or of King Alfred the Great in England around 900, represented the ambition of a ruler to project a higher level of civilization, the Romanesque era was more than a projection; European civilization legitimately began to rival both Byzantium and Islam in terms of cultural development and sophistication. The visual arts—sculpture in stone and wood, metalwork, textiles, manuscript illumination, and mural painting—bear witness to this remarkable achievement.

**THE RELIQUARY SHRINE OF SAN ISIDORO.** The Reliquary Shrine of San Isidoro in León is a good example of how royal sponsorship helped to bring about the production of what may be considered the earliest known Romanesque reliquary shrine. In its monumentality of conception and execution, it anticipates works of the following century. The occasion for the creation of this shrine was the defeat of the Muslim forces at Seville and the capture of that city by King Fernando I of León in 1063 (a major advance in the Christian Reconquest of Spain). The prized relics of San Isidoro (who was something of a Spanish national saint) were transferred at this time from Seville in the south to León in the north and deposited in a church that was rededicated to the saint. The ideological importance of the relics

Marble cloister pier relief of Abbot Durandus of Brédon, bishop of Toulouse. Church of Saint-Pierre, Moissac, France, 1100. PETER WILLIAMS/BRIDGEMAN ART LIBRARY.

within the kingdom of León and the political importance of the occasion warranted the creation of the gilt silver container. The five scenes from the biblical book of Genesis (two additional scenes have been lost) as well as the figure of Fernando I appear on plaques that adorn the shrine. The choice of scenes and particular compositions recall both Carolingian Bible illustration from the Tours school and figurative bronze work from the Ottonian era (specifically a set of bronze-relief doors from Hildesheim in Saxony). The decorative silks lining the casket are of Islamic origin, their re-use a customary practice for Christian reliquary containers in Spain.

**ABBOT DURANDUS AT MOISSAC.** The effectiveness of so much Romanesque art in conveying a sense of political authority by drawing upon powerful, iconic modes of representation is well illustrated by an image of Abbot Durandus from about 1100, carved in low relief on the central marble pier in the cloister of the abbey

St. George and the dragon initial, Gregory the Great, *Moralia in Job*. Dijon, France, Bibliothèque Municipale MS 168, folio 4v, 1111. THE ART ARCHIVE/BIBLIOTHÈQUE MUNICIPALE, DIJON/DAGLI ORTI.

church of Saint-Pierre, in Moissac (southwest France). This church, an important stop on one of the major pilgrimage roads, was a key outpost of the powerful monastic order of Cluny. It was reformed according to the Cluniac Order by Durandus, who ruled the religious community there as abbot from 1047 to 1072. This marble slab, erected later in his memory, commemorates the period of his rule and serves as a visualization of the authority that was so important within a monastery. This sense is conveyed by the rigid symmetry and frontality of the figure and by the ceremonial vestments and gesture. In its position facing the room where the monks regularly held meetings, this image functioned very well as a reminder of the abbot's supremacy. Romanesque art does not always display such rigidly abstract qualities; in fact the period after 1100 saw the spread of a more dynamic expressiveness in many works of visual art. But the close physical connection between the figure of Durandus and the architectural frame enclosing him (and also the structural support upon which he appears) is very characteristic of the Romanesque aesthetic.

Harold II King of England assisting Duke William, later William I the Conqueror, to escape from quicksand near Mont Saint-Michel, France, Bayeux Tapestry, France, 1080. THE ART ARCHIVE/MUSÉE DE LA TAPISSERIE, BAYEUX/DAGLI ORTI.

**THE CISTERCIAN MORALIA IN JOB.** The close relationship between figure and support was even more creatively explored in the realm of manuscript illumination, a much more fluid medium. Text and image were often conflated in “historiated” or “inhabited” initials, in which the form of a letter provides space and structure for one or more figures to appear and to act out scenes related to the text. An example is the initial “R” from the title page of an early twelfth-century manuscript of the *Moralia in Job*, a well-known commentary on the Old Testament Book of Job composed centuries earlier by Pope Gregory the Great. The title *Moralia* indicates the “moralities” or allegories of New Testament events Gregory found contained in the story of Job. Literally occupying the space within the letter is a dragon confronted by a sword-wielding knight who stands upon the back of a lance-wielding soldier or servant. The monastic community responsible for the production of this manuscript and its decorations is that of the new Cistercian Order, founded in 1098 in Cîteaux (in Burgundy, France) by Benedictine monks who op-

posed what they saw as the worldly excesses of the Cluniac Order (the leading order of Benedictine monasticism). They wished to live a more austere life closer to the model of the early Christian hermit monks, and their outlook eventually carried over into the visual art (and architecture) that they produced. By the time this manuscript was completed in 1111, the Cistercians’ most rigorous strictures regarding the artistic embellishment of books and other objects had not yet been enforced (although there is a conspicuous absence of gold leaf, and there are no full-page illustrations within). Decorated initials such as this one were seen by the monastic audience in terms of spiritual meanings; in this case the fight between dragon and knight represented the spiritual struggle of the monks over evil impulses. Although involved in a scene of strenuous action that might seem to call for a realistic style, the figures are depicted with fantastically proportioned bodies and decorative, stylized clothing characteristic of the Romanesque. Naturalism here is clearly subordinated to a scheme that is decorative and made to literally “fit” the text it embellishes.

*a PRIMARY SOURCE document***BERNARD OF CLAIRVAUX ON THE VANITY OF SACRED ART**

**INTRODUCTION:** The following is an extract from a letter written in 1125 by St. Bernard (Bernard of Clairvaux, 1091–1153) to the monk William of Thierry, in which he builds upon the early Christian critiques of sacred art production in offering an elaborate complaint against what he argues are the excesses and the inappropriateness of art in a monastic context. Bernard was a leader of the new Cistercian Order of monks, a group that formed in reaction to the more permissive and worldly Benedictine orders, which were associated with the sponsorship of artistic works and monuments. This critique of the Benedictine (especially Cluniac) approach to the visual arts in a sacred context was written in 1125.

Their eyes are feasted with relics cased in gold, and their purse-strings are loosed. They are shown a most comely image of some saint, whom they think all the more saintly that he is the more gaudily painted. Men run to kiss him, and are invited to give; there is more admiration for his comeliness than veneration for his sanctity. Hence the church is adorned with gemmed crowns of light—nay, with lustres like cartwheels, girt all round with lamps, but no less brilliant with the precious stones that stud them. Moreover we see candelabra standing like trees of massive bronze, fashioned with marvellous subtlety of art, and glistening no less brightly with gems than with the lights they carry. What, think you, is the purpose of all this? The compunction of penitents, or the admiration of beholders? O vanity of vanities, yet no more vain than insane! The church is resplendent in her walls, beggarly in her poor; she clothes her stones in gold, and leaves her sons naked; the rich man's eye is fed at the expense of the indigent. The curious find their delight here, yet the needy find no relief. In short, so many and so marvellous are the varieties of divers shapes on every hand, that we are more tempted to read in the marble than in our books, and to spend the whole day in wondering at these things rather than in meditating on the law of God. For God's sake, if men are not ashamed of these follies, why at least do they not shrink from the expense?

*a PRIMARY SOURCE document***ARTISTIC TECHNIQUES FROM DIFFERENT LANDS**

**INTRODUCTION:** This extract is from *De diversis artibus* (On Divers Arts), considered the foremost medieval treatise on the arts of painting, stained glass, and metalwork techniques. It was written around 1125 in western Germany by a certain Theophilus, who is tentatively identified with the goldsmith Roger of Helmarshausen from Lower Saxony. As a defense of the liturgical and decorative arts, the treatise offers a response to St. Bernard's critique of sacred art. It argues that art for liturgical purposes follows God's own specifications, and that the work of artists aware of this religious significance is an inspired spiritual activity that imbues the whole process of making and using liturgical art with a dignity transcending decorative concerns. The passage excerpted here from the introduction presents the author's claim to include descriptions of artistic techniques from all over the known world.

Wherefore, gentle son ... covet with greedy looks the "Book on Various Arts," read it through with a tenacious memory, embrace it with an ardent love.

If you scrutinize this book most diligently, you will find the mixtures and kinds of various colors which they use in Greece; whatever Russia knows about the crafts of enamels and niello; how Arabia is distinguished by skill in repoussé or casting or open-work; how Italy decorates vessels with gems and gold and excels in carving of ivory; how France delights in the precious tracery of windows; and whatever subtle Germany appreciates in the fine working of gold, silver, copper, and iron, and in wood and precious stones.

**SOURCE:** Theophilus, *De diversis artibus*, in Robert Hendrie, *An Essay Upon Various Arts, in Three Books by Theophilus, called also Rugerus, Priest and Monk* (London: John Murray, 1847): 1. Translated by John Block Friedman.

**THE BAYEUX TAPESTRY.** The relationship between text and image is just as important in the 231-foot-long "Bayeux Tapestry," which is technically not really a tapestry at all but an embroidery on linen. Commissioned in the 1080s, it features a continuous pictorial narrative relating the story of the Norman conquest of England in 1066. This secular work, apparently unique, follows very closely the written narrative account of the conquest by William of Poitiers, the chaplain of the victorious Duke

William of Normandy. Captions throughout identify figures and scenes. In one section, for example, the Earl Harold of England can be seen accompanying Duke William of Normandy on his military campaign in Brittany; another section shows the Battle of Hastings, where William's forces defeated Harold and paved the way for William's ascent to the English throne. Meant largely as a justification for the Norman Conquest and subsequent rule over the English, this monumental work draws inspiration from the ancient Roman tradition of the continuous picture roll, which similarly served a political function. The combination of forms, colors, composition, and iconography marks this work as distinctly Romanesque. It is also worth noting that the Bayeux Tapestry shares with other Romanesque works a certain focus on the contest for power and authority (whether secular or religious). Interestingly, its theme and its lively narrative have appealed to more modern military leaders and would-be conquerors (such as Napoleon and Hitler, who sought to study this work), just as its abundant imagery continues to inspire new art-historical scholarship.

### ART AT THE CULTURAL FRONTIER IN THE TWELFTH CENTURY

**A MULTICULTURAL ART.** Interregional trade in luxury and art objects helped make it possible for Romanesque art to synthesize many different visual languages. But there were also particular regions where Latin Christians from Europe coexisted or came into frequent contact with members of other cultures, and these points of contact were important in giving Romanesque art its international character. Spain continued to be a frontier region where Christians and Muslims intermingled, sometimes sharing in a common artistic culture. In southern Italy and Sicily, a dynasty of Norman rulers presided over “a kingdom of the Two Sicilies” in which Latin, Greek (Byzantine), and Islamic traditions all had a share in defining the local culture. The eastern Mediter-

## WEAVING and Embroidery

Because they were so often damaged or destroyed through use, exposure, or some other calamity, medieval textiles have not survived in numbers indicative of their actual importance for medieval culture. Decorative woven and embroidered textiles were used most often in the creation of ceremonial vestments (for bishops or secular rulers) or for large wall-hangings and floor-coverings.

Weaving is a process used in the production of carpets, tapestries, and other textiles, and is carried out on a loom. The structure of vertical threads is known as the warp; the weft refers to the horizontal threads woven across to form the pattern or decoration. Different artisans were involved in the design and execution of a piece of artistic weaving. A famous example is the series of tapestries illustrating the Apocalypse commissioned in 1376 by Louis of Anjou for the decoration of his castle. A master weaver named Nicholas Bataille was commissioned to do the work, but he in turn ordered designs to be drawn up by the king's painter, Jean Bandol of Bruges.

Embroidery is a needlework technique in which designs are sewn in a fine material (like silk) onto a support made of another material, such as wool, cotton, or linen. The most famous example of a medieval embroidery is the improperly named “Bayeux Tapestry.” It is a 70-meter long strip of linen embroidered in dyed wool with narrative scenes relating the story of the Norman conquest of England in 1066 in great detail—over 50 scenes with more than 600 human figures. This example is unique; more common were the many decorative textiles used for liturgical purposes by priests and bishops. English embroidery became well known throughout later medieval Europe as *opus Anglicanum*. An example is the Chichester-Constable Chasuble, a velvet vestment worn during performance of the Mass and probably made for Edward III (r. 1327–1377), whose family emblem appears in the top portion of the decoration. Embroidery on the back of the vestment, done in gold, silver, and silk threads adorned with seed pearls, depicts scenes from the Life of the Virgin.

anean—the Holy Land—was another crucible of cross-cultural interaction where Latin Christian crusaders, Byzantine Christians, and Muslims fought each other and yet gained knowledge of each other's traditions in the visual arts. Sometimes, art objects produced by one

Christ crowning King Roger II of Sicily, Mosaic, St. Mary's of the Admiral (Martorana) church, Palermo, Sicily, Italy, 1151.

culture were taken and reused in a new context by another culture. Some hybrid art forms (Christian or Islamic? Latin or Greek?) carried across Europe through trade, war, or diplomacy were expressive of this medieval multiculturalism. With such a rich and cosmopolitan art scene in twelfth-century Europe, the stage was set for the advent of the more complex, intellectually sophisticated, and naturalistic visual art of the later Middle Ages.

**NORMAN SICILY.** The Normans, who had recently invaded and conquered England, established dominion over Sicily in the early twelfth century and founded a state which became a major power in the Mediterranean basin. The mantle for the coronation of the Christian king Roger II, created between 1133 and 1134, is a work of Islamic art made by Muslims in the royal workshop in Palermo (as its Arabic inscription states). It features a central Tree of Life flanked by lions attacking camels, a common hunting motif that signified royal power and dominion. What is meant by the commissioning and ceremonial employment of Islamic art by a Christian king? A comparison with the Spanish situation is in-

Cast bronze Griffin, Museo delle Opera del Duomo, Pisa, probably Fatimid Egypt, 11th–12th centuries. SCALA/ART RESOURCE, NY.

structive. Christian kings of Spain brought back Islamic textiles or carved ivory caskets (often produced at the caliph's court in Córdoba) as spoils of war and then often incorporated them into Christian shrines (as in the Reliquary Shrine of San Isidoro). This sort of hybridization in the arts, however, must be seen in the light of the ongoing military struggle between the two communities and the practice of despoiling one's enemy and then neutralizing enemy symbols by re-contextualizing them. In Norman Sicily, Muslims were recognized subjects and even members of the royal administration; they were not the enemy. The coronation mantle, when worn by the king, visualized his claim to be ruler over a diverse ethnic constituency. His appeal to the visual tradition of his Muslim subjects demonstrates that rulers during this period could no longer assert their authority in the early medieval terms of absolute power. In multicultural contexts, they increasingly relied on a visual language of inclusiveness.

**THE PISA GRIFFIN.** Sometimes works of art from this period are not so easy to identify with one specific cultural group or another. This may be because of the fact that they were moved from region to region, or perhaps because many of the same techniques and visual

Beatus Vir initial, Psalter of Queen Melisende, MS Egerton 1139, folio 23v, c. 1135. © THE BRITISH LIBRARY.

motifs were often employed in different places. A long-celebrated enigma of Islamic craftsmanship in bronze, the so-called “Pisa Griffin” has been alternatively assigned to Ummayyad Spain, Fatimid Egypt (the first two named for the dynasties of their Muslim rulers), Sicily, Italy, or Iran. Each of these places had bronze-working traditions as well as flourishing court cultures that produced luxury objects and engaged in trans-regional trade. For some 700 years the Griffin stood proudly atop Pisa Cathedral in Pisa, Italy; how it got there is something of a mystery. It is thought to have been made in the late eleventh or early twelfth century, but was it given as a gift, exchanged through channels of trade, or taken as booty during a military campaign? Standing just over three and a half feet tall, this majestic creature would have been understood by any number of Mediterranean communities as a symbol of power and victory (hence its placement as a trophy atop the cathedral). It is the circulation of such works from place to place that gives evidence for cross-cultural relations during the period.

Scenes from life of King David, ivory cover from the Psalter of Queen Melisende, MS Egerton 1139. © THE BRITISH LIBRARY.

But surely these works also played a role in establishing pan-cultural identities and fostering knowledge of neighboring and distant peoples. In an era long before “globalization,” individual works of art very often did the work of establishing connections between places or attesting to the existence of those connections.

**QUEEN MELISENDE’S PSALTER.** One outpost of Latin Christendom that served as a crucible of cross-cultural exchange in the visual arts was the Holy Land during the period of the Crusades (from about 1100 to almost 1300). During this time, knights and adventurers from all over Western Europe established states along the coast of the eastern Mediterranean, the most important of which was the Latin Kingdom of Jerusalem. Here, rulers of Latin or sometimes mixed Latin-Byzantine ancestry asserted their sovereignty over a mixture of peoples, not unlike the rulers of Norman Sicily. One such ruler was Queen Melisende, who ruled alongside her husband Fulk until his death in 1143, after which she enjoyed exclusive sovereignty over the kingdom until 1152. One of the greatest monuments of visual art from the

Biblical scenes from Stavelot Triptych, Mosan enamel and metal work. New York, Pierpont Morgan Library, 1156–1158. THE PIERPOINT MORGAN LIBRARY/ART RESOURCE, NY.

period of her reign is a deluxe psalter, or book of Psalms, currently preserved in the British Library. The psalter text itself, the first page (and the first letter, an historiated letter “B” for “Beatus vir,” the first words of one of the Psalms), begins after a cycle of full-page New Testament illustrations and a calendar of the feasts of the saints. The golden script used throughout, as well as the overall sumptuousness of the book, indicates royal patronage and imitates the manner of imperial manuscripts from the Byzantine court in Constantinople. The text was copied by a scribe in a northern French style, and the figural work within the initial letter “B” imitates an English style. This mixture of influences can be found throughout the manuscript; the illustrations are largely Byzantine with some western touches, and the carved ivory covers recall textile motifs from the Near East. A work that truly synthesizes various cultural influences, the psalter expresses the queen’s desire to establish royal

authority over a mixture of peoples by accommodating their various traditions within the new visual culture of the royal court. Other strategies are employed as well, such as the propagandistic scenes of King David on the front ivory cover which suggest a biblical prototype for the crusader rulers of Jerusalem.

**THE STAVELOT TRIPTYCH.** That a single work of art may express inter-regional connections by the literal incorporation of other works within it is clear from the example of the Stavelot Triptych, thought to have been commissioned by Wibald, the Benedictine abbot of Stavelot (in modern-day Belgium) sometime after 1155. It is a portable gilt copper altarpiece whose doors open to reveal scenes from the life of the Roman emperor Constantine in circular enamel panels, an assortment of gems and pearls, and two smaller triptychs in the central section. Wibald had just returned from a trip to Constantinople, and this altarpiece, executed by master

metalsmiths in the Mosan region, emphasizes the abbot's regard for Byzantine traditions in the visual arts. The two small triptychs in the center are actually reliquary containers from Constantinople, given as gifts by the Emperor Manuel I. The fragment of the True Cross that each contains as well as the particular type of enamel-work used to decorate the small reliquaries are both decidedly Byzantine intrusions into a work from Western Europe. The pride of place they are given within the overall work suggests that Byzantine sacred objects were held in especially high regard in the West. Perhaps the patron is also making a statement about the interconnectedness of different Christian traditions or about his own enlightened cosmopolitanism. Regardless of the specific meaning, it is works such as this that tell us that twelfth-century Europeans were finding many ways to assimilate influences from neighboring and distant cultures in the forging of new works of visual art. It is this openness to the larger world, as much as any internal developments, that helped pave the way toward the magnificent visual arts of the later Middle Ages.

### POLITICAL LIFE AND THE NEW STATE

**ACHIEVEMENT OF THE ROYAL STATE.** By the later Middle Ages the various European states reached a crucial stage in their political development. England, France, and the Spanish kingdoms were each able to consolidate power and territory, asserting royal prerogatives and centralizing the administration of the realm. In France of the Capetian and Valois dynasties (987–1498) and in England of the Plantagenet dynasty (1154–1399), particularly, this resulted in the achievement of the royal state—the predecessor of the modern nation-state. The case of France is especially important because it is there that centralized political authority coincided with the development of the Gothic style—the prevailing style of European art in the later Middle Ages. Generally associated with the patronage of Abbot Suger of Saint-Denis in the 1140s, outside of Paris, and emerging first in architecture, the new style very quickly came to be thought of as both "modern" and native to France. Leaving behind all notions of aesthetic and spiritual austerity, Gothic art fully embraced visual splendor for the greater glory of

Abraham presents his prisoners to Melchisedek, St. Louis Psalter, Paris, Bibliothèque nationale MS lat. 10525, folio 6, 1250. GIRAUDON/ART RESOURCE, NY.

God, not to mention the glory of the monarchs, bishops, and noble individuals that promoted it. It was elegant and awe-inspiring, human-centered and otherworldly. The Gothic spread rapidly throughout the Ile-de-France (Paris and the surrounding region) and then on to England and elsewhere. It is found first in architecture but soon became predominant in all the visual arts, in fashion, and even in the design of mundane and everyday objects.

**THE GOTHIC AS A FRENCH STYLE.** If the maturity of the Gothic style in France and its dissemination throughout Europe can be associated with the reign of a single monarch, then that ruler is King Louis IX (r. 1226–1270). This "most Christian king" (Louis was made a saint 27 years after his death) patronized the arts in grand fashion as part of his effort to glorify Paris as the "new Jerusalem" and exalt the French nation as the "true Israel." Convinced he was favored by God and destined for greatness, Louis spared no expense in pursuing his ambitious plans, both at home in Paris and on Crusade in the Holy Land. Because Paris became such an important and influential center during Louis' 44-year reign, the mature Gothic style found its way from there to all corners of Europe. As a strong monarch and a

*a PRIMARY SOURCE document***ABBOT SUGER ON ALTAR DECORATION**

**INTRODUCTION:** Suger (1081–1151), abbot of Saint-Denis outside of Paris from 1122 onward, is one of the most famous and best-documented medieval patrons of the arts. The text below comes from Book XXXIII of *De Administratione* (1144–1149), Suger's treatise detailing the change in his abbey's economic fortunes and the remodeling and artistic embellishment of the church's interior. It is one of three treatises he wrote concerning the rebuilding and redecorating campaign that he led. In it, we see Suger's effort to glorify as well as describe; he was well aware of the artistic importance of his patronage. The latter part of the excerpted passage describes the "anagogical" power attributed to religious art by Suger: this is the ability of art and material beauty to help transport the human spirit into closer proximity to the Divine.

We hastened to adorn the Main Altar of the blessed Denis where there was only one beautiful and precious frontal panel from Charles the Bald, the third [Carolingian] Emperor; for at this [altar] we had been offered to the monastic life. We had it all encased, putting up golden panels on either side and adding a fourth, even more precious one; so that the whole altar would appear golden all the way round. On either side, we installed there the two candlesticks of King Louis, son of Philip, of twenty marks of gold, lest they might be stolen on some occa-

sion; we added hyacinths, emeralds, and sundry precious gems; and we gave orders carefully to look out for others to be added further ...

But the rear panel, of marvelous workmanship and lavish sumptuousness (for the barbarian artists were even more lavish than ours), we ennobled with chased relief work equally admirable for its form as for its material, so that certain people might be able to say: "The workmanship surpassed the material. ..."

Often we contemplate, out of sheer affection for the church our mother, these different ornaments both new and old...Thus, when—out of my delight in the beauty of the house of God—the loveliness of the many-colored gems has called me away from external cares, and worthy meditation has induced me to reflect, transferring that which is material to that which is immaterial, on the diversity of the sacred virtues: then it seems to me that I see myself dwelling, as it were, in some strange region of the universe which neither exists entirely in the slime of the earth nor entirely in the purity of Heaven; and that, by the grace of God, I can be transported from this inferior to that higher world in an anagogical manner.

**SOURCE:** *Abbot Suger On the Abbey Church of St.-Denis and its Art Treasures*. 2nd ed. Eds. and trans. Erwin Panofsky and Gerda Panofsky-Soergel (Princeton, N.J.: Princeton University Press, 1979): Book XXXIII, 64–65.

patron of the arts, Louis came to be a model for other late medieval kings, most notably his contemporaries kings Henry III of England (r. 1216–1272) and Alfonso X of León-Castile (r. 1252–1284), as well as later rulers like King Charles V of France (r. 1364–1380) and King Edward III of England (r. 1327–1377).

**THE PSALTER OF SAINT LOUIS.** Created between 1253 and 1270 for the private devotion of the French king, the Psalter of Saint Louis defines the Gothic as a courtly French art. This exquisite small-format manuscript (5 cm x 3.5 cm), along with the many other high-quality illuminated manuscripts produced for the royal court of France during this time, earned for France its reputation as a center of Gothic art and culture. As a bibliophile whose library was famous throughout the royal courts of Europe, King Louis commissioned the psalter to be decorated with more than 78 full-page illustrations of Old Testament scenes. Each scene is set in an architectural frame adorned with lancets, pinnacles, tracery, and rose windows that seem to echo in miniature the architectural elements of Louis's newly built Sainte-Chapelle (1243–1248). Along the borders run

scrolls with an ivy leaf motif and fantastic animals in the corners. The program of illustrations lacks a clearly-defined relationship with the psalter text, and the choice of scenes—many of which concentrate on biblical heroes, such as Abraham and David—suggests that Louis probably intended there to be an association between himself and the biblical figures who were seen as his prototypes. In one example two episodes from a biblical story are depicted, conveniently separated by an oak tree. On the left, three strangers appear before the bearded and kneeling Abraham; on the right, the men have been invited in to break bread with their host, who has just learned that Sarah—who peeks through the open curtain in the back—will bear a child. Such a story would have been understood in thirteenth-century Christian Europe as a prefiguration of the Annunciation to the Virgin, a pattern of symbolism in which the Old Testament episode was intended to foreshadow a New Testament event, thus showing that the New Testament stories fulfilled prophecies in the Old. For Louis, programmatic and jewel-like works of art like this psalter were part of a coordinated cultural policy that exalted

Canopied marble tomb of King Edward II. Gloucester Cathedral, England, 1330. ANGELO HORNAK/CORBIS.

the ruler as saintly and his kingdom as a latter-day Israel, chosen by God and destined for greatness.

**THE SPREAD OF THE GOTHIC STYLE.** Within the culture of the aristocratic and royal courts, the arts continued to flourish, sponsored by men and women who shared a common culture and held fast to the noble virtues of rank, wealth, and vestiges of chivalry. These individuals decorated castles, erected public monuments, and sought to commemorate their own deeds and those of their ancestors. They also turned to the visual arts to celebrate the more mundane pleasures and activities of courtly life, such as hunting, jousting, and literary invention. The taste and high standards of the nobility—visualized in illuminated manuscripts, goldsmith work, tapestries, and sculpture—translated into an aesthetic of opulence, elegance, and technical complexity that created a fashion across Europe. Drawing their inspiration from the new Gothic style in architecture, both visual artists and sculptors endowed their works with a decorative style of intricate lacy designs, sinuous curves, and a taste for architectural motifs such as high, pointed arches and pinnacles. Stone- and wood-carvers tended to favor patterns inspired by nature, such as vine and ivy foliage and acanthus flowers. The tomb of King Edward

## BOOK of Hours

One of the most popular types of privately owned books in the later Middle Ages was the illuminated Book of Hours (called *horæ* in the Latin plural). A devotional book, almost always illuminated, it was intended for laypeople so that they could imitate the devotions of the monastic hours followed by monks and nuns. They did, in fact, contain liturgical texts borrowed from the Breviary, the book used by monks that contained the complete service for the Divine Office (the daily cycle of prayers for the eight canonical hours). At the heart of the Book of Hours was the Little Office of the Blessed Virgin (or Hours of the Virgin), a series of prayers to be recited at seven different times during the day: *matins* and *lauds* at daybreak, *prime* at 6 a.m., *terce* at 9 a.m., *sext* at noon, *nonas* at 3 p.m., *vespers* at sunset, and *compline* in the evening. This was supplemented by many other elements, such as a calendar, a litany of saints, the Office of the Dead, the Penitential Psalms, other offices (of the Trinity, of the Passion, etc.), and other prayers and suffrages (which typically contained a picture and a prayer to a specific saint).

Texts varied quite a bit depending upon the needs and preferences of each owner; for example, books of hours owned by women often had prayers for St. Apollonia, connected with childbirth, and St. Anne, who taught Mary to read. Likewise books often provide clues to their region of origin. The calendar of a Book of Hours intended for someone living in Paris, for example, would contain the festival days for certain saints such as Dionysius (St. Denis) who was especially venerated in central France, while a Book of Hours for Oxford (called “Oxford use”) would include the city’s patron saint, Frideswide. Even the date of the book can sometimes be determined by its content, since suffrages for St. Sebastian and St. Roche, associated with protection from plague, would have begun to appear only after 1349. The book of hours assumed its standard form in the thirteenth century and continued to be produced in large numbers, especially in northern Europe, until the sixteenth century, when print versions with hand-colored woodcuts replaced painted decoration. Its popularity was an expression of the growing piety of laypeople in the later Middle Ages, though books of hours also showcased the wealth and taste of patrons. Typically, major divisions would feature an illustration or a cycle of illustrations, and decoration throughout the book could be quite extensive.

Christ carrying the cross and Annunciation to the Shepherds, double page. Hours of Jeanne d'Evreux, New York, The Cloisters, Metropolitan Museum of Art, MS 54.1.2 folios 61–62, 13th century. FRANCIS G. MAYER/CORBIS.

II of England (Gloucester Cathedral, 1307–1327) illustrates all these characteristics and shows how thoroughly this style of French origin was now implanted in England. It features an effigy of the deposed monarch reclining beneath a canopy of marble adorned with high pinnacles and ogival (curved and pointed) arches. With its complex architectural structure, its profuse ornament and overwhelming size, the marble canopy sets the deceased king apart from the viewer as it elevates him to an unattainable heavenly resting-place. Enshrined in this highly decorative structure, the idealized alabaster portrait of the king, contrasting in size and sobriety with the canopy, rests undisturbed in a majestic dignity. Here we see the Gothic in the service of the later medieval royal state, expressing the power and importance of the royal office while commenting upon the greatness of the honored individual.

**THE HOURS OF JEANNE D'EVREUX.** Charles IV of France was another of the monarchs whose patronage expressed the elegant and aristocratic quality of the Gothic style. His wedding present to his wife, Jeanne d'Evreux, was a precious Book of Hours executed between 1325 and 1328. The small size of this manuscript (8.2 cm x 5.6 cm)

made it a perfect present for the queen. Like many other ladies of the court, she most certainly treasured compact and portable manuscripts that could easily be carried in a pouch on the belt and read at intervals throughout the day. Books of Hours were very often personalized with portraits of the owner (Jeanne appears kneeling in an initial D below an image of the Annunciation) and with coat of arms when appropriate, and their pages were also used to press flowers or to hold images of favorite saints on tabs of parchment attached to the margins.

**ICONOGRAPHY AND DECORATION.** Both the iconographic program of the Hours of Jeanne d'Evreux and its decoration point to its essentially aristocratic nature. The book includes a special cycle of devotions to Saint Louis (King Louis IX of France), newly canonized and favored at the French court. In the borders and the lower margins, small human figures and animal or hybrid grotesques are performing courtly games and secular activities such as jousting, hunting, and musical performance, so as to amuse the reader. The famous Parisian illuminator Jean Pucelle was responsible for the majority of the decoration, most notably the innovative technique of grisaille painting in manuscripts. Grisaille

Arrest of Christ, Annunciation to the Virgin. Double page, Hours of Jeanne d'Evreux, New York, The Cloisters, Metropolitan Museum of Art, MS 54.1.2 folios 15–16. 13th century. FRANCIS G. MAYER/CORBIS.

or monochrome painting (in shades of gray) was better known as a stained-glass technique and was also used in fresco painting when artists wished to emulate the volumetric quality of sculpture. During his travels in Italy, Pucelle may have been inspired by the works of Italian painters from whom he borrowed technical as well as compositional features. Besides the grisaille technique, he employed the device of the apparently three-dimensional volume of space containing each scene, the mannered drapery of the figures, and their swaying posture. The double page showing the Annunciation and the Betrayal of Christ illustrates some of these characteristics: the architectural device that encloses the Virgin and the archangel Gabriel resembles an Italian loggia, with decorative niches housing cherubs watching the scene. Mary's mannered position and elegant drapery fit the delicate attitude of the court ladies of France, but Pucelle could also have seen examples of this style in Italy. Below, young girls and boys play a game of "froggy in the middle," mocking one of the children, perhaps a deliberate reference to the mocking of Christ. On the facing page, below the Betrayal of Christ, two knights

mounted on goats attack a barrel, possibly an allusion to military training.

**THE INTERNATIONAL STYLE.** The Hours of Jeanne d'Evreux expresses a courtly aesthetic that was increasingly international and that would before long give rise to the well-known and aptly-named "International Style" of aristocratic art by the end of the fourteenth century. Following the blood lines and the marriage ties that linked aristocratic courts, the International Gothic style could be found by the later fourteenth century in France, Italy, England, Germany, Bohemia (the western part of the modern Czech Republic), and Aragon. Instrumental in the establishment of interregional connections were the artistic commissions of the papal court in its new surroundings in southern France. By the early fourteenth century, political intrigue had combined with a weakened papacy in bringing about the pope's exile from Rome to Avignon in 1305. This exile lasted for much of the fourteenth century, only to be followed by the Great Schism (beginning 1379), in which two and, at one point, even three rival popes each claimed absolute spiritual authority over Christendom. Pope Clement VI

Hunting scene fresco in the Stag Room, by Matteo Giovanetti (1322–1368). Papal Palace, Avignon, France, 1356–1364. THE ART ARCHIVE/ PAPAL PALACE, AVIGNON/DAGLI ORTI.

(r. 1342–1352) saw himself as a worldly sovereign and member of the aristocratic elite, and his grandiose palace in Avignon was meant to express this status. He employed both French and Italian artists under the supervision of the Italian master Matteo Giovanetti to decorate his private apartment with scenes that convey all the pleasures of courtly life. The Stag room (or *camera cervinus*), the antechamber leading to the pope's private bedroom, gets its name from one of the scenes that decorate the walls. Each of the four walls presents a large fresco depicting several scenes of fishing, stag hunting, falconry, fruit gathering, and bathing. Only the two windows of the south wall interrupt the scenes, which are set upon a continuous landscape background (complete with animals, men, and all sorts of naturalistic detail), itself presented upon a lavish red ground. In terms of style, the frescoes combine the elegance of Parisian court painting, the realism of Flemish painting, and the Italian fresco technique in a truly international style.

## INTELLECTUAL INFLUENCES ON ART IN THE LATER MIDDLE AGES

**ACADEMIC INFLUENCES ON NATURALISM.** Already in the twelfth century, formal education had moved from monastic houses to urban cathedral schools, and by the turn of the thirteenth century, the latter had given rise to the first universities, which quickly became the center of later medieval intellectual life throughout Europe. Although the traditional seven “liberal arts” (grammar, rhetoric, logic, geometry, arithmetic, astronomy, and music) remained part of the curriculum, it was the newly translated writings of Aristotle that were most highly valued. Because of the perceived heretical ideas in the more naturalistic of his works, university scholars often dedicated themselves to the integration of this classical inheritance with Christian theology. Thomas Aquinas and Albertus Magnus were two of the most important masters in the project of integrating faith and reason. More important for the visual arts, however, were the teachings of Robert Grosseteste (who wrote a treatise on light) and his admirer, Roger Bacon, who argued for greater attention to what can be seen with the human eye and more intellectual emphasis on empiricism and experimentation. Aristotle had placed the sense of sight at the top of the hierarchy of human senses, but these medieval thinkers formulated new ideas that harmonized with, perhaps justified, and possibly even helped to bring about the greater naturalism of later Gothic art. Artists always reserved a place for copying designs from model-books, but as the Middle Ages progressed, more artistic attention was also devoted to the observable world as inspiration.

**A VISUAL STATEMENT ON LEARNING.** The “Allegory of Learning,” an illustration from an early thirteenth-century encyclopedic work known as the *Garden of Delights* (*Hortus Deliciarum*), provides a clear visual statement of the interrelationship of faith and reason (and the curricular dominance of theology and philosophy) in the Gothic era. The original manuscript of the *Gar-*

*den of Delight*, preserved in Strasbourg until it was destroyed by fire during the bombardment of the city in 1870 (and after which reproductions of some illustrations were made based on nineteenth-century drawings from the originals), was the ambitious product of Herrad von Landsberg, abbess of the convent of St. Odile in Hohenbourg (near Strasbourg) from 1167 to 1195. The new genre of the Christian encyclopedia or compendium of knowledge was a product of the twelfth century that sought to accommodate biblical, moral, and theological material. The *Garden of Delights* included nearly 1,200 texts by various authors, as well as some 636 illustrations that were so closely tied to their texts it is thought that Herrad must have supervised their planning, if not their execution (the manuscript illumination was most likely completed after her death). Although she undertook this massive project in “praise of Christ and the Church,” Herrad’s privileging of intellectual pursuits is obvious. “The Allegory of Learning” illustration in the text represents the seven liberal arts arrayed in niches around the central personification of Philosophy, who is enthroned and holding a scroll that reads, “All knowledge comes from God.” Socrates and Plato sit at her feet, emphasizing further the prominence of the Greek intellectual heritage within the now-Christian world of later medieval Europe. That such an undisguised tribute to pagan learning was possible at the time is a testament to the efforts of theologians and scholars who made this material “safe” by enveloping it within a thoroughly Christian worldview. It is notable in the history of medieval visual arts that such innovative compendia as the *Garden of Delights* relied so heavily upon their visual component. Certainly the compelling visual images helped to define the new construct according to which reason and revelation would continue to be reconciled.

**ATTENTION TO HUMAN PHILOSOPHY.** Two fourteenth-century paintings from Italy demonstrate a similar concern for the intellectual preoccupations of medieval scholastic philosophers, and they present them in a format that offered much greater public access than Herrad’s manuscript, which was produced solely for the nuns in her convent. The first, an altarpiece from Santa Caterina in Pisa, created by artists working in the circle of Simone Martini and Lippo Memmi (c. 1340–1345), depicts the glorification of St. Thomas Aquinas (See Philosophy, Challenging the Averroists, for a portrait of this type.) Aquinas had recently been canonized, and such images were meant in part to combat the spread of heretical ideas by reminding Christians that this saint’s approach to synthesizing philosophy and theology had become part of church doctrine. Accordingly, the painting shows the saint receiving his inspiration directly from

God as he reads from the books presented to him by none other than Aristotle and Plato. This knowledge is transmitted to lay and religious figures alike in the form of golden rays, a motif traditionally used to depict the transmission of divine revelation. The figures of the evangelists above, accompanied by Paul and Moses, represent the enduring authority of God’s revelation, newly accommodated (but not subordinated) to the wisdom of human philosophy. At the bottom, the Muslim philosopher Averroës (1126–1198) reclines half-asleep. Another work that visualizes this theme for a Christian public is the fresco painting of the Apotheosis of St. Thomas Aquinas, made by Andrea da Firenze in the vault of a chapel in Santa Maria Novella in Florence (c. 1360–68). Clearly, the church wished for the saint to be viewed as the model of Christian wisdom, for here he is enthroned with the representation of the seven liberal arts as well as leading figures from the various sacred and secular realms of knowledge. Such attention to human philosophy, here and elsewhere, did not pose a threat to the church’s authority because according to Aquinas, the physical world (as described by the philosophers) is a metaphor for the divine cosmos. Likewise, the work of art was to be seen as only a mirror image of the physical world. By cultivating the virtues of order, clarity, and harmony in their work, artists approach the ideal of beauty that for Aquinas refers ultimately to the perfection of the divine. Hence there was not only a justification for visual representation, but also an argument for greater realism in art, greater fidelity to the physical world.

**ART FROM SKETCHBOOKS.** Direct evidence for such an approach to art-making is available in the preserved notebooks of an architect from early thirteenth-century France named Villard de Honnecourt. His ink sketches on parchment, dating from the 1220s or 1230s, illustrate Aquinas’ Aristotelian belief that “all causes in nature can be given in terms of lines, angles, and figures.” Since basic geometry (one of the liberal arts) was thought to assist artists and practitioners of all kinds in the creation of ideal structures in any medium, it was the essential tool in reconciling the observable physical world with the perfect and transcendent divine cosmos. Honnecourt’s notebook, used as a teaching manual, shows how such lofty ideas, conceived by great thinkers like Aquinas, translated into the relatively mundane and humble practice of art and architecture during the later Middle Ages.

**ART FOR MORAL INSTRUCTION.** In addition to the famous naturalism of Gothic art, university teaching also gave rise to new kinds of texts with commentaries used

Blanche of Castile, King Louis IX, author dictating to scribe.  
*Bible Moralisée*, MS M 240, fol. 8r., 1226–1234. THE PIERPOINT  
 MORGAN LIBRARY, NEW YORK.

at court for the instruction of princes. From the viewpoint of the visual arts, an especially notable group of such texts are the ones developed in Paris and known as “moralized Bibles” (*Bibles moralisées*). A sophisticated program of illustrations was developed for this book; copies of this work were among the most ambitious and beautifully decorated illuminated manuscripts of the thirteenth century. The creation of the illustrations, as well as the writing of the commentary texts, was overseen by clerics and theologians associated with the university in Paris. They were concerned with maintaining influence at court despite the increasing independence of the state from the church. In addition to advising lay rulers on how best to govern, they also wished to combat any heretical ideas associated with pagan learning or with Jewish traditions. One surviving example of a moralized bible was produced in Paris around 1230 under the patronage of Blanche of Castile and her son, the young king Louis IX. Preserved today as a fragment (of what was originally a three-volume work with over 5,000 illustrations) in the Pierpont Morgan Library in New York, this volume follows the typical format for arranging the illustrations in two columns of four superim-

posed medallions. The first of each vertical pair illustrates a scriptural verse, which is duly transcribed in a separate column just to the left of the medallion. The second of each pair illustrates the commentary text, also located on the left, which was intended to elucidate the contemporary meaning of the scriptural passage. The illustrations were generally configured according to a system of biblical typology: the first medallion of each pair illustrates an Old Testament scene while the second illustrates a New Testament scene. The former was understood to be a “type” (i.e., prototype) for the latter, the relationship between them helping to describe how the truth of the New Testament was “disguised” in the verses of the Old Testament, which has been superseded but which, through typological connections, continues to bear witness to Christian truth. Sometimes a medallion depicted a biblical scene while its companion illustrated a scene from contemporary life in order to show how real-life events unfold according to scriptural truth. In contrast to this innovative arrangement, the frontispiece of the book shows a conventional set of portraits, including Blanche of Castile, King Louis IX, the author, and a scribe.

**ILLUSTRATIONS FOR DIDACTIC TEXTS.** Another, more secular kind of morally didactic art appears in a work by Christine de Pizan, a prolific author who supported herself with her writing after the death of her husband, Estienne Castel, in 1389. Because they were responsible for the rearing of children, medieval women were often recognized as ambassadors of lay education, and it was not all that uncommon for women to be tutors or advisors in the employ of kings and queens, as Christine de Pizan was at the courts of Charles V (r. 1364–1380) and Charles VI (r. 1380–1422) of France. Born in Venice, she embraced French aristocratic culture at the court of Charles V where her father was appointed as court doctor and astrologer. She became an important figure at court, advising and tutoring the princes through her didactic texts, which were often preserved in manuscripts with illustrations and lavish decoration meant to amuse the reader and to augment the text. Sometime after 1405 all of her existing works were collected in one manuscript now in Paris. Often her works focused on moral precepts as do two illustrations from *Epître d’Othéa* (Letter from Othéa), a work that takes the form of a letter to the warrior Hector from the goddess Othéa (See illustration in Literature, Europe’s First Professional Female Writer). One illustration depicts the “Wheel of Fortune,” a device that demonstrates the ephemeral nature of fame and fortune by sending each figure in turn from the top of the wheel down to the bottom (and then back again). Related in its con-

cern for the vanity of worldly happiness, the second illustration depicts two lovers who are criticized for confusing the happiness of their carnal embrace with a more meaningful and transcendent happiness.

## ART AND THE KNOWLEDGE OF DISTANT LANDS

**SATISFYING THE THIRST FOR KNOWLEDGE.** The Crusades to the Holy Land during the twelfth and thirteenth centuries had whetted the European appetite for contact with foreign and distant lands and knowledge of strange peoples and customs. Despite the risks of travel, individuals set out on long-distance journeys and brought back tales that circulated throughout Europe and inspired the late medieval imagination. The travels of the young Venetian Marco Polo to the Mongol court of Khublai Khan and of the Englishman John Mandeville to both familiar and exotic regions became known through written accounts as well as through the programs of illustration developed to accompany these texts. During this period there also developed a new genre of world map, offering large circular depictions of the earth that included not only place names and topographical features, but images of unusual peoples and mythical animals believed to live in remote parts of the world. The largest example (destroyed in an air raid on Hanover, Germany, during World War II) was the Ebstorf Map (c. 1239), which was twelve feet in diameter and painted on thirty goatskins. In a typical symbolic representation of cosmology, the world is depicted as a disc in the hand of Christ, with his head at the top and feet below. Still to be seen today is the Hereford Map in Hereford Cathedral in England (65 by 53 inches, dated 1290), which shows an image of the crucifixion in Jerusalem, as well as a griffin fighting with men over emeralds, and numerous other exotic animals such as parrots, crocodiles, and camels. Visual images therefore assisted the growing late medieval thirst for empirical knowledge of the world.

**THE BOOK OF WONDERS.** “Empirical knowledge” is a relative term when applied to the Middle Ages. Most of the works of travel literature and accounts of journeys relied at least in part upon standard formulas, previous works, or even ancient accounts of the “monstrous races” of the earth. A good example is a manuscript of the *Book of Wonders*, produced in early fifteenth-century France. This work included the travel accounts of both Marco Polo and Sir John Mandeville. Marco Polo (c. 1254–1324) was a Venetian who set out for China in 1271 with his father and uncle, both merchants. At that time China was ruled as one of four Mongol khanates under Khublai Khan, and the Polo family bore letters for the Mongol leader from Pope Gregory X. The journey took four years and was followed by a seventeen-year sojourn in the service of the great Khan, during which Marco traveled extensively throughout China. He returned to Italy in 1295 and dictated his book, *A Description of the World*, while a prisoner during the war between the rival city-states of Venice and Genoa. *The Travels of John Mandeville* was in fact a compilation of geographical texts from diverse sources (including medieval encyclopedic works), and, although attributed to an Englishman, was probably first written in mid-fourteenth century Flanders. It was divided into two parts: a sort of pilgrim’s guide to the Holy Land and a description of travels in the Far East. Like Marco Polo’s text, it circulated widely in the late Middle Ages and helped spur a popular fascination with outlying territories and exotic peoples (the circulation of such works would only increase with the invention of printing and the voyage of Columbus to the New World).

**ILLUSTRATING THE MONSTROUS RACES.** One famous image from the *Book of Wonders* depicts three inhabitants of “Syberia,” who were described by Marco Polo as “wildmen” and who were illustrated as representative of the marvelous races of the East. In fact, these figures—one a *blemmiæ* with his head on his chest; the second a *sciopode* or shadow foot with only one leg ending in a huge foot that provided shade from the sun; and the third a naked wildman with club and shield—refer back to the descriptions of the monstrous races from antiquity (such as those encountered by Alexander the Great) that were compiled in the early Middle Ages by Isidore of Seville and passed along into later medieval compendia. Extreme climates were often thought to account for the deformities of these grotesque figures. Although opportunities for travel were increasing and readers were eager for factual information, the images in these books tended to reproduce mythical and imaginary legends, so that, ironically, real travelers, even as late as

Three monstrous inhabitants of Syberia, Marco Polo, *Divisement du Monde*, French, Paris, Bibliothèque Nationale MS fr 2810, folio 29v, 1415. THE GRANGER COLLECTION.

Christopher Columbus, continued to expect to find such peoples.

**TOPOGRAPHICAL MAPS.** Another perspective on the world, with attendant visual imagery, was provided by late medieval cartographers. Knowledge of classical cartography combined with newer and more accurate technology enabled the creation of topographical maps that bore little resemblance to the earlier maps that typically placed Jerusalem at the center of the world and imagined the earth as the very body of Christ, whose head, hands, and feet could often be seen projecting from the top, bottom, and sides. A splendid example of the newer variety is the famous “Catalan Atlas” of 1375, commissioned by King Pedro IV of Aragon and executed by a Jewish cartographer from Palma de Mallorca named Abraham Cresques (1325–1387). The completed Atlas was given as a gift to King Charles V of France, and was intended to assist in the navigation of the seas. Several different cosmographical, astronomical, and astrological texts were copied onto the parchment in order to provide practical information on how to gauge tides and reckon time at night. Other illustrations, calendars, and

charts document the state of contemporary knowledge on the planets and constellations, the tides, and so on. The actual map itself shows an indebtedness to the literary traditions of Marco Polo, Mandeville, and their precursors. There are also many biblical and mythological references, such as Moses’ crossing of the Red Sea with the Israelites, the Tower of Babel, the magi following the star, Alexander the Great, pygmies battling cranes, etc. Overall, this unique artifact provides a very compelling demonstration of the accumulated learning of the Middle Ages and the effectiveness of visual traditions when deployed for such a purpose. Of course, it also points toward the historic sea voyages of over a century later and their discoveries that would forever alter the European outlook on the world and that belong more properly to the period of the Renaissance.

## SOCIAL LIFE AND THE INDIVIDUAL

**THE RISE OF URBAN CENTERS.** With the continued growth of the mercantile economy throughout Europe, towns and cities flourished and became the vital centers of late medieval culture and art production. At the forefront of this new urban culture was the middle class, a social group that increasingly came to be associated with the patronage base for much art of the period. They were merchants and financiers, manufacturers and craftsmen, and they could afford to acquire works of art

that accorded with their tastes and growing sense of their social status. With the rise of a professional class of artists organized by trade or specialty into guilds, cities such as Paris, London, Barcelona, Siena, Cologne, and Brussels became booming marketplaces for the production and sale of art. Art from such a context was very often secular in nature and in its new subjects and themes it tended to express the materialism and social experience of the middle class.

**DAILY LIFE IN ART.** These new clients for art encouraged artists to explore new themes in their work. Painters, in particular, increasingly turned to the objects of everyday life, which when rendered in a naturalistic style expressed the taste of their middle-class patrons. Subjects such as landscapes, cityscapes, still lifes, and portraits became more and more prominent in art, whether the work was to have a religious or a purely secular function. In works of a religious nature, complex theological ideas were made more accessible to a middle-class viewer

Virgin and Child before a Firescreen (sometimes called the Salting Madonna), oil on oak panel by Robert Campin (Master of Flémalle), National Gallery, London, England, 1425–1430. THE GRANGER COLLECTION.

when expressed in a visual language of everyday naturalism. In the oil painting known as the Salting Madonna, Robert Campin, an artist from the city of Tournai in Flanders, placed the Virgin Mary within a contemporary domestic setting, complete with fireplace, a bench with comfortable pillows (upon which lies an open Book of Hours), and a window with an open shutter allowing a view of the town outside. An attentive mother dressed in contemporary bourgeois clothing, Mary holds her baby gently and prepares to nurse. Except for the occasional visual clue that a contemporary viewer would recognize in this or similar paintings—the fire screen that frames Mary’s head like a halo, in this case (the chalice is part of a modern restoration)—little about such paintings suggests a divine, otherworldly subject. In fact, bourgeois viewers would have easily identified with the familiar scene and its homey details. The modest size of this work and others like it stood in contrast to the more lavish and grandiose productions destined for the church or the aristocracy and suited the taste and the needs of a middle-class urban clientele. As head of the Tournai painters’ guild (as well as holder of several other prominent positions in the city), Campin

was part of the new urban social fabric and thus he well understood the milieu of his patrons.

**CIVIC IDENTITY.** Town life also bred a sense of civic identity, and as urban populations assumed more control over society and politics, the arts provided a visual expression of this new sense of civic pride and power. This is especially evident in the case of the rival city-states in Italy like Florence, Siena, Pisa, and Venice, which commissioned major civic monuments throughout the later Middle Ages. Increasingly specialized and organized into guilds, artists participated in a professional culture that was more highly regulated and standardized than ever before. Regulations stipulating the civic responsibilities of artists were laid out in compilations such as the *Livre des Métiers* (Book of the Trades) written in Paris in 1268.

**COMPETITION FOR ART.** In thriving European cities, cathedral and town hall often competed with one another in luring the best artists and commissioning works that combined in equal parts civic pride and Christian piety. The case of fourteenth-century Siena is exemplary in this regard. The acclaimed painter Duccio di Buoninsegna (active 1278–1318/19) was commissioned in 1308 to create a large altarpiece for the cathedral’s main altar. It was to depict the Virgin Mary in glory according to an established format and type known as *Maestà*. Duccio’s completion of the project in 1311 occasioned citywide festivities. The huge altarpiece, made up of a large central panel and 26 smaller side panels, was carried in procession from Duccio’s workshop to the cathedral accompanied by the music of tambourines, trumpets, and castanets. In acknowledgment of Duccio’s great renown and his importance to the city, his signature was prominently displayed on the face of the altarpiece. In this case the artist and the work of art are both emblems of civic pride and identity. But this status was not conferred only upon one artist or one work: six years later the acclaimed painter Simone Martini was commissioned to paint the same subject for Siena’s city hall.

**A FRESCO OF GOOD GOVERNMENT.** In 1338, the elected city council of Siena (the nine good and lawful merchants of the city, known simply as The Nine) requested the services of Ambrogio Lorenzetti to create an elaborate program of frescoes to decorate their meeting chamber (the Sala della Pace) in the Palazzo Pubblico or town hall. A Siena native, Ambrogio (with his brother Pietro) was perhaps the chief rival to the great Simone Martini. The commission was granted in the hope that the work—in its quality as well as its subject—would reflect well upon the governing administration. The subject consisted of three scenes depicting the effects of good

La Maestà or Virgin and Child in Majesty, fresco by Duccio di Buoninsegna (1278–1318), Siena, Italy, 1308–1311. THE ART ARCHIVE/ MUSEO DELL'OPERA DEL DUOMO, SIENA/DAGLI ORTI.

and bad government and an allegory of good government. Ambrogio chose the wall receiving the most light (East) to paint the Effects of Good Government, while leaving the Effects of Bad Government on the darker side. (For Ambrogio's Effects of Good Government, see the paragraph "Round Dance" in the Dance chapter.) In the former, Ambrogio depicted the interrelated urban and rural economies by means of realistic topographical representations of a town and its surrounding countryside, with all the details of an organized landscape and the industrious work of its inhabitants. The view of the town offers a panorama of late medieval occupations that included, among others, carpenters, shopkeepers, shoemakers, and shepherds. A school recalls the importance of education for good government, and the tavern perhaps alludes to the necessity of some leisure in a balanced society. To complete this image of harmony, a group of elegant ladies are dancing and playing tambourines in the foreground. Painted with utmost realism, this picture of civic life in Siena impressed upon any visitors to the Palazzo Pubblico the soundness of the local government and the pride of the citizens.

#### INDIVIDUALISM AMONG ARTISTS AND PATRONS.

Both patrons and artists came to imprint their own personal identities on works of art. Although patrons now included members of the rising civic elite, they shared with the most exalted rulers a desire to express their pretensions and their ideology in commissioned works. Artists, encouraged by demanding clients to achieve ever-

greater levels of technical mastery, developed innovative approaches and personal styles that increased their status and their appeal among patrons. Aristocratic patrons especially sought out some of the most well-known and accomplished painters, illuminators, sculptors, and goldsmiths of their day, from the late twelfth-century's Nicholas of Verdun to later masters such as William de Brailes, Jean Pucelle, Jean de Liège, Simone Martini, Ferrer Bassa, the Limbourg brothers, and Giovanni Pisano. Because society recognized the importance of the arts for the promotion of particular values, the status and role of the artist in society advanced from that of a simple artisan to the more distinguished rank of ambassador or city councilor. With this upwardly mobile status came the prospect of steady commissions as well as special tax exemptions and other advantages. Many of the best artists were drawn to important urban centers for these reasons, while the competition among artists encouraged innovation and technical virtuosity.

**COMMISSIONS IN GOLD AND ENAMEL.** Perhaps the practice of the goldsmith best represents the patrons' demands for singularity and perfection in their commissioned works. Religious commissions in gold and silver were intended to express the brilliance of the celestial city and they often occupied a proud spot within their respective church treasuries. The durability of the material was seen as fitting for a representation of an eternal concept, and the economic and symbolic value of the precious metals meant that such commissions were

Panels depicting biblical scenes. Altarpiece, Mosan, *champlevé* enamel, niello, and gold by Nicholas of Verdun. Stiftsmuseum, Abbey of Klosterneuburg near Vienna, Austria, 1181. ALI MEYER/BRIDGEMAN ART LIBRARY.

generally entrusted to the expert hands of the most talented craftsmen. An important center for this kind of work was the Meuse Valley, in northwest Germany. The goldsmiths, aware of their own status and importance, typically signed their work, and some even included a self-portrait within a completed art object. Nicholas of Verdun's Klosterneuburg altarpiece, executed around 1181, is a good example. The work was originally conceived as a pulpit for the abbey of Klosterneuburg near Vienna, Austria, and it was later reconstructed as an altarpiece after it was damaged in a fire in 1330. In this most excellent example of the goldsmith's craft, Nicholas employed both the *niello* and *champlevé* enamel techniques on bronze-gilt panels. The translucent blue

enamel technique vividly contrasts with the gilt-bronze, and the virtuoso chiseling of the metal creates a fine design delineating sinuous figures and details of drapery folds, hair, beards, and muscle definition. A certain Provost Wernher, whose name is recorded with that of the artist, was presumably responsible for orchestrating the iconographic program that contains typological comparisons between the Life of Christ and the Old Testament scenes. These scenes, reconstructed into three horizontal rows are organized into the following categories: *ante legem* (before the Law of Moses: scenes from Genesis and Exodus), *sub lege* (under the Law of Moses: scenes from subsequent sections of the Old Testament), and *sub gracia* (under Grace: the new dispensa-

## METALWORK and Enamel

Always important in medieval Europe (especially as part of the luxury trade), the so-called decorative arts of metalwork and enamel reached a new peak of technical accomplishment and popularity during the Romanesque and Gothic periods. Metal smiths applied their skill to the creation and embellishment of liturgical (church) objects, secular objects such as vessels for use at royal and noble courts, and decorative covers for deluxe illuminated manuscripts. They used both precious and non-precious (base) metals, and often ornamented their objects with gems (precious and semi-precious stones) and enamels. Vessels, candlestick holders, and other objects used for church services were cast in bronze, brass, or copper, and their production seems to have increased beginning in the twelfth century. The surfaces of these cast objects were often tooled for decorative effect, gilded, or enameled. Sometimes they were ornamented using *niello*, a metalwork process (from the Italian *niellare*, meaning to fill in) whereby a design was engraved in the metal surface and then filled with a black substance made from sulfur combined into an alloy with gold, silver, copper, or lead, and then fused with heat so that the image is in contrast to the background.

Gold and silver were more highly valued metals. They were considered precious because of their sheer material splendor and their rarity, but also because of their malleability. Most often these metals were not cast but were made into reliefs using a process known as embossing or

*repoussé* (literally “pushed away”) in which the sheet is hammered from behind to create a raised design. Further texture and detail is created by *chasing*, or indenting the surface with a blunt instrument. Reliquary containers were often made using these techniques.

Enamel is a substance formed from colored glass powder that is melted and fused, usually to a metal surface. It was developed into a major art form in medieval Europe and was used principally for liturgical objects, such as reliquary containers, altarpieces, crowns, chalices and other vessels, and altar crosses. The enamel itself is not expensive, though the objects adorned with this colorful, durable, jewel-like medium were highly valued. In *cloisonné* enamel, a technique more associated with the Byzantine Empire where it was likely invented (and known in the West thanks to the trade in luxury goods), a network of metal bands or strips of gold (*cloison* in French means “partition”) is soldered together on a thin, usually gold surface to form the structure of the design. The enamel is then set within these compartments, which are visually separated by the exposed top edge of the dividing bands. The very delicate effect suited the Byzantine aesthetic. *Champlevé* enamel was practiced long before it was reinvigorated in twelfth-century Western Europe. It is a process whereby the substance is poured into grooves that are previously engraved into the metal surface, so that the hardened enamel is flush with the surface of the metal (*champlevé* is French for “raised field”). Production was concentrated in two main areas: the Mosan region in the Meuse River Valley, today’s Belgium, and the southwest of France (most notably in the city of Limoges).

tion of Christ, with scenes from the Annunciation to the Pentecost).

**PROFESSIONAL ARTISTS IN THE COURT.** As artists’ sense of self-worth and social importance increased, patrons and artists developed new kinds of relationships. Artists working in the service of kings and dukes were often recognized with courtly titles, such as Valet de Chambre, which guaranteed them lifelong security. A well-known example is that of the brothers Limbourg and the duke of Berry. The story of Pol, Herman, and Jean Limbourg, manuscript illuminators, begins in Nijmegen in the northern Netherlands where they were born to a family of artisans. While traveling to Brussels where they planned to join their uncle the painter Jean Malouel, who worked for the Duke Philip the Bold of Burgundy, they fell victim to the conflict between the regions of Brabant and Guelders, and were imprisoned. Thanks to the intervention of their uncle, the generos-

ity of the duke of Burgundy (who paid their ransom), and the duke’s family ties to Jean, duke of Berry, the three brothers ended their journey at the court of Jean, duke of Berry, in Poitiers (south-central France). There, they entered into a privileged relationship with the duke that ended only with his death in 1416. An exceptional art amateur, a great collector of gems and precious objects, and a renowned bibliophile, Jean, duke of Berry, became for the three brothers an ideal patron and benefactor. Expert in the art of illuminations, the Limbourg brothers offered to the duke, in exchange for his protection and support, some of the most excellent manuscript decorations of the late fourteenth and early fifteenth centuries. Their best-known production is the very famous *Très Riches Heures* (Very Rich Hours) executed between 1390 and 1416.

**THE TRÈS RICHES HEURES.** The decorated book of hours was a quintessentially late medieval product

Resurrection of the Dead, Altarpiece, Mosan, champlevé enamel, niello, and gold by Nicholas of Verdun. Stiftsmuseum, Abbey of Klosterneuburg near Vienna, Austria, 1181. THE ART ARCHIVE/KLOSTERNEUBURG MONASTERY, AUSTRIA/DAGLI ORTI.

with which some of the most familiar artistic personalities and the most pretentious and demanding patrons found common cause. A compendium of devotional texts that developed from the psalter and the monastic breviary but that was intended for private use among the laity, the book of hours became a showcase for both illuminators and patrons to express their identities and to champion the individualism and the artistry of the late Middle Ages. In the *Très Riches Heures*, the Limbourgs present a wonderfully detailed panorama of the duke's properties and of courtly life in later medieval France. In the calendar pages, scenes depicting the "labors of the months" feature aristocrat pleasures or peasant activities set against the background of the duke's castles. In the January page, for instance, the duke receives his guests at a lavish banquet. Jean can be identified sitting at the center of the group with a "halo" that is in fact a fire screen. The master of the ceremony welcomes his guests ("approche, approche") who warm their hands near the fire, and servants bring more food and wine to the table. The detailed depiction of the trappings of courtly life helps to showcase the wealth and extravagance of the duke: for example, the bells hanging from the lavish costumes of the courtiers, gold thread embroideries, the

## *a PRIMARY SOURCE document*

### TWO DECORATED BIBLES

**INTRODUCTION:** Decorated books were among the treasured works of art that often were passed down from one generation to another and thus appear in wills and inventories. The first of the two illuminated Bibles described below originally belonged to the French king Charles V, was inherited by Charles VI, and then was loaned to his uncle, Jean, duke of Berry, one of the great collectors of the Middle Ages (he had, for example, 1,500 hunting dogs). Jean never returned the book to its owner, and, judging from the mention of the swan—one of Jean's personal insignia—on the metalwork of the cover, perhaps had it rebound to his own taste. Jean's interest in clothing and fashion is reflected in the mention of the three different kinds of fabric used to make the covers of the second Bible. The importance of the decoration on these two books is illustrated by the fact that the secretary entering the items into an inventory of Jean's possessions in 1413 says almost nothing about the contents of the books, but offers careful descriptions of the bejeweled covers.

Item, a very beautiful Bible in French, written in Gothic book script, richly illuminated at the beginning, decorated with four gold clasps, two with two light-colored rubies and the other two with sapphires, each with two pearls, enameled with the arms [of the king] of France; the bars on the other side each having a pearl at the ends and on top tiny gold fleurs-de-lys nailed to them, the edge being rimmed with two heads of serpents adorned with small swans.

Also another Bible in two small volumes, written in French in Gothic book script, well illuminated with narrative and decorative designs; at the beginning of the second leaf of the first volume it contains the sermon and on the second leaf of the second volume the inscription: "Whatever is born (*nais*) will be destroyed." Each volume is covered with a flowered silk cloth having four gold clasps, each enameled with the royal arms and with a portrait. There is also a gold border enameled with said arms. The whole is covered with a jacket of purple damask, lined with black *tiercelin* [a textile woven of three kinds of thread]. The Bible was given to my lord in August 1407 by the now deceased commander (Vidame) of the province of Laon, who used to be great master of the palace of the king. My lord had the jacket made.

**SOURCE:** Jean, Duke of Berry, *Inventaires de Jean Duc de Berry (1401–1416)*. Ed. Jules M. J. Guiffrey (Paris: E. Leroux, 1894–1896). Translation by John Block Friedman.

ducal coats of arms and emblems woven into the tapestries that hang on the walls, the golden vessels, and the generous display of food upon the table. The Limbourgs' knowledge of the duke's collection is demonstrated by their faithful rendering of particular objects, such as the golden vessel in the shape of a boat or the tapestries with battle scenes. Their views of several of the duke's castles suggest that they at times accompanied their patron on his journeys to these residences.

### SPIRITUAL LIFE AND DEVOTION

**THE CHURCH IN CRISIS AND THE RISE OF DEVOTIONAL ART.** Throughout the medieval period, the church continued to be a powerful force in the dissemination of the aristocratic tastes and styles of the Gothic movement. At the same time, however, the later medieval papacy experienced a number of crises that served to diminish both its political authority and its spiritual credibility among the faithful. German emperors such as Frederick II (1212–1250) enjoyed an expanded sphere of influence and challenged the authority of the popes, and widespread perceptions of corruption in the church—particularly on such issues as the sale of indulgences, which promised sinners a reduced period of time in purgatory—caused ordinary people to turn away from the authority of hierarchical religion. While a good deal of art continued to celebrate the “Church Triumphant” during the Gothic era, a new artistic trend based on the imagery associated with private devotional practices resulted from the spiritual needs of individual Christians. Moreover, the interest in this devotional imagery in later medieval Europe was reinforced by a growing middle-class demand for privately owned images of all kinds. At the center of this world was the *Devotio Moderna*, an approach to personal devotion that was newly formulated by the Flemish Dominican mystic Geert Groote (1340–1384) and was soon widespread (especially in northern Europe). In appealing to popu-

Nobles feasting. Calendar page for the month of January. CHANTILLY, MUSÉE CONDÉ MS 65, FOL. 2R IN JEAN LONGNON AND RAYMOND CAZELLES EDS. *THE TRÈS RICHES HEURES OF JEAN, DUKE OF BERRY* (NY: BRAZILLER, 1969): PL. 2. REPRODUCED BY PERMISSION.

lar belief and practice, the *Devotio Moderna* relied a great deal upon the cult of saints and especially of the Virgin Mary, a practice that was centuries old, but now more popular than ever. Marian devotion prompted Christians to visit shrines of “Our Lady” all over Europe, and the many images of Mary created during this time expressed the popularity of the accessible and ever-compassionate Virgin.

**PRINTED IMAGES OF SAINTS.** The various saints were popular as subjects in later medieval art because as role models, personal protectors, and intercessors they were so well-positioned to attend to the needs of individual believers. Cities and guilds all had their own patron saints, and routine events and solemn occasions both required special devotion. Individuals also turned to particular saints at specific times and for specific reasons: St. Margaret watched over pregnancy, St. Apollonia could be helpful in soothing a toothache, and St.

A modern tracing of a woodcut of St. Christopher carrying Jesus across the river. MARY EVANS PICTURE LIBRARY.

Sebastian received particular devotion during outbreaks of plague. A woodblock print image of St. Christopher carrying Jesus across the river, produced in Germany anonymously in 1423 illustrates the contemporary piety for individual saints and the new medium of woodblock printing, through which their images were so easily disseminated. A necessary companion to the medieval traveler, St. Christopher's image facilitated devotion to the saint who provided protection on the difficult and often unsafe journeys of tradesmen, artisans, noblemen, clerics, students, soldiers, and pilgrims. Easily reproduced by mechanical means (though colored by hand) and reasonably priced, prints were an ideal form of portable devotional image that gained tremendous popularity in the later Middle Ages. Prints were pasted in books, jewel boxes, and on walls. They were kissed and handled, prayed to, and wept upon. Such popular devotional practices have been learned from written sources, but the images themselves, with the material evidence of their use, are silent witnesses to a vibrant and flourishing visual tradition.

**THE CANTIGAS OF SANTA MARIA.** The art of devotion also made an impact in more elite contexts. Created for Alphonso X (the Wise), king of Castile, around 1280 by an anonymous court illuminator, the *Cantigas de Santa Maria* demonstrates both the importance of Marian devotion in later medieval culture and the obsession with tangible signs of divine intervention in everyday life. The royal manuscript is a collection of some hundred songs in praise of the Virgin Mary, with narrative illustrations describing many of her miracles. In one illustration that tells the story of how the Virgin miraculously saved a man from falling, the page is split up into six different scenes. A line of text below each scene provides the reader with an abbreviated version of the story. The first scene shows an artist perched on scaffolding beneath the vaults of a church interior as he paints images of both the Virgin and the Devil. The Devil, apparently not flattered by his portrait, confronts the painter and causes the scaffolding to fall in the next scene. Thanks to the intervention of the Virgin, the man remains suspended in mid-air in the following scenes so that he can finish his work, which is subsequently admired by the community in the final scene. The moral here, as in each *Cantiga*, is that the sincerity of one's devotion to the Virgin will protect him or her from harm.

**THE HUMANITY OF CHRIST AND THE DIPTYCH.** Another important facet of late medieval devotional culture was the focus on the humanity (as opposed to the divinity) of Christ. Mystic writers of the fourteenth century, such as the German Meister Eckhart (a Dominican) and his disciple Henry Suso, focused their attention on Christ's suffering, spurring the production of new visual images, such as the Pietà (Mary cradling the limp, dead Christ) and the Man of Sorrows (the dead Christ displaying his bloody wounds to the viewer). These images were meant to convey the grief and pathos that would prompt a viewer's empathy, and were thus aids to devotion. One painted diptych (a pair of paintings on two hinged panels) produced around 1350 depicts Christ as Man of Sorrows on one side and the Madonna and Child on the other. Viewers are meant to be struck by the contrasting (though interrelated) images of maternal compassion and pitiful suffering. The figures are depicted on a gold-tooled ground that recalls the aesthetic of Byzantine icon painting. The tilt of the Virgin's face, saddened with the foreknowledge of her son's sacrifice, echoes that of Christ, and her pensive gaze foretells her future grief. Meanwhile the infant seems to provide reassurance to his mother with a gentle caress on her cheek. Such painted images were often produced in small format and used as private devotional altarpieces. Opened up at times of prayers and for special celebrations, dip-

tychs could easily be personalized with their owners' mottos, monograms, or coats of arms, usually on the back of the panels.

#### THE INFLUENCE OF THE MENDICANT ORDERS.

Individual piety and affective devotional practices were advanced early on by the friars of the new mendicant orders, the Franciscans (founded 1210) and Dominicans (founded 1216). Poverty, asceticism, and preaching were the ideals from the Gospels that the mendicants espoused, providing all Christians access to personal and profound spiritual experience. Instead of the almighty and powerful judge familiar from the early Middle Ages,

God was increasingly imagined in human terms as the suffering and merciful Christ. In the visual arts Christ was more consistently presented in these terms, his humanity and earthly life eclipsing images of apocalyptic Majesty or stern judgment. During times of plague or pestilence mendicant preachers reassured the populace with verbal imagery that was closely connected to the visual imagery of devotion. Conversely, new visual images drew upon the preaching of the mendicants. Works of visual art from the Rhineland, intended to trigger a viewer's empathy for the suffering Christ, show a particularly striking connection to the sentiments often conveyed orally by preachers. Known by the term *Vesperbilden*,

such images and objects aroused a sense of grief comparable to that experienced by the Virgin (and commemorated during the Vespers celebration on Good Friday). The Seon Pietà, sculpted around 1400, effectively conveys a sense of emotional distress through the representation of suffering. The grief-stricken Virgin holds the oversized body of her dead son on her lap. The contorted body of Christ prominently displays bleeding wounds. Similarly moving is the Pestkreuz Crucifix (plague crucifix) of around 1304 that displays an emaciated Christ on the cross. By visualizing Christ's suffocation, dehydration, and dislocation, the work encourages viewers to contemplate and meditate upon this ultimate sacrifice, endured for the sake of their own salvation.

## IMAGES OF DEATH

**CONSCIOUSNESS OF MORTALITY.** Whether or not one's pious devotions assured him or her of salvation, the specter of death continued to provoke anxiety among

Three Living and Three Dead. Office for the Dead, Book of Hours, Musée Condé, Chantilly, France MS 72, folio 50v, 1530. RÉUNION DES MUSÉES NATIONAUX/ART RESOURCE, NY.

even the most faithful. In the later Middle Ages, the visual arts record this anxiety with a particular vividness. Climaxing around the time that the worst epidemic of the bubonic plague (referred to as the Black Death) wiped out a third of the European population (1347–1350), visual images of death and mortal decay appear throughout Europe. Scenes of the Dance of Death, the Three Living and Three Dead, the Apocalypse, and the Last Judgment reminded viewers of their inexorable fate. Hoping to guarantee salvation or lessen their time in purgatory, the poor often undertook arduous pilgrimages to shrines of their favorite saints, while the rich commissioned lavish tombs, public monuments, and private works of art to express their piety and devotion.

**THE OFFICE OF THE DEAD.** Such apprehension about death is illustrated in the scene of the Last Judgment from the Office of the Dead in the *Grandes Heures de Rohan*. The manuscript, named after its last owner, was probably commissioned by Yolande of Aragon (widow

Effigy of Duke Philip the Bold with angels. Tomb begun in 1386 by Jean de Marville, continued by Claus Sluter, and finished in 1411 by Claus de Werve. Charterhouse of Champmol, France. THE ART ARCHIVE/MUSÉE DES BEAUX ARTS, DIJON/DAGLI ORTI.

of Louis II, duke of Anjou) and executed by an anonymous French master illuminator between 1420 and 1427. In books of hours the office of the dead (a series of prayers) functioned as a sort of gateway into paradise for those who read it regularly. Since all believing Christians were concerned with the fate of their souls after death and wished desperately to find salvation, with little or no time spent in purgatory (in Catholic thinking, the place where souls expiate their sins before going to heaven), the prayers read as part of the office of the dead were a special focus of attention. Another illustration from the *Grandes Heures de Rohan* depicts the ultimate combat between the archangel Michael and the devil for the soul of a deceased man, whose naked body reclines on a burial ground scattered with bones and skulls. He engages a conversation in Latin with the almighty God above: “Into thy hand I commit my spirit, thou hast redeemed me, O Lord of Truth” (Psalm 31:5). God’s

response in French comes as a modified version of his response to the repentant thief who died with Jesus at the Crucifixion (Luke 23:41–43): “For your sins you shall do penance. On Judgment Day you shall be with me.” The grayish body of the man features realistic details such as stiff limbs, crooked feet, and a limp neck that all imply the artist’s direct observation of death or dying. The aristocratic beholder of this image took the opportunity to meditate upon her own mortality and to consider the likelihood of salvation.

**THE THREE LIVING AND THE THREE DEAD.** Humor—usually mixed with a dose of moralizing—focused on human vanity and foolishness and helped the medieval Christian community to deal with the certainty of death. A popular visual “lesson” was the theme of the “Three Living and the Three Dead.” Based on a subject from thirteenth-century troubadour poetry, the image

flourished in several different versions in later medieval Europe and was reproduced in various media, including manuscript paintings, fresco painting, and sculpture in stone, in addition to printed images. The image normally depicts three noblemen, often hunting on horseback, who suddenly come across three dead men near a cemetery. The three grotesque specters of death harangue them with testimonies of their own past deeds, as a warning to the noblemen about the folly of pride and the inevitability of death. The lesson warns the three noblemen as well as the beholder of the image that “what you are now we once were, and what we are you will become.” This is an admonition to abandon fleeting worldly pleasures for eternal life in the love of God.

**FUNERARY ART.** In the funerary art of later medieval Europe, the obsession with confronting death and publicly visualizing one’s piety and hope for salvation took many forms. Many great cycles of frescoes and sculptures were commissioned to express devotion to saints and to proclaim the virtue of the deceased. Tombs themselves were often framed by elaborately carved niches in the walls of a chapel or by ornately embellished canopies (as was the case with the tomb of King Edward II of England). Very often tombs containing the mortal remains were topped with carved representations of the deceased in idealized, peaceful repose. The most elaborate of these tomb chests had multiple levels—called *transi tombs*—with portrait effigies accompanied by solemn funeral processions and grieving figures. Sometimes sculpted effigies took the form of decaying corpses in order to emphasize the divergent paths of the soul and the body after death. A notable example is the tomb of the Burgundian duke Philip the Bold, originally situated in the Chartreuse (or monastic charterhouse) of Champmol. Executed by the renowned artist Claus Sluter and two other sculptors, the tomb (finished by 1414, ten years after the death of the duke) features a portrait effigy reclining above the sarcophagus with some forty mourning Carthusian monks within a curtain of niches below, in a carved evocation of the actual procession that took place between Brussels, near the duke’s place of death, and Dijon, where he was laid to rest. This six-week procession over more than 250 arduous miles was undertaken on foot, though the carved representation expresses more playfulness than exhaustion. Each monk, draped in a heavy woolen garment, expresses a unique attitude: one is absent minded, another is bored, one is pinching his nose in mock disgust, and yet another grieves in silence. The striking naturalism with which Sluter is associated (and that was such a hallmark of the later Middle Ages) is employed here both to capture a real-life event and to guarantee the eternal rest of one mortal soul.

## SIGNIFICANT PEOPLE in Visual Arts

---

### ROBERT CAMPIN

c. 1376–1444

*Painter*

**AN URBAN PAINTER.** Robert Campin (d. 1444) exemplifies the late medieval urban artist, with his middle-class connections and civic activism. A highly respected resident of Tournai, in Flanders, Campin held the positions of dean of the Guild of St. Luke (the guild of painters), member of the *stewards* (a committee entrusted with the accounts and finances of the city), warden of his parish, bursar of his church, and captain of the city militia. He was probably already a recognized painter in 1406 when his name first appears in the city archives. He received commissions from the local bourgeoisie, city officials, and clergy members, and he also lent his talent to the city by creating banners, coats of arms, and costumes for civic events. Formerly referred to by modern scholars as the Master of Flémalle (from a set of paintings wrongly ascribed to the Abbey of Flémalle on the Lower Rhine), Campin is well known for the realism of his work and especially for his inclusion of domestic details, such as

those in his *Salting Madonna* of about 1430. His best known work, a triptych (three-panelled altarpiece) called the *Merode Altarpiece* (dated about 1425, now in the Cloisters Museum in New York), presents significant aspects of Flemish art. Filled with religious symbolism, this work comprises a wealth of domestic details painstakingly depicted with special care for realistic textures, surfaces, and portraits, generous draperies, and an intuitive use of perspective. In placing his religious subjects in domestic interiors, Campin brought a sense of actuality and reality to the divine that spoke more directly to his lay audience. This innovative way of treating religious scenes also echoes the contemporary piety that required a more “down to earth” and tangible experience of the divine. Campin collaborated with other important artists such as Jacques Daret and Rogier van der Weyden, whose careers flourished respectively in France and Flanders during the fifteenth century. His work remained influential well into the sixteenth century when a number of his compositions were still being copied or imitated.

## JEAN, DUKE OF BERRY

1340–1416

*Duke*

*Patron of the arts*

**AN ARISTOCRATIC PATRON OF THE ARTS.** Jean, duke of Berry, was a Capetian prince and brother to the French king Charles V, Duke Philip the Bold of Burgundy, and Duke Louis I of Anjou. He was born in 1340 in Vincennes and died in Paris in 1416 during a plague epidemic. Probably one of the greatest art patrons of his time, Jean had an eclectic taste and collected a variety of artifacts of immeasurable value, both ancient and modern, including antique coins and cameos, jewels, gold and silver vessels, tapestries, 1,500 dogs, and even ostriches and camels. Most noteworthy, however, was his collection of illuminated manuscripts. Three extant inventories provide a glimpse of the range and scope of his library of 300 books, of which only about 100 have survived, scattered today among various libraries through-

out the world. His outstanding collection of books, which he tended to maintain at his castle at Mehun, comprised many kinds of texts, such as Trojan histories, chronicles, astronomical treatises, *mappaemundi* (representational maps), and religious books. He attracted artists of renown to his court, and his enlightened patronage encouraged their creativity and originality, as well as the mixing of stylistic influences from France, Flanders, and Italy. Jacquemart de Hesdin, Jean Le Noir, André Beauneveu, and the Limbourg brothers were just a few of the most famous artists who produced works for the duke's collection and for his many castles (seventeen in all) at Poitiers, Dourdan, Mehun, Lusignan, Bicêtre (Paris), and other places. In some of his books can be found the duke's coat of arms, emblem, and the motto “The time will come.” His portrait appears in several manuscripts: in a wishful entry into heaven in the *Grandes Heures* (Great Hours); introduced to the Virgin by his patron saints Andrew and John the Baptist in the *Belles Heures* (Beautiful Hours); or welcoming his guests at his first-of-the-year banquet in the *Très Riches Heures* (Very Lavish Hours). In his *Grandes Heures*, a bear and a swan occupy the margins of a page that features the arms of France. This is a play on the words *ours* (bear) and *cygne* (swan) that together stand for *Oursine*, the name of a mysterious woman the duke once loved. Records show that Jean, duke of Berry, was a generous patron with his artists, bestowing upon them many gifts (such as coins, rings, and diamonds, on special occasions) in addition to substantial financial compensation, which was often sufficient to enable the purchase of a house. Artists traveled with the duke from one to the other of his many residences. All in all, the duke stands as an example of the type of enlightened collector and patron of the arts who helped bring about the creation of many great works in a period generally known for its artistic excellence.

## THE LIMBOURG BROTHERS

1380s–1416

*Manuscript illuminators*

**ILLUMINATORS AT THE DUKE'S COURT.** The Limbourg Brothers (Pol, Herman, and Jean) were born into

a family of artisans in Nijmegen, in the northern Netherlands, and their names were mentioned as apprentices in the goldsmith shop of Alebret de Bolure in Paris as early as 1399. Caught between the rival regions of Brabant and Guelders, they were imprisoned and held for ransom while on their journey home from Paris. Only after the intervention of their uncle, Jean Malouel, a highly regarded painter at the court of Duke Philip the Bold of Burgundy, and a generous ransom payment from the duke himself, were they finally freed. Afterwards, they resided at the court of Burgundy long enough to produce an illuminated manuscript for the duke (a *Bible Moralisée*, or moralized bible), and then they entered into the service of the Philip's brother, Jean, the duke of Berry, in 1404. Their art flourished under the patronage of Jean, whose collections of rare objects, antique coins, precious stones, and jewelry provided primary source materials for the artists' study. Their brief training as goldsmiths probably enabled them to render the minute details of jewelry and other objects found in their paintings. The duke held his artists in very high esteem, granting Pol one of the largest houses in the city of Bourges. As an example of the affection and good humor that characterized their relationship with their patron, the Limbourg brothers presented the duke with an unusual New Year's gift. They created a "fake" manuscript from a piece of wood that they painted with a *trompe-l'oeil* design (illusionistic, means "trick of the eye") simulating a vellum cover with gilt silver clasps featuring the arms of the duke. Their most famous work is the *Très Riches Heures* (or Very Lavish Hours), an ornate book of hours made for the duke. Mixing the spheres of religious devotion and secular life, the miniatures offer a vision of the duke's world—his chateaux, tapestries, coins, and other belongings—in alternating scenes of aristocratic pleasure and peasant toil on the duke's lands. Although they demonstrated their knowledge of Italian paintings in some of their compositions, they remained true northerners in their depiction of realistic details and life-like textures. In terms of their elegant representations of aristocratic figures, they were working in true Parisian fashion. All three brothers and their patron died in the same year (1416), probably from an outbreak of plague, leaving the Most Lavish Hours to be completed (in 1485) by another famous painter, Jean Colombe.

## LOUIS IX

1214–1270

*King of France*

*Patron of the arts*

**PATRON OF THE GOTHIC STYLE.** Born in 1214, Louis IX was king of France from 1226 until his death in 1270. During his minority he ruled under the regency of his mother Blanche of Castile (1226–1242) who even afterwards remained an influential counselor to the king in matters of politics, culture, and religion. Guided as a young man by his mother's interest in education, he later confirmed the foundation of the University of Paris (the Sorbonne, 1257), where significant theologians and intellectuals such as Thomas Aquinas, Bonaventure, and Roger Bacon came to teach and contribute to Paris's fertile intellectual climate. Louis also followed his mother in becoming a famous bibliophile, commissioning numerous illuminated manuscripts and thereby contributing to the development of a Parisian court style in painting. Among the many such works of which Louis oversaw the production and likely also the iconographic programs are a well-known psalter and a *Bible Moralisée*. Works such as these and the many architectural projects undertaken under Louis' patronage brought about a consolidation of the Gothic style. A devout Christian, Louis understood his royal mission to include evangelizing, the giving of charity, and the administration of justice, and he strove to make France a model Christian state. He participated in the seventh and eighth Crusades (during the second of which he contracted the plague), founded public hospitals, and presided over a court of justice, which later evolved into the Paris Parlement. Hence, during his reign, considered the Golden Age of French monarchy, Paris became a flourishing intellectual, administrative, and artistic capital, full of Gothic masterworks such as the flamboyant Sainte-Chapelle, built in the 1240s to house the relics of the Passion that Louis acquired from the East. His wisdom, magnanimity, and mediating prowess were recognized throughout Europe, and he was often solicited to intervene in conflicts outside of France. He was canonized by Pope Boniface VIII in 1297, and his cult was especially honored thereafter at the court of France (the Office of St. Louis appears in some notable illuminated books of hours created for members of the royal court). Louis was a patron of the arts *par excellence*, and subsequent rulers sought to emulate him in this regard.

## SIMONE MARTINI

1283–1344

*Painter*

**AN ITALIAN MASTER.** A close imitator and perhaps even a pupil of the famous painter Duccio in Siena, Italy, Simone Martini (active 1315–1344) might have worked on some of his master's later commissions and perhaps even on the famous *Maestà* (an altarpiece featuring the Virgin enthroned). He was himself commissioned to paint a *Maestà* in 1315 for the council chamber in the Palazzo Pubblico (town hall) in Siena. Invited to Naples by Robert of Anjou, king of Naples, he painted a portrait of the king receiving his crown from the hands of his brother St. Louis of Toulouse. His most notable works, however, remained in Siena. For the city council there he created an equestrian portrait of Guidoriccio da Fogliano (to celebrate the Siennese victory of Montemassi in 1328), and for the Cathedral he painted an impressive *Annunciation* set in a French gothic flamboyant frame with twisted colonnades. He spent the last six years of his life in the service of the pope in Avignon, decorating the papal palace and probably instructing French artists on the Italian art of fresco painting. His works continued the tradition of Duccio, with their Italo-Byzantine aesthetic and abundant ornamentation. With his elegant figures draped with weightless fabrics silhouetted against decorative, flat grounds, his work exemplifies the Italian court style, which contributed to the formation of the International Gothic Style at the turn of the fifteenth century.

## DOCUMENTARY SOURCES *in Visual Arts*

Aelred of Rievaulx, *De institutione inclusarum* or *On the Institution of the Recluse* (1109/10–1167)—Written by an English monk, this work contains a description of the devotional practices of the recluse who concentrates on images of the life and death of Christ in order to

identify mystically with the event. It illuminates the practices of individuals like Christina of Markyate who turned to illustrated psalters for their devotions in the twelfth century.

Bernard of Clairvaux, *Letter to William of St. Thierry* (1125)—Written by the Cistercian founder of the monastery of Clairvaux who would later be canonized as St. Bernard (1091–1153), this critique of the Benedictine (especially Cluniac) approach to the visual arts in a sacred context is part of the twelfth-century debate over the appropriateness of sacred art.

Etienne Boileau, *Le Livre des métiers* (1268)—Written in Paris, this work discusses the city regulations of the artistic trades in the thirteenth century.

*The Pilgrim's Guide to Santiago de Compostela*—Written in France in the twelfth century, this guide for pilgrims includes excerpts about shrines and relics to visit along the way, and the many perils of the journey.

Theodulf, Bishop of Orléans, *Opus Caroli regis contra synodum* or *Libri Carolini* (c. 791)—Probably authored by Theodulf, bishop of Orléans (c. 760–821), a member of Charlemagne's court chapel, this theological treatise on the religious significance of visual imagery was ordered by Charlemagne as a direct response to the Byzantine Council of Nicaea of 787, which restored the cult of images for the Greek church. Denying that human-made images are intrinsically sacred, the *Libri Carolini* concluded that images should be neither worshipped nor condemned, and that as a human art, painting could legitimately be used in the service of the church or for secular purposes.

Theophilus, Presbyter, *On Divers Arts* (c. 1125)—Written in western Germany, offering a response to St. Bernard's critique of sacred art, this treatise on painting, glasswork, and metalwork argues that art for liturgical purposes follows God's own command and specifications, and that the work of artists aware of this religious significance is an inspired spiritual activity which imbues the whole process of making and using liturgical art with a dignity transcending decorative concerns. Theophilus is tentatively identified with goldsmith Roger of Helmarshausen from Lower Saxony.

Villard de Honnecourt, *Sketchbook* (c. 1230)—This book of 33 leaves (from probably what were originally around fifty) was created by an artist from Picardy in northern France, who traveled widely and drew animals, cathedrals, abbeys, carpentry, church furnishings, geometrical figures, people, masonry, mechanical devices, and surveying implements and techniques, as well as recipes and formulas. Addressed to an unspecified audience, the book gives advice on the professional practice of the arts in the thirteenth century.

## GLOSSARY

**Abbey:** A monastery under the supervision of an abbot or a convent of nuns under the supervision of an abbess.

**Acolyte:** A person in the beginning stages of the priesthood delegated to assisting priests and deacons in the service of the Latin Church.

**Affective mysticism:** Religious spirituality taking place in the emotions as opposed to the intellect, to the extent that a spirituality of the heart becomes the center of one's piety.

**Aisle:** A long, open, narrow area at the sides of a church used to walk through the structure.

**Al-Andalus:** The Muslim-controlled portion of Spain from 711 to 1492.

**Albigensian Crusade:** A series of military campaigns, beginning in 1209, intended to put an end to Cathar heresy in southern France.

**Allegory:** A narrative mode in which abstract ideas are presented either through personifications (that is, characters who embody ideas like truth or justice) or through concrete, realistic characters and situations that have an additional layer or layers of symbolic meaning, even though they operate within a literal plot that makes sense in and of itself.

**Alliterative revival:** Use of the Anglo-Saxon alliterative poetic line (featuring three to four repetitions of words having the same initial consonant or vowel per line) in fourteenth-century Middle English poems, such as *Sir Gawain and the Green Knight* and *The Alliterative Morte D'Arthur*.

**Almuce:** An elongated, fur-lined hood initially worn by the general population but later becoming the headdress worn by clerics, especially canons.

**Altar:** The elevated place in a church where rites are performed.

**Altarpiece:** A devotional, religious work (painting or sculpture) placed usually on or above a church altar (where the Mass is celebrated). It can depict one or several different scenes, the imagery usually referring to the doctrine of the Mass or to the saint to whom the church or chapel is dedicated. It can include one or multiple panels (*diptych* with two panels; a *triptych* with three; or a *polyptych* with more).

**Ambulatory:** The passageway around the end of the choir.

**Anchoress (f.)/Anchorite (m.):** A solitary or hermit who pledges her or his life to prayer and contemplation. Anchoresses often lived in a small room attached or "anchored" to a church or public building. Visitors could come and speak with them and receive spiritual direction.

**Antiphon:** A style of liturgical chant in which the chanted verses constitute a conversation between two choirs, with solo interventions by a cantor.

**Antiphonary:** A choir book containing chants used during the canonical hours in a monastery.

**Antipope:** Someone who claims or is declared to be pope, even though a pope recognized by the orthodox canonical system already holds office.

**Apocrypha:** The non-canonical books of the Old and New Testaments, many of which were believed genuine in the Middle Ages.

**Apologia:** Something written in defense or justification of a position.

**Apostolic:** Relating to the pope, or connected with the Apostles (one of the twelve followers of Jesus chosen by him to preach Christianity) and their teachings.

**Apse:** A vaulted semicircular or polygonal recess in the church at the end of the choir.

**Arcade:** A series of arches supported by piers or columns.

**Arch:** An architectural formation that spans an opening in such a manner that the weight of the material is converted into outward thrusts, carried to the sides and then down along flanking columns, piers, or buttresses. The rounded arch was common in ancient Rome and in Romanesque Europe and is made from wedge-shaped blocks. The Gothic or pointed arch forms a central point above. The ogival (or ogee) arch is formed by double curved lines (like two S-curves mirroring each other) that meet at a point.

**Archdeacon:** The bishop's principal assistant or officer.

**Arian Christianity:** A sect founded upon the ideas of an Alexandrian priest, Arius, who came into conflict with mainstream Christianity at the Council of Nicea in 325. Arians believed that Jesus and the Father were not one in the same being, that is, as God's son Jesus possessed a certain creaturehood. The doctrine became popular for a brief period in the East at the imperial court and was adopted by Western Goths and Vandals.

**Ascetic:** Devoted to solitude, contemplation, discipline, and fasting; denying the body in order to derive spiritual benefits.

**Ashlar:** Stone that is faced and squared, often with a chipped or irregular surface.

**Atrium:** A front court, sometimes covered, sometimes containing a fountain, before the entry to the church proper.

**Aubade, or Aube, or Alba:** Literally a "dawn song," a type of troubadour lyric in which lovers lament the coming of the dawn because they must part after a night of clandestine lovemaking.

**Augustinianism:** The school of philosophy in the thirteenth century that adhered to the teachings of the pre-Aristotelian period, rallying around the name and authority of St Augustine, and strongly opposing Aristotelian and Thomistic views.

**Augustinian Rule:** A set of guidelines devised by St. Augustine of Hippo in the fourth century for the common life of the religious and often used by the canons regular or Austin Friars, but rarely before the eleventh century.

**Austin Friars:** An order of friars that began as hermits in Italy in the mid-thirteenth century. Brought together into one group called the Order of Hermits of St. Augustine, they eventually began ministering and preaching in urban areas and became interested in the formalized study of theology, the scriptures, and the philosophy of St. Augustine.

**Avignon Papacy:** A period from 1309 to 1377 when the leadership of the Latin Christian Church was located in Avignon (now southern France) rather than in Rome.

**Bagpipe:** An instrument found throughout the Middle Ages in most areas of Asia and the Middle East as well as in Europe, in many different sizes and shapes. The sound is made by squeezing a bag (originally the skin of a goat), and the melody is played on a chanter pipe with finger holes, accompanied by a sustained tone created by one or more drone pipes. The bagpipe is most often seen playing alone, frequently for dancers, and it is usually associated with rural or pastoral settings.

**Bailey:** The open courtyard in a castle between the outer ring of fortified walls and the keep.

**Ballo:** A late medieval form of dance that is the precursor of ballet. Unlike the earlier *bassadanza*, which is danced at a single steady tempo and measure, the *ballo* is made up of an irregular series of up to four different tempos (called *misura*), each having a different kind of rhythmic organization and speed.

**Banns:** A formal public announcement of weddings, required in Christian Europe after the early thirteenth century.

**Basilica:** An early Christian church which borrows elements from Roman public buildings called basilicas (often oblong or rectangular in shape) used for law courts, tribunals, and meetings. Some Roman basilicas were given to the Christians to use as churches. The title of basilica was also given by Rome to denote certain privileged churches.

**Bassadanza:** An Italian dance similar to the Burgundian *basse danse* in that it was a processional dance, moving at a single steady tempo, and organized around a number of relatively simple basic steps. The *bassadanza*, however, had nine basic steps and allowed the choreographers and dancers more freedom, as, for example, in the addition of "ornamental" steps.

**Basse danse:** An elegant choreographed processional dance originating in Burgundy by the early fourteenth century

and consisting of five basic steps that are arranged in a unique sequence for each composition. The steps themselves are not complicated, and all require that the feet stay close to the floor.

**Battlement:** The low parapet at the top of a fortified wall composed of solid shields of masonry, called merlons, alternating with openings, called crenels.

**Bay:** In architecture, any of a number of similar spaces or compartments between the vertical dividing structures of a large interior.

**Béguine:** A member of a lay movement based on piety that began in the early 1200s when groups of urban laywomen in Germany and the Low Countries came together to live celibately in communities, supporting themselves with the labor of their own hands. The movement suffered persecution in Germany but had the protection of powerful patrons in France.

**Benedictine monastery:** Monastic house or community of monks adhering to the Rule of St. Benedict.

**Benedictine monasticism:** Western communal practice begun in the sixth century by Benedict, the abbot of Monte Cassino in Italy. *The Rule of Benedict*, one of the first of its kind for western monks, stressed a corporate life of prayer, work, humility, and stability under the leadership of an abbot. By the eighth century, the Benedictine lifestyle had become an important blueprint for the development of western monasticism.

**Benefice:** Originally a manor, estate, or land that one held (often for life) at the pleasure of the donor. In later periods, the term under canon law came to refer to certain church offices, such as the rectorship of a parish church, with particular duties for which one would be granted revenues.

**Berbers:** A people living in northern Africa, especially in the area that is now Algeria and Morocco.

**Bishop:** A senior cleric in charge of the spiritual life and administration of a geographical region known as a diocese.

**Bishop of Rome:** A title used by the pope since his authority over the entire Latin Church was due, in part, to his control over the local Roman Episcopal See. The symbol of Rome as the center of the empire gradually gave way to the place of Rome as the center of Christendom.

**Black Death:** An epidemic of bubonic plague that killed over 50 million people in Asia and Europe in the fourteenth century.

**Blessed Sacrament:** The sacrament of the Eucharist or Lord's Supper, often referring to the consecrated elements of wine and wafer themselves.

**Bliaut:** Either a costly fabric, a knight's court tunic, or a lady's court dress. When this term refers to the lady's garment, it signifies a gown of the richest fabrics, banded at neck and wrist edges with strips of embroidery, fur-lined, having a tightly-laced (at the sides) elongated bodice, a full, long skirt, and sleeves of various styles. As a fabric, bliaut meant silk, satin, or velvet imported from the Orient, frequently woven with gold thread and embroidered with gems.

**Bogomils:** Followers of Bogomil, a tenth-century preacher in Macedonia who taught a life of prayer, penitence, wandering, and simplicity of worship, and subscribed to a quasi-dualist view that the world was evil because it had been created by the devil, the eldest son of God.

**Bonnet (English "cap"):** A general French term, used from the Middle Ages onward to denote a small head-covering.

**Breton Lays:** Short verse narratives, exemplified by the *Lais* of the Anglo-Norman poet Marie de France, which were originally performed orally in the Breton language and were transformed into written narratives from the twelfth-century onward, featuring rash promises, erotic entanglements, an ambivalent code of ethics, and a strong supernatural strain.

**Bubonic plague:** *See* Black Death.

**Bull:** *See* Papal bull.

**Burgundian:** Relating to the area and court of Burgundy (now part of France), an independent duchy beginning in the eleventh century lying halfway between Paris and the Mediterranean. In the late fourteenth and fifteenth centuries, Burgundy became the capital of a powerful principality that included not only northeastern France but much of Lorraine, Luxembourg, Hainaut, Brabant, and Flanders (present-day Belgium and the Netherlands).

**Byzantine:** Relating to the eastern part of the late Roman Empire or to the Orthodox Christian Church and its traditions.

**Caliphs:** Literally, successors to the Prophet Muhammad who are temporal and spiritual heads of the religious community in the Muslim world.

**Canon:** A member of the clergy following a rule like those followed by monks but often attached to a cathedral or large urban church; the canon is responsible for the daily running of the church and for educating the children of the nobility (sometimes called "canons regular" because they lived according to a rule and formed groups called "colleges.")

**Canon law:** The body of Latin Church law imposed by the authority of councils and bishops, particularly pertaining

- to matters of belief, morals, and discipline of the Christian faithful. One schooled in canon law is a canonist.
- Canonical:** Belonging to a set of religious writings regarded as authentic and definitive, and forming a religion's body of scripture.
- Canonical hours:** The Divine Office or daily prayers usually sung or recited (often 7 times a day) by members of religious orders as part of their required normal routine.
- Canonize:** In western Christianity, to declare an exceptionally holy person who is deceased to be a saint.
- Capital:** The uppermost portion of a column or pillar, often carved with relief sculpture on several faces.
- Cardinal:** A member of the college of Roman princes who are the immediate counselors of the pope and rank second only to the pontiff in the church hierarchy. At various times they meet in conclave to elect new popes.
- Carmelite Friars:** Members of the order of Our Lady of Mount Carmel, which originated in mid-twelfth-century Palestine as a group of hermits following a strict rule of asceticism. With the fall of the Holy Land and the demise of the Latin Christian kingdoms in the early part of the thirteenth century, the community broke up into several groups that moved into Italy, Spain, Cyprus, Sicily, southern France, and England, where they soon became engaged in a more active life of preaching and study in the world.
- Carol:** The most popular dance of the medieval period, a type of line dance in which the principle arrangement calls for dancers to join in a line holding hands, fingers, or a scarf, while they move along, often through the streets, following the leader.
- Carolingian:** Relating to the dynasty of Frankish kings, descended from Emperor Charlemagne, that ruled an area corresponding to modern France and Germany (expanding into northern Italy and as far east as Austria) in the eighth to tenth centuries.
- Carthusians:** Members of an order of monks, founded in 1080 by Bruno of Cologne, that mixed both eremitical (hermitic) and cenobitic (communal) elements. The monks lived in a group hermitage where each member spent most of his time in the solitude of a private cell, except for communal prayer twice a day.
- Cathars:** A mid-twelfth-century movement that taught that the material world was impure and that the soul must strive to free itself from the evils of this existence. Like the Bogomils, they regarded Jesus not as God, but as more of a super-angelic being who came to earth to lead people on the right path.
- Cathedral:** The church which forms the seat or throne of a bishop and is the main church in a diocese or large administrative division of the church in a region.
- Catholic:** A term meaning "all inclusive" that was used to refer to the Roman Christian church from the fourteenth century onward and became official with the Council of Trent in the sixteenth century.
- Cause/Causality:** In philosophy, responsibility of one being for some feature in another (the effect), such as its existence, essence, matter, accidents, or changes.
- Cellar:** Space used for storage and located on the ground level of the west range of a monastery.
- Cenobitic:** Having to do with the communal aspect of monasticism; monks or nuns living a communal lifestyle.
- Champlevé:** A form of enamel work in which the melted glass is poured into grooves that are previously engraved into the metal surface, so that the hardened enamel is flush with the surface of the metal.
- Chancellor:** A church officer in charge of a university.
- Chanson de geste:** Literally "songs of deeds or exploits," a type of French heroic verse narrative of the eleventh through thirteenth centuries, based on earlier oral accounts recounting heroic deeds in warfare, often connected with the Crusades.
- Chapel:** A small space for private worship, located off the aisle of a church.
- Chaperone:** A hood with a lower edge long enough to cover the nape of the neck and upper shoulders, having a circular opening for the face and often a long point, sometimes with a tail or tippet added. In the fifteenth century, the chaperone was often worn in an elaborate curved turban-like arrangement on top of the head, with the tippet wrapped to retain the desired shape.
- Chapter:** The assembly of a monastic community (often daily) where a chapter of their rule was read, official business was dealt with, and faults of the monks were addressed. This term can also refer to a group of clergy (often canons) serving a cathedral.
- Chapter of faults:** A community meeting where religious individuals can make confessions of their failings or imperfections to leaders, or the failings of individuals may be pointed out by leaders and other community members.
- Chapter room:** A room usually located along the east range of the cloister used by the monastic community for daily meetings.

- Charismatic:** Christian groups or forms of worship characterized by a quest for spontaneous and ecstatic experiences, such as healing, prophecy, and speaking in tongues.
- Chastity:** The practice of abstaining from sex on moral grounds; one of the basic vows of monastic life.
- Chevron:** A pattern of angled stripes.
- Choir (or quire):** The part of the church to the east of the transept containing seats for the monks, canons, or clergy, often near the altar; the place where monks and canons would sing the daily offices.
- Choreographed dance:** A dance having a unique sequence of steps (in contrast to conventional dance).
- Christendom:** The extent of Christianity on earth, often configured in the Middle Ages as a series of Christian states.
- Cistercian Order:** A reform monastic movement that began in 1098 and became one of the largest and fastest growing religious movements of the Middle Ages. The Cistercian Order was directed toward reform of the perceived growing laxities within the French Benedictine system, especially among the Cluniacs, and focused on moving away from the “worldliness” that had crept into medieval monasticism.
- Clerestory:** A portion of the interior of a church rising above adjacent rooftops and having windows to admit light.
- Cloisonné:** A kind of enamel work in which the melted glass is poured into compartments formed by a network of metal bands such that the exposed tops of the bands serve to divide the areas of colored enamel.
- Cloister:** An enclosed space (often in the form of a roofed walkway with arches and columns) that forms part of a monastery.
- Cloistered:** Enclosed in a monastery, literally in the cloister space that forms part of a monastery; not free to leave or have visitors due to one’s monastic status.
- Cluniacs:** Members of a reform Benedictine monastic movement (founded at Cluny, Burgundy, in 909) whose members sought to experience God in the unceasing prayer of their community and the paradise of the cloister. The order is known for its large abbey church and its elaborate liturgy based on the idea of continuous prayer. By the mid-twelfth century, Cluny had expanded to over 1,000 dependencies and had become one of the wealthiest and most influential establishments in all of Christendom.
- Coif:** A small covering for the head, usually of linen, that tied under the chin, resembling a present-day baby bonnet.
- It was worn beneath other types of headdresses. Dating from the early thirteenth century, it disappeared from men’s fashionable dress by the middle of the fourteenth century, except that it continued to be worn by Sergeants at Law in England even after they became judges.
- Collect:** A short form of prayer or petition in the Mass, originally used to denote the collecting of petitions.
- College of canons:** A group of religious leaders charged with the administration of a cathedral and living together in a group (college).
- Column:** A large post-like support holding up an arch or other architectural feature. The tops of columns were often decorated with sculpture.
- Comitatus:** The early medieval heroic code practiced by male members of a communal group in a special reciprocal relationship in which the lord offered material rewards and a social identity in return for military and political allegiance.
- Conciliarism:** The notion that an assembly of Christian bishops who are gathered in the name of the church have the right to make binding decisions for the church in the absence of the pope, especially during a time of crisis. This idea was advanced by bishops during the Great Schism.
- Confraternity:** Association with a monastic community granted to a layperson, conferred by prayers, including the sharing in the spiritual privileges of the monastery.
- Consecration:** The action of blessing by a priest or bishop and made holy by the power of God. Bread and wine are consecrated in the Eucharistic action.
- Consummation:** The act of making a marriage legally complete and fully valid through physical sexual union.
- Contemptus mundi:** Literally “scorn of worldly things,” especially wealth, beauty, social status, and political power. This attitude of rejecting earthly life in favor of hope of the world to come was particularly pervasive in medieval Europe during the fourteenth-century famine and plague, and is reflected in literature and art.
- Contingency:** (a) In philosophy, a state of affairs which may and also may not be; (b) a relation between events such that the second would not happen but for the first.
- Contrapasso:** The method used by Dante in the *Divine Comedy* to allocate appropriate punishment for sin, where the punishment suits the sin by being its ironic opposite; for example, the gluttons, who ate excessively in life, are punished by being pelted by hurricanes of excrement, the byproduct of their own overeating.

- Convent:** Living quarters of nuns or a community of friars.
- Conventional dance:** A dance consisting of the continuous repetition of a single pattern of steps.
- Conversi:** Lay brothers, or adult converts, to religious life, as opposed to those oblates who were raised in the monastery as children.
- Corbel:** A short horizontal bracket of stone or timber projecting from a wall and supporting an architectural element.
- Corpus Christi:** Festival dedicated to the “body of Christ” instituted in 1311 by Pope Clement V; it became the occasion around which many of the mystery cycles and Passion plays of Europe were performed.
- Corse:** The bodice of a bliaut, or a stiffened garment worn underneath a bodice made of lighter-weight fabric. It could be laced tightly to shape the waist and torso.
- Cotehardie:** A short, tightly-fitting jacket-like garment for men popular from around 1333 through the mid-fifteenth century. In its earliest form, it was a low-necked garment reaching only to the knee, worn over a shirt, distinguished by a row of buttons that ran from the neckline to the low waistline.
- Courtepie:** A short version of the houppelande for men, worn over other garments in the fourteenth and fifteenth centuries.
- Courtly Love:** The term coined by the nineteenth-century French scholar and critic Gaston Paris to describe *fin’amors* (refined love), the extremes of devotion and psychological suffering experienced by male protagonists for their ladies in medieval romances and lyrics. This medieval amatory experience was codified by twelfth-century writer Andreas Capellanus in his *Art of Courtly Love*.
- Crenellation:** A battlement (protective wall) with tapered embrasures or squared openings.
- Crosier:** The staff of a bishop, abbot, or abbess, sometimes bearing his or her insignia, commonly depicted in the form of a shepherd’s staff signifying pastoral powers.
- Cruciform:** In the shape of a cross.
- Crusade:** One of a series of military campaigns, first promoted in 1095, in which European Christians attempted to retake the Holy Land from Muslim domination. The term was also applied to campaigns against heretics inside Christendom, as well as campaigns against pagans on the boundaries of Europe.
- Crypt:** A chamber or vault below the main floor of a church, often used as a burial spot.
- Cubit:** A measurement of ancient origins corresponding to the length of the forearm (about 17–21 inches), sometimes used in medieval architecture.
- Customals:** Books containing the instructions for practice and celebration of the divine office and other activities of monastic daily life. The customals also spelled out rubrics or instructions for processions, and the use of candles, incense, crosses, and reliquaries in liturgical and devotional celebrations or commemorations. In addition, they might contain customs concerning the manors and estates controlled by a monastery along with information concerning rents and obligations.
- Cyclic:** A musical composition of several movements that are related by the use of some of the same material.
- Dagging:** Fancy cut-work decorating the edges of sleeves and hems in medieval clothing.
- Dance of Death (Danse macabre):** In late medieval literature, sermons, and iconography, a dance involving humans and skeletons, intended as a reminder of mortality.
- Dar-al-Islam:** The abode of Islam or the Islamic territory.
- Day room:** A room in which monks pursued manual labor within the cloister, sometimes a scriptorium. The day room was often located next to the chapter room along the east range and below the dormitory.
- Deacon:** Literally, the servant of the bishop in early Christianity. The status of deacon was one of the early steps on the way to priestly ordination in the medieval period. The deacon could have specific liturgical functions associated with the Eucharist and dismissal at mass.
- Deism:** The view that while God is responsible for the existence of the world, He otherwise has no commerce with it.
- Dialectics:** (a) The science or art of logic; (b) a method of arguing and defending with probability open questions.
- Diocese:** A geographic division or extent of a bishop’s jurisdiction.
- Diptych:** A pair of painting or carvings on two panels, usually hinged together.
- Disputation:** A formal and structured dialogue between master and pupil, proposing questions and replies, difficulties to the teacher’s reply, and solution of these.
- Docetism:** From the Greek “I seem,” a belief popular among early Christian gnostic groups (sects claiming superior knowledge of spiritual things) that the human-

ity and suffering of the earthly Christ were apparent, but not real.

**Dolce stil nuovo:** In Italy, the “sweet new style” of poetry practiced by such poets as Dante and Guido Cavalcanti, who mirrored the themes of the southern French troubadours in Italian love lyrics of the thirteenth century.

**Dominican friars:** Members of the Order of Preachers, which originated when an Augustinian canon (Dominic de Guzman) from Spain began preaching against the heretical Cathars in southern France in 1203. Given official confirmation in 1217, the order frequently located near university towns and maintained a focus on preaching, teaching, writing, and combating heresy.

**Donjon:** The great tower or keep of a castle, sometimes thought to be the residence of the lord of the castle.

**Dormitory:** The common sleeping room of the monks. The dormitory was customarily attached directly to the south arm of the church and was located above the chapter room on the east side of the cloister.

**Double monastery:** The buildings used by a group of cloistered religious individuals that includes both monks and nuns.

**Doublet (pourpoint, gambeson):** A short garment for men with a tight waist and a thickness of padding through the chest; also a garment worn by knights both as an outer garment (coupled with hose) and as padding under armor.

**Dream vision:** A medieval poetic genre consisting of a narrator’s account of his unusual dream, provoked by his physical surroundings or bedtime reading matter, in which he is often visited by a male or female authority figure who issues guidance or advice. These narratives treated such themes as love, philosophical and spiritual issues, and contemporary mores, often from a satirical perspective.

**Dualism:** Belief consisting of, or focusing upon, two elements, often the spiritual and the corporeal, or forces of good and evil.

**Ecclesiology:** The study of the church, or theories concerning the organizational and spiritual body of believers.

**Ecumenical:** Worldwide, as in a general synod or council called by bishops, church leaders, or a pope. Ecumenical councils were often called to resolve issues that affected the entirety of Christendom.

**Eddic poetry:** Heroic and mythological lays composed in medieval Scandinavia in free form or varying meters, based on Germanic legends and mythology about the pagan northern gods.

**Effigy:** The likeness of a person, sculpted in wood, plaster, stone, or bronze, and placed on top of the person’s tomb; effigies often adorned the aisles of medieval churches.

**Eigenkirchen:** A church under private control or ownership. Many rural churches in the early Middle Ages were of this kind.

**Emanation:** Flowing forth from a source; the pantheistic view that all things arise necessarily out of the substance of God’s being, intellect, etc.

**Enamelwork:** The artistic use of enamel, a substance formed from colored glass particles that are melted and fused, usually to a metal surface.

**Episcopal:** Having to do with a bishop.

**Eremitic:** Having to do with the life of a hermit or solitary.

**Essence:** In the broad sense, what a thing is, all its characteristics, as contrasted with its existence.

**Essentialism:** The metaphysical view that identifies being with essence or that holds that the act of existing is always identified with the actual essence.

**Estampie:** Mentioned in literature from France and Italy, a dance or musical form whose name derives from the Latin *stante pedes* (stationary feet), referring to the fact that the dance steps remain close to the ground, in contrast to those dances that employ jumps or kicks.

**Eucharist:** In Christianity, the celebration or reenactment of the Lord’s Supper using bread and wine consecrated by a priest in order to memorialize Christ’s death and resurrection.

**Excommunication:** Church censure imposed by an authority which excludes individuals from communion with the faithful and deprives them of rights to certain sacraments.

**Exemplum (pl. exempla):** Moralizing anecdotes drawn from the lives of saints, animal fables, or wise sayings about everyday life, assembled to help a preacher make a powerful connection with his audience.

**Existence:** In philosophy, the actuality of an essence; that act by which something is.

**Extreme unction:** The sacrament of the sick and dying, usually accompanied by prayers and an anointing, given as a last grace and opportunity of forgiveness.

**Fabliau:** A brief tale, most often in French, set in the present-day world, populated by stock bourgeois characters, employing clever, complicated plots (often love triangles) about humankind’s most basic functions, especially sex.

**Façade:** The front of a church, usually imposing and decorated.

**Fasting:** Abstinence from food as a religious observance.

**Feast:** A certain day in the liturgical calendar of the Catholic Church devoted to the birthday or martyrdom of a particular saint, or event of significance in the Christian year.

**Feudalism:** *See* Lordship.

**Fideism:** The thesis that religious belief is based on faith and not on either evidence or reasoning.

**Filiations:** Daughter houses, often founded or adopted by the mother monastery. A group of daughter houses dependent upon a main house or linked together in a system.

**Filigree work:** Fine metalwork created using tiny beads or very fine threads of metal to create the effect of delicate, lacelike, openwork ornament.

**Filioque:** A Latin phrase (literally meaning “and the son”) referring to an argument as to whether or not the Holy Spirit proceeded from the Father or emanates from both the Father and the Son. The Latin Church seems to have added the notion that the Holy Spirit can also proceed through Jesus as well as God the Father.

**Flagellation:** Whipping or beating oneself in punishment for sins or to commiserate with the suffering of Christ.

**Flying buttress:** A segmental arch transmitting outward and downward thrust to a solid buttress or square column which transforms the force into a vertical one.

**Fortune’s wheel:** The popular medieval metaphoric construct to explain cyclical human misfortune, caused by the turning of a Wheel by an allegorical personification, blindfolded Lady Fortune, on whose “wheel of fortune” all men are situated, rising high upon or being cast off of the wheel (regardless of their merits or evil actions) according to their current state of luck.

**Four-fold medieval allegory:** Four levels of medieval allegorical interpretation: 1) the literal level; 2) the allegorical level; 3) the tropological or “moral” level; and 4) the anagogical or eschatological level, about the afterlife.

**Franciscan friars:** The Brothers Minor, an order based on the principles of extreme poverty and itinerancy, first proposed by Francis of Assisi in 1210. In the early fifteenth century, the order split into the conventual (the more lax) and observant (the more traditional) branches in a disagreement over the issue of property and observance.

**Fresco:** A technique of painting on a moist lime plaster surface with colors ground in water or a limewater mixture.

**Friar:** A member of one of several religious orders who served as missionaries, teachers, and confessors; in contrast to monks, friars (brothers) did not live a cloistered life, but rather lived together in convents on the edges of cities.

**Gallery:** A long, narrow area in a church, open at each end or at sides and sometimes elevated.

**Gambeson:** *See* Doublet.

**General Chapter:** An assembly bringing together all the abbots, abbesses, heads, or representatives of the houses of a monastic order for a general meeting.

**Genuflection:** A Christian practice of bending down on one knee, as it touches the ground in veneration.

**Girdle:** A kind of belt introduced into female costumes in the eleventh century to give the female figure a more distinctive outline, but later worn by both men and women. Girdles were usually constructed as twisted cords, sometimes knotted, made from gold or silver wire and dyed wool or silks, and bound with ornamental fasteners or finished off with tassels. Simpler girdles were also constructed from a length of fabric that was decorated with stitching of a contrasting color.

**Gittern:** A plucked string instrument that was smaller and higher-pitched than the lute, depicted with three to five single strings.

**Gothic:** A term originating in the Renaissance to refer to the architectural style that dominated the western half of Europe from the twelfth through the mid-sixteenth centuries, distinguished by the use of pointed arches, ribbed vaults, flying buttresses, and stained glass windows.

**Gown:** One of several garments worn by both men (over an under-tunic) and women (over a chemise), distinguished, according to a principle of layering, as an under-gown or over-gown.

**Grace:** The theological notion of the free gift of love and unmerited assistance that God gives individuals so that they bridge the gap between humanity and divinity, attain salvation, and participate in the life of God.

**Grail:** An object, apparently originating in medieval literature, associated with the last moments of Jesus Christ’s life, sometimes identified as the chalice or bowl used by Joseph of Arimathea to collect Christ’s blood after the Roman soldier Longinus pierced His side with a spear.

**Grange:** A monastic farm settlement at a distance from the monastery that was part of an abbey’s estates, usually

- supervised by a monk and worked by the lay brothers, but sometimes contracted out to others.
- Great Schism:** The period from 1378 to 1417 during which there were two, and sometimes three, claimants to the papal office.
- Grisaille:** Monochrome painting, usually in tones of gray, found especially in stained glass and painted altarpieces (and sometimes illuminated manuscripts, textiles, etc.) from the later Middle Ages.
- Groin vault:** In architecture, the curved line or edge formed by the intersection of two vaults.
- Guild:** An association of persons belonging to the same class or job, often connected with a particular profession, joined together for the betterment or promotion of their situation.
- Gyrovagi:** Monks or clergy who wandered from institution to institution, a practice frowned upon by the Church; these unsettled religious and clerics were sometimes referred to as “professional guests.”
- Hagia Sophia:** A famous sixth-century church in Constantinople, Byzantium, now Istanbul in modern Turkey.
- Hagiography:** Medieval narratives about the lives of saints or virtuous people.
- Haincelin:** A short version of the houppelande, sometimes said to have been named for the jester Haincelin Coq in the court of Charles VI of France, who may—as was the case with many jesters—have been a dwarf.
- Hammerbeam:** One of a pair of short cantilevered timbers supporting a ceiling arch.
- Harmony:** The result of two or more notes sounding at the same time.
- Harp:** A common medieval musical instrument that existed in a variety of sizes and forms. The type most often depicted in art was a small portable harp with 24 or 25 strings.
- Hennin:** A French headdress of the second half of the fifteenth century that had a cone-shaped construction with soft veiling attached at the peak that hung behind it in varying lengths, sometimes reaching to the floor.
- Heresy:** Opinion or doctrine at variance with the orthodox or accepted doctrine of a church or religious system.
- Hierarchy:** A chain of office, consisting of a body of officials organized by rank.
- Holy Roman Empire:** The term used from the twelfth century onward for a Germanic empire (originating with the coronation of Otto I of Germany in 962) that was viewed theoretically as the continuation of the Western Roman Empire and as the temporal form of a universal dominion whose head was the pope.
- Homage:** The formal public acknowledgment by which a knight or tenant declared himself a vassal of his lord, owing him fealty and service. See also *Lordship*.
- Host:** The consecrated bread at the Mass which medieval Christians believed was changed into the body of Christ in conjunction with the action of the celebrant.
- Houppelande:** A fourteenth-century garment of variable length that was worn over the doublet and hose. The longest version of this garment was worn for formal occasions and was ground-length or somewhat longer. A short version reached halfway between ankle and knee, and one of an even shorter length hit some inches above the knee. Initial forms of the houppelande had high collars that fanned out, but later collar styles differed. Sleeves were funnel shaped, increasingly wide at their ends, and often edged with fancy cut-work (dagging) and slashed to show fur linings of complementary colors. After 1450, the more usual term for this garment was “gown.”
- Humiliati:** A lay spiritual movement, eventually given papal approval, that developed in the late twelfth century and emphasized voluntary poverty and vernacular translation of the scriptures. The Humiliati became known for the production of inexpensive cloth for the poor.
- Hurdy-gurdy:** A musical instrument that made its sound by turning a crank that caused a wheel to scrape against two or three strings. A set of keys or levers could be pressed against one of the strings to change the pitch, while the other(s) provided a drone.
- Hussite Wars:** A persecution of the followers of Jan Hus that took place between 1419 and 1436 when they continued to preach throughout Germany and Czech territories after Hus was burned for heresy.
- Icelandic family sagas:** Tightly structured, complexly plotted thirteenth-century heroic prose narratives composed from earlier oral accounts, depicting the blood feuds and other events that happened during the settlement of Iceland as a colony of Norway in the tenth and eleventh centuries.
- Iconic:** The quality of a visual image or object that is generally static, frontal, and non-narrative.
- Iconoclast:** One who literally would smash religious statues and icons, based on the belief that they were idolatrous.
- Iconography:** The pictorial representation of a subject, especially when comparing the particular character of a

represented subject to the complete visual record of that subject throughout the history of art; also the study of the meaning of the subject matter of visual images.

**Illuminated manuscript:** A manuscript (handwritten book) with hand-painted decoration or illustrations, usually employing silver, gold, and different colored pigments.

**Illumination:** In the Augustinian sense, the function of the divine light within a human intellect that makes truths or intellectual knowledge (as opposed to sense knowledge), especially of immaterial things, possible to the rational creature. Also, the gilded hand-painted decoration or illustrations in an illuminated manuscript.

**Immanence:** (a) Presence in and operation within; indwelling: as “God is immanent in all things”; (b) Pantheistic sense: God’s presence in the universe as a real part of it.

**Indulgence:** After the confession of sin, the substitution of penance by another act, such as almsgiving, pilgrimage, crusade, or financial contribution for the construction of a church.

**Infirmary:** The building devoted to the care of sick and infirm monks. Often situated outside the cloister precinct to the east with its own cloister and chapel, it formed a monastery in miniature.

**Inquisition:** The juridical persecution of heresy by special church courts.

**Interdict:** A ban imposed by a pope, church council, or bishop that excludes a person, group or country from the sacraments.

**Investiture:** The investing or conferring of authority to a church official by a superior in a ceremony involving presentation of the symbols of office, including an exchange of homage before consecration.

**Isorhythm:** A rhythmic pattern that is imposed on a melody and repeated exactly throughout the length of the composition.

**Jihad:** The Muslim duty of struggling or fighting to maintain excellence or striving for an ideal society in which Islam might flourish. Early interpretations emphasized the “greater jihad,” that is the struggle within oneself, while the “lesser jihad,” connected to the idea of the physical struggles, such as mission effort, good works, building mosques, and overcoming the enemies of the faith, would not become significant to Muslim theology and ideology until the twelfth century.

**Jongleur:** An Old French word associated with modern English “juggler,” used as a catch-all term to identify a

person with the array of talents shared by professional performers of the Middle Ages.

**Jubilee year:** A holy year in which special blessing and indulgences remitting time spent in purgatory are granted to Christians who visit Rome and fulfill certain spiritual requirements. Jubilees come every fifty years.

**Kabbalah:** Meaning “tradition,” a medieval Jewish mystical movement which has its roots in scriptural accounts of visions.

**Karaites:** Meaning “readers,” a ninth-century Jewish movement (also known as “Children of the Text”) that saw the Talmud as a departure from the divinely revealed truth of the Torah, which was the supreme authority in matters of faith.

**Keep:** The multi-storied tower that combined living quarters and defensive features in a medieval castle.

**Kenning:** In Anglo-Saxon poetry, an oral-formulaic phrase that employs juxtaposed words as metaphors to imagine familiar objects in a new way, such as “whale-road” (the sea), “earth’s candle” (the sun), and “ring-giver” (king).

**Keystone:** A wedge-shaped stone at the summit of an arch serving to lock the other stones in place and create structural strength.

**Kirtle:** Originally a short linen undergarment, later an overgown, and still later, analogous to the French *cote*, the outer garment also known as robe or surcote.

**Knight:** A member of the warrior sector of medieval European culture, who owed homage as a vassal to a duke or baron (his temporal lord), usually in the form of military service. See also *Lordship*.

**Koran (Qur’an):** The sacred text of Islam, believed to have been dictated to Muhammad by the angel Gabriel.

**Laisses similaires:** Literally “similar stanzas,” repeated verse stanzas used to emphasize important and dramatic scenes in French *chansons de geste* and other heroic narratives.

**Laity:** Secular persons, not members of the clergy (monks, priests, canons, bishops, deacons, etc.)

**Lancet window:** A tall, narrow window usually ending in a sharply pointed arch and found mainly in Gothic architecture.

**Lay brother:** A person associated with monastic life, but often of a lower social class than the other monks; lay brothers were commonly less educated or unable to recite in Latin, were not part of the choir, and spent much of their time in manual labor.

- Lectionary:** A book containing readings (usually of sacred scriptures) for use at Mass in a church or during the offices of monks and nuns.
- Lent:** A forty-day period of penance, fasting, and reflection leading up to the commemoration of the death and resurrection of Christ.
- Limbo:** An abode of souls for those who, through no fault of their own, are barred from salvation because they were not baptized (as in the case of infants or people who lived before the time of Christ).
- Litotes:** The rhetorical device of ironic understatement employed in northern European literature of the Middle Ages, especially in *Beowulf* and other Anglo-Saxon poems and the Icelandic sagas.
- Liturgy:** In the Latin Christian church, the forms of prayers, acts, and ceremonies used in public and official worship. The main parts of the liturgy are the offering of the Eucharistic sacrifice called the Mass, the singing of the divine office, and the administration of the sacraments. It was from elements of the Mass that the earliest medieval drama is thought to have developed.
- Locus Amoenus:** Literally the “beautiful place,” the locale of most medieval romances, the opening of dream visions, and the troubadours’ *chansons d’amour*, featuring soft spring breezes, flowing water, blooming flowers, budding greenery, and the songs of birds.
- Lollards:** Literally the “mumblers,” followers of John Wyclif after his death in 1384. Lollards (or Wycliffites) subscribed to John Wyclif’s belief in the importance of preaching and vernacular Bibles, and rejected beliefs in transubstantiation, purgatory, and clerical celibacy.
- Lordship:** A complex network of interlinked political, economic, and social obligations (formerly called “feudalism”) that extended to and involved almost all sectors of the socioeconomic hierarchy in the Middle Ages.
- Low Countries:** The lowland regions near the North Sea, divided in the Middle Ages into numerous small states (Brabant, Flanders, Hainaut, Holland, etc.) and corresponding today to Belgium, the Netherlands, and Luxembourg (sometimes called, as a group, “Benelux”).
- Ludus:** From the Latin word for “game,” it later came to mean “play.” Thus the name *Ludus Coventriae* refers to the cycle of Coventry plays.
- Lute:** A plucked musical instrument that came in several sizes, with frets and four “courses” (paired sets) of strings and a fifth solo string called a *chantarelle*, used for playing melodies. During the medieval period it was usually plucked with a quill plectrum and played mostly single-line melodies with drones.
- Machicolations:** A projecting gallery at the top of a fortified wall with floor openings through which heavy objects or boiling liquids could be dropped on attackers.
- Magyars:** An ethnic group that makes up the predominant element of the population of Hungary.
- Maniple:** A church vestment consisting of a narrow strip of cloth usually worn over the arm in the service of the Eucharist.
- Mantle:** An outer garment, usually bordered with embroidery or gold and silver threads, worn to protect its wearer from bad weather while serving also to designate high social status and power. In the period from 1066 to 1154, two shapes of mantles had long been in use—the semicircular and the rectangular. A mantle was often received from an overlord as a valuable gift, then bequeathed from generation to generation.
- Manuscript:** A hand-written or hand-copied book or document, which may, if created for a wealthy patron, be decorated with elaborate painted illustrations and a highly ornate cover. Before the fourteenth century, the pages of manuscripts were generally made of vellum (parchment) prepared from the skin of a lamb or goat.
- Marian lyrics:** Medieval religious lyric poetry, especially in France, Italy, and England, devoted to veneration of the Virgin Mary but featuring some of the same tropes used to honor the courtly lady in the *chansons d’amour* of the troubadours and other medieval lyric poets.
- Mass:** The official name of the liturgical rite of Christianity commemorating the Eucharistic sacrifice, involving the consecration of bread and wine, along with the conventional prayers, songs, and readings that accompany it. It is a reenactment of the Last Supper when Jesus broke bread, asked his disciples to eat this symbol of his own flesh, and then bade them drink wine representing the blood he would shed for them the following day, Good Friday.
- Matter of Britain:** Stories about King Arthur and the Knights of the Round Table, which contributed to the development of romance and made Arthur first a national hero in England and later a literary figure of international stature.
- Matter of France:** Tales of figures in the development of French national culture such as Roland, Charlemagne, and William of Orange, contributing especially to the genre of *chanson de geste*.
- Matter of Rome the Great and Antiquity:** The broad category of plots about classical antiquity in Greece, Troy, Rome, or Northern Africa, retold in medieval vernacular romances such as the French *Roman de Thebes* and Boccaccio’s *Teseide*.

**Mendicants:** Those religious peoples, specifically friars, who depend upon begging for their support.

**Mensural signs:** In music, symbols that indicate tempo and rhythmic subdivisions.

**Merovingian:** Pertaining to the Frankish dynasty established by Clovis I, which reigned in Gaul and Germany from about 500 to 751. The dynasty was named after the semi-legendary Merovech, Clovis' grandfather.

**Metaphysics:** The division of philosophy which studies being as such and the universal truths, laws, or principles of all beings; "the science of being as being" (Aristotle).

**Midrash:** In Judaism, a body of oral commentary on the scriptures, Talmud, and Halakah (legal texts), collected and expanded by rabbis beginning about the ninth century.

**Military orders:** Religious congregations of knights whose initial purpose was to protect pilgrims and maintain control of the Crusader Kingdoms in the Holy Land, but who, in different orders, engaged in various activities, including protecting holy places, campaigning against pagans, staffing hospices, and providing hospitality to travelers.

**Minnesingers (German Minnesänger):** Singers about *minne*, which means "love," such as Walter von der Vogelweide; the German equivalents of the French troubadours and trouvères, who developed the themes of *fin'amors* in German lyrics.

**Miracle:** An extraordinary event that surpasses what is known of natural laws and is considered a work of God.

**Missal:** A book containing the complete rite of the Mass, with all prayers, readings, and chants.

**Moat:** A ditch of some width and depth around a fortified area like a castle serving to repel intruders.

**Monasticism:** The way of life typical of monks or nuns who dwell together for life, living austere and sharing in common according to a rule; their lives are devoted to the service of God.

**Monk:** A member of an all-male religious order who follows a rule requiring withdrawal from society and devotion to prayer, solitude, and contemplation.

**Monophony:** Music of one part, either a solo song or a single melody performed by more than one person or instrument.

**Monotheism:** The doctrine or belief that there is only one God.

**Moresca:** A special dance in which the dancers all blackened their faces in imitation of Moors (people of northern

Africa), and dressed in what were thought to be "Moorish" costumes with bells attached to their legs. The dance sometimes depicts a fight between Moors and Christians, a reference to Spanish history, and sometimes includes a fool as part of the cast of characters.

**Motet:** A polyphonic composition with more than one text, first created in or near Paris around 1250.

**Motiv:** A short passage of music (as short as three notes) that is repeated.

**Motte:** A fortification consisting of a timber tower set atop a conical earth mound. The motte often was surrounded by a ditch and wooden palisade.

**Mystery:** a) A term referring to one of the "mysteries" of Christianity, a miraculous event which must be accepted on faith, such as the idea of the Virgin birth of Jesus; or b) a play put on by a craft guild, a group who have trade secrets or mysteries.

**Mysticism:** The religious theory that conceives of God as absolutely transcendent, beyond reason and all approaches of mind, placing emphasis on the negative way, that is, on what God is not.

**Nakers:** A pair of small "kettle" drums, usually tied to the performer's waist or over the neck of a horse.

**Narthex:** An enclosed passage between the main entrance and the nave of a church.

**Nave:** The main longitudinal area of a church.

**Neoplatonism:** The philosophical school, founded by Plotinus (205–270), which extended the philosophy of Plato and built it into a system, focusing on the emanation of all things from the One and their return thereto. A version of this philosophy, made compatible with Christian teachings, was forged by St Augustine and became a very influential school in the Middle Ages.

**Niello:** A metalwork process whereby a design is engraved in a metal surface and then filled with a black alloy of sulfur with gold, silver, copper, or lead and then fused with heat.

**Nominalism:** The theory that universal terms like *horse* or *equality* are merely names, not real essences.

**Nun:** A member of a religious community of women living a cloistered life of religious devotion in a convent or double monastery.

**Obedience:** An oath taken to a superior (often religious) to abide by that person's judgment and jurisdiction.

**Oblate:** A lay person who is part of a religious community. From the Latin word *oblatio*, meaning to offer, this

term often refers to children who were “offered” by their families to the service of God in a monastery or convent, to be brought up as a monk or nun.

**Office:** From Latin *officium*, or duty, the prescribed daily round of prayers, mainly psalms, recited seven times a day in community, called for in the *Benedictine Rule*. Also, the prayers and ceremonies in the Latin Christian church for some particular purpose, such as the Office for the Dead, or the church’s services in general, such as the Divine Office.

**Office of the Dead:** Prayers said on behalf of the deceased, often for individuals connected, by membership or patronage, to the monastery or community offering the prayer.

**Oral-formulaic tropes:** Poetic stock phrases that could be recalled easily or recombined to invent new lines if the scop (the Anglo-Saxon minstrel) forgot a line during performance or needed to fill out the meter in a new passage. Examples from *Beowulf* include the exclamation “That was a good King!”; the formula for introducing a new speaker, “Beowulf unlocked his word-hoard”; and the term for the temporal lord in the *comitatus*, “ring giver.”

**Ordo (pl. Ordines):** A book of directives for the celebration of liturgies, including Mass, the order of the Divine Office, and other religious rituals.

**Organum:** An early, fairly simple type of polyphony. There are several different varieties, including one in which the voices sing the same melody at different pitches (known as “parallel organum”). Other varieties include the addition of an upper part over an already-existing melody (that is, a tenor). The upper part usually moves faster than the tenor.

**Orthodox:** A sound or correct theological or religious doctrine.

**Orthodox Church:** The Christian church of those countries formerly comprising the Eastern Roman Empire and of those countries evangelized by it; the Byzantine Church.

**Ottonian:** Pertaining to the German dynasty that ruled from 962 to 1002 as the emperors of the Romans (later the Holy Roman Empire).

**Pageant:** A separate event in a pageant cycle or large group of plays on Old and New Testament themes, such as a pageant of Christ’s nativity.

**Paletot:** A short-sleeved short and loose gown for men, sometimes worn as an over-garment with the doublet.

**Pantheism:** The doctrine that the world or nature in the widest sense is identical with God.

**Pantheon:** In polytheism, the system of all the gods and goddesses.

**Papal:** Having to do with the bishop of Rome and his authority as pope over Western Christendom.

**Papal bull:** A written pronouncement or mandate from the pope. In the early days, these pronouncements were sealed with a large circular wax disk containing an impression of the pope’s ring (from the Latin *bullā*, or seal).

**Parapet:** A battlement wall protecting the wall-walk and roof.

**Parish church:** The local church attended by the people of a parish and ministered to by a rector or sometimes a curate whose living comes from rent provided from the lands of that community.

**Passion:** The events of Christ’s last hours, his torments, suffering, and crucifixion. The term also refers to Passion Sunday or the fifth Sunday in Lent as these are dramatized in Passion plays of the late Middle Ages.

**Pastourelle:** Literally, a “song about a shepherdess,” a short, dialogue-filled, narrative account in verse about a courtly knight’s attempt to seduce an innocent but clever shepherdess.

**Peace of God:** An ideal articulated by numerous church councils between 990 and 1096 obliging the knightly order to protect unarmed poor, children, women, clerics, merchants, and pilgrims.

**Penance:** The sacrament of forgiveness (that is, forgiveness by God through the action of a priest), which in the Middle Ages involved confession of sins followed by an act of restitution.

**Penitential:** A book setting out recommended penances or satisfactions associated with particular sins.

**People of the Book:** A category of people in Islam that consisted of monotheists with written scriptures, including most types of Christians and Jews. Because of the common heritage of faith that they shared, Muslims often extended to them the status of *dhimmi*, or protected people.

**Perfected:** Leaders of the Cathars who had developed a high level of spiritual attainment.

**Pier:** In architecture, a support for the ends of adjacent spans of arches.

- Pilgrimage:** A journey made usually for spiritual reasons, to reach a particular shrine or sacred place; a pilgrim is one who makes such a journey. The Haj was the Arabic term for the pilgrimage required of all adult Muslims.
- Pilgrimage church:** A large church on one of the major pilgrimage routes (for example, the shrine of St. James at Compostela) that often offered shelter and provided maps and information about the route.
- Pinnacle:** A small, decorative turret or end of a spire, buttress, or other such architectural element, generally pointed, conical, or pyramidal in shape.
- Plainchant:** Music for the sacred services, the largest surviving repertory of the medieval period.
- Plate:** A horizontal timber laid flat atop a pier or wall used to attach the ends of rafters.
- Polyphony:** Music of more than one part, each musical line having a separate rhythmic and melodic profile.
- Polytheism:** The belief that there are many gods within the religious system.
- Pope:** The head of what is now called the Roman Catholic Church. The pope, or pontiff, was also called the Bishop of Rome since he presided over the entire Latin Church due, in part, to his authority over the local Roman Episcopal See.
- Portcullis:** A heavy iron or wooden grill, set in vertical grooves, that can be raised or lowered by chains to protect the entrance to a castle.
- Postulant:** A person seeking admission to a religious order. Often he or she was allowed to try out monastic life for a brief time.
- Pourpoint:** *See* Doublet.
- Premonstratensians:** An order founded in 1121 that was unique in its policy of accepting both men and women and attempting to accommodate them in the same monastery.
- Primacy:** The idea that the Bishop of Rome had a primary place over all other bishops by virtue of the tradition of St. Peter being at Rome and the idea that Rome was the center of the old Roman Empire.
- Prime:** The liturgical office celebrated at sunrise (or the first hour of the day).
- Principle source:** In philosophy, that from which something proceeds.
- Procession:** A type of stately dance in which couples move forward side by side, often holding hands.
- Psalter:** A book containing the Psalms for liturgical or devotional use.
- Purgatory:** According to medieval Christian doctrine, a place where the souls of those who die penitent remain to be purified from sins before they go to heaven.
- Purlin:** A longitudinal member in a roof frame usually for supporting common rafters between the plate and the ridge.
- Qabbalah:** *See* Kabbalah.
- Qaraites:** *See* Karaites.
- Quietism:** The attitude of passivity and receptivity before God, as opposed to activism (that is, the view that the human agent has some role to play in earning God's favor).
- Quire:** *See* Choir.
- Qur'an:** *See* Koran.
- Rabbi:** A title used in early Judaism to identify one who had received a type of ordination based upon his ability to teach and judge the law or his mastery of the Talmud, and applied specifically to those who were experts regarding Jewish law. By the Middle Ages, rabbis were scholars, teachers, judges (particularly in Muslim Spain), and preachers.
- Rafter:** The beam, usually angled and joined at the top to a similar beam in the form of an inverted V, which is used to support a roof.
- Rationalism:** Any one of the views that attribute primary importance to the human reason: for example, that all authority in matters of truth is subject to the scrutiny and approval of reason, without any duty of obedience or reverence for religious authority.
- Realism:** (a) The philosophical position that accepts the existence of things prior to and independent of human knowledge; or (b) in relation to the problem of universals, the epistemological view that man's direct universal concepts ordinarily represent natures that are objectively real and in some way fit to be represented as universal by the mind's activity.
- Rebec:** A small three-string musical instrument, played in the soprano range.
- Reconquista:** The process of recovering Christian lands from the Moors who had control of Spain or various parts of the Iberian Peninsula during the Muslim occupation from 718 to 1492.

- Refectory:** The dining hall of a monastery, usually located on the south walk of the cloister.
- Relic:** Something that is kept and venerated because it once belonged to a saint, martyr, or holy person, especially a part of his or her body.
- Reliquary:** A box, container, or shrine in which relics are kept for veneration, often highly decorated and made of precious materials.
- Repoussé:** Relief (that is, raised) decoration on a metal surface produced by hammering from the underside.
- Reticulated headdress:** A style in the fourteenth and fifteenth centuries characterized by the enclosure of hair arrangements in a net-like receptacle. The forerunner of this headdress was the *caul* or *crispinette*. Reticulated headdresses were made of gold, silver, or silk nets, sometimes set with jewels at intersections, and fashioned into bags to hold the hair in place.
- Revelation:** The word of God as it is manifest through the sacred scriptures and the church tradition.
- Reverdie:** A term in Middle English meaning “re-greening,” celebrating the reappearance of spring after a long winter, employed to start a lyric poem or song, or to open a love poem or dream vision.
- Rigoletto:** A dance that includes forward and backward jumps and some type of “waving” motion.
- Robe:** A name applied to many different garments during the Middle Ages, ranging from the long tunic in England (late eleventh century) to a complete outfit of a varying number of layers intended to be worn together, some of them made of silk, some furred (fourteenth century).
- Romances:** Episodic narratives composed in verse or prose throughout Europe from the twelfth through fifteenth centuries, whose plots derive from the various “Matters” of France, Britain, Rome, or Antiquity and involve a high degree of fantasy and sometimes the attainment of love in a search or quest, as well as the testing of the prowess or morality of their knightly heroes.
- Rose window:** A large, circular stained-glass window placed centrally above the portal(s) on the façade of a Gothic church.
- Round dance:** One of the most popular forms of medieval dance, a dance in which a group of people hold hands in the form of a circle, usually with a leader in the center. The dance steps require the circle to move first in one direction and then the other, reversing its direction at the beginning of each new verse. The leader sings the verses and the entire group joins in the chorus.
- Rotunda:** A circular high space in a church surmounted by a dome.
- Rubble:** A wall made of different sizes and types of uncut stone.
- Rubric:** From the Latin word for red (*rugeo*), the larger script indicating a chapter heading or division in a manuscript and particularly the directions (often printed in red in missals and breviaries) for the conduct of church services and the carrying out of liturgical rites.
- Rus’:** Tribal people, perhaps originally Scandinavian Vikings who, by the ninth century, had settled in what is now the area around Kiev, Russia.
- Sacrament:** A visible sign instituted by Jesus Christ to symbolize or confer grace. Those accepted in medieval Christianity were baptism, confirmation, the Eucharist, matrimony, penance, holy orders, and extreme unction.
- Sacramentals:** Actions or ceremonies resembling sacraments but regarded as originating with the church rather than with Jesus Christ himself.
- Sacramentary:** A book used in the celebration of the Mass and for other liturgical rites.
- Saga:** A unique kind of prose narrative invented in Iceland during the twelfth through fourteenth centuries. The Old Norse word *saga*, literally “something said,” indicates the oral origins of most of these accounts of the exploits of noteworthy men or events that were later amplified, embellished, and transmitted by skilled tale-tellers over the course of several centuries.
- Saint:** In Christianity, a person who led a holy life on earth and has been declared to have a privileged place in heaven and be worthy of veneration.
- Sanctuary:** The part of the church containing the altar.
- Sapientia and Fortitudo:** Wisdom and fortitude, a combination of discretion and cleverness with physical strength and bravery, which contributed to successful lordship or heroism in early medieval literature.
- Schism:** The division of a group into mutually antagonistic factions, as, in the Middle Ages, the Photian Schism (ninth century), between Eastern and Western Christianity; the ongoing schism between the Greek and Latin churches that began in 1053; and the Great Schism within Western Christianity (1378–1417) when there were two, or even three, popes.
- Scop:** An Anglo-Saxon minstrel who recited poems, perhaps to a harp accompaniment.

**Screen:** A wooden or iron structure separating the nave from the choir of a church, sometimes called “rood screen” if it had a large crucifix ornamenting its top.

**Scriptorium:** The workshop or area found especially in abbeys and monasteries where manuscripts are copied and decorated.

**Secular clergy:** Priests living in the world (as, for example, parish priests serving local churches), as opposed to regular clergy living under the rule of a religious order.

**See:** Literally, the official seat (from the Latin *sedes*) of a bishop, hence the place where the bishop sits or resides.

**Sequence:** A type of hymn, but not in a regular meter, said or sung between the gradual and the gospel of certain masses.

**Serf:** A member of the agricultural workforce that tilled the land of the medieval estates and manors owned by temporal lords such as dukes and barons, and was bought and sold with the land.

**Seven Deadly Sins:** The Roman Church’s designation of the seven most serious sins—pride, wrath, avarice, envy, gluttony, lust, and sloth.

**Shawm:** A double-reed instrument much like an oboe first depicted in Spanish sources of the late thirteenth century, suggesting that it had been introduced to Europe during the Arab or Moorish occupation of Spain.

**Shi’ite:** The more conservative branch of Islam that accepts only the direct descendants of the Prophet as legitimate successors, beginning with Ali Talib, the fourth caliph who was the cousin and son-in-law of Muhammad.

**Simony:** The sale or purchase of a church office or possession.

**Skaldic Poetry:** Verse composed in medieval Scandinavia that employed an erudite, specialized vocabulary in a highly complicated syntax.

**Skepticism:** The philosophical school that doubts or denies the possibility of any certain human knowledge; the skeptic is therefore enjoined to suspend all judgments in the speculative order.

**Spiritual authority:** The power exerted by the institutional church, its leaders, and other religious entities, as opposed to the “temporal power” wielded by political institutions or individuals such as kings and lords. Spiritual power included the authority to excommunicate and to place a temporal leader’s subjects under interdict.

**Stability:** The vow taken, often by monks, to remain stable in one place as part of their profession, until death.

**Stadia:** Ancient units of measurement of about 607 feet, used in medieval architecture to liken church buildings to biblical descriptions of the celestial Jerusalem.

**Stigmata** Marks on the hands and feet resembling the wounds from Jesus Christ’s crucifixion, thought to be supernaturally impressed on the person as a sign of spiritual similarity to the Christ.

**Stole:** A long narrow cloth worn around the neck by priests and bishops as part of their vestment.

**Story collections:** Anthologies of various separate stories that circulated together in a reasonably coherent form, organized around a theme or involving a framing device, a larger narrative that linked all the stories through an author’s invented occasion at which tales were exchanged, as in Boccaccio’s *Decameron* or Chaucer’s *Canterbury Tales*.

**Studium:** An institution of higher education, not just for clerics, which taught law, medicine, and rhetoric, as well as theology.

**Sub-deacon:** A minor order of cleric who could not administer sacraments (only sacramentals) and who prepared bread, wine, and vessels at Mass.

**Substitute clausula:** A new section of polyphonic music intended to replace an old one.

**Sufism:** A mystical branch of Islam, which began as a monastic movement in the eighth and ninth centuries and became popular among individuals who rejected the formalized trappings of Islamic religious life and were looking for more inward and personal expressions of their relationship with Allah.

**Sunni:** The branch of Islam that believes anyone from the Qurayish clan or tribe of Muhammad can succeed him as caliph. Sunnis recognize the first four caliphs and their traditions as the rightful succession.

**Synagogue:** A building used by a Jewish community as a formal house of prayer and worship, but also as a gathering place for other communal activities.

**Tabor:** A large barrel-shaped drum, often called a “side drum,” usually associated with the military.

**Talmud:** From the Hebrew word for “study,” a collection of commentaries on the Hebrew scriptures that was begun in the first century B.C.E. and was eventually codified by rabbis.

**Tambourine:** A hand-held percussion instrument with jingles, usually depicted in conjunction with dancing.

**Tempo:** The speed of a musical composition.

- Temporal authority:** The power exerted by political institutions or individuals such as kings and lords, as opposed to the spiritual authority of religious institutions. The word “temporal” refers to the limitation of time associated with earthly life, in contrast to the timelessness of eternity.
- Tenor:** A melody borrowed from another composition and used as a guide for the structure of a new polyphonic composition. The notes are held as long notes. Music for dance sometimes was written only as a tenor line, requiring the musicians to improvise the accompanying lines.
- Tertiary:** “Third Order,” or lay groups that came into existence in the thirteenth century to give the laity living in the world opportunities to live lives of religious dedication. Many of the Third Orders are linked to the mendicant movements.
- Tithes:** Payment of a portion (customarily one-tenth) of one’s produce or income to the church, clergy, or the clergy person’s office.
- Torah:** The scriptures that constitute the Jewish law, identified by Christians as the first five books of the Old Testament: Genesis, Exodus, Leviticus, Numbers, and Deuteronomy.
- Tracery:** Ornamental, openwork, sculptural decoration, in wood or stone, found especially above Gothic windows and on screens or panels.
- Transcendence:** Existence apart from and superior to the universe; opposed to immanence.
- Transept:** The transverse part of the rectangular body of the church, usually crossing the nave.
- Translatio studii:** Reflecting the Latin root of “translate,” meaning “to carry across,” the transfer of the plot and characters of a tale produced for the audience of one national culture or earlier period to that of another culture in a later period by medieval writers, involving significant changes in the plot and original roles of the characters as well as the very genre that the model text represented.
- Transubstantiation:** In the sacrament of the Eucharist, the conversion of the substance of the bread and wine into the body and blood of Christ, with appearances of bread and wine remaining.
- Trial by combat:** Rooted in the medieval notion that God punished evil and preserved good, a judicial process in which the accused and the accuser of a crime (or a contracted “champion”) would engage in physical combat in the expectation that right would triumph over wrong.
- This judicial remedy was never officially approved by the church and was eventually outlawed.
- Trial by fire:** A means of allowing divine intervention in the case of a dispute, often involved the burning of the accused’s hand. The wound was bandaged for three days and then examined. If the area had become infected, the person was seen as guilty.
- Trial by water:** A means of allowing divine intervention in the case of a dispute, in which the accused were tied up and thrown into a body of water. If they floated, they were deemed guilty (the common belief being that water as a pure element would reject the sinner). Jews were exempt from the ninth century onward since it was believed that their rejection of Christ caused disfavor in the eyes of God.
- Triforium:** The wall at the side of the nave, choir, or transept of a church corresponding to the space between the vaulting or ceiling and the roof of an aisle.
- Trinitarian:** Subscribing to the doctrine of the Trinity, the union of three persons (Father, Son, and Holy Spirit) in one Godhead.
- Triptych:** A group of paintings or carvings on three panels, usually hinged together.
- Trope:** An antiphon or verse interpolated into a liturgical text.
- Troubadour:** Poets, such as Bernart de Ventadorn and Adam de la Halle, respectively from southern and northern France, attached to particular courts and patrons or wandering from court to court, who composed a new style of lyric love poetry with complex stanzas and rhyme patterns, especially the *chansons de croisade* and the *chansons d’amour* from the twelfth century onwards.
- Trouvère:** *See* Troubadour.
- Truce of God:** A policy developed at a series of church councils between 990 and 1096 to promote the cessation of unnecessary violence in Western Europe by imposing penalties for carrying on warfare during certain holy seasons, on Sundays, and in certain holy places.
- Truss:** A triangle of timbers used to support compression, used in the construction of a roof.
- Tunic:** A loose wide-necked garment, usually extending to the hip or knee and gathered with a belt at the waist.
- Ulama:** A class of learned Islamic scholars, particularly those who have special knowledge or expertise in theology and Muslim law.
- Ummah:** The collective community of Islam.

**Universal:** In philosophy, a term for a typical form that can be affirmed of or is attributed to many in a univocal and distributed sense; one name applied in exactly the same sense to many objects taken singly.

**Unleavened bread:** Bread that is flat, containing no yeast or leavening agent to make the dough rise, used in many Christian eucharistic services in imitation of the unleavened bread from the Jewish Passover service, in recognition of the fact that three of the four New Testament Gospel writers describe the Last Supper as taking place during the week of the Jewish Passover.

**Usury:** The charging of interest (or excessive interest) for a loan.

**Vassal:** A person granted the use of land, in return for which he rendered homage, fealty, and usually military service to his lord or other superior. See *Lordship*.

**Vernacular:** The language of a national culture of medieval Europe—French, English, Spanish, Italian, German, Norse—as distinguished from the language of learning and the medieval church, Latin.

**Vielle:** A four- or five-string medieval musical instrument with a range similar to a modern viola.

**Vikings:** Migrating northern tribal people from Scandinavia who traveled along coastlines in swift longships and invaded almost all regions of Europe during the period between the eighth and the mid-eleventh centuries.

**Vocal dance:** A dance song—that is, one with words to be sung, as differentiated from an instrumental dance.

**Votive:** A liturgy or offering of prayer that is done with a particular intention in mind.

**Vousoir:** A wedge-shaped brick or stone used to form the curved part of an arch or vault.

**Waldensians:** A popular movement of the late twelfth century (also called the Poor of Lyon) whose members (followers of Peter Waldo) led lives of poverty, read the Gospels in the vernacular, and encouraged lay people to preach. Interest in the movement was fueled by a famine that struck the city of Lyon in 1176, creating inequity in the distribution of resources, as well as by evidence of clerical corruption in the church of Lyon.

**Warming room:** A space, often adjacent to the refectory on the south side of a monastery (under the dormitory in the Saint-Gall plan), where a fire was kept burning during the winter months.

**Wattle and daub:** A building material consisting of wattle, a light mesh of laths or interwoven twigs, covered with mud, stucco, or brick.

**Westwork:** The monumental western front to a church involving a tower or group of towers and containing an entrance and vestibule below and a chapel above.

**Wimple:** A small veil or shawl-like garment worn over the neck and upper chest, usually draped, pleated, or tucked. Attached at the sides of the head either by ties or pins, they were worn sometimes as loose coverings and at other times fitted so as to adhere closely to the neck. Wimples were stylish in the late thirteenth and early fourteenth centuries, but by the second half of the fourteenth century, they were primarily conservative garments worn only by nuns, ladies in mourning, and elderly women.

**Wycliffites:** Followers of the reform movement originated by the Oxford clergyman John Wyclif. See *Lollards*.

## MEDIA AND ONLINE SOURCES

---

### GENERAL

The Labyrinth: Resources for Medieval Studies (<http://labyrinth.Georgetown.edu>)—Produced by Georgetown University, this is one of the best resources, growing all the time, for materials about texts and culture in all languages of Medieval Europe. It contains a multitude of links to other sites about various medieval authors, online texts and translations of medieval literary works, related visual images, and other materials that bring the Middle Ages to life for students, whether beginners or advanced.

The ORB: On-Line Reference Book for Medieval Studies (<http://the-orb.net>)—This comprehensive site features a general compendium of resources, textual and otherwise, for the study of the Middle Ages, including electronic texts and translations, an encyclopedia of terms, and links to other important sites about medieval European culture.

---

### ARCHITECTURE

Amiens Cathedral: An Animated Glossary ([http://www.learn.columbia.edu/amiens\\_flash/](http://www.learn.columbia.edu/amiens_flash/))—Produced by the Media Center for Art History, Archaeology & Historic Preservation at Columbia University in New York City, this useful beginners-level site matches the cathedral's ground plan and elevation to key terms in architecture. Clicking on a term causes the appropriate area on the diagram to be highlighted, and vice versa.

*Cathedrals: Notre Dame to the National Cathedral*, A&E, 50 minutes, 1995. VHS Media for the Arts #AAE95010—

This video explores the engineering feats (some of which have not changed in 900 years) involved in creating Gothic cathedrals.

A Digital Archive of Architecture ([http://www.bc.edu/bc\\_org/avp/cas/fnart/arch/contents\\_europe.html](http://www.bc.edu/bc_org/avp/cas/fnart/arch/contents_europe.html))—This site was created by Professor Jeffery Howe at Boston College. Images include Romanesque cathedrals, Gothic cathedrals, medieval fortifications, rural architecture, and half-timbered houses, with special attention to Belgian architecture, including Bruges.

*The Great Cathedral at Amiens*, VHS or DVD. Films for the Humanities & Sciences, 29 minutes color, #JEY11430—Looking at both the history and the engineering of one of the monumental achievements of the High Gothic period, this film examines a thirteenth-century cathedral that stands 140 feet high, is virtually all windows, and could accommodate 10,000 people.

*The Jeweled City: The Cathedral of Chartres*, BBC. Text written and narrated by Professor Christopher Frayling. 50 minutes color, 1995. Films for the Humanities & Sciences #JEY7624—This documentary is a narrated tour of the cathedral, a masterpiece of Gothic architecture built between 1150 and 1220, with commentary on the religious and political sentiments of the time. It is one of five films in a series now entitled *The Medieval Mind* but originally called *Strange Landscape: The Illumination of the Middle Ages*.

The Lost Medieval Village (<http://loki.stockton.edu/~ken/wharram/wharram.htm>)—This site about the lost village of Wharram Percy contains descriptions and artist's renderings of both peasant houses and manor houses

from a long-deserted village in northern England as it was in the thirteenth century.

*Notre Dame: Cathedral of Amiens*, Media Center for History, Columbia University, 2 vol., 1997. VHS Media for the Arts Series #CP6152—This two-part high-tech architectural video describes the thirteenth-century construction of Amiens Cathedral.

*Walls Of Light: The History of Stained Glass*, VHS, 85 minutes, 1997. Media for the Arts #CP6153—This is a documentary on the history of stained and leaded glass from its beginnings in the Middle East 5,000 years ago up to the exciting works of today's artists. Rare pieces are included from locations in five continents.

---

## DANCE

*A L'Estampida: Medieval Dance Music*. Dufay Collective. Audio CD Avie #AV0015. ASIN: B00008LJGB—This CD recording, released in August 2003, offers examples of several estampies and saltarellos, including the Robertsbridge Codex estampie and “La Rotta.”

*Chevrefoil*, Istanpitta Medieval Music Ensemble. Audio CD. Avatar Music.—Besides including the complete text of *Chevrefoil* by the Anglo-French twelfth-century poet Marie de France, this CD made by a Texas-based early music group includes examples of an estampie, a salterello, and the ballo “Petit Vriens,” performed on oud, saz, medieval bagpipes, recorder, vielle, Gothic harp, and long tabors.

The Library of Congress page on Burgundian Dance in the Late Middle Ages (<http://lcweb2.loc.gov/ammem/dihtml/diessay1.html>)—This site discusses the history of western social dance.

Medieval Dance Picture Collection (<http://www.uni-mainz.de/~khoppe/sammlung/>)—This repository includes images of medieval dance, including manuscripts, wall-paintings, sculpture, and photos of modern performances.

*Music of the Troubadours*, Ensemble Unicorn and Ensemble Oni Wytars. Dir. Michael Posch and Marco Ambrosini. Naxos 8554257—Songs in French and Provençal are sung by a female voice with instrumental accompaniment.

---

## FASHION

Circa: 1265, Male Clothing and Armor (<http://www.bumply.com/Medieval/Kit/kit.htm>)—This site, designed to give information for historical re-enactors, provides

detailed descriptions and drawings of each piece of medieval male clothing, along with photographs of modern reproductions and links to thirteenth-century source images.

Extant Clothing of the Middle Ages (<http://www.virtue.to/articles/extant.html>)—This site, assembled by Cynthia du Pré Argent, contains photographs and descriptions of complete garments, generally earlier than 1500, which are preserved in museums. It includes men's and women's clothing, jewelry, and shoes.

Footwear of the Middle Ages (<http://www.personal.utulsa.edu/~marc-carlson/shoe/SHOEHOME.HTM>)—This site examines the history and development of footwear and shoemaking techniques up to the end of the sixteenth century. Includes discussion and illustrations of particular shoe types, such as turned shoes, pattens, clogs, and long-toed shoes, as well as details about shoe decorations, tools and techniques, and methods of construction. It provides detailed instructions and patterns for making shoes, as well as a bibliography of research about them.

Historical Clothing from Archaeological Finds (<http://www.personal.utulsa.edu/~marc-carlson/cloth/bockhome.html>)—This document is intended to be a cursory examination, for people interested in historical recreation and replication, of the extant archaeological and museum materials relating to clothing in the Middle Ages, with images redrawn by the author. It covers all the basic garments—kirtles, cotes, tunics, gowns, chemises, smocks, etc.—as well as hoods, hats, hose, shoes, and weaving and spinning.

Index of Resources: Skin Out ([http://www.maisonstclair.org/resources/skin\\_out/](http://www.maisonstclair.org/resources/skin_out/))—This index of costume resources, prepared for re-enactors, provides access to an excellent collection of actual manuscript miniatures illustrating all aspects of male and female costume. Most useful are the links called “Menswear,” “Womenswear,” “Skin Out,” and “Bare Necessities,” which illustrate each type of garment one by one.

---

## LITERATURE

*The Camelot Project at the University of Rochester* (<http://www.lin.Rochester.edu/Camelot/cphome.stm?CFID=890430&CFTOKEN=5688408>)—This compendium of resources having to do with the world of King Arthur, medieval Arthurian romance, and Arthurian medievalism includes links to electronic texts, visual images, and related websites. The Main Menu lists Arthurian characters, symbols, and sites; sub-menus direct visitors to basic information, texts, images, and a bibliography about that subject.

*The Decameron*. Dir. Pier Paolo Pasolini, Italian, subtitled, 1971, Water Bearer Films, 116 min., VHS and DVD.—An adaptation of eight stories of the hundred in Boccaccio's *Decameron*, this is part of the director's medieval trilogy, which included films of the *Arabian Nights* and Chaucer's *Canterbury Tales*. This film captures the earthy spirit of the Italian author's realism. Rated R.

The Decameron Web ([http://www.brown.edu/Departments/Italian\\_Studies/dweb/dweb.shtml](http://www.brown.edu/Departments/Italian_Studies/dweb/dweb.shtml))—Sponsored by the Italian Department at Brown University, this site is an interlinked resource containing the text of Boccaccio's *Decameron* as well as many links to information about cultural contexts of Boccaccio's Italy and medieval Europe.

*Gawain and the Green Knight*. Dir. John Phillips, Thames Productions, 90 minutes, VHS and DVD, 1991. Films for the Humanities & Sciences FFH 3084.—This feature film is an extraordinarily faithful cinematic rendering of the Middle English romance *Sir Gawain and the Green Knight*. Phillips succeeds in getting settings, costumes, the material culture of the feast and hunt scenes accurate for the period, and the depiction of the human-monstrous Green Knight surpasses other earlier film versions such as Stephen Weeks's *Sword of the Valiant*.

*Excalibur*. Dir. John Boorman, Orion, 141 minutes, VHS and DVD, 1981.—This feature film, though it claims to be based on Malory's *Morte D'Arthur*, actually better reflects the vast thirteenth-century *Vulgate Cycle* of Arthurian romances, including major treatments of not only all aspects of Arthur's life, but also Perceval's Grail Quest and the activities of such important Arthurian characters as Merlin, Morgan le Faye, Guinevere, Lancelot, and Mordred. Boorman's film is noted for its epic sweep and its employment of a mythic perspective to the legend. Rated R.

The Harvard Chaucer Page (<http://www.courses.fas.harvard.edu/~chaucer>)—Sponsored by Harvard University, this site offers a multitude of materials to enhance the study of Chaucer's texts and his cultural milieu both in England and on the Continent.

*Lancelot of the Lake*. Dir. Robert Bresson, French, subtitled, 1974, New Yorker Video, VHS and DVD—A dark, de-romanticized cinematic version of the Arthurian legend, particularly the Grail Quest and the romance between Guinevere and Lancelot, very different from Boorman's grand epic treatment or Bresson's simplicity and stylization. Rated PG.

*The Middle English Collection at the Electronic Text Center, University of Virginia* (<http://etext.lib.virginia.edu/mideng.browse.html>)—This site features electronic texts of most major works of Middle English Literature, in-

cluding those by Geoffrey Chaucer, John Gower, the Gawain-poet, and William Langland.

*Perceval* (also titled *Perceval le Gallois*). Dir. Eric Rohmer, Fox Lorber, 141 minutes, French with English subtitles, VHS and DVD, 1979—This feature film is an extraordinarily faithful cinematic rendering of Chrétien de Troyes's romance about the Grail Quest, *Perceval*. Rohmer's visual direction is very stylized, achieving an effect of having twelfth-century manuscript illuminations come to life.

---

## MUSIC

*The Age of Cathedrals: Music from the Magnus Liber Organi*. Theatre of Voices. Dir. Paul Hillier. Harmonia Mundi France 907157—This 1996 CD includes anonymous works, as well as works by such composers as Leonin and Perotin, documenting the emergence of polyphony. The disc comes with a deluxe set of notes, including texts, translations, and color photographs of the manuscript basis of the music.

*Ancient Voices: Vox sacra*. Anonymous 4, Ensemble Organum, Marcel Pérès, Soeur Marie Keyrouz. Harmonia mundi HMX 290 608—This collection presents a selection of masses, lyrics, sequences, antiphons, hymns, motets, and offices, as well as Byzantine, Maronite, and Melchite chant.

*Chant: The Benedictine Monks of Santo Domingo de Silos*. Dir. Ismael Fernandez de la Cuesta and Francisco Lara. EMI Angel 55138—In this 1994 recording, a twenty-man choir sings in the Solesmes style.

Early Music FAQ (<http://www.medieval.org/emfaq/>)—This website provides lists of recordings, biographies, discographies, and helpful short articles on such technical topics as "Pythagorean Tuning and Medieval Polyphony" and "Chord Structure in Medieval Music."

*A Feather on the Breath of God: Sequences and Hymns by Abbess Hildegard of Bingen*. Gothic Voices. Dir. Christopher Page. Hyperion 66039—This 1981 recording began the popularization of Hildegard's music, with performances alternating soloists and unison choir over a drone (bagpipes) or using a single unaccompanied voice. It is Hyperion's best-selling title.

The Gregorian Chant Home Page ([http://www.music.princeton.edu/chant\\_html/](http://www.music.princeton.edu/chant_html/))—Chant Research Sites listed include Medieval Music Theory Sites, Resources for Chant Performance, Other Chant Web Sites, and Web Sites Helpful for Chant Researchers.

A Guide to Medieval and Renaissance Instruments (<http://www.s-hamilton.k12.ia.us/antiqua/instrumt.html>)—

This website provides illustrations and short sound recordings to demonstrate 32 medieval instruments.

Malaspina Great Books ([http://www.malaspina.com/site/results\\_c5\\_p7\\_page1.htm](http://www.malaspina.com/site/results_c5_p7_page1.htm))—This site offers biographies, bibliographies, and links on ten medieval composers.

*Music of the Troubadours*. Ensemble Unicorn and Ensemble Oni Wytars. Dir. Michael Posch and Marco Ambrosini. Naxos 8554257—Songs in French and Provençal are sung by a female voice with instrumental accompaniment.

*Musica humana*. Anonymous 4, Ruth Cunningham, and Marsha Genenski, et al. Dir. Brigitte Lesne and Marcel Pérès. Empreinte digitale (L) ED 13 047—This wide-ranging 1996 CD includes selections from Machaut and Ockeghem, as well as a variety of music from the Byzantine world and the Middle East.

*My Fayre Ladye: Tudor Songs and Chant*. Lionheart. Nimbus 5512—This 1997 CD performed by a male ensemble includes a number of types of late medieval English music, some based on the Eton choirbook. Texts and modern English translations are given.

*Paschale Mysterium: Gregorian Chant for Easter*. Aurora Surgit. Dir. Alessio Randon and Alberto Turco. Naxos 553697—This CD featuring a female vocal ensemble and solos by Alessio Randon takes chant from various eras to create a program for the Catholic Easter vigil.

The Recorder in Literature and Art (<http://members.iinet.net.au/~nickl/fortune.html>)—In a site entitled “A Pipe For Fortune’s Finger: The Recorder in Literature and Art,” Nicholas S. Lander presents a thorough history of the recorder from medieval to modern times, with a wealth of illustrations from medieval art, numerous literary references, and a list of bibliographical sources.

*El Sabio: Songs for King Alfonso X of Castile and Leon (1221–1284)*. Sequentia. Deutsche Harmonia Mundi 77234—This 1991 CD includes songs mostly from the collection of over 400 *Cantigas de Santa Maria*, made for Alfonso X “The Wise.”

*Sumer is Icumen in: Medieval English Songs*. Hilliard Ensemble. Dir. Paul Hillier. Harmonia Mundi 1951154—Songs are performed in Middle English, Middle French, and Latin, including secular and many religious lyrics.

---

## PHILOSOPHY

EpistemeLinks.com (<http://www.epistemelinks.com/Main/Topics.aspx?TopiCode=Medi>)—This site provides a collection of links to resources in medieval philosophy—a

good source for information about philosophers from all periods, portraits, chat about matters of current philosophical interest, and hot buttons to other sites that provide lists of reference materials, books, academic departments, and special features, such as famous quotations.

Medieval Philosophy Texts Online (<http://www.fred.net/tzaka/medvtxt.html>)—An excellent source of various full and excerpted texts from the time period, this site also provides links to other websites on the medieval period.

Society for Medieval and Renaissance Philosophy (<http://www.lmu.edu/smrp/>)—This site provides updated bibliographies (twice yearly) and other information of interest to historians of medieval philosophy.

Society for Medieval Logic and Metaphysics (<http://www.fordham.edu/gsas/phil/klima/SMLM/index.htm>)—This site provides links to professional societies and recent publications.

---

## RELIGION

*Becket*. Dir. Peter Glenville, with Richard Burton and Peter O’Toole (1964)—This film depicts the relationship between the English king Henry II and his friend Thomas Becket. A serious conflict occurs when Becket, who is Henry’s chancellor, accepts an appointment as the archbishop of Canterbury. Traditional elements of the medieval church-state rivalries are portrayed. Rated R.

*Charlemagne and the Holy Roman Empire*. Europe in the Middle Ages Series (1989), dist. Films for the Humanities & Sciences—This 31-minute color documentary depicts life at court as well as the Battle of Roncevaux; it ends with the critical church-state confrontation between Henry IV and Gregory VII.

Franciscan Authors, 13th–18th Century: A Catalogue in Progress (<http://users.bart.nl/%7eroestb/franciscan/index.htm>)—This alphabetical list of Franciscan authors from the thirteenth century onwards includes biographies and information on miracles, manuscripts, editions, and studies.

Internet Medieval Sourcebook ([www.fordham.edu/halsall/sbook.html](http://www.fordham.edu/halsall/sbook.html))—This general website on the Middle Ages includes countless links to topics concerning religion.

*The Passion of Joan of Arc*. Dir. Carl Theodor Dreyer, with Maria Falconetti and Eugene Silvain (1928)—A new boxed DVD collection includes this classic silent film, which has been digitally restored and enhanced by original orchestral work from Richard Einhorn’s *Voices of*

*Light*. The music is performed with lines from actual texts of medieval women mystics by Anonymous 4 and soloist Susan Narucki. There are also interactive essays on the production of the film, a libretto booklet from Einhorn, and historical information on Joan's life. Much of the film was inspired by the transcripts of the trials of Joan, an early fifteenth-century teenage peasant girl who is called by heavenly voices to lead the French army against the English, subsequently captured by the Burgundians, and tried in a church court for heresy and witchcraft.

## THEATER

European Medieval Drama in Translation (Steve Wright, Catholic University of America) (<http://arts-sciences.cua.edu/engl/faculty/drama/index.cfm>)—This site provides an online bibliography of published English translations of early European drama, including Latin, French, German, Italian, Dutch, Spanish, Cornish, Welsh, and Croatian.

Hildegard of Bingen, *Ordo virtutum*. Performed by Sequentia. Dir. Barbara Thornton and Benjamin Bagby. Deutsche Harmonia Mundi. 05472-77394-2—Recorded in the Basilica of Knechtsteden, Germany, in June 1998, this two-CD set offers a full performance of the innovative twelfth-century musical drama *The Service of the Virtues*. Music ranges from the Soul's weary lament as she returns from her sojourn with the devil to the grunts and shouts of the devil himself, who cannot sing because music is heavenly.

*Lo Gai Saber: Troubadours and Jongleurs, 1100–1300*. Performed by Camerata Mediterranea. Dir. Joel Cohen. Erato 2292-45647-2—Among its 21 performances, this 1992 CD includes *Le jeu de Robin et de Marion* (The Play of Robin and Marion) by Adam de la Halle, as well as songs by famous troubadours, such as “Lancan vei la folha” by Bernart de Ventadorn and “Dirai vos senes duptansa” by Marcabru.

*Ludus Danielis*. Performed by the Harp Consort. Deutsche Harmonia Mundi. 05472-77395-2—Recorded in April 1997 at St. Bartholomew's Church, Oxford, this CD captures a live performance of a medieval “opera” (The Play of Daniel) from the 13th-century cathedral in Beauvais. Musical instruments include the vielle, the shawm, the gittern, the psaltery, and the medieval harp, lute, and drone organ.

The Medieval and Renaissance Drama Society (<http://www.byu.edu/~hurlbut/mrds/mrds.html>)—The site for this academic organization offers twice yearly news-letters and information about research opportunities.

Medieval Drama Links (University of Leeds) (<http://collectorspost.com/Catalogue/medramalinks.htm>)—This set of about 200 links, collected personally by Sydney Higgins, is most useful for its access to information on sets, props, and make-up, and to images of manuscripts (such as the *Jeu de Robin et de Marion*).

*The Mysteries*. Produced by the Royal National Theater of Great Britain. Heritage Theater Video Production/BBC. VHS 3904013—This work is a complete performance of a medieval play, recorded in September 2002.

The St. Albans Psalter (<http://www.abdn.ac.uk/stalbanspsalter/>)—This website includes an introduction to the story of the Psalter, as well as page-by-page photographs of this beautiful multi-colored document, with English transcription of the text printed alongside.

The Oberammergau Passion Play ([http://www.passionsspiele2000.de/passnet/english/index\\_e.html](http://www.passionsspiele2000.de/passnet/english/index_e.html))—This is the official site, including tourist information, for the German town where performances of their local medieval passion play have taken place every ten years since 1634, with the next performance scheduled for 2010.

*The Play of Daniel* and *The Play of Herod*. Performed by New York Pro Musica. Dir. Noah Greenberg. MCA Classics. MCAD2-10102—This two-CD set offers a compilation of earlier recordings of the Play of Daniel at The Cloisters in New York City, January 1958 (40 minutes), and The Play of Herod from January 1964 (75 minutes). Both feature vocal and period musical performances, including the boy choristers of the Church of the Transfiguration, New York.

Poculi Ludique Societas—Medieval and Renaissance Players of Toronto (<http://www.chass.utoronto.ca/~plspls/>)—This site offers information on past, present, and future productions, with extensive archives of photos.

The York Cycle in York, England (<http://www.yorkearlymusic.org/mysteryplays/index1.htm>)—This official site for the York Early Music Foundation includes a history of the York Corpus Christi plays and video clips from the 1998 production.

The York Cycle in Toronto, Canada (1998) (<http://arts-sciences.cua.edu/engl/toronto/york98.htm>)—This record of the performance of the entire York cycle in Toronto in 1998 includes discussions of history, staging, and sources, as well as pictures from all 47 plays.

## VISUAL ARTS

The Aberdeen Bestiary ([http://www.clues.abdn.ac.uk:8080/bestiary\\_old/firstpag.html](http://www.clues.abdn.ac.uk:8080/bestiary_old/firstpag.html))—Sponsored by the University

of Aberdeen Library and Department of History of Art, this website offers a full set of digitized images from a medieval bestiary, a type of book that probably originated in Greece and that began to be produced in Britain by the twelfth century. The manuscript is organized as a collection of short descriptions of all sorts of animals, real and imaginary, birds and even rocks, accompanied by a moralizing explanation.

Corpus of Romanesque Sculpture in Britain and Ireland (<http://www.crsbi.ac.uk/>)—The first searchable digital archive of Romanesque British and Irish stone sculpture, this site is adding new data county by county to provide images and detailed descriptions from all locations representing the Romanesque period.

A Hypertext Book of Hours (<http://members.tripod.com/~gunhouse/hourstxt/hrstoc.htm>)—This site offers side-by-side Latin and English texts illustrating the structure and contents of a Book of Hours. It can be downloaded as a zip file and used off-line. The site also offers numerous links to sites with illuminated images from Books of Hours.

Medieval Illuminated Manuscripts (<http://www.kb.nl/kb/manuscripts/>)—Hosted by the National Library of the Netherlands, this site allows visitors to browse through the library's manuscripts, as well as to search by subject or by more specialized categories, such as scribe, miniaturist, language, and place of origin. Text is available in English, German, and French.

Timeline of Art History (<http://www.metmuseum.org/toah/splash.htm>)—Hosted by the New York Metropolitan Museum of Art, this site allows visitors to choose a spot on a timeline and a location on a world map to see images of individual works of art owned by the museum that represent the indicated time and place. Each work is carefully labeled and shown in the context of other objects from the same region and period.

Web Gallery of Art (<http://gallery.euroweb.hu/welcome.html>)—This website “contains over 11,600 digital reproductions of European paintings and sculptures created between the years 1150 and 1800” supplemented with commentary on their technique and history. The site has been online since 1996.

## ABOUT THE BOOK

**SEEING HISTORY FROM A DIFFERENT ANGLE.** An education in history involves more than facts concerning the rise and fall of kings, the conquest of lands, and the major battles fought between nations. While these events are pivotal to the study of any time period, the cultural aspects are of equal value in understanding the development of societies. Various forms of literature, the philosophical ideas developed, and even the type of clothes worn in a particular era provide important clues about the values of a society, and when these arts and humanities are studied in conjunction with political and historical events a more complete picture of that society is revealed. This inter-disciplinary approach to studying history is at the heart of the *Arts and Humanities Through the Eras* project. Patterned in its organization after the successful *American Decades*, *American Eras*, and *World Eras* products, this reference work aims to expose the reader to an in-depth perspective on a particular era in history through the study of nine different arts and humanities topics:

- Architecture and Design
- Dance
- Fashion
- Literature
- Music
- Philosophy
- Religion
- Theater
- Visual Arts

Although treated in separate chapters, the connections between these topics are highlighted both in the text and through the use of “See Also” references to give the reader a broad perspective on the culture of the time period. Readers can learn about the impact of religion on literature; explore the close relationships between dance, music, and theater; and see parallel movements in architecture and visual arts. The development of each of these fields is discussed within the context of important historical events so that the reader can see history from a different angle. This angle is unique to this reference work. Most history books about a particular time period only give a passing glance to the arts and humanities in an effort to give the broadest historical treatment possible. Those reference books that do cover the arts and humanities tend to cover only one of them, generally across multiple time periods, making it difficult to draw connections between disciplines and limiting the perspective of the discipline’s impact on a specific era. In *Arts and Humanities Through the Eras* each of the nine disciplines is given substantial treatment in individual chapters, and the focus on one era ensures that the analysis will be thorough.

**AUDIENCE AND ORGANIZATION.** *Arts and Humanities Through the Eras* is designed to meet the needs of both the beginning and the advanced history student. The material is written by subject experts and covers a vast array of concepts and masterworks, yet these concepts are built “from the ground up” so that a reader with little or no background in history can follow them. Technical terms and other definitions appear both in the

text and in the glossary, and the background of historical events is also provided. The organization of the volume facilitates learning at all levels by presenting information in a variety of ways. Each chapter is organized according to the following structure:

- Chronology covering the important events in that discipline during that era
- Brief overview of the development of that discipline at the time
- Topics that highlight the movements, schools of thought, and masterworks that characterize the discipline during that era
- Biographies of significant people in that discipline
- Documentary sources contemporary to the time period

This structure facilitates comparative analysis, both between disciplines and also between volumes of *Arts and Humanities Through the Eras*, each of which covers a different era. In addition, readers can access additional research opportunities by looking at the “Further References” and “Media and Online Sources” that appear at the back of the volume. While every effort was made to include only those online sources that are connected to institutions such as museums and universities, the web-

sites are subject to change and may become obsolete in the future.

**PRIMARY DOCUMENTS AND ILLUSTRATIONS.** In an effort to provide the most in-depth perspective possible, *Arts and Humanities Through the Eras* also includes numerous primary documents from the time period, offering a first-hand account of the culture from the people who lived in it. Letters, poems, essays, epitaphs, and songs are just some of the multitude of document types included in this volume, all of which illuminate some aspect of the discipline being discussed. The text is further enhanced by 150 illustrations, maps, and line drawings that bring a visual dimension to the learning experience.

**CONTACT INFORMATION.** The editors welcome your comments and suggestions for enhancing and improving *Arts and Humanities Through the Eras*. Please mail comments or suggestions to:

## CONTRIBUTORS

**Philip M. Soergel** received the Ph.D. in history from the University of Michigan in 1988, and has been a member of the Department of History at Arizona State University since 1989. There he is responsible for teaching courses on the Renaissance, the Reformation, and early-modern Europe. From 1993–1995, he was a member of the Institute for Advanced Study in Princeton, and he has also held fellowships from the Friedrich Ebert and Woodrow Wilson foundations, the American Philosophical Society, and the National Endowment for

the Humanities. He has twice served as a visiting professor at the University of Bielefeld in Germany. Professor Soergel's research interests lie in the history of the Protestant and Catholic Reformations, particularly in their use of miracles as propaganda. His books include *Wondrous in His Saints: Counter-Reformation Propaganda in Bavaria* (California, 1993); the forthcoming, *Miracles and the Protestant Imagination*; and the Baroque volume in Thomson Gale's *Arts and Humanities Through the Eras* series.

## ERA OVERVIEW

**DATING THE RENAISSANCE.** The concept of the Renaissance as a broad cultural renewal in European history that occurred at the end of the Middle Ages has long been used to structure the larger narrative of Western history. This book focuses on developments in the arts, literature, religion, and philosophy between 1300 and 1600—three centuries that saw the rise of distinctive attitudes toward human creativity and its artistic and philosophical expression which shaped our modern notion of the humanities and the arts. The act of dating an historical period is significant in that it often reveals the underlying assumptions of those who establish the dates. Choosing a beginning or ending date for a period often highlights a particular development or event as decisive in producing key changes in the years that follow it. So, for instance, modern historians have often chosen the date 1789, the beginning of the French Revolution, as a decisive turning point leading to the rise of the modern period. In this way dating or naming a period also functions as a kind of intellectual shorthand that allows us to identify key changes that occurred from one period to the next. But in reality all schemes of historical periodization are artificial constructs. Scholars might speak of “nineteenth-century Victorian values,” “Cold War mentalities,” or “medieval economic realities,” but human history itself is a web of events and movements in which what comes before continues to shape what follows. Societies are too varied and complex to be understood completely according to simplistic terminologies, and a time’s values or beliefs do not change suddenly with the rise of a new king or political party. So, too, the Renaissance did not sweep away elements

of medieval life. Instead it is best conceived as a broad, but sometimes diffuse, cultural renewal that affected the ideas, perceptions, and mentalities particularly of the upper classes and learned elite over a long stretch of European history. The choice of the dates 1300–1600 used in this volume has been largely one of convenience and tradition. Some historians have argued that the Renaissance’s beginnings should be dated later, often around 1450; more recently, others have pushed back the rise of Renaissance values into the thirteenth century. The traditional periodization used here has been adopted for several reasons. The date 1300 corresponds roughly to the birth of Francesco Petrarca (1304–1374), a figure long noted as vital to the formation of Renaissance philosophy and literature. The fourteenth century also witnessed the first glimmer of a new naturalism in sculpture and painting, and it saw key changes in fashion and style as well. Although much of the tenor of fourteenth-century life seems traditional and medieval in nature, great economic and social changes were underway in Europe at this time that brought forth a new kind of society and intellectual life. These changes often appear in stark contrast to the relative peace and stability that had prevailed in Europe during the twelfth and thirteenth centuries. Increased famine, economic recession, the enormous catastrophe of the Black Death (1347–1351), as well as a series of great peasant and urban revolts were just a few of the trials that gripped the fourteenth century. From these trials a new set of economic and social realities was born that led to the even greater flowering of art and intellectual culture that occurred in Europe during the fifteenth and sixteenth centuries.

**THE END OF THE RENAISSANCE.** It is relatively easy to identify forces at work in the fourteenth century that helped to produce renewal in Europe, but the question of when the Renaissance ended is considerably more problematic. It has been argued that the relatively free and tolerant attitude of Renaissance intellectuals began to change with the rise of the Reformation in the first half of the sixteenth century—that the rise of Protestantism and the Counter-Reformation, in other words, led to a gradual eclipse of the Renaissance in the face of a renewed religious intolerance. On the other hand, other scholars have seen key elements of Renaissance intellectual life persisting even into the late seventeenth century, when the rise of science and the early Enlightenment began to alter Europe’s high culture once again. There are elements of truth in both of these arguments, although the date of 1600 has again been used for several reasons. It corresponds roughly to the death of Michel de Montaigne (1533–1592), the last great philosopher to be universally recognized as a Renaissance thinker. In 1598, moreover, the promulgation of the Edict of Nantes in France granted a limited degree of religious toleration to French Protestants, a key event in bringing to an end the religious controversies that Montaigne himself decried in much of his writing. Only a few years later, in 1603, Queen Elizabeth I passed away in England, and the period to which she had given her name, the Elizabethan Age, gradually changed as a result of the accession of the Stuart kings and the religious controversies of their reigns. All these factors justify the choice of 1600 as a date that approximates the end of the Renaissance, a date that might, of course, be fixed elsewhere if one relied on different rationale.

**CONCEPTUALIZING THE PERIOD.** The concept of the Renaissance as a rebirth of culture and intellectual life in Europe has its origins in the period itself, as intellectuals and artists of the time spoke of their time as one of progress and achievement. They contrasted the innovative and inquiring spirit of their days against the “Middle Ages” that preceded them, and in this way they helped give birth to the tripartite division of Western history into the periods of antiquity, the Middle Ages, and the modern world, that has survived ever since their time. Scholarly conceptions of the Renaissance have been greatly influenced by the work of the great Swiss historian Jacob Burckhardt, who published *The Civilization of the Renaissance in Italy* in 1860. In that work, Burckhardt argued that the Renaissance witnessed a great awakening of modern individualism and human creativity, which he first saw emerging in Italy. There the absence of a strong monarch allowed the values of individual

achievement and merit to flourish, creating a society in which rank and status mattered less than a human being’s intellect and creativity. While he generally celebrated the growth of individualism in the Renaissance as a positive development in Western history, Burckhardt’s admiration for it was not unbounded. The darker side of Renaissance individualism led to the growth of a secular spirit and opened the door to intense egotism and even atheism, developments that Burckhardt saw as the root of problems in his own nineteenth-century Europe. Since Burckhardt’s time, scholarship has often assessed the validity of his model, and while certain features of his picture have survived, many have been rejected as projections of his discontent with his own age onto the very different circumstances of the Renaissance. Few scholars would now characterize the beliefs of Renaissance intellectuals as secular, or as in any way connected to the growing atheism of the nineteenth century. Instead they recognize that the Renaissance represented a curious amalgam of medieval and innovative elements. While they agree with Burckhardt that the Renaissance was a period of outstanding artistic, literary, and intellectual creativity, they have also demonstrated that these forces were at work within the constraints of a society that was often conservative and highly traditional in nature.

**THE REVIVAL OF ANTIQUITY.** The love of precedent and custom expressed itself in the Renaissance world in a deep and abiding affection for the culture of ancient Rome and Greece. During the fourteenth century, figures like Petrarch and Boccaccio reached out to the ancient world in search of values and philosophies that might help them negotiate the problems of living in an urban world. Ancient philosophy and literature had never disappeared from the Latin world of medieval Europe, but the scholars of the Middle Ages had often considered the writings of the ancients like a database of factual information and insights that might be applied to problems of Christian theology and the law. Renaissance humanism, by contrast, embraced antiquity as an inspiration for resolving ethical and moral dilemmas and for creating a philosophy that might foster virtuous living. The word “humanism” itself was a nineteenth-century creation that described those Renaissance scholars who practiced the *studia humanitatis* or “humane studies,” the origin of our modern notion of the humanities. While there was no creed or manifesto to which all these scholars subscribed, the humanists were united by a distaste for what they considered the logical and arid theorizing of scholasticism, the dominant intellectual movement of the medieval church. In place of the

scholastic curriculum, which emphasized logic, the humanists tried to create a philosophy that provided an ethical standard for living. The disciplines the humanists championed differed from place to place and across time, but most often humanists identified these studies as rhetoric (the art of graceful speaking and writing), moral philosophy, grammar, history, and poetry, perceiving the language arts as the primary keys to virtue. Beyond humanism's advocacy of a common curriculum, it remains difficult to generalize about the character of this movement. There were civic humanists, who concentrated their efforts on exploring the arts of government and civic involvement; humanists influenced by ancient Stoic philosophers, who argued that virtuous human beings should avoid social entanglements and develop an indifference to the world; and still other scholars who revived the ideas of Plato and used these to create a mystical philosophy that might join the human soul with God. Other forms of humanism also flourished in the Renaissance, and these are discussed in the pages that follow. While they attacked the methods of scholastic philosophy that prevailed in the European universities at the time, humanists could not avoid considering many of the same logical problems the scholastics had tackled in their works. Thus humanism and scholasticism shared many common concerns. At the same time the rivalry between the two movements was often intense, with the humanists attacking the scholastics' method of logical argumentation as "childish prattling" and "logic-chopping." By contrast, they argued that their goal of creating more virtuous human beings was far more important. Petrarch summarized these sentiments in the fourteenth century when he wrote, "It is better to will the good, than to understand truth." In choosing the word "truth," the fourteenth-century philosopher had in mind the scholastics' attempt to prove Christianity's teachings logically. For humanists like Petrarch, such attempts fell far short of the greater task of making Christianity's teachings relevant as a force of moral renewal.

**CHRISTIANITY AND HUMANISM.** In his *Civilization of the Renaissance in Italy* Burckhardt argued that secular values triumphed in the Renaissance world, a notion that has long been rejected by the scholars who followed him. Since Burckhardt's day, a long line of historians has called attention to the Christian roots of humanism and restored its character as an orthodox movement within Christianity. Indeed one prominent American scholar, Charles Trinkaus (1911–2000), demonstrated that humanism might best be conceived as a long Christian discourse on the concept of human creativity and its divine origins. Trinkaus agreed with Burckhardt that the Re-

naissance world saw an unparalleled growth in Western individualism. At the same time he called attention to the many humanists' discussions of mankind's creation in God's likeness, a Jewish and Christian teaching rooted in the scriptures. Humanist philosophers frequently considered the attributes human beings shared as a result of their creation in God's image, identifying language, poetry, music, and the arts as proof of the human race's divine origins. As the Renaissance progressed, the search for these signs of divinely inspired creativity grew more intense, and the exploration of ancient philosophy deepened, efforts that reached a high point in the movement known as Renaissance Platonism. This intellectual creed became attractive to many scholars and artists during the late fifteenth and sixteenth centuries. Renaissance Platonists like Marsilio Ficino (1433–1499) and Giovanni Pico della Mirandola (1463–1494) attempted to harmonize the ancient philosophy of Plato with the Christianity of their day. In works like his *Oration on the Dignity of Man* Pico celebrated human creativity and the arts in some of the most extravagant and optimistic terms ever used in the Western tradition. The larger goal of these explorations of human creativity was to identify ways in which the human soul might achieve mystical union with God. To achieve these ends, the Platonists embraced astrology, poetry, music, the visual arts, metaphysics, and many occult philosophies. The emphasis they placed on the arts, however, had a definite impact in fostering a distinctive Renaissance notion of human creativity as divinely inspired. Michelangelo Buonarroti and Sandro Botticelli were just a few of the many Renaissance artists who tried to give visual expression to many Platonic teachings, while more generally, the notion of artistic inspiration as divine is to be found in many Renaissance writings.

**HUMANISM AS A PROFESSION.** During the fifteenth century humanist investigations of ancient philosophy deepened, and humanists themselves emerged as a professional group in Renaissance Italy. At this time many humanists found employment in Italy's princely courts or in its cities. The most prized and rare positions of the day were as scholars-in-residence and tutors in princely courts and in the households of Italy's wealthiest merchants, situations that provided the humanist scholars with a large amount of free time to pursue their scholarship. The Medici family, the behind-the-scenes manipulators of Florence's fifteenth-century political scene, were just one of many Italian families who supported humanist scholars in this way. Among the many figures they brought under their patronage in the fifteenth century were Marsilio Ficino and the distinguished Latinist

Angelo Poliziano (1454–1494). Humanists also found employment as secretaries in the growing state bureaucracies of Italy. Towns and princes prized these intellectuals for their mastery of the skills of graceful speaking and writing, and many humanists rose to powerful positions of authority in Italy's governments. They often became ambassadors, entrusted with representing Italy's states in diplomatic negotiations. The church also nourished humanism, as many humanists were members of monastic orders, or some took priestly vows and found employment in ecclesiastical government. At Rome, there were many humanists employed in the papal court and in the households of cardinals and other church officials. The fashion for humanism at Rome grew throughout the fifteenth century, intensifying especially after the election of the humanist Pope Nicholas V (r. 1447–1455), who assured the city a lasting role in the movement by founding the Vatican Library in 1450. This institution played a key role in furthering scholarship in the humanities over the following centuries. Of all Italy's institutions, the universities proved most resistant to the new educational movement, a mark of the ongoing rivalry between humanists and scholastics. But even in academia, humanists began to make inroads by securing a number of appointments by the later fifteenth century.

**INCREASING SCHOLARLY SOPHISTICATION.** As humanism spread as an important intellectual movement, it acquired greater sophistication in dealing with language and history. During the fourteenth century new investigations of ancient Latin showed that the language had changed greatly over time, and in the work of Lorenzo Valla (1407–1457) a new discipline known as philology emerged. Philology, the historical study of literature and language, allowed scholars to date anonymous and disputed texts by examining the words, phrases, and syntax used in these documents. Although he had the support of the papacy as a scholar, Valla did not shy away from controversy. In several treatises he took on ancient claims of the church. In one of his works, for instance, he demonstrated that the *Donation of Constantine*, a document that had long been alleged to have been written by the fourth-century Roman emperor Constantine, was a forgery. Valla examined the language of the text and showed that it could not have been written earlier than the late eighth century. The papacy had long relied on this document to support its claims to secular power in Western Europe, and in this way, Valla challenged one of the church's sources of authority. His investigations into language also resulted in an important work, *The Elegancies of the Latin Language*, a grammar and stylistic manual that showed scholars how

to master the ancient Latin of the Golden Age. Valla's defense of pure Latin style had the enthusiastic support of many humanists in the fifteenth century, and the ability to write and to speak a grammatically correct ancient Latin became a mark of social distinction among Italy's elites. Other developments in fifteenth-century humanism allowed for scholars to judge the authenticity of various texts, as well as to date their origins. As scholars at the time studied ancient writings more thoroughly than before, they realized that there were frequently many variant editions of key texts. At Florence, Angelo Poliziano developed scholarly methods for establishing the authenticity of variant versions of a text, and for establishing which version was the earliest and hence likely the most authoritative. In the development of these techniques humanism played an important role in developing more critical forms of historical analysis.

**THE MOVEMENT SPREADS.** After 1450, the techniques and disciplines that the humanists had developed began to spread beyond Italy's borders, particularly to Germany, the Netherlands, England, Spain, and France. The character of humanism in northern Europe differed from place to place, but nevertheless shared certain similarities. Often humanists outside Italy pursued the mystical, magical, and artistic investigations of Renaissance Platonism. At the same time study of the Bible and the early church fathers was popular among Northern Renaissance scholars. As they studied the Bible, many humanists realized that the Latin translation that had long been used in medieval Europe, the Vulgate, had been seriously flawed with many mistranslations. By the early sixteenth century humanists like Desiderius Erasmus, John Guillaume Budé, and Jacques Lefèvre d'Étaples devoted themselves to biblical study and to correcting the Vulgate's errors. At the same time Northern Renaissance humanists championed the cause of reform in the church and the ethical renewal of society. Here Erasmus' brand of "Christian humanism" was particularly important, and the teachings of this greatest scholar of the Northern Renaissance influenced the demands of Protestant reformers like Martin Luther, Ulrich Zwingli, and John Calvin, although Erasmus and many of his fellow humanists remained loyal to the church. While scholars have sometimes seen an increasingly intolerant attitude developing toward humanism in the wake of the Protestant Reformation, more recent research has called attention to the ways in which the movement's educational concerns survived to be accommodated within new Protestant and Catholic schools and their curricula. It is true that the tenor of debate the Reformation and Counter Reformation produced sometimes resulted in

new repressive measures that outlawed the critical and inquiring spirit the humanists had championed in the previous centuries. At the same time, humanism as a scholarly method survived and was transformed in the later sixteenth century to become one of the most visible legacies of the Renaissance. Its techniques and discoveries were transmitted to the seventeenth-century Baroque world, where an even more disciplined and scientific examination of ancient literature, science, and history developed.

**HUMANISM'S INFLUENCE ON THE ARTS.** As a movement, Renaissance humanism was broad and diffuse, factors that still make it difficult for historians to summarize today. At the same time its close affiliation with and influence on the arts of the Renaissance has never been in doubt. Humanists like Petrarch and Boccaccio wrote great literary works that inspired later painters and sculptors, even as both these figures' studies of ancient literature and mythology continued to inspire later artists. Until the seventeenth century the humanist Boccaccio's *Genealogy of the Pagan Gods* (1350–1373) served as a kind of textbook for artists seeking to depict mythological themes. The alliance between the visual arts and humanism, however, ran deeper than just a preference for ancient themes. In Italian Renaissance cities artists mingled freely with humanists, acquiring a familiarity with the movement and its various philosophies. The great families of the era often appointed their own resident artists, even as they kept philosophers at work in their libraries and households. Michelangelo was for a time a student in the Medici household in Florence, where he acquired more than a passing familiarity with Renaissance Platonism, the dominant philosophy of the city's humanists in the late fifteenth century. In his subsequent works as a sculptor and a painter, Michelangelo labored to give visual expression to many of the Platonic ideals he had acquired in his youth. Michelangelo's education in the Medici household was one of the more extraordinary examples of the links that developed in the Renaissance between art and learning. Yet many similar, if perhaps less dramatic ties between the visual arts and humanism appear throughout the fifteenth and sixteenth centuries. In architecture, humanism's influence is readily visible in the revival of ancient styles that began in the early fifteenth century and continued through the sixteenth. Humanist scholars studied the proportions and building techniques of ancient architects like Vitruvius, often translating these works into Italian, and the designers of the time enthusiastically read and studied these new vernacular editions. During the fifteenth and sixteenth centuries Italian archi-

itects labored to clothe the medieval cityscapes of towns like Florence, Siena, Rome, and Venice with a new veneer of classicism that gave visual expression to the new humanist ethos. Many of these buildings became vehicles for conveying philosophical truths. In designing them, architects often relied on proportions, shapes, and numerical relationships that carried with them a philosophical message. The fashion for round structures and for churches constructed in a central style with equal radiating arms were two styles whose origins can be traced to the influence of humanism, and more particularly to Renaissance Platonism. In these and many other ways, works of Renaissance art expressed the philosophical viewpoints of learned elites and the wealthy merchants and princes who commissioned them.

**STATUS OF THE ARTIST.** Another byproduct of the ties between art and humanism was a rise in the social status of artists. In 1300, artists were considered craftspeople, and were usually members of urban craft guilds. Italy and northern Europe continued to produce many figures that enjoyed modest reputations as craftsmen, and artists' affiliations with the guilds largely survived intact throughout the period. At the same time the most accomplished painters, sculptors, architects, composers, and dancers enjoyed considerable reputations for their ability to create, and the modern notion of the artist as an individual charged with a powerful and unique vision began to emerge. This transformation can be seen in the voluminous notebooks that Leonardo da Vinci and Michelangelo kept, or in the *Autobiography* of the boastful sixteenth-century sculptor Benvenuto Cellini. As the status of the artist as a creator rose, many of the arts also began to acquire their own histories and a sense of lineage. Giorgio Vasari's *Lives of the Most Eminent Painters, Sculptors, and Artists* (1550) is now the most famous of the many histories of art that survive from the period, but many similar treatments of the history of music, literature, and dance were written at the time as well. A sense of achievement permeates many of these texts, a sense that is also to be found in the many theoretical manuals that treated the practice of the arts of painting, sculpture, architecture, dance, and music. Writers often traced recent innovations in their fields, crediting key figures with an enormous "divinely-inspired genius," even as they argued that these accomplishments proved the high status of a particular art form. In this way the defenders of various arts made use of the same arguments humanists had long exploited to defend their literary, philosophical, and poetic works. In some cases the claims artists made for themselves and for their art likely fell on deaf ears. Despite his own powerful sense of his art as a

divine gift, Michelangelo sometimes suffered treatment as a hired hand by the popes who employed him. They moved him from project to project at their whims, a fact that explains the many incomplete projects he left behind at his death. At the same time the enormous gifts of a Michelangelo, a Titian, a Palladio, or a Dürer gained wide recognition, and the greatest of Renaissance artists consequently rose to the status of gentlemen.

**AN ARTFUL SOCIETY.** Another feature of Renaissance life points to the vital role that all the arts played as indicators of social refinement. In his nineteenth-century classic Burckhardt called attention to the great number of “universal men” that existed in the Italy of the fifteenth and sixteenth centuries. One of these, Leon Battista Alberti (1404–1472), adopted the motto “Man can do all things, if he but will,” and Alberti’s life became a testimony to the pervasiveness of his philosophy. Trained in law, he was also a humanist and took minor orders in the church, eventually finding employment as a secretary to the humanist pope Nicholas V. While pursuing a life of active engagement in public affairs, Alberti became a practicing architect, sculptor, and painter, and his theoretical treatises on these subjects were widely read and disseminated among artists of the time. He was a gymnast, a horseman, a poet, a musician and composer, a theologian, a mathematician, and a philosopher. To his many other talents, Alberti also added skills as a comic, writing a number of popular spoofs on the lives of animals. This short snapshot of his many talents shows the role that the arts and humanities played in the Italian Renaissance. They were signs of refinement that displayed one’s ability to live graciously. This trend intensified in the sixteenth-century world, and the ability to write at least a passable sonnet; to paint and sculpt; and to dance, sing, play an instrument, and compose music all became celebrated as skills necessary to participate in an increasingly rarefied court society. The conduct manuals of the time taught courtiers and wealthy patricians in Italy’s cities how to refine their conversation, even as they often included an almost endless list of skills that were necessary for anyone hoping to be admitted into aristocratic society. Of these texts, Baldassare Castiglione’s *Book of the Courtier* (1528) survives as the most famous and influential. In the course of the sixteenth century conduct manuals like this became popular in almost every corner of Renaissance Europe. They soon acquired a broader readership, being studied not only by courtiers and patricians but also by members of the urban bourgeoisie. As the conduct manual moved into these new frontiers, writers pared down the number of skills and arts that were nec-

essary for their readers to master, while preserving some like dancing and singing as essential tools that demonstrated a person’s refinement. This tendency can be seen already in Thomas Elyot’s *Book of the Governor* (1531), one of the most widely read conduct manuals to survive from England. Elyot knew that the urban men for whom he wrote had neither the time nor the inclination to master all the disciplines and arts promoted in a rarefied courtly manual like Castiglione’s, so he condensed the essence of that earlier work and showed his readers only the most essential skills for functioning in civil society. In this way achievement in the arts and at least a passable degree of classical learning functioned as necessary skills for those who desired to participate in the public world.

**NEW MEDIA.** The rise of technological innovations in fifteenth- and sixteenth-century Europe also influenced the arts and the humanities in new ways. The most visible and important of the many new media that emerged in the Renaissance was the printing press, which greatly increased the flow of information in Europe and played a vital role in informing artists and scholars of key developments elsewhere in the continent. Printing helped to fuel the dynamism of the religious controversies of the Reformation, while at the same time allowing for music, dances, plays, and other art forms to be performed far from the place at which they were written or composed. With the development of woodcut illustration and copper engraving techniques, the press also contributed greatly to the visual arts, giving birth to new forms of pictorial art that have persisted since the Renaissance. At the same time printing also constricted the rich variety of local art forms that had long flourished throughout Europe, particularly in the performing arts. As performance manuals in both dance and music sanctioned one set of practices as correct over other possibilities, longstanding local performance customs began to disappear in favor of the ones in printed books. In musical composition, too, the popularity of printed madrigals and motets throughout Europe tended to eclipse many native forms of music. Printing also sounded the death knell for the art of hand copying and illuminating manuscripts with beautiful miniatures. Scribes simply could no longer compete with the cheaper flood of books that now poured from Europe’s printing houses. At the same time, printing was only the most visible of the many technological innovations that transformed the arts and scholarship in Renaissance Europe. In painting, new techniques in oils allowed for a broader range of color and provided artists with a medium that was more adaptable to an artist’s expressive brushwork

than the true tempera techniques used in the Middle Ages and early Renaissance. In music, new instruments similarly increased the tonal range and volume of instruments, even as rich forms of polyphony introduced a new harmonic complexity and depth of sound in choral music. This list of technical innovations that occurred in the arts and humanistic scholarship of the period might be lengthened considerably, and it forms a significant focus in all the chapters that follow. But more fundamentally the rise of a climate of technological experimentation points to the development of a culture increasingly concerned with pioneering ways of mastering and extending the possibilities of the natural world, an observation that many scholars have long associated with the Renaissance. At the same time not every attempt to improve artistic production or scholarly techniques was successful. In creating his famous painting of the Last Supper at Milan, Leonardo da Vinci experimented with a new medium of fresco that mixed traditional pigments with oils. Soon after he completed his work, the painting began literally to slide off the wall, much to the chagrin of art lovers ever since. But many more technical innovations were successful than unsuccessful, and the legacy of Renaissance experimentation greatly extended the expressive power of the arts in Europe over the centuries that followed.

**THE VERNACULAR LANGUAGES.** A final fundamental transformation of which readers of this volume should be aware is the rise of vernacular languages as literary modes of expression, a development that did not proceed at the same rate in all of Europe's national cultures. Of all the medieval national languages spoken in Europe, only French had a rich tradition of use as a literary language during the Middle Ages. While native epics, religious poems, and other works survive from before 1300 in all Europe's languages, the explosion of vernacular literature in the fourteenth, fifteenth, and sixteenth centuries is undeniable. This rise of literary forms of Italian, German, Spanish, and English occurred at the same time as humanists avidly pursued the revival of a grammatically correct and uncorrupted style in Latin. In these efforts the works of the ancient Roman Golden Age, including the writings of Cicero, Livy, Horace, and Ovid, guided Renaissance authors. By 1500, their efforts in defense of an ancient pure form of Latin had triumphed over the many medieval usages that had long flourished in the language. The revival of classical Latin was widely successful; writers produced more literature in the language during the sixteenth century than at any other time in history. At the same time, the efforts of humanism in defense of pure Latin style produced a para-

doxical effect, since the language was no longer a living and expanding language as it had been throughout most of the Middle Ages when new vocabulary and usages had been constantly introduced over time. Scholars and authors soon became aware that Latin was no longer a growing, vital language, and many sensed that the future lay in the vernacular languages. The rise of native forms of Italian, French, Spanish, English, and German consequently began to inspire many disputes about the literary styles that were appropriate for these languages. In every country authors debated which dialect of the language and which syntax and vocabulary were best suited for writing in French, German, or English. These heated debates reveal to us the excitement surrounding the possibilities the native languages offered. In his *Book of the Courtier* Baldassare Castiglione neatly summarized this excitement when he judged Latin a "dead" language, and instead advocated his readers adopt the lively conversational form of Tuscan Italian since it was "a garden full of sundry fruits and flowers." The new nectar writers like Castiglione hoped to squeeze from national languages captivated authors even more as the sixteenth century progressed. Michel de Montaigne, who had been trained from his earliest youth to speak and write in Latin, nevertheless chose French to compose his *Essays*, and in so doing, he helped to extend its possibilities for literary expression. In England, the great achievements of the Elizabethan theater had a similar effect in raising the literary standard of English, and in Spain, the authors and playwrights of the emerging Golden Age fulfilled a similar function for modern Spanish. Latin was far from moribund by the end of the Renaissance; it remained an essential language for the educated for centuries to follow. But the quality of prose and poetry Renaissance authors composed in the various national languages helped to assure their further development as literary languages, even as the styles these languages used in subsequent centuries often continued to pay tribute to the Renaissance and its debates over syntax, structure, and vocabulary.

**SCOPE OF THE BOOK.** As the title suggests, this work focuses exclusively on the arts and humanistic scholarship. The definition of humanism, the source of the modern notion of the humanities, has been outlined in this introduction. At the same time the notion of the arts that is developed here demands some explanation. A broad and inclusive definition of the arts has defined the choice of chapters in this volume. During the seventeenth and eighteenth centuries aesthetic philosophers in Europe pioneered the concept of the "beaux arts" from which we derive our modern English term, "Fine Arts." That concept has been most often applied to the arts of

painting, sculpture, architecture, music, and poetry. In the eighteenth century an increasingly formal system of aesthetics also drew a firm distinction between the “Fine Arts” and the “crafts.” Under crafts, aesthetic theorists once placed an entire variety of skills as diverse as needlepoint, weaving, tailoring, ceramics, and cabinet making. Value judgments lay hidden in these classification schemes, since these distinctions were intended to separate those practices that required art, understood as intellectual skill, and those that by contrast primarily demonstrated the powers of the hands. As anyone knows who has ever tried a hand at cabinet making, it is an enormously difficult craft that requires both great intellectual as well as physical skill. In considering the role of the arts in Renaissance culture, we can largely bypass these distinctions between what is an art and what is a craft. At this time, the system of the “Fine Arts” played no role in how people defined the term “art.” When Renaissance people used that term, they had one of several meanings in mind. The arts referred, of course, to the seven liberal arts that were an identifiable curriculum in which educated people were schooled before entering university. At the same time “art” described the crafts that were practiced in the urban guilds. And by the sixteenth century the word “artist” had acquired much of its modern meaning; it implied someone who had developed a high degree of skill in one of the categories that we today associate with the arts: painting, sculpture, architecture, dance, music, poetry, and theater. In this

sense tailors were not generally considered “artists” at the time, even though they practiced an “art” that was regulated by the craft guilds of the day. In trying to render the very different attitudes that Renaissance people had toward artistic production, then, we have come to emphasize many areas of cultural production. Numerous discussions of masterpieces abound in the chapters that follow, the traditional preserve of literary scholars and of art, theater, and music historians. At the same time we have treated a broad range of works and physical artifacts in order to suggest the inclusive nature of art in the Renaissance.

**ACKNOWLEDGMENTS.** I am grateful to the editors and staff at Gale for bringing this project to a successful completion. In particular, I would like to thank Tom Carson, who originally suggested the idea of this book to me; Julia Furtaw, who helped initially define the work and its contents; Rebecca Parks, who edited the book and eliminated numerous stylistic errors; and Shelly Dickey, who oversaw the entire venture. I also acknowledge the advice of the following scholars, who read and advised on portions of the manuscript: Andrew Barnes, Neithard Bulst, Ann Moyer, Sachiko Kusukawa, Thomas Tentler, and Retha Warnicke. Finally, I would like to thank the several thousand students I have taught during the past quarter century. They have forced me always to be “on my toes,” and have constantly stimulated my curiosities about the many issues treated in this book.

# CHRONOLOGY OF WORLD EVENTS

*By Philip M. Soergel and Melanie Casey*

- 1303 Pope Boniface VIII dies a broken man about a month after being beaten up by a gang of toughs sent by King Philip IV of France.
- 1304 Francesco Petrarch, who will become known as the “Father of Humanism,” is born.
- 1309 The pope moves the capital of his government to the French border town of Avignon, beginning the so-called “Babylonian Captivity” of the church.
- 1316 The Great Famine strikes much of Europe.
- 1321 The poet Dante, author of the epic poem *Divine Comedy*, dies.
- c. 1325 The Aztecs settle in the area around modern Mexico City.
- 1337 Edward II is crowned king of England and begins the Hundred Years’ War with France.
- 1340 Defeat of the Moors in Spain leaves the kingdom of Granada as the only Arab possession in Iberia.
- The English attack the French fleet off the coast of the Netherlands in order to secure the English Channel for an invasion of France.
- 1341 Petrarch is crowned with laurel at Rome, a ceremony that imitates the ancient Roman custom of naming poet laureates.
- 1346 The Battle of Crécy is fought in the ongoing war between England and France. It is the first battle to use cannons, and is a decisive victory for England.
- 1347 The Black Death strikes Europe. Over the next three years it will claim perhaps as much as a third of the entire population, and the disease will recur many times over the following three centuries.
- 1348 Giovanni Boccaccio begins to write his *Decameron*.
- 1349 Pogroms (organized massacres) against Jews rage in Germany and France in the wake of the Black Death. Jews are blamed for causing the disease, either through magic or through poisoning wells.
- 1350 War breaks out between the two Italian powers of Venice and Genoa over their rights to navigate in the Black Sea.
- Sixteen-year-old Javan ruler Hayam Wuruk takes the throne of the Hindu state of

- Majapahit when his mother, Tribhuvana, abdicates. Along with his powerful minister Gajah Mada, he extends Javan control throughout Indonesia.
- Ramathibodi I, a Utong (Thai) general, becomes king and moves the capital to Ayutthaya, a settlement on an island north of Bangkok. He engages in warfare against the Cambodians—who are defeated, but they introduce Khmer culture into that of their conquerors—and establishes coded laws. He becomes a Buddhist priest and rules until his death in 1369.
- 1352 The Ottoman Turks establish a settlement on Gallipoli, near Tzyppe.
- Arab traveler Ibn Battutah crosses the Sahara and visits the Mandingo Empire.
- 1353 Fa Ngum unites the Laotian people and introduces Khmer civilization. He leads his country until he is exiled in 1371.
- Chinese general Hsü Ta and rebel Hungwu join their forces and fight against the Mongols, eventually leading to the downfall of Mongol control and the start of a new Chinese dynasty.
- 1354 Forces of the Ottoman Turks capture the Byzantine province of Thrace in the Balkans.
- 1355 Chu Yüan-chang becomes leader of rebel forces in China, after the death of Kuo-Tzu-hsing.
- 1356 The English Black Prince attacks the French at the Battle of Poitiers, capturing the French king John the Good. England demands much of southwestern France and the port of Calais, in addition to a large ransom, to return John. A temporary lull in the hostilities begins.
- Yüan-chang's forces take the city of Nanking.
- Mobarez od-Din Mohammad, son of southern Iranian ruler Sharaf od-Din Mozaffar, captures Tabriz in northwest Iran.
- 1358 In France, the peasant rebellion of the *Jacquerie* begins.
- Od-Din Mohammad is deposed by his sons Qotb od-Din Shah Mahmud and Jalal od-Din Shah Shoja', who divide the kingdom between themselves.
- 1359 At London, a treaty signed between France and England forces the former to give control over a large portion of its territory. The following year the English king Edward III will fail in his attempt to try to capture the French throne during an unsuccessful campaign on the continent.
- Angora (later Ankara) is captured by the Ottomans. It will become the capital of modern Turkey.
- 1360 The Ottoman Turks seize the important city of Adrianople from the Byzantine Empire. In the same year Murad I assumes the throne of the empire, establishing the powerful force of troops that will become known as the Janissaries. The Janissaries are made up of prisoners of war and Christians, and they remain a powerful Turkish force until the nineteenth century.
- Mari Jata II becomes the mansa of the Mali Empire in West Africa. He rules until 1374.
- 1362 Adrianople (now Edirne, Turkey) is captured by the Ottomans under Murad I.
- 1364 Javan minister Gajah Mada dies, possibly after being poisoned by Hayam Wuruk, who may have feared the influence of his powerful subordinate.
- 1365 Indonesian poet Prapanca writes *Nāgarakertāgama*, an epic poem featuring the rule of Wuruk.
- 1368 The Yüan dynasty in China, a period of Mongol control initiated by Kublai Khan in 1260, ends. It is replaced by the Ming dynasty, founded by the monk Chu Yüan-chang, whose forces capture Khahbalik (later Beijing). Ashikaga Yoshimitsu becomes a shogun in Japan. He serves in

- many government posts, reorganizes civil service and suppresses piratical activities.
- 1369 The peace that has reigned between England and France ends with the outbreak of renewed hostilities in the Hundred Years' War between the two countries.
- 1370 King Timur or Tamerlane assumes the throne of the state of Samarkand (in modern Uzbekistan). During his reign he will subdue much of Central Asia and the Middle East.
- c. 1371 Arab jurist ad-Damīrī writes the *Hayāt al-hayawān*, an encyclopedia of animals that appear in the Koran.
- 1373 Sam Sene Thai becomes the ruler of the Lan Xang kingdom of Laos and rules for forty-four years of peace and prosperity.
- 1375 Suleiman-Mar wins independence for the Songhai, who controlled the western Sahara, from the Mali Kingdom.
- 1377 Islamic traditionalist theologian al-Jurjānī arrives to teach in Shīrāz, where he stays for ten years. He is best known for his dictionary *Kitāb at-ta' rifāt*.
- 1378 In Florence, members of the guilds rebel against the great masters and seize control of the city government in the Revolt of the Ciompi.
- Pope Gregory XI dies in Rome while preparing the way for the return of papal court to its ancient capital. Competition between Avignon and Rome, however, gives rise to the Great Schism.
- 1381 English peasants revolt under the leadership of Wat Tyler. During their brief rebellion, they slay the archbishop of Canterbury and other British nobles.
- 1382 The Mongols are decisively expelled from China, making way for the rise of the Ming dynasty.
- 1385 Japanese poet Kanami, who is credited with transforming primitive dance into Nō drama, dies.
- 1386 Serbian prince Lazar Hrebeljanović defeats the Turks at the battle of Pločnik.
- 1389 Hrebeljanović is killed, and his forces are crushed by the Turks at the battle of Kosovo. Also killed, however, is the Ottoman sultan Murad I, who is replaced by Bayazid I.
- 1390 Bayazid I captures Anatolia.
- 1391 A massacre of Jews in Seville in Iberia claims as many as 4,000 lives.
- 1392 Korean general Yi Sōnggye overthrows the Koryō dynasty, names his kingdom Chosōn, and establishes his capital at Hanyang (Seoul). The Yi dynasty rules Korea until 1910, when Japan annexes the country.
- 1393 The Thais invade Cambodia, capturing Angkor and ninety thousand people. The policy of seizing and subjugating whole populations, often removing them to the home state, leads to much intermixing of peoples in the region.
- 1394 King Charles VI expels all Jews from France.
- Turkish ruler Timur captures Baghdad and controls Mesopotamia.
- 1395 Thai king Ramesuan dies and is replaced by his son Ramraja. Fourteen years of peace follow.
- 1397 The Ming law code is introduced in China, reinforcing traditional authority and the responsibility of the paterfamilias along hereditary groupings. A system of social organization (ten-family groups organized into one-hundred-family communities) is developed to regulate and indoctrinate the populace.
- 1398 Timur's Turkish troops invade India, destroying the province of Delhi and massacring more than one hundred thousand Hindus before capturing the city of the same name.

- 1399 Faraj becomes ruler of Egypt. He allows a defensive alliance with the Turks to lapse and is later captured by the Turks while trying to regain Syria.
- c. 1400 Five Iroquois nations (Mohawk, Oneida, Onondaga, Cayuga, and Seneca) emerge as distinct tribal entities in North America.
- 1400 Damascus and Aleppo in Syria fall to Timur's armies.
- 1402 Bayazid is defeated, and later dies in captivity, by Timur at the Battle of Angora.
- 1403 Prince Paramesvara founds Malacca (Melaka) on the west coast of the Malay Peninsula. The area will become a major supplier of spices.
- 1405 Chinese explorer Cheng Ho (Zheng He) begins the first of seven expeditions, which will last until 1433, to Asia, India, East Africa, Egypt, Ceylon, and the Persian Gulf.
- Timur dies during an expedition to conquer China. Shah Rokh, his son, begins his reign of Persia (Iran) and Central Asia, which lasts until 1447.
- 1406 The city of Florence conquers nearby Pisa, granting it an access to the Mediterranean.
- 1407 Civil conflicts rage among the nobility of France.
- 1408 The king of Ceylon is taken to China as a prisoner.
- 1409 Thai prince Nakonin overthrows Ramraja and takes the Intharaia.
- 1410 Sultan Ahmad Jalayir of Iraq is killed in a dispute with the chief of the Black Sheep Turkmen tribal confederation from eastern Anatolia.
- 1411 The once powerful Teutonic Knights are forced to relinquish control over much of their Eastern European territory after defeat by an alliance of Polish, Lithuanian, Russian, and other ethnic groups' forces.
- 1412 Faraj is killed by the Turks in Damascus while trying to recapture Syria.
- 1413 Henry V begins to press his claim to the throne of France.
- 1414 Khizr Khan, former governor of the Punjab, becomes ruler of the Delhi sultanate, beginning a reign known as the Sayyid dynasty, because the leaders claimed to be descendants of the Prophet Muhammad. North India is divided among military chiefs for half a century.
- 1415 The Great Schism is brought to an end through the work of the Council of Constance.
- Although his forces are outnumbered four to one, Henry V defeats the French at the Battle of Agincourt.
- 1416 A revolt begins in Iznik, Turkey, initiated by the communalistic social theories pushed by Moslem theologian Bedreddin, who had been exiled to the city. He is captured and hanged after the rebellion is crushed by Mehmed I.
- 1418 Le Loi begins a Vietnamese independence movement in the Red River basin against the Chinese.
- 1419 In Portugal, Prince Henry begins to support voyages of exploration down the coast of West Africa.
- Sejong becomes the king of Korea. His reign, which lasts until 1450, is known for cultural achievement, development of a phonetic alphabet, and reduction of the power of the Buddhists.
- 1420 The Duchy of Burgundy supports Henry V as king of France. The southern part of the kingdom remains loyal to the heir of Charles the Mad.
- 1421 Murad II becomes the Ottoman sultan.
- China establishes its capital at Beijing.
- 1422 Indian Bahami Shihāb-ud-Dīn Ahmad I becomes sultan of the Deccan and expands

- the territorial holdings of his country during his reign, which lasts until 1436.
- 1423 Mongol leader Aruqtaï, chief of the As, declares himself khan of the Mongols and attacks North China.
- 1425 The lands and rule of the Mentese Dynasty of the Mugla-Milas region of southwestern Anatolia are annexed by the Ottomans.
- 1427 In Florence, a census is undertaken of all the population, and an income tax is introduced.
- 1428 Joan of Arc's visions begin to play a vital role in French opposition to English occupation.
- Aztec ruler Itzcóatl begins his reign, which lasts until 1440.
- 1429 Charles VII is crowned King of France with Joan of Arc at his side.
- 1430 Philip the Good of Burgundy founds the Order of the Golden Fleece on the occasion of his marriage. The order's aims are to defend the code of chivalry and the church.
- 1431 Joan of Arc is burned at the stake after being captured by Burgundian forces and sold to the English.
- 1432 The Kara Koyunlu destroy remnants of the Jalayirid dynasty of Iraq, which had fled to areas around Basra.
- 1435 Chu Ch'i-chen, son of Chu Chan-chi, begins his rule of China.
- 1438 In France, the Pragmatic Sanction of Bourges limits the rights of the pope in that country.
- Pachacuti begins his 33-year reign, expanding and reorganizing the social and political system of the Inca Empire. His domain stretches from present-day Ecuador to southern Peru.
- 1440 The Praquerie, a rebellion of nobles against the French king, fails in France.
- Venice and Florence combine to defeat the Duchy of Milan.
- Aztec ruler Montezuma I begins his reign, which lasts until 1469. He extends the control of his people over what will become known as Mexico.
- 1442 The Portuguese begin trading in Berber slaves they capture in North Africa.
- 1444 The Ottomans, led by Murad II, who had been coaxed out of retirement from public life, defeat Christian Hungarians, led by János Hunyadi, at Varna.
- 1446 A revolt of the Janissaries, who opposed a planned attack on Constantinople, calls Murad II back to Edirne from a second retirement because of the weakness of his fourteen-year-old son Mehmet's rule.
- 1447 Tartar prince Ulugh Beg becomes ruler of Turkestan. His short reign, which lasts until 1449, marks the transition of Central Asia, as after his death the Timurid Empire breaks up.
- 1450 The French defeat English forces at the Battle of Formigny, paving the way for France to reclaim its possessions in Normandy.
- 1451 Ottoman sultan Mehmed II (Mehmed the Conqueror) succeeds his father, Murad II. He is considered the true founder of the Ottoman Empire.
- Afghan king Bahlul Lodī begins his reign, initiating the Lodī dynasty.
- 1453 Constantinople falls to the Turks and is renamed Istanbul.
- The English are defeated in the Hundred Years' War and withdraw from France.
- 1454 The Greek Orthodox Patriarchate is restored to Istanbul by Mehmed, who also allows a Jewish rabbi and Armenian patriarch into the city.
- 1455 Johann Gutenberg von Mainz perfects the first press with movable type and prints the first book, the Bible.

- The War of the Roses breaks out between the Houses of York and Lancaster in England.
- 1456 Tun Perak, the chief minister of Malacca, leads his forces to a victory over the invading Siamese.
- 1457 Chu Ch'i-chen returns as emperor of China, remaining on the throne until his death in 1464.
- 1458 Herāt, an ancient town on the trade route through Afghanistan, is captured by Jahān Shān of Azerbaijan.
- 1460 The Portuguese prince Henry the Navigator, supporter of that country's explorations, dies.
- Le Thanh Tong becomes ruler of Vietnam. He institutes Chinese-style government, develops an efficient provincial system, employs centrally appointed officials, institutes new taxes, and promotes education.
- 1462 The Portuguese found a colony on the Cape Verde Islands.
- In Russia, Ivan III assumes the title of Grand Prince of Moscow. He will be a strong ruler committed to expelling foreign influences in the country.
- 1464 Sonni 'Alī (Alī the Great) becomes king of Gao and Songhai, beginning an expansion of territory that leads to the development of the Songhai Empire.
- 1468 Mengli Giray begins nearly half a century of rule as Khan of the Crimean Tartars.
- Sonni 'Alī drives the Tuaregs out of Timbuktu.
- 1469 The two Medici brothers, Lorenzo the Magnificent and Giuliano, assume control of government in Florence.
- 1471 The conquest of Champa by Le Thanh Tong, who establishes military colonies in the southern parts of Vietnam, is completed. This victory allows the Vietnamese the freedom to take border areas from the Cambodians.
- Topa Inca Yupanqui, son of Pachacuti, assumes the Incan throne.
- 1472 Chinese Ming philosopher Wang Yang-ming is born. Trained as a Taoist, he brings new interpretations to Confucianism, advocating the philosophy of subjectivism. He serves as a governor and war minister in the Chinese government.
- 1474 Isabel of Castile seizes the throne of her native kingdom from her sister. As ruler of Castile, Isabel is also married to Ferdinand of Aragon. Their union begins the process of forging a united Spanish kingdom in Iberia.
- 1476 Japanese painter and art critic Nōami compiles a catalogue of Chinese artists, titled the *Kundaikan sayu*.
- 1478 The Pazzi Conspiracy at Florence fails. The conspiracy had been planned by enemies of the Medici and was timed to occur during a Mass in Florence's Cathedral. One of the Medici brothers, Giuliano, is killed, but Lorenzo survives and puts down the plot by executing a number of conspirators and their supporters, including Florence's bishop. These executions cause disputes between Florence and the papacy that last for several years.
- 1479 The Spanish claim the Canary Islands.
- 1481 Sultan Mehmed II dies, possibly from poisoning, and is replaced by his elder son Bayezid II, despite the dead leader's wish that his favorite son, Cem, get the throne. Cem attempts a revolt, but is defeated and exiled to Rhodes. Bayezid rules until 1512.
- 1482 The Portuguese begin to develop trade links with the African state of the Congo.
- The mouth of the Congo River is located by Portuguese navigator Diogo Cão, who soon finds the Kongo people. Trade be-

- tween Kongo and Portugal commences, and the Kongo people become Christianized and Europeanized.
- 1483 Bābur (Zahīrud-Din Muhammad), founder of the Mughal dynasty in India and its first emperor, is born. He rules until 1530.
- 1485 King Richard III is killed at the Battle of Bosworth Field, and the Earl of Richmond, his attacker, assumes the throne of England as Henry VII. Henry thus establishes the Tudor dynasty that will last until 1603.
- Saluva Narasimha begins a new dynasty in India, opening ports on the west coast to trade, revitalizing the army, and establishing centralized rule.
- 1486 Japanese poet Ike Sōgi, a Buddhist monk and master of linked verse, writes *Minase Sangin Hyakuin*.
- 1487 The Fugger family of Augsburg founds an international banking empire that soon competes successfully against the Medici Bank.
- The Court of Star Chamber is established in England to hear cases against the nobility in secret.
- Chu Chien-shen's son Chu Yu-t'ang begins his rule, a mostly peaceful reign, of China. He controls the throne until his death in 1505.
- 1488 King Trailok dies and is replaced by his son and deputy Boromaraja III, who leads the Thais for only three years.
- The True Pure Land Sect in northern Japan rebels against a local lord and kills him, leading to a series of uprisings by this group.
- 1492 Columbus sails west in hopes of finding a route to India. Instead, he discovers the Caribbean.
- The Jews are expelled from Spain.
- 1494 The Treaty of Tordesillas is signed between Spain and Portugal. It establishes a line approximately 1,200 leagues west of the Cape Verde Islands. Portugal is to be allowed to colonize east of the line in modern Brazil and Africa, while Spain is to control the area west of the marker.
- France invades Italy, touching off the "Italian Wars" that will last intermittently until 1559 and produce a bitter rivalry between the Hapsburgs and the French Valois for territory in the peninsula.
- 1497 The Italian explorer John Cabot sets sail on a voyage underwritten by King Henry VII of England. His intentions are to find a route to India, but he finds lands in modern Labrador and Newfoundland instead.
- 1498 The Portuguese explorer Vasco da Gama discovers a route to India by sailing around the Cape of Good Hope in Africa.
- 1499 War between Venice and the Ottoman Turks begins, and a Venetian fleet is defeated in the same year.
- Switzerland's independence from the Holy Roman Empire is recognized.
- c. 1500 The Aztec empire has by this date grown into a vast and powerful force in Central America.
- The Portuguese explorer Pedro Alvares Cabral claims Brazil for his king.
- For approximately forty years, two queens, Rafohy and Rangita, successively rule the island nation of Imerinanjaka, located on Madagascar.
- 1501 The French conquer the kingdom of Naples.
- The enslavement of Africans is introduced into the West Indies to replace the rapidly dying off Native American population, which had been pressed into service. Nicolás de Ovando of Hispaniola imports some Spanish-born blacks for the purpose of using them as slaves.

- 1505 Emperor Chu Yu-t'ang dies, leaving the throne in the hands of his son, Chu Hou-chao, whose reign is marked with rampant corruption, dominance by the eunuchs, and internal strife.
- Ozolua (the Conqueror) dies after a twenty-three year reign as king of Benin (Nigeria). He expanded the size of his kingdom and traded with the Portuguese.
- 1506 The king of the African Kongo, Alfonso I, converts to Christianity.
- 1507 Martin Waldseemüller publishes his imposing atlas, *Cosmographie Introductio*, naming the continents of the Western Hemisphere "America," after the Italian navigator, Amerigo Vespucci.
- 1509 An Arab-Egyptian fleet is destroyed off Diu (northwest of Bombay, India) by a Portuguese navy led by Francisco de Almeida, who had established forts along the Indian coast.
- 1510 The Portuguese establish trading colonies at Calcutta and Gao in India, thus establishing their powerful position in the European spice trade.
- 1512 Selim I (the Grim) becomes sultan upon the abdication of his father, Bayezid II. He doubles Ottoman territory, moves the capital to Istanbul, brings the Arab world into the Ottoman Empire, and becomes an Islamic caliph (or protector) of the Sunni Muslims. He rules until 1520.
- Afonso I of Kongo signs a treaty with Manuel I of Portugal.
- 1513 The Spanish explorer Balboa crosses Panama, discovering the Pacific Ocean.
- 1515 The Turks capture Anatolia and Kurdistan.
- 1516 King Ferdinand of Aragon dies in Spain, and Charles I assumes the throne.
- Ang Chan becomes the king of Cambodia, resists Thai dominance, and rules until 1566.
- Syria is annexed by the Ottoman Empire.
- 1517 Martin Luther's 95 Theses begins to excite controversy in Germany.
- Spain allows the importation of slaves from Africa in its New World colonies.
- 1519 The Spanish conquistador Cortés conquers Mexico, making the once powerful ruler Montezuma into a puppet.
- Charles I of Spain is elected Holy Roman Emperor. Charles now controls a vast empire that includes Spain, the New World, the Netherlands, Austria, and parts of Italy.
- 1520 Cuauhtémoc becomes the last emperor of the Aztecs, but is hanged in 1522 by Cortés.
- Babur invades northern India.
- Photsarath becomes ruler of Lan Chang (Laos), builds monasteries and temples, and promotes Buddhism. He rules until 1547.
- 1521 After a short revolt, the Aztec capital Tenochtitlan falls to the Spanish.
- Magellan is the first European to sight one of the Polynesian Islands, that of Pukapuka.
- 1522 Ferdinand Magellan completes his circumnavigation of the globe.
- 1526 The Muslim Moguls, rulers of an empire centered at Kabul (in modern Afghanistan), invade India, subduing a large part of the subcontinent.
- The Turks defeat Hungarian forces at the Battle of Mohács.
- 1527 Imperial forces of Charles V sack Rome and take the pope hostage.
- Somali chieftan Ahmed Gran, a Moslem, invades Ethiopia.
- 1529 Spain names Mexico City, built on the site of the former Tenochtitlán, capital of the viceroyalty of New Spain.

- The Turks attack the city of Vienna in Austria.
- 1530 Atahualpa assumed the throne of the Incan Empire in Peru.
- 1531 Tabinshweti becomes the king of Burma.
- 1533 Francisco Pizarro conquers Cuzco, capital of Peru, and secures a large quantity of gold from the former empire.
- Four-year-old Prince Ratsadatiratkumar becomes ruler of Siam, but is killed by his half brother Prince Prajai.
- 1534 The French explorer Jacques Cartier sails to the Gulf of St. Lawrence in modern Canada.
- 1535 The first printing press in the Western Hemisphere is established in the colony of Mexico.
- 1536 The Spaniard Pedro de Mendoza leads an expedition into modern Argentina.
- 1537 A period of peace and stability in China begins with the ascension to the throne of Chu Tsai-kou, son of Chu Hou-tsung.
- 1539 In Ghent in the Low Countries, a revolt begins against the rule of the emperor Charles V. It fails, but Charles stations a permanent garrison of troops in the city.
- Tabinshweti conquers the kingdom of Pegu (Myanmar).
- 1543 Portuguese naval ships arrive in Japan, the first time Europeans visit these islands.
- The English perfect the iron cannon, a weapon that is stronger and cheaper to produce than those made out of bronze.
- Altan Khan becomes chief of the eastern Mongols. His army breaches the Great Wall of China in 1550.
- 1544 The city of Lima is named the capital of the Spanish province of Peru.
- Hindu religious reformer Dādu, founder of the Dādupanthīs sect, is born.
- 1545 Spanish conquistadors discover a large lode of silver at Potosi in modern Bolivia.
- 1548 Sinan, considered the greatest Ottoman architect, builds the Sehzade Mosque in Istanbul. He is credited with designing more than three hundred buildings.
- 1549 Spanish missionary Francis Xavier, who helped found the Jesuit Order and preached in Gao and India, arrives in Kagoshima, Japan, where he works for two years. He returns to India in 1551 and dies on Sancian Island.
- 1550 Jón Arason, a prelate of Iceland who resists the expansion of Lutheranism into his country, is beheaded.
- Arab traveler Leo Africanus's *Descrittione dell' Africa*, the only source of information on the Sudan, is published.
- 1555 The Peace of Augsburg in Germany resolves religious tensions between Protestants and Catholics and establishes the principle, "He who rules, his religion," a settlement that will hold until 1618 when hostilities once again break out between the two factions. At the end of that conflict, the so-called Thirty Years' War in 1648, the principles of the Peace of Augsburg ("He who rules, his religion") are reiterated.
- Turkish poet Bâkî gains the favor of Sultan Süleyman I, helping to revitalize lyric poetry in Turkey.
- 1556 Abu-ul-Fath Jalāl-ud Din Muhammad Akbar (Akbar the Great) becomes the Mughal emperor of India. He reigns until 1605, conquers most of India, and promotes reforms, learning, and art.
- 1557 Spanish troops defeat the French at the Battle of Saint-Quentin, forcing them to abandon Italy.
- Shaybanid ruler 'Abd Allāh ibn Iskandar conquers Bukhara in Central Asia, as well as several regional kingdoms, and attacks Persia (1593–1594, 1595–1596).

- 1559 King Henri II of France dies as a result of a wound he received in a jousting tournament.
- The Treaty of Cateau-Cambrésis ends hostilities between France and Spain and allows the latter to remain dominant in the peninsula.
- 1562 The Wars of Religion between Protestants and Catholics commence in France. They will last until 1598.
- A cargo of African slaves is deposited in Hispaniola by Englishman John Hawkins, the first of three such voyages, initiating English participation in the trade.
- 1563 Burmese king Bayinnaung invades Siam, assaulting the capital of Ayutthaya.
- 1564 England surrenders its claim to the port of Calais.
- 1566 Selim II becomes sultan of the Ottoman Empire.
- 1568 The Azuchi-Momoyama period begins in Japan, an era of unification under military rule that lasts until the turn of the century.
- 1569 The Flemish mapmaker Gerardus Mercator perfects the Mercator Projection map.
- c. 1570 The Iroquois League is established between various tribes of Oneida, Mohawks, Onondaga, Cayuga, and Seneca in the modern northeastern United States and Canada.
- 1571 Forces of Venice and Spain combine to produce a navy of about 200 ships. They capture an Ottoman navy at the Battle of Lepanto, thus stopping for a time the advance of the Turks into the Mediterranean.
- The Spanish conquer the Philippine Islands.
- The Ottomans capture Cyprus.
- Safavid philosopher-author Mullah Sadra is born; he will lead the Iranian cultural renaissance into the early seventeenth century.
- 1572 The Dutch declare their independence from Spain, thus precipitating a long conflict between the two countries.
- 1574 Murad III, the son of Selim II, becomes the sultan of the Ottomans.
- Rās Dās becomes the fourth Sikh Guru and founds Amritsar (in Punjab, India).
- Hindu poet Tulsīdās writes *Rāmcaritmānas* (Lake of the Acts of Rama), one of the greatest Hindi literary works.
- The Spanish are pushed out of Tunis by the Turks. While the Spanish are losing in Tunis, they are establishing a settlement in Angola.
- 1576 In an attempt to destroy a rebellion in the Netherlands, Spanish forces advance on Antwerp. There they wreak devastation on the city when Spain is unable to pay them.
- 1578 The Jesuit missionary Matteo Ricci journeys to China and works to promote Christianity. In 1601, he founds a mission in Beijing.
- 1580 Chinese dramatist Liang Ch'en-yü, whose K'un-shan style of singing dominates Chinese theater for nearly three centuries, dies.
- 1581 King Bhueng Noreng of Burma, who had conquered the Thais, is succeeded by his son Nanda Bhueng.
- 1582 Pope Gregory XIII establishes the Gregorian Calendar in place of the older Julian styled one that had been used in Europe since the first century C.E. It will be adopted in Portugal, Germany, and Spain the following year.
- 1584 Queen Elizabeth I authorizes Sir Walter Raleigh to undertake an expedition to the New World. The colony that Raleigh establishes at Roanoke Island fails the fol-

- lowing year, and another settlement will fail in 1587.
- 1586 Japanese dancer Izumo Okuni, considered the founder of Kabuki, begins performing works inspired by Buddhist prayers.
- 1587 An expedition of Spaniards visits Japan. The Inquisition is established in Portugal.
- 1588 Elizabeth I's navy defeats the Spanish Armada after a storm comes to the aid of her forces. More than half the Spanish navy is destroyed in the conflict.
- Abbās I (Abbas the Great), the son of Shāh Soltān Mohammad, begins his reign in Persia. He rules the empire, defeating the Uzbeks and Ottoman Turks and regaining Persian lands, until 1629.
- 1589 King Henri III of France is assassinated by a monk, thus paving the way for the Protestant Henri of Navarre to come to the throne as Henri IV. Civil war again breaks out in France.
- 1590 Japan, including the islands of Shikoku and Kyushu, is united under the leadership of Hideyoshi Toyotomi. He brings peace and infrastructural improvements, and will lead his nation (though he relinquishes his official title), until his death in 1598.
- 1591 The kingdom of Aragon rebels against King Philip II of Spain.
- 1592 Ming troops defending Korea battle Hideyoshi's Japanese army in its unsuccessful attempt to capture the country.
- 1593 Henri IV renounces his Protestant faith, and is crowned the following year as King of France.
- 1596 Mexican historian Agustin Dávila Padilla publishes *Historia de la fundación de la provincial de Santiago de México de la Orden de predicadores*.
- 1597 Hugh O'Neill leads an uprising against the English in Ulster; Irish forces will eventually be reinforced by Spanish armies, but the uprising will be finally subdued in 1603.
- 1598 Henri IV of France promulgates the Edict of Nantes, granting a limited degree of toleration to French Protestants. King Philip II of Spain dies.
- Abbās I defeats the Uzbeks near Herāt.
- Trade between Ayutthaya and Spain begins.
- 1599 Manchurian chief Nurhachi begins conquering the Juchen tribes in his quest to unite the Manchu, which will become the Ch'ing dynasty starting in 1644.
- 1600 The East India Company is founded to regulate England's trade with India.

## IMPORTANT EVENTS *in Architecture and Design*

- c. 1300 Work begins on the Cathedral of Florence. When completed, the building will be the largest church in Europe.
- 1334 The painter Giotto is appointed to oversee the construction of Florence's cathedral.
- c. 1350 Work is temporarily halted on the cathedral at Florence. It soon resumes and during the 1350s the structure's bell tower or campanile is completed.
- 1377 The future founder of the early Renaissance style in architecture, Filippo Brunelleschi, is born.
- 1401 The competition to create new doors for the Baptistery of Florence's cathedral is announced.
- c. 1420 In Florence, Brunelleschi designs the orphanage known as the *Ospedale degli Innocenti*, the Church of San Lorenzo, and the dome of the cathedral.
- 1433 The Pazzi Chapel, one of Brunelleschi's important masterpieces, is begun.
- 1434 The humanist architect Leon Battista Alberti arrives in Florence.
- 1436 The dome of Florence's cathedral is completed.
- c. 1443 Giuliano da Sangallo, the first of a dynasty of Florentine architects, is born.
- 1445 The Medici Palace, designed by Michelozzo di Bartolommeo, is begun at Florence.
- Bernardo Rossellino designs a classically-styled tomb for the Florentine chancellor Leonardo Bruni.
- 1447 The humanist Tommaso Parentucelli is elected pope and takes the name Nicholas V. Nicholas will support public works and construction projects in Rome during his eight-year pontificate.
- c. 1450 The humanist Alberti writes his *Ten Books on Architecture*, a work that is influenced by the ancient Roman architect Vitruvius. Around this time he also designs at Rimini the Malatesta Temple for the tyrant Sigismondo Malatesta.
- c. 1455 Alberti plans several important buildings in Florence that will be imitated by other architects over the coming decades.
- 1458 The Pitti Palace is begun at Florence.
- 1459 Pope Pius II commissions Bernardo Rossellino, a follower of Alberti, to redesign the core of the city of Pienza.
- c. 1460 A great age of palace building begins in Florence. The wealthiest families of the town try to outdo each other to build the most sumptuous family residence.
- c. 1465 Federigo da Montefeltro commissions Luciano Laurana to design a classical courtyard in his palace at Urbino.
- 1470 Alberti designs the Church of Sant'Andrea in Mantua.
- c. 1475 The artist Piero della Francesca paints his *Vision of an Ideal City*.
- 1481 Leonardo da Vinci leaves Florence to work in Milan. There he serves the dukes of Milan for almost twenty years, undertaking the design of many important military and civil engineering projects.
- 1484 Francesco di Giorgio designs the Church of Santa Maria del Calcinaiò at Cortona.
- 1499 The architect Donato Bramante is forced to flee Milan after French forces capture the city. He travels to Rome where Popes

- Alexander VI and Julius II will keep him busy designing many projects.
- 1502 Bramante designs the little *Tempietto* for King Ferdinand and Queen Isabella of Spain. When eventually built, the small domed structure will commemorate the site where, according to legend, St. Peter was crucified, as well as influence many later designers.
- 1505 Michelangelo completes his first plans for Julius II's massive tomb.
- 1506 Pope Julius II orders the original St. Peter's Basilica demolished at Rome, and Bramante designs its replacement as a central-style church in which all the radiating wings will be of the same size.
- 1508 The central-style Church of Santa Maria della Consolazione is begun at Todi. The popularity of this style derives, in part, from the vogue for Renaissance neoplatonism.
- Andrea Palladio is born.
- c. 1510 Bramante designs the facade for Palazzo Caprini in Rome.
- c. 1515 The painter Raphael designs the pleasure palace called Villa Madama at Rome. A great age of palace building commences within the city, as the town's major families and important church officials compete against one another to build ever more imposing structures.
- 1519 Michelangelo designs the New Sacristy at the Church of San Lorenzo in Florence.
- The Château de Chambord is begun in France.
- c. 1520 Antonio da Sangallo, younger brother of Giuliano da Sangallo, receives the commissions for a number of important churches and urban palaces in Florence and Central Italy.
- 1524 The Laurentian Library, designed by Michelangelo, is begun at Florence.
- 1527 The Mannerist Palazzo del Te, designed by Giulio Romano, is begun near Mantua.
- Rome is sacked by forces of the imperial armies of Charles V.
- 1528 The royal palace of Fontainebleau is begun in France.
- 1532 The High Renaissance architect Baldassare Peruzzi designs the Palace of the Monumental Columns at Rome, a work that is influenced by the developing taste for Mannerism in architecture.
- c. 1535 Jacopo Sansovino plans classical buildings to house Venice's mint and the Library of San Marco.
- 1538 Michelangelo's Campidoglio, a complex of public buildings on the Capitoline Hill in Rome, is begun.
- 1546 The Renaissance-styled Square Court of the Louvre, designed by Pierre Lescot and Jean Goujon, is begun.
- c. 1550 Andrea Palladio designs a number of important palaces and churches in and around the cities of Vicenza and Venice.
- 1556 A classical facade is begun for part of the Heidelberg castle in Germany.
- c. 1560 Giorgio Vasari designs the Mannerist-styled Uffizi Palace in Florence, home of the future famous gallery of paintings.
- 1563 The Escorial, a royal palace and monastery combined in the same complex, is begun outside Madrid in Spain.
- c. 1575 Il Gesù, the church of the Jesuit order in Rome, is begun. The design will be widely imitated in Jesuit churches throughout Europe.
- 1580 Andrea Palladio dies. His last important design is for the Olympian Theater at Vicenza.
- Wollaton Hall is begun in England.
- 1583 The Renaissance-styled St. Michael's Church is begun at Munich.

## OVERVIEW *of Architecture and Design*

**TRADITION AND CHANGE.** In 1300 most Europeans lived in cities that resembled fortresses more than the spaces modern people would associate with urban life. Long-standing warfare and insecurity in medieval Europe had caused people to huddle together closely within the confines of towns protected by walls and battlements. Inside these fortifications, functional houses and tenements crafted from rustic stone, timber, or brick were built close to the street, choking out light and the flow of air from above. Poor or inadequate sanitation was usually the norm, and smoke from family hearths filled the cities. The largest public buildings in a medieval city were almost always churches, and around 1300, the Gothic style—notable for its height and intricate complexity—dominated their construction. These buildings, the largest architectural monuments of the Middle Ages, were not only centers of worship and Christian ritual, but also objects of local civic pride, and towns avidly competed to outdo each other in their construction. Three hundred years later the situation had changed dramatically in many places, as Renaissance Europeans built churches, public buildings, broad squares, and urban palaces that expressed new and strikingly different attitudes towards urban space and design. In creating these projects architects found inspiration in the buildings of classical Antiquity. The revival of knowledge about ancient styles, proportions, and construction techniques deepened tremendously during the Renaissance as architects studied the buildings and urban spaces of ancient Rome more systematically than before. The birthplace of this revolution in architecture was Italy, and as in many other areas of Renaissance life, it was in Florence that the new classicism first developed. There the new projects that architects built in the early fifteenth century made use of the language of classical Roman architecture, while developing a native style that would be imitated elsewhere. As the fifteenth century progressed, architectural innovations appeared in a number of other cities throughout the peninsula.

**THE HIGH RENAISSANCE.** By 1500, Italy's architects, drawn mostly from the guilds of sculptors and carpenters in the cities, had achieved a remarkable mastery of the elements of ancient design. They had used ancient inspiration to create buildings that functioned well under the quite different circumstances of life in Renaissance cities. During the first quarter of the sixteenth century, architecture, like painting and sculpture, underwent another rapid transformation. This period, known as the High Renaissance, saw painters like Leonardo da Vinci, Donato Bramante, Raphael Sanzio, and Michelangelo Buonarroti entering into the planning of buildings with increasing frequency. As painters trained in the Florentine tradition of *disegno*, that is, draftsmanlike design, each brought with them a new sophistication about the use of light, line, and mass in the construction of buildings. Although natives of Tuscany and central Italian towns, each of these figures worked in Rome at different points in their careers, and that city benefited from the construction of most of the grand projects of the High Renaissance. This style was notable for its great simplicity, harmonious proportions, and unified design. Julius II, the commanding "Warrior Pope," employed Michelangelo, Bramante, and Raphael, among many other artists, to fashion his grand rebuilding and renewal projects in the church's capital. By far the greatest of the pope's ambitions was his plan to demolish and rebuild the ancient Basilica of St. Peter's, a building originally constructed by the emperor Constantine in the fourth century. The scale of this project was unprecedented in European history, and in Bramante, Julius found an architect whose designs were equal to his goals. Bramante designed the new structure to be a central-style church that radiated from a commanding dome. Like many of the projects that Julius began, however, the rebuilding of St. Peter's was too immense to be completed in a single lifetime. The pope accepted Bramante's designs and had his workmen begin the demolition of Constantine's basilica. He also ensured that the central piers that were to support Bramante's dome were begun before his death in 1513. Thus Julius laid down the proportions for a truly grand structure that later consumed the energies and creativity of the finest artists and architects of the sixteenth and seventeenth centuries. The High Renaissance in Rome was also a time of creative and often frenzied building projects undertaken throughout the city. In domestic architecture, Bramante, Raphael, and others created new edifices notable for the complete integration of classical decoration as well as their harmonious beauty. Toward the end of the period the sculptor-painter Michelangelo began to turn to architecture as well, applying the skills that he had acquired

in the planning and execution of Julius II's massive tomb project. During the 1510s he returned to Florence, where he designed several projects for the Medici family. Increasingly these designs took on a willful nature, that is, Michelangelo violated certain tenets of classical design in order to create structures of greater imaginative creativity. In his Laurentian Library at Florence, in particular, the artist created spaces that inspired later Mannerist architects to search for new and innovative ways to use space and decoration.

**THE LATER RENAISSANCE IN ITALY.** Rome had been the great stage on which High Renaissance architects had designed their new monumental and heroic structures. It had been Julius II's aim, and that of his successors Leo X and Clement VII, to remake the city into an imposing showpiece that celebrated Rome as the very center of the Christian world. Even as this monumental rebuilding of the city was underway in the High Renaissance, Rome's position on the international political scene grew more precarious. In 1527, the great period of creative activity in the city came to an abrupt halt with the Sack of Rome carried out by imperial forces of Charles V. Almost all of the artists and architects who had been active in the High Renaissance fled to work in other cities, carrying with them the skills they had acquired while working in the church's capital. During the 1530s and 1540s Rome experienced a slow recovery from the massive destruction and psychological distresses the Sack had caused. Construction resumed on the new St. Peter's, but not until the 1560s was the building of another large church, the Gesù, begun. During the brief pontificate of Sixtus V (r. 1585–1589) Rome again became a great center of architectural and artistic endeavors. Like Julius before him, Sixtus employed an army of designers, painters, and sculptors to beautify the city. He brought new sources of public water to the town; forged broad, straight avenues through Rome's ancient maze of streets; and built public spaces with attractive architectural focal points. Rome became a model for urban planning and renewal that would be imitated throughout Europe in subsequent centuries. Elsewhere in Italy the sixteenth century was a time of great architectural vitality. In Florence, the Mannerist painters and designers of the mid- and late century created new projects characterized by a style of intricate complexity and repetition. Many of the city's artists worked for the Medici, who now ruled the city as dukes. For inspiration, these figures turned to the architectural works of Michelangelo at the Church of San Lorenzo, notable for its willful violations of classical design tenets. Their projects inspired other designers in Rome and central Italian cities, although their influence rarely spread

into the world of northern Italy and Venice. Here a refined and elegant classicism, best articulated in the architecture of figures like Jacopo Sansovino and Andrea Palladio, continued to dominate both public and private construction. This classicism, characterized by a greater lightness and delicacy and balanced symmetry, was eventually widely imitated throughout Europe, but most notably in England during the seventeenth and eighteenth centuries. Palladio's illustrated architectural treatises even influenced American architecture such as the graceful structures that Thomas Jefferson and other colonials designed for the new Republic.

**THE ARCHITECTURAL RENAISSANCE THROUGHOUT EUROPE.** Around 1500, European architecture outside Italy remained traditional. The first buildings inspired by the Renaissance of architectural design occurring in Italy were not in Western Europe, but at the continent's eastern fringes. In the second half of the fifteenth century King Matthias Corvinus encouraged the development of humanism in Hungary, and brought to his kingdom a small group of Italian artists and architects to remodel his castles and to build several new projects. In Russia, Grand Prince Ivan III did likewise when he lured a group of Italian craftsmen and architects to Moscow to beautify the Kremlin complex. In Western Europe the spread of humanism similarly encouraged patrons and designers to adopt elements of Renaissance classicism, but this process of integration occurred slowly throughout the sixteenth century. In Western Europe, Spain was among the earliest places to show signs of a classically influenced architectural Renaissance. In Northern European countries, building in the early sixteenth century usually proceeded along late-Gothic lines. In its late phase, Gothic architecture embraced a highly ornate and decorative style, with highly elaborate piers and vaulted ceilings being among its most distinctive elements. As the Renaissance affected styles throughout the region, Northern Europeans often borrowed ancient decorative elements to create highly ornate decorations that were more Gothic than Renaissance in their overall effect. The presence of Italian architects and painters in France, Germany, and Spain, as well as the journeys of craftsmen to Italy, gradually helped to develop a more complete understanding of classical architecture, its design elements, and its uses, as did the spread of architectural treatises written by Italians like Serlio, Palladio, and Vignola. These works, with their engraved illustrations, deepened the appreciation of classicism among European architects working outside Italy. One notable holdout, though, was England, where a native style of Gothic architecture continued to be popular throughout

much of the sixteenth century, with very few attempts at Renaissance classicism. In most of Northern Europe, a shift in the type of building was also evident. In France, the Netherlands, and England, religious controversy between Catholics and Protestants had a dampening effect on the building of new churches in the sixteenth century. At the same time the era was one of great achievement in the building of royal palaces, country châteaux, and public buildings. These structures illustrate the gradual appropriation of Renaissance classicism that occurred throughout the region. At the beginning of the century most projects continued to be built in native and traditional styles with classical and Gothic elements appearing on the same structure. As the sixteenth century progressed, a new sophistication and rigor developed in the uses of ancient design, sponsored by changing tastes, a deepening knowledge of antique architecture, and the spread of humanistic ideas. By 1600, all Western European countries, with the exception of England, had developed vigorous new patterns of building that combined native traditions with Renaissance classicism. These edifices played an important role in expressing the power of the church and state, even as they expressed a new longing for balance, harmony, and order.

## TOPICS *in Architecture and Design*

---

### THE BIRTH OF THE RENAISSANCE STYLE

**ENVIRONMENT.** The development of a uniquely Renaissance style centered on the city of Florence, the town often called the “birthplace of the Renaissance.” While the citizens of Florence did not single-handedly create the revival of culture and learning that occurred in Europe during the period, they did nevertheless pioneer new architectural styles imitated first in Italy and later abroad. This revival was evident to visitors to the city in the fifteenth century, as they saw the town’s urban fabric being transformed through the building of a host of new architectural monuments, most of them created in a style that imitated the buildings of Antiquity. During this period the building of Renaissance Florence was a significant industry, and one whose foundations can be traced to the peculiar circumstances of the town’s history in the later Middle Ages and early Renaissance.

**POPULATION.** During the thirteenth and early fourteenth centuries Florence’s population expanded rapidly,

more rapidly than most European cities at the time. Around 1200, for example, the town was smaller than nearby Pisa. A little more than a century later in the time of Dante and Giotto, its numbers had increased at least fourfold. The city’s population was then probably around 90,000. Although small by modern standards, the city ranked among the largest in Europe. This great expansion created a building boom, beginning with the new walls constructed to defend the town. A new system of fortifications had been built around Florence in the late twelfth century, but a century later, another was already necessary. These new walls, begun around 1284, were not completed until the mid-fourteenth century. When complete, they increased by five times the area enclosed within the city’s fortifications. Such ambitious plans proved unnecessary, however. Between 1347 and 1351 the Black Death struck Florence hard, as it did other European cities at the time; Florence experienced a sudden and dramatic decline in its population as the disease moved quickly through densely packed streets and overcrowded dwellings. Florence’s population may have fallen by as much as one-half after the Black Death, and the city’s numbers remained depressed from their pre-plague levels in the late fourteenth and early fifteenth centuries, in part because of renewed outbreaks of the disease.

**CAPITALISM.** Although the Black Death produced sudden economic dislocation in Europe’s towns and countryside, it is more difficult to generalize about the epidemic’s long-term economic effects. The population decline affected Europe’s various industries differently. Activities that required a great deal of labor, for instance, tended to experience a rise in the real wages of their workers, since there were fewer laborers than before the Black Death. In many parts of Europe nobles and peasants converted their lands to pastoral purposes, raising sheep and other animals that required less manpower than other kinds of farming. The increase in the production of wool this transformation provided presented producers in towns like Florence with a steady source of cheap raw materials to refine into finished cloth. While many wealthy families had died out during the epidemics of the fourteenth century, those that survived now faced ideal circumstances in which to consolidate their control over the local economy. By 1400, all evidence suggests that an extraordinary amount of wealth had accumulated in the hands of Florence’s wealthy merchants, bankers, and industrial producers. Over the coming years a large part of this wealth funded the construction of buildings designed to glorify and immortalize the city’s most prominent families. As a result, the building trades wit-

nessed unprecedented expansion, as cities throughout Italy—but most particularly in Florence—devoted significant capital resources to construction.

**LURE OF ANTIQUITY.** Florence, like many Italian cities in the early fifteenth century, was a republic that had long been dominated by an oligarchy comprised of prominent families. During the fifteenth century the Medici family, in particular, increased its control over Florence's political structure, while at the same time upholding Florence's pretensions to being a republic. The town's control extended into the surrounding countryside, and during the fifteenth century Florence continued to conquer many neighboring towns in Tuscany, bringing them under its control. These conquests, which had been occurring for years, were now increasingly necessary to protect the town from the threat of outside invasion. Around 1400, Florence narrowly averted a major threat to its independence from the duchy of Milan when a sudden outbreak of plague struck the enemy's armies. A decade later another threat loomed, this time from the Kingdom of Naples to the south. Disease again prevented the town's conquest. In this situation of constant endangerment the image of the city as a David that stood up against the greater Goliaths of Italy became a potent symbol in the town's mythology. At the same time the town's humanist philosophers, artists, and architects were studying the antique worlds of Rome and Greece, finding a kinship with the urbane sophistication and republican values of Greek, Etruscan, and early Roman civilizations. In the decades after 1400 Florence's wealthy families surrounded themselves with the trappings of Antiquity, not only in their intellectual culture but in their art and architecture as well. While this taste for Antiquity was certainly a distinctive element of Florence's Renaissance, it was also at the time becoming a general phenomenon throughout Italy. Even in towns and cities ruled by despotic princes, rulers and ruled were coming to a deeper understanding and appreciation of the ancient world. In Florence, though, the revived classicism of Renaissance architecture played a vital role in expressing the values of independence, civic involvement, and local identity.

**MEDIEVAL PROJECTS.** Despite the falloff that had occurred in Florence's population as a result of the Black Death, many public building projects had continued in the fourteenth century unabated. Some of these projects were still under construction even as the new architecture of the Renaissance transformed the cityscape. Around 1300, the city's government had begun construction on a new town hall. Today known as the Palazzo Vecchio (or Old Palace, to distinguish it from

another civic complex dating from the sixteenth century), the building was constructed in a thoroughly medieval style, with heavily rusticated walls and a crenellated tower. Toward the end of the fourteenth century the town had also opened a new square outside this town hall by demolishing medieval houses that had stood at the site. Florence's governmental square was notable for its size and attractive shape, and although medieval in origin, the plaza displayed sculptural works by the town's most prominent artists throughout the Renaissance, a practice that has continued to the present day. A second major project of the fourteenth century, the town's grain market, began in 1336. When completed, the covered market of Orsanmichele was the most elaborate in Europe. Constructed in stone, the building was over 120 feet high and had two floors of vaulted space for merchants' sales. Even prior to the structure's completion, Florence's town fathers converted the building, allowing it to be used by the city's confraternities and guilds as a center for their charitable works and religious devotions. The decoration of the new religious complex consumed the energies of many Florentine artists and sculptors during the early Renaissance. Although their design was still medieval in nature, the scope of Orsanmichele and the Palazzo Vecchio went far beyond the scale of other projects built in Florence in previous centuries. They, in turn, were soon to be dwarfed by the building of the town's cathedral, the single largest project ever undertaken in the city and still one of the world's largest churches.

**CATHEDRAL.** Although work began on the Florence cathedral in 1296, it took over a century and a half to complete the mammoth structure. From the first, the cathedral's creators conceived it as a public monument, rather than an ecclesiastical project. The town's government and the local guilds, for instance, financed the church's construction, and Florence's archbishops had little say in how the structure was built. Over time the city's most powerful guild, the Arte de Lana or "wool-maker's guild," controlled the cathedral's construction, establishing a special Board of Works of the cathedral charged with supervising all matters concerning the building. This board appointed many of the city's famous artists and sculptors to decorate the project, including Giotto Bondone (c. 1277–1337), who has long been credited with designing the cathedral's graceful campanile or bell tower, to serve as the director of the work during the final years of his life. Most European cities with similar projects underway at the time of the Black Death abandoned or radically pared down their plans in the years following the epidemic. This was not

*a PRIMARY SOURCE document***MASTERING ANCIENT BUILDING PRACTICES**

**INTRODUCTION:** The Florentine scholar Antonio Manetti (1423–1491) was the first to write a life of the great early Renaissance architect Filippo Brunelleschi. In it, he lauds Brunelleschi for his innovation. The following excerpt from that biography describes the way in which the architect gained mastery over the process of building by examining the structures of ancient Rome.

Having perceived the great and difficult problems that had been solved in the Roman buildings, he was filled with no small desire to understand the methods they had adopted and with what tools [they had worked]. In the past he had made, for his pleasure, clocks and alarm clocks with various different types of springs put together from a variety of different contrivances. All or most of these springs and contrivances he had seen; which was a great help to him in imagining the various machines used for carrying, lifting, pulling, according to the occasions where he saw they had been necessary. He took notes or not, according to what he thought necessary. He saw some ruins, some still standing upright, and others which had been overthrown for various reasons. He studied the methods of centering the vaults and of other scaffolding, and also where one could do without them to save money and effort, and what method one would have to follow. Likewise, [he considered] cases where scaffolding cannot be used because the vault is too big and for various other reasons. He saw and considered

many beautiful things which from those antique times, when good masters lived, until now had not been utilized by any others, as far as we know. Because of his genius, by experimenting and familiarizing himself with those methods, he secretly and with much effort, time and diligent thought, under the pretense of doing other than he did, achieved complete mastery of them, as he afterwards proved in our city and elsewhere ...

During this period in Rome he was almost continually with the sculptor Donatello. From the beginning they were in agreement concerning matters of sculpture more particularly ... [but] Donatello never opened his eyes to architecture. Filippo never told him of his interest, either because he did not see any aptitude in Donatello or perhaps because he was himself not sure of his grasp, seeing his difficulties more clearly every moment. Nevertheless, together they made rough drawings of almost all the buildings in Rome and in many places in the environs, with the measurements of the width, length and height, so far as they were able to ascertain them by judgment. In many places they had excavations done in order to see the joinings of the parts of the buildings and their nature, and whether those parts were square, polygonal or perfectly round, circular or oval, or of some other shape ... The reason why none understood why they did this was that at that time no one gave any thought to the ancient method of building, nor had for hundred of years.

**SOURCE:** Antonio Manetti, *The Life of Filippo di Ser Brunellesco*, in *A Documentary History of Art*. Vol. I. Ed. Elizabeth G. Holt (New York: Doubleday Anchor, 1957): 177–178.

the case in Florence where construction continued on the cathedral despite the decline that occurred in the city's population after the Black Death. During the 1350s builders completed the structure's campanile, and soon after Florentines laid down the piers of the church's massive crossing, the area between the nave and the choir. The massive scale laid out for these piers committed Florence to the construction of a building of truly enormous size. For years the project continued, even though no one had any idea how the structure's crossing—more than 130 feet in diameter wide—was to be roofed over.

**BRUNELLESCHI'S DOME.** In the years after 1400 the architect Brunelleschi worked to solve this puzzle. Originally trained as a sculptor, Brunelleschi had been a finalist in a competition to create new doors for Florence's cathedral baptistery in 1401. The judges were unable to decide between Brunelleschi's and his competitor

Lorenzo Ghiberti's submissions, and awarded the commission to be shared by both. Brunelleschi, according to a long-standing legend, refused to accept this plan, and from this point onward he turned away from sculpture to devote himself to architecture. He traveled to Rome where he studied the buildings of the ancient world, measuring their proportions and analyzing their structural elements. By 1420, he had perfected his skills as an architect. His designs for a dome to complete the city's cathedral had been accepted and work began on his novel conception. The existing structure, a Gothic-styled cathedral, shaped Brunelleschi's plans for this work, and except for the lantern that sits atop the structure, there are few classical influences in the architect's dome. The ingenious solutions that Brunelleschi developed to cover this enormous space, though, point to his great skill as an engineer, skills that he would put to use later in a series of churches, chapels, and public buildings he designed in Florence. Brunelleschi directed the cathedral

project for a number of years, supervising work crews and resolving thorny issues of design and building on a daily basis. His solutions to the practical problems of building show the strongly inventive strain of his mind. One of the problems of constructing a dome of this magnitude proved to be the issue of scaffolding. It had been estimated that it might consume the wood from several forests to build a scaffold large enough to construct the structure's dome. Brunelleschi instead devised an innovative system in which the scaffolding positioned at the top of the dome's drum could be moved up as new sections of the structure were completed. He also created a device whereby building materials could be hoisted up to these scaffolds as needed, an invention that reduced the number of workmen needed to ferry materials. The dome's structural elements consisted of eight ribs that supported both an outer and inner skin. Patterned brickwork between the ribs added strength to the structure, allowing the two elements—the stone ribs and brickwork—to support the dome's interior skin. A series of buttresses arranged around the base or drum of the dome also gave further support to the entire project's mass. This solution allowed the structure to soar with commanding simplicity almost 40 stories over the skyline of Florence. Since its completion in 1436, Brunelleschi's dome has become the most famous and readily recognizable symbol of the city.

**OTHER PROJECTS.** As construction on Brunelleschi's dome reached completion, the city of Florence witnessed a building boom of unprecedented proportions. For the architect Brunelleschi, managing the cathedral project was a full-time job that required his presence on a day-to-day basis. Even though the demands of this work were considerable, Brunelleschi still found time to design a number of structures elsewhere in the city. These projects helped forge a distinctive Renaissance architectural style imitated by later architects. In these designs Brunelleschi put to even greater use the classical language he had learned from his study of ancient architecture in Rome. The architect's plans for the Ospedale degli Innocenti show the artist's first attempts to develop a complete style influenced by classical proportions and design elements. Founded in 1410, the Ospedale was a foundling hospital or orphanage—one of the first European institutions to deal with the problem of abandoned children. The design that Brunelleschi crafted for the institution's orphanage was similarly innovative. In it, he created an arcade of eleven slender columns that supported rounded Roman arches. One of the most significant things about the architecture the artist created here was its use of a geometrically regular system of propor-

tions. Each column, for instance, was as high as the width of the arch it supported and equal, too, to the distance between the outer colonnade and the interior wall. Brunelleschi made similar use of regular proportions throughout his plans, thus producing a work that was simple, elegant, and visually balanced. The only decorative elements he included in his original plans were the acanthus-leaved Corinthian capitals that crowned the colonnade's columns. Thus in contrast to the complexity of Gothic architecture being constructed at the time in most of Europe, his designs for the Ospedale were a model of restraint, clarity, and simplicity. A key feature of Brunelleschian architecture was its use of numerical relationships. On the building's façade the proportions he relied upon made use of the relationships one to two, one to five, and two to five. Brunelleschi repeated these same numerical relationships in the building's interiors. These numbers were not haphazardly chosen, but were religiously significant: one being the number associated with God the Father, two with Jesus Christ, and five with the number of wounds the Savior suffered during his crucifixion. Further, the multiple of two and five equals ten, the number of the Commandments, which were an important set of strictures used in raising the orphanage's children. In this way Brunelleschi's mathematical relationships, which were readily intelligible to the astute fifteenth-century observer, expressed certain underlying religious ideals, a feature of his architecture that became one of the hallmarks of Renaissance design. In both the fifteenth and sixteenth centuries architects would use numerical relationships, proportions, and shapes not only to create harmonious designs but to express underlying philosophical and religious truths.

**CHURCHES.** In a series of churches and chapels designed throughout Florence the architect perfected his new classical idiom. Work on Brunelleschi's plans for the Church of San Lorenzo commenced in 1421. The Medici family, which was rising to prominence at the time, financed much of the construction of this project, and their ties to the church remained strong throughout the fifteenth and sixteenth centuries. In his designs for San Lorenzo, Brunelleschi pioneered the first use of an architectural system of single-point perspective. Looking down the church from the high altar back to the end of the nave, the church's lines and columns are designed so that they diminish and converge at one point in the rear of the structure. In place of the mystery of a Gothic church, Brunelleschi here expressed an architectural system in which the interplay of light on simple refined surfaces recalled the grand interior spaces of ancient Rome. In place of the traditional Latin cross usually relied upon

The Pazzi Chapel, Church of Santa Croce in Florence, Italy, designed by Filippo Brunelleschi. © ANGELO HORNAK/CORBIS. REPRODUCED BY PERMISSION.

in Western church architecture, the architect substituted the T-shape of the ancient Roman basilica. On both sides of the nave, a colonnade of Corinthian columns supporting Roman arches sets off side aisles, in which the church's chapels are recessed again into Roman arches. Above these arches round windows known as *oculi* admit light into the space. Throughout the structure Brunelleschi restricted his use of materials to the gray stone known in Italy as *pietra serena* and white plaster. Although the resulting effect is severe, it is also rational, harmonious, and altogether appealing. The use of the two-tone palette of gray and white, found in Brunelleschi's earliest creations, became a long-standing feature of Tuscan design, surviving well into the nineteenth century. The architect perfected this new classical style of church architecture further in his plans for a new Church of Santo Spirito, a building that eventually replaced an older medieval structure on the spot. Here Brunelleschi

relied on a different set of proportional relationships to produce a structure that appears more massive and imposing than the lighter and more elegant San Lorenzo. In the case of both churches Brunelleschi planned to situate the structures within impressive piazzas that would serve as a focus for civic life. Unfortunately, neither design was executed in the way in which the artist had wished, although later architects studied his plans. Thus they had an indirect impact upon developing ideas about urban design in the Renaissance. For the Church of Santa Croce in Florence, Brunelleschi designed a third architectural masterpiece, the small Pazzi Chapel that is a free-standing structure on the church's grounds. In this building the contrast between the late-medieval architectural world and that of the developing Renaissance becomes even more evident. In contrast to the complexity and mystery of Gothic spaces, Brunelleschi's plans for the chapel are at once clear, graceful, and har-

monious. They give expression as well to the developing sensibilities of the humanist movement, with its emphasis on the notions of a universe filled with divinely inspired harmonies and proportions that could be understood by the human mind. At the Pazzi Chapel, the artist again relied on the color scheme he chose for Santo Spirito and San Lorenzo: cool gray and white. Yet within this space, touches of blue—from the terracotta medallions designed for the chapel by the sculptor Luca della Robbia—relieve the severity inherent in the earlier structures. In addition, Brunelleschi altered his proportions so that he diminished the scale of each of the chapel's three stories. The result makes the Corinthian pilasters, which serve as a decorative element upon the chapel's walls, take on an even greater visual importance.

**MICHELLOZZO.** All Brunelleschi's completed buildings in Florence were public in nature. At the same time a revolution was also underway in domestic architecture led by the architect's younger competitor, Michelozzo di Bartolommeo (1396–1472). Michelozzo and his studio designed numerous chapels, churches, and monastic buildings in and around the city of Florence, along with urban palazzi (palaces) and country villas. The quality of domestic architecture in medieval Florence had been low, consisting mostly of medieval tenements filled with crowded apartment-styled dwellings. Even the wealthiest families in the town had long clung to fortress-like houses, which in the uncertain and insecure world of the Middle Ages had often been sited around a massive defensive tower. During the 1440s Cosimo de' Medici, the head of the wealthy banking family and the backdoor manipulator of Florence's politics, commissioned the architect Michelozzo to design a new family palace or palazzo. At that time, as now, the word "palazzo" in Italian referred to all kinds of substantial urban buildings. The Medici Palace that Michelozzo designed became the nerve center of the Medici banking and business concerns as well as the family's domestic residence. At the time the Medici was a family of comparatively new wealth that lacked a noble title. Cosimo de' Medici consequently wanted to use his new palazzo to project the right image. We know, for instance, that he had originally approached Brunelleschi to design the building, but he rejected the architect's plans because he felt that they were too ostentatious and elaborate. Since Florence was a republic (although ostensibly one largely controlled by Cosimo) he desired a palace that would bolster the image of his family as cultured and substantial private citizens of the city. The Michelozzo design he chose has been somewhat altered over the centuries. It consisted of three floors. The first floor, which was the center of the

The Medici Palace in Florence, Italy. © PHILIPPA LEWIS/CORBIS.

Medici bank during the Renaissance, originally had large Roman-styled arches that were open to the street so that merchants and businessmen could gain free access to the structure. The exterior walls of this floor are finished with rustic blocks of stone, while above on the second and third floors, the masonry becomes progressively more refined. At the top of the structure a classical cornice crowns the building. Although the Medici Palace is more than 70 feet high, the overall effect is not one of grandeur, but of squatness. The interior courtyard fills the structure with light and relieves the fortress appearance of the exterior. The colonnade that surrounds this courtyard shows the influence of Brunelleschi's designs for the Ospedale, although Michelozzo used columns that were shorter and more massive to support the heavy weight of the floors above. To modern minds, the appearance of the Medici Palace appears far from homey since its high ceilings and forbidding rusticated exterior seem to connote more the appearance of public rather than domestic spaces. Such distinctions, however, played little role in the overheated commercial world of fifteenth-century

**BEAUTY IN BUILDING**

**INTRODUCTION:** Leon Battista Alberti's *On the Art of Building* closely followed the ideas of the ancient Roman designer Vitruvius. Later architects and patrons read Alberti's treatise, and many of Alberti's ideas were to shape the aesthetic values of the later High Renaissance. The scholar's definition of beauty was often repeated in the evolution of Renaissance thought.

In order therefore to be as brief as possible, I shall define Beauty to be a harmony of all the parts, in whatsoever subject it appears, fitted together with such proportion and connection that nothing could be added, diminished or altered, but for the worse. A quality so noble and divine that the whole force of wit and art has been spent to procure it; and it is but very rarely granted to any one, or even to Nature herself, to produce any thing in every way perfect and complete. How extraordinary a thing (says the person introduced in Tully) is a handsome Youth in Athens! This Critick in Beauty found that there was something deficient or superfluous in the persons he disliked, which was not compatible with the perfection of beauty, which I imagine might have been obtained by means of Ornament, by painting and concealing anything that was deformed, trimming and polishing what was handsome; so that the unsightly parts

might have given less offence, and the more lovely, more delight. If this be granted, we may define Ornament to be making of an auxiliary brightness and improvement to Beauty. So that then Beauty is somewhat lovely which is proper and innate, and diffused over the whole body, and Ornament somewhat added or fastened on rather than proper and innate. To return therefore where we left off. Whoever would build so as to have their building commended, which every reasonable man would desire, must build according to a justness or proportion, and this justness of proportion must be owing Art. Who therefore will affirm that a handsome and just structure can be raised any otherwise than by the means of Art? and consequently this part of building, which relates to beauty and ornament, being the chief of all the rest, must without doubt be directed by some sure rules of art and proportion, which whoever neglects will make himself ridiculous. But there are some who will by no means allow of this, and say that men are guided by a variety of opinions in their judgment of beauty and of buildings, and that the forms of structures must vary according to every man's particular taste and fancy, and not be tied down to any rules of Art. A common thing with the ignorant to despise what they do not understand!

**SOURCE:** Leon Battista Alberti, *On the Art of Building*, in *A Documentary History of Art*. Vol. I. Ed. Elizabeth G. Holt (New York: Doubleday Anchor, 1957): 230–231.

Florence, as most families lived and worked in the same space. The Medici Palace, by contrast, offered the family a greater degree of privacy and comfort than was usually present in the dark and damp homes in which even many of the city's wealthiest citizens lived. The building's rusticated exterior, too, duplicated the surviving monuments of ancient Rome rather than medieval models, in order to give the Medici family a degree of greater respectability. To the fifteenth-century observer, the palace's exterior likely conveyed an impression of dignity and solidity. Observed from this direction, it is not difficult to see why the palace exercised an influence over the construction of many similar structures for Italy's notable families.

**ALBERTI.** Leon Battista Alberti (1404–1472) was the finest fifteenth-century architect to follow Brunelleschi in Florence. One of the great “universal men” of the Renaissance, Alberti was a humanist by training who worked in Florence during the mid–1430s. Although he was a member of one of the town's most distinguished families, the young Alberti had been born illegitimate

and was brought up in Venice during one of the periods of his father's exile from the city. His father died during Alberti's student years, ultimately leaving the young scholar without sufficient resources to support himself. Thus Alberti sought patrons in the wealthy, cultivated families of Italy, numbering among his distinguished supporters the Este of Ferrara, the Gonzaga of Mantua, at least two popes, and the Rucellai family in Florence. He designed a number of structures for these patrons, and in 1450 he finished his *Ten Books on Architecture*, a work that revived the ideas of the ancient Roman scholar Vitruvius about architectural proportions. While his architectural ideas were not widely influential among Florentine builders in the fifteenth century, architects elsewhere in Italy imitated his design tenets.

**DESIGNS.** At the invitation of Pope Nicholas V (1459–1557), a scholarly pope whom Alberti met during his student days, the architect completed the first plans for the rebuilding of St. Peter's Basilica in Rome. Although that project stalled for almost another half cen-

tury, Bramante, Raphael, and Michelangelo—the Vatican’s chief sixteenth-century builders—all studied his plans. Alberti’s ideas about architecture maintained that beauty was a truth, and that buildings must be designed rationally to provide people with space that was harmonious and beautiful. At the same time he was conscious of the functionality of the spaces he created, insisting that buildings must serve practical uses and consequently be designed for their inhabitants. Alberti’s theories on architectural beauty are evident in the palace he designed for the Rucellai family during the mid-1440s. The architect rejected the heavy fortress style of Michelozzo’s slightly earlier Medici Palace, and instead created a façade that was altogether more refined. Unlike Brunelleschi who used columns to support his graceful colonnades and arches, Alberti liberated the column and the pilaster to become mere decorative elements. The arch itself, he insisted, was an opening in a wall, and most of his designs preserved its essential nature. Alberti, for instance, did not create colonnades of columns that supported Roman arches in the way that Brunelleschi had done before him. He developed these ideas in a number of commissions he completed for Italian princes, amassing a distinctive list of creations that influenced the development of the later High Renaissance style. One of the most unusual buildings he designed was for the notorious despot Sigismondo Malatesta, at the time lord of Rimini. Alberti was then working within the papal household and was also a member of a religious order, but this did not dissuade him from helping Malatesta in his plans to build a temple that glorified pagan learning and humanist scholars. Originally, Malatesta had planned to remodel a local church to suit his ambitions for a pagan shrine. At Alberti’s instigation, though, the tyrant began to completely encase the former church within an entirely new skin of marble. Unfortunately, Malatesta’s fortunes changed before the shrine’s completion, and work on the structure ceased. The exterior of this structure, though, shows Alberti’s successful assimilation of classical elements of design, an assimilation that was also expressed in the architect’s plans for the Church of Sant’Andrea in Mantua. The architect finished designing this project in 1470, shortly before his death, and most of its construction occurred following his death. Here he relied on a traditional Latin cross layout for the structure, although in his writings he advocated the use of central style, in which none of a church’s radiating wings was larger than another. Instead of the rows of columns that Brunelleschi and other fifteenth-century architects had used to support their vaulted ceilings, Alberti created a single-aisle church with side chapels recessed into the walls within gigantic Roman

Engraving of Leon Battista Alberti. THE LIBRARY OF CONGRESS.

arches. Further he designed the ceiling of this church as a single rounded barrel vault that moves toward the crossing and is met by similar barrel vaults in the transepts and choir. The overall effect of the design produced is at once harmoniously proportioned and majestically beautiful. It is little wonder, then, that elements of Sant’Andrea’s barrel-vaulted style had numerous imitators, most notably in both Bramante’s plans for the new St. Peter’s Basilica and the Jesuit Church of Il Gesù, important sixteenth-century projects in the city of Rome.

**AFTER ALBERTI.** The impact of Alberti’s harmonious creations inspired many designers in the second half of the fifteenth century. In Rome, Alberti’s work for Pope Nicholas V created a new urban design for the city centered on St. Peter’s and the Vatican complex. A number of buildings constructed after 1450 seem to be influenced by his ideas and designs, although their architects are unknown. These nameless figures copied Alberti’s plans for the façade of Santa Maria Novella in Florence at several Roman churches during the 1470s and 1480s. In addition, Alberti’s architectural ideas are evident in the courtyard built for the Palazzo Venezia in

Rome sometime after 1455. Although the architect's influence upon subsequent designers was profound, innovators also continued to appear on the Italian scene. One of these, Giuliano da Sangallo, was the first of a distinguished family of architects. Like Brunelleschi and Alberti, Sangallo studied the buildings of ancient Rome, recording a number of buildings that have since disappeared. In Prato, a suburb outside Florence, he designed the Church of Santa Maria dell'Carceri that drew imaginatively on elements from Alberti and also from Brunelleschi's plans for the Pazzi Chapel. In this structure he placed a ribbed dome similar to those Brunelleschi had designed in Florence. Sangallo designed the church itself in the central style, a departure from the traditional Latin cross used throughout most of the Middle Ages. Alberti's theoretical writings on architecture had stressed that the central style—in which the radiating transepts of the building were of equal size—was

more harmonious and beautiful. Sangallo's integration of Albertian and Brunelleschian styles continued throughout the interior and exterior of the building. Inside he decorated the structure with the palette of *pietra serena* and white plaster typical of Brunelleschi. On the exterior of the church, however, the architect played off brilliant white and green marbles, similar to the façades that Alberti had crafted for his structures. Sangallo established a popular design practice in Florence, and during the late fifteenth century he produced plans for a number of charming structures, including a new country villa for the Medici at Poggio a Caiano.

**PALACE BUILDING.** The years between 1450 and 1500 saw a great boom in the construction of urban palaces for the wealthy merchants and nobles of Italian cities. In Florence the town's patrician class rushed to imitate the Medici and other families who had already constructed domestic palaces during the first half of the

fifteenth century. The façades of these structures were either constructed from rusticated stone or finished with rough plaster known as *intonaco*. In a few cases both materials were combined on the same façade. Like the Medici Palace, the impression most Florentine palaces made from the street was not one of opulence or grandeur, although such buildings would have stood out in a cityscape filled with monotonous and undistinguished medieval houses. Inside, though, the interiors were flooded with light from the stylish courtyards that usually served as the central focus of the building. The contrast between the dark spaces typical of medieval houses and those of the Renaissance was probably striking to fifteenth-century observers. Over time, the palazzi grew larger and more elaborate, as families competed to outdo each other. In the 1490s, for instance, the prominent Strozzi family began construction on a palace that they hoped would outshine all others in the city. Not completed until 1507, the Palazzo Strozzi was, like many of these palace projects, an early exercise in urban renewal that necessitated the demolition of many pre-existing structures. The family demolished a huge city block that included a massive medieval tower that belonged to a noble count, several shops, and at least four other houses in order to build its new home. While the interiors of these dwellings offered definite improvements in comfort over most medieval structures, a palace's walls were frequently plain and unadorned. The amassing of collections of art, a custom that grew more popular at the time, did much to relieve the monotony of Florence's new interior spaces. Even with these great collections, though, a palace was not a homey structure in a modern sense.

**CONSEQUENCES.** The construction of so many great structures within such a short time transformed the Florentine cityscape. Palace construction displaced huge numbers of people from their residences, as wealthy families bought up large tracts of land within the city and demolished former tenements. As poor residents were dispersed into other areas of town, fashionable and unfashionable neighborhoods emerged. The city's wealthiest families crowded into particular areas and even certain streets, while the poor sought housing at the boundaries of the town's developed areas. The result produced more notable distinctions between rich and poor in the city. Writing about 1470, a prominent Florentine observed that thirty imposing urban palaces had been constructed during his lifetime. A half century later another observer noted an additional twenty structures that had been added to the city, but he also remarked that anyone who would want to list all of the town's major

palaces would have a difficult job indeed. The construction of such a large number of imposing structures required an equally large number of designers and tradespeople. Among the architects who frequently designed and supervised construction of these buildings were Giuliano da Sangallo, his brother Antonio, and their nephew Antonio. The Sangallos maintained a popular and profitable business constructing domestic palaces. But Florence also produced a number of competent designers at this time, men who met the demands of wealthy citizens for new accommodations. Most of these figures had risen in their respective guilds—goldsmithing, carpentry, and stonecutting—and had acquired notable expertise in the arts of construction. Around 1500, painters, too, ranked among those who designed urban buildings, and the long list of sixteenth-century artists who planned such buildings included Raphael Sanzio, Michelangelo, and Giorgio Vasari. But in most cases architecture was not a self-sustaining profession, as in the modern world. Most designers practiced other crafts besides designing buildings, and many merely designed one or two structures at the request of their patrons.

**URBAN PLANNING.** From Brunelleschi's days onward, architects had often envisioned plazas and squares surrounding the structures that they built; but like the oft-unfinished façades of Renaissance churches, few of these plans ever came to fruition during the fifteenth century. The experience of seeing the Roman forum, even in its dilapidated and ruined state, suggested to Renaissance scholars, architects, and artists, the public vitality of ancient life. In an effort to recover this kind of use of urban space, architects in the fifteenth century increasingly turned to study the ancient designer Vitruvius as well as the works of Polybius. They often envisioned entirely new cities planned along lines suggested by these antique writers. Although they rarely produced results, these plans had avid students in the artists and designers who came later. The fifteenth century, though, did produce one fine example of a planned city. During the 1460s Pope Pius II had his native village south of the city of Siena rebuilt along the lines suggested by contemporary Renaissance architects. Eventually named Pienza in his honor, the town featured a plan in which streets and subsidiary squares radiated out from a central plaza. Within Pienza, different architectural proportions established a visible hierarchy among the city's various structures. Architects and artists admired this kind of centralized, rational planning. The Urbino court artist Luciano Laurana designed one of the most famous plans for an ideal city of this sort. In a plan from around 1475 the architect grouped all structures in a large city

around a central square in which he placed a classically styled round “temple” inspired by the architectural writings of Alberti. The central Italian painter Piero della Francesca immortalized Laurana’s visually appealing plans in a famous panel painting, *Vision for an Ideal City*. Most fifteenth-century architects, Laurana included, had to be satisfied with far more limited successes, such as the design of the small squares that surrounded their architectural creations.

**THEORY.** The fifteenth century also witnessed a revival in interest in the theory of architecture. Brunelleschi and other architects had studied the buildings of ancient Rome, measuring their proportions and analyzing their structural and design elements. This initial interest gave rise to a heightened interest in architectural theory. The humanist scholar and artist Alberti had been among the first to comb the pages of the ancient builder Vitruvius’ works on architecture. In his *On the Art of Building*, completed around 1450, he had codified the ancients’ ideas about decoration and proportion into a set of architectural “laws.” Vitruvius had insisted that the human body was the primary model for architectural design, and he had based the building of his structures on proportions and design elements drawn from the body. Alberti similarly argued that beautiful buildings arose from principles that were similar to those of the human body’s design. According to Alberti, beauty arose from the interplay of design elements within a building so that, like the human body, no part could be taken away without diminishing the effect of the whole. Alberti’s treatise, however, was primarily a literary work. He provided, in other words, no illustrations to make clear just exactly how buildings designed with these principles might look. For clues to the application of his ideas, his later students studied the many he had planned throughout Italy.

**FILARETE AND DI GIORGIO.** Shortly after the completion of Alberti’s treatise, *On the Art of Building*, the Florentine sculptor and architect, Antonio Averlino (1400–1469), who was widely known as Filarete, completed a similar work of theory. Unlike Alberti’s work, though, Filarete illustrated his *Treatise on Architecture* with examples of the buildings he envisioned. The architect wrote the work for the duke of Milan and, although it was not printed in the next generations, it was widely circulated in manuscript form. Filarete wrote his theory with an evangelical tone, trying to convert his readers to the Florentine way of construction. He celebrated the revival of Antiquity that had recently occurred in his hometown and tried to convince his readers of the supremacy of antique styles of building. Along the way he advised on topics about ornament, decoration, pro-

portions, and urban design. He did not write his work, though, with designers in mind, since he addressed his comments not to architects and artists but to princes and nobles. He hoped to encourage these figures to patronize the new architecture. He used a complex and contrived style throughout the work that included a narrative plot in which a court architect educates a young prince in the arts of building. By contrast Francesco di Giorgio (1439–1501), a Siennese painter, sculptor, and architect, was more systematic in his *Treatise on Civil and Military Architecture*, which he probably wrote sometime during the 1480s and later revised in a completely new manuscript edition. As a painter, di Giorgio laid great emphasis both on the inventiveness and drafting skills that were necessary for those who hoped to practice architecture. Like Filarete, di Giorgio illustrated his work, but he did so more systematically than the earlier theoretician. His illustrations, in other words, elaborated upon issues he had discussed in the text, even as they conveyed additional technical information necessary to the practitioner. This technical strain recurs in the text as well, since di Giorgio included a great deal of practical information on methods for measuring heights and depths, military engineering, and hydraulics. Like many artists of the period, di Giorgio also desired to elevate the practice of his discipline and to promote it as an endeavor equal in intensity and seriousness to the liberal arts. His treatise praised the skills that were necessary in the architect, including sophistication in geometry and arithmetic. These he celebrated as signs of the nobility of the calling. Together with Filarete’s and Alberti’s works, di Giorgio’s treatises helped establish a body of architectural theory studied by later sixteenth-century practitioners in Italy and throughout Europe.

**ACHIEVEMENT.** Fifteenth-century Italian Renaissance architects had many accomplishments. Early in the century Filippo Brunelleschi had made the pilgrimage to Rome to study the structural elements of Antique buildings and to measure their proportions. Returning to his native Florence, he had used the insights gained there, as well as his own skills as a sculptor and stonemason, to create a dome of stunning beauty for the town’s cathedral. In works undertaken throughout the city, he had also relied on his new knowledge of classical Antiquity to design buildings notable for their graceful harmonies and proportions. The success of his initial structures had inspired other figures to create monuments that made use of the visual language of classical buildings. These architects, at first drawn mostly from the stonemasons’, goldsmiths’, and carpenters’ guilds, produced works for the ever-intensifying building boom that occurred in

Florence during the later fifteenth century. The results of this swell in construction clothed the town in new marble-clad churches, domestic palaces, and civic buildings notable for their size and elegance. Florence, in other words, developed from a medieval town filled with monotonous, fortress-like buildings, into a city punctuated by great squares, imposing churches, and dignified residences. These developments did not go unnoticed elsewhere in Italy. Throughout central and northern Italian towns, architects observed the elements of Florentine design and imitated some of its innovations. While the influence that the city cast was great, designers native to other cities—figures like Luciano Laurana and Francesco di Giorgio—point to the growing vitality and originality of centers outside Florence. By the end of the fifteenth century, this productivity had prepared the stage for an even greater era of architectural accomplishment that unfolded in the following century.

## THE HIGH RENAISSANCE

**ACHIEVEMENT.** By the end of the fifteenth century Italian designers had developed a new sophisticated architectural language that relied on elements culled from the monuments and buildings of Antiquity. They had used this knowledge to create daring new structures that were unparalleled in the centuries that preceded the Renaissance. In Florence and other Italian cities, the new knowledge of classical style had also been used to create imposing urban palaces for wealthy families. For most of the fifteenth century architecture had been a craft largely practiced by sculptors, masons, and carpenters. Around 1500, though, painters began to design build-

ings with increasing frequency. Painters brought new skills to the practice of architecture, including a surer sense of draftsmen's skills acquired in their craft. They also used light and mass in building in bold new ways. Although none of his structures were ever built, Leonardo da Vinci's plans for several buildings point to the vibrancy of this new trend. Both his imagined designs as well as the writings and buildings of Alberti—all of which emphasized harmonious beauty and elegant refinement—were major influences on the development of High Renaissance architects. This period, which began around 1500 and ended abruptly with the Sack of Rome, produced many fine designs for buildings planned on an enormous scale. As in painting and sculpture, the High Renaissance in architecture produced new structures that were more heroic and grand than those of the fifteenth century. Unfortunately, the relatively slow progress of building construction doomed many of the High Renaissance's monumental architectural plans to incompleteness. Some builders abandoned projects altogether; other builders truncated their projects or modified them to fit changing tastes. The High Renaissance in architecture, then, frequently presents us with a picture of great promises, but promises that were often left unfulfilled.

**SHIFT TO ROME.** Around 1500, the center of architectural innovation also shifted in Italy from Florence to Rome. The pace of construction in the city had already picked up during the second half of the fifteenth century, but with the election of Pope Julius II in 1503 a great period of expansion began. Julius was an impetuous and fiery personality. Known as the "Warrior Pope" he faced friends and foes alike with equal determination. Abroad, Julius marched into battle with his troops, pronounced public curses against his enemies, and beat recalcitrant cardinals who refused to march into battle with him with his cane. At home in Rome, he turned his steely will upon the face of the city, razing whole districts and rebuilding them to suit his desires for a grand capital. The tentative renewal plans of previous Renaissance popes paled in comparison with the building campaigns he waged during his ten-year pontificate. Julius called a host of artists to work in the city and refused to live in the papal apartments that had been recently refurbished by his predecessors. Instead he commissioned Raphael to provide him with new monumental frescoes that might equal the forcefulness of his personality. He hired Michelangelo to work on his enormous tomb, and then only a few years later, redirected the artist to painting the ceiling frescoes of the Sistine Chapel. His greatest endeavor of all, though,

Portrait of Pope Julius II by Raphael. © NATIONAL GALLERY COLLECTION; BY KIND PERMISSION OF THE TRUSTEES OF THE NATIONAL GALLERY, LONDON/CORBIS.

was his decision to rebuild St. Peter's Basilica, a structure originally constructed by the Roman emperor Constantine in the fourth century. To create the new church, which he stipulated must outshine every other church in Christendom, he demolished one of the largest surviving buildings from the ancient world. Summoning the architect Bramante, he soon began the greatest building project of the sixteenth century. Along the way to completion, the new St. Peter's Basilica consumed the efforts of the greatest architectural minds of the age, not to mention enormous sums of money. The project also lasted for more than 175 years, long beyond the scope of the pope's life. Before his death in 1513, Julius oversaw the partial destruction of the old basilica and the construction of the piers of the new building's crossing in order to commit future popes to follow through with his ambitious plans, even when those plans ran counter to the best interests of the church. During the reign of his immediate successor, Leo X (1513–1523), the demand for money to continue St. Peter's construction actually contributed to the great crisis of the Protestant Reformation when Leo arranged for the sale of an indulgence in Germany to finance the building's construction. Similar crises throughout the sixteenth

century threatened the building's completion, although it was, and it remains, an indubitable testimony to Julius' initial inspiration.

**BRAMANTE.** Donato d'Agnolo, who was better known as Bramante, (1444–1514) became the chief aid to Julius in attaining his greatest architectural ambitions. A native of a small town near the central Italian city of Urbino, Bramante had a successful career as a painter before beginning to practice architecture in his forties. At that time he worked for the Sforza duke Lodovico il Moro and he designed several churches in their capital Milan. The architecture of Alberti (particularly in its use of Roman barrel vaults) and the architectural drawings of Leonardo, with their emphasis on the use of the central style and geometric shapes, both influenced Bramante's style. In 1499, French forces conquered Milan, however, and Bramante was left without employment. He traveled to Rome, where he soon found work because of his connections with the Sforza dynasty. In the city a member of the family, Ascanio Sforza, commissioned him to build his tomb, and over the following years Bramante designed and supervised the construction of a cloister in the city. In 1502, he created the small *Tempietto*, a memorial commissioned by King Ferdinand and Queen Isabella of Spain to mark the site upon which St. Peter supposedly had been crucified. This small domed structure, considered one of the finest of High Renaissance architectural creations, perfects the central style of construction to a point of high finesse. Everything in the small building radiates outward from the memorial's center point, and shows that Bramante had now taken full advantage of his recent viewing of ancient Roman monuments firsthand. Although more severe than the architect's earlier designs, the work points forward toward his plans for the new Basilica of St. Peter's, a commission he won in 1506.

**ST. PETER'S.** For that great construction project the artist may have considered several possible plans, although he settled eventually on a central-style church, created in the shape of a Greek cross. The architectural drawings of Leonardo da Vinci, which Bramante had studied years before in Milan, influenced his plans for a building constructed as a Greek cross in which each of the church's four radiating wings were of exactly equal size. Eventually, the church's later architects abandoned the Greek cross in favor of a more traditional Latin cross design in which the nave was longer than the other three wings. Bramante's plan, however, called for each of the four corners of the building to be crowned with a large tower, and a dome—envisioned from the very first—was to sit atop the central crossing. Inside the structure Ro-

*a PRIMARY SOURCE document***A PAPAL ARCHITECT**

**INTRODUCTION:** The architect and painter Giorgio Vasari wrote a famous series of biographies of Italy's greatest artists, which were first published in 1550. In his life of Bramante, Vasari carefully catalogues the changes that were made up to his day in the architect's plans for the new St. Peter's Basilica. The following excerpt illustrates the dangers of later alteration, to which most of the great architectural projects of the High Renaissance fell prey. By Vasari's time, Michelangelo, then the papal architect, was at work to restore key elements of Bramante's original design.

But the work we are here alluding to was conducted after a much altered fashion on his death and by succeeding architects; nay, to so great an extent was this the case, that with the exception of the four piers by which the cupola is supported we may safely affirm that nothing of what was originally intended by Bramante now remains. For in the first place, Raffaello da Urbino and Giuliano da San Gallo, who were appointed after the death of Julius II to continue the work with the assistance of Fra Giocondo of Verona, began at once to make alterations in the plans; and on the death of these masters, Baldassare Peruzzi also affected changes when he constructed the chapel of the king of France in the transept which is on the side to-

wards the Campo Santo. Under Paul III the whole work was altered once more by Antonio da San Gallo, and after him Michael Angelo, setting aside all these varying opinions, and reducing the superfluous expense, has given the building a degree of beauty and perfection, of which no previous successor to Bramante had ever formed the idea; the whole has indeed been conducted according to his plans, and under the guidance of his judgment, although he has many times remarked to me that he was but executing the design and arrangements of Bramante, seeing that the master who first founded a great edifice is he who ought to be regarded as its author. The plan of Bramante in this building does indeed appear to have been of almost inconceivable vastness and the commencement which he gave to his work was of commensurate extent and grandeur; but if he had begun this stupendous and magnificent edifice on a smaller scale, it is certain that neither San Gallo nor the other masters, not even Michael Angelo himself, would have been found equal to the task of rendering it more imposing, although they proved themselves to be abundantly capable of diminishing the work: for the original plan of Bramante indeed had a view to even much greater things.

man barrel vaults, drawn from the architecture of Alberti, were to cover each of the wings, a design feature that was also later achieved. The dome Bramante designed was innovative by Renaissance standards, and shows his growing mastery of the architectural forms of Antiquity. Until Bramante's time architects had relied on the ribbed-style dome first used by Brunelleschi at the cathedral of Florence. In that structure, floating ribs of stone had supported panels of masonry. Bramante's plans for the new St. Peter's stipulated a circular structure, an exact hemisphere based upon the still-standing ancient Pantheon in Rome. To give the dome's unusual shape greater height, Bramante placed the structure atop a drum, a structure that was one of the Renaissance's chief design innovations in constructions of this nature. In sum, the plans Bramante crafted for the new St. Peter's were monumental, and befit the enormous ambitions of the "Warrior Pope" Julius II. At the same time the design was too large to be completed in a single person's lifetime. At the time of Julius' death only the eastern portion of the ancient Roman structure at the site had been cleared away. Many of the features of Bra-

mante's design never came to fruition, including his plans for a perfectly hemispherical dome and other elements of his interior and exterior plans for the church. The imaginative design that he envisioned can best be seen not in Rome but in the small central Italian town of Todi. Here in 1508 Bramante designed the much smaller Santa Maria della Consolazione, a small pilgrimage church, which made use of the ideas he was developing for the new St. Peter's around the same time. The building sits on a small plain and is not surrounded by any other structures, a site that provides an excellent vantage point to observe the harmonious aspects of its design. Like many of Bramante's other plans, the structure functions organically, almost as if it were a sculptural, rather than an architectural creation. It is here that one can observe the Renaissance's desire to develop an architecture based upon the design principles of the human form.

**OTHER PROJECTS.** Even as he was at work upon the designs for the new St. Peter's, Julius II deployed Bramante to plan other projects. One of these was the

Sixteenth-century fresco showing the construction of St. Peter's Basilica at Rome. PUBLIC DOMAIN.

rebuilding of the Vatican Palace. Julius wished to join two structures—the small hilltop house known as the Belvedere and the Vatican Palace—which stood more than an eighth of a mile apart across undulating terrain. Bramante planned two enormous corridors that were more than a thousand feet long and two hundred feet wide. These corridors enclosed three garden terraces filled with fountains and grand staircases designed to follow the rolling shape of the site's hills. The scale of the project was immense, and like many of Bramante's buildings it was left unfinished at his death. Subsequent alterations changed the face of those parts of the work that Bramante designed, destroying the grand vistas that the architect had envisioned for the Vatican complex. Not until Louis XIV's building program at Versailles in the seventeenth century, though, did another monarch attempt anything quite so grand as Bramante's design, and the partial realization of the surviving plans for the gardens of the complex influenced garden planning for several centuries to come. A similarly important work from the architect's later years in Rome was his design for the Palazzo Caprini, a structure that is sometimes referred to as the House of Raphael, since the artist purchased it in 1517. In that building Bramante made full use of the

concept of a screen or decorative façade filled with classical elements that masked the building's underlying structural elements. The ground floor of this structure was heavily rusticated and contained a succession of Roman arches. Above this, the living quarters featured decorative balustrades and grouped columns that supported a classical cornice. None of these elements played a structural role, but were design touches that evoked Roman Antiquity and granted an air of refinement to the building. The elegance of the design (the house itself has long since been demolished) affected later architects, including the Venetian Andrea Palladio. Palladio so admired Bramante's Roman buildings that he observed that the artist had single-handedly brought "the light of architecture" back into the world. This hyperbole was far from correct, since a number of great and innovative designers had preceded Bramante. Nevertheless, his grand Roman designs instituted and continued to shape architecture in the style of the High Renaissance throughout the sixteenth century.

**DOMESTIC BUILDING.** The first decades of the sixteenth century witnessed a dramatic surge in the building of great urban palaces and suburban villas for Rome's

*a PRIMARY SOURCE document***ASSESSING ANCIENT ROME**

**INTRODUCTION:** With the death of Bramante, Pope Leo X appointed Raphael to serve as his chief architect. One of the tasks given to the artist was to complete a survey of the surviving ancient monuments in Rome. Raphael was a poor writer, so it appears that he wrote his report with the aid of his friend, Baldassare Castiglione. Castiglione was the author of the *Book of the Courtier*, one of the greatest prose works in sixteenth-century Italian. The following excerpt from the report shows the deep feelings of wonder that ancient architecture inspired in Raphael, and he laments the decay of the city.

For, if one considers what may still be seen amid the ruins of Rome, and what divine gifts there dwell in the hearts of the men of ancient times, it does not seem unreasonable to believe that many things which to us would appear to be impossible were simple for them. Now I have given much study to these ancient edifices: I have taken no small effort to look them over with care and to measure them with diligence. I have read the best authors of that age and compared what they had written with the works which they described, and I can therefore say that I have acquired at least some knowledge of the ancient architecture.

On the one hand, this knowledge of so many excellent things has given me the greatest pleasure: on the other hand the greatest grief. For I behold this noble city, which was the queen of the world, so wretchedly wounded as to be almost a corpse. Therefore I feel, as every man must feel, pity for his kindred and for his country. I feel constrained to use every part of my poor strength to bring to life some likeness, or even a shade of that which once was the true and universal fatherland of all Christians ...

May your Holiness, while keeping the example of the ancient world still alive among us, hasten to equal and to surpass the men of ancient days, as you even now do, by setting up magnificent buildings, by sustaining and encouraging the virtuous, by fostering talent, by rewarding all noble effort—thus sowing the fruitful seeds among the Christian princes. For, as by the calamities of war are brought to birth the destruction and the ruin of the arts and sciences, so from peace and concord are born the happiness of men and that highly-prized serenity of spirit that may imbue us with strength to accomplish work reaching to the heights of achievement.

wealthiest citizens and foreign dignitaries. This boom, similar to the great construction bonanza that occurred in fifteenth-century Florence, resulted in the erection of a number of new and innovative domestic structures. The finest painters and architects of the age worked on these projects, including Raphael, Baldassare Peruzzi, Antonio da Sangallo the Younger, and Giulio Romano. By contrast to the solidity and weight of most Florentine palaces of the previous century, an elegant refinement characterized these Roman structures. In the years after Bramante's death in 1514, Raphael entered the arena of Roman architecture. He became director of the construction of St. Peter's Basilica, a project on which he accomplished little since the building program slowed in the years after 1515 because of lack of funds. His most ambitious design program, outside of his involvement in the great basilica, was the construction of the Medici Villa or, as it is now known, the Villa Madama, a large suburban house near the Vatican intended for the use of Cardinal Giulio de' Medici. Raphael designed the structure with a number of intriguing and fantastic details, including circular courtyards and domed ceilings. He made use of the sloping hillside site and planned to set

the villa within a series of delightful gardens. As in the case of many ambitious Renaissance projects of this nature, circumstances forced Giulio de' Medici to divert his attentions from the project, and little of Raphael's ambitious design saw completion. One section of the villa, the Great Hall, still stands today, allowing us to observe Raphael's skills as an architect. He designed the room with a series of arches that supported a dome; the room's arches also frame the exterior gardens. Both the interior and exterior space thus work as part of a harmonious whole; later sixteenth-century architects imitated Raphael's design at the Villa Madama.

**SANGALLO.** Another domestic project from the early sixteenth century merits mention. In 1517, the influential Cardinal Alessandro Farnese commissioned Antonio da Sangallo the Younger to remodel a palace he had bought in Rome. Sangallo, a member of the Florentine dynasty of builders and designers, had originally served as a carpenter at the building of St. Peter's Basilica in Rome. The majestic structure he crafted for Farnese established Sangallo's reputation; he received numerous commissions and even served as the chief architect of St. Peter's during the years between 1539 and 1546. The

architect planned a huge masonry palace for the cardinal that abandoned the long-standing use of rusticated stone on its façade. Rough stone appears only at the arches that grant entrance into the building's massive interior courtyard. On the first floor he used low-rising windows, similar to ones that Michelangelo had designed to be installed a few years before on the façade of the Medici Palace in Florence. On the story above he relied on the Corinthian columns to frame the windows, which are alternately topped by rounded and triangulated pediments. Above on the structure's final floor, he mixed elements from the lower two floors before capping the entire structure with a cornice. Michelangelo, who supervised the later years of the building's long construction period, made this element grander and more prominent. The Palazzo Farnese was a huge building, massive in size, severe, yet refined in its effect. It influenced the design of many public and private buildings in European cities for years to come. The Palazzo Farnese also shaped American architecture. With the Renaissance architectural revival that occurred in North America in the late nineteenth century, numerous buildings resembling Italian palaces appeared in American cities. The style of the Farnese became popular. Perhaps it is for this reason that, in 1944, the United States purchased the Palazzo Margherita, another palace closely constructed upon the model of the Farnese, to serve as its embassy in Rome.

**PLEASURE PALACES.** The sixteenth century in Rome also produced a spate of pleasure palaces, buildings designed as retreats for their owners and as the backdrop for impressive banquets and other entertainments. The artist Raphael, who had already designed the suburban Villa Madama, also played a role in the decoration of one of these projects, a pleasure palace constructed for Agostino Chigi, the pope's banker. This structure is now known as the Villa Farnesina (since the Farnese family later bought it and connected it to their town Palazzo by a suspended walkway). Originally, the villa stood in a quiet country setting on the outskirts of the city. Chigi chose Baldassare Peruzzi as the project's architect. The building has two stories with a large façade of Roman arches in the center facing the surrounding gardens. Originally, delicate ornamentation carved into the stucco plaster or *intonaco* decorated the façade. Today, these decorative details survive only on the building's frieze, the others having been covered up since the sixteenth century. The delicacy of these decorations suggested the building's role as a pleasure palace, a building intended for the amusement of Chigi, his wife, and their guests, as opposed to a dwelling. The villa had only a few ma-

ior rooms, but these were sumptuously decorated and used to entertain. At Chigi's banquets, guests were said to have imitated the customs of ancient Rome by throwing their gold plates out the villa's windows (although Chigi's servants soon reclaimed them below). The interior walls of the villa were filled with ornate and sumptuous decorative cycles painted by Peruzzi, Raphael, and other artists in a style that imitated ancient Roman frescoes. The illusionistic details of the frescoes suggested the architecture of ancient Rome, and their erotic and classical imagery impressed Chigi's guests not only with the size of his fortune but the depth of his learning. The example of Chigi's pleasure villa inspired other members of Italy's ruling classes to build similar structures in the decades that followed.

**MICHELANGELO.** The artist Michelangelo had the longest and most varied career of any figure of the Renaissance. He lived until 1464 and his art underwent a progression from the idealized, heroic forms of the High Renaissance to the more willful and turbulent creations that inspired Italian Mannerism. As the greatest artistic genius of the age, his development affected other figures who avidly imitated his design innovations. Originally trained as a painter in the studio of the prosperous Florentine artist Domenico Ghirlandaio, Michelangelo also studied sculpture, and throughout his life he felt most at home in this medium. It was as a sculptor that the artist made his first decisive marks on Renaissance art. The carving of his Roman statues *Bacchus* and the *Pietà* established his reputation. Following these masterpieces, Michelangelo returned to Florence to complete, among many other works, his colossal *David*, the largest free-standing statue since Antiquity. Michelangelo continued to work in Florence, but with the accession of Julius II to the papacy, he was soon called to Rome to work on the pope's tomb project. The plans for the Julian tomb called for a massive independent structure that would contain scores of sculptures, architectural niches, and a bronze frieze. The tomb was never completed on this ambitious scale and it took more than thirty years for a greatly scaled-down memorial to be finished. But in the years between 1505–1508, Michelangelo was at work on the project, and from these initial experiences he began to acquire the skills necessary to be a successful architect and project supervisor. The tomb project required the quarrying of enormous amounts of marble and the supervision of large work crews. Although Michelangelo worked on the project for several years full time, Julius II soon moved him to work on the famous Sistine Chapel ceiling frescoes, a commission he completed in the years between 1508 and 1512. The election of the Medici

pope Leo X in 1513 confirmed Michelangelo's papal patronage, and by 1517 the artist was back in Florence, undertaking an important project for the pope: the construction of a new façade for the Medici's family church of San Lorenzo. During the fifteenth century the family had richly showered this site with patronage. By the time that Michelangelo worked there, the Medici had weathered several challenges to their control over Florence and they had now allied themselves through marriage to the kings of France. The family now turned again to San Lorenzo, to shower it with new projects that underscored their rising status. Just before Michelangelo had arrived in Florence the venerable architect Giuliano da Sangallo, the uncle of the Roman architect Antonio, had made several drawings for plans for the project, although he had died before progressing further on the project. One of Sangallo's designs created an imaginative solution to the problem of the façade. Sangallo created a two-story Roman temple flanked by enormous towers to hide certain of the unattractive exterior elements of Brunelleschi's

original design. In this drawing he planned to mass classically-styled sculptures of the saints atop the façade's upper story, in effect creating a screen similar to that with which Baldassare Peruzzi was experimenting in Rome at the Palazzo Caprini around the same time.

**SAN LORENZO.** The Medici chose Michelangelo's plan for the church's façade instead. In keeping with the grand pretensions of the church's patron family, Michelangelo intended his design to be a "mirror of architecture and sculpture of all Italy" and he labored on the plans for over three years. The design he formulated was also for a two-story structure, although Michelangelo designed his structure without towers to cover the entire area of the church's edifice. Like the earlier project for the building of Julius' tomb, the San Lorenzo project was overly ambitious; it included eighteen statues in bronze and marble as well as fifteen carved reliefs. A surviving model of the façade shows shallow niches, from which the planned statues were to have projected

outward. The use of marbles and bronze together would have created a dramatic interplay of color. Michelangelo set himself to the task quickly, supervising the quarrying of stone, a project that eventually required him to build a road through a portion of the Apennine Mountains outside Florence. But although the artist worked feverishly on the project for several years, the Medici cancelled the commission for the façade abruptly in 1520, deciding to expend the family's resources on a chapel and family tomb at the church instead. They chose Michelangelo again to direct this commission, and the chapel he designed was made to harmonize with a sacristy Brunelleschi had built for the opposing side of the church in the fifteenth century. Work was frequently interrupted on the tombs, and the chapel was never finished as it had been designed. But among Michelangelo's architectural creations it ranks as one of his most completely realized creations. To secure better lighting for the tombs, Michelangelo raised the roof of the chapel by

adding a third story that brought the structure's roofline above those of surrounding houses. In other respects he relied on the traditions of Brunelleschian architecture, including the use of gray *pietra serena* set against white stucco. In this structure Michelangelo's carved tombs, with their more delicate and refined High Renaissance architectural frames, seem out of place with the surrounding fifteenth-century style of the chapel.

**LAURENTIAN LIBRARY.** Michelangelo was soon to develop a more unified style, one that was notable for its willful violations of the traditional canons of classical design. In 1524 the Medici pope Clement VII (r. 1523–1534) awarded the artist the commission to design a new library for San Lorenzo. This site was intended from the first to be dedicated to the use of humanist scholars and was to house the Medici's large collection of rare manuscripts. Michelangelo planned an entire complex at the site, including an Entrance Hall, Reading Room, and a

rare-book chamber, although he never lived to see the structure completed. The site itself was problematic since it was irregularly shaped, and the building had to be made to fit overtop and in between other structures that already stood on the church's grounds. Michelangelo's design solved these problems brilliantly, although the building was not executed completely in the manner in which he had planned. He designed a stately entrance to the library with a high staircase set in an imaginative architecture that bent the rules of traditional classical design. Michelangelo lined the walls of these spaces with pilasters that appear to support the ceiling, but which are instead set in niches, so that on second glance they appear like mere decorative sculptures that taper as they move downward. Below these niches the architect placed classical stone scrolls that again serve, not as traditional supports, but as mere sculptural or decorative elements placed on the walls. The effect of these design elements seems to make the room cave inward, although other features counteract this effect. The architect, for instance, divided the large staircase—the focal point of the room—into three sections and he bowed the stairs of the central section outward in a bold hemispherical shape. These hemispheres wage battle against the downward tapering pilasters that are placed within the wall's niches. Once above within the Reading Room the first impression is at once more traditional. The columns that line the room actually appear to support the ceiling, and its other elements seem to be drawn from a traditional classical architectural language. On closer inspection, though, Michelangelo seems to repeat the elements of the room's design *ad infinitum*, so that the windows and transepts that are above them, as well as the endless rows of reading desks and the patterned floor, take on the same dimension of a Herculean struggle as occurred outside in the entry hall. One appears, for instance, to be caught in a cage in which the room's design elements are constantly being repeated without relief. Unfortunately, the last element of Michelangelo's Laurentian Library design was never built. The architect had planned a final culmination to the architectural battle he had presented in the library's first two spaces: a dramatic triangular-shaped rare-book room designed to fit inside the spaces between buildings on the library's exterior. This conclusion to the Laurentian Library's strange and challenging architecture might have presented one of the most unusual spatial solutions of the Renaissance. But like many architectural plans of the period it was not constructed when the patron's interests shifted elsewhere.

**CHANGING TASTES.** The Laurentian Library reveals a new taste for creative experimentation, a taste shaped by artist and patron alike. As the High Renaissance pe-

riod drew to its conclusion at the end of the first quarter of the sixteenth century, architectural design came to be affected by changes similar to those underway in painting, sculpture, and literature. During the course of the fifteenth century architects had fastidiously studied classical Antiquity, and in the High Renaissance had achieved a mastery over ancient styles that allowed them to produce designs and structures notable for their complete assimilation of classicism. These details had been used to grant a human scale to projects that were heroic and monumental in nature. In his Laurentian Library complex Michelangelo showed a new direction, and the structure influenced later architects who used the language of classical Antiquity in a boldly willful and creative way. The violations of the canons of ancient design that Michelangelo displayed at the Laurentian were intentional, and they helped to give rise to the new movement in Renaissance architecture known as Mannerism.

#### THE LATER RENAISSANCE IN ITALY

**MANNERISM.** The High Renaissance of the early sixteenth century was notable both for its amazing level of artistic achievement and its brevity. By 1520, artists and architects were already in search of new styles that made the heroic and idealized paintings, sculptures, and buildings of the early years of the sixteenth century appear to many connoisseurs as dated. In architecture, Michelangelo had shown a new willful creativity that inspired later designers, particularly in Rome, Florence, and Central Italy. Even here, though, High Renaissance architectural styles persisted alongside the new Mannerism. The path of architectural development in Venice was slightly different. There, figures like Jacopo Sansovino and Andrea Palladio created a classical style notable for its elegance and refinement as well as its faithful use of the elements of ancient design. The very multiplicity of styles that

coexisted at the time provided a wealth of inspiration as Renaissance design moved from Italy into other parts of Europe.

**ROME.** Although the first two decades of the sixteenth century had been a time of incredible productivity, artistic activity and construction in Rome slowed dramatically in the later 1520s and 1530s. This falloff in production was largely the result of the Sack of Rome that occurred in 1527. During the 1520s the Medici pope Clement VII had tried increasingly to maintain the autonomy of the city of Rome and the Papal States he controlled in Central Italy. These policies had brought him increasingly in conflict with both the Habsburg emperor Charles V and the king of France. In May of 1527, a force comprised of mostly German, French, and Italian soldiers laid siege to Rome and conquered the city within a day. The army's commander soon died, and his successor was unable to control the force. Over the next few months the invading armies raped local women, tortured and ransomed citizens, and plundered Rome's villas and palaces. Many of the attacking soldiers were Germans who acted on anti-Italian sentiments fueled by the rise of the Reformation and its distaste for religious art. They desecrated the city's most venerable churches, plundering their gold and silver and destroying their religious art. Forced to take refuge in the papal fortress, the Castel Sant' Angelo, Clement VII was completely unable to stop this wanton destruction and carnage. Eventually, he surrendered, and to regain control over the city he paid a ransom of more than 400,000 ducats, an enormous sum that required him to melt down papal crowns and other ornaments. As a result of the Sack, Rome's ambitions to be an autonomous and powerfully independent state ended. A spate of prophecies that interpreted the crisis as signs both of God's judgment on papal immorality and warnings of the coming end of the world followed the attack. At the same time scholars in both Protestant and Catholic camps throughout Europe expressed regrets about the event since numerous libraries and important monuments had been destroyed. Rome gradually regained political and economic strength during the reign of Paul III (1534–1549), but most of the artists and architects who had worked in Rome during the golden years of productivity before the Sack packed up and left to work in other Italian centers. Slowly new artists and architects arrived, while others returned. Michelangelo was the most notable of those who returned to Rome. He arrived even in the relatively dark days of 1534, and he stayed in the city for the rest of his life. In part from his inspiration, as well as the arrival of other enormously creative figures, Rome's culture flow-

ered again in the second half of the sixteenth century. Yet even then, a growing realization of the city's dependence upon other major European powers helped to breed a kind of nostalgic longing for the early years of the sixteenth century. This nostalgia can be seen reflected in many of the grand and monumental church and secular projects that were undertaken at the time. These late sixteenth-century monuments, impressive in their grandeur, formed the foundations for the flowering of the Baroque in the first half of the seventeenth century in Rome.

**MICHELANGELO.** The first commission Michelangelo undertook upon his return to Rome was the project for his famous *Last Judgment*, which he painted on the wall behind the High Altar of the Sistine Chapel between 1534 and 1541. While he was involved at the Sistine, the artist also began to take on architectural projects. In 1538 he won the commission to redesign Rome's Capitoline Hill, the center of the ancient city. Although the Capitoline was not completed until after his death, it reflects the intentions of Michelangelo's late style. During the late 1530s the artist made several tentative steps toward refurbishing the famous plaza on the Capitoline Hill, and in 1561, shortly before his death, he returned to the plaza's designs. At this time he planned a dramatic square, and in the pavement to this plaza, he created a circular pattern filled with trapezoids, triangles and diamonds, at the center of which he placed an ancient Roman equestrian statue of the emperor Marcus Aurelius. At the time Romans believed that this statue was of the emperor Constantine, the figure who had converted the empire to Christianity. It had long stood nearby at the Church of St. John Lateran, the pope's cathedral church within the city of Rome. Although Michelangelo resisted moving the statue to the Capitoline, he eventually relented and created his dramatic plans for the square to frame the sculpture. His new design glorified Rome's position as the center of the world, a position that by the time was only symbolic, since the city's political powers had grown increasingly circumscribed by the greater European states of France and Spain. Michelangelo designed two palaces for the site that served as the center of Rome's civil government, and he sited these structures so that they radiated outward at angles from the pre-existing Palace of the Senate at the back of the plaza. The result produces a trapezoidal-shaped courtyard notable for its warm and enveloping feel. Despite poor eyesight and bad health, Michelangelo managed to keep up an astonishing level of productivity during his later years in Rome. During the 1540s, he undertook the decoration of the Pauline

*a PRIMARY SOURCE document***TROUBLE AT ST. PETER'S**

**INTRODUCTION:** In 1557, Michelangelo wrote the following letter to his friend Giorgio Vasari at Florence, explaining his dissatisfactions with the pace of the building's construction, and explaining his reasons for staying in Rome.

Messer Giorgio, Dear Friend,

God is my witness how much against my will it was that Pope Paul forced me into this work on St. Peter's in Rome ten years ago. If the work had been continued from that time forward as it was begun, it would by now have been as far advanced as I had reason to hope, and I should be able to come to you. But as the work has been retarded the fabric is much behindhand. It began to go slowly just when I reached the most important and difficult part, so that if I were to leave it now it would be nothing less than a scandal that I should let slip all reward for the anxieties with which I have been battling these ten years. I have written this account in reply to your letter because I have also received one from the Duke which fills me with astonishment that His Lordship should deign to write to me in such kindly terms. I thank both God and His Excellency with all my heart. I am wandering from my subject, for both my memory and my thoughts have deserted me and I find writing most difficult, being, as it is,

not my profession. What I wish to say is this: I want you to understand what would happen if I were to leave the aforesaid work and come to Florence. Firstly, I should give much satisfaction to sundry robbers here, and should bring ruin upon the fabric, perhaps causing it to close down for ever: then also I have certain obligations here, as well as a house and other possessions which are worth several thousand crowns, and if I were to depart without permission I do not know what would happen to them: and finally, my health is in the condition, what with renal and urinary calculi, and pleurisy, that is the common lot of all old people. Maestro Eraldo can bear witness to this, for I owe my life to his skill. You will understand, therefore, that I have not the courage to come to Florence and then return once more to Rome; and that if I am to come to Florence for good and all it is imperative that I should be allowed sufficient time in which to arrange my affairs so that I should never again have to bother about them. It is so long since I left Florence that Pope Clement was still alive when I arrived here, and he did not die until two years later. Messer Giorgio, I commend myself to you, begging you to commend me to the Duke and to do the best you can on my behalf, for there is only one thing left that I should care to do—and that is to die.

Chapel, a private papal chapel, within the Vatican with two large frescoes. At the same time Pope Paul III appointed him to serve as the official architect for the rebuilding of St. Peter's Basilica in 1546, and in 1547, he took on supervision of the final stages of the Farnese Palace's construction. On this building he added a massive decorated window above the palace's central entrance and increased the size of the cornice, two features that softened the severe effects of the original architect Antonio da Sangallo's design. In the interior courtyard his revisions inspired later seventeenth-century Baroque architects. On the courtyard's third story, for instance, he superimposed pilasters on top of each other and added broken moldings and lions' heads to the windows, features that played an important role in the language of seventeenth-century architecture.

**ST. PETER'S.** At St. Peter's Michelangelo's innovations removed many of the innovations that Antonio da Sangallo had made in the project, and he reinstated features of Bramante's original plans. Sangallo had added a series of loggias, galleries, and towers that, had they been

built, might have doubled the already colossal size of the building. Michelangelo swept away these planned additions and returned the design to a more harmonious High Renaissance style in tune with Bramante's original plans. At the dome the architect abandoned Bramante's idea of a simple hemispherical dome and instead adopted a shape that was more ovoid. To achieve the greater height necessary for this shape, Michelangelo's design required the Florentine ribbed style of construction, a system that Bramante had avoided. But although most of Michelangelo's design for the dome was realized, the wooden model he created for the structure shows that even his plans were not carried out completely in the way he wished. The huge drum that supports the dome was later lengthened and the dome itself was stretched into an even more oval shape than he had originally planned; both these features added even more height to the design than Michelangelo's already soaring plan stipulated. Michelangelo's designs, like Bramante's before him, tried to make the dome the central architectural feature so that it would dominate all views of the church. During the seventeenth century the Greek style of

The dome of St. Peter's Basilica, designed by Michelangelo.

construction that both he and Bramante had advocated was abandoned. St. Peter's was made into a more traditional Latin cross by the addition of several bays of arches to the nave. This change increased the size of the church to truly enormous proportions, its total length from the rear of the church to the edge of the choir being almost 700 feet in length. At the same time these alterations obscure views of the dome to those who stand directly before the entrance to the church. Despite the change, the overall effect of the structure bears Michelangelo's indubitable stamp, and the architect returned clarity and coherence to a construction that might have turned out dramatically different had Sangallo's plans been realized. In the rich decorative elements that the architect designed for the church, which included grouped pairs of Corinthian columns and pilasters on the dome and exterior of the church, his plan also anticipated the complexity and grandeur of the later Baroque period.

**THE GESÙ.** For many years following the Sack of Rome in 1527, the construction of large churches in the city of Rome dropped off. The largest religious building program underway in the years between the Sack and 1560 had been the ongoing reconstruction of St. Peter's, a project that proceeded by fits and starts. After 1560, the construction of new churches picked up again in the

city and the most important building of the time was the new Church of the Gesù. This structure was designed to be the center of the new Jesuit order in Rome. In 1540 the pope had recognized the Jesuits, who soon became a major force in the reform of the church and in opposing the spread of Protestantism. Officials of the order sought a structure to express their organization's rising status within the church and to present their ideas about the reform of Christian worship they believed was a necessary precondition for the reform of the church to be successful. Their plans for a Roman church proceeded slowly during the 1540s and 1550s. Finally in 1561, they secured funding from Cardinal Farnese, with the stipulation that he was to be the only person allowed a tomb within the structure. Several architects, including Michelangelo, had already created plans for the church, although construction of the interior followed a plan laid down by Giacomo Vignola. A student of Michelangelo, Giacomo della Porta, later assumed responsibility for the façade and the church's dome, and under his supervision, the Gesù became a showpiece for the developing aesthetic sensibilities of the Counter Reformation. Inside the Gesù a single massive barrel vault, similar to Alberti's Church of St. Andrea in Mantua, leads to the domed crossing and high altar of the church. Throughout the structure nothing detracts from the centrality of the High Altar, a demand that had recently been made explicit in the decrees of the Council of Trent. The exterior that Giacomo della Porta fashioned for the church was similarly innovative. As in Michelangelo's later designs, della Porta paired Corinthian pilasters upon the church's two-story façade, but he also incorporated fluid lines into his design above the central entrance and in the consoles that hid the vaults of the church's side chapels. These fluid lines inspired later Baroque designers in the seventeenth century, but already in the sixteenth a number of imitations of the Gesù were begun throughout Italy and Europe. During the 1580s, for instance, the plans for the church were already being copied in Munich, where the Jesuit order used the new St. Michael's Church to express the architectural ideas of the Counter Reformation. The heightened emphasis on visual unity and the centrality of a church's main altar became a feature in other churches throughout Europe that imitated the design of the Gesù. Constructed elaborately in marble and often decorated later in the less restrained and sumptuous style of the Baroque, these had a profound effect on early-modern Catholicism.

**ROME RESURGENT.** During the reign of Pope Sixtus V (r. 1585–1590) the gathering strength of Rome's

artistic and architectural wealth came to fruition in dramatic new plans for the city's renewal. The sixteenth century had already seen enormous changes in Rome, first through the offices of the High Renaissance popes Julius II, Leo X, and Clement VII. All three figures had attracted an army of artists and designers to the city with the intention of remaking the town into a truly Renaissance capital. The Sack of the city had cut this first spate of activity short in 1527. Around mid-century, Michelangelo had aided the designs of the popes for urban renewal, but even his projects paled in comparison to the great energy displayed during the reign of Sixtus V. This Counter-Reformation pope set his hand to creating a grand capital that was to make Rome the envy of European cities. During his short pontificate he set in motion the forces that transformed the town into a model early-modern capital. Sixtus concentrated his efforts on restoring the great churches of the city and on joining these ancient monuments together with the construction of a series of broad and straight streets. These new thoroughfares linked Rome's major points of religious interest together in a circuit that was easily comprehensible for the many pilgrims who came to the city. Despite enormous expense and technical problems, he arranged for ancient Egyptian obelisks captured by Roman armies to be moved to the new squares and plazas his designers created, adding architectural focal points to the cityscape he was creating. He capped Roman columns, with their historical reliefs narrating the exploits of ancient emperors, with new bronze figures of the saints. Many of his new axis streets, broad squares, and monuments still exist as defining features of Rome today, and during the seventeenth century successive popes elaborated upon his basic plans. Sixtus, too, provided new sources of water to the city by restoring ancient Roman aqueducts and building a series of fountains throughout the city. These new projects resolved a long-standing shortage of fresh water in the city that had plagued inhabitants throughout the Middle Ages and which had often forced citizens to bring their water daily from the polluted Tiber. In all these projects Sixtus employed a group of accomplished architects and designers. Most prominent among these was Domenico Fontana, who aided the pope in his plans to construct straight streets through the city and to beautify the urban landscape. Fontana also provided technical solutions for the pope's plans to relocate Egyptian obelisks and to make them prominent landmarks in the city, and he aided the pope by restoring the interiors of many of the city's ancient churches. Another architect who won papal favor in the reign of Sixtus V was Giacomo Della Porta, who had already designed the new façade for the

Gesù. Della Porta supervised the final stages of the construction of the dome at St. Peter's Basilica, adding even more height to the already towering structure. The completion of the project proved to be a symbolic victory for the papacy, demonstrating to Romans and Europeans alike the power of the Roman pontiff to conquer seemingly insoluble problems of design. It is no wonder, then, that during the seventeenth century urban planners elsewhere throughout Europe looked favorably upon the Rome that Sixtus and his architects had helped to fashion. Throughout the continent architects avidly copied features typical of Rome's renewal plan, and thus even as the city's political power weakened on the European landscape, it took on a new role as a force for urban planning and renewal.

**FLORENCE.** In the course of the sixteenth century the Medici rule increasingly dominated both the visual arts and architecture in Florence. The family had long been the most influential citizens of the town. In the fifteenth century they had at first used back-room manipulation to dominate the town's politics, although later they increasingly abandoned these subtle measures in favor of a more overt management of Florence's political affairs. In 1537, the family's elder statesman Cosimo de' Medici, known as Cosimo I, became a duke, which officially ended Florence's long-standing republican pretensions. Cosimo secured the often unstable Medicean dominance of the city and he ruled over both Florence and its surrounding territory Tuscany until his death in 1574. During Cosimo's long reign Florence's major artists and architects came increasingly to serve the court. These figures—men like Giorgio Vasari (1511–1574), Francesco Salviati (1510–1563), Bartolommeo Ammannati (1511–1592), and Angelo Bronzino (1503–1572)—had either studied with the great master Michelangelo or with one of his pupils. They were often described as *maniera* (meaning “mannered” or “stylish”). In English, long-standing usage has referred to these figures as Mannerists. At its best Mannerism became known for its great elegance, profound intellectual and allegorical content, formalism, and linear complexity. At its worst, art critics through the ages have criticized the Mannerists for being artificial, intellectually arid, overly elaborate, and slavishly imitative of Michelangelo and earlier masters. In the sixteenth century, however, the principle of imitation of previous models was a venerable one. At their core, most of the arts and scholarly activities practiced in the sixteenth century proceeded from the principle of imitation, whether it was the imitation of Antiquity, or of more recent models. In verse and prose, the works of the Renaissance authors Dante and Petrarch were highly

venerated models. In art, the achievements of Leonardo and Michelangelo fulfilled a similar role. Most theoreticians of the arts assured their audience that only through imitation of an acknowledged master was one really able to acquire the sure style that would harness human creativity and allow for truly great expression. Criticisms of the Mannerists' art as derivative and unimaginative, then, represent modern, and not Renaissance, notions about taste and creativity. In architecture, as in painting and sculpture, Mannerist designers often paid homage to Michelangelo, Bramante, and Raphael, figures they placed at the pinnacle of artistic achievement. Florence was the leading center of Mannerism in sixteenth-century Italy, although the style appeared in many Italian courts and was prized for its elegance and sophistication. By the second half of the sixteenth century Mannerist styles were also influencing the arts and architecture of Northern Europe, particularly in the Netherlands. The foundation of the Florentine Academy in 1563 helped to establish Mannerism's dominance within Tuscany's capital and in the surrounding region. Cosimo I patronized and sponsored this institution, which his chief artist and architect Giorgio Vasari had helped to organize. The Florentine Academy nurtured the development of new styles and themes in the arts along the lines favored by the Mannerist artists who participated in the institution. Its members also nourished an interest in art theory and aesthetics. In the second half of the sixteenth century the two important members of the academy, its founder Giorgio Vasari and Bartolommeo, were the town's most important architects.

**VASARI.** Giorgio Vasari is better known to the modern world for his *Lives of the Most Eminent Artists*, a collection of biographies of the most prominent sculptors, painters, and architects of the Renaissance. He was himself an accomplished painter and architect, and his greatest construction design was for a new civic palace, the Palazzo Uffizi, in Florence. The Uffizi, as it is commonly known today, was intended to house all the offices of Florence's civil government, as well as those of the guilds, and of the court artists who served the Medici. Vasari designed an enormous U-shaped complex whose exterior shows a clear influence from Michelangelo's Laurentian Library. Four stories tall, the building's three sides enclose a space that is narrow, more like a street than a city square. Throughout the building Vasari achieves a grand effect by the seemingly endless repetition of details. At the street level two columns and a pier continually alternate along the two parallel sides of the building. Above, at the second floor, decorative consoles inspired by those in Michelangelo's Laurentian Entrance

Hall demarcate triplets of simple square windows. At the third floor, groups of three windows are again repeated, but this time with rounded and triangular pediments governed by a strict A-B-A pattern. On the top floor, an open loggia (now glassed in) repeats the columns of the street level. The only break in this constant pattern of repetition comes at the perpendicular wing at the end of the complex. Here three arches at the street level—the center one rounded—serve to relieve the seeming monotony of the other two façades. To build this massive government complex, Vasari made use of pre-existing buildings at the site. These various structures are visible from the rear of the complex, but are masked by the massive edifices Vasari designed for the façade. To join these disparate structures together and to build to such a height, Vasari reinforced parts of the Uffizi with steel supports. Thus, his building was one of the first in European history to rely upon a metal skeleton.

**BARTOLOMMEO AMMANATI.** The sculptor Bartolommeo Ammanati, a close associate of Michelangelo, also completed two notable architectural projects in Florence in the second half of the sixteenth century. First, he created designs for a remodeled Palazzo Pitti, a fifteenth-century palace purchased by Cosimo I to serve as his official residence. The original design of the palace had been massive, and included seven bays of Roman arches on the ground floor. It eventually grew to more than three times its original proportions, but the sixteenth-century remodeling plan of Ammanati consisted of lengthening the structure's façade and in creating a beautiful interior courtyard, now known as the Cortile dell' Ammanati (Ammanati's courtyard). In this interior space the architect again relied on the principles of repetition inspired by Michelangelo's Laurentian Library. The chief elements he used included Roman arches and rusticated stonework, which appeared on all three of the building's floors. An interesting innovation that Ammanati made at the Pitti was his use of rusticated columns and arches. On all three floors the architect relied upon rustic stonework to outline both the arches of the courtyard's ground floor colonnade and those of the windows on the second and third floors. Despite the palace's monumental scale Ammanati's use of decorative stonework tamed the colossal spaces of the interior courtyard. Rustication had traditionally been used in Florence's palaces to grant an impression of weight and solidity. In Ammanati's hands, however, he transformed the traditional design element into a kind of decorative ornament, a breakthrough typical of the often creative aesthetics of Mannerism. The second of Ammanati's great architectural contributions in Florence was his Bridge of the

Façade of the Palazzo del Te in Mantua. © MASSIMO LISTRI/CORBIS.

Holy Trinity (Ponte Santa Trinita), which was begun in 1566. Here he relied on triangular pylons and flattened Roman arches to support a delicate roadway over the River Arno. He created this elegant construction after showing his original designs to Michelangelo, shortly before the elder artist's death. Michelangelo made several suggestions that improved upon Ammanati's original designs, and the result was a structure of great beauty. Tragically, the original structure did not survive the Second World War, falling victim to the retreating German army as they destroyed bridges to hinder the advancing Allied forces. It was, however, rebuilt according to its original plans shortly after the war's end.

**GIULIO ROMANO.** Rome and Florence did not have a monopoly on architectural innovation in sixteenth-century Italy. Throughout the peninsula designers of merit produced plans for buildings that shaped architectural tastes in Europe in the decades that followed. One influential figure was Giulio Romano, a native Roman who had originally worked as a painter in the studio of Raphael as a young man. In 1527 he moved to Mantua

in Northern Italy, where he became a court artist to Duke Federigo Gonzaga. The duke deployed Giulio on a variety of projects, including the design and construction of a new pleasure palace to be situated in a meadow known as the Te outside Mantua. Duke Federigo was a breeder of horses, and the plans for the Palazzo del Te, as it is known today, situated a banqueting hall beside his stables. Soon the duke decided to expand the structure at the site to build a larger palace in which he could entertain his guests while on retreat in the country. The grand exterior that Romano designed for the palace makes the structure appear far larger than it is in reality, and similar illusions recur throughout the structure. On the structure's façade the artist played willfully with the traditional classical orders in a way that was similar to the somewhat later structures built by the Florentine Mannerists. Doric order columns and heavily rusticated blocks of stone finished the exterior of the building, while inside a series of luxurious rooms are filled with rich illusionism. In the Salon of the Giants, for instance, the walls of the entire room have been painted without

any kind of framing device, so that the viewers enter a room in which they are totally surrounded by illusion. Columns snap under the exertions of heaving Giants, clouds roll by, and everywhere Romano surrounds his viewers with a rich panoply drawn from the artist's imagination and its interpretation of classical myth. Similar illusionistic devices occur throughout the palace, so that the façade and the interior function as one of the most fantastic creations of the later Renaissance. The dukes of Mantua entertained many visiting dignitaries with their playful palace, including the Hapsburg emperor Charles V. It is not hard to understand, then, why other designers throughout Europe turned to the structure for inspiration as they crafted similar pleasure palaces for their noble patrons.

**VENICE.** Like other Italian cities Venice in the fifteenth and early sixteenth centuries had seen a construction boom, still visible today through the many churches and palaces that survive from this period. These early Renaissance buildings were craftsman-like without being innovative masterpieces. Venetians in the fifteenth and early sixteenth centuries indulged a taste for the elaborate Gothic ornamentation still in fashion in much of Northern Europe. Architects hired from other Italian regions—most notably the northern Italian province of Lombardy around Milan—had designed many of these structures. In the sixteenth century Venice continued to import its architects, and no native school of designers developed in the city until much later in the seventeenth century. By the mid-1500s, though, two architects of unsurpassed skill practiced in the city: Jacopo Sansovino and Andrea Palladio. Together they created new and innovative plans for Venice's renewal influenced by the lessons they had learned in Rome, Florence, and other centers of the Italian architectural Renaissance. Given its enviable position as the City of the Lagoons, Venice provided a safe haven in the turbulent world of sixteenth-century Italy. Sansovino (1486–1570) was just one of many great figures who found refuge there after the disturbing Sack of Rome in 1527. Palladio was a resident of nearby Vicenza and he settled in Venice late in life, when he assumed the position of architectural adviser to the Republic after Sansovino's death. By this time Palladio had already designed several churches in Venice as well as many country villas within Venice's mainland territories. Together both figures helped to forge a distinctively northern Italian Renaissance style different from the Mannerist creations to the south in Florence, Rome, and central Italian towns.

**SANSOVINO.** When Sansovino arrived as a refugee in Venice, he was already 41 years old. He intended only

to stay for a few months, but remained in the city for the rest of his life. Over this considerable span of years, his plans largely reshaped the Venetian cityscape. Trained in Florence during his youth, he had also worked in Rome during the High Renaissance, and the works of Bramante, Raphael, and Michelangelo had shaped his designs. The grand architecture of ancient and High Renaissance Rome affected him deeply, but in his years in Venice, he developed a new style well-suited to the broad vistas and brilliant light of this city literally on the sea. At the time of his arrival, Venice's Doge and the Venetian Senate intended a renewal of the city that was to symbolize the town's claim to be a second Rome. Outside forces had threatened Venice since the early sixteenth century, but at the conclusion of the first phase of the Italian Wars in 1530, the town could boast, unlike most other Italian powers, to having retained its independence relatively unscathed. Sansovino was an ideal architect for the grand plans that were underway in Venice at this time. Unlike Florence or Rome with their cramped streets and tiny plazas, Venice was a city of broad canals. Sansovino designed buildings that were not only functional, but a delight to the eye. He altered his styles and ornamentation to fit different projects and the spaces in which they were located. His first great masterpiece of design in the city was the *Zecca*, a building that housed the town mint. In the sixteenth century Venice's currency, the ducat, was among the most respected in Europe. Sansovino labored to create a structure worthy of the eminent currency produced inside. A rusticated first floor, similar to those of Rome and Florence at the time, is crowned by a second and third story more delicate in design. On the façade he included banded Doric columns, similar to those in use among some Mannerist designers at the time. The elegant and overall classical effect of the building, though, differs greatly from the repetitive formalism typical of Mannerist designs. Despite the building's gentle appearance, particularly in the upper stories, Sansovino claimed that the structure was fireproof. The structure he designed proved to be a venerable tribute to the distinguished city and its highly respected coinage.

**ST. MARK'S LIBRARY.** In the fourteenth and fifteenth centuries, Venetians had often evidenced a taste for richly ornamented gothic façades. In Sansovino's greatest work, the Library of St. Mark's, he translated this traditional idiom into the world of the Renaissance. He designed two arcades, one atop the other, that made use of rich and graceful classical ornamentation in a way that fit in with the pre-existing architecture of St. Mark's Square. The building had been necessary to house,

*a PRIMARY SOURCE document***CHURCH ARCHITECTURE**

**INTRODUCTION:** In his *Four Books on Architecture*, Andrea Palladio discussed how the insights of antique temple builders could be used to create more beautiful Christian churches. Since the time of Alberti, architects had argued that churches should be constructed in the central style, that is, in the form of a Greek cross where the radiating wings are of equal length or that they should be built in the round. Palladio, too, was fascinated by the possibility of a round church. The long-standing use of the Latin Cross style was too deeply ingrained in contemporary practice and prevented the great popularity of round churches, although a few attempts were made during the Renaissance to build structures in that shape. Palladio admits that even he had been forced to adopt the traditional style in his Church of St. George Major in Venice.

We, therefore, who have no false Gods, should, in order to preserve a decorum about the form of Temples, choose the most perfect and excellent; and seeing the round form is that (because it alone among all figures is simple, uniform, equal, strong, and most capacious) we should make our Temples round, as being those to which this form does most peculiarly belong: because it being included within a circle, in which neither end nor beginning can be found nor distinguished from each other and having all its parts like one another, and that each of them partakes of the figure of the whole: and finally the

extreme in every part being equally distant from the center, it is therefore the most proper figure to shew the Unity, infinite Essence, the Uniformity, and Justice of God. Over and above all this, it cannot be deny'd that strength and durability are more requisite in Temples than in all other Fabrics; in as much as they are dedicated to the most Gracious and Almighty God, and that in them are preserved the most precious, famous, and authentick records of towns: for which very reasons it ought to be concluded that the round figure, wherein there's no corner or angle, is absolutely the most suitable to Temples. Temples ought likewise to be as capacious as may be, that much People may conveniently assist in them at divine service; and of the figures that are terminated by an equal circumference, none is more capacious than the round. I deny not but those Temples are commendable, which are made in the form of a Cross, and which, in that part making the foot of the Cross, have the entry over against the great Altar and the Quire, as in the two aisles, which extend like arms on each side are two other entries or two Altars; because being built in the form of the Cross, they represent to the eyes of those who pass by what wood on which our Savior was crucified. In this form I built myself the Church of Saint George the Great in Venice.

among other things, the great collection of manuscripts given to the city by the Greek humanist Cardinal Bessarion. Like other Venetian buildings, St. Mark's Library glitters in the brilliant sun reflected from the light blue waters of Venice's lagoons. Sansovino's Library and Mint, which form part of the large civic and Cathedral plaza of St. Mark's Square, grant a dignified yet human scale to the surrounding plaza, considered one of the finest in Europe. It is interesting to note that part of the vaulting of Sansovino's Library collapsed shortly after it was built during an unusually cold winter. Authorities blamed the artist and imprisoned him for producing shoddy designs. Sansovino's friend, the painter Titian, eventually negotiated his release and the restoration of his reputation and fortunes. While the architect maintained a successful career designing public buildings for the Venetian Republic, he also took on commissions for domestic palaces in the city. Among these, the Palazzo Corner dell Ca Grande, commissioned by the wealthy Corner family, ranks among his greatest works. Here

Sansovino introduced rigorous classical detailing drawn from the ancient architectural theoretician Vitruvius. Although thoroughly classical in design, Sansovino ensured that the palace fit in visually with the other older structures that surrounded it on its canal. For the ground floor, he designed a heavily rusticated façade and included elements of the severe Doric order. The three bays he placed in the façade served to admit merchants and businessmen into the interior courtyard, much as the arched colonnades in Roman and Florentine palaces did at the same time. On the two floors above, Sansovino used first the Ionic order and then the Corinthian. While the exterior of the structure fit neatly into the unusual canals of Venice, Sansovino also included an immense interior Roman-styled courtyard. This was an unprecedented luxury in a city in which dry land was a dear commodity.

**PALLADIO.** The architect Andrea di Pietro is better known today by the classical Latin name he took in middle age, Palladio. The precise place of his birth remains

an uncertainty but he first served as an apprentice to a Paduan stonemason. By 1524, he had moved to Vicenza, the site of many of his architectural masterpieces. He joined a local workshop, but by his mid-thirties he had come to the notice of a nobleman residing in Vicenza, the humanist scholar Gian Giorgio Trissino. Trissino took Palladio into his scholarly circle, exposed him to the rudiments of a humanist education and to Vitruvius' treatise on architecture. It was under the influence of Trissino, too, that the architect adopted his classical name. With the elder humanist's patronage, Palladio traveled to Rome many times during the 1540s. On one of these trips he met Michelangelo, and on all of his journeys he spent a great deal of time in Rome's ruins, studying and drawing their design elements. Even as he was developing his taste for classical Antiquity, Palladio was also at work designing structures for Vicenza's wealthy inhabitants. His first independent creation seems to be the designs for the Villa Godi in a small town near Vicenza. Within the city he also created plans for two domestic palaces as well as another country villa. These works do not yet show the secure integration of classi-

cal design elements, while one of them, Palazzo Thiene, shows that the architect toyed with some elements of central Italian Mannerism. He later rejected Mannerism of a thoroughly classical idiom. By 1549, the architect had been appointed by Vicenza's town council to restore the city's Basilica, or town hall. In the fifteenth century this large complex of separate buildings had been joined into a single structure surrounded by Gothic-styled arcades. One of these arcades had collapsed in 1496, and the Vicenza council had long searched for an architect who could remodel the complex along the lines of the new Renaissance classicism. In the structure that Palladio designed he displayed a thorough knowledge of Roman styles of building, and the ingenious solution that he created for this problematic structure helped to establish his reputation as a designer of merit.

**DOMESTIC ARCHITECTURE.** Palladio continued to design new palaces in Vicenza during the 1550s and 1560s, and much of the city still bears his indubitably elegant stamp. He also filled the countryside in and around Vicenza with numerous villas. The most influential of these was Villa Rotonda (sometimes referred to

as Villa Capra). Later it would become the model for Thomas Jefferson's Monticello. The Rotonda, so called because of its central dome, sits atop a hill with a view of Vicenza. The villa is a square building with a hemispherical dome shaped like that of the Roman Pantheon at the center. Each of the building's four sides is framed with a portico whose columns and pediments show the influence of ancient temple architecture. Each portico frames a different view of the attractive countryside and distant city, and at the same time these structures provide shelter from the elements and from the harsh summer sun. In this way Palladio created a building that allowed inhabitants to spend a great deal of time outdoors at all times of the year. Palladio's porticoes have continued to be an important design feature in houses since his day, and they are to be found not only in Europe but also in many hot regions of North and South America. Here these structures provide shelter from the elements and the sun, allowing people to spend greater time out of doors. Palladio decorated each of his structures with an arcade of Ionic columns and classical pediments. Statues atop these pediments and at the corners of the stairs leading to each portico are among the only decorative elements placed upon the structure. The window pediments, often a place upon which Renaissance designers showered great decorative attention, are restrained. The structure is elegant, yet severe, with simple unadorned plaster facing the exterior walls rather than expensive stonework. Perhaps this restraint explains the great popularity the Palladian style had for the colonial settlers of North America and for rapidly expanding eighteenth-century towns like London and Philadelphia. In these circumstances the building techniques of Palladian architecture provided structures that were pleasing to the eye, yet relatively inexpensive since they could be constructed with materials that were close at hand.

**VENICE.** Most of Palladio's architectural commissions were for domestic structures, and, unlike other great Italian architects of the Renaissance, he designed churches only infrequently. As he matured and his fame spread, however, he did complete designs for two famous churches in the city of Venice. The first of these, the Church of St. George Major, stands on an island away from the main center of Venice but still visible from the Doge's Palace in St. Mark's Square. Built for a Benedictine monastery at the same site, the church has been one of the most beautiful landmarks of Venice's cityscape since its completion. In his architectural writings Palladio, like other sixteenth-century architects, advocated a central-style church as the most visually pleasing and harmonious space. He believed that such a shape stressed

the unity and power of God. At St. George, however, he bowed to the pressure of the local church authorities and instead created a traditional Latin cross plan with a long nave. Palladio filled these spaces with light from the dome at the crossing, as well as a row of windows placed just under the vault. He crafted an arcade of Roman arches set off with columns in gray stone, and above this he included a large entablature that was among the most prominent decorative elements in the church. Designed after the conclusion of the Council of Trent (1545–1563), Palladio also complied with the new dictates of the church for simple unobstructed views of the High Altar. The effect of St. George Major is at once simple, rational, and harmonious. Together with another Church of the Redeemer that the architect designed a little more than a decade later, Palladio's church architecture inspired several generations of English designers, including Sir Christopher Wren (1632–1723), who relied on its appealing visual language in the churches he created in seventeenth- and eighteenth-century London. A final important design from the late period of Palladio's life was his plan for the Olympian Theater, the construction of which was overseen by his student Vincenzo Scamozzi in the city of Vicenza after his death. The architect's designs for the theater had been influenced by architectural theory about the size and shape of ancient Roman theaters, and the building was intended for recreations of classical dramas. Fixed scenery was included in Palladio's design, and after his death Scamozzi added perspectival street scenes. These are stepped up so that they appear to vanish at a great distance from the front of the stage. In reality, these are only tricks of perspective, for the depth of the stage from front to back is only a few feet, rather than the vast distance that it appears to be. The Olympian Theater was one of several attempts in Italy to reconstruct a historically accurate version of a Roman theater, an effort in which both humanist scholars and artists participated. Most other attempts involved temporary structures in wood or plaster, while Palladio's more elaborate stage and theater has survived over the ages.

**THEORY.** Palladio was also an important figure in the history of architectural theory. In 1556, Palladio created a series of illustrations for a new printed edition of Vitruvius' ancient architectural text. Slightly later, the author published his own *Four Books on Architecture*, a work that he also illustrated and used to inform his readers about many of the practical problems of building in the classical style. He treated the preparation of building sites, the practical design elements of the ancient architectural orders, and discussed what types of rooms

Exterior of the Church of San Giorgio Maggiore in Venice. © ARALDO DE LUCA/CORBIS.

were best suited to which activities. Palladio also discussed public works and civic buildings, even as he surveyed ancient Roman designs. He also assessed and criticized the most prominent structures of his own times. The architect's writings advocated the styles of Antiquity, not from a doctrinaire perspective, but as the most practical forms for the contemporary situation. He showed, in other words, how classical elements and designs could be profitably adapted to current realities to provide city and country dwellers alike with spaces that were visually pleasing, yet functional. Palladio's prominent pupil Vincenzo Scamozzi, later updated and expanded upon this pragmatic dimension of Palladio's work in a treatise entitled *The Idea of a Universal Architecture* (1615). In sixteenth-century Italy, Palladio's work shared an audience with the *Rules of the Five Orders of Architecture* (1563), a treatise written by the papal architect Giacomo Barozzi da Vignola. Elsewhere in Europe Palladio's work traveled farther and acquired a greater following, a following that eventually stretched from England to Croatia, from Scandinavia to the Americas. In these widely diverse cultures the *Four Books of Architecture* kept alive High Renaissance classicism, de-

spite the simultaneous popularity of Mannerism in many of these regions. Even centuries later, Palladio's treatise produced new revivals of classicism. The work was particularly admired in Georgian England, and one disciple, the colonial revolutionary Thomas Jefferson, relied on its canons as he planned the buildings and grounds of the University of Virginia in the new American Republic. Thus it is difficult to overestimate the importance that Palladio's treatise on classical design exercised upon the minds of Europeans, both in the Renaissance and in the centuries that followed.

**IMPLICATIONS.** The sixteenth century in Italy was an era of amazing architectural productivity. The century opened with the ambitions of Julius II for the rebuilding of St. Peter's Basilica and the renewal of the ancient city of Rome, plans that came abruptly to an end with the Sack of the city in 1527. In Florence, Michelangelo's first architectural works, notable for their willful individualism and creative use of ancient design elements, inspired Mannerist artists and architects in the decades that followed. Dissatisfied with Medicean rule in his native city, though, Michelangelo returned to

Rome in 1534. His later Roman works, while monumental and influential in inspiring later Baroque designers, did not continue along the path that he had laid out in his Florentine buildings. Mannerism persisted in Italy, and became a significant influence throughout Europe in the decades following 1550. The emphasis of Mannerist artists on designing complex spaces and on repeating classical elements in new formations inspired many projects in Florence, Rome, and Central Italy, and slightly later in Northern Europe. At the same time the allure of Palladio's classicism, and of High Renaissance forms generally, survived in the second half of the sixteenth century. This rich diversity in sixteenth-century Italian design presented architects working in other European regions with a wealth of examples, styles, and possibilities upon which to draw as they integrated the new architecture of the Renaissance into buildings constructed in their own countries. While they reached out to Italy for inspiration, European designers also created their own ways to give native expression to the Renaissance's taste for the world of classical Antiquity.

## THE ARCHITECTURAL RENAISSANCE THROUGHOUT EUROPE

**SPREAD OF CLASSICISM.** The adoption of the classical style that had flourished in Italy since the early fifteenth century appeared only slowly throughout Europe. Even within Italy, the spread of classicism had been uneven in the 1400s, and had often been governed by the presence of vigorous local circles of humanists. With its love of Roman and Greek texts, humanism tended to support the revival of classical architecture, as scholars and patrons pursued an interest in all aspects of life in the ancient world. In Northern Europe, the fondness for the intricacies of Gothic style persisted everywhere dur-

ing the fifteenth century, and buildings constructed in the classical style appeared first, not in Western Europe, but in Hungary and Russia. Hungary's despotic King Matthias Corvinus (r. 1458–1490) was among the first European monarchs to import Renaissance humanists and architects to his court. He subdued his country's nobles and established a firm but tenuous hold over the country. At Buda he rebuilt the city's castle in the Italian Renaissance style and provided space for a library, the Biblioteca Corvina. The library housed Corvinus' large collection of manuscripts, a collection that at the time was about the same size as that of the popes' Vatican Library in Rome. At several other places throughout the country he deployed his Italian architects to remodel or build anew structures in the Renaissance styles of contemporary Italy. Far from the centers of Western Europe, the Grand Prince Ivan III did much the same when he called several Italian designers to plan projects for his rebuilding of the Kremlin in Moscow. One of the structures he built, the Palace of the Facets, was the first secular building to be located within the walls of the ancient fortress upon its completion in 1491. Ivan's Italian architects also aided him in strengthening the fortifications of the Kremlin by constructing defensive works similar to those being built in Italy at the same time. In Western Europe, though, patrons and architects proved more resistant to the new style, and it was not until the early sixteenth century that a great number of buildings based on the newly revived classicism began to appear. As in Italy, the spread of humanism furthered these developments, and royal and aristocratic patrons, as well as wealthy merchants and townspeople desired buildings that expressed their newfound fondness for classical Antiquity. The political chaos of the Italian scene in the first decades of the sixteenth century also created a supply of architects available for commissions and positions as court designers in France, Spain, and elsewhere throughout the continent.

**ORNAMENTATION AND INTEGRATION.** Local artists, though, designed most of the Renaissance buildings constructed outside Italy in the sixteenth century. Kings and princes were usually the only figures who possessed resources considerable enough to import their designers from Italy, the wellspring of Renaissance neoclassicism. Oftentimes the new fashion for Antiquity of the early sixteenth century produced buildings that were not notably ancient in their feel or design, but which were merely decorated classical elements. The fondness for elaborate ornamentation characteristic of the late phases of Gothic architecture thus persisted, and designers produced many buildings that were a forest of classical

**INTRODUCTION:** Francis I of France was one of the great sixteenth-century royal builders and connoisseurs of art. In a relatively long reign, he beautified the Palace of Fontainebleau, began rebuilding the Louvre, and created a string of country châteaux. Francis also called artists from Italy and Flanders to work for him, among them the swashbuckler, Benvenuto Cellini. In his *Autobiography*, Cellini reported how he received one commission from Francis to build a new fountain at Fontainebleau in a casual almost offhand manner. Whether the story is true or not, Cellini usually engineered his accounts to throw himself into the best possible light.

For my great King, as I have said, I had been working strenuously, and the third day after he returned to Paris, he came to my house, attended by a crowd of his chief nobles. He marvelled to find how many pieces I had advanced, and with what excellent results. His mistress, Madame d'Etampes, being with him, they began to talk of Fontainebleau. She told his Majesty he ought to commission me to execute something beautiful for the decoration of his favourite residence. He answered on the instant: "You say well, and here upon the spot I will make up my mind what I mean him to do." Then he turned to me, and asked me what I thought would be appropriate for that beautiful fountain. I suggested several

ideas, and his Majesty expressed his own opinion. Afterwards he said that he was going to spend fifteen or twenty days at San Germano del Aia, a place twelve leagues distant from Paris; during his absence he wished me to make a model for that fair fountain of his in the richest style I could invent, seeing he delighted in that residence more than in anything else in his whole realm. Accordingly he commanded and besought me to do my utmost to produce something really beautiful; and I promised that I would do so.

When the King saw so many finished things before him, he exclaimed to Madame d'Etampes: "I never had an artist who pleased me more, nor one who deserved better to be well rewarded; we must contrive to keep him with us. He spends freely, is a boon companion, and works hard; we must therefore take good thought for him. Only think, madam, all the times that he has come to me or that I have come to him, he has never once asked for anything; one can see that his heart is entirely devoted to his work. We ought to make a point of doing something for him quickly, else we run a risk of losing him." Madame d'Etampes answered: "I will be sure to remind you." Then they departed, and in addition to the things I had begun, I now took the model of the fountain in hand, at which I worked assiduously.

ornamentation, but in which the overall effects lay closer to medieval than to Renaissance sensibilities. Eventually the growing body of books treating architectural theory and practice aided architects in Northern Europe and Spain, as designers and patrons were now able to read about the design principles and rationale that underlay classical architecture. Many of these works' illustrations, along with the independent prints that circulated of classical buildings, helped to produce purer forms of architectural classicism, although the development was not without difficulty. In Northern Europe the sixteenth century was also a time of great religious and political upheaval. The protracted religious crisis had a dampening effect everywhere on the construction of new churches, one of the chief kinds of monuments upon which Italian designers had displayed their newfound fondness for Antiquity. The Religious Wars in France and the Netherlands delayed or caused patrons to abandon the completion of many secular projects as well. In England, the Reformation similarly dampened enthusiasm for church building. Despite these difficul-

ties Northern European and Spanish architects learned many lessons from ancient and Renaissance architectural designs, and by 1600, they had developed their own forms of classicism tempered by their native traditions.

**FRANCE.** France proved to have one of the most innovative climates for pioneering new architectural forms in the era. Although the period was not one of great achievement in church building, the country produced a wealth of new châteaux, palaces, townhouses, and civic structures during the sixteenth century. The taste for Italian design influenced many of these buildings. In the early stages of the French Renaissance, Italian designers—at first drawn from the Duchy of Milan conquered by the French at the very end of the fifteenth century—planned and executed many ambitious projects for the French crown. Among the Italians lured to France was Leonardo da Vinci, who experienced a stroke shortly after his arrival, and produced little in the last years of his life in France. Da Vinci did design a new royal château to be built at

Château de Chambord, France. MICHELLE GARRETT/CORBIS.

Romorantin, and although the project did not begin until after the artist's death, it was soon given up to build the larger, still-standing Château de Chambord. Leonardo's design ideas, nevertheless, seem to have left their impact on French design. While the artist was still living in Milan, he had developed plans for interlocked double staircases, built in a structure that resembled a double helix. These structures allowed one staircase to be used by those ascending and another for those who were descending. His designs seem to have encouraged a series of interlocked staircases in sixteenth-century French châteaux, a type of construction that was springing up on the French landscape with increasing frequency at the time.

**CHÂTEAUX.** Although the sixteenth century proved to be a time of religious warfare and chaotic political rivalries in France, the period actually opened on a note of optimism. This optimism is evident in the large number of construction projects undertaken for new and rebuilt châteaux. The English equivalent for this French word is "castle," and originally medieval châteaux had been heavily fortified, their role being defensive. Certainly, most sixteenth-century French châteaux for the

nobility and the king retained their defensive elements, but now they also took upon a refined elegance more in keeping with their residential nature. Francis I (1515–1547) was an avid builder of these country châteaux, and during the early years of his reign, he concentrated his efforts on his castles at Blois, Chambord, and Amboise. One of the most unusual of the many structures he built was a loggia at Blois, modeled closely upon Donato Bramante's famous plans for the Belvedere Palace at the Vatican. At Chambord, he built the most imposing of his country castles, using a plan that melded French Gothic ideas with the newer design features of the Italian Renaissance. Built over a period of twenty years, the castle was notable for the layout of its central keep (the most heavily fortified part of the château). Francis had the keep designed in the shape of a Greek cross, an innovation that showed the influence of Italian ideas about the superiority of the central style of design. At Chambord, he also included paired ascending and descending staircases made popular by Leonardo's designs, and at Chambord their construction shows a new concern with privacy, since no one is able to see those who are on the opposing staircases. But although this, the largest and most impressive of Francis' châteaux,

Château Ancy-le-Franc in France. © BOB KRIST/CORBIS.

included some of these Renaissance details, it continued to display the traditional French Gothic taste for dormers, spires, and fanciful roof decorations. These tended to overwhelm the building's classical details. At the same time as Francis beautified his castles, similar structures built for the country's notable families dotted France's countryside. While the Loire Valley contained the greatest number of châteaux as France's nobles congregated there in hopes of being close to the king, construction of châteaux in the more refined and elegant style of the times occurred throughout the country—albeit on a distinctly smaller scale than the royal castles at Chambord and Blois. One of the most beautiful structures that traces its origins to this early boom in Renaissance châteaux construction is Chenonceaux. It was picturesquely sited above a river, where it replaced a mill that had stood upon the same spot. Later in the century, Henry II (r. 1547–1559) purchased it for his mistress, Diana of Poitiers, who gave the original castle greater classical detailing and connected it to the opposite shore by the construction of a new Renaissance-styled wing. Significant additions over the centuries have altered the appearance of the castle, which today still ranks as one of

the most delicate and beautiful of European buildings. The châteaux at Azay-le-Rideau, Villandry, and Le Rocher Mézanger also present examples of the various styles that were popular during the first half of the sixteenth century, and show the taste for mingling of Renaissance and Gothic ornamentation.

**ITALIAN ARTISTS.** Besides Leonardo, three other prominent Italian artists—Rosso Fiorentino, Primaticcio, and Serlio—spent significant portions of their careers in France. They were among the most influential Italian émigrés who settled in the country in the sixteenth century. Rosso Fiorentino and Primaticcio had begun their careers in Italy as painters during the development of early Mannerism. While they continued to paint in France, they also designed and decorated rooms for the royal palace at Fontainebleau as well as for a string of royal châteaux located mostly in the Loire River valley and in the Île de France, the countryside surrounding the city of Paris. This tradition of imported Italian designers continued in the 1540s when Sebastiano Serlio (1475–1554) took up residence in the country. Serlio was an architect, sculptor, and painter whose designs

attracted a wide following through his publication of his architectural treatise. In France he designed several works, including the new Château Ancy-le-Franc. The building's plan was C-shaped and enclosed a central courtyard guarded on the open side by a low rising wall. This style of construction grew popular in France over the coming centuries, as French patrons generally disregarded the central enclosed courtyards that were popular in Renaissance Italy.

**FONTAINEBLEAU.** Throughout his long reign Francis showered his greatest attentions on the royal palace of Fontainebleau. He commissioned a number of Italian artists to decorate the palace's chambers, including Rosso and Primaticcio. In the rooms they decorated for the king both artists developed a highly ornamental style that made use of the design techniques that Raphael and Giulio Romano had developed in Rome at the Villa Farnesina, but which extended that pattern of decoration to an almost baroque complexity and elegant finesse. From 1528 onward, Francis also began to transform parts of the palace's façade, relying on the native architect Gilles Le Breton as his designer. With the premature death of Rosso in 1540, Francis also coaxed Sebastiano Serlio to France. By this time Serlio's reputation had already been established by the publication of his architectural treatise in 1537. The work was popular and appeared in French and Italian editions during the following years. Serlio's design tenets included impressive classical colonnades similar to those Bramante had designed for the Belvedere Palace in the Vatican. His influence was widespread and gave encouragement to the construction of similar structures at Fontainebleau and at the Louvre in Paris as well as in other noble houses constructed throughout France.

**LOUVRE.** The greatest achievement of sixteenth-century French architecture was the rebuilding of the Louvre Palace in Paris, a project planned and executed by mostly French, rather than Italian designers. The project began in 1546 under the direction of Pierre Lescot (1510–1578), and the rebuilding continued for centuries. Francis began by demolishing the medieval keep that stood in the center of the palace, and building on its site a series of buildings arranged around a courtyard. Lescot was unusual by the standards of many Northern European architects of the time. In France, in particular, most sixteenth-century designers came from stonemason backgrounds. By contrast, Lescot was from a prosperous legal family, and he had received a broad education. Unlike many native French architects of the time, he did not learn his craft by traveling to Italy. Instead he applied the mathematical, painting, and archi-

Façade of the Palace of the Louvre in Paris. © PHILIP GOULD/CORBIS.

tectural lessons he had learned at home in France. His chief achievement at the Louvre was the building of the Square Court. In the designs he crafted for this part of the palace, Renaissance architecture in France reached a high expression of classical finesse. Lescot's plan shows a mastery of all the details of the classical orders, and at the same time the building's appearance is refined and unified. It is also an elegant structure when compared against the massive palaces of Florence and Rome. Lescot also skillfully incorporated details that were typically French. In the cold climate of Northern Europe, steeply sloped roofs were a necessity, and thus the imitation of the Italian example was never to be complete. Lescot's steeply pitched roof, however, manages to fit nicely with the other details of his design. His use of small decorative statues to ornament the façade was a design element rarely used in Italy, and points to the greater taste for ornamentation that continued to live on in France even under the guise of the classical revival. In total, though, Lescot's classicism was more assured than any work designed by a French designer to this point. Yet at the same time he developed a native French Renaissance idiom

that was free from tutelage to Italian models. It is not surprising, then, that later designers were to build upon his example.

**SPAIN.** The architectural Renaissance in Spain followed a path similar to that of France. Like its northern neighbor, Spain dominated political developments in Italy in the early years of the sixteenth century, and many of its artists traveled there to learn firsthand about the new styles in painting and architecture. Three phases occurred in the integration of Renaissance elements into the native architecture of Spain. In the first phase, a decorative style known as the Plateresque (for its affinities to work in silver and gold plate (in Spanish known as *plata*), incorporated classical elements as highly decorative ornaments on tombs and altars in churches. Soon this classical detailing spread to use on wall surfaces and façades, too. By the end of the first quarter of the sixteenth century, in the second phase of classical integration, a more thorough adoption of Italian influences resulted in the construction of projects that were more outrightly Renaissance in their design and construction methods. Finally, an austere classicism, known as the Herreran style (for the architect Juan de Herrera), began to appear around 1560. As in all regions in Renaissance Europe, elements of older styles continued to co-exist alongside newer innovations. Decorative Plateresque buildings, in other words, continued to appear at the same time as the more austere forms of Herreran classicism were growing popular.

**ROYAL PATRONAGE.** The greatest architectural projects in sixteenth-century Spain were undertaken on a grand scale with royal patronage, as befitted the country's status and the enormous wealth its government derived from New World silver and gold. Among the classically styled monuments erected under the patronage of the crown, the Royal Hospital at Santiago de Compostela was one of the first examples of Renaissance classicism in Spain. Santiago de Compostela was the site of an important pilgrimage church to which Europeans from throughout the continent came, and the hospital was intended to care and provide lodging for these pilgrims. Spain, like France, had no formal capital in a modern sense during the sixteenth century, and the monarch regularly moved from place to place, supervising the administration of the country. This annual circuit brought the king to Spain's most important cities. Taking up residence in various parts of the country was even more important in Spain than in France or England, for the country was really an amalgamation of many kingdoms and provinces, many with very distinct customs, laws, and languages. During the later Middle Ages,

two kingdoms—Castile and Aragon—had conquered much of the peninsula, and they had been linked in an uneasy alliance through the marriage of the dual monarchs Ferdinand and Isabella. Granada, Toledo, Madrid, and Seville were just a few of the cities the sixteenth-century Spanish kings regularly visited as they conducted their annual tour of Spain. The itinerant nature of the Spanish monarchs during much of the sixteenth century thus necessitated the construction of palaces, churches, and other governmental buildings throughout the country. After 1560, the center of royal administration of the two kingdoms became situated in the central Spanish city of Madrid, thus setting off a building boom in and around that town. Besides these royal construction projects, the crown in Spain was also a fervent supporter of universities, and in the sixteenth century Spain's major educational centers acquired many new buildings in the various Renaissance styles flourishing throughout the peninsula. Among these, the campuses of the University of Salamanca and the new University of Alcalá acquired some of the finest Renaissance structures in Spain. In both cases, these buildings utilized the more ornate Plateresque style, rather than the severe Herreran classicism that became popular later in the sixteenth century.

**THE ESCORIAL.** The greatest, and at the same time most unusual, architectural project undertaken in sixteenth-century Spain was the construction of the Escorial near Madrid. King Philip II's favorite architect, Juan de Herrera (c. 1530–1597), designed this building, which was constructed between 1563 and 1584 as a combination church, monastery, mausoleum, and royal palace. The complex expresses the fervent, unbending Catholicism of its patron, Philip, who presided over the country's internal affairs and vast colonial empire between 1556 and 1598. The king acquired a reputation, even in his own lifetime, for being an overly scrupulous religious fanatic and a meddling absolutist ruler. In reality, Philip exercised a great deal of restraint and was far from being a zealot, but the religious wars of the sixteenth century were chiefly to blame for developing a “Black Legend” about Spain and his rule, particularly in Protestant countries where fear of the forces of the Counter-Reformation ran high. The king was an avid connoisseur of art and he maintained a long friendship with the great Venetian artist Titian. Both his taste for Italian art and his own austere religious temperament influenced his distaste for the ornamental Plateresque style of Renaissance architecture that flourished in much of Spain at the time. Herrera became the perfect architect to give expression to Philip's tastes. Undertaking the great project of the Escorial, the king wrote to his architect, advising him that

El Escorial, Spain. © VANNI ARCHIVES/CORBIS. REPRODUCED BY PERMISSION.

the building should have “simplicity of form, severity in the whole, nobility without arrogance, majesty without ostentation.” Herrera gave brilliant expression to these demands in the plans he completed for the building, although a change in the purpose of the building likewise necessitated a radical change to the architect’s original plans. In 1558, Philip’s father, the emperor Charles V, died, and his son decided to transform his palace, still in the design stages, into a tomb for his father. He added a monastery, where monks were to pray continually for the soul of his father. The church at the center of the new palace was to become Charles’ mausoleum. Herrera designed a great gray granite mass of a building with its prominent domed church for a plot at the edge of the mountains outside Madrid. Until he received the commission for the Escorial, Herrera had been living in Naples, at the time a Spanish possession in Italy. While in Italy he had studied the plans for the new St. Peter’s Basilica, and the influence of Michelangelo’s designs can be seen in his subsequent plans for the Escorial. He designed the central domed church as a simplified, even puritanical version of Michelangelo’s St. Peter’s dome. Around this he built a series of square courtyards, the sur-

rounding wings of which house the royal palace and monastery complex. The façade of the entire structure is largely undecorated, and where ornamental elements appear, they are in the simplest of classical forms. Herrera used the Doric, rather than the more ornate Corinthian order, and on the palace’s many rectangular windows he placed mere square pediments, the only decorations that penetrated the otherwise unending granite wall surfaces. Four large spires at the four corners of the structure repeat the motif of the two central spires of the palace’s church; the overall effect of the palace bears more resemblance to the grand churches of sixteenth-century Rome than to any kind of domestic structure. Detractors have long criticized the structure as cold and monotonous, while its admirers have defended it as simple and grand. Its influence on subsequent designs in Spain was considerable, as the Escorial paved the way for a new Spanish architecture characterized by a rigid use of classical forms and massive, relatively undecorated spaces.

**GERMANY.** The influence of Italian Renaissance architecture can be seen at work in Germany from the first decades of the sixteenth century. Religious turbulence, though, characterized life in the region during much of

the sixteenth century, and the disputes of the Reformation initially cast a pall over the construction of new churches. These were once the largest building projects of the German Middle Ages. In the first half of the sixteenth century, though, church building ground to a halt before reviving in the second half of the century. As in France and somewhat later in England, the greatest architectural projects that made use of Renaissance classicism were castles, palaces, and civic buildings. But in contrast to France and Spain, most German projects were on a decidedly smaller scale because of political realities. The area comprising modern Germany and Austria was part of the Holy Roman Empire, a loosely knit confederation of more than 350 states, ruled over in theory—if not always in practice—by an emperor chosen from the Habsburg dynasty. In the sixteenth century this powerful family had amassed significant territories outside the region, including the kingdoms of Spain, the counties of the Netherlands, and the New World colonies. These more prosperous territories became far more important to the dynasty than the traditional seats of Habsburg power in Austria and the German southwest. Although Charles V (r. 1519–1558) ruled over the Holy Roman Empire for much of his life, his positions as king of Spain and ruler of the Netherlands consumed more of his time than the rural and undeveloped territories of Central Europe. He visited Germany only occasionally, and centuries of feudal development in the region limited his power, allowing small territories and cities to become, in effect, semi-autonomous states. Thus court life on the massive scale typical of France or Spain was largely unknown in Germany. Before his death Charles divided his massive empire into two parts, splitting off his Spanish and Italian possessions as well as the Netherlands from the ancient German heart of Habsburg power. Charles' Spanish heir was Philip II, while his son Ferdinand (r. 1558–1564) succeeded him as Holy Roman Emperor; during his relatively short reign, Ferdinand concentrated his energies on resolving Germany's religious crisis, on his role as king of Hungary and Bohemia, and on his struggles against the incursion of the Turks into his Eastern European possessions. Despite these problems Ferdinand and his successors began to devote significant attention to the development of the court at Vienna. But this was a local phenomenon that affected only Austria and the other centers of Habsburg power in Eastern Europe. Ferdinand called several Italian artists to his court and he patronized a small circle of German masters. His successors followed this pattern, although the great age of the Austrian Habsburgs' patronage of art and architecture lay ahead in the seventeenth century. At this time Vienna and the surrounding Austrian countryside became

a great stage upon which the Habsburgs displayed their absolutist pretensions through the construction of monumental and imposing edifices. There was, in other words, no sixteenth-century Austrian Fontainebleau or Escorial, although the Habsburg emperors constructed several projects in their homelands on a decidedly more modest scale.

**COURTS.** For most of the sixteenth century Germany may have lacked the central state authority typical of France and Spain which inspired monumental architectural projects. More than 300 territories ruled by members of the feudal aristocracy and the Roman Church produced hundreds of courts, in which German princes were increasingly concerned to safeguard their power and to demonstrate their control over the small lands they held. Architectural projects were thus a visible result of the trend toward heightened local control. To imitate the greater princes of Europe, Germany's territorial rulers relied on building projects to express their increasingly grand pretensions. In the first half of the sixteenth century relatively few projects relied upon the innovative styles of the Renaissance. One notable exception was the remodeling of the Wittelsbach's Residence in Landshut. Landshut today is no more than a respectably sized town about an hour's train ride north of Munich. In the sixteenth century, though, it was an important center of the duchy of Bavaria's government. In 1536, the local duke visited Italy, where he saw the imaginative designs that Giulio Romano had crafted for the pleasure Palace of the Te. The duke recruited a small circle of Italian craftsmen and painters to come to Landshut, where they constructed and decorated a series of rooms in the city's palace that strongly resembled the Te. Such fervent devotion to Italian design, though, was rare among the German princes of the first half of the sixteenth century.

**RELIGIOUS CONTROVERSY.** The ideas of Protestant Reformers like Martin Luther and Ulrich Zwingli spread through German cities and the surrounding countryside quickly during the 1520s. Outlawed by imperial edict, Luther's views continued to attract significant support, particularly in the empire's towns and among some of its most prominent nobility. Growing tension between Protestant and Catholic factions of towns and the nobility produced brief, but vicious religious wars followed by attempts at reconciliation between both sides. In 1555, leaders crafted a compromise between the two opposing religious factions. Known as the Peace of Augsburg, this treaty stipulated that German rulers possessed the power to sanction either Lutheranism or Catholicism within their territories. Although most combatants in the religious disputes that had gripped Germany over the

previous decades thought of the treaty as a temporary truce, its solution to the problems of religious diversity proved to be particularly long lasting. The Peace of Augsburg forestalled religious war in Germany until 1618, introducing a period of stability that was unusual in Northern Europe at the time. One of the stipulations of the treaty had the unintended effect of producing a great flowering in church building. The Peace of Augsburg forbade Protestants from appropriating additional property belonging to the Roman Catholic Church. As a result, Protestant cities and princes constructed a number of new churches in the years after 1555.

**PROTESTANT CHURCHES.** While many important church-building projects had been underway in Germany during the early sixteenth century, new construction had generally ceased with the rise of the Reformation. Protestants had found the late-medieval trend to create ever larger and more elaborate side-aisle chapels within churches wanting, believing that such structures detracted from the central messages of the altar and the pulpit. These, their leaders intoned, were more suitable foci for the laity's devotion. Although they initially avoided new church construction, Protestants still placed their indelible stamp on existing structures. In many places the Reformers removed side-aisle chapels, and introduced more elaborate main altars and pulpits to underscore the change in church teachings. With the conclusion of the Peace of Augsburg, and the realization of its prohibitions against the further appropriation of Roman Church property, Protestants began to build new churches. At first no single style dominated, as designers searched for a distinctive style that might express their new religious convictions. By the end of the sixteenth century, though, a new style of construction began to appear. Designers adopted Renaissance classical elements to create spaces characterized by simpler sight lines, less ornate decoration, and better-lighted, vaulted spaces for the purpose of throwing into greater relief the central messages conveyed from the altar and the pulpit. The Marian Church in Wolfenbüttel, in a town today near the northern industrial city of Braunschweig, and the City Church in the Black Forest town of Freudenstadt in southwest Germany are typical examples of this new style. Both structures date from around 1600.

**CATHOLIC CONSTRUCTION.** Between 1580 and 1600 more church construction began in Germany than in all the other regions of Northern Europe combined. In contrast to the traditional designs of the later Middle Ages, those of the later sixteenth-century Catholic Church evidenced innovative new designs, designs that answered the calls of religious reformers, both Catholic

and Protestant, for renewal in the church's teachings and worship. These included St. Michael's Church in Munich, the headquarters of the new Jesuit order in the Bavarian capital. Modeled closely on the designs that Giocomo Vignola had perfected for the Gesù in Rome, the St. Michael's Church gave prominence to the High Altar by eliminating side aisles and truncating the normally long transepts that radiated from the church's crossing. While side chapels did not disappear altogether, they were tucked inside the walls of the church, so that all sight lines in the structure led eyes inexorably to the church's main focal point in the choir. In this way the designers of the church, and the Jesuit patrons who commissioned it, hoped to answer the call of the Counter-Reformation Catholic Church for greater focus on the centrality of the Eucharist in the Mass. In Münster in northwestern Germany, the Jesuits began the Peter's Church around 1590, a structure very much influenced by St. Michael's. During the seventeenth century the order continued to rely on a similar style throughout Northern Europe, which they hoped might focus the attention of their worshippers closely on the important features of Roman Catholic ritual.

**CASTLES.** As in other regions of Europe, the sixteenth century in Germany was a great age in the construction of palaces and castles. Like the châteaux of sixteenth-century France, the German *Schloss*, (meaning literally "keep") was more refined and elegant than the castles of the Middle Ages. They appear today more like grand homes than the fortress-like structures of the late-medieval period. Most were constructed of stucco and refined stone masonry, rather than the heavy and rustic stonewalls of the past. Although produced on a smaller scale than buildings of the kings of France or Spain, German palaces and castles often made imaginative use of the design tenets of the Renaissance, and merged the new classicism with older native styles of buildings in ways that were similar to trends in France and Spain.

**PROJECTS.** The boom in construction was particularly vigorous between 1560 and 1580. Among the Renaissance projects constructed at this time were a new castle for the Dukes of Brunswick-Wolfenbüttel in the town of Wolfenbüttel and a grand new section of the Palatine Electors' castle at Heidelberg. At Heidelberg, the local Duke Ottheinrich used his offices to try to introduce humanist learning into his small, but politically important territory. The new wing he constructed for his palace made use of ancient architectural forms, as well as design tenets drawn from Sebastiano Serlio's famous architectural treatise. Further south and east in Munich, the reigning Wittelsbach dynasty set itself to

remodeling their residence. Among the many important monuments they constructed at this time on the grounds of the residence was an Antiquarium, a new hall built under the family's library and intended from the first to house their collection of antiquities. Painted by the Netherlandish artist Peter Candid, the hall became the first museum to be built in Germany. These projects in Wolfenbüttel, Heidelberg, and Munich represent only a tiny fraction of the many princely projects undertaken in the later sixteenth century. Throughout the country the second half of the sixteenth century proved to be one of particularly vigorous building on the parts of Germany's nobles, as the country's princes made use of the relative domestic stability to indulge a taste for construction. The aristocratic embrace of refined palace architecture continued over time. Although initially dampened by the Thirty Years' War (1618–1648), the German princes' support of architecture survived to become one of the defining features of the court life of the later seventeenth and eighteenth centuries.

**CITIES.** Besides the presence of numerous courts throughout Germany, there were scattered throughout the country about eighty imperial cities that were relatively independent since they owed allegiance only to the rather distant figure of the emperor. It was in these towns that Germany's most vigorous circles of humanists had appeared in the early sixteenth century. As elsewhere in Europe, urban life proved to be one of the factors encouraging the adoption of Renaissance architecture. Germany's wealthy merchants, bankers, and patricians favored the new styles as an expression of their solidity and their embrace of humanism. Here the imperial city of Augsburg was the leader. There the wealthy banking family, the Fuggers, had a chapel built in the Church of St. Anna around 1510. They also remodeled three existing patrician houses on an important market square in the city, adopting new classical façades for their project. The inspiration for these projects came from the family's close association with Italy, particularly its trading contacts with Venice, although the designers for the Fuggers' Augsburg projects were Germans. Many other notable families in towns and cities throughout Germany imitated the architectural attentions the Fugger family had showered on their native city. From Augsburg's early embrace of classical design, Renaissance architecture spread quickly in all directions throughout southern Germany. By 1550, classically styled public buildings and houses decorated with ancient elements had appeared in Regensburg, Nuremberg, Basel, and Strasbourg, among many other cities in the region. Thereafter the taste for buildings in the Renaissance style spread even further a field throughout Germany. During the years between 1570 and 1620, for example, the towns of the Weser River valley in north central Germany experienced a building boom, and many of the new structures constructed at the time made use of the new fashion for Antiquity. While many projects undertaken during this "Weser Renaissance" had styles affected by the classicism of Renaissance architecture, older medieval patterns of building persisted, as they did elsewhere in Germany. Half-timbered houses continued to be constructed alongside the classical masonry styles favored by Renaissance designers. We would like to know more about the many architects who practiced in the Weser Renaissance, but, like most of the designers active in sixteenth-century Germany, their identities are rarely mentioned in contemporary documents. Most seem to have come from the stonemason and construction trades, and the buildings they constructed were often eclectic, mixing elements of the new classicism with those drawn from native traditions. Steep stepped roofs, a design style popular in the later Middle Ages, persisted in newer build-

ings that made use of Renaissance design elements. Many houses built at the time made use of Gothic and Renaissance elements simultaneously. During the Weser Renaissance, as elsewhere throughout Germany at the time, designers often built houses that ran perpendicular to the street on which they were situated. Thus in many cases the longest part of the house faced inward and was not visible to passersby, a contrast to Italy where architects had designed most domestic palaces since the fifteenth century to face the street with an impressive façade oriented to foot traffic. Urban vistas were rare in Renaissance Germany, and few great squares dotted the cityscape, as people huddled into the cramped spaces enclosed by a town's walls. Open-air markets, often sited in front of a city's major churches or town hall, were among the largest places in which people congregated out-of-doors. It was not until the late seventeenth and eighteenth centuries that many German towns began to realize plans for broader public squares and avenues like those envisioned in the works of Italian Renaissance architects.

**NETHERLANDS.** The outlines of architectural development in the Low Countries (today the areas making up modern Belgium and Holland) followed closely developments in Germany and France, although the heavily urbanized region allowed for the construction of fewer great castles. No new churches appeared in the region between the Reformation and the 1590s, the first major structure for the new Dutch Calvinist Church being the *Zuiderkerk* begun around that time in Amsterdam. Although Calvinism generally discouraged the building of large and elaborate church structures, the *Zuiderkerk* and the structures that imitated it were truly monumental structures filled with elaborate and often ornate decorations, when compared against other Calvinist-inspired churches throughout Europe. The great age of church building in Amsterdam and other cities throughout the Netherlands lay more in the Baroque than the Renaissance period. Netherlandish designers were particularly innovative in their planning of town halls, if not in their construction of castles, palaces, or churches. In 1561 the harbor city of Antwerp in Flanders began construction of an immense town hall based upon plans by Cornelis Floris de Vriendt (1514–1575). De Vriendt had studied in Rome and published books of engravings based upon his study of classical buildings. In comparison with many Northern European buildings at the time, de Vriendt's town hall is relatively restrained and has a simpler and more harmonious appeal. Its classical decoration shows a thorough understanding of antique building practices, and displays de Vriendt's

conscientious attempt to adapt that style to the very different climate and situation of Northern Europe. Antwerp's new town hall was an influential building as well. Even prior to its completion, designers from other towns in the region began adapting its plans in the construction of similar town halls throughout the Netherlands.

**ENGLAND.** The classicism typical of Renaissance architecture played little role in early sixteenth-century England where a vigorous tradition of building in the late Gothic style persisted. When antique elements appeared in the architecture of the island at this time, they were almost always treated as mere decorative elements to be elaborated upon in ways drawn from the Gothic tradition. A few notable exceptions to the almost universal love of Gothic architecture may have been built in the early sixteenth century. Recent theories suggest that Cardinal Thomas Wolsey's massive estate at Hampton Court, a property later given to Henry VIII (r. 1509–1547) when its owner was disgraced, may have originally been constructed in a style imitative of Italian Renaissance palaces of the time. A coffered ceiling and other details that survive at the site point to an original style influenced by Italian designs, albeit with rather poor craftsmanship. Whatever Hampton Court's original style, though, Henry VIII soon set about modifying its design to fit with more native traditions of palace building. The remodeling of the massive palace, then the largest in England, continued for almost a dozen years. At Nonesuch, another royal palace later destroyed, Henry allegedly entertained his taste for a palace in the Italian style, although the images that survive of the building suggest that he based his designs instead on fairly traditional models drawn from France and the Low Countries, rather than Italy. Throughout the sixteenth century Nonesuch remained one of the most popular of English royal palaces, although it had originated in a game of one-upmanship played against King Francis I of France. No great Renaissance classical churches survive from the sixteenth century, and the few churches and ecclesiastical building projects undertaken in the period were usually on a small scale and relied on the architecture of the past. The Reformation in England produced the same stultifying effects on church building that it did in France and the Netherlands, although in other respects Protestantism aided in the creation of a building boom. Soon after pushing his divorce from Catherine of Aragon through England's Parliament and contracting his ill-fated marriage to Anne Boleyn, Henry imitated the actions of some German princes by seizing the property of England's convents and monasteries. Cromwell realized great gains for the crown by selling these lands to English aristocrats and wealthy merchants. These, in turn, were made wealthy by their newly gotten gains, and they built a number of great country houses throughout England during the rest of the sixteenth century. Most of these structures followed traditional lines, although several magnificent exceptions stand out. At Longleat, Sir John Thyme designed a house constructed around 1572 that is noteworthy for its elegance and restraint. Built in Somerset, the house contained a number of beautiful bay windows, a typically English feature used at Longleat to accentuate the vertical lines of the great house. Inside the house Thyme moved the traditional English Great Hall to the structure's side, thus allowing for a central entrance hall and a symmetrical placement of the front door and many luxurious glass windows, a ridiculously expensive commodity at the time. This harmonious rationality had a number of imitators. At Hardwick Hall and Wollaton, two houses designed by Robert Smythson at the very end of the century, central entrance halls imitative of continental examples recurred. At Hardwick the design made the traditional Great Hall the center of the house, approached as it was by the building's

colonnaded entrance and interior hall. The growing importance of Netherlandish and German styles throughout Northern Europe influenced the designs of both Hardwick and Wollaton. In many respects, in other words, these houses seem to owe little to the Italian Renaissance. It was not until the seventeenth century, with the rise of figures like Inigo Jones (1573–1652) and the great designer Christopher Wren (1632–1723), that English architecture integrated fully the lessons of Italian Renaissance classicism. In buildings such as Jones' Banqueting Hall (1619), once a part of the royal palace complex at Westminster but now a venerable monument in the governmental quarters of Whitehall in London, Jones fully integrated the lessons of Renaissance classicism in a way similar to the Louvre rebuilding projects of Lescot. He repeated this successful formulation several years later in his Queen's House in Greenwich, a structure that demonstrates his increasing mastery of the tenets of Renaissance design, and at the same time still preserves some native elements of English architecture. Jones, a figure of the very late Renaissance, also laid out the great market square of Covent Garden along lines that many Italian fifteenth- and sixteenth-century designers might

Exterior view of Wollaton Hall in Nottingham, England, designed by architect Robert Smythson. © FARRELL GREHAN/CORBIS.

have envied. His innovative plans were to be followed a generation later by Sir Christopher Wren, who revived the architectural models of Andrea Palladio in England, and, in turn, created a native English style that today is popularly referred to as “Georgian,” in reference to the Hanoverian kings who ruled England in the eighteenth century. The origins of this widely popular style, which influenced British colonial design in the Americas, had their roots in sixteenth-century Northern Italy. Thus while the classical revival of the fifteenth and sixteenth centuries had little immediate impact on the architecture of England, its influence reappeared to shape British construction in the centuries following the Renaissance.

**IMPLICATIONS.** Throughout the continent the classicism that had first been born in Renaissance Italy in the early fifteenth century helped to reinvigorate native styles of architecture and to inspire new construction projects, notable for the inclusion of classical details, harmonious designs, and rationalistic proportions. The process of integrating the classical heritage into the very different circumstances of life that prevailed throughout Renaissance Europe was a long one. The rising popu-

larity of humanism as a scholarly movement helped to encourage the adoption of classical designs, and in the first stages—as in Hungary, Russia, and France—kings and princes who had a passing familiarity with the movement imported Italian architects to design new structures and supervise their construction. Over time, though, native architects dedicated themselves to mastering the tenets of the new Renaissance modes of construction. Architectural treatises and engravings helped to broaden knowledge of the buildings of Antiquity, as did the journeys of local craftsmen to Italy. In Northern Europe until about 1550, architects merely added Renaissance elements to buildings that were more traditional and Gothic in their feel and flavor. The fashion for classicism produced buildings in which ancient columns and orders combined to create a thicket of ornamentation similar to the highly decorative styles of the later Middle Ages. In Spain, the highly decorative Plateresque style made use of classical elements to form architectural filigrees more similar to the works of silversmiths than to those of ancient architects. Over time, as knowledge of the ancient world deepened, an increasing sophistication and appreciation of the classical uses of space, mass, and

ornament appeared. In France, this sophistication can be seen in the façade of Pierre Lescot's Square Court at the Louvre; in Spain, it found expression in the austere and severe Escorial; and in Germany, it was articulated in scores of castles and churches constructed in the second half of the sixteenth century. The quest to integrate the architectural forms of the ancient world into contemporary life proved to be more than just mere fad or fashion. In the new styles of churches that Renaissance classicism inspired, a rational, harmonious attitude toward space became an essential tool for both Protestants and Catholics to enhance the worship of ordinary Christians. Similarly, the new town hall projects constructed throughout Northern Europe with designs inspired by Antiquity gave expression to notions of order and the public good that prevailed when cities were ruled by long-standing traditions of civic involvement and self-government. And finally, for Renaissance kings and princes who were increasingly jealous of their power, monumental classical buildings revived the purposes of the temples and ancient public spaces of imperial Rome. The new structures showed subjects the necessity of submitting to the growing central authority of the state.

## SIGNIFICANT PEOPLE *in Architecture and Design*

---

### LEON BATTISTA ALBERTI

1404–1472

*Humanist  
Artist*

**IMPACT.** Leon Battista Alberti has long been considered one of the finest examples of the Renaissance “universal man.” During his relatively long life he mastered an enormous number of arts, made important contributions to humanist scholarship, and fulfilled administrative roles within the papal government and the noble courts of Italy. In the history of architecture he played a key role as a designer and in deepening contemporary understanding of the buildings of classical Antiquity. His treatise, *On the Art of the Building* (1452), had a great impact on later fifteenth- and early sixteenth-century designers.

**EARLY LIFE.** Alberti's early life had been filled with problems. He had been born illegitimate, the son of Lorenzo Alberti, a member of a powerful Florentine banking family. At the time Alberti's family was in exile from Florence, and as a young boy, he grew up in Genoa and Venice. He received his early schooling in Padua before attending the University of Bologna, then Europe's premier center for the study of church law. His father intended for Alberti to have a career in the church bureaucracy, but he died during Alberti's student days, and members of the Alberti clan appropriated his inheritance. Alberti was drawn to the ancient philosophy of Stoicism, which taught disregard for fortune and worldly cares, as a solace for these problems. One of his closest associates in his student days was Tommaso Parentucelli, a figure whom Alberti later served. Parentucelli became Pope Nicholas V (r. 1447–1455), the first humanist scholar to hold the office. As Alberti completed his law degree, he took holy orders and accepted a position within the church bureaucracy. In 1432, he finally visited his family's native Florence, where he remained for several years. His exposure to Florentine humanism and the vigorous artistic culture of the city left a profound mark on his subsequent development. The quality of Alberti's written work deepened. He wrote his famous *Book of the Family*, a work that analyzes the strategies that preserve great families over time, during this first period in the city. The work is a lively dialogue in Italian, an unusual innovation for a humanistic work of the time. Alberti's display of the possibilities of literary Italian helped to encourage other humanists to use the language. In Florence, Alberti also befriended the architect Filippo Brunelleschi, and in 1435, he composed a Latin treatise entitled *On Painting*. The work included a technical method for artists who wished to use linear perspective. Alberti likely learned these techniques from his friendship with Brunelleschi. He soon saw the need for a translation of his work into Italian since many of the artists of the time could not read Latin. A year after

completing the Latin version he issued his new Italian version. Alberti followed his treatise on painting with other works on artistic theory and practice, including his *On Sculpture* and *On the Art of Building*. This latter work dates from 1452 and its ten books written in Latin treat many aspects of the theory and practical application of architecture. Alberti relied on the ancient Roman architectural treatise of Vitruvius, but the views expressed in his work did not support a slavish imitation of antique designs. Instead he showed how classical symmetry, ornament, and proportion could be mined to solve contemporary design problems in new and imaginative ways. Alberti had acquired much of the obvious architectural sophistication evident in *On the Art of Building* while serving in the 1440s in the church government at Rome. One of the tasks he undertook in these years was the survey of the city's ancient monuments, and when his friend Parentucelli became pope, he took on many planning projects for the renewal of Rome.

**BUILDINGS.** Despite his professional duties and his scholarly interests, Alberti was also a practicing architect in his spare time. His first important design was for the Malatesta Temple, a project he undertook for the ruthless despot Sigismondo Malatesta at Rimini around 1450. Alberti was an official of the papal government, but he seems to have had few qualms about desecrating an existing church in Rimini by transforming it into a Roman-style temple intended to glorify pagan virtues. He clothed the existing church with a new skin of marble and planned a classical arched façade for the exterior. A change in Malatesta's fortunes left the building unfinished. Among Alberti's subsequent architectural plans, several works had broad influence. These included his plans for a new Rucellai family palace in Florence and his Church of St. Andrea in Mantua. Alberti's palace design successfully adapted classical elements to the building of a contemporary palace; his façade, harmonious and more elegantly refined than was the custom in Florence at the time, inspired later designers from other parts of Italy to adopt his style in similar projects. At the Church of St. Andrea in Mantua he forged massive barrel vaults to cover the church's nave, transepts, and choir, and for the crossing he designed an attractive dome. His design dispensed with the side aisles traditional in most Italian churches to this point. He recessed the lesser chapels of the church into the building's walls. In this way he created clear sight lines that focused on the church's central altar, at once creating a structure that was symmetrical and harmonious. In his architectural treatise Alberti had described beauty in building as an organic phenomenon that arose from the balanced

interrelationships of a structure's constituent parts. At St. Andrea, Alberti achieved his ideal, and elements of the structure can be found in many later Renaissance church designs, including that of St. Peter's Basilica and the famous Jesuit Church of the Gesù in Rome. This latter structure became, in turn, the model for many Baroque churches throughout Europe. Even in Alberti's lifetime, his architectural ideas bore fruit in new structures from the hands of other designers. Although his buildings were not particularly influential among Florentine builders, who preferred the more severe style first developed by Brunelleschi, figures working in Central Italy and Rome, in particular, relied heavily upon Alberti's designs in the decades that followed his death.

### FILIPPO BRUNELLESCHI

1377–1446

*Sculptor*  
*Architect*

**EARLY TRAINING.** The future architect Filippo Brunelleschi was born the son of a notary who worked for the city of Florence. His mother was from a prominent local family. Brunelleschi spent most of his life in Florence. As a child, Brunelleschi received a thorough education, including training in the reading of Latin, in the hopes that he might follow in his father's footsteps and become a notary. Early on, he took great pleasure in drawing, and in 1398, he joined Florence's Silk Guild, membership of which also included goldsmiths. Brunelleschi soon became a master of the goldsmith's trade. He completed his first commissioned sculptures in silver for the cathedral of the nearby town of Pistoia. By 1401, after having completed several other major sculptural projects, he entered the competition to create new bronze baptistery doors at the cathedral of Florence. The subject chosen was the "Sacrifice of Isaac," and Brunelleschi completed a highly dramatic and moving panel for the doors that still exists today. The judges of the competition were unable to decide between his submission and that of the sculptor Lorenzo Ghiberti. They asked the two to share the project, although Brunelleschi

allegedly refused. Disheartened, he turned now away from sculpture to study architecture. In the first decade of the fifteenth century he made several journeys to Rome, where he measured and studied the proportions of ancient buildings. He also became one of the first Renaissance figures to excavate ancient buildings so that he could examine their foundations. During these years he studied mathematics and geometry. Even in this early stage of his development as an architect, he became fascinated with problems of numerical proportions and perspective. Contemporaries in Florence credited him with solving the riddles of linear perspective, and his system for working out geometric relationships on a picture plane allowed artists to represent three-dimensional space in their paintings and sculptures more rigorously than previously. Up to this time artists had used perspective only intuitively. Brunelleschi's breakthrough permitted paintings and sculptures to be constructed with a single vanishing point in the background. This system found expression in the Florentine frescoes of the great painter Masaccio, and the theoretical treatise of the humanist Leon Battista Alberti on painting codified and communicated it to artists throughout Italy. Later in life, Brunelleschi used his knowledge of linear perspective in the creation of his architecture. In his designs for the Church of San Lorenzo he constructed the interior much like a three-dimensional pictorial space so that the lines of the building converged at a single vanishing point in the rear of the church.

**THE DOME.** Brunelleschi's first great achievement as an architect was his successful design of the dome over the crossing in Florence's cathedral. The construction of this massive church had continued throughout the fourteenth and early fifteenth centuries, even though no one knew at the time how a roof might be constructed between the enormous piers that stood at the central crossing of the structure. Florence's foremost builders had estimated that it might consume the wood of several forests to construct scaffolding sufficient enough to build a roof over the structure. Previous designers feared that any structure that covered this space could not stand without some kind of central support that rose from the cathedral's floor, thus obstructing the view of the altar. Brunelleschi turned to the problem and realized that a central support was unnecessary. The building might be covered with a freestanding dome made up of an inner and outer shell. In designing the dome he created a huge octagon drum, which added height to the structure and dispersed the dome's weight. He buttressed this drum with hemispherical constructions at its base. Over this, he created a huge conical structure supported by eight

stone ribs on its outer shell. Between these ribs, Brunelleschi devised a pattern of brickwork that added great strength to the dome's outer shell. Consequently the inner shell—in effect the ceiling of the church—hung from the outside ribs and masonry. Brunelleschi's accomplishments in building the dome were far more than a mere design marvel. The dome was the greatest practical construction feat of the fifteenth century. A key problem to contemporaries had been the issue of scaffolding, which Brunelleschi resolved by designing hanging platforms that could be moved up as the construction progressed and the dome grew higher. To bring materials to workmen who were hundreds of feet in the air, the architect built a system of sturdy winches that hoisted the stone, brick, and mortar to the scaffolds. Brunelleschi duplicated this system in the great projects he designed throughout Florence in the years after 1420.

**PUBLIC PROJECTS.** Brunelleschi's dome, completed in 1436, established his reputation as an architect of great merit. Despite the punishing schedule of his duties as master builder at the cathedral, the architect also undertook many commissions in Florence. These works form the foundation of the early Renaissance in architecture, and include his designs for the Orphanage of the Innocents (in Italian, *Ospedale degli Innocenti*), the churches of San Lorenzo and Santo Spirito, and the gemlike Pazzi Chapel on the grounds of the Church of Santa Croce. Key elements in Brunelleschi's classicism, which was not nearly as rigorous as that of later fifteenth- and sixteenth-century Italian architects, were the construction of graceful colonnades that supported Roman arches. The designer was the first European architect to rely on a system of clear mathematical relationship in his buildings. These are readily distinguishable to the astute observer, and in the fifteenth century these numerical proportions were intended to convey underlying religious and philosophical truths. The interiors of many of Brunelleschi's structures appear to many today as severe, since his buildings are less highly decorated than those constructed in later Renaissance styles. All his public buildings relied on simple gray *pietra serena*, a stone quarried near Florence, set against white stucco. The result was harmonious and elegant, and it was a style that Florentines embraced enthusiastically. Until the nineteenth century, buildings modeled on Brunelleschi's early Renaissance achievements were built in Florence and the surrounding region of Tuscany. The architect himself lived to see few of his creations completed, since the painstaking building processes of the time meant that their construction usually lasted over many decades. Lack of funds, too, sometimes dogged the construction of his

great public buildings in Florence, and changing tastes and demands altered some of his designs. Still, Brunelleschi has long been credited with being the “father of Renaissance architecture,” and his key position in the creation of the early Renaissance style is even now maintained, although more recent scholarship has located many of the designer’s seeming innovations within the contemporary context of widespread building practices in the Florence of his day.

## FRANCIS I

1494–1547

*King of France*

**UPBRINGING.** Francis I was born the cousin of King Louis XII of France. His father Charles was a Count of Angoulême and his mother was a member of the princely house of Savoy in northwestern Italy. When it appeared that he was to succeed his elder cousin as king, the young Francis and his sister Margaret moved to court so they could be trained to assume royal duties. During this time, however, their mother, Louise of Savoy, continued to supervise her children’s education, which appears to have been remarkably advanced for the time. Francis’ sister, the future Marguerite of Navarre, became an important advocate for reform in the church and an author of unusual distinction. Francis, on the other hand, led a spirited life that seemed to bear more resemblance to that of an itinerant and carefree knight than a man of state affairs. Early on in his reign he challenged the growing power of Spain, opposing its conquests in Italy and waging his own battles to achieve supremacy in the peninsula. On one of these campaigns during 1525, he was captured by Charles V at Pavia, and taken as a hostage to Spain. Later his sister, Marguerite of Navarre, successfully negotiated his release, in exchange for which Francis renounced his claims to his Italian possessions. He was twice married, first to the daughter of his cousin, King Louis XII, Claude de France, and later to Eleanor of Portugal, who was a sister of the emperor Charles V. Never faithful to either wife, Francis kept a long string

of mistresses, some of whom played important roles in court politics.

**RULE.** Francis was a competent, if not astute monarch. His foreign policy brought him continually into conflict with Spain and involved him in constant intrigues with Italy, England, and the papacy. Domestically, his policies were often authoritarian, but ineffective. During his reign the Reformation swept through France. At first Francis’ policies against the new religious ideas vacillated between toleration and condemnation. Toward the middle part of his reign he began to persecute Protestants, who multiplied despite his prohibitions. Under Francis’ rule, corruptions in the system of taxation and royal fiscal system worsened. Francis attempted to deal with these problems by creating a system of public debt that was secured by the taxes levied on the city of Paris. Corruption, nevertheless, persisted.

**PATRONAGE.** Francis compensated for his deficiencies in governing with his avid connoisseurship of the arts and architecture. From his earliest youth the king was a great lover of art, and early in his reign he built three stunning châteaux at Blois, Chambord, and Amboise. At this time the royal court moved from palace to palace on an annual progress. The itinerant nature of the court thus made necessary a large number of stately palaces and castles, but the progress was more than just a sign of royal extravagance. Through these annual circuits through the countryside French kings conducted royal business in the various regions of their large kingdom. The progress was often attended by elaborate royal entries, in which particular towns welcomed the king with elaborate processions and musical and theatrical performances. During the sixteenth century these entries grew more elaborate, and they often imitated Roman triumphs in keeping with the French taste for Renaissance classicism. The increasingly elaborate scale of court life in France necessitated an almost continual program of palace decoration. To undertake these projects, Francis brought Italian artists to France and he hired native craftsmen, too. He began by attracting Leonardo da Vinci to his court in 1516. Although the artist spent the last three years of his life there, he produced little in France beyond several drawings for a new royal château at Romorantin. The artist suffered a stroke shortly after his arrival, and his slow recovery affected his productivity. Several years after Leonardo’s death, Francis also lured the Italian painters Rosso Fiorentino and Francesco Primaticcio to France, where they worked on decorating a series of new rooms at the royal palace of Fontainebleau. As Francis’ reign progressed this great palace became the focal point for his most ambitious

artistic and architectural programs. Among the architects who left their stamp upon the Fontainebleau were Sebastiano Serlio, Giacomo da Vignola, and the sculptor Benvenuto Cellini. Later in his reign Francis focused greater attention on his plans for rebuilding the Louvre, the medieval royal palace within Paris. In 1528, he added a royal chateau that became known as the Madrid in the Bois de Boulogne, the woods just outside the Louvre. And in the 1540s, the native French architect Pierre Lescot began construction on a new central section of the palace, the Square Court, which replaced the old medieval structure that had stood at the spot. Lescot's façade for the new palace has long been judged the first truly Renaissance construction by a French artist. The Louvre rebuilding project was massive and lasted over many generations. While Francis' tastes in art and architecture were generally Italian, he favored portraitists in the Flemish tradition. Among these, Jean Clouet and his son Francis most often painted members of the royal court.

**ASSESSMENT.** In the sixteenth century Francis was known as one of the country's great kings. Since that time assessments of this larger-than-life figure have changed. Modern judgments have sometimes cast the king in a harsh light, pointing to his extravagance as well as the corruption that reigned in his government. At the same time even the most critical of assessments of Francis have had to take account of the great cultural legacy of his reign. In the construction of palaces, the amassing of a royal collection of art, and the support of humanistic scholarship, Francis outshone almost every other European prince of the time.

## ANDREA PALLADIO

1508–1580

### *Architect*

**TRAINING.** Palladio, the greatest architect of sixteenth-century Northern Italy, was probably born in Padua in 1508. At birth his name was Andrea di Pietro; he did not take the classical name Palladio until he was middle-aged. Around the age of 13 he worked as an apprentice

to a local stonemason, but he apparently did not stay in this workshop long. By 1524, records show that he had enrolled in the stonemasons' guild in nearby Vicenza, where he joined a local workshop. Eventually, his talents came to the attention of the local aristocrat, Gian Giorgio Trissino. Trissino was a humanist scholar and he soon became the young stonemason's patron. Under Trissino's influence, the future architect acquired some knowledge of Latin and studied Vitruvius' ancient treatise on architecture. At Trissino's urging, Andrea di Pietro changed his name to the Latin, Palladio, and with the elder aristocrat's support the designer made several study trips to Rome during the 1540s. On one of these journeys he met Michelangelo, and during all his stays in Rome he spent a great deal of time in the ancient center of the city, studying and drawing the monuments of the ancient Roman Empire.

**ARCHITECTURE.** Around 1540, Palladio had already begun to design buildings in and around Vicenza. His earliest commissions were for domestic palaces in the city and country villas. These works do not yet show a secure understanding of ancient Roman architecture. During the course of the 1540s, though, his mastery of classicism grew more assured. The most important commission Palladio received at this early stage in his career as an architect was for the reconstruction of Vicenza's Basilica. This complex, a series of local government offices, had been joined together in the later Middle Ages with a series of Gothic arcades. In 1496, one of these structures had collapsed, and during the following decades the government at Vicenza searched for an architect who might rebuild the structures on a more secure footing. Palladio won the commission, and the resulting building he created established his reputation as an architect of merit. Palladio continued in the 1550s to design domestic palaces, government buildings, and country villas in and around Vicenza. In his country villas especially, Palladio's works display his certain mastery over classical building styles and his ability to adapt those elements to contemporary situations. His structures were notable as well for the great harmony they achieved between interior spaces and the surrounding exterior gardens. Before his death in 1580, the architect had populated the region around Vicenza and the Veneto (Venice's mainland possessions) with a number of graceful and harmonious structures. Palladio's classicism was restrained and, in contrast to the great Venetian architect Sansovino, he used relatively little ornament. Porticos that made use of the region's gentle climate were one common feature, as was the so-called Palladian window, a structure in which side columns supported a hemi-

spherical shaped arch. In later years Palladio used his relatively severe but graceful style in two churches he designed in the city of Venice.

**THEORY.** Trissino had introduced Palladio to circles of humanists in Northern Italy, and Palladio nourished his scholarly interests even as he was busy designing his many domestic and public projects. His career testifies to the rising status that was accorded Italian architects in the sixteenth century. When his friend Trissino died in 1550, Palladio began to develop his own contacts among Northern Italian humanists. One of the most avid friendships of his later life grew to become a fruitful collaboration. In the years following Trissino's death, the humanist Daniele Barbaro influenced Palladio, and the two cooperated to produce an Italian translation of Vitruvius' ancient architectural work. Palladio wrote a commentary for this new edition and prepared a number of illustrations of the works that Vitruvius had discussed in his text. Both the illustrations and the translation were of undeniable importance in spreading knowledge of Vitruvius' architectural ideas. Few architects at the time had the advantage of Palladio's Latin education, and thus the edition became an indispensable tool for those hoping to design classically styled buildings. In his later years, the friendship with Barbaro, a member of a distinguished Venetian family, also helped to gain Palladio several commissions in the city of Venice. At this time Palladio also published his own work on theoretical treatise, the *Four Books on Architecture*. Palladio's work was just one of many produced by sixteenth-century designers. Its author had written sections of the work over a long period of time, and then in 1570 he rushed to get the book into print. As a result, the work contained numerous internal contradictions, and its illustrations sometimes defy the canons that the author sets out in the text. Later the artist's most accomplished student, Vincenzo Scamozzi, expanded the work and clarified its arguments. But even in its imperfect state, Palladio's text influenced architects throughout Europe, and somewhat later in America. In England, the famous designers Inigo Jones and Christopher Wren were disciples of Palladio's elegant style of building. Their influence, in turn, spread knowledge of his systems of design everywhere where English was spoken. Elsewhere in Europe, interest in Palladio's architectural treatises and in his villa projects gave rise in the seventeenth and eighteenth centuries to structures that continue to show his influence. It is for this reason that some scholars have argued that Palladio was the single most important architect in spreading the ideas of Renaissance classicism to the rest of Europe.

## DOCUMENTARY SOURCES *in Architecture and Design*

- Leon Battista Alberti, *On the Art of Building* (1452)—This humanist attempt to come to terms with the ancient architectural treatise of Vitruvius cast a wide influence over subsequent building in fifteenth-century Italy. Alberti argued that beauty was an organic phenomenon. Harmony between the constituent parts of a building was similar to the functions of the limbs and various parts of the human body. Take away one element and, Alberti warned, disaster might result. An architect who added too much ornamentation might similarly violate Alberti's canons of classical beauty.
- Filarete, *Work on Architecture* (c. 1460)—Antonio Averlino, known popularly as Filarete, originally circulated this treatise on building among noble and wealthy urban patrons in Italy in many manuscript editions. The text recounts the education of a prince by his architect, thus encouraging noble patrons to support the architecture of the Renaissance. It is illustrated, although many of Filarete's building prescriptions are drawn from the medieval past and are not in sync with the innovations of Renaissance design occurring at the time.
- Andrea Palladio, *The Four Books on Architecture* (1570)—A major architectural treatise by one of Italy's most accomplished Renaissance designers, this work treats many practical problems arising from construction and presents illustrations of Palladio's classically inspired buildings. Inaccuracies and disagreement between the illustrations and the text did not prevent this book from exercising a major influence on later designers, particularly in seventeenth- and eighteenth-century England and America.
- Sebastiano Serlio, *Treatise on Architecture* (1537)—The famous architectural theorist Sebastian Serlio served in many sixteenth-century courts, including that of the opulent King Francis I in France. His architectural treatise went through several editions, published in Italy, France, and the Low Countries, and was to have a wide

influence, particularly in Northern Europe. Serlio's books defined subsequent treatments of Vitruvian-inspired architecture, as later writers came to terms with the categories that Serlio had developed to treat the classical revival of the Renaissance.

Giorgio Vasari, *Lives of the Most Eminent Painters, Sculptors, and Architects* (1550)—This work is one of the first attempts to write a history of art and architecture from a biographical perspective. Vasari was himself a painter and he treats Italian artists from the time of Giotto until Michelangelo. He is frequently opinionated, and his work gave rise to a number of legends about various artists. He stresses that the development of Italian art occurred as an organic process. According to Vasari, the arts first began to bud in Italy in the time of Giotto.

Later, the bud turned to a bloom in the years after Masaccio, before coming to full flower in the time of Leonardo and Michelangelo. As a result, his assessments of contemporary architectural achievements placed great emphasis on the buildings of the High Renaissance and Mannerist artists.

Vitruvius, *Ten Books on Architecture* (1st century B.C.E.)—The most influential of ancient writings on building in the Renaissance, this work became the Bible for many designers anxious to revive the classical style. Alberti relied upon it in the fifteenth century to write his *On the Art of Building*. In the sixteenth century it was given an important new edition, labored over by the architect Palladio and his friend the Venetian humanist Daniele Barbaro.

## IMPORTANT EVENTS *in Dance*

- c. 1420 A Burgundian manuscript preserved at Brussels outlines the steps necessary to perform the *bassedance*.
- c. 1445 Domenico da Piacenza, dance master to the D'Este family at Ferrara, completes the dance handbook, *The Art of Leaping and Dancing*. Piacenza's work is the first to discuss the theory of dance.
- 1459 The lively Italian dance known as the *chiarentina* is performed before Pope Pius II. The *chiarentina* is full of hops and jumps and elaborate reel constructions.
- 1488 The anonymous book, *The Art and Instruction of Good Dancing* appears in print in Paris. It is the first dancing manual to be written for use in urban, rather than aristocratic society.
- 1499 A total of 144 performers are needed to stage the *moresca* dances that are performed in the intervals between the acts of four comedies staged in Ferrara. Throughout the following years the practice of staging elaborate *intermedi* between the acts of plays will steadily intensify throughout Italy.
- 1512 Henry VIII introduces the Italian practice of *masquerie* into the English court.
- 1528 In his important conduct book, *The Book of the Courtier*, Baldassare Castiglione celebrates dance as an essential skill necessary for the cultivated courtier.
- 1531 Thomas Elyot's *The Book of the Governor* recommends dance to gentlemen as a virtuous and civilizing pursuit.
- 1533 The first ordinances governing dance schools are enacted in London.
- 1539 Elaborate *intermedi* or interludes, which include dances, are staged during a comedy produced at Florence, which is presented to commemorate the wedding of Cosimo I de' Medici to Elenore of Toledo.
- 1545 The office of Master of the Revels is established within the Tudor Court to supervise entertainment.
- c. 1550 The *allemande* emerges as an independent dance form in France and spreads in the later sixteenth century throughout Europe.
- 1557 The term "suite" is first used to describe a grouping of dances.
- 1559 Catherine de' Medici becomes regent of France, giving important support to the development of the ballet in France.
- 1570 The Academy of Poetry and Music is founded by Jean de Baïf in France. The institution works to revive ancient Greek meters in French poetry and music, and leads to experiments in dance.
- 1572 The City of London grants a monopoly to three expert dancing masters to teach dance within the city limits.
- c. 1580 The *camerata*, a loose-knit organization of scholars and musical amateurs, supports the revival of ancient poetry, music, and dance in and around Florence.
- 1581 Fabrizio Caroso publishes his dance instruction manual *Il Balarino*.  
  
In France, the first *ballet de cour* is performed in the French court.
- 1583 The sexually suggestive dance known as the *sarabande* is prohibited in Madrid.
- 1588 Thoinot Arbeau completes his *Orchésographie*, a late-Renaissance dance manual

- that outlines a variety of dances just coming into fashion at the time.
- 1589 Catherine de' Medici, an avid supporter of dance and particularly of the French court form known as the *ballet de cour*, dies.
- c. 1590 Shakespeare begins to write his plays in London. These will make use of rich metaphors about dance's role in the cosmos.
- 1594 The English poet John Davies' poem "Orchestra. A Poem of Dance" praises the art for its ability to enhance people's sociability and argues that the universe itself is organized around principles that mirror the dance's harmonious choreography.
- 1600 Fabrizio Caroso's dancing manual *On the Nobility of Ladies* appears in Italy.
- c. 1601 The *chaconne* and *sarabande* are the two most popular dances in Spain.
- 1602 Cesare Negri publishes his important dance manual, *The Charms of Love*, which he dedicates to Philip III, king of Spain.
- 1606 Ben Jonson and Inigo Jones stage the influential *The Masque of Blackness* in King James' court in London.

## OVERVIEW of Dance

**DEVELOPMENT.** By the early Renaissance dance had flourished in Europe for more than a thousand years. Evidence for medieval dance, though, comes to us primarily from literature and art. With the coming of the Renaissance, new dance manuals appeared in both Italy and Burgundy, the two major centers of courtly dance of the period. In Burgundy, the first of these works was written around 1420, and in Italy somewhat later, in the 1440s. The Italian examples, in particular, show that there was already a high degree of choreographical sophistication in Renaissance dance by this time. The authors of these books were courtly dance masters who lived in the houses of Italy's nobles and who were charged with training noble children and courtiers in the dance steps. These dancing masters also staged elaborate spectacles for Italy's counts and dukes that expressed the rising taste of the period for pageantry and ritual. The dance masters considered their art to be an athletic exercise that displayed a courtier's intellect through his ability to subject the body to the mind. Italy's dance theorists reached back to ancient philosophy—particularly to Aristotle's *Nichomachean Ethics*—to elevate the status of dance into an art, rather than just a mere pastime. By contrast, Burgundian *bassedance* was an elegant form of processional dance that consisted of a rigid vocabulary of walking steps, performed either sideways, backwards, or in a forward direction. Popular at the court of Burgundy, it also spread to England, France, and other northern European regions, its diffusion aided by Burgundy's enviable position as one of the most brilliant courts of fifteenth-century Europe.

**HIGH AND LATE RENAISSANCE DANCE.** The development of dance as a social entertainment continued to expand during the sixteenth century, the period of the High and Late Renaissance. New forms of choreographed dances flourished in the elegant court societies of Italy and Northern Europe, notable now for their complex footwork and relatively rigid upper body positions. The styles, epitomized in the popularity of the

*branze* in France or the Italian *galliard* and *pavan*, owed much to changing fashions in court dress. Men and women now wore corsets that constricted the movements of the torso and the upper body. By contrast, tight leggings for men and women's bell-shaped skirts allowed the feet relatively more freedom to move than had the older long-flowing gowns of the fifteenth century. New types of shoes equipped with soles and heels allowed dancers a greater degree of flexibility on the floor. The dance manuals published at the time reveal an increasingly complex and elaborate language of steps. Jumps, skips, lifts, twirls, stomps, and hops, which had previously been avoided as unseemly and inelegant, came now to play a vital role in social dance. In their manuals, too, dance theorists argued that dancers were reviving the movements of the ancients and experiencing again the dance's power to unite the force of poetry and music to movement. They celebrated dance in ever more elaborate metaphors and imagery and promoted the art as a force for ennobling the human spirit.

**THEATER.** Dance also played a vital role in Renaissance theater, particularly in the spectacles staged in Europe's courts. In Italy, the *intermedi*, or interludes that occurred between the acts of plays, included dances. Since the humanist-influenced theater of the period favored five-act comedies based upon ancient Roman models, there were plenty of opportunities in an evening for dancers to display their skills. Often members of the court danced in these productions, but professional dancers also flourished in Italy's wealthy courts. During a festival of four comedies staged at Ferrara in 1499, more than 140 performers danced the sixteen *intermedi* that occurred between these plays' acts. Throughout the sixteenth century these interludes grew even more complex, mixing together song, poetry, dance, and music in ways that influenced later dramatic forms like the opera and the ballet. In France, the inspiration of Italian *intermedi* combined with older forms of court spectacle to produce the *ballet de cour*, a dance and musical entertainment staged in the royal court. Patronized by the queen regent Catherine de' Medici, the *ballet de cour* made use of a story line and a libretto text, and it enlisted members of the court as its dancers. It included recited poems, musical airs, and a succession of mimed and danced scenes. The English equivalent of the *ballet de cour* and the *intermedi* was the court masque, a form of entertainment that Henry VIII introduced into England from Italian examples in 1512. At these masques, disguised courtiers and professional entertainers rode into a palace's great hall atop an elaborate pageant wagon, and proceeded to present a series of dances and

songs to the court. Even Queen Elizabeth, notable for her restraint in expenditure, paid out generous sums for the celebrations of these masques. During her reign, the genre adopted some of the features of the French *ballet de cour* and the Italian *intermedi*, including the use of a unified story line and of complex and expensive stage machinery. The greatest masques to be celebrated in England were those written by the playwright Ben Jonson and staged by the architect Inigo Jones, which were performed in the early years of the seventeenth century.

**FOLK DANCE.** As the Renaissance matured in the sixteenth century, urban elites developed a dance culture similar to that which flourished in Europe's great courts. Wealthy merchants and political figures in the towns avidly studied the dance manuals of the time, and dance schools allowed them to learn the complex steps that had previously only been taught by resident dance instructors in the palaces of the nobility. As a result, dance became a mark of social distinction among gentlemen and gentlewomen. At the same time the sixteenth century records a rising chorus of complaints about the dances of the lower orders, the urban poor and peasants. Many of the charges made against their dances—that they promoted sexual immorality, that they wasted time, and that they were generally lascivious—had long been leveled against folk dances throughout medieval Europe. It was not until the Reformation and Counter Reformation, however, that religious reformers joined forces with civil magistrates in an effort to try to curb, and sometimes even to prohibit, such dancing. These officials tried to reform the celebration of Carnival, an occasion that frequently erupted into raucous dancing, and to curb the excesses associated with the celebration of the wedding feast, although these efforts were generally unpopular and produced few long-term results. Attitudes towards Europe's folk dances present us with a paradox. On the one hand, civil authorities and religious moralists feared that the dancing of the people was a source of disorder and sexual immorality. On the other hand, nobles and cultivated elites adopted many dances from popular culture, and thus folk forms played a vital role in dance's elevation to one of the "fine arts."

**TOWARD THE FUTURE.** By the conclusion of the Renaissance dance had benefited from at least two centuries of attention from dance masters, theorists, and cultivated elites who perceived in its practice an art form that might ennoble performers and audiences alike. The results of Renaissance innovation had raised the status of dance beyond the role that it had played as a sociable pastime in the Middle Ages to a point from which dance now competed against other art forms, like mu-

sic and the theater, for the attentions of noble patrons. Dance had found its way into the spectacles of court, and in art forms like the *intermedi*, the *ballet de cour*, and the masque, dance had come to play a key role in Renaissance pageantry. These developments paved the way for the rise of the professional ballet in the seventeenth century, an art form that has persisted since that time as a display of beauty, intellect, and sheer athleticism. Dance also had entered into the European imagination as a model of how social relationships might function in an ideal world. In courtesy books, like Thomas Elyot's *Book of the Governor* (1531), European social commentators recommended dance for its ability to teach its participants the disciplines and behaviors necessary for conducting life in a civilized society. Dance also played an important role in the fictions of the era, as dramatists like Shakespeare frequently relied on dance to emphasize key observations in their literary masterpieces. In his popular tragedy *Romeo and Juliet*, Shakespeare never let his star-crossed lovers share a dance, foreshadowing their dismal fate, while in his comedy, *Much Ado about Nothing* he underscored the successful resolution of the drama's many plot twists with a dance that began just as the curtain fell. Like Shakespeare, the Elizabethan poet John Davies glorified dance in his popular poem "Orchestra" (1594) as "love's proper exercise," and he described the movements of the planets themselves as a heavenly dance, with the sun, earth, moon, and stars progressing through an elaborate choreography in the heavens to the music of the heavenly spheres. In these ways dance entered into the Western imagination during the Renaissance as a force of civility, sophistication, and human inventiveness, and from this vantage point, the art continued to flourish for centuries to come.

## TOPICS in Dance

---

### COURTLY DANCE IN THE EARLY RENAISSANCE

**MEDIEVAL DANCE.** Dance is one of the oldest and most universal of human art forms. European cave art from the Stone Age depicted dancing figures, and dance flourished in the ancient societies of Greece and Rome. The ancient Greek word for poetry, *mousike*, referred to a series of stanzas that were delivered in song while dancing. The art form of dance is unique from the other

Renaissance arts in that the church did not dominate its development, and largely failed in its attempts to regulate it. Although there were some religious dances—particularly as part of the Good Friday celebrations that occurred prior to Easter—dance was largely a secular pastime by the thirteenth century, and every segment of the society participated: peasants, urban townspeople, and courtly societies. Another unique feature of dance was its inability to exist apart from music as an essential part of performance. Changing musical fashions have served to inspire new dance forms on the one hand, but dances have just as easily given rise to new tastes and fashions in music. Medieval sources testify to the vast popularity of dance, although before the fifteenth century no instructional or theoretical manual survives in Europe that allows us to reconstruct medieval dance steps. Our knowledge of the medieval forms of dance that existed in Europe on the eve of the Renaissance comes to us from paintings and frescoes and from literary sources. Two basic forms of dance seem to have been generally performed throughout the Middle Ages, of which there were a number of variations. The first, known as the *carole*, was common in folk and elite society alike, and was a kind of line dancing in which groups of men and women formed linear or circular patterns. Jumps and hops were common to the caroles, although some involved nothing more than a series of relatively peaceful steps. In addition, singing often accompanied the carole, and these songs were either sung in unison or in response to the chants of a leader. The most common kinds of songs to accompany the carole in the later Middle Ages and the early Renaissance were the *virelais*, the *rondeaux*, and the *ballades*. The second form, often referred to in the documents with the French word “danse,” was more elevated and consisted of groups of two or three dancers walking and making a series of elegant steps, struts, and glides. The possibilities of variation were limitless in such dances, and it is for this reason that this form of entertainment flourished in elegant court societies. Many courtly dances appear to have been international and spread from country to country through the efforts of professional entertainers who moved between courts. In France these entertainers were known as *jongleurs* (jugglers) and in German, *spielleute* (players). Jews often played a special role as well, since Jewish entertainers known as *letzim* were prized at court for their knowledge of dance steps. All these figures were itinerant. Traveling from place to place, they entertained nobles with dances, pantomimes, and song, often teaching those in court the latest dance steps. Medieval folk dancing, by contrast, seems to have been subject to a greater degree of regional variation.

**DANCE MASTERS.** The appearance of dance masters in Renaissance Italy reveals a new attitude toward dancing in the great courts of the region. Just how and when the dance masters of the Renaissance appeared cannot be determined, but by the mid-1400s many of Italy’s wealthiest, most powerful noble and merchant families already had a resident dance master. In contrast to the medieval entertainers who had traveled from court to court, the dance masters were permanent members of noble and merchant households. They trained the family in the latest dance steps as well as instructed them in a variety of other skills. They might be best thought of as a kind of physical education instructor, charged with teaching members of the household, not only dance but gymnastics, fencing, riding, and every kind of athletic endeavor. Beyond physical training, dance masters taught the children about manners and deportment (the proper carriage of the body), and they staged entertainments and choreographed dances and spectacles for the court. The variety of their tutoring duties mandated that the dance masters be highly educated figures skilled in the arts of music, painting, sculpture, poetry, mathematics, philosophy, and aesthetics. The appearance of these masters points to a key change between medieval and Renaissance attitudes toward dance. In the Middle Ages dance had been a relatively straightforward pastime that had flourished in court and village societies, usually at the end of the day as a social entertainment that concluded a festival, a hunt, the harvest, or a tournament. Steps had been so simple that most people probably learned them on the spot. In the Italian Renaissance court, though, dance grew more complex, becoming an art form that must be mastered through careful study. In addition, the dance master’s role in teaching skills besides dancing demonstrates the increasingly ritualized and formal character of Renaissance courtly life. Proper manners, good carriage or deportment, and the mastery of a variety of athletic skills were now important signs of social distinction.

**PROMINENT FIGURES.** A lineage of distinguished masters in fifteenth-century Italy flourished from the training of the early dance theorist and master Domenico da Piacenza (c. 1400–c. 1476). Piacenza served for many years in the urbane, sophisticated court of the D’Este family at Ferrara, where he not only taught dance to members of the court, but also choreographed a number of special dances for the family’s entertainments. He was also much in demand elsewhere in Italy, and frequently staged important dance entertainments for the peninsula’s wealthiest families. Sometime around 1445, Piacenza completed his dance manual, *On the Art of*

*a PRIMARY SOURCE document***THE GOLDEN MEAN**

**INTRODUCTION:** Domenico da Piacenza began his *On the Art of Dancing* (1445), the oldest surviving Renaissance dance manual, by treating the theory of dance before outlining its contemporary practices. His opening chapter defended dance against the charge that it wasted time by pointing to Aristotle's *Nicomachean Ethics*, an ancient work that outlined the doctrine of the "golden mean," the notion that human beings should avoid actions and emotions that are extreme, and instead search for the moderate position. Aristotle also treated dance in the *Ethics* as a way to harness the mind's power over the body, a position that Piacenza also relies upon in his defense.

Thanks to the great and glorious God for the intellects that by his grace are inspired. To Him belongs the honor and glory in all things intellectual and moral. The respectable and noble knight Mister Domenico da Piacenza wishes to petition with great reverence Him who, because of his holy humanism, has always blessed the said practitioner to treat this material to a good end. Although many object to this agile and elegant motion made with great subtlety and effort as one which is a waste of time, the practitioner cites the second [book] of *Ethics*. The author states that all things spoil or go bad if they go astray, that is, to extremes. Being moderate saves one. The wise Aristotle discusses movement well quite a bit in the tenth of *Ethics*. In other parts, even with his sensitivity, he could not draw forth the implications of his bodily motion through space. With *misura* [measure], *memoria* [memory], *agilitate* [agility], *maniera* [grace], *misura di terreno* [balance], aided by placing the body with *fantasmate* [imagination], he argues well that this art is a refined demonstration of as much intellect and effort

one can find. Not that if you perform this motion in the way that you do not go to extremes, I say that this refined art has natural goodness and many things because of its delicateness in its execution.

Note that no creature who has natural defects is capable of this refined motion. He [Aristotle] states that lame, hunch-backed, or maimed people of all callings will not succeed in this. One needs good fortune—which is beauty. The proverb goes, "The one made beautiful by God is not all poor." Nature must grace and sculpt from the foot to the head the practitioner of this art form. But beauty alone is not all required for this refined art.

Note that aside from being blessed by God with a good mind and body, one has to learn to discern the underlying structure of this refined art. He states that the foundation is *misura*, which governs everything quick or slow according to the music. Aside from this, it is necessary to have a large and deep *memoria*, which stores all of the corporal movements—natural and incidental—that are required by all performers depending upon the composition of the dances. Note that aside from all these things, it is necessary to have a refined *agilitate* and physical *maniera*. Note that this *agilitate* and *maniera* under no circumstances should be taken to extremes. Rather, maintain the mean of your movement, that is—not too much nor too little. With smoothness appear like a gondola that is propelled by two oars through waves when the sea is calm as it normally is. The said waves rise with slowness and fall with quickness.

**SOURCE:** Domenico da Piacenza, *On the Art of Dancing in Fifteenth-Century Dance and Music. Twelve Transcribed Italian Treatises and Collections in the Tradition of Domenico da Piacenza*. Trans. A. W. Smith (Stuyvesant, N.Y.: Pendragon Press, 1995): 11, 13. Annotations by Philip M. Soergel.

*Dancing*, the first theoretical and instructional handbook for the art of dance. For his theory of dance, he drew upon the *Nicomachean Ethics* of Aristotle, the text that outlined the doctrine of the "Golden Mean" and whose Tenth Book discussed beauty and pleasure in movement. Similarly, Piacenza advised his readers that dance provided a "refined and delicate demonstration of ... intellect and effort" and he counseled against extremes or jerks in movement. After treating the theory of dance along these Aristotelian grounds, he proceeded to outline the musical meters commonly used in Italy at the time and the various steps needed to perform dances. Piacenza's manner of treating first the theory of dance and then its practice had imitators in the many dance manuals that followed his early hand-

book. Two of these came from the hands of his students, Guglielmo Ebreo da Pesaro (William the Jew of Pesaro) (c. 1420–1484) and Antonio Cornazano (c. 1430–1484), both of whom were active in courts throughout Italy in the second half of the fifteenth century. Guglielmo Ebreo was much sought after as a dance master. Born a Jew, he converted to Christianity and took the name Giovanni Ambrosio, perhaps to increase his prospects at court. He spent most of his career working as a dance master at the court of the Malatesta family in Pesaro and Rimini, although he also worked for the ruling dynasties of Milan, Ravenna, Naples, Ferrara, Urbino, and Camerino, and for the Medici family at Florence. Ebreo earned special recognition for the quality of dance spectacles he choreographed for weddings, entries, and the

visits of state dignitaries, and his skill in the construction of elaborate entertainments meant that he was very much in demand. In 1463, he completed his own instructional manual on dance, a work that was less theoretical than that of his teacher, Piacenza. Antonio Cornazano, by contrast, was born a nobleman at Piacenza near Milan. Early on, he studied dance with Domenico da Piacenza before joining the Sforza family as a secretary around 1454. In the years that followed he also served as dance master to the young Sforza princess Ippolita, dedicating his first edition of the *Book on the Art of Dancing* to her in 1455. This work, like Ebreo's shows a great debt to the ideas of Cornazano's teacher, Domenico da Piacenza. Together these three treatises inspired many similar works over the following years that discussed both the theory and practice of dance.

**BALLO AND BASSADANZA.** Each of these manuals outlined two types of dance: the *bassadanza* and the *ballo*. The *bassadanza* was the Italian version of the French and Burgundian *bassedance*, although it was significantly different from this Northern European style. In a dance of this type lines or circular groups of dancers performed a series of steps in procession. The word "bassa," meaning "low," reveals one feature of the *bassadanza*: the feet stayed close to the floor. There were, in other words, no leaps or hops worked into the steps and the *bassadanza* was an elegant, if somewhat severe dance. A *ballo* or *ballo*, by contrast, was a highly choreographed dance with a more playful dimension, in which a couple or several couples performed a series of dances involving changes of speed and steps. Oftentimes, *balli* followed a story line, which required a higher level of choreography. A key difference between the *bassadanza* and *ballo* at this time seems to have lain in the music available to each. *Balli* were choreographed for a specific piece of music that fit with the steps of the dance master's choreography. A *bassadanza*, on the other hand, was more often performed with any piece that had a suitable tempo, meter, and length for the steps chosen. Although the dance manuals recommended that all dancers develop a fluid and beautiful line, displays of mere technical prowess on the dance floor were generally discouraged in these manuals. These styles of dance constituted courtly entertainment, and thus the authors advised their aristocratic readers to avoid unseemly movements or specific dances that might tarnish their reputations. The dancer's body should become, these writers observed, an expression of beauty and of the dancer's own intellect. Courtly dance was thus a restrained art, different from the athletic proficiency displayed by professional performers. At the same time all three writers allowed men a greater degree

of flexibility on the dance floor than women. A male dancer's jumps were to be higher and his steps could be ornamented more vigorously. A woman's conduct on the dance floor was expected to be more modest, and although she was always to stand tall, she was expected to keep her eyes downcast as a sign of modesty.

**BURGUNDY.** Unlike Italian court dances of the fifteenth century, which were characterized by great complexity, difficult choreographies, elegant footwork, and other bodily disciplines that expressed the taste of the Renaissance for a language of movement that was refined and difficult to achieve, the styles of dance that flourished in Northern Europe at the time were heavily influenced by the tastes of the court of the Duchy of Burgundy, a powerful territory in the center of Europe. While Burgundian dance was very refined, its steps were simpler and its choreography less difficult to master than the Italian models. It is perhaps for this reason that we find evidence of the appearance of dance masters in Northern Europe much later than in Italy. Burgundy was a territory that was officially subject to the French king, but which had by the end of the fourteenth century acquired a vast amount of land in central and northwestern Europe, including Lorraine, large parts of northern France, and the Netherlands or Low Countries (modern Belgium, Luxembourg, and Holland). These areas included some of the wealthiest commercial centers of Europe, and in the early fifteenth century, Burgundy's style of court life influenced many other European regions. Courts throughout Europe sought out Burgundy's music and musicians, and its dance form—the *bassedance*—affected tastes in dance in places far from the center of Burgundian power.

**BASSEDANCE.** The *bassedance* was a line dance that consisted of only five steps: single steps, double steps, branle, reverence (a bow or curtsy), and reprise. Very strict rules governed the ways in which these steps could be arranged, and dances that followed all these rules were known as common dances. Others that slightly altered these conventions were known as uncommon forms. It is difficult to reconstruct these steps precisely from the few technical descriptions that survive, although artistic evidence does provide some clues. Burgundian dance did not emphasize the technical display of skill, but slow and graceful movements of the feet and the upper body. Like the early Italian *bassadanza*, which had originally been inspired by the Burgundian *bassedance*, this form was to be performed "low," that is, without hops and skips. The elegant, controlled steps allowed the lines of the dancers' bodies and the folds and drape of their clothes to be brilliantly displayed.

### FEMININE MODESTY

**INTRODUCTION:** All writers of dance manuals firmly insisted on a distinction between the sexes in dance. William the Jew, who converted to Christianity and changed his name to Giovanni Ambrosio, was one of the great fifteenth-century Italian dance masters. In his dance treatise, *The Art of Dancing*, he gave these rules to his female readers.

For the young, virtuous woman who delights in learning and understanding such exercise and art, it is necessary to have a rule and manner with much more modesty and honesty than for the man ... Her *movimiento corporeo* [bodily movements] should be humble and controlled, with a worthy and noble body carriage, agile in the feet, and with well-formed gestures. Her eyes should not be arrogant or flighty, looking here or there as many do. Most of the time, they should be honestly glancing at the floor, though the head should not be lowered in the chest, as some do, but should be straight up and corresponding to the body, as nature herself would teach. Her moving should be agile, graceful, and moderate, because when performing a *sempio* [single step] or a *doppio* [double step] she needs to be well adapted. Also for the *riprese* [sideways movements], *continentie* [sideways steps], *riverentia* [curtseys], and *scossi*

[rises] she needs to have a human, gentle, and sweet manner. Her mind should always remain attentive to the harmonies and *misura* [beat of the music] so that her actions and sweet gestures are well composed and correspond to them. At the end of the *ballo* [dance] when left by the man, she turns entirely around to him and with a sweet glance at him performs a compassionate and honest *riverentia* [curtsey] to that of the corresponding man. Then, with a modest attitude she goes to rest, noting the actual defects of others, the correct actions, and the perfect *movimenti* [movements]. If these things are well noted and prudently observed by the young woman, she will be notably adept in the aforesaid art of dancing, worthy of virtuous and commendable fame. So much more, because it is most rare for women to perfectly understand such virtue and art. They use such exercise as a random practice rather than as a science. Some of them often commit errors and oversights and are reprimanded by one who understands. With devoted disposition for their comfort let all attentively read this little work of mine. It will offer them very refined and virtuous fruit.

**SOURCE:** Guglielmo da Pesaro or Giovanni Ambrosio, *The Art of Dancing in Fifteenth-Century Dance and Music: Twelve Transcribed Italian Treatises and Collections in the Tradition of Domenico da Piacenza*. Trans. A. W. Smith (Stuyvesant, N.Y.: Pendragon Press, 1995): 141–142. Italian terms translated by Philip M. Soergel.

Since it was a highly stylized, dance-like procession, its steps involved simple, short movements of the feet, the raising and lowering of the body, and gentle sideways motions. In the final step—the reprise—dancers moved backwards, and great care needed to be taken so that the women did not trip on the elaborate trains popular in Burgundy at the time. The shoes worn at Burgundy's court at the time were known as *poulaine*, and they were long constructions in felt that ended with a high-rising point at the toe. While preventing a great freedom of movement, the *poulaine* allowed the graceful stepping movements typical of the basse dance, and they also accentuated the line of the foot, thus adding to the impression of the dancer's elegance. The range of steps was limited, yet at the same time, modern reconstructions of the Burgundian basse dance have shown that it can be a remarkably expressive form. Like Italian dances, the basse dance inspired its own manuals of instruction, including an anonymous fifteenth-century manuscript written at Brussels around 1420 and a later anonymous dance manual published in Paris in 1488. This later book, *The Art and Instruction of Good Dancing*, con-

tained instructions about the music that should accompany these dances. It stipulated a tenor line for the music above which up to three layers of instruments might improvise harmonies to accompany the dance. Typically, the *sackbut* (an early trombone) played the tenor, while *shawms* (the Renaissance counterpart of the modern oboe) performed the improvised lines.

**OTHER REGIONS.** The Burgundian style of basse dance was already well developed as a form in the early fifteenth century and maintained its popularity in many of the courts of Northern Europe throughout the century. It was performed in France, England, and in certain parts of Germany and Spain at the time. Certainly, other forms of dances may have flourished in Northern European court societies, but the lack of documentation makes it difficult for us to reconstruct many of the precise details of dance in Western Europe during the fifteenth century. In the sixteenth century an increase in sources reveals the rising popularity of dance as a form of entertainment as well as its steadily increasing repertory of forms.

## HIGH AND LATE RENAISSANCE COURTLY DANCE

**FASHION.** The styles of courtly dance popular in fifteenth-century Italy and Northern Europe favored restraint in the use of the body. The Burgundian bassedance was intended to be an elegant dance procession that displayed the rich splendor of courtly costumes. Sudden jerks, quick steps, and hops were avoided in favor of an understated repertory of subtle footwork that showed off the long, flowing lines of dancers’ bodies and their costumes. Despite the greater complexity of Italy’s courtly dance, the Italian dancing masters of the time similarly urged restraint in their dance manuals. Changing fashions, both in clothing, shoes, and dance itself, altered the types of movements used in courtly dancing in the sixteenth century. For much of the fifteenth century Burgundian and Italian women’s fashions had favored a long flowing gown under which was worn a simple white chemise. The trains of these creations restricted sideways and backward movements because of the great lengths of material that trailed behind a woman as she moved on the dance floor. At the outset of the sixteenth century the corset came into use and was adopted by both men and women. In women’s dress, its rise to popularity inspired new styles in which the bust line was flattened and the bodice tapered toward the waist in a funnel-like shape. Bulky skirts then flowed from the waist to the floor, often flaring outward into a bell-like shape. The upper portions of both men’s and women’s dress, with their whale-boned corsets, restricted the movements of the torso. The fashion that developed later in the century for ruffled starched collars similarly constricted head movements.

At the same time, the broad, bell-shaped skirts allowed women’s feet to move with relative freedom, as did the tights favored by fashionable courtly men. New styles of shoes, too, allowed greater flexibility in steps. Shoes with soles and heels became common among the nobility, allowing dancers to stomp and stamp their feet and protecting them from splinters and other debris on the floor. Thus while the upper body grew more rigid, the feet at the same time could explore a greater range of movement than before.

**REFINEMENT.** Italian courts continued to lead the way in creating complex social dances in the sixteenth century, and Italy’s dances spread to many Northern European courts. At the very end of the Renaissance three technical manuals published by the great Italian dance masters Fabrizio Caroso (c. 1527–c. 1605) and Cesare Negri (c. 1535–c. 1604) allow us to gauge the changes that had occurred in attitudes toward courtly dance since the fifteenth century. Both Negri and Caroso laid incredible stress on the proper execution of steps, setting down a large number of rules for the proper performance of each. Caroso continually warned his readers about the possible pitfalls that existed in each dance step, and he spent a large amount of his treatise cautioning his readers about proper deportment at a ball. In addition, he prescribed how men and women should treat their dance accessories—swords, gloves, handkerchiefs, fans and so forth—so that all their movements at a ball were closely choreographed. This increasing emphasis on social refinement was partially inspired by the humanist fashion for Antiquity, as writers like Negri and Caroso argued that modern dance revived the virtues of movement of the ancient Greeks and Romans. In his dance manual, *Love’s Graces*, published in 1602, Cesare Negri contrasted the art of dancing with another popular courtly pursuit: jousting. Jousting, he argued, was the provenance of the ancient god Mars, while the goddess Venus ruled over the dance floor. In his two popular treatises on dancing, *The Ballerina* (1581) and *The Nobility of Ladies*, Caroso gave ancient Latin names—drawn from the poetry of Ovid and Vergil—to the new dances he created. The styles outlined in Caroso’s and Negri’s works were more elaborate than ever before and were now choreographed for groups of up to four couples. Many new steps, too, had been added to the dancing repertoire. In addition to the traditional walking and running steps, bows and reprise steps (which were performed backwards) new foot crossings, leg raisings, and swings flourished, as did vigorous foot stomping. Single-sex dances and solo dances thrived in the period, and many of the new complex

*a PRIMARY SOURCE document***BEHAVIOR ON THE DANCE FLOOR**

**INTRODUCTION:** Fabritio Caroso published *The Nobility of Ladies*, a dance manual, in 1600 at Venice. The work expanded upon another manual he had published about two decades before. In the *Nobility*, he included dialogues between a dance master and a gentleman disciple in which he set out rules for conduct at balls. His style was lively, and he left nothing to chance, as this exchange over the matter of a man's gloves and cape shows.

**Disciple:** Please Master, I pray you to teach me the gentleman's comportment at a party.

**Master:** I will do so, if you are patient. Let me say, then, that there are some gentlemen who go to parties wearing gloves so tightfitting that, upon being invited to dance by the ladies, and preparing to take hands, they must take more time than an 'Ave Maria' to remove [them]; and if they do not succeed with their hands, they even use their teeth! When they do this some accidentally drop their capes (or riding cloaks). This also pays little honour to the lady who has invited one, by making her wait so long. It is better, then, to wear gloves that are fairly loose rather than too tight, for on occasion I have seen [a gentleman] on trying to remove them with his teeth, who has had one finger of the glove left in his

mouth, while all in attendance at the party laughed at this behaviour.

**Disciple:** Is there anything else you wish to advise me of, Sir?

**Master:** Yes, of course. Let me say, then, that there are others who, while dancing a grave dance, or promenading with a lady, take one side of their cape in their left hands and put it over their left shoulders, leaving the other [end] hanging down so far that it trails along the ground, which is awkward and doesn't look well; for though ladies are permitted to trail their dresses, or trains (if you will), this is not suitable for a gentleman. There are still others who wear their [cloaks] even more improperly while dancing, for they wrap themselves up as if swaddled, which has two unfortunate consequences; first, that they cover their swordhilts; and the other is that the swords are so obstructed that if they should be needed, they could not be [got at], thereby endangering their lives, which is a bad and perilous habit. So I advise you to wear your cape, or any mantle with which you cover yourself, in the style I have shown you above, and always to shun this bad behaviour since it displeases everyone, and could cause the entire company to ridicule you.

creations choreographed by the dancing masters of the High Renaissance bore elaborate titles and were dedicated to noble patronesses.

**NEW FORMS.** One of the most popular dances to flourish in the sixteenth century was the *branle*, a couple's dance that had originated in France, but which soon spread to most of Europe. Branles developed out of the sideways steps that were prescribed in fifteenth-century *bassedances*. In his dance treatise, *Orchesographie* (1588), Thoinot Arbeau outlined three kinds of branles that were practiced at the time. These included the simple branle, which consisted of either single or double sideways steps; the mixed branle, which included hops on one leg; and the mimed branle, which incorporated the steps of the other two but also required that performers mime facial gestures and hand movements. Here the *Washerwoman's Branle* and the *Maltese Branle* were among the most popular forms. The boisterousness of the branle form, which evolved over time to include foot stomping, hand clapping, and other exaggerated pantomimes, helped to sustain the dance's popularity throughout the sixteenth

century. Not all observers, though, found the style worthy of inclusion in court balls. In his famous conduct manual, *The Book of the Courtier* (1528), Baldassare Castiglione warned courtiers and princes against performing the branle in public, arguing that its extremes of motions were not compatible with the decorum necessary for court life. The branle style seems to have been resisted in England for a time, where its English term—the brawl—suggests some of the noisome and “peasant” qualities associated with the dance. In both Italy and England, though, the branle established itself as a popular court entertainment throughout Europe after 1550. In his dance treatises written in 1602, Cesare Negri included several late sixteenth-century examples of branle or *brando* as they were known in Italy, that had been performed in some of the most elevated court circles of the peninsula.

**GALLIARD AND PAVAN.** By far one of the most difficult dances that flourished in the sixteenth-century court was the *galliard*. Of Italian origin, it quickly spread to almost every corner of the continent. Within the

*a PRIMARY SOURCE document***A PERFECT UNION**

**INTRODUCTION:** The English gentleman Thomas Elyot modeled his conduct book, *The Book of the Governor* (1531), on Baldassare Castiglione's famous *The Book of the Courtier*. While Elyot wrote for an elite reader, his work was notable for disseminating the ideas of civility and courtly manners among the English gentry (a wealthy, but non-aristocratic class of wealthy landowners and commercial figures). Elyot's book also included one of the most enthusiastic endorsements of the art of dance in the sixteenth century. For several pages he catalogued the virtues that accrued to those who mastered its complexities, showing the gravity with which Renaissance thinkers considered the art form. In the following excerpt, he celebrates dance's power to achieve a perfect marriage of the contrasting natures of men and women. In dance, he argued, the ideals of the sacrament of matrimony were actually achieved. Each sex on its own is incomplete before the dance, but when joined in its artful motions, their natural qualities are brought into the perfection of the "golden mean."

But now to my purpose. In every dance of a most ancient custom, a man and a woman dance together, holding each other by the hand or the arm, which betokens concord. Now it behooves the dancers, and also their audience, to know all the qualities incident to a man, and also all the qualities that also pertain to a woman.

A man in his natural perfection is fierce, hardy, strong in opinion, covetous of glory, desirous of knowl-

edge, hungers to reproduce his likeness. The good nature of a woman is mild, timorous, tractable, benign, with a good memory, and modest. Certainly, many other qualities of each [of the sexes] might be identified, but these are the most apparent, and for our purposes sufficient.

Therefore, when we behold a man and a woman dancing together, let us suppose there is a concord of all these said qualities, being joined together, as I have set them here in order. And the moving of the man is more vehement, while the woman is more delicate, and she moves with less advancing of the body. These [qualities] signify the courage and strength that ought to be in a man, and the pleasant soberness that should be in a woman. And in this wise fierceness, joined with mildness, severity is formed. Audacity with temerity produces magnanimity; willful opinion and tractability (which is to be shortly persuaded and moved [by the dance]) makes constancy a virtue. [Man's] search for glory adorned with [a woman's] benign nature produces honor. [His] desire for knowledge combined with woman's good memory procures Wisdom. [Women's] modesty joined to the [male] appetite for generation makes continence, which is a mean between Chastity and inordinate lust. These qualities, in this wise being knit together, and signified in the personages of man and woman dancing, do express or set out the figure of very nobility, which in the higher estate it is contained [there], the more excellent is this virtue's estimation.

**SOURCE:** Thomas Elyot, *The Booke Named the Governor* (London, 1531): L1v–L2r. Text modernized by author.

galliard, the male dancer makes a series of five jumps, shifting his weight back and forth from side to side. This feat must be performed within a musical interval of six beats. More complex and difficult jumping patterns were also common in the galliard, allowing dancers at court to demonstrate their prowess on the dance floor in a way that had generally been avoided in the more restrained fifteenth century. In his *Orchesographie* (1588) Thoinot Arbeau included a number of variations on the basic galliard as well as some choreographies that linked together two five-jump variations into an even longer eleven-step variation. By contrast, the *pavan* was more restrained and dignified. It consisted of two single steps walked forward, followed by a double step. Of Italian origin, the pavan was first mentioned in texts in the early sixteenth century. Its name may derive from the Latin word for the city of Padua, or from the Spanish word for a peacock's tail. The pavan was in many respects similar to the

bassedance styles that had flourished in fifteenth-century northern Europe in its restraint and use of staid and grand music.

**ALLEMANDE.** Little is known about the origins of this form, although the dance's name, the French word for "German," suggests that its origins may lie in Germany. Some have suggested that it developed as a German form of the bassedance. By 1550, the *allemande* was considered its own independent dance form. In this dance a group of couples stand beside one another and fall into a procession that moves across the dance floor. At the other end of the floor each male partner turns his female partner, and the progress is repeated in the opposite direction. By the end of the sixteenth century the allemande had grown more complex with small jumps or leg lifts worked into some of its surviving choreographies. The allemande's music witnessed a long life. The surviving music composed for the dance in the sixteenth

Dancers performing the galliard, from Thoinot Arbeau's *Orchesographie*. HULTON ARCHIVE/GETTY IMAGES. REPRODUCED BY PERMISSION.

century shows that the form was innovative in its exploration of changes in tonality as well as tempo. It is perhaps for this reason that allemandes continued to be written as music long after the popularity of the dance had faded on the ballroom floor.

**OTHER FORMS.** The great popularity of dance as an entertainment in the High and Late Renaissance court gave rise to an almost infinite number of styles. There were couple's dances like the *volta* in which the dancers held themselves in a tight embrace, moving around the dance floor. At regular intervals in the *volta* the man thrust his female partner high into the air by grabbing her firmly at the back, and the couple then performed a series of turns in this position. Considered obscene by some authorities, the dance was banned for a time in early seventeenth-century France during the reign of Louis XIII. Its freedom of movement and athleticism, however, inspired its popularity, and the dance spread far from its origins in the southern French region of Provençale. The *chiarentana*, by contrast, was an elaborate figure dance preceded by a staged chase in which men picked their female partners. The dance that followed made use of complex patterns of line dancing, reels, and figure eights that some authorities, including the great dance expert Fabrizio Caroso, found confusing and difficult to perform. Simpler and easier to learn were the "country dances," figure dances that flourished in the courts and noble households of France and England at the time and which harked back to rural line dances and earlier bassedance forms. Similar to modern square dancing, the country dances might be learned quickly,

since only the first couple that stood at the head of the line needed to be certain of the various steps that were to be performed for the dance to begin. Others might learn the dance merely by imitating the actions of the first couple.

**DANCE MUSIC.** The writers of dance manuals had usually informed their readers about the kinds of musical meters used to perform particular dances, often even including tunes in their guidebooks for performance. Printed music became more popular in the sixteenth century, giving us a clearer glimpse of the kinds of dance music that flourished at the time. The first printed collections of dance music issued from the houses of Ottaviano de Petrucci at Venice and Robert Attaignant in Paris in the early sixteenth century. Printed music was an expensive commodity and thus was likely only to have been used in the wealthiest noble houses and merchant families of the time. Most collections were scored for lute (the most common household instrument), for the keyboard, or for small ensembles of wind and brass instruments. Throughout the sixteenth century printed dance music grew more popular, and toward the end of the century printed dance music popularized dance suites that had been recently performed in some of Europe's greatest households. These dance suites were often specially written to accompany highly choreographed "ballets" created by dance masters in these courts.

**IMPLICATIONS.** The wealth of dance forms that flourished in the sixteenth century points to the rising

Portrait of Cesare Negri from the frontispiece of his dance manual *Nuove inventioni di balli*. AMERICAN MEMORY/THE LIBRARY OF CONGRESS.

importance that dance played as a marker of social distinction and cultivation in courtly societies at the time. In the dance manuals of Italy and France, theorists like Negri, Caroso, and Arbeau celebrated the art as a sign of the era's kinship with classical Antiquity, and they left little to chance in the choreographies and recommendations that they prescribed to their readers. Dance as an art form had clearly come of age in Renaissance courts, and the clear distinctions of genres and forms that developed at the time expressed the era's determination to mold the actions of the body to the creative impulses of the human mind.

## THEATRICAL DANCE

**TYPES.** Dance played a vital role in Renaissance theater. In Italy, troupes of *Commedia dell'Arte* performers relied on songs and dances to break up the action of their improvised comedies. Dances and musical interludes became a feature of the intermissions of the early professional theaters common in Europe's largest cities during the sixteenth century. The surviving sources, though, give little information about the kinds of dances that were performed in these circumstances. In aristocratic society, by contrast, dance flourished as an important component of court spectacles and was well recorded in the documents of the period. The fifteenth and sixteenth centuries saw a steady increase in the theatricality of these entertainments, as kings and princes competed with each other to create ever more elaborate spectacles. Such entertainments were almost always undertaken with the purpose of demonstrating a prince's power and wealth to foreign visitors. Diplomatic visits, dynastic marriages, and ceremonies of royal entry were just a few of the many important political occasions for which elaborate spectacles were mounted. Dance played a key role in these celebrations, and its popularity in the Renaissance provided a constant source of employment for the prominent dance masters of the day who choreographed these productions.

**BANQUETS.** During the fifteenth century Europe's nobles marked important occasions with "theme" banquets. The rise of these great feasts can be traced to the Duchy of Burgundy, which influenced aristocratic tastes throughout Europe in these years. Philip the Good, who served as Duke of Burgundy between 1423 and 1467, established a court life notable for its lavish display and intricate rituals. In 1430, Philip founded an order of nobility on the occasion of his marriage to Isabella of Portugal. This Order of the Golden Fleece was intended to promote chivalry and to mediate disputes between nobles. With the fall of Byzantium to the Turks in 1453, however, Philip devised a plan to use the order to promote a new crusade that might wrest the Holy Land from Islamic control. At his famous "Feast of the Pheasant," held in 1454, Philip announced his vow to un-

Marguerite de Valois dancing the volta at court. © GIRAUDON/ART RESOURCE, NY. REPRODUCED BY PERMISSION.

dertake the campaign and encouraged other members of the Golden Fleece to follow suit. The evening's festivities soon became famous throughout European aristocratic society and set a bar that later Renaissance princes tried to surpass. As Philip's disguised guests arrived in the hall, they encountered elaborate *entremets* or sculpted concoctions of food that adorned the tables. Originally, such platters had consisted of nuts and other lighter fare that guests consumed between the feast's courses. Philip's ingenious chefs, though, had created *entremets* in which ships sailed, a working pipe organ played music to accompany a celestial choir, and animals engaged in combat. As the banquet proceeded, living *entremets*, consisting of acrobatic acts, dances, and musical performances, also entertained the guests between the feast's courses. At the end of the banquet Philip announced his vow to retake the Holy Land in a highly staged manner,

and he encouraged his fellow members of the Order to follow suit. A ball concluded the festivities.

**INTERMEDI.** Pantomime, dances, and songs performed in the space between a banquet's courses flourished in the wake of the *Feast of the Pheasant*. In Italy these interludes, known as *intromesse* (the origin of our modern English word "intermission") or *intermedi* soon came to be used not only in banquets but in theatrical performances in the space between the acts of plays performed in Italian courts. The dancing of a *moresca* was among the most common type of interlude used at the time. The *moresca* was an exotic dance that took its name from the Italian word for "moorish." Often participants blackened their faces and attached bells to their clothing in imitation of the North African and Spanish Moors. *Morescas* often had a loose plot narrative in which a Moor threatened a fool dressed as a woman. Sexual

Engraving of the set and costume designs used in the first intermedio of the comedy *La Pellegrina*. ART RESOURCE.

overtones and whirling, seemingly ecstatic movements were common to the *morescas*, and for this reason, the dance was often entrusted to professionals, who would not be embarrassed by performing such exotic actions. In his *Book of the Courtier*, for instance, Baldassare Castiglione recommended that no prince be seen dancing a *moresca* in public since its suggestive movements and themes were incompatible with his dignity. By 1500, the popularity of the *moresca* as a form of theatrical dance was well established throughout Italy, and the rising fashion for Antiquity prompted dancers to adopt the seductive imagery of the *moresca* to story lines that they drew from ancient mythology and pastoral poetry. At Ferrara, these dance interludes first flourished in the last quarter of the fifteenth century. At the time the D'Este family who ruled the city favored five-act comedies written in the style of the ancient Latin dramatists Plautus and Terence, thus providing four opportunities between the acts for dancers to perform. These interludes usually bore little relationship to the plays themselves, and the dances and other entertainments that occurred between the acts were intended to be mere diversions while the actors prepared for the next act. Over time, intermedi were some-

times added before and after the performance and there were attempts to rely upon the interlude to establish an atmosphere for the play itself. The purpose of the intermedi, though, was always to entertain, and their popularity soon rivaled that of the plays themselves. During 1499, for example, 133 actors performed four plays staged at the court of Ferrara, while 144 performers danced the sixteen *moresca* interludes that occurred between these plays' acts. During the sixteenth century the great popularity of dance in court life encouraged the custom's rapid adoption in palaces throughout Italy and Europe.

**DEVELOPMENT.** The dancing of *moresca* continued to flourish in the interludes popular in sixteenth-century Italy, but a great variety of musical forms and pantomimes also developed. The singing of madrigals was soon to be adopted in these interludes, and in Florence and other Italian cities the most extravagant stagings of intermedi were usually reserved for the celebration of important dynastic weddings. For the marriage celebrations of Cosimo de' Medici to Elenore of Toledo in 1539, specially composed madrigals and dance music were used

Portrait of Catherine de' Medici, queen of France.

to stage six interludes for a comedy: four for the spaces between the acts and one each at the beginning and end of the play. Each of the interludes was carefully crafted to enhance the evening's overarching message: that the union of Cosimo and his bride Elenore was to give birth to a new Augustan Golden Age in Florence. That evening, though, the play came to a quiet and serene ending, and the producers of the entertainment feared that its conclusion might disappoint the audience. Thus the final concluding intermedi of the performance consisted of 20 performers who entered the stage to sing and dance an elaborate Bacchanalian rite. Experiments with interludes like these, then, contributed to the development of the modern musical theater, and they continued in Florence during the rest of the sixteenth century. The genre had an important impact on the development of opera, a form that emerged in the city during the final years of the sixteenth century. Concluding "ballets," similar to that staged at the performance marking the marriage of Cosimo de' Medici, became a popular feature of these early performances.

**BALLET DE COUR.** In France, the popularity of these interludes combined with a native tradition of court *fêtes* or festivities that had long been staged around

a central theme. Together the two forms of the intermedi and *fête* inspired a new genre that came to be known as the *ballet de cour* or "court ballet." The ballet de cour became a popular dance entertainment in the royal court during the final decades of the sixteenth century. Members of the royal family commissioned the poetry and music for these events, and the productions made use of elaborate stage machinery and sumptuous costumes. The court ballet was very much influenced by the ideas of the French Academy of Poetry and Music, which had been established in 1570 by Jean-Antoine de Baïf. De Baïf was interested in reviving the powerful union he believed had existed in the ancient world between poetry and music. Members of the academy strove to write poetry and music that made use of the ancient metrical modes, thus hoping to deepen music's power to influence the human spirit. The curiosity the academy bred also inspired investigations into ancient dance, and members of the academy soon experimented with performances staged to their rhythmical songs. Catherine de' Medici, the regent of France and later Queen Mother, supported these innovations, and frequently included choreographed dances in the festivities she staged at court. Under her influence and patronage, the ballet de cour flowered in the years around 1580. The genre wedded fantastic stage effects with instrumental and vocal music, poetry, and dancing. The first *ballet de cour* to rely on an integrated and dramatically effective libretto was *Circe, or the Comic Ballet of the Queen*, which was produced in Paris in 1581. The story retold the ancient tale of Circe, daughter of Perseus and the Sun, who lured men to ruin through their passions. In the end, though, human reason triumphs over the weaknesses of passion, and rationality succeeds in destroying Circe's power. It is because of this plot, a story in which order is brought out of chaos, that the ballet was termed a "comedy." The subject matter—the relative power of reason and the passions—was to recur many times in sixteenth- and seventeenth-century French literature. Yet as it was conceived in the *Comic Ballet of the Queen*, the triumph of reason was also intended to glorify the French monarchy. The work's poetry and art drew frequent parallels between rationality and its French champion, the reigning monarch Henri III, and it glorified the harmony his rule bred in France. In the coming years the optimism of such sentiments proved misplaced as France descended ever deeper into the malaise of religious civil war at the end of the sixteenth century. Despite these troubles, ballets de cour remained popular in these years, but none of the successive works rose to the artistic level of the early *Comic Ballet of the Queen*. As the seventeenth century approached, though, the

*a PRIMARY SOURCE document***A MASQUE**

**INTRODUCTION:** In the Tudor and Stuart court in England masques often marked the Christmas celebrations, especially the final concluding or “Twelfth Night” of those festivities. Ben Jonson and Inigo Jones mounted the most sumptuous of these masques in 1605, *The Masque of Blackness*. Jones, an architect, designed the sets for the masque, which made use of innovations in stage machinery and set design of the French *ballet de cour*. Jonson included this description of the sets in his prologue to the printed edition of the masque. The masque is notable for its rich mixture of poetry, song, and dance, a development inspired by the revival of antiquity that the Renaissance initiated.

First, for the scene, was drawn a landscape consisting of small woods, and here and there a void place filled with huntings; which falling, an artificial sea was seen to shoot forth, as if it flowed to the land, raised with waves which seemed to move, and in some places the billows to break, as imitating that orderly disorder which is common in nature. In front of this sea were placed six tritons, in moving and sprightly actions, their upper parts human, save that their hairs were blue, as partaking of the sea-color: their desinent parts fish, mounted above their heads, and all varied in disposition. From their backs were borne out certain light pieces of taffeta, as if carried by the wind, and their music made out of wreathed shells. Behind these, a pair of sea-maids, for song, were as conspicuously seated; between which, two great sea-horses, as big as the life, put forth themselves, the one mounting aloft, and writhing his head from the other, which seemed to sink forward; so intended for variation, and that the figure behind might come off better: upon their backs, Oceanus and Niger were advanced. Oceanus presented in a human form, the color of his flesh blue; and shadowed with a robe of sea-green; his head gray, and horned, as he is described by the ancients: his beard of the like mixed color: he was garlanded with algae, or sea-grass; and in his hand a trident. Niger, in form and color of an Æthiop; his hair and rare beard curled, shadowed with a blue and bright mantle: his front, neck, and wrists

adorned with pearl, and crowned with an artificial wreath of cane and paper-rush.

These induced the masquers, which were twelve nymphs, negroes, and the daughters of Niger; attended by so many of the Oceaniæ, which were their light-bearers. The masquers were placed in a great concave shell, like mother of pearl, curiously made to move on those waters and rise with the billow; the top thereof was stuck with a chevron of lights, which indented to the proportion of the shell, struck a glorious beam upon them, as they were seated, one above another: so they were all seen, but in an extravagant order.

On sides of the shell did swim six huge sea-monsters, varied in their shapes and dispositions, bearing on their backs the twelve torch-bearers, who were planted there in several graces; so as the backs of some were seen; some in purple, or side; others in face; and all having their lights burning out of whelks, or murex-shells.

The attire of the masquers was alike in all, without difference: the colors azure and silver; but returned on the top with a scroll and antique dressing of feathers, and jewels interlaced with ropes of pearl. And for the front, ear, neck, and wrists, the ornament was of the most choice and orient pearl; best setting off from the black.

For the light-bearers, sea-green, waved about the skirts with gold and silver; their hair loose and flowing, garlanded with sea-grass, and that stuck with branches of coral. These thus presented, the scene behind seemed a vast sea, and united with this that flowed forth, from the termination, or horizon of which (being the level of the state, which was placed in the upper end of the hall) was drawn by the lines of perspective, the whole work shooting downwards from the eye; which decorum made it more conspicuous, and caught the eye afar off with a wandering beauty: to which was added an obscure and cloudy night-piece, that made the whole set off.

**SOURCE:** Ben Jonson, *The Masque of Blackness*, in *The Works of Ben Jonson*. (Boston: Phillips, Sampson, and Co., 1853): 660–661.

conventions that governed these ballets’ performances became ever firmer. Members of the court danced in the productions and played characters in the various scenes, while in the final choreographed dance, the *grand seigneurs* or “peers of the realm” participated. At least once each year the king danced in the finale of a ballet de cour, establishing a tradition of royal performance that lasted into the early years of the reign of Louis XIV

(r. 1643–1715). The genre, with its mixture of music, poetry, and dance, had a profound impact on the emergence of both opera and ballet as independent art forms in seventeenth-century France.

**MASQUES.** Dance figured prominently in a final category of court entertainments popular in England, which became known as “masques.” The development of masques was long and complex. In late-medieval Eng-

land professional actors and dancers known as mummers regularly visited the houses of the nobility in disguises to perform for members of the household. These mummers performed elaborate dance pantomimes, and while festive social dances sometimes concluded these events, the professionals did not mingle or dance with the noble audience. In 1512, Henry VIII introduced a new kind of *masquerie* into England that was inspired by Italian examples. The king and revelers—all in disguise—surprised members of the court, danced and sang, and, in a break with tradition, recruited volunteers from the audience to participate with them. In the course of the sixteenth century, these masques at court grew increasingly formalized. One force that aided in their rising popularity was the establishment of the Master of the Revels in 1545, the chief Tudor official responsible for supervising entertainments at court. The Master appointed the poet George Ferrars to serve as the court's official "Lord of Misrule," and during his tenure, Ferrars staged a number of fantastic masques with odd-sounding titles, including *The Masque of Covetous Men with Long Noses* and *The Masque of Cats*. Mounting such productions was costly. At first, masques only required an elaborate pageant wagon, which served as their principal set. The performers rode atop this wagon as it was wheeled into the hall in which the masque was to be performed. Over time, though, English spectacles adopted the expensive costumes and elaborate stage machinery typical of Italian intermedii and French ballets de cour. Despite Queen Elizabeth I's thriftiness, she doled out large sums for the celebration of the masques, and she participated in them on many occasions. They often marked Twelfth Night, the concluding festivities of the annual Christmas celebrations. During Elizabeth's reign (r. 1559–1603), the English court masque also adopted the unified themes and high quality literary texts that were typical of the intermedii and ballets de cour. Masques were also celebrated, not only at court, but in the Inns of Court, the four legal societies in London. The greatest English masques—notable for their high literary quality, fusion of music and dance with poetry, and elaborate architectural stage effects—were mounted in the first decades of the seventeenth century during the reign of Elizabeth's successor James I (1603–1625). The playwright Ben Jonson (1572–1637) and the architect Inigo Jones (1573–1652) joined forces in these years to produce high-quality works that influenced all court entertainments during James's reign. Jones served as set designer, importing innovations in stage machinery from the continent and adapting them for use in the masques. The production that Jones and Jonson mounted in 1605, *The Masque of Blackness*, influenced the style of a number of

other Stuart-age poets who wrote for the masque, including Thomas Campion, Thomas Middleton, and William Rowley.

#### FOLK DANCING IN EUROPE

**PROBLEM.** The development of the office of dance master and the circulation of dance manuals in the fifteenth and sixteenth centuries aided the rise of courtly dance as an art form. Court pageants, ballets de cour, masques, and intermedii were all well documented in the artistic records of the period, allowing for the reconstruction of these festivities in which dance played a central role. These increasingly complex and highly choreographed events spurred dance's rise to one of the "fine arts" in the seventeenth century, as ballet and other forms of cultivated dance eventually became professional endeavors for which long periods of training and athletic development were necessary. We are less informed, however, about the kinds of dances that were performed by the lower orders of urban people and rural peasants. Certainly dance played a crucial function in these strata of society. It was a vastly popular entertainment, recorded in literary and artistic sources. Fifteenth- and sixteenth-century engravings as well as the paintings of artists like Pieter Bruegel frequently depict dancing at peasant festivals and weddings. The sermons and moral tracts of both Catholic and Protestant religious reformers constantly criticized this popular dancing, attacking it as an evil that led to lasciviousness and sexual promiscuity. Europe's princes and magistrates often tried to limit the lengths of wedding feasts, which sometimes included up to three days of dancing and revelry. At the same time the dances of the countryside inspired dancing masters and courtiers as they fashioned new dances

*a PRIMARY SOURCE document***A PLEA FOR RULES**

**INTRODUCTION:** The dance masters of the Renaissance frequently criticized the absence of rules in popular dance. Thoinot Arbeau wrote his *Orchesography* for cultivated urban people, hoping to foster a strict understanding of the rules of the dance. The text was written, like many of the dance manuals, as a dialogue between the master, in this case Arbeau, and the student, named Capriol or Caper. Capriol at one point asks about the proper performance of the galliard, a court dance that sprang from folk roots. Arbeau criticizes the way in which the dance is being practiced in the cities of his time, and instead makes a plea for a strict interpretation of the dance's traditional courtly rules. In point of fact, however, the free-flowing way in which he describes the dance being performed in his own time may lie closer to the dance's true roots. While Arbeau is critical of popular practice of the dance, and tries to foster a "courtly style," his comments are interesting because he realizes that all dances change over time.

throughout the Renaissance. The *branle*, or brawl as it was known in English, had originally been one of the steps of the Burgundian *bassedance*. During the sixteenth century, though, it was expanded to include a number of elements drawn from the dancing of French peasants, including hand-clapping, facial gestures, hops, skips, and jumps. Even though cultivated aesthetes like Baldassare Castiglione implicitly criticized the dancing of the lower orders of society as rambunctious and lacking in refinement, the court society longed for the livelier rhythms and forthright gestures of popular dance.

**CITIES.** Perhaps nowhere were the dancing styles more varied and complex than in Europe's cities. Here elites imitated the dances of the European courts, while the lower orders of society continued to use dance forms that were popular in the countryside. Accounts from ur-

ban society, too, point to a great innovation in the cities, as urban dancers experimented with new forms that were often perceived by moralists to be sexually suggestive. Courtly patterns of dance first influenced urban elites through printed dance manuals. In 1488, an anonymous dance manual, *The Art and Instruction of Good Dancing*, was printed in Paris. Unlike the elaborate theoretical manuals of dance that were being written for Italian aristocrats at the time, this manual was more pragmatic than theoretical and was designed for urban burghers who were interested in mastering the techniques of dance. Other practical manuals intended for city elites anxious to develop their skills on the ballroom floor soon followed in England, Germany, and Italy. While the great dancing masters of the Renaissance worked primarily in courtly society, dance schools began to appear throughout Europe during the sixteenth century for anyone who

Examples of peasant dance in Pieter Bruegel the Elder's painting *Wedding Dance in the Open Air*. © FRANCIS G. MAYER/CORBIS. REPRODUCED BY PERMISSION.

could afford the tuition. By 1533, the first laws were enacted in England to regulate the new dancing schools. Somewhat later, the City of London granted a monopoly over the instruction of dance within its boundaries to three dancing instructors. At about the same time, two types of dance schools flourished in Lisbon, Portugal: those that taught the whirling, ecstatic style of the *morescas*, and others that instructed in the more restrained courtly forms. A number of Spaniards also flocked to Italy to learn dancing technique from figures like Cesare Negri. Returning home, they opened their own schools in cities throughout the peninsula, but especially in the capital Madrid and the important provincial city of Seville, which were populated with a large number of dance schools by the late sixteenth century. In his important dance treatise, *The Charms of Love* (1602), Negri mentioned more than forty men who had trained in Italy before establishing their own schools or winning court positions throughout Europe. Through

these new dance schools the techniques and forms of elegant dancing that had flourished in Europe's courts during the fifteenth and early sixteenth centuries spread far beyond the confines of castles and palaces. In the late Renaissance this refined style now became a mark of social distinction among the upper and middle ranks of urban society as well.

**PEASANT DANCES.** The artistic evidence that survives of rural society suggests that different patterns of dancing prevailed in the countryside and among many of the lower orders in the cities. The French engraver, Théodore de Bry, completed a series of engravings documenting the styles of dance in use in sixteenth-century Europe. His *Dance of Lords and Ladies* showed cultivated couples arranged in the stylized poses recommended in the elite dancing manuals of the period. By contrast, his *Peasants' Dance* showed wild and raucous movements, with couples hopping and springing, men lifting their women high off the ground, and couples

*a PRIMARY SOURCE document***THE EVILS OF DANCE**

**INTRODUCTION:** During the sixteenth century both Catholic and Protestant reformers stepped up attacks on dance and even tried to eliminate dancing, particularly the kind of folk dance that occurred in connection with weddings and peasant festivals. In 1581, Thomas Lovell, a Puritan minister in London, published a short dialogue about the evils of dance, entitled *A Dialogue Between Custome and Veritie Concerning the Uses and Abuses of Dance*. It was typical of the many pamphlets that circulated in sixteenth-century Europe attacking dance. In the dialogue, the figure of Custom continually defends dance by recourse to traditional arguments, i.e., dance increases sociability, it provides a way for men and women to meet one another, and so on. Verity, on the other hand, launches bitter attacks like that which follows on the evils of dance.

**Custom:** But some reply what fool would dance  
if that when dance is done  
He may not have at lady's lips  
What dance hath for him won.

**Verity:** By this their minds they utter plain:  
To feed their fancy and their lust  
Not God in mind to keep.  
Such dancing where both men and maids  
together trace and turn,  
Stirs up the flesh to Venus' games,  
causes men with lust to burn.  
If we the living God do fear,  
and dread his laws to break,  
what so might move us until evil  
we should nay do nor speak.  
So if the causes we cut out,  
the effect we take away.  
Our holy life our loving Lord,  
better serve we may.  
Lest I alone with dance do fight  
this battle should be thought,  
out of the works of worthy men  
let's see what may be brought.  
Sirach, that sage in chapter ninth  
this counsel doth he give:  
In company with dancing dame,  
see that thou doth not live,  
Gaze not upon her beauty brave,  
hear not her mermaid's noise,  
Lest thou be snared, and lest that she  
enchant thee with her voice.

Bishop (Saint) Augustine were wont  
vain dances to reprove.  
But they are now so far from it,  
they that to dance do love.  
Better (he saith) that on Sabbath's rest,  
if were all day to ditch,  
Then on that day to be defiled  
with dancing as with pitch.  
Dancing is a flattering devil,  
a poison fire, destroying them  
that take delight therein.  
Oh, would that men their sins could see,  
how dance do them defile:  
Though pricked in pride and garnished gay,  
and they like wanton's smile.  
And Chrysostom, that golden mouth,  
for so his name may spell,  
where he of Jacob's wedding writes  
this doth he plainly tell:  
Weddings, thou hearest that thou might  
no wanton dancing hear,  
might it which dances diabolical  
he plainly calleth there,  
The bride and ere the bridegroom is with  
dance (saith he) beguiled,  
and the whole house and family  
therewith also defiled.  
And writing of Herodias  
her daughter's dancing nice,  
before the king to which her gave  
John Baptist's head of price.  
Ye saith that many nowadays whom  
Christians men do judge  
Not half their kingdoms for to give,  
nor others heads do grudge.  
But their own souls most dear of all,  
they give to be destroyed.  
While by their devilish dancing  
they are daily sore annoyed.  
Yea where that wanton dancing is  
erected, he doth say,  
The devil himself doth dance with them  
in that ungodly play.  
I wish that dancers then would weigh  
the author of their sport,  
which is the devil, and that he doth  
with them in dance resort.

engaged in close tight embraces. The hops, lifts, and tight embraces that de Bry depicted were also found in the artistic depictions of peasant dances of Albrecht Dürer, Hans Sebald Beham, and Pieter Bruegel. These movements had long raised the ire of moral reformers throughout Europe. The popular fifteenth-century preachers St. Bernard of Siena and St. John Capistrano had frequently railed against the immodesty of popular dances. When they preached in towns and villages, their audience sometimes tossed the musical instruments and other frivolities used to celebrate dances into massive “bonfires of the vanities.” Other more cautious individuals packed musical instruments and other dance paraphernalia away, waiting for the religious fervor to subside before bringing their items out of hiding. During the sixteenth century, though, the attacks on dancing from Protestant and Catholic reformers grew more severe, and in many places attempts were made to prohibit the custom. A pamphlet published in Augsburg in 1549, *A God-fearing Tract on Ungodly Dancing*, criticized peasant dances for their overt sexuality. The author attacked the custom of “fore” and “after” dances. After couples danced a serious “fore-dance,” the author railed, they then proceeded to perform a “less disciplined dance, with nudging, romping about, secretive hand touching, shouts, other improper things, and things about which I dare not speak.” Moralists feared such “improper” mixing of the sexes, and civil authorities tried to curb the popularity of such spirited movements by limiting opportunities for dances or by prohibiting these customs altogether. In spite of the efforts to censure dance, it continued to be a part of wedding celebrations as well as the long church festival of Carnival. While authorities attempted to segregate the young, unmarried men from women at these occasions, these festivals and celebrations provided an important avenue for socializing in country and town societies. At dances many men met their future wives through the courting rituals during which men often sat on ladies’ laps, caressing and fondling them. Such open displays were perceived by Christian moralists and governing officials alike as an easy entree into premarital sex. Sixteenth-century government officials responded by enacting ever-tighter regulations against dance and by sending magistrates into the countryside to punish offenders. Sometimes the magistrates seized and smashed the instruments that had been used to accompany such dancing. But despite such draconian efforts, the popularity of dance persisted.

**NEW FORMS.** The association of the dances of peasants and the urban poor with immorality and disorder

was reinforced in the sixteenth century by the rise of several new dance forms, including the *sarabande* and the *chaconne*. Legends linked both dances to the New World Indians, although each derived inspiration from native Spanish folk traditions as well. The sarabande was first mentioned in a manuscript poem written by Fernand Guzmán Mexía in 1539 in Panama, but was not recorded in a Spanish document until 1583, when it was prohibited at Madrid. The sarabande was performed in groups with castanets and tambourines and was explicitly sexual in its movements. It was denounced as a “national disgrace,” and described by one Spanish moralist as a “dance and song so lascivious in its words, so ugly in its movements, that it is enough to inflame even very honest people.” In 1599, Swiss observer Thomas Platter witnessed a group of fifty men and women performing the sarabande in Barcelona, making “ridiculous contortions of the body, the hands, the feet.” Still others condemned the dance as a devilish creation. From Spain the dance spread into France, Germany, and England, where it flourished in the early seventeenth century. As the dance moved throughout Europe, it developed different styles. Some of the forms of the dance were lively and suggestive, while others were grave and mannered, suitable to be performed in the ballrooms of the aristocracy and the rich. The rhythm of the dance, which was similar to the later Baroque minuet, inspired new native sarabande steps. In time, the original daring element of the dance disappeared, and it became one of the more staid of seventeenth-century dances. The chaconne, like the sarabande, developed in Spain, emerging in the final years of the sixteenth century. The songs that accompanied it were frequently filled with anticlerical sentiments and sexual innuendo, and the movements of the dance were thought to be similarly suggestive. The refrains to its songs frequently began with phrases like, “Let’s live the good life! Let’s go to Chacona!” Chacona may have been associated at the time with a colonial outpost in Mexico, but the precise derivation of the dance’s name is still a matter of conjecture. The dance grew popular in Spain’s cities around 1600, and chaconnes together with sarabandes were the two most popular urban dances in the country during the first quarter of the seventeenth century. No one was said to be able to resist the call to dance the chaconne, and its feverish popularity soon spread to other European regions. Its adoption in courtly societies toned down its more overt sexuality, as had happened with the sarabande before it.

**FOLK DANCES.** The examples of the chaconne and sarabande illustrate the ongoing and important influence that European folk dance had on the more elevated and

Hans Sebald Beham's engraving of folk dance steps. MARY EVANS PICTURE LIBRARY.

highly choreographed styles of the continent's great ballrooms. A distinguished lineage of ballroom styles in France, Italy, England, and Germany developed out of the folk dances of the European Renaissance. The *gavotte*, *bourrée*, *passepied*, and *jig* (or *gigue*) were just a few of the many folk dance forms that entered the repertory of social dances practiced in aristocratic and upper-class European societies during the period.

**CONCLUSION.** As one of the fine arts, dance experienced a long period of apprenticeship in the Renaissance under the direction of courtly dance masters and European aristocrats. The widespread love for dance gave birth to scores of new styles, choreographies, and spectacles that were characterized by complexity and grace of movement. For inspiration, Europe's dance theorists turned to the ancients, trying to recapture the power they believed had flourished in ancient Rome's poetry, dance, and music. They revived neoplatonic ideas about the nature of the universe as a dance, believing that the harmonies on the dance floor mirrored those of the cosmos. And they also combed through the native styles of their regions and adapted folk dances to the new demands of the ballroom. Dance as an art form of the Renaissance

court flourished, even as moralists and civic authorities attacked the spirited dances of the countryside and the urban landscape. Dance played an important role as a marker of social distinction, a sign of cultivated upbringing. As the end of the Renaissance approached, new court forms of theatrical dance like the ballets de cour, masques, operas, and intermedii were being performed throughout Europe. Dance played a key role in court spectacle, and the stage was set in these developments for the emergence of the independent professional ballet in the seventeenth century, a form which has since delighted audiences with its combination of stagecraft and highly choreographed movements.

## SIGNIFICANT PEOPLE *in Dance*

---

### THOINOT ARBEAU

1520–1595

*Cleric*

*Dance theorist*

**A CLERIC.** Thoinot Arbeau was born Jehan Thauburot in 1520 in Dijon, once a center of fifteenth-century Burgundian court life. He received his schooling in Dijon and Poitiers and may have also attended the University of Paris. He took a degree in law before entering holy orders. By 1542, he became treasurer of the chapter house at Langres, and five years later was named a cathedral canon. He held a number of important church positions throughout his life, rising to the post of vicar-general, an important diocesan office. Late in life he wrote his dance treatise, *Orchesography*, a work that provides a vital glimpse of the styles of dance practiced in late sixteenth-century France, and which subscribes to the prevalent Neoplatonic notion about the importance of dance as a reflection of the cosmos.

**TONE.** Arbeau's dance manual was the only such work to appear in France in the late sixteenth century, although works of this kind were relatively common in Italy. It is a text comparable to the works of Fabrizio Caroso and Cesare Negri, and it records a similar number of dances. Arbeau, though, writes for an urban clientele, in contrast to the "courtly" tone of Caroso and Negri, and his dances are simpler and more direct. At the same time he includes even more important information about musical accompaniments to the dances. Arbeau developed, for example, a precise system for mapping out the steps to the accompanying musical passages he includes. Thus there can be no doubt about how he wanted the dance steps to follow the music, and for this reason, his work has been an invaluable tool to modern scholars wishing to recreate sixteenth-century dances. Among the many dances he relates, Arbeau includes 25 different branles, perhaps the most

popular dance of the time in France. The branle, known as the brawl in English, had originally developed out of one of the steps of the Burgundian basse dance of the fifteenth century. In the sixteenth century, though, ingenious dance masters and dancers had added a number of choreographed movements and innovations to the dance, which Arbeau carefully catalogues. One of the colorful branles he relates is the *washerwomen's branle*, in which dancers clap their hands like washerwomen beating clothes on the banks of the Seine. Another is the *hermit's branle*, in which participants mime the hand gestures that religious hermits made in greeting. Fancy footwork was a hallmark of such dances, and Arbeau recounts these with care as well. Beyond his numerous branle variations, he includes choreographies for the pavan, 15 different galliards, the volta, allemande, canary, as well as many others. The entire tone of the book is good-natured and charming; it is written, for instance, in the form of a dialogue between the teacher Arbeau and his disciple Capriol (meaning "step" or "caper"). As a cleric, Arbeau was one of an increasingly rare breed that actively pursued secular pursuits like the dance, and he recommended it in a strikingly modern way as good exercise. The changing spirit in the church, fueled by the severe tastes of the Counter-Reformation, took an increasingly dim view of priests like Arbeau who danced. The Jesuits and other religious orders of the time included dance instruction into their school curricula for children destined for marriage and secular careers, but dance was quickly becoming a pursuit too worldly for the rectory and the chapter house.

### FABRIZIO CAROSO

c. 1530–c. 1605

*Dance master*

*Dance theorist*

**EARLY LIFE.** Little is known about the circumstances of Caroso's life, except that he was born in Sermoneta, a small town near Rome, sometime between

1527 and 1535. Long-standing legends have alleged that he was a peasant taken into the household of the Caetani family, dukes of Sermoneta and Rome, and provided with an education. In his treatises Caroso dedicates a number of his dances to members of the Caetani and Orsini families, and it is likely that he probably served as the dance instructor in these households for a time. Both families kept large palaces in Rome during the sixteenth century, and besides the Orsini and Caetani, Caroso mentions other powerful Roman nobles of the day, including the Farnese and Aldobrandini Duke and Duchess of Parma and Piacenza, to whom he dedicates his second dance book, *The Nobility of Ladies* (1600). Torquato Tasso, the accomplished late Renaissance poet, also wrote a sonnet dedicated to Caroso, which is included in *The Nobility*. Like most of the prominent dance masters of the period, though, he probably spent much of his life moving in princely circles in Italy, teaching dance and mounting spectacles and other entertainments for court circles. Little more, though, can be determined about his life.

**WORKS.** Caroso is remembered today for two dance manuals he published late in the sixteenth century: *The Dancing Master* (1581) and *The Nobility of Ladies* (1600). Both are informative sources about the kinds of dances that were popular in the later Renaissance and together include information on about 100 different dances. Among these dances, Caroso includes a number of *balletto*, which were specially choreographed dances that consisted of multiple parts and specially composed music. While Caroso's works include a few simple dances that could be easily mastered, most of them were highly complex constructions that even expert amateurs might have had to spend many hours practicing. His books also include music intended to accompany these dances, and thus his work has been of great value to scholars and modern dance enthusiasts anxious to recover Renaissance styles of dance. In his *Nobility of Ladies* Caroso also included two dialogues between a dance master and his student that outline ballroom etiquette and a series of hard-and-fast rules for dancers to observe. His prescriptions on etiquette are notable for their extreme courtliness. He advises his readers on such subjects as how to wear a cape, how to sit and stand, when and how to remove gloves, and so forth. New editions of Caroso's book *Nobility of Ladies* continued to appear in Italy until 1630, demonstrating its continued role in the seventeenth century as an authority on dance techniques and ballroom behavior.

## CATHERINE DE' MEDICI

1519–1589

*Queen of France*

**CULTURED BEGINNINGS.** Catherine de' Medici was one of the most powerful women of the sixteenth century. She was the daughter of Lorenzo de' Medici, duke of the Italian city of Urbino, and the French princess Madeleine de la Tour D'Avergne, but was completely orphaned by the age of one. Her upbringing was entrusted to nuns in the city of Florence and later in Rome. Her marriage to the heir to the French throne, Henri, the duke of Orléans (king of France from 1547–1559), was negotiated by her uncle, Pope Clement VII. This wedding took place in Paris in October 1533. According to long-standing legend, Catherine made a sensation in her first appearance at the wedding ball by wearing a new style of high-heeled shoe that gave a swaying undulation and grace to her dance steps. Shoes with soles and heels were just coming into use in the early sixteenth century, and they had a definite effect on dancing, since they allowed performers to stomp and stamp their feet and to perform more intricate steps than was possible in the older fifteenth-century styles. Whether or not Catherine introduced these shoes to France cannot be determined, but she has long been credited with raising the standards of civility and culture in France's noble courts. Her cuisine was widely admired, and noble families searched for Italian cooks that could make the kinds of dishes that Catherine served at state festivities. Italians have long been fond of crediting the subsequent glories of French cooking to the advances that this Italian princess introduced into the royal kitchens in the sixteenth century.

**COURT FESTIVITIES.** Catherine's years in political life were tumultuous ones, dominated by the ongoing controversies and civil conflicts between French Protestants, known as Huguenots, and Catholics. One way in which Catherine escaped the stress of these difficulties was through the development of the genteel and ordered

art of dance in her court. Like dance enthusiasts elsewhere in Renaissance Europe, Catherine saw in the art a way of teaching the harmony and order that should prevail in the social and political world. Dance was, in her mind and in the minds of other cultivated Europeans, a model for properly ordered social relationships. In the many festivities she staged at court during the troubled years of her reign, she relied upon dance to express these ideas. She staged a series of “magnificences,” grander than any that had yet been seen in France. These costly spectacles were attacked at the time as a source of ruination and poverty to the French crown, although Catherine saw them as an essential way to unify the French monarchy’s quarrelling noble factions. As Catherine wooed other European kings and states and as she tried to mediate between her restive nobles, she imported ideas from the Italian dances and *intermedi* of the day. The “magnificences” relied extensively on dance choreography to express the faith in dance’s powers to teach peaceful and harmonious living. Out of her efforts the *ballet de cour* emerged, a royal art form that joined together artistic stage designs, poetry, music, and dance. This genre influenced both the rise of the opera and the seventeenth-century ballet. Thus although Catherine’s years as regent of France were troubled, her political career has long been credited with being an important stimulus to the development of the *beaux arts*, or “fine arts” in France.

### CESARE NEGRI

c. 1535–c. 1604

*Dance master*  
*Dance theorist*

**MILAN.** Cesare Negri’s *The Graces of Love* (1602) was the most complete and detailed of all the great Renaissance works on dance theory and practice, and it provides a great deal of information about the dance life of the Italian upper classes in the late Renaissance. In this work Negri also informs us about his own life, allowing

us to reconstruct the career of one of the Renaissance’s most important dance masters. Born in Milan around 1535, he served the city’s Spanish governors as dance master until 1599. Between 1555 and 1600 he also directed a number of spectacles for major Italian ducal families. His list of distinguished clients included the Visconti, the Medici, the Gonzaga, and D’Este. One of his most impressive productions was a spectacle celebrating the naval victory of the Italian admiral Andrea Doria against the Turks in 1560. Another was his direction of the festivities marking the visit of Queen Margarethe of Spain to Milan in 1598. In his capacity as dance master, Negri also traveled extensively with Milan’s noble rulers, performing dances for them on journeys to Malta, Genoa, Naples, Florence, Mantua, and Saragossa. Negri’s *Graces of Love* is also a rich source of information about the major dancing masters of the later Renaissance. He includes the names of over forty dance masters who practiced at the time and gives details about their training and where they traveled to practice their art. His work thus points to the development in Italy of a group of professional male dancers, many of whom opened dancing schools in Europe’s cities or who taught dance to their noble patrons.

**DANCES.** Negri’s dance manual includes some of the typical information on ballroom etiquette that is to be found in many similar books from the period. He also discusses dance’s role in aristocratic processions and *intermedi*, two of the most common occasions for theatrical dance in Renaissance Italy. By far, though, the largest portion of *The Graces of Love* is given over to a technical discussion of dance steps. The dances that he treats in the work are extremely complex, among the most difficult to survive from the Renaissance. In particular, he treats extensively the upper-class forms of the galliard and outlines a number of variations on the dance’s footwork. He also shows that dances, just like the music of the time, were often improvised and that dancers loved to practice variations on the basic steps, joining different steps and footwork together to create ever more difficult choreographies. He includes 43 choreographies for dances, a number of which are figure dances similar to those that are still performed in American square dances. Like other dance manuals of the period, Negri’s also included music to accompany these forms.

## DOCUMENTARY SOURCES *in Dance*

- Anonymous, *The Art and Instruction of Good Dancing* (1488)—This text was printed in Paris and was the first dance manual written for urban townspeople, rather than the nobility. It inspired a host of similar texts written in the native languages of European countries.
- Thoinot Arbeau, *Orchesography* (1588)—Written in a dialogue between the dance master Arbeau and his student Capriol or Caper, this dance treatise provides invaluable evidence for many of the dances that flourished in late Renaissance Europe. It is important, too, because it includes many of the melodies and rhythms to which dances were performed.
- Fabritio Caroso, *The Nobility of Ladies* (1600)—Caroso's second edition of his *Il Ballarino* or *The Dancing Master* includes a greater range of choreographies than his first work. It also outlines the rules of deportment that are essential to men and women on the dance floor. Dedicated to the Duke and Duchess of Parma, it was printed in Venice in an impressively produced edition.
- Robert Davies, "Orchestra, or a Poem of Dancing" (1596)—Davies' Elizabethan verse celebrates the power of dance and in its many stanzas also informs about many of the customs of the dance floor in Renaissance England.
- Thomas Elyot, *The Book of the Governor* (1531)—A Tudor conduct book modeled on Castiglione's *Book of the Courtier* (1528), Elyot's book outlines the behaviors necessary for a man to be considered a "gentleman" in sixteenth-century England, and devotes a large amount of space to the subject of dancing. He recommends the art as a way for a gentleman to display his civility.
- Cesare Negri, *The Charms of Love*, (1602)—A late-Renaissance dance manual, this work provides a complete look at the social dance and theatrical spectacle that flourished in Italy during the period.
- Domenico da Piacenza, *Of the Art of Dancing* (1445)—The first Italian dance treatise to survive from the early Renaissance, this work demonstrates Piacenza's vast reading on the history and theory of dance as well as his general theoretical knowledge of the arts. He relies on Aristotle's *Nicomachean Ethics*, particularly its outlining of the law of the "golden mean," to evaluate what steps nobles should perform on the dance floor.

## IMPORTANT EVENTS *in Fashion*

- 1311 The Council of Ravenna repeats a traditional medieval requirement that Jews wear a distinguishing sign on their clothes. These measures continue to be unpopular and largely disregarded by populations throughout Italy.
- 1348 The bubonic plague, also known as the Black Death, strikes Europe.
- c. 1350 The hemlines of men's *jupons* or doublets begin to rise in France to scandalous levels; women's bust lines, on the other hand, start to plunge.
- 1373 The city of Florence passes stricter sumptuary laws (laws designed to curtail luxury in dress) aimed at women.
- 1405 In her *Book of the City of Ladies*, Christine de Pizan praises women's love of fashion.
- 1416 Giacomina della Marca takes clerical orders in Italy. Della Marca's fiery sermons delivered over the next sixty years are typical of the fifteenth-century Franciscans, who favored restraint in dress and the adoption of a strict system of dress codes to identify Jews, prostitutes, and other marginal groups.
- 1427 Bernard of Siena conducts a hugely successful preaching tour in Italy that encourages men to discard their gaming boards, dice, and cards, and women to throw their finery into "bonfires of the vanities."
- 1434 The humanist Leon Battista Alberti completes his *Book of the Family*, an important work in promoting styles of feminine beauty for women, and one that encourages men to adopt a gravity in dress.
- c. 1450 The rich court of the Duchy of Burgundy dominates fashions in courtly societies in Northern Europe.
- c. 1460 The codpiece begins to grow, both in popularity and size, in male fashions.
- 1463 A series of sumptuary laws are passed in England that aim to define the status of various classes of society through distinguishing dress.
- 1464 Pope Paul II passes a series of vestment laws at Rome that exert greater control over the dress of the clergy.
- 1469 Galeazzo Maria Sforza, duke of Milan, gives his wife a pair of earrings, a style of jewelry long associated with Jewish women. Over the next half century earrings will be increasingly adopted by Christian women.
- 1477 A fashion for "slashed" and puffed styles in court dress develops in Germany.
- c. 1485 Italian court dress becomes fashionable in aristocratic circles throughout Europe.
- 1493 The popularity of the *poulaine*, long and pointed footwear, fades in favor of new soled and heeled shoes.
- 1494 The fiery Dominican Girolamo Savonarola begins to preach in Florence after the expulsion of the Medici. Over the following years, his sermons will encourage many Florentines to abandon their sumptuous clothing styles, but his preaching will remain controversial.
- 1498 Savonarola, recently excommunicated by the pope, is deposed following a counter-revolution in Florence.
- 1501 Catherine of Aragon marries Prince Arthur of England, introducing the style of the *farthingale*, a large hoop skirt, to the country.

- 1510 German styles reign in court dress fashions adopted throughout Europe, spreading the popularity of “slashing,” in which overgarments are cut away to reveal rich undergarments.
- Many aristocrats adopt the richly jewelled and decorative patterns of clothing popular in Italy.
- 1512 While Venice is under attack from the League of Cambrai, its Senate deliberates for a month about the kinds of ornaments that are to be permitted on clothing.
- 1527 In England, the German painter Hans Holbein begins to immortalize the clothing styles of many of the most famous English aristocrats and courtiers of the Tudor period through his minutely accurate and richly opulent portraits.
- 1530 The Medici family is restored to power after a brief interlude of republicanism at Florence. They will adopt a richly elegant style of dress in contrast to the severe republican styles that flourished in the city during the fifteenth century.
- c. 1535 The Italian sculptor Benvenuto Cellini is active at the court of Francis I. Besides his many duties as a sculptor, Cellini designs a great deal of jewelry for the French king Francis I.
- 1539 Cosimo I de’ Medici celebrates his wedding to Elenore of Toledo at Florence. Elenore will become known in the city for her lavish gowns.
- Henry VIII sends his court painter Hans Holbein to Flanders to paint the image of his prospective bride Anne of Cleves. Although the marriage is never consummated because of Henry’s personal distaste for her physical appearance, Anne gains a reputation in England for her richly decorated clothes, which establish new styles in the English court.
- c. 1540 In Italy the Mannerist painters’ portraits of the upper classes are notable for their richly jewelled and elaborately decorated women’s dresses.
- 1541 Protestant leader John Calvin establishes control over the Reformation at Geneva and begins to promote tougher sumptuary laws. During his more than two decades in the city over 800 people will be arrested for violations, and 58 will be put to death for excesses in clothing.
- c. 1550 The upper-class dress of Spain begins to affect courtly styles throughout Europe.
- Henry II of France forbids the wearing of clothes made of silk and velvet and of styles that are trimmed in silver and gold in order to prevent the flow of money outside France.
- 1553 Marguerite de Valois, the future wife of King Henry IV (r. 1589–1609) and an important originator of many upper-class feminine styles, is born.
- 1558 Queen Elizabeth I ascends the throne of England. During her more than forty-year reign she will influence the styles of her court and will, according to legend, commission more than 3,000 costly dresses.
- c. 1560 Pocket watches begin to appear in France.
- Huge pants known as “Plunder” trousers are popular in Germany, although preachers attack the style as wasteful and sinful.
- 1564 The use of starch is introduced in England, allowing for the development of complex pleats and ruffles.
- 1569 The Flemish painter Pieter Bruegel paints his famous *Peasant’s Wedding*, a source for information on rural styles at the time.
- c. 1570 The ruffled collar becomes popular as an upper-class style favored throughout Europe.

- c. 1580 In Germany, the style of women's clothes grows increasingly severe and restrained. Religious changes in both Catholic and Protestant regions as well as the popularity of Spanish dress at the time encourage the new style.
- 1581 The French court witnesses the production of a *ballet de cour* entitled *The Comic Ballet of the Queen* which is notable for its rich costuming and its elaborate use of gold, silver, and jeweled decoration on the characters' costumes.
- 1589 William Lee invents the knitting machine in England. Elizabeth I denies him a patent for his invention because she fears it will put people out of work.
- 1590 Men begin to wear "love locks" at court in England. These locks are long shocks of hair that fall over one side of the collar.
- 1599 The Tudor court in England spends approximately £10,000 on clothes this year at the same time many professionals (lawyers and government officials) live on less than £100 per year.
- 1600 Marie de' Medici becomes queen of France. She establishes a court notable for its luxury and acquires a reputation as the most expensively dressed woman in Europe.
- 1603 Elizabeth I dies in England. Her successor, James I of Scotland, ascends the throne. During the initial years of his reign James will quadruple the amount spent on clothing in the English court.

## OVERVIEW *of Fashion*

**A CLIMATE OF RESTRICTION.** Renaissance society depended upon the production of cloth and clothing as one of its key industries. As a time-consuming and labor-intensive process, the production of textiles kept as much as a third of urban populations employed, often in servile and brutal conditions. Despite the immense amount of energy that went into the production of clothes, there was a prevalent mistrust of clothing as “fashion” at the dawn of the Renaissance; the majority of the population still adhered to the medieval belief that such displays contributed to the sin of vanity. This attitude lost some ground during the fourteenth century, however, as court and urban fashions in Europe became more changeable and daring. The tension between moralists who denounced changing fashions as sinful and the upper-class obsession with clothes became a hallmark of this period. Renaissance moralists particularly zeroed in on a perceived association of style’s fickleness and mutability with women, even though little evidence exists to suggest women’s passion for clothes exceeded that of men. In fact, the advice books of the Renaissance written by humanists frequently encouraged men to pay more attention to their clothing than women. The association of women as the “fashion horses” of the time, though, arose from complex causes and transformations in the exchange of property that, by the Renaissance, had become established throughout society. The system of inheritance excluded women from inheriting property from their husbands, and they received their share of their father’s estate when they married in the form of a dowry and a trousseau (a gift of clothing that was intended to see women through the first few years of marriage). The husbands, in turn, had to give a complex set of gifts to their wives that rivaled the trousseau and dowry she had received from her own family or face the loss of status. During the fourteenth and early fifteenth centuries the cost of establishing a household rose quickly in Europe as a result of inflation touched off by the Black Death and subsequent outbreaks of the plague.

As a result, men began to marry later, and dowry and trousseau expenses rose. The cost of a man’s “counter-trousseau,” the gifts he gave his wife at marriage, consequently rose to keep pace with this inflation. Thus in the minds of Renaissance men, women’s taste for fashion was one of the chief evils of the age. Civic officials tried valiantly to contain the costs of this luxury, while the popular preachers of the age denounced it. Still, fashion had penetrated into Renaissance society, and over the following centuries its steady advancement knew no retreat.

**FASHION AS INDUSTRY.** Although moralists and town and state officials tried to contain fashion’s excesses, the style industry was a significant portion of a Renaissance city’s economy by the early fifteenth century. In many parts of Europe tailors had their own guilds that regulated production and fixed prices. Elsewhere this group existed within pre-established guilds. In Florence, tailors became associated with several guilds, but gained a greater reputation as part of the relatively low status “clothing resellers” guild. By the standards of the fifteenth century tailoring was still only a middling occupation, but the increasing emphasis on clothing and appearance increased the status of the best tailors. Beyond tailors, however, an entire battery of professions satisfied the Renaissance demands for style. Milliners, cobblers, lace makers, leather workers, and furriers were just a few of the myriad professions who served the fashion industry. The boundaries between all these various occupations were often strikingly clear, although at the bottom rung of the clothing market independent suppliers sometimes poached these professions’ livelihood. The clothing market was highly competitive, with the high cost of materials offset by the relatively cheap labor. To take advantage of these realities, families bought their own cloth from retailers and producers before commissioning a tailor to construct a garment. Many families did their own sewing at home or gave it to a family member who had entered a convent. Still, the cost of clothing was dear, and patterns in dressing drew a clear line of demarcation between social classes; servants, the lower classes, and the poor dressed in clothes that were considerably more threadbare, and made over patterns that required far less material than those of the wealthy.

**EARLY RENAISSANCE STYLES.** In Florence an ethos of republicanism in the fourteenth and fifteenth centuries bred restraint in clothes. The humanist literature of the age counseled wealthy men of affairs to dress in a magnificent, but severe fashion that reflected favorably on their lineage and their city. Although this literature advised women from the same class to think less about

their clothes and more about their husband's desires, wives often dressed in elaborate styles at ceremonial occasions attended by other members of the upper classes as reflections of their husbands' wealth and status. The greatest of the many occasions that called for finery was the wedding. Brides and grooms planned for months and sometimes years the clothes that they were to wear on these occasions, and an ever-escalating climate of competition among families is evident in Renaissance cities throughout the period. Governments frequently tried to control the expenditure of these events, but despite these prohibitions urban dress continued to grow more sumptuous, elaborate, and ornate as the fifteenth century drew to a close. At this time urban fashions, particularly in Italy, reflected the increasingly elegant styles popular in court circles throughout Europe. While the elites in cities tried to ape court societies, they could never come close to rivaling the expense and magnitude of styles favored by Europe's aristocrats.

**THE SIXTEENTH CENTURY.** As the sixteenth century approached, styles in Europe were largely regional. Around 1500, however, a wave of styles that emanated from Germany and somewhat later from Italy affected European court dressing. The new dress was elaborate, many-layered, and given to patterns that reshaped the body, sometimes into profoundly distorted shapes. A case in point is the Spanish-inspired *farthingale*, or wide hoop skirt, which made it difficult for women to sit in chairs and even to pass through doorways. It became popular in France, England, and Germany in the sixteenth century, although moralists attacked it for deforming the human body. Despite such attacks, fashion's ever-changing whims persisted. The corset, an undergarment adopted by both men and women, achieved strikingly different effects in each gender. For men, it allowed tight-fitting, heavily tailored doublets, while for women it flattened the bust and tapered the waist into an "hour glass" shape. In the styles of the first half of the sixteenth century, this tendency to distort the human form gave birth to eccentric fashions like slashing, in which elaborate cuts in an outer garment's material allowed the many-layered undergarments to show through. Around 1550, upper-class fashions changed again rather quickly. The new styles came from the Spanish court and favored heavily tailored, more restrained appearances. High ruff collars and capes were also elements of Spanish style adopted by courtiers and urban elites at the time. The continued criticism of fashion's ever-changing bazaar failed to blunt the reality that style had become a fundamental feature of European life.

---

## THE REGULATION OF CLOTHING

**CONSUMPTION.** The Commercial Revolution that began in Europe around 1000 C.E. rested on a firm foundation of cloth and clothing production. As Europe's cities increased in population during the High Middle Ages, fabric weaving became a lucrative business, and by the early Renaissance Italy was Europe's preeminent center of cloth production, exporting fine silks and woolens throughout the continent. The production of cloth—an item for which there was universal need—was the foundation upon which great Renaissance economies relied, and the spinning of fabric produced much of the enormous wealth that allowed the era's elites to indulge their tastes for art, fine buildings, and sumptuous fashions. The guilds that controlled the milling of wool and the weaving of textiles were usually the most important commercial organizations in Europe's cities, and they often dominated local politics. In Florence, perhaps as many as a third of the city's population worked in the woolen industry, and Florentine cloth had a reputation throughout Europe for its fine quality. Spun from English wool, it had captured a place as a luxury commodity of the highest distinction. In the course of the Renaissance the wealth that Florence's looms produced funded many of the city's building projects, including the construction of the city's cathedral. In the 150 years it took to complete the massive edifice, the town's Arte della Lana, or Wool Guild, controlled the building's construction, even as it dominated the city's economy and government.

**LABOR PROBLEMS.** The medieval and Renaissance guilds have often been compared to modern trade unions, but in one crucial respect they were vastly different. The goal of modern unions is to better the living standards and wages of workers, while in pre-modern Europe, great masters dominated the guilds and acted to keep costs low. As a result, many guilds were far from harmonious organizations, as journeymen and small producers resented the actions of the great masters who controlled the guilds' structures. At Florence, for example, the master weavers responsible for the final stages of production of the town's luxurious woolens sat at the apex of a vast pyramid of woolen workers. Their high-handed tactics frequently angered those who performed simpler, less skilled tasks associated with cloth production. Tensions erupted in the Arte della Lana, sometimes threatening the city's social fabric. In 1378, for instance, the

*a PRIMARY SOURCE document***LABOR TROUBLES**

**INTRODUCTION:** Like many large European cities in the later fourteenth century, Florence experienced major conflicts in its guilds. After the population decline caused by the Black Death and subsequent outbreaks of the plague, labor grew comparatively more expensive in the towns, although the demands for better wages and working conditions sometimes fell on deaf ears in the guilds, many of which were controlled by the wealthiest masters. In his *History of Florence*, the famous sixteenth-century humanist Niccolò Machiavelli recounted the history of Florence's bitter revolt of the *Ciampi*, or wool carders, in 1378. As this relatively powerless group within the wool guild clamored for a greater voice in their guild and in urban government, they were joined by many of the minor artisans of the city. Machiavelli was not unsympathetic to the workers' plight and the interesting observations that he places in the mouth of one of the rebels show us the fundamental role that dress played in the mentality of the Renaissance.

When the companies of the arts were first organized, many of those trades, followed by the lowest of the people and the plebeians, were not incorporated, but were ranged under those arts most nearly allied to them; and, hence, when they were not properly remunerated for their labor, or their masters oppressed them, they had no one of whom to seek redress, except the magistrate of the art to which theirs was subject; and of him they did not think justice always attainable. Of the arts, that which always had, and now has, the greatest number of these subordinates is the woolen; which being both then, and still, the most powerful body, and first in authority, supports the greater part of the plebeians and lowest of the people.

The lower classes, then, the subordinates not only of the woolen, but also of the other arts, were discontented from the causes just mentioned; and their apprehension of punishment for the burnings and robberies they had committed, did not tend to compose them. Meetings took place in different parts during night, to talk over the past, and to communicate the danger in which they were, when one of the most daring and experienced, in order to animate the rest, spoke thus:

If the question now were, whether we should take up arms, rob and burn the houses of the citizens, and plunder churches, I am one of those who would think it worthy of further consideration, and should, perhaps prefer poverty and safety to the dangerous pursuit of an uncertain good. But as we have already armed, and many offenses have been committed, it appears to me that we have to consider how to lay them aside, and secure ourselves from the consequences of what is already done ... We must, therefore, I think, in order to be pardoned for our old faults, commit new ones; redoubling the mischief, and multiplying fires and robberies; and in doing this, endeavor to have as many companions as we can; for when many are in fault, few are punished; small crimes are chastised, but great and serious ones rewarded ... Be not deceived about that antiquity of blood by which they exalt themselves above us; for all men having had one common origin are all equally ancient, and nature has made us all after one fashion. Strip us naked, and we shall all be found alike. Dress us in their clothing, and they in ours, we shall appear noble, they ignoble—for poverty and riches make all the difference.

Ciampi, or the wool carders, revolted against the control over production held by the weaving masters and retailers. The carders did not possess a vote within the guild so they demanded their own guild to represent them against the wealthier weavers and exporters of fabric. Eventually, many of the city's less-skilled workers or "little people" (*popolo minuto*) joined the carders in their demands and succeeded in briefly seizing control of the town's government. Although eventually suppressed, the Revolt of the Ciampi left a legacy of bitter faction and enmity in Florence's government and cloth industry that persisted in the early fifteenth century.

**LUXURY GOODS.** Florence was not alone in its guild tensions, as a demographic crisis had long aggravated problems within Europe's cities. By 1300, three centuries

of unparalleled population growth had outstripped the towns' ability to provide employment for the thousands of new immigrants who flooded into them each year. This population boom depressed wages and made widespread poverty a fact of life in Renaissance towns. While the numbers of the poor varied widely from place to place, as many as one-third of a town's population might be impoverished. They survived on occasional day labor, begging, and thievery. The problem of overpopulation encountered a devastating solution between 1347 and 1350 when the bubonic plague decreased the population of many of Europe's cities by as much as one-half. Repeated outbreaks of the disease throughout the fourteenth and fifteenth centuries effectively prevented population numbers from replenishing. The dramatic falloff in population in the towns initially deflated the

demand for the goods produced in cities, but as equilibrium returned to the urban scene the population decline bred inflation. While the Black Death and subsequent plagues often destroyed entire families, those wealthy producers who survived faced relatively less competition than before the epidemic. As a result, the concentration of wealth allowed the great families who had long dominated town governments and the urban economy to achieve even greater dominance. While this dominance fueled urban revolts like the Ciompi, it also inspired a new taste for luxury consumption. In Italy, especially, the cities' great families embraced fashion as a way to demonstrate their status and standing within urban society.
